Section 1.0 Introduction

1.1 INTRODUCTION

The County of San Bernardino has prepared this Final Environmental Impact Report (FEIR) in compliance with the California Environmental Quality Act (CEQA) for the Speedway Commerce Center II Specific Plan Project (Project). The County is required, after completion of a DEIR (State Clearinghouse No. 2021120259), to consult with and obtain comments from public agencies having jurisdiction by law with respect to the Project and provide the general public with an opportunity to comment on the DEIR. This FEIR has been prepared to respond to comments received on the DEIR, which was circulated for public review from June 1, 2022 through July 18, 2022. The preceding Table of Contents lists all persons, organizations, and public agencies who commented on the DEIR.

The County will evaluate comments on environmental issues from persons who reviewed the DEIR and will prepare a written response, pursuant to CEQA Guidelines §15088(a). The written response must address any significant environmental issues raised. In addition, there must be a good faith and reasoned analysis in the written response. However, lead agencies need only respond to significant environmental issues associated with the Project and do not need to provide all the information requested by commenters, as long as a good faith effort at full disclosure is made in the EIR (State CEQA Guidelines §15204, §15088). Those comments are responded to in **Section 2.0, Comments on the Draft EIR and Responses to Comments**.

State CEQA Guidelines §15088 recommends that where a response to a comment makes important changes in the information contained in the DEIR text, the Lead Agency either revises the text of the DEIR or includes marginal notes showing that information. Added or modified text is shown in **Section 3.0, Errata**, by underlining (<u>example</u>), while deleted text is shown by striking (~~example~~). The additional information, corrections, and clarifications are not considered to affect the conclusions within the EIR substantively and therefore, the City has determined that recirculation of the DEIR is not required as none of the criteria for recirculation under CEQA Guidelines Section 15088.5 have been met.

CEQA Guidelines §15132 indicates that the contents of an FEIR shall consist of:

(a) The DEIR or a revision of the draft.

(b) Comments and recommendations received on the DEIR either verbatim or in summary.

(c) A list of persons, organizations, and public agencies commenting on the DEIR.

(d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process.

(e) Any other information added by the Lead Agency.

Pursuant to CEQA Guidelines §15088(b), the County will provide written responses to comments to any public agency that commented on the DEIR, at least ten (10) days before the County's Board of Supervisors' consideration of certifying the EIR as adequate under CEQA. Written responses to comments will also be provided to non-public agency individuals, organizations, and entities that commented on the

DEIR. In addition, the FEIR will be made available to the general public at the County's Land Use Services Department and on the County's website a minimum of 10 days before the Planning Commission public hearing.

The FEIR, along with other relevant information and public testimony at the Planning Commission and County Board of Supervisors public hearings, will be considered by the County's Board of Supervisors. Next, the Planning Commission would recommend EIR certification and Project approval to the County Board of Supervisors.

1.2 ORGANIZATION OF EIR

This FEIR provides the requisite information required under CEQA and is organized as follows:

- **Section 1.0: Introduction.** This section provides an introduction to the FEIR, including the requirements under CEQA, the organization of the document, as well as a summary of the CEQA process activities to date.
- **Section 2.0: Comments on the Draft EIR and Responses to Comments.** This section provides a list of public agencies, organizations, and individuals commenting on the DEIR, a copy of each written comment received, and any response required under CEQA.
- **Section 3.0: Errata to the Draft EIR.** This section presents clarifications, amplifications, and insignificant modifications to the EIR, identifying revisions to the text of the document.

1.3 CEQA PROCESS HISTORY

The County has complied with relevant Public Resources Code provisions and CEQA Guidelines regarding the preparation and processing of the Project EIR. A brief summary of the Project's CEQA process is as follows:

- A Notice of Preparation (NOP) informing interested parties and agencies of the Project was distributed on December 13, 2021.
- Written and verbal comments were given at a public scoping meeting held for the Project on January 11, 2022.
- Following a Notice of Completion (NOC), the DEIR and Notice of Availability was distributed for public review and comment for a 45-day period, beginning June 1, 2022. The public review period closed on July 18, 2022.

1.4 CHANGES TO THE DRAFT EIR

As previously stated, **Section 3.0, Errata** to the Draft EIR, details the changes to the DEIR. In response to public comments, text changes have been made to DEIR sections to clarify and amplify the analysis or mitigation measures, and to make insignificant modifications to the DEIR. This information does not rise to the level of significant new information as the resulting impact analysis and alternatives considered remain essentially unchanged, and no new or more severe impacts have been identified. These changes do not warrant DEIR recirculation pursuant to California Public Resources Code §21092.1 and CEQA

Guidelines §15088.5. As discussed herein and as elaborated upon in the respective Response to Comments, none of the clarifications or changes made in the Errata reflect a new significant environmental impact, a "substantial increase" in the severity of an environmental impact for which mitigation is not proposed, or a new feasible alternative or mitigation measure that would clearly lessen significant environmental impacts but is not adopted, nor do the Errata reflect a "fundamentally flawed" or "conclusory" DEIR. In all cases, as discussed in individual responses to comments and DEIR Errata, these minor clarifications and modifications do not identify new or substantially more severe environmental impacts that the City has not committed to mitigate. Therefore, the public has not been deprived of a meaningful opportunity to comment upon a substantial adverse environmental effect of the Project or an unadopted feasible Project alternative or mitigation measure. Instead, the information added supports the existing analysis and conclusions, and responds to inquiries made from commenters. Therefore, this FEIR is not subject to recirculation prior to certification.

CEQA Guidelines §15088.5 describes when an EIR requires recirculation prior to certification, stating in part:

> *"(a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification. As used in this section, the term "information" can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement. "Significant new information" requiring recirculation include, for example, a disclosure showing that:*
>
> *(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.*
>
> *(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.*
>
> *(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to apply it.*
>
> *(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded (Mountain Lion Coalition v. Fish and Game Com. (1989) 214 Cal.App.3d 1043).*
>
> *(b) Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR."*

Comments and Responses

Kimley»Horn

Section 2.0 Comments and Responses to Draft EIR

This section includes all comments received by the County on the Draft EIR, including written comments and comments submitted online via email to the County. The County circulated the Draft EIR and its associated Notice of Availability (NOA) for a 45-day review period as required by CEQA. The review period ran from June 1, 2022 through July 18, 2022.

2.1 INTRODUCTION TO COMMENTS AND RESPONSES

In accordance with State CEQA Guidelines Section 15132, **Table 2.0-1, Comments from Public Agencies, Organizations, and the General Public** below provides a list of those parties that provided written comments on the Draft EIR during the public review period. Copies of the written comments are provided in this section and have been annotated with the assigned letter along with a number for each comment. Each comment is followed by a written response which corresponds to each commenter.

MASTER RESPONSES

Master Response 1

Project Scope and Description

The Speedway Commerce Center II Specific Plan Project (SCCIISP or Project) proposes conceptual land uses that include, but are not limited to, up to approximately 6.6 million square feet (SF) of high-cube logistics and e-commerce uses and 261,360 SF of ancillary commercial uses, as well as ancillary open space to support Project development and pedestrian travel, as discussed in detail starting on page 3-16 in *Section 3.0, Project Description*, of the Draft EIR. The Project does not directly propose the development of buildings or seek the approval of individual plot plans.

The Project entitlements listed on pages 3-34 and 3-35 of the Draft EIR include the approval of the SCCIISP, a Tentative Parcel Map, and Development Agreement. A revision to an Approved Action would also be required to amend the existing Planned Development permit for the Auto Club Speedway (ACS) to remove from its coverage approximately 433 acres of the ACS site that would be governed by the SCCIISP. Draft EIR *Section 3.0, Project Description*, *Table 3-5: Agency Approvals for the Proposed Project*, identifies subsequent approvals the Project would require to move forward with development

As explained starting on Draft EIR page 3-2, the Project does not propose the demolition of the existing ACS. The redevelopment of the existing ACS is a separate action under the "Next Gen in California Project," which was proposed by California Speedway, LLC and approved by the County in June 2021. The Next Gen in California Project replaces the existing 2-mile oval with a new 0.67-mile track to facilitate more competitive "short track" racing favored by race fans and broadcast partners, and will provide a more intimate venue with upgraded amenities and an enhanced fan experience. The Next Gen in California Project would continue to host NASCAR races and other events similar to and/or identical to the events that were previously hosted at the ACS and provide similar but upgraded amenities and support facilities. The Next Gen in California Project has received all necessary approvals and CEQA clearance for its construction and operation and is not part of the SCCIISP Project. See *Section 3.0, Project Description* of the Draft EIR for additional background on the history of the Project site and adjacent land uses.

The Project Description, found in Draft EIR *Section 3.0*, is accurate and stable and provides adequate detail to evaluate Project impacts. Under CEQA, the EIR must contain a general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals, if any, and supporting public service facilities. (CEQA Guidelines, Section 15124(c)). CEQA also states that the project description should not supply extensive detail beyond that needed for evaluation and review of the proposed project's potentially significant environmental impacts. (CEQA Guidelines, Section 15124). A conceptual description of project components is sufficient so long as the description contains enough detail to enable decision-makers and the public to understand the environmental impacts of the proposed project. This level of detail is provided in *Section 3.0* of the Draft EIR.

Master Response 2

CalEnviroScreen and Air Quality

The Project's construction and operational Health Risk Assessment (HRA) discusses the California Communities Environmental Health Screening Tool (CalEnviroScreen) rankings (refer to Draft EIR *Appendix C*). According to CalEnviroScreen, the Project site and the nearest residences to the northeast are located within Census Tract 6071002204, which is within the 93rd percentile overall for the CalEnviroScreen Score, which considers pollution burden (average of exposure and environmental effects) and populations characteristics (average of sensitive populations and socioeconomic factors).

CalEnviroScreen has been developed by the Office of Environmental Health Hazard Assessment (OEHHA) and California Environmental Protection Agency (CalEPA). While CalEnviroScreen can assist CalEPA in prioritizing resources and helping promote greater compliance with environmental laws, it is important to note some of its limitations. The tool's output provides a relative ranking of communities based on a selected group of available datasets, through the use of a summary score. The CalEnviroScreen score is not an expression of health risk and does not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment. Accordingly, CalEnviroScreen is not intended to be used as a health or ecological risk assessment for a specific area or site. Refer to Draft EIR *Section 4.3, Air Quality* for a full evaluation of the Project's CEQA air quality effects.

It should be noted that health risks are determined by examining the types and levels of air toxics generated and the associated impacts to air quality. As described in Draft EIR *Section 4.3*, impacts related to cancer risk would be less than significant with implementation of MM AQ-1 and MM AQ-9. Additionally, non-carcinogenic hazards are calculated to be less than significant. It should be noted that the EIR assesses the Project's incremental contribution to health risk impacts, consistent with the SCAQMD guidance and methodology. The SCAQMD has not established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SCAQMD considers projects that do not exceed the project-specific thresholds to generally not be cumulatively significant. Therefore, impacts related to air quality-related health risk from the Project would be less than significant. Refer to *Appendix C* of the Draft EIR for additional information.

While cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time, an EIR or MND can determine that a project's contribution to a significant cumulative impact will be rendered less than cumulatively considerable, and thus is not significant (see Section 15130 of the State CEQA Guidelines). With implementation of MM AQ-1, the Project's contribution to health risk impacts would be less than cumulatively considerable. The Project would not exceed the SCAQMD's 10 in one million incremental threshold as shown in Draft EIR *Table 4.3-21: Carcinogenic Risk Assessment*, and therefore would not exacerbate existing conditions.

Furthermore, it should be noted that the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates

that the regional increases shown in Draft EIR *Tables 4.3-13* through *4.3-17* would not necessarily cause an exceedance of the ambient air quality standards. Although the regional thresholds were developed to determine a level at which a project could affect the ambient air quality standards, these thresholds are the same for projects of all sizes and locations. The health risk LST analyses more accurately evaluate emissions based on the location and scale of the project. For example, LSTs for larger sites are higher than smaller sites to account for additional dispersion that occurs over a larger area. Additional dispersion also lowers the concentration of a pollutant.

Air Quality and GHG Impacts

The Project's exceedance of regional air quality emissions thresholds or greenhouse gas (GHG) thresholds does not necessarily indicate that a project is not in compliance with applicable standards. The exceedance of the regional thresholds is a direct function of the Project's size. As noted above, although emissions would exceed regional level thresholds, the Draft EIR determined that the Project's LSTs would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53).

Although GHG emissions would exceed the numerical threshold identified in the Draft EIR, the Project is subject to the County's GHG Reduction Plan. Draft EIR *Table 4.8-4: San Bernardino County GHG Reduction Measures Screening Table,* demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. MM GHG-1 requires the Project to apply reduction measures identified in the County's GHG Screening Tables so that each building would achieve a minimum of 100 points.

The County's 2021 GHG Emissions Reduction Plan Update states that any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and its corresponding GHG emissions

Air Quality Regulations

The Project would be required to comply with all applicable SCAQMD and CARB rules and regulations. For example, CARB's Advanced Clean Truck Regulation requires truck manufacturers to transition from diesel trucks and vans to electric zero-emission trucks beginning in 2024. By 2045, every new truck sold in California is required to be zero-emission. The Advanced Clean Truck Regulation accelerates the transition of zero-emission medium-and heavy-duty vehicles from Class 2b to Class 8.

CARB's Mobile Source Strategy facilitates the adoption of zero emissions buses and trucks. Additionally, CARB's Sustainable Freight Action Plan utilizes near-zero emissions technology and facilitates the deployment of zero emissions trucks.

Furthermore, the SCAQMD Warehouse Indirect Source Rule (ISR) (Rule 2305) requires the warehouse operator to, among other things, acquire zero emissions or near zero emissions trucks, requires zero

emissions/near zero emissions truck visits, requires zero emissions yard trucks, and install on-site zero emissions charging/fueling infrastructure, or pay to SCAQMD a mitigation fee to incentivize the purchase of zero emissions/near zero emissions trucks and charging/fueling infrastructure in communities nearby.

Air Quality and Greenhouse Gas Mitigation

The Draft EIR identifies numerous air quality and GHG mitigation measures to minimize emissions to the greatest extent feasible. Furthermore, Draft EIR *Section 4.8, Greenhouse Gas Emission*, *Table 4.8-4*, demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and its corresponding GHG emissions.

Exceedance of the regional emissions thresholds indicates when emissions reduction mitigation measures would be required. The Draft EIR identifies numerous design features which are part of the initial Project design and have the added benefit of reducing emissions (refer to Draft EIR pages 4.3-21 through 4.3-23). The Draft EIR identifies numerous mitigation measures to minimize emissions to the maximum extent feasible (refer to Draft EIR pages 4.3-38 through 4.3-42 and pages 4.8-31 through 4.8-33).

The Draft EIR Air Quality Section (*Section 4.3*) includes numerous construction and operational mitigation measures. Construction mitigation measures include use of the cleanest equipment available (meeting CARB Tier 4 Final emissions standards) and dust control (MM AQ-1) and low VOC paints (MM AQ-2). Additionally, operational mitigation includes a TDM Program to reduce vehicle trips/miles (MM AQ-3), constructing EV infrastructure (MM AQ-4), conduit for Transport Refrigeration plugins (MM AQ-5), idle limits (MM AQ-6), energy efficient vendor trucks (MM AQ-7), EV charging stations and carpool parking (MM AQ-8), electric/zero emission cargo handling equipment (MM AQ-9), and compliance with SCAQMD Rule 2305 which is also addressed in the Draft EIR and included in mitigation (MM AQ-10) which is a program to incentivize the purchase of cleaner trucks and charging/fueling infrastructure for the project and in the nearby community. Therefore, the Draft EIR GHG mitigation measures comply with State CEQA Guidelines Section 15041 and go above and beyond to meet the essential nexus and rough proportionality standards.

In addition, the Draft EIR GHG Section (*Section 4.8*) includes additional GHG mitigation measures, such as requiring compliance with the County's GHG reduction measures (MM GHG-1), the Draft EIR also requires the project to implement solar energy generation (MM GHG-2), requires energy efficient buildings that exceed the building code standards (MM GHG-3), requires the solid waste diversion (MM GHG-4), and requires the use of 100 percent electrically powered landscape equipment (MM GHG-5).

As explained in the preceding section, state regulations requiring the implementation of near zero or zero emission trucks are expected to substantially reduce the Project's GHG emissions over time, although such reductions are not factored into the Draft EIR's quantification of GHG emissions.

As noted above and in Draft EIR pages 4.8-25 through 4.8-31, the Project would achieve more than 100 points from the County's GHG Reduction Plan Screening tables and would not conflict with the County's GHG Reduction Plan. However, due to the size of the Project, the magnitude of the Project's emissions are conservatively considered significant. Additionally, 86 percent of the total emissions are

from mobile sources. Mitigation measures would be required to reduce emissions to the maximum extent feasible; however, emissions of motor vehicles are controlled by State and Federal standards and the Project has no control over these standards. CARB is addressing emissions from heavy duty vehicles through various regulatory programs including lower emission standards, restrictions on idling, the use of post-combustion filter and catalyst equipment, and retrofits for diesel truck fleets. Additionally, the SCAQMD is addressing mobile source emissions through the implementation of the Warehouse Indirect Source Rule (Rule 2305), which would also reduce the Project's emissions.

Traffic Impacts

Feasible mitigations have been proposed where applicable to reduce the project's environmental impacts. The project will pay Development Impact Fees and Fair-Share towards improvements recommended to alleviate congestion. Transportation Demand Management strategies were used for analysis and are listed below:

- Transit Rerouting
- Transit Stops
- Implement Neighborhood Shuttle
- Mandatory Travel Behavior Change Program
- Promotions & Marketing
- Emergency Ride Home (ERH) Program
- School Carpool Program
- Bike Share
- Implement/Improve On-street Bicycle Facility
- Traffic Calming Improvements
- Pedestrian Network Improvements
- Transportation Management Association (TMA)

Master Response 3

Project Alternatives

Neither a General Plan Amendment nor a Zone Change is required to allow or authorize the uses permitted in the Specific Plan area. Although the Project site currently contains a commercial land use designation, the underlying special development zoning allows for combination of residential, commercial, industrial, agricultural, open space and recreation uses, and similar and compatible uses. A text and map amendment to the Development Code and General Plan will be made to identify the Specific Plan designation on the official map. Additionally, the Project complies with the large majority of County policies established for these land use types. The Project's consistency with County policies is outlined in Draft EIR *Table 4.11-4: Consistency with the Countywide Policy Plan*.

Development of land within the County is dependent on the will of the property owner, who in turn is subject to land use and zoning standards established by the County. As required by CEQA, a reasonable range of alternatives to the Project was also considered for their ability to reduce environmental impacts and meet Project objectives. A Commercial Alternative (Alternative 3) was considered which would involve the development of a commercial and light office warehouse/industrial development that would allow general retail and the uses described in Table 82-17 of Chapter 82.06 of the County's Zoning Code. These uses include:

- General retail - 10,000 sf or less, with or without residential unit
- General retail - More than 10,000 sf, with or without residential unit
- Library, museum, art gallery
- Night Club
- Restaurant, café, coffee shop
- Medical, Profession Service and other office uses
- Commercial entertainment-indoor

After an analysis of the alternative, it was concluded that a commercial alternative would cover a greater square footage than the Project, as commercial and retail traditionally include more lot coverage and are spread out to accommodate commercial storefronts with parking for shoppers and visitors. Additionally, the increased Project size associated with the commercial alternative would likely create greater air quality, GHG, energy and transportation impact due to the increased building footprint and corresponding vehicle trips and emissions. These impacts are of greatest concern to the community and would be exacerbated through the implementation of this alternative. The Commercial Project Alternative would not meet Project objectives including: (1) Maximize the efficient movement of goods through the region; (2) Develop and operate a large format high-cube logistics and e-commerce center that maximizes the use of one of the few remaining large industrial sites; and would partially meet; (4) Develop a high-cube logistics and e-commerce center that is close to Interstate I-10; (7) Develop and operate an attractive large format high-cube logistics and e-commerce center in Southwestern San Bernardino County; (8) Develop a location for siting clean industry; (10) Develop and operate a large format logistics center that limit truck traffic disruption to residential areas; (11) Develop and operate a large format high-cube logistics and e-commerce center that positively contribute to the economy; and (12) Develop and operate employee-intensive facilities as this Alternative would have a smaller footprint and revenue-generating capacity. Therefore, this Alternative was found to be unfavorable relative to the Project.

A Reduced Footprint Alternative (Alternative 2) was also considered which focused on redesigning the Project to reduce the building area by 25 percent. The up to approximately 6.6 million square feet of high-cube logistics/e-commerce use that would be constructed under the Project would be reduced by 1,650,000 square feet to 4,950,000 square feet. The 261,360 square feet of ancillary commercial use would be reduced by 65,340 square feet to 196,020 square feet. Parking fields/drop lots would remain at 98 acres, providing parking for the Auto Club Speedway/future Next Gen in California Project. Open space associated with the water basin and existing storm channel would remain the same at 9.4 acres. Public

right-of-way requirements would also remain the same at 33.7 acres. In some cases, impacts were proportionally less due the 25 percent decrease in building area. However, significant and unavoidable air quality and GHG emissions impacts would remain. This Alternative would meet the Project Objectives to a lesser degree than the Project because the Reduced Footprint Alternative would not allow for the same level of development of the larger high-cube logistics and e commerce facilities and would still require the same level of infrastructure costs; therefore, the Alternative would not fully meet all the Project Objectives, and it was found to be unfavorable relative to the Project. Any smaller facility than Alternative 2 would not fulfill the Project Objectives nor meet demand and would require more smaller facilities resulting in greater impacts from more truck trips.

Lastly, a No Project/No Build Alternative (Alternative 1) was considered consistent with CEQA Guidelines Section 15126.6(e), which assumed that the existing land uses and condition of the Project site at the time the NOP was published (December 13, 2021) would continue to exist without the Project and no development would occur. The No Project/No Build Alternative would avoid all potential significant impacts and significant and unavoidable impacts that would occur from Project construction and operation. The No Project/No Build Alternative would not meet any of the Project Objectives with the exception of partially meeting objective (6) Facilitate the continued operation of the existing Speedway uses at the Next Gen motorsports facility. The No Project/No Build Alternative fails to meet all other Project Objectives such as maximizing the efficient movement of goods throughout the region through developing and operating a large format high-cube logistics and e-commerce center, as the site would remain in its current condition and would not undergo any development.

RE: CEQA – NOTICE OF AVAILABILITY OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE SPEEDWAY COMMERCE CENTER II PROJ-2021-000150

Dear Mr. Valdez:

Thank you for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced project. **We received this request on June 2, 2022** and pursuant to our review, we have the following comments for your consideration and inclusion into public record:

Flood Control Planning & Water Resources Division (Michael Fam, Chief, 909-387-8120):

1. We are aware there may be storm drains in and around the site that may be affected by the proposed Project. When planning for or altering existing or future storm drains, be advised that the Project is subject to the City of Fontana MPD, dated June 1992. It is to be used as a guideline for drainage in the area and is available in the City of Fontana offices. Any revision to the drainage should be reviewed and approved by the jurisdictional agency. Should construction of new, or alterations to existing storm drains be necessary as part of the Proposed Project, their impacts and any required mitigation should be discussed within the EIR before the document is adopted by the Lead Agency. 1

Permits/Operations Support Division (Fong Tse, Chief, 909-387-7995):

1. The proposed Project is located adjacent to a San Bernardino County Flood Control District (SBCFCD) right-of way and facilities (1-803-4A) Banana Basin, (1-809-GA/B) West Fontana Channel, (1-811-4A) Hickory Basin and (1-801-IG) San Sevaine Channel. Any encroachments including, but not limited to access for grading, fence removal and installation, side drain connections, utilities, and new street dedications on the District's right-of-way or facilities will require a permit from the SBCFCD prior to start of construction. The necessity for permits, and any impacts associated with them, should be addressed in the EIR prior to adoption and certification. If you have any questions regarding this process, please contact the FCD Permit Section at (909) 387-1863 2

BOARD OF SUPERVISORS
Col. Paul Cook (Ret.) First District | Janice Rutherford Second District | Dawn Rowe Vice Chair, Third District | Curt Hagman Chairman, Fourth District | Joe Baca, Jr. Fifth District
Leonard X. Hernandez Chief Executive Officer

We respectfully request to be included on the circulation list for all project notices, public reviews, or public hearings. In closing, I would like to thank you again for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced project. Should you have any questions or need additional clarification, please contact the individuals who provided the specific comment, as listed above.

3

Sincerely,

Anthony Pham P.E,
Chief,
Environmental Management

Response to Comment Letter R1 – San Bernardino County of Department of Public Works

R1-1 The commenter provides general introductory and background information. Further the commenter notes that the Project is subject to the City of Fontana MPD. New sewer and storm drainage facilities are proposed in Streets "A," "B," "C," and "D" with additional storm drainage placed along the western boundary of the Project site. Future development would comply with relevant regulations, including the Fontana Master Drainage Plan. Impacts related to the Project, alterations of facilities, and new utility infrastructure, including storm drain facilities are further discussed in Draft EIR *Section 4.19, Utilities and Service Systems*.

R1-2 Commenter notes the location of the Project in relation to San Bernardino County Flood Control District (SBCFCD) facilities and permit requirements. Project development will seek approvals from applicable agencies and regulatory bodies, including the SBCFCD. All impacts associated with improvements to the SBCFCD facilities were evaluated and are further discussed in Draft EIR *Section 4.19, Utilities and Service Systems*.

R1-3 The comment requests to be included on the circulation list for all Project notices, public reviews, or public hearings, and is noted for the record. The San Bernardino County Department of Public Works has been added to the Project's circulation list and will be notified of any Project notices including upcoming meetings or hearings.

Draft Environmental Impact Report (DEIR) for the Proposed Speedway Commerce Center II Specific Plan Project (Proposed Project) (SCH No.: 2021120259)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The County of San Bernardino is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. The following comments on the Draft EIR include recommended revisions to the Localized Significance Thresholds (LST) Analysis and Health Risk Assessment (HRA), existing air quality project design features, and mitigation measures.

Based on the Draft EIR, the Proposed Project consists of construction and operation of 433 acres that encompasses development of six different planning areas. The aforementioned consists largely of up to approximately 6,600,000 square feet of high-cube logistics and e-commerce, 261,360 square feet of ancillary commercial uses, and approximately 98 acres of parking fields.[1] The Proposed Project is located on the northwest corner of Entry Road and Cherry Avenue in the unincorporated portion of southwestern San Bernardino County within the City of Fontana sphere of influence.[2] Construction of the Proposed Project will occur over four phases, starting in the year 2023 with an anticipated completion year of 2027.[3] Each construction phase is estimated to last about 12 months.[4]

The Proposed Project will include 23 project design features (PDFs) for air quality.[5] These include features such as requiring tenant/facility operators ensure heavy-duty vehicles accessing the Proposed Project site are equipped with model year 2010 or newer engines and be zero-emission beginning in 2030, if such trucks are widely available and economical feasible, among other requirements.[6] The Proposed Project will also include 10 mitigation measures (MMs) for air quality.[7] These include mitigation measures such as requiring that all off-road diesel-powered construction equipment greater than 50 horsepower meets California Air Resource Board Tier 4

1

[2] *Ibid.* Section 1.2 Project Overview. Page 1-3.
[3] *Ibid.* Section 2.0 Introduction. Page 2-1.
[4] *Ibid.* Section 4.9.5 Impacts and Mitigation Measures. Page 4.9-14
[5] *Ibid.* Section 4.3.4 Impact Thresholds and Significance Criteria. Page 4.3-21 through 4.3-23.
[6] *Ibid.*
[7] *Ibid.* Section 4.3.5 Impacts and Mitigation Measures. Page 4.3-38 through 4.3-42.

Final emission standards or incorporate CARB Level 3 Verified Diesel Emission Control Strategy (VDECS), and requiring that all construction on-road haul trucks be model year 2010 or newer if diesel-fueled, among other requirements.[8] Once operational, the Proposed Project is anticipated to generate a maximum of 43,549 trips per day, 9,865 of which would be made by trucks.[9,10]

The potential tenants and end users of the Proposed Project Site are unknown at the time of the release of the draft EIR.[11] Mitigation measure AQ-4, however, states that prior to the issuance of a building permit, the Planning Department shall confirm that the Proposed Project is designed so that the buildings' electrical room supports additional panels that may be needed to supply power to trailers with transport refrigeration units (TRUs) during the loading/unloading of refrigerated goods, if required by future tenants who utilize cold storage.[12] Based on the Draft EIR, the nearest existing sensitive receptor is within 410 feet of the Proposed Project site (single family residence), and the nearest school, Redwood Elementary School, is about 1,370 feet from the Proposed Project site.[13]

1

Based on a review of the Draft EIR, South Coast AQMD staff has three main comments. A summary of these comments is provided as follows with additional details provided in the attachment.

1. Recommended Revisions to the LST Analysis and HRA: The estimated on-site emissions from the Proposed Project were compared to the South Coast AQMD's LST to determine the significance for localized Air Quality Impacts for both project construction and operation. The on-site Diesel Particulate Matter (DPM) emissions from the mobile source exhaust were also estimated and used to perform the HRA. However, staff found the on-site emissions from the haul trucks and yard trucks[14] in project construction and container/trailer trucks and TRUs in project operation were not included, under-estimated, or improperly calculated in the analyses. It is recommended to revise the LST analysis and HRA to include those emissions correctly.

2

2. Recommended Revisions to Existing Mitigation Measure (MM) AQ-1: In the Draft EIR, construction of the Proposed Project is found to have significant and unavoidable regional air quality impacts for NOx and CO emissions, even after implementation of the stated mitigation measures.[15] Haul truck exhaust is the primary source of NOx emissions during construction of the Proposed Project.[16] The Lead Agency included MM AQ-1, which requires that construction on-road haul trucks shall be model year 2010 or newer if

3

[9] *Ibid.* Section 4.3.4 Impact Thresholds and Significance Criteria. Page 4.3-19.
[10] *Ibid.* Section 4.13.5 Impacts and Mitigation Measures. Page 4.13-22.
[11] *Ibid.* Section 4.3.4 Impact Thresholds and Significance Criteria. Page 4.3-20.
[12] *Ibid.* Section 4.3.5 Impacts and Mitigation Measures. Page 4.3-41
[13] Appendix C-AQ_HRA. Section 2.3 Sensitive Receptors. Page 10.
[14] *Ibid.* For example Section 5.1, Table 20. Page 49. Emissions from Haul Trucks and Yard Trucks are not included in this table.
[15] Draft EIR. Section 4.3.5 Impacts and Mitigation Measures. Page 4.3-26 through Page 4.3-29.
[16] Appendix C-AQ_HRA. Section 5 Potential Impacts and Mitigation. Page 32.

diesel-fueled.[17] About 129,418 maximum haul truck trips are expected during construction for Phase 1A,[18] about 86,803 maximum haul truck trips for construction phase 1B,[19] about 104,578 maximum haul truck trips for construction Phase 2,[20] and about 1,879 maximum haul truck trips for the Commercial construction phase.[21] This would result in a maximum of 367 lbs of NOx emissions per day in Phase 1A and 255 lbs, 263 lbs, and 10 lbs of maximum NOx emissions per day in the remaining phases, respectively.[22] Given the close proximity of sensitive receptors, the Lead Agency should commit to not only 2010 or new diesel haul trucks, but also commit to near-zero and zero-emission haul trucks during construction. 3

3. Recommended Revisions to Existing Air Quality Project Design Features (PDFs) or Mitigation Measures: Once operational the Proposed Project is anticipated to generate a maximum of 43,549 trips per day, 9,865 of which would be made by trucks.[23,24] In the Draft EIR, the Lead Agency incorporated two PDFs (PDF AQ-9, PDF AQ-10) which would require implementation of cleaner operational vehicles, including zero-emission light duty, medium-duty, and heavy-duty trucks. These PDFs, however, will only be implemented by the Lead Agency when such trucks are "widely available and economically feasible".[25] South Coast AQMD staff recommends that the Lead Agency provide additional information on how "widely available and economically feasible" will be defined and determined in the Final EIR. 4

Pursuant to California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(b), South Coast AQMD staff requests that the Lead Agency provide South Coast AQMD staff with written responses to all comments contained herein prior to the certification of the Final EIR. In addition, issues raised in the comments should be addressed in detail giving reasons why specific comments and suggestions are not accepted. There should be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice (CEQA Guidelines Section 15088(c)). Conclusory statements do not facilitate the purpose and goal of CEQA on public disclosure and are not meaningful, informative, or useful to decision makers and to the public who are interested in the Proposed Project. Further, if the Lead Agency makes the finding that the recommended revisions to the existing PDFs or mitigation measures are not feasible, the Lead Agency should describe the specific reasons supported by substantial evidence for rejecting them in the Final EIR (CEQA Guidelines Section 15091).

South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Evelyn Aguilar, Air Quality Specialist, at eaguilar@aqmd.gov, should you have any questions or wish to discuss the comments. 5

ATTACHMENT

South Coast AQMD Staff's Summary of Air Quality Analysis and Health Risk Assessment in the Draft EIR

In the Air Quality Analysis Section of the Draft EIR, the Lead Agency quantified the Proposed Project's maximum daily construction emissions. The Lead Agency considered four different construction phases: Phase 1a, Phase 1b, Phase 2, and Commercial. The Lead Agency compared the Proposed Project's construction emissions to South Coast AQMD's recommended regional air quality CEQA significance thresholds. Based on the analysis, the Lead Agency found that emissions from Phase 1a would result in significant regional air quality impacts from NOx and CO emissions, even with implementation of MM AQ-1, which requires off-road construction equipment greater than 50 brake horsepower meet CARB Tier Final Emissions Standards. [26] The Lead Agency also found that emissions from Phase 1b and Phase 2 would result in significant regional air quality impacts from NOx, even with implementation of MM AQ-1.[27] Finally, the Lead Agency found that emissions from the Commercial construction phase would be less than significant.[28]

The Lead Agency also considered five different operational phases: Phase 1a, Phase 1b, Phase 2, Commercial, and Project Buildout (Overlapping Construction and Operations). Based on the analysis, the Lead Agency found that emissions from Phase 1a would result in significant regional air quality impacts from VOC, NOx, PM10 and PM2.5 emissions even with implementation of MMs,[29] Phase 1b would result in significant regional air quality impacts from VOC, NOx, and PM10 emissions even with implementation of MMs,[30] and Phase 2b would result in significant regional air quality impacts from VOC and NOx emissions even with implementation of MMs.[31] The Lead Agency found that emissions from the Commercial operation phase would be less than significant.[32] Project Buildout would also result in significant air quality impacts from VOC, NOx, CO, PM10 and PM2.5 emissions even with implementation of MMs.[33] MMs AQ-2 through MM AQ-9 require the following: contractual specifications to use zero emission/electric-powered outdoor cargo handling equipment during operations (e.g. forklifts and yard trucks), contractual language that requires all TRUs entering the Project site be plug-in capable, postage of idling restriction signage, prepare and submit a transportation demand management program, utilize low VOC architectural coatings with no more than 10g/L of VOC, among other requirements.[34]

In the Draft EIR, the Lead Agency also quantified the Proposed Project's localized construction and operational emissions and compared them to the applicable South Coast AQMD's localized significance thresholds. The Lead Agency quantified this for construction phases 1a, 1b, 2, and Commercial, and operational phases 1a, 1b, 2, Commercial, and Project Buildout. Based on the

[26] Draft EIR. Section 4.3.5 Impacts and Mitigation Measures. Page 4.3-27.
[27] *Ibid*. Page 4.3-28 through 4.3-29.
[28] *Ibid*. Page 4.3-29.
[29] *Ibid*. Page 4.3-30.
[30] *Ibid*. Page 4.3-32.
[31] *Ibid*. Page 4.3-34 through 4.3-35.
[32] *Ibid*. Page 4.3-34.
[33] *Ibid*. Page 4.3-35.
[34] *Ibid*. Page 4.3-38 through 4.3-42.

5

analysis, the Lead Agency found that the Proposed Project's localized construction and operational air quality impacts would be less than significant.[35]

Additionally, the Lead Agency calculated cancer risks from the Proposed Project's construction and operational activities and found that they would result in a maximum cancer risk of 88.53 in one million, which would exceed South Coast AQMD's CEQA significance threshold of 10 in one million for cancer risk. With Implementation of MM AQ-1 through MM AQ-9, the maximum cancer risk would be reduced to 8.18 in one million, which would be below the significance threshold.[36]Finally, the Lead Agency discussed South Coast AQMD Rules 2305, 2202, 1166, 1403, and 1466 in the Draft EIR.[37,38,39]

South Coast AQMD staff's detailed comments on the Draft EIR are provided as follows.

1. **Recommended Revisions to the LST and HRA:**
In Appendix C - Air Quality Assessment of the DEIR, the estimated on-site emissions from the Proposed Project were compared to the South Coast AQMD's LST to determine the significance for localized Air Quality Impacts for both project construction and operation. The on-site DPM emissions from the mobile source exhaust were also estimated and used to perform the HRA. However, staff found the on-site emissions (including idling, exhaust, cold-starts, fugitive, and etc.) from the haul trucks and yard trucks[40] in project construction and container/trailer trucks and TRUs in project operation[41] were not included, under-estimated, or improperly calculated in the analyses. The idling and running emissions from those on-road and off-road heavy-heavy-duty diesel engine trucks in the area of over 400 acres could be substantial and have the potential to change the findings of not significant in localized air quality impact and cancer risk impact to significant. It is recommended to revise the LST analysis and HRA to include those emissions correctly.

2. **Recommended Revisions to Existing Mitigation Measure (MM) AQ-1**
In the Draft EIR, the Lead Agency found that the Proposed Project would result in significant and unavoidable regional air quality impacts from NOx and CO emissions during construction. Haul truck exhaust is the primary source of NOx emissions during construction of the Proposed Project.[42] About 129,418 maximum haul truck trips are expected during construction for Phase 1A,[43] about 86,803 haul truck trips for construction phase 1B,[44] about 104,578 haul truck trips for construction Phase 2,[45] and about 1,879 haul truck trips for the Commercial construction

[44] *Ibid.* Page 836.
[45] *Ibid.* Page 1,474.

phase.[46] This would result in a maximum of 367 lbs of NOx emissions per day in Phase 1A and 255 lbs, 263 lbs, and 10 lbs of maximum NOx emissions per day in the remaining phases, respectively.[47] CEQA requires that the Lead Agency consider mitigation measures to minimize significant adverse impacts (CEQA Guidelines Section 15126.4) and that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant adverse impacts. The Lead Agency included MM AQ-1, which, among other requirements, requires that construction on-road haul trucks shall be model year 2010 or newer if diesel-fueled.[48] Given the close proximity of sensitive receptors, South Coast AQMD staff recommends that the Lead Agency consider including the following construction air quality mitigation measures in the Final EIR to further reduce the Proposed Project's significant and unavoidable air quality impacts during construction.

Technology is transforming the goods transport and movement sector at a rapid pace. ZE or NZE construction equipment and trucks are already commercially available and in-use. Therefore, the Lead Agency should use good-faith efforts to identify the available types of ZE or NZE construction equipment and trucks in the Final EIR and require their uses by the construction start date for Phase 1a in 2023.[49]

Clean construction equipment and trucks will become increasingly more feasible and commercially available as technology advances. If using ZE or NZE technologies is not feasible today, it could become feasible in a reasonable period of time during the Proposed Project's construction schedule which was conservatively analyzed to begin in 2023 and end in 2027 (CEQA Guidelines Section 15364).[50] Therefore, it is recommended that the Lead Agency include considerations of potential cleaner technologies that will become feasible and available during the construction period of the Proposed Project and develop a process with performance standards to require and/or accelerate the deployment of the lowest emission technologies and the utilization of ZE or NZE construction equipment and trucks (CEQA Guidelines Section 15126.4(a)). The Lead Agency can and should develop the following performance standards or any other comparable standards in the Final EIR.

- Develop a minimum amount of ZE or NZE construction equipment and trucks that the Proposed Project must use each year during construction to ensure adequate progress. Include this requirement in the Proposed Project's Construction Management Plan.

- Establish a contractor(s) selection policy that prefers contractor(s) who can supply and use ZE or NZE construction equipment and heavy-duty trucks during construction. Include this policy in the Request for Proposal, procurement documents, and purchase order(s) for selecting contractor(s).

- Establish a policy to select and use vendors that use ZE or NZE heavy-duty trucks. Include this policy in the vendor contracts.

[49] Draft EIR. Section 4.3.4 Impact Thresholds and Significance Criteria. Page 4.3-16.
[50] *Ibid.* Section 2.0 Introduction. Page 2-1.

- Establish a purchasing policy to purchase and receive materials from vendors that use ZE or NZE heavy-duty trucks to deliver materials. Include this policy in the procurement documents and purchase orders with vendors.

3. **Recommended Revisions to Existing Air Quality Project Design Features (PDFs)**
Once operational the Proposed Project is anticipated to generate a maximum of 43,549 trips per day, 9,865 of which would be made by trucks.[51,52] In the Draft EIR, the Lead Agency incorporated 23 PDFs related to air quality. Two PDFs (PDF AQ-9, PDF AQ-10) would require implementation of cleaner operational vehicles, including zero-emission light-duty, medium-duty, and heavy-duty trucks. These PDFs, however, will only be implemented by the Lead Agency when such trucks are "widely available and economically feasible".[53] South Coast AQMD staff recommends that the Lead Agency provide additional information on how "widely available and economically feasible" will be defined and determined in the Final EIR. The recommended information would establish a clear set of standards and criteria for assessing the technological, commercial, and economic availability and feasibility of using cleaner operational vehicles, provide public transparency in the Lead Agency's decision-making regarding cleaner operational vehicles, demonstrate a commitment by the Lead Agency to using cleaner operational vehicles, ensure implementation when they are available, strengthen the Proposed Project's air quality commitments, and facilitate the purpose and goal of CEQA on public disclosure.

Responses to Comment Letter R2 – South Coast Air Quality Management District

R2-1 Comment noted. The commenter provides general introductory and background information as well as a summary of the Project, existing nearby sensitive receptors, and air quality analysis. The County appreciates and values these comments during the EIR participation process. Responses to specific comments are provided below; no further response is required.

R2-2 **(This response also responds to Attachment Comment 1)** The comment states that the on-site truck emissions are not included in LST construction emissions analysis. The Project's construction and operational emissions were quantified with the California Emissions Estimator Model (CalEEMod). CalEEMod was developed for the California Air Pollution Officers Association (CAPCOA) in collaboration with the California Air Districts (including the SCAQMD). Default data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California Air Districts to account for local requirements and conditions. However, the types and amount of construction equipment as well as number and trip length of construction hauling truck and deliveries have been modified (i.e., default values have been increased) to accurately represent the project.

Construction

The CalEEMod outputs in the Draft EIR (see *Appendix C*) delineate on- and off-site emissions. On-site emissions occur from fugitive dust and off-road construction equipment exhaust. CalEEMod includes off-site exhaust emissions from hauling trips, vendor trips, and worker trips for each stage of the construction during different phases of the project. Draft EIR *Table 4.3-19: Localized Significance of Construction Emissions* summarizes the total on-site emissions provided in CalEEMod. It should be noted that CalEEMod does not indicate a proportion of the off-site hauling, vendor, and worker exhaust emissions that should be expected to occur on-site. The SCAQMD also does not provide a recommendation or methodology for determining the proportion of off-site emissions that would occur on-site. As such, the LST analysis in the Draft EIR uses the emissions in the CalEEMod outputs labeled as "on-site" to evaluate the on-site LST emissions. SCAQMD does not provide standards, guidance, or methodology describing that off-site emissions should also be considered to occur on-site or how much of the off-site emissions should be assumed to occur on-site. On-site emissions from off-site Project construction sources such as hauling and vendor trucks and worker trips are anticipated to be nominal.

Nonetheless, in order to fully respond to the comment, a proportion of the off-site emissions have been estimated to occur on-site, combined with on-site emissions, and compared to the LST thresholds, as reflected in the table below. Total off-site hauling trips modeled in CalEEMod would have a weighted trip length of 37 to 42 miles (depending on phase), and vendor and worker trips would have a trip length of 6.9 and 14.7 miles, respectively. The Project would be constructed in three distinct phases (1a, 1b, and 2) and a conservative one-way on-site trip assumption is approximately 0.5 miles across the longest side Phase 1a (i.e., the phase with the largest area). Therefore, a one-mile off-site trip length expected to occur on-site is a conservative assumption. It should be noted that the mobile source emissions calculations in CalEEMod include running, idling, break wear/tire wear, and startup exhaust, among others. The proportion one mile out of

the total off-site mileage would be 2.7 percent in Phase 1a, 2.6 percent in Phase 1b, 2.4 percent in Phase 2 and would include idle, exhaust, cold start, and fugitive emissions. The table below shows the construction on-site emissions provided in the Draft EIR *Table 4.3-19* and includes an additional proportion of the off-site emissions as on-site. The added on-site emissions associated with Hauling Trips, Vendor Trips, and Worker Trips are shown as underlined text to indicate what has been added for this response. The table below shows that even when adding up the overlap emissions, the LST thresholds would still not be exceeded for all the stages and phases and therefore would not change the Draft EIR's findings of not significant in localized air quality impact and cancer risk impact.

Operations

Regarding the operational LST analysis, TRU emissions were included in the analysis (refer to Draft EIR *Table 4.3-20: Localized Significance of Operational Emissions*). Pursuant to MM AQ-10, yard trucks are required to be electric and would not contribute to on-site emissions. Additionally, three percent total emissions for off-site mobile source emissions were assumed to also occur on-site (see Localized Operational Significance Analysis discussion on Draft EIR page 4.3-45). This is a reasonable approach because the site is 1.5 miles across, which is a worst-case assumption for a one-way truck trip. It should be noted that trucks would not be traversing the entire project site. Instead, a truck would travel directly to the building that it needs to access. Therefore, the Draft EIR's methodology of assuming three percent of the off-site emissions would also occur on-site (i.e., one mile out of the total 33.2-mile truck trip length modeled equals three percent) is a conservative representation of vehicles traveling, idling, and maneuvering onsite.

Therefore, the LST construction and operational analysis does not need to be revised and the EIR does not need to be recirculated.

Health Risk Assessment (HRA)

The construction HRA models on-site and off-site construction. Refer to Section 4.2: Methodology of the HRA in Draft EIR *Appendix C* which identifies that on-road truck trips were included in the assessment. It should be noted that operational on-and off-site emissions from truck movements and Transport Refrigeration Units (TRU), as well as truck idling emissions were calculated using CARB EMFAC2021 and OFFROAD2021 emissions rates. The off-site emissions modeling includes truck and TRU emissions occurring on the surrounding roads that trucks would use to access the

project site. An idling time of 15 minutes per truck was used per SCAQMD recommendations. Although the Project is required to comply with CARB's idling limit of 5 minutes, the SCAQMD recommends the on-site idling emissions should be estimated for 15 minutes of truck idling, which would take into account on-site idling that occurs while the trucks are waiting to pull up to the truck bays, idling at the bays, idling at check-in and check-out, etc.

Additionally, the HRA was prepared in accordance with the SCAQMD Guidance: *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis* (August 2003) and SCAQMD Modeling Guidance for AERMOD (https://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance). The HRA also quantifies emissions from yard trucks and on-site equipment and identifies Mitigation Measure AQ-9, which requires zero emissions cargo handling equipment (e.g., forklifts, yard trucks, hostlers, etc.) to reduce on-site emissions.

Furthermore, as described on Draft EIR pages 4.3-19 and 4.3-20, the air quality and HRA emissions analyses assumed a conservative maximum number of trips that could be associated with the project. For instance, if the Project were to develop with 6.6 million square feet of high-cube logistics uses only, the number of trips associated with the Project would be less than if the Project were to develop with the assumed 2,641,000 million square feet of high-cube logistics and 2,773,050 million square feet of e-commerce uses due to the higher intensity of trips generated with e-commerce uses. Potential tenants and end users are unknown at this time; therefore, the exact square footage allocation between high-cube logistics and e-commerce uses cannot be determined at this time. Therefore, future development of high-cube logistics and e-commerce uses within the Project site would occur in a combination that would not exceed the maximum number of vehicle trips analyzed within the Draft EIR, which represents a conservative, worst-case scenario.

R2-3 **(This response also responds to Attachment Comment 2)** The comment asks for the commitment to use zero-emission or near-zero emissions trucks and construction equipment during construction years of the Project. The Project Applicant, in consultation with their construction contractor, identified the list of equipment necessary for construction of the Project, including which equipment may be alternatively fueled. The construction contractor reviewed the existing equipment in their fleet that would be used for the Project and contacted their subcontractors to determine the available equipment and trucks that would be used. Alternative fuel and electric construction equipment (including excavators, wheel loaders, and soil compactors) that are commercially available are compact, medium-duty, and have limited capacity and capabilities when viewed in the context of a major construction project like the proposed Project. The vast majority of earth moving activities at the Project site would require heavy-duty capabilities beyond those of the zero emissions equipment recommended by the SCAQMD. A review of commercially available alternative fueled construction equipment was conducted by the construction contractor. The construction contractor has indicated that currently there are no zero emissions or near zero emissions equipment available in the marketplace for the earthwork operations necessary to construct the Project because the available zero emissions and near zero

emissions equipment is typically too small for the type of work that would be performed. The types of heavy-duty on-road trucks for the activities required for the Project construction (e.g., soil import/export, transport of steel and pre-cast concrete structure elements and materials) are typically larger trucks (Class 8 trucks with a displacement greater than 10 liters) than those currently available with zero emission or near-zero emission technology. Furthermore, in response to the commenter's concern, the contractor has reached out to the major trades (earthwork, concrete, mechanical, electrical fire protection) and no subcontractor has construction trucks and/or heavy-duty trucks that are zero emissions or near zero emissions (all are diesel powered). However, the on-site smaller construction equipment such as scissor lifts, grade-alls, and forklifts are propane powered.

Zero emissions and near zero emissions trucks are available but with limited applicability to construction-related activities for the reasons mentioned above. There are limitations related to the availability/suitability of electric construction equipment. The types of electric construction equipment that are available are compact electric equipment with limited capacity and capabilities, and are not suitable to support a major construction project such as the Project.

PDF AQ-1 requires that if feasible, the Project shall provide electrical hookups to the power grid, rather than use diesel-fueled generators, for the use of electric construction tools, such as saws, drills, and compressors. However, it would not be feasible to require the Project Applicant to use more electric construction equipment than stated in the Draft EIR or zero emissions or near zero emissions heavy-duty trucks because such equipment suitable for project construction are not now nor are they expected to be commercially available to meet the construction needs of the Project within the Project schedule.

For the reasons discussed above, it would be infeasible to require additional electric equipment or zero emissions and near zero emissions heavy-duty haul trucks during construction of the proposed Project because such equipment would not be commercially available in sizes capable of the work needed for Project construction. Therefore, all feasible Project Design Features and mitigation measures have been identified in the Draft EIR.

The Comment identifies the close proximity of sensitive receptors as a basis to require additional construction air quality mitigation measures. However, as discussed on Draft EIR page 4.3-44 (Table 4.3-19) and pages 4.3-51 through 4.3-53, localized air quality impacts and health risk impacts would be less than significant with mitigation incorporated. Also refer to Response R2-2 regarding localized impacts.

R2-4 **(This response also responds to Attachment Comment 3)** To promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment, PDF AQ-9 requires that all heavy-duty trucks shall be zero emissions beginning in 2030 if such trucks are widely available and economically feasible and PDF AQ-10 requires the use of zero emissions light- and medium-duty trucks as part of business operations, if such trucks are widely available and economically feasible. The commenter requests additional information on how "widely available and economically feasible" will be defined and determined in the Final EIR.

These PDFs include the phrase "widely available and economically feasible" because the availability of zero emissions vehicles in future years is speculative. Widely available means that zero emissions trucks (including heavy duty trucks) can be readily purchased and put into operation (i.e., commercially available). Economically feasible refers to the condition where the cost to buy, own, and operate zero emissions trucks would be similar to the cost for non-zero emissions trucks.

The existing regulatory environment already requires various mobile source emissions reduction measures and transition to zero emissions and near zero emissions vehicles (as noted above, CARB already regulates truck emissions with the Advanced Clean Truck Regulation, the Mobile Source Strategy [including the low-NO_X engine emissions standard], the Sustainable Freight Action Plan, and the Emissions Reduction Plan for Ports and Goods Movement, among others). However, even with adoption of CARB's Advanced Clean Truck Rule, CARB acknowledges that it will take time for zero emissions and near zero emissions vehicles to become commercially available and to penetrate the market. For example, CARB's EMission FACtor (EMFAC) 2021 model provides detailed vehicle registration information and estimates the official emissions inventories of on-road mobile sources, vehicle population, and vehicle miles traveled (VMT) in California. The EMFAC2021 data for South Coast portion of San Bernardino County shows that in 2024 (the Project's Phase 1a opening year), approximately 85 percent of heavy trucks would still be powered by diesel and 91 percent of the VMT would occur from diesel trucks. Electric vehicles would make up approximately 0.29 percent of the heavy-duty fleet and 0.25 percent of the heavy truck VMT. The EMFAC data shows that penetration of zero emissions and near zero emissions vehicles into commercial fleets will be slow. For example, for 2030, the model predicts that 81 percent of heavy trucks would be diesel-powered and that 88 percent of the heavy truck VMT would be from diesel trucks. Therefore, as CARB data anticipates that the vast majority of trucks to be diesel-powered in the Project opening year and in 2030, it would not be feasible to develop numeric targets, to establish preferential occupancy policies, or require purchasing policies applicable to future, unknown tenants.

Additionally, as discussed on Draft EIR page 4.3-36, the Project would be required to comply with SCAQMD Rule 2305 (Warehouse Indirect Source Rule), which requires the Project operator to directly reduce NO_X and particulate matter emissions or to otherwise facilitate emission and exposure reductions of these pollutants in nearby communities. Alternatively, warehouse operators can choose to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby. Warehouse owners and operators are required to earn WAIRE Points each year. WAIRE points are a menu-based system earned by emission reduction measures. Warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. WAIRE points can be earned by completing actions from a menu that can include acquiring and using natural gas, Near-Zero Emissions and/or Zero-Emissions on-road trucks, zero-emission cargo handling equipment, solar panels or zero-emission charging and fueling infrastructure, or other options. As noted in the Draft EIR, a preliminary WAIRE calculation

indicates that the project would more than fulfill its Warehouse Points Compliance Obligation (WPCO).

Nonetheless, PDF AQ-9 and PDF AQ-10 have been included to promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment. Furthermore, the Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants.

R2-5 The commenter's request for continued communications and noticing is noted for the record. Please refer to Responses R2-3 through R2-4 regarding recommended revisions to the existing PDFs.

The Metropolitan Water District of Southern California (R3)

THE METROPOLITAN WATER DISTRICT
OF SOUTHERN CALIFORNIA

Office of the General Manager

July 18, 2022 **Via Electronic Mail**

Steven Valdez, Senior Planner
County of San Bernardino
Land Use Services Department - Planning Division
385 North Arrowhead Avenue, First Floor
San Bernardino, California 92415-0187

Dear Mr. Valdez:

Notice of Availability of a
Draft Environmental Impact Report for the Speedway Commerce Center II Project

The Metropolitan Water District of Southern California (Metropolitan) reviewed the Notice of Availability of a Draft Environmental Impact Report (DEIR) for the Speedway Commerce Center II Project. The County of San Bernardino (County) is acting as the Lead Agency under the California Environmental Quality Act (CEQA). The Project proposes to develop six planning areas with high cube warehouse and e-commerce uses, with accessory commercial uses, vehicle parking/drop lot areas, associated open space and internal public roadways. This letter contains Metropolitan's response to the DEIR as a potentially affected public agency.

Metropolitan is a public agency and regional water wholesaler. It is comprised of 26 member public agencies, serving approximately 19 million people in portions of six counties in Southern California, including Orange County. Metropolitan's mission is to provide its 5,200 square mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way.

Our review of the DEIR notice indicates that Metropolitan owns and operates the Upper Feeder Pipeline and appurtenant facilities within the Project's proximity. The aforementioned pipelines and appurtenant facilities deliver untreated water from the Colorado River Aqueduct to F. E. Weymouth Water Treatment Plant in La Verne.

1

Metropolitan provides the following comments on the Draft Environmental Impact Report:

1. Page 4.5-16: "Archival information also determined that the Metropolitan Water District of Southern California's Upper Feeder Aqueduct was constructed through the

2

THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA
Steven Valdez, Senior Planner
July 18, 2022

Project area in the 1930s. Project implementation is not anticipated to impact the buried historic-era water pipeline and construction activities will not alter, demolish, or relocate the existing feature." The pipeline is not an aqueduct. The official name is the Upper Feeder. 2

2. Metropolitan requests that all references to the Upper Feeder as a historical resource be removed from the DEIR.
    a. A historical resource as defined in the CEQA and the Public Resources Code can be an archaeological resource or built environment resource and is:
        i. A resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources ((Pub. Res. Code § 5024.1, Title 14 CCR, Section 4850 et seq.);
        ii. A resource included in a local register of historical resources, as defined in section 5020.1(k) of the Public Resources Code or identified as significant in an historical resource survey meeting the requirements section 5024.1(g) of the Public Resources Code; or
        iii. Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. 3
    b. The Upper Feeder is not a resource listed in or determined eligible for listing in the California Register of Historical Resources, nor is it listed in a local register. Metropolitan, as a CEQA Lead Agency and owner of the Upper Feeder pipeline, has not determined the Upper Feeder to be historically significant. While the Upper Feeder may be considered a built environment resource, there does not appear to be any substantial evidence in light of the record as a whole to consider it as a resource eligible for listing in the California Register of Historical Resources.

Metropolitan must be allowed to maintain its rights-of-way and requires unobstructed access to its facilities in order to maintain and repair its system. In order to avoid potential conflicts with Metropolitan's facilities and rights-of-way, we require that any design plans for any activity in the area of Metropolitan's pipelines or facilities be submitted for our review and written approval. Metropolitan will not permit procedures that could subject the pipeline to excessive vehicle, impact or vibratory loads. Any future design plans associated with this project should be submitted to Metropolitan's Substructures Team. Approval of the project should be contingent on Metropolitan's approval of design plans for portions of the proposed project that could impact its facilities. 4

THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA
Steven Valdez, Senior Planner
July 18, 2022

Detailed prints of drawings of Metropolitan's pipelines and rights-of-way may be obtained by calling Metropolitan's Substructures Information Line at (213) 217-7663 or via email at EngineeringSubstructures@mwdh2o.com. To assist the applicant in preparing plans that are compatible with Metropolitan's facilities and easements, attached are the "Guidelines for

Improvements and Construction Projects Proposed in the Area of Metropolitan's Facilities and Rights-of-Way". Please note that all submitted designs or plans must clearly identify Metropolitan's facilities and rights-of-way. 4

Additionally, Metropolitan encourages projects within its service area to include water conservation measures. Water conservation, reclaimed water use, and groundwater recharge programs are integral components to regional water supply planning. Metropolitan supports mitigation measures such as using water efficient fixtures, drought-tolerant landscaping, and reclaimed water to offset any increase in water use associated with the proposed project.
We appreciate the opportunity to provide input to your planning process and we look forward to receiving future documentation and plans for this project. For further assistance, please contact Ms. Jolene Ditmar at (213) 217-6184 or jditmar@mwdh2o.com. 5

Very truly yours,

Additional Copies: To obtain a copy of this document, please contact the Engineering Services Group, Substructures Team.

Disclaimer

Metropolitan assumes no responsibility for the accuracy of the substructure information herein provided. The user assumes responsibility for verifying substructure locations before excavating and assumes all liability for damage to Metropolitan's facilities as a result of such excavation. Additionally, the user is cautioned to conduct surveys and other field investigations as deemed prudent, to assure that project plans are correct. The appropriate representative from Metropolitan must be contacted at least two working days, before any work activity in proximity to Metropolitan's facilities.

It generally takes 30 days to review project plans and provide written responses. Metropolitan reserves the right to modify requirements based on case-specific issues and regulatory developments.

Issue Date: July 2018

1.0 GENERAL INFORMATION

Note: Underground Service Alert at 811 must be notified at least two working days before excavating in proximity to Metropolitan's facilities.

1.1 Introduction

These guidelines provide minimum design and construction requirements for any utilities, facilities, developments, and improvements, or any other projects or activities, proposed in or near Metropolitan Water District of Southern California (Metropolitan) facilities and rights-of-way. Additional conditions and stipulations may also be required depending on project and site specific conditions. Any adverse impacts to Metropolitan's conveyance system, as determined by Metropolitan, will need to be mitigated to its satisfaction.

All improvements and activities must be designed so as to allow for removal or relocation at builder or developer expense, as set forth in the paramount rights provisions of Section 20.0. Metropolitan shall not be responsible for repair or replacement of improvements, landscaping or vegetation in the event Metropolitan exercises its paramount rights powers.

1.2 Submittal and Review of Project Plans/Utilities and Maps

Metropolitan requires project plans/utilities be submitted for all proposed activities that may impact Metropolitan's facilities or rights-of-way. Project plans shall include copies of all pertinent utilities, sewer line, storm drain, street improvement, grading, site development, landscaping, irrigation and other plans, all tract and parcel maps, and all necessary state and federal environmental documentation. Metropolitan will review the project plans and provide written approval, as it pertains to Metropolitan's facilities and rights-of-way. Written approval from Metropolitan must be obtained, prior to the start of any activity or construction in the area of Metropolitan's facilities or rights-of-way. Once complete project plans and supporting documents are submitted to Metropolitan, it generally takes 30 days to review and to prepare a detailed written response. Complex engineering plans that have the potential for significant impacts on Metropolitan's facilities or rights-of-way may require a longer review time.

Project plans, maps, or any other information should be submitted to Metropolitan's Substructures Team at the following mailing address:

Attn: Substructures Team
The Metropolitan Water District of Southern California
700 North Alameda St.
Los Angeles, CA 90012

General Mailing Address: P.O. Box 54153
Los Angeles, CA 90054-0153

Email: EngineeringSubstructures@mwdh2o.com

For additional information, or to request prints of detailed drawings for Metropolitan's facilities and rights-of-way, please contact Metropolitan's Substructures Team at 213-217-7663 or EngineeringSubstructures@mwdh2o.com.

1.3 Identification of Metropolitan's Facilities and Rights-of-Way

Metropolitan's facilities and rights-of-way must be fully shown and identified as Metropolitan's, with official recording data, on the following:

A. All applicable plans

B. All applicable tract and parcel maps

Metropolitan's rights-of-ways and existing survey monuments must be tied dimensionally to the tract or parcel boundaries. Metropolitan's Records of Survey must be referenced on the tract and parcel maps with the appropriate Book and Page.

2.0 General Requirements

2.1 Vehicular Access

Metropolitan must have vehicular access along its rights-of-way at all times for routine inspection, patrolling, operations, and maintenance of its facilities and construction activities. All proposed improvements and activities must be designed so as to accommodate such vehicular access.

2.2 Fences

Fences installed across Metropolitan's rights-of-way must include a 16-foot-wide gate to accommodate vehicular access by Metropolitan. Additionally, gates may be required at other specified locations to prevent unauthorized entry into Metropolitan's rights-of-way.

All gates must accommodate a Metropolitan lock or Knox-Box with override switch to allow Metropolitan unrestricted access. There should be a minimum 20-foot setback for gates from the street at the driveway approach. The setback is necessary to allow Metropolitan vehicles to safely pull off the road prior to opening the gate.

2.3 Driveways and Ramps

Construction of 16-foot-wide commercial-type driveway approaches is required on both sides of all streets that cross Metropolitan's rights-of-way. Access ramps, if necessary, must be a minimum of 16 feet wide.

There should be a minimum 20-foot setback for gates from the street at the driveway approach. Grades of ramps and access roads must not exceed 10 percent; if the slope of an access ramp or road must exceed 10 percent due to topography, then the ramp or road must be paved.

2.4 Walks, Bike Paths, and Trails

All walkways, bike paths, and trails along Metropolitan's rights-of-way must be a minimum 12-foot wide and have a 50-foot or greater radius on all horizontal curves if also used as Metropolitan's access roads. Metropolitan's access routes, including all walks and drainage facilities crossing the access routes, must be constructed to American Association of State Highway and Transportation Officials (AASHTO) H-20 loading standards (see Figure 1). Additional requirements will be placed on equestrian trails to protect the water quality of Metropolitan's pipelines and facilities.

2.5 Clear Zones

A 20-foot-wide clear zone is required to be maintained around Metropolitan's manholes and other above-ground facilities to accommodate vehicular access and maintenance. The clear zone should slope away from Metropolitan's facilities on a grade not to exceed 2 percent.

2.6 Slopes

Cut or fill slopes proposed within Metropolitan's rights-of-way must not exceed 10 percent. The proposed grade must not worsen the existing condition. This restriction is required to facilitate Metropolitan use of construction and maintenance equipment and allow uninhibited access to above-ground and below-ground facilities.

2.7 Structures

Construction of structures of any type is not allowed within the limits of Metropolitan's rights-of-way to avoid interference with the operation and maintenance of Metropolitan's facilities and possible construction of future facilities.

Footings and roof eaves of any proposed buildings adjacent to Metropolitan's rights-of-way must meet the following criteria:

A. Footings and roof eaves must not encroach onto Metropolitan's rights-of-way.

B. Footings must not impose any additional loading on Metropolitan's facilities.

C. Roof eaves must not overhang onto Metropolitan's rights-of-way.

Detailed plans of footings and roof eaves adjacent to Metropolitan's rights-of-way must be submitted for Metropolitan's review and written approval, as pertains to Metropolitan's facilities.

2.8 Protection of Metropolitan Facilities

Metropolitan facilities within its rights-of-way, including pipelines, structures, manholes, survey monuments, etc., must be protected from damage by the project proponent or property owner, at no expense to Metropolitan. The exact location, description and method of protection must be shown on the project plans.

2.9 Potholing of Metropolitan Pipelines

Metropolitan's pipelines must be potholed in advance, if the vertical clearance between a proposed utility and Metropolitan's pipeline is indicated to be 4 feet or less. A Metropolitan representative must be present during the potholing operation and will assist in locating the pipeline. Notice is required, a minimum of three working days, prior to any potholing activity.

2.10 Jacked Casings or Tunnels

A. General Requirements

Utility crossings installed by jacking, or in a jacked casing or tunnel under/over a Metropolitan pipeline, must have at least 3 feet of vertical clearance between the outside diameter of the pipelines and the jacked pipe, casing, or tunnel. The actual

cover over Metropolitan's pipeline shall be determined by potholing, under Metropolitan's supervision.

Utilities installed in a jacked casing or tunnel must have the annular space between the utility and the jacked casing or tunnel filled with grout. Provisions must be made for grouting any voids around the exterior of the jacked pipe, casing, or tunnel.

B. Jacking or Tunneling Procedures

Detailed jacking, tunneling, or directional boring procedures must be submitted to Metropolitan for review and approval. The procedures must cover all aspects of operation, including, but not limited to, dewatering, ground control, alignment control, and grouting pressure. The submittal must also include procedures to be used to control sloughing, running, or wet ground, if encountered. A minimum 10-foot clearance must be maintained between the face of the tunneling or receiving pits and outside edges of Metropolitan's facility.

C. Shoring

Detailed drawings of shoring for jacking or receiving pits must be submitted to Metropolitan for review and written-approval. (See Section 10 for shoring requirements).

D. Temporary Support

Temporary support of Metropolitan's pipelines may be required when a utility crosses under a Metropolitan pipeline and is installed by means of an open trench. Plans for temporary support must be reviewed and approved in writing by Metropolitan. (See Section 11, Supports of Metropolitan Facilities).

3.0 Landscaping

3.1 Plans

All landscape plans must show the location and limits of Metropolitan's right-of-way and the location and size of Metropolitan's pipeline and related facilities therein. All landscaping and vegetation shall be subject to removal without notice, as may be required by Metropolitan for ongoing maintenance, access, repair, and construction activities. Metropolitan will not be financially responsible for the removal of any landscaping and vegetation.

3.2 Drought-Tolerant Native and California Friendly Plants

Metropolitan recommends use of drought-tolerant native and California Friendly® plants (excluding sensitive plants) on proposed projects. For more information regarding California Friendly® plants refer to www.bewaterwise.com.

3.3 Trees

Trees are generally prohibited within Metropolitan's rights-of-way as they restrict Metropolitan's ability to operate, maintain and/or install new pipeline(s) located within these rights-of-way. Metropolitan will not be financially responsible for the removal and replacement of any existing trees should they interfere with access and any current or future Metropolitan project located within the right-of-way.

3.4 Other Vegetation

Shrubs, bushes, vines, and groundcover are generally allowed within Metropolitan's rights-of-way. Larger shrubs are not allowed on Metropolitan fee properties; however, they may be allowed within its easements if planted no closer than 15 feet from the outside edges of existing or future Metropolitan facilities. Only groundcover is allowed to be planted directly over Metropolitan pipeline, turf blocks or similar is recommended to accommodate our utility vehicle access. Metropolitan will not be financially responsible for the removal and replacement of the vegetation should it interfere with access and any current or future Metropolitan project.

3.5 Irrigation

Irrigation systems are acceptable within Metropolitan's rights-of-way, provided valves and controllers are located near the edges of the right-of-way and do not interfere with Metropolitan vehicular access. A shutoff valve should also be located along the edge of the right-of-way that will allow the shutdown of the system within the right-of-way should Metropolitan need to do any excavation. No pooling or saturation of water above Metropolitan's pipeline and right-of-way is allowed. Additional restrictions apply to non-potable water such as Recycled Water and are covered on Table 3 of Page 20.

3.6 Metropolitan Vehicular Access

Landscape plans must show Metropolitan vehicular access to Metropolitan's facilities and rights-of-way and must be maintained by the property owner or manager or homeowners association at all times. Walkways, bike paths, and trails within Metropolitan's rights-of-way may be used as Metropolitan access routes. (See Section 2.4, Walks, Bike Paths, and Trails).

4.0 General Utilities

Note: For non-potable piping like sewer, hazardous fluid, storm drain, disinfected tertiary recycled water and recycled water irrigation see Table 1 through Table 3.

4.1 Utility Structures

Permanent utility structures (e.g., manholes, power poles, pull boxes, electrical vaults, etc.) are not allowed within Metropolitan's rights-of-way. Metropolitan requests that all permanent utility structures within public streets be placed as far from its pipelines and facilities as practical, but not closer than 5 feet from the outside edges of Metropolitan facilities.

Note: Non-potable utility pipelines are an exception to the 5-foot minimum clearance. Non-potable utility pipelines should have 10 feet of separation.

4.2 Utility Crossings

Metropolitan requests a minimum of 1 foot of vertical clearance between Metropolitan's pipeline and any utility crossing the pipeline. Utility lines crossing Metropolitan's pipelines must be as perpendicular to the pipeline as possible. Cross-section drawings, showing proposed locations and elevations of utility lines and locations of Metropolitan's pipelines and limits of rights-of-way, must be submitted with utility plans, for all

crossings. Metropolitan's pipeline must be potholed under Metropolitan's supervision at the crossings (See Section 2.9).

4.3 Longitudinal Utilities

Installation of longitudinal utilities is generally not allowed along Metropolitan's rights-of-way. Within public streets, Metropolitan requests that all utilities parallel to Metropolitan's pipelines and appurtenant structures (facilities) be located as far from the facilities as possible, with a minimum clearance of 5 feet from the outside edges of the pipeline.

Note: Non-potable utility pipelines are an exception to the 5-foot minimum clearance. Non-potable utility pipelines should have 10 feet of separation (for more information See Table 1 on Page 18).

4.4 Underground Electrical Lines

Underground electrical conduits (110 volts or greater) which cross a Metropolitan's pipeline must have a minimum of 1 foot of vertical clearance between Metropolitan's pipeline and the electrical lines. Longitudinal electrical lines, including pull boxes and vaults, in public streets should have a minimum separation of 5 feet from the edge of a Metropolitan pipeline or structures.

4.5 Fiber Optic Lines

Fiber optic lines installed by directional boring require a minimum of 3 feet of vertical clearance when boring is over Metropolitan's pipelines and a minimum of 5 feet of vertical clearance when boring is under Metropolitan's pipelines. Longitudinal fiber optic lines, including pull boxes, in public streets should have a minimum separation of 5 feet from the edge of a Metropolitan pipelines or structures. Potholing must be performed, under Metropolitan's supervision, to verify the vertical clearances are maintained.

4.6 Overhead Electrical and Telephone Lines

Overhead electrical and telephone lines, where they cross Metropolitan's rights-of-way, must have a minimum 35 feet of clearance, as measured from the ground to the lowest point of the overhead line. Overhead electrical lines poles must be located at least 30 feet laterally from the edges of Metropolitan's facilities or outside Metropolitan's right-of-way, whichever is greater.

Longitudinal overhead electrical and or telephone lines in public streets should have a minimum separation of 10 feet from the edge of a Metropolitan pipelines or structures where possible.

4.7 Sewage Disposal Systems

Sewage disposal systems, including leach lines and septic tanks, must be a minimum of 100 feet from the outside limits of Metropolitan's rights-of-way or the edge of its facilities, whichever is greater. If soil conditions are poor, or other adverse site-specific conditions exist, a minimum distance of 150 feet is required. They must also comply with local and state health code requirements as they relate to sewage disposal systems in proximity to major drinking water supply pipelines.

4.8 Underground Tanks

Underground tanks containing hazardous materials must be a minimum of 100 feet from the outside limits of Metropolitan's rights-of-way or edge of its facilities, whichever is greater. In addition, groundwater flow should be considered with the placement of underground tanks down-gradient of Metropolitan's facilities.

5.0 Specific Utilities: Non-Potable Utility Pipelines

In addition to Metropolitan's general requirements, installation of non-potable utility pipelines (e.g., storm drains, sewers, and hazardous fluids pipelines) in Metropolitan's rights-of-way and public street rights-of-way must also conform to the State Water Resources Control Board's Division of Drinking Water (DDW) regulation (Waterworks Standards) and guidance for separation of water mains and non-potable pipelines and to applicable local county health code requirements. Written approval is required from DDW for the implementation of alternatives to the Waterworks Standards and, effective December 14, 2017, requests for alternatives to the Waterworks Standards must include information consistent with: DDW's Waterworks Standards Main Separation Alternative Request Checklist.

In addition to the following general guidelines, further review of the proposed project must be evaluated by Metropolitan and requirements may vary based on site specific conditions.

A. Sanitary Sewer and Hazardous Fluids (General Guideline See Table 1 on Page 18)

B. Storm Drain and Recycled Water (General Guideline See Table 2 on Page 19)

C. Irrigation with Recycled Water (General Guideline See Table 3 on Page 20)

D. Metropolitan generally does not allow Irrigation with recycled water to be applied directly above its treated water pipelines

E. Metropolitan requests copies of project correspondence with regulating agencies (e.g., Regional Water Quality Control Board, DDW); regarding the application of recycled water for all projects located on Metropolitan's rights-of-way

6.0 Cathodic Protection/Electrolysis Test Stations

6.1 Metropolitan Cathodic Protection

Metropolitan's existing cathodic protection facilities in the vicinity of any proposed work must be identified prior to any grading or excavation. The exact location, description, and type of protection must be shown on all project plans. Please contact Metropolitan for the location of its cathodic protection stations.

6.2 Review of Cathodic Protection Systems

Metropolitan must review any proposed installation of impressed-current cathodic protection systems on pipelines crossing or paralleling Metropolitan's pipelines to determine any potential conflicts with Metropolitan's existing cathodic protection system.

7.0 Drainage

7.1 Drainage Changes Affecting Metropolitan Rights-of-Way

Changes to existing drainage that could affect Metropolitan's rights-of-way require Metropolitan's approval. The project proponent must provide acceptable solutions to ensure Metropolitan's rights-of-way are not negatively affected by changes in the drainage conditions. Plans showing the changes, with a copy of a supporting hydrology report and hydraulic calculations, must be submitted to Metropolitan for review and approval. Long term maintenance of any proposed drainage facilities must be the responsibility of the project proponent, City, County, homeowner's association, etc., with a clear understanding of where this responsibility lies. If drainage must be discharged across Metropolitan's rights-of-way, it must be carried across by closed conduit or lined open channel and must be shown on the plans.

7.2 Metropolitan's Blowoff and Pumpwell Structures

Any changes to the existing local watercourse systems will need to be designed to accommodate Metropolitan's blowoff and pumpwell structures, which periodically convey discharged water from Metropolitan's blowoff and pumping well structures during pipeline dewatering. The project proponents' plans should include details of how these discharges are accommodated within the proposed development and must be submitted to Metropolitan for review and approval. Any blowoff discharge lines impacted must be modified accordingly at the expense of the project proponent.

8.0 Grading and Settlement

8.1 Changes in Cover over Metropolitan Pipelines

The existing cover over Metropolitan's pipelines must be maintained unless Metropolitan determines that proposed changes in grade and cover do not pose a hazard to the integrity of the pipeline or an impediment to its maintenance capability. Load and settlement or rebound due to change in cover over a Metropolitan pipeline or ground in the area of Metropolitan's rights-of-way will be factors considered by Metropolitan during project review.

In general, the minimum cover over a Metropolitan pipeline is 4 feet and the maximum cover varies per different pipeline. Any changes to the existing grade may require that Metropolitan's pipeline be potholed under Metropolitan's supervision to verify the existing cover.

8.2 Settlement

Any changes to the existing topography in the area of Metropolitan's pipeline or right-of-way that result in significant settlement or lateral displacement of Metropolitan's pipelines are not acceptable. Metropolitan may require submittal of a soils report showing the predicted settlement of the pipeline at 10-foot intervals for review. The data must be carried past the point of zero change in each direction and the actual size and varying depth of the fill must be considered when determining the settlement. Possible settlement due to soil collapse, rebound and lateral displacement must also be included.

In general, the typical maximum allowed deflection for Metropolitan's pipelines must not exceed a deflection of 1/4-inch for every 100 feet of pipe length. Metropolitan may require additional information per its Geotechnical Guidelines. Please contact Metropolitan's Substructures Team for a copy of the Geotechnical Guidelines.

9.0 Construction Equipment

9.1 Review of Proposed Equipment

Use of equipment across or adjacent to Metropolitan's facilities is subject to prior review and written approval by Metropolitan. Excavation, backfill, and other work in the vicinity of Metropolitan's facilities must be performed only by methods and with equipment approved by Metropolitan. A list of all equipment to be used must be submitted to Metropolitan a minimum of 30 days before the start of work.

A. For equipment operating within paved public roadways, equipment that imposes loads not greater than that of an AASHTO H-20 vehicle (see Figure 1 on Page 21) may operate across or adjacent to Metropolitan's pipelines provided the equipment operates in non-vibratory mode and the road remains continuously paved.

B. For equipment operating within unpaved public roadways, when the total cover over Metropolitan's pipeline is 10 feet or greater, equipment imposing loads no greater than those imposed by an AASHTO H-20 vehicle may operate over or adjacent to the pipeline provided the equipment is operated in non-vibratory mode. For crossings, vehicle path shall be maintained in a smooth condition, with no breaks in grade for 3 vehicle lengths on each side of the pipeline.

9.2 Equipment Restrictions

In general, no equipment may be used closer than 20 feet from all Metropolitan above-ground structures. The area around the structures should be flagged to prevent equipment encroaching into this zone.

9.3 Vibratory Compaction Equipment

Vibratory compaction equipment may not be used in vibratory mode within 20 feet of the edge of Metropolitan's pipelines.

9.4 Equipment Descriptions

The following information/specifications for each piece of equipment should be included on the list:

A. A description of the equipment, including the type, manufacturer, model year, and model number. For example, wheel tractor-scraper, 1990 Caterpillar 627E.

B. The empty and loaded total weight and the corresponding weight distribution. If equipment will be used empty only, it should be clearly stated.

C. The wheel base (for each axle), tread width (for each axle), and tire footprint (width and length) or the track ground contact (width and length), and track gauge (center to center of track).

10.0 Excavations Close to Metropolitan Facilities

10.1 Shoring Design Submittal

Excavation that impacts Metropolitan's facilities requires that the contractor submit an engineered shoring design to Metropolitan for review and acceptance a minimum of 30 days before the scheduled start of excavation. Excavation may not begin until the shoring design is accepted in writing by Metropolitan.

Shoring design submittals must include all required trenches, pits, and tunnel or jacking operations and related calculations. Before starting the shoring design, the design engineer should consult with Metropolitan regarding Metropolitan's requirements, particularly as to any special procedures that may be required.

10.2 Shoring Design Requirements

Shoring design submittals must be stamped and signed by a California registered civil or structural engineer. The following requirements apply:

A. The submitted shoring must provide appropriate support for soil adjacent to and under Metropolitan's facilities.

B. Shoring submittals must include detailed procedures for the installation and removal of the shoring.

C. Design calculations must follow the Title 8, Chapter 4, Article 6 of the California Code of Regulations (CCR) guidelines. Accepted methods of analysis must be used.

D. Loads must be in accordance with the CCR guidelines or a soils report by a geotechnical consultant.

E. All members must be secured to prevent sliding, falling, or kickouts.

Metropolitan's pipelines must be located by potholing under Metropolitan's supervision before the beginning construction. Use of driven piles within 20 feet of the centerline of Metropolitan's pipeline is not allowed. Piles installed in drilled holes must have a minimum 2-foot clearance between Metropolitan's pipeline and the edge of the drilled hole, and a minimum of 1-foot clearance between any part of the shoring and Metropolitan's pipeline.

11.0 Support of Metropolitan Facilities

11.1 Support Design Submittal

If temporary support of a Metropolitan facility is required, the contractor shall submit a support design plan to Metropolitan for review and approval a minimum of 30 days before the scheduled start of work. Work may not begin until the support design is approved in writing by Metropolitan. Before starting design, the design engineer should consult with Metropolitan regarding Metropolitan's requirements.

11.2 Support Design Requirements

Support design submittals must be prepared, stamped, and signed by a California registered civil or structural engineer. The following requirements apply:

A. Support drawings must include detailed procedures for the installation and removal of the support system.

B. Design calculations must follow accepted practices, and accepted methods of analysis must be used.

C. Support designs must show uniform support of Metropolitan's facilities with minimal deflection.

D. The total weight of the facility must be transferred to the support system before supporting soil is fully excavated.

E. All members must be secured to prevent sliding, falling, or kickouts.

12.0 Backfill

12.1 Metropolitan Pipeline Not Supported

In areas where a portion of Metropolitan pipeline is not supported during construction, the backfill under and to an elevation of 6 inches above the top of the pipeline must be one-sack minimum cement sand slurry. To prevent adhesion of the slurry to Metropolitan's pipeline, a minimum 6-mil-thick layer of polyethylene sheeting or similar approved sheeting must be placed between the concrete support and the pipeline.

12.2 Metropolitan Pipeline Partially Exposed

In areas where a Metropolitan pipeline is partially exposed during construction, the backfill must be a minimum of 6 inches above the top of the pipeline with sand compacted to minimum 90 percent compaction.

12.3 Metropolitan Cut and Cover Conduit on Colorado River Aqueduct (CRA)

In areas where a Metropolitan cut and cover conduit is exposed, the following guidelines apply:

A. No vehicle or equipment shall operate over or cross the conduit when the cover is less than 3 feet.

B. Track-type dozer with a gross vehicle weight of 12,000 lbs or less may be used over the conduit when the cover is a minimum of 3 feet.

C. Wheeled vehicles with a gross vehicle weight of 8,000 lbs or less may operate over the conduit when the cover is a minimum of 4 feet.

D. Tracked dozer or wheeled vehicle should be used to push material over the conduit from the side.

E. Tracked dozer or wheeled vehicle should gradually increase cover on one side of the conduit and then cross the conduit and increase cover on the other side of the conduit. The cover should be increased on one side of the conduit until a maximum of 2 feet of fill has been placed. The cover over the conduit is not allowed to be more than 2 feet higher on one side of the conduit than on the other side.

F. The cover should be gradually increased over the conduit until the grade elevations have been restored.

13.0 Piles

13.1 Impacts on Metropolitan Pipelines

Pile support for structures could impose lateral, vertical and seismic loads on Metropolitan's pipelines. Since the installation of piles could also cause settlement of Metropolitan pipelines, a settlement and/or lateral deformation study may be required for pile installations within 50 feet of Metropolitan's pipelines. Metropolitan may require additional information per its Geo-technical Guidelines for pile installation. Please contact Metropolitan's Substructures Team for a copy of the Geotechnical Guidelines.

13.2 Permanent Cast-in-place Piles

Permanent cast-in-place piles must be constructed so that down drag forces of the pile do not act on Metropolitan's pipeline. The pile must be designed so that down drag forces are not developed from the ground surface to springline of Metropolitan's pipeline.

Permanent cast-in-place piles shall not be placed closer than 5 feet from the edge of Metropolitan's pipeline. Metropolitan may require additional information per its Geo-technical Guidelines for pile installation. Please contact Metropolitan's Substructures Team for a copy of the Geotechnical Guidelines.

14.0 Protective Slabs for Road Crossings Over Metropolitan Pipelines

Protective slabs must be permanent cast-in-place concrete protective slabs configured in accordance with Drawing SK-1 (See Figure 2 on Page 22).

The moments and shear for the protective slab may be derived from the American Association of State Highway and Transportation Officials (AASHTO). The following requirements apply:

A. The concrete must be designed to meet the requirements of AASHTO

B. Load and impact factors must be in accordance with AASHTO. Accepted methods of analysis must be used.

C. The protective slab design must be stamped and signed by a California registered civil or structural engineer and submitted to Metropolitan with supporting calculations for review and approval.

Existing protective slabs that need to be lengthened can be lengthened without modification, provided the cover and other loading have not been increased.

15.0 Blasting

At least 90 days prior to the start of any drilling for rock excavation blasting, or any blasting in the vicinity of Metropolitan's facilities, a site-specific blasting plan must be submitted to Metropolitan for review and approval. The plan must consist of, but not be limited to, hole diameters, timing sequences, explosive weights, peak particle velocities (PPV) at Metropolitan pipelines/structures, and their distances to blast locations. The PPV must be estimated based on a site-specific power law equation. The power law equation provides the peak particle velocity versus the scaled distance and must be calibrated based on measured values at the site.

16.0 Metropolitan Plan Review Costs, Construction Costs and Billing

16.1 Plan Review Costs

Metropolitan plan reviews requiring 8 labor hours or less are generally performed at no cost to the project proponent. Metropolitan plan reviews requiring more than 8 labor hours must be paid by the project proponent, unless the project proponent has superior rights at the project area. The plan review will include a written response detailing Metropolitan's comments, requirements, and/or approval.

A deposit of funds in the amount of the estimated cost and a signed letter agreement will be required from the project proponent before Metropolitan begins or continues a detailed engineering plan review that exceeds 8 labor hours.

16.2 Cost of Modification of Facilities Performed by Metropolitan

Cost of modification work conducted by Metropolitan will be borne by the project proponent, when Metropolitan has paramount/prior rights at the subject location.

Metropolitan will transmit a cost estimate for the modification work to be performed (when it has paramount/prior rights) and will require that a deposit, in the amount of the estimate, be received before the work will be performed.

16.3 Final Billing

Final billing will be based on the actual costs incurred, including engineering plan review, inspection, materials, construction, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the total cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice for the additional amount will be forwarded for payment.

17.0 Street Vacations and Reservation of Easements for Metropolitan

A reservation of an easement is required when all or a portion of a public street where Metropolitan facilities are located is to be vacated. The easement must be equal to the street width being vacated or a minimum 40 feet. The reservation must identify Metropolitan as a "public entity" and not a "public utility," prior to recordation of the vacation or tract map. The reservation of an easement must be submitted to Metropolitan for review prior to final approval.

18.0 Metropolitan Land Use Guidelines

If you are interested in obtaining permission to use Metropolitan land (temporary or long term), a Land Use Form must be completed and submitted to Metropolitan for review and consideration. A nonrefundable processing fee is required to cover Metropolitan's costs for reviewing your request. Land Use Request Forms can be found at:

http://mwdh2o.com/PDF_Doing_Your_Business/4.7.1_Land_Use_Request_form_revised.pdf

The request should be emailed to RealEstateServices@mwdh2o.com,or contact the Real Property Development and Management (RPDM) Group at (213) 217-7750.

After the initial application form has been submitted, Metropolitan may require the following in order to process your request:

A. A map indicating the location(s) where access is needed, and the location & size (height, width and depth) of any invasive subsurface activity (boreholes, trenches, etc.).

B. The California Environmental Quality Act (CEQA) document(s) or studies that have been prepared for the project (e.g., initial study, notice of exemption, Environmental Impact Report (EIR), Mitigated Negative Declaration (MND), etc.).

C. A copy of an ACORD insurance certification naming Metropolitan as an additional insured, or a current copy of a statement of self-insurance.

D. Confirmation of the legal name of the person(s) or entity(ies) that are to be named as the permittee(s) in the entry permit.

E. Confirmation of the purpose of the land use.

F. The name of the person(s) with the authority to sign the documents and any specific signature title block requirements for that person or any other persons required to sign the document (i.e., legal counsel, Board Secretary/Clerk, etc.).

G. A description of any vehicles that will have access to the property. The exact make or model information is not necessary; however, the general vehicle type, expected maximum dimensions (height, length, width), and a specific maximum weight must be provided.

Land use applications and proposed use of the property must be compatible with Metropolitan's present and/or future use of the property. Any preliminary review of your request by Metropolitan shall not be construed as a promise to grant any property rights for the use of Metropolitan's property.

19.0 Compliance with Environmental Laws and Regulations

As a public agency, Metropolitan is required to comply with all applicable environmental laws and regulations related to the activities it carries out or approves. Consequently, project plans, maps, and other information must be reviewed to determine Metropolitan's obligations pursuant to state and federal environmental laws and regulations, including, but not limited to:

A. California Environmental Quality Act (CEQA) (Public Resources Code 21000-21177) and the State CEQA Guidelines (California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 1500-15387)

B. Federal Endangered Species Act (ESA) of 1973, 16 U.S.C. §§ 1531, et seq.

C. California Fish and Game Code Sections 2050-2069 (California ESA)

D. California Fish and Game Code Section 1602

E. California Fish and Game Code Sections 3511, 4700, 5050 and 5515 (California fully protected species)

F. Federal Migratory Bird Treaty Act (MBTA), 16 U.S.C. §§ 703-712

G. Federal Clean Water Act (including but not limited to Sections 404 and 401) 33 U.S.C. §§ 1342, 1344)

H. Porter Cologne Water Quality Control Act of 1969, California Water Code §§ 13000-14076.

I. Title 22, California Code of Regulations, Chapter 16 (California Waterworks Standards), Section 64572 (Water Main Separation)

Metropolitan may require the project applicant to pay for any environmental review, compliance and/or mitigation costs incurred to satisfy such legal obligations.

20.0 Paramount Rights / Metropolitan's Rights within Existing Rights-of-Way

Facilities constructed within Metropolitan's rights-of-way shall be subject to the paramount right of Metropolitan to use its rights-of-way for the purpose for which they were acquired. If at any time Metropolitan or its assigns should, in the exercise of their rights, find it necessary to remove or relocate any facilities from its rights-of-way, such removal and replacement or relocation shall be at the expense of the owner of the facility.

21.0 Disclaimer and Information Accuracy

Metropolitan assumes no responsibility for the accuracy of the substructure information herein provided. The user assumes responsibility for verifying substructure locations before excavating and assumes all liability for damage to Metropolitan's facilities as a result of such excavation. Additionally, the user is cautioned to conduct surveys and other field investigations as you may deem prudent, to assure that your project plans are correct. The relevant representative from Metropolitan must be called at least two working days, before any work activity in proximity to Metropolitan's facilities.

It generally takes 30 days to review project plans and provide written responses. Metropolitan reserves the right to modify requirements based on case-specific issues and regulatory developments.

Table 1: General Guidelines for Pipeline Separation between Metropolitan's Pipeline[1] and Sanitary Sewer[2] or Hazardous Fluid Pipeline[3]

Pipeline Crossings	Metropolitan requires that sanitary sewer and hazardous fluid pipelines that cross Metropolitan's pipelines have special pipe construction (no joints) **and** secondary containment[4]. This is required for the full width of Metropolitan's rights-of-way or within 10 feet tangent to the outer edges of Metropolitan's pipeline within public streets. Additionally, sanitary sewer and hazardous fluid pipelines crossing Metropolitan's pipelines must be perpendicular and maintain a minimum 1-foot vertical clearance between the top and the bottom of Metropolitan's pipeline and the pipe casing. These requirements apply to all sanitary sewer crossings regardless if the sanitary sewer main is located below or above Metropolitan's pipeline.
Parallel Pipeline	Metropolitan generally does not permit the installation of longitudinal pipelines along its rights-of-way. Within public streets, Metropolitan requires that all parallel sanitary sewer, hazardous fluid pipelines and/or non-potable utilities be located a minimum of 10 feet from the outside edges of Metropolitan's pipelines. When 10-foot horizontal separation criteria cannot be met, longitudinal pipelines require special pipe construction (no joints) **and** secondary containment[4].
Sewer Manhole	Sanitary sewer manholes are not allowed within Metropolitan's rights-of-way. Within public streets, Metropolitan requests manholes parallel to its pipeline be located a minimum of 10 feet from the outside edges of its pipelines. When 10 foot horizontal separation criteria cannot be met, the structure must have secondary containment[5].

Notes:

[1] *Separation distances are measured from the outer edges of each pipe.*

[2] *Sanitary sewer requirements apply to all recycled water treated to less than disinfected tertiary recycled water (disinfected secondary recycled water or less).* Recycled water definitions are included in Title 22, California Code of Regulations, Chapter 3 (Water Recycling Criteria), Section 60301.

[3] *Hazardous fluids include e.g., oil, fuels, chemicals, industrial wastes, wastewater sludge, etc.*

[4] *Secondary Containment for Pipeline - Secondary containment consists of a continuous pipeline sleeve (no joints). Examples acceptable to Metropolitan include welded steel pipe with grout in annular space and cathodic protection (unless coated with non-conductive material) and High Density Polyethylene (HDPE) pipe with fusion-welded joints.*

[5] *Secondary Containment for Structures – Secondary containment consists of external HDPE liner or other approved method.*

Table 2: General Guidelines for Pipeline Separation between Metropolitan's Pipeline[1] and Storm Drain and/or Disinfected Tertiary Recycled Water[2]

Pipeline Crossings	Metropolitan requires crossing pipelines to be special pipe construction (no joints) or have secondary containment[3] within 10-feet tangent to the outer edges of Metropolitan's pipeline. Additionally, pipelines crossing Metropolitan's pipelines must be perpendicular and maintain a minimum 1-foot vertical clearance.
Parallel Pipeline	Metropolitan generally does not permit the installation of longitudinal pipelines along its rights-of-way. Within public streets, Metropolitan requests that all parallel pipelines be located a minimum of 10 feet from the outside edges of Metropolitan's pipelines. When 10-foot horizontal separation criteria cannot be met, special pipe construction (no joints) or secondary containment[3] are required.
Storm Drain Manhole	Permanent utility structures (e.g., manhole. catch basin, inlets) are not allowed within Metropolitan's rights-of-way. Within public streets, Metropolitan requests all structures parallel to its pipeline be located a minimum of 10 feet from the outside edges of its pipelines. When 10 foot horizontal separation criteria cannot be met, the structure must have secondary containment[4].

Notes:

[1] *Separation distances are measured from the outer edges of each pipe.*

[2] *Disinfected tertiary recycled water as defined* in Title 22, California Code of Regulations, Chapter 3 (*Water Recycling Criteria*), Section 60301.

[3] *Secondary Containment for Pipeline - Secondary containment consists of a continuous pipeline sleeve (no joints). Examples acceptable to Metropolitan include welded steel pipe with grout in annular space and cathodic protection (unless coated with non-conductive material) and High Density Polyethylene (HDPE) pipe with fusion-welded joints.*

[4] *Secondary Containment for Structures – Secondary containment consists of external HDPE liner or other approved method.*

Table 3: General Guidelines for Pipeline Separation[1] between Metropolitan's Pipeline and Recycled Water[2,4] Irrigations

Pressurized recycled irrigation mainlines	• Crossings - must be perpendicular and maintain a minimum 1-foot vertical clearance. Crossing pressurized recycled irrigation mainlines must be special pipe construction (no joints) or have secondary containment[3] within 10-feet tangent to the outer edges of Metropolitan's pipeline. • Longitudinal - must maintain a minimum 10-foot horizontal separation and route along the perimeter of Metropolitan's rights-of-way where possible.
Intermittently Energized Recycled Water Irrigation System Components	• Crossings - must be perpendicular and maintain a minimum 1-foot vertical clearance. Crossing irrigation laterals within 5-feet tangent to the outer edges of Metropolitan's pipeline must be special pipe construction (no joints) or have secondary containment[3]. • Longitudinal – must maintain a minimum 5-foot horizontal separation between all intermittently energized recycled water irrigation system components (e.g. irrigation lateral lines, control valves, rotors) and the outer edges of Metropolitan's pipeline. Longitudinal irrigation laterals within 5-feet tangent to the outer edges of Metropolitan's pipeline must be special pipe construction (no joints) or have secondary containment[3].
Irrigation Structures	Irrigation structures such as meters, pumps, control valves, etc. must be located outside of Metropolitan's rights-of-way.
Irrigation spray rotors near Metropolitan's aboveground facilities	Irrigation spray rotors must be located a minimum of 20-foot from any Metropolitan above ground structures with the spray direction away from these structures. These rotors should be routinely maintained and adjusted as necessary to ensure no over-spray into 20-foot clear zones.
Irrigations near open canals and aqueducts	Irrigation with recycled water near open canals and aqueducts will require a setback distance to be determined based on site-specific conditions. Runoff of recycled water must be contained within an approved use area and not impact Metropolitan facilities. Appropriate setbacks must also be in place to prevent overspray of recycled water impacting Metropolitan's facilities.

Notes:

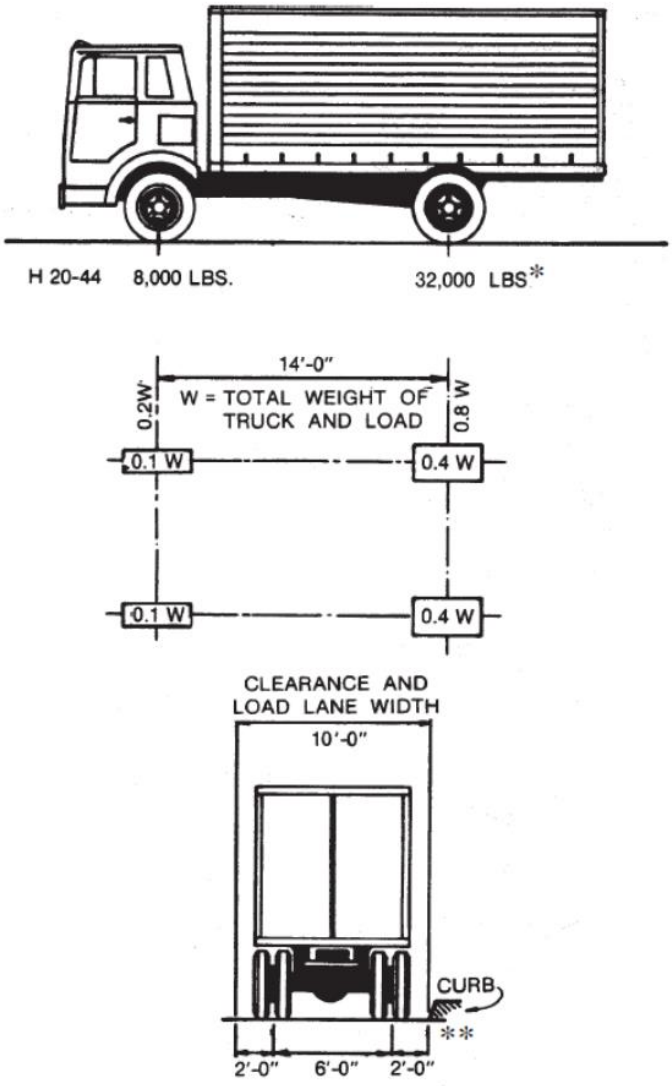
[1] *Separation distances are measured from the outer edges of each pipe.*

[2] *Requirements for recycled water irrigation apply to all levels of treatment of recycled water for non-potable uses.* Recycled water definitions are included in Title 22, California Code of Regulations, Chapter 3 (*Water Recycling Criteria*), Section 60301.

[3] *Secondary Containment for Pipeline - Secondary containment consists of a continuous pipeline sleeve (no joints). Examples acceptable to Metropolitan include welded steel pipe with grout in annular space and cathodic protection (unless coated with non-conductive material) and High Density Polyethylene (HDPE) pipe with fusion-welded joints.*

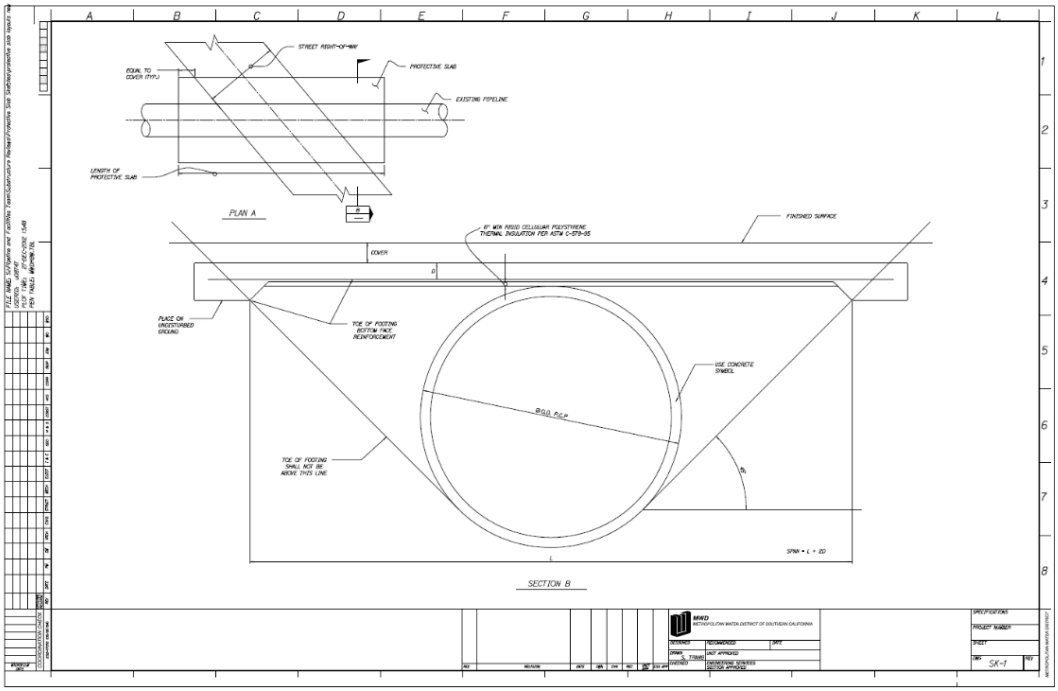
[4] *Irrigation with recycled water shall not be applied directly above Metropolitan's treated water pipelines.*

Figure 1: AASHTO H-20 Loading



Note: The H loadings consist of a two-axle truck or the corresponding lane loadings as illustrated above. The H loadings are designated "H" followed by a number indicating the gross weight in tons of the standard truck.

Figure 2: Drawing SK-1



Responses to Comment Letter R3 – The Metropolitan Water District of Southern California

R3-1 The commenter provides general introductory information, description of Metropolitan Water District, and notes that Metropolitan owns and operates the Upper Feeder Pipeline within the Project's vicinity. The County appreciates and values these comments during the EIR participation process. The Comment is noted, and the remaining comments are responded to below**.**

R3-2 Commenter advises that the Upper Feeder is not an aqueduct. *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft *EIR Sections 3.0, Project Description* and *4.5, Cultural Resources*. These edits revise and clarify the proper name of the Upper Feeder by removing 'Aqueduct' from the name. As noted in *Section 4.5*, the Project would not impact the Upper Feeder Pipeline. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

R3-3 Commenter requests that all references to the Upper Feeder as an historical resource be removed from the Draft EIR. *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Sections 3.0 Project, Description* and *4.5, Cultural Resources*. These edits revise and clarify the language that the Upper Feeder Pipeline is not a historical resource as defined under CEQA and to remove instances of the Upper Feeder from discussions of historical resources. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

R3-4 Commenter advises on necessary coordination efforts between Project and the Metropolitan Water District of Southern California. The Project would seek all necessary approvals from applicable agencies, including the Metropolitan Water District of Southern California if any aspect of the Project would affect any of Metropolitan's facilities.

R3-5 Commenter encourages the use of water conservation measures. The Project would include the use of recycled water for irrigation and other non-potable water uses. As discussed in the SCCIISP and in the Draft EIR *Section 3.0, Project Description*, energy and water-efficient appliances, fixtures, lighting, and windows shall meet or exceed state energy performance standards. Energy Star qualified (or equivalent) models of mechanical equipment are strongly encouraged. Plants included within the Specific Plan's preliminary plant list were selected for the unique aesthetic qualities which complement the architectural design themes throughout the Specific Plan area as well as their drought-tolerant nature. Future noticing and updates regarding the Project will be made available as requested.

San Bernardino CA 92415

RE: Notice of a Draft Environmental Impact Report (Draft EIR) for the proposed Speedway Commerce Center II Specific Plan Project

Dear Mr. Steven Valdez:

Thank you for the Notice of Preparation for the Draft EIR. for the proposed project that includes the Speedway Commerce Center II Specific Plan. 1

The City of Fontana has the following comments:

1. The SB 743 VMT Analysis completed in February 2022 references the California Air Pollution Control Officers Association (CAPCOA) Quantifying Greenhouse Gas Mitigation Measures (August 2010). It is recommended that the more recent standard which was released in December 2021 be referenced in the analysis presented. 2
2. The City of Fontana requests the opportunity to discuss the findings of the Traffic Study dated January 2022 with the County of San Bernardino. 3
3. Please utilize the attached draft Truck Route Exhibit for the evaluation of traffic impact. The attached exhibit will be presented to the City Council in Sept/Oct 2022. 4
4. The staff noticed that the submitted traffic study does not include the area south of Jurupa. Would you please explain the reasoning behind? 5

If you have any questions, please feel free to contact me at (909) 350-6566 or rleung@fontana.org

Sincerely,

Rina Leung
Senior Planner

Subject: RE: NOP for the Speedway Commerce Center II SP Project

Hello Steven,

In addition to the City of Fontana comments, I would like to inform you and the applicant that the project area is within the City and County's Western Sphere Agreement. I attached the MOU between the two entities for your information for additional conditions of the project.

FIRST AMENDED AND RESTATED

MEMORANDUM OF UNDERSTANDING

BETWEEN

CITY OF FONTANA
AND
COUNTY OF SAN BERNARDINO

AMENDED AS OF OCTOBER 9 , 2012

WESTERN SPHERE OF INFLUENCE

16498.00000\7568621.3

CITY OF FONTANA / COUNTY OF SAN BERNARDINO

FIRST AMENDED AND RESTATED MEMORANDUM OF UNDERSTANDING (Western Sphere of Influence)

This First Amended and Restated Memorandum of Understanding (Western Sphere of Influence) ("Agreement") is entered into between (1) the City of Fontana, a California general law city and municipal corporation ("City") and, (2) the County of San Bernardino, a political subdivision of the State of California ("County"). This Agreement is reference dated as of October 9, 2012, and supersedes that certain Memorandum of Understanding (Western Sphere of Influence) dated August 26, 2008 (the "2008 MOU"). This Agreement will not become effective until the occurrence of the "Effective Date" defined below. If the Effective Date does not occur on or before December 31, 2012, then this Agreement may not thereafter become effective and any prior approvals and/or signatures of the Parties shall be deemed, automatically and without need of further act or instrument by either Party, rescinded and void ab initio. The City and the County are sometimes referred to in this Agreement, individually, as a "Party" and, collectively, as the "Parties".

This Agreement will become effective on the date ("Effective Date") on which it has been approved by both the City Council on behalf of the City and the Board of Supervisors on behalf of the County and fully executed counterpart originals have been exchanged between the Parties. The term ("Term") of this Agreement shall commence on the Effective Date and shall automatically end upon the City's annexation of the entire Western Sphere (as defined in Recital A, below), or either Party's election to terminate this Agreement, which election may be made at any time and for any reason (or for no reason), notice of which shall be given as provided by Section 6.

RECITALS

A. Immediately adjacent to the westerly border of the City is an unincorporated area of land located within the County and designated by the San Bernardino County Local Agency Formation Commission ("LAFCO") as the City's Western Sphere of Influence ("Western Sphere"). The Western Sphere is approximately 8.5 square miles in size. A map depicting the boundaries of the Western Sphere is attached as Exhibit "A".

B. The City provides sanitary sewer services within portions of the Western Sphere. The City owns and maintains the pipes and other transmission infrastructure needed to provide such service, whereas the Inland Empire Utilities Agency ("IEUA") provides wastewater treatment services within portions of the Western Sphere through a series of agreements with the City. The City's current annexation policy is to require any landowner or developer within the Western Sphere who desires to connect to the City's sanitary sewer system to either sign an irrevocable agreement to annex to the City or to complete a pre-annexation agreement. By this Agreement, the City and County have agreed on certain practices and procedures that they intend will facilitate economic development within the Western Sphere.

16498.00000\7568621.3

C. The City and the County acknowledge that the Western Sphere, or some portion of it, may be annexed into the City at some future date. The County further acknowledges that the City's intent in entering into this Agreement includes ensuring that development within the Western Sphere which occurs prior to such annexation be accomplished in a manner that as closely as possible reflects the City's practices and requirements as established in the City's Development Code as it exists from time to time throughout the Term of this Agreement.

D. The Parties recognize that development within the Western Sphere will be enhanced and facilitated by the investment of public funds into the public infrastructure needed to support such development. The chief sources of public funds for such public infrastructure are those fees and charges imposed and collected from developers within the Western Sphere as a condition to the obtaining of building permits and other entitlements for such development. County has a limited program for the collection of such fees. The City, in connection with the pre-annexation agreements described in Recital "B" above, requires developers within the Western Sphere to pay to the City certain of those development impact fees that would otherwise be assessed against such development if it were located within the City's jurisdictional boundaries. As to the Western Sphere, these development impact fees will consist solely of sewer connection and expansion fees, a storm drainage facilities fee, a fire facilities fee, and a park development fee (for residential properties only) (collectively, the "Western Sphere Development Impact Fees" or "Western Sphere DIF"). The Western Sphere DIF shall be charged at the same rates which City charges for similar development projects within the City's incorporated boundaries, as such rates may be amended from time to time. To facilitate the economic development and revitalization of the Western Sphere, the City and the County have agreed that the Western Sphere DIF and the corresponding impact fees collected by the County from projects being developed within the Western Sphere shall be invested into public infrastructure projects located within the Western Sphere as more particularly described in this Agreement.

AGREEMENT

Section 1. Incorporation of Recitals. The Parties each acknowledge the accuracy of the factual matters set forth in the Recitals and further acknowledge that such facts form the material basis for their entry into this Agreement.

Section 2. County's Obligation to Consult re Development Entitlements and Development Code and Development Standard Changes. The City has reviewed the County's current Development Code and other regulations concerning development within the Western Sphere (collectively, the "County Standards"). Although not identical to City standards, the City is nonetheless satisfied that development which takes place in accordance with the County Standards will be of sufficient quality and character so as to be compatible with the development in the adjoining portion of the City. Accordingly, and in order to foster the continued development of the Western Sphere consistent with the above objective, the County agrees as follows:

2.1. The County shall submit to the City full and complete copies of any and all development or other entitlement permits or applications for development entitlements occurring within the Western Sphere. Such information shall be provided to the City

16498.00000\7568621.3

no less than thirty (30) days prior to the administrative or County Planning Commission hearing at which the development application or other entitlement is to be considered. The City shall promptly review the application and, within twenty (20) days following its receipt from the County, the City will provide written comments to the County for its consideration. The County agrees to reasonably consider the City's comments and, to the extent not in conflict with the County Standards, to incorporate such City-recommended changes as either modifications to or conditions of approval of such entitlement.

2.2. The County shall provide to the City no less than thirty (30) days prior notice of any proposed changes to any of the County Standards, including General Plan amendments and Zoning and Development Code amendments. The County shall review and reasonably respond to any suggested changes and County staff shall incorporate such City-recommended changes for consideration by the County Planning Commission or Board of Supervisors, as applicable.

2.3. The requirements of the foregoing Sections 2.1 and 2.2 shall not operate to modify, waive or abridge any County obligation arising under the California Environmental Quality Act (Public Resources Code Sections 21000, et seq.) ("CEQA") to provide the City with environmental notice and opportunity to comment as prescribed by CEQA.

2.4. The County shall review and consider a proposed change to the County Standards to make the County Standards consistent with the City's Automatic Fire Sprinkler Systems standards as set forth in City Code Sections 11-26 thru 11-31.

Section 3. City Provision of Sewer Service. To the extent the City/IEUA has available wastewater (sewer) treatment capacity, the City agrees to provide sewer service to and authorize a sewer connection by any landowner requesting such connection and service within the Western Sphere provided that: (1) such landowner complies with the City's annexation policy, as it may be amended from time to time (a current copy of which is attached as Exhibit "B"); (2) the landowner meets all other City requirements and pays the applicable sewer service fees which are imposed by the City pursuant to the City's Municipal Code and other policies and regulations, as they may be amended from time-to-time, in connection with such sewer service; and (3) the landowner pays to the City the Western Sphere DIF which would be applicable to the development if it were to occur in the City at the time a sewer connection permit is issued. Provided, however, that the City shall not require the payment of any development impact fee which is imposed by the County to fund the same infrastructure as being funded by the City impact fee, City agrees that this Agreement will accomplish, in major part, what annexation would provide for the Western Sphere. Therefore, notwithstanding the requirement for a landowner to comply with the City's annexation policy or LAFCO's requirements, or both, the City agrees it will not file a formal application with the Local Agency Formation Commission seeking to annex any part of the Western Sphere as long as this Agreement is in effect, unless the annexation application is otherwise agreed upon by the City and the County.

Section 4. Use of Development Impact Fees Within Western Sphere. Each year as part of their preparation and approval of their respective Capital Improvement Plans described by Government Code Section 66002, the City and the County shall each use reasonable good faith efforts to include capital improvement/public infrastructure projects within

16498:00000\7568621.3

the Western Sphere which will be funded by the Western Sphere DIF (as to the City) and those development impact fees received by the County from development occurring within the Western Sphere. Without limiting the legislative discretion granted to either the City Council or the Board of Supervisors, the Parties agree that, to the extent possible, the following projects shall be given priority in the allocation of Western Sphere DIF and those development impact fees received by the County from development occurring within the Western Sphere:

4.1 Sewer Facilities
4.2 Storm Drainage Facilities
4.3 Park Development: a central park
4.4 Fire Facilities

The above list is intended by the Parties to be precatory only and shall not be a binding commitment to fund. The County's Second District Supervisor and City's Mayor are authorized to meet and attempt to resolve any disputes regarding the priority of projects to be funded and/or add new projects, subject to the consent and ratification of the City Council and Board of Supervisors. Actual funding of such projects shall require separate agreements for each specific project, as approved by both the City Council and Board of Supervisors.

Section 5. Sales Tax Allocations. Sharing of Sales Tax under the 2008 MOU is hereby terminated. In lieu of the ongoing Sales Tax allocation by the County under the 2008 MOU, the County's remaining obligation under Section 5 shall be fulfilled in its entirety by the following actions:

5.1 Five Million Five Hundred Sixty Seven Thousand Eight Hundred and Sixty Seven Dollars and 39/100 ($5,567,867.39) currently set aside in the County Fire CIP accounts to fund construction of Fire Station 80 shall be paid by the County to the Fontana Fire Protection District within ten (10) days following the Effective Date of this Agreement, for use in the acquisition of land and construction of a fire station to serve the Western Sphere area, tentatively located near the intersection of Foothill Boulevard and Banana Avenue; and

5.2 County shall, within ten (10) days following the Effective Date of this Agreement, pay to the City Four Million Five Hundred Thousand Dollars ($4,500,000.00) to fund the improvement of a flood control/water quality control basin by the City.

Section 6. Notices. All notices permitted or required under this Agreement shall be given to the respective Parties at the following addresses, or at such other address as the respective parties may provide in writing for this purpose.

City	County
City of Fontana 8353 Sierra Avenue Fontana, CA 92335	County of San Bernardino 385 North Arrowhead Avenue San Bernardino, CA 92415
Attention: City Manager	Attention: County Administrative Officer

16498.00000\7568621.3

Section 7. Integration/Modifications. This Agreement contains the entire understanding of the Parties with respect to the matters set forth in this Agreement and supersedes any and all prior writings and oral discussions concerning the same. This Agreement may not be amended except by a writing duly signed and duly approved by the City and County. This Agreement is not intended to and shall not accrue to the benefit of any person or entity other than the City and the County.

Section 8. Governing Law. This Agreement shall be governed by the procedural and substantive laws of the State of California.

Section 9. Invalidity; Severability. If any portion of this Agreement is declared invalid, illegal, or otherwise unenforceable by a court of competent jurisdiction, the remaining provisions shall continue in full force and effect.

Section 10. Counterpart Originals. This Agreement may be executed by the Parties in counterparts, all of which together shall constitute a single Agreement.

Section 11. Attorney's Fees. If any legal action is instituted to enforce or declare any Party's rights hereunder, each Party, including the prevailing Party, shall bear its own costs and attorneys' fees.

Section 12. Authority to Enter into Agreement. City and County both warrant that the individuals who have signed this Agreement have the legal power, right and authority to make this Agreement and bind both respective Parties to this Agreement.

Responses to Comment Letter L1 – City of Fontana

L1-1 The commenter provides general introductory information, project description, and a greeting. The commenter requests a more recent version of the CAPCOA be referenced in the Draft EIR's VMT analysis. At the time of preparation of the VMT analysis, the 2021 CAPCOA document was released as a draft. Therefore, the adopted 2010 CAPCOA document was referenced. Review of the December 2021 CAPCOA document showed that there will not be any significant changes to the VMT analysis findings and conclusions in the EIR. The project VMT impacts are less than significant. The CAPCOA reference is only for the purposes of showing potential VMT reductions from the project design features. The total potential reduction in VMT based on 2021 CAPCOA document for the TDM measures in the EIR is up to 15 percent, which is higher than the potential reduction identified in the EIR. As such, the analysis presented is conservative.

L1-2 The commenter requests further opportunity to consult with the County**.** This comment is noted and acknowledged for the record.

L1-3 The commenter requested the utilization of an attached draft Truck Route exhibit for the evaluation of traffic impacts. The truck distribution assumptions in the Traffic Study were based on truck route adopted at the time of the study. The City of Fontana General Plan update is not yet adopted (the timeline for adoption is not known at this time) and the analysis was based on the adopted General Plan at the time the analysis was conducted. It is up to the City of Fontana to evaluate the effects of removing a major roadway which is currently a truck route which would affect not only Project traffic but all truck traffic.

L1-4 Based on the San Bernardino County VMT/Traffic guidelines and the approved Traffic Scoping Agreement, the study area includes all study intersections where the Project would contribute more than 50 peak hour trips. Areas south of Jurupa Avenue consist of primarily industrial uses with small amounts of residential housing.

L1-5 The commenter's request to be provided subsequent public noticing and hearing information is noted for the record and the commenter will be added to the list and sent notices of upcoming hearings or notices related to the Project.

L1-6 The comment refers to a Memorandum of Understanding (MOU) between the City and San Bernadino County and a copy of the MOU is attached. However, the Project is subject to a November 24, 2015, Agreement for the Provision of Sewer and Recycled Water Service, to which the City of Fontana, Inland Empire Utilities Agency (IEUA), The California Speedway Corporation, and others are party. As a result, the Master Developer will not enter into a pre-annexation agreement with the City of Fontana, and will not be subject to the provisions of the MOU. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

Hi Steven,

Please see comments below provided on January 13, 2022. Beyond this list of comments, please also see attached for the updated list of cumulative projects proposed within the City of Rancho Cucamonga which will need to be incorporated within any cumulative analysis related to environmental impacts.

Please let me know of any questions.

Thanks,

Subject: Speedway Commerce Center II - Notice of Preparation of DEIR

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Hello, Steven

The City of Rancho Cucamonga has received the Notice of Preparation (NOP) dated December 13, 2021 of the Draft Environmental Impact Report (DEIR) for *Speedway Commerce Center II* with a comment period that closes on January 13, 2022. 2

We have reviewed the NOP and have the following, broad topics for discussion in the DEIR. Please consider the following impacts on the City of Rancho Cucamonga (the "City") and, in general, the surrounding area in the vicinity of the project site: 3

1. Aesthetic impacts due to glare generated by new lighting;
2. Air quality impacts during construction of the project - in particular impacts on the residential neighborhoods in the City located to the northwest of the project site; 4
3. Air quality impacts caused by the operations of the tenant(s) of the project - in particular impacts on the residential neighborhoods in the City located to the northwest of the project site; 5
4. Noise generated by additional traffic on, for example, segments of Arrow Route and Foothill Boulevard in the City, where there is residential development, between the project site and Interstate 15; 6
5. Truck parking and trailer storage during conditions when parking/storage demand exceeds the availability/capacity of parking/storage on the project site; 7
6. Traffic circulation impacts on the City's street network - in particular on Foothill Boulevard, Arrow Route, Napa Street, 4th Street, and Etiwanda Avenue; 8
7. Additional street connections to ensure efficient/effective circulation, redundancy, and access. As this is a critical topic, consider the following: 9

    - The westerly north-south "VIP Access Road" between Street "D" and San Bernardino Avenue should continue north to Napa Street to provide additional routing opportunities and more direct access for properties in the vicinity of the San Sevaine Channel between Napa Street and San Bernardino Road;
    - Street "D" should extend west to Etiwanda Avenue. This east-west connection would balance the amount of traffic and traffic movements between Cherry Avenue and Etiwanda Avenue;
    - A potential connection at 6th Street to provide an additional east-west connector between Ontario and Fontana between 4th Street/San Bernardino Avenue and Arrow Route south of the Metrolink Tracks. This will improve circulation around the properties that are bounded by the BNSF/Metrolink railroad tracks and 4th Street/San Bernardino Road. This is a connection that is not accomplished by the Napa Street connection since it terminates at Etiwanda Avenue.

8. Traffic and vehicle miles traveled (VMT) generated by the project due to trucks (shipping and final delivery) and passenger vehicles (employee commutes); 10
9. Operational impacts of the project on utilities and utility-related services in the general area due to the obsolescence of infrastructure that needs to be upgraded/reconstructed; 11
10. Public safety, e.g. police and fire, access to the project site during emergencies. 12

NOTE: the City has recently approved, or is reviewing, applications for several industrial development projects in the vicinity of the subject project site. Please contact us regarding these projects so that they are included in any evaluation of the construction/operational impact of the subject project.

The City would like to participate in the preparation and review of the DEIR. Please send all notices related to the subject project and applicable procedural steps to me via the address and email address listed below. Also, please notify me of any future projects at the Auto Center Speedway. Our awareness of these projects will assist us in informing and serving the Community.

Thank you.

Responses to Comment Letter L2 – Rancho Cucamonga

L2-1 The commenter includes the letter sent in response to the Notice of Preparation (NOP) and requests those prior comments be addressed and also provides an updated cumulative project list dated July 18, 2022. The City of Rancho Cucamonga provided the initial cumulative project list (dated August 30, 2021) on September 14, 2021, which was considered to evaluate cumulative impacts per Sections 15130 and 15355 of the State CEQA Guidelines. The NOP for the Project was released on December 13, 2021. The data available at the time of the preparation of the NOP was the most current at that time, and the date of the NOP is a reasonable cutoff date for the cumulative impacts analysis. Furthermore, State CEQA Guidelines, Section 15125(a)(1) states that generally, the lead agency should describe physical environmental conditions as they exist at the time the NOP is published, including relative to the proper baseline for cumulative impacts analysis. Therefore, no further revision to the cumulative projects analyzed in the Draft EIR is required.

L2-2 The commenter notes receipt of the Notice of Preparation prepared for the Project. No further response is required.

L2-3 The commenter provides a summary of topics to consider. The commenter requests consideration of impacts to the City of Rancho Cucamonga including impacts to glare associated with the Project's lighting. Draft EIR Impact 4.1-4 assesses if the Project would create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area. Impacts were found to be less than significant. As discussed in Draft EIR *Section 4.1, Aesthetics*, no structures or features that create adverse glare effects are permitted. Thus, all exterior lighting would be shielded/hooded to prevent light trespass onto nearby properties, as defined above. The high-cube logistics, e-commerce, and ancillary commercial buildings proposed for the Project would use a variety of non-reflective building materials, and although some new reflective improvements (i.e., windows and building front treatments) would be introduced to the Project site, the proposed buildings would not be a source of substantial glare in the area. Also, the Project would serve as a benefit to the surrounding area as the proposed structures would dampen (block or absorb) the light/glare effects associated with the bright lighting that would be put in place for the proposed NextGen motorsports facility races and events. Project buildings would surround the short track on three of its four sides.

L2-4 The commenter identifies air quality impacts during construction of the Project as a topic of discussion. Air Quality impacts are discussed in *Section 4.3, Air Quality* of the Draft EIR. No significant and unavoidable impacts were identified in relation to sensitive receptors.

L2-5 The commenter identifies air quality impacts during operations of the Project as a topic of discussion. Air Quality impacts are discussed in *Section 4.3, Air Quality* of the Draft EIR. No significant and unavoidable impacts were identified in relation to sensitive receptors.

L2-6 The commenter identifies noise generated by additional traffic as a topic of discussion. Noise impacts are discussed in *Section 4.13, Noise* of the Draft EIR. Implementation of the Project would create new sources of noise in the Project vicinity, one of which is off-site traffic noise.

Implementation of the Project would generate increased traffic volumes along nearby roadway segments. The amount of traffic generated by the Project would result in a substantial increase in traffic noise in exceedance of the County's noise standards under Opening Year 2024 Plus Phase 1, Opening Year 2027 Plus Phases 1 & 2, and Opening Year 2040 Plus Phases 1 & 2 conditions, and there is no feasible mitigation to reduce these impacts. It should be noted, however, that as electric trucks and passenger vehicles become more commercially available in accordance with California's Advanced Clean Truck (ACT) and zero emission vehicle rules, the truck fleets and passenger vehicles accessing the Project site would generate lower traffic noise levels compared to a business-as-usual scenario. Nonetheless, off-site traffic noise impacts from the Project would be significant and unavoidable.

L2-7 The commenter identifies truck parking and trailer storage as a topic of discussion. Transportation impacts are discussed in *Section 4.17, Transportation* of the Draft EIR and the Specific Plan. The Specific Plan provides parking standards for the Project parking lots and Parking Fields/Drop lots, which are consistent with the Development Code requirements. Parking proposed for the Project exceeds minimum standards presented by the County development code.

L2-8 The commenter identifies traffic circulation impacts as a topic of discussion. Transportation impacts are discussed in *Section 4.17, Transportation* of the Draft EIR. No significant unavoidable impacts were found in relation to traffic impacts. A traffic study was conducted for the Project (Draft EIR *Appendix L*). Seventy-two study locations were evaluated under seven analysis scenarios. Study locations were inclusive of intersections along Foothill Boulevard, Arrow Route, Napa Street, 4th Street, and Etiwanda Avenue. See the traffic study in *Appendix L* for analysis results for each of the intersections under the varying scenarios, recommended improvements, and findings and conclusions. A roadway segment analysis was not conducted.

L2-9 The commenter identifies additional street connections as a topic of discussion. Transportation impacts are discussed in *Section 4.17, Transportation* of the Draft EIR. The Specific Plan provides a new circulation network that connects to the existing road network. A new Street "A" will be constructed as a public collector that will be an east/west roadway that intersects Cherry Avenue and continues off-site to the west to Napa Street. Napa Street extends west to Etiwanda Avenue and further provides access to 6th Street. The Project includes a new Streets "B" and "C" which run internally in a north/south direction within the Specific Plan area. VIP Access Road provides access to the Specific Plan area from San Bernardino Avenue from the southwest corner of the Specific Plan area and connects to Street "D." Therefore the additional suggested connections of the continuation of VIP Access Road north to Napa Street, the extension of 6th Street, and the extension of "D" Street was considered and rejected.

L2-10 The commenter identifies traffic and VMT generated by the Project as a topic of discussion. VMT impacts are discussed in *Section 4.17, Transportation* of the Draft EIR. VMT impacts were evaluated under Draft EIR Impact 4.17-2 and found to be less than significant. See Draft EIR pages 4.17-17 through 4.17-20.

L2-11 The commenter identifies operational impacts of the Project on utilities and utility-related services as a topic of discussion. Utility impacts are discussed in *Section 4.19, Utilities and Service*

Systems of the Draft EIR. Impacts identified in relation to infrastructure improvements were found to be less than significant and no mitigation was necessary.

L2-12 The commenter identifies public safety access to the Project site as a topic of discussion. Public safety resources are discussed in *Section 4.15, Public Services* of the Draft EIR. Impacts identified in relation to public safety/services were found to be less than significant and no mitigation was necessary. Draft EIR Impact 4.17-4 considers whether the Project would result in inadequate emergency access. Impacts were found to be less than significant with mitigation incorporated. MM TRANS-1 requires the Master Developer to form a Transportation Management Association by the date of issuance of the first building permit issued for the development. MM TRANS-2 requires the preparation, submittal, and approval of a comprehensive traffic management plan to be developed by the Transportation Management Association.

L2-13 The commenter requests receipt of all notifications regarding the Project. The City's request for additional correspondence is noted for the record and will be notified of any Project updates or hearings.

San Gabriel Valley Water Company (L3)

SAN GABRIEL VALLEY WATER COMPANY

July 18, 2022

Mr. Steven Valdez
Senior Planner
Land Use Services Department
Planning Division
County of San Bernardino
385 North Arrowhead Avenue, 1st Floor
San Bernardino, CA 92415-0187

Subject: Speedway Commerce Center II Specific Plan
Draft Environmental Impact Report
Project No.: PROJ-2021-000150

Dear Mr. Valdez:

Fontana Water Company ("Fontana Water"), a division of San Gabriel Valley Water Company ("San Gabriel"), is a public utility company regulated by and subject to the jurisdiction of the California Public Utilities Commission. Fontana Water provides public utility potable water and recycled water service to a population of nearly 240,000 in the City of Fontana, City of Rialto, City of Ontario, City of Rancho Cucamonga, and unincorporated areas of San Bernardino County within its service area. Fontana Water's comments about San Bernardino County ("County") Speedway Commerce Center II Specific Plan Project ("Project") Draft Environmental Impact Report dated June 2022 ("DEIR") are provided below and in the Exhibit attached to this letter. 1

Fontana Water completed a Water Supply Assessment ("WSA") to ensure that sufficient water supply resources are available to supply water service to the Speedway Project. The DEIR affirms the findings of the WSA that sufficient water supply resources exist to meet the demands for potable water for the Project. However, the DEIR presents some statements that are incorrect. The DEIR states that Fontana Water's existing potable water production, storage, and distribution infrastructure are sufficient to produce, store, and distribute water service to the Project and have the capacity to meet its demands for potable water, and that additional potable water infrastructure would not be required to construct the Project. To evaluate the capacity of Fontana Water's existing water production, storage, and distribution infrastructure to meet the potable water demands for the Project, Fontana Water prepared a hydraulic assessment of its water system. The hydraulic assessment indicates that additional water production, storage, and distribution infrastructure will need to be 2

ENGINEERING DEPARTMENT
15966 ARROW ROUTE • FONTANA, CALIFORNIA 92335 • (909) 201-7375 • Fax (909) 201-7377

constructed to meet the potable water demands the Project. While the DEIR does state that water distribution mains are to be constructed in the new streets for the Project, the DEIR also needs to state that additional potable water infrastructure will be required to provide water service to the Project. Accordingly, Fontana Water prepared specific comments regarding the DEIR and provides them herewith in Exhibit "A".

Please send a response to this letter and the comments about the Project.

Very truly yours,

Matt Y. Yucelen

Matt Y. Yucelen, P.E.
Vice President – Engineering

EXHIBIT "A"

**San Gabriel Valley Water Company's Fontana Water Company division ("FWC")
Comments on the Speedway Commerce Center II Specific Plant Project
Draft Environmental Impact Report – June 2022 ("DEIR")**

Comment No. 1 – Page 1-4 – Objective 5

DEIR: Provide a system of infrastructure that includes public and private transportation, sewer, water, drainage, solid waste disposal, and other essential facilities to serve the needs of the Project.

FWC: Objective 5 of the EIR, requires that a system of water infrastructure needs to be provided to serve the needs of the Project. Many statements are made throughout the report that claim that existing water infrastructure is sufficient to provide necessary water supply and service the Project. Some of the statements seem to confuse the fact that sufficient water supply resources are available with the availability of sufficient water production, storage, and distribution infrastructure. However, new water infrastructure of a sufficient capacity is required to provide sufficient water service to the Project to meet all of its demands, including, but not limited to, demands for fire flow, domestic, and irrigation purposes. Therefore, these statements need to be removed and replaced with statements that explain the need for the additional water infrastructure (e.g. new water supply well, storage reservoir, booster station, and transmission and distribution mains), and that such statements support Objective 5 of the EIR. At a minimum, the report needs to state that new infrastructure needs to be installed to provide water service to the Project, instead of stating in several locations of the report, that existing infrastructure is sufficient and that no additional water infrastructure is needed. 3

Comment No. 2 – Page 3-31 – Water Supply – First Paragraph

DEIR: The Project site is served by Fontana Water Company (FWC) and Inland Empire Utilities Agency (IEUA).

FWC: This section is specific to Water Supply and states that FWC and IEUA serve the project site. This statement is not correct since FWC will provide domestic water and recycled water to this development. Correct the statement to specify that FWC will provide domestic and recycled water service to the development. 4

Comment No. 3 – Page 3-31 – Water Supply – First Paragraph

DEIR: To meet water supply demand, the portions of the County that are operated by the Fontana Water Company receive water supply from Lytle Creek surface flow and from wells in the Lytle Basin, Chino Basin, and another groundwater basin known as No Man's Land.

FWC: This paragraph omits Rialto-Colton Basin as a water supply source and instead includes No Man's Land. Correct the statement to list the water supply sources as the Chino Basin, Lytle Basin and Rialto-Colton Basin. 5

1

Comment No. 4 – Page 3-31 – Recycled Water – First Paragraph

DEIR: Recycled water supply is delivered at a lower cost than potable water and is not interrupted during drought restriction periods, making it ideal for irrigation sources.

FWC: As of June 10th, 2022 the use of potable water for irrigating Non-Functional Turf ("NFT") as defined in the SWRCB May 23, 2022 Emergency Order is prohibited making recycled water even more ideal for irrigations sources. Refer to Appendix C of the WSA for the Recycled Water Agreement between FWC and IEUA. 6

Comment No. 5 – Page 3-31 – Water Supply – Second Paragraph

DEIR: There is an existing 18-inch waterline that runs through the Project site, connecting existing water facilities in Napa Street to Cherry Avenue. A portion of this existing waterline would need to be removed with the development of the Project site.

FWC: The outside diameter of the existing pipe is 17 3/8" The inside pipe diameter is 16-inches. 7

Comment No. 6 – Page 3-31 – Water Supply – Second Paragraph

DEIR: The proposed new water facilities would connect to existing FWC waterlines located in Cherry Avenue and Napa Street to provide water for the Project site.

FWC: This sentence states that the Project will be provided with water simply by connecting to existing mains in Cherry Avenue, and omits the need for the new backbone main in Cherry Avenue and new water production, storage, and distribution infrastructure. Although there are existing mains in the vicinity of the project, both potable and recycled water, FWC's water system requires capacity improvements in order to meet the potable and recycled water demands for the Project. FWC also has a 16-inch waterline and rights of way that exist within the Project area that are required to be abandoned and relocated, which need to be described here. 8

Comment No. 7 – Page 3-32 – Site Utilities/Infrastructure – First Paragraph

DEIR: To meet water supply demand, the portions of the County that are operated by the FWC receive water supply from Lytle Creek surface flow and from wells in the Lytle Basin, Chino Basin, and another groundwater basin known as No Man's Land.

FWC: All references to No Man's Land should be omitted or revised to clarify it is a basin managed as part of the Rialto-Colton Basin. 9

Comment No. 8 – Page 3-32 – Site Utilities/Infrastructure – Second Paragraph

DEIR: The Project site would tie into existing utility lines within the existing roadways and right-of-ways adjacent to the site.

FWC: The statement that the Project will tie into existing utility lines is not entirely correct. The Project requires the construction of a new water utility transmission main in Cherry Avenue, in addition to the frontage and backbone water distribution mains and services,= to be installed in the Project streets. The frontage and backbone distribution mains tie into existing mains. However, those existing mains need to be supported by the construction of a new transmission main in Cherry Avenue. 10

Comment No. 9 – Page 4.3-26 – Construction Emissions

FWC: Emissions and GHG estimates resulting from the construction of the Project might need to be revisited if emissions and GHG related to the construction of the off-site water infrastructure required for the project needs to be considered in the report, since there appears to be no consideration of the requirements for any new offsite water infrastructure in the draft report. 11

Comment No. 10 – Page 4.8-21 – Short-Term Construction Greenhouse Gas Emissions

FWC: Emissions and GHG estimates resulting from the construction of the Project might need to be revisited if emissions and GHG related to the construction of the off-site water infrastructure required for the project needs to be considered in the report, since there appears to be no consideration of the requirements for any new offsite water infrastructure in the draft report. 12

Comment No. 11 – Page 4.10-16 – Constructions and Operations – Last Paragraph

DEIR: FWC receives groundwater from multiple groundwater sources including the Chino Basin, the Lytle Basin, the Rialto-Colton Basin, and the No Man's Land Basin.

FWC: All references to No Man's Land should be omitted or revised to clarify it is a basin managed as part of the Rialto-Colton Basin. 13

Comment No. 12 – Page 4.10-16 – Construction and Operations – Second Paragraph

DEIR: The recycled waterline was installed by IEUA with service being provided by Fontana Water Company (FWC). As an option to using potable water for irrigation uses, new recycled water facilities may be installed in the backbone streets (Streets "A", "B", "C", and "D"), shown in SCCIISP Figure 3-17: Conceptual Recycled Water Plan to provide irrigation water for the Project area.

FWC: To save precious potable water supplies and comply with the 2022 SWRCB Emergency Regulation, FWC strongly encourages customers to utilize recycled water for outdoor irrigation. There are no irrigation limitations for the use of recycled water. 14

3

Comment No. 13 – Page 4.19-2 – Table 4.19-1 Potable Water Demand by Land Use and 4.19-2 Water Demand Projections by Land Use

FWC: Tables 4.19-1 and 4.19-2 that show historic and projected water demand by land use and type from the 2020 UWMP are missing units for all of the water demand quantities, which are in acre-feet per year (AFY). 15

Comment No. 14 – Page 4.19-3 – Table 4.19-3 Normal Year Water Supplies

FWC: Normal Year Water Supplies from 2020 through 2045, the 2025 Total Supply appears to be misstated as "40,446". According to Table 6-1 of the 2020 UWMP the total supply for 2025 is 45,593 AFY. The table 14.19-3 is also missing units for supply quantities of AFY. 16

Comment No. 15 – Page 4.19-4 – Imported Water – Last Sentence

DEIR: Although FWC has no established allocation with SBVMWD, FWC anticipates the importation of approximately 3,200 AFY of imported water from SBVMWD by 2025. 17

FWC: First portion needs to be updated. As of January 5, 2022, FWC has an agreement with SBVMWD for the purchase of up to 3,650 acre-feet of imported water at an in district applicable rate. Additional water may be purchased from SBVMWD, if available, at a higher rate.

Comment No. 16 – Page 4.19-4 – Waste Water and Recycled Water – First Paragraph

DEIR: FWC received recycled water resources from IEUA which operates four Regional Water Recycling Plant (RPs) 18

FWC: The paragraph states that FWC received recycled water resources from IEUA. This needs to be clarified in this section and any other Wastewater and Recycled Water Section in the EIR document that FWC is the service provider for the direct use of recycled water for irrigation use and applicable commercial/industrial process use.

Comment No. 17 – Page 4.19-7 – State Regulatory Framework

FWC: List California Public Utilities Commission General Order 103 and the California Water Code sections, including Sections 64554 (maximum day demand and peak hour demand calculations) and 64572 (utility separations), among others. 19

Comment No. 18 – Page 4.19-9 – Additional Drought Actions and Regulations:

FWC: Insert a section titled **Additional Drought Actions and Regulations** following the section on **Assembly Bill 1668 and Senate Bill 606.** The text below should be incorporated as part of the section.

California is once again in a period of extended severe drought. In response, Governor Newsom proclaimed a State of Emergency asking all Californians to reduce their water use by up to 20%. The Governor's action was in response to unprecedented drought conditions that have brought below average snow and rainfall, resulting in record low water levels in the state's water reservoirs and historically low snowpack levels recorded in the Sierra Nevada mountain range.

In response to the governor's call to action, on April 26, 2022 the Board of Directors of the Metropolitan Water District of Southern California ("MWD"), Southern California's water wholesaler, declared a Water Shortage Emergency Condition for areas that depend on the State Water Project. MWD's Board voted unanimously to adopt a framework for an Emergency Water Conservation Program which requires local water suppliers, like FWC, to adopt one of two approaches to reduce water use; either (1) limit outdoor watering once per week, or (2) comply with monthly water allocation limits.

In addition to MWD's declaration and in response to the governor's call to action, on May 24, 2022 the State Water Resources Control Board ("SWRCB") adopted an Emergency Regulation to remain in effect for one year unless it is determined that drought conditions no longer persist or unless the regulation is renewed by the SWRCB. This regulation calls on each local water supplier to implement a Shortage Level 2 (ten to twenty percent) from its Water Supply Contingency Plan by June 10, 2022. The Regulation also bans use of potable water to irrigate turf on commercial, industrial, or institutional properties that is not regularly used for human recreational purposes or for civic or community events.

20

Comment No. 19 – Page 4.19-10 – Local, Goal IU-1

DEIR: Water Supply. Water supply and infrastructure are sufficient for the needs of residents and businesses and resilient to drought.

FWC: This statement is not correct, that existing water infrastructure is sufficient. The Project requires new water infrastructure to be constructed. The proposed new water infrastructure that is required to be constructed for the Project will be designed to have a sufficient capacity to meet the demands of residents and businesses and improve drought resiliency.

21

Comment No. 20 – Page 4.19-12 – Section 4.19.5 Impacts and Mitigation Measures – Construction and Operations – Second Paragraph

DEIR: Localized utility infrastructure and facilities would be extended and upgraded as needed during construction of the Project to serve the anticipated demands and to accommodate operation of the high cube logistics, e-commerce, and ancillary commercial facilities.

22

5

FWC: The statement is correct that the Project would construct new utilities and infrastructure, yet this statement contradicts the other passages that state that existing infrastructure is sufficient. Please rectify other statements to mention the need to construct new infrastructure to serve the development. 22

Comment No. 21 – Page 4.19-13 – Water – First Paragraph

DEIR: The WSA created for the Project concluded that the Project would generate a potable water demand of 596 AFY and a recycled water demand of 570 AFY, which would be accommodated by FWC based on its existing water supply projections without the construction of new or expanded facilities. 23

FWC: The Project states that water is to be supplied without the need to construct new or expanded facilities. The Project does require construction of new and expanded facilities, including new water production, storage, and distribution infrastructure facilities.

Comment No. 22 – Page 4.19-15 – Construction and Operations – Second Paragraph

DEIR: Water use on the Project site may involve the use of existing recycled water infrastructure, further reducing potable water demand. 24

FWC: To save precious potable water supplies and comply with the 2022 SWRCB Emergency Regulation, FWC strongly encourages customers to utilize recycled water for outdoor irrigation. There are no irrigation limitations for the use of recycled water.

Comment No. 23 – Page 4.19-16 – Under the heading Mitigation Measures, regarding Impact 4.19-2 – Last Sentence

DEIR: Since these water demands have been incorporated and accounted for, and do not directly necessitate the further development of water infrastructure, a less than significant impact would occur. 25

FWC: The statement that water demands for the Project do not necessitate the further development of water infrastructure needs to be corrected to indicate that new water production, storage, and distribution infrastructure facilities are required to be constructed to meet the Project's water demand.

Comment No. 24 – Page 4.19-19 – References

FWC: In the references section, the Water Supply Assessment prepared by Stetson Engineers and the Hydraulic Assessment prepared by Civiltec Engineers need to be included. 26

Comment No. 25 – Page 4.20-3 – Regulatory Setting

FWC: General Order 103 shall be referenced because it requires that water infrastructure facilities for new or expanded portions of the water system be designed to meet the fire flow demand for the Project. The new water infrastructure to be designed for the Project will mitigate the deficiency in FWC's water system to deliver water to meet the fire suppression demand and will comply with General Order 103. 27

Comment No. 26 – Page 6-14 – Project Alternative 2 Comparison to the Project

DEIR: An evaluation of the potential environmental impacts of the Reduced Footprint Alternative, as compared to those of the Project, is provided below.

FWC: The reduced footprint alternative would also require new water production, storage, and distribution infrastructure facilities.

28

Comment No. 27 – Page 6-29 – Utilities and Service Systems

DEIR: Both this Alternative and the Project would result in an increased demand for utilities. This Alternative's demands for services including natural gas, electricity, water, wastewater treatment, and solid waste disposal are anticipated to be greater than that of the Project. Existing utilities would be extended and upgraded as needed during construction of the Project and this Alternative to serve the anticipated demands and to accommodate operation of each. While the Project and this Alternative would increase the overall demand for services, adequate capacity to serve this Alternative and the Project is anticipated. Project impacts to utilities and service systems would be less than significant in compliance with existing laws, ordinances, regulations, and standards. No additional unmitigated impacts to utilities and service systems including, electricity, natural gas, sewer, water, and telecommunications infrastructure, are anticipated to occur. It is anticipated that the Alternative would tie into existing utility lines within close proximity to the Project site.

FWC: This alternative would result in the need for new water production, storage, and distribution infrastructure facilities.

Responses to Comment Letter L3 – San Gabriel Valley Water Company

L3-1 Comment noted. The commenter provides a general introduction of the San Gabriel Valley Water Company and background information as well as a summary of the Project. The County appreciates and values these comments during the EIR participation process. Responses to specific comments are provided below; no further response is required.

L3-2 The commenter discussed the WSA completed by FWC and adds that the Draft EIR needs to state that additional potable water infrastructure will be required to provide water service to the Project. Revisions to the EIR and responses based on the updated WSA are discussed in greater detail below.

L3-3 The commenter emphasizes that although the Draft EIR accurately indicates that there are available water supplies, the Draft EIR inaccurately indicates that there is available water infrastructure to supply the Project. The commenter correctly states that Objective 5 of the Draft EIR applies to necessary utility improvements required for redevelopment of a site, including water lines, drainage improvements, and site-specific utility infrastructure. The EIR concludes multiple times that additional infrastructure is required for Project implementation. For example, Draft EIR *Section 4.19, Utilities and Service Systems*, pages 4.19-12 to 4.19-13 state "Localized utility infrastructure and facilities would be extended and upgraded as needed during construction of the Project to serve the anticipated demands and to accommodate operation of the high-cube logistics, e-commerce, and ancillary commercial facilities. All required improvements to existing water/wastewater, electrical, natural gas, or telecommunications utilities are anticipated to occur within the Project boundary and the adjacent existing public right-of-way (ROW)."

Draft EIR text from page 3-31, subsection Water supply, has been revised in Final EIR *Section 3.0, Errata* to state that The need for a new backbone main in Cherry Avenue was also identified as was new water production, storage, and distribution infrastructure. Although there are existing mains in the vicinity of the Project, both potable and recycled water, FWC's water system requires capacity improvements in order to meet the potable and recycled water demands for the Project. FWC also has a 16-inch waterline and rights of way that exist within the Project area that are required to be abandoned and relocated. These improvements would generally occur within the existing improved rights-of-way on Cherry Avenue which is generally improved or built out. Therefore, minimal impacts to biological resources, cultural resources, and air quality or GHG would occur. All relevant mitigation measures identified in this EIR would apply to the construction of any off-site water/wastewater improvements by the Project.

Draft EIR text from page 4.19-13 regarding Water has been revised in Final EIR *Section 3.0, Errata* to state that potable and recycled water (if available) would be conveyed throughout the Project site via new water lines beneath Streets "A," "B," "C," and "D." And that the new infrastructure would include fire flow, domestic, and irrigation. The impact area for new on-site infrastructure falls within the footprint of the proposed Project, for which impacts are assessed in Draft EIR *Sections 4.1* through *4.20*. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

Page 4.19-15 of the Draft EIR states that "the Project would construct new public roads, utilities, and infrastructure that would serve both the Project and the Next Gen Project, as well as relocate the existing water service connection to the ACS to a new location for the Next Gen Project." Additionally, the same page of the Draft EIR states that "the use of existing recycled waterlines along Napa Street and the installation of additional recycled water facilities within proposed Streets "A," "B," "C," and "D" would occur."

Lastly, the commenter broadly states that "Many statements are made throughout the report that claim that existing water infrastructure is sufficient to provide necessary water supply and service the Project" without identifying specific locations. Where the commenter alludes to these instances in the following comments, appropriate edits shall be made in Final EIR *Section 3.0, Errata*. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-4 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 3.0, Project Description* to clarify that the existing domestic and recycled water provider shall be FWC, rather than IEUA and FWC. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-5 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 3.0, Project Description* to state "Rialto-Colton Basin" as a water supply source in lieu of "No Man's Land." The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-6 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 3.0, Project Description* to clarify the required use of recycled water per the SWRCB May 23, 2022 Emergency Order, which states that the use of potable water for irrigating Non-Functional Turf ("NFT") is prohibited making recycled water even more ideal for irrigations sources. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-7 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 3.0, Project Description* to provide correct pipe diameter, (changing the diameter from 18 inches to 16 inches), for the existing waterline that runs through the Project site, connecting existing water facilities in Napa Street to Cherry Avenue. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-8 The Draft EIR document was written based on the baseline information available at the time of NOP release. The language referenced within this comment has been included within *Section 3.0, Errata* of this Final EIR to provide an updated description of expected connections to existing infrastructure as follows: The need for a new backbone main in Cherry Avenue was also identified as was new water production, storage, and distribution infrastructure. Although there are existing mains in the vicinity of the Project, both potable and recycled water, FWC's water system requires

capacity improvements in order to meet the potable and recycled water demands for the Project. FWC also has a 16-inch waterline and rights-of-way that exist within the Project area that are required to be abandoned and relocated.

L3-9 See Response L3-5.

L3-10 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 3.0, Project Description* to omit the referenced statement that "The Project site would tie into existing utility lines within the existing roadways and rights-of-way adjacent to the site" and to clarify that a new transmission main will be constructed within Cherry Avenue that will support exiting mains. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-11 The commenter states that emissions and GHG estimates resulting from the construction of the Project might need to be revisited. See Response L3-8. As described in Response L3-8, emissions associated with off-site improvements were considered in the Air Quality analysis and therefore no further response is necessary.

L3-12 The commenter states that emissions and GHG estimates resulting from the construction of the Project might need to be revisited. See Response L3-8.

L3-13 See Response L3-5.

L3-14 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.10, Hydrology and Water Quality* to clarify the required use of recycled water as follows: In accordance with the SWRCB Emergency Order published in May 2022, the use of potable water for landscaped areas will be prohibited. Therefore, new recycled water facilities would be installed in the backbone streets (Streets "A," "B," "C," and "D"), shown in SCCIISP Figure 3-17: Conceptual Recycled Water Plan to provide irrigation water for the Project area. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-15 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service Systems*, *Tables 4.19-1: Potable Water Demand by Land Use* and *4.19-2: Water Demand Projections by Land Use* to include the appropriate demand unit, which is acre-fee per year (AFY). The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-16 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19,* Utilities *and Service Systems*, *Table 4.19-3: Normal Year Water Supplies* to include correct total water supply for year 2025 from 40,446 AFY to 45,593 AFY, and include the appropriate demand unit, which is AFY. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-17 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service* Systems to include updated partnership with SBVMWD as follows: Due to FWC's recent agreement with SBVMWD, FWC anticipates the importation of

approximately 3,650 AFY of imported water from SBVMWD by 2025. Additional water may be purchased from SBVMWD, if available, at a higher rate. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-18 Page 6-15 of the FWC UWMP notes that IEUA is the recycled water provider for the FWC service area as well as stating that RP-4 provides recycled water to the area. However, the language referenced within this comment will be revised within *Section 3.0* of this Final EIR to clarify FWC as the source of recycled water. As it pertains specifically to this comment a statement was added to *Section 4.19*, to clarify that FWC is the service provider for the direct use of recycled water for irrigation and any applicable industrial/commercial uses. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-19 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service Systems* to include additional regulatory framework from the CPUC General Order 103 and California Water Code Sections 64554: New and Existing Source Capacity and 64572: Water Main Separation. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-20 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service Systems* to include suggested State regulatory subsection for Additional Drought Actions and Regulations. As requested, provided text has been incorporated into the Errata. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-21 Commenter is referring to text associated with Goal IU-1 from the Countywide Plan's Policy Plan which states: Water supply and infrastructure are sufficient for the needs of residents and businesses and are resilient to drought.[1] Text in the Draft EIR is presented accurately, as derived from the Policy Plan. No change made.

L3-22 See Response L3-3.

L3-23 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service Systems* to state that the Project would require construction of new and expanded facilities, including new water production, storage, and distribution infrastructure facilities. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-24 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service Systems* to clarify the required use of recycled water. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

[1] https://countywideplan.com/policy-plan/infrastructure-utilities/

L3-25 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service Systems* to clarify this statement by omitting text that the Project would not necessitate development of water infrastructure. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-26 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.19, Utilities and Service Systems* to update the references to include the Water Supply Assessment prepared by Stetson Engineers and the Hydraulic Assessment prepared by Civiltec Engineers. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-27 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.20, Wildfire* to include additional regulatory framework from General Order 103. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-28 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 6.0, Alternatives*, Reduced Footprint Alternative to update Utilities and Service Systems discussion to note this alternative would also require new water production, storage, and distribution infrastructure facilities. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

L3-29 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 6.0, Alternatives*, Commercial Project Alternative to update Utilities and Service Systems discussion to note this alternative would also require new water production, storage, and distribution infrastructure facilities. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

Yuhaaviatam of San Manuel Nation (T2)

From: Ryan Nordness <Ryan.Nordness@sanmanuel-nsn.gov>
Sent: Wednesday, June 29, 2022 3:54 PM
To: Valdez, Steven <Steven.Valdez@lus.sbcounty.gov>
Subject: CEQA response for Speedway Commerce Center II Specific Plan,

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Thank you for contacting the Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians) regarding the above referenced project. YSMN appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on June 1st 2022, pursuant to CEQA (as amended, 2015) and CA PRC 21080.3.1. The proposed project area exists within Serrano ancestral territory and, therefore, is of interest to the Tribe. However, due to the nature and location of the proposed project, and given the CRM Department's present state of knowledge, YSMN does not have any concerns with the project's implementation, as planned, at this time. As a result, YSMN requests that the following language be made a part of the project/permit/plan conditions: 1

CUL MMs

1. In the event that cultural resources are discovered during project activities, all work in the immediate vicinity of the find (within a 60-foot buffer) shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be hired to assess the find. Work on the other portions of the project outside of the buffered area may continue during this assessment period. Additionally, the Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted, as detailed within TCR-1, regarding any pre-contact and/or historic-era finds and be provided information after the archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regards to significance and treatment.

2. If significant pre-contact and/or historic-era cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to YSMN for review and comment, as detailed within TCR-1. The archaeologist shall monitor the remainder of the project and implement the Plan accordingly.

3. If human remains or funerary objects are encountered during any activities associated with the project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code enforced for the duration of the project.

2

TCR MMs

1. The Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted, as detailed in CR-1, of any pre-contact and/or historic-era cultural resources discovered during project implementation, and be provided information regarding the nature of the find, so as to provide Tribal input with regards to significance and treatment. Should the find be deemed significant, as defined by CEQA (as amended, 2015), a cultural resources Monitoring and Treatment Plan shall be created by the archaeologist, in coordination with YSMN, and all subsequent finds shall be subject to this Plan. This Plan shall allow for a monitor to be present that represents YSMN for the remainder of the project, should YSMN elect to place a monitor on-site. 3

2. Any and all archaeological/cultural documents created as a part of the project (isolate records, site records, survey reports, testing reports, etc.) shall be supplied to the applicant and Lead Agency for dissemination to YSMN. The Lead Agency and/or applicant shall, in good faith, consult with YSMN throughout the life of the project.

Note: Yuhaaviatam of San Manuel Nation realizes that there may be additional tribes claiming cultural affiliation to the area; however, Yuhaaviatam of San Manuel Nation can only speak for itself. The Tribe has no objection if the agency, developer, and/or archaeologist wishes to consult with other tribes in addition to YSMN and if the Lead Agency wishes to revise the conditions to recognize additional tribes.

3

Please provide the final copy of the project/permit/plan conditions so that YSMN may review the included language. This communication concludes YSMN's input on this project, at this time, and no additional consultation pursuant to CEQA is required unless there is an unanticipated discovery of cultural resources during project implementation. If you should have any further questions with regard to this matter, please do not hesitate to contact me at your convenience, as I will be your Point of Contact (POC) for YSMN with respect to this project.

Respectfully,
Ryan Nordness

Response to Comment Letter T2 – Yuhaaviatam of San Manuel Nation

T2-1 Comment noted. The commenter provides general introductory of Yuhaaviatom of San Manuel Nation and background information as well as a summary of the Project. The County appreciates and values these comments during the EIR participation process. No further response is required.

Assembly Bill 52 coordination was conducted with the Yuhaaviatom of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians) on February 22, 2022. Response from the Tribe was received February 25, 2022. The Tribe did not have concerns with the Project's implementation and requested that provided mitigation measures be made part of the Project/permit/plan conditions. These same measures were included in the Tribe's response to the NOA for the Draft EIR, and have been incorporated, with requested minor edits, into the Project in Final EIR *Section 3.0, Errata*.

T2-2 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.5, Cultural Resources*. These edits revise and clarify the mitigation measures (MM) and to add the 60-foot buffer as requested. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

T2-3 *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, including revisions to Draft EIR *Section 4.18, Tribal Cultural Resources*. These edits revise and clarify MM CR-1. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

T2-4 The commenter's request for continued communications regarding entitlement documents and permits associated with the Project is noted and any Project notices will be provided. As is the commenter's conclusion of the formal consultation process, barring any unanticipated discoveries.

Re: Request for Mailed Notice of Actions and Hearings – Speedway Commerce Center II Specific Plan (Project No. PROJ-2021-000150; SCH No. 2021120259)

Dear Mr. Doublet, Ms. Monell, and Mr. Valdez:

We are writing on behalf of Californians Allied for a Responsible Economy ("CARE CA") to request mailed notice of the availability of any environmental review document, prepared pursuant to the California Environmental Quality Act, related to the Speedway Commerce Center II Specific Plan (Project No. PROJ-2021-000150; SCH No. 2021120259) ("Project"), proposed by Kimley-Horn & Associates, Inc, as well as a copy of the environmental review document when it is made available for public review. 1

The Project consists of the development of six separate planning areas with up to 6.6 million square feet (sf) of high-cube logistics and e-commerce uses with 261,360 sf of ancillary commercial uses, and approximately 98 acres of parking fields/drop lot areas as well as ancillary open space to support the Project. The Project site would also be developed with greenbelts, public roads, other support amenity features, and water detention areas. The Project would surround the future Next Gen motorsports facility ("Next Gen in California Project"), which was 2

6192-001acp

printed on recycled paper

approved by the County of San Bernardino in June 2021 and is proposed to be developed on approximately 90 acres of the existing the Auto Club Speedway (ACS) site. The Project site is located in an unincorporated portion of Southwestern San Bernardino County within the City of Fontana Sphere of Influence (SOI). The Project site consists of ten parcels (Assessor Parcel Numbers [APNs] 0231-011-09, 0231-011-10, 0231-011-11, 0231-011-12, 0231-111-06, 0231-111-10, 0231-111-17, 0231-111-18, 0231-111-19, and 0231-111-20). 2

We also request mailed notice of any and all hearings and/or actions related to the Project. These requests are made pursuant to Public Resources Code Sections 21092.2, 21080.4, 21083.9, 21092, 21108, 21152, 21167(f), and Government Code Section 65092, which require local agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

Please send the above requested items by email and U.S. Mail to our South San Francisco Office as follows:

Response to Comment Letter O1 – Adams Broadwell Joseph & Cardozo

O1-1 Comment noted. The commenter provides general introductory information and requests project information when available. This commenter's request for project information is noted for the record. The County will coordinate to ensure that publicly available information is provided.

O1-2 The comment provides a general description of the Project. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O1-3 The comment requests that all notices of public hearing be sent and provides a contact name and address. When appropriate, plans will be provided to the commenter for review and noticing will be provided in instances of future updates to the Project or environmental documentation. The commenters provided contacts are noted for the record.

Re: Request for Immediate Access to Public Records - Speedway Commerce Center II Specific Plan (Project No. PROJ-2021-000150; SCH No. 2021120259)

Dear Mr. Doublet, Ms. Monell, and Mr. Valdez:

We are writing on behalf of Californians Allied for a Responsible Economy ("CARE CA") to request ***immediate access*** to any and all public records referring or related to the Speedway Commerce Center II Specific Plan (Project No. PROJ-2021-000150; SCH No. 2021120259) ("Project"), proposed by Kimley-Horn & Associates, Inc. This request includes, but is not limited to, any and all materials, applications, correspondence, resolutions, memos, notes, analyses, electronic mail messages, files, maps, charts, and/or any other documents related to the Project. This request *does not include* the Draft Environmental Impact Report ("DEIR") or documents referenced or relied upon in the DEIR, which we have requested in a separate letter pursuant to the California Environmental Quality Act. 1

The Project consists of the development of six separate planning areas with up to 6.6 million square feet (sf) of high-cube logistics and e-commerce uses with 2

6192-003acp

printed on recycled paper

261,360 sf of ancillary commercial uses, and approximately 98 acres of parking fields/drop lot areas as well as ancillary open space to support the Project. The Project site would also be developed with greenbelts, public roads, other support amenity features, and water detention areas. The Project would surround the future Next Gen motorsports facility ("Next Gen in California Project"), which was approved by the County of San Bernardino in June 2021 and is proposed to be developed on approximately 90 acres of the existing the Auto Club Speedway (ACS) site. The Project site is located in an unincorporated portion of Southwestern San Bernardino County within the City of Fontana Sphere of Influence (SOI). The Project site consists of ten parcels (Assessor Parcel Numbers [APNs] 0231-011-09, 0231-011-10, 0231-011-11, 0231-011-12, 0231-111-06, 0231-111-10, 0231-111-17, 0231-111-18, 0231-111-19, and 0231-111-20). 2

This request is made pursuant to the California Public Records Act, Government Code §§ 6250, *et seq*. This request is also made pursuant to Article I, section 3(b) of the California Constitution, which provides a constitutional right of access to information concerning the conduct of government. Article I, section 3(b) provides that any statutory right to information shall be broadly construed to provide the greatest access to government information and further requires that any statute that limits the right of access to information shall be narrowly construed.

We request ***immediate access*** to review the above documents pursuant to section 6253(a) of the Public Records Act, which requires public records to be "open to inspection at all times during the office hours of the state or local agency" and provides that "every person has a right to inspect any public record." Gov. Code § 6253(a). Therefore, the 10-day response period applicable to a "request for a copy of records" under Section 6253(c) does not apply to this request. 3

I will be contacting you to arrange for the review/duplication/transmission of the requested records soon. In the interim, if you have any questions or concerns regarding this request, my contact information is:

Response to Comment Letter O2 – Adams Broadwell Joseph & Cardozo

O2-1 Comment noted. The commenter is requesting access to all public records related to the Project, excluding the Draft EIR and supporting documents related to the Draft EIR requested in a prior letter. The County will continue to coordinate with the commenter to ensure that publicly available information is provided.

O2-2 The comment provides a general description of the Project. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O2-3 The commenter is requesting access to all public records related to the Project. Please see Response to Comment O2-1.

Re: Comments on the Draft Environmental Impact Report - Speedway Commerce Center II Specific Plan Project (PROJ-2021-00150, SCH No. 2021120259)

Dear Mr. Valdez:

We are writing on behalf of Californians Allied for a Responsible Economy ("CARECA"), to provide comments on the Draft Environmental Impact Report ("DEIR") prepared by the County of San Bernardino ("County") for the Speedway Commerce Center II Specific Plan Project ("Project") proposed by Candyce Burnett of Kimley Horn & Associates, Inc. ("Applicant"). 1

The Project proposes to develop 6,600,000 square feet of a mix of high cube and e-commerce warehousing, approximately 261,369 square feet of accessory commercial uses, and approximately 98 acres of vehicle parking/drop lot areas and associated open space and internal public roadways. The approximately 433-acre Project site is within the 522-acre site currently developed with the Auto Club Speedway ("ACS"), formerly known as the California Speedway. The Project site is located at 9300 Cherry Avenue, Fontana California 92335 between Arrow Boulevard and San Bernardino Avenue in the unincorporated portion of San Bernardino County within the City of Fontana Sphere of Influence. The Project site comprises ten Assessor Parcel Numbers (APNs) 0231-011-09, 0231-011-10, 0231-011-11, 0231-011-12, 0231-111-06, 0231-111-10, and 0231-111-17, 0231-111-18, 0231-111-19, and 0231-111-20. 2

printed on recycled paper

The Project requires a new Specific Plan (PROJ-2021-00150), Tentative Parcel Map (TPM-20478), a Development Agreement, and a Revision to an Approved Action (PRAA-2020-00150) to amend the existing Planning Development Permit for the existing ACS to remove from its coverage 433 acres of the ACS site that will be governed by the new Specific Plan.[1] The Project site is currently zoned Special Development Commercial (SD-Com).[2] San Bernardino County Municipal Code Section 82.01.020 defines Special Development land use zoning districts as areas which allow for a combination of residential, commercial, industrial, agricultural, open space and recreation uses, and similar and compatible uses.[3] Project construction would occur over four phases: Phase 1a would commence in 2023 with a 12-month duration; Phase 1b would commence in 2024 with a 12-month duration; Phase 2 would commence in 2025 with a 12-month duration; and construction of the Commercial Parcel would commence in 2026 with an 11-month duration.[4]

2

We have conducted our review of the DEIR with the assistance of our technical consultants, air quality and hazardous resources expert James J. Clark, Ph.D., traffic and transportation expert Daniel T. Smith, Jr., M.S, and acoustics expert Derek Watry, M.S.[5] The County must separately respond to these technical comments.

Based upon our review of the DEIR and supporting documentation, we conclude that the DEIR fails to comply with the requirements of CEQA. As explained more fully below, the DEIR fails to provide an accurate Project description and environmental baseline upon which to measure the whole Project's reasonably foreseeable impacts. The consequences of these defects are far-reaching and require the revision of the DEIR. The DEIR does not accurately disclose potentially significant air quality, GHG, soil contamination, noise, and transportation impacts. As a result of its shortcomings, the DEIR lacks substantial evidence to support its conclusions and fails to properly mitigate the Project's significant environmental impacts. Further, the Project does not comport with the San Bernardino Countywide Plan ("Countywide Plan") which serves as the County's General Plan or the Countywide Plan's Draft Environmental Impact Report. The County cannot approve the Project until the errors and omissions in the DEIR are remedied, and a revised DEIR is recirculated for public review and comment which

fully discloses and mitigates the Project's potentially significant environmental and public health impacts. 3

I. STATEMENT OF INTEREST

CARECA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental impacts of the Project. The coalition includes San Bernardino County residents Derek Brill, Nicholas Corrigan, Justin Dempsey, Anthony Diaz, the District Council of Ironworkers, Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in San Bernardino County.

CARECA advocates for protecting the environment and the health of their communities' workforces. CARECA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARECA members live, work, recreate, and raise their families in San Bernardino County and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite. 4

In addition, CARECA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

II. LEGAL BACKGROUND

CEQA has two basic purposes, neither of which the DEIR satisfies. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project.[6] CEQA requires that an agency analyze potentially significant environmental impacts in an EIR.[7] The EIR should 5

[6] CEQA Guidelines, § 15002, subd. (a)(1).
[7] *See* Pub. Resources Code, § 21000; CEQA Guidelines, § 15002.

printed on recycled paper

not rely on scientifically outdated information to assess the significance of impacts, and should result from "extensive research and information gathering," including consultation with state and federal agencies, local officials, and the interested public.[8] To be adequate, the EIR should evidence the lead agency's good faith effort at full disclosure.[9] The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return."[10] "Thus, the EIR protects not only the environment but also informed self-government."[11]

Second, CEQA directs public agencies to avoid or reduce environmental damage when possible by requiring alternatives or mitigation measures.[12] The EIR serves to provide public agencies and the public in general with information about the effect that a proposed project is likely to have on the environment and to "identify ways that environmental damage can be avoided or significantly reduced."[13] If a project has a significant effect on the environment, the agency may approve the project only upon a finding that it has "eliminated or substantially lessened all significant effects on the environment where feasible," and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns" specified in CEQA section 21081.[14]

5

As these comments will demonstrate, the DEIR fails to comply with the requirements of CEQA and may not be used as the basis for approving the Project. It fails in significant aspects to perform its function as an informational document that is meant "to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment" and "to list ways in which the significant effects of such a project might be minimized."[15]

The use of inaccurate and flawed information on which the DEIR bases its conclusions results in underestimated Project impacts. This, in turn, leads to a failure to comply with CEQA's requirement that an agency mitigate "all significant environmental impacts to the greatest extent feasible, and that any remaining

[15] *Laurel Heights I, supra,* 47 Cal.3d at p. 391.

6192-004acp

printed on recycled paper

significant environmental impacts are acceptable due to overriding considerations."[16] Mitigation of impacts to the fullest extent feasible requires an agency to accurately quantify the severity of Project impacts, and because the DEIR's inadequate analyses underestimate the severity of the Project's impacts, the County has failed to comply with CEQA and cannot approve the Project based upon the DEIR's analyses and conclusions. Furthermore, the County's proposed findings that the Project's impacts are significant and unavoidable are unsupported because the Project does not consider mitigation measures which may adequately minimize Project impacts to the greatest extent feasible.

5

III. THE PROJECT DESCRIPTION IS INADEQUATE

The DEIR does not meet CEQA's requirements because it fails to include an accurate and complete Project description, rendering the entire analysis inadequate. California courts have repeatedly held that "an accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."[17] CEQA requires that a project be described with enough particularity that its impacts can be assessed.[18] Without a complete project description, the environmental analysis under CEQA is impermissibly limited, thus minimizing the project's impacts and undermining meaningful public review.[19] Accordingly, a lead agency may not hide behind its failure to obtain a complete and accurate project description.[20]

6

CEQA Guidelines section 15378 defines "project" to mean "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[21] "The term "project" refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term project does not mean each separate governmental approval."[22] Courts have explained that a complete description of a project must "address not only the immediate environmental consequences of going forward with the project,

but also all "*reasonably foreseeable* consequence[s] of the initial project."[23] "If a[n]…EIR…does not adequately apprise all interested parties of the true scope of the project for intelligent weighing of the environmental consequences of the project, informed decisionmaking cannot occur under CEQA and the final EIR is inadequate as a matter of law."[24]

6

A. The DEIR Fails to Identify Reasonably Foreseeable Uses of the Project Site

CEQA is concerned with a project's environmental impacts, regardless of who ultimately uses or operates a project.[25] However, courts have held that where the tenant or type of business is foreseeable and there is evidence that an impact unique to that tenant or type of business will result, an EIR must disclose that information.[26] An EIR must include an analysis of the environmental effects of a proposed future use or action at a project site if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects.[27]

7

Here, the Project is being developed for unknown future tenants, but for reasonably foreseeable future uses. The DEIR refers to "future development of high-cube logistics and e-commerce uses within the Project site."[28] These uses, as pointed out by CARB, can result in highly significant environmental impacts: "Freight facilities, such as warehouse and distribution facilities, can result in high daily volumes of heavy-duty diesel truck traffic and operation of on-site equipment (e.g., forklifts and yard tractors) that emit toxic diesel emissions, and contribute to regional air pollution and global climate change."[29] The impacts generated by the particular operations of different users within this broad category can also result in significant impacts. The adverse impacts generated by cold storage warehouses, for example, are far more severe than those from a high-cube warehouse without cold storage.[30] Warehouses with cold storage capabilities and the ability to accommodate refrigerated trucks, or Transport Refrigeration Units ("TRUs"),

[23] *Laurel Heights I,* 47 Cal. 3d 376, 398 (emphasis added); *see also Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal. 4th 412, 449-50.

6192-004acp

printed on recycled paper

require more truck trips per square foot and have higher energy demands due to the low temperatures required by the trucks, whose refrigeration units are most often powered by diesel internal combustion engines.[31]

Though the DEIR does not name the Project's specific end user tenants, the Project is being constructed to support warehouse, distribution, and cold storage uses. The DEIR's omission of information about the reasonably foreseeable operations at the Project site that could have significant impacts is similar to the EIR's omission of critical operational analysis in *Bakersfield Citizens for Local Control v. City of Bakersfield*. In *Bakersfield,* the court found that an EIR's simple statement that "no stores have been identified" for the subject shopping center "without disclosing the type of retailers envisioned for the proposed project is not only misleading and inaccurate, but it hints at mendacity."[32] Since the Project is being designed to be capable of supporting warehouse, distribution, and cold storage uses at the Project site, the DEIR must be revised to include that information and to analyze the impacts of the most intensive reasonably foreseeable uses of the Project site. The DEIR must also include all known information about the types of future users at the Project site. 7

Additionally, the DEIR notes that cold storage may be required. Cold storage warehouses require a constant energy supply to power their temperature-controlled facilities, for which they often rely on emergency backup generators.[33] Backup generators commonly rely on fuels such as natural gas or diesel,[34] and thus can significantly impact air quality, GHG emissions, and public health through toxic diesel particulate ("DPM") emissions.[35] In its NOP Comments, CARB noted that 8

6192-004acp

printed on recycled paper

the DEIR should account for "all potential health risks from Project-related diesel PM emission sources such as backup generators, TRUs, and heavy-duty truck traffic."[36] The DEIR lacks this discussion.

Since cold storage is a reasonably foreseeable use of the Project site, it is also reasonably foreseeable that the Project would require on-site backup generators.[37] The DEIR must disclose whether the Project will use generators and for how many hours a year, and analyze the impacts of their use on the environment and public health. The DEIR's failure to provide an accurate picture of the number of reasonably foreseeable hours required for backup generation further invalidates it as an informational document. As a result of these omissions, the DEIR's operational air quality, health risk, and truck trip analyses are not supported by substantial evidence and must be revised. 8

B. The DEIR Fails to Describe the Project's Lifespan

The DEIR does not disclose the expected lifespan of the Project. Such information is necessary to evaluate the impacts of the Project's operations on the environment. Per South Coast Air Quality Management District ("SCAQMD") recommendations, the DEIR assumes a 30-year Project life when conducting the GHG emissions analysis, but fails to provide elsewhere a Project-specific lifespan.[38] The courts have held that an EIR fails as an informational document when the project description is obscure as to the true scope of the project.[39] Here, the DEIR's failure to put forth a clear project description that is reflective of the Project's potential uses and lifespan violates CEQA.[40] 9

IV. THE DEIR FAILS TO ADEQUATELY ESTABLISH THE EXISTING BASELINE

CEQA requires that a lead agency include a description of the physical environmental conditions in the vicinity of the Project as they exist at the time environmental review commences.[41] As numerous courts have held, the impacts of 10

[41] CEQA Guidelines, § 15125, subd. (a).

6192-004acp

printed on recycled paper

a project must be measured against the "real conditions on the ground."[42] The description of the environmental setting constitutes the baseline physical conditions by which a lead agency may assess the significance of a project's impacts.[43] Use of the proper baseline is critical to a meaningful assessment of a project's environmental impacts.[44] An agency's failure to adequately describe the existing setting contravenes the fundamental purpose of the environmental review process, which is to determine whether there is a potentially substantial, adverse change compared to the existing setting.

Baseline information on which a lead agency relies must be supported by substantial evidence.[45] The CEQA Guidelines define "substantial evidence" as "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion."[46] "Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts ... [U]nsubstantiated opinion or narrative [and] evidence which is clearly inaccurate or erroneous ... is not substantial evidence."[47]

10

A. The DEIR's Baseline Vehicle Speed Surrounding the Project Site Are Underestimated and Unsupported

The California Supreme Court, in *Communities for a Better Environment v. South Coast Air Quality Management District* ("*CBE v. SCAQMD*"),[48] recognized that "the baseline 'normally' consists of 'the physical environmental conditions in the vicinity of the project, as they exist at the time ... environmental analysis is commenced....'"[49] An approach using hypothetical conditions as the baseline, results in "illusory" comparisons that "can only mislead the public as to the reality of the

6192-004acp

printed on recycled paper

impacts and subvert full consideration of the actual environmental impacts," a result which contravenes CEQA's intent.[50]

Here, the DEIR provides an inadequate baseline associated with traffic speeds surrounding the Project area. This results in underestimated air quality modeling because higher speeds results in lower localized emissions. An adequate baseline shows a lower traffic speed resulting in a significantly higher air quality impact which results in a potentially significant impact under CEQA. The DEIR relies on a baseline vehicle speed of 15 miles per hour[51], but a slower speed on unpaved roads will be utilized as mitigation for construction, and would result in higher localized air emissions. 11

V. THE DEIR FAILS TO ADEQUATELY DISCLOSE AND MITIGATE POTENTIALLY SIGNIFICANT AIR QUALITY IMPACTS

An EIR must fully disclose all potentially significant impacts of a project, and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact must be supported by accurate scientific and factual data.[52] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[53] 12

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by CEQA.[54] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[55] In reviewing challenges to an agency's approval of an EIR based on a lack of substantial evidence, the court will "determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements."[56] Even when the substantial evidence standard is applicable to agency decisions to certify

an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[57] 12

The California Air Resources Board ("CARB") stated that the Project will expose nearby communities to elevated levels of air pollution.[58] Numerous residences are within 1,550 feet of the Project.[59] Additionally, Live Oak Elementary School, Beech Avenue Elementary School, Redwood Elementary School and Almond Elementary School are located within one mile of the Project.[60] "Due to the Project's proximity to residences and schools already burdened by multiple sources of air pollution, CARB is concerned with the potential cumulative health impacts associated with the construction and operation of the Project."[61] CARB recommended that the DEIR quantify and discuss the Project's air quality impacts associated with Project construction and operation but these concerns were not adequately addressed in the DEIR. 13

A. The DEIR Fails to Adequately Analyze the Project's Construction and Operation Air Quality Impacts

Diesel particulate matter emissions associated with the use of the Emergency Backup Generator during project operation are significant and unmitigated. The DEIR incorrectly assumes the use of the Emergency Backup Generator for only 50 hours per year.[62] According to commenters' air quality consultant, it is more likely that the Backup Generator would need to be used more than 150 hours per year, due to increasing Public Safety Power Shutoff ("PSPS") events and extreme heat events.[63] 14

During a PSPS event, the use of stationary generators is permitted as an emergency use.[64] For every PSPS or extreme heat event, significant diesel particulate matter ("DPM") will be released. DPM has been identified as a toxic air

6192-004acp

printed on recycled paper

contaminant, composed of carbon particles and numerous organic compounds, including forty known cancer-causing organic substances.[65] Dr. Clark notes that the California Air Resources Board found that the 1,810 additional stationary generators during a PSPS in October 2019 generated 126 tons of NOx, 8.3 tons or particulate matter, and 8.3 tons of DPM.[66] Dr. Clark therefore determined that the air quality and DPM emission impacts associated with the use of the Backup Generator are significant, but the DEIR fails to adequately analyze or mitigate such impacts.[67] The failure to analyze is a failure to proceed in a manner required by law. The DEIR must be revised and recirculated to adequately analyze impacts associated with DPM emissions from the Backup Generator. 14

Additionally, the County failed to follow SCAQMD guidance by utilizing a less conservative average daily trip vehicle trip rate. This results in an incorrectly reduced operational emissions analysis. Dr. Clark asserts that the value used to justify the number of vehicle trips per day utilized by the County is not supportable and the higher rate of 1.68 daily vehicle trips per 1,000 GSF recommended by SCAQMD is more appropriate for this project.[68] The analysis used by the County in the DEIR is not supported by substantial evidence. Dr. Clark finds that the value used by the County is not supported by evidence in the record and the higher rate of 1.68 daily vehicle trips per 1,000 GSF recommended by SCAQMD is the correct value. The DEIR must be revised and recirculated to reflect an accurate daily vehicle trip rate and operational emissions analysis in order to satisfy CEQA. 15

B. The DEIR Fails to Adequately Mitigate the Project's Construction and Operation Air Quality Impacts

An EIR must describe feasible measures which could minimize significant adverse impacts and which "must be fully enforceable through permit conditions, agreements, or other legally binding instruments."[69] CEQA defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors."[70] When weighing the costs of a project's adverse environmental effects against its social, economic, legal, or technological benefits, an agency must make detailed findings regarding each project impact and available mitigation measures, including those proposed by project proponents, agencies, and the public that could 16

6192-004acp

printed on recycled paper

reasonably be expected to reduce adverse impacts.[71] Here, the mitigation measures proposed by CARB and Dr. James Clark below are feasible mitigation which may reduce the Project's significant impacts. 16

The DEIR incorrectly assumes that operational Nitrogen Oxides ("NOx") emissions cannot feasibly be mitigated. But, Dr. Clark offers additional, feasible mitigation which may effectively reduce operational NOx emissions to less than significant levels.[72] Some mitigation measures were also recommended by the California Air Resources Board to further reduce the Project's air emissions, but were not included in the DEIR as binding mitigation, only as project design features ("PDFs"), rendering them unenforceable. 17

CARB recommended that the Project "Include contractual language in tenant lease agreements that requires tenants to use the cleanest technologies available, and to provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating on site."[73] The DEIR disregarded this measure for the beginning stages of Project operation, and only requires zero-emission heavy duty trucks "beginning in 2030, if such trucks are widely available and economically feasible."[74] Th measure included in the DEIR is not adequate to reduce the Project's air quality and energy impacts to less than significant levels, and is inadequate as a project design feature because it should have been included in the DEIR as binding mitigation.

The DEIR contains several other PDFs which are intended to reduce the Project's air quality impacts. These measures are therefore mitigation, not design features, and must be included in the EIR's mitigation plan as binding mitigation. PDF AQ-9 attempts to address the Project's significant emissions from mobile sources, particularly heavy-duty trucks, by requiring all heavy-duty trucks entering or operated on the Project site to be zero-emission beginning in 2030.[75] PDF AQ-10 also provides that the light- and medium-duty trucks used as part of business operations shall be zero-emission.[76] PDF AQ-15 provides that the Applicant will include contractual language in tenant lease agreements that requires the tenant be in, and monitor compliance with, all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, 18

Periodic Smoke Inspection Program (PSIP), SCAQMD Rule 2305 (Warehouse Indirect Source Rule) and the Statewide Truck and Bus Regulation.[77]

Including mitigation as project design features is a violation of CEQA because the DEIR's air quality analysis assumes implementation of these mitigation measures in its underlying emissions calculations, thus failing to disclose the severity of the Project's air quality impacts prior to mitigation, as required by CEQA.

The court in *Lotus v. Department of Transportation* held that "[b]y compressing the analysis of impacts and mitigation measures into a single issue, the EIR disregards the requirements of CEQA.[78] The court in *Lotus* held the EIR in that case was inadequate, because "[t]he DEIR also contains other measures that should be listed as mitigation but which will only be done at the discretion of the contractor. These need to be measurable and enforceable and listed as mitigations."[79]

CEQA defines mitigation as including any measures designed to avoid, minimize, rectify, reduce, or compensate for a significant impact.[80] The actions required under PDF AQ-9, PDF AQ-10, and PDF AQ-15 are included in the DEIR to reduce the Project's air pollution emissions, as recommended by CARB. But, these measures are not currently binding or enforceable. PDF AQ-9, PDF AQ-10, and PDF AQ-15 must be included in the DEIR as a mitigation measure because they are intended to reduce the Project's significant air quality impacts. PDF AQ-9, PDF AQ-10, and PDF AQ-15 are not designed to simply modify a physical element of the Project, as is inherent in any project "design feature," but instead are included for the purpose of reducing the Project's significant air quality impacts. This makes PDF AQ-9, AQ-10, and PDF AQ-15 mitigation measures within the meaning of CEQA. The DEIR must be revised and recirculated to include these measures as binding mitigation.

18

Additionally, CARB recommended installing vegetative walls or other effective barriers that separate loading docks and people living and working nearby.[81] A vegetative wall would provide an aesthetic, air pollution, and noise benefit to the surrounding community, but was excluded from the DEIR. CEQA directs public agencies to avoid or reduce environmental damage when possible by

6192-004acp

printed on recycled paper

requiring alternatives or mitigation measures.[82] Here, CARB and commenters recommend feasible mitigation in the form of vegetative walls to reduce Project impacts. Vegetative walls should be included in a revised DEIR as a binding mitigation measure. CARB also recommended restricting idling to two minutes.[83] But, the DEIR provides that "On-site idling shall be limited to three minutes in any one hour."[84] The DEIR also disregards CARB's recommendation that "all emergency generators [] be powered by a non-diesel fuel."[85] These measures are feasible mitigation, and must be included in a revised EIR.

19

CARB also recommended construction mitigation measures, that were largely disregarded by the County in preparation of the DEIR. CARB recommended that the construction contracts for the Project, include language that requires all heavy-duty trucks entering the construction site during the grading and building phases be model year 2014 or later.[86] But, the DEIR only provides that "Construction on-road haul trucks shall be model year 2010 or newer if diesel-fueled."[87] Dr. Clark concludes that changing the requirement to model year 2014 or later for all heavy-duty vehicles entering or operated on the project site would substantially reduce Project emissions are below SCAQMD thresholds.[88] Dr. Clark finds that changing the minimum allowable model year from 2010 to 2014 or 2018 would result in:

- 31% reduction in running NOx emissions (NOx RUNEX) from trucks operating on site if the vehicles were restricted to model year 2014 or later.
- A 44% reduction in running NOx emissions (NOx RUNEX) from trucks operating on site if the vehicles were restricted to model year 2018 or later.
- A 27.5% reduction in DPM emissions from trucks measured as PM2.5 operating on site (PM2.5 RUNEX) if the vehicles were restricted to model year 2014 or later.
- A 46.8% reduction in DPM emissions from trucks measured as PM2.5 operating on site (PM2.5 RUNEX) if the vehicles were restricted to model year 2018 or later.
- A 9.5% reduction in ROGs from trucks operating on site (ROG RUNEX) if the vehicles were restricted to model year 2014 or later.

6192-004acp

printed on recycled paper

- A 14.8% reduction in ROGs from trucks operating on site (ROG RUNEX) if the vehicles were restricted to model year 2018 or later.

The imposition of all feasible air quality mitigation for the Project is mandatory given that the DEIR concludes that the Project will result in significant air quality impacts due to exceedances of SCAQMD significance thresholds.[89] Yet, the DEIR fails to evaluate whether additional mitigation beyond a 2010 model year cut-off is feasible despite the substantial emission reductions from such a change and the feasibility of enforcing a revised cut-off date to 2014 or 2018 through the tenant agreement.[90] Accordingly, the County lacks substantial evidence to support the DEIR's conclusion that construction emissions are significant and unavoidable, and substantial evidence from CARB and Dr. Clark demonstrates that the DEIR has not proposed all feasible mitigation measures to minimize the Project's significant impacts on air quality and thus the DEIR is deficient. The DEIR must be revised and recirculated to include all feasible mitigation to reduce construction air emissions, including model year 2014 or 2018 or newer construction on-road diesel haul trucks. 20

VI. THE DEIR FAILS TO ADEQUATELY DISCLOSE AND MITIGATE POTENTIALLY SIGNIFICANT HEALTH RISK IMPACTS

A. The DEIR Fails to Analyze and Mitigate Significant Impacts Associated with Air Pollutant Dispersion

The DEIR fails to adequately analyze impacts associated with building downwash effect. Building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution from nearby stacks.[91] A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity.[92] This downwash effect leads to higher ground-level concentration of chemicals emitted from sources.[93] The downwash effect increases as the relative difference between the release height and top of the building increases. Dr. Clark concludes that, for the closest receptors to the site, the residences to the Project, this difference will create an additional air quality impact that is not accounted for in the County's analysis.[94] The NextGen Raceway will 21

printed on recycled paper

include grandstands with over 35,000 people that will be subject to significantly higher DPM emissions than was estimated in the DEIR. Additionally, the DEIR fails to analyze downwash impact for nearby receptors as well as farther away receptors. Dr. Clark finds receptors farther away will still be subject to the downwash effect given the assumed emission height release incorporated into the model.[95]

21

The DEIR's failure to analyze the downwash effect of DPM pollution underestimates the exposure point concentrations for receptors near the Project.[96] The County must prepare a revised EIR which adequately analyzes the impacts associated with downwash effect and adequately mitigates such potentially significant impacts.

B. The DEIR Fails to Analyze and Mitigate Impacts Associated with a Severe Urban Heat Island Effect

CEQA requires EIRs to analyze any significant environmental effects the project might cause or risk exacerbating by bringing development and people into the area affected.[97] Both CEQA and the CEQA Guidelines require an analysis of a project's effects on the environment and human health. CEQA also provides that the EIR should evaluate any potentially significant direct, indirect, or cumulative environmental impacts of locating development in areas susceptible to hazardous conditions, including both short-term and long-term conditions.[98] The DEIR fails to even mention the Project's risk of exacerbating the urban heat island effect, in violation of CEQA.

22

The California Environmental Protection Agency ("Cal EPA") concluded that large, urbanized areas can experience higher temperatures, greater pollution and more negative health impacts than rural communities due to the urban heat island effect.[99] The concentration of heat in urban areas creates health risks both because of heat exposure and because of the enhanced formulation of air pollutants,

particularly ozone.[100] Major increases in deaths, hospitalizations, and emergency room visits have been documented to occur during heat waves.[101] Increased hospital visits and emergency room visits have been documented in California from increased heat, including visits due to respiratory disease, emphysema, heart disease, heart attacks, stroke, diabetes, renal failure, intestinal infections, heat stroke, dehydration, hypertension, and asthma.[102] For every increase of temperature by 10 degrees Fahrenheit, there is a nearly 9 percent increase in preterm births.[103]

22

Cal EPA found that San Bernardino, in particular, suffers from a surprisingly intense urban heat island.[104] Additionally, at night time, as the heat is gradually released from the pavement, the urban heat island effect is even more pronounced.[105] Cal EPA found that nighttime temperatures can be as much as 22° F higher in urban areas than in rural areas, as the heat is gradually released from buildings and pavement.[106] Impacts associated with the urban heat island effect are only expected to worsen as time goes on, as statewide average temperatures increase due to climate change, see figure below.

printed on recycled paper

Table 2. Summary of Temperature Projections for California

Model	Findings
Hayhoe, et al.2004	Increase of 3°-5° F in state-wide average temperature by 2030s and up to 9° F for summer average by 2050s under high emission scenario
Drechsler, et al.2006	Summer daily maximum temperatures would increase by 2.2°–7.6° F by 2035–2065
Cayan, et al.2009	Increase in state-wide annual average temperature between 2.8°-10.8° F by end of century
Mastrandea, et al.2009	Extreme temperatures currently estimated to occur once every 100 years would occur annually under high emission scenario
Ostro, et al.2011	Statewide changes in annual average temperature of 1.9° F in 2025 and 4.6° F in 2050 would translate to 2,100 to 4,300 excess deaths in 2025 and 6,700 to 11,300 excess deaths in 2050.

[107]

22

According to data provided by CalEPA, the increase in temperature due to the heat island effect at the Project site would be 11 degrees Fahrenheit.[108] This is calculated through dividing the daily Urban Heat Island Index at the Project site of 156.46 by 24 hours, and multiply the result by 1.8 degrees equals 11.73 degrees Fahrenheit. [109] 11.73 degrees Fahrenheit is the increase in temperature at the Project site due to the urban heat island effect. The data show that the Project exacerbates the existing heat island effect, resulting in a higher temperature and more adverse health outcomes to the community. The Project risks exacerbating the heat island effect in the area and bringing people to the affected area, without providing any mitigation. This is a potentially significant impact of the Project that must be disclosed, analyzed and mitigated in a revised EIR.

C. The DEIR Fails to Analyze and Mitigate Impacts Arising from Disturbance of Contaminated Soil

23

In *Cal. Building Industry Ass'n v. Bay Area Air Quality Mgmt. Dist.*,[110] the California Supreme Court held that the disturbance of contaminated soil is a potentially significant impact which requires disclosure and analysis of health and safety impacts in an EIR.[111] The Court explained that "when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an

6192-004acp

printed on recycled paper

agency must analyze the potential impact of such hazards on future residents or users."[112]

Dr. Clark's comments provide substantial evidence that carcinogenic compounds including polycyclic aromatic hydrocarbons, arsenic, cadmium, and benzene may be found on the Project site.[113] The DEIR failed to include a Phase I or Phase II Environmental Site Assessment, and failed to analyze the full extent of the soil contamination onsite. Soil contaminants will be disturbed during excavation and construction, which will present a public health risk to construction workers working on the Project, and the public nearby.[114] This risk is a significant impact under CEQA.[115] The County must analyze and mitigate the health and safety risks arising from disturbing contaminants in the soil on the Project site. The County must also calculate the potential health risks associated with the exposure of nearby residents to mechanically disturbed soil and provide adequate mitigation for such exposure. The DEIR must be revised and recirculated to adequately address soil contamination associated with the Project site, and provide adequate mitigation to reduce the health risk associated with exposure.

23

VII. THE DEIR FAILS TO DISCLOSE AND MITIGATE POTENTIALLY SIGNIFICANT HAZARDS IMPACTS

A. The DEIR Fails to Analyze Remaining Contamination from the Kaiser Steel Mill

The Project Site is located on the original Kaiser Steel Mill, located on approximately 1,200 acres in Fontana.[116] The facility was an integrated steel production plant that the Kaiser Steel Corporation owned and operated from approximately 1942 to 1983.[117] The DEIR states that the Applicant's consultant "did not include *any environmental assessment* for the presence or absence of hazardous/toxic materials, including methane or other landfill related gases."[118]

6192-004acp

printed on recycled paper

The hazardous contamination the Project site is significant and was found by the California Department of Toxic Substances to be "above acceptable health risk-based levels."[119] Studies of the steel mill found that it emitted large quantities of carcinogenic compounds that will persist in the environment and that the emission controls on the plant were deficient.[120]

Dr. Clark concludes that the Project's construction phase will disturb large quantities of soils in areas that were identified in the DEIR as former process areas that contained measurable concentrations of COPCs from the Kaiser Steel Mill.[121] Mechanically disturbing the soils will release impacted soils that will migrate offsite to the residences nearby.[122] This may result in a significant and unmitigated impact. The County must assess the concentrations of contaminants that will be released offsite and calculate the potential health risks from those exposures.[123] The County must revise the hazardous materials section and health risk analysis of the DEIR and present the results in a revised EIR.

24

B. The DEIR Fails to Discuss the Presence and Potential Releasees of Listed Toxic Chemicals During Project Construction

The Project site contains a number of toxic chemicals listed on the most recent Proposition 65 list, including:

- acenaphthene,
- anthracene,
- antimony,
- arsenic,
- benz(e)snthracene,
- benzene,
- benzo(b)fluoranthene,
- beazo(k)fluoranthene,
- benzo(a)pyrene,
- beryllium,
- cadmium,
- chrysene,
- chromium(includinghexavalent),
- cyanide,

25

[119] DEIR, Appendix I, pdf p. 37.

[122] *Id.*
[123] *Id.*

printed on recycled paper

- fluoranthene,
- fluorene,
- indeno(1,2,3.cd)pyrene,
- lead,
- mercury,
- molybdenum,
- nickel,
- styrene,
- toluene.[124]

The presence or release of chemicals in drinking water, or through dermal contact or inhalation, that exceed the reproductive toxicity and/or carcinogenic warning levels set forth in Proposition 65 is a potentially significant impact that must be disclosed in the EIR.

The DEIR also fails to analyze the Project's conformance with Proposition 65 and fails to mention the legislation altogether. Proposition 65, the Safe Drinking Water and Toxic Enforcement Act of 1986, requires businesses to provide a clear and reasonable warning before knowingly and intentionally exposing *anyone* to chemicals that are known to the state to cause cancer or birth defects or other reproductive harm.[125] Additionally, Proposition 65 establishes regulation on the prohibition of discharges or release onto land which may pass into a drinking water source. Given the Project site is known to contain chemicals known to the state to cause cancer or reproductive toxicity, a warning must be posted during construction and operation of the Project and the County and Applicant must ensure there is no runoff of the toxic chemicals into any water source.[126]

25

The DEIR must be revised and recirculated to discuss the severity of potential impacts and human exposure to toxic chemicals at the Project site that are listed on the most recent Proposition 65 list. The County must also ensure that the developer fully complies with Proposition 65 requirements to warn workers and future site users of the site's contamination. The County must ensure that the Applicant fully complies with requirements under Proposition 65's discharge regulations as well. Absent this information in a revised and recirculated EIR, the hazards impacts associated with toxic chemicals onsite remain significant and unmitigated.

[126] Health and Safety Code § 25249.14.

printed on recycled paper

VIII. THE DEIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE THE POTENTIALLY SIGNIFICANT TRANSPORTATION IMPACTS OF THE PROJECT

A. Mitigation Measure TRANS-2 is Inadequate

MM TRANS-2 proposes to provide a comprehensive traffic management plan to manage traffic to and from the Next Gen motorsports facility and SCCIISP Project *only* during race weekends and as required for ancillary events. This is inadequate mitigation for failure to provide for impacts that occur outside of race weekends and ancillary events. Additionally, the preparation of a traffic management plan outside the scope of the CEQA process constitutes impermissibly deferred mitigation. CEQA Guidelines § 15126.4(a)(1)(B) provides that formulation of mitigation measures shall not be deferred until some future time.[127] "Impermissible deferral of mitigation measures occur when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR."[128] "By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage in the planning process."[129] The DEIR must be revised and recirculated to include adequate analysis and mitigation of the Project's traffic and transportation impacts.

26

The CEQA Guidelines provide that "[t]he specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review…"[130] The DEIR does not state why specifying the traffic management plan was impractical or infeasible at the time the DEIR was drafted. In *Preserve Wild Santee v. City of Santee,* the city impermissibly deferred mitigation where the EIR did not state why specifying performance standards for mitigation measures "was impractical or infeasible at the time the EIR was certified."[131] The court determined that although the City must ultimately approve the mitigation

6192-004acp

printed on recycled paper

standards, this does not cure these informational defects in the EIR.[132] Further, the court in *Endangered Habitats League, Inc. v. County of Orange*, held that mitigation that does no more than require a report to be prepared and followed, or allow approval by a county department without setting any standards is inadequate.[133] Here, the fact that the traffic management plan will be approved later by the County does not cure the informational defects in this DEIR.[134]

26

B. The VMT Threshold of Significance is Unsupported

CEQA requires that "[a] threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant."[135] Additionally, "notwithstanding compliance with a pertinent threshold of significance, the agency must still consider any fair argument that a certain environmental effect may be significant."[136]

The VMT threshold chosen by the County is four percent below the existing average VMT per employee in non-urbanized portions of the County instead of the fifteen percent below the existing average VMT as recommended by OPR. "Based on OPR's extensive review of the applicable research, and in light of an assessment by the California Air Resources Board quantifying the need for VMT reduction in order to meet the State's long-term climate goals, **OPR recommends that a per resident or per employee VMT that is fifteen percent below that of existing development…"**[137] OPR states that "Fifteen percent reductions in VMT are achievable at the project level in a variety of place types."[138] "Moreover, a fifteen percent reduction is consistent with SB 743's direction to OPR to select a threshold that will help the State achieve its climate goals."[139]

A fifteen percent reduction in VMT for this Project is both feasible and in line with the purpose of SB 743, whereas the threshold used in the DEIR is not supported by substantial evidence.[140] The four percent threshold is not supported by substantial evidence in the record, because the DEIR fails to show that the Project is in a low-VMT area. The failure to utilize an adequate threshold causes the County to fail to analyze potentially significant impacts associated with the urbanized VMT from the project.

27

IX. THE DEIR FAILS TO ADEQUATELY DISCLOSE THE POTENTIALLY SIGNIFICANT OPERATIONAL NOISE IMPACTS OF THE PROJECT

A. Operation of the Project Will Result in Significant and Unmitigated Noise Impacts to Residents Along Randall Avenue

The Project would result in approximately 43,549 daily trips at full buildout, including approximately 9,865 daily truck trips.[141] Project generated traffic would result in an increase of 3.8 dBA CNEL along Randall Avenue (from Cherry Avenue to Citrus Avenue) which would exceed 3.0 dBA.[142] Additionally, traffic noise levels along Randall Avenue (from Cherry Avenue to Citrus Avenue) would be 64.4 dBA CNEL such that they would exceed the County's applicable noise standard of 60 dBA CNEL for residential uses.[143] The DEIR concludes, absent substantial evidence, that this impact is unavoidable.[144]

28

Commenters' noise and acoustical consultant, Derek Watry, determined that the DEIR is incorrect to conclude that the impacts on residences from Cherry Avenue to Citrus Avenue cannot feasibly be mitigated.[145] The DEIR Noise Appendix states that the "Project applicant…does not have jurisdiction over the local roadways and/or existing residences to directly mitigate traffic noise impacts at the impacted receivers."[146] The DEIR further asserts that "Individual residences may deny approval of sound walls or upgraded windows."[147] Thus, the DEIR is

6192-004acp

printed on recycled paper

recognizing that mitigation exists to reduce noise impacts to sensitive receptors at residences adjacent to the Project, but disregards them as infeasible mitigation. 28

An EIR must describe feasible measures which could minimize significant adverse impacts and which "must be fully enforceable through permit conditions, agreements, or other legally binding instruments."[148] CEQA defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors."[149] When weighing the costs of a project's adverse environmental effects against its social, economic, legal, or technological benefits, an agency must make detailed findings regarding each project impact and available mitigation measures, including those proposed by project proponents, agencies, and the public that could reasonably be expected to reduce adverse impacts.[150] A project that will result in significant effects that will not be avoided or substantially lessened requires the agency to "state in writing the specific reasons to support its action" based on and supported by substantial evidence in the record.[151]

The courts have held that mere conclusory statements that the project's alternatives or other mitigation measures were infeasible did not "fulfill CEQA's mandate that the agency's thinking process be disclosed. 'The conclusionary, almost boilerplate language of the findings is insufficient evidence that such balancing [environmental consequences versus benefit] occurred.'"[152] "CEQA does not authorize an agency to proceed with a project that will have significant, unmitigated effects on the environment, based simply on a weighing of those effects against the project's benefits, unless the measures necessary to mitigate those effects are truly infeasible."[153] 29

The DEIR provides "mere conclusory statements" that the measures to reduce noise pollution to residents are infeasible. The installation of acoustical insulation of homes along Randall Avenue is a feasible mitigation measure that may reduce the significant noise impact of Project operation.[154] The County of San Bernardino can require the implementation of a Noise Insulation Program to reduce

the significant noise impact on residences to less than significant levels. In San Francisco, the San Francisco International Airport offer acoustical improvements to qualifying homes where the daily aircraft noise exceeded allowable noise thresholds.[155] Such improvements include: window and door replacement, caulking, weather-stripping, and installation of central fresh air ventilation.[156] Here, sensitive receptors along Randall Avenue, and those shown in the figure below, will be exposed to damaging noise levels, absent mitigation measures including a Noise Insulation Program. The DEIR must be revised and recirculated to include a Noise Insulation Program as part of the Project's binding mitigation.

29

Table 4.13-3: Sensitive Receptors[1]

Receptor Description	Distance and Direction from the Project (Measured from the Nearest Property Lines)
Single-family Residences	410 feet to the east
Single-family Residences	540 feet to the north
Single-family Residences	675 feet to the east
Paduma Monastery	1,100 to the north
Single-family Residences	1,300 feet to the east
Redwood Elementary School	1,370 feet to the northeast
Single-family Residences	1,800 feet to the north
Living Waters Ministry Church of God in Christ	2,000 feet to the north
Single-family Residences	2,100 feet to the north

B. The Project Will Result in Cumulatively Significant Noise Impacts

30

The DEIR recognizes that the Project will result in cumulatively significant impacts resulting from traffic noise on Randall Avenue (from Cherry Avenue to Sierra Avenue), Fourth Street/San Bernardino Avenue (from Etiwanda Avenue to Cherry Avenue) and on Cherry Avenue (from Foothill Boulevard to Valley Boulevard.)[158] But, the DEIR determined that these impacts are unavoidable.[159] The implementation of a Noise Insulation Program may also reduce the significant cumulative traffic noise impacts associated with Project operation. But, the DEIR fails to adequately mitigate such impacts. An EIR must fully disclose all potentially

significant impacts of a project, and implement all feasible mitigation to reduce those impacts to less than significant levels. Here, the County fails to require feasible mitigation to reduce impacts to less than significant.

CEQA grants the lead agency the authority to require feasible changes in "any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment."[160] The County must act to reduce the Project's significant noise impacts to less than significant levels.

30

X. CONCLUSION

For the foregoing reasons, the County must fulfill its responsibilities under CEQA by preparing a legally adequate EIR to address the significant omissions and deficiencies described in this comment letter and the attached expert comments. The DEIR must be revised and recirculated to adequately inform the decision-makers and public of the Project's significant environmental impacts and feasible mitigation measures.

31

Thank you for your attention to these comments.

Sincerely,

Kelilah Federman

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Ms. Kelilah Federman

Subject: Comments On Draft Environmental Impact Report (DEIR) For Speedway Commerce Center II Specific Plan (SCCIISP Project), State Clearinghouse Number 2021120259

Dear Ms. Federman:

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the June 2022 County of San Bernardino's (the County's) DEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

Project Description:

According to the County the proposed project consists of the development of up to 6.6 million square feet of high-cube logistics and e-commerce development (i.e., warehouses) on approximately 433 acres of the existing Auto Club Speedway (ACS) site. The ACS consists of approximately 522 acres. In addition to the high-cube logistics and e-commerce structures, the project would also include 261,360 square feet (sf) of ancillary commercial development. The Project site is approximately 433 acres and is located north of the San Bernardino Freeway (I-10) and San Bernardino Avenue and is bounded by Cherry Avenue to the east, an active freight and passenger rail line to the north,

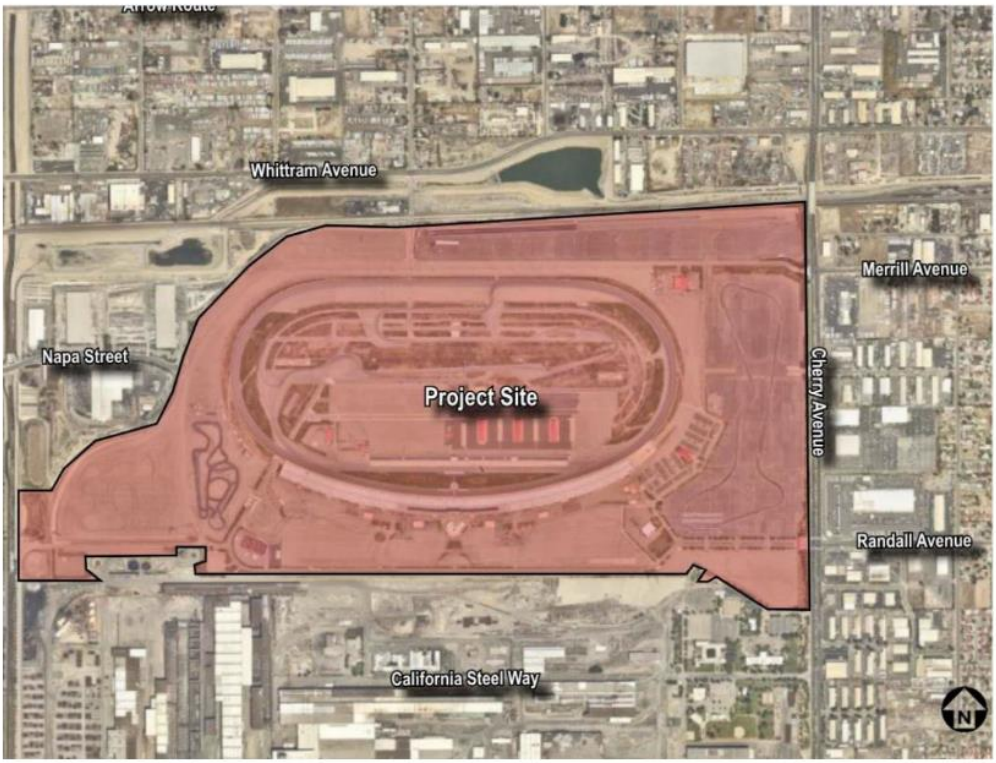

Figure 1: Project Site Location

the West Valley Materials Recycling Facility to the west, and California Steel Industries to the south.

According to the DEIR's project background[1], "The Project site would encompass approximately 433 acres of the approximately 522-acre existing ACS site. The existing ACS is a two-mile oval superspeedway racetrack, owned and operated by California Speedway, LLC. The County originally approved the California Speedway through the approval of the Development Plan Report for the California Speedway and Speedway Business Park (Speedway PD) and adopted the Final Project EIR in 1995 (1995 FEIR; SCH# 1994082080). The existing ACS has been hosting NASCAR races and other motorsports and entertainment events since 1997. The Project would be constructed

[1] Kimley Horn. 2022. Speedway Commerce Center II Specific Plan Project Draft Environmental Impact Report. State Clearinghouse Number 2021120259. Prepared for Land Use Services Department, San Bernardino County. Prepared by Kimley-Horn and Associates, Inc. June, 2022. Pg 3-2.

on 433 acres of the existing site. The remaining approximately 90 acres are not a part of this Project, and plan to be developed as the "Next Gen in California Project" (Next Gen motorsports facility) which was separately approved by the County in June 2021. The Next Gen motorsports facility will continue to host the same type of events hosted by the ACS, on a smaller racetrack surface for more competitive racing and a more intimate experience for race fans."

Exhibit 3: Conceptual Site Plan

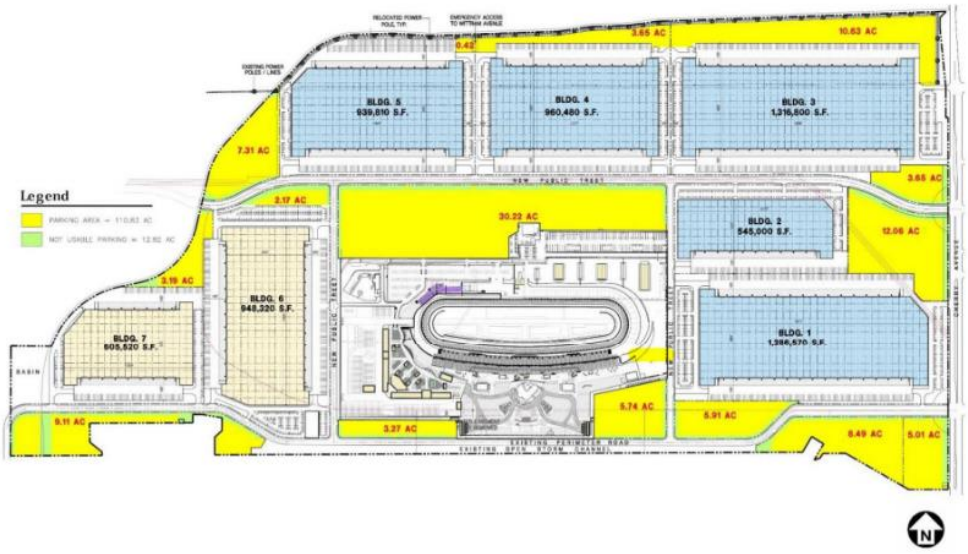

Figure 2: Conceptual Site Plan

The Next Gen in California Project involves the replacement of the existing two-mile track of the California Speedway with a 0.67-mile short track and reduce seating capacity to a maximum capacity of 50,000 persons with approximately 35,000 grandstands seats. According to the DEIR, the Next Gen in California Project has received all necessary approvals and CEQA clearance for its construction and operation, and it is not considered as part of the SCCIISP Project. However, the SCCIISP Project will be designed and developed to be compatible with the Next Gen in California Project, including accommodating ongoing Next Gen in California Project events on designated days and allowing parking for permitted uses.

Figure 3: Conceptual Site Plan

Unavoidable Significant Impacts

According to the County's DEIR of the Project, the potentially significant and unavoidable impacts from the project include:

- Consistency With Air Quality Management Plan: The proposed project would result in exceedances of regional emissions thresholds and, therefore, be inconsistent with the South Coast Air Quality Management District (SCAQMD) regional air quality planning assumptions. Mitigation is proposed requiring the implementation of feasible emissions reduction measures; however, these measures would not reconcile this inconsistency. Therefore, the significance after mitigation is significant and unavoidable.
- Project-Related Construction and Operational Emissions. Despite implementation of mitigation measures, the Project's criteria pollutant emissions would remain above

SCAQMD thresholds resulting in a significant and unavoidable impact (Impact 4.3-2). However, localized impacts would be less than significant (Impact 4.3-3).

- Cumulative Criteria Pollutant Emissions Impacts: The proposed project would result in a cumulatively considerable net increase of criteria pollutants for which the project region is nonattainment under an applicable federal or State ambient air quality standard. Mitigation is proposed requiring the implementation of air emissions reduction measures, but it would not fully reduce this impact to a level of less than significant. Therefore, the significance after mitigation is significant and unavoidable.
- Greenhouse Gas (GHG) Emissions: The Project's emissions would be considered significant unavoidable even with the implementation of Project Design Features (PDFs), Standard Conditions, and Mitigation Measures.

The conclusion from the County that the significant impacts are unavoidable is not supported by the facts of the Project. There are substantial impacts that are not addressed in the County's analysis that must be addressed in a revised environmental draft impact report (R-DEIR).

Specific Comments:

1. The Air Dispersion Model Used For The Health Risk Assessment For Operational Phases Of The Project Has A Structural Flaw That Result In Inaccurate Estimates Of The Project Emissions Within The Community

The modeling approach has a significant flaw - the model does not account for the impact on emissions from building downwash. If the building downwash were included in the model, then the Proponent would be reasonably expected to call that out in the text summary of the model. The AERMOD model calculates the ground-level concentration of diesel particulate matter (DPM) emission associated with the project. The height of release for emissions from idling trucks is generally assumed to be 2.55 meters to 3.4 meters (8.4 feet to 11.2 feet) well below the heights of the prosed buildings. The release height for DPM from trucks traveling along the streets is generally assumed to be at the ground surface (0 meters or 0 feet). In addition, the NextGen Raceway will include grandstands for 35,000 people that will be significantly higher than the sources of DPM onsite.

Building downwash occurs as the wind flows over and around buildings and impacts the

dispersion of pollution from nearby stacks. A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity. This downwash effect leads to higher ground-level concentration of chemicals emitted from sources. The downwash effect increases as the relative difference between the release height and top of the building increases.[2]

For the closest receptors to the site, the residences to the Project, this difference will create an additional air quality impact that is not accounted for in the County's analysis. In addition to incorporating the building downwash impacts of the Project buildings, the AERMOD model should also incorporate the building downwash for receptors near the Project. Receptors farther away will still be subject to the downwash effect given the assumed emission height release incorporated into the model. Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[3] requires the inclusion of building heights and dimensions for building downwash calculations. Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). The County should address the impact of this issue in a R-DEIR.

2. Mitigation Measure AQ-1 Assumes That The Fleet of Heavy Duty Trucks Entering the Site During The Construction Phase of The Project Will Be From Year 2010 Or Later. If the MM Can Require A Specific Age of Vehicles Entering The Project Site, It Should Be Changed To Make A Real Impact On Emissions From The Heavy Duty Truck Traffic.

The County's MM requires heavy-duty vehicles entering the Project site during the construction phase of the Project will be model year 2010 or later. The County offers no logic as to why model year 2010 is the baseline value for heavy-duty vehicles on-site. If the County can limit the age of the heavy duty vehicles entering and exiting the site then choosing new model vehicles will limit the impacts of the Project on the surrounding community.

[2] The so-called good engineering practice height (GEP) of the source. The GEP is defined in Section 123 of the Clean Air Act as "the height necessary to ensure that emissions from a stack do not result in excessive concentrations of any air pollutant in the immediate vicinity of the source as a result of atmospheric downwash, eddies or wakes which may be created by the source itself, nearby structures or nearby terrain obstacles."

[3] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

Using the California Air Resources Board's (CARB) EMission FACtor (EMFAC) model, it is possible to estimates the emissions from onroad mobile sources in California, including but not limited to heavy duty trucks. The model calculates emissions factors and emissions inventories for:

- Carbon monoxide (CO)
- Nitrogen oxides (NO_x)
- Hydrocarbons (HC): HC can be expressed as TOG (total organic gases), ROG (reactive organic gases), THC (total hydrocarbon), or CH_4 (methane). The TOG class includes all organic gases emitted into the atmosphere. The ROG class is same as EPA's VOC (volatile organic compounds) definition and does not contain compounds exempt from regulation.
- Particulate matter (PM): PM estimates are provided for total suspended particulates for particulate matters 10 microns or less in diameter (PM_{10}), and particulate matters 2.5 microns or less in diameter ($PM_{2.5}$).
- Sulfur oxides (SO_x): Emissions of oxides of sulfur are a function of the sulfur content of fuel. The model calculates these emissions by multiplying the fuel consumption by the weight fraction of sulfur in a gallon of fuel.
- Greenhouse Gases (GHG): GHG emissions are consisted of complete combustion CO2, Nitrous Oxide (N_2O) and Methane (CH_4). These are the greenhouse gases that are now included in the EMFAC2017 but not in EMFAC2014 or prior versions

In my analysis the emissions for NO_x, $PM_{2.5}$ as exhaust, and ROGs for vehicles with model years 2010 through 2022 are presented in the table below.

Table 1: EMFAC Emission Estimates For Heavy Duty Vehicles For Model Years 2010 Through 2022

Note: Units: g/mile for RUNEX, g/vehicle/day for IDLEX

Using the population size of each model year it is possible to calculate the weighted average aggregate value for the fleet of heavy duty vehicles using the Project Site. Based on the averaged emissions from the table above (limiting the fleet to vehicles built before the year 2021) it is clear that changing the minimum allowable model year from 2010 to 2014 or 2018 would result in:

- A 31% reduction in running NO_x emissions (NO_x RUNEX) from trucks operating on site if the vehicles were restricted to model year 2014 or later.
- A 44% reduction in running NO_x emissions (NO_x RUNEX) from trucks operating on site if the vehicles were restricted to model year 2018 or later.
- A 27.5% reduction in DPM emissions from trucks measured as $PM_{2.5}$ operating on site ($PM_{2.5}$ RUNEX) if the vehicles were restricted to model year 2014 or later.
- A 46.8% reduction in DPM emissions from trucks measured as $PM_{2.5}$ operating on site (PM2.5 RUNEX) if the vehicles were restricted to model year 2018 or later.
- A 9.5% reduction in ROGs from trucks operating on site (ROG RUNEX) if the vehicles were restricted to model year 2014 or later.
- A 14.8% reduction in ROGs from trucks operating on site (ROG RUNEX) if the vehicles were restricted to model year 2018 or later.

The County must reassess the impact that restricting the model year of vehicles operating during the construction phase of the Project in Mitigation Measure AQ-1 to newer models than 2010 in a revised EIR.

3. **The Underlying Assumptions Regarding The Number of Vehicles Associated With Each Square Foot of Building Utilized In The Air Quality Analysis Is Not Supported By ITE Guidance On High Cube Warehouses. The Critical Value For Estimating Daily Trips From The Project (Weighted Average Daily Trip Per 1,000 Square Feet) Has A Low Level Of Correlation Between Building Gross Square Footage And Vehicle Trips.**

The County ignores the SCAQMD's recommendation to utilize an average daily vehicle trip rate per 1,000 square feet and an average daily truck trip rate per 1,000 square feet. The County's analysis cites the use of the 2016 study of High-Cube Warehouse Distribution Centers (HCWs) by the SCAQMD and Institute of Transportation Engineers (ITE) included an analysis of high-cube

warehouses (HCW) as a reason for using a different daily trip rate. An HCW was defined as a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses.

In the 2016 SCAQMD study, a value of 1.432 daily vehicle trips per 1,000 GSF is calculated for Transload and Short-term Storage HCWs. The study further states that while the dataset for Transload and Short-term Storage HCWs is larger than those for Cold Storage HCWs, Fulfillment Center HCWs, and Parcel Hub HCWs, the relationship between building gross square footage and vehicle trips for Transload and Short-term HCWs *does not produce an acceptable level of correlation to develop a fitted curve equation (emphasis added)*. This suggests that the value used to justify the number of vehicle trips per day utilized by the County is not supportable and the higher rate of 1.68 daily vehicle trips per 1,000 GSF recommended by SCAQMD is more appropriate for this project. The County should re-evaluate the operational emissions based on the recommended SCAQMD rate in an R-DEIR.

4. The DEIR Fails To Consider The Health Risks From Grading Activities On-Site During The Construction Phase Of The Project Based On Historically Important Chemicals Of Concern (COCs) That Were Released From The Former Kaiser Steel Mill.

The DEIR has failed to assess impact of chemicals of potential concern (COPCs) associated with the largest source of pollution in the area, the former Kaiser Steel Mill. . The Project Site is located within the confines of the original Kaiser Steel Mill, located on approximately 1,200 acres in Fontana. The facility was an integrated steel production plant that the Kaiser Steel Corporation owned and operated from approximately 1942 to 1983. Studies of the steel mill found that it emitted large quantities of carcinogenic compounds that will persist in the environment[4] and that the emission

[4] KVB. 1970. An Inventory Of Carcinogenic Substances Released Into The Ambient Air Of California. Final Report – Task II & IV. Prepared for Science Applications, Inc by R.M. Roberts, KVB, Inc. Energy and Environmental Systems. March, 1980.

controls on the plant were deficient.[5] In 1970, a report by KVB[6] sought to identity areas where the highest concentrations of emissions might be expected to occur resulting from the use or manufacture of 11 specific carcinogenic substances in California. The report focused on recognized "hot spots" in which carcinogenic compounds were released and had the potential for dispersion after release. Concern about the emissions from the Kaiser Steel Mill as a major source of polycyclic organic matter (POMs are also known as polycyclic aromatic hydrocarbons), arsenic, cadmium, and benzene in California.[7] Arsenic, cadmium, and POMs are not subject to degradation in the environment and will represent a COPC for the area. According to the U.S. EPA's 1976 assessment of visible emissions from the Steel Mill,[8] the basic coke, iron and steel processes result in the emission to the atmosphere of excessive levels of particulate air pollutants, despite the installation of various air pollution control devices. Emissions from the plant would have covered the area of the Project Site for many decades and present a recognized environmental concern for the site.

The Project's construction phase will disturb large quantities of soils in areas that were identified in the DEIR's appendices to represent former process areas that contained measurable concentrations of COPCs from the Kaiser Steel Mill. Mechanically disturbing the soils will release impacted soils that will migrate offsite to the residences nearby. The County must assess the concentrations of contaminants that will be released offsite and calculate the potential health risks from those exposures. The County must correct this error in the hazardous materials section and health risk analysis of the DEIR and present the results in a revised environmental impact report (REIR).

5. There Are A Number Of Mitigation Measures That Will Have A Direct Impact On Operational NOx and GHG Emissions Not Explored By The County In The DEIR

[5] U.S. EPA. 1976. Visible Emission Observation, Kaiser Steel Corporation, Fontana, California, September, 1975. EPA-330/2-76-028.

[6] KVB. 1970. An Inventory Of Carcinogenic Substances Released Into The Ambient Air Of California. Final Report – Task II & IV. Prepared for Science Applications, Inc by R.M. Roberts, KVB, Inc. Energy and Environmental Systems. March, 1980.

[7] KVB. 1970. An Inventory Of Carcinogenic Substances Released Into The Ambient Air Of California. Final Report – Task II & IV. Prepared for Science Applications, Inc by R.M. Roberts, KVB, Inc. Energy and Environmental Systems. March, 1980.

[8] U.S. EPA. 1976. Visible Emission Observation, Kaiser Steel Corporation, Fontana, California, September, 1975. EPA-330/2-76-028.

Mitigation measures that have previously been recommended by the California Air Resources Board and the Air Quality Management Districts in California to reduce operational NO_x and GHG emissions not included in the DEIR by the County include:

1. Include contractual language in tenant lease agreements that requires tenants to use the cleanest technologies available to the extent feasible, and to provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating on site.
2. Include contractual language in tenant lease agreements that requires all TRUs entering the project site be plug-in capable to the extent feasible.
3. Include contractual language in tenant lease agreements that requires future tenants to exclusively use zero-emission light and medium-duty delivery trucks and vans to the extent feasible.
4. Include contractual language in tenant lease agreements requiring all TRUs, trucks, and cars entering the Project site be zero-emission to the extent feasible.
5. Include contractual language in tenant lease agreements that requires the tenant be in, and monitor compliance with, all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation,[9] Periodic Smoke Inspection Program (PSIP),[10] and the Statewide Truck and Bus Regulation.[11]
6. Include rooftop solar panels for each proposed warehouse to the extent feasible, with a capacity that matches the maximum allowed for distributed solar connections to the grid.
7. Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.

[9] In December 2008, CARB adopted a regulation to reduce greenhouse gas emissions by improving the fuel efficiency of heavy-duty tractors that pull 53-foot or longer box-type trailers. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the heavy-duty tractors that pull them on California highways. CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation is available at: https://www.arb.ca.gov/cc/hdghg/hdghg.htm.

[10] The PSIP program requires that diesel and bus fleet owners conduct annual smoke opacity inspections of their vehicles and repair those with excessive smoke emissions to ensure compliance. CARB's PSIP program is available at: https://www.arb.ca.gov/enf/hdvip/hdvip.htm.

[11] The regulation requires that newer heavier trucks and buses must meet particulate matter filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 201 0 model year engines or equivalent. CARB's Statewide Truck and Bus Regulation is available at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm

8. Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the CEQA document. If higher daily truck volumes are anticipated to visit the site, the County as the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this land use or higher activity level.
9. Ensure that any check-in point for trucks is well inside the Proposed Project site to ensure that there are no trucks queuing outside of the facility.
10. Establish overnight parking within the industrial building where trucks can rest overnight.
11. Establish area(s) within the Proposed Project site for repair needs.

6. The HRA Failed To Accurately Account For The Back-up Generator (BUG) Usage Onsite. The HRA Accounts For 50 Hours Of Operation And Does Not Account For The More Likely Use of Up To 200 Hours Of Operation Per Year.

In the DEIR's Air Quality Analysis, the County states that the use of Emergency Backup Generators (BUGs) is speculative. Backup generators would only be used in the event of a power failure and would not be part of the Project's normal daily operations. Emissions from an emergency backup generator for each warehouse building were calculated separately from CalEEMod. The five 750 horse power (hp) and three 3,634 hp cold storage BUGs were assumed to be operated up to 50 hours per year.

In addition to the testing emissions, the air quality analysis must include the substantial increase in operational emissions from BUGs in the Air Basin due to unscheduled events, including but not limited to Public Safety Power Shutoff (PSPS) events and extreme heat events. Extreme heat events are defined as periods where in the temperatures throughout California exceed 100 degrees Fahrenheit. The total duration of the PSPS events lasted between 141 hours to 154 hours in 2019. In 2021, the Governor Of California declared that during extreme heat events the use of stationary generators shall be deemed an emergency use under California Code of Regulations (CCR), title 17, section 93115.4 sub. (a) (30) (A)(2). The number of Extreme Heat Events is likely to increase in California with the continuing change in climate the State is currently undergoing.

Power produced during PSPS or extreme heat events is expected to come from engines regulated by CARB and California's 35 air pollution control and air quality management districts (air districts). Of particular concern are health effects related to emissions from diesel back-up engines.

Diesel particulate matter (DPM) has been identified as a toxic air contaminant, composed of carbon particles and numerous organic compounds, including over forty known cancer-causing organic substances. The majority of DPM is small enough to be inhaled deep into the lungs and make them more susceptible to injury.

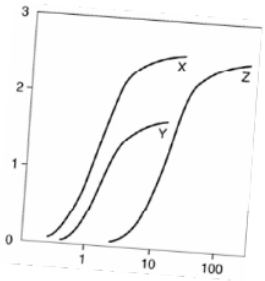
According to the California Public Utilities Commission (CPUC) de-energization report in October 2019, there were almost 806 PSPS events (emphasis added) that impacted almost 973,000 customers (~7.5% of households in California) of which ~854,000 of them were residential customers, and the rest were commercial/industrial/medical baseline/other customers. CARB's data also indicated that on average each of these customers had about 43 hours of power outage in October 2019. Using the actual emission factors for each diesel BUG engines in the air district's stationary BUGs database, CARB staff calculated that the 1,810 additional stationary generators (like those proposed for the Project) running during a PSPS in October 2019 generated 126 tons of NOx, 8.3 tons or particulate matter, and 8.3 tons of DPM.

For every PSPS or Extreme Heat Event (EHE) triggered during the operational phase of the project, significant concentrations of DPM will be released. A R-DEIR should be prepared for the Project that includes an analysis of the additional operation of the BUG that will occur at the project site that is not accounted for in the current air quality and GHG analyses.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant unmitigated impacts if the DEIR is approved. The County must re-evaluate the significant impacts identified in this letter by requiring the preparation of a revised draft environmental impact report.

Sincerely,



Clark & Associates

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling

Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995

M.S., Environmental Health Science, University of California, 1993

B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well recognized toxicologist, air modeler, and health scientist. He has 20 years of experience in researching the effects of environmental contaminants on human health including environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); conducting and managing human health risk assessments for regulatory compliance and risk-based clean-up levels; and toxicological and medical literature research.

Significant projects performed by Dr. Clark include the following:

LITIGATION SUPPORT

Case: James Harold Caygle, et al, v. Drummond Company, Inc. Circuit Court for the Tenth Judicial Circuit, Jefferson County, Alabama. Civil Action. CV-2009

Client: Environmental Litgation Group, Birmingham, Alabama

Dr. Clark performed an air quality assessment of emissions from a coke factory located in Tarrant, Alabama. The assessment reviewed include a comprehensive review of air quality standards, measured concentrations of pollutants from factory, an inspection of the facility and detailed assessment of the impacts on the community. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Rose Roper V. Nissan North America, et al. Superior Court of the State Of California for the County Of Los Angeles – Central Civil West. Civil Action. NC041739

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to multiple chemicals, including benzene, who later developed a respiratory distress. A review of the individual's medical and occupational history was performed to prepare an exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to respiratory irritants. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: O'Neil V. Sherwin Williams, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to petroleum distillates who later developed a bladder cancer. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Summary judgment for defendants.

Case: Moore V., Shell Oil Company, et al. Superior Court of the State Of California for the County Of Los Angeles

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to chemicals while benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Raymond Saltonstall V. Fuller O'Brien, KILZ, and Zinsser, et al. United States District Court Central District of California

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to benzene who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a quantitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Richard Boyer and Elizabeth Boyer, husband and wife, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-7G.

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: JoAnne R. Cook, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-9R

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of an individual exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Patrick Allen And Susan Allen, husband and wife, and Andrew Allen, a minor, V. DESCO Corporation, et al. Circuit Court of Brooke County, West Virginia. Civil Action Number 04-C-W

Client: Frankovitch, Anetakis, Colantonio & Simon, Morgantown, West Virginia.

Dr. Clark performed a toxicological assessment of a family exposed to chlorinated solvents released from the defendant's facility into local drinking water supplies. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to chlorinated solvents. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Michael Fahey, Susan Fahey V. Atlantic Richfield Company, et al. United States District Court Central District of California Civil Action Number CV-06 7109 JCL.

Client: Rose, Klein, Marias, LLP, Long Beach, California

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Settlement in favor of plaintiff.

Case: Constance Acevedo, et al., V. California Spray-Chemical Company, et al., Superior Court of the State Of California, County Of Santa Cruz. Case No. CV 146344

Dr. Clark performed a comprehensive exposure assessment of community members exposed to toxic metals from a former lead arsenate manufacturing facility. The former manufacturing site had undergone a DTSC mandated removal action/remediation for the presence of the toxic metals at the site. Opinions were presented regarding the elevated levels of arsenic and lead (in attic dust and soils) found throughout the community and the potential for harm to the plaintiffs in question.

Case Result: Settlement in favor of defendant.

Case: Michael Nawrocki V. The Coastal Corporation, Kurk Fuel Company, Pautler Oil Service, State of New York Supreme Court, County of Erie, Index Number I2001-11247

Client: Richard G. Berger Attorney At Law, Buffalo, New York

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to refined petroleum hydrocarbons who later developed a leukogenic disease. A review of the individual's medical and occupational history was performed to prepare a qualitative exposure assessment. The exposure assessment was evaluated against the

known outcomes in published literature to exposure to refined petroleum hydrocarbons. The results of the assessment and literature have been provided in a declaration to the court.

Case Result: Judgement in favor of defendant.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model will be used to estimate acute and chronic exposure concentrations to multiple contaminants and will be incorporated into a comprehensive risk evaluation.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

Client – Los Angeles Alliance for a New Economy (LAANE), Los Angeles, California

Dr. Clark is advising the LAANE on air quality issues related to current flight operations at the Los Angeles International Airport (LAX) operated by the Los Angeles World Airport (LAWA) Authority. He is working with the LAANE and LAX staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client – City of Santa Monica, Santa Monica, California

Dr. Clark is advising the City of Santa Monica on air quality issues related to current flight operations at the facility. He is working with the City staff to develop a comprehensive strategy for meeting local community concerns over emissions from flight operations and to engage federal agencies on the issue of local impacts of community airports.

Client: Omnitrans, San Bernardino, California

Dr. Clark managed a public health survey of three communities near transit fueling facilities in San Bernardino and Montclair California in compliance with California Senate Bill 1927. The survey included an epidemiological survey of the effected communities, emission surveys of local businesses, dispersion modeling to determine potential emission concentrations within the communities, and a comprehensive risk assessment of each community. The results of the study were presented to the Governor as mandated by Senate Bill 1927.

Client: Confidential, San Francisco, California

Summarized cancer types associated with exposure to metals and smoking. Researched the specific types of cancers associated with exposure to metals and smoking. Provided causation analysis of the association between cancer types and exposure for use by non-public health professionals.

Client: Confidential, Minneapolis, Minnesota

Prepared human health risk assessment of workers exposed to VOCs from neighboring petroleum storage/transport facility. Reviewed the systems in place for distribution of petroleum hydrocarbons to identify chemicals of concern (COCs), prepared comprehensive toxicological summaries of COCs, and quantified potential risks from carcinogens and non-carcinogens to receptors at or adjacent to site. This evaluation was used in the support of litigation.

Client – United Kingdom Environmental Agency

Dr. Clark is part of team that performed comprehensive evaluation of soil vapor intrusion of VOCs from former landfill adjacent residences for the United Kingdom's Environment

Agency. The evaluation included collection of liquid and soil vapor samples at site, modeling of vapor migration using the Johnson Ettinger Vapor Intrusion model, and calculation of site-specific health based vapor thresholds for chlorinated solvents, aromatic hydrocarbons, and semi-volatile organic compounds. The evaluation also included a detailed evaluation of the use, chemical characteristics, fate and transport, and toxicology of chemicals of concern (COC). The results of the evaluation have been used as a briefing tool for public health professionals.

EMERGING/PERSISTENT CONTAMINANT RESEARCH/PROJECTS

Client: Ameren Services, St. Louis, Missouri

Managed the preparation of a comprehensive human health risk assessment of workers and residents at or near an NPL site in Missouri. The former operations at the Property included the servicing and repair of electrical transformers, which resulted in soils and groundwater beneath the Property and adjacent land becoming impacted with PCB and chlorinated solvent compounds. The results were submitted to U.S. EPA for evaluation and will be used in the final ROD.

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark is managing the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark is assisting the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of perchlorate in environment. Dr. Clark evaluated the production, use, chemical characteristics, fate and transport, toxicology, and remediation of perchlorate. Perchlorates form the basis of solid rocket fuels and have recently been detected in water supplies in the United States. The results of this research

were presented to the USEPA, National GroundWater, and ultimately published in a recent book entitled *Perchlorate in the Environment*.

Client – Confidential, Los Angeles, California

Dr. Clark is performing a comprehensive review of the potential for pharmaceuticals and their by-products to impact groundwater and surface water supplies. This evaluation will include a review if available data on the history of pharmaceutical production in the United States; the chemical characteristics of various pharmaceuticals; environmental fate and transport; uptake by xenobiotics; the potential effects of pharmaceuticals on water treatment systems; and the potential threat to public health. The results of the evaluation may be used as a briefing tool for non-public health professionals.

PUBLIC HEALTH/TOXICOLOGY

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

Client: Confidential, San Francisco, California

Identified and analyzed fifty years of epidemiological literature on workplace exposures to heavy metals. This research resulted in a summary of the types of cancer and non-cancer diseases associated with occupational exposure to chromium as well as the mortality and morbidity rates.

Client: Confidential, San Francisco, California

Summarized major public health research in United States. Identified major public health research efforts within United States over last twenty years. Results were used as a briefing tool for non-public health professionals.

Client: Confidential, San Francisco, California

Quantified the potential multi-pathway dose received by humans from a pesticide applied indoors. Part of team that developed exposure model and evaluated exposure concentrations in a comprehensive report on the plausible range of doses received by a specific person. This evaluation was used in the support of litigation.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client – United Kingdom Environmental Agency

Oversaw a comprehensive toxicological evaluation of methyl-*tertiary* butyl ether (M*t*BE) for the United Kingdom's Environment Agency. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of M*t*BE. The results of the evaluation have been used as a briefing tool for public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of *tertiary* butyl alcohol (TBA) in municipal drinking water system. TBA is the primary breakdown product of M*t*BE, and is suspected to be the primary cause of M*t*BE toxicity. This evaluation will include available information on the production, use, chemical characteristics, fate and transport in the environment, absorption, distribution, routes of detoxification, metabolites, carcinogenic potential, and remediation of TBA. The results of the evaluation were used as a briefing tool for non-public health professionals.

Client – Confidential, Los Angeles, California

Prepared comprehensive evaluation of methyl *tertiary* butyl ether (MTBE) in municipal drinking water system. MTBE is a chemical added to gasoline to increase the octane

rating and to meet Federally mandated emission criteria. The evaluation included available data on the production, use, chemical characteristics, fate and transport, toxicology, and remediation of MTBE. The results of the evaluation have been were used as a briefing tool for non-public health professionals.

Client – Ministry of Environment, Lands & Parks, British Columbia

Dr. Clark assisted in the development of water quality guidelines for methyl tertiary-butyl ether (MTBE) to protect water uses in British Columbia (BC). The water uses to be considered includes freshwater and marine life, wildlife, industrial, and agricultural (e.g., irrigation and livestock watering) water uses. Guidelines from other jurisdictions for the protection of drinking water, recreation and aesthetics were to be identified.

Client: Confidential, Los Angeles, California

Prepared physiologically based pharmacokinetic (PBPK) assessment of lead risk of receptors at middle school built over former industrial facility. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Client: Confidential, Atlanta, Georgia

Researched potential exposure and health risks to community members potentially exposed to creosote, polycyclic aromatic hydrocarbons, pentachlorophenol, and dioxin compounds used at a former wood treatment facility. Prepared a comprehensive toxicological summary of the chemicals of concern, including the chemical characteristics, absorption, distribution, and carcinogenic potential. Prepared risk characterization of the carcinogenic and non-carcinogenic chemicals based on the exposure assessment to quantify the potential risk to members of the surrounding community. This evaluation was used to help settle class-action tort.

Client: Confidential, Escondido, California

Prepared comprehensive Preliminary Endangerment Assessment (PEA) of dense non-aqueous liquid phase hydrocarbon (chlorinated solvents) contamination at a former printed circuit board manufacturing facility. This evaluation was used for litigation support and may be used as the basis for reaching closure of the site with the lead regulatory agency.

Client: Confidential, San Francisco, California

Summarized epidemiological evidence for connective tissue and autoimmune diseases for product liability litigation. Identified epidemiological research efforts on the health effects of medical prostheses. This research was used in a meta-analysis of the health effects and as a briefing tool for non-public health professionals.

Client: Confidential, Bogotá, Columbia

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of a 13.7 hectares plastic manufacturing facility in Bogotá, Colombia The risk assessment was used as the basis for the remedial goals and closure of the site.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally cadmium) and VOCs from soil and soil vapor at 12-acre former crude oilfield and municipal landfill. The site is currently used as a middle school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and was used as the basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Managed remedial investigation (RI) of heavy metals and volatile organic chemicals (VOCs) for a 15-acre former manufacturing facility. The RI investigation of the site included over 800 different sampling locations and the collection of soil, soil gas, and groundwater samples. The site is currently used as a year round school housing approximately 3,000 children. The Remedial Investigation was performed in a manner

that did not interrupt school activities and met the time restrictions placed on the project by the overseeing regulatory agency. The RI Report identified the off-site source of metals that impacted groundwater beneath the site and the sources of VOCs in soil gas and groundwater. The RI included a numerical model of vapor intrusion into the buildings at the site from the vadose zone to determine exposure concentrations and an air dispersion model of VOCs from the proposed soil vapor treatment system. The Feasibility Study for the Site is currently being drafted and may be used as the basis for granting closure of the site by DTSC.

Client: Confidential, Los Angeles, California

Prepared comprehensive human health risk assessment of students, staff, and residents potentially exposed to heavy metals (principally lead), VOCs, SVOCs, and PCBs from soil, soil vapor, and groundwater at 15-acre former manufacturing facility. The site is currently used as a year round school housing approximately 3,000 children. The evaluation determined that the site was safe for the current and future uses and will be basis for regulatory closure of site.

Client: Confidential, Los Angeles, California

Prepared comprehensive evaluation of VOC vapor intrusion into classrooms of middle school that was former 15-acre industrial facility. Using the Johnson-Ettinger Vapor Intrusion model, the evaluation determined acceptable soil gas concentrations at the site that did not pose health threat to students, staff, and residents. This evaluation is being used to determine cleanup goals and will be basis for regulatory closure of site.

Client –Dominguez Energy, Carson, California

Prepared comprehensive evaluation of the potential health risks associated with the redevelopment of 6-acre portion of a 500-acre oil and natural gas production facility in Carson, California. The risk assessment was used as the basis for closure of the site.

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Unocal Corporation - Los Angeles, California

Prepared comprehensive assessment of petroleum hydrocarbons and metals for a former petroleum service station located next to sensitive population center (elementary school). The assessment used a probabilistic approach to estimate risks to the community and was used as the basis for granting closure of the site by lead regulatory agency.

Client: Confidential, Los Angeles, California

Managed oversight of remedial investigation most contaminated heavy metal site in California. Lead concentrations in soil excess of 68,000,000 parts per billion (ppb) have been measured at the site. This State Superfund Site was a former hard chrome plating operation that operated for approximately 40-years.

Client: Confidential, San Francisco, California

Coordinator of regional monitoring program to determine background concentrations of metals in air. Acted as liaison with SCAQMD and CARB to perform co-location sampling and comparison of accepted regulatory method with ASTM methodology.

Client: Confidential, San Francisco, California

Analyzed historical air monitoring data for South Coast Air Basin in Southern California and potential health risks related to ambient concentrations of carcinogenic metals and volatile organic compounds. Identified and reviewed the available literature and calculated risks from toxins in South Coast Air Basin.

IT Corporation, North Carolina

Prepared comprehensive evaluation of potential exposure of workers to air-borne VOCs at hazardous waste storage facility under SUPERFUND cleanup decree. Assessment used in developing health based clean-up levels.

Subject: **Speedway Commerce Center II Specific Plan Project DEIR**
County of San Bernardino, California
Review and Comment on DEIR Noise Analysis

Dear Ms. Federman,

As requested, we have reviewed the information and noise impact analysis in the following document:

Speedway Commerce Center II Specific Plan Project
Draft Environmental Impact Report ("DEIR")
State Clearinghouse No. 2021120259
County of San Bernardino, California
June 2022

This letter reports our comments on the noise analysis in the subject document.

Wilson Ihrig, Acoustical Consultants, has practiced exclusively in the field of acoustics since 1966. During our 56 years of operation, we have prepared hundreds of noise studies for Environmental Impact Reports and Statements. We have one of the largest technical laboratories in the acoustical consulting industry. We also utilize industry-standard acoustical programs such as Environmental Noise Model (ENM), Traffic Noise Model (TNM), Roadway Construction Noise Model (RCNM), SoundPLAN, and CADNA. In short, we are well qualified to prepare environmental noise studies and review studies prepared by others.

5900 HOLLIS STREET, SUITE T1 | EMERYVILLE, CA 94608 | (510) 658-6719 | WWW.WILSONIHRIG.COM

Adverse Effects of Noise[1]

Although the health effects of noise are not taken as seriously in the United States as they are in other countries, they are real and, in many parts of the country, pervasive.

Noise-Induced Hearing Loss. If a person is repeatedly exposed to loud noises, he or she may experience noise-induced hearing impairment or loss. In the United States, both the Occupational Health and Safety Administration (OSHA) and the National Institute for Occupational Safety and Health (NIOSH) promote standards and regulations to protect the hearing of people exposed to high levels of industrial noise.

Speech Interference. Another common problem associated with noise is speech interference. In addition to the obvious issues that may arise from misunderstandings, speech interference also leads to problems with concentration fatigue, irritation, decreased working capacity, and automatic stress reactions. For complete speech intelligibility, the sound level of the speech should be 15 to 18 dBA higher than the background noise. Typical indoor speech levels are 45 to 50 dBA at 1 meter, so any noise above 30 dBA begins to interfere with speech intelligibility. The common reaction to higher background noise levels is to raise one's voice. If this is required persistently for long periods of time, stress reactions and irritation will likely result. The problems and irritation that are associated with speech disturbance became and to some extent remain more pronounced during the COVID-19 pandemic because many people find themselves and the people they live with trying to work and learn simultaneously in spaces that were not designed for speech privacy.

Sleep Disturbance. Noise can disturb sleep by making it more difficult to fall asleep, by waking someone after they are asleep, or by altering their sleep stage, e.g., reducing the amount of rapid eye movement (REM) sleep. Noise exposure for people who are sleeping has also been linked to increased blood pressure, increased heart rate, increase in body movements, and other physiological effects. Not surprisingly, people whose sleep is disturbed by noise often experience secondary effects such as increased fatigue, depressed mood, and decreased work performance.

Cardiovascular and Physiological Effects. Human's bodily reactions to noise are rooted in the "fight or flight" response that evolved when many noises signaled imminent danger. These include increased blood pressure, elevated heart rate, and vasoconstriction. Prolonged exposure to acute noises can result in permanent effects such as hypertension and heart disease.

Impaired Cognitive Performance. Studies have established that noise exposure impairs people's abilities to perform complex tasks (tasks that require attention to detail or analytical processes) and it makes reading, paying attention, solving problems, and memorizing more difficult. This is why there are standards for classroom background noise levels and why offices and libraries are designed to provide quiet work environments. When working and learning from home, many people find their tasks more difficult because their home environment is not as quiet as their office or school was.

[1] More information on these and other adverse effects of noise may be found in *Guidelines for Community Noise*, eds B Berglund, T Lindvall, and D Schwela, World Health Organization, Geneva, Switzerland, 1999. (https://www.who.int/docstore/peh/noise/Comnoise-1.pdf)

Comments on DEIR Noise Analysis

This project is sited in a largely industrial area, and the current land use – a motorsports venue – is itself a noise generator. Therefore, it is not surprising that the proposed project which consists of seven warehouses does not cause many significant noise impacts. It does, however, cause one impact due to the large number of vehicular trips the project would generate:

> . . . the proposed Project would result in approximately 43,549 daily trips at full buildout, including approximately 9,865 daily truck trips. [DEIR at p. 4.13-22]
>
> Project generated traffic would result in a maximum increase of 3.8 dBA CNEL along Randall Avenue (from Cherry Avenue to Citrus Avenue). . . . AA Table 18 shows that increases in traffic noise levels along Randall Avenue (from Cherry Avenue to Citrus Avenue) would exceed 3.0 dBA and would exceed the County's applicable noise standard of 60 dBA CNEL for residential uses. The impacted roadway segments along Randall Avenue comprise approximately three miles and land use along this stretch are primarily residential. Potential mitigation measures to reduce the Project's traffic noise impacts at the impacted residences would include the construction of sound walls, noise abatement design features (e.g., providing upgraded windows), and/or re-paving the impacted roadway segments with rubberized asphalt. However, there are several issues with the aforementioned measures that would make off-site mitigation for traffic noise impacts infeasible . . . [DEIR at p. 4.13-22]

I do not dispute that the introduction of 33,684 automotive trips and 9,865 truck trips will cause a significant noise impact along "primarily residential" Randall Avenue, but I do dispute that it is infeasible to mitigate the noise impact by providing the residences with upgraded acoustical windows. The DEIR claims that the infeasibility is because

> The Project applicant (and the future Master Developer/Site Developers) does not have jurisdiction over the . . . existing residences to directly mitigate traffic noise impacts at the impacted receivers.

and

> Individual residences may deny approval of . . . upgraded windows.
>
> [DEIR at p. 4.13-23]

The second reason quoted above inadvertently reveals that the preparers of the DEIR know that a viable mitigation option is to offer to upgrade the acoustical insulation of the residences. Yes, some residences may deny approval, but the success of many "residential sound insulation programs" indicates that most will accept. A few of the programs of which I have peripheral knowledge include:

- San Francisco International Airport (more than 15,200 properties treated)[2]
- San José Mineta International Airport (2,675 residences treated)[3]
- Los Angeles World Airports (7,400 of 8,200 eligible residences in Los Angeles treated)[4]
- Sound Transit (303 residences treated)[5]

The *LAX Noise Management Program* document notes the many economic and other benefits that LAX operations bring to Southern California, but it also notes that "with these benefits, though, come impacts – such as . . . . noise – on the densely populated areas adjacent to the airport" and then explains how the residential sound insulation program available in Los Angeles, Inglewood, and El Segundo is one means of providing relief for those affected. Similarly, the development of the Speedway Commerce Center will provide many benefits to the communities of Fontana, Rancho Cucamonga, and others in San Bernardino and Riverside Counties, but CEQA requires that the environmental impacts that are brought about by the development be mitigated to the extent feasible, and offering to improve the acoustical insulation of homes along Randall Avenue is, indeed, a feasible mitigation measure.

♦ ♦ ♦ ♦ ♦

Please contact me if you have any questions about these comments on the feasibility of noise mitigation for the Speedway Commerce Center II Specific Plan Project.

Very truly yours,

WILSON IHRIG

WILSON IHRIG
ACOUSTICS, NOISE & VIBRATION

DEREK L. WATRY

Principal

Since joining Wilson Ihrig in 1992, Derek has gained experienced in many areas of practice including environmental, construction, forensic, architectural, and industrial. For all of these, he has conducted extensive field measurements, established acceptability criteria, and calculated future noise and vibration levels. In the many of these areas, he has prepared CEQA and NEPA noise technical studies and EIR/EIS sections. Derek has a thorough understanding of the technical, public relations, and political aspects of environmental noise and vibration compliance work. He has helped resolve complex community noise issues, and he has also served as an expert witness in numerous legal matters.

Education

- M.S. Mechanical Engineering, University of California, Berkeley
- B.S. Mechanical Engineering, University of California, San Diego
- M.B.A. Saint Mary's College of California

Project Experience

12th Street Reconstruction, Oakland, CA
Responsible for construction noise control plan from pile driving after City received complaints from nearby neighbors. Attendance required at community meetings.

525 Golden Gate Avenue Demolition, San Francisco, CA
Noise and vibration monitoring and consultation during demolition of a multi-story office building next to Federal, State, and Municipal Court buildings for the SFDPW.

911 Emergency Communications Center, San Francisco, CA
Technical assistance on issues relating to the demolition and construction work including vibration monitoring, developing specification and reviewing/recommending appropriate methods and equipment for demolition of Old Emergency Center for the SFDPW.

Central Contra Costa Sanitary District, Grayson Creek Sewer, Pleasant Hill, CA
Evaluation of vibration levels due to construction of new sewer line in hard soil.

City of Atascadero, Review of Walmart EIR Noise Analysis, Atascadero, CA
Review and Critique of EIR Noise Analysis for the Del Rio Road Commercial Area Specific Plan.

City of Fremont, Ongoing Environmental Services On-Call Contract, Fremont, CA
Work tasks primarily focus on noise insulation and vibration control design compliance for new residential projects and peer review other consultant's projects.

City of Fremont, Patterson Ranch EIR, Fremont, CA
Conducted noise and vibration portion of the EIR.

City of King City, Silva Ranch Annexation EIR, King City, CA
Conducted the noise portion of the EIR and assessed the suitability of the project areas for the intended development. Work included a reconnaissance of existing noise sources and receptors in and around the project areas, and long-term noise measurements at key locations.

WILSON IHRIG
ACOUSTICS, NOISE & VIBRATION

Conoco Phillips Community Study and Expert Witness, Rodeo, CA
Investigated low frequency noise from exhaust stacks and provided expert witness services representing Conoco Phillips. Evaluated effectiveness of noise controls implemented by the refinery.

Golden Gate Park Concourse Underground Garage, San Francisco, CA
Noise and vibration testing during underground garage construction to monitor for residences and an old sandstone statue during pile driving for the City of San Francisco.

Laguna Honda Hospital, Clarendon Hall Demolition, San Francisco, CA
Project manager for performed vibration monitoring during demolition of an older wing of the Laguna Honda Hospital.

Loch Lomond Marina EIR, San Rafael, CA
Examined traffic noise impacts on existing residences for the City of San Rafael. Provided the project with acoustical analyses and reports to satisfy the requirements of Title 24.

Mare Island Dredge and Material Disposal, Vallejo, CA
EIR/EIS analysis of noise from planned dredged material off-loading operations for the City of Vallejo.

Napa Creek Vibration Monitoring Review, CA
Initially brought in to peer review construction vibration services provided by another firm, but eventually was tapped for its expertise to develop a vibration monitoring plan for construction activities near historic buildings and long-term construction vibration monitoring.

San Francisco DPW, Environmental Services On-Call, CA
Noise and vibration monitoring for such tasks as: Northshore Main Improvement project, and design noise mitigation for SOMA West Skate Park.

San Francisco PUC, Islais Creek Clean Water Program, San Francisco, CA
Community noise and vibration monitoring during construction, including several stages of pile driving. Coordination of noise and ground vibration measurements during pile driving and other construction activity to determine compliance with noise ordinance. Coordination with Department of Public Works to provide a vibration seminar for inspectors and interaction with Construction Management team and nearby businesses to resolve noise and vibration issues.

San Francisco PUC, Richmond Transport Tunnel Clean Water Program, San Francisco, CA
Environmental compliance monitoring of vibration during soft tunnel mining and boring, cut-and-cover trenching for sewer lines, hard rock tunnel blasting and site remediation. Work involved long-term monitoring of general construction activity, special investigations of groundborne vibration from pumps and bus generated ground vibration, and interaction with the public (homeowners).

Santa Clara VTA, Capitol Expressway Light Rail (CELR) Bus Rapid Transit (BRT) Update EIS, CA
Reviewed previous BRT analysis and provide memo to support EIS.

WILSON IHRIG
ACOUSTICS, NOISE & VIBRATION

Shell Oil Refinery, Martinez, CA
Identified source of community noise complaints from tonal noise due to refinery equipment and operations. Developed noise control recommendations. Conducted round-the-clock noise measurements at nearby residence and near to the property line of the refinery and correlated results. Conducted an exhaustive noise survey of the noisier pieces of equipment throughout the refinery to identify and characterize the dominant noise sources that were located anywhere from a quarter to three-quarters of a mile away. Provided a list of actions to mitigate noise from the noisiest pieces of refinery equipment. Assisted the refinery in the selection of long-term noise monitoring equipment to be situated on the refinery grounds so that a record of the current noise environment will be documented, and future noise complaints can be addressed more efficiently.

Tyco Electronics Corporation, Annual Noise Compliance Study, Menlo Park, CA
Conducted annual noise compliance monitoring. Provided letter critiquing the regulatory requirements and recommending improvements.

University of California, San Francisco Mission Bay Campus Vibration Study, CA
Conducted measurements and analysis of ground vibration across site due to heavy traffic on Third Street. Analysis included assessment of pavement surface condition and propensity of local soil structure.

Ms. Kelilah Federman
Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080-7037

Subject: Speedway Commerce Center II Specific Plan DEIR P22013

Dear Ms. Federman:

Per your request, I reviewed the Draft Environmental Impact Report (the "DEIR") for the Speedway Commerce Center II Specific Plan Project (the "Project") in the County of San Bernardino (the "County"). My review is with respect to transportation and circulation considerations.

My qualifications to perform this review include registration as a Civil and Traffic Engineer in California, over 50 years professional consulting practice in these fields and both preparation and review of the traffic and transportation components of numerous environmental documents prepared under the California Environmental Quality Act ("CEQA"). My professional resume is attached hereto.

The County's VMT Significance Threshold Is Unreasonably Lenient and Not Based on Substantiated Analysis. The More Rigorous Threshold Recommended By OPR Would Result In Findings of Significant Impact

Although the technical analysis of the Project's Vehicle Miles Traveled ("VMT") seems to have been reasonably performed, the significance threshold is set at just 4% below the existing average VMT per employee in non-urbanized portions of the County. This is instead of the 15% below prevailing average recommended by the Governor's Office of Planning and Research ("OPR"), the organization that maintains CEQA and its guidelines. There is also no evidence

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

whether this less rigorous threshold – barely one-quarter of the OPR-recommended VMT reduction - conforms to the legislative intent of SB 843 which designated VMT as the principal measure of transportation impact for the purpose of reducing greenhouse gas and air pollution emissions. Additionally there is no evidence of any professional technical analysis affirming a 4% reduction is the maximum theoretical reduction feasible in the non-urbanized areas of San Bernardino County. It appears a percentage subjectively picked as less than zero to give pro forma impression of conformance to legislative intent but much closer to zero, the status quo, than the 15 percent recommended by OPR. Furthermore, since this an area under County jurisdiction that is surrounded by lands in the Cities of Rancho Cucamonga, Fontana and San Bernardino, it appears illogical for the non-urbanized VMT threshold to be used instead of one reflecting the urbanized condition in those three cities.

In this Particular Situation, LOS Impacts and Mitigation Are Subject To Review and Comment Under CEQA. Proposed Mitigations Do Not Qualify Under CEQA Due to Lack of Assured Timeliness.

The first condition of transportation impact under CEQA is an affirmative response to the following question: Would the Project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities? In this instance the Cities of Rancho Cucamonga and Fontana, San Bernardino County and Caltrans have retained certain traffic Level of Service ("LOS") policies. This makes any non-adherence to those policies as the result of the Project a CEQA impact and makes mitigation of those impacts also subject to CEQA review. DEIR Appendix L does identify numerous locations in the various scenarios studied where the Project would cause or cumulatively contribute to noncompliance with the relevant LOS policies. Although it does identify mitigations for these situations, it presumes without any specificity to each instance that the mitigations can be implemented through financial contributions to established fee programs, payment of fair share fees or a combination of both. However, it cannot be assured that completion of mitigation improvements under such vaguely described financial measures will occur in a sequence that is timely relative to the time of occurrence of the Project's impacts. Consequently, the measures do not qualify as mitigation under CEQA.

Rail Crossings Issue

Roadway improvements related to the Project involve improving and converting two private rail crossings to public crossings and improving another public rail crossing. These are involved and time consuming matters involving the California Public Utilities Commission and the consent of the involved railroads. The DEIR states at page 4.17-22 that "This application process would be

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

conducted after approval of the Final EIR in conjunction with applicable agencies." Hence, there is no assurance mitigation will be implemented in a manner that is timely if ever. Because this involves public safety at rail crossings, this is a reviewable matter under CEQA.

Conclusion

Given all of the above, the DEIR's transportation analysis is deficient, should be revised and recirculated in Draft status.

Sincerely,

Smith Engineering & Management
A California Corporation

Daniel T. Smith Jr., P.E.
President

California No. 938 (Traffic) Arizona No. 22131 (Civil)

PROFESSIONAL EXPERIENCE

Smith Engineering & Management, 1993 to present. President.
DKS Associates, 1979 to 1993. Founder, Vice President, Principal Transportation Engineer.
De Leuw, Cather & Company, 1968 to 1979. Senior Transportation Planner.
Personal specialties and project experience include:

Litigation Consulting. Provides consultation, investigations and expert witness testimony in highway design, transit design and traffic engineering matters including condemnations involving transportation access issues; traffic accidents involving highway design or traffic engineering factors; land use and development matters involving access and transportation impacts; parking and other traffic and transportation matters.

Urban Corridor Studies/Alternatives Analysis. Principal-in-charge for State Route (SR) 102 Feasibility Study, a 35-mile freeway alignment study north of Sacramento. Consultant on I-280 Interstate Transfer Concept Program, San Francisco, an AA/EIS for completion of I-280, demolition of Embarcadero freeway, substitute light rail and commuter rail projects. Principal-in-charge, SR 238 corridor freeway/expressway design/environmental study, Hayward (Calif.) Project manager, Sacramento Northeast Area multi-modal transportation corridor study. Transportation planner for I-80N West Terminal Study, and Harbor Drive Traffic Study, Portland, Oregon. Project manager for design of surface segment of Woodward Corridor LRT, Detroit, Michigan. Directed staff on I-80 National Strategic Corridor Study (Sacramento-San Francisco), US 101-Sonoma freeway operations study, SR 92 freeway operations study, I-880 freeway operations study, SR 152 alignment studies, Sacramento RTD light rail systems study, Tasman Corridor LRT AA/EIS, Fremont-Warm Springs BART extension plan/EIR, SRs 70/99 freeway alternatives study, and Richmond Parkway (SR 93) design study.

Area Transportation Plans. Principal-in charge for transportation element of City of Los Angeles General Plan Framework, shaping nations largest city two decades into 21'st century. Project manager for the transportation element of 300-acre Mission Bay development in downtown San Francisco. Mission Bay involves 7 million gsf office/commercial space, 8,500 dwelling units, and community facilities. Transportation features include relocation of commuter rail station; extension of MUNI-Metro LRT; a multi-modal terminal for LRT, commuter rail and local bus; removal of a quarter mile elevated freeway; replacement by new ramps and a boulevard; an internal roadway network overcoming constraints imposed by an internal tidal basin; freeway structures and rail facilities; and concept plans for 20,000 structured parking spaces. Principal-in-charge for circulation plan to accommodate 9 million gsf of office/commercial growth in downtown Bellevue (Wash.). Principal-in-charge for 64 acre, 2 million gsf multi-use complex for FMC adjacent to San Jose International Airport. Project manager for transportation element of Sacramento Capitol Area Plan for the state governmental complex, and for Downtown Sacramento Redevelopment Plan. Project manager for Napa (Calif.) General Plan Circulation Element and Downtown Riverfront Redevelopment Plan, on parking program for downtown Walnut Creek, on downtown transportation plan for San Mateo and redevelopment plan for downtown Mountain View (Calif.), for traffic circulation and safety plans for California cities of Davis, Pleasant Hill and Hayward, and for Salem, Oregon.

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

TRAFFIC • TRANSPORTATION • MANAGEMENT

Transportation Centers. Project manager for Daly City Intermodal Study which developed a $7 million surface bus terminal, traffic access, parking and pedestrian circulation improvements at the Daly City BART station plus development of functional plans for a new BART station at Colma. Project manager for design of multi-modal terminal (commuter rail, light rail, bus) at Mission Bay, San Francisco. In Santa Clarita Long Range Transit Development Program, responsible for plan to relocate system's existing timed-transfer hub and development of three satellite transfer hubs. Performed airport ground transportation system evaluations for San Francisco International, Oakland International, Sea-Tac International, Oakland International, Los Angeles International, and San Diego Lindberg.

Campus Transportation. Campus transportation planning assignments for UC Davis, UC Berkeley, UC Santa Cruz and UC San Francisco Medical Center campuses; San Francisco State University; University of San Francisco; and the University of Alaska and others. Also developed master plans for institutional campuses including medical centers, headquarters complexes and research & development facilities.

Special Event Facilities. Evaluations and design studies for football/baseball stadiums, indoor sports arenas, horse and motor racing facilities, theme parks, fairgrounds and convention centers, ski complexes and destination resorts throughout western United States.

Parking. Parking programs and facilities for large area plans and individual sites including downtowns, special event facilities, university and institutional campuses and other large site developments; numerous parking feasibility and operations studies for parking structures and surface facilities; also, resident preferential parking .

Transportation System Management & Traffic Restraint. Project manager on FHWA program to develop techniques and guidelines for neighborhood street traffic limitation. Project manager for Berkeley, (Calif.), Neighborhood Traffic Study, pioneered application of traffic restraint techniques in the U.S. Developed residential traffic plans for Menlo Park, Santa Monica, Santa Cruz, Mill Valley, Oakland, Palo Alto, Piedmont, San Mateo County, Pasadena, Santa Ana and others. Participated in development of photo/radar speed enforcement device and experimented with speed humps. Co-author of Institute of Transportation Engineers reference publication on neighborhood traffic control.

Bicycle Facilities. Project manager to develop an FHWA manual for bicycle facility design and planning, on bikeway plans for Del Mar, (Calif.), the UC Davis and the City of Davis. Consultant to bikeway plans for Eugene, Oregon, Washington, D.C., Buffalo, New York, and Skokie, Illinois. Consultant to U.S. Bureau of Reclamation for development of hydraulically efficient, bicycle safe drainage inlets. Consultant on FHWA research on effective retrofits of undercrossing and overcrossing structures for bicyclists, pedestrians, and handicapped.

Response to Comment Letter O3 – Adams Broadwell Joseph & Cardozo

O3-1 The comment provides introductory comments which are noted for the record. All attachments to the comment letter have been received. As the specific comments in the letter re-state the comments in the attachments, responses to the letter also fully respond to the more detailed comments provided in the attached exhibits.

O3-2 The comment provides a general description of the Project. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O3-3 The commenter makes general statements that the Draft EIR does not provide an adequate project description or environmental baseline, lacks substantial evidence, and does not adequately identify potentially significant air quality, greenhouse gas (GHG), soil contamination, noise, and transportation impacts. The comment also states the Project is not consistent with the County's General Plan and requests the Draft EIR be recirculated for public review and comment. Please see Responses O3-13 through O3-22 that address more detailed comments on air quality and GHG; Responses O3-23 through O3-25 that address soil contamination concerns; Responses O3-28 and O3-29 that address noise; and Responses O3-26 and O3-27 that address transportation. Please see Master Response 1 and Response O3-5 that address comments regarding the adequacy of the project description and baseline.

Regarding recirculation, Section 15088.5 of the CEQA Guidelines states recirculation of an EIR is required when "significant new information" is added to the EIR after public notice is given of the availability of the Draft EIR for public review but prior to certification of the Final EIR. The term "information" can include changes in the project or environmental setting, as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative). The changes described in this Final EIR clarify and amplify the existing language. Thus, none of these changes involves "significant new information" triggering recirculation because the changes did not result in any new significant environmental effects, any substantial increase in the severity of any previously identified significant effects, or otherwise trigger recirculation. Instead, the modifications were either environmentally benign or environmentally neutral, and thus represent the kinds of changes that commonly occur as the environmental review process works towards its conclusion. Under such circumstances, recirculation of a Draft EIR is not required.

O3-4 The commenter provides a summary of the Californians Allied for a Responsible Economy (CARECA) organization, which is noted for the record. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O3-5 The comment summarizes general CEQA requirements and case law related to the purpose and requirements of an EIR. This comment does not raise any specific issues with the environmental analysis provided in the Draft EIR. To the extent that the commenter expresses general criticism of the adequacy of the Draft EIR, detailed responses to specific issues raised elsewhere within the comment letter are provided in Responses O3-6 to O3-29, below. In addition, the Draft EIR relies on recent technical reports for analysis; includes mitigation measures for significant impacts; includes alternatives to address impacts; meets the requirement for a disclosure document; does not rely on inaccurate or flawed information; and accurately identifies any significant Project impacts.

O3-6 This comment incorrectly asserts that the Draft EIR does not include an accurate and complete Project Description, while summarizing CEQA requirements and case law related to a project description. The County agrees with commenter that a project description must be "accurate, stable, and finite," which is what is provided in the Draft EIR. Refer to Master Response 1 and Response O3-7 below.

O3-7 The commenter states that the Draft EIR fails to identify reasonably foreseeable uses of the Project site. As disclosed in the Draft EIR, end users of the Project were not known at the time the Draft EIR was prepared and remain unknown at the time of preparation of the Final EIR. However, the speculative nature of the Project does not preclude a thorough analysis of its potential effects. Based on the experience and expertise of the EIR preparer (Kimley-Horn), information provided by the Project Applicant, and the independent judgment of the County, the Draft EIR made reasonable assumptions that the Project would be built out by future high-cube logistics and e-commerce uses, which are the reasonably foreseeable uses of the Project site. These use assumptions provide a worst-case scenario due to impacts associated with cold storage including truck trips and use of refrigerated trucks. To provide a conservative ("worst-case") analysis, and to inform the public and County decision-makers of the full scope of environmental impacts that could occur should the Project be approved, the Draft EIR provided a comprehensive analysis of the potential environmental impacts that would occur. See also Response O3-6 above. The Project is fully described in *Section 3.0, Project Description* of the Draft EIR.

The commenter incorrectly asserts that the Project Description is lacking detail regarding reasonably foreseeable Project operations and the associated impacts; however, the commenter fails to substantiate this claim. The Project is a Specific Plan to allow future development to include high-cube and e-commerce uses, including cold storage. The assertion made that a specific end user tenant is not named, is unreasonable as there would be no way of identifying future occupant(s). The Project analyzed a conservative, worst-case scenario against existing land use allowances and regulatory thresholds. This remains true in the analysis of alternatives.

Specifically, the Air Quality Assessment provided in Draft EIR *Section 4.3, Air Quality* analyzed the Project for build out assuming a worst-case scenario. Refrigerated buildings and Transport Refrigeration Units (TRU) were assumed for modeling purposes to provide a worst-case scenario. The worst-case scenario was also considered when evaluating greenhouse gas emissions, noise, and transportation impacts.

The comment incorrectly states that the Draft EIR fails to identify reasonably foreseeable uses of the Project site. It should be noted that for the purposes of trip generation, the traffic analysis assumed a mix of high-cube logistics and e-commerce space (i.e., 2,641,000 square feet of high-cube logistics and 2,773,050 square feet of e-commerce uses, which total 5,414,050 square feet). E-commerce uses have a higher trip generation rate than high-cube logistics uses but have a lower floor area ratio (FAR). E-commerce uses have a lower FAR (i.e., smaller building size) to accommodate additional parking from higher rates of employees per square foot. Potential tenants and end users are unknown at this time; therefore, the exact square footage allocation between high-cube logistics and e-commerce uses also cannot be determined at this time. Therefore, future development of high-cube logistics and e-commerce uses within the Project site would occur in a combination that would not exceed the maximum number of vehicle trips analyzed within the Draft EIR traffic analysis, which represents a conservative, worst-case scenario (note that a worst-case scenario is more conservative than a "reasonably foreseeable" scenario). (see Draft EIR pages 4.8-19 and 4.8-20). It should be noted that the Project would be subject to a trip budget that would ensure that vehicle trips do not exceed what was analyzed in the traffic analysis. Under the trip budget, the maximum amount of permissible warehouse development would depend upon the final mix of e-commerce and high-cube development, as, for example, 6.6 million square feet of only high-cube warehouse space would generate less trips than the 5,414,050 square foot scenario described above and would therefore be allowed. Therefore, the ultimate identity of the Project's end users would not change this analysis or result in additional or more severe environmental impacts.

For the purposes of construction air quality and greenhouse gas (GHG) emissions modeling, the maximum potential development of approximately 6.6 million square feet of warehouse building area (i.e., conservatively 1,188,460 square feet more than what is reasonably foreseeable) was modeled to reflect the maximum square footage of permissible warehouse building construction potential, as provided in Draft EIR *Section 4.8, Greenhouse Gas Emissions*. This additional building area was also evaluated in the operational air quality and GHG modeling and reflected in the mobile, area, energy, stationary, water, and solid waste emissions. Because truck trip rates vary between the e-commerce and high-cube uses, this additional building area and associated operational vehicle trips was also modeled to capture the worst case truck trip emissions to provide flexibility between land use types and phases. Specifically, the Project's Traffic Study calculated 47,352 passenger car equivalent (PCE) daily trips (34,149 non-PCE daily trips, which include 25,861 passenger cars and 8,468 trucks); refer to Table 4: Summary of Project Trip Generation, Total Trip Generation of the Traffic Study (included as Draft EIR *Appendix L*). The air quality and GHG emissions modeling evaluated 43,549 total daily vehicle trips (non-PCE), which included a total of 33,684 daily passenger car trips and 9,865 daily truck trips (refer to Draft EIR *Table 4.3-8: CalEEMod Land Use and Trip Generation*). As such, the air quality and GHG emissions analysis conservatively evaluated 9,400 additional non-PCE daily vehicle trips (8,003 passenger cars and 1,397 trucks) beyond what was included in the Traffic Study, and beyond the trips that could permissibly be generated under the Project's trip budget. As described above, this conservative analysis was evaluated to capture a "worst case" mix of e-commerce and high-cube

uses and provide flexibility between phases from an air quality and GHG emissions standpoint. As noted in Draft EIR on page 4.3-8, the overall building area and daily vehicle trips are considered conservative and additional building area (refrigerated and non-refrigerated) has also been included in the initial phases of the Project.

O3-8 Commenter discusses cold storage and states that the Draft EIR must disclose use and impacts of backup generators. See Responses O3-6 and O3-7 above. Analysis of air quality impacts associated with Project operations considered emissions from area sources, energy sources, off-road equipment, transport refrigeration units, emergency backup generators, and mobile sources, and discusses each source under the Methodology in Draft EIR *Section 4.3, Air Quality*. The Draft EIR also included a Health Risk Assessment (HRA), which is included as *Appendix C* of the Draft EIR. The HRA and *Section 4.3* include a lengthy discussion of potential impacts, including health risks, regarding diesel particulate matter (DPM). Draft EIR *Table 4.3-21: Carcinogenic Risk Assessment* on page 4.3-53 shows the unmitigated and mitigated DPM health risk for the combined construction and operations of the Project for sensitive receptors including residential, workers, and students. The analysis found that implementation of MM AQ-1 and MM AQ-9 would reduce cancer risk from Project construction and operations to below the SCAQMD's 10 in one million threshold for all types of receptors. As such, impacts related to DPM would be less than significant with the implementation of MM AQ-1 and MM AQ-9.

The use of backup generators is based on necessity and potential for power outages. Therefore, it is speculative to identify the number of generators, and the hours of use per year. For the purposes of modeling one (1) backup generator per building was assumed to evaluate potential impacts with larger generators assumed for two (2) buildings that would potentially have cold storage The commenter states that the Draft EIR must disclose whether the Project will use generators. Draft EIR *Section 4.3, Air Quality* page 4.3-17 specifically states: "As the Project warehouses are speculative, it is unknown whether emergency backup generators would be used. Backup generators would only be used in the event of a power failure and would not be part of the Project's normal daily operations. Nonetheless, emissions associated with this equipment were included to be conservative. Emissions from an emergency backup generator for each warehouse building were calculated separately from CalEEMod; refer to Draft EIR *Appendix A*. However, CalEEMod default emissions rates were used. If backup generators are required, the end user would be required to obtain a permit from the SCAQMD prior to installation. Emergency backup generators must meet SCAQMD's Best Available Control Technology (BACT) requirements and comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines), which would minimize emissions."

Furthermore, PDF AQ-1 states that if feasible, the Project shall provide electrical hookups to the power grid, rather than use diesel-fueled generators, for the use of electric construction tools, such as saws, drills, and compressors. The analysis of operational air quality, health risks associated with stationary sources, and air emissions from truck trips is based on substantial evidence and no changes to the analysis are required.

O3-9 The commenter states that the Draft EIR fails to describe the Project's lifespan. The Project is for approval of a Specific Plan within unincorporated San Bernardino County. Future development within the Specific Plan would be included within each Planning Area until each parcel builds out. It is anticipated that all Planning Areas would develop per the phasing plan, as described in the Draft EIR *Section 3.0, Project Description*, in accordance with the requirements of State CEQA Guidelines Section 15126. Further, in order to provide annualized Project emissions, Draft EIR *Section 4.8.4: Impact Thresholds and Significance Criteria,* uses methodology recommended by agencies such as SCAQMD to amortize construction emissions. Lastly, there is no requirement in CEQA to identify a project's lifespan. As stated in CEQA Guidelines, Section 15124: "The description of the project shall contain the following information but should not supply extensive detail beyond that needed for evaluation and review of the environmental impact." While discussion of a project lifespan may be relevant to a project with a defined, limited lifespan (e.g., a reclamation plan for a proposed mining operation) the commenter does not identify any specific requirement in CEQA to specify a project lifespan in this instance, which would not be relevant to the proposed Specific Plan.

With regard to GHG emissions, construction emissions would be short-term and only occur during construction and would not be continuous over the life of a project. However, GHG thresholds are established on an annual basis. Therefore, as recommended by the SCAQMD, the Draft EIR amortizes construction emissions over a 30-year period in order to compare emissions to the annual threshold. The 30-year period is recommended by the SCAQMD in their Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13 (August 26, 2009).[2] Additionally, the International Energy Agency, Energy Efficiency Requirements for Building Codes (March 2008), states that a 30-year period is a reasonable timeframe before the first major renovation.[3] Please see Response O3-3 and Master Response 1 regarding adequacy of the project description.

O3-10 The commenter provides a general summary of the State CEQA Guidelines and case law regarding the selection of a baseline for the environmental analysis. The baseline used in the Draft EIR is based on the existing conditions present on the Project site at the time of NOP circulation, consistent with State CEQA Guidelines Section 15125(a)(1), *Environmental Setting*. According to subdivision (a) of Section 15125 of the Guidelines, an EIR must include a description of the existing physical environmental conditions in the vicinity of the project as they exist at the time when the Notice of Preparation (NOP) is published. This "environmental setting" will normally constitute the "baseline condition" against which project-related impacts are compared. Therefore, the baseline conditions for the EIR, unless noted otherwise, are based on conditions that existed in December 2021, when the NOP was published and circulated. The CEQA Guidelines recognize that the data for establishing an environmental baseline cannot be rigid. Because physical environmental conditions may vary over a range of time, the use of environmental baselines that

[2] http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-13/ghg-meeting-13-minutes.pdf.
[3] https://iea.blob.core.windows.net/assets/3783f5e8-b14c-4c18-b04c-aab7c59d6e92/Building_Codes.pdf.

differ from the date of the NOP is reasonable and appropriate in certain circumstances when doing so results in a more accurate or conservative environmental analysis.

The environmental setting is presented in Draft EIR *Section 3.5, Project Setting*. Where appropriate, citations to information presented are included. Furthermore, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O3-11 The commenter alleges that the Draft EIR provided an incorrect baseline associated with traffic speeds surrounding the Project area. The Draft EIR utilizes the SCAQMD Rule 403 requirements, which include limiting speeds on unpaved roads to 15 miles per hour. This is also stated in *Appendix C* of the Draft EIR. MM AQ-1, which states: "All vehicle speeds on unpaved roads, driveways, or driving surfaces shall be limited to 15 miles per hour" is consistent with this SCAQMD requirement. This is describing future conditions that will occur during construction, rather than baseline conditions. The baseline conditions described in the Draft EIR are based on existing conditions present on the Project site at the time of NOP circulation, consistent with State CEQA Guidelines Section 15125(a)(1), and the commenter does not offer further support for their contention that modeling of reduced vehicle speeds during construction results in an inaccurate baseline.

O3-12 The comment provides a summary of State CEQA Guidelines and case law is noted for the record. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O3-13 The commenter described residences and schools in the Project area. The commenter then goes on to state that CARB recommended that the Draft EIR quantify and discuss the Project's air quality impacts associated with Project construction and operation and that these concerns were not adequately addressed in the Draft EIR. The Draft EIR discusses potential air quality and greenhouse gas impacts related to Project implementation in *Section 4.3* and *Section 4.8*, respectively. Data used within these sections is available in *Appendix C* and *Appendix H* of the Draft EIR and summarized in the associated Draft EIR sections. Air quality impacts are quantified and discussed in *Section 4.3.5: Impacts and Mitigation Measures*. In response to the Project's NOP, CARB responded with comments and recommendations on January 12, 2022. CARB stated that the Draft EIR should quantify and discuss the potential cancer risks from Project operations and discussions. CARB also provided recommended air pollution emission reduction measures for warehouses and distribution center. CARB recommendations were included as Standard Conditions for the Project; see *Section 4.3.5*. A Heath Risk Assessment (HRA) was prepared to evaluate impacts to sensitive receptors and is located in Draft EIR *Appendix C*. Project-related health risks were evaluated in a Health Risk Assessment (refer to Draft EIR *Appendix C*) and discussed on Draft EIR pages 4.3-51 through 4.3-53. It should be noted that the HRA also quantifies emissions from yard trucks and on-site equipment and identifies MM AQ-9, which requires zero

emissions cargo handling equipment (e.g., forklifts, yard trucks, hostlers, etc.) to reduce on-site emissions. The HRA evaluated pollutant concentrations at the closest sensitive receptors to the project site, which included residences and Redwood Elementary School. As discussed in the Draft EIR and HRA, impacts would be less than significant with mitigation incorporated. (see Draft EIR at 4.3-43 to 4.3-53). It should be noted that Live Oak Elementary School, Beech Avenue Elementary School and Almond Elementary School mentioned in the comment are further away than Redwood Elementary School. As pollutant concentrations decline further away from the Project site, impacts at these locations would be lower than what was identified in the Draft EIR. The Draft EIR also determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46).

O3-14 The commenter states that the Draft EIR fails to adequately analyze the Project's construction and operation air quality impacts. See Response O3-8. The use of backup generators may be necessary depending on each tenant and expectation of power outages. Therefore, potential use of backup generators is not known at this time. As analyzed in *Section 4.3, Air Quality*, emergency backup generators for each building were included to be conservative. If generators are required, each user would be required to obtain a permit from the SCAQMD prior to installation. Emergency backup generators must meet SCAQMD's Best Available Control Technology (BACT) requirements and comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines), which would minimize emissions. As the end users and future tenants of the proposed Project are unknown, the need for emergency backup generators is speculative. However, emissions from an emergency backup generator for each warehouse building were calculated in *Appendix C* of the Draft EIR. The Draft EIR assumed a typical size backup generator for each warehouse building and large generators for refrigerated space for emergency purposes. Nonetheless, emissions from backup generators were quantified and incorporated into the air quality, health risk, and greenhouse gas emissions analyses (refer to Draft EIR *Section 4.3* and *Section 4.8*, and *Appendix C*. As shown in the Draft EIR, the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.353). Despite the differing opinion offered by commenter's air quality expert, the existence of disagreement among experts concerning the conclusions of an EIR or the propriety of the analytical methods employed in an EIR are not indicative of any deficiency. The County, as CEQA lead agency, is entitled to choose among conflicting expert opinions. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 409; *Greenbaum v. City of Los Angeles* (1984) 153 Cal.App.3d at 412, 413; (*Browning-Ferris v. City Council* (1986) 181 Cal.App.3d 852 at 863). The opinion offered by commenter's air quality expert that backup generators would need to be used more than 150 hours per year is also speculative and is based on an October 2019 event unrelated to the Project; "argument, speculation, unsubstantiated opinion or narrative" is not substantial evidence for purposes of CEQA. (State CEQA Guidelines Section 15384). The Draft EIR analysis of backup generator operations is based on substantial evidence and no changes to the analysis are required.

O3-15 The commenter asserts that the Draft EIR utilized an inaccurate daily vehicle trip rate. As shown in Draft EIR *Section 4.17, Transportation*, vehicle trips generated by the Project were modeled using the Institute of Transportation Engineers average by land use category. The ratio of truck trips was based on the traffic study prepared for the Project. Also refer to Response O3-7 above for an explanation of how the AQGHG modeled trip generation is conservative. The Project utilized the appropriate trip generation factor for each proposed land use type. Refer also to Response O3-14 above, regarding CEQA's treatment of differing expert opinions. Therefore, the Draft EIR assumptions of daily vehicle trip rates are based on substantial evidence and no changes to the analysis are required

O3-16 The commenter provides a general summary of State CEQA Guidelines regarding the feasibility of mitigation measures and references additional mitigation measures proposed by commenter and its expert which are further addressed in responses to Comments O3-17 through O3-20. Potential mitigation measures proposed by commenters and agencies have been considered for their validity and efficacy. Any mitigation which is determined to be feasible and capable of avoiding or minimizing significant impacts will be included in the Project MMRP and *Section 3.0, Errata* of this Final EIR. It is important to note, CEQA does not require adoption of every imaginable feasible mitigation measure. CEQA's requirement applies only to feasible mitigation that will "substantially lessen" a project's significant effects. (Public Resources Code, Section 21002.) As explained by one court: A lead agency's "duty to condition project approval on incorporation of feasible mitigation measures only exists when such measures would [avoid or] 'substantially lessen' a significant environmental effect." (*San Franciscans for Reasonable Growth v. City and County of San Francisco (1989) 209 Cal.App.3d 1502, 1519*.) "Thus, the agency need not, under CEQA, adopt every nickel and dime mitigation scheme brought to its attention or proposed in the project EIR." (Ibid.) Rather, an EIR should focus on mitigation measures that are feasible, practical, and effective. (*Napa Citizens for Honest Government v. Napa County Board of Supervisors (2001) 91 Cal.App.4th 342, 365*.).This commenter lists numerous, general mitigation measures but does not explain how they could feasibly be implemented to reduce or avoid impacts for this Project.

The Draft EIR Air Quality Section (*Section 4.3*) includes numerous construction and operational mitigation measures to reduce emissions. Construction mitigation measures include use of the cleanest equipment available and dust control (MM AQ-1) and low VOC paints (MM AQ-2). Additionally, operational mitigation includes a TDM Program to reduce vehicle trips/miles (MM AQ-3), constructing EV infrastructure (MM AQ-4), conduit for Transport Refrigeration plugins (MM AQ-5), idle limits (MM AQ-6), energy efficient vendor trucks (MM AQ-7), EV charging stations and carpool parking (MM AQ-8), electric/zero emission cargo handling equipment (MM AQ-9), and compliance with SCAQMD Rule 2305 (MM AQ-10) which is a program to incentivize the purchase of cleaner trucks and charging/fueling infrastructure for the project and in the nearby community. Therefore, the Draft EIR GHG mitigation measures comply with State CEQA Guidelines Section 15041 and go above and beyond to meet the essential nexus and rough proportionality standards.

In addition, the Draft EIR GHG Section (*Section 4.8*) includes additional GHG mitigation measures, such as requiring compliance with the County's GHG reduction measures (MM GHG-1), the Draft

EIR also requires the project to implement solar energy generation (MM GHG-2), requires energy efficient buildings that exceed the building code standards (MM GHG-3), requires the solid waste diversion (MM GHG-4), and requires the use of 100 percent electrically powered landscape equipment (MM GHG-5). Refer to Master Response 2.

O3-17 The commenter states that additional mitigation is available which could reduce NO_x emissions to less than significant levels and stated that CARB-recommended measures were not included as legally binding mitigation. However, the commenter acknowledges that some CARB recommended measures were included as Project Design Features (PDFs). CARB's applicable recommendations were included as Standard Conditions for the Project and therefore are not required to be separately included as mitigation. (See *Tracy First v. City of Tracy* (2009) 177 Cal. App. 4th 912, 933-934). Standard Conditions are legally enforceable by the County in connection with the plan check process and issuance of permits for the Project. Additionally, ten mitigation measures were included to reduce potential emissions impacts. (see Draft EIR at pages 4.3-38 to 4.3-42). However, the Project was found to remain beyond the threshold of significance even with the implementation of mitigation. Additionally, refer to Master Response 2 and Responses R2-3 and R2-4 regarding mitigation measures. As noted in Response R2-4, mobile sources are already regulated by CARB and SCAQMD and even with adoption of CARB's Advanced Clean Truck Rule, CARB acknowledges that it will take time for ZE and NZE vehicles to become commercially available and to penetrate the market. For example, CARB's EMission FACtor (EMFAC) 2021 model provides detailed vehicle registration information and estimates the official emissions inventories of on-road mobile sources, vehicle population, and vehicle miles traveled (VMT) in California. The EMFAC2021 data for South Coast portion of San Bernardino County shows that in 2024 (the Project's Phase 1a opening year), approximately 85 percent of heavy trucks would still be powered by diesel and 91 percent of the VMT would occur from diesel trucks. Electric vehicles would make up approximately 0.29 percent of the heavy-duty fleet and 0.25 percent of the heavy truck VMT. The EMFAC data shows that penetration of ZE and NZE vehicles into commercial fleets will be slow. For example, for 2030, the model predicts that 81 percent of heavy trucks would be diesel-powered and that 88 percent of the heavy truck VMT would be from diesel trucks. Therefore, as CARB data anticipates that the vast majority of trucks to be diesel-powered in the Project opening year and in 2030, it would not be feasible to develop numeric targets, to establish preferential occupancy policies, or require purchasing policies applicable to future, unknown tenants. Additionally, SCAQMD Rule 2305 requires reduction in NO_X and particulate matter emissions with reduction measures and/or a mitigation fee that would be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby.

O3-18 The commenter expresses disagreement with the use of project design features (PDFs) as opposed to mitigation measures. As PDFs, the recommendations proposed by CARB, submitted during the NOP comment period for the project, would be incorporated into the Project design prior to emission analysis, thus eliminating their need to be included as separate mitigation. (*See Tracy First v. City of Tracy* (2009) 177 Cal. App. 4th 912, 933-934). Standard Conditions are legally enforceable by the County in connection with the plan check process and issuance of permits for the Project; thus, *Lotus v. Department of Transportation* cited by commenter is inapplicable. The

Draft EIR notes on page 4.3-21 that the PDFs facilitate compliance with regulations and latest best practices. Emissions benefits from implementation of PDF AQ-1 through PDF AQ-23 are not directly quantifiable and not quantified; no credit is taken for these measures. Quantifiable reduction measures were incorporated as mitigation measures, which would be supported by the PDFs. Tenant requirements regarding cleaner vehicles are included as Standard Conditions in the Draft EIR. Though they are not mitigation measures, PDFs are project-specific elements which are required components of Project implementation and are enforceable components of the Project.

O3-19 Recommendations made by CARB were implemented in the environmental analysis to the maximum extent feasible. However, these recommendations (as listed in Response O3-17) are not regulations or requirements. The proposed Project would be subject to all applicable requirements from public agencies. It should be noted that the comment does not demonstrate a nexus to require additional mitigation such as vegetative walls. Such a measure would only reduce localized emissions, which were shown to be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46). Aesthetic impacts were also found to be less than significant (refer to Draft EIR pages 4.1-8 through 4.1-12). Limiting non-essential idling to three minutes as required by MM AQ-1 is considered to be a feasible and achievable mitigation measure for trucks to avoid unnecessarily stopping and restarting engines and the associated startup exhaust. Requiring non-diesel fueled emergency generators is not considered feasible because non-diesel emergency generators are typically not available in the size/horsepower necessary to support warehouse buildings. Additionally, refer to the Response O3-17 regarding mitigation measures.

O3-20 The commenter expresses disagreement with air quality mitigation to reduce construction emissions and states that requiring newer model year construction diesel haul trucks would further reduce emissions. The Draft EIR identifies numerous air quality and GHG mitigation measures to minimize emissions to the greatest extent feasible. Further, while the Project has some control over mobile source efficiencies, the majority of the mobile source emissions are beyond the Project's control. The comment suggests mitigation requiring all heavy-duty construction vehicles entering the Project site to be model year 2014 or 2018 or later. However, CARB is addressing emissions from heavy duty vehicles through various regulatory programs including lower emission standards, restrictions on idling, the use of post-combustion filter and catalyst equipment, and retrofits for diesel truck fleets. These programs are expected to result in significant reductions in NO_X, ROG, PM_{10}, $PM_{2.5}$, and CO emissions as they are fully implemented by 2023. Federal and State agencies regulate and enforce vehicle emission standards. It is not feasible for San Bernardino County to effectively enforce a prohibition on trucks from entering the property that are otherwise permitted to operate in California and access other properties in the County, region, and State. Based on data from CARB, most heavy-duty trucks entering the Project site will meet or exceed 2010 model year emission standards by 2023. Specifically, according to CARB EMFAC inventories, approximately 50 percent of all instate heavy-heavy duty trucks met the 2010 engine standard in 2019, 59 percent in 2020, 62 percent in 2021. Additionally,

65 percent and 90 percent of trucks were projected to meet the 2010 engine standard in in 2022 and 2023 respectively.[4]

O3-21 The commenter states that the Draft EIR fails to analyze and mitigate significant impacts associated with air pollution dispersion. The County disagrees that the dispersion modeling must include building downwash. The commenter refers to the SCAQMD Health Risk Assessment Guidance for Analyzing Cancer Risks form Mobile Source Diesel Emissions, August 2003, page 2, for identification of building height for downwash calculations. However, this guidance document includes guidance for truck idling, ship hoteling at ports and train idling. Page 6 of said document further describes that volume or area source options are most appropriate for the DPM sources associated with truck idling and movement and that point source treatment is most appropriate for ship activity and train idling emissions. Additionally, the treatment of downwash in AERMOD is based on the Plume Rise Model Enhancements (PRIME) model which is integrated into AERMOD for point sources (Schulman et al. 2000). Therefore, the building downwash modeling option is only applicable to point and flare emission source types and is not applicable to the line-volume sources that were modeled for the proposed Project. The purpose of building downwash is to determine if stack discharge might become caught in the turbulent wakes of structures within close proximity. The Draft EIR modeled the mobile sources in the AERMOD dispersion model as line-volume sources consistent with SCAQMD guidance that represent on- and off-site truck movements and idling and is consistent with industry standard analysis. The modeling data is available in Appendix C of the Draft EIR. Additionally, the potential spectators at the speedway would not be considered sensitive receptors because they would not be exposed to the project for extended periods of time. Per AQMD, Sensitive Receptor means any residence including private homes, condominiums, apartments, and living quarters, schools as defined under paragraph (b)(57), preschools, daycare centers and health facilities such as hospitals or retirement and nursing homes. A sensitive receptor includes long term care hospitals, hospices, prisons, and dormitories or similar live-in housing.

O3-22 The comment summarizes the heat island effect and data from the California Environmental Protection Agency (CalEPA). The heat island effect refers to large, urbanized areas that can experience higher temperatures during hot summer months when compared to more rural communities. Heat islands are created by a combination of heat-absorptive surfaces (such as dark pavement and roofing), heat-generating activities (such as engines and generators) and the absence of vegetation (which provides evaporative cooling).

The Project would redevelop an already urbanized area that consists of portions of the Auto Club Speedway and also associated asphalt paved areas. The Project would be required to comply with the County's GHG Reduction Measures (refer to MM GHG-1), which includes requirements for enhanced cool roofs that would actually reduce the heat island effect.

Additionally, the comment incorrectly states that the CalEPA's heat island index data shows that the Project would exacerbate the existing heat island effect. The Urban Heat Island Index data

[4] CARB. (2017). EMFAC2017, An Update to California On-Road Mobile Source Emissions Inventory. Available at: https://ww3.arb.ca.gov/msei/downloads/emfac2017_workshop_11_09_2017_final.pdf (accessed June 2022).

from the CalEPA's Heat Island Interactive Maps quantify the extent and severity of an urban heat island for individual cities. The maps allow for a comparison of different areas, but do not evaluate individual development projects or show the effect of new development. The comment provides no basis for the statement that the CalEPA data exacerbates the existing heat island effect. As noted above, the Project would replace existing asphalt (i.e., black top) with new buildings that would be required to meet the latest building codes and County requirements for light-colored solar reflective roofs that reduce the heat island effect. Furthermore, environmental components that exacerbate the urban heat island effect, such as ozone generation and other GHG emissions, are discussed in *Section 4.3* and *Section 4.8* of the Draft EIR. These sections also include mitigation measures intended to reduce impact associated with these emissions.

O3-23 A Summary Assessment of Environmental Conditions and Land Use Restrictions at the Auto Club Speedway property, 9300 Cherry Avenue, Fontana, California 92335 ("Assessment") was included as *Appendix I* to the Draft EIR. It discussed background site history (associated with Kaiser Steel Mill), environmental conditions, and restrictions. The assessment found that:

- Several areas of the greater current Auto Club Speedway Property were subject to historical remediation activities, and with the exception of ongoing groundwater monitoring, other areas have received no further action designation from the DTSC or "closure" two of these areas received closure with land use covenants (LUCs) prohibiting future development of sensitive uses (i.e., residential, daycare, schools).
- The Capped Property located in the infield of the existing racetrack and beneath existing garages is restricted by a LUC (this area is outside the boundary of the proposed Project).
- The Restricted Property located under the existing racetrack and existing grandstands is restricted by a LUC.
- The Southwest Corner parcel of the Site appears to be used for flood management and may be subject to permitting requirements with the SBCFCD.

The Summary Assessment reviewed multiple documents associated with the investigation, characterization, and remediation of the Project site. The characterization included soil investigations that characterized soil impacts in areas of concern. Impacts associated with upset and accident conditions involving the release of hazardous materials into the environment was evaluated in Draft EIR *Section 4.9, Hazards and Hazardous Materials*. Furthermore, the Draft EIR states that the removal of graded soil throughout the site could potentially release some of the hazardous materials historically found on the site. However, this is unlikely due to the previous remediation performed on the Project site and the time that has passed since remediation actions were taken. Furthermore, although some sites were noted to have previously involved the use or generation of potentially hazardous materials such as hydrocarbons and VOCs, no current violations were noted. Despite the limited potential for the exposure of the public and environment to hazardous materials, with MMs HAZ-1, HAZ-2, and HAZ-3 and compliance with all applicable Federal, State, and regional regulations, the impact would be reduced to less than significant levels with mitigation incorporated. MMs HAZ-1 and HAZ-2 would ensure proper

handling of any contaminated soils and substances which may be encountered, including regulatory oversight, as applicable. While the comment suggests that surrounding populations could be impacted by contaminated soils, the SMP outlined in MM-HAZ-1 includes requirements to properly handle contaminated soils, including proper coverage during transportation and onsite dust suppression. Impacts were found to be less than significant with mitigation incorporated. Additionally, with implementation of BMPs, impacts from uncontrolled dust would be reduced and dust control measures would be in place. Adherence to SCAQMD Rule 1403 would limit asbestos emissions from building demolition and renovation.

O3-24 See Response O3-23 above regarding disturbed soil and the site's historical use as part of the Kaiser Steel Mill. Commenter cites to the preliminary geotechnical study, which is not the relevant document with regard to assessment of hazardous/toxic substances on the site. Refer to the Assessment included as *Appendix I* to the Draft EIR. The Assessment concluded that with the exception of ongoing groundwater monitoring, all areas have received no further action designations from DTSC or "closure." Mitigation Measures HAZ-1 to HAZ-3 will ensure that any potential impacts related to residual contamination from the historic steel mill use will be less than significant. MM-HAZ-1 includes fugitive dust controls during soil disturbing activities, and therefore offsite impacts would be mitigated to a less than significant levels.

O3-25 See Responses O3-23 and O3-24 above. No further response is required. The Soil Management Plan required under MM HAZ-1 will ensure construction worker safety. At this time, future tenants/occupants are not known. However, once identified, they will be required to adhere to the requirements and regulations of Proposition 65 during construction and operations, including the provision of required notices to employees. As Proposition 65 is a state regulation, the Proposition 65 notifications and actions noted in the comment are required by law and therefore are not required as mitigation within the Draft EIR.

O3-26 The commenter states that transportation mitigation measures have been impermissibly deferred. Mitigation measures are required in situations that would generate impacts that are anticipated to be significant. Roadway impacts were not anticipated to require mitigation. However, increased traffic during raceway events were found to generate potentially significant cumulative effects regarding emergency access. Therefore, mitigation was proposed to minimize those specific effects. The mitigation is not improperly deferred because specific performance standards are included, traffic-related mitigation is known to be feasible, and review and approval is required by the County Engineer with input from the Highway Patrol and neighboring cities. A traffic management plan is properly developed after the Project's end-users have been identified and a specific development plan approved. The Transportation Management Plan (TMP) required under MM TRANS-2 will be event-specific and is required to be submitted to the County Engineer a minimum of 30 days prior to each race event; therefore, is not feasible to prepare the TMP at this point in time. This measure is fully enforceable by the County. It is well-settled under CEQA that future preparation of a plan subject to regulatory agency review and approval is not improper deferral. (*See Defend the Bay v. City of Irvine* (2004) 19 Cal.App.4th 1261, 1275-76).

O3-27 The commenter expresses disagreement with the selected VMT threshold. The Project complies with all applicable transportation regulations set by regulatory agencies. However, the Project does not control standards set by those regulatory agencies. The 2018 Technical Advisory On Evaluating Transportation Impacts in CEQA issued by OPR contains *recommendations* for thresholds, but expressly states that "this document does not alter lead agency discretion in preparing environmental documents subject to CEQA" and that "OPR is not enforcing or attempting to enforce any part of the recommendations contained herein." Under CEQA, lead agencies have the discretion to set or apply their own thresholds of significance. (*Center for Biological Diversity v. California Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 218-223; *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th at p. 1068.) OPR's Technical Advisory is not binding on public agencies, and CEQA allows lead agencies to "consider thresholds of significance . . . recommended by other public agencies, provided the decision to adopt those thresholds is supported by substantial evidence." (CEQA Guidelines, Section 15064.7 (c)). The VMT thresholds vary by agency, even among the agencies in the Inland Empire. In the City of Rancho Cucamonga, for example, a significant VMT impact would occur "if the project VMT/Specific Plan exceeds the Citywide average."

The County has adopted 4 percent below existing VMT as the applicable threshold and provides the following reason for the threshold in the San Bernardino County Transportation Impact Study Guidelines (July 9, 2019): "4 percent below existing was identified as an appropriate threshold through an exercise completed by Fehr & Peers as part of the General Plan process. The process focused on development in the growth areas of the County (where major development is expected to occur) and utilized the California Air Pollution Control Officers Association (CAPCOA) Quantifying Greenhouse Gas Mitigation Measures (August 2010) to estimate the maximum feasible VMT mitigation that could be achieved through TDM. The TDM effort identified that the maximum achievable TDM reduction associated with development in the identified growth areas would be just over 4 percent for both residential projects and for commute trips associated with employment uses. Utilizing the maximum achievable TDM reduction as the threshold provides an achievable threshold for County development to consider when processing applications" (Section 4.2: CEQA VMT Impact Threshold and Mitigation). Therefore, the use of the four percent threshold is supported by substantial evidence.

O3-28 The commenter provides a general summary of CEQA principles related to determining and documenting the feasibility of mitigation for identified significant impacts and states that feasible mitigation is available that could reduce the Project's significant and unavoidable roadway noise impacts. The Draft EIR correctly concludes that the Project applicant does not have jurisdictional authority over private residences in a manner where they can enforce the development of sound walls or installation of upgraded windows, nor could the County compel private landowners to accept the erection of soundwalls within their properties or to consent to the installation of sound-rated windows; thus, while available, such mitigation measures are deemed infeasible, because there is no means of assuring universal voluntary participation by residents exposed to potentially significant traffic noise exposure.

O3-29 See Response O3-28 above. Even if a voluntary Noise Insulation Program were proposed, off-site roadway noise impacts would still be considered significant and unavoidable for CEQA purposes since implementation of noise insulation methods by each resident that is potentially exposed to significant traffic noise levels would not be certain.

O3-30 See Responses O3-28 and O3-29 above.

O3-31 The comment states the Draft EIR must be revised and recirculated to inform the decision makers and the public of the Project's significant impacts. The commenter's request for recirculation is noted for the record. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. Please see Response O3-3.

Subject: Comments On Speedway Commerce Center II Specific Plan Project And EIR (SCH NO. 2021120259)

Dear Mr. Valdez,

Thank you for the opportunity to comment on the Environmental Impact Report (EIR) for the proposed Speedway Commerce Center II Specific Plan Project and EIR. Please accept and consider these comments on behalf of Golden State Environmental Justice Alliance (GSEJA). Also, GSEJA formally requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877. 1

1.0 Summary

The project proposes the construction and operation of 6.6 million square feet (sf) of high-cube logistics and e-commerce uses, 261,360 sf of ancillary commercial uses, and approximately 98 acres of parking fields/drop lot areas, as well as ancillary open space. The Project encompasses approximately 433 acres of the approximately 522-acre site that is currently developed with the Auto Club Speedway (ACS), formerly known as the California Speedway. The Project would surround the Next Gen in California Project that will remodel the existing ACS. 2

Steven Valdez

Page 2

3.0 Project Description

The EIR does not include a floor plan, grading plan, elevations, or detailed site plan for the proposed project. The basic components of a Planning Application include a site plan, floor plan, grading plan, elevations, and written narrative. The site plan provided in Figure 3-4 does not provide any detailed information such as the earthwork quantity notes, parking requirements, site coverage, floor area ratio, etc. The EIR has excluded these required application items from public review, which does not comply with CEQA's requirements for adequate informational documents and meaningful disclosure (CEQA § 15121 and 21003(b)). Incorporation by reference (CEQA § 15150 (f)) is not appropriate as these documents contribute directly to analysis of the problem at hand. Providing a grading plan is vital as the EIR utilizes uncertain language in stating that "Earthwork for the site is *anticipated* to balance; however, there is the *potential* for import of soils. Retaining walls *may be needed* in areas of elevation differential between parcels and/or along the Project site boundary." The EIR must be revised to include a grading plan to determine the amount of soils/materials to be imported/exported from the site. These grading truck hauling trips must be included for analysis in the Air Quality, Energy, and Greenhouse Gas Emissions analysis. 3

The EIR does not include the proposed Speedway Commerce Center II Specific Plan (SCCII SP) document as an attachment for public review. The SCCII SP would include permitted uses and development standards such as maximum height, floor area ratio, parking requirements, and other items that contribute directly to the analysis of environmental impacts. Incorporation by reference (CEQA § 15150 (f)) is not appropriate as the SCCII SP contributes directly to analysis of the problem at hand. The EIR must be revised and recirculated to include the SCCII SP document for public review in order to comply with CEQA's requirements for adequate informational documents and meaningful disclosure (CEQA § 15121 and 21003(b)). 4

3.1 Project Piecemealing

The EIR does not accurately or adequately describe the project, meaning "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment" (CEQA § 15378). The proposed project is a piecemealed portion of a larger overall project to be developed in the immediate vicinity including Speedway Commerce Center (SCH No. 2020090076; 655,878 sf of industrial warehouse developed by Hillwood adjacent to west of project site; Notice of Determination published January 21, 2022) and the Next Gen in California Project (SCH No. 2008081077; approved in December 2020 and modified in June 2021). The proximate timeline of submittal and approval of these piecemealed projects to the proposed project further clarifies that 5

the overall development plan for the site was known and planned at the time of the first Next Gen revision in December 2020. 5

CEQA § 15165 - Multiple and Phased Projects requires that "Where individual projects are, or a phased project is, to be undertaken and where the total undertaking comprises a project with significant environmental effect, the Lead Agency shall prepare a single program EIR for the ultimate project as described in Section 15168." The EIR misleads the public and decision makers by circumventing adequate and accurate environmental analysis for the whole of the action - construction and operation of all Speedway Commerce Center buildings and the Next Gen in California project as a whole. A program EIR must be prepared which accurately represents the whole of the action without piecemealing the project into separate, smaller development projects or development areas to present unduly low environmental impacts. Table 4-1 Cumulative Projects List did not include the Next Gen in California Project for cumulative analysis. Including this project for analysis is vital as construction and operations of Next Gen and the proposed project have significant potential to overlap and result in significant cumulative impacts. 6

It must be noted that this is especially vital as the the Next Gen in California Project utilized two EIR Addendums as the environmental analysis documents for approval. EIR Addendums do not require public review and comment periods, which reduce transparency in the public process. The environmental analysis for these piecemealed projects exclude a meaningful analysis that includes all proposed development. The EIR must be revised to comply with CEQA § 15165 by preparing a Program EIR pursuant to CEQA § 15168 and provide a cumulative analysis of all piecemealed projects. 7

4.3 Air Quality, 4.6 Energy, and 4.8 Greenhouse Gas Emissions

Please refer to attachments from SWAPE for a complete technical commentary and analysis.

The EIR does not include for analysis relevant environmental justice issues in reviewing potential impacts, including cumulative impacts from the proposed project. This is especially significant as the surrounding community is highly burdened by pollution. According to CalEnviroScreen 4.0[1], CalEPA's screening tool that ranks each census tract in the state for pollution and socioeconomic vulnerability, the proposed project's census tract (6071002204) ranks worse than 96% of the rest of the state overall. The proposed project's census tract (6071002204) and surrounding community, including residences to the north and east, Kaiser Park to the south, and Live Oak Elementary School and Sequoia Middle School to the east, bears the impact of multiple sources of 8

[1] CalEnviroScreen 4.0 https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40

pollution and is more polluted than average on several pollution indicators measured by CalEnviroScreen. For example, the project census tract ranks in the 95th percentile for ozone burden, the 94th percentile for PM 2.5 burden, the 90th percentile for diesel particulate matter burden, and the 70th percentile for traffic impacts. All of these environmental factors are typically attributed to heavy truck activity in the area. The census tract also ranks in the 97th percentile for hazardous waste impacts. Hazardous waste generators and facilities contribute to the contamination of air, water and soil near waste generators and facilities can harm the environment as well as people[2]. Additionally, the census tract ranks in the 95th percentile for solid waste facility impacts, which can expose people to hazardous chemicals, release toxic gases into the air (even after these facilites are closed), and chemicals can leach into soil around the facility and pose a health risk to nearby populations[3]. 8

Further, the census tract is a diverse community including 75% Hispanic, 7% African-American, and 6% Asian-American residents that are especially vulnerable to the impacts of pollution. The community has a high rate of low educational attainment, meaning 79% of the census tract over age 25 has not attained a high school diploma, which is an indication that they may lack health insurance or access to medical care. Medical care is vital for this census tract as it ranks in the 86th percentile for incidence of cardiovascular disease and 72nd percentile for incidence of asthma. The community also has a high rate of linguistic isolation, meaning 73% of the census tract speaks little to no English and faces further challenges and inequities due to this. 9

Additionally, the project's census tract (6071002204) and the census tracts adjacent to the project site (6077005119 (east), 6077005122 (east), 6077005302 (west), 6077005206 (west), and 6077003900 (north)) are identified as SB 535 Disadvantaged Communities, which is not discussed or presented for analysis in the EIR. 10

The State of California lists three approved energy compliance modeling softwares for non-residential buildings: CBECC-Com, EnergyPro, and IES VE. CalEEMod is not listed as an approved software. The spreadsheet-based analysis and CalEEMod modeling in Appendix E does not comply with the 2019 Building Energy Efficiency Standards and under-reports the project's significant Energy impacts and fuel consumption to the public and decision makers. Since the EIR did not accurately or adequately model the energy impacts in compliance with Title 24, an additional finding of significance must be made. A revised EIR with modeling in one of the 11

[2] OEHHA Hazardous Waste Generators and Facilities https://oehha.ca.gov/calenviroscreen/indicator/hazardous-waste-generators-and-facilities
[3] OEHHA Solid Waste Facilities https://oehha.ca.gov/calenviroscreen/indicator/solid-waste-sites-and-facilities

approved software types must be circulated for public review in order to adequately analyze the project's significant environmental impacts. This is vital as the EIR utilizes CalEEMod as a source in its methodology and analysis, which is clearly not one of the approved softwares. 11

4.11 Land Use and Planning

Table 4.11-3: Consistency with SCAG 2020-2024 RTP/SCS erroneously finds consistency with SCAG's Connect SoCal RTP/SCS document. Due to errors in modeling as noted throughout this comment letter and the EIR's determination that the project will result in significant and unavoidable impacts to Air Quality (cumulatively considerable), Energy (cumulatively considerable), Greenhouse Gas Emissions (cumulatively considerable), and Noise (cumulatively considerable), the proposed project is directly inconsistent with Goal 5 to reduce greenhouse gas emissions and improve air quality, Goal 6 to support healthy and equitable communities, and Goal 7 to adapt to a changing climate. The EIR must be revised to include a finding of significance due to inconsistency with SCAG's Connect SoCal RTP/SCS. 12

Additionally, due to errors in in modeling as noted throughout this comment letter and the EIR's determination that the project will result in significant and unavoidable impacts to Air Quality (cumulatively considerable), Energy (cumulatively considerable), Greenhouse Gas Emissions (cumulatively considerable), and Noise (cumulatively considerable) within the County's Western Fontana Environmental Justice Focus Area/an SB 535 Disadvantaged Community, the project is inconsistent with the following applicable items from the General Plan and the EIR has not provided a consistency analysis:

Goal HZ-3 Environmental Justice: For unincorporated environmental justice focus areas, equitable levels of protection from environmental and health hazards; expanded opportunities for physical activity and meaningful civic engagement; and access to healthy food, public facilities, safe and sanitary housing. 13

Policy HZ-3.18 Application requirements. In order for a Planning Project Application (excluding Minor Use Permits) to be deemed complete, we require applicants to indicate whether the project is within or adjacent to an unincorporated environmental justice focus area and, if so, to:

- document to the County's satisfaction how an applicant will address environmental justice concerns potentially created by the project; and
- present a plan to conduct at least one public meeting for nearby residents, businesses, and property owners to obtain public input for applications involving a change in zoning or the Policy Plan. The County will require additional public outreach if the proposed project changes substantively in use, scale, or intensity.

Goal NR-1 Air Quality. Air quality that promotes health and wellness of residents in San Bernardino County through improvements in locally-generated emissions.

Policy NR-1.7 Greenhouse gas reduction targets. We strive to meet the 2040 and 2050 greenhouse gas emission reduction targets in accordance with state law.

Policy NR-1.9 Building design and upgrades. We use the CALGreen Code to meet energy efficiency standards for new buildings and encourage the upgrading of existing buildings to incorporate design elements, building materials, and fixtures that improve environmental sustainability and reduce emissions.

Policy LU-2.3 Compatibility with natural environment. We require that new development is located, scaled, buffered, and designed for compatibility with the surrounding natural environment and biodiversity.

Policy LU-4.5 Community identity. We require that new development be consistent with and reinforce the physical and historical character and identity of our unincorporated communities, as described in Table LU-3 and in the values section of Community Action Guides. In addition, we consider the aspirations section of Community Action Guides in our review of new development.

13

Analysis of the proposed project in accordance with these goals and policies is vital as there is significant potential for inconsistency with the General Plan. For example, the project site is located within an EJ focus area (west Fontana census tract 6071002204) and the EIR does not include any information regarding the required EJ concerns documentation and public outreach meeting. Additionally, the project will result in significant and unavoidable impacts to Air Quality (cumulatively considerable), Energy (cumulatively considerable), Greenhouse Gas Emissions (cumulatively considerable), and Noise (cumulatively considerable) within the project census tract that is a San Bernardino County Environmental Justice Focus Area and is designated as a SB 535 Disadvantaged Community. The EIR must be revised to include this information for analysis in order to provide an adequate, accurate environmental analysis.

14

4.14 Population and Housing

The EIR's justification of no impact to population and housing relies upon the total 2019 existing workforce of San Bernardino County. The EIR states that the project would "comprise approximately 0.4 percent of the County's 2019 workforce." However, the threshold for impact analysis is: "Would the project induce substantial *unplanned* population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through

15

extension of roads or other infrastructure)?" The EIR's reliance upon the existing workforce to fill the project's operational jobs does not analyze to any extent the *planned* population or employment growth within San Bernardino County. 15

The planned growth for San Bernardino County is developed by the Southern California Association of Governments (SCAG). SCAG's Connect SoCal Demographics and Growth Forecast[4] states that the unincorporated areas of San Bernardino County will add 14,100 jobs between 2016 - 2045. Utilizing the EIR's calculation of 3,732 employees, the project represents 26% of unincorporated San Bernardino County's employment growth from 2016 - 2045. SCAG's Growth Forecast states that unincorporated San Bernardino County's population will increase by 45,000 residents between 2016 - 2045. Utilizing the EIR's calculation of 3,732 employees, the project represents 8.3% of unincorporated San Bernardino County's population growth from 2016 - 2045. A single project accounting for these amounts of growth within unincorporated San Bernardino County over 29 years represents a significant amount of growth. The EIR must be revised to include this analysis, and also provide a cumulative analysis discussion of projects approved since 2016 and projects "in the pipeline" to determine if the project will exceed SCAG's employment and/or population growth forecast. 16

The EIR does not provide a quantified analysis of construction jobs generated by the proposed project. The EIR relies upon uncertain language in its analysis of construction jobs generated by the proposed project. The EIR states that "Construction of the Project would generate *temporary* employment opportunities, including short-term design, engineering, and construction jobs. Construction related jobs would not result in a significant population increase because those jobs are temporary in nature and are expected to be filled by persons within the *local area*." Additionally, the EIR does not define the boundaries of the "local area," or demonstrate how the project will not need any workers from outside the "local area." Relying upon the workforce of the greater SCAG region will increase VMT and air quality/greenhouse gas emissions, and a revised EIR must be prepared to reflect this. The revised EIR must also include information and analysis regarding the number of construction jobs generated by the project and their potential to relocate to the County. 17

[4] SCAG Connect SoCal Demographics and Growth Forecast adopted September 3, 2020 https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_demographics-and-growth-forecast.pdf?1606001579

4.17 Transportation

Appendix L: VMT/Traffic calculates the project's VMT using "two components – the total number of trips generated and the average trip length of each vehicle." However, the VMT analysis does not provide the number of trips generated or the average trip length of each vehicle. The EIR must be revised to include this information for analysis in order to be an adequate informational document. This is vital as Appendix C: Air Quality utilizes the following trip generation information for analysis:

Phase 1a Passenger Cars

29,518,574 Annual Mitigated VMT
7,583 Average Daily Trips (ADT)

3,892 VMT Daily

Phase 1a Trucks

56,779,851 Annual Mitigated VMT
4,664 ADT

12,174 VMT Daily

Phase 1a Vans

18,540,139 Annual Mitigated VMT
4,707 ADT

3,938 VMT Daily

Phase 1a Total VMT Daily = 20,004

Phase 1b Passenger Cars

23,740,625 Annual Mitigated VMT

6,099 ADT

3,892 VMT Daily

Phase 1b Trucks
42,801,696 Annual Mitigated VMT
3,541 ADT

18

12,087 VMT Daily

Phase 1b Vans

14,657,440 Annual Mitigated VMT
3,765 ADT

3,893 VMT Daily

Phase 1b Total VMT Daily = 19,872

Phase 2 Passenger Cars

7,785,257 Annual Mitigated VMT
2,023 ADT

3,848 VMT Daily

Phase 2 Trucks

15,690,861 Annual Mitigated VMT
1,298 ADT

12,088 VMT daily

Phase 2 Total VMT Daily = 15,936

General Commercial

18,554,948 Annual Mitigated VMT
9,866 ADT

1,880 VMT daily

Full Operations Total VMT Annually = 228,069,391
Full Operations Total VMT Daily = 57,692

18

The EIR states that the VMT per employee for the project is 17.5, which is 6.9% less than the San Bernardino Unincorporated County Average of 19.6 VMT per employee. The EIR does not provide a source or methodology for the calculation of County Average VMT per employee. This must be included as part of a revised EIR. The EIR relies on the project's alleged 6.9% reduction in VMT per employee to conclude that the project will result in less than significant impacts to VMT. However, the operational nature of industrial/warehouse uses involves high rates of

19

truck/trailer VMT due to traveling from large regional distribution centers to smaller industrial parks (such as the proposed project) and then to their final delivery destinations. As shown above, Appendix A: Air Quality calculates that the project's operational VMT is 228,069,391 miles annually, which results in an average of 57,692 miles per day based on the number of average daily trips. The project's truck/trailer activity is unable to utilize public transit and it is misleading to the public and decision makers to conclude the project will result in less than significant VMT impacts. A revised EIR must be prepared which reflects the average daily trips and VMT utilized for Air Quality modeling regarding the potentially significant project transportation impacts, including cumulative impacts. 19

5.0 Other CEQA Considerations

5.3 Growth Inducing Impacts

The EIR utilizes uncertain language in stating that "*Most* construction workers would be *anticipated* to come from within the County *or from the nearby region*, which already has a population of substantial size to supply the needed workers." The EIR does not provide any specific information, details, or meaningful evidence regarding the "nearby region" and its "population of substantial size." The boundaries of the "nearby region" are also undefined. Relying upon the regional workforce of the greater SCAG region will increase VMT and air quality/greenhouse gas emissions, and a revised EIR must be prepared to reflect this. The revised EIR must also include information and analysis regarding the number of construction jobs generated by the project and their potential to relocate to the County. 20

The EIR is internally inconsistent. The population and housing analysis in this section states the project will generate "approximately 3,127 employees" at full project operation. Section 4.14 Population and Housing states the project will generate 3,732 employees at full project operation. The EIR must be revised to state the project will generate 3,732 employees. Further, the EIR relies upon the notion that the number of operational employees is less than the number of unemployed persons within the County to determine less than significant impacts. However, the EIR does not give any information regarding if the County's unemployed population is qualified for or interested in work in the industrial sector. The EIR has not provided meaningful evidence to support the conclusion that the project will result in less than significant impacts. A finding of significance must be made. 21

The EIR is misleading and an inadequate informational document. In response to the threshold, "Would the Project encourage or facilitate other activities that could significantly affect the environment, either individually or cumulatively?" the EIR simply states "Refer to Section 4.1 through Section 4.20 of this EIR." This response is not adequate and circumvents providing a 22

direct analysis of the project in response to this threshold. The EIR must be revised here to discuss and analyze the project's significant and unavoidable cumulatively considerable impacts to Air Quality, Energy, Greenhouse Gas Emissions, and Noise. Project implementation will result in growth that does not comply with the AQMP, has significant potential to cumulatively contribute to population/employment growth that exceed planned growth, and will have additional environmental impacts that cannot be mitigated. These significant and irreversible environmental changes caused by the project necessitate a finding of significance in this section. 22

The EIR must also include a cumulative analysis discussion here to demonstrate the impact of the proposed project in a cumulative setting. For example, other recent warehousing projects in San Bernardino County including but not limited to Arrow Route Warehouse represents 1.2% of the unincorporated County's employment growth from 2016 - 2045, Whittram Avenue Warehouse represents 1.2% of this growth, and Bloomington Business Park represents 20% of this growth. Cumulatively, these three projects plus the proposed project represent 48.4% of employment growth over the 29 year period. 23

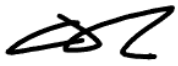
6.0 Alternatives

The EIR is required to evaluate a reasonable range of alternatives to the proposed project which will avoid or substantially lessen any of the significant effects of the project (CEQA § 15126.6.) The alternatives chosen for analysis include "No Project," "Reduced Footprint," and "Commercial Development." The EIR does not evaluate a reasonable range of alternatives as only two alternatives beyond the required No Project alternative are analyzed. The EIR does not include an alternative that meets the project objectives and also eliminates all of the project's significant and unavoidable impacts. The EIR must be revised to include analysis of a reasonable range of alternatives and foster informed decision making (CEQA § 15126.6). This could include alternatives such as development of the site with a project that reduces all of the proposed project's significant and unavoidable impacts to less than significant levels. 24

Conclusion

For the foregoing reasons, GSEJA believes the EIR is flawed and a revised EIR must be prepared for the proposed project and recirculated for public review. Golden State Environmental Justice Alliance requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877. 25

Sincerely,



Gary Ho

Subject: Comments on the Speedway Commerce Center II Specific Plan Project (SCH No. 2021120259)

Dear Mr. Ho,

We have reviewed the June 2022 Draft Environmental Impact Report ("DEIR") for the Speedway Commerce Center II Specific Plan Project ("Project") located in the County of San Bernardino ("County"). The Project proposes to construct up to approximately 6,600,000-square-feet ("SF") of high-cube logistics and e-commerce development with approximately 261,360-SF of ancillary commercial uses and 98 acres of parking lot areas on the 433-acre site.

Our review concludes that the DEIR fails to adequately evaluate the Project's air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the environment.

Air Quality

Failure to Implement All Feasible Mitigation to Reduce Emissions

The DEIR concludes that the Project's construction, operational, and buildout emissions would be significant-and-unavoidable. Specifically, the DEIR estimates that the NO_X emissions associated with Phase 1a, Phase 1b, and Phase 2 of Project construction would exceed the applicable South Coast Air

Quality Management District ("SCAQMD") threshold of 100 pounds per day ("lbs/day") (see excerpt below) (p. 4.3-27 – 4.3-29, Table 4.3-9, Table 4.3-10, Table 4.3-11).[1]

Table 4.3-9: Phase 1a Construction Emissions

Construction Year	Emissions (Maximum Pounds Per Day)					
	ROG	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Unmitigated Emissions[1]						
Year 2023	372.22	555.14	702.91	2.12	155.16	54.34
SCAQMD Threshold	*75*	*100*	*550*	*150*	*150*	*55*
Exceed SCAQMD Threshold?	**Yes**	**Yes**	**Yes**	**No**	**Yes**	**No**
Mitigated Emissions[2]						
Year 2023	43.04	465.49	702.91	2.12	94.27	31.30
SCAQMD Threshold	*75*	*100*	*550*	*150*	*150*	*55*
Exceed SCAQMD Threshold?	**No**	**Yes**	**Yes**	**No**	**No**	**No**

ROG = Reactive Organic Gases; NO_X = Nitrogen Oxides; CO = Carbon Monoxide; SO_2 = Sulfur Dioxide; PM_{10} = Particulate Matter 10 microns in diameter or less; $PM_{2.5}$ = Particulate Matter 2.5 microns in diameter or less

1. SCAQMD Rule 403 Fugitive Dust applied. The Rule 403 reduction/credits include the following: properly maintain mobile and other construction equipment; water exposed surfaces three times daily; and limit speeds on unpaved roads to 15 miles per hour. Reductions percentages from the SCAQMD CEQA Handbook (Tables XI-A through XI-E) were applied. No mitigation was applied to construction equipment. Refer to Appendix A for Model Data Outputs.
2. Mitigation includes the incorporation of MM AQ-1 and MM AQ-2. MM AQ-1 requires dust control and exhaust measures including requiring off-road equipment 50 horsepower or greater to meet CARB Tier 4 Final standards. MM AQ-2 requires the use of "Super-Compliant" low VOC paints.

As a result, the DEIR concludes that the impacts associated with Project construction, operation, and buildout would be significant-and-unavoidable (p. 4.3-34). However, while we agree that the Project's criteria air pollutant emissions would result in a significant air quality impact, the DEIR's conclusion that these impacts are "significant and unavoidable" is incorrect. According to CEQA Guidelines § 15096(g)(2):

> "When an EIR has been prepared for a project, the Responsible Agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment."

As stated above, an impact can only be labeled as significant and unavoidable after all available, feasible mitigation is considered. Here, while the DEIR includes Project Design Feature ("PDF") AQ-1 through AQ-23, Standard Condition ("SC") AQ-1 through AQ-11, and Mitigation Measure ("MM") AQ-1 through AQ-10 the DEIR fails to implement *all* feasible mitigation (p. 4.3-21 – 4.3-23; 4.3-37 – 4.3-38; 4.3-38 – 4.3-42). Therefore, the DEIR's conclusion that the Project's air quality impacts are significant-and-

unavoidable is unsubstantiated. To reduce the Project's air quality impacts to the maximum extent possible, additional feasible mitigation measures should be incorporated, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." Thus, the Project should not be approved until an updated EIR is prepared, incorporating all feasible mitigation to reduce emissions to less-than-significant levels.

Failure to Include PDFs as Mitigation Measures

As discussed above, the DEIR concludes that the Project would have significant construction and operational air quality impacts after the incorporation of Project Design Features ("PDFs") and mitigation. Specifically, the DEIR indicates "the Project would comply with various SCs and includes numerous PDFs and MMs that would minimize emissions," including PDF AQ-1 through PDF AQ-23 (p. 4.3-32; p. 4.3-21 – 4.3-23). For example, the DEIR incorporates PDF AQ-4, which states:

> "Tenant lease agreements shall include contractual language restricting trucks and support equipment from idling longer than five minutes while on site" (p. 4.3-21).

As demonstrated above, PDF AQ-4 requires tenant lease agreements to restrict idling to less than five minutes. Furthermore, the DEIR incorporates PDF AQ-8, which states:

> "During operations, tenants/facility operators shall ensure that all heavy-duty vehicles (i.e., fleet equipment with a gross vehicle weight rating greater than 14,000 pounds) registered in California entering or operated on the Project site shall be model year 2010 emissions equivalent or later as currently defined in California Code of Regulations Title 13, Division 3, Chapter 1, Article 4.5, Section 2025. Tenants/facility operators shall maintain records on its fleet equipment and ensure that all heavy-duty trucks accessing the Project site use year 2010 or newer engines. The records shall be maintained on-site and be made available for inspection by the County. Encouraging the use of model year 2010 or newer trucks and other efficiency measures could incentivize near zero emission (NZE) or zero emission (ZE) truck visits, which would facilitate compliance with SCAQMD Rule 2305 (Warehouse Indirect Source Rule)" (p. 4.3-22).

As demonstrated above, all heavy-duty vehicles accessing the Project site should be model year 2010 or later. However, the Project's air quality analysis is inadequate, as the DEIR should have incorporated all of the above-mentioned PDFs as formal mitigation measures. According to the Association of Environmental Professionals ("AEP") *CEQA Portal Topic Paper* on Mitigation Measures:

> "While not "mitigation", a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a

> change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."[3]

As you can see in the excerpt above, PDFs that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the PDFs described in the DEIR are not formally included as mitigation measures, we cannot guarantee that they would be implemented, monitored, and enforced on the Project site. As a result, until the PDFs are included as mitigation measures, the DEIR's air quality analysis should not be relied upon to determine Project significance.

Disproportionate Health Risk Impacts of Warehouses on Surrounding Communities

Upon review of the DEIR, we have determined that the development of the proposed Project would result in disproportionate health risk impacts on community members living, working, and going to school within the immediate area of the Project site. According to the SCAQMD:

> "Those living within a half mile of warehouses are more likely to include communities of color, have health impacts such as higher rates of asthma and heart attacks, and a greater environmental burden."[4]

In particular, the SCAQMD found that more than 2.4 million people live within a half mile radius of at least one warehouse, and that those areas not only experience increased rates of asthma and heart attacks, but are also disproportionately Black and Latino communities below the poverty line.[5] Another study similarly indicates that "neighborhoods with lower household income levels and higher percentages of minorities are expected to have higher probabilities of containing warehousing facilities."[6] Additionally, a report authored by the Inland Empire-based People's Collective for Environmental Justice and University of Redlands states:

> "As the warehouse and logistics industry continues to grow and net exponential profits at record rates, more warehouse projects are being approved and constructed in low-income communities of color and serving as a massive source of pollution by attracting thousands of polluting truck trips daily. Diesel trucks emit dangerous levels of nitrogen oxide and particulate matter that cause devastating health impacts including asthma, chronic obstructive pulmonary

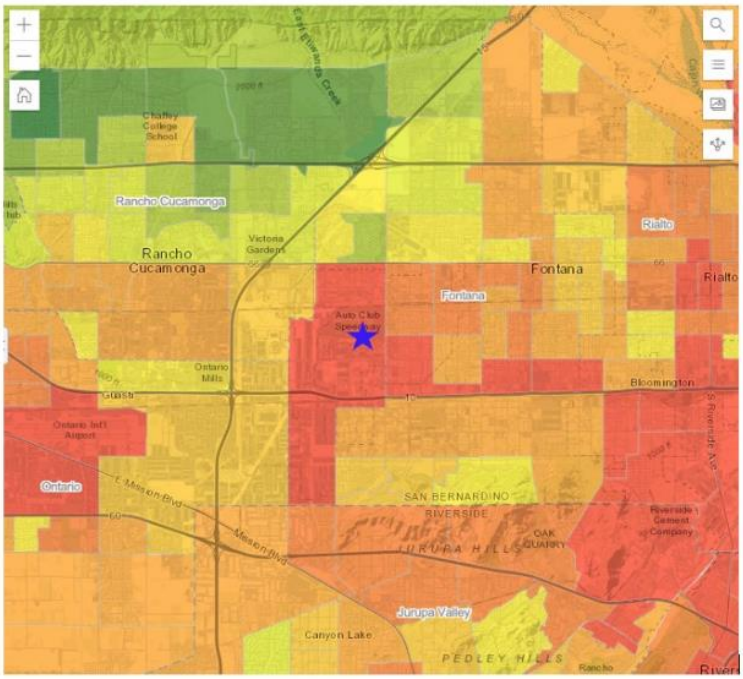
disease (COPD), cancer, and premature death. As a result, physicians consider these pollution-burdened areas 'diesel death zones."[7]

It is evident that the continued development of industrial warehouses within these communities poses a significant environmental justice challenge. However, the acceleration of warehouse development is only increasing despite the consequences on public health. The Inland Empire alone is adding 10 to 25 million SF of new industrial space each year.[8] San Bernardino County, the setting of the proposed Project, has long borne a disproportionately high pollution burden compared to the rest of California. When using CalEnviroScreen 4.0, CalEPA's screening tool that ranks each census tract in the State for pollution and socioeconomic vulnerability, we found that the Project's census tract is in the 93rd percentile of most polluted census tracts in the State (see excerpt below).[9]



[7] "Warehouses, Pollution, and Social Disparities: An analytical view of the logistics industry's impacts on environmental justice communities across Southern California." [9] "CalEnviroScreen 4.0." California Office of Environmental Health Hazard Assessment (OEHHA), October 2021, *available at:* https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40.

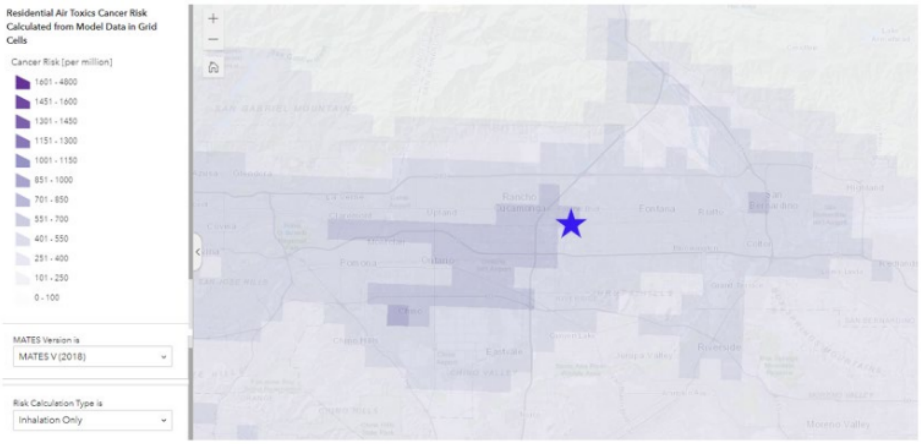
6

The DEIR's Health Risk Assessment ("HRA"), provided in Appendix C, elaborates on the Project's high pollution burden itself, stating:

> "OEHHA has developed CalEnviroScreen 3.0, which is a mapping tool that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. CalEnviroScreen uses environmental, health, and socioeconomic information to produce scores for every census tract in the State. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores.
>
> According to CalEnviroScreen, the Project site and the nearest residences to the northeast are located within Census Tract 6071002204, which is within the 93rd percentile" (p. 11).

Furthermore, the Data Visualization Tool for Mates V, a monitoring and evaluation study conducted by SCAQMD, demonstrates that the Project site already exhibits a heightened residential carcinogenic risk from exposure to air toxics (see excerpt below).[10]



Therefore, development of the proposed warehouse would disproportionately contribute to and exacerbate the health conditions of the residents in San Bernardino County.

In April 2022, the American Lung Association ranked San Bernadino County as the worst for ozone pollution in the nation.[11] The Los Angeles Times also reported that San Bernardino County had 130 bad

[10] "Residential Air Toxics Cancer Risk Calculated from Model Data in Grid Cells." 7

air days for ozone pollution in 2020, violating federal health standards on nearly every summer day.[12] Downtown Los Angeles, by comparison, had 22 ozone violation days in 2020. This year, the County continues to face the worst ozone pollution, as it has seen the highest recorded Air Quality Index ("AQI") values for ground-level ozone in California.[13] The U.S. Environmental Protection Agency ("EPA") indicates that ozone, the main ingredient in "smog," can cause several health problems, which includes aggravating lung diseases and increasing the frequency of asthma attacks. The U.S. EPA states:

> "Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure. Children are also more likely than adults to have asthma."[14]

Furthermore, regarding the increased sensitivity of early-life exposures to inhaled pollutants, the California Air Resources Board ("CARB") states:

> "Children are often at greater risk from inhaled pollutants, due to the following reasons:
>
> - Children have unique activity patterns and behavior. For example, they crawl and play on the ground, amidst dirt and dust that may carry a wide variety of toxicants. They often put their hands, toys, and other items into their mouths, ingesting harmful substances. Compared to adults, children typically spend more time outdoors and are more physically active. Time outdoors coupled with faster breathing during exercise increases children's relative exposure to air pollution.
>
> - Children are physiologically unique. Relative to body size, children eat, breathe, and drink more than adults, and their natural biological defenses are less developed. The protective barrier surrounding the brain is not fully developed, and children's nasal passages aren't as effective at filtering out pollutants. Developing lungs, immune, and metabolic systems are also at risk.
>
> - Children are particularly susceptible during development. Environmental exposures during fetal development, the first few years of life, and puberty have the greatest potential to influence later growth and development."[15]

[12] "Southern California warehouse boom a huge source of pollution. Regulators are fighting back." Los Angeles Times, May 2021, *available at:* https://www.latimes.com/california/story/2021-05-05/air-quality-officials-target-warehouses-bid-to-curb-health-damaging-truck-pollution.
[13] "High Ozone Days." American Lung Association, 2022, *available at:* https://www.lung.org/research/sota/city-rankings/states/california.
[14] "Health Effects of Ozone Pollution." U.S. EPA, May 2021, *available at:* https://www.epa.gov/ground-level-ozone-pollution/health-effects-ozone-pollution.
[15] "Children and Air Pollution." California Air Resources Board (CARB), *available at:* https://ww2.arb.ca.gov/resources/documents/children-and-air-pollution.

8

A Stanford-led study also reveals that children exposed to high levels of air pollution are more susceptible to respiratory and cardiovascular diseases in adulthood.[16] Thus, given children's higher propensity to succumb to the negative health impacts of air pollutants, and as warehouses release more smog-forming pollution than any other sector, it is necessary to evaluate the specific health risk that warehouses pose to children in the nearby community.

According to the above-mentioned study by the People's Collective for Environmental Justice and University of Redlands, there are 640 schools in the South Coast Air Basin that are located within half a mile of a large warehouse, most of them in socio-economically disadvantaged areas.[17] Regarding the proposed Project itself, the DEIR indicates that the Project is located near several residential communities and schools (see excerpt below) (p. 4.3-5, Table 4.3-3):

Table 4.3-3: Sensitive Receptors

Receptor Description	Distance and Direction from the Project
Single-family Residential Unit	410 feet to the northeast
Single-family Residential Unit(s)	540 feet to the northeast
Single-family Residential Unit(s)	675 feet to the north
Paduma Monastery	1,100 feet to the north
Single-family Residential Unit(s)	1,300 feet to the east
Redwood Elementary School	1,370 feet to the northeast
Single-family Residential Unit(s)	1,800 feet to the north
Living Waters Ministry Church of God in Christ	2,000 feet to the north
Single-family Residential Unit(s)	2,100 feet to the north

Source: Google Earth, 2021.

As demonstrated above, an elementary school, church, and several residential homes are located within the Project's vicinity. This poses a significant threat because, as outlined above, children are a vulnerable population that are more susceptible to the damaging side-effects of air pollution. As such, the Project would have detrimental short-term and long-term health impacts on local residents and children if approved.

An updated EIR should be prepared to evaluate the disproportionate impacts of the proposed warehouse on the community adjacent to the Project, including an analysis of the impact on children and people of color who live and attend school in the surrounding area. Finally, in order to evaluate the cumulative air quality impact from the several warehouse projects proposed or built in a one-mile radius of the Project site, the updated EIR should prepare a cumulative HRA to quantify the adverse health outcome from the effects of exposure to multiple warehouses in the immediate area in conjunction with the poor ambient air quality in the Project's census tract.

Greenhouse Gas

Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would result in mitigated net annual greenhouse gas ("GHG") emissions of 207,327 metric tons of carbon dioxide equivalents per year ("MT CO_2e/year") (see excerpt below) (p. 4.8-22 – 4.8-23, Table 4.8-3).

Table 4.8-3: Project Greenhouse Gas Emissions

Emissions Source	$MTCO_2e$ per Year

1. Mitigation Measure GHG-2 requires the installation of photovoltaic solar panels to offset energy emissions. Mitigation Measure GHG-3 requires the buildings to meet or exceed CalGreen Tier 2 standards.
2. Mitigation Measure AQ-3 (refer to the Projects Air Quality Assessment) requires implementation of a TDM program.
3. Energy savings from water conservation resulting from the Green Building Code Standards for indoor water use and the County's Water Efficient Landscape Ordinance for outdoor water use are not included in CalEEMod. These are regulatory measures have been incorporated into the CalEEMod mitigation module.

Source: CalEEMod version 2020.4.0. Refer to *Appendix H* for model outputs.

As a result, the DEIR concludes that the Project's GHG emissions would exceed the County's significance threshold of 3,000 MT CO_2e/year (p. 4.8-23). After the implementation of MM GHG-1 through MM GHG-5, the DEIR concludes that the Project's GHG emissions would be significant-and-unavoidable, stating:

> "The Project would achieve more than 100 points from the County's GHG Reduction Plan Screening tables and would not conflict with the County's GHG Reduction Plan. However, due to the size of the Project, the Project's emissions could be considered significant. Additionally, 86 percent of the total emissions are from mobile sources. Mitigation measures would be required to reduce emissions to the maximum extent feasible; however, emissions of motor vehicles are controlled by State and Federal standards and the Project has no control over these standards. CARB is addressing emissions from heavy duty vehicles through various regulatory programs including lower emission standards, restrictions on idling, the use of post-combustion filter and catalyst equipment, and retrofits for diesel truck fleets. Additionally, as described above, the SCAQMD is addressing mobile source emissions through the implementation of the Warehouse Indirect Source Rule (Rule 2305), which would reduce the Project's emissions. Nonetheless, impacts related to GHG emissions are conservatively considered significant and unavoidable despite the implementation of all feasible mitigation" (p. 4.8-25).

However, the DEIR's GHG analysis, as well as the subsequent significant-and-unavoidable impact conclusion, is incorrect for two reasons.

First, while we acknowledge that the Project incorporates MM GHG-1, which requires the implementation of a minimum of 100 points per the County's Screening Tables, we recommend that individual design features be included as formal mitigation measures. According to the Association of Environmental Professionals' ("AEP") *CEQA Portal Topic Paper* on Mitigation Measures:

> "While not 'mitigation', a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."[18]

As demonstrated above, design features that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the specific reduction features are not formally included as mitigation measures in the DEIR, we cannot guarantee that they would be implemented, monitored, and enforced on the Project site. As such, until the specific reduction measures are included as mitigation measures, the Project's GHG analysis should not be relied upon to determine Project significance.

[18] "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, *available at:* https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf, p. 6.

Second, as discussed above, the DEIR concludes that the proposed Project's GHG emissions would be significant-and-unavoidable (p. 4.8-25). However, while we agree that the Project would result in a significant GHG impact, the DEIR's conclusion that this impact is "significant and unavoidable" is incorrect. As previously stated, according to CEQA Guidelines § 15096(g)(2):

> "When an EIR has been prepared for a project, the Responsible Agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment."

As you can see, an impact can only be labeled as significant-and-unavoidable after all available, feasible mitigation is considered. Here, while the DEIR implements MM GHG-1 through MM GHG-5, as well as SC GHG-1 through GHG-9, the DEIR fails to implement *all* feasible mitigation (p. 4.8-31 – 4.8-33). Therefore, the DEIR's conclusion that Project's GHG emissions would be significant-and-unavoidable is unsubstantiated. To reduce the Project's GHG impacts to the maximum extent possible, additional feasible mitigation measures should be incorporated, such as those suggested in the section of this letter titled "Feasible Mitigation Measures Available to Reduce Emissions." Thus, the Project should not be approved until an updated EIR is prepared, incorporating all feasible mitigation to reduce emissions to less-than-significant levels.

Mitigation

Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project results in significant air quality and GHG impacts that should be mitigated further. As such, in an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Feasible mitigation measures can be found in the Department of Justice Warehouse Project Best Practices document.[19] Therefore, to reduce the Project's emissions, consideration of the following measures should be made:

- Prohibiting off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.
- Providing electrical hook ups to the power grid, rather than use of diesel-fueled generators, for electric construction tools, such as saws, drills and compressors, and using electric tools whenever feasible.
- Limiting the amount of daily grading disturbance area.
- Prohibiting grading on days with an Air Quality Index forecast of greater than 100 for particulates or ozone for the project area.
- Forbidding idling of heavy equipment for more than two minutes.
- Keeping onsite and furnishing to the lead agency or other regulators upon request, all equipment maintenance records and data sheets, including design specifications and emission control tier classifications.

[19] "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act." State of California Department of Justice.

- Conducting an on-site inspection to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations for construction employees.
- Requiring all heavy-duty vehicles entering or operated on the project site to be zero-emission beginning in 2030.
- Requiring on-site equipment, such as forklifts and yard trucks, to be electric with the necessary electrical charging stations provided.
- Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations.
- Forbidding trucks from idling for more than two minutes and requiring operators to turn off engines when not in use.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, air filtration systems at sensitive receptors within a certain radius of facility for the life of the project.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project, and making the resulting data publicly available in real time. While air monitoring does not mitigate the air quality or greenhouse gas impacts of a facility, it nonetheless benefits the affected community by providing information that can be used to improve air quality or avoid exposure to unhealthy air.
- Constructing electric truck charging stations proportional to the number of dock doors at the project.
- Constructing electric plugs for electric transport refrigeration units at every dock door, if the warehouse use could include refrigeration.
- Constructing electric light-duty vehicle charging stations proportional to the number of parking spaces at the project.
- Requiring all stand-by emergency generators to be powered by a non-diesel fuel.
- Requiring facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.
- Requiring operators to establish and promote a rideshare program that discourages single-occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking.
- Achieving certification of compliance with LEED green building standards.
- Providing meal options onsite or shuttles between the facility and nearby meal destinations.
- Posting signs at every truck exit driveway providing directional information to the truck route.
- Improving and maintaining vegetation and tree canopy for residents in and around the project area.
- Requiring that every tenant train its staff in charge of keeping vehicle records in diesel technologies and compliance with CARB regulations, by attending CARB approved courses. Also

require facility operators to maintain records on-site demonstrating compliance and make records available for inspection by the local jurisdiction, air district, and state upon request.

- Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program, and requiring tenants to use carriers that are SmartWay carriers.
- Providing tenants with information on incentive programs, such as the Carl Moyer Program and Voucher Incentive Program, to upgrade their fleets.

Additionally, to further reduce the Project's emissions, we recommend consideration of SCAG's 2020 *RTP/SCS* PEIR's Air Quality Project Level Mitigation Measures ("PMM-AQ-1") and Greenhouse Gas Project Level Mitigation Measures ("PMM-GHG-1"), as described below: [20]

SCAG RTP/SCS 2020-2045
Air Quality Project Level Mitigation Measures – PMM-AQ-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:
j) Require contractors to assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that could be used an aggregate of 40 or more hours for the construction project. Prepare a plan for approval by the applicable air district demonstrating achievement of the applicable percent reduction for a CARB-approved fleet.
m) Provide an operational water truck on-site at all times. Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas. Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway.
n) Utilize existing power sources (e.g., power poles) or clean fuel generators rather than temporary power generators.
o) Develop a traffic plan to minimize traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly and ensure safety at construction sites.
p) As appropriate require that portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, obtain CARB Portable Equipment Registration with the state or a local district permit. Arrange appropriate consultations with the CARB or the District to determine registration and permitting requirements prior to equipment operation at the site.
q) Require projects within 500 feet of residences, hospitals, or schools to use Tier 4 equipment for all engines above 50 horsepower (hp) unless the individual project can demonstrate that Tier 4 engines would not be required to mitigate emissions below significance thresholds.

[20] "4.0 Mitigation Measures." Connect SoCal Program Environmental Impact Report Addendum #1, September 2020, available at: https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocal_addendum_4_mitigationmeasures.pdf?1606004420, p. 4.0-2 – 4.0-10; 4.0-19 – 4.0-23; See also: "Certified Final Connect SoCal Program Environmental Impact Report." Southern California Association of Governments (SCAG), May 2020, *available at:* https://scag.ca.gov/peir.

r) Projects located within the South Coast Air Basin should consider applying for South Coast AQMD "SOON" funds which provides funds to applicable fleets for the purchase of commercially available low-emission heavy-duty engines to achieve near-term reduction of NOx emissions from in-use off-road diesel vehicles.
s) Projects located within AB 617 communities should review the applicable Community Emissions Reduction Plan (CERP) for additional mitigation that can be applied to individual projects.
t) Where applicable, projects should provide information about air quality related programs to schools, including the Environmental Justice Community Partnerships (EJCP), Clean Air Ranger Education (CARE), and Why Air Quality Matters programs.
u) Projects should work with local cities and counties to install adequate signage that prohibits truck idling in certain locations (e.g., near schools and sensitive receptors).
y) Projects that will introduce sensitive receptors within 500 feet of freeways and other sources should consider installing high efficiency of enhanced filtration units, such as Minimum Efficiency Reporting Value (MERV) 13 or better. Installation of enhanced filtration units can be verified during occupancy inspection prior to the issuance of an occupancy permit.
z) Develop an ongoing monitoring, inspection, and maintenance program for the MERV filters.
aa) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities.
bb) The following criteria related to diesel emissions shall be implemented on by individual project sponsors as appropriate and feasible: - Diesel nonroad vehicles on site for more than 10 total days shall have either (1) engines that meet EPA on road emissions standards or (2) emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85% - Diesel generators on site for more than 10 total days shall be equipped with emission control technology verified by EPA or CARB to reduce PM emissions by a minimum of 85%. - Nonroad diesel engines on site shall be Tier 2 or higher. - Diesel nonroad construction equipment on site for more than 10 total days shall have either (1) engines meeting EPA Tier 4 nonroad emissions standards or (2) emission control technology verified by EPA or CARB for use with nonroad engines to reduce PM emissions by a minimum of 85% for engines for 50 hp and greater and by a minimum of 20% for engines less than 50 hp. - Emission control technology shall be operated, maintained, and serviced as recommended by the emission control technology manufacturer. - Diesel vehicles, construction equipment, and generators on site shall be fueled with ultra-low sulfur diesel fuel (ULSD) or a biodiesel blend approved by the original engine manufacturer with sulfur content of 15 ppm or less. - The construction contractor shall maintain a list of all diesel vehicles, construction equipment, and generators to be used on site. The list shall include the following: i. Contractor and subcontractor name and address, plus contact person responsible for the vehicles or equipment. ii. Equipment type, equipment manufacturer, equipment serial number, engine manufacturer, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. iii. For the emission control technology installed: technology type, serial number, make, model, manufacturer, EPA/CARB verification number/level, and installation date and hour-meter reading on installation date. - The contractor shall establish generator sites and truck-staging zones for vehicles waiting to load or unload material on site. Such zones shall be located where diesel emissions have the least impact on abutters, the general public, and especially sensitive receptors such as hospitals, schools, daycare facilities, elderly housing, and convalescent facilities. - The contractor shall maintain a monthly report that, for each on road diesel vehicle, nonroad construction equipment, or generator onsite, includes:

15

i. Hour-meter readings on arrival on-site, the first and last day of every month, and on off-site date.
ii. Any problems with the equipment or emission controls.
iii. Certified copies of fuel deliveries for the time period that identify:
1. Source of supply
2. Quantity of fuel
3. Quantity of fuel, including sulfur content (percent by weight)

cc) Project should exceed Title-24 Building Envelope Energy Efficiency Standards (California Building Standards Code). The following measures can be used to increase energy efficiency:

- Provide pedestrian network improvements, such as interconnected street network, narrower roadways and shorter block lengths, sidewalks, accessibility to transit and transit shelters, traffic calming measures, parks and public spaces, minimize pedestrian barriers.
- Provide traffic calming measures, such as:
  i. Marked crosswalks
  ii. Count-down signal timers
  iii. Curb extensions iv. Speed tables
  iv. Raised crosswalks
  v. Raised intersections
  vi. Median islands
  vii. Tight corner radii
  viii. Roundabouts or mini-circles
  ix. On-street parking
  x. Chicanes/chokers
- Create urban non-motorized zones
- Provide bike parking in non-residential and multi-unit residential projects
- Dedicate land for bike trails
- Limit parking supply through:
  i. Elimination (or reduction) of minimum parking requirements
  ii. Creation of maximum parking requirements
  iii. Provision of shared parking
- Require residential area parking permit.
- Provide ride-sharing programs
  i. Designate a certain percentage of parking spacing for ride sharing vehicles
  ii. Designating adequate passenger loading and unloading and waiting areas for ride-sharing vehicles
  iii. Providing a web site or messaging board for coordinating rides
  iv. Permanent transportation management association membership and finding requirement.

Greenhouse Gas Project Level Mitigation Measures – PMM-GHG-1

In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:

c) Include off-site measures to mitigate a project's emissions.

e) Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to the following:

i. Promote transit-active transportation coordinated strategies;
ii. Increase bicycle carrying capacity on transit and rail vehicles;
iii. Improve or increase access to transit;
iv. Increase access to common goods and services, such as groceries, schools, and day care;

v. Incorporate affordable housing into the project; vi. Incorporate the neighborhood electric vehicle network; vii. Orient the project toward transit, bicycle and pedestrian facilities; viii. Improve pedestrian or bicycle networks, or transit service; ix. Provide traffic calming measures; x. Provide bicycle parking; xi. Limit or eliminate park supply; xii. Unbundle parking costs; xiii. Provide parking cash-out programs; xiv. Implement or provide access to commute reduction program;
f) Incorporate bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; and planning for and building local bicycle projects that connect with the regional network;
g) Improving transit access to rail and bus routes by incentives for construction and transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and
i) Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles;
j) Land use siting and design measures that reduce GHG emissions, including: i. Developing on infill and brownfields sites; ii. Building compact and mixed-use developments near transit; iii. Retaining on-site mature trees and vegetation, and planting new canopy trees; iv. Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and v. Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.
k) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities. The measures provided above are also intended to be applied in low income and minority communities as applicable and feasible.
l) Require at least five percent of all vehicle parking spaces include electric vehicle charging stations, or at a minimum, require the appropriate infrastructure to facilitate sufficient electric charging for passenger vehicles and trucks to plug-in.
m) Encourage telecommuting and alternative work schedules, such as: i. Staggered starting times ii. Flexible schedules iii. Compressed work weeks
n) Implement commute trip reduction marketing, such as: i. New employee orientation of trip reduction and alternative mode options ii. Event promotions iii. Publications
o) Implement preferential parking permit program
p) Implement school pool and bus programs
q) Price workplace parking, such as: i. Explicitly charging for parking for its employees;

17

ii. Implementing above market rate pricing;
iii. Validating parking only for invited guests;
iv. Not providing employee parking and transportation allowances; and
v. Educating employees about available alternatives.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. An updated EIR should be prepared to include all feasible mitigation measures, as well as include updated air quality and GHG analyses to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The updated EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

Sincerely,

Matt Hagemann, P.G., C.Hg.

Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
Industrial Stormwater Compliance
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 30 years of experience in environmental policy, contaminant assessment and remediation, stormwater compliance, and CEQA review. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) and directed efforts to improve hydrogeologic characterization and water quality monitoring. For the past 15 years, as a founding partner with SWAPE, Matt has developed extensive client relationships and has managed complex projects that include consultation as an expert witness and a regulatory specialist, and a manager of projects ranging from industrial stormwater compliance to CEQA review of impacts from hazardous waste, air quality and greenhouse gas emissions.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2104, 2017;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 300 environmental impact reports and negative declarations since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at more than 100 industrial facilities.
- Expert witness on numerous cases including, for example, perfluorooctanoic acid (PFOA) contamination of groundwater, MTBE litigation, air toxins at hazards at a school, CERCLA compliance in assessment and remediation, and industrial stormwater contamination.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted

public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9.

Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific

principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt is currently a part time geology instructor at Golden West College in Huntington Beach, California where he taught from 2010 to 2014 and in 2017.

Invited Testimony, Reports, Papers and Presentations:

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Presentation to the Public Environmental Law Conference, Eugene, Oregon.

Hagemann, M.F., 2008. Disclosure of Hazardous Waste Issues under CEQA. Invited presentation to U.S. EPA Region 9, San Francisco, California.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, industrial, military and agricultural sources, unconventional oil drilling operations, and locomotive and construction engines. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities. Dr. Rosenfeld has also successfully modeled exposure to contaminants distributed by water systems and via vapor intrusion.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, creosote, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at sites and has testified as an expert witness on numerous cases involving exposure to soil, water and air contaminants from industrial, railroad, agricultural, and military sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 5-14-2021
Trial, October 8-4-2021

In the Circuit Court of Cook County Illinois
Joseph Rafferty, Plaintiff vs. Consolidated Rail Corporation and National Railroad Passenger Corporation d/b/a AMTRAK,
Case No.: No. 18-L-6845
Rosenfeld Deposition, 6-28-2021

In the United States District Court For the Northern District of Illinois
Theresa Romcoe, Plaintiff vs. Northeast Illinois Regional Commuter Railroad Corporation d/b/a METRA Rail, Defendants
Case No.: No. 17-cv-8517
Rosenfeld Deposition, 5-25-2021

In the Superior Court of the State of Arizona In and For the Cunty of Maricopa
Mary Tryon et al., Plaintiff vs. The City of Pheonix v. Cox Cactus Farm, L.L.C., Utah Shelter Systems, Inc.
Case Number CV20127-094749
Rosenfeld Deposition: 5-7-2021

In the United States District Court for the Eastern District of Texas Beaumont Division
Robinson, Jeremy et al *Plaintiffs*, vs. CNA Insurance Company et al.
Case Number 1:17-cv-000508
Rosenfeld Deposition: 3-25-2021

In the Superior Court of the State of California, County of San Bernardino
Gary Garner, Personal Representative for the Estate of Melvin Garner vs. BNSF Railway Company.
Case No. 1720288
Rosenfeld Deposition 2-23-2021

In the Superior Court of the State of California, County of Los Angeles, Spring Street Courthouse
Benny M Rodriguez vs. Union Pacific Railroad, A Corporation, et al.
Case No. 18STCV01162
Rosenfeld Deposition 12-23-2020

In the Circuit Court of Jackson County, Missouri
Karen Cornwell, *Plaintiff,* vs. Marathon Petroleum, LP, *Defendant.*
Case No.: 1716-CV10006
Rosenfeld Deposition. 8-30-2019

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case No.: 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No.: 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In United States District Court For The Southern District of Mississippi
Guy Manuel vs. The BP Exploration et al., Defendants
Case: No 1:19-cv-00315-RHW
Rosenfeld Deposition, 4-22-2020

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court for the Middle District of Alabama, Northern Division
James K. Benefield, et al., *Plaintiffs*, vs. International Paper Company, *Defendant*.

Rosenfeld Deposition: July 2010, June 2011

In the Circuit Court of Jefferson County Alabama
Jaeanette Moss Anthony, et al., *Plaintiffs*, vs. Drummond Company Inc., et al., *Defendants*
Civil Action No. CV 2008-2076
Rosenfeld Deposition: September 2010

In the United States District Court, Western District Lafayette Division
Ackle et al., *Plaintiffs*, vs. Citgo Petroleum Corporation, et al., *Defendants*.
Case Number 2:07CV1052
Rosenfeld Deposition: July 2009

Response to Comment Letter O5 – Blum Collins & Ho, LLP

O5-1 The comment provides general introductory comments and notes comments are on behalf of the Golden State Environmental Justice Alliance (GSEJA) and requests to be notified for any public information or notices associated with the Project. The request to be added to the public noticing list is noted for the record and the commenter will be notified, as requested. All attachments to the comment letter have been received. As the specific comments in the letter re-state the comments in the attachments, responses to the letter also fully respond to the attachments.

O5-2 The comment provides a general description of the Project. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O5-3 This comment incorrectly asserts that the Draft EIR does not include a complete Project Description due to not including a floor plan, grading plan, elevations, or a detailed site plan, while summarizing CEQA requirements related to a project description. The County agrees with commenter that a project description must meet the requirement for "adequate informational documents and meaningful disclosure," which is exactly what is provided in the Draft EIR. The Project Description included in *Section 3.0* of the Draft EIR includes a detailed description of the Project including the conceptual site plan, Land Use Plan and description, and description of grading activities that are further described and analyzed in the Draft EIR. Project information specific to earthwork, parking requirements, site coverage and floor area ratio is described in *Section 3.0, Project Description* of the Draft EIR. The Draft EIR provides the required level of detail in *Section 3.0* to evaluate impacts of the Project, as required under Section 15124 of the CEQA Guidelines. Impacts associated with short term construction activities (e.g., air and GHG emissions, truck trips), including onsite grading are addressed in *Section 4.3, Air Quality, Section 4.8, Greenhouse Gas Emissions, and Section 4.17, Transportation*. The Project proposes the approval of a Specific Plan which is a policy plan for the future build out of development within the Specific Plan area. Future site specific (Planning Area) entitlement plans will be required for each parcel which will include full project plans including elevations, grading, site plans, landscape plan, etc. However, the anticipated future buildout of "up to 6.6 million square feet" for the Project does not preclude a thorough analysis of its potential effects. Based on the experience and expertise of the EIR preparer (Kimley-Horn), information provided by the Project Applicant, and the independent judgment of the County, the Draft EIR made reasonable assumptions that the Project would be built out by future high cube logistics and e-commerce uses, and the analysis includes limitations on the maximum amount of combined warehouse space that may be developed and trips that the Project may generate. To provide a conservative ("worst case") analysis, and to inform the public and County decision-makers of the full scope of environmental impacts that could occur should the Project be approved, the Draft EIR provided a comprehensive analysis of the potential environmental impacts that would occur. The Project is therefore analyzed in a conservative, worst-case scenario against existing land use allowances and regulatory thresholds. Please see Master Response 1 and Response O3-3.

O5-4 The commenter notes that the Draft EIR does not include the SCCIISP as an attachment, and that the incorporation by references is not appropriate. The commenter closes by stating that the Draft EIR must be revised and recirculated to include the Specific Plan for public review. Although the Specific Plan may be provided as an attachment to the Draft EIR, it is not required. As defined under Section 15080 of the CEQA Statutes, the EIR process should be combined with the planning review process to the extent possible. *Section 3.0, Project Description* and *Section 4.11, Land Use and Planning*, described the Specific Plan development standards, project Planning Areas, circulation elements, and other features which provide a thorough description of the Project. CEQA Guidelines Section 15124 provides that the description of the project should not supply extensive detail beyond that needed for evaluation and review of the environmental impact and that requirement has been satisfied. There is no need to include the proposed SCCIISP in the Draft EIR and the commenter cites no authority to the contrary.".

O5-5 See Master Response 1. The Project is not a part of, or associated with, the Next Gen project, which has been separately approved by the County. The Next Gen project would be implemented to serve separate motorsports and entertainment purposes that are unrelated to the industrial purposes of the SCCIISP Project. As stated in Draft EIR *Section 3.0, Project Description*, page 3-4 "The Next Gen in California Project has received all necessary approvals and CEQA clearance for its construction and operation, and it is not part of the SCCIISP Project." Industrial development of the surrounding property is not required for the implementation of the Next Gen project, which would be done independently by a separate project proponent. The Next Gen project has received all necessary approvals and CEQA clearance for its construction and operation and is no longer subject to discretional review by the County. In addition, the County's approval of the Next Gen project did not commit the County to any further approvals or preclude CEQA review of any subsequent project in the area, as evidenced by the current environmental review process for the SCCII SP Project.

The Project is not a part of, or associated with, the Speedway Commerce Center I project, which has been separately approved by the City of Rancho Cucamonga. The SCCII SP project and the Speedway Commerce Center I project do not together comprise one large project, but instead are two separate and complete projects. Further, the Speedway Commerce Center I was included in the cumulative projects list as identified in *Section 3.0, Project Description* of the Draft EIR and evaluated in the respective analysis.

The Project would entail the approval of a Specific Plan consisting of acceptable design standards. While the Specific Plan prepared for the Project would provide for community benefits and facilities that would encourage a more integrated circulation, placemaking, parking, and open space/walkway connection, this would be in an effort to enhance the connections between the two separate Projects and buffer the existing Next Gen motorsports facility. California Public Resources Code Section 21065 defines a 'Project' as an activity that could result in a direct or indirect physical change in the environment and which involves the issuance to a person of an entitlement by one or more public agencies. Piecemealing occurs when a Project is segmented in a way that environmental evaluation of some of the activities associated with the Project is deferred. The Next Gen Motorsports Facility project was undertaken by someone other than the

Master Developer and its entitlements (and the associated environmental determination) were approved, and the approvals were final and non-appealable when the subject Project began. The Next Gen Project and the subject Project are separate Projects undertaken by separate persons at different times and therefore, piecemealing is not possible and has not occurred.

O5-6 Commenter begins by defining CEQA Guidelines Section 15165 – Multiple and Phased Projects and goes on to state that the EIR misleads the public and decisions makers by circumventing adequate and accurate environmental analysis for the whole of the action – SCCII and Next Gen in California. See Response O5-5 above. As discussed in Response O5-5, the Project is not proposed as a phase of the Speedway Commerce Center I Project or the Next Gen Project, which were both approved prior to the circulation of the NOP for the SCCIISP Project. Further, the Next Gen Project was described in detail in Draft EIR *Section 3.0, Project Description* with a thorough description of the previous entitlements, historical background, and CEQA clearance for construction and operation of the motorsports facility. This discussion also makes clear how the SCCIISP Project would be designed and developed to be compatible with the Next Gen Project. In addition, the Draft EIR includes mitigation to address transportation-related issues that could occur on Next Gen Project event days when the SCCIISP Project is operating.

The Major Revision to Approved Action for the Next Gen project, which has been evaluated in the EIR analysis, simply removes from the coverage of the Planned Development governing the Next Gen project the approximately 433 acres of property that would be subject to the SCCIISP. This approval does not affect the development or operations permitted for the Next Gen Project, as approved by the County in June 2021. The environmental analysis in the Draft EIR discusses relevant cumulative impacts which may occur as a result of Project implementation. Lastly, the Next Gen Project was described in detail in Draft EIR *Section 3.0, Project Description* with a thorough description of the previous entitlements, historical background, and CEQA clearance for construction and operation of the motorsports facility. This discussion also makes clear how the SCCIISP Project would be designed and developed to be compatible with the Next Gen Project. In addition, the Draft EIR includes mitigation to address transportation-related issues that could occur on Next Gen Project event days when the SCCIISP Project is operating. *Section 3.0, Errata* of this Final EIR includes revisions to the Draft EIR, *Section 4.0, Environmental Impact Analysis* which adds the Next Gen In California Project to the Cumulative Projects List. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications.

O5-7 The commenter again refers to project piecemealing. Comment is noted for the record. See Responses O5-5 and O5-6 above. The Next Gen Project is a separate project and the adequacy of the CEQA review prepared for that project is not relevant. However, the Next Gen Project has received all necessary approvals and CEQA clearance, which were properly issued by the County and are no longer subject to review. The commenter's general criticism of EIR Addendums is noted but is not relevant to this Project (see, e.g., CEQA Guidelines Section 15164). As explained in Response O5-5, the Next Gen Project proposes motorsports and entertainment uses that are separate and unrelated to the industrial uses proposed by the SCCIISP Project, and each project would be independently implemented by separate proponents. These are not "phased" projects,

and separate environmental review of each is contemplated by the authority cited by the commenter. A Project level EIR is the appropriate CEQA document for the SCCIISP Project and includes a thorough discussion of the Project's potential impacts, including cumulative impacts.

O5-8 The comment starts with a sentence that refers to an attachment to the letter from SWAPE ("SWAPE Letter") and refers the reader to the SWAPE Letter for technical commentary and analysis related to Air Quality, Energy and Greenhouse Gas Emissions. The comment letter is a distillation of the information in the SWAPE Letter for support of their comments. The SWAPE Letter does not include any additional information or comments that is not included in the commentor's letter. As such, this response and Responses O5-9, O5-10, and O5-11 are responding to both the Commentor's letter and the SWAPE Letter.

The comment asserts that the EIR does not include analysis relevant to environmental justice (EJ) issues and that the community is impacted per the California Communities Environmental Health Screening Tool (CalEnviroScreen). CalEnviroScreen has been developed by the Office of Environmental Health Hazard Assessment (OEHHA) and California Environmental Protection Agency (CalEPA). While CalEnviroScreen can assist CalEPA in prioritizing resources and helping promote greater compliance with environmental laws, it is important to note some of its limitations. The tool's output provides a relative ranking of communities based on a selected group of available datasets, through the use of a summary score. Unlike the Health Risk Assessment (HRA) prepared for the Project, the CalEnviroScreen score is not an expression of health risk and does not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment. Accordingly, CalEnviroScreen is not intended to be used as a health or ecological risk assessment for a specific area or site, but a tool used by the state to identify those areas that need additional resources and assistance in promoting greater compliance with environmental laws. Also refer to Master Response 1.

Furthermore, although the EIR is not required to include analysis of potential EJ issues, as Environmental Justice is not listed amongst the "Environmental Factors Potentially Affected" in Appendix G, Environmental Checklist Form, to the State CEQA Guidelines[5], the County analyzed the Project with the Countywide goals and policies and incorporated elements of the findings from this analysis and the public outreach meetings to support the Countywide goals through additional programs, facilities and community benefits in the Specific Plan and in the analysis of the Draft EIR including enhancements of open space, mitigation measures to reduce pollution exposure, and more. In addition, while the State CEQA Guidelines do not specifically call out EJ issues, EJ concerns do include the secondary or indirect effects (air quality and GHG Emissions) and direct effects (noise, transportation, and hazards and hazardous materials), which are analyzed throughout the Draft EIR. The County does not dispute the data from CalEPA's CalEnviroScreen. These results are presented for comparative purposes and cannot be used and are not intended to be used to determine whether a project will result in a significant impact. The

[5] Title 14. Natural Resources. (2018). Retrieved from: http://files.resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf.

fact that the Project is located in an area that CalEnviroScreen identifies as in the 96th percentile for pollution burden is not indicative of a CEQA impact.

Furthermore, it should be noted that the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

O5-9 The comment summarizes the demographic makeup of the census tract and speculates that the community may lack health insurance or access to medical care. However, as noted above in Response O4-8 and in the Draft EIR, the Project would not result in significant health effects. Additionally, speculation whether individuals within a community may or may not have health insurance or access to medical care is not required to be considered under CEQA. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O5-10 The Project has been analyzed for its impacts to nearby communities and the surrounding environment. Requirements regarding Environmental Justice (EJ) have been complied with during the preparation of the Specific Plan document and included outreach workshops as discussed below. The comment states that the Project is adjacent to census tracts that are designated as SB 535 Disadvantaged Communities. It should be noted that SB 535 does not include project-specific requirements or prohibit developments in proximity to the designated communities. SB 535 directs 25 percent of the proceeds from the state's Greenhouse Gas Reduction Fund (i.e., funds from the AB 32 cap-and-trade program) to go to projects that provide a benefit to disadvantaged communities (as identified by the OEHHA mapping). As noted throughout this Final EIR, an HRA was prepared for the Project and quantified risk levels at nearby sensitive receptors and determined that impacts would be less than significant.

Further, the Project held two EJ outreach workshops: on January 12, 2022, and on July 9, 2022. Additional analysis of the Project design was conducted after the initial scoping meeting and EJ outreach workshop and based on community input and interest, the Specific Plan was modified to incorporate elements of the findings from these outreach meetings to support additional programs, facilities and community benefits through enhancements of open space, community art, exercise stations, reduction of pollution generation through reliance on on-site solar, enhanced wellness walks, and more. Furthermore, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O5-11 This comment identifies compliance modeling software approved by the CEC to show compliance with Title-24 Standards using the performance method. The comment then implies that only these modeling programs can be used to estimate energy consumption for CEQA energy analysis. The

County disagrees with the assertions that the Draft EIR must use one of three approved compliance modeling software for non-residential buildings and that the EIR does not comply with the 2019 Building Energy Efficiency Standards. This is not the case. Showing compliance with Title-24 Standards is not a requirement of CEQA analysis and CEQA does not require the use of specific programs. The software listed by the CEC and referenced in the comment are to be utilized for performance approach (energy budget) method of compliance for Title 24 Energy Standards and are to be used for demonstrating performance compliance. As stated in the CalEEMod User's Guide, CalEEMod utilizes widely accepted methodologies for estimating emissions combined with default data. The sources for the methodologies include studies commissioned by the CEC and also utilize energy conservation standards subject to Title 24.[6] The energy analysis and associated thresholds are provided on Draft EIR pages 4.6-17 through 4.6-28. The analysis specifically responds to the guidance for energy analysis in the State CEQA Guidelines Appendix F, which requires a determination on if a project would increase wasteful energy consumption and conflict with state or local energy efficiency plans. The analysis is used to disclose the amount of energy that the Project would require and is not utilized to demonstrate compliance for performance. Additionally, the Draft EIR discloses the Project's electricity consumption, natural gas consumption, and transportation fuel consumption and determined that the Project's energy consumption would not be inefficient or wasteful as the Project will be required by the CALGreen Code to comply with the Title 24 Building Energy Efficiency Standards (Nonresidential) published by the CEC, which contain stringent mandatory standards for mechanical systems, lighting (indoor and outdoor), and appliances to minimize energy use. Therefore, the Project used the appropriate model to calculate and disclose the Project's energy use, and also demonstrated that the Project would be required to comply with the CALGreen Code and Title 24.

O5-12 The comment states that the Project's analytical findings have not been substantiated due to errors in the modeling that result in significant and unavoidable impacts in air quality, energy, greenhouse gas emissions, and noise. Therefore, the Project is inconsistent with SCAG's Connect SoCal RTP/SCS. The Project's significant and unavoidable impacts and their consistency with the SCAG RTP/SCS goals are documented in *Section 4.11, Land Use and Planning*, of the Draft EIR. As discussed on Draft EIR pages 4.11-11 and 4.11-12, the Project would be consistent with Connect SoCal Goals 5 (Reduce GHG emissions and improve air quality), 6 (Support healthy and equitable communities), and 7 (Adapt to a changing climate and support an integrated regional development pattern and transportation network). With regards to Goal 5, the Project would not result in more severe air quality or GHG emissions impacts beyond the significant unavoidable impacts that were already disclosed and analyzed within the Countywide Plan EIR. The Project is consistent with the County's Greenhouse Gas Reduction Plan Update, which includes the County GHG reduction measures and actions that are committed to increasing sustainability awareness and resilience by making resource-efficient choices to conserve water, energy, and materials, and improve air quality. Development of the Project site would be consistent with current building

[6] CalEEMod User's Guide. (2021). Retrieved from: http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/01_user-39-s-guide2020-4-0.pdf?sfvrsn=6.

codes, state and federal requirements including Green Building Standards. This includes EV charging spaces, energy-efficient buildings, and use of construction and grading equipment that complies with current air quality standards. As it pertains to Goal 6, the development of the Project would not only increase employment for the County and its residents', but it would also introduce quality of life improvements for the community as well. These planned improvements include a 10-foot-wide multi-purpose trail, with exercise pop-outs along the trail to promote exercise and healthy lifestyle, along Street "A," connecting Cherry Avenue in the City of Fontana, to Napa Street in the City of Rancho Cucamonga, and roadway improvements to reduce traffic hazards. Lastly, with regard to Goal 7, the Project proposes non-motorized transportation improvements in the form of a multi-purpose trail along Street "A" which would encourage alternative forms of transportation such as bicycling and walking by providing an east/west connection from Cherry Avenue in the City of Fontana to Napa Street in the City of Rancho Cucamonga.

Lastly, the goal of the consistency analysis is to provide the reader with a general overview of whether the project is in harmony with the overall intent of the applicable goals and policies. It is within the County's purview to decide if the project is consistent or inconsistent with applicable goals or policies. Under state law, a Specific Plan must be consistent with the General Plan (Cal. Gov't Code Section 65454) and cannot be approved if it is inconsistent with the General Plan; therefore, the project could not proceed if determined by the Board of Supervisors to be inconsistent with the General Plan.

O5-13 The commenter notes that due to errors in modeling and determination of significant and unavoidable impacts, the Project is inconsistent with specified goals and policies. The commenter refers to Goal HZ-3 and associated Policy HZ-3.18; Goal NR-1 and associated policies NR-1.7 and NR-1.9; and policies LU-2.3 and LU-4.5. See Responses O5-8 and O5-10 above. The Project conducted outreach in accordance with Countywide Plan Goal HZ-3 regarding Environmental Justice. Further, the Specific Plan includes language discussing environmental justice assessments. Additionally, mitigation measures, PDFs, and standard conditions proposed for the Project include provisions for meeting air quality goals set by the state, the air district and the County. Finally, the Project has been designed in accordance with applicable local regulations and land use policies. This comment provides anecdotal claims with no justification or substantiation and no further response is needed.

O5-14 Commenter states that the EIR must be revised to include EJ information for analysis in order to provide an adequate, accurate environmental analysis. See Response O5-10 regarding the discussion of environmental justice.

O5-15 The Draft EIR relied on relevant, available information at the time of its drafting. The Draft EIR did not predict future growth beyond what was set by SCAG in 2045, and other reputable sources. Further prediction of workforce trends would have been conjecture, and not adequate analysis. Draft EIR *Section 4.14, Population and Housing* does state that construction of the Project would generate temporary employment opportunities, including short-term design, engineering, and construction jobs. Construction related jobs would not result in a significant population increase

because those jobs are temporary in nature and are expected to be filled by persons within the local area. This expectation is based, among other things, on the County's 7.7 percent unemployment rate. Furthermore, the small percentage of skilled and managerial construction-related positions could either be filled by the local workforce or by persons from the larger region. Therefore, Project construction would not directly or indirectly induce substantial, unplanned population growth in the County resulting in a less-than-significant impact.

O5-16 The Draft EIR concluded on page 4.14-7 that the temporary nature of construction employment associated with the Project would not constitute a significant permanent increase in population since the County's unemployment rate would be large enough to absorb the additional workforce without necessitating the additional influx of residents. Furthermore, the commenter uses incorrect population counts, as stated in *Draft EIR Table 4.14-2: San Bernardino County Projected Population* the SCAG expects a population increase of approximately 225,741 people by the year 2045, not 45,000.

O5-17 The commenter states that the Draft EIR does not provide a quantified analysis of construction jobs generated by the Project. The Draft EIR identifies the County of San Bernardino and its unemployment rate when discussing local labor. Further, short-term construction and long-term employment estimates are based on average estimates published by SCAG. Due to the temporary nature of construction activities, focus was given to sustained potential employment which would remain through the life of the Project. According to Draft EIR *Table 4.14-5: Project Employment Generation*, the Project would generate 3,732 employees. Local area is this unincorporated area of San Bernardino County and the surrounding incorporated cities of Fontana, Rancho Cucamonga, and Ontario.

O5-18 The VMT analysis was prepared in conformance with San Bernardino County Transportation Impact Study Guidelines (July 2019; VMT/Traffic guidelines). Per the guidelines, the VMT/employee is provided in the VMT analysis. The Office of Planning and Research (OPR) has indicated that for the purposes of SB 743 CEQA Transportation analysis, automobile VMT will be considered. The County's threshold is established based on Employee VMT per Capita metric and the same metric is used to measure project's VMT consistent with County guidelines to provide an apples-to-apples comparison. The Air Quality analysis utilizes a different tool (CalEEMod) to calculate VMT and the methodology for Air Quality analysis is consistent with SCAQMD requirements.

O5-19 Calculations were made using SBTAM, consistent with the VMT analysis methodology noted in the San Bernardino County VMT/Traffic guidelines. The VMT metric used for measuring the Project's transportation impact is Home-based Work VMT/employee, an efficiency metric which does not include trucks or trucks equivalents. As such, trucks were not included for measuring against SB 743 VMT which is the threshold adopted by the County of San Bernardino. In addition, to evaluate the Project's effect on VMT for the region, link based total VMT per service population was also calculated for both San Bernardino County and Unincorporated San Bernardino County without and with the project. The link based total VMT calculation included the truck trips and

showed the VMT per service population for the region with project is less than baseline VMT per service population, resulting in a less than significant impact.

O5-20 Commenter states that the EIR uses uncertain language in stating that "Most construction workers would be anticipated to come from within the County or from the nearby region, which already has a population of substantial size to supply the needed workers." The Draft EIR *Section 4.14, Population and Housing* includes analysis regarding the number of anticipated short-term and long-term construction-related jobs based on the 2019 American Community Survey data profiles and job characteristics. Local area or nearby region is this unincorporated area of San Bernardino County and the surrounding incorporated cities of Fontana, Rancho Cucamonga, and Ontario.

O5-21 The reference to only the potential logistics employment (3,127 employees) in *Section 4.14, Population and Housing* of the Draft EIR will be revised to encapsulate the entirety of the Project (3,732 employees) in *Section 3.0, Errata* of the Final EIR. The updated information does not change the conclusions of the Draft EIR, and changes merely clarify, amplify, or make insignificant modifications. Draft EIR *Section 5.0, Other CEQA Considerations* is based on analysis from the Draft EIR *Section 4.14, Population and Housing* that relies on the number of employees provided in the 2019 American Community Survey data profiles and job characteristics and information from the 2020-2045 RTP/SCS Growth Forecast. Specifically, the County's 7.7 percent 2019 unemployment rate was applied to the Project and further postulated with existing 2019 employment density by industry provided by American Community Survey data. The 605 commercial employees and 3,127 high-cube logistics/e-commerce employees anticipated to be generated by the Project were therefore found to create an unsubstantial increase in the County's 2021 population. Continuing to gauge the interest of the County's unemployed population in construction focused employment would be conjecture and would not constitute adequate CEQA analysis.

O5-22 The Draft EIR provides a cumulative impact analysis for each technical area in its respective section. The reference in *Section 5.3, Growth-Inducing Impacts* of the Draft EIR to the technical sections was provided to refer the reader to where the detailed cumulative analysis is provided. Cumulatively significant effects were individually discussed in each of the environmental technical area's (*Sections 4.1* through *4.20* of the Draft EIR) Cumulative Impacts subsection.

Short-term construction emissions associated with the Project would represent a cumulatively considerable contribution to significant cumulative air quality impacts. Operational impacts would also remain significant. With regard to energy, due to the high volume of diesel fuel consumption, the Project's diesel fuel consumption would be cumulatively considerable. There are no additional feasible mitigation measures that would reduce this impact. Therefore, cumulative impacts would be potentially significant. Despite Project Design Features, Standard Conditions, Mitigation Measures and CARB and SCAQMD efforts to reduce mobile source emissions, the Project would result in a potentially significant cumulative GHG impact. Project construction would not result in a cumulatively considerable contribution to a significant cumulative impact related to

construction noise. However, cumulative off-site traffic noise levels would result in a significant and unavoidable impact.

O5-23 See Response O5-22 above. The cumulative project list prepared for the Project and included in the Draft EIR was considered to evaluate cumulative impacts per Sections 15130 and 15355 of the State CEQA Guidelines. The cumulative project list available at the time of Notice of Preparation (NOP) was released in December 2021 was the most current available at that time. Furthermore, State CEQA Guidelines, Section 15125(a)(1) states that generally, the lead agency should describe physical environmental conditions as they exist at the time the NOP is published, including the proper baseline for cumulative impacts analysis. The cumulative analysis included in the Draft EIR adequately evaluates the Project's contribution to any existing cumulative impacts; therefore, no further revision to the cumulative projects analyzed in the Draft EIR is required.

O5-24 This comment summarizes the CEQA requirements related to the provision of reasonable range of alternatives to the proposed project which will avoid or substantially lessen any of the significant effect of the project. The State CEQA Guidelines do not require a specific number of alternatives be evaluated, rather only those alternatives necessary to foster informed decision-making. As defined in Section 15126.6(f), the rule of reason limits alternatives analyzed to those that would avoid or substantially lessen one or more of the significant effects of a project. Of those alternatives, an EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project. It would be infeasible to develop the site with industrial uses that reduce all of the significant unavoidable impacts to less-than-significant levels and meet the Project objectives, because this would require a much smaller development that would not meet Project objectives. See Master Response 3 which provides information on Project alternatives.

O5-25 The commenter's request for the Draft EIR to be recirculated is noted for the record. Please see Response O3-3 that addresses recirculation. The commenter's request to be provided subsequent public noticing and hearing information is noted for the record and the commenter will be added to the list and sent notices of upcoming hearings or notices related to the Project.

Submitted via email to Steven.Valdez@lus.sbcounty.gov.

Re: Speedway Commerce Center II Specific Plan Draft Environmental Impact Report (SCH #2021120259)

Dear Mr. Valdez:

This letter is being submitted on behalf of the Center for Community Action and Environmental Justice (CCAEJ) in response to the Draft Environmental Impact Report ("DEIR") which was prepared for the Speedway Commerce Center II Specific Plan ("Project") and made available for public review and comment. After reviewing the available documentation, there are a number of concerns with the Project based on the information from the DEIR. **This Project has violated several County policies and will result in unmitigated significant impacts to the community and should not be built.** 1

The first concern is over the very development of the Project itself. It is concerning to see that the County is using loopholes to shirk its responsibility as set out in the policies of the Countywide Plan ("Plan"). Per Policy LU-6.4 Industrial amendments near schools and parks of the Plan, it is stated that industrial amendments are not allowed if within half a mile of an existing or future school or park. The Live Oak Elementary School is located approximately four-ninths of a mile from the proposed Project, falling within the range where County policy states that no industrial amendments would be approved. Additionally, Sequoia Middle School falls just beyond the half-mile boundary but which is very much still within range of the impacts of the Project. 2

Unfortunately, the policy left a loophole of being submitted via a specific plan which is the method being used here. This is problematic because the County also has also set forth a requirement in Policy HZ-3.18 Application requirements to ensure that environmental justice communities are active participants in the development of applications for projects submitted in those areas to ensure that the community does not continue to be a dumping ground for polluting sources or uses.

However, the required engagement has not been provided for this Project. The first evidence of a public meeting that was found for this Project was the scoping meeting as is required for CEQA compliance for the preparation of the DEIR. However, a scoping meeting cannot possibly be considered to be a reasonable part of the required two meeting series because there generally is **not** a plan or expectation to make substantial changes to a project at that point. Instead, a scoping meeting happens after the project has been largely decided upon. Thus, by not conducting any of the required meetings for gathering public input prior to the scoping meeting when the Project had already been decided on, it puts the Project out of compliance with Policy HZ-318 Application 3

CENTER FOR COMMUNITY ACTION AND ENVIRONMENTAL JUSTICE
"Bringing People Together to Improve Our Social and Natural Environment"

requirements which itself is also a significant impact under CEQA. We demand that the County and applicant take the Project back to the drawing board and actually follow the policy as set forth to engage the public *prior* to deciding on what the Project would look like, **not** after. 3

However, it is the even bigger concern is also what underscores why the refusal to actually follow the policies is so infuriating and problematic for the community. Based on the data from the DEIR, the Project will be wildly out-of-compliance with Air Quality standards as well as Greenhouse Gas (GHG) emissions, leaving Significant Impacts in those categories even after mitigation. This includes a number of criteria of pollutants which would be pumped into a community which per CalEnviroScreen, is already one of the most-impacted in the state for diesel particulate matter, ozone, and $PM_{2.5}$.

Per Section 4.3.5 Impacts and Mitigation Measures of the DEIR, the Project will produce emissions which exceed the South Coast Air Quality Management District's thresholds for both construction and operational phases of the Project, even after mitigation. Based on the DEIR, the Project will even after mitigation, create the following emissions which nearly or completely exceed the SCAQMD's thresholds in pounds per day (threshold value): 4

- Table 4.3-9: Phase 1a Construction Emissions
  - NO_X – 465.49 (100)
  - CO – 702.91 (550)
- Table 4.3-10: Phase 1b Construction Emissions
  - NO_X – 362.88 (100)
- Table 4.3-11: Phase 2 Construction Emissions
  - NO_X – 354.33 (100)
- Table 4.3-13: Phase 1a Operational Emissions
  - ROG – 169.94 (55)
  - NO_X – 727.36 (55)
  - CO – 549.57 (550)*
  - PM_{10} – 217.65 (150)
  - $PM_{2.5}$ – 70.65 (55)
- Table 4.3-14: Phase 1b Operational Emissions
  - ROG – 109.80 (55)
  - NO_X – 496.78 (55)
  - PM_{10} – 167.67 (150)
  - $PM_{2.5}$ – 53.94 (55)*
- Table 4.3-15: Phase 2 Operational Emissions
  - ROG – 84.17 (55)
  - NO_X – 205.06 (55)
- Table 4.3-17: Project Buildout Emissions
  - ROG – 440.82 (55)
  - NO_X – 1,915.82 (55)
  - CO – 1,949.61 (550)
  - PM_{10} – 564.23 (150)
  - $PM_{2.5}$ – 184.98 (55)

As is evident, from that information, the Project would have a substantial impact on the community and section 4.3.7 Significant Unavoidable Impacts of the DEIR documents indicates that there will be no additional measures taken to mitigate the impacts to air quality. Yet, the Project will produce emissions which are up to *nearly 35 times higher* than the allowed limits. While it is true that on occasion, many projects do indeed have significant and unavoidable impacts, it is a stretch of the imagination to assert that it is reasonable to simply allow for impacts to remain unmitigated without taking further action when the difference is as large as in this Project. 5

These significant impacts for Air Quality which would be produced by the Project do not belong in any community. They especially do not belong in a community which per CalEnviroScreen, is already more impacted than 93% of other census tracts in the state, they do not belong in a 6

"Bringing People Together to Improve Our Social and Natural Environment"

community where the pollution burden is even higher at the 96th percentile, and they certainly do not belong in a community in the 72nd percentile for asthma (see Figure 1 attached). It is simply unacceptable that they be treated as "Significant and Unavoidable" and no additional measures be taken to reduce the impacts to even a more reasonable overage which are not dozens of times larger than the standards. All these impacts and concerns are issues which could have been identified ahead of time had the appropriate public notification and involvement as is required per the County's policies been followed.

We call on the County to have the applicant take this Project back to the drawing board and properly engage the community as the policies call for to create a plan for a project that would actually meet the needs and desires of what the community wants to see done, not produce one of the most polluting sources in an area already heavily impacted and in urgent need of cleanup to address existing sources of pollution.

Thank you for your time and attention to this matter. If there are any concerns or questions regarding our comments, please do not hesitate to reach out to have them answered. 6

Sincerely,

Marven Norman
Policy Specialist

CCAEJ is a long-standing community based organization with over 40 years of experience advocating for stronger regulations through strategic campaigns and building a base of community power. Most notably, CCAEJ's founder Penny Newman won a landmark federal case against Stringfellow Construction which resulted in the `Stringfellow Acid Pits' being declared one of the first Superfund sites in the nation. ***CCAEJ*** prioritizes community voices as we continue our grassroots efforts to bring lasting environmental justice to the Inland Valley Region.

Response to Comment Letter O6 – Center for Community Action and Environmental Justice

O6-1 The commenter indicates the letter is submitted on behalf of the Center for Community Action and Environmental Justice (CCAEJ) which addresses the implementation of the Speedway Commerce Center II Specific Plan ("Project") and states the Project has violated several County policies, would result in significant impacts to the community and should not be constructed. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O6-2 The commenter is concerned that Project development does not meet Countywide Plan policies, specifically Countywide Plan Policy LU-6.4. This policy states the following:

Policy LU-6.4 Industrial amendments near schools and parks: We approve Land Use Plan amendments for new industrial development only if they are at least one-half mile from an existing or planned public primary or secondary school or public park. *We may waive this requirement for obsolete school or park sites or for industrial amendments submitted through a specific plan.*[7] *(emphasis added)*

The commenter addresses that Live Oak Elementary School is located approximately four-ninths of a mile from the proposed Project, and Sequoia Middle School falls just beyond the half-mile boundary, and that the Countywide Plan policies are not being met.

As discussed in Draft EIR *Section 3.0, Project Description*, the Project site is located in the Policy Plan Commercial (C) Land Use Category and in the Special Development - Commercial (SD-COM) Zoning. The Project requires the approval of a Specific Plan, Development Agreement, Revision to Approved Action – Major, and a Tentative Map. Neither a General Plan Amendment nor a Zone Change is required to allow or authorize the uses permitted in the Specific Plan area. Although the Project site currently contains a commercial land use designation, the underlying special development zoning allows for combination of residential, commercial, industrial, agricultural, open space and recreation uses, and similar and compatible uses. A text and map amendment to the Development Code and General Plan will be made to identify the Specific Plan designation on the official map. The Project is consistent with Policy LU-6.4. See also Response O3-13.

O6-3 The commenter addresses a loophole that the Project doesn't meet Countywide Plan Policy HZ-3.18, which ensures environmental justice communities are active participants in Project application development review. Countywide Policy Plan Policy HZ-3.18 states the following:

Policy HZ-3.18 Application requirements: In order for a Planning Project Application (excluding Minor Use Permits) to be deemed complete, we require applicants to indicate whether the project is within, adjacent to, or nearby an unincorporated environmental justice focus area and, if so, to:

[7] https://countywideplan.com/policy-plan/land-use/

- document to the County's satisfaction how an applicant will address environmental justice concerns potentially created by the project; and
- present a plan to conduct at least two public meetings for nearby residents, businesses, and property owners to obtain public input for applications involving a change in zoning or the Policy Plan. The County will require additional public outreach if the proposed project changes substantively in use, scale, or intensity from the proposed project presented at previous public outreach meeting(s).[8]

While the Project did hold a Public Scoping Meeting (via Zoom on January 11, 2022) during the NOP comment period, it also held two publicly-noticed Environmental Justice (EJ) outreach workshops: the first on January 12, 2022, and the second on July 9, 2022. Noticing for these meetings was provided as follows: via letters mailed to all property owners within a 1,300-foot radius per County Code requirement a notice was posted on the County's website and on the Project website; notices were hand delivered within the project area; and, for the second workshop, distributed at the local farmers market (Thursday, June 30th and Thursday, July 7th of 2022); and provided at the local community center (Cypress Neighborhood Center). All notices were provided in both English and Spanish. Furthermore, additional analysis of the Project design was conducted after the initial scoping meeting and after the EJ outreach workshops. As a result of the additional analysis and based on community input, the Specific Plan was refined to incorporate additional programs, facilities and community benefits through enhancements of open space, community art, exercise stations, reduction of pollution exposure through solar, enhanced wellness walks, and more. The commenter states that the County is out of compliance with this policy. However, the Project met the requirement of Policy HZ-3.18 and conducted the required public outreach to obtain feedback from the community on potential EJ concerns.

O6-4 The comment incorrectly states that the Project would be out of compliance with Air Quality standards and GHG emissions standards and would have significant impacts even after mitigation, including criteria pollutants. The commenter addresses the Project will exceed the SCAQMD's thresholds for construction and operation, even with mitigation. The Project's exceedance of regional air quality emissions thresholds and GHG thresholds does not necessarily indicate that a project is not in compliance with applicable standards. For significant impacts, CEQA requires consideration of feasible mitigation measures that will substantially lessen the project's significant impacts. The Air Quality analysis and mitigation is identified in *Section 4.3, Air Quality*. The exceedance of the regional thresholds is a direct function of the Project's size.

Although emissions would exceed regional level thresholds, the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant with mitigation (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Although the regional thresholds were developed to determine a

[8] https://countywideplan.com/policy-plan/hazards/

level at which a project could affect the ambient air quality standards, these thresholds are the same for projects of all sizes and locations. The health risk LST analyses more accurately evaluate emissions based on the location and scale of the project. For example, LSTs for larger sites are higher than smaller sites to account for additional dispersion that occurs over a larger area. Additional dispersion also lowers the concentration of a pollutant. Also refer to Master Response 2.

The Project would be required to comply with all applicable SCAQMD and CARB rules and regulations. In addition, the Draft EIR identifies numerous air quality and GHG mitigation measures would minimize emissions to the greatest extent feasible. Furthermore, Draft EIR *Section 4.8* (Greenhouse Gas Emission), *Table 4.8-4: San Bernardino County GHG Reduction Measures Screening Table*, demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and resulting emissions.

Exceedance of the regional emissions thresholds indicates when emissions reduction mitigation measures would be required. The Draft EIR identifies numerous design features and mitigation measures to minimize emissions to the maximum extent feasible (refer to Draft EIR pages 4.3-21 through 4.3-23, 4.3-38 through 4.3-42, and 4.8-31 through 4.8-33). The comment does not identify any specific air quality or GHG standards that the Project would not comply with. Nor does the commenter identify any additional mitigation measures it believes could be feasibly implemented. Refer to Master Response 2 regarding CalEnviroScreen and rankings.

O6-5 The commenter states that the Draft EIR document indicates that there will be no additional measures taken to mitigate impacts to air quality, and that the Project will produce emission up to nearly 35 times higher than the allowed limits. The commenter suggests that the impacts will remain unmitigated. Refer to Response O6-4 above. Specifically, the Air Quality Assessment provided in Draft EIR *Section 4.3, Air Quality* analyzed the Project for build out assuming a worst-case scenario. Refrigerated buildings and Transport Refrigeration Units (TRU) were assumed for modeling purposes to provide a worst-case scenario. The worst-case scenario was also considered when evaluating greenhouse gas emissions, noise, and transportation impacts. Furthermore, it is assumed that overtime, emission will decrease as regulations are implemented and programs such as alternative fuels and clean fleets are required. As noted above, the Draft EIR identifies numerous project design features and mitigation measures to minimize air quality and GHG emissions impacts (refer to Draft EIR pages 4.3-21 through 4.3-23, 4.3-38 through 4.3-42, and 4.8-31 through 4.8-33). All feasible mitigation has been applied to mitigate all environmental impacts, including air quality and GHG emissions impacts.

O6-6 The commenter suggests the Air Quality impacts produced by the Project impacts a community, which per CalEnviroScreen, is already more impacted that 93 percent of other census tracts in the state, and where the pollution burden is in the 96th percentile, and the community is in the 72nd percentile for asthma. The commenter suggest and the Project should include additional engagement with the community, to meet the needs and desires of the what the area needs . The

commenter indicates the Project fails to engage the community properly and therefore is not following the County policies.

CalEnviroScreen has been developed by the Office of Environmental Health Hazard Assessment (OEHHA) and California Environmental Protection Agency (CalEPA). While CalEnviroScreen can assist CalEPA in prioritizing resources and helping promote greater compliance with environmental laws, it is important to note some of its limitations. The tool's output provides a relative ranking of communities based on a selected group of available datasets, through the use of a summary score. Unlike the Health Risk Assessment (HRA) prepared for the Project, the CalEnviroScreen score is not an expression of health risk and does not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment. Accordingly, CalEnviroScreen is not intended to be used as a health or ecological risk assessment for a specific area or site. Please refer to Draft EIR *Section 4.3, Air Quality* for a full evaluation of the Project's CEQA air quality effects. Furthermore, it should be noted that the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant with mitigation (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

The Project is consistent with the General Plan and existing zoning and proposes uses allowed by the Development Code. The Draft EIR proposed mitigation measures are intended to mitigate potential air quality and greenhouse gas emissions to the extent feasible. While the effects were found to be significant and unavoidable, mitigation was proposed to reduce these impacts to the maximum extent feasible.

The Project adhered to County policies by conducting two publicly-noticed EJ meetings, as noted in Response O6-3. The commenter's request for performing additional community outreach is noted for the record. However, the commenter has presented no substantial evidence (only conclusory non-expert opinion) that the Draft EIR is legally inadequate or which would necessitate additional outreach or further evaluation. Therefore, no further action is required at this time.

Re: Speedway Commerce Center II Specific Plan Draft Environmental Impact Report (SCH #2021120259)

Dear Mr. Valdez:

I am writing on behalf of the Inland Empire Biking Alliance to respond to the draft environmental impact report for the Speedway Commerce Center II Specific Plan ("Project"). After reviewing the documents, it is clear that this Project must do more to mitigate the impacts which remain unmitigated, impacts which bicycles are well-suited to address. It is imperative that additional headway be made toward reducing the impacts this Project will impose on the community than has currently been demonstrated in the DEIR.

Based on the data and information presented in the DEIR and its appendices, it is abundantly clear that motor vehicles are the major issue which is plaguing this Project and leading to emissions which exceed the limits, sometimes by cartoonishly obscene amounts. This remains the case even after applying several mitigation measures. However, it is simply unacceptable that impacts of this magnitude would be approached with essentially hands thrown in the air and no further efforts made to address them. The Project **must** do more to reduce the driver of those impacts: Motor vehicle traffic. To accomplish that, there must be a far more robust investment into alternatives to driving than has been provided in the DEIR, not just merely as options which are there "just in case" someone might not have access to a car, but as part of a concerted effort to intentionally make those other options at least as equally if not more attractive for using to reach the Project than driving.[1] 1

[1] The YouTube video about business parks (found here: https://www.youtube.com/watch?v=SDXB0CY2tSQ) from the channel Not Just Bikes is an outstanding example of how to do things better.

P.O. BOX 8636 Redlands, CA 92375 www.iebike.org

INLAND EMPIRE BIKING ALLIANCE

Bicycles and various other similar devices which are emerging onto the market offer an opportunity to make sizable reductions in motor vehicle use[23] at the Project and thus the associated emissions, but it requires being intentional about making the policy and design decisions which are necessary to ensure that these alternative modes are a viable and attractive option for future tenants, employees, and visitors of the Project. Yet, despite Policy TM-1.9 New transportation options of the Countywide Plan stating that the County "support[s] the use of" various alternative and "emerging transportation options" to do things including "reduce congestion, minimize land area needed for roadways, create more pedestrian- and bicycle-friendly streets, reduce VMT, or reduce dependency on privately-owned vehicles," it does not appear that it has been effectively employed with this Project as there remain a number of other steps which are certainly feasible and should be employed to further reduce emissions from the proposed Project. 2

Although there is much more that must be done, it is heartening to see that the Project does plan to include a "10-foot-wide multi-purpose trail along Street 'A'" in the design. That could represent a step forward as compared to what has traditionally been provided for projects as it would be a welcome change that allows future employees to be able to have a choice of how they would access their place of employment by removing one of the major barriers to ridership—safety. Numerous studies have identified that when provided with infrastructure which provides a low-stress environment,[4] people are more likely to consider[5] and use a bike for making more of their trips, including to work.[6][7] 3

In many instances, there are often constraints imposed by the existing environment that hamper the ability for agencies to provide the best practice designs and infrastructure due to the changes that would be required, and a balance is struck which usually provides some, but not all, of the improvements and design elements needed. However, developments such as the proposed Project offer the opportunity of essentially a blank slate which does not suffer from the issues which often impair the construction of good bikeways but instead provides the opportunity to design around the usual impediments from the

INLAND EMPIRE BIKING ALLIANCE

very beginning. It is imperative that the opportunity not be wasted but instead used to do better than mediocre and provide the most up-to-date designs for bicyclist travel. 3

As referenced earlier, it is now well-established via research that providing infrastructure for bicyclists that enables them to travel without having to mix with fast or heavy motor traffic is critical to both safety as well as ridership. Thus, while the multi-purpose trail along Street "A" is a good start, it is not enough. Despite looking through the DEIR and Appendices several times, forecast traffic counts of the internal streets to the Project remained elusive. Nevertheless, the description of the planned Streets "A" through "D" on e.g. Figure 3-5: Circulation Plan states that they would all be constructed as a "Collector" with varying widths. However, it seems rather unlikely that the traffic conditions on these new Streets would fall under the limits set forth by guidelines from Caltrans[8] or the FHWA on where it is acceptable to expect that bicyclists would not be provided the requisite infrastructure for safe travel, a violation of the County's Policy TM-4.9 Bike and pedestrian safety. 4

But there is also some confusion in this regard because Figure 3-4: Conceptual Site Plan does in fact show an "Enhanced Greenway 10'-0" Multi-Use Path (Typ)" along Streets "B" and "C" and along most of Street "D" up until Street "B." If that is in fact the plan, then that would address the concern stated above about the lack of provision of safe bikeways beyond along Street "A." However, if the written description is correct and no trail is planned along 5

Figure 1: Bikeway along Peelo Oost in an industrial area of Assen, NL provides a model of what the Project could accomplish. Image credit: Marven Norman.

INLAND EMPIRE BIKING ALLIANCE

Streets "B" through "D" as shown in Figure 3-4, then the importance of including them cannot be understated. Although Policy TM-4.9 does state that the County would "monitor…bicycle traffic accidents and promote safety improvements," it is asinine to propose to construct bike facilities which are known to be less safe, then wait for crashes to happen to try chasing down grants to fix a situation that did not have to exist in the first place. Streets "B" through "D" all need a separate bikeway just like Street "A" (or modifications need to be made to the proposed design to bring the speed and/or volume of motor traffic on Streets "B" through "D" to within the acceptable range for mixed traffic). Doing so would set this Project forward as a model nationally and potentially on par with the best provision in places which are more well-known for their bike-friendliness (e.g. Figure 1). 5

It also is critical to address the design of the bicycle facilities themselves. Per the various descriptions within the DEIR, the trail(s) would be 10 feet wide. However, it is important to design for the future and that includes providing additional width to ensure that the space exists for future demand of the facility, including potential use by micromobility delivery services from the Project such as are being trialed by Amazon, DHL, UPS, the USPS, or others.[9] With the planned San Sevaine Trail that also connects to the Pacific-Electric Trail, the growing network of bikeways provides an increasing area of the region that is reachable via a low-stress connection, offering the opportunity for deliveries to homes and businesses along those routes. 6

As the paths gain popularity, it paramount to not see crowding on the trails become a problem. To avoid that outcome, it would be ideal to see that the width be increased from the 10 feet as currently planned to 12-13 feet (or at least 11 feet if there is a separate sidewalk provided). Such a width is enough to enable safe and comfortable travel by all on the trails even as usage grows and is especially necessary if they are intended to be shared with pedestrians instead of having separate sidewalks.

Another issue is that of lighting as well as wayfinding for the paths within the Project. Presumably, highway-scale streetlights would be provided along the Streets, but it is vital for usability that there is also lighting of the appropriate scale provided along the paths. This is critical from the standpoint of both social safety (i.e. CPTED principles) as well as to ensure that users are able to have enough lighting to be able to see and safely navigate the path. Similarly, wayfinding along the path (though it can serve double duty if provided at a scale that is relevant and useful to motorists on the road) is an important tool to help people navigate[10] within the Project as well as connections to other locations such as the San Sevaine Trail. It is also helpful to include distances and travel times to the locations as part of the wayfinding. 7

[9] Several of the various models now or soon on the market in this space can be seen in this video: https://www.youtube.com/watch?v=EhMCKY-fTmY.

P.O. BOX 8636 Redlands, CA 92375 www.iebike.org

INLAND EMPIRE BIKING ALLIANCE

The third vital issue to be identified is of intersection design. How precisely this matter would be addressed is not clear from the DEIR documents. However, the importance of getting this part right cannot be stressed enough. Bad intersection designs hamper the usefulness of bikeways at best and while separate bike facilities offer overall safety benefits, they can be undermined by bad intersection design. Again, it is critical to draw attention to the fact that this is a Project with a substantial blank slate opportunity so there is no reason to not have the best designs in use for its construction. There are several resources available for this purpose in both video form[11] as well as published guides,[12] but it is critically important that the chosen designs maximize nonstop travel for bicyclists, including at driveways, and that signalized intersections include the appropriate signals *and curb cut or ramp designs* specifically for bikeways as well. 8

Additionally, Policy TM-2.4 Atypical intersection controls states that the County will "allow the use of atypical intersection concepts" to "improve traffic flow and safety compared to conventional intersection controls." In this regard, grade-separation is an option that should be on the list. Doing so is helpful for ensuring safety of bicyclists at major intersections as well as ensuring that bicycling is as inviting as possible by reducing the number of stops required when riding, something which has a real impact on how far people are willing to ride. Ideally, grade-separations should be designed such that motorized traffic makes the change of grade while human-powered users are provided with a route closer to flat or which allows for the gaining of momentum on the descent that is useful coming up on the other side. Typically, this leads to a tunnel or underpass being the preferred option in situations such as are present in the Project, though there are also examples such as the world-famous Hovenring which are accomplished by lowering the road surface to allow the bikeway to remain relatively flat[13] while passing over it. But these facilities are not just something that are limited to international locations as many have been built in communities around the United States, even in small towns,[14] with more under construction. 9

This Project should be added to that list. As a major construction with a blank slate, it offers an opportunity for the inclusion of such a facility in lieu of an at-grade intersection with the bikeway at the intersection of Streets "A" and "B." That would improve safety and support ridership by providing the ability for people to get to almost anywhere within the Project from the San Sevaine Trail without having to stop at all. By raising the road several feet above the grade, it would be possible to build a

INLAND EMPIRE BIKING ALLIANCE

tunnel or underpass for the bikeway which minimizes or eliminates the need for a long approach ramp and thus reducing the amount of descending and ascending people would need to make as well as being better for social safety. 9

Additionally, per Policy TM-4.2 Complete streets improvements, the County states that "we require new development to contribute to complete street improvements…" Looking over the Recommended Improvements in Appendix L – VMT Traffic, nearly all of them would have a direct impact on bikeways included in the bike, active transportation, or mobility plans for the various jurisdictions in the area and some are in direct conflict with the improvements identified in those places which represents an unmitigated impact. They are summarized in the table below along with the improvements that need to be included at the same time. 10

Recommended Improvement from DEIR	Description	ATP	Needed improvement
#15 – Citrus Ave at Baseline Ave	Add a dedicated northbound right-turn lane with overlap phasing	Implement Class IV bikeway on Citrus from Baseline Avenue to SCE Utility South	Include Class IV bikeway and bike-specific signals
#20 – Etiwanda Ave at Foothill Blvd	Widen all approaches by 1 through lane	City of Rancho Cucamonga designates Foothill Blvd as a "Boulevard" which prioritizes bike, pedestrian, and transit, **not** automobiles	Include Class IV bikeway based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#22 – Beech Ave at Foothill Blvd	Traffic signal recommended	Class II on Foothill Blvd	Include Class IV bikeway instead of Class II bike lanes based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#23 – Citrus Ave at Foothill Blvd	Widen north, south, and eastbound approaches by 1 through lane	Class II on Foothill Blvd, Citrus Ave	Include Class IV bikeway instead of Class II bike lane based on Caltrans/FHWA guidelines; bike-specific signals for bikeway

P.O. BOX 8636 Redlands, CA 92375 www.iebike.org

INLAND EMPIRE BIKING ALLIANCE

#24 – Sierra Ave at Foothill Blvd	Restripe southbound approach to provide dual left-turn lanes	Class IV on Sierra Ave	Class IV on Sierra Ave with appropriate bike-specific signals
#25 – Etiwanda Ave at Arrow Rte	Add 2nd eastbound through lane	Both are arterials in City of RC PlanRC2040 which allows bike traffic	Include Class IV bikeway based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#26 – Cherry Ave at Arrow Rte	Widen all approaches by 1 through lane	Class II on Arrow Rte, Cherry Ave	Include Class IV bikeway instead of Class II bike lane based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#30 – Etiwanda Ave at Whittram Ave	Widen north and southbound approaches by 1 through lane	Class II on Etiwanda Ave	Include Class IV bikeway instead of Class II bike lane based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#32 – Beech Ave at Whittram Ave	Traffic signal recommended under HY2040 conditions	none	Include Class IV bikeway based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#33 – Etiwanda Ave at Napa St	Widen north and southbound approaches by 1 through lane	Class II on Etiwanda Ave	Include Class IV bikeway instead of Class II bike lane based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#34 – Cherry Ave at Merrill Ave	Widen north and southbound approaches by 1 through lane	Class II on Cherry Ave, Merrill Ave	Include Class IV bikeway instead of Class II bike lane based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#35 – Beech Ave at Merrill Ave	Traffic signal recommended under HY2040 conditions	Class II on Merrill Ave	Include appropriate bikeway based on Caltrans/FHWA

10

INLAND EMPIRE BIKING ALLIANCE

			guidelines; bike-specific signals for bikeway
#39 – Cherry Ave at Randall Ave	- Modified eastbound approach – 1 left, 1 through, and 2 rights - Modified westbound approach – 1 left, 2 through, 1 right	Class II on Cherry Ave	Employ appropriate design of path shown on Figure 3-4 and signals to facilitate east-west travel to/from Randall Ave, to provide a transition to the path for northbound cyclists on Cherry, and to provide access to paths within the Project
#40 – Beech Ave at Randall Ave	Traffic signal recommended under HY2040 conditions	none	Include appropriate bikeway based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#41 – Fontana Ave/Catawba Ave at Randall Ave	Traffic signal recommended under HY2040 conditions	Class II on Fontana Ave, Randall Ave; Randall identified for road rebalancing	Include appropriate bikeway based on Caltrans/FHWA guidelines; bike-specific signals for bikeway; implement road rebalancing
#49 – Cherry Ave at San Bernardino Ave	Widen westbound approach by 1 through lane	Class II on Cherry Ave, San Bernardino Ave	Include Class IV bikeway instead of Class II bike lane based on Caltrans/FHWA guidelines; bike-specific signals for bikeway
#41 – Fontan Ave/Elm St at San Bernardino Ave	Widen eastbound approach by 1 through lane	Class II on Fontana Ave, San Bernardino Ave; San Bernardino Ave. identified for road rebalancing	Include appropriate bikeway based on Caltrans/FHWA guidelines; bike-specific signals for bikeway; no widening, implement road rebalancing
#59 – Beech Ave at Valley Blvd	- Traffic signal recommended in HY2040 - Widen all approaches by 1 through lane	Class II on Valley Blvd	Include Class IV bikeway instead of Class II bike lane based on Caltrans/FHWA

10

P.O. BOX 8636 Redlands, CA 92375 www.iebike.org

INLAND EMPIRE BIKING ALLIANCE

			guidelines; bike-specific signals for bikeway

Of course, it is not just important that the Project do the bare minimum and not undermine the existing bike master plans within the region, but rather the developer should be conditioned to making fair share contributions to the various other non-car-focused transportation projects and missing links that would connect to bikeways as well as transit. This includes efforts to fill in gaps in existing bike infrastructure and sidewalks to help ensure that people seeking to access the Project by alternative modes can do so in safety and comfort—just like the DEIR has worked hard to make sure is the case for people traveling by motor vehicle. 10

Finally, the DEIR makes it even more apparent that there is a real need for converting the event Metrolink station to a fulltime station. As noted in that document, the nearest stations at present are the Fontana or Rancho Cucamonga stations, both over three miles away from the Project. That distance means that for all practical purposes, they are inaccessible from the Project site. Thus, although the San Bernardino Line which passes directly north of the Project site and is forecast to have 30-minute headways by 2027 per the 2018 State Rail Plan, the potential for a convenient and competitive travel option that would greatly reduce the need for motor vehicles, a goal of Policy TM-4.5 Transit access to job access and tourist destinations, would remain unavailable for use without the effort to upgrade the existing station to be a fulltime station.

Based on current schedules, the station would be within half an hour of travel time to every station along the San Bernardino Line from Pomona – North in the west to San Bernardino – Downtown in the east and as Metrolink is undertaking several siding extension projects along the San Bernardino Line as part of their SCORE program, those improvements can enable the scheduled times to be shaved a little bit more. Additionally, SBCTA has previously studied improving service frequency to 20- or even 15-minute headways and efforts to advance that reality are ongoing. Thus, in combination with bike access,[15] people living within a mile or two of train stations in cities like Rialto, where more than 10% of households in the station area are already car-free,[16] could be able to access a job at the Project within half an hour,[17] a travel time that is competitive with driving and which compares favorably with commute times in the overall region. This would provide a meaningful reduction in motor traffic, 11

[15] Zuo, T., Wei, H., Chen, N., & Zhang, C. (2020). First-and-last mile solution via bicycling to improving transit accessibility and advancing transportation equity. *Cities*, 99, 102614.

INLAND EMPIRE BIKING ALLIANCE

particularly when paired with TDM measures such as employer-provided transit passes (which is something that unfortunately appears to be missing from the list of mitigations in MM AQ-3). 11

In summary, there are several additional steps that can be taken to ensure that the Project does a better job of mitigating the impacts it is imposing on the community, a vitally important point given the fact that per CalEnviroScreen 4.0, it is one of the most impacted in the state. It is not acceptable to simply refuse to take further action to reduce the cause of the emissions and in fact, several plainly obvious measures were not even employed, putting the Project in conflict with several existing policies from the County. Ideally, this Project should have been approached from the standpoint of not just how all the trips get mitigated (which did not even happen), but rather *identify how to keep more of the trips from happening in the first place*. Instead, the Project analysis went precisely the opposite way and has assumed that all trips will be driven, then works backwards from there in attempting to address them. Thus, there is a lot more that the Project could and must do that would reduce the emissions it produces, so it is imperative that these changes to mitigations be made and incorporated. Doing so should provide the ability to reduce at least 20% of driving to the Project and thus improving the emissions by a commensurate amount. Not only is that the right thing to do, but it would set the Project apart as a leader in not just the region, but the entire nation with a model of this development done right from the ground up and it would save money in the process. 12

Sincerely,

Marven E. Norman, Executive Director

About IEBA The Inland Empire Biking Alliance is advocating for making the Inland Empire a better place for people from all rolls of life. From the children just learning how to ride to the mountain bikers to those headed back and forth to work, school, or their preferred shopping center and beyond, we speak up to make sure they all have safe and convenient place to ride.

P.O. BOX 8636 Redlands, CA 92375 www.iebike.org

Response to Comment Letter O7 – Inland Empire Biking Alliance

O7-1 The commenter provides a general introduction on behalf of the Inland Empire Biking Alliance and suggest additional mitigation should be included to reduce the environmental impacts associated with the Project. The commenter provides additional comments on the importance of additional modes of transportation to reduce emissions caused by motor vehicles and suggest the reduction of motor vehicle traffic.

The commenter's request for additional modes of transportation in association with the Project is noted for the record. The Project includes design features (PDFs) which promote alternate forms of transportation beyond vehicular uses such as PDF TRANS 1: Bike/Pedestrian Facilities. Sidewalks would be provided on most street sections within the Project area per the SCCIISP. Limited street sections within the Project area (i.e., along the flood control channel) will not have sidewalks to discourage pedestrian activity and existing conditions outside the Project area along VIP Access Road. For Street "A," a 10-foot-wide multi-use trail would be provided for internal connectivity. In addition, MM AQ-3 requires the implementation of a Transportation Demand Management (TDM) program to reduce single occupant vehicle trips and encourage transit. Additionally, the Project would implement various PDFs that encourage the use of alternate transportation. PDF TRANS-1 through PDF TRANS-3 listed on page 4.17-13 of the Draft EIR would result in the construction of bike and pedestrian facilities, increase consultation with Omni Trans to increase bus routes to the Project area as needed, and to implement a Commuter Trip Reduction Program. Implementation of these mitigation measures and PDFs would reduce emissions by reducing the number of employee vehicles on-site, encouraging bike and pedestrian modes of travel, and facilitating electric vehicle (EV) infrastructure.

The Draft EIR found no significant and unavoidable transportation impacts. Mitigation measures proposed within the Draft EIR are those that were found to be feasible and within the scope of the Project.

O7-2 The commenter states that bicycles would create reductions in motor vehicle use, however this would require policy and design decisions to ensure these alternative modes of transportation are used in the future of Project implementation. The commenter also indicates Policy TM-1.9 is not effective with this Project.

Countywide Plan Policy TM-1.9 does not include a quantifiable requirement for alternative transportation options. However, the Project has proposed a circulation plan which promotes pedestrian travel and bicycle usage within the Specific Plan and to connect to future trail improvements. The Project also includes PDFs which promote alternate forms of transportation beyond vehicular uses. For example, MM AQ-3 requires the implementation of a TDM program to reduce single occupant vehicle trips and encourage transit. Other PDFs that would encourage the use of alternate transportation include PDF TRANS-1 through PDF TRANS-3 which include the construction of bike and pedestrian facilities, increase consultation with Omni Trans to increase bus routes to the Project area as needed, and to implement a Commuter Trip Reduction Program. PDF TRANS 3 also includes bicycle end-trip facilities (parking, showers, and lockers).

For Street "A," a 10-foot multi-use path is provided for internal connectivity. This multi-use path provides a Class I bicycle lane with a landscaped parkway area providing separation between cyclists and on-street vehicles. The multi-use path runs the full east/west length of the Project area from Cherry Avenue to the connection point at Napa Street. The multi-use path also connects with both Street "B" and Street "C" to allow riders greater accessibility throughout the Project area. Sidewalks are provided on all street sections within the Project area. The Project proposes to provide exercise stations, employee walking loops, wayfinding signage and other community benefit programs such as public art and green spaces. Further, the Project includes opportunities for enhanced pedestrian walkway connections between the parking lots/drop lots and the Next Gen motorsports facility, with enhanced landscaping, signage or art installation, and pedestrian walkways.

O7-3 The commenter states that the Project does not plan to include a 10-foot wide multi-purpose trail along Street A which would provide future employees a low-stress environment and a choice of how they would access their place of employment. The commenter indicates that the Project offers the opportunity to design around the usual impediments and provide the most up-to-date designs for bicyclist travel.

Comment noted for the record. However, no specific comments on the contents or adequacy of the Draft EIR are provided. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. However, the Project proposes to provide 10-foot wide multi-purpose path, exercise stations, employee walking loops, wayfinding signage and other community benefit programs such as public art and green spaces.

O7-4 The commenter states that providing infrastructure for bicyclists that enables them to travel without interacting with heavy motor traffic is critical for safety and ridership and addresses that the multi-purpose trail along Street A is not adequate. The commenter notes forecast traffic counts of the internal streets to the Project are elusive and the description of Streets A through D on, e.g., Figure 3-5: Circulation Plan should better address traffic conditions on these new Streets and confirm with Caltrans guidelines and the FHWA. The commenter suggest the Project violates the Countywide Policy TM-4.9.

The Project includes along Street "A" a 10-foot-wide multi-use path on the southern edge of the street that would provide a connection between Cherry Avenue and Napa Street. This multi-use path provides a Class I bicycle lane with a landscaped parkway area providing separation between cyclists and on-street vehicles. The Draft EIR addresses bicycle access in *Section 3.6, Circulation Plan*. As discussed in Draft EIR *Section 4.17, Transportation*, page 4.17-10, bikeway facilities and guidelines can be found in the San Bernardino County Non-Motorized Transportation Plan (June 2018) summarized in *Section 4.17* of the Draft EIR.

The Project would be consistent with policy TM-4.9 by including a 10-foot-wide multi-purpose path along Street "A." Street "A" is a proposed east-west trending public street and would connect Cherry Avenue on the Project area's eastern edge with existing Napa Street on the west. It would

form an intersection with Rancho Vista Drive to the east of Cherry Avenue to provide safe bicycle and pedestrian access. This multi-use path provides a Class I bicycle lane with a landscaped parkway area providing separation between cyclists and on-street vehicles.

O7-5 The commenter addresses Draft EIR *Figure 3-4: Conceptual Site Plan* does not show an "Enhanced Greenway 10' Multi-Use Path (Typ)" along Streets B and C and most of Street D and is concerned about the lack of provision of safe bikeways. The commenter indicates if the written description is correct, and no trail is planned along Streets B through D. The commenter indicates the Project violates Countywide Policy TM-4.9 and suggests Streets B through D should include a separate bikeway, same as indicated on Street A.

Street "A" proposes a 10-foot-wide multi-use pathway on the southern edge of the street. The multi-use path also connects with both Street "B" and Street "C" to allow greater accessibility throughout the Project area. See also Response O7-4. Internal roadways will include infrastructure to allow for pedestrian movement. The Project also includes an opportunity for a wellness walk which includes walking paths that connects amenity areas throughout the development.

O7-6 The commenter notes the importance for future demand of bicycle facilities and the growing network of bikeways in the region that can provide low-stress connection and offer opportunities for deliveries to homes and businesses along these routes. The commenter suggests the width of the trail be increased to 12-13 feet to avoid future overcrowding. Refer to Response O7-2.

Comment noted for the record. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O7-7 The commenter suggests lighting of the appropriate scale be provided along the paths to ensure safety. The commenter also suggests including distances and travel times to the locations to serve wayfinding along the path.

Lighting within the Project site would comply with all applicable regulations, including the County's development code which requires proper illumination of outdoor areas while protecting sensitive receptors to potential light leakage. Safety and directional signage for bicycle circulation shall be provided as required by the California Manual on Uniform Traffic Control Devices, Caltrans, and AASHTO Standards. Future projects should also reference the San Bernardino County Non-Motorized Transportation Plan. Furthermore, the Project would implement Crime Prevention Through Environmental Design (CPTED) practice strategies to deter and prevent crime.

Once operational, the buildings would use interior and exterior lighting. Consistent with Section 83.07.030 (Glare and Outdoor Lighting – Valley Region) of the County's Development Code, all exterior lighting used on the Project site would be fully shielded to preclude light pollution or light trespass on any of the following: An abutting residential land use zoning district; A residential parcel; or Public right-of-way. Lighting should be strategically placed to illuminate parking areas, docks/loading zones, and building entries. Lighting would utilize high-efficiency

technologies, dark-sky cutoffs, strategic orientation to avoid spillover into adjacent properties, and open space areas, and appropriate shielding or recesses to minimize glare and reflections. Public and private street lighting and parking lot lighting would meet County standards.

O7-8 The commenter suggests the intersection design is not detailed enough in the Draft EIR. The commenter notes the importance of safety being threatened by poor intersection design.

Comment noted for the record. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. However, the multi-use path was designed on the south side of Street A to limit the number of driveway and street crossings. Moreover, the Draft EIR concluded that the Project would not result in a significant impact due to a hazardous design feature such as a dangerous intersection. See Draft EIR pages 4.17-21 through 4.17-23.

O7-9 The commenter suggests the Project provide grade-separation and reduce the number of slopes required for bicyclists as recommended by Countywide Policy TM-2.4 to ensure the safety and the willingness to ride of bicyclists at major intersections. The commenter suggest that motorized traffic should be required to make the necessary grade changes so bicyclists can remain on flat surfaces. The commenter further suggests additional improvements to support safe ridership.

The Draft EIR found no significant and unavoidable impacts associated with transportation effects associated with the Project. Additionally, roadway improvements are proposed with development of the Specific Plan. Moreover, the Draft EIR concluded that the Project would not result in a significant impact due to a hazardous design feature such as a dangerous intersection. See Draft EIR pages 4.17-21 through 4.17-23.

O7-10 The commenter indicates nearly all the recommended improvements in *Appendix L* – VMT Traffic have a direct impact on bikeways or felt they were in direct conflict with the improvements in the various jurisdictions. The commenter suggested that the developer make contributions to non-car-focused transportation projects.

The recommended improvements are to meet an acceptable LOS per County Standards. Project will pay development impact fee (DIF) that the County can use towards Complete Street Improvements. Refer to County Bicycle Master Plan.

O7-11 The commenter indicated that the Project shouldn't convert the event Metrolink station to a fulltime station and that transit access for jobs and tourist destinations would remain unavailable without the effort to upgrade the existing station as a fulltime station. The commenter references improving service frequency in combination with bike access, people living within a mile or two of train stations and job access to the Project within half an hour, areas an opportunity to increase transit uses.

The current event Metrolink station is not being considered as a permanent station by SBCTA or Metrolink. Therefore, the Draft EIR analyzed other options. Omnitrans is a public transit agency in the County providing bus service throughout the San Bernardino Valley. There are no existing

Omnitrans public transit routes or stops providing regular service adjacent to the Project site. The closest Omnitrans Transit System routes are Route 66 along W. Foothill Boulevard and Route 61 along San Bernardino Avenue. As the Project develops, the Transit System may assess the potential demand for these facilities in the area and may establish new or extended routes in the area in the future. Coordination with Omnitrans has begun and will be ongoing as the Project builds out to determine the need for future bus service to the Project site.

The Draft EIR found no significant and unavoidable impacts associated with transportation effects associated with the Project. Mitigation measures proposed within the Draft EIR are those that were found to be feasible and within the sphere of influence of the Project.

O7-12 The commenter concludes there are several steps that should be taken to ensure the Project better mitigates environmental impacts and summarizes the location in the most impacted state, in terms of traffic trips as a basis to support alternative transportation.

The commenter's summary of previous comments are noted for the record. Refer to Response O6-6 and Master Response 2.

RE: Speedway Commerce Center II Specific Plan Project and EIR

Dear Steven Valdez,

On behalf of the Southwest Regional Council of Carpenters ("**Southwest Carpenters**" or "**SWRCC**"), my Office is submitting these comments on the County of San Bernardino's ("**County**") Draft Environmental Impact Report ("**DEIR**") (SCH No. 2021120259) for the Speedway Commerce Center II Specific Plan Project and EIR Project ("**Project**").

The Southwest Carpenters would like to express their support for this Project and withdraw their prior July 18, 2022 comment letter. After receiving clarification and further information about this Project, SWRCC believes that this Project will benefit the environment and the local economy by utilizing a local skilled and trained workforce and will be built utilizing protocols that will protect worker health and safety. 1

If the County has any questions or concerns, feel free to contact my Office.

Sincerely,

Mitchell M. Tsai
Attorneys for Southwest Regional
Council of Carpenters

RE: County of San Bernardino's Speedway Commerce Center II Specific Plan and Environmental Impact Report (SCH No. 2021120259)

Dear Mr. Valdez:

On behalf of the Southwest Regional Council of Carpenters ("**SWRCC**" or "**Southwest Carpenters**"), my Office is submitting these comments regarding the County of San Bernardino's ("**County**" or "**Lead Agency**") Draft Environmental Impact Report (**DEIR**) (SCH No. 2021120259) for the Speedway Commerce Center II Specific Plan ("**SCCIISP**" or "**Project**").

The SWRCC is a labor union representing more than 57,000 union carpenters in six states, including California, and has a strong interest in well-ordered land use planning, addressing the environmental impacts of development projects, and equitable economic development.

Individual members of the SWRCC live, work, and recreate in the County and its surrounding communities and would be directly affected by the Project's environmental impacts.

The SWRCC expressly reserves the right to supplement these comments at or prior to hearings on the Project, and at any later hearing and proceeding related to this Project. Gov. Code, § 65009, subd. (b); Pub. Resources Code, § 21177, subd. (a); see *Bakersfield Citizens for Local Control v. Bakersfield* (2004) 124 Cal.App.4th 1184, 1199-1203; see also *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal.App.4th 1109, 1121.

2

The SWRCC incorporates by reference all comments raising issues regarding the Environmental Impact Report (**EIR**) submitted prior to certification of the EIR for the Project. *Citizens for Clean Energy v. City of Woodland* (2014) 225 Cal.App.4th 173, 191 (finding that any party who has objected to the project's environmental documentation may assert any issue timely raised by other parties).

Moreover, the SWRCC requests that the County provide notice for any and all notices referring or related to the Project issued under the California Environmental Quality Act (**CEQA**), Pub. Resources Code, § 21000 *et seq.*, and the California Planning and Zoning Law ("**Planning and Zoning Law**"), Gov. Code, §§ 65000–65010. California Public Resources Code sections 21092.2 and 21167(f) and California Government Code section 65092 require agencies to mail such notices to any person who has filed a written request for them with the clerk of the agency's governing body.

3

The County should require that the Applicant provide additional community benefits by requiring local hire and the use of a skilled and trained workforce to build the Project. The County should also require the utilization of workers who have graduated from a joint labor-management apprenticeship training program approved by the State of California, who have at least as many hours of on-the-job experience in the applicable craft which would be required to graduate from such a program, or who are registered in an apprenticeship training program approved by the State of California.

Community benefits such as local hire and skilled and trained workforce requirements can also be helpful in reducing the negative environmental impact and improving the positive economic impact of the Project. Local hire provisions requiring that a certain percentage of workers reside within 10 miles or less of the Project site, for example, can reduce the length of vendor and worker trips, reduce greenhouse gas (GHG) emissions, and provide localized economic benefits from saved time and costs associated with commuting. As environmental consultants Matt Hagemann and Paul E. Rosenfeld note:

4

> [A]ny local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

March 8, 2021 SWAPE Letter to Mitchell M. Tsai regarding Local Hire Requirements and Considerations for Greenhouse Gas Modeling. 4

Skilled and trained workforce requirements also promote the development of skilled trades that yield sustainable economic development. As the California Workforce Development Board and the University of California, Berkeley Center for Labor Research and Education concluded:

> [L]abor should be considered an investment rather than a cost—and investments in growing, diversifying, and upskilling California's workforce can positively affect returns on climate mitigation efforts. In other words, well-trained workers are key to delivering emissions reductions and moving California closer to its climate targets.[1]

On May 7, 2021, the South Coast Air Quality Management District found that the "[u]se of a local state-certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.[2] 5

Cities are increasingly adopting local skilled and trained workforce policies and requirements into general plans and municipal codes. For example, the City of Hayward's 2040 General Plan requires the city to "promote local hiring . . . to help achieve a more positive jobs-housing balance and reduce regional commuting, gas consumption, and greenhouse gas emissions."[3]

In fact, the City of Hayward has even incorporated a skilled labor force policy into its Downtown Specific Plan and municipal code. The policy contributes to the stabilization of regional construction markets by motivating applicants of housing and nonresidential developments to require that contractors utilize apprentices from state-

[1] California Workforce Development Board (2020) Putting California on the High Road: A Jobs and Climate Action Plan for 2030 at p. ii, *available at* https://laborcenter.berkeley.edu/wp-content/uploads/2020/09/Putting-California-on-the-High-Road.pdf.

approved joint labor-management training programs.[4] The City of Hayward mandates the same measure on all projects that are 30,000 square feet or larger.[5]

5

Locating jobs closer to residential areas can also have significant environmental benefits. As the California Planning Roundtable noted in 2008:

> People who live and work in the same jurisdiction would be more likely to take transit, walk, or bicycle to work than residents of less balanced communities and their vehicle trips would be shorter. Benefits would include potential reductions in both vehicle miles traveled and vehicle hours traveled.[6]

Moreover, local hire mandates and skill training are critical facets of a strategy to reduce vehicle miles traveled (VMT). As planning experts Robert Cervero and Michael Duncan note, simply placing jobs near housing stock is insufficient to achieve VMT reductions given that the skill requirements of available local jobs must match to those held by local residents.[7] Some municipalities have gone as far as linking local hire and skilled and trained workforce policies to local development permits to address transportation issues. As Cervero and Duncan note:

6

> In nearly built-out Berkeley, CA, the approach to balancing jobs and housing is to create local jobs rather than to develop new housing. The city's First Source program encourages businesses to hire local residents, especially for entry- and intermediate-level jobs, and sponsors vocational training to ensure residents are employment-ready. While the program is voluntary, some 300 businesses have used it to date, placing more than 3,000 city residents in local jobs since it was launched in 1986. When needed, these carrots are matched by sticks, since the city is not shy about

negotiating corporate participation in First Source as a condition of approval for development permits.

Therefore, the County should consider utilizing skilled and trained workforce policies and requirements to benefit the local area economically, mitigate greenhouse gas emissions, improve air quality, and reduce transportation impacts. 6

The County should also require the Project to be built to standards exceeding the current 2019 California Green Building Code to mitigate the Project's environmental impacts and to advance progress towards the State of California's environmental goals.

Subject: Local Hire Requirements and Considerations for Greenhouse Gas Modeling

Dear Mr. Tsai,

Soil Water Air Protection Enterprise ("SWAPE") is pleased to provide the following draft technical report explaining the significance of worker trips required for construction of land use development projects with respect to the estimation of greenhouse gas ("GHG") emissions. The report will also discuss the potential for local hire requirements to reduce the length of worker trips, and consequently, reduced or mitigate the potential GHG impacts.

Worker Trips and Greenhouse Gas Calculations

The California Emissions Estimator Model ("CalEEMod") is a "statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects."[1] CalEEMod quantifies construction-related emissions associated with land use projects resulting from off-road construction equipment; on-road mobile equipment associated with workers, vendors, and hauling; fugitive dust associated with grading, demolition, truck loading, and on-road vehicles traveling along paved and unpaved roads; and architectural coating activities; and paving.[2]

The number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[3]

[1] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[2] "California Emissions Estimator Model." CAPCOA, 2017, *available at:* http://www.aqmd.gov/caleemod/home.
[3] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.

Specifically, the number and length of vehicle trips is utilized to estimate the vehicle miles travelled ("VMT") associated with construction. Then, utilizing vehicle-class specific EMFAC 2014 emission factors, CalEEMod calculates the vehicle exhaust, evaporative, and dust emissions resulting from construction-related VMT, including personal vehicles for worker commuting.[4]

Specifically, in order to calculate VMT, CalEEMod multiplies the average daily trip rate by the average overall trip length (see excerpt below):

> "$VMT_d = \Sigma(\text{Average Daily Trip Rate}_i * \text{Average Overall Trip Length}_i)_n$
>
> Where:
>
> n = Number of land uses being modeled."[5]

Furthermore, to calculate the on-road emissions associated with worker trips, CalEEMod utilizes the following equation (see excerpt below):

> "$\text{Emissions}_{pollutant} = VMT * EF_{running,pollutant}$
>
> Where:
>
> $\text{Emissions}_{pollutant}$ = emissions from vehicle running for each pollutant
>
> VMT = vehicle miles traveled
>
> $EF_{running,pollutant}$ = emission factor for running emissions."[6]

Thus, there is a direct relationship between trip length and VMT, as well as a direct relationship between VMT and vehicle running emissions. In other words, when the trip length is increased, the VMT and vehicle running emissions increase as a result. Thus, vehicle running emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise.

Default Worker Trip Parameters and Potential Local Hire Requirements

As previously discussed, the number, length, and vehicle class of worker trips are utilized by CalEEMod to calculate emissions associated with the on-road vehicle trips required to transport workers to and from the Project site during construction.[7] In order to understand how local hire requirements and associated worker trip length reductions impact GHG emissions calculations, it is important to consider the CalEEMod default worker trip parameters. CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act ("CEQA") requires that such changes be justified by substantial evidence.[8] The default number of construction-related worker trips is calculated by multiplying the

[4] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14-15.
[5] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 23.
[6] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[7] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[8] CalEEMod User Guide, *available at:* http://www.caleemod.com/, p. 1, 9.

number of pieces of equipment for all phases by 1.25, with the exception of worker trips required for the building construction and architectural coating phases.[9] Furthermore, the worker trip vehicle class is a 50/25/25 percent mix of light duty autos, light duty truck class 1 and light duty truck class 2, respectively."[10] Finally, the default worker trip length is consistent with the length of the operational home-to-work vehicle trips.[11] The operational home-to-work vehicle trip lengths are:

> "[B]ased on the *location* and *urbanization* selected on the project characteristic screen. These values were *supplied by the air districts or use a default average for the state*. Each district (or county) also assigns trip lengths for urban and rural settings" (emphasis added). [12]

Thus, the default worker trip length is based on the location and urbanization level selected by the User when modeling emissions. The below table shows the CalEEMod default rural and urban worker trip lengths by air basin (see excerpt below and Attachment A).[13]

Worker Trip Length by Air Basin

Air Basin	Rural (miles)	Urban (miles)
Great Basin Valleys	16.8	10.8
Lake County	16.8	10.8
Lake Tahoe	16.8	10.8
Mojave Desert	16.8	10.8
Mountain Counties	16.8	10.8
North Central Coast	17.1	12.3
North Coast	16.8	10.8
Northeast Plateau	16.8	10.8
Sacramento Valley	16.8	10.8
Salton Sea	14.6	11
San Diego	16.8	10.8
San Francisco Bay Area	10.8	10.8
San Joaquin Valley	16.8	10.8
South Central Coast	16.8	10.8
South Coast	19.8	14.7
Average	**16.47**	**11.17**
Minimum	**10.80**	**10.80**
Maximum	**19.80**	**14.70**
Range	**9.00**	**3.90**

[9] "CalEEMod User's Guide." CAPCOA, November 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, p. 34.
[10] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 15.
[11] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 14.
[12] "Appendix A Calculation Details for CalEEMod." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6, p. 21.
[13] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-84 – D-86.

3

As demonstrated above, default rural worker trip lengths for air basins in California vary from 10.8- to 19.8-miles, with an average of 16.47 miles. Furthermore, default urban worker trip lengths vary from 10.8- to 14.7-miles, with an average of 11.17 miles. Thus, while default worker trip lengths vary by location, default urban worker trip lengths tend to be shorter in length. Based on these trends evident in the CalEEMod default worker trip lengths, we can reasonably assume that the efficacy of a local hire requirement is especially dependent upon the urbanization of the project site, as well as the project location.

Practical Application of a Local Hire Requirement and Associated Impact

To provide an example of the potential impact of a local hire provision on construction-related GHG emissions, we estimated the significance of a local hire provision for the Village South Specific Plan ("Project") located in the City of Claremont ("City"). The Project proposed to construct 1,000 residential units, 100,000-SF of retail space, 45,000-SF of office space, as well as a 50-room hotel, on the 24-acre site. The Project location is classified as Urban and lies within the Los Angeles-South Coast County. As a result, the Project has a default worker trip length of 14.7 miles.[14] In an effort to evaluate the potential for a local hire provision to reduce the Project's construction-related GHG emissions, we prepared an updated model, reducing all worker trip lengths to 10 miles (see Attachment B). Our analysis estimates that if a local hire provision with a 10-mile radius were to be implemented, the GHG emissions associated with Project construction would decrease by approximately 17% (see table below and Attachment C).

Local Hire Provision Net Change	
Without Local Hire Provision	
Total Construction GHG Emissions (MT CO_2e)	3,623
Amortized Construction GHG Emissions (MT CO_2e/year)	120.77
With Local Hire Provision	
Total Construction GHG Emissions (MT CO2e)	3,024
Amortized Construction GHG Emissions (MT CO_2e/year)	100.80
% Decrease in Construction-related GHG Emissions	***17%***

As demonstrated above, by implementing a local hire provision requiring 10 mile worker trip lengths, the Project could reduce potential GHG emissions associated with construction worker trips. More broadly, any local hire requirement that results in a decreased worker trip length from the default value has the potential to result in a reduction of construction-related GHG emissions, though the significance of the reduction would vary based on the location and urbanization level of the project site.

This serves as an example of the potential impacts of local hire requirements on estimated project-level GHG emissions, though it does not indicate that local hire requirements would result in reduced construction-related GHG emission for all projects. As previously described, the significance of a local hire requirement depends on the worker trip length enforced and the default worker trip length for the project's urbanization level and location.

[14] "Appendix D Default Data Tables." CAPCOA, October 2017, *available at:* http://www.aqmd.gov/docs/default-source/caleemod/05_appendix-d2016-3-2.pdf?sfvrsn=4, p. D-85.

Village South Specific Plan (Proposed)
Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	45.00	1000sqft	1.03	45,000.00	0
High Turnover (Sit Down Restaurant)	36.00	1000sqft	0.83	36,000.00	0
Hotel	50.00	Room	1.67	72,600.00	0
Quality Restaurant	8.00	1000sqft	0.18	8,000.00	0
Apartments Low Rise	25.00	Dwelling Unit	1.56	25,000.00	72
Apartments Mid Rise	975.00	Dwelling Unit	25.66	975,000.00	2789
Regional Shopping Center	56.00	1000sqft	1.29	56,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	9			**Operational Year**	2028
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Annual

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Summer

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

1.3 User Entered Comments & Non-Default Data

Village South Specific Plan (Proposed) - Los Angeles-South Coast County, Winter

Project Characteristics - Consistent with the DEIR's model.

Land Use - See SWAPE comment regarding residential and retail land uses.

Construction Phase - See SWAPE comment regarding individual construction phase lengths.

Demolition - Consistent with the DEIR's model. See SWAPE comment regarding demolition.

Vehicle Trips - Saturday trips consistent with the DEIR's model. See SWAPE comment regarding weekday and Sunday trips.

Woodstoves - Woodstoves and wood-burning fireplaces consistent with the DEIR's model. See SWAPE comment regarding gas fireplaces.

Energy Use -

Construction Off-road Equipment Mitigation - See SWAPE comment on construction-related mitigation.

Area Mitigation - See SWAPE comment regarding operational mitigation measures.

Water Mitigation - See SWAPE comment regarding operational mitigation measures.

Trips and VMT - Local hire provision

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Thesis on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years' experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from unconventional oil drilling operations, oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, and many other industrial and agricultural sources. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at dozens of sites and has testified as an expert witness on more than ten cases involving exposure to air contaminants from industrial sources.

Professional History:

Soil Water Air Protection Enterprise (SWAPE); 2003 to present; Principal and Founding Partner
UCLA School of Public Health; 2007 to 2011; Lecturer (Assistant Researcher)
UCLA School of Public Health; 2003 to 2006; Adjunct Professor
UCLA Environmental Science and Engineering Program; 2002-2004; Doctoral Intern Coordinator
UCLA Institute of the Environment, 2001-2002; Research Associate
Komex H_2O Science, 2001 to 2003; Senior Remediation Scientist
National Groundwater Association, 2002-2004; Lecturer
San Diego State University, 1999-2001; Adjunct Professor
Anteon Corp., San Diego, 2000-2001; Remediation Project Manager
Ogden (now Amec), San Diego, 2000-2000; Remediation Project Manager
Bechtel, San Diego, California, 1999 – 2000; Risk Assessor
King County, Seattle, 1996 – 1999; Scientist
James River Corp., Washington, 1995-96; Scientist
Big Creek Lumber, Davenport, California, 1995; Scientist
Plumas Corp., California and USFS, Tahoe 1993-1995; Scientist
Peace Corps and World Wildlife Fund, St. Kitts, West Indies, 1991-1993; Scientist

Presentations:

Rosenfeld, P.E., Sutherland, A; Hesse, R.; Zapata, A. (October 3-6, 2013). Air dispersion modeling of volatile organic emissions from multiple natural gas wells in Decatur, TX. *44th Western Regional Meeting, American Chemical Society.* Lecture conducted from Santa Clara, CA.

Sok, H.L.; Waller, C.C.; Feng, L.; Gonzalez, J.; Sutherland, A.J.; Wisdom-Stack, T.; Sahai, R.K.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Atrazine: A Persistent Pesticide in Urban Drinking Water. *Urban Environmental Pollution*. Lecture conducted from Boston, MA.

Feng, L.; Gonzalez, J.; Sok, H.L.; Sutherland, A.J.; Waller, C.C.; Wisdom-Stack, T.; Sahai, R.K.; La, M.; Hesse, R.C.; **Rosenfeld, P.E.** (June 20-23, 2010). Bringing Environmental Justice to East St. Louis, Illinois. *Urban Environmental Pollution.* Lecture conducted from Boston, MA.

Rosenfeld, P.E. (April 19-23, 2009). Perfluoroctanoic Acid (PFOA) and Perfluoroactane Sulfonate (PFOS) Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*, Lecture conducted from Tuscon, AZ.

Rosenfeld, P.E. (April 19-23, 2009). Cost to Filter Atrazine Contamination from Drinking Water in the United States" Contamination in Drinking Water From the Use of Aqueous Film Forming Foams (AFFF) at Airports in the United States. *2009 Ground Water Summit and 2009 Ground Water Protection Council Spring Meeting*. Lecture conducted from Tuscon, AZ.

Wu, C., Tam, L., Clark, J., **Rosenfeld, P**. (20-22 July, 2009). Dioxin and furan blood lipid concentrations in populations living near four wood treatment facilities in the United States. Brebbia, C.A. and Popov, V., eds., *Air Pollution XVII: Proceedings of the Seventeenth International Conference on Modeling, Monitoring and Management of Air Pollution*. Lecture conducted from Tallinn, Estonia.

Rosenfeld, P. E. (October 15-18, 2007). Moss Point Community Exposure To Contaminants From A Releasing Facility. *The 23rd Annual International Conferences on Soils Sediment and Water.* Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). The Repeated Trespass of Tritium-Contaminated Water Into A Surrounding Community Form Repeated Waste Spills From A Nuclear Power Plant. *The 23rd Annual International Conferences on Soils Sediment and Water*. Platform lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld, P. E. (October 15-18, 2007). Somerville Community Exposure To Contaminants From Wood Treatment Facility Emissions. The *23rd Annual International Conferences on Soils Sediment and Water*. Lecture conducted from University of Massachusetts, Amherst MA.

Rosenfeld P. E. (March 2007). Production, Chemical Properties, Toxicology, & Treatment Case Studies of 1,2,3-Trichloropropane (TCP). *The Association for Environmental Health and Sciences (AEHS) Annual Meeting*. Lecture conducted from San Diego, CA.

Rosenfeld P. E. (March 2007). Blood and Attic Sampling for Dioxin/Furan, PAH, and Metal Exposure in Florala, Alabama. *The AEHS Annual Meeting.* Lecture conducted from San Diego, CA.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (August 21 – 25, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *The 26th International Symposium on Halogenated Persistent Organic Pollutants – DIOXIN2006*. Lecture conducted from Radisson SAS Scandinavia Hotel in Oslo Norway.

Hensley A.R., Scott, A., **Rosenfeld P.E.,** Clark, J.J.J. (November 4-8, 2006). Dioxin Containing Attic Dust And Human Blood Samples Collected Near A Former Wood Treatment Facility. *APHA 134 Annual Meeting & Exposition.* Lecture conducted from Boston Massachusetts.

Paul Rosenfeld Ph.D. (October 24-25, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. Mealey's C8/PFOA. *Science, Risk & Litigation Conference.* Lecture conducted from The Rittenhouse Hotel, Philadelphia, PA.

Paul Rosenfeld Ph.D. (September 19, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, *Toxicology and Remediation PEMA Emerging Contaminant Conference*. Lecture conducted from Hilton Hotel, Irvine California.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference.* Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference.* Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus On Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water And Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference.* Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. and Rob Hesse R.G. (May 5-6, 2004). Tert-butyl Alcohol Liability and Toxicology, A National Problem and Unquantified Liability. *National Groundwater Association. Environmental Law Conference*. Lecture conducted from Congress Plaza Hotel, Chicago Illinois.

Paul Rosenfeld, Ph.D. (March 2004). Perchlorate Toxicology. *Meeting of the American Groundwater Trust*. Lecture conducted from Phoenix Arizona.

Hagemann, M.F., **Paul Rosenfeld, Ph.D.** and Rob Hesse (2004). Perchlorate Contamination of the Colorado River. *Meeting of tribal representatives*. Lecture conducted from Parker, AZ.

Paul Rosenfeld, Ph.D. (April 7, 2004). A National Damage Assessment Model For PCE and Dry Cleaners. *Drycleaner Symposium. California Ground Water Association*. Lecture conducted from Radison Hotel, Sacramento, California.

Rosenfeld, P. E., Grey, M., (June 2003) Two stage biofilter for biosolids composting odor control. *Seventh International In Situ And On Site Bioremediation Symposium Battelle Conference* Orlando, FL.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. (February 20-21, 2003) Understanding Historical Use, Chemical Properties, Toxicity and Regulatory Guidance of 1,4 Dioxane. *National Groundwater Association. Southwest Focus Conference. Water Supply and Emerging Contaminants*.. Lecture conducted from Hyatt Regency Phoenix Arizona.

Paul Rosenfeld, Ph.D. (February 6-7, 2003). Underground Storage Tank Litigation and Remediation. *California CUPA Forum*. Lecture conducted from Marriott Hotel, Anaheim California.

Paul Rosenfeld, Ph.D. (October 23, 2002) Underground Storage Tank Litigation and Remediation. *EPA Underground Storage Tank Roundtable*. Lecture conducted from Sacramento California.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Understanding Odor from Compost, *Wastewater and Industrial Processes. Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Using High Carbon Wood Ash to Control Compost Odor. *Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Grey, M. A. (September 22-24, 2002). Biocycle Composting For Coastal Sage Restoration. *Northwest Biosolids Management Association*. Lecture conducted from Vancouver Washington..

Rosenfeld, P.E. and Grey, M. A. (November 11-14, 2002). Using High-Carbon Wood Ash to Control Odor at a Green Materials Composting Facility. *Soil Science Society Annual Conferenc*e. Lecture conducted from Indianapolis, Maryland.

Rosenfeld. P.E. (September 16, 2000). Two stage biofilter for biosolids composting odor control. *Water Environment Federation.* Lecture conducted from Anaheim California.

Rosenfeld. P.E. (October 16, 2000). Wood ash and biofilter control of compost odor. *Biofest.* Lecture conducted from Ocean Shores, California.

Rosenfeld, P.E. (2000). Bioremediation Using Organic Soil Amendments. *California Resource Recovery Association*. Lecture conducted from Sacramento California.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. *Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings*. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., and C.L. Henry. (1999). An evaluation of ash incorporation with biosolids for odor reduction. *Soil Science Society of America*. Lecture conducted from Salt Lake City Utah.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Comparison of Microbial Activity and Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Brown and Caldwell.* Lecture conducted from Seattle Washington.

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest.* Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E, C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation With High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions From Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Deposition and/or Trial Testimony:

In the United States District Court For The District of New Jersey
Duarte et al, *Plaintiffs,* vs. United States Metals Refining Company et. al. *Defendant.*
Case No.: 2:17-cv-01624-ES-SCM
Rosenfeld Deposition. 6-7-2019

In the United States District Court of Southern District of Texas Galveston Division
M/T Carla Maersk, *Plaintiffs,* vs. Conti 168., Schiffahrts-GMBH & Co. Bulker KG MS "Conti Perdido" *Defendant.*
Case No.: 3:15-CV-00106 consolidated with 3:15-CV-00237
Rosenfeld Deposition. 5-9-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
Carole-Taddeo-Bates et al., vs. Ifran Khan et al., Defendants
Case No.: No. BC615636
Rosenfeld Deposition, 1-26-2019

In The Superior Court of the State of California In And For The County Of Los Angeles – Santa Monica
The San Gabriel Valley Council of Governments et al. vs El Adobe Apts. Inc. et al., Defendants
Case No.: No. BC646857
Rosenfeld Deposition, 10-6-2018; Trial 3-7-19

In United States District Court For The District of Colorado
Bells et al. Plaintiff vs. The 3M Company et al., Defendants
Case: No 1:16-cv-02531-RBJ
Rosenfeld Deposition, 3-15-2018 and 4-3-2018

In The District Court Of Regan County, Texas, 112th Judicial District
Phillip Bales et al., Plaintiff vs. Dow Agrosciences, LLC, et al., Defendants
Cause No 1923
Rosenfeld Deposition, 11-17-2017

In The Superior Court of the State of California In And For The County Of Contra Costa
Simons et al., Plaintiffs vs. Chevron Corporation, et al., Defendants
Cause No C12-01481
Rosenfeld Deposition, 11-20-2017

In The Circuit Court Of The Twentieth Judicial Circuit, St Clair County, Illinois
Martha Custer et al., Plaintiff vs. Cerro Flow Products, Inc., Defendants
Case No.: No. 0i9-L-2295
Rosenfeld Deposition, 8-23-2017

In The Superior Court of the State of California, For The County of Los Angeles
Warrn Gilbert and Penny Gilber, Plaintiff vs. BMW of North America LLC
Case No.: LC102019 (c/w BC582154)
Rosenfeld Deposition, 8-16-2017, Trail 8-28-2018

In the Northern District Court of Mississippi, Greenville Division
Brenda J. Cooper, et al., *Plaintiffs,* vs. Meritor Inc., et al., *Defendants*
Case Number: 4:16-cv-52-DMB-JVM
Rosenfeld Deposition: July 2017

In The Superior Court of the State of Washington, County of Snohomish
Michael Davis and Julie Davis et al., Plaintiff vs. Cedar Grove Composting Inc., Defendants
Case No.: No. 13-2-03987-5
Rosenfeld Deposition, February 2017
Trial, March 2017

In The Superior Court of the State of California, County of Alameda
Charles Spain., Plaintiff vs. Thermo Fisher Scientific, et al., Defendants
Case No.: RG14711115
Rosenfeld Deposition, September 2015

In The Iowa District Court In And For Poweshiek County
Russell D. Winburn, et al., Plaintiffs vs. Doug Hoksbergen, et al., Defendants
Case No.: LALA002187
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Jerry Dovico, et al., Plaintiffs vs. Valley View Sine LLC, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Iowa District Court For Wapello County
Doug Pauls, et al.,, et al., Plaintiffs vs. Richard Warren, et al., Defendants
Law No,: LALA105144 - Division A
Rosenfeld Deposition, August 2015

In The Circuit Court of Ohio County, West Virginia
Robert Andrews, et al. v. Antero, et al.
Civil Action N0. 14-C-30000
Rosenfeld Deposition, June 2015

In The Third Judicial District County of Dona Ana, New Mexico
Betty Gonzalez, et al. Plaintiffs vs. Del Oro Dairy, Del Oro Real Estate LLC, Jerry Settles and Deward DeRuyter, Defendants
Rosenfeld Deposition: July 2015

In The Iowa District Court For Muscatine County
Laurie Freeman et. al. Plaintiffs vs. Grain Processing Corporation, Defendant
Case No 4980
Rosenfeld Deposition: May 2015

In the Circuit Court of the 17th Judicial Circuit, in and For Broward County, Florida
Walter Hinton, et. al. Plaintiff, vs. City of Fort Lauderdale, Florida, a Municipality, Defendant.
Case Number CACE07030358 (26)
Rosenfeld Deposition: December 2014

In the United States District Court Western District of Oklahoma
Tommy McCarty, et al., Plaintiffs, v. Oklahoma City Landfill, LLC d/b/a Southeast Oklahoma City Landfill, et al. Defendants.
Case No. 5:12-cv-01152-C
Rosenfeld Deposition: July 2014

In the County Court of Dallas County Texas
Lisa Parr et al, *Plaintiff*, vs. Aruba et al, *Defendant.*
Case Number cc-11-01650-E
Rosenfeld Deposition: March and September 2013
Rosenfeld Trial: April 2014

In the Court of Common Pleas of Tuscarawas County Ohio
John Michael Abicht, et al., *Plaintiffs,* vs. Republic Services, Inc., et al., *Defendants*
Case Number: 2008 CT 10 0741 (Cons. w/ 2009 CV 10 0987)
Rosenfeld Deposition: October 2012

In the United States District Court of Southern District of Texas Galveston Division
Kyle Cannon, Eugene Donovan, Genaro Ramirez, Carol Sassler, and Harvey Walton, each Individually and on behalf of those similarly situated, *Plaintiffs,* vs. BP Products North America, Inc., *Defendant.*
Case 3:10-cv-00622
Rosenfeld Deposition: February 2012
Rosenfeld Trial: April 2013

In the Circuit Court of Baltimore County Maryland
Philip E. Cvach, II et al., *Plaintiffs* vs. Two Farms, Inc. d/b/a Royal Farms, Defendants
Case Number: 03-C-12-012487 OT
Rosenfeld Deposition: September 2013

Matthew F. Hagemann, P.G., C.Hg., QSD, QSP

Geologic and Hydrogeologic Characterization
Industrial Stormwater Compliance
Investigation and Remediation Strategies
Litigation Support and Testifying Expert
CEQA Review

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certifications:

California Professional Geologist
California Certified Hydrogeologist
Qualified SWPPP Developer and Practitioner

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Geology Instructor, Golden West College, 2010 – 2014;
- Senior Environmental Analyst, Komex H2O Science, Inc. (2000 -- 2003);

- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);
- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Lead analyst and testifying expert in the review of over 100 environmental impact reports since 2003 under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, Valley Fever, greenhouse gas emissions, and geologic hazards. Make recommendations for additional mitigation measures to lead agencies at the local and county level to include additional characterization of health risks and implementation of protective measures to reduce worker exposure to hazards from toxins and Valley Fever.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Technical assistance and litigation support for vapor intrusion concerns.
- Lead analyst and testifying expert in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.

- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.

3

- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.

- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.
- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Matt taught physical geology (lecture and lab and introductory geology at Golden West College in Huntington Beach, California from 2010 to 2014.

Response to Comment Letter O8 – Mitchell M. Tsai

O8-1 The commentor notes that the letter is on behalf of the Southwest Regional Council of Carpenters (SWRCC) and provides support for the Project and withdraws their prior comment letter from July 18, 2022. The commenter notes the SWRCC believes the Project will benefit the environment and the local economy.

The commenter's support of the Project letter is noted for the record and no further response is required. Following are responses to the commenter's July 18, 2022 letter.

O8-2 The comment notes the letter is on behalf of the Southwest Regional Council of Carpenters (SWRCC) and provides introductory comments describing the labor union and claim the SWRCC employees will be directly affected by the Project's environmental impacts.

Comments are noted for the record. All attachments to the comment letter have been received. As the specific comments in the letter re-state the comments in the attachments, responses to the letter also fully respond to the more specific comments provided in the attachments.

O8-3 The commenter makes a request that the County provide the commenter with copies of any and all notices referring or related to the Project as part of the CEQA process.

The County acknowledges the commenter's request, and the County will include the commenter on the mailing list for future CEQA notices related to the Project.

Environmental review documents pertaining to the Project were circulated for public review and remain available on the County's website. The County will continue to provide public notice in compliance with State CEQA Guidelines and state law.

O8-4 The commenter asserts that the County should require the Project Applicant to provide additional community benefits by requiring hiring of local union labor during construction of the Project as well as a skilled and trained workforce to include workers who have graduated from apprenticeship training programs approved by the state. The County has no authority over the hiring practices of private businesses as part of a development review process and there is no enforceable or otherwise feasible mechanism for the County to accommodate the commenter's request. However, the Project includes a community benefit program that is identified in the Development Agreement and in the Specific Plan, that includes partnerships with local based training organizations and colleges for skilled labor and other community programs to encourage hiring local labor and to provide local job opportunities. The County hopes that the development of this Project would result in good-paying jobs for its residents; but, has no feasible mechanism for requiring such. The comment also refers to an attachment to the letter from SWAPE ("SWAPE Letter") and refers the reader to the SWAPE Letter for commentary and analysis related to local hire requirements related to greenhouse gas modeling. Please see Responses O8-5 and O8-6 which respond to both the commentor's letter and the SWAPE Letter.

O8-5 See Response O8-4 above. The comment refers to benefits to hiring skilled workers and using local labor to aid in reducing air pollutants and goes on to discuss how other jurisdictions are including general plan policies requiring the promotion of local hiring. the general information

provided by the commenter raises an economic concern that does not address the adequacy of the environmental analysis contained in the Draft EIR and does not provide any substantial evidence (only conclusory non-expert opinions) to dispute the analysis provided in the Draft EIR or to demonstrate that local hire would specifically reduce any of the Project's environmental impacts that were disclosed in the Draft EIR. No additional response is necessary.

O8-6 See Response O8-4 and O8-5 above. The comment states locating jobs closer to residential areas and mandating local hire can have significant environmental benefits and reduce VMT. The comment suggests the County should consider utilizing skilled and trained workforce policies and requirements to benefit the local economy, mitigate greenhouse gas emissions, improve air quality, and reduce transportation impacts. The commenter does not provide any data that quantifies the reduction in air emissions or vehicle trips attributed to hiring local labor. As noted above in Response O8-4, the Project includes a community benefit program that is identified in the Development Agreement and in the Specific Plan, that includes partnerships with local based training organizations and colleges for skilled labor and other community programs to encourage hiring local labor and to provide local job opportunities.

O8-7 The comment suggests the County should require the Project to be built to standards exceeding the current 2019 California Green Building Code to mitigate environmental impacts.

The state's building code (CalGreen) is periodically updated to require more energy efficient building practices. As the Specific Plan is built out subsequent development would be subject to the latest version of the state (and County's) building code. It is anticipated as the Specific Plan is implemented development would be required to comply with more stringent energy requirements that would further help reduce the Project's GHG emissions in compliance with the state's environmental goals. The Project is consistent with all applicable regulations, including the 2019 California Green Building Code, as demonstrated in the Draft EIR in *Section 4.3, Air Quality* and *Section 4.8, Greenhouse Gas Emissions*.

Robert Redford Conservancy for Southern California Sustainability (O9)

Robert Redford Conservancy for Southern California Sustainability (O7)

Robert Redford
CONSERVANCY
for Southern California Sustainability
PITZER COLLEGE

July 18, 2022

Attn: Steven Valdez
County of San Bernardino
Senior Planner

Steven.Valdez@lus.sbcounty.gov

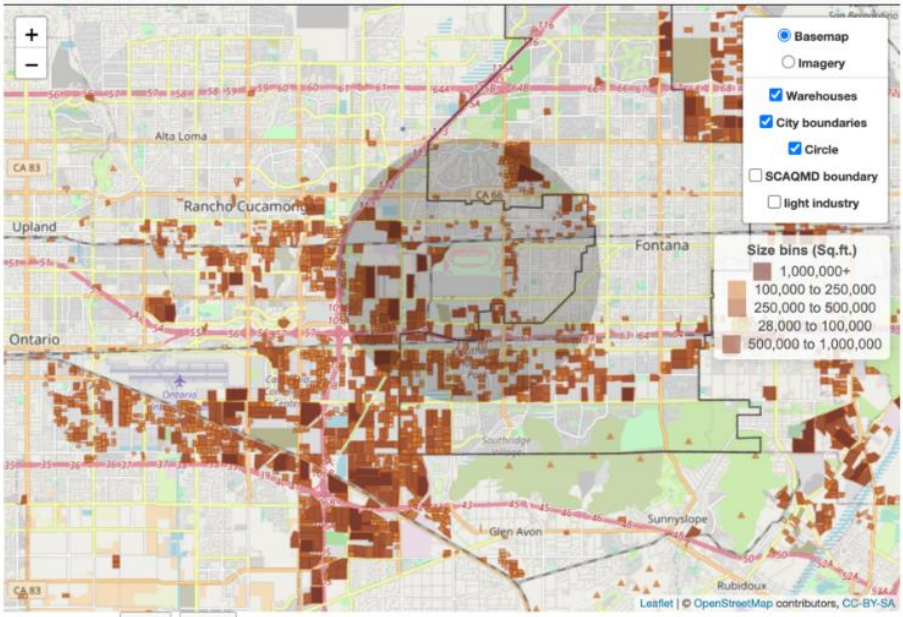
Dear Mr. Valdez:

My name is Susan Phillips and I am the Director of the Robert Redford Conservancy for Southern California Sustainability and a Professor of Environmental Analysis at Pitzer College. The Redford Conservancy aims to increase socio-ecological justice and sustainability in our surrounding communities and beyond. We support projects that bolster multiple and interconnected systems (ecological, human, political, economic and cultural), and we foster collaboration and leadership for socio-ecological justice and sustainability. We are writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring nearly 10,000 more truck trips per day to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for PM2.5, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to more than 13 times the allowed limits. On the basis of these numbers, the County should reject the plan. 2

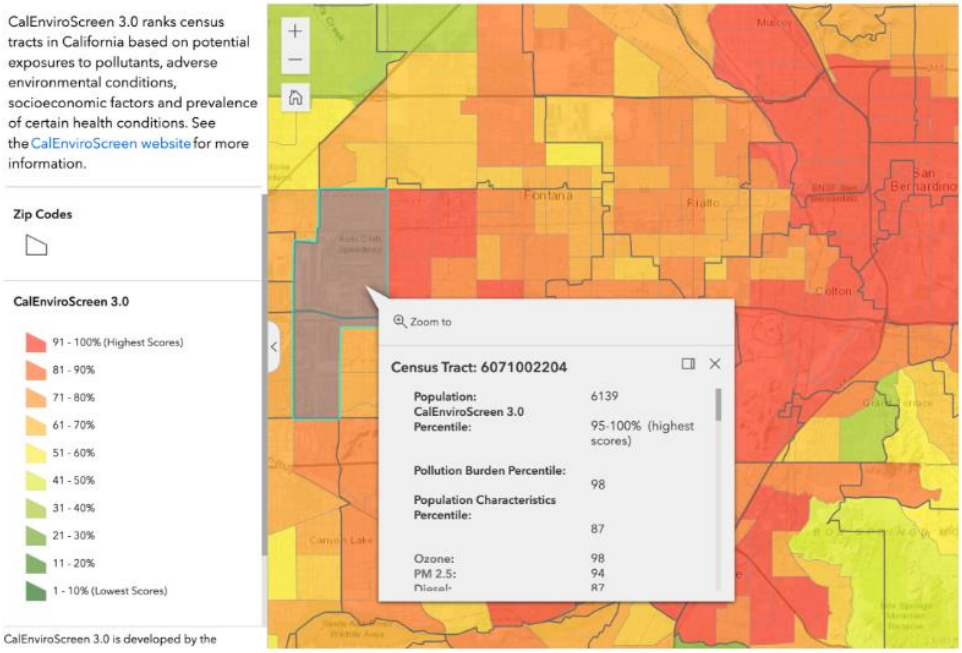
Based on our Warehouse CITY Cumulative Impact Tool, numbers associated with this area are already high enough to merit a rejection of the project. We have included two graphics below. The first shows the estimated warehouse numbers, numbers of associated truck trips per day as well as associated emissions of carbon, PMs, and NOx within a 5 km radius of the Speedway Project. Even while these numbers are most likely an underestimation, the area and nearby neighborhoods are dealing with almost 53 thousand truck trips per day, emissions of over 70 pounds per day of diesel particulate matter, over 8 thousand pounds of NOx per day, and almost 4.5 million pounds of carbon emitted per day. 3

Warehouses	Warehouse Acreage	Warehouse floor space (Sq.Ft.)	Daily Truck trips	Daily Diesel PM (pounds)	Daily NOx (pounds)	Daily CO2 (pounds)
375	2780	79060367	52970	71.7	8326	4477116



For the area near the Speedway, we also consulted the MATES tool through the AQMD. In zip code **92335**, the cancer risk is already **511** per million. According to the MATES V AQMD tool, the AQMD monitoring site adjacent the Speedway demonstrates a non-cancer health index of 8.0 out of a potential maximum of 8.1. This is already in the highest category. Furthermore, California Enviroscreen data demonstrate equally concerning statistics.

3



3

To spell this out even more clearly, we paste the section in its entirety below, which describes the elements of the 98% pollution burden this area already faces.

Pollution Burden Percentile:	98
Population Characteristics Percentile:	87
Ozone:	98
PM 2.5:	94
Diesel:	87
Pesticides:	0
Toxic Releases:	83
Traffic:	72
Drinking Water:	73
Cleanups:	88
Groundwater Threats:	22
Hazardous Waste:	99
Impaired Water:	0
Solid Waste:	96
Asthma:	82
Low Birth Weight:	41

Cardiovascular Rate:
93

With these numbers as a baseline, we are concerned about this project's addition to cumulative impacts. The large influx of additional truck traffic for this Project would have on the ability for the community to get around in addition to the health consequences. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all.

3

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, walking trails, wildland restoration projects, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project.

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development.

4

Sincerely,

Susan A. Phillips, Ph.D.
Professor of Environmental Analysis
Interim Director, Robert Redford Conservancy
susan_phillips@pitzer.edu

Response to Comment Letter O9 – Robert Redford Conservancy for Southern California Sustainability

O9-1 Comment states that it is on behalf of the Robert Redford Conservancy for Southern California, which aims to increase socio-ecological justice and sustainability, and supports projects that bolster multiple interconnected systems, and foster collaboration for socio-ecological justice and sustainability. The commenter suggests the Project is bad for the community and there are too many logistic uses in the Inland Empire, which increases truck traffic and air pollution.

Comment noted for the record. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. Concerns regarding the increase in truck trips and air pollutants are addressed in the responses below.

O9-2 The commenter states that the Project would bring nearly 10,000 more truck trips per day without effective mitigation measures. Additionally, the commenter notes that the community is impacted per the California Communities Environmental Health Screening Tool (CalEnviroScreen). CalEnviroScreen has been developed by the state's Office of Environmental Health Hazard Assessment (OEHHA) and California Environmental Protection Agency (CalEPA). The Project is consistent with the County's general plan land use designations in the area which includes commercial, limited industrial, and general industrial. Furthermore, the Project includes mitigation measures, project design features, and standard conditions to reduce potentially significant and significant Project impacts. While CalEnviroScreen can assist CalEPA in prioritizing resources and helping promote greater compliance with environmental laws, it is important to note some of its limitations. The tool's output provides a relative ranking of communities based on a selected group of available datasets, through the use of a summary score. Unlike the Health Risk Assessment (HRA) prepared for the Project (see Draft EIR *Appendix C*), the CalEnviroScreen score is not an expression of health risk and does not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment. Accordingly, CalEnviroScreen is not intended to be used as a health or ecological risk assessment for a specific area or site. Refer to Draft EIR *Section 4.3* (Air Quality) for a full evaluation of the Project's air quality effects.

Furthermore, the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (Draft EIR pages 4.3-51 through 4.353), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2 for additional information.

O9-3 The commenter provides a statement about the Project's potential to increase cumulative impacts, and notes that widening roads is not a community benefit but will create less safe streets.

The comment cites data from their Warehouse Cumulative Impact Tool but does not provide the source of the data. Refer to Response to Comment O9-2 regarding CalEnviroScreen data. Cumulative air quality impacts are discussed on Draft EIR pages 4.3-54 through 4.3-55. Additionally, the comment references the SCAQMD's Multiple Air Toxics Exposure Study (MATES) mapping. The MATES mapping was evaluated and impacts in the Project area were summarized in Draft EIR pages 4.3-8 through 4.3-9 and the Health Risk Assessment in Appendix C. The MATES estimates were based on monitoring data collected at ten fixed sites within the South Coast Air Basin. None of the fixed monitoring sites are near the Project site. However, MATES V has extrapolated the excess cancer risk levels throughout the SCAB by modeling the specific grids.

It should be noted that health risks are determined by examining the types and levels of air toxics generated and the associated impacts to air quality. As described in Response O9-2 above, The Project's impacts related to cancer risk would be less than significant with implementation of MM AQ-1 and MM AQ-9. Additionally, non-carcinogenic hazards are calculated to be less than significant. It should be noted that the Draft EIR assesses the Project's incremental contribution to health risk impacts, consistent with the SCAQMD guidance and methodology. The SCAQMD has not established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SCAQMD considers projects that do not exceed the project-specific thresholds to generally not be cumulatively significant. Therefore, impacts related to health risk from the Project would be less than significant. Refer to Appendix B of the Draft EIR for additional information.

While cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time, a project's contribution to a significant cumulative impact can be determined to be less than cumulatively considerable, and thus is not significant (see Section 15130 of the State CEQA Guidelines). In the case of the Project, with the implementation of MM AQ-1 the Project's impacts would not exceed SCAQMD's 10 in one million threshold. Therefore, the project would not result in a cumulatively considerable increase in TAC emissions.

Additionally, as noted in Response O9-2, above, impacts would be less than significant (Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (Draft EIR pages 4.3-51 through 4.3-53). Also refer to Master Response 2.

O9-4 The commenter suggests the County pursues a development that is more in line with uses permitted within the commercial zoning permitted and states the Project opposes the vision the community has for the Speedway. The commenter also notes the community meetings held were not enough to ensure participation.

Alternatives developed for the Project were based on State CEQA Guidelines. As evaluated in *Section 6.0, Alternatives* of the Draft EIR, a commercial alternative was developed that includes uses permitted under the General Plan Commercial (C) Land Use Category and in the Special Development - Commercial (SD-COM) Zoning Designation. The Commercial Alternative did not meet a majority of the Project Objectives. Also see Master Response 3. Accordingly, alternatives are in fact considered in the Draft EIR.

Further, the Project did hold a Public Scoping Meeting (via Zoom on January 11, 2022) during the NOP comment period, it also held two publicly-noticed Environmental Justice (EJ) outreach workshops: the first on January 12, 2022, and the second on July 9, 2022. Noticing for these meetings was provided as follows: via letters mailed to all property owners within a 1,300 -foot radius per County Code requirement a notice was posted on the County's website and on the Project website; notices were hand delivered within the project area; and, for the second workshop, distributed at the local farmers market (Thursday, June 30th and Thursday, July 7th of 2022); and provided at the local community center (Cypress Neighborhood Center). All notices were provided in both English and Spanish. Furthermore, additional analysis of the Project design was conducted after the initial scoping meeting and after the EJ outreach workshops. As a result of the additional analysis and based on community input, the Specific Plan was refined to incorporate additional programs, facilities and community benefits through enhancements of open space, community art, exercise stations, reduction of pollution exposure through solar, enhanced wellness walks, and more. The Project met the requirement of Policy HZ-3.18 and conducted the required public outreach to obtain feedback from the community on potential EJ concerns.

San Bernardino, CA 92415

RE: Speedway Commerce Center II Draft EIR, SCH#2021120259

These comments are being submitted on behalf of Teamsters Local 1932 regarding the above-captioned project, specifically in response to the San Bernardino Speedway ("the Project") project's draft environmental impact report (DEIR). Teamsters Local 1932 represents members who live in the affected area.

There are a number of areas of significant concern associated with this project. First, there are defects in the alternatives analysis offered by the County. Second, mitigation measures are insufficient to reduce impacts below significance or are insufficiently specific and binding; and third, the draft EIR failed to properly address cumulative impacts.

1

Project Background

The speedway redevelopment project is located in unincorporated southwestern San Bernardino County, within Fontana's sphere of influence. The project site is 433 acres, and currently hosts the Auto Club Speedway. Proposed for the site are approximately 6.6 million square feet of "high-cube logistics and e-commerce development" over four sub-areas, a quarter million of ancillary commercial development, nearly 100 acres of vehicle parking and drop lot areas, and variety of rights-of-way and internal circulation infrastructure.

2

Significant and Unavoidable Impacts

The Project would result in numerous significant and unavoidable impacts that cannot be reduced below significance thresholds, and recommends adoption of a statement of overriding considerations. The significant and unavoidable impacts are in the areas of air quality most significantly, energy, greenhouse gas emissions, and noise. Given that the site is to be redeveloped exclusively as a logistics and e-commerce hub, these long-term impacts are of serious concern. Development of the project without mitigation measures that reduce these impacts below significance will make permanent adverse impacts on the local community and the County as a whole, positioning the logistics industry as a negative presence for the County, and subjecting the workers and nearest neighbors to the Project to potentially serious health and quality of life impacts.

3

Issuing a statement of overriding considerations per CEQA Guidelines Section 15093, subd. (a), without more information provided to the public via the EIR process, would be in error. For a statement of overriding consideration to be properly adopted, it must be supported by substantial evidence in the record from which a reasonable person could conclude that specific economic, legal, social, technological, or other benefits" of the proposed project that "outweigh the unavoidable adverse environmental effects. See Woodward Park Homeowners Ass'n, Inc. v. City of Fresno (2007) 150 Cal. App. 4th 683, 699. Often, this substantial evidence will rest on the analysis of potential project alternatives, demonstrating that a project should go forward because there are no alternatives that could meet the project objectives.

Given the intensity of the proposed uses at the project site, the generalized nature of the project objectives and the General Plan goals, and the narrow nature of the considered alternatives, as it stands there is not substantial evidence in the record sufficient to support any statement of overriding considerations. 3

Project Alternatives Analysis is Insufficient

As a background to the alternatives analysis found in the DEIR, it is important to note that as currently proposed, the Project would entail significant impacts that should be of grave concern to the public: not only serious air quality and greenhouse gas emissions impacts, but an on-going impact that, according to the DEIR itself, would result in persistent interference with the attainment goals for air quality in the region. What this means is that by developing this Project, future developments in the County will also consistently have trouble meeting air quality attainment goals, and potentially keep the County in a statement of permanent or near-permanent non-attainment. In essence, because this DEIR is being prepared as a Project EIR–that is, that it is purporting to complete the environmental review process for numerous high-intensity and high-impact projects, adopting this EIR entitles, with limited or no further environmental review (nor opportunities to review and apply fastly-evolving mitigation technologies and practices) development of projects that will permanently degrade air quality below attainment levels. This could have a cascading effect, essentially requiring the County to keep issuing statements of overriding considerations for future projects which, even with much smaller impacts, will contribute to non-attainment. This trivializes the entire environmental review process, and counsels the County to seriously consider a broader range of alternatives (as well as more intense and flexible mitigation measures, described further below). 4

The Project Objectives most relevant to the alternatives analysis, in the sense that they underlie the adoption of any statement of overriding considerations, are Objectives 1, 4, 7, 10, and 11. These are the "logistics objectives," that give the purpose of the project as developing a competitive, large-scale "high-cube logistics and e-commerce" facility. 5

The alternatives analysis declined to study an alternative site, given that there are minimal available sites of similar size, and none which the project applicant currently controls, and since siting of the project is not the cause of the significant impacts (i.e., that the significant impacts would still materialize at any alternative location, they are not location-specific).

The analysis goes on to consider three alternatives: a "no-project" alternative, a smaller footprint, and a commercial development alternative which replaces the logistics uses with commercial and office uses. Of most importance as the second and third alternatives, "reduced footprint" and "commercial substitution" respectively. 6

Reduced Footprint Alternative

The Alternative 2 Reduced Footprint analysis does not state how the approximately 25% reduction was chosen as the alternative. This is one element of seeming circular logic meant to ensure that the public and the County would have grounds to reject the alternative. The analysis ultimately provides to reasons why the alternative should be rejected: first, because despite the reduction in footprint, the project would still result in significant and unavoidable impacts, even with mitigations and second and relatedly, because while the alternative would meet project objectives, it would not "fully" meet project objectives. This conclusion is not properly discussed or even really explained internally in the alternatives analysis: in the "Ability to Meet Project Objectives Section," the analysis begins like this: "The Reduced Footprint Alternative would generally meet the Project Objectives, including: [Objectives] (1) […] (3) […] (4) […] (5) […] (6) […] (7) […] (8) […] (9) […] (10) […] (13)[.]" The Analysis then goes on to state that the alternative does not meet the project objectives because Objectives (2), (11) and (12) are not "fully" met. The analysis also states, contradictorily, that the Reduced Footprint Alternative, by nature of being reduced footprint, "would not meet project objectives." 7

The matter is confused further because the analysis states that two of the three objectives that this Alternative seemingly does not meet are in fact "partially" met (i.e., Objectives (11) and (12)), and the remaining Objective, (2), is only not met in vague terms: i.e., because it would not allow for the development of a "larger format" high-cube e-commerce facility (or perhaps because it would not "maximize" the use of the site, which presumably means built to the absolute limit of the property).

First, the Analysis plays sleight-of-hand by saying that the Reduced Footprint Alternative does not meet three of thirteen Objectives, while it also partially meets two of the three missing alternatives. The remaining supposedly unmet objective, Objective 2, is only unmet because it sets as an objective being large as possible–or, alternatively, being "large" in some vague sense. The Analysis therefore rejects the Reduced Footprint Alternative based on a circular situation wherein one of the Objectives is written to preclude any reduction in size of the Project.

While CEQA does not require that Project Alternatives be studied with the same intensity and detail as the Project itself, the Analysis of the Reduced Footprint Alternative is deficient in its level of detail given (1) the grounds for its rejection; and (2) the potential to meet all Project Objectives with proper mitigation.

First, the grounds for rejection reduce down to one: because a single supposedly unmet Project Objective requires "maximizing" use of the site, and/or developing a "large" series of facilities, and the reduced footprint is not as big as the Project, it cannot meet this one objective. If this is the case, then there needs to be some discussion and elucidation of what constitutes a "large" or "larger" facility or set of facilities, other than simply one being smaller than the other. The related reduction of fees, due to the reduction in size, similarly needs to be explained: the Project Objective (2) does not state an optimal or necessary amount of fees, only rejects this Alternative because it is less than what is proposed. Notably, this same rationale applies to the supposed lack of sufficient employment opportunities, based on the assumption that square footage has a direct correlation to employment figures, but does not state any objective number or range of acceptable employment opportunities–possibly because the project developer and operator does not want to commit to a binding employment number of quality of jobs. 8

Second, and directly related, the Analysis only states that the proposed mitigation measures would not reduce the impacts from a Reduced Footprint Alternative after a conclusory statement about the reduction by 25% of the relevant particulates and greenhouse gas emissions and traffic. There is no discussion of whether any particular mitigations measures become more feasible because of the reduced footprint.

Commercial Substitution Alternative

The third alternative considers replacing the proposed logistics facility with commercial uses. This will plainly fail the project alternatives, which are heavily weighted towards developing a large, high-cube logistics and e-commerce development. However, the Analysis does not state why the alternative does not include a blend of logistics and commercial uses, including office and retail. This is particularly important given that courier-reliant retail developments are increasingly common and are also developed on the same site. That is, since logistics and e-commerce facility can often be developed with retail or commercial elements, and can feasibly coexist with especially large-format retail and office developments, there was no reason, and no rationale provided to the public or decision makers, why the commercial substitution alternative proposed solely commercial substitution and not a blend of commercial and logistics uses, which could feasibly meet the Project Objectives and still considerably reduce the adverse impacts. 9

Mitigation Measures are Inadequate for a Project EIR

Given that the EIR details significant and unavoidable impacts and suggests adoption of a statement of overriding considerations, the proposed mitigation measures are to some degree academic: in particular, the total air quality and greenhouse gas emissions impacts, as well as the traffic and noise impacts, so far exceed the attainment standards that just about any mitigation measures will not be able to reduce the impacts below significance.

This EIR is a Project EIR. It entitles development over phases of a series of facilities and therefore evaluations the total impact of these interrelated projects. It is critical that the mitigation measures include serious on-going engagement by the impacted agencies and the public. Three things make this more serious: first, because mitigation measures must consider feasible technological mitigations and reasonably foreseeable technological fixes to significant impacts; second, because the degree of non-attainment going into the far future means environmental entitlement of the Project now, without any mechanism for the public to intercede, means that the Project can continually operate in violation of attainment and impact standards into the future even when mitigation technologies and practices become available; and third, because should the Project be approved on the strength of a statement of overriding considerations, the public needs to be assured that the supposed economic and social benefits which outweigh the serious environmental and health impacts are in fact being met. Without such a mitigation mechanism in place, despite its plain availability, the approval of the EIR and entitlement of the Project would be in error. 10

We would strongly urge that the County include a community benefits process into as a mitigation measure, for the express purpose of regular reporting of environmental and social impacts, revisiting of mitigation technologies and practices (such as adoption of electric vehicles, renewable energy, recycling of waters and other materials, etc.) as they become available, and finally for purposes of conflict resolution with city governments, the County, and the public should conflicts arise.

This mitigation measure would simply operationalize in a binding way what the current mitigation measure currently aim for. An agreement to create and appoint a multi-agency and community-representative committee which can receive reports and issue recommendations for adoption of technologies and practices as they become widely available would make the current mitigations binding and ensure that the local agencies are able to intervene to reduce the drastic impacts of the Project area.

Cumulative Impacts

In the comments to the Notice of Preparation, the City of Ontario specifically requested that the Project be evaluated along with the cumulative impact of projects being developed within the City of Ontario. This does 11

not seem to have been done in the EIR. In fact, the cumulative impact analysis does not seem to consider the development of other high-cube logistics facilities concurrently with, and potentially as a result of, the Project; nor the likelihood of the closure of existing facilities in Ontario or other cities in the Project area. 11

Since the Spring of 2022, major e-commerce companies like Amazon have announced the closure, delay, or moving of millions of square feet of warehouse space. In general, e-commerce warehousing is already considered as overbuilt, as a result of a pandemic land-rush for delivery services infrastructure. Adding 6.6 million square feet of precisely this type of warehousing, without any attendant analysis of existing and underutilized warehouse space in the service-area communities, such as the cities of Ontario and Fontana etc., and the high potential for urban decay given the size and specific uses such structures can be put to, makes the EIR deficient. Importantly, the addition of so many millions of square feet of e-commerce capacity to the region could have a significant impact on brick-and-mortar facilities; indeed, retailers like Amazon have already begun closing brick-and-mortar retail in preference to their e-commerce operations, and e-commerce has a negative impact on brick-and-mortar stores. 12

Beyond the urban decay analysis, the lack of study of cumulative impact of reasonably foreseeable cumulative impacts from the development of the Project means there is no understanding of how adding "large high-cube" capacity could result in development of smaller scale local- or neighborhood-focused delivery station facilities of smaller scale to provide last-mile service. The draft EIR does not mention last-mile service except in reference to the type of vehicles used for deliveries. However, distribution and sorting facilities at "large" or "large-scale" high cube facilities are often for the purpose of distribution to last-mile facilities that then complete e-commerce transactions, i.e., by delivering packages to consumers' homes and businesses.

Transportation and Public Resource Analysis

The transportation analysis does not clearly identify part-time couriers (such as "gig workers") and home-delivery drivers as an element of the VMT analysis, instead relying primarily on the per-square footage calculation of number of employees. This needs to be corrected to make the DEIR sufficient, because the nature of the Project means that it is possible that e-commerce operators who deliver directly to consumers' homes can or will be developed at the site. Further, since the ultimate project operators are not identified, the EIR needs to fully evaluate the potential uses the project site will be set to. 13

Relatedly, the EIR needs to evaluate the wear-and-tear on residential roads as a result of the addition of so much capacity for e-commerce home deliveries, as well as projections of increased demand on public safety personnel to respond to moving violations and traffic accidents with the additional of potentially hundreds of thousands or millions of miles of vehicle miles traveled by courier drivers.

Conclusion

Due to the foregoing, we urge the County to refer the EIR back to the drafters to ensure that is legally adequate and meets the County's policy requirements. Alternatively, we urge the County to reject and not adopt the draft EIR.

Sincerely, 14

Randy Korgan

Response to Comment Letter O10 – Teamsters Local Union No. 1932

O10-1 The comment notes the letter is on behalf of the Teamsters Local 132 and provided introductory comments, which are noted for the record. The commenter asserts that there are defects in the analysis specific to alternatives, mitigation measures and cumulative impacts, but does not indicate where the analysis provided in the Draft EIR is inadequate. Thus, no additional response is necessary.

O10-2 The comment provides a general Project Description and Background. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O10-3 The commenter states that the Project would result in significant and unavoidable impacts related to air quality, energy, greenhouse gas (GHG) emissions, noise and the Draft EIR lacks substantial evidence to support a Statement of Overriding Considerations.

The Project is consistent with the County's General Plan and existing zoning and proposes uses allowed by the County's Development Code. The Draft EIR identifies numerous Standard Conditions, project design features, and mitigation measures in *Section 4.3, Air Quality* and *Section 4.8, Greenhouse Gas Emissions* to minimize air and GHG emissions to the maximum extent feasible (Draft EIR pages 4.3-21 through 4.3-23, 4.3-38 through 4.3-42, and 4.8-31 through 4.8-33). Nonetheless, the Draft EIR conservatively concludes that impacts associated with the Project's contribution to GHGs would remain significant and unavoidable due to the size of the Project. The Draft EIR mitigation measures were developed in compliance with State CEQA Guidelines Section 15041 and the essential nexus and rough proportionality standards.

A Health Risk Assessment (HRA) was prepared to evaluate impacts to nearby sensitive receptors and is located in Draft EIR *Appendix C*. Project-related health risks were evaluated in the HRA and discussed in the Draft EIR on pages 4.3-51 through 4.3-53. The HRA evaluated pollutant concentrations at the closest sensitive receptors to the Project site, which included residences and Redwood Elementary School. As discussed in the Draft EIR and HRA, impacts would be less than significant with mitigation MM AQ-1 and MM AQ-9 incorporated. (see Draft EIR pages 4.3-43 to 4.3-53). The Draft EIR also determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant because the localized significance of construction and operational emissions would not exceed SCAQMD thresholds as most of the emissions are regional and occur from vehicles traveling away from the Project site (see Draft EIR pages 4.3-43 through 4.3-46). Significant unavoidable impacts would occur with regard to AQMP consistency, Project-related construction and operational emissions, and cumulative emissions. No other significant unavoidable air quality impacts would occur.

Energy impacts are discussed in Draft EIR *Section 4.6, Energy*. With implementation of the Project, significant unavoidable impacts would occur regarding fuel consumption. Although operation of the Project would not result in wasteful, inefficient, or unnecessary consumption of diesel fuel, the potential for the Project to increase San Bernardino County's consumption of diesel fuel by

over five percent is conservatively considered significant and unavoidable. However, in the future, Project demands for diesel fuel are anticipated to decrease over time as ZE and NZE trucks become more available.

Noise impacts are discussed in *Section 4.13, Noise* of the Draft EIR. Implementation of the Project would create new sources of noise in the Project vicinity, one of which is off-site traffic noise. Implementation of the Project would generate increased traffic volumes on nearby roadway segments. The amount of traffic generated by the Project would result in a substantial increase in traffic noise in exceedance of the County's noise standards under the following scenarios: Opening Year 2024 Plus Phase 1, Opening Year 2027 Plus Phases 1 & 2, and Opening Year 2040 Plus Phases 1 & 2, and there is no feasible mitigation to reduce these impacts as the Project has exhausted all risible mitigation measures. It should be noted, however, that as electric trucks and passenger vehicles become more commercially available in accordance with California's Advanced Clean Truck (ACT) and zero emission vehicle rules, the truck fleets and passenger vehicles accessing the Project site would generate lower traffic noise levels compared to a business-as-usual scenario. Nonetheless, off-site traffic noise impacts from the Project would remain significant and unavoidable.

O10-4 See Response O10-3. The commenter provides general discussion of the County's ability to meet the air quality attainment goals and asserts that the Project should have further significant and unavoidable impacts other than those identified in the Draft EIR and therefore the County should consider a broader range of alternatives. The anticipated future buildout of "up to 6.6 million square feet" for the Project was thoroughly analysis in the Draft EIR for the Projects potential effects. Based on the experience and expertise of the EIR preparer (Kimley-Horn), information provided by the Project Applicant, and the independent judgment of the County, the Draft EIR made reasonable assumptions for the Project built out of future high cube logistics and e-commerce uses. To provide a conservative ("worst case") analysis, and to inform the public and County decision-makers of the full scope of environmental impacts that could occur should the Project be approved, the Draft EIR provided a comprehensive analysis of the potential environmental impacts that would occur. The Project is therefore analyzed in a conservative, worst-case scenario against existing land use allowances and regulatory thresholds. Further, the State CEQA Guidelines do not require a specific number of alternatives; instead, a reasonable range of alternatives must be considered as appropriate for a particular project. CEQA Guidelines Section 15126.6(a), (c). See Master Response 3 which provides information of the Project alternatives. The Project was assessed for additional alternatives beyond those studied in the Draft EIR, with none found to be feasible and warranting of additional discussion. CEQA Guidelines Section 15126.6(c).

O10-5 The commenter identifies Project Objectives 1, 4, 7, 10 and 11 as defining the goal of the Project to develop a high cube logistics and e-commerce facility.

The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to

evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O10-6 The commenter provides a summary of the Project alternatives evaluated and states an alternative site alternative, or offsite alternative was rejected as infeasible.

CEQA does not require an EIR to evaluate alternative sites, and the EIR may evaluate on-site or off-site alternatives (or both). Analysis of an alternative site may be rejected if relocation of a project would be infeasible. In the case of the Project, there are no feasible or identifiable alternative sites which meet the objectives of the Project (CEQA Guidelines Section 15126.6(f)(1).

O10-7 See Master Response 3. The commenter provides an overview of the Reduced Footprint Alternative and the Project Objectives and provides a statement of the objectives that were partially met (11 and 12) and Objective 2 is not met because it would not allow for the development of a "larger format" high- cube e-commerce facility.

As stated in Master Response 3, this Alternative would meet the Project Objectives to a lesser degree than the Project because the Reduced Footprint Alternative would not allow for the same level of development of the larger high-cube logistics and e-commerce facilities but would still require the same level of infrastructure costs; therefore, the Alternative would not fully meet all the Project objectives, and it was found to be unfavorable relative to the Project. The Reduced Footprint Alternative was arrived upon as it would provide a meaningful reduction in the development footprint while also working to achieve to some degree the Project objectives. In addition, the Reduced Footprint Alternative would reduce, but not avoid, the significant and unavoidable GHG and air quality impacts that would occur under the Project. The Reduced Footprint Alternative would not fully leverage and maximize the use of one of the few remaining large industrial sites in the County to serve the area and region with additional distribution capacity, to the same degree as the Project. The smaller facility as proposed under the Reduced Footprint Alternative would not fulfill Project objectives as fully as the Project and would not develop the Project site as efficiently, and remaining unmet demand for high-cube logistics and e-commerce facilities would require additional smaller facilities to be located throughout the region, thereby creating additional truck trips elsewhere along with the corresponding direct and indirect impacts.

O10-8 See Master Response 3 and Response O10-7 above. The commenter indicates the Reduced Footprint Alternative is deficient in its level of detail, in accordance with CEQA, given the grounds for its rejection and the potential to meet all Objectives with proper mitigation. The commenter suggests defining what constitutes "large" or "larger" facility or set of facilities and further explain reduction fees. The commenter states Objective 2 does not state an optimal or necessary amount of fees, but only rejects the Alternative because it is less than what is proposed. The commenter addresses the analysis only states the proposed mitigation measures would not reduce the impacts from a Reduced Footprint Alternative after 25 percent reduction of the relevant particulates, emissions, and traffic and indicates the analysis needs a more thorough discussion of mitigation measures that become more feasible due to the reduced project footprint.

Reducing the Project size by 25 percent would not affect the feasibility or non-feasibility of mitigation measures. The same mitigation measures would apply, and the severity of impacts in some areas would be reduced based on reduction of project size, but not to a level of insignificance.

The CEQA Guidelines notes there is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason. This rule is described in Section 15126.6(f) of the CEQA Guidelines and requires the EIR to set forth only those alternatives necessary to foster informed decision-making. As defined in Section 15126.6(f), the rule of reason limits alternatives analyzed to those that would avoid or substantially lessen one or more of the significant effects of a project. Of those alternatives, an EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project.

A reasonable range of alternatives to the Project was considered for their ability to reduce environmental impacts and meet Project objectives. Alternatives assessed for the Project were based on State CEQA Guidelines and their potential feasibility. Furthermore, the Project was assessed for additional alternatives with none found to be feasible and warranting of additional discussion.

O10-9 See Master Response 3. The commenter questions why the analysis does not state why the third alternative does not include a blend of logistics and commercial uses.

The Project as proposed already involves a blend of high-cube logistics/e-commerce and commercial uses; therefore, a commercial alternative was selected for analysis that includes uses permitted under the General Plan Commercial (C) Land Use Category and in the Special Development - Commercial (SD-COM) Zoning Designation. The Project includes approximately 261,360 square feet of ancillary commercial uses proposed in Planning Subareas 1c, 2c, and 5a. As explained in Draft EIR *Section 6.8, Comparison of Alternatives* for a list of retail uses permitted, including commercial entertainment – indoor; restaurant, café, coffee shop; and warehouse retail (Draft EIR page 6-22). The Project Objectives – the basic reasons for the Project – provide the metrics against which the Alternatives must be measured.

O10-10 The commenter notes air quality, greenhouse gas, and traffic impacts exceed the attainment standards and mitigation measures are unable to reduce the impacts below significance. The commenter indicates mitigation measures must consider feasible technological mitigations and a mechanism must be in place that can mitigate the degree of non-attainment for a Project. The commenter urges the County to include a community benefits process as a mitigation measure.

The Draft EIR proposes mitigation measures designed to lessen or remove potential environmental impacts. In addition, Project design features included in the Project have been designed to further minimize impacts on the surrounding environment. Collectively, these measures, specifically mitigation measures MM AQ-5, MM AQ-7, MM AQ-8, MM AQ-9 and MM AQ-10, require the Project to incorporate technology improvements that would minimize or avoid impacts as those technologies become feasible and widely available. The Specific Plan includes environmental justice discussions which address potential community benefits. See

Response O8-6. Additionally, the Project's Mitigation Monitoring and Reporting Program (MMRP) identifies the party responsible for the implementation of each mitigation measure, the timing of its implementation, and the party responsible for monitoring its implementation. See also, Master Response 2.

O10-11 The commenter notes the City of Ontario requested the Project be evaluated along with the cumulative impact of projects under review development within the City of Ontario in the NOP. The commenter states this has not been addressed in the Draft EIR and the cumulative impact analysis does not address other high-cube logistics facilities.

The NOP for the Project was released on December 13, 2021. The data available at the time of the preparation of the NOP was the most current at that time, and the date of the NOP is a reasonable cutoff date for the cumulative impacts analysis. Furthermore, State CEQA Guidelines, Section 15125(a)(1) states that generally, the lead agency should describe physical environmental conditions as they exist at the time the NOP is published, including relative to the proper baseline for cumulative impacts analysis. Therefore, no further revision to the cumulative projects analyzed in the Draft EIR is required. Refer to Responses O5-22 and O5-23.

O10-12 See Response O10-11 above, regarding discussion of cumulative impacts. The commenter states the number of e-commerce facilities and the significant impact of brick-and-mortar facilities, and suggests a more thorough cumulative impact analysis be completed.

The Project's impacts to other land uses within the County are discussed the Draft EIR in *Section 4.11, Land Use and Planning*, and were found to be less than significant. The evaluation of economic impacts is not a CEQA requirement unless such impacts could result in a physical impact on the environment, such as visual blight caused by urban decay. Visual blight related to urban decay is defined as a general deterioration of the urban landscape that is characterized by long-term building vacancies, poor building maintenance, and increased vandalism. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) (124 Cal. App. 4th 1184). The commenter's claim that the Project could cause urban decay is based on speculation and is unsupported by any evidence that warehouse space in the region is overbuilt or that the Project could result in long-term vacancies that would be severe enough to result in urban decay in the surrounding communities.

In addition, according to a Quarter 2 (Q2) 2022 report from CBRE, Inc. regarding Inland Empire (IE) industrial development, the vacancy rate for industrial development decreased 10 basis points (bps) quarter or over quarter to an historic low of only 0.2 percent (the lowest rate in the nation). Even with construction activity ramping up, the majority of new warehouses that completed construction were immediately occupied in Q2 2022. This left little to no available product in the IE market. With the level of industrial construction activity in the IE another record-high level of development has been reached due to strong demand for industrial space. Currently, there is a record 38.9 million square feet under construction in the IE sector, of which 41.7 percent is preleased. Despite a strong construction pipeline, an increase in demand and preleasing activity are expected to keep the vacancy rate and availability rate low. This data invalidates the commenter's claim that this type of development is overbuilt and would lead to urban decay.

O10-13 The commenter claims the analysis does not clearly identify part-time couriers and home-delivery drivers as an element of the VMT analysis and needs to be corrected. The commenter also claims the EIR needs to evaluate the wear-and-tear on residential roads from the vehicle miles traveled by courier drivers.

The VMT analysis is consistent with San Bernardino County VMT/Traffic guidelines and has been reviewed and approved by the County. See Draft EIR *Section 4.15, Public Services* for discussion on demand of emergency personnel. It was determined that the Project would be adequately served by existing fire and police protection services, and no new or expanded unplanned facilities would be required, and impacts would be less than significant.

Policy TM-1.7 from the Countywide Plan's Policy Plan is as follows: Fair share contributions. We require new development to pay its fair share contribution toward off-site transportation improvements. For a summary of the Project's fair share contributions, see Table 11 of the Traffic Study in Draft EIR *Appendix L*.

O10-14 The comment urges the County to refer the Draft EIR back to the drafters to ensure it is legally adequate, and alternatively urges the County to not certify the EIR. The comment is noted for the record and forwarded the decision makers for their consideration. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

County of San Bernadino
Land Use Services Department - Planning Division
385 North Arrowhead Avenue, First Floor
San Bernardino, CA 92415-0187

Re: Comments on the Draft Environmental Impact Report for Speedway Commerce Center II Specific Plan, SCH # 2021120259

Dear Mr. Valdez:

These comments are submitted on behalf of the Center for Biological Diversity (the Center) and the Sierra Club regarding the Draft Environmental Impact Report (DEIR) for the Speedway Commerce Center II Specific Plan (Project), for which the County of San Bernardino (County) is the lead agency. The Center has reviewed the DEIR closely and is concerned that the DEIR fails to adequately address the Project's individual and cumulative impacts on air quality, greenhouse gas emissions, sensitive receptors, land use, and noise. Should the Project go forward, the Center urges the County to commit to clear, enforceable mitigation for these impacts. 1

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in San Bernadino County. 2

The Sierra Club is a national nonprofit organization of over 830,000 members dedicated to exploring, enjoying, and protecting the wild places of the earth; to practicing and promoting the responsible use of the earth's ecosystems and resources; to educating and enlisting humanity to protect and restore the quality of the natural and human environment; and to using all lawful

Arizona . California . Colorado . Florida . N. Carolina . Nevada . New Mexico . New York . Oregon . Washington, D.C. . La Paz, Mexico
BiologicalDiversity.org

means to carry out these objectives. The San Gorgonio Chapter serves Riverside and San Bernardino Counties. 2

This Project would add an additional 6.6 million square feet (sf) of warehouse development to a low-income community of color already disproportionately impacted by unchecked warehouse development in the area. This one facility would *double* the existing warehouse footprint in the region, as the existing 37 warehouse facilities identified in the cumulative projects list total 6.4 million sq ft. (DEIR at Table 4-1, 4-14.) 3

This is a textbook example of the massive industrial development near residences that every public health official warns against and that virtually every state and local planning effort is seeking to contain. The Project would have devastating impacts on air quality, greenhouse gas emissions, sensitive receptors, land use, and noise. The Project's criteria pollutant emissions for reactive organic gases (ROG) and nitrogen oxides (NOx) are projected to be dozens of times higher than the protective standard. The Project would also emit approximately 210,000 metric tons of carbon dioxide equivalent (MTCO2e) per year—just shy of the carbon footprint of all Disney's theme parks and resorts, combined. Given the staggering individual and cumulative impacts posed by this Project, one would expect the County to consider all available mitigation measures to protect the health of its residents. Instead, the Project's mitigation barely makes a dent in reducing these impacts, despite the readily available feasible mitigation measures that the County appears not to have considered. To address these concerns and comply with the California Environmental Quality Act (CEQA), the County must consider and incorporate enforceable, evidence-backed mitigation measures into the DEIR. 4

Given the DEIR's numerous and serious inadequacies, there can be no meaningful review of the Project. The magnitude of revisions required to create a legally defensible EIR will require recirculation of a revised DEIR, not just publication of a Final EIR, to give decisionmakers and the public an accurate understanding of the environmental issues at stake (CEQA Guidelines, § 15088.5(a)(4).)

I. THIS PROJECT ADDS ADDITIONAL WAREHOUSE DEVELOPMENT TO A REGION ALREADY SUFFERING FROM HIGH POLLUTION.

The Project proposes to construct up to 6.6 million sf of high-cube logistics and e-commerce uses, 261,360 sf of ancillary commercial uses, and approximately 98 acres of parking. (DEIR at 3-1.) The DEIR projects that the Project would generate approximately 33,594 daily vehicle trips and 9,865 daily truck trips, which would route through existing residential neighborhoods. (*Id.* at 4.3-19.) The Project is slated to operate 12 hours a day, 365 days a year. (*Id.* at 4.8-24.) The Project will have approximately 475,000 sq ft of cold storage warehousing, which means diesel transport refrigeration units (TRUs) will utilize the Project site. (*Id.* at 4.3-18, 4.3-19.) Trucks with TRUs emit significantly higher levels of toxic diesel particulate matter (PM), nitrogen oxides (NOx), and greenhouse gas emissions than trucks without TRUs. 5

The Project is in unincorporated San Bernadino County, within the City of Fontana Sphere of Influence. (DEIR at 1-3.) Disadvantaged communities in Fontana are "located predominantly in parts of central Fontana and the central Sphere of Influence." (City of Fontana

GPU 2018.) An annotated image of the Project's vicinity is attached as Appendix A. The surrounding area is a mix of residential, school, and industrial uses. Homes border the northern and eastern boundaries of the Project site, with the closest homes located within 410 feet. (DEIR at 4.3-5.) Redwood Elementary School is within 1,500 feet of the Project site. (*Ibid*.) An additional four elementary schools, a middle school, and a high school are off Randall Avenue, east of the Project site. (See Exhibit 1.) Interstate 10 runs along the southern edge. 5

A. Warehouse Projects Have Documented Air Quality Impacts That the DEIR Must Address.

Air quality is a significant environmental and public health concern in California. Unhealthy, polluted air contributes to and exacerbates many diseases and increases mortality rates. The U.S. government has estimated that between 10 to 12 percent of total health costs can be attributed to air pollution. (VCAPCD 2003.) Greenhouse gases, such as the air pollutant carbon dioxide, which is released by fossil fuel combustion, contribute directly to human-induced climate change (EPA 2016), and in a positive feedback loop, poor air quality that contributes to climate change will in turn worsen the impacts of climate change and attendant air pollution. (BAAQMD 2016.)

Air pollution and its impacts are felt most heavily by young children, the elderly, pregnant women and people with existing heart and lung disease. People living in poverty are also more susceptible to air pollution as they are less able to relocate to less polluted areas, and their homes and places of work are more likely to be located near sources of pollution, such as freeways or ports, as these areas are more affordable. (ALA 2022.) Some of the nation's most polluted counties are in Southern California, and San Bernadino County continually tops the list. (ALA 2022.) According to the American Lung Association's 2022 "State of the Air" report, San Bernadino County is the ninth-worst ranked county in the state for both ozone pollution and year-round particulate matter (PM2.5) pollution, with a "Fail" grade and an average number of 180 days per year with ozone levels in the unhealthy range. (*Id*.) Even more disturbing, the same report found that San Bernadino County is one of only fourteen counties in the country that received a "Fail" grade in all air quality metrics. (*Id.*) 6

Although there are many different types of air pollution, Ozone, PM2.5, and Toxic Air Contaminants (TACs) are of greatest concern in San Bernadino County. These three air pollutants have been linked to an increased incidence and risk of cancer, birth defects, low birth weights and premature death, in addition to a variety of cardiac and lung diseases such as asthma, COPD, stroke and heart attack. (Laurent 2016; ALA 2022.) Ozone (commonly referred to as smog) is created by the atmospheric mixing of chemicals released from fossil fuel combustion – such as reactive organic gases (ROG) and nitrogen oxides (NOx) – and sunlight. Although it is invisible, ozone poses one of the greatest health risks, prompting the EPA to strengthen its National Ambient Air Quality Standard for Ozone in 2015. (ALA 2022.) PM2.5 is a common component of vehicle exhaust emissions and contributes to visible air pollution. These tiny particles are dangerous because they are small enough to escape our body's natural defenses and enter the blood stream. Fugitive dust is a term used for fine particulate matter that results from disturbance by human activity such as construction and road-building operations. (VCAPCD 2003.) TACs are released from vehicle fuels, especially diesel, which accounts for

70% of the cancer risk from TACs. (CARB 2022a.) This is especially relevant for Southern California with its abundance of diesel shipping traffic. (Bailey; Betancourt 2012.) 6

Warehouse projects are well-documented sources of air quality degradation that can create serious, negative health outcomes for surrounding communities. (Betancourt 2012, pp. 4-5.) Particulate emissions from diesel vehicles that carry freight to and from warehouses contribute to "cardiovascular problems, cancer, asthma, decreased lung function and capacity, reproductive health problems, and premature death." (*Id.* at 5.) With the rapid increase in global trade, the Ports of LA and Long Beach have become a primary entryway for goods, processing over 40 percent of all imports into the United States, and accounting for 20 percent of diesel particulate pollutants in southern California—more than from any other source. (Minkler, et al. 2012.) These goods are often 'transloaded' before leaving Southern California, meaning that they spend some time in warehouse storage facilities before they reach their final destination. (Betancourt 2012, p. 2.) This has resulted in a massive expansion of warehouse development in Southern California. 7

Nowhere has this growth been more drastic than in San Bernadino County, and particularly in Fontana. (Betancourt 2012.) The number of warehouses in San Bernardino and Riverside counties has grown from 162 in 1975 to 4,299 in 2021, according to a recent mapping project from the Robert Redford Conservancy for Southern California Sustainability at Pitzer College. (Rode 2022.) There were 970 warehouses by 2000, which almost doubled to 1,574 in 2005, then 2,089 in 2010 and to 2,757 in 2015. (*Ibid*.) From 2020 to 2021, the number rose again from 3,727 to 4,299. (*Ibid.*) The approximately 840 million square feet of new warehouse facilities—and the roads and railyards that serve them – has permanently altered the landscape of the Inland Valley area, creating a logistics hub so massive that it is now visible from space. (Pitzer 2022.)

B. This Project Would Compound the Environmental and Health Problems of People Living in this Area. 8

Exhibit 1 illustrates the conflict between warehouses, schools, and homes in the Project's vicinity. Four schools—Live Oak Elementary School, Beech Avenue Elementary School, Sequoia Middle School, and Redwood Elementary—are all located within four blocks of the Project site. A residential development also lies to the east. The Project area has experienced a rapid transformation from a primarily open, residential area to a logistics hub. The result of this development is a patchwork of conflicting land uses, leaving sensitive receptors—such as residents, students, the immunocompromised, and the elderly—increasingly surrounded by warehouses and their deleterious public health impacts.

The surrounding community, which is overwhelmingly Hispanic, is already highly burdened by pollution. According to CalEnviroScreen 4.0, CalEPA's screening tool that identifies the California communities most affected by pollution and where people are often especially vulnerable to pollution's effects, the Project's census tract is more polluted than 93% of the state's census tracts, making it among the most polluted areas in the state. (OEHHA 2021.) Residents here suffer from some of the highest exposures statewide to ozone, fine particulate matter, diesel particulate matter, and hazardous waste. The three census tracts covering the 9

nearby communities are also among the most polluted in the state. This area – commonly referred to as the Fontana Sphere of Influence area – has lower high school graduation rates than the Fontana average, with a median income of $25,000 to $50,000. (City of Fontana GP Update, Appendix 6, pp. 14-15.) Thirty to forty percent of the population is below the poverty line. (*Id.*, pp. 14-16.) This area unsurprisingly also suffers from higher-than-average rates of asthma. (City of Fontana GP Update, Chapter 6, p. 6.6.)

9

This Project is one in an extensive line in which local decisionmakers approve warehouse development close to homes, despite health warnings from state air quality officials about the elevated asthma and cancer risks caused by warehouse distribution centers, primarily due to diesel truck pollution. (Esquivel 2019.) Back in 2005, the California Air Resources Board recommended that decisionmakers keep warehouses at least 1,000 feet away from homes, based on estimates that pollution concentrations drop by 80% at that distance. (CARB 2005.) Yet, almost twenty years later and despite the overwhelming evidence of impacts, the County here proposes a warehouse immediately adjacent to existing residential development, exacerbating poor air quality in a region that is already in extreme non-attainment for ozone. (DEIR at 4.3-10.) This Project will certainly add to and compound the environmental and health problems of people living in the area.

10

II. CLIMATE CHANGE IS A CATASTROPHIC AND PRESSING THREAT TO CALIFORNIA.

A strong, international scientific consensus has established that human-caused climate change is causing widespread harms to human society and natural systems, and that the threats from climate change are becoming increasingly dangerous. The Intergovernmental Panel on Climate Change ("IPCC"), the leading international scientific body for the assessment of climate change, concluded in its 2014 Fifth Assessment Report that: "[w]arming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. The atmosphere and ocean have warmed, the amounts of snow and ice have diminished, and sea level has risen," and further that "[r]ecent climate changes have had widespread impacts on human and natural systems." (IPCC 2014, p. 2.) These findings were echoed in the United States' own 2014 Third National Climate Assessment and 2017 Climate Science Special Report, prepared by scientific experts and reviewed by the National Academy of Sciences and multiple federal agencies. The Third National Climate Assessment concluded that "[m]ultiple lines of independent evidence confirm that human activities are the primary cause of the global warming of the past 50 years" (Melillo et al. 2014, p. 7) and "[i]impacts related to climate change are already evident in many regions and are expected to become increasingly disruptive across the nation throughout this century and beyond." (*Id*. at 10.) The 2017 Climate Science Special Report similarly concluded:

> [B]ased on extensive evidence, … it is extremely likely that human activities, especially emissions of greenhouse gases, are the dominant cause of the observed warming since the mid-20th century. For the warming over the last century, there is no convincing alternative explanation supported by the extent of the observational evidence.

11

> In addition to warming, many other aspects of global climate are changing, primarily in response to human activities. Thousands of studies conducted by researchers around the world have documented changes in surface, atmospheric, and oceanic temperatures; melting glaciers; diminishing snow cover; shrinking sea ice; rising sea levels; ocean acidification; and increasing atmospheric water vapor.

(USGCRP 2017, p. 10.)

The U.S. National Research Council determined that "[c]limate change is occurring, is caused largely by human activities, and poses significant risks for—and in many cases is already affecting—a broad range of human and natural systems." (NRC 2010, p. 2.) Based on observed and expected harms from climate change, in 2009 the U.S. Environmental Protection Agency found that greenhouse gas pollution endangers the health and welfare of current and future generations. (74 Fed. Reg. 66496 (Dec. 15, 2009) [U.S. EPA, Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act; Final Rule].) 11

These authoritative climate assessments decisively establish the dominant role of anthropogenic GHG emissions in driving climate change. As the Third National Climate Assessment explains: "observations unequivocally show that climate is changing and that the warming of the past 50 years is primarily due to human-induced emissions of heat-trapping gases." (Melillo et al. 2014, p. 2; *see also id.* at 15 [Finding 1: "The global warming of the past 50 years is primarily due to human activities, predominantly the burning of fossil fuels."].) The Assessment makes clear that "reduc[ing] the risks of some of the worst impacts of climate change" will require "aggressive and sustained greenhouse gas emission reductions" over the course of this century. (*Id*. at 13-14, 649; *see also id.* at 15 [Finding 3: "Human-induced climate change is projected to continue, and it will accelerate significantly if global emissions of heat-trapping gases continue to increase."].)

The impacts of climate change will be felt by humans and wildlife. Climate change is increasing stress on species and ecosystems—causing changes in distribution, phenology, physiology, vital rates, genetics, ecosystem structure and processes—in addition to increasing species extinction risk. (Warren et al. 2011.) Climate-change-related local extinctions are already widespread and have occurred in hundreds of species. (Weins 2016.) Catastrophic numbers of species extinctions are projected to occur during this century if climate change continues unabated. (Thomas, et al. 2004; Maclean et al. 2011; Urban 2015.) In California, climate change will transform our climate, resulting in impacts including, but not limited to, increased temperatures and wildfires and a reduction in snowpack and precipitation levels and water availability.

Therefore, immediate and aggressive GHG emission reductions are necessary to keep warming well below 2°C above pre-industrial levels. The IPCC Fifth Assessment Report and other expert assessments have established global carbon budgets, or the total amount of carbon that can be burned while maintaining some probability of staying below a given temperature target. According to the IPCC, total cumulative anthropogenic emissions of CO_2 must remain below about 1,000 $GtCO_2$ from 2011 onward for a 66 percent probability of limiting warming to 12

2°C above pre-industrial levels, and to 400 $GtCO_2$ from 2011 onward for a 66 percent probability of limiting warming to 1.5°C. (IPCC 2013, p. 25; IPCC 2014, pp. 63-64, Table 2.2.) These carbon budgets have been reduced to 850 $GtCO_2$ and 240 $GtCO_2$, respectively, from 2015 onward. (Rogeli et al. 2016, Table 2.) Given that global CO_2 emissions in 2016 alone totaled 36 $GtCO_2$ (Le Quéré et al. 2017), humanity is rapidly consuming the remaining carbon budget needed to avoid the worst impacts of climate change. As of 2022, climate policies by the world's countries would lead to an estimated 3.4°C of warming, and possibly up to 4.7°C of warming, well above the level needed to avoid the worst dangers of climate change. (Climate Action Tracker 2022.)

The United States has contributed more to climate change than any other country. The U.S. is the world's biggest cumulative emitter of GHGs, responsible for 27 percent of cumulative global CO_2 emissions since 1850, and the U.S. is the world's second highest emitter on an annual and per capita basis. (World Resources Institute 2014.) Nonetheless, U.S. climate policy is wholly inadequate to meet the international climate target to hold global average temperature rise to well below 2°C above pre-industrial levels to avoid the worst dangers of climate change.

12

In its 2018 *Special Report on Global Warming of 1.5°C*, the IPCC—the leading international scientific body for the assessment of climate change—describes the devastating harms that would occur at 2°C warming. The report highlights the necessity of limiting warming to 1.5°C to avoid catastrophic impacts to people and life on Earth (IPCC 2018). The report also provides overwhelming evidence that climate hazards are more urgent and more severe than previously thought, and that aggressive reductions in emissions within the next decade are essential to avoid the most devastating climate change harms.

In response to inadequate action on the national level, California has taken steps through legislation and regulation to fight climate change and reduce statewide GHG emissions. Enforcement of and compliance with these measures is essential to help stabilize the climate and avoid catastrophic impacts to our environment. AB 32 mandates that California reach 1990 levels of GHG emissions by the year 2020, equivalent to a 15 percent reduction from a business-as-usual projection. (Health & Saf. Code § 38550.) Based on the warning of the IPPC and leading climate scientists, Governor Brown issued an executive order in April 2015 requiring GHG emissions reductions to 40 percent below 1990 levels by 2030. (Executive Order B-30-15 (2015).) The Executive Order is line with a previous Executive Order mandating the state reduce emission levels to 80 percent below 1990 levels by 2050 in order to minimize significant climate change impacts. (Executive Order S-3-05 (2005).) In enacting SB 375, the legislature has also recognized the critical role that land use planning plays in achieving greenhouse gas emission reductions in California.

The legislature has found that failure to achieve GHG emissions reductions would be "detrimental" to California's economy. (Health & Saf. Code § 38501(b).) In his 2015 Inaugural Address, Governor Brown reiterated his commitment to reduce greenhouse gas emissions with three new goals for the next fifteen years:

- To increase electricity derived from renewable sources to 50 percent;
- To reduce petroleum use in cars and trucks by 50 percent;

- To double the efficiency of existing buildings and make heating fuels cleaner.

(Brown 2015.) In 2018, Governor Brown issued Executive Order B-55-18, in which he declared it to be a statewide goal to "achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." 12

Although some sources of GHG emissions may appear insignificant in isolation, climate change is a problem with cumulative impacts and effects. (*Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*, (9th Cir. 2008) 538 F.3d 1172, 1217 ["the impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis" that agencies must conduct].) One source or one small project may not appear to have a significant effect on climate change, but the combined impacts of many sources can drastically damage California's climate as a whole. Therefore, project-specific GHG emissions disclosure, analysis and mitigation is vital to California meeting its climate goals and maintaining our climate. 13

The impacts of climate change are already being felt by humans and wildlife. Thousands of studies conducted by researchers around the world have documented changes in surface, atmospheric, and oceanic temperatures; melting glaciers; diminishing snow cover; shrinking sea ice; rising sea levels; ocean acidification; and increasing atmospheric water vapor (USGCRP 2017). In California, climate change will result in impacts including, but not limited to, increased temperatures and wildfires and a reduction in snowpack and precipitation levels and water availability.

Given the increasingly urgent need for drastic action to reduce GHG emissions, the DEIR's failure to fully disclose, analyze, mitigate, or consider alternatives to reduce the Project's significant climate change effects is all the more alarming. 14

III. THE DEIR FAILS TO ADEQUATELY ANALYZE THE PROJECT'S SIGNIFICANT ENVIRONMENTAL IMPACTS.

CEQA's fundamental purpose is to ensure that a lead agency fully evaluates, discloses, and mitigates wherever feasible a project's significant environmental effects. (Pub. Resources Code, §§ 21000, et seq.) An EIR serves as an "informational document" that informs the public and decisionmakers of the significant environmental effects of a project and ways in which those effects can be minimized. (CEQA Guidelines, § 15121, subd. (a).) Accordingly, CEQA requires an EIR to include "enough detail 'to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'" (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 516.) Here, the DEIR fails to properly disclose and analyze significant air quality, greenhouse gas (GHG), sensitive receptor, and land use impacts. 15

A. The DEIR Must Properly Account For the Project's Air Quality and GHG Impacts.

The DEIR's analysis of the proposed Project's air quality and GHG emissions is inadequate to the public and decision-makers. (See DEIR Sec. 4.3 and 4.8.) The DEIR finds that 16

the Project – even with the proposed mitigation – will result in a significant and unavoidable increase in criteria pollutants such as ROG, NOx, CO, PM10, and PM 2.5. (DEIR at 4.3-24, 4.3-35.) It also finds that GHG emissions after mitigation would measure 207,327 MTCO2e, nearly *seventy times* in excess of the DEIR's threshold of significance of 3,000 MTCO2e. (*Id.* at 4.8-23.) 16

The DEIR here grossly underestimates the vehicle trips associated with the Project, the main driver of the Project's air quality and greenhouse gas impacts. It estimates that the Project will generate 9,865 daily truck trips, which it calculated using the Institute of Transportation Engineers (ITE) Common Trip Generation Rates. The ITE estimates trip generations based on the type of facility and square footage of the facility. (ITE 2017; DEIR, Appendix L at 46.) The DEIR relies on two facility types: Land Use 154: High-Cube Short-Term Storage and ITE Land Use 150: Warehousing, which have generation rates of .1 and .19 trips per unit respectively (DEIR, Appendix F at 46.) Other types of warehouse projects identified by ITE, such as High-Cube Fulfillment Center Warehouses and High-Cube Parcel Hub Warehouses, have significantly higher vehicle trip estimates, 1.37 and .64 trips per unit, respectively.

The DEIR provides no information or evidence justifying its selection of high-cube short-term storage and warehousing when other types of high cube warehouse centers result in truck trip estimates orders of magnitude higher. The DEIR describes the Project generally as a "large format high-cube logistics and e-commerce center." (DEIR at 1-4.) The DEIR lacks additional detail about the type of warehouse facility it anticipates constructing. It does not disclose the number of loading docks, trailer stalls, or parking spots associated with the Project – all of which inform the intensity of use. Nor does the DEIR place limits on the type of e-commerce facility that could operate on the site. Absent additional information, it appears that any tenant could operate a high-cube center or parcel hub warehouse on the site, which would generate significantly more truck trips than the DEIR disclosed, analyzed, or mitigated. The DEIR's approach violates CEQA's requirement that an EIR fully analyze and attempt to mitigate all significant direct and indirect impacts of a project. (CEQA Guidelines, § 15126.2; Pub. Resources Code, § 21002.) 17

The County must support its choice to rely upon these lower estimates, or select an estimate that more conservatively and accurately accounts for the Project's potential to generate truck trips.[1] Should the County ultimately rely on these lower estimates, the County must condition any project approval on a lease provision that guarantees a Project tenant could not operate a high-cube fulfillment center or parcel hub warehouse on the site, absent additional environmental review and mitigation.

The DEIR then compounds its error by underestimating the diesel pollution that would be generated by each truck trip. The primary objective of the Project is to build the Project "in close proximity to the Ports of Los Angeles and Long Beach, enabling trucks servicing the site to achieve a minimum of two round trips per day." (DEIR at 1-4.) The Project is approximately 62 miles away from the Ports of LA and Long Beach. (Exhibit 2.) 18

[1] The County's underestimation of diesel impacts affects its SCAQMD Rule 2305 Warehouse Actions and Investments to Reduce Emissions Program calculation. Once recalculated, the Project may no longer comply with the SCAQMD indirect source rule and may be required to pay additional funds. (*See* DEIR at 4.3-46.)

The EIR engages in a misleading minimization of impacts by assuming that, on average, trucks will travel 33.2 miles one way, based on CARB's estimate of the average truck trip length from the Ports of LA and Long Beach to warehouse facilities in the region. (DEIR at 4.3-18; CARB 2007.)[2] Since the County plans for trucks to travel to and from the Port, the only evidence-backed metric for trip length is the Project's distance from the Port – approximately 62 miles one way. Reliance on a basin-wide average masks up to one-half of the diesel pollution that the Project will generate. 18

These same flaws that infect the DEIR's air quality analysis cause the DEIR to underestimate the Project's already significant and unavoidable GHG impacts, which are driven primarily by truck trips. (DEIR at 4.8-22.)

B. The DEIR's Analysis of and Mitigation For the Cumulative Air Quality Impacts to Sensitive Receptors is Inadequate.

The DEIR fails to properly analyze cumulative air quality impacts on sensitive receptors. As courts have explained, "[o]ne of the most important environmental lessons evident from past experience is that environmental damage often occurs incrementally from a variety of small sources." (*Kings Cty. Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720.) Consequently, CEQA requires analysis of cumulative impacts. (CEQA Guidelines, Appendix G, §§ 15130, 15355.) 19

The DEIR's health risk assessment purports to evaluate the increased cancer risk caused by the Project. The analysis concludes that the Project's diesel particulate matter emissions could result in up to 88.53 cases of cancer for every million residents and up to 83.62 cancer cases for every million workers, well above the significance threshold of ten cancer cases per million people. (DEIR at 4.3-53.) The DEIR identifies two air quality mitigation measures – MM AQ-1 and MM AQ-9 – then concludes without explanation that these alone will reduce cancer levels to less than 10 per one million for all receptors, resulting in an insignificant impact after mitigation. (*Id.* at 4.3-53.)

An EIR that relies on mitigation measures to reduce a project's impacts must provide substantial evidence of the effectiveness of those measures to reduce the impacts. (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 522.) The DEIR provides no such analysis. These measures do not go nearly far enough toward reducing, avoiding, or minimizing the Project's operational impacts on sensitive receptors. MM AQ-1 involves emissions from construction only, and MM AQ-9 requires charging equipment for onsite electric/zero-emissions yard equipment. (DEIR at 1-15, 1-16.) Neither mitigation measure commits to quantifiable reductions to address the long-term air quality harms from operation of the warehouse and trips by heavy diesel trucks in and out of the facility. 20

[2] The County's Localized Operational Significance Analysis is also based on the faulty 33.2-mile estimate and must be updated. (*See* DEIR at 4.3-45.)

The proposed mitigation measures do nothing to address diesel particulate matter, a primary driver of cancer risk. (DEIR at 4.3-4 [estimating that 70 percent of the cancer risk the average California faces from TACs stems from diesel exhaust particles].) This Project is a 6.6 million sf warehouse sited within 500 feet of the nearest sensitive receptor. It would generate 9,865 daily truck trips—orders of magnitude higher than the threshold—and would emit nearly nine times the SCAQMD threshold for reactive organic gases, approximately 35 times the SCAQMD threshold for nitrogen oxide, 40 times the SCAQMD threshold for carbon monoxide, almost four times the threshold for PM10, and three times the threshold for PM2.5. (*Id. at* 4.3-35.) There is no basis for the DEIR's conclusion that cancer risks can be reduced to less than significant levels via the two measures identified in the DEIR. The DEIR must provide evidence to support its conclusion that these solutions at the margins will lead to the dramatic reduction in cancer levels the DEIR purports.[3] 21

Additionally, the EIR must be revised to incorporate evidence-backed solutions to these harms. For example, the County should consider site design adjustments to reduce the adjacent disadvantaged community's exposure, such as the location of Project docking stations. The Project places docking stations to the east of the Project site along Cherry Avenue and also to the north near residences. (DEIR at 4.13-17, 4.13-19.) This will route truck traffic through adjacent residential neighborhoods off Cherry Avenue, especially between Arrow Route and San Bernardino Avenues. The DEIR's traffic analysis shows that these intersections, with the addition of Project traffic, will operate at level of service E and F, which indicates that the County has made no effort to route diesel trucks away from these intersections and other intersections near residences. (DEIR, Appendix G pp. 75-76.) Rather than expose sensitive receptors near Cherry Avenue and elsewhere to the impacts of heavy truck traffic passing their homes, we urge the County to relocate driveways away from residences and enact turn restrictions that will prevent trucks from traversing streets with fronting sensitive receptors. 22

Pursuant to a recent settlement with the Attorney General's Office, the South Coast Air Quality Management District (SCAQMD) has committed to revise its CEQA guidance for analyzing cumulative air quality impacts. (AGO 2022; SCAQMD 2022.) SCAQMD staff have proposed an approach for new guidance that would consider existing burdens associated with nearby pollution sources and quantify cumulative air quality impacts and the effects on human health. The purpose of this new approach is to consider the impacts of concentrating polluting land uses, like warehouse projects, in disadvantaged areas, thereby encouraging local governments to site future projects in areas where they will have the least impact on human health. (AGO 2022.) Accordingly, the County may soon be required to conduct additional analysis for cumulative air quality impacts. Should SCAQMD release its updated rules, the County must update its cumulative air quality analysis. 23

//
//
//

[3] If the County cannot mitigate the cancer impacts to less than 10 per one million, which appears to be the case, then the County must explain how this Project complies with the Fontana General Plan mitigation measure MM-AQ-24. MM-AQ-24 prohibits the siting of new, large warehouse facilities within 1,000 feet of a sensitive receptor whenever, as here, the incremental cancer risk exceeds 10 in 1 million. (City of Fontana GP FEIR 2-18, p. 2-7.)

C. The County Fails to Adequately Analyze the Project's Land Use Impacts.

An EIR must clearly set forth all significant effects of the Project on the environment, including impacts on land use. (Pub. Resources Code, § 21100, subd. (b)(1); CEQA Guidelines, § 15126.2, subd. (a).) The DEIR must identify and discuss any inconsistencies between the Project and applicable general, specific, and regional plans, including plans for the reduction of greenhouse gas emissions. (CEQA Guidelines, § 15125, subd. (d).) Here, the County evaluated the significance of the Project's land use impacts by considering whether the Project "has the potential to conflict with an applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect." (DEIR at 4.11-9.) The DEIR concludes that the Project would not result in any adverse environmental impacts due to an inconsistency with any applicable land use plans, policies or regulations. (DEIR at 4.11-27.) The County determined that overall land use impacts would be less than significant through evaluating the Project's consistency with the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Community Strategy and the County of San Bernardino Countywide Policy Plan.

24

The County failed to analyze the Project's consistency with relevant land use plans and thus does not disclose potentially significant impacts. Noticeably absent is any discussion of the Project's consistency with the City of Fontana's General Plan or Municipal Code, both of which apply to the Project by the DEIR's own admission. (DEIR at 2-12, 2-13 [The Fontana Forward General Plan was used in this EIR as it relates to the analysis of the project area parcels within the City of Fontana Sphere of Influence since it contains information, policies, and regulations relevant to the Project.]) This failure is especially egregious given that the recent settlement agreement between Fontana and the Attorney General to protect these vulnerable communities from the unchecked proliferation of industrial development. (AGO 2022.)

Fontana's General Plan has several policies protecting residents from excessive impacts from industrial land uses. (City of Fontana GPU 2018.) The DEIR failed to evaluate the Project's consistency with the dozens of policies in the City's Environmental Justice element, which are required by SB 1000 and designed to reduce the unique and compounded health risks in disadvantaged communities such as the Fontana Sphere of Influence (SOI). (City of Fontana Appendix Six 2018.) The City of Fontana SOI is one of the most disadvantaged communities identified in Fontana's General Plan. (City of Fontana Appendix Six 2018.) Included in the policies designed to protect the SOI are requirements that large industrial projects undergo a Health Fontana Advisory Project Review process and that noise encroachment from such projects be minimized into adjoining residential neighborhoods. (City of Fontana Appendix Six 2018.) Yet the EIR fails to explain how siting the Project near these noise-sensitive receptors is consistent with the City General Plan's requirement to minimize noise spillover from industrial uses into adjoining residential neighborhoods and noise-sensitive uses. (City of Fontana Appendix Six 2018.) Nor does the EIR explain how the Project is consistent with the green building requirements in its Sustainability and Resilience element. (City of Fontana GPU 2018.) We encourage the County to more carefully analyze the Project's consistency with applicable General Plan policies.

25

The County also failed to demonstrate consistency with Fontana's Municipal Code. Stemming from the deleterious public health impacts suffered by Fontana residents due to unchecked warehouse development, Fontana entered into a settlement with the Attorney General's Office and adopted Ordinance No. 1891, setting stringent environmental standards for all future warehouse development in Fontana. (City of Fontana 2022.) The ordinance includes a host of measures that were designed to mitigate impacts and protect Fontana residents and the air basin from the most deleterious impacts. Among other requirements, the ordinance mandates that all on-site motorized equipment be zero emission, that solar panels on-site supply 100 percent of the power needed to operate non-refrigerated portions of the facility, and that anti-idling signs reflect a 3-minute idling restriction. The DEIR does not adopt these requirements nor demonstrate consistency. 26

Third, the EIR fails to consider the Project's consistency with the mitigation measures in the final EIR for Fontana's General Plan. For example, the Fontana General Plan contains 24 mitigation measures related to air quality, most of which should apply to the Project. (City of Fontana GP Update FEIR 2018, Table 2-2, pp. 2-4 – 2-6.) Those measures set requirements for building efficiency standards, on-site equipment, and preferential vanpool parking, among others. The EIR should clarify whether those requirements have been incorporated into the Project design, and, if not, explain why the Project is inconsistent with these mitigation measures. 27

The Project does not comply with many of these requirements. Indeed, nowhere does the DEIR even mention the ordinance or attempt to demonstrate compliance. The County must either explain why these plans do not apply, contrary to the DEIR's own statements, or must show how this Project is consistent with such plans and measures.

D. The County Fails to Adequately Analyze and Mitigate the Project's Noise Impacts.

Noise can be one of the most intrusive impacts of warehouse and logistics development to nearby sensitive receptors. Diesel trucks and unloading activities can contribute substantial noise pollution to neighboring communities.

Based on faulty assumptions, the DEIR concludes that on-site noise impacts from stationary noise would be less than significant. The DEIR estimated truck and loading dock noise for the Project by relying on measured noise levels at one loading dock at the La Palma Neighborhood Walmart. (DEIR at 4.13-19.) The typical Neighborhood Walmart is around 50,000 square feet, a quarter the size of typical Walmart Supercenter, and it sells primarily groceries, lacking all the regular Walmart departments like clothing and toys. (Bowman 2016.) The La Palma Neighborhood Walmart, for example, only has 2 loading docks.[4] The Project, on the other hand, is slated to be 6.6 million sf – the size of seven Crypto.com Arenas – and will year-round handle a wide variety of consumer goods. There is no basis by which to conclude that this grocery store is an appropriate proxy to predict stationary noise levels for a massive industrial warehouse. The noise analysis must be redone using noise measurements from a 28

[4] July 14, 2022 phone call with Las Palmas Neighborhood Walmart Store Manager.

similarly sized high cube industrial warehouse facility. Accordingly, the DEIR must clarify the assumptions underlying its noise analysis. 28

Despite concluding that off-site traffic noise impacts will be significant and unavoidable and cumulatively considerable—exceeding the thresholds set by the General Plan and noise ordinance—the Draft EIR does not adopt a single mitigation measure to address off-site noise, concluding that any mitigation would be infeasible. (DEIR at 4.13-23, 4.13-25.) The County dismisses all potential mitigation based on alleged "jurisdictional and access limitations, safety and maintenance issues, and cost." (DEIR 4.13-31.) The County fails to make an adequate showing of infeasibility. The standard for feasibility is high. Whether a mitigation measure is unfeasible "is not measured by increased cost or lost profit, but upon whether the effect of the proposed mitigation is such that the project is rendered impractical." (*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 600 (internal citation omitted).) In *Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1180, the Court agreed with the trial court that the administrative record did not contain analysis of the project alternatives in terms of comparative costs, comparative profit or losses, or comparative economic benefit to the project applicant or the community at large. The DEIR makes no showing that the Project would be rendered impractical should it incorporate practical, routinely accepted noise mitigation measures. 29

The County must consider such mitigation measures, including ones that divert traffic away from the nearby communities that will experience significant noise impacts. Further, the County has failed to consider mitigation to route trucks away from residences. The Project's current design – with loading docks along Cherry Avenue – will route trucks along the eastern edge of the Project, adjacent to residential neighborhoods. Without mitigation, the Project presents a significant risk that a large volume of trucks will travel off truck routes and through residential areas.

E. The County Gives Short Shrift to Cumulative Impacts.

CEQA requires a lead agency consider whether the combined effects from both the proposed project and other projects would be "cumulatively considerable." (CEQA Guidelines, § 15130, subd. (a).) The incremental effects of an individual project are cumulatively considerable if the effects are significant when "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." (*Id*., §§ 15065, subd. (a)(3), 15355, subd. (b).) To perform this analysis, a lead agency must "use its best efforts to find out and disclose all that it reasonably can." (*Id*., § 15144; *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 96.) Where, as here, a community already bears a high pollution burden, the relevant question is "whether any additional amount" of pollution caused by the project "should be considered significant in light of the serious nature" of the existing problem. (*Kings County Farm Bureau*, *supra*, 221 Cal.App.3d at 718.) Absent this analysis, piecemeal approval of multiple projects with related impacts could lead to severe environmental harm. (*San Joaquin Raptor/Wildlife Rescue Ctr. v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 720.) 30

The DEIR finds cumulative significant and unavoidable impacts for air quality, GHG emissions, and noise. (DEIR at 4.4-28, 4.8-24, 4.13-25.) Despite the substantial increase in all three these metrics, the DEIR assumes any cumulative impact would be lessened due to CEQA environmental review:

> Most of the projects included in the cumulative analysis have undergone, are undergoing, or will be required to undergo, their own independent environmental review under CEQA. Significant adverse impacts of the cumulative projects would be required to be reduced, avoided, or minimized through the application and implementation of mitigation measures applicable to those separate projects. The net effect of these mitigation measures is assumed to be a general lessening of contribution to cumulative impacts. (DEIR at 4-5.)

This assumption is betrayed by the DEIR's own analysis, which finds the impacts in all three categories will be significant and unavoidable *after* mitigation and therefore create a cumulatively considerable impact. There is zero basis by which to conclude that the existence of CEQA alone will ensure going forward that cumulative impacts will be lessened.

30

In light of the now-overwhelming evidence of the bevy of public health harms caused by the overconcentration of polluting warehouses near neighborhoods, even those that undergo CEQA review, the County must no longer delay in requiring substantial project design and mitigation measures for this warehouse project and all warehouse projects operating in these unincorporated areas, as the DEIR in several places appears to do. We discuss these additional measures in Part V of our DEIR-specific comments below.

31

IV. THE COUNTY HAS ARTIFICALLY NARROWED ITS PROJECT OBJECTIVES AND IMPROPERLY DISCARDED REASONABLE ALTERNATIVES.

CEQA requires an EIR to identify alternatives to the proposed project. (Pub. Resources Code, § 21002.1, subd. (a).) The EIR must "describe a range of reasonable alternatives . . . which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives." (CEQA Guidelines, § 15126.6, subd. (a).) The alternatives analysis must also "include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project." (CEQA Guidelines, § 15126.6, subd. (d).) "Evaluation of project alternatives and mitigation measures is the core of an EIR." (*Banning Ranch v. City of Newport Beach* (2017) 2 Cal.5th 918, 937 (alterations omitted).) Discussion of alternatives allow governmental agencies to consider alternatives to proposed actions affecting the environment. (*Laurel Heights Improvement Ass'n. v. Regents of Univ. of California* (1988) 47 Cal. 3d 376, 400 (en banc) (citing Pub. Resources Code, § 21001, subd. (g)).) To consider alternatives under CEQA, an EIR measures the chosen alternatives' environmental impacts against the Project's impacts. Selected alternatives must be able to meet some of the basic Project objectives, (CEQA Guidelines, § 15126.6, subd. (a),) though they need not meet all objectives, (*Watsonville Pilots Ass'n. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1087 ["It is virtually a given that the alternatives to a project will not attain all of the project's objectives."].)

32

In sum, "[a]n alternatives analysis in an EIR is intended to facilitate consideration of whether an environmentally superior alternative could meet *most* project objectives; therefore, the key to the selection of the range of alternatives is to identify alternatives that meet most of the project's objectives but have a reduced level of environmental impacts." (*Bay Area Citizens v. Assn. of Bay Area Govts.* (2016) 248 Cal.App.4th 966, 1014 (internal quotations and citation omitted, emphasis added); see also *Habitat and Watershed Caretakers v. City of Santa Cruz* (2013) 213 Cal.App.4th 1277, 1304 ("[a] potentially feasible alternative that might avoid a significant impact must be discussed and analyzed in an EIR").) Nonetheless, "a lead agency may not give a project's purpose an artificially narrow definition" to limit the scope of acceptable alternatives. (*N. Coast Rivers All. v. Kawamura* (2015) 243 Cal.App.4th 647, 668.) That is exactly what the County has done here. 32

The EIR defines thirteen objectives for the Project, and the majority are directed toward placement of a large warehouse at the Project site. Objectives 1, 2, 4, 7, 8, 10, and 11 expressly state this purpose:

> (1) Maximize the efficient movement of goods through the region by locating a large format high-cube logistics and e-commerce center in close proximity to the Ports of Los Angeles and Long Beach, enabling trucks servicing the site to achieve a minimum of two round trips per day;
> (2) Develop and operate a large format high-cube logistics and e-commerce center that maximizes the use of one of the few remaining large industrial sites in Southwestern San Bernardino County, to realize substantial unmet demand in Southwestern San Bernardino County and the region, and to allow Southwestern San Bernardino County to compete on a domestic and international scale through the efficient and cost-effective movement of goods;
> (4) Develop a high-cube logistics and e-commerce center that is in close proximity to Interstate I-10 and other major transportation arterials, to support the distribution of goods throughout the region and that also limits truck traffic disruption to sensitive receptors within the surrounding region;
> (7) Develop and operate an attractive large format high-cube logistics and e-commerce center in Southwestern San Bernardino County that meets industry standards for operational design criteria that will attract quality tenants and that will be competitive with other similar facilities in the region;
> (8) Develop a location for siting clean industry involving large scale buildings and impervious parking areas on a heavy industrial site that was once a steel mill;
> (10) Develop and operate a large format high-cube logistics center and e-commerce that limit [sic] truck traffic disruption to residential areas within Southwestern San Bernardino County and neighboring jurisdictions;
> (11) Develop and operate a large format high-cube logistics and e-commerce center that positively contributes to the economy. (DEIR at 1-4, 1-5.) 33

One alternative considered in the EIR is a "reduced footprint" alternative. (DEIR at 6-13.) This alternative would construct a 4,950,000 square-foot warehouse on the Project site instead of a 6.6 million square-foot warehouse. (*Ibid.*) The reduced footprint alternative would have the benefit of reducing the Project's otherwise significant and unavoidable impacts to air 34

quality and greenhouse gas emissions, promising reductions of up to 25 percent. (*Id.* at 6-14, 6-17.) The County also found this alternative "would generally meet the Project objectives." (*Id*. at 6-21.) But then, the County minimized the 25 percent reductions in pollutants and GHG as "functionally equivalent" to the Project and found that this alternative would not satisfy at least three of the thirteen objectives because it "would not allow for the same level of development of the larger high-cube logistics and e-commerce facilities" of the Project site. (*Id*. at 6-21.) There is no basis by which to conclude that a 4.9 million sf warehouse – which would still increase the area's warehouse footprint by 75 percent – is not "large." (*See* DEIR at Table 4-1, 4-14.) The Project's objectives are so artificially narrow as to require placement of the *largest* possible warehouse on the site. The DEIR's overly narrow definition of objectives to preclude all but the largest possible warehouse at the Project site violates CEQA's directives. 34

V. THE DEIR FAILS TO SUFFICIENTLY MITIGATE THE PROJECT'S SIGNIFICANT ENVIRONMENTAL IMPACTS.

An EIR must describe and adopt all feasible mitigation measures that minimize the significant environmental impacts of a project. (Pub. Resources Code, § 21002; CEQA Guidelines, § 15126.4, subd. (a)(1).) The lead agency is expected to develop mitigation in an open public process that considers measures proposed by interested agencies and the public. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 93.) The CEQA Guidelines provide that, "[w]here several measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified." (CEQA Guidelines, § 15126.4, subd. (a)(1)(B).) Further, mitigation measures must be fully enforceable and cannot be deferred to a future time. (*Id.*) 35

Even under the Project's unrealistic assumptions regarding the Project's vehicle traffic and the substantial emissions it would generate, the Project under the DEIR's own terms would have a profound negative impact on air quality in the region and for adjacent residential communities and would generate air pollutants, significant GHG emissions, and noise. Yet the DEIR makes little honest effort to mitigate these impacts, failing to adopt or consider the most basic and widely available of mitigation measures. Despite the Project's significant impacts, the DEIR does not incorporate several basic measures that would reduce the Project's impacts on adjacent residential communities and the region's air basin.

A. The DEIR Makes Faulty Assumptions Regarding the Feasibility of Mitigation Measures.

As discussed above, the DEIR concludes that the Project's GHG emissions will well exceed the threshold of significance, resolving to mitigate a paltry 5.5 percent of the Project's total GHG emissions. (DEIR at 4.8-23.) Authoritative climate assessments decisively recognize the dominant role of greenhouse gases in driving global climate change. As stated by the Third National Climate Assessment: "observations unequivocally show that climate is changing and that the warming of the past 50 years is primarily due to human-induced emissions of heat-trapping gases." (Mellilo 2014.) The Assessment makes clear that "reduc[ing] the risks of some of the worst impacts of climate change" will require "aggressive and sustained greenhouse gas emission reductions" over the course of this century. (*Id.*) The IPCC Sixth Assessment Report 36

and other expert assessments have established global carbon budgets, or the total amount of carbon that can be burned while maintaining some probability of staying below a given temperature target. (IPCC 2021.)

36

The Project proposes to mitigate only an approximate 12,000 of the 220,000 MTC02e that the Project is estimated to generate. (DEIR at 4.8-23, 4.8-42.) Although the Project will result in significant and unavoidable GHG impacts, the DEIR concludes that the adoption of five GHG mitigation measures is sufficient and that any additional mitigation is not feasible due to the limited ability of the County to address emissions resulting from cars and trucks outside of the County's limits. (*Id*. at 4.8-33.) Such an assertion lacks basis in the science and in common sense. Whether GHG emissions result from vehicles or from construction is irrelevant because the effect of that emission is the same – a small but significant contribution to global climate change. The County cannot hide behind its limited regulatory authority to escape its obligation to reduce greenhouse gas emissions, wherever it can, to the extent feasible.

37

B. The DEIR's Mitigation is Unlawfully Deferred.

CEQA mandates that mitigation for significant environmental impacts are not deferred. (CEQA Guidelines, § 15126.4(a)(1)(B).) However, when immediate mitigation is "impractical or infeasible," mitigation may be developed after project approval with certain conditions. (*Ibid*.) Deferral is permissible provided the agency "(1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will be…incorporated into the mitigation measure." (*Golden Door Properties, LLC. V. County of San Diego* (2020) 50 Cal.App.5th 467, 518-19; CEQA Guidelines, § 15126.4(a)(1)(B).) "If mitigation is feasible but impractical at the time of [project approval], it is sufficient to articulate specific performance criteria and make further approvals contingent on finding a way to meet them." (*San Joaquin Raptor Rescue Ctr. v. County of Merced* (2007) 149 Cal.App.4th 645, 670 [internal citations omitted].)

38

The DEIR includes multiple mitigation measures that are improperly deferred or lack defined performance standards. The DEIR mandates zero-emission equipment when "commercially available," but does not define criteria for determining commercial availability. (See MM-AQ-1, MM-AQ-4.) Likewise, the DEIR requires incorporation of new technology when "feasible" or "as applicable," but there are no criteria describing how feasibility or applicability is to be assessed. (See PDF AQ-1, PDF AQ-5, PDF AQ-6, PDF-AQ-9, PDF-AQ-10.) Many measures delay compliance deadlines to tenant occupancy or other deadlines, such as within two years of commencing operations, rather than the time of Project approval, without reason. (MM AQ-3, MM AQ-4, MM AQ-5, MM AQ-6, MM AQ-7, MM AQ -8, MM AQ-9, MM GHG-1, MM GHG-2, MM GHG-3, MM GHG-4, MM GHG-5.) These measures should be revised in the final EIR to contain clearer and more defined terms, criteria, and timelines.

C. The DEIR Fails to Consider Proven, Feasible Mitigation Measures.

39

CEQA prohibits the County from approving the Project if there are other feasible measures to reduce the Project's impacts. (Pub. Resources Code, § 21100, subd. (b)(3).)

Numerous measures exist to further mitigate the Project's impacts on local community health, regional air quality, and greenhouse gas emissions—a list of measures is below for the County's consideration. If the County declines to adopt the measures suggested in this comment, it must explain the basis for its decision as to each measure. (*Los Angeles Unified Sch. Dist. v. City of Los Angeles* (1997) 58 Cal.App.4th 1019, 1029.)

The DEIR fails to meet the County's obligation to adopt all feasible mitigation to reduce the Project's air quality impacts. The County fails to consider basic mitigation measures that have become standard for new warehouse development.

39

By proposing inadequate mitigation and then concluding that the Project's air quality impacts are significant and unavoidable, the County has fallen short of CEQA's requirement that lead agencies consider all feasible mitigation to reduce or avoid the Project's significant impacts. (See Pub. Resources Code, § 21002 [It is the "policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures which will avoid or substantially lessen the significant environmental effects of such projects."], CEQA Guidelines, §§ 15092(b), 15043, 15126.4, subd. (a)(1).) Here, the EIR overlooks, or simply ignores, numerous feasible mitigation measures.

As discussed above, the Project fails to incorporate the measures required by the Fontana General Plan Update and Fontana Ordinance No. 1891, which were specifically formulated to mitigate these impacts and protect Fontana residents and the air basin from cumulative environmental impacts. (City of Fontana 2022.) The County must incorporate these requirements.

40

The South Coast Air Quality Management District ("SCAQMD") recently adopted Rule 2305 - Warehouse Indirect Source Rule—Warehouse Actions and Investments to Reduce Emissions (WAIRE) Program, which contains a host of mitigation measures that warehouse facilities can adopt. (SCAQMD 2021, Table 3.) The rule applies to individual warehouses and distribution facility projects like the Project and is intended to reduce air quality emissions from mobile sources associated with the projects. (*Ibid*.) The mitigation measures include, but are not limited to:

- Requiring that a certain percentage of trucks in warehouse operators' fleet(s) be Zero Emissions or Near Zero Emissions.
- Requiring the installation of Zero Emissions charging or fueling infrastructure
- Requiring installation and use of onsite solar panels
- Installing high-efficiency air filters or filtering systems in residences, schools, daycares, hospitals, or community centers.

41

The California Office of the Attorney General also has published a document entitled "Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act" to help lead agencies comply with these requirements. (AGO 2021.) Nearly all of the example mitigation measures in this document have been adopted in a warehouse project in California, demonstrating their feasibility. (*Ibid.*) Unfortunately, the County has only incorporated a handful of them, which partially explains the severe and unmitigated air

42

quality and greenhouse gas impacts. At minimum, the County should consider the following best practices and mitigation measures:

Recommended Best Practices

- Placing facility entry and exit points from the public street away from sensitive receptors, e.g., placing these points on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.
- Locating warehouse dock doors and other onsite areas with significant truck traffic and noise away from sensitive receptors, e.g., placing these dock doors on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.
- Screening dock doors and onsite areas with significant truck traffic with physical, structural, and/or vegetative barriers that adequately prevent or substantially reduce pollutant dispersal from the facility towards sensitive receptors.
- Posting signs indicating that all parking and maintenance of trucks must be conducted within designated on-site areas and not within the surrounding community or public streets.
- Fully analyzing impacts from truck trips. CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin. Emissions beyond the air basin are not speculative, and, because air pollution is not static, may contribute to air basin pollution. Moreover, any contributions to air pollution outside the local air basin should be quantified and their significance should be considered.

42

Recommended Mitigation Measures

- Prohibiting off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.
- Providing electrical hook ups to the power grid, rather than use of diesel-fueled generators, for electric construction tools, such as saws, drills, and compressors, and using electric tools whenever feasible.
- Limiting the amount of daily grading disturbance area.
- Prohibiting grading on days with an Air Quality Index forecast of greater than one hundred for particulates or ozone for the project area.
- Forbidding idling of heavy equipment for more than two minutes.
- Keeping onsite and furnishing to the lead agency or other regulators upon request, all equipment maintenance records and data sheets, including design specifications and emission control tier classifications.
- Conducting an on-site inspection to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts.

43

- Using paints, architectural coatings, and industrial maintenance coatings that have volatile organic compound levels of less than 10 g/L.
- Requiring that all facility-owned and operated fleet equipment with a gross vehicle weight rating greater than 14,000 pounds accessing the site meet or exceed 2010 model-year emissions equivalent engine standards as currently defined in California Code of Regulations Title 13, Division 3, Chapter 1, Article 4.5, Section 2025. Facility operators shall maintain records on-site demonstrating compliance with this requirement and shall make records available for inspection by the local jurisdiction, air district, and state upon request.
- Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations.
- Forbidding trucks from idling for more than two minutes and requiring operators to turn off engines when not in use.
- Posting both interior- and exterior-facing signs, including signs directed at all dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, the air district, and the building manager.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, air filtration systems at sensitive receptors within a certain radius of facility for the life of the project.
- Installing and maintaining, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project and making the resulting data publicly available in real time. While air monitoring does not mitigate the air quality or greenhouse gas impacts of a facility, it nonetheless benefits the affected community by providing information that can be used to improve air quality or avoid exposure to unhealthy air.
- Constructing electric truck charging stations proportional to the number of dock doors at the project.
- Installing solar photovoltaic systems on the project site of a specified electrical generation capacity, such as equal to the building's projected energy needs.
- Requiring all stand-by emergency generators to be powered by a non-diesel fuel.
- Requiring facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.
- Requiring operators to establish and promote a rideshare program that discourages single-occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking.
- Posting signs at every truck exit driveway providing directional information to the truck route.
- Improving and maintaining vegetation and tree canopy for residents in and around the project area.
- Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program and requiring tenants to use carriers that are SmartWay carriers.

43

July 18, 2022
Page 21

- Plant trees and vegetation near structures to shade buildings and reduce energy requirements for heating/cooling.
- Constructing physical, structural, or vegetative noise barriers on and/or off the project site.
- Preserve or replace onsite trees (that are removed due to development) as a means of providing carbon storage.
- Locating or parking all stationary construction equipment as far from sensitive receptors as possible and directing emitted noise away from sensitive receptors.
- Verifying that construction equipment has properly operating and maintained mufflers
- Requiring all combustion-powered construction equipment to be surrounded by a noise protection barrier
- Limiting operation hours to daytime hours on weekdays.
- Paving roads where truck traffic is anticipated with low noise asphalt.
- Orienting any public address systems onsite away from sensitive receptors and setting system volume at a level not readily audible past the property line.
- Retrofit municipal water and wastewater systems with energy efficient motors, pumps, and other equipment, and recover wastewater treatment methane for energy production.
- Designing, clearly marking, and enforcing truck routes that keep trucks out of residential neighborhoods and away from other sensitive receptors.
- Installing signs in residential areas noting that truck and employee parking is prohibited.
- Constructing new or improved transit stops, sidewalks, bicycle lanes, and crosswalks, with special attention to ensuring safe routes to schools.
- Consulting with the local public transit agency and securing increased public transit service to the project area.
- Designating areas for employee pickup and drop-off.
- Placing facility entry and exit points on major streets that do not have adjacent sensitive receptors.
- Restricting the turns trucks can make entering and exiting the facility to route trucks away from sensitive receptors.
- Preparing a construction traffic control plan prior to grading, detailing the locations of equipment staging areas, material stockpiles, proposed road closures, and hours of construction operations, and designing the plan to minimize impacts to roads frequented by passenger cars, pedestrians, bicyclists, and other non-truck traffic.
- Appointing a compliance officer who is responsible for implementing all mitigation measures and providing contact information for the compliance officer to the lead agency, to be updated annually.
- Creating a fund to mitigate impacts on affected residents, schools, places of worship, and other community institutions by retrofitting their property. For example,

43

July 18, 2022
Page 22

retaining a contractor to retrofit/install HVAC and/or air filtration systems, doors, dual-paned windows, and sound- and vibration-deadening insulation and curtains.
- Using cool pavement to reduce heat island effects.
- Installing climate control in the warehouse facility to promote worker well-being.
- Installing air filtration in the warehouse facility to promote worker well-being.

43

Additionally, the California Air Resources Board ("CARB") has compiled a list of "Recommended Air Pollution Emission Reduction Measures for Warehouses and Distribution Centers." (CARB 2019). These measures include:

Recommended Construction Measures

- Ensure the cleanest possible construction practices and equipment are used. This includes eliminating the idling of diesel-powered equipment, and providing the necessary infrastructure (e.g., electrical hookups) to support zero and near-zero equipment and tools.
- Implement, and plan accordingly for, the necessary infrastructure to support the zero and near-zero emission technology vehicles and equipment that will be operating onsite. This includes the physical (e.g., needed footprint), energy, and fueling infrastructure for construction equipment, onsite vehicles and equipment, and medium-heavy and heavy-heavy duty trucks.
- In construction contracts, include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers, etc.) used during project construction be battery powered.
- In construction contracts, include language that requires all heavy-duty trucks entering the construction site, during either the grading or building construction phases be model year 2014 or later. Starting in the year 2022, all heavy-duty haul trucks should also meet CARB's lowest optional low-NOx standard.
- In construction contracts, include language that requires all construction equipment and fleets to be in compliance with all current air quality regulations. CARB staff is available to provide assistance in implementing this recommendation.

44

Recommended Operation Measures

- Include contractual language in tenant lease agreements that require tenants to use the cleanest technologies available, and to provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating onsite.
- Include contractual language in tenant lease agreements that requires all service equipment (e.g., yard hostlers, yard equipment, forklifts, and pallet jacks) used within the site to be electric or powered by compressed natural gas.
- Include contractual language in tenant lease agreements that requires the tenant be in, and monitor compliance with, all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program (PSIP), and the Statewide Truck and Bus Regulation.

45

July 18, 2022
Page 23

- Include contractual language in tenant lease agreements that requires all heavy-duty trucks entering the project site to be model year 2014 or later.
- Include contractual language in tenant lease agreements that limits onsite TRU diesel engine runtime to no longer than 15 minutes. If no cold storage operations are planned, include contractual language and permit conditions that prohibit cold storage operations unless a health risk assessment is conducted, and the health impacts mitigated.
- Include contractual language in tenant lease agreements that requires all trucks entering the project site to meet CARB's lowest optional low-NOx standard.
- Install rooftop solar panels, with a capacity that matches the maximum allowed for distributed solar connections to the grid.

45

Additionally, where all opportunities for emissions-reduction from onsite-mitigation and alternatives have been exhausted, agencies should consider the use of legally adequate carbon offset programs.

Because the DEIR improperly fails to consider these and other feasible mitigation measures, the County cannot make the requisite CEQA findings prior to approving the Project. The DEIR should be revised to include these and other measures to reduce, avoid, or minimize the Project's admittedly significant impacts to air quality and be recirculated for public review and comment. As a reminder, should the County decide that one of the suggested mitigation measures is not feasible, it must explain in the record why it concluded that specific mitigation measure was not feasible, supported by substantial evidence. (*Los Angeles Unified Sch. Dist. v. City of Los Angeles* (1997) 58 Cal.App.4th 1019, 1029.)

46

After considering all available on-site mitigation, the County should also consider whether local or regional offset programs are available. Offsets are an available mitigation measure for mitigating greenhouse gas impacts. The DEIR makes no mention of offsets.

CARB and the courts have indicated that "direct investments in local projects to offset carbon emissions" may help to mitigate projects' GHG-related impacts. (*See Golden Door, supra,* 50 Cal.App.5th at 492.) A direct investment project is an action that reduces, avoids or sequesters GHG emissions, such as weatherization or tree planting projects. (*Ibid.*) Direct investment projects are valid as long as they (1) comply with protocols approved by the California Air Resources Board, the California Air Pollution Control Officers Association or the local air pollution control district which received public review prior to adoption; and (2) yield GHG reductions that are additional to reductions that would not otherwise occur. (*Id.* at 492-493.) The newest draft of CARB's Scoping Plan provides useful examples of direct, local investment projects. (CARB 2022b, pp. 16-17.) These include local urban forestry projects, building retrofit programs, financing the installation of electric vehicle charging stations, and the funding of the electrification of public buses. (*Ibid*.)

Yet the DEIR provides no information regarding offsets. The County must explain whether it made any effort to create offset programs within County limits, work with the Riverside County Transportation Commission to identify offsets or demonstrate the infeasibility of the available offset programs. Of course, the County should prioritize onsite mitigation before

offsets. But once the County considers and incorporates all feasible onsite mitigation measures, outlined above, if it finds that the Project still has significant and unavoidable impacts, then the County must consider offsets. The County should first consider local offsets, then regional, then statewide offsets. Nevertheless, the County should prioritize local offsets to benefit the nearby community with an emphasis on developing community climate resiliency and adaptation. 46

VI. THE DEIR MUST BE RECIRCULATED.

Under California law, this DEIR cannot properly form the basis of a final EIR. CEQA and the CEQA Guidelines describe the circumstances that require recirculation of a draft EIR. Such circumstances include: (1) the addition of significant new information to the EIR after public notice is given of the availability of the DEIR but before certification, or (2) the draft EIR is so "fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." (CEQA Guidelines, § 15088.5.) 47

Here, both circumstances apply. Decisionmakers and the public cannot possibly assess the Project's impacts, or even its feasibility, through the present DEIR, which is riddled with error. Among other fundamental deficiencies, the DEIR repeatedly underestimates the Project's significant impacts and assumes that mitigation measures at the margins will effectively reduce those impacts. In order to resolve these issues, the City must prepare a revised EIR that would necessarily include substantial new information.

VII. CONCLUSION

Thank you for the opportunity to submit comments on the Draft Environmental Impact Report for the Speedway Commerce Center II Project. Given the State and Fontana's recent efforts to protect communities from the compounding ills of additional warehouse development, it is unconscionable that the County would consider such a use directly adjacent to Fontana residences.

Given the possibility that the Center and Sierra Club will be required to pursue legal remedies to ensure that the County complies with its legal obligations including those arising under CEQA, we would like to remind the County of its statutory duty to maintain and preserve all documents and communications that may constitute part of the "administrative record" of this proceeding. (§ 21167.6(e); *Golden Door Properties, LLC v. Superior Court* (2020) 53 Cal.App.5th 733, 762-65.) The administrative record encompasses any and all documents and communications that relate to any and all actions taken by the County with respect to the Project, and includes "pretty much everything that ever came near a proposed [project] or [] the agency's compliance with CEQA . . . ." (*County of Orange v. Superior Court* (2003) 113 Cal.App.4th 1, 8.) The administrative record further includes all correspondence, emails, and text messages sent to or received by the County's representatives or employees, that relate to the Project, including any correspondence, emails, and text messages sent between the County's representatives or employees and the Applicant's representatives or employees. Maintenance and preservation of the administrative record requires that, *inter alia*, the County (1) suspend all data destruction policies; and (2) preserve all relevant hardware unless an exact replica of each file is made. 48

We appreciate the opportunity to raise these concerns with the County. Please add the Center and Sierra Club to your notice list for all future updates. If you have any questions about our concerns, please contact Hallie Kutak at the email or phone number listed below.

Sincerely,

Hallie Kutak

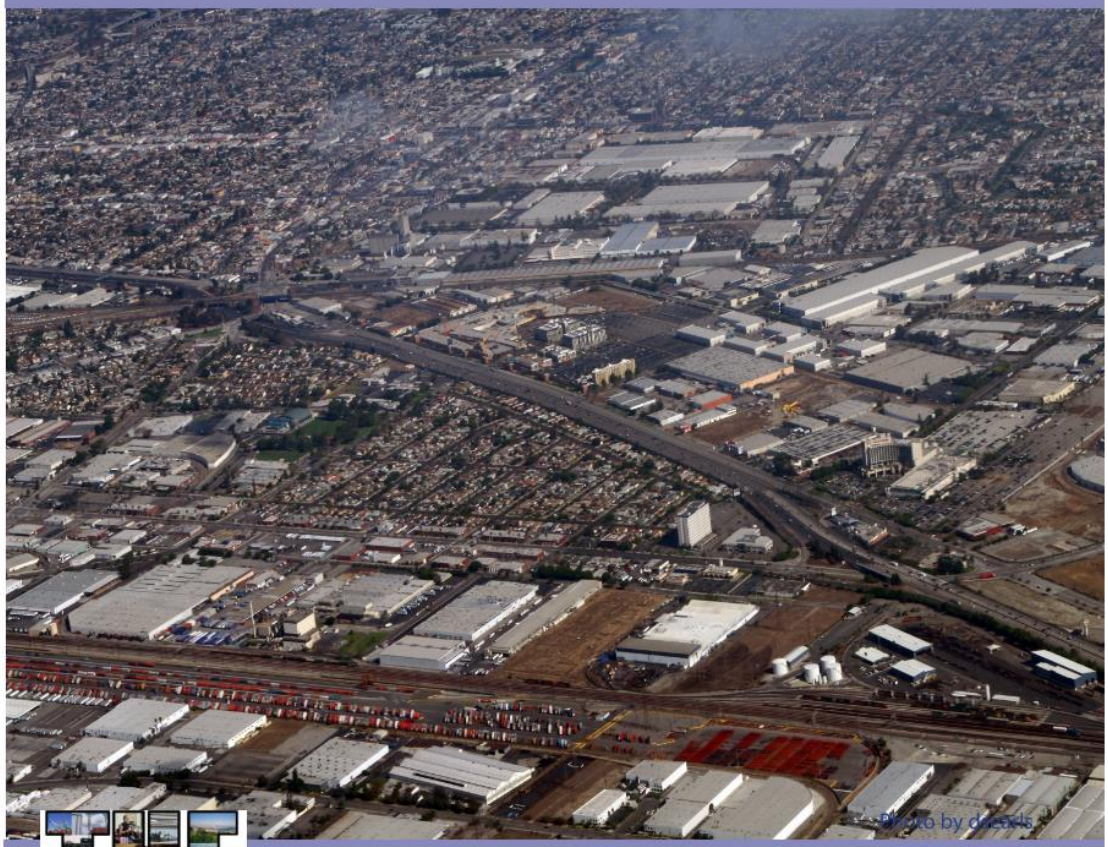
Storing Harm: the Health and Community Impacts of Goods Movement Warehousing and Logistics

THE Impact Project Policy Brief Series

January 2012



Trade, Health and Environment Impact Project
www.theimpactproject.org

Introduction

Every year millions of ocean freight containers – over half of those offloaded at the Ports of Los Angeles and Long Beach – are transported through and beyond southern California to their ultimate destination across the country. Before reaching the shelves of the nation's stores, the contents of many of these containers are stored in warehouses along transportation routes from the coastal ports to the inland deserts. Distribution center activity significantly impacts public health due to particulate pollution emitted by the trucks and trains that supply the huge warehouse buildings with goods in shipping containers. The giant warehouses used by the goods movement industry are also a sprawling and ugly land use that swallows farmland and overwhelms the scale of adjacent residential and commercial neighborhoods. Environmental justice advocates have been following the growth in the warehousing/logistics industry with concern. They have advocated for attention to be paid to residential communities impacted by warehouse expansion. Their work provides a way forward, with strategies to mitigate the health impacts of existing warehouses, design, and operate storage facilities in a more responsible manner, limit excessive concentrations of warehouses, and better regulate land use so that the future of the region is brighter than being the rent-a-storage for the nation's freight movers and retailers.

The warehouse/logistics industry

Warehousing is an integral link in the goods movement chain that distributes products imported from Asia throughout the United States. Approximately 40% of the 13-15 million shipping containers entering the region's ports each year are 'transloaded' before leaving greater Los Angeles, meaning that they spend some time in warehouse storage facilities being unpacked and repacked for their final destination.[1] The Los Angeles region currently has approximately 840 million square feet of warehouse facilities.[2] Clusters of warehouses exist along the I-710 and I-110 freeways north of the ports, in such cities as Carson, Compton, Commerce and

Bellflower; south and southeast of downtown Los Angeles; along the 91 freeway near Cerritos and Buena Park; along the 60 freeway in Puente and Rowland Heights; and in the Inland Valleys with massive concentrations in Ontario and Mira Loma (see figure 1). Modern warehouses used by the goods movement industry are vast buildings, some larger than 1.5 million square feet.[3] As close as one can come to "sprawl in a box," these structures are spartanly built, lined with dozens of truck bays. The purpose of warehouses are to service distant points – factories in China, rail yards near the ports, Wal-Mart stores in Illinois – with little connection to the fabric of life in the communities where they are located.

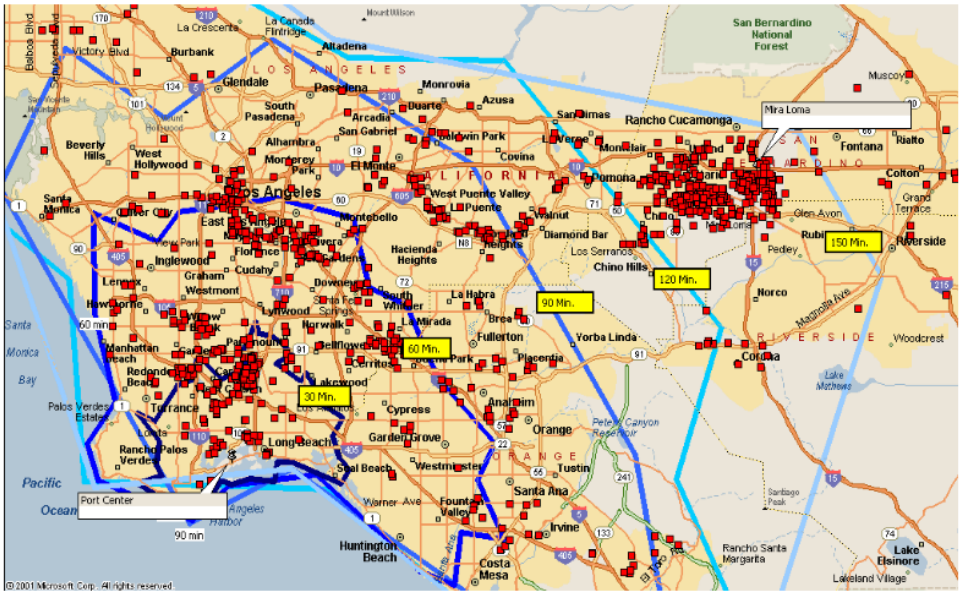


Figure 1: Map of warehouses in the Los Angeles region. From Cambridge Systematics, "Comprehensive Regional Goods Movement Plan and Implementation Strategy Study Update," Presentation to SCAG, December 3, 2009.

Case study: warehouses in the Inland Valleys

The fastest growing cluster of warehouses serving the goods movement and logistics industry lies in the Inland Valleys of Riverside and San Bernardino Counties in California. See Figure 2. In 2004, one-sixth of the commercial development in the entire nation was taking place in this area due to the rapid construction of warehouses.[4] The unchecked growth in this network of warehouses and the roads and railyards that serve them is transforming the landscape of the Inland Valley area and the health of its residents in a dramatic fashion. Farmland has been converted to immense, windowless warehouses surrounded by asphalt and chain link fencing—and some of the worst air pollution in the nation. Mira Loma, a low income Latino community in Riverside County, which is surrounded by warehouses and distribution centers,

is known to have among the highest levels of particulate pollution in the nation.[5] That pollution has resulted in startling findings — Mira Loma children have the slowest lung growth and weakest lung capacity of all children studied in southern California.[6]

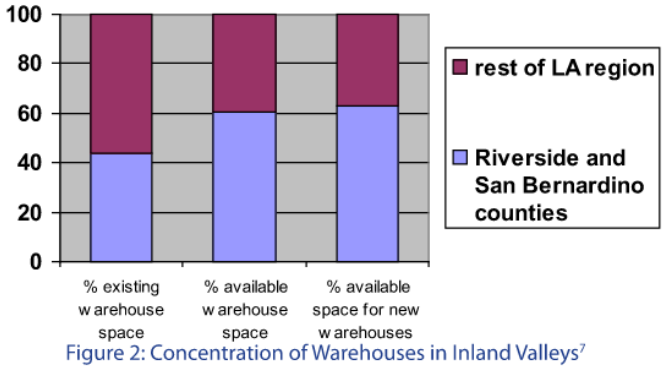

Figure 2: Concentration of Warehouses in Inland Valleys[7]

Huge warehouses and distribution centers are not just a California phenomenon. Wal-Mart alone has 40 regional distribution centers around the United States that are larger than one million square feet each. The corporation boasts that it has 53,000 trailer trucks on the move across the United States.[8] In 2007, Target opened its largest U.S. distribution center in Savannah, Georgia, which was 2.1 million square feet. In addition, there is a move to develop "inland ports" with intermodal rail facilities and distribution centers to serve East Coast ports, which anticipate a rise in imports from Asia when the Panama Canal expansion is completed in 2014.[9] Figure 3 shows some large warehouses/distribution facilities located across the country.

Figure 3: Some large distribution centers in the United States[10,11,12,13,14]

Corporation	Location	Size (millions of square feet)
Wal-Mart	Ellwood, IL (near Chicago)	3.4
Wal-Mart	Hampton Roads, VA	2.1
Target	Hampton Roads, VA	1.8
Ross Stores	Moreno Valley, CA	1.4
Ross Stores	Fort Mill, SC	1.3
Mattel	San Bernardino, CA	1.2
Pier 1	Savanna, GA	.78
Home Depot	Braselton, GA	.55

Community impacts of warehousing

Local, state, and federal environmental protections have not kept pace with the rapid growth of warehousing in the Los Angeles region. The concentration and proximity of diesel trucks and the warehousing facilities that service them threatens the health of people living and working near busy roads and logistics facilities. The trucks and trains that carry freight to be warehoused (and trucks idling engines at or near warehouse sites) pollute by emitting small toxic particles

called particulate matter (PM) into the air. These particles are of varying size and toxicity—from PM_{10} (dust and soot of 10 microns or less in size, that can irritate the throat and lungs); $PM_{2.5}$ (particles of 2.5 microns or less in size that are considered dangerous; and ultrafine particles (less than .01 microns in size) from fuel combustion, especially trucks and motor vehicles. Particulate emissions from diesel vehicles and equipment contribute to health problems that include cardiovascular problems, cancer, asthma, decreased lung function and capacity, reproductive health problems, and premature death.[15]

Beyond health threats from the transportation of freight, warehouses are also associated with negative impacts on residents' quality of life. Residents often feel a sense that they are losing their community to encroachment by warehouses and kept in the dark about what is being stored in facilities near their homes. Trucks servicing the facilities park and idle on public streets, sometimes using streets as "staging areas" because a warehouse property is over capacity or does not provide adequate on-site parking. There are also safety concerns as residents share roads not originally designed for heavy vehicles with lines of trucks. Warehouse centers also deprive local communities of land that could be used for future green space, schools and public buildings, and new residential, retail, and commercial centers.

Policy Recommendations

Local government decisions have facilitated rapid and at times irresponsible warehouse development. Acres and acres of formerly agricultural land located next to residential areas have been rezoned to permit heavy industrial uses. Once warehouses are allowed, city and county officials approve new warehouse developments very close to existing residences, schools and other sensitive receptors, even though additional scientific research shows that health risks from particulates increases significantly when pollution sources are close to where people live.[16] Jurisdictions eager to attract new development have even fast-tracked warehouse projects, approving warehouses within 90 days of submitted plans, without adequate time for nearby residents to comment on a proposed project. Officials have also regularly granted "negative declarations" to proposed warehouse developments, meaning that warehouses do not have to undergo environmental impact assessments, despite the evidence of health harms associated with warehouses and trucks.[17]

The Impact Project is committed to zero emissions technologies and regulations across all stages of goods movement. Policy recommendations to reduce rather than eliminate emissions should be considered important interim steps towards achieving zero emissions.

1. Use zoning rules to protect health and quality of life and preserve farmland
   - Create buffer zones. The California Air Resources Board recommends buffer zones between logistics facilities and sensitive receptors (homes, schools).[18] Community organizations active in THE Impact Project have often called for 1500 foot buffer zones. In addition, these rules should apply in both directions: no location of new industrial facilities near sensitive receptors, as well as no new sensitive receptors near industrial facilities.

- Do not allow additional warehouses in air pollution hot spots. New warehouses should not be permitted in residential (homes, schools, parks, etc) areas that already experience unusually high concentrations of particulate pollution until pollution levels are reduced.[19]
- Protect high value farmland. Do not allow conversion of farmlands to warehouses, especially those designated by the state as high value farmland.
- Manage traffic routes and parking. Establish warehouse facility truck operating capacity limits and ensure that warehouses have enough property to allow deliveries and truck parking on site so trucks are not using public streets as staging areas. Designate truck routes with posted no stopping and parking signs on adjacent streets. Warehouse owners should be held accountable for parking and idling violations by trucks visiting their facility.
- Limit noise and light pollution. Require sound barriers, lower lights and light deflectors; and restrict hours of operation to limit noise and light pollution to nearby residential areas.

2. Require environmentally responsible operations by warehouse operators and truck drivers
   - Require clean trucks, with warehouse owners helping subsidize purchases of new vehicles.[20] Older trucks should be phased out in order to reduce emissions. Warehouses should be electrified so that arriving vehicles can plug in rather than run their engines.[21] In the mid to long term future, all new trucks should have electric rather than internal combustion engines.
   - Plant trees and provide air filters to capture particulates. Warehouse owners should be required to plant trees around the edge of their property, especially in between the warehouse and adjacent residences. Warehouse owners should also be required to provide air filters to residents and schools located within 1500 feet of the facility. While reducing emissions should be the priority, air filters and mature trees may help reduce health impacts on nearby residents.[22,23]
   - Require sustainability features in warehouses. Warehouse roofs should be white in color to deflect heat and reduce temperatures and air conditioning.
   - Require companies to protect worker health. Warehouse workers should be given respiratory masks when opening containers because some shipping containers have had fumigant chemicals sprayed or released at their place of origin.

3. Inform and empower the public to improve community oversight
   - Notify the public about potentially toxic substances stored in warehouses and shipped on trucks. The public has a right to know what is being stored in facilities.[24]
   - Require new warehouse developments to complete environmental impact assessments. If significant impacts are found, operation should not be permitted unless these impacts are mitigated.

Conclusion

Corporations build and operate warehouses according to their own logistical needs and profit motives. Clusters of warehouses develop where land is located close to transportation infrastructure and is relatively inexpensive. But people also live near many warehouses, and warehouses bring pollution and noise, shape traffic patterns, and influence future economic and community development options. Decision-makers need to update land use rules and conditional use permits to ensure that warehouses are better neighbors, and, when appropriate, block new warehouses that would unfairly burden communities already facing polluted air.

16 One approach to reducing health impacts from diesel is to increase the distance between diesel sources and sensitive receptors. Several studies have shown that the closer one is to a diesel source the greater the health risk. In a 2002 study, "Mira Loma Specific Air Quality Study" conducted by South Coast AQMD researchers measured levels of pollution and calculated the areas in the community receiving the highest health risk. The study found that the health risk posed to local residents is reduced if the distance between the receptor and the source is increased. At a distance of 500 meters (1500 feet), the study found, the health risk drops by approximately 80%. Nazemi, M. SCAQMD Mira Loma Specific Air Management Project. (2002, August).

Walmart's neighborhood market is crushing the competition

Walmart Neighborhood Markets emphasize fresh produce. Walmart

There's a retail business with 700 stores nationwide that has 22 straight quarters of positive comparable sales growth and 11 straight quarters with comps up 5% or more.

It's not Kroger or Costco, but a division of Walmart that has been quietly crushing the competition -- the Neighborhood Market.

WalMart launched its first Neighborhood Market in 1998, but it began aggressively expanding the concept a few years ago, more than doubling the number of stores between fiscal 2013 and fiscal 2015.

The pace of expansion peaked in fiscal 2015 with 235 Neighborhood Markets opened, but the company plans to open about 90 stores this year, bringing the total to around 750 stores, about as many as Costco.

HOMEPAGE Subscribe

Supercenters, which carry a wide variety of general merchandise in addition to a full

line of groceries.

Wal-Mart does not break out results from its Neighborhood Market chain, but the quick acceleration in expanding the format and its same-store sales growth show how promising the concept has been. For the last five years, including this one, the chain has made up a majority of the company's U.S. store openings.

The chart below shows how the Neighborhood Market's comparable sales growth has outpaced Wal-Mart's overall growth.

Wal-Mart Same-Store Sales Growth (in %)

HOMEPAGE Subscribe

Share

Create line charts

There are a number of reasons why Neighborhood Market has found success.

1. Grocery is hard to disrupt

Grocery now makes up the majority of WalMart's U.S. segment, and it's been its best performing one in recent years. The company has doubled down on the segment with the rapid expansion of Neighborhood Markets and by bringing its grocery pick-up service to 400 store in 60 markets, which allows customers to order online and then pick-up groceries from a kiosk in the parking lot.

On the most recent earnings call, management noted the impact the pick-up service was having on overall e-commerce growth as last quarter was the first time in more than two years that e-commerce growth accelerated.

Grocery is also one of the few retail categories that rivals like Amazon.com have

HOMEPAGE Subscribe

delivering perishables to your doorstep remains difficult and expensive.

Sales per square foot at Walmart U.S. averaged $435 last year, but they appear to have been higher in Wal-Mart's grocery segment than the rest of the store. Using the $435 figure would mean WalMart's Neighborhood Markets generated about $11 billion in revenue last year, though the actual number is probably higher.

2. Urban penetration

Wal-Mart began its life catering to rural customers and has long struggled to penetrate markets. The company is still without a store in New York and only recently opened its first in Washington, DC. The Neighborhood Market concept, however, has given it the ability to open up in dense cities where real estate may not be suitable for a Supercenter. Wal-Mart opened its first Neighborhood Market in Chicago in 2011, and now has five of them in that city. In Atlanta and the surrounding area, it now has 12 such stores.

Wal-Mart's Neighborhood Markets can also take advantage of food deserts in such

HOMEPAGE Subscribe

priced supermarket chain that is hard for competitors to match.

While the pace of Neighborhood Market openings has slowed down over the last two years, I'd expect the concept to be a continuing source of growth for the retailer, especially as management has signaled a desire to expand in groceries. With comparable sales consistently in the mid-to-high single digits, that should be one reason for investors to believe in the company's future.

CA Do Not Sell My Info

CALIFORNIA AIR RESOURCES BOARD

Mary D. Nichols, Chair
Jared Blumenfeld, CalEPA Secretary
Gavin Newsom, Governor

March 28, 2019

Mr. Aron Liang
Senior Planner
Land Use Services Department - Planning
385 North Arrowhead Avenue, First Floor
San Bernardino, California 92415

Dear Mr. Liang:

Thank you for providing the California Air Resources Board (CARB) with the opportunity to comment on the Notice of Preparation (NOP) for the Slover/Cactus Avenue Warehouse Facility Project (Project) Draft Environmental Impact Report (DEIR), State Clearinghouse No. 2019039033. The proposed Project consists of the development of a 257,855 square-foot warehouse facility on 13.27 acres of land located within an unincorporated area of San Bernardino County. The Project will be divided into 247,855 square feet of warehouse space and 10,000 square feet of office space. There will be 104 trailer parking spaces and the warehouse will be accessed through 38 loading dock doors.

CARB is currently engaged in statewide efforts to identify actions that minimize emissions and community health impacts from freight facilities, including warehouse and distribution facilities such as the proposed Project. Warehouse and distribution facilities can result in high daily volumes of heavy-duty diesel truck traffic and operation of onsite equipment (e.g., forklifts, yard tractors, etc.) that emit toxic diesel emissions, and contribute to regional air pollution and global climate change. The Project site is located within close proximity of existing emission sources such as warehouses, the Union Pacific (UP) rail yard, and a major freeway (I-10). There are residential receptors located immediately east, south, and west of the Project site, with the closest residence located approximately ten feet south of the Project's southern boundary. Other sensitive receptors located within one mile of the proposed Project site include Joe Baca Middle School, Ruth Grimes Elementary School, Bloomington Christian School, Crestmore Elementary School, Walter Zimmerman Elementary School, and Bloomington Head Start Preschool.

The State of California has recently placed additional emphasis on protecting local communities from the harmful effects of air pollution through the passage of Assembly Bill 617 (AB 617) (Garcia, Chapter 136, Statutes of 2017). AB 617 is a significant piece of air quality legislation that highlights the need for further emission reductions in communities with high exposure burdens, like those in which the proposed Project is located. Diesel emissions generated during the construction and operation of the

arb.ca.gov 1001 I Street • P.O. Box 2815 • Sacramento, California 95812 (800) 242-4450

Project would negatively impact existing sensitive receptors, which are already disproportionally impacted by air pollution, from existing freight facilities in the community.

The California Environmental Protection Agency (CalEPA) defines a disadvantaged community as a community that scores within the top 25 percent of the census tracts, as analyzed by the California Communities Environmental Health Screening Tool Version 3.0 (CalEnviroScreen). CalEnviroScreen uses a screening methodology to help identify California communities that are disproportionately burdened by multiple sources of pollution. The census tract containing the proposed Project is within the top 1 percent for Pollution Burden and is directly adjacent to Bloomington, which is a designated disadvantaged community, as defined by CalEPA.

A preliminary air quality report and health risk assessment (HRA) was prepared for the Project and is currently available for public review on the County of San Bernardino's website. CARB staff is concerned that the estimated health risks associated with the operation of the Project are underestimated. According to the project description in the NOP, the conditional use permit would not restrict the Project from including cold storage warehouse space. The operation of cold storage warehouses would include trucks with transport refrigeration units (TRU) that emit significantly higher levels of toxic diesel emissions, oxides of nitrogen (NO_x), and greenhouse gases than trucks without TRUs. Since it is unclear whether the Project would include cold storage warehouse space, the lead agency should revise the air quality technical report and HRA assuming a conservative percentage of the truck and trailer fleet serving the Project are equipped with TRUs.

In addition to the health risk associated with operations, construction health risks should be included in the HRA. Construction of the project would result in short-term diesel emissions from the use of both on-road and off-road diesel equipment required for construction activities. The Office of Environmental Health Hazard Assessment's (OEHHA) guidance recommends assessing cancer risks for construction projects lasting longer than two months.[1] Since Project construction would occur over a twelve-month period and the nearest residence is located ten feet from the Project site, the lead agency should revise the HRA to include health risks for existing residences near the Project site during construction.

The lead agency should require mitigation measures to reduce the Project's construction and operational criteria pollutant and toxics emissions. The Project should utilize all existing and emerging zero-emission technologies that could minimize NO_x and diesel emission exposure to the neighboring community. To that end, the lead

[1] Office of Environmental Health Hazard Assessment (OEHHA). Air Toxics Hot Spots Program. February 2015.

agency should apply the recommended air pollution reduction measures for warehouses and distribution centers found in Attachment A of this comment letter.

CARB appreciates the opportunity to comment on the NOP for the proposed Project and is able to provide assistance on zero-emission technologies and emission reduction strategies, as needed. Please include CARB on your State Clearinghouse list of selected State agencies that will receive the DEIR as part of the comment period. If you have questions, please contact Stanley Armstrong, Air Pollution Specialist, at (916) 440-8242 or via email at stanley.armstrong@arb.ca.gov.

Sincerely,

Richard Boyd

ATTACHMENT A

Recommended Air Pollution Emission Reduction Measures for Warehouses and Distribution Centers

To minimize exposure burdens from air pollution, California Air Resources Board (CARB) staff recommends developers and government planners use all existing and emerging zero to near-zero emission technologies during project construction and operation. Below are some measures, currently recommend by CARB staff, specific to warehouse and distribution center projects. These recommendations are subject to change as new zero-emission technologies become available.

Recommended Construction Measures

1. Ensure the cleanest possible construction practices and equipment are used. This includes eliminating the idling of diesel-powered equipment, and providing the necessary infrastructure (e.g. electrical hookups) to support zero and near-zero equipment and tools.

2. Implement, and plan accordingly for, the necessary infrastructure to support the zero and near-zero emission technology vehicles and equipment that will be operating onsite. This includes the physical (e.g. needed footprint), energy, and fueling infrastructure for construction equipment, onsite vehicles and equipment, and medium-heavy and heavy-heavy duty trucks.

3. In construction contracts, include language that requires all off-road diesel-powered equipment used during construction to be equipped with Tier 4 or cleaner engines, except for specialized construction equipment in which Tier 4 engines are not available. In lieu of Tier 4 engines, equipment can incorporate retrofits such that emission reductions achieved equal or exceed that of a Tier 4 engine.

4. In construction contracts, include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers, etc.) used during project construction be battery powered.

5. In construction contracts, include language that requires all heavy-duty trucks entering the construction site, during either the grading or building construction phases be model year 2014 or later. Starting in the year 2022, all heavy-duty haul trucks should also meet CARB's lowest optional low-NO_x standard.[1]

[1] In 2013, CARB adopted optional low-NO_x emission standards for on-road heavy-duty engines. CARB staff encourages engine manufacturers to introduce new technologies to reduce NO_x emissions below the current mandatory on-road heavy-duty diesel engine emission standards for model years 2010 and later. CARB's optional low-NO_x emission standard is available at https://www.arb.ca.gov/msprog/onroad/optionnox/optionnox.htm.

Attachment - 1

6. In construction contracts, include language that requires all construction equipment and fleets to be in compliance with all current air quality regulations. CARB staff is available to provide assistance in implementing this recommendation.

Recommended Operation Measures

1. Include contractual language in tenant lease agreements that require tenants to use the cleanest technologies available, and to provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating onsite.

2. Include contractual language in tenant lease agreements that requires all loading/unloading docks and trailer spaces be equipped with electrical hookups for trucks with transport refrigeration units (TRU) or auxiliary power units (APU). This will eliminate the amount of time that a TRU powered by a fossil-fueled internal combustion engine can operate from within the project site. Use of zero-emission all-electric plug-in TRUs, hydrogen fuel cell transport refrigeration, and cryogenic transport refrigeration are encouraged and can also be included lease agreements.[2]

3. Include contractual language in tenant lease agreements that requires all service equipment (e.g., yard hostlers, yard equipment, forklifts, and pallet jacks) used within the site to be electric or powered by compressed natural gas.

4. Include contractual language in tenant lease agreements that requires all heavy-duty trucks entering the project site to be model year 2014 or later.

5. Starting in the year 2022, include contractual language in tenant lease agreements that requires all trucks entering the project site to meet CARB's lowest optional low-NO_x standard.

[2] CARB's Technology Assessment for Transport Refrigerators provides information on the current and projected development of TRUs, including current and anticipated costs. The assessment is available at https://www.arb.ca.gov/msprog/tech/techreport/tru_07292015.pdf.

Attachment - 2

6. Include contractual language in tenant lease agreements that requires the tenant be in, and monitor compliance with, all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation,[3] Periodic Smoke Inspection Program (PSIP),[4] and the Statewide Truck and Bus Regulation.[5]

7. Include contractual language in tenant lease agreements restricting trucks and support equipment from idling longer than five minutes while onsite.

8. Include contractual language in tenant lease agreements that limits onsite TRU diesel engine runtime to no longer than 15 minutes. If no cold storage operations are planned, include contractual language and permit conditions that prohibit cold storage operations unless a health risk assessment is conducted and the health impacts mitigated.

9. To reduce indirect greenhouse gas (GHG) emissions, include rooftop solar panels for each proposed warehouse to the extent feasible, with a capacity that matches the maximum allowed for distributed solar connections to the grid.

[3] In December 2008, CARB adopted a regulation to reduce greenhouse gas emissions by improving the fuel efficiency of heavy-duty tractors that pull 53-foot or longer box-type trailers. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the heavy-duty tractors that pull them on California highways. CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation is available at https://www.arb.ca.gov/cc/hdghg/hdghg.htm.

[4] The PSIP program requires that diesel and bus fleet owners conduct annual smoke opacity inspections of their vehicles and repair those with excessive smoke emissions to ensure compliance. CARB's PSIP program is available at https://www.arb.ca.gov/enf/hdvip/hdvip.htm.

[5] The regulation requires newer heavier trucks and buses must meet PM filter requirements beginning January 1, 2012. Lighter and older heavier trucks replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. CARB's Statewide Truck and Bus Regulation is available at https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm.

Standing under an aging pav

years, Mary Anita Valdepeña

"It's too depressing," she said.

Her family used to gather in the yard to celebrate birthdays and holidays, under the shade of the mulberry trees her husband planted, the rounded peak of Mt. Baldy in the background.

These days, the yard is overgrown with dandelions, the mulberries are dying and her view is the towering concrete wall of a warehouse. A line of semi truck trailers is parked nearby against another, shorter, concrete wall at her property line. And from where she stands, there's a constant hum — a truck rumbles, tires squeak, a forklift beeps, metal hits metal.

"You want to know about the warehouses? They ruined my life," she said.

The noise, the air pollution and the trucks are a daily reality for the dozens of working-class, mostly Latino residents of Rose Avenue in south Fontana. They have been surrounded by warehouses in the last five years as the Inland Empire has been transformed into a national logistics hub, with local officials jockeying to roll out the red carpet for the industry.

The warehouses have brought thousands of jobs to a place where residents have often struggled with high unemployment and long commutes. Their proliferation makes it possible for Southern Californians to buy something online and have it arrive at their doors within hours.

In Fontana, where Mayor Acq[illegible] prides herself on being nicknamed "Warehouse Warren," developers have dramatically reshaped the city, buying dozens

of single-family homes, horse properties, chicken ranches and other small businesses and tearing them down to build millions of square feet of distribution centers for Amazon, UPS and others.

Developers offered to buy Valdepeña's home and those of her neighbors, but they refused to sell, and the warehouses went up around them. In Valdepeña's case, one warehouse's perimeter wall is right at her property line, 150 feet from her back window.

"Boxed. We're boxed in from either direction," said Josie Kuhl, 64, who has lived on Rose Avenue for 30 years. "We hear the forklifts at night. The rumbling of trucks when they're docking, it's just nonstop."

The warehouses, as Warren sees it, will once again remake Fontana: from a community whose residents face arduous commutes into a city where they just cross the street to get to work.

Warren was born in Compton and left in 1993, the year after jurors acquitted LAPD officers in the beating of Rodney King, sending angry residents into the streets.

"My kids, I had to get them out of there," she said.

She took a job with the city of Upland and settled in Fontana, where she said she was drawn to the trees, the parks and the family-oriented community.

The company's CEO pulled he aside and described the extent to which distributors were already quietly settling in her town, she recalled.

"He told me, 'We're moving product and distributing throughout the United States right here in Fontana,'" Warren said. "I had goosebumps when I left there. I think I'm onto something."

She went to the Chamber of Commerce and to City Council members and started looking for ways to make Fontana accommodating to warehouse development, she said.

ADVERTISEMENT

Warren faced a recall effort in 2017 over what her critics called "reckless residential and warehouse development." They criticized her for taking large amounts of campaign money from developers, but the mayor remains popular and undeterred.

By continuing to use our site, you agree to our Terms of Service and Privacy Policy. You can learn more about how we use cookies by reviewing our Privacy Policy. Close

In the last five years, distribution centers have been squeezing out Fontana residents. (Brian van der Brug / Los Angeles Times)

"They started calling me 'Warehouse Warren,' and at first I was like, 'Wow, they're killing our jobs here.' But the l going with it," Warren said. " going to Orange County,' and

Big rigs pass schoolchildren waiting at a bus stop in Fontana. (Gina Ferazzi / Los Angeles Times)

"It used to be when people would come here, all of this was a hot mess. One night, a goat ran out in front of my car," Warren said. "Now ... look how clean it is."

The north side of the street was a line of new warehouses. On the south side was a tract with hundreds of single-family homes.

Tucked behind one warehouse, invisible from the street, were the about three dozen homes in the Rose Avenue neighborhood. Just down the street, about half a dozen boarded-up homes sat behind a chain link fence.

A sign on the fence announced that three warehouses, totaling 1.1 million square feet, would soon be put in their place. Nearby was St. Mary Catholic Church, where officials said they too had been approached by developers wanting to buy the property. They turned down the offer.

In the last decade, more than 150 million square feet of industrial space, the vast majority of it warehouses, has been built in the Inland Empire, according to real estate services company CBRE.

In that time, about 54 warehouses have been built or are under construction in Fontana, totaling about 16 million square feet, and about 100 homes have been sold and demolished to make way for those projects, city officials said.

Warren acknowledged that there had been some "growing pains" related to development — but she dismissed most criticism. The city follows state and federal law when it comes to these projects, she said. And air pollution, she said, gets swept away by wind.

*

Valdepeña has witnessed Fontana's reinventions first-hand. Her husband worked for Kaiser Steel for 25 years, until the mills closed down in the 1980s. He got a pension and healthcare benefits that helped sustain her family for years, she said.

These days, her son works in warehouses through a temp agency.

"They work them for three months and then ... they don't hire them," she said.

In 1965, when Valdepeña and her husband built their home on Rose Avenue, the couple and their children were surrounded by empty fields, citrus groves and grapevines.

Over the years, they bought additional plots on the street and built homes for other family members. Then other residents began to build nearby, until Rose Avenue had dozens of homes.

Eventually, a juice-box packing company opened on the street's west end. There were truck-storing businesses and a chicken ranch nearby, and some residents ran their own small businesses from their homes.

park, Valdepeña and many of her neighbors recalled. They offered to buy their homes but said, for the deal to work, everyone had to agree.

"The majority didn't want to sell because they were offering very little," said Socorro Bogarin, 38.

Still, Bogarin said, she's not troubled by the warehouses around her.

"I'm comfortable," she said. "They can keep making warehouses, and I'll stay."

Bogarin pointed to a road she said was improved when the warehouses came and said she preferred knowing there were jobs to be had inside the massive buildings.

But some officials are starting to express concern about the proliferation of warehouses near homes without an adequate buffer.

Experts have long warned about elevated asthma and cancer risks near warehouse distribution centers and other freight hubs because of the pollution emitted by trucks — physicians have even labeled these places "diesel death zones."

ADVERTISEMENT

The state Air Resources Board recommended in 2005 that houses be at least 1,000 feet from warehouses, based on estimates that pollution concentrations drop by 80% at that distance.

"That 1,000-foot buffer is cited in many cities as a recommendation, as a mitigation measure, but unfortunately it's not taken seriously," said Andrea Vidaurre, a policy analyst with the Center for Community Action and Environmental Justice, a local advocacy group.

In the last two years, city and county officials throughout the region have approved several major projects that would sit right next to homes — some 100 feet or less from

property lines — despite sometimes heated opposition from activists and residents concerned about the effects of traffic, noise and pollution.

In early 2017, Riverside residents took to City Hall carrying signs that said: "No Megahouses next to our neighborhoods," as officials approved a 1.4-million-square-foot warehouse project in the Sycamore Canyon Business Park, with one proposed building just 100 feet away from property lines in a neighborhood of tract homes.

Warehouse projects have encroached on homes in Fontana. Residents worry about the health consequences. (Gina Ferazzi / Los Angeles Times)

That summer, San Bernardino County supervisors approved a 680,000-square-foot warehouse in the unincorporated community of Bloomington, just 90 feet from some residential properties and 260 feet from an elementary school. Later, at a meeting in which they were confronted by dozens of angry residents and activists, they voted to rezone 17 acres of residential land for a 344,000-square-foot warehouse facility just 50 feet from some residents' property lines.

And earlier this year, Fontana approved the West Valley Logistics Center, a proposed 3.4-million-square-foot warehouse project that would be bordered by a large neighborhood.

Residents and activists have pushed back against these projects, to little effect.

"I don't think many of our groups are really stopping the warehouses. I think they have a plan and it doesn't matter what the community says," said Kim Rocha, a resident of Bloomington who organized for years to try to stop the proposed development there.

A few weeks ago, trucks arrived and began grading the land for the warehouse.

It will rise directly behind Rocha's home.

Acknowledgments

This report grew out of our belief that participatory research can be a critically important approach for community-driven efforts to improve health, in part by promoting relevant change on the policy level. We also believed that many exciting examples of such work could be found in California from which valuable lessons could be drawn. The experiences and materials collected for this project, and the dialogue held among leaders in the field, more than confirmed these beliefs: Community-based participatory research (CBPR) is already practiced effectively in California and is poised to have an even greater impact through the emphasis many partnerships increasingly are placing on policy-focused research and action.

We gratefully acknowledge our research team and advisory group members at the University of California, Berkeley School of Public Health and PolicyLink, and particularly Priscilla Gonzalez, Karemi Alvarez, Mary Lee, Mildred Thompson, and Rebecca Flournoy for their contributions. Thanks also are due the participants in an earlier statewide convening who provided important early feedback and advice on this project. We also owe much gratitude to the many community leaders, researchers, and policymakers who gave of their time and insights as part of our six case study analyses. Finally, we are deeply grateful to The California Endowment for its continued support of this work, and particularly to Evaluation Manager Mona K. Jhawar and former Research Director Will Nicholas, for their valuable insights and feedback.

CBPR is "a collaborative process that equitably involves all partners in the research process and recognizes the unique strengths that each brings. CBPR begins with a research topic of importance to the community with the aim of combining knowledge and action for social change to improve community health and eliminate health disparities."

–Kellogg Community Health Scholars Program (2001)

I. Background and Overview of Community-Based Participatory Research

Introduction

When the discipline and drive for answers, so integral to good research, are combined with the commitment, passion, and strategic thinking of good organizing, the result can be a very powerful tool in the effort to eliminate health disparities. The principles of effective community-based participatory research (CBPR), as derived from projects all over the country and around the world over several decades, can provide very useful lessons for groups who are beginning to think about, or engage in, this work as a means of studying and improving community health and well-being. These lessons can be augmented and brought to life by the experiences of CBPR partnerships in California. This report combines lessons and best practices from around the country with insights drawn from six case studies set in California. Background and context are provided, along with promising practices and sample resources and tools to assist local leaders in planning their own CBPR-inspired projects.

As partnerships using CBPR proliferate in California, more of these efforts are going the distance, from recognition and definition of a problem all the way to bringing about policy changes. The most enduring images of CBPR are those of residents fully engaged in speaking about their community and their lives, in ways that lead to tangible progress. From the cases in this report we see:

- Residents, in partnership with environmental researchers, analyze and present the adverse consequences of local industries—including asthma and other chronic conditions—leading to major changes in the land use and transportation plans of their city.
- A group of parents and *promotoras* (community health workers) carefully and colorfully document the unacceptable conditions of their local parks and streets, conditions which work against their own and their children's chances of leading safe and healthy lives. The combination of grassroots research and organizing leads to an array of improvements to the community and a shared realization that together they have the capacity to make meaningful change.
- Young people, in a part of town known mainly for homelessness and substance abuse among adults, collect, organize, and put forward detailed, moving information about their lives and circumstances, giving them a voice and moving the school district and city authorities to take action.

CBPR is a strategy or process that can be useful across many outcome areas in the social determinants of health, from air and water quality and food access to the health and safety conditions in homes, schools, neighborhoods and the rest of the built environment. It can also be central to understanding and addressing disparities in medical care and the treatment of particular diseases, though those will not be the focus of this report. The science and research employed in CBPR can run from tightly managed clinical trials to basic community-level data collection, and the tools used can range from complex technical equipment to everyday materials. The common threads weaving across these diverse experiences are, at their most fundamental level, about how the research is conducted, how all the parties are involved, and how the work is then presented and used. This report concentrates on cases where there was a tight connection between local organizing and research, and where the information was effectively employed in the development of new policies or changes in public systems.

Although CBPR is itself a change strategy, it in turn encompasses many diverse approaches.

We provide examples of promising practices, lift up case studies, and discuss the many ways in which CBPR can be tailored for use in different geographic settings, and in relation to different outcomes of interest. We also explore how CBPR projects can help move policy. Ultimately, our aim is to help spark new ideas among coalitions and other interested groups as to how they might apply CBPR as a strategy for improving their communities and for better understanding and addressing the issues with which they are concerned.

Building healthy communities, whether through formal undertakings such as The California Endowment's ambitious 14-site initiative of the same name (BHC), or through informal efforts by community groups and their supporters in public health departments is, in part, about achieving the outcomes necessary to eliminate health disparities and enable children and their families to live healthy and productive lives. But *how we get to those outcomes* is also critical, since building healthy communities also requires fostering community trust, engagement, and multisectoral partnerships. Finally, creating the environments in which people can be healthy often requires change on the policy or systems level. Building healthy communities therefore increasingly involves working to foster health-promoting policies in both the public and private sectors.

Community-based participatory research (CBPR) is a process that has shown considerable promise in building healthy communities because of its emphasis on building trust and genuine collaborative partnerships, and on using study findings to help bring about changes in programs, practices, and policies that can in turn help improve health outcomes.

We turn first to defining some terms and guiding principles derived from many years of observing and working on these kinds of projects. Next, the report explores a range of practices that have been shown to be valuable in carrying out CBPR in a way that supports efforts at policy and systems change. Throughout the report, examples of effective practices are drawn from both the six cases explored specifically for this project (the full case studies are presented in Section IV) and from many others. A number of resources published in print or available on the Internet, as well as descriptions of organizations whose work embodies these effective practices, are inserted in the report, and a listing of these and other relevant resources is available in the Appendix.

CBPR Defined

CBPR is "a collaborative process that equitably involves all partners in the research process and recognizes the unique strengths that each brings. CBPR begins with a research topic of importance to the community with the aim of combining knowledge and action for social change to improve community health and eliminate health disparities." That is the definition agreed upon by the community and academic partners of the Kellogg Community Health Scholars Program (2001), one of the leading sources of support for these endeavors.

The research dimension of CBPR as a part of community engagement can involve a wide range of qualitative and quantitative methods. Developing and administering community surveys or focus groups; conducting walkability assessments or air monitoring; using GIS (Geographic Information Systems) mapping; conducting secondary data analysis; and even using randomized controlled trials (RCTs) to assess intervention effectiveness have all been used as part of CBPR projects. Regardless of the particular research methods used, what is unique about this orientation to research is the *way* in which the research is conceptualized and carried out; the heavy accent placed on genuine community engagement throughout the process; and the use of findings to help bring about change. The 11 principles of CBPR described below help further articulate how this orientation differs from more traditional "top down" approaches to research and is consistent with initiatives aimed at empowering community leaders and members.

CBPR Principles

Nine guiding principles developed by Barbara Israel and her community and academic colleagues in 1998 are widely used to inform and guide the process of CBPR. Two other principles were added subsequently by Meredith Minkler and Nina Wallerstein (2008) and are also critical in this work. Every partnership wishing to undertake CBPR should adapt these principles, or develop new ones, tailored to their unique context. Following the chart is a capsule description of each principle.

Principles for Community-Based Participatory Research

Effective, authentic CBPR aspires to the following qualities:

1. Recognizes community as a unit of identity.
2. Builds on strengths and resources within the community.
3. Facilitates a collaborative, equitable partnership in all phases of research, involving an empowering and power-sharing process that attends to social inequalities.
4. Fosters co-learning and capacity building among all partners.
5. Integrates and achieves a balance between knowledge generation and intervention for the mutual benefit of all partners.
6. Focuses on the local relevance of public health problems and on ecological perspectives that attend to the multiple determinants of health.
7. Involves systems development using a cyclical and iterative process.
8. Disseminates results to all partners and involves them in the wider dissemination of results.
9. Involves a long-term process and commitment to sustainability.
10. Openly addresses issues of race, ethnicity, racism, and social class, and embodies "cultural humility."
11. Works to ensure research rigor and validity but also seeks to "broaden the bandwidth of validity" with respect to research relevance.

Sources: 1-9, Israel et al., 1998 and 2005; 10-11, Minkler and Wallerstein, 2008.

Recognizes community as a unit of identity. This first principle emphasizes the significance of community for people, and the importance of using that identification with community as a starting point for the work. A definition of community extends beyond geography and racial identity, and depends heavily on members' perceptions of what "the community" really is.

Builds on strengths and resources within the community. Rather than beginning with a "deficit mentality" that emphasizes community problems and challenges, this second principle reminds us that members of communities have a wealth of knowledge and lived experience from a cultural, local, and historical lens (Corburn, 2007). This understanding can in turn provide important insider information that is typically unattainable by an outside scientific researcher.

Facilitates a collaborative, equitable partnership in all phases of research, involving an empowering and power-sharing process that attends to social inequalities. This third principle highlights the importance of shared accountability in the decision-making process, across all steps of the research process. It also recognizes the inherent inequalities that exist between researchers and community partners. Finally, it stresses the importance of addressing

these imbalances by building trusting and mutually respectful relationships grounded in an empowering process emphasizing communication, information sharing, and joint decision making.

Fosters co-learning and capacity building among all partners. This principle stresses the importance of fostering a reciprocal relationship that engages all parties in the exchange of knowledge, skills, and capacity, reminding us that all partners bring a wealth of diverse experiences, skills, and perspectives to the partnership process.

Integrates and achieves a balance between knowledge generation and intervention for the mutual benefit of all partners. CBPR reminds partnerships of the important contributions needed from both the scientific community, and community partners. It emphasizes integrating knowledge gained through the partnership, in the advancement of interventions and policies that capture the concerns of all partners and the larger communities they serve.

Focuses on the local relevance of public health problems and on ecological perspectives that attend to the multiple determinants of health. As described by the Institute of Medicine, "an ecological approach assumes that health and well-being are affected by interaction among multiple determinants including biology, behavior, and the environment." This interaction "unfolds over the life course of individuals, families and communities" (Gebbie et al., 2003, p. 32). Consistent with an ecological view of health, this sixth principle stresses a localized approach to health with data that is relevant, timely, and inclusive. It emphasizes an approach to health that extends beyond the individual, to the immediate and larger contexts in which families live, work, and play. In CBPR partnerships, the multiple determinants of health, such as social, economic, and physical environmental factors are examined through an interdisciplinary lens, and their interactions stressed.

Involves systems development using a cyclical and iterative process. Principle seven reminds us of the iterative nature of partnerships and the importance of revisiting each stage of the research process as necessary. This is done to ensure that all voices are captured and that the action agreed upon is appropriate for all partners involved.

Disseminates results to all partners and involves them in the wider dissemination of results. This principle highlights the importance of sharing findings in an accessible and respectful way with the community and other stakeholders. The principle further stresses providing opportunities for involvement in broader dissemination strategies such as publications and presentations at the local, state, and national levels.

Involves a long-term process and commitment to sustainability. This principle places an emphasis on the importance of committing to the long haul through adequate investment of time and resources in the CBPR process. It further reminds us to keep a critical eye on sustainability and enforcement of the outcomes of the CBPR process.

Openly addresses issues of race, ethnicity, racism, and social class and embodies "cultural humility." CBPR frequently brings together community partners from marginalized groups and "outside" researchers and other institutional partners who have more privileged backgrounds in terms of race/ethnicity, education, and social class. To be effective in such situations, CBPR partners must work hard to embody what Tervalon and Murray-Garcia (1998) call "cultural humility," recognizing that while no one can be truly "competent" in another's culture, we can demonstrate a commitment to self-reflection and critique, working to redress power imbalances and to develop authentic partnerships.

Works to ensure research rigor and validity but also seeks to "broaden the bandwidth of validity" with respect to research relevance. To be sound and useful in helping promote policy change and other action outcomes that can in turn help build healthy communities, the research dimension of CBPR must take seriously notions of research rigor, validity, and reliability. At the same time, as Peter Reason and Hilary Bradbury (2006) suggest, practitioners of CBPR need to "broaden the bandwidth of validity" by asking, is the research question valid or relevant to the community and are different "ways of knowing," including community lay knowledge, valued alongside more traditional scientific sources of knowledge.

The earlier principles, and many of the accompanying skills, tools, and competencies discussed in this report, are designed to increase a partnership's familiarity and comfort level with CBPR, particularly when it is focused on broader systems or policy change. But we hope that many of these same principles and skills will also be useful to communities that may not be ready to engage in CBPR. Many of the tenets and models developed and used, by both community and academic/institutional partners, for building capacity for CBPR, for example, work equally well in building individual and collective capacity for other forms of community engagement and action. And they also often hold special relevance for coalitions and partnerships whose primary concern is with reducing health disparities and creating environments in which children and their families can be healthy.

CBPR and the Fight against Health Disparities

Despite some recent progress, disparities in health based on race, ethnicity, and social class remain pronounced, and have been associated with socio-structural problems including poverty, racism, lack of employment, and inadequate public infrastructure, as well as neighborhood characteristics. Environmental factors, such as higher rates of air pollution in poor communities often associated with asthma and related conditions, further contribute to health disparities, as do differences in neighborhood **"social capital,"** or reciprocity and trust (Putnam, 2000; Kawachi et al., 2008).

These realities, and the fact that healthy communities (and societies) tend to be those in which **social equity** is highly valued, underscore the need for new approaches to studying and addressing health disparities. CBPR is uniquely suited to building healthy communities and eliminating health disparities because of its recognition of the dramatic contributions that can be made by intensive levels of civic engagement (Minkler, 2010). The voices of lay leaders and residents of communities most affected by health disparities, when included in research and policy deliberations, can help bring about innovative and sustainable solutions, while also helping ensure that the conversation addresses the root causes of health inequities and broader policy changes that can improve health outcomes. Such conversations, however, can only take place when partners are open to discussing race, class, discrimination, and racism, as these have contributed to the often substantial distrust between academically trained researchers and communities. Cultural and linguistic accommodations, understanding of intra-group disparities and openness to making institutional partners, such as health departments and universities, more culturally sensitive and open to alternative ways of thinking are important prerequisites for such conversations to take place (Iton, 2006).

14 Community-Based Participatory Research

II. CBPR as a Strategy for Policy Change: A Conceptual Model

A defining feature of CBPR in health and related fields is the belief that action is an essential part of the research process itself. Action aimed at policy change is increasingly being recognized as integral to building healthy communities and eliminating health disparities.

CBPR is a particularly promising vehicle in bridging research and policy, since evidence and data alone are insufficient to gain political momentum to address more deeply rooted and problematic social conditions. To help build healthy communities and move the health disparities agenda to a "front burner issue," relevant research must be accompanied by political momentum and the civic engagement of communities of color and other constituents.

Many models exist for helping understand the policymaking process. The model on page 14, however, looks specifically at how CBPR partnerships may help use their research, organizing, and advocacy efforts to help bring about policy change.

CBPR Contexts, Processes, Policy Strategies, and Outcomes

As this model suggests, a wide range of **contextual factors** influence the policy process, and the CBPR partnership's work. These include "macro" factors such as socioeconomic status (SES) and the broader socioeconomic environment, and more immediate ones, such as the history of collaboration and trust (or distrust) between the community and outside research partners.

The second oval, **CBPR Processes,** includes group structure, dynamics, and stakeholders, and addresses questions such as:

Are there policymakers who are already committed to the issue?

Are there democratic decision-making processes in place among partners?

This second oval also includes both the role of **science and evidence,** and the equally important role of **civic engagement** in helping make the case for a desired policy change. The role of science and evidence reminds us that to help change policy, research must be perceived as "useful," of high quality, available in real time, and tailored to the needs of decision makers. Of particular interest here is how community partners can adopt and integrate the evidence into their organizing strategies.

The **Policy Stages and Strategies** oval includes in the center the problem or problems to be addressed, and around the periphery, the various stages in which CBPR partnerships may be engaged. These range from agenda setting to policy formulation, adoption, implementation, and evaluation and modification. Agenda-setting involves a number of strategies including but not limited to:

- defining and prioritizing the problems within a given political environment
- creating awareness of the issue(s) among key policymakers and the public
- constructing policy alternatives based on what is timely and feasible
- deciding on which policies to pursue
- advocating for the proposed changes and policy options (typically drawing on both research findings and community members' stories and experiences)

PolicyLink

"Moving Out of the Nursing Home" project, Chicago, Illinois.

Although many CBPR partnerships think of their work as over when a desired policy is adopted, this is not necessarily so. Implementation involves a process that plays out in stages:

- creating the necessary operational details
- enforcing the new or modified rules
- evaluation
- modification of the policy (if necessary)

This means that the task of collecting and reviewing information is not over for an active community partnership when the policy is passed: It is necessary to garner input from constituencies about the impact of policies. Without attention to such follow up, a policy may fail to be implemented in a way that can help build healthier communities.

Lastly, the **Outcomes** oval includes changes in policy, the consequences of these outcomes, and perceptions of what has taken place and its importance. But it also includes longer-term health outcomes toward which policy changes ultimately are directed. **"Procedural justice"** is included as an outcome too, and involves making sure that community partners "gain a seat at the policymaking table—and stay at the table"—so that their views and concerns are routinely considered in future policy deliberations (Minkler, 2010). The six case studies featured in Section IV of this report, as well as other case examples highlighted in the report, illustrate some of the diverse pathways through which CBPR can link place-based work with policy change to help build healthier communities. What practices, however, make for a good case study? A few answers are provided in the following section.

III. Eight Promising CBPR Practices

Several promising approaches, under the broad rubric of CBPR, are examined in this section, with published, online, and organizational resources highlighted and examples used to illustrate their utility. We focus in particular on those practices that appear particularly relevant for having an impact on the policy or systems level, and better addressing the social determinants of health so critical to healthy communities.

1. Build an Effective CBPR Partnership.
2. Use Asset Identification.
3. Reflect Local Ways and Values.
4. Use Multiple Methods of Data Gathering.
5. Demystify the Policymaking Process.
6. Engage Children and Youth.
7. Rely on Visual and Social Media.
8. Think on a Regional Scale.

1. Build an Effective CBPR Partnership and Maintain it Over Time

There is no one starting place or technique for developing a CBPR partnership (Wallerstein et al., 2005). Each collaboration will involve different stakeholders, and while some may include trained researchers as partners, others may not. Partnerships between diverse stakeholders will be in different stages of development if, and when, the decision to embark on a CBPR project is undertaken. Since CBPR involves some new skills and ways of working in partnership, however, several strategies may be useful. These are:

1. Having each partner reflect on the strengths, resources, and potential liabilities they—and their institution or community-based organization—may bring to the work.
2. Looking at the existing partners in your collaboration and asking, "who else needs to be involved?" In some cases, this may be a university or health department-based researcher or a local political figure who shares an interest in the outcome you hope to address. Identifying such additional potential partners through appropriate networks and associations is key to getting off on the right foot.
3. Making sure that there is agreement on the health or related issues you wish to address, and if needed, reframing the problem to ensure maximum relevance for partnership members and the outcome(s) with which they are concerned.
4. Creating structures to nurture and sustain the partnership. Many CBPR partnerships develop "group rules" or formal memorandums of understanding to guide their work. But whatever strategies are decided upon, frequent check-ins on partnership process and not merely task-related updates are important to building and maintaining effective collaborations for the work.

Resources and illustrations

The community-based **restaurant worker health and safety study** in San Francisco's Chinatown District (www.cpasf.org) began by having members from the community, academic, and health department teams use ice breakers such as "what's the meaning of your name?" to help build trust and familiarity while also increasing members' understanding of each other's backgrounds and cultures. In initial meetings, full steering committee discussions of topics such as "what does your team bring to the partnership?" and "what are your concerns and expectations about working with each other in partner teams?" (e.g., the community, academic or health department team) often were preceded by subgroup meetings in which the community partners could discuss these issues among themselves while the other partner teams did the same. Such small group meetings helped to prepare partners for more confidently expressing their views in the larger group, while also bringing to the surface some shared concerns that might otherwise have been missed. Finally, partners used exercises like an interactive time line (with each partner indicating with sticky notes on the wall under seasons (fall, spring, etc.) when they believed different activities would be taking place and discussing their points of disagreement.

An excellent resource for help in building and maintaining partnerships is **Community-Campus Partnerships for Health (CCPH)** (http://www.ccph.info/) whose mission is to foster partnerships between communities and academic institutions and, building upon each other's strengths and resources, serve as change agents to improve the education of health professionals, civic responsibility and engagement, as well as the overall health of communities. Through annual conferences, frequent "webinars," and intensive trainings at the American Public Health Association annual meeting and other venues, CCPH offers newcomers and "old hands" at CBPR opportunities to learn new tools and approaches, and network with others around the country who are engaging in this work. The CCPH website is also filled with resources on many aspects of CBPR, including the

"how to's" of getting started, tools for building partnerships and assessing partnership strengths, along with information on conferences, funding opportunities, and evaluations of projects that can serve as examples of "best practices" in the field.

Partners in CBPR may also wish to utilize tools, such as Shawna Mercer, Lawrence Green, and others' (2008) **"Reliability-Tested Guidelines for Assessing Participatory Research Projects,"** to help periodically "check in" on how the coalition or partnership is doing in terms of group process and effective functioning. Alternatively, the partners may want to conduct in-depth, semi-structured interviews and close-ended questionnaires to evaluate or measure their partnership process. According to Israel and her colleagues, in a chapter entitled, **"Documentation and Evaluation of CBPR Partnerships"** (2005), it is not only important to measure the long-term outcomes of the project, but equally important to undertake early and ongoing documentation and evaluation that can help inform the partners of the effectiveness of their collaboration.

Top and above: Chinatown Restaurant Worker Health and Safety Study, San Francisco, California.

2. Use Asset Identification:
Build on Community, Academic, and Other Partners' Strengths in Studying and Addressing Shared Concerns

CBPR reminds us of the importance of identifying and validating the community's strengths and assets, to avoid an exclusive focus on problems. By elevating what is working, and viewing communities from a balanced perspective, community asset identification helps communities identify their strengths, along with the issues they hope to address. Equally important is the accent on authentic dialogue that can lead to a richer and deeper understanding of community strengths and how these might be used or built upon to better address community concerns or problems. Collectively, this process can also shed light on the strengths and capacities of each partner. This might include the scientific expertise of academic or health department partners (including their ability to provide scientific testimony), which can be complemented with the advocacy strength and role of the community partner, e.g., in providing personal stories/testimonials and applying political pressure.

Resources and illustrations

The **Healthy Neighborhoods Project (HNP),** initiated by the Public Health Department in the west part of Contra Costa County, California, began by identifying a small number of local community members who were respected by their peers and often sought out for advice and help. Invited to an initial meeting at a local community center, these informal leaders were helped to further identify their own assets (e.g., being bilingual) and invited to be hired and trained as local neighborhood health advocates or community organizers. After learning methods like **neighborhood asset and risk mapping**, they used these tools with community members, who went in groups around the neighborhood, making notes on local assets and risks, and then convened in a local park to consolidate their findings on a large map. Through both a resident-conducted community survey and community dialogues, residents identified key issues they wanted to address (e.g., getting speed bumps, restoring night bus service, and getting improved street lighting). But they also built on their own assets for helping secure these changes, researching the issues, learning about key decision makers and leverage points etc., and then writing letters, engaging in testimony, and in other ways working together to bring about change. In addition to securing the speed bumps, night bus service, and many other changes they had worked for, this CBPR project helped spawn replication projects in several other neighborhoods, including some in Berkeley and Oakland (Ellis and Walton, 2012; Iton, 2006).

A wide range of tools is available which can guide both the asset and problem identification process. These include **walking and windshield tours**, which involve walking or driving around the neighborhood, documenting observations and impressions, or using a checklist to indicate assets or risks identified. The **California Center for Physical Activity** (http://www.cawalktoschool.com/checklists.html) has a multilingual online **walkability assessment checklist** to assist community residents in answering the question, "how walkable is your community?" The tool also includes action steps residents can take to improve the walkability and safety conditions of their neighborhood. Kretzmann and McKnight's **mapping community capacity** approach, including sample maps of primary and secondary assets or building blocks in communities, and an **"associational map"** of diverse types of community groups and organizations to look for, can be found in their user-friendly workbook, ***Building Communities from the Inside Out.*** Finally, Eugenia Eng and Lynn Blanchard's **action-oriented community diagnosis** approach offers a seven-step process for helping communities or CBPR partnerships identify lay (informal) community leaders and other assets and resources while also identifying problems of local concern and providing a plan for collectively addressing these issues. Such tools, and the many others available on websites such as the **Community Tool Box** (http://ctb.ku.edu/en/tablecontents/chapter_1027.htm) and the previously mentioned **Community-Campus Partnerships for Health** website (www.ccph.info/) can be beneficial to partners interested in identifying local resources and challenges, and taking action.

3. Local Ways and Values:
Use Approaches and Processes That Reflect Local Community Culture and Ways of Doing Things—Even If It Slows Down the Process

Each community is a special and unique place that is home to a host of diverse families and subgroups, such as Hmong refugees or second generation Mexican American families. When attempting to engage in CBPR, therefore, it is critical to be mindful of local cultures and ways of doing things, and asking, for example, who are the local (informal) leaders? Where do people gather? What places or organizations hold special meaning for them, and might therefore be good potential "homes" for a CBPR project? Many tribal communities have formal protocols or processes through which nonmembers wishing to partner in CBPR or other collaborations must approach tribal leaders, explain their interests and benefits to the tribe, and seek permission to engage in a collaborative project.

Although such formality is unusual in nontribal communities, going through a process of finding and approaching local community leaders on their turf (e.g., a respected faith-based or ethnic organization), introducing yourself and the proposed project, and exploring their interest in possible collaboration, is a good approach to emulate. Although outside research partners may want to expedite the process at times to yield faster results, in doing so, critical groundwork may be missed, and important stories and other rich data not adequately captured. Partnerships that move too quickly also risk addressing an issue in ways that do not reflect community wisdom. By taking the time to establish trust and rapport and meeting community residents where they are, on their terms, and in places and at times they select, partnerships are more likely to achieve success. Getting to know and appreciate local community culture is an important prerequisite to effective CPBR and must be embraced by partnerships if they are to be successful.

Resources and illustrations

In the **Tribal Efforts Against Lead** (TEAL) project in Tar Creek, Oklahoma, a substantial amount of time was spent addressing the power and cultural differences between the outside researchers and community residents, and breaking down barriers of distrust, particularly given the historical context of rampant abuse of Native Americans by outside researchers. By showing cultural humility in their approach to the tribes and their leaders, university partners were able to enlist the support of 40 respected community elders from eight tribes who were hired and trained as "Clan Mothers and Clan Fathers," and held positions of respect and high-level decision making throughout the process. In part because of the attention paid to local ways of doing things, the project was successful not only in testing an intervention to reduce lead exposure in children, but also in helping secure policy changes (e.g., restricting the use of lead-rich mine "tailings"[1] on roads and in construction, to help decrease children's lead exposure (Kegler et al.,2004; Petersen et al., 2007).

An important resource that can help members of the dominant culture better understand the unspoken advantages they carry by virtue of their race and how it can affect work with other cultures is the "**white privilege**" **checklist** developed by Peggy McIntosh (http://www.fpg.unc.edu/~scpp/pdfs/whiteprivilegechecklist.pdf). This exercise can be used to facilitate a discussion of what unearned privilege means, and how that may affect working relationships with diverse cultures. A newer tool by Cheryl Hyde (2012), entitled, ***Challenging Ourselves: Critical Self-Reflection on Power and Privilege,*** also may be useful and includes exercises individuals and partnerships may use in such reflection. The **Community Tool Box** (http://ctb.ku.edu/en/tablecontents/chapter_1027.htm) includes many resources for partnerships under the heading, Cultural Competence in a Multicultural World, on topics including: Building relationships with people from different cultures; learning to be an ally with people from diverse groups and backgrounds; and strategies and activities for reducing racial prejudice and racism.

[1] Materials left behind following extraction of valuable minerals from iron ore.

4. Multiple Methods:
Use Forms of Data Collection That Can Provide Both the "Stories and Statistics" Needed to Help Effect Policy Change

CBPR can involve a wide range of qualitative and quantitative methods, from photovoice[2] and community members' narrative accounts to spatial statistics, secondary data analysis using large government data sets, and even randomized controlled trials (RCTs). The goal should be to aim for high-quality research, but make results easily accessible and highlight their policy relevance.

To document community concerns, there may be the need for different levels of quantitative data, e.g., the monitoring, walk-throughs or counting that the community partners can do, and more rigorous quantitative studies by academically trained partners. Yet as policymakers frequently remind us, to help move policy they need the numbers but also people's stories captured in more qualitative data collection methods. And regardless of the method used, they need to feel confident that the findings presented can "stand up to careful scrutiny." Finally, study findings need to be accessible and their policy relevance clear, e.g., through pie charts and graphs, striking quotes from focus groups or interviews, and concise policy briefs. Such products summarizing the problem, relevant findings, and potential solutions based in part on the findings need to be available and accessible to diverse audiences.

Resources and illustrations

A collection of 10 case studies of CBPR partnerships that helped move policy, entitled ***Promoting Healthy Public Policy through Community-Based Participatory Research,*** is available on the website, www.policylink.org. Developed for the W.K. Kellogg Foundation, the majority of the 10 case studies showcase projects that used multiple research methods, such as water sampling and door-to-door interviews, or secondary data analysis of public data on issues such as substance use and incarceration along with focus groups with former inmates. Providing rich qualitative data along with the hard numbers was valuable in helping the partnerships make the case for policy changes they wanted to see.

The multimethod research conducted as part of a CBPR process can be powerful and pack a substantial advocacy punch. This was well demonstrated by the work of the Harlem Community and Academic Partnership in New York, in its efforts to address the fact that fully half of the mostly African American and Latino inmates returning to the community from prison or jail annually were reincarcerated within a year, often due to substance abuse. The partners conducted: focus groups with 36 substance users and former inmates; a survey of 79 substance abuse providers; secondary data analysis, using the government's own data sets; and public opinion poll data to study the problem. Through this mixed methods research, they uncovered 11 policies (involving drug treatment, the correctional system, etc.) that worked directly against effective reintegration into the community. Using their data, and effective advocacy, the partnership was credited with helping bring about a number of policy changes, among them having Medicaid immediately reinstated at the time of release, so that former inmates could receive the treatment and other help they needed to remain with their families and communities and avoid the jail-to-community "round trip" (Freudenberg et al., 2005).

Both online resources (e.g., the **Community Tool Box)** and publications like ***A Guide to Facilitating Action Research for Youth*** (Goldwasser, 2004) may be helpful to community groups interested in learning more about research processes and methods, and their utility in place-based work. Increasingly too, articles on topics like how to conduct data analysis with communities may be found in venues like the ***American Journal of Public Health*** (www.ajph.org), ***Progress in Community Health Partnerships*** (www.press.jhu.edu/journals/progress_in_community_health_partnerships/), and ***Health Promotion Practice*** (http://hpp.sagepub.com).

[2] A photographic technique in which group members learn to capture community issues and assets in their photos, and then collectively analyze them as a basis for deeper understanding, action, and change (see page 26).

5. Demystify the Policymaking Process: Trainings, Web-Based Tools, and Links to a "Policy Mentor" Can Help Your Partnership Better Understand and Navigate the Policy Process

Although working on the policy level can be an important "intermediate step" in efforts to reduce health disparities and build healthier communities, CBPR partnerships often feel ill-equipped to work on this level, or worry that it's simply beyond the scope of what they can hope to achieve. Working to help effect policy change does take time and resources, but the longer-term payoffs of policy level change remind us of the value of engaging on this level where appropriate. CBPR partnerships may need help in understanding the policymaking process, as well as how their partnership can become effectively engaged in efforts to move policy, and what the constraints might be on such work. They may also need assistance in thinking through how current policies created the problem; who wins and loses from the current policy; what the technical, legal, engineering, and other factors are that may limit the range of solutions, and where there are possibilities for partnership around moving policy forward (Themba-Nixon, 2010; Freudenberg et al., 2005).

Many community partners already have a sophisticated understanding of power relations and the policy process, and have developed impressive and creative approaches to power mapping and advocacy, that they in turn have shared with their institutional partners and other advocates. Some of these are highlighted below.

Resources and illustrations

A useful and accessible guide to the policy process is Cassandra Ritas' user-friendly booklet, ***Speaking Truth, Creating Power: A Guide to Policy Work for CBPR Practitioners***, available on the University of Washington website (http://depts.washington.edu/ccph/pdf_files/ritas.pdf). The PolicyLink document, ***Advocating for Change*** (http://www.policylink.org/AdvocatingforChange), also may be helpful in providing a variety of resources for partnerships interested in exploring a range of policy options as well as sample tools for pursuing them. PolicyLink recently created a **policy bingo** game as a useful and fun way for community and other groups to learn key concepts and terms (Lee et al., 2012).

PolicyLink also is creating a new set of tools by which practitioners can assess the progress and impacts of their policy change efforts. This effort, known as **Getting Equity Advocacy Results** (GEAR) (with its work in progress available for review at http://www.policylink.org/gear), outlines 10 phases of activity in efforts to bring about policy change for equity, the relationships among these phases, and benchmarks and indicators for assessing a campaign or coalition's progress toward its interim and long-term goals.

For those specifically interested in media advocacy, or the "strategic use" of the mass media to help frame and present issues from a healthy communities' perspective, the **Berkeley Media Studies Group** (www.bmsg.org) and its user-friendly workbook, ***News for a Change*** (Wallack et al., 1999) may be of considerable help. **The Praxis Project** (www.thepraxisproject.org/), a national nonprofit organization that builds partnerships with local community groups to influence policymaking, also incorporates media approaches, as well as research and community-driven plans, to build local community power to effect change and address social and political structural problems. Praxis assists local groups in holding their local government agencies accountable and responsible in the pursuit of sustainable solutions. It offers technical assistance, capacity building, research and training, and useful tools and publications for partnerships. ***Talking the Walk***, a workbook by Hunter Cutting and Makani Themba-Nixon (2006), is particularly helpful in using media advocacy to promote racial/ethnic justice. Finally, the booklet, ***Working Upstream: Skills for Social Change,*** by Lori Dorfman and others (2009), provides a wealth of easy-to-access information, exercises, and tools for community groups and CBPR partnerships interested in addressing health disparities and building healthy communities through advocacy and other policy-focused change (http://bmsg.org/sites/default/files/bmsg_handbook_working_upstream.pdf).

PolicyLink

Coalitions and partnerships interested in helping move policy through CBPR may also benefit from identifying and collaborating with local **policy mentors** familiar with the issue and the local political scene. Such mentors may become invaluable partnership members and/or an important source of support and guidance in the work.

In San Francisco's Bayview District, a CBPR partnership was interested in increasing access to healthy foods and decreasing the advertising and availability of tobacco and alcohol products in local "mom and pop" stores. A charismatic local county supervisor became a policy mentor to youth and their organization, **Literacy for Environmental Justice** (www.lej.org), as well as the partnership's health department and other adult CBPR partners early in the process, helping them consider the feasibility of potential policy options. The partnership was originally interested in working for an ordinance requiring more access to healthy foods in neighborhood stores, for example, but their mentor pointed out that such a measure would "lack teeth," and helped them find an alternative, voluntary policy option, which was ultimately more effective. The resultant **"Good Neighbor" Program** provided incentives for stores that provided a minimum of 10 percent of shelf space for healthy foods, along with other changes, and the first of several such Good Neighbor stores showed dramatic and sustained changes in product sales—and increased profits—as a result of their participation (Hennessey Lavery, 2005; Brechwich Vásquez et al., 2007). Whether elected officials or individuals who know the "ins and outs" of the policymaking process, policy mentors can be most helpful if identified early and consulted as needed throughout a policy-focused CBPR project.

6. Engage Children and Youth in CBPR

Increasing attention has been devoted to CBPR as a means for increasing the civic engagement of children and youth while improving the self-esteem, critical thinking, and future orientation needed for success in school and beyond.

Youth can play important roles in CBPR partnerships and projects by serving as cultural brokers and/or offering high-level energy and proficiency in using Internet technologies and other new media. Policymakers have pointed out that when children and youth are involved in helping to collect data and present testimony based on the findings, "policymakers pay attention." The importance of working for change indeed appears to resonate in a more forceful way than when adults advocate for changes that would benefit children and youth. For these reasons too, and without negating the often substantial challenges involved in working with youth, their training, mentoring, and engagement may be a useful strategy for coalitions and partnerships.

Resources and illustrations

For more than 20 years before its recent closure, health departments, schools, and community partners interested in engaging youth in participatory research called upon the former Sacramento-based organization, **Youth in Focus (YIF).** With its mission of educating and working in partnership with adult partners and underrepresented communities, YIF provided consultation and assistance to organizations throughout the state wishing to use youth-led participatory action research as an empowerment strategy. YIF developed workshops, trainings, and a series of resources for youth, adults, policymakers, and educators engaged in creating social conditions in which youth and families can thrive.

Youth in Focus was a key partner in Fresno's youth-driven **Escuelas, Sí! Pintas, No! (ESPINO)**

project, a youth-led coalition in which youth and their adult partners and YIF mentors conducted youth action research and youth organizing in the California Central Valley. Through the use of policy-focused participatory research, the youth investigated the experiences of incarcerated youth. Their findings led them to successfully advocate for several changes in the California juvenile justice system. With support from Youth in Focus and their other adult partners, the youth proposed an amendment to California Senate Bill 1642, testified at the Senate Committee for a Responsible Budget Commission, screened a film, *Systems Failure*, and joined a statewide workgroup to promote policy level change. As the youth learned of the connection between education and juvenile justice issues, they challenged the initial focus of an adult-led organizing campaign aimed at countering the "No Child Left Behind…Bars" legislation. The youth reframed the issue to not only focus on the school-to-jail pipeline, but also to create a proactive school-to-college pipeline. The youth, supported by their adult partners, also investigated the impacts of the California high school exit exam, joined a statewide campaign for quality education, and testified on two bills in this area as well (Wright, 2007).

An excellent resource for helping youth develop the tools and ways of thinking necessary for effective participation in CBPR is the five-step **Community Action Model (CAM)** (www.sfdph.org/dph/comupg/oprograms/CHPP/CAM/default.asp) developed by Tobacco Free Program staff at the San Francisco Department of Public Health (SFDPH). The model has been used to teach dozens of youth critical thinking and research skills for understanding the root causes of problems, identifying contributing factors, gathering data, evaluating action-oriented change strategies, and proposing policy solutions.

In the previously mentioned LEJ partnership, youth used the CAM model in their efforts to study and address the problem of food insecurity in their San Francisco neighborhood, exploring such forces as "food deserts" which lack access to healthy foods, and then collecting their own data to help work for change. The youth's store-shelf diagramming enabled them to determine the amount of space devoted to different types of products in the 11 corner or "mom and pop" stores in this neighborhood which, until recently, had no full-service grocery store. Their findings—for example, that almost 40 percent of shelf space was devoted to packaged foods, 26 percent to alcohol and tobacco, and just 2 to 5 percent to fresh produce and other healthy foods—were critical to their subsequent use of the CAM model in pushing for relevant policy and practice changes (Hennessey Lavery, 2005; Breckwich Vásquez et al., 2007). More recently, in this same neighborhood, a group of older youth known as the **food guardians** have played a key role in working with the health department and other partners in CBPR and related projects to further increase healthy food access in the neighborhood (http://www.sfgov3.org/index.aspx?page=1183).

The Oakland-based community service center, **Youth UpRising** (www.youthuprising.org/), the Los Angeles-based **Community Coalition** (http://cocosouthla.org/), and the **Imoyase Group, Inc.** (www.imoyaseinc.com/), also in Los Angeles, frequently partner on youth-engaged CBPR and are excellent resources. Some organizations not specifically focused on youth, moreover, have become engaged in this work when the opportunity has arisen. The **United Coalition East Prevention Project (UCEPP)** in LA's Skid Row (http://www.socialmodelrecovery.org/united-coalition-east-prevention-project-ucepp) was predominantly serving the senior population in this rundown neighborhood when some local youth began hanging out. As described in Section IV, the staff at UCEPP saw an opportunity to engage the youth, and ultimately help connect them with an academic partner, laying the ground work for a powerful CBPR partnership. The youth's video and survey, and their powerful advocacy, helped bring about several policy changes (albeit without adequate enforcement) while building their own confidence and future orientation.

PolicyLink

7. Visual and Social Media:
Take Advantage of New Technologies to Document, Study, and Effect Change

With cell phones doubling as cameras and video recorders, and once expensive technologies now in the hands of countless Americans, even in low-income neighborhoods, the power of visual and other new media approaches for helping to build healthy communities through CBPR has never been greater. Many CBPR partnerships are relying on Internet-based technology to conduct sophisticated GIS (Geographic Information Systems) mapping and other ways of visually depicting the concerns and assets of their communities, as well as differences by race/ethnicity, income level, geography, disease prevalence, and other factors and indicators.

Resources and illustrations

An excellent overview of resources in this area may be found in ***Communicating for Change: Targeting Audiences with New Communication Tools***, and published by the HealthExChange Academy of the Center for Healthy Communities, part of The California Endowment (www.calendow.org/Article.aspx?id=3904). The guide includes sections on building user-friendly and easy-to-maintain advocacy websites, as well as podcasting, electronic letter writing and community building, and a host of websites with further information on these and other approaches.

Older visual methodologies also have gained popularity in CBPR, and may be particularly useful with youth, low literacy groups, and other marginalized populations. Among these is **photovoice** (http://www.photovoice.org), a collaborative approach to photography developed by Caroline Wang (Wang et al., 2000) that involves community members in taking and discussing photographs to promote change on the individual, community, and/or policy levels. The acronym SHOWeD frequently is used in this process, with participants collectively "digging deeper" while viewing their group's photographs to address the questions: What do we See in this picture? What's really Happening? How does this relate to Our lives, How can we become Empowered… and What can we Do to address the problem?

Photovoice projects have been used to address a broad range of health and community concerns, including asthma and diabetes, tobacco control, violence prevention, obesity and physical activity, and HIV/AIDS. The process provides training and capacity-building, opportunities for critical dialogue, and rich descriptive research. It further can enhance understanding of community assets and needs, and facilitate changes on the policy level that can help build healthy communities.

The **Youth Empowerment Strategies (YES!) Project** in West Contra Costa County, California, made photovoice a central part of its after-school program in six local schools which trained and engaged over 120 ten- to twelve-year-olds in critical thinking, participatory research, and social action organizing. As part of the YES! Curriculum, and under the guidance of college student facilitator pairs, groups of five to six youth were given inexpensive cameras and taught the basics of photography, along with **asset and risk mapping** and other methods for assessing both the strengths and the problems in their school settings. Using the SHOWeD technique, they then discussed their pictures, and collectively devised social action plans. Of the 28 YES! groups that took place over three years, all but two developed and completed social action projects, among them a public awareness campaign about the dangers of dumping in a creek behind the school; conducting a survey of students about their concerns and devising methods to address them; and writing to a building engineer to successfully remove a shack on campus that attracted drug users. Preliminary findings comparing program participants and controls at non-YES! schools showed substantial improvements in such outcomes as sense of control, future orientation, and pro-social behavior.

During exit interviews, a number of the youth also expressed their interest in continuing to engage in participatory action research and organizing (Wilson et al., 2006 and 2007).

Building on the philosophy and methodology of photovoice, a newer approach, **videovoice** (http://video-voice.org), puts videocameras in the hands of community members who similarly use this technology, together with critical analysis of community assets and problems, to collect visual data and employ it in working for changes in programs, policies, and practices. **In Harmony**, a videovoice project in post-Katrina New Orleans' 9th ward, resulted in a powerful video shown at two large community screenings. The screenings, which attracted 200 people, included lively dialogue about race, education, and other issues, and a renewed community commitment to working for change. Other outcomes included creation of a new local nonprofit organization that has since made several other videos; paid employment for several of the original team members in the city's burgeoning movie industry; thousands of hits to YouTube showings of In Harmony video segments; and use of the information gathered, and the videos themselves, to press for policy change (Catalani et al., 2012).

GIS mapping increasingly is being used by community groups to illustrate and provide powerful, visual data to help address a wide range of health disparities. For example, as described in the book ***Street Science***, by Jason Corburn (2005), a community in Brooklyn, New York, generated maps and successfully challenged the city's approval of a waste transfer station. The maps served as evidence in the argument against the anticipated cumulative environmental impacts to neighborhood residents.

The **Toxic Free Neighborhoods Campaign** in Old Town National City, San Diego County, discussed in more detail in Section IV, conducted GIS mapping to quantify and compare the toxic emissions exposures of four neighborhoods on a large scale. Using the **ESRI mapping program, ArcView™,**

New Orleans videovoice project, New Orleans, Louisiana.

the partnership was successful in creating a "footprint" of the neighborhood, comparing it to three adjacent neighborhoods, which revealed a staggeringly disproportionate number of pounds of toxic emissions to which residents were exposed. The information gathered through the mapping contributed to the partnership's ability to successfully advocate for policy change, including a Specific Plan to relocate polluting industries out of the community (EHC, 2005; Minkler et al., 2010).

The advent of a number of free or low-cost applications has made GIS mapping a powerful and accessible instrument for communities interested in finding scientific evidence to back up their concerns, and is ideally suited to many policy-focused CBPR efforts. **Google maps** is a potent and accessible online tool that CBPR partnerships can access to design and customize interactive maps of their local community (http://maps.google.com). Google maps has unique features that can assist groups in identifying place markers, such as grocery outlets, parks, and schools, which can be layered to compare, for example, the number of grocery stores against the number of liquor outlets. Free online resources like Google maps lend themselves to be shared among members of your partnership and can provide valuable information in mapping community assets and risks, while helping build a case to present to local officials.

PolicyLink

8. Regional Scale:
Communities Can Work Together on a Regional Level on Efforts to Improve Health and the Environment

Although most policy-focused CBPR has thus far occurred at the local level, there are situations where potential partners should also think regionally and beyond, as they consider where they can have the greatest impact, and whether their local efforts and findings might help further broader-level change efforts. Widespread recognition of the regional scale on which problems like air pollution and children's asthma are experienced, and of the power of broad-based coalitions for helping study and address such problems, have led to growing social movements stressing "regional equity." Although the fight for regional equity takes many forms and involves a wealth of diverse strategies, CBPR increasingly is being leveraged and used as a promising approach in efforts to build on local and regional assets and engage community, academic, and other partners in addressing problems that do not respect local boundaries. The new regionalism is not a substitute for action at the neighborhood or city level, but a necessary complement to it.

Resources and illustrations

In Long Beach, Los Angeles, and the Inland Empire, **THE (Trade Health and Environment) Impact Project** (http://hydra.usc.edu/scehsc/web/Index.html) described in Section IV has been effective in part *because* it is a regional coalition composed of community-based organizations and academic partners across multiple counties. While trained community members collected much useful local data (e.g., through traffic counts and air sampling), that work was complemented by the University of Southern California academic partners' analysis of potential emissions and health impacts emphasizing the regional nature of the problem of air pollution in southern California. This combined local and regional data, and effective advocacy work by the partnership and its allies, was credited with helping to delay a major freeway expansion, as well as helping secure the adoption of a "Clean Air Action Plan" in Los Angeles and other positive legislation.

In California's San Joaquin Valley, the **Community Equity Initiative**, a partnership coordinated by PolicyLink, California Rural Legal Assistance, Inc., and the CRLA Foundation, has been working with residents of disadvantaged unincorporated communities to map and survey conditions as a starting point for efforts to improve water systems, sewers, streets, parks, and other infrastructure, and to bring greater democratic participation to the governance of local service districts. Residents of three unincorporated communities have conducted door-to-door interviews, in English and Spanish, as well as windshield surveys of environmental conditions, using survey instruments and procedures developed jointly by the residents and their research partners. In one of these communities, students and faculty from UC Merced were key contributors to the data collection, as part of that new university's commitment to civic engagement in the San Joaquin Valley. For a description of the initiative, see http://www.policylink.org/site/c.lkIXLbMNJrE/b.5160111/k.8DA6/Unincorporated_Communities.htm.

Communities for a Better Environment (CBE) (www.cbecal.org/), based in Los Angeles and Richmond, has frequently engaged with academic and other partners to undertake powerful CBPR on a regional level. The **Southern California Environmental Justice Collaborative,** of which CBE is a partner, is exemplary of such regionally focused partnerships that have conducted effective CBPR and helped move regional policy (e.g., regarding exposure to toxic emissions from both stationary and mobile sources). This collaborative also has been credited for some state level policy change, including making the case to California's

Trade, Health and Environment project, Southern California.

EPA to consider cumulative and not merely individual risk exposure in its deliberations over population health and safety from environmental exposures.

The Community Action to Fight Asthma Initiative (CAFA), (www.calendow.org/Collection_Publications.aspx?coll_id=18&ItemID=306#), **Ditching Dirty Diesel** (www.pacinst.org/topics/community_strategies/ditching_dirty_diesel/index.html), and the previously mentioned **CCROPP** are examples of collaboratives that welcome new members and willingly share their expertise in using CBPR and related community-engaged strategies with a regional focus.

IV. Using CBPR to Help Effect Policy Change: Six California-Based Case Studies

A major challenge in CBPR involves being able to document the processes and pathways through which a community partnership's research and advocacy efforts "on the ground" may have contributed to changes in policy or the policy environment. In this section, we describe six cases in which an in-depth, multimethod analysis was undertaken to do just that. With an advisory group, six diverse partnerships were selected, from West Oakland through the Central Valley to Los Angeles and San Diego, to learn more about their evolution, the place-based research they conducted, and how they used their findings to help work for change on the policy level. Information was collected using methods such as in-person, "key source" interviews, focus groups, observations, and review of mass media accounts and other documents. Phone interviews were also conducted with relevant policymakers in each community to gain their perspectives on whether and to what extent these CBPR partnerships had helped bring about particular policy changes.

Drawing on these many findings, we now present the six case studies which, we believe, well illustrate the many diverse ways in which communities, working collaboratively with academics, health departments, and other partners, may indeed collect and use the "stories and statistics" that can help move policy.

Reclaiming a Latino Neighborhood in San Diego County:
The Environmental Health Coalition Partnership

Environmental Health Coalition health promotoras.

Once a vibrant Latino residential community, Old Town National City (OTNC) in San Diego County, California, has, in recent decades, "become a dumping ground for polluting industry and warehouses" (EHC, 2005). The disproportionate burden of toxic air contaminants, over two-thirds of which come from the community's many noncompliant auto body and paint shops, also contribute to a childhood asthma rate of 14 percent—almost twice the state average.

To help address these concerns, the Environmental Health Coalition (EHC) partnered with the Southern California Environmental Health Sciences Center at the University of Southern California and other key stakeholders in 2000 and engaged in a multi-pronged CBPR and policy advocacy effort. The Toxic Free Neighborhoods Campaign involved a range of research approaches from secondary data analysis and Geographic Information Systems (GIS) mapping to air sampling and survey research.

Following a six-session training on topics including land use and environmental health, and how to design and conduct surveys and minimize bias, six *promotoras* (community health workers), under the guidance of EHC researchers, conducted a 56-item survey of 119 community members and worked with staff on data interpretation and dissemination. Survey results indicated that almost a third of children lacked health insurance, making the likely proportion with undiagnosed asthma considerably higher than the 14 percent reported. Respondents also showed a high level of support for ending the neighborhood's designation as a Light Manufacturing and Residential Area, and for relocating auto body shops and other polluting industries outside the community.

The *promotoras'* findings, using ultrafine particulate counters (P-trak) to measure the smallest and most dangerous particles, also were revealing, and demonstrated a dramatic difference in air quality from 25,000 particles per cubic centimeter at a control site (City Hall) to 150,000 near a truck from the truck-driving school located opposite the community's primary school.

The academically trained research partners' broader base of information helped contextualize these local findings and concerns. "Visual footprints" produced with GIS mapping compared toxic releases for OTNC with those of three adjacent areas: 23,000 pounds of toxic air contaminants were released in National City in 2005, while the nearby footprints contain 6,000, 3,500, and 0 pounds respectively (EHC, 2005).

Based on these findings, and burden of disease data from academics at the University of Southern California, EHC staff and *promotoras* developed principles and recommendations for action, which

> *"Numbers and statistics make or break an argument…[and the] role of community members in the decision-making process is critical because of the experiences they have…They see the impacts on their neighborhood, the priorities at that point in time, they get organized, and get all of the information by going door-to-door, and provide us with their testimonial."*
> **—Vice Mayor**

were published in 2005, along with the survey and GIS findings, in a widely cited report. The partners then undertook a number of policy-related steps and activities, including a broad-based public and policymaker awareness campaign that included media advocacy, door-knocking, briefing public officials, and testifying at hearings. Although EHC's researcher and other top leadership participated in providing such testimony, a special effort was made to enable the "front and center" participation of *promotoras*. These and other community members also took part in visioning processes and strategic planning to help identify the policy strategies most likely to be effective in helping achieve their goals. After reviewing a variety of policy alternatives, the partners decided on the short-term goal of an "amortization ordinance" to phase out polluting businesses. But the partners also selected a larger policy goal: securing passage of a Specific Plan for OTNC, which would address the toxic emissions issue, but also other urgent concerns of residents. Among these were limiting gentrification pressures and increasing access to housing which would be affordable to the mostly low-income residents of OTNC.

Through a power mapping process, the partners identified the city council and several organizations and individuals as key policy targets with the power to make desired changes. EHC then worked with San Diego State University's Environmental Law Clinic to develop the legal grounds for the amortization ordinance and help advocate for its adoption. Presentations at city council meetings, including the sharing of "statistics and stories" from the partnership's research and from the lived experience of the *promotoras*; a strong relationship with the local media; and strong alliances with diverse advocates, all contributed to the successful passage of an amortization ordinance in August 2006. Maintenance of strong lines of communication with key policymakers also proved critical, as did mobilizing the community to be present at hearings and other events and show their support on this and related issues.

Although implementation of the ordinance proved less successful, the partners and their allies were effective in helping win support for their larger goal. In October 2009, the city council voted to become the first municipality in California to include environmental justice as a full element of its General Plan, and six months later, the Specific Plan was adopted. As a policymaker noted, "numbers and statistics make or break an argument," and the EHC partnership's compelling data, together with its effective organizing and policy advocacy, was widely credited as having been a major contributor to this substantial policy victory (Minkler et al., 2010).

CBPR with Youth in Los Angeles's Skid Row

UCEPP staff member reviews *Los Angeles Times* coverage; Cover image from Coalition booklet, Children Left Behind.

Typically bringing to mind images of homeless single men, often with substance abuse issues, the 55-block square block "Skid Row" area in Central City East, Los Angeles, also includes a less visible population of families with children. From 1990-2000, the number of children under the age of 18 living in Skid Row grew from 1 percent to 15 percent of the area's population, while the number of women grew from 168 to 1,251. Although the number of youth declined substantially over the last decade, families and children remain an important, if less visible, part of the face of Skid Row.

Despite a dense network of social services, the neighborhood is not designed or equipped to meet the needs of families and youth. Much of the housing stock consists of single room occupancy (SRO) residential hotels which typically are overcrowded and in poor condition, posing threats to the health and well-being of children and adults alike. In the words of staff at the Social Model Recovery Systems, Inc.'s United Coalition East Prevention Project (UCEPP), however, in addition to adverse living conditions, the children of Skid Row have "no place to play, no sports, no chance for a good education" (UCEPP, 2005). The UCEPP report further noted that "the children living in Skid Row are not protected by law enforcement or school officials" but instead are further stigmatized or discriminated against, placing them in vulnerable or compromising positions becoming targets for "drug dealers or sex predators." In the words of UCEPP leader Zelenne Cardenas, living in these conditions has taken these youth from being "at risk" to being "in risk."

In 2003, UCEPP, located in the heart of Skid Row, began informally connecting with local youth, who had begun dropping by on a regular basis. Seeing the need for a more strategic engagement, UCEPP began working with the youth on their concerns, including "lack of recreational activities," and unsupportive school and community environments.

With the assistance of UCEPP staff and a professor at Loyola Marymount University, several of the youth—who called themselves "Coalition X" in reference to all the unknowns in their lives and futures—then helped design a survey, which they administered to 96 Skid Row youth. After conducting a preliminary analysis of the findings, the academic partner met with the youth and UCEPP staff to engage the youth in discussing and interpreting what they had learned. Among the

> *"If you put forth the effort people will listen…you have to be willing to do it and to know that change doesn't happen overnight."*
> **—Youth Partner, CBPR Partnership**

study results were that 53 percent of the youth had been suspended, 50 percent of them reported being "in trouble at school" for not having proper uniforms, and 43 percent had been ticketed for minor offenses, most often jaywalking (66 percent). Finally, and far from the image of skid row youth as homeless transients, the great majority lived with a parent or family member, over 70 percent lived in the neighborhood for at least a year, and 30 percent for four or more years (UCEPP, 2005).

Based on their findings, the youth helped their adult mentors craft recommendations directed at the Los Angeles School District, the Los Angeles Police Department, and Los Angeles Parks and Recreation. They held policy breakfasts for the media, and brought substantial attention to a little known provision in the No Child Left Behind Act which requires that homeless children not be discriminated against in terms of access to free and appropriate public education.

Findings of the partnership's research, along with their recommendations for action, were published by UCEPP in a much-publicized report, *Toxic Playground: Growing Up in Skid Row,* in 2005. Youth also shared their perspectives through media advocacy, with one of the youth authoring a first-person account in the *LA Times*.

The UCEPP partnership's research, and its strong and effective advocacy, have been credited with helping secure, albeit without needed enforcement, several policy victories. Among these was working for enforcement of the McKinney Vento Homeless Assistance Act, reauthorized in No Child Left Behind, regarding equal education access for homeless youth. The partnership's work in this regard resulted in a substantial increase in the number of case managers assigned to work with homeless youth in the Los Angeles Unified School District. The partnership also was credited with helping get the Department of Parks and Recreation to clean up and open a neighborhood park—although even today, the park typically remains locked for all but a few hours a week. Indeed, so many of these "victories" were severely curtailed by lack of enforcement and adequate resources, that the slowness of change has been a major source of frustration.

Yet the very fact that politicians took notice, and felt compelled to act, even given a dismal subsequent implementation record, made UCEPP and its youth-involved CBPR partnership a potent example of the power of youth in standing up for their right to be respected and have a safe place in which to learn, live, and play. The resilience of young people even under the most difficult circumstances also was well demonstrated in this case. In the words of one youth, "If you put forth the effort people will listen…you have to be willing to do it and to know that change doesn't happen overnight."

The Trade, Health and Environment (THE) Impact Project:
Addressing the Ports and Goods Movement through a Collaborative Partnership

One of the key entry portals to the global trade and goods movement can be found in the southern California region, at the ports of Los Angeles and Long Beach. With the rapid increase in global trade in the 1990s, the twin ports became even more dominant, receiving over 40 percent of all imports into the United States, and accounting for 20 percent of diesel particulate pollutants in southern California—more than from any other source. The movement of goods through this area has had detrimental effects and consequences for neighborhood residents living close to the shipyards, railroad yards, and along the connecting highways (Hricko, 2006). For decades, they have been disproportionally exposed to diesel exhaust, other vehicle pollutants, and noise from congested roadways. Ironically, while goods are being transported through the southern California region to communities across the United States, the neighboring residents are left to bear the burden of the enormous negative impact of goods movement on their communities, their families' lives, and their health. Regionally, this goods movement has been estimated to account for 2,400 premature heart-related deaths, 62,000 cases of asthma symptoms, and among a million more cases of respiratory distress (CARB, 2006).

In 2006, with funding from The California Endowment, the Trade, Health and Environment (THE) Impact Project established a regional CBPR partnership between the University of Southern California, Occidental College, and four advocacy groups in a coalition to address air pollution and other community health impacts associated with the movement of goods through the Los Angeles and Long Beach ports.

THE Impact Project grew organically from residents concerned about asthma in communities close to the docks, and from advocacy groups from several spread out localities with separate concerns. The East Yard Communities for Environmental Justice (EYCEJ) in East Lost Angeles, for example, grew out of concerns about rail yard issues; the Center for Community Action and Environmental Justice (CCAEJ) in Riverside from concerns about movement near big warehouses; and the Coalition for a Safe Environment (CSE) in Wilmington from the desire to stop the expansion of a local port terminal and the effects of numerous air pollution sources. Finally, the Long Beach Alliance for Children with Asthma (LBACA) started as a clinic serving families with asthma and became another leading partnership member.

In 2001, two critical events occurred in the southern California policy environment, creating a window of opportunity for the academic-community coalition to come together over the next decade. First, the National Resources Defense Council, along with two other advocacy groups and two homeowner associations, sued the Port of Los Angeles for insufficient emission mitigation strategies for a planned large shipping terminal, winning a $50 million settlement two years later. Second, USC hosted its first town hall meeting in 2001, with 300 people attending, allowing a first -ever exchange between USC scientists showcasing their work on air pollution, and community residents sharing their concerns in the open microphone sessions. Building from CCAEJ and USC's long-term personal relationships, the town hall also offered a chance for two new advocacy partners to be introduced and to coalesce around the ports. In the words of one participant, "We realized that we'd been working on all these air pollution issues [i.e., from the railroad yards, warehouses, highways, etc.], and the ports were such a significant part of this, and they had completely escaped our attention."

In 2003, USC received a prestigious NIEHS/EPA Children's Center grant, which formalized work between USC, LBACA, and CCAEJ. As part of the grant's outreach, USC formed neighborhood assessment teams, or "A teams," which taught *promotoras* and other community members to count traffic and measure ultrafine particles. This "street science" (Corburn, 2005), coupled with new USC epidemiologic studies linking traffic exposures to higher levels of premature births and low birth rates (Wilhelm and Ritz, 2003;2005), helped build the science base for this work. As LBACA became more sophisticated in the issues, it also began to shift its focus towards policy. A major catalyst for this shift was a proposed highway bypass that would increase diesel emissions within 100 feet of homes and 700 feet of a neighborhood

THE Impact Project community partners and community forum.

school. At the same time, EYCEJ and its new partners expanded their work on railroad yard emissions.

Policy around the ports' emissions has been a consistent challenge, both because of their role as major economic engines, and because of the multiple policy jurisdictions, including city and port authorities; regional air quality districts; and state of California oversight of highways, railroads, and specific legislative initiatives, on the state and federal levels. Despite these challenges, progress has been made. Through the partners' consistent public advocacy and community organizing, in addition to another major town hall hosted by USC in 2005 with 500 people in attendance, receptive public figures, and the project's enhanced scientific research, the successful passage of the Clean Air Action Plan (CAAP) was achieved in 2006. This act created a five-year plan to reduce pollution from the ports by 45 percent. In addition, the CAAP gave a major boost to five out of the six Impact Project partners which were invited to serve on the governor's ports advisory board, as well as a similar mayor's advisory board in Los Angeles. In addition, they serve on the CAAP implementation task force.

The community-driven movement built by THE Impact project has dramatically influenced and changed how policy decisions about goods movement are made. It has shifted from one with no participation to a deeply rooted community participation approach that brings to the forefront community voices on important health issues that will ultimately impact residents' daily lives. The community organizing strategies employed by the partners engage community members who were most affected by the issue at hand. They do this through training, such as in the neighborhood assessment teams, and through skills-building. Neighborhood residents learn to collect, translate, and disseminate findings to their local neighbors at schools, churches, or other community venues, while working collectively to identify solutions to the problem.

From the inception of THE Impact Project's collaborative efforts, the goal has remained the same: to shift the policy debate and make the goods movement industry accountable for its decision making by taking into account the health and environmental impacts from the multiple sources of air pollution. This has shifted the debate among policymakers from being only about an "economic engine" and business model to encompassing a comprehensive community model. The latter takes into account the needs of the neighbors most affected by the goods movement and transportation system.

The successes of THE Impact Project at shifting the debate is grounded in the often challenging, but critical and sensitive balance between research and community organizing. THE Impact Project partners continue to have a mutually respectful and beneficial relationship with all partners involved, which, in the eyes of policymakers, has resulted in the successful marriage of strong, rigorous science to support the claims made by neighborhood residents, with community organizing strategies.

The Central California Regional Obesity Prevention Project:
A CBPR Effort in Kern County

Greenfield Walking Group (CCROPP); children walking to school.

Despite providing much of the fresh fruits and vegetables for California, the many low-income, often immigrant residents of the San Joaquin Valley frequently have trouble affording or accessing healthy food for their own families. They also often lack access to safe streets and parks that help promote physical activity. In Kern County, as in other parts of this rural region of sprawling cities and small towns, obesity rates are above the state average.

The Central California Regional Obesity Prevention Project (CCROPP) is an initiative supported by The California Endowment and devoted to addressing these disparities through community action. In Kern County's CCROPP alliance, the lead partner—Get Moving Kern—began by seeking to learn who was *already* taking action, and identified a group of approximately 40 Latino mothers who had met in a nutrition class and subsequently formed themselves into the Greenfield Walking Group (GWG). This group planned to meet daily at the local neighborhood park to exercise, but they were confronted with barriers such as lack of access to a safe and open space. Greenfield Group members began working with other partners to study and address their number one concern: barriers to physical activity at Stiern Park.

The Greenfield residents partnered with California WALKS and received technical assistance and training on neighborhood walk audits, and invited city officials to join them. (For a description of these methods, see https://californiawalks.org.) They also used GIS mapping and small video recorders called flip cameras to further document their observations. After completing their assessments, they worked in small groups to identify, on a master map, additional information and barriers that they and their families had encountered in trying to walk or play in the park. Safety concerns included broken street and park lights, drug use and hypodermic needles, aggressive stray dogs, gang recruitment, and even a kidnapping. They also pointed out that the park's location—across from a four-lane highway without a crosswalk or pedestrian signal—posed a serious barrier for families wishing to get there safely. In the words of former Project Director Jennifer Lopez: "Everybody has a horror story about the park. The walkability assessment gave them an opportunity to share their stories with people who could help develop solutions."

Conducting walkability assessments with city officials was critical—the walking group members learned who to contact about animal control, law enforcement, and public works. Another important strategy was inviting City officials to partake in the lives of families. It is a challenge when a parent has trouble pushing a baby stroller over a cracked, narrow sidewalk or park path, but when City officials try and have difficulty, it gives them a heightened sense of reality

concerning the obstacles that families face. GWG members also worked with the local school district to study and address the need for new school policies promoting healthy eating and physical activity at school. Using flip cameras and GIS mapping, they were able to highlight areas that posed particular risks.

Eight middle-school youth from the César Chavez Leadership Program also took part in a photovoice project (http://www.photovoice.org) by taking pictures documenting health and safety risks, discussing their findings as a group, and then using selected pictures at city council meetings and other venues to press for change. Powerful pictures of an unsafe play structure and a broken and gang-tagged water fountain were among many that, together with their other data, helped catalyze action to renovate the park.

Infrastructure changes for which CCROPP and the Greenfield Walking Group have received much of the credit include new lighting and safer walking paths, the impounding of aggressive stray dogs, a new playground funded by the Kaiser Family Foundation, and a new fence—something particularly important since the neighborhood had tragically lost a small child who got through the broken fence and drowned in a sump ditch on the other side. A new phone system also is in place for reporting hazards, with directions in both Spanish and English.

Finally, and in a testament to the visibility and respect the Greenfield Walking Group has attained, many local and statewide organizations now call on the group for advice. These include the Kern Council of Governments, which has held special meetings with the group to include community health concerns as they develop both the Master Plan for the Valley, and their County General Plan for Transportation and Transit.

Addressing Diesel Bus Traffic and Asthma in West Oakland

Child using inhaler at park; diesel truck moving goods; WO EIP Community Leader and now Port Commissioner Margaret Gordon; air sampling device.

Located on the shores of the San Francisco Bay, and bounded on all sides by freeways, West Oakland is a small but vibrant community of 25,000 mostly low-income African American and Latino residents. A popular destination for diesel trucks taking goods to and from the Port of Oakland, the community has long borne the brunt of disproportionate exposure to diesel exhaust and traffic-related pollutants that can cause or exacerbate asthma and adversely affect the growth of lung functioning in children (Gauderman et al., 2007).

To help address these and other community concerns, the West Oakland Environmental Indicators Project (WO EIP) began in 2000 as a partnership between a nonprofit research organization, the Pacific Institute, and the 7th Street-McClymonds Neighborhood Initiative. Through this project, the residents themselves determined the indicators to be studied, and helped collect, analyze, and use the data to effect change. The resulting 2002 report, *Neighborhood Knowledge for Change,* was cited in the local media, with one of its findings in particular—that children under age 15 in West Oakland had asthma rates seven times the state's average—drawing widespread attention. This visibility, together with the high quality of the research produced, contributed to WO EIP's becoming a community-based organization in its own right and incorporating as a nonprofit in 2004.

Together with its partners at the Pacific Institute, WO EIP then used CBPR to study and address the high volume of diesel truck traffic in West Oakland, and its potential links to high asthma rates. As part of this research, and with training from a technologies consulting firm, 10 residents gathered data on the number and type of trucks on selected neighborhood streets, as well as on truck idling at the port. Their studies revealed that 6,300 truck trips through West Oakland occurred *every day,* some in areas where trucks were prohibited. They further demonstrated that idling outside the port amounted to an estimated 280 truck-hours per day. In all, they found some 64 pounds of diesel particulate matter emissions were being generated from truck traffic and truck idling in this neighborhood daily—or about 90 times more exposure per square mile annually than in California as a whole (Buchan, Jackson and Chan, 2003).

Study findings were released in November 2003 in a widely cited report, *Clearing the Air,* and WO EIP partners and their allies then went to work on their number one priority: creating, with high-level community involvement, a designated truck route that would prevent trucks from traveling through West Oakland neighborhoods. The WO EIP partnership began by building alliances with other concerned local organizations and a city councilwoman with deep roots in West Oakland. But the partnership also reached out to less likely allies, including an independent trucking company and the Port of Oakland, which was a major change target, to collectively create a truck route committee. This group of sometimes unlikely bedfellows met monthly in the councilwoman's office to hammer out a truck route all could agree to, and strategically plan for its adoption. The partnership also leveraged its alliances with

> *"We were not doing the research 'on them' but they were leading the research effort. They were asking the questions, choosing the contractor, deciding the policy solutions, and we were supporting them with technical assistance and facilitation…This is completely the opposite of the typical academic-community partnership. What if a high-powered research institution could be put at the service of communities…what dramatic changes could result?"*
> **—Academically Trained Research Partner**

statewide groups, such as the Ditching Dirty Diesel Collaborative. Through a multipronged advocacy process, residents testified about the impact of diesel exposure on their health and quality of life, and WO EIP partners used their study findings in briefing officials and presenting at hearings.

In September 2005, WO EIP and Pacific Institute achieved a key victory when the city council unanimously passed a truck route ordinance that adhered closely to the specific truck route the partners had recommended. Although enforcement of the ordinance proved difficult, WO EIP's work helped spur other changes that have helped create a policy environment more favorable for environmental justice. The partnership's work also prompted other groups to conduct their own studies, with the California Air Resources Board beginning in 2006 a comprehensive and multiyear Health Risk Assessment for diesel exhaust in West Oakland. Policymakers and stakeholders have cited the *Clearing the Air* study as "instrumental" in catalyzing regional and statewide attention and action regarding the crisis of diesel pollution in West Oakland. The WO EIP partnership's truck count and related studies and policy level work also serve as a model for others of how CBPR can help produce solid data and use it to move forward environmental policy efforts in a way that empowers and respects the community (Gonzalez et al., 2011).

Engaging Youth and *Promotoras* in CBPR to Improve the Built Environment: A Case Study from Chula Vista

Chula Vista community survey; Network for a Healthy California "Champion Mom".

Nestled between the U.S.-Mexico border and downtown San Diego, Chula Vista, once the "Lemon Capital of the World," has a rich culture of diversity and a name that in Spanish means "a beautiful view." However, the "view," for many low-income families, was, until recently, less than beautiful, especially when they were seeking a safe space in which to live, work, and play.

Lauderbach Park, a local community park in southwest Chula Vista, had long suffered from vandalism, including graffiti, broken playground equipment and light fixtures, dilapidated fences, delinquency, and problematic homeless and drug activity. The forgotten park, although surrounded by family homes and adjacent to a church, had a history of ineffective patrolling by police, leaving families feeling insecure and discouraged from visiting the park for physical activity or social interaction. This decades-long situation changed, however, as a result of two independent projects, a youth leadership development project, and a faith-based *promotoras* project, which, unbeknownst to their leaders, were independently working towards a similar goal: promoting physical activity by improving the built environment.

The faith-based project was initiated by San Diego State University (SDSU) Research Foundation and named the 'Caminando con Fe' or the Walking with Faith *Promotora* Program. This program was part of the foundation's study examining the feasibility of using *promotoras* to encourage fellow Latina church members to be more physically active by catalyzing changes in the built environment. The youth leadership development project was initiated by the Healthy Eating, Active Communities (HEAC) Initiative and named CX3, or Communities of Excellence in Nutrition, Physical Activity and Obesity Prevention. CX3 youth received in-depth training in nutrition, physical activity, walkability assessment, leadership, and advocacy from community partners including CANFIT (Communities, Adolescents, Nutrition, Fitness), California Project LEAN (Leaders Encouraging Activity and Nutrition), the San Diego County Health & Human Services Agency, and WalkSanDiego.

After completing the training, CX3 youth and their adult mentors conducted walkability audits to assess obstacles to engaging in physical activity in their community and recorded the availability of fresh fruits and vegetables at neighborhood markets. The youth also took pictures to document the health and safety risks in their community.

SDSU *promotoras*, who had also received training on walkability audits from WalkSanDiego, were connected by that organization with the CX3 youth, for whom they provided mentorship and with whom they collaborated on data collection and action. Together, the *promotoras* and CX3 youth, with

guidance from staff at HEAC, SDSU, and the San Diego County Childhood Obesity Initiative, provided input on the design and wording of questionnaires, and then administered and helped analyze over 120 community surveys. The analysis corroborated existing community wisdom about the long history of the park's lack of security and the ways in which this discouraged access and physical activity.

With technical support from WalkSanDiego, in January 2008, the youth and *promotoras* prepared a report of the identified built environment barriers and provided recommended solutions. The youth wrote a letter to the city council advocating for improvements and the *promotoras*, HEAC, and WalkSanDiego all provided testimony. The City of Chula Vista, under pressure from the community, had planned to make a few changes to the park—but not nearly to the extent to which the youth and *promotoras* were advocating.

Media advocacy played an important role at this stage, with the Network for a Healthy California bringing citywide English- and Spanish-language media attention to bear to highlight the unique collaboration among youth, *promotoras*, community organizations, and city officials. Powerful testimony before the city council by the CX3youth, the *promotoras*, and other community partners also had an important impact. A councilmember and City staff in engineering, general services, and landscape architecture subsequently met with the partners, as well as with local church representatives, to discuss areas for park improvement.

As a result of these varied advocacy efforts, over $500,000 was secured to restore Lauderbach Park. Completed in September 2008, the park's revitalization included many of the recommendations that the youth, *promotoras*, and the community had identified through their surveys and walkability assessments. These included removal of the dilapidated fence dividing the park from the adjacent church; the building of restroom facilities and water fountains; improved and more energy-efficient lighting for both the park and the church exterior; a new children's playground area; a new and more level walking path; repainted benches and tables; and an enlarged soccer field. Long ignored alcohol and tobacco use bans also were enforced.

Deterring homeless people from living at Lauderbach Park was a challenge: According to the police department, the weekly free meals provided by the adjacent church and the numerous liquor stores within walking distance of the park contributed to this problem. But there were other obstacles to change: Many parents surveyed, for example, had expressed concern for their children's safety because of the homeless activity at the park, but also stated that they did not report illicit or disruptive behaviors to the police. This lack of reporting had made it difficult for the police to address the issue. Similarly, and while the dilapidated fence raised safety issues, church authorities were concerned about the removal of the fence out of fear that this would put the safety of church members at risk. Collaborating with the police department was key in this effort, as the chief of police assured church authorities that removing the fence was in alignment with the Crime Prevention through Environmental Design (CPTED) model, a multidisciplinary approach that had proven effective elsewhere in deterring criminal behavior.

An additional key outcome of the project was policy-related. Residents wanted to bring a community garden to the park to both help address food insecurity and increase a sense of community ownership. Following the park's renovation, HEAC, WalkSanDiego, and the Network for a Healthy California therefore educated policymakers about the community garden. Partners then participated in meetings with city representatives and community members, and in July 2009 the City of Chula Vista approved not only a community garden at Lauderbach Park, but a citywide community garden ordinance as well. Further, and in a noteworthy example of government-community collaboration, the City of Chula Vista developed a draft ordinance, and the Network

for a Healthy California provided feedback to help ensure that health was placed front and center in the proposed policy. Its recommendations were included in the ordinance that was then adopted.

Much of the success of this project has been attributed to the fact that youth were given the opportunity to choose the issue of most importance to them and were then helped to study and address that issue. Empowering and elevating youth voices helped lead to sustainable changes in their community: Not only was the park restored, but the youth had a place at the table, influencing the political process. Celebrating the youth's successes was also an important component of the project. A City representative expressed to the group how much City decision makers needed and valued their documentation and advocacy efforts. The youth also received, in 2009, both the WalkSanDiego's Golden Footprint Award for their leadership and commitment to the project, and the County of San Diego's Public Health Champion Award. Additionally, one of the youth was invited to present at the 2009 Active Living Research Conference, where he described the project and the impact participation had had on him. Finally, all partners involved in the project learned from one another and contributed unique resources, contacts, and expertise critical for restoring the park and securing the community garden policy. This partnership now is being used as a model of how youth-engaged research and community collaboration, including the work of *promotoras*, can maximize efforts, bring political support, and leverage resources to make a sustainable impact on community health.

V. Evaluating CBPR Processes and Outcomes

An important component of CBPR is finding ways to measure progress without violating the very tenets of empowerment and high-level community engagement that lie at the core of the work. Although traditional evaluation approaches are necessary to assess progress, newer methods, variously termed **participatory evaluation** and **empowerment evaluation** and well described at **The Community Tool Box** website (http://ctb.ku.edu), also are helpful in enabling partnerships themselves to measure their progress both in growth and functioning, and in achieving the outcomes and objectives of their CBPR projects. The website of **Community-Campus Partnerships for Health** (www.ccph.info/), described earlier, also is an excellent source of resources and ideas on participatory and other means of CBPR partnership and project evaluation.

Several useful assessment tools and guidelines further have been developed to help partnerships appraise their areas of strength and room for improvement, and their progress toward shared goals. Israel et al.'s **guidelines for CBPR partnerships** (2005) as well as those developed by Mercer and Green, et al. (2008) may be particularly helpful (see references).

Evaluating Contributions to Policy Change

Particularly for policy-focused CBPR projects, where numerous players and contextual factors beyond the partnership are involved, teasing apart the partnership's contributions to helping move policy is fraught with difficulty. The California Endowment's two-volume booklet, entitled ***The Challenge of Assessing Policy and Advocacy Activities*** (www.calendow.org/uploadedFiles/challenge_assessing_policy_advocacy2.pdf), is an excellent resource for understanding how "most policy work involves multiple players 'hitting' numerous leverage points" magnifying the difficulty of assessing "the distinct effect of any individual player or any single activity." (p. 9)

In attempting to assess their role in helping achieve a policy change—or their inability to do so—CBPR partnerships must carefully consider such factors as the role of an economic downturn, the opening of a window of opportunity following a media exposé, or the appointment or election of a new policymaker who shares or opposes the partnership's goals. The role of such external forces, and the complex nature of the policymaking process, remind us not to engage in simplistically attributing causation where policy change is concerned.

Finally, the fact that policy change tends to take place over a long period of time makes evaluation of a partnership's work in this regard challenging. Paraphrasing Guthrie et al. (2006), rather than asking whether *policy* has changed, more fruitful questions might be:

How did the [partnership's] work *improve the policy environment* for this issue?

How successful was the [partnership] *in taking the necessary steps toward the policy change?*

To help address such questions, **triangulation**, or the use of multiple methods of data collection, is helpful. Interviews with policymakers and other key stakeholders, focus groups with community members, participant observation at public hearings and other venues, and documents review, including coverage by local and regional media, all are helpful sources of information and together can help improve a partnership's assessment of its contribution to changing a

PolicyLink

> *We have had successes because at city council meetings they see that a lot of us from the community get together…we put our t-shirt on, there is certain pressure from the community on the city council members—they have never seen this level of participation…It is important for them to know that people are present and listening to what is happening."* ***—Community Member***

policy or the policy environment. Where possible, having an **outside evaluator** engaged in this data gathering can be useful in helping increase the rigor and real and perceived validity of the assessment being undertaken. But whether by an outsider or a partnership member or subcommittee, and whatever questions are asked regarding policy-related outcomes, it is critical to think not in terms of *attribution*, but rather *contribution and connection*. In other words, in what ways did the work of the CBPR partnership help contribute to efforts to change a policy, or the broader policy environment in relation to an outcome of interest. The evaluation section of the **Community Tool Box** (http://ctb.ku.edu) and the PolicyLink **Getting Equity Advocacy Results** (GEAR) project mentioned earlier (http://www.policylink.org/gear) are useful resources for helping partnerships think about their results in this way.

VI. Additional Resources by Topic

Here are some helpful journal articles, reports, and websites relevant to topics and case studies addressed in this resource guide. They are grouped by topic, and hopefully many of the references cited will lead the reader to other sources and tools.

Appendix: Summary of Helpful Websites and Other Resources

Advocating for Change (http://www.policylink.org/AdvocatingforChange)

An online source developed by PolicyLink that may be helpful in providing a variety of resources for partnerships interested in exploring a range of policy options as well as sample tools for pursuing the appropriate advocacy strategies.

Berkeley Media Studies Group (www.bmsg.org)

A wonderful resource for those specifically interested in media advocacy, or the strategic use of the mass media to help frame and present issues from a healthy communities' perspective.

Community-Campus Partnerships for Health (CCPH) (www.ccph.info/)

A comprehensive resource to help build and maintain partnerships between communities and academic institutions, the CCPH website is filled with resources on many aspects of CBPR, including the "how to's" of getting started, tools for building partnerships and assessing partnership strengths, using CBPR to help promote policy change, along with information on conferences, funding opportunities, and evaluations of projects that can serve as examples of "best practices" in the field.

California Center for Physical Activity (http://www.caactivecommunities.org)

This online site includes a wide range of tools which can guide both the asset and problem identification process. The tools, including the popular walkability check list tool, can assist community residents in studying and improving accessibility and safety conditions of their neighborhood.

Community Action Model (CAM) (www.sfdph.org/dph/comupg/oprograms/CHPP/CAM/default.asp)

An excellent resource for helping youth develop critical thinking and the tools necessary for effective participation in community building and CBPR toward the end of promoting sustainable change on the policy and systems level.

Community Tool Box (http://ctb.ku.edu/en/tablecontents/chapter_1027.htm)

Over 6,000 pages in length, the tool box is a global resource focused on building healthy communities by assisting and connecting partners interested in identifying local resources, tools, and challenges, and taking action. Includes excellent resources relevant to CBPR and the evaluation of its impacts on problems, policies, and practices, in part through empowerment evaluation approaches.

Getting Equity Advocacy Results (GEAR) (http://www.policylink.org/gear)

PolicyLink is creating a new set of tools (GEAR) through which practitioners can better assess the progress and impacts of their policy change efforts.

Photovoice (http://www.photovoice.org)

A visual methodology, photovoice is a collaborative approach to photography and subsequent critical dialogue and action plans that may be particularly useful with youth, low literacy groups, and other marginalized populations to promote change on the individual, community, and/or policy levels. This website includes links to many photovoice projects and publications, as well as other useful resources.

The Praxis Project (www.thepraxisproject.org)

A national nonprofit organization that builds partnerships with local community groups to influence policymaking by building local community power to effect change and address

PolicyLink

social and political /structural problems. The Praxis Project and its website offer technical assistance, capacity building, research and training, and useful tools and publications for partnerships.

Promoting Healthy Public Policy through Community-Based Participatory Research: Ten Case Studies (www.policylink.org/atf/cf/%7B97C6D565-BB43-406D-A6D5-ECA3BBF35AF0%7D/CBPR_PromotingHealthyPublicPolicy_final.pdf)

This document explores diverse community-based participatory research (CBPR) partnerships around the United States that have in common a commitment to fostering healthy public policy. These case studies offer a window into the world of community, health department, and academic partnerships throughout the nation that are working to change policy to improve community health, reduce disparities, and foster equity. The report draws on data from dozens of in-depth interviews with partnership members, community focus groups, and policymakers.

Speaking Truth, Creating Power: **A Guide to Policy Work for CBPR Practitioners**

This user-friendly work book, available on the University of Washington website (http://depts.washington.edu/ccph/pdf_files/ritas.pdf), helps community and other stakeholders better understand the policymaking process, and contains helpful tools for teaching and communicating this information.

"**White Privilege**" **Checklist** by Peggy McIntosh (http://www.fpg.unc.edu/~scpp/pdfs/whiteprivilegechecklist.pdf)

This exercise can be used to facilitate a discussion of what unearned privilege means, and how that may affect working relationships with diverse cultures in CBPR and other cross-cultural undertakings.

Working Upstream: Skills for Social Change (http://bmsg.org/sites/default/files/bmsg_handbook_working_upstream.pdf)

This detailed and user-friendly resource from the Berkeley Media Studies Group (BMSG), with support from The California Endowment, presents a curriculum and resource guide for advocates and others interested in learning the art of working to address the social determinants of health through advocacy and related approaches. Available in print copy as well as online from BMSG.

Authors' Biographies

Meredith Minkler, DrPH, MPH, is professor and director of Health and Social Behavior at the School of Public Health, University of California, Berkeley. She is editor of *Community-Organizing and Community Building for Health* (3rd edition, 2012) and co-editor, with Nina Wallerstein, of *Community-Based Participatory Research for Health: From Processes to Outcomes* (2nd edition, 2008).

Analilia P. Garcia, DrPH, MPH, is a lecturer in the Health Science Department at San Jose State University, and project director at the University of California, Berkeley. She has over 15 years of public health experience, working with diverse multicultural groups, with a commitment to social justice and equity.

Victor Rubin is vice president for research at PolicyLink. A noted authority on community engagement in higher education, and on social factors that affect health, he leads efforts at PolicyLink to build a strong research base for equity. As an author and editor, he has appeared in various academic journals, most recently as guest editor for the special issue on regional equity of the journal *Community Development* (2011). He collaborated with Meredith Minkler on the 2008 PolicyLink report, *Promoting Healthy Public Policy through Community-Based Participatory Research: Ten Case Studies.*

Nina Wallerstein, DrPH, MPH, is professor of Public Health, and director of the Center for Participatory Research, Department of Family and Community Medicine, School of Medicine, University of New Mexico. As a long-time empowerment and popular education and CBPR practitioner, she is co-author (with Elsa Auerbach) of *Problem-Posing at Work: A Popular Educator's Guide,* (Grassroots Press, 2004) and co-editor (with Meredith Minkler) of *Community-Based Participatory Research for Health: From Processes to Outcomes* (2nd edition, 2008).

3 warehouses in works on N. Indian Canyon bring economic promise, environmental concerns

Erin Rode
Palm Springs Desert Sun

The transformation of North Indian Canyon Drive near Interstate 10 from a windy, mostly undeveloped corridor dotted with windmills to a logistics hub is officially underway, with three warehouses planned or proposed for the area.

Elsewhere in the region warehouses have proliferated — especially throughout the western portions of San Bernardino and Riverside counties — bringing jobs as well as concerns over air pollution and truck traffic.

But some warehouse-saturated Inland Empire communities are pushing back against new projects, and developers have started turning to the San Gorgonio Pass and Coachella Valley because demand for warehouse space remains high.

With the fresh economic potential for Desert Hot Springs and Palm Springs comes some well-known concerns, some of which have prompted other cities in the Inland Empire to take measures to mitigate the negative environmental impacts.

The question remains whether the Coachella Valley cities can reap the financial benefits while avoiding the same fate.

On the Desert Hot Springs side of North Indian Canyon Drive, Amazon recently purchased a site approved for a 3.4-million-square-foot warehouse. It's the first approved logistics warehouse in the Coachella Valley.

Construction on the Desert Hot Springs Amazon facility could begin as soon as this summer, with the project expected to be operational in the fourth quarter of 2023.

The project site is near Coachillin' Business Park and the Mission Springs Water District's new wastewater treatment facility, which recently broke ground.

On the other side of North Indian Canyon Drive, the City of Palm Springs has received two pre-applications for large warehouses in the past few months.

The Palm Springs Logistics Center would be a 1,468,160-square-foot warehouse on a 74-acre swath of undeveloped property at the northwest corner of Indian Canyon Drive and 18th Avenue. A neighboring proposal for the Palm Springs Fulfillment Center would build a 751,000-square-foot industrial building with 711,000 square feet of warehouse space and 40,000 square feet of office space at the northwest corner of Indian Canyon Drive and 19th Avenue.

City staff have held pre-submittal conferences with the applicants for both warehouse facilities, but have yet to receive the formal applications, according to Deputy City Manager Flinn Fagg.

It is unclear who the eventual tenants of the warehouses might be. Snider Interests LLC, the applicant for the Palm Springs Fulfillment Center, did not respond to The Desert Sun's request for more information.

Seefried Industrial Properties, the applicant for the Palm Springs Logistics Center, also did not respond to The Desert Sun's request for comment, but the company has been closely linked to Amazon in the past. Seefried Industrial Properties initially proposed the Desert Hot Springs warehouse, with Amazon purchasing the land sited for the warehouse after it was approved.

All three applications came after the two cities made zoning changes in January to better accommodate large warehouses by allowing taller building heights in industrial and manufacturing zones primarily located north of I-10 along North Indian Canyon Drive.

Leaders in both cities cited a desire to capitalize on potential tax revenue from the Inland Empire's ever-expanding logistics industry as demand for warehouse space surges alongside growth in online shopping.

Commercial real estate firm CBRE estimates that the U.S will need 330 million square feet of additional distribution space by 2025 just to meet the projected increase in online ordering during the next few years. This doesn't account for potential demand from other industries that use warehouses, such as grocery companies.

Over 4,000 warehouses in Riverside, San Bernardino counties

Driven by cheap and available land, as well as close proximity to major freeways and the Port of Los Angeles and Port of Long Beach, the warehouse boom in Southern California has resulted in over 1 billion square feet of Inland Empire land occupied by warehouses.

The number of warehouses in Riverside and San Bernardino counties has grown from 162 in 1975 to 4,299 in 2021, according to a recent mapping project from the Robert Redford Conservancy for Southern California Sustainability at Pitzer College. Much of the growth began in the late 1990s, continuing at an exponential pace over the past two

decades. There were 970 warehouses by 2000, a number that grew to 1,574 in 2005, then 2,089 in 2010 and to 2,757 in 2015. From 2020 to 2021, the number rose again from 3,727 to 4,299.

But many of the cities in this region are now pushing back with moratoriums on new warehouse development, citing the adverse effects of air pollution from heavy-duty diesel truck traffic on the predominately low-income communities of color.

According to the South Coast Air Quality Management District, sources associated with warehouses are responsible for nitrogen oxide emissions comparable to all of the refineries, power plants, and other stationary pollution sources in the South Coast Air Basin combined.

Those living within a half mile of warehouses are more likely to include communities of color, who experience health impacts such as higher rates of asthma and heart attacks.

“It’s an astronomical figure. And if you start to factor in the carbon emissions, the number of truck trips per day, the diesel particulate matter, it's just an overwhelming footprint,” said Susan Phillips, a professor of environmental analysis and director of the Robert Redford Conservancy for Southern California Sustainability at Pitzer College.

Most recently, Redlands enacted a 45-day moratorium on new warehouses in June, and Pomona is also considering a 45-day pause on new warehouse developments. Redlands had 64 warehouses as of 2021, totaling approximately 19,402,136 square feet of space, and Pomona had 217 warehouses totaling 27,007,673 square feet of space.

According to the analysis by the Redford Conservancy and Radical Research, LLC, Pomona's warehouses result in approximately 18,095 daily truck trips, which in turn produces about 24.5 pounds of diesel particulate matter, 2,844 pounds of nitrogen oxides, and 1,529,421 pounds of carbon dioxide, all on a daily basis.

The latest moratoriums follow previous pauses on new warehouse development in Riverside, Chino, and Colton, which recently extended its moratorium for another year.

"One of the reasons why developers are moving to the desert and high desert areas is because they're running out of land here in the core of the Inland Empire. But some of those cities (in the Inland Empire) have also been calling for moratoriums on warehouses. So (developers) are also moving to those other areas because they see that the community there hasn't mobilized around this issue yet," said Ana Gonzalez, Executive Director of the Inland Empire-based Center for Community Action and Environmental Justice.

Environmental groups push for mitigation, benefits

Project Viento, the warehouse proposal approved for land recently purchased by Amazon, is estimated to generate an average of 670 average daily truck trips, with trucks arriving and departing the facility primarily between 7 p.m. and 1 a.m. Those trucks are estimated to emit an estimated 165.17 pounds of nitrogen oxide each day, above the South Coast Air Quality Management District's significance threshold of 66 pounds per day for pollution from all sources.

After two local environmental groups appealed the project's approval, Desert Hot Springs settled with the two groups in June by adding new conditions on the project. Under the settlement agreement, the project must include "maximally sized" rooftop solar, at least 20% of light-duty delivery vehicles serving the project must be zero-emission, trucks cannot idle for more than three minutes, and all on-site cargo handling equipment must be powered by electricity. The settlement also requires the developer to install 100 electric vehicle charging stations at the site.

"I think it was a fair settlement. The area is zoned for logistics and warehouses are very likely to happen there. This is an area that already has cannabis warehouses, windmills, gas plants, solar plants... You're putting an industrial use in an industrial area," said Joan Taylor, chair of the local Tahquitz Group chapter of the Sierra Club, which appealed the project's approval alongside the Oswit Land Trust. She added that

she hopes the settlement will serve as a precedent for future warehouses in the Coachella Valley.

Taylor said the Project Viento site, which is about a mile away from the nearest homes, is preferable to where warehouses are built in communities like Fontana, where they often abut residential neighborhoods. As for the potential local air quality impacts of Project Viento, the settlement agreement will require the developer to make a $200,000 payment to the city that will help fund a Coachella Valley Regional Truck Impact and Mitigation Study by the Coachella Valley Association of Governments.

“Everybody wants to order online, but nobody wants the warehouses... It seems like they're a fact of life. There are real mitigations that can make these things a lot better. And that's what we strove for, and I think we insured with this particular project,” Taylor said.

The settlement in Desert Hot Springs comes after a string of recent settlements with environmental groups in the Inland Empire. Gonzalez points to the settlement between CCAEJ and other environmental groups and the developer of the proposed World Logistics Center in Moreno Valley as one example of a settlement agreement that includes adequate mitigation measures as well as community benefits.

That settlement requires the developer of the 40.6 million-square-foot project to pay for air filtration systems for nearby homes, install more than 1,000 electric vehicle chargers on-site, and provide grants for Moreno Valley residents to purchase electric vehicles, along with several other requirements.

In the absence of the ability to stop a warehouse project altogether, CCAEJ focuses on securing community benefits, such as a commitment to hire local residents or to provide good wages and benefits, as well as mitigation efforts, like requiring the developer to use air filters or electric equipment.

“A lot of times developers say that the environmental justice groups just want solar and electrification. But it’s more than that. We want good paying jobs, we want them to contribute toward the General Fund for that city, to help with things like maintenance because trucks are going to ruin the roads…, Gonzalez said. "You don’t get to just come and build this massive warehouse in our community and go back to your fancy home in Beverly Hills, you have to make sure you’re addressing the needs of the community if you want to do business in the community.”

'Nobody talks about the cumulative impacts'

While the proposed and approved warehouses along North Indian Canyon aren't directly adjacent to homes, some worry they could still have negative impacts on the overall air pollution in the region.

"Yes, these are away from sensitive receptors like homes or schools. But nobody talks about the cumulative impacts. The freeways are already overburdened with traffic, the pollution levels are already super high," said Gonzalez.

Phillips views warehouse development as "death by 1,000 cuts," with each individual city considering each warehouse proposal without necessarily considering the broader cumulative impacts.

"(Cities) never see the project as the full force of the decisions that have been made in the past, the decisions that are being made in the

present, and the decisions that are being made in the future," said Phillips.

Efforts are currently underway to improve the way cities consider the cumulative impacts of a proposed warehouse project. South Coast Air Quality Management District is in the process of revising its California Environmental Quality Act guidance for how cities evaluate the cumulative air quality impacts of existing projects, proposed projects, and probable future projects under the California Environmental Quality Act. The new guidance would consider existing air toxics from nearby pollution sources and in some cases quantify the cumulative air quality impacts of projects in an area for the first time.

South Coast AQMD aims to adopt the policy toward the end of this year or early next year, but the guidelines would only serve as recommendations, which cities could decide whether they want to implement as requirements, according to spokesperson Nahal Mogharabi.

These efforts are related to a recent lawsuit filed by Attorney General Rob Bonta against the city of Fontana for its approval of a 205,000 square-foot warehouse that shares a border with a public high school, in an area already home to several dozen warehouses totaling approximately 16 million square feet.

In the lawsuit, Bonta challenged the city's use of the air district's existing guidelines, arguing that Fontana violated CEQA by failing to disclose the existence of dozens of other warehouses in the area and

other approved future warehouses, and didn't account for the cumulative air quality impacts of those projects.

That lawsuit was settled in April, resulting in additional mitigation measures for the warehouse in question and a new city ordinance with more stringent environmental standards for future warehouses.

Increasing impacts of climate change upon ecosystems with increasing global mean temperature rise

Rachel Warren · Jeff Price · Andreas Fischlin · Santiago de la Nava Santos · Guy Midgley

Received: 7 October 2008 / Accepted: 16 June 2010 / Published online: 21 August 2010
© Springer Science+Business Media B.V. 2010

Abstract In a meta-analysis we integrate peer-reviewed studies that provide quantified estimates of future projected ecosystem changes related to quantified projected local or global climate changes. In an advance on previous analyses, we reference all studies to a common pre-industrial base-line for temperature, employing up-scaling techniques where necessary, detailing how impacts have been projected on every continent, in the oceans, and for the globe, for a wide range of ecosystem types and taxa. Dramatic and substantive projected increases of climate change impacts upon ecosystems are revealed with increasing annual global mean temperature rise above the pre-industrial mean (ΔT_g). Substantial negative impacts are commonly projected as ΔT_g reaches and exceeds 2°C, especially in biodiversity hotspots. Compliance with the ultimate objective of the United Nations Framework Convention

on Climate Change (Article 2) requires that greenhouse gas concentrations be stabilized within a time frame "sufficient to allow ecosystems to adapt naturally to climate change". Unless ΔT_g is constrained to below 2°C at most, results here imply that it will be difficult to achieve compliance. This underscores the need to limit greenhouse gas emissions by accelerating mitigation efforts and by protecting existing ecosystems from greenhouse-gas producing land use change processes such as deforestation.

1 Introduction

Effects of climate change are already being observed on a wide range of ecosystems and species in all regions of the world (Rosenzweig et al. 2007), in response to the 0.74°C rise (ΔT_g) in global mean temperature (GMT) that has been experienced since pre-industrial times (Solomon et al. 2007). Such responses include changes in phenology and shifts in species ranges (e.g. Walther et al. 2002; Root et al. 2003), whilst the first extinctions which are likely to be attributable to climate change—acting synergistically with disease—have already occurred in amphibians (Pounds et al. 2006; Bosch et al. 2006). Coral reef bleaching is expected to increase strongly with rising sea surface temperatures (Hughes et al. 2003). At the same time, the ocean has already acidified by 0.1 pH units since pre-industrial times (Solomon et al. 2007) due to the direct effects of increasing atmospheric concentrations of carbon dioxide from the pre-industrial level of 280 ppm to the 2005 level of 379 ppm CO_2 (Solomon et al. 2007).

The literature contains a growing number of studies that project for the future increasingly severe impacts that further anthropogenic climate change would have on ecosystems and species around the world (see the 71 studies referenced in Tables 2, 3, 4 and 5). Such studies typically identify the onset of some positive, but predominantly negative, impacts upon a species or ecosystem as the climate changes. However, these studies have largely been carried out independently from each other and have used a wide range of future climate scenarios. This makes it difficult to compare results and obtain a clear and aggregated picture of how impacts accrue with increasing global mean temperature rise. Such an aggregated picture is important for two reasons: firstly it addresses climate change at the appropriate scale, i.e. as a global phenomenon; and secondly it enables the evaluation of major policy recommendations, such as the much discussed 2°C limit suggested by the EU as both a "safe" and achievable level of global temperature increase. Existing reviews (Houghton et al. 2001; Thomas et al. 2004a; Hare 2006; Warren 2006) have not included the full range of recent literature and have not estimated uncertainties. Similarly to the summary given in Fischlin et al. (2007), this paper integrates the dispersed and fragmented literature on ecosystem impacts of projected climate change, often expressed at a regional level, into a set of tables of projected impacts for different levels of global mean temperature rise with respect to pre-industrial times, ΔT_g, providing an estimate of uncertainty in these levels. The tables report the main findings in terms of: range losses for species, habitats or entire ecosystems; extinction risks; and other biodiversity impacts caused by ecosystem degradations or declines in key populations due to anticipated climate changes.

2 Materials and methods

2.1 Literature search

A literature search was made to assess pertinent impacts of climate change on both terrestrial and marine ecosystems across the globe (Fischlin et al. 2007). Search engines were first used to identify references in the peer reviewed literature, and further references were then derived from information provided within these. Existing reviews (Gitay et al. 2001; Thomas et al. 2004a; Hare 2006; Warren 2006) were particularly useful in identifying additional references. All references were then reviewed for specific information about thresholds in local or global temperature change/sea level rise above which adverse consequences could be expected, and also for quantified projections of ecosystem or species changes associated with quantified local or global climate changes, taking note of the climate scenario and any general circulation model (GCM) used, and the treatment of dispersal and migration. Thus studies that contained insufficient detail about the climate scenario used, or that did not provide quantitative estimates of the resultant ecosystem or species changes, could not be included in the analysis. In particular, studies which reported only the general direction of trends in response to changing temperature or precipitation were deliberately excluded. In cases where more than one study addressed similar species or ecosystems, each study was included separately in the summary table, since it may be projecting different sensitivities due to the use of other climate change scenarios and/or assessing other kinds of impact responses.

2.2 Converting to a pre-industrial reference point for global mean temperature change

Information on the climate change scenario simulated by each original study was converted to a common pre-industrial reference point for temperature. Studies often refer to baselines of pre-industrial (<1850), 1960–1990 mean, 1990, or "present day" (e.g. 1980–1999). In this study the temperature rise between pre-industrial and the 1960–1990 mean is taken as 0.3°C and the temperature rise between pre-industrial and 1990 is taken as 0.6°C (Houghton et al. 2001); whilst that from the mid 1970s to 1990 is taken as 0.2°C (Houghton et al. 2001). Where studies report impacts as caused by a particular GCM simulation using the HadCM3 model, Table 7 of Arnell et al. (2004) was used to convert the temperatures to a common pre-industrial baseline.

While some of the literature relates impacts directly to global mean temperature increases, many studies refer only to local temperature rise, and hence upscaling from a local to a global scale is required. Upscaling was carried out as detailed below for the different classes of studies identified (Table 1) and also provided an opportunity to estimate the uncertainties arising from the use of different GCMs in climate projection. Whenever possible it was also considered whether the impact had been estimated based only on temperature change, or also on associated precipitation change.

When studies gave minimal detail about GCM scenarios, such as referring to them only as "CO_2 doubling scenarios", the original literature publishing that scenario was traced, and/or the model authors were contacted, in order to verify the global mean

Table 1 Detail of the upscaling methodology used to derive global mean temperature (GMT) change (ΔT_g) for the eight study classes a–h

Class	Description of study	Derivation of central estimate of GMT change ΔT_g	Derivation of range of GMT change
a	Relates global impacts directly to ΔT_g	ΔT_g by definition already provided: harmonised if necessary to pre-industrial	Not derived unless provided in original study
b	Relates local impact (e.g. x% species at risk of extinction) to regional temperature change without using GCM output	ΔT_g is the mean of values derived via upscaling procedure, using the cited regional temperature change	Range of values derived via upscaling procedure using the cited regional temperature change
c	Relates a local impact (e.g. y% species at risk of extinction) to regional temperature change while using the output of specific GCM(s)[2]	As not all studies provide the regional temperature change this may need to be derived by first downscaling for the appropriate timeslice (e.g. Gyalistras and Fischlin 1999). ΔT_g is then the mean of values derived via a subsequent upscaling of the downscaled regional temperature change	Range of values derived via upscaling procedure, using the downscaled regional temperature change
d	As b but regional precipitation change also used	As b	As b
e	As c but study uses also GCM simulated precipitation as well as temperature	Upscaling is not applicable, as procedure is based on temperature only. ΔT_g is derived from published values simulated by the used GCM(s)	Not derivable
f	Cases where upscaling is not possible because regional temperature changes are out of range of the GCM patterns available	Estimated from maps in Meehl et al. (2007) relating local and global temperature change	Not derivable
g	As c or e but GCM output comes from 3 or more different GCM models	Mean of values as simulated by the used GCM(s)	Range derived from published values simulated by the used GCM(s)
h	Cases where the key variable is sea surface temperature	Estimated from maps in Meehl et al. (2007) relating local surface air temperature over the sea to ΔT_g, since maps of SST were not readily available, and increases in surface air temperature over the ocean were assumed to approximate increases in SST	Not derivable

temperature increase corresponding to CO_2 doubling, taking into account the control CO_2 concentration as necessary.

2.3 Dynamics

Many reviewed studies do not consider a temporal dimension. There are two issues here (1) whether the climate scenario a study considers relates to transient or equilibrium climate change and (2) whether the projected ecological response is considered a steady state. Studies in class b project impacts without distinguishing between transient and equilibrium temperature change. However, most studies use models, which project the future long-term ecological response to a changed climate (i.e. a new steady state) while the climate scenario is a transient one: studies in classes c and e are typically based on transient climate change scenarios produced by GCMs, although there are a few which also include equilibrium temperature change scenarios. Hence, the ecological projections are *not* mere snapshots of a transient climate change and its concomitant response, rather do these studies artificially hold the transient climate constant and assume the ecosystem response to equilibrate, regardless of the time the system may need to actually reach such an equilibrium. Thus an important question is the time lag between the forcing temperature change, be it transient or equilibrium, and the ecosystem response (see Section 4). The upscaling procedure described below is based on transient GCM scenario outputs throughout.

2.4 Upscaling procedure

The upscaling procedure involved the use of 0.5 × 0.5° resolution outputs produced from original 5 × 5° resolution outputs of five GCM models HadCM3, ECHAM4, CSIRO2, PCM, and CGCM2, by using pattern scaling and downscaling methods (Christensen et al. 2007). These climate projections based on transient GCM outputs were available for the entire global land area at a resolution of 0.5 × 0.5°. They were produced from up to four IPCC SRES emission scenarios (Nakicenovic et al. 2000) providing 13 different GCM patterns on which to base the upscaling (available at http://ipcc-ddc.cru.uea.ac.uk). In each 0.5 × 0.5° grid cell, 13 alternative twenty-first century time series of regional annual (or if required seasonal) temperature were thus available, each one expressed as the running 30-year mean temperature increase since 1961–1990 mean climate, to smooth inter-annual variability.

For each study in Table 1 of type b or c, the location was then related to a grid cell or to grid cells depending on how large an area the study covered. For each grid cell, all 13 upscaling calculations were carried out, to encompass the full range of inter-GCM and inter-scenario pattern variability as an uncertainty surrogate. The upscaling calculation was simply performed by examining any one of the 13 time series for a grid cell. A computer program calculated the date at which the regional temperature reached the temperature threshold which is referred to in the study of type b or c and therein associated with some particular impact on an ecological system. The program then used this derived date to identify the associated global temperature rise ΔT_g in the transient GCM runs, matching this same date, using if available the global temperature time series from the exact same GCM scenario as

Table 2 Projected impacts of climate change on various ecological systems and species as reported in the literature for different levels of global mean annual temperature rise ΔT_g, relative to pre-industrial climate (mean and range), showing also regional temperature change ΔT_{reg} relative to 1990 if provided by the literature: range losses for species, habitats or whole ecosystems

No.	ΔT_g above pre-ind °C	ΔT_g (range)	ΔT_{reg} above 1990 °C (range)	Impacts to unique or widespread ecosystems or population systems	Region	Taxa	Source
1	1.3	1.1–1.6	1	8% loss freshwater fish habitat, 15% loss in Rocky Mountains, 9% loss of salmon	N America	Fish	13
2	1.6			Bioclimatic envelopes eventually exceeded leading to 10% transformation of global ecosystems; loss of 47% wooded tundra, 23% cool conifer forest, 21% scrubland, 15% grassland/steppe, 14% savannah, 13% tundra and 12% temperate deciduous forest. Ecosystems variously lose 2–47% areal extent	Globe		6
3	1.6	1.1–2.1	1	Suitable climates for 25% of eucalypts exceeded	Australia	Plants	12
4	1.7	1.3–2.4	2	16% freshwater fish habitat loss, 28% loss in Rocky Mountains, 18% loss of salmon	N America	Fish	13
5	1.8			Mean latitude of range of *Aloe dichotoma* shifts S by 1.1° of latitude causing range loss	Namibia	Plants	68
6	<1.9	<1.6–2.4	<1	Range loss begins for Golden Bowerbird	Australia	Birds	4
7	1.9	1.6–2.4	1	Range loss of 40–60% for Golden Bowerbird	Australia	Birds	4
8	2.1			Without dispersal 17 common European deciduous trees variously lose 1–100% of their range (2 sp. lose 100%); whilst full dispersal could reduce this to 11 losing between 1–99% (2 sp. lose 99%) and 6 increasing their range by 42–303%	Europe	Plants	67
9	2.3	1.6–3.2	3	24% loss freshwater fish habitat, 40% loss in Rocky Mountains, 27% loss of salmon	N America	Fish	13
10	2.4			63 of 165 rivers studied lose >10% of their fish species	Globe	Fish	19
11	2.5	1.9–4.3		42% of UK land area with bioclimate unlike any currently found there; in Hampshire, declines in climate suitability space for curlew and hawfinch and gain for yellow-necked mouse; loss of montane habitat in Scotland; potential bracken invasion of Snowdonia montane areas	UK, Europe	Birds, mammals, plants	57
12	2.5			20–70% loss (mean 44%) of coastal bird habitat at 4 sites	USA	Birds	29

13	2.5	1.9–3.5		20% loss of coastal migratory bird habitat	Delaware, USA	Birds	36	
14	2.7			32–70% of 111 European mammals studied lose >30% of current distribution whilst 24–35% undergo range expansions	Europe	Mammals	71	
15	2.7			Bioclimatic envelopes exceeded leading to eventual transformation of 16% of global ecosystems: loss of 58% wooded tundra, 31% cool conifer forest, 25% scrubland, 20% grassland/steppe, 21% tundra, 21% temperate deciduous forest, 19% savanna. Ecosystems variously lose 5–66% of their areal extent	Globe		6	
16	2.8	2.3–4.6	2.1–2.5	Cloud forest regions lose hundreds of metres of elevational extent, potential extinctions ΔT_{reg} 2.1°C for C America and ΔT_{reg} 2.5°C for Africa	C. America, Tropical Africa, Indonesia		17	
17	2.8	2.1–3.1	3	Eventual loss of 9–62% of the mammal species from Great Basin montane areas	USA	Mammals	32	
18	2.8			Most European bird distributions are reduced in area by 81% and displaced from 38–53% of their present location; 25% have ranges reduced by > = 90%. Avian species richness reduced by 9–60% depending on dispersal assumptions	Europe	Birds	65	
19	2.8	1.9–3.8	3	38–54% loss of waterfowl habitat in prairie pothole region	USA	Birds	37, 38	
20	2.9		3.2–6.6	50% loss existing tundra offset by only 5% eventual gain; millions of Arctic nesting shorebirds species variously lose up to 5–57% of breeding area; high Arctic species most at risk; geese species variously lose 5–56% of breeding area	Arctic	Birds	14	
21	2.9			Lat. of N forest limits shifts N by 0.5° latitude in W Europe, 1.5° in Alaska, 2.5° in Chukotka and 4° in Greenland	Arctic	Plants	40	
22	2.9			Substantial loss of boreal forest	China	Plants	15	
23	3.0			66 of 165 rivers studied lose >10% of their fish species	Globe	Fish	19	

Table 2 (continued)

No.	ΔT_g above pre-ind °C	ΔT_g (range)	ΔT_{reg} above 1990 °C (range)	Impacts to unique or widespread ecosystems or population systems	Region	Taxa	Source
24	2.4–4.0			431 bird species lose on average 76–89% of their present range, with new potential ranges overlapping original ones by 31–47% so that species richness declines locally by a mean of 9–56% depending on dispersal assumptions	Europe	Birds	73
25	3.3	2.3–3.9	2.6–2.9	Substantial loss of alpine zone, and its assoc. flora and fauna (e.g., alpine sky lily, and mountain pygmy possum)	Australia	Plants, marsupials	45
26	3.4			6–22% loss of coastal wetlands; large loss migratory bird habitat particularly in USA, Baltic and Mediterranean	Globe	Birds	35, 36
27	3.5	2.3–4.1	2.5–3.5	Loss of temperate forest wintering habitat of Monarch butterfly	Mexico	Insects	28
28	3.6	2.6–4.3	3	Bioclimatic limits of 50% of eucalypts exceeded	Australia	Plants	12
29	3.6	3.0–3.9		Parts of the USA lose 30–57% neotropical migratory bird species richness	USA	Birds	43
30	3.7			Bioclimatic envelopes exceeded leading to eventual transformation of 22% of global ecosystems; loss of 68% wooded tundra, 44% cool conifer forest, 34% scrubland, 28% grassland/steppe, 27% savannah, 38% tundra and 26% temperate deciduous forest. Ecosystems variously lose 7–74% areal extent	Globe		6
31	3.7	2.6–4.8	3	Up to 60% loss in upland stream macro-invertebrate abundance; local extinction of 4 taxa; 25% of mean species richness at risk of local extinction	UK	Invertebrates	62

32	4.0		3.3	47–78% of 111 European mammals studied lose >30% of current distribution whilst 13–33% undergo range expansions	Europe	Mammals	71
33	>>4.0		5	Bioclimatic limits of 73% of eucalypts exceeded	Australia	Plants	12
34	4.9			Without dispersal 17 common European deciduous tree species variously lose 15–100% of their range; full instantaneous dispersal could reduce this to 11 losing between 13% and 100% and 6 increasing their range by 3–320%	Europe	Plants	67
35	5.0			92–97% of 100 *Banksia* species studied experience range contraction, 9% expand	W Australia	Plants	74
36	5.2			62–100% loss of bird habitat at 4 major coastal sites	USA	Birds	29

A novel climate is a climate which is significantly different from the present climate whilst a disappearing climate is a climate that disappears from a given area, for example on a mountaintop or a coastline where geography prevents a species from tracking the changing climate. Table 3 Projected impacts of climate change on various ecological systems and species as reported in the literature for different levels of global mean annual temperature rise ΔT_g, relative to pre-industrial climate (mean and range), showing also regional temperature change ΔT_{reg} relative to 1990 if provided by the literature: extinction risks

No.	ΔT_g above pre-ind °C	ΔT_g above pre-ind °C (range)	ΔT_{reg} above 1990 °C (range)	Impacts to unique or widespread ecosystems or population systems	Region	Taxa	Source
37	0.6			Amphibian extinctions/extinction risks on mountains due to climate-change induced disease outbreaks	Costa Rica, Spain, Australia	Amphibians	52, 54
38	1.6	1.2–2.0	0.7–1.5	9–31% (mean 18%) of species committed to extinction	Globe (20% terrestrial surface)	Plants, vertebrates and insects	1
39[a]	1.6			23–25% of bird species at risk of extinction, and 1–2% projected extinct	Western Hemisphere	Birds	70
40	1.7	1.2–2.6		38–45% of the plants in the Cerrado committed to extinction	Brazil	Plants	1, 44
41	1.7	1.3–3		2–18% of the mammals, 2–8% of the birds and 1–11% of the butterflies committed to extinction	Mexico	Mammals, birds, insects	1, 26
42	1.75	1.5–2.0		2–4% loss of global vascular plant diversity	Globe	Plants	64
43	1.9	1.6–2.4	1	7–14% of reptiles, 8–18% of frogs, 7–10% of birds, and 10–15% of mammals committed to extinction as 47% of appropriate habitat in Queensland lost	Australia	Reptiles, amphibians, birds, mammals	1, 7
44	2.1			41–51% loss in plant endemic species richness	S Africa, Namibia	Plants	39
45	2.1		1.4–2.6	13–23% of butterflies committed to extinction	Australia	Insects	1, 30
46	2.1	1.4–2.6		Bioclimatic envelopes of 2–10% plants exceeded leading to endangerment or extinction; mean species turnover of 48% (spatial range 17–75%); mean species loss of 27% (spatial range 1–68%)	Europe	Plants	22

				3–16% of plants committed to extinction	Europe	Plants	1	
48	2.2		1.6–1.8	15–37% (mean 24%) of species committed to extinction	Globe (20% terrestrial surface)	Plants, vertebrates and insects	1	
49	2.2	1.7–3.2		8–12% of 277 medium/large mammals in 141 national parks critically endangered or extinct; 22–25% endangered	Africa	Mammals	23	
50	2.3	1.5–2.7	2°C SST	Loss of Antarctic bivalves and limpets	Southern Ocean	Molluscs	51	
51	2.3	1.5–2.7	2.5–3.0	Extinctions (100% potential range loss) of 10% endemics; 51–65% loss of Fynbos; including 21–40% of *Proteaceae* committed to extinction; Succulent Karoo area reduced by 80%, threatening 2800 plant species with extinction; 5 parks lose >40% of plant species	S Africa	Plants	1, 5, 24, 25	
52	2.3	2.3–4.0	2.5–3.0	24–59% of mammals, 28–40% of birds, 13–70% of butterflies, 18–80% of other invertebrates, 21–45% of reptiles committed to extinction; 66% of animal species potentially lost from Kruger National Park	S Africa	Mammals, birds, reptiles, insects, other invertebrates	1, 27	
53	2.3	2.2–4.0		2–20% of mammals, 3–8% of birds and 3–15% of butterflies committed to extinction	Mexico	Mammals, birds, insects	1, 26	
54	2.3	1.6–3.2		48–57% of Cerrado plants committed to extinction	Brazil	Plants	1	
55[a]	2.3			27–28% of bird species at risk of extinction, and 2–3% projected extinct	Western Hemisphere	Birds	70	
56	2.3			Changes in ecosystem composition, 32% of plants move from 44% of area with potential extinction of endemics	Europe		16	

Table 3 (continued)

No.	ΔT_g above pre-ind °C	ΔT_g above pre-ind °C (range)	ΔT_{reg} above 1990 °C (range)	Impacts to unique or widespread ecosystems or population systems	Region	Taxa	Source
57	2.4			Bioclimatic range of 25–57% (full dispersal) or 34–76% (no dispersal) of 5,197 plant species exceeded leading to extinction risks	Subsaharan Africa		60
58	2.5		2°C SST	Functional extinction of coral reef ecosystems (overgrown by algae)	Indian Ocean	Corals, fish	9
59	2.6			4–21% of plants committed to extinction	Europe	Plants	1
60	2.7			1–6 rodent species (1–5% of 111 mammals studied) committed to extinction	Europe	Mammals	71
61	2.8	2.5–3.0		Multimodel mean 62% (range 40–100%) loss Arctic summer ice extent, high risk of extinction of polar bears, walrus, seals; Arctic ecosystem stressed	Arctic	Mammals	11, 53
62	2.8			65 species at increased risk of extinction with high risk for endemic Scottish Crossbill, Imperial Eagle and Marmora's warbler	Europe	Birds	65
63	2.9		2.1–3.9	21–36% of butterflies committed to extinction; >50% range loss for 83% of 24 lat. restricted species	Australia	Insects	1, 30
64	2.9	2.6–3.3	2.1–2.8	21–52% (mean 35%) of species committed to extinction	Globe (20% terrestrial surface)	Plants, vertebrates and insects	1
65	3.1	2.3–3.7	2°C SST	Functional extinction of remaining coral reef ecosystems (overgrown by algae)	Globe	Corals, fish	2
66	3.1	2.5–4.0	2	High risk of extinction of Golden Bowerbird as habitat reduced by 90%	Australia	Birds	4

67	3.1	1.8–4.2	3–4	Risk of extinction of Alpine species	Europe	Plants	41	
68	2.4–4.0			Of 40 endemic/near endemic species studied, 5–8 are threatened with extinction losing 90–100% of their original range	Europe	Birds	73	
69	3.3	2.8–3.8	2	Risk of extinction of Hawaiian honeycreepers as suitable habitat reduced by 62–89%	Hawaii	Birds	18	
70	3.3		3.7	4–38% of birds committed to extinction	Europe	Birds	1	
71[a]	3.3			32–34% of bird species at risk of extinction, and 6–8% projected extinct	Western Hemisphere	Birds	70	
72	3.5	2.0–5.5		Projected extinction of 15–40% endemic species in global biodiversity hotspots (narrow specificity)	Globe		50	
73	3.6	2.6–3.7		30–40% of 277 mammals in 141 parks critically endangered/extinct; 15–20% endangered	Africa	Mammals	23	
74	3.9			4–24% plants critically endangered/extinct; mean species turnover of 63% (spatial range 22–90%); mean species loss of 42% (spatial range 2.5–86%)	Europe	Plants	22	
75	4.0	3.0–5.1	3	Likely extinctions of 200–300 species (32–63%) of alpine flora	New Zealand	Plants	33	
76	4.0			1–10 species (1–9.% of 111 mammals studied) committed to extinction	Europe	Mammals	71	
77	>4.0		3.5	38–67% of frogs, 48–80% of mammals, 43–64% of reptiles and 49–72% of birds committed to extinction in Queensland as 85–90% of suitable habitat lost	Australia	Reptiles, amphibians, birds, mammals	1, 7	
78[a]	4.5			39–42% of bird species at risk of extinction, and 10–15% projected extinct	Western Hemisphere	Birds	70	
79	>>4.0		5	57 endemic frogs/mammals eventually extinct, 8 endangered	Australia	Amphibians, mammals	7	

Table 3 (continued)

No.	ΔT_g above pre-ind °C	ΔT_g above pre-ind °C (range)	ΔT_{reg} above 1990 °C (range)	Impacts to unique or widespread ecosystems or population systems	Region	Taxa	Source
80	>=4.0		7	Eventual total extinction of all endemic species of Queensland rainforest	Australia	Reptiles, amphibians, birds, mammals	7
81	5.0			22–24% of 100 *Banksia* species studied projected extinct	W. Australia	Plants	74
82[a]	6.9			50–57% of bird species at risk of extinction, and 19–30% projected extinct	Western Hemisphere	Birds	70

A novel climate is a climate which is significantly different from the present climate whilst a disappearing climate is a climate that disappears from a given area, for example on a mountaintop or a coastline where geography prevents a species from tracking the changing climate. (2007), 73—Huntley et al. (2008), 74—Fitzpatrick et al. (2008)

used originally by the study to assess the impact. The process was repeated (1) for the other 12 GCM/emission scenarios and (2) for eight surrounding adjacent grid cells to test the sensitivity of the results in terms of spatial coherence when using a group of grid cells versus a single grid cell. For each GCM scenario, the average ΔT for the nine (central plus eight adjacent) grid cells was computed. The resultant collection of up to 13 global ΔT values gave the range of global annual mean temperature rise as listed in Tables 2, 3, 4 and 5. In cases where a study has referred to an area larger than a group of nine grid cells, either a cluster of disjunct groups or contiguous orographic features, such as a mountain range or a plain, were aggregated into several clusters of grid cell groups across the region. The entries in the tables reflect also the average and range of outputs over the appropriate clusters of groups of grid cells.

Large local temperature increases can lie outside the range of the outputs of the GCMs held in the database. If this was the case, the study was not included in the upscaling calculations. GCMs with temperature changes that were too low to reach the study value(s) were excluded. Table 6 in the Appendix details which GCMs were used in the upscaling. If more than two GCMs were thus out of range, we assumed case f (Table 1) to avoid underestimating ΔT_g. Note that the GCM time series for ΔT_g are provided with respect to an observed mean over the period 1961–1990, ensuring that correct temperature reference points were maintained in all upscaling.

3 Results

Tables 2, 3, 4 and 5 provide the resultant summary of key impacts on various ecological systems, ranging from the global level to that of individual, endemic species. The supplementary information in Table 6 in the Appendix provides for each entry from Table 2a–d information on the GCM runs used in upscaling, the climate variables considered by the impact study, and the category of the upscaling method we applied (a–h, see Table 1). 71 studies were found to provide sufficient quantitative climatic and ecological information for inclusion in Table 2a–d. Projected impacts were found for all major world regions, but only one study focused on Asia. Most studies were on terrestrial systems, whilst relatively few covered changes in the marine environment. Range losses and extinctions (Tables 2 and 3) were projected for many important taxa with vascular plants, birds, and mammals being particularly well represented. A significant number of studies also projected impacts on amphibians, reptiles, fish, butterflies, and freshwater or marine invertebrates. Table 2 also shows many projections for major losses of regional ecosystems as climate changes. Table 4 shows projections for large scale collapse in ecosystems, i.e. thresholds at which major components of the world's ecosystems become irreversibly damaged, positive feedbacks emerge, or their functioning, collapse. As global temperatures rise, many of these thresholds start to be crossed at around $\Delta T_g = 2.5°C$ above the pre-industrial level.

A key finding is that some significant negative impacts for range losses and extinctions (Tables 2 and 3), and also damages to marine ecosystems (Table 4), were projected to occur for values of ΔT_g below 2°C, especially in some biodiversity hotspots, and also globally for the diversity rich coral reef ecosystems ($\Delta T_g = 1.7°C$). However, it is also noticeable that, given the analyzed literature, projected impacts

increase in magnitude, numbers and geographic spread once a 2°C rise in global mean temperature is reached. Beyond this temperature rise the level of impacts and the transformation of the Earth's ecosystems become steadily more severe, with the potential collapse of some entire ecosystems, and extinction risks accelerating and becoming widespread. Additional positive feed-backs emerge causing land ecosystems to transition from their current status as a net carbon sink to a net carbon source.

4 Discussion

4.1 General

A large body of literature exists discussing the potential future impacts of climate change upon ecosystems, as reviewed in Fischlin et al. (2007). Much of this literature does contain only qualitative or no directly comparable quantitative projections of change or does not relate any quantitative estimates of change to quantitative changes in global climate. Previous integrating summaries of climate change impacts on wild species and ecosystems have suggested substantial ecosystem disruption with projected anthropogenic climate changes, and particularly the increased risk of species extinction (e.g. Thomas et al. 2004a, b). Such findings have been criticised partly because they did not reference the projected impacts to a consistent measure of climate change. In order to provide robust findings in a policy relevant manner, it is critical to reduce the uncertainty created by this lack of a common reference. Hence Warren (2006) and Hare (2006) both took steps to do so. The results reported here, through use of a common temperature reference point, confirm the likelihood of significant negative impacts of climate change first mooted in studies such as Thomas et al. (2004a, b), but provide a far clearer picture of the likely increase in scale of impacts with increasing levels of climate change, together with an indication of uncertainty associated with ΔT_g.

With our common referencing system, we can also address the question as to what extent the literature has sampled the range of climate change forcings of the next few centuries adequately for the observations made by this study to be valid. The likely range of temperature increase in 2100 is 1.1°C to 6.4°C above the 1980–1999 average (i.e. 1.6°C to 6.9°C above the pre-industrial level), showing that the literature currently does not sample the upper end of this range, with most studies considering only the range between 1.5°C and 4°C above pre-industrial). Within these limits however, a broad range of global annual mean temperature rises is sampled, owing to the many different scenarios and GCMs used. This is the case for those studies that are based on GCM scenario outputs as well as the many other regional scenarios based only upon potential local, non-GCM-scenario based climate changes. A small subset of the studies considers the effects of doubling CO_2 concentrations, whilst another subset is based on transient climate change simulations. Because different GCMs are used in these subsets, the resultant global mean temperature, and concomitantly precipitation, values vary considerably among climate models, in particular in cases where regional scenarios of climate change were derived. We believe the small subset of table entries referring only to CO_2 concentration doubling has not introduced a bias. Owing to a sampling of a relatively comprehensive temperature

range similar to that covered by many scenarios (0.3–6.4°C, IPCC 2007), the overall interpretation of the results is not biased by any artificial clustering of data around a particular global mean temperature rise.

The majority of the impacts found in the literature are negative, with the exception of those projecting increases in primary production. Whilst a higher productivity may indeed increase vegetation growth, this in itself can disrupt species assemblages and thereby degrade ecosystems. For example, in tropical forests increased concentrations of CO_2 are stimulating rapid growth by vines (Granados and Körner 2002), which can strangle large trees (Phillips et al. 2002); and increasing growth rate and turnover of trees could even result in lower carbon storage rates, thus reducing the forest's service as a carbon sink (Feeley et al. 2007). Hence, with the exception of enhanced growth at moderate climate change we have rarely identified definitively positive impacts of climate change upon ecosystems. Whilst some authors consider transitions from desert to grassland or grassland to forest as "positive" in terms of gains in net primary production, this often neglects the issue of transient dynamics between previous and new equilibrium, and threats to endemic and specialist organisms of the replaced environments. Some studies indicate transitionally an even lower productivity (e.g., Fischlin and Gyalistras 1997).

4.2 Uncertainties in the analysis

This study has considered the role of uncertainty only in a limited manner, as it is difficult to quantify. The uncertainty analysis carried out is limited by its dependency on downscaling and upscaling of pattern-scaled transient temperature outputs of GCMs, and thus is contingent on the assumptions of pattern regularity as assumed in most down-scaling procedures (e.g., Gyalistras et al. 1994), in particular that the patterns are constant over a particular temperature range. It is also assumed that the patterns are independent of the history of greenhouse gas forcing, whereas in actuality an equilibrium climate change pattern may differ from transient ones. Equilibrium patterns were not available for this analysis, but would be more suitable for use with studies of type b, or studies of type c or d which actually use outputs of equilibrium runs of GCMs. The uncertainty analysis also reflects only the different relationships between global and local temperature displayed by various GCMs, and not the relationship between global temperature and local precipitation changes. In some cases where impacts are strongly driven by precipitation and models differ widely for the location in question, for example entry 41, the loss of forest cover in the Amazon basin (Cox et al. 2004), this could be important.

Much of the literature reviewed here is based on a biogeographical or bioclimatic approach. Whilst this approach has been criticised for its shortcomings in largely ignoring some mechanisms such as physiological responses, the treatment of species–species interactions, the limited accounting for population processes or migration (Pearson and Dawson 2003; Pearson 2006), or the common assumption that current species distributions are in equilibrium with current climate, the approach has nevertheless proved capable of simulating known species range shifts in the distant and the recent past (Martinez-Meyer et al. 2004, Araujo et al. 2005), and furthermore, is generally corroborated by the observed responses of many species to recent climatic changes (e.g. Walther et al. 2002; Root et al. 2003; Rosenzweig et al. 2007) and climate-change induced changes in geographical species ranges, which are starting to

be reported (Thomas et al. 2006; Foden et al. 2007). However the approach remains nevertheless to be comprehensively and explicitly tested against the observational record (Midgley and Thuiller 2005), an opportunity that should be taken as soon as possible. Most of the studies reported in Tables 2 and 3 result from detailed analysis of well-studied species and ecosystems in a given locality. In the case of the global extinction rate estimates (Thomas et al. 2004a) there has been a debate as to the validity of the particular species–area relationship used to estimate extinction rates (Thuiller et al. 2004; Thomas et al. 2004b; Buckley and Roughgarden 2004; Harte et al. 2004; Lewis 2006). Whilst these estimates are based on extrapolation of studies of endemics, Thomas et al. (2004b) argue that this creates only a small bias because such a large percentage of global species are in fact endemics. The study of Malcolm et al. (2006) provides an overall estimate of extinctions of endemics in biodiversity hotspots that does not rely on bioclimatic modelling of individual species, and generally supports the findings of Thomas et al. (2004a), though the use of endemic–area relationships rather than simple species–area relationships indicates some reduced impacts.

Responses of species to changing climate will also be affected by biotic interactions, which affect the levels of space occupancy and dispersal; e.g. in alpine plant communities, mutualists are expected to be able to tolerate greater climate change than competitors at slow rates of climate change, whereas at faster rates they may be excluded by competitors if these can easily disperse into newly climatically suitable areas (Brooker et al. 2007).

4.3 Factors omitted or partly considered in this study and the underlying literature

4.3.1 Direct effects from raising atmospheric CO_2 concentrations

In Tables 2, 3, 4 and 5, the temperature column is essentially used as a proxy for the accompanying other changes, which will occur concurrently, such as precipitation change or elevated CO_2 concentrations. However, only a limited number of studies that project climate change impacts upon ecosystems consider concurrent changes such as the direct effects of elevated ambient CO_2 concentrations associated with local or global scenarios of temperature rise. This is particularly true of studies based on bioclimatic modeling, or niche-based modelling techniques that simulate species geographic range shifts. Despite increasing evidence that CO_2 fertilization effects on crop species have been somewhat overestimated in the past (Fischlin et al. 2007), those on wild plant species and particularly trees are corroborated by strong evidence (e.g., Ainsworth and Long 2005). This may remain a significant omission in the modeling of some ecosystem types. For example, CO_2 fertilization may differentially affect woody and herbaceous species, affecting the dynamics of forest–savanna–grassland conversions with major implications for biodiversity (Bond et al. 2003). Whilst a small number of entries in the tables derive from consideration of ocean acidification, the literature in this area is in its infancy. As oceans continue to acidify as atmospheric CO_2 concentrations rise concurrently with warming, there is significant potential for changes in marine food webs and hence the valuable ecosystem services that the oceans provide for humankind (Orr et al. 2005; Haugan et al. 2006).

4.3.2 Indirect effects of climate change

Tables 2, 3, 4 and 5, and the literature upon which they are based, largely document only the projected impacts on ecological systems resulting directly from climate changes such as changes in temperature and precipitation, the most commonly considered variables. However, there are a number of other impacts on ecosystems to be expected, that result from non climatic causes or indirectly via climatic changes. For example (1) wildfires and certain defoliating insects are projected to increase with warming (for example in boreal forests and the Mediterranean, e.g., Fischlin et al. 2007; Kurz et al. 2008), and decomposition rates will change by large percentages as rainfall changes (for example in deciduous forests in the USA, e.g. Lensing and Wise 2007) both of which is likely to have further impacts on forest and grassland ecosystems as well as causing substantive biotic feedbacks to the climate system; (2) secondary succession may last several centuries (Fischlin and Gyalistras 1997), thus delaying actual impacts and causing additional effects in other communities; (3) surprising ecological changes may also occur in marine and terrestrial communities with climate change if predators and prey become decoupled, or newly engage with each other, which could occur if they have differing phenological, geographical, and/or physiological responses to climate change (Price 2002; Burkett et al. 2005); (4) indirect impacts from sea ice melting, for example reductions in sea ice in the Antarctic are likely to have contributed to the dramatic 80% declines in krill observed since 1970 (Atkinson et al. 2004) with penguin populations already affected, and particularly if climate change shifts the Antarctic Circumpolar Current, krill could suffer further and the ecosystem could be severely impacted; (5) climate change is also projected to cause deglaciations, e.g. of the Himalayan region, which would adversely affect the hydrology of the downstream regions, e.g. of the Indian region including its ecosystems; (6) increases in the magnitude and/frequency of (intra-annual) extreme weather events are projected with climate change as climate variability increases (e.g. Schär et al. 2004; Meehl et al. 2007), all of which have a significant potential to affect ecosystems further (e.g. Fuhrer et al. 2006). Many impact models consider such effects only in a limited manner, e.g. because of a too coarse temporal resolution; (7) climate change may affect major modes of inter-annual cyclic variability such as El Nino, the North Atlantic Oscillation, or the Pacific Decadal Oscillation. GCMs do not capture such changes to a realistic extent and many impact models have only captured such climate variability effects to a limited extent if at all. Changes to these cycles are likely to affect ecosystems through for example, changed rainfall patterns and/or drought and fire incidence (e.g. Holmgren et al. 2001).

4.3.3 Land-use change

This meta-analysis focuses on the impacts of climate change and does not account for the effects of land-use change. More realistic impacts, notably those of species extinctions in 2100 and beyond, are likely to be greater than Tables 2, 3, 4 and 5 indicate, since land-use change is included in only one study (Sekercioglu et al. 2008), and is known to negatively impact biodiversity. These additional negative impacts from land-use change would only be avoided if effective stringent policies would soon be put into place that avoid further conversion of natural and semi-natural ecosystems to agriculture, landscape fragmentation, and/or other degradations within a

given type of land use as for instance also caused by intensification of agricultural practices. Owing to the development of human systems and their adaptation to climate change, including the potential use of biofuels as a mitigation measure, both of which may force new areas into cultivation, and the projected increases in global human populations, there are in fact rather to be expected increased pressures on extant land uses than the reverse. Some scenarios of future land uses have been developed for and reviewed in the Millennium Ecosystem Assessment (2005) and evince this overall trend.

Since land-use change is well known to be of critical relevance for biodiversity conservation, Lewis (2006) raised the concern that recent literature on potential extinctions due to climate change could distract conservationist's efforts in preventing land-use change in existing ecosystems, in particular with respect to avoiding deforestation. Jetz et al. (2008) projects losses of current ranges for 21–26% of the world's approximately 8,750 bird species by 2050, and for 29–35% by 2100, due to the combination of climate change scenarios from Solomon et al. (2007) and land-use change scenarios from the Millennium Ecosystem Assessment (MEA 2005). The need to provide for species to disperse successfully to reach areas that become newly climatically suitable increases the need for protecting existing ecosystems from land-use change. These findings suggest that avoided deforestation policies offer a crucial double benefit of reducing both climate change and land-use change impacts upon biodiversity. Thus, for these reasons we consider evidence that climate change can have severe impacts on biodiversity as presented in this analysis rather to provide an additional strong incentive for preserving existing ecosystems, including their protection from land-use changes, than an invitation to neglect conservation policies.

4.3.4 Dynamics

There are very few studies in the literature, which take into account the effect that the rate of climate change exerts upon ecosystems. This is also likely to be a key factor, since the slower the rate of change the greater is the potential for adaptation by dispersal or through natural selection for physical or behavioural characteristics better suited to a changed climate (for a recent review see Fischlin et al. 2007, notably Section 4.4.5). For very small amounts of warming there may be benefits in terms of increased productivity in ecosystems which are below their thermal optimum, for example in boreal forests. However, as temperature increases further the thermal optimum is passed, and the ecosystem begins to decline. It is the passing of such thresholds or "tipping points", the onset of negative impacts, which are the focus of the literature underlying this paper.

Some such "tipping points" are breached when a certain magnitude of climate change is reached. Regional features of the earth's climate system might also be disrupted, with concurrent un-quantified impacts upon ecosystems. For example, the Indian Monsoon might be disrupted (Zickfield et al. 2005). At the Earth system scale, as temperature continues to rise, additional positive feedback mechanisms may be activated. Examples are the saturation of the net carbon sink land ecosystems currently provide, the transition to a net source (Fischlin et al. 2007, Fig. 4.2), or the risk for the potential release of methane from tundra yedoma and permafrost (Fischlin et al. 2007) and perhaps beyond 2100 even clathrates from shallow seas. The weakening of the land sink, let alone the turning into a source, as well as a

release of substantive amounts of methane would cause a strong amplification of the greenhouse effect, greatly exacerbating the ongoing climate change.

Some such "tipping points" are breached when a certain rate of climate change surpasses the rate by which ecosystems can adapt naturally. During past phases of large climate changes, species have typically responded by shifting range rather than by evolving in situ (Davis and Shaw 2001). Ecosystems have been estimated to be able to withstand a temperature increase of only 0.05–0.1°C/decade (van Vliet and Leemans 2006), much slower than the current rate of 0.13°C/decade (Solomon et al. 2007) and hugely slower than the current rate near the poles of 0.46°C/decade, considered sufficient to cause serious ecosystem disruption. Foden et al. (2007) show how the currently observed migration rate of *Aloe dichotoma* (quiver tree), a Namib desert plant, in response to observed climate change, would be insufficient to keep pace with a moderate climate change scenario for 2050. Based on a comprehensive review of these issues Fischlin et al. (2007) concluded that "The resilience of many ecosystems is likely to be exceeded this century" for business-as-usual emissions scenarios (e.g. IS92a, A1FI, A2). Resilience is here understood as the capacity of ecosystems to adapt naturally and sufficiently fast to their changing environment without altering their mode of operation entirely.

This meta-analysis is based on impact studies that assume in many cases a new hypothetical equilibrium between the projected climate change and the impacted ecosystems. Typically the forcing climate change is then assumed to have remained constant indefinitely at the ΔT_g for which the impact was assessed and that the ecosystems are given sufficient time to adapt till the new estimated equilibrium has been reached. Most of the literature used in this analysis does not explicitly discuss the time dimension, but it can nevertheless be assumed in most cases that the ecosystem impacts in Table 5 might also occur if the temperature thresholds are breached transiently (i.e. local or regional temperature "overshoots") as simulated in various studies of the dynamics of climate change (O'Neill and Oppenheimer 2004).

Den Elzen and Meinshausen (2006) show that transient probabilities of exceeding various temperature thresholds might either be higher, or lower, than the equilibrium probabilities of exceedance of that threshold. Similarly Mastrandrea and Schneider (2006) show how probability of exceedance of temperature thresholds in stabilisation scenarios is a strong function of the pathway to stabilisation. Thus, one may argue that our assessment may indeed be questioned as the evolution of temperature and other concomitant climate change variables differ. However, the advantage of our approach is that the ranking of the impacts relative to the temperature increase as an indicator of climate change is unlikely to be affected even if the absolute values might have to be corrected as our understanding of these relationships progresses. In this respect our results can be viewed as being quite robust and conservative.

The question remains whether the impact models used have realistic sensitivities. Otherwise overestimations or underestimations of the impacts would have to be expected. The majority of the impact models we used here have considered changes in temperature as well as precipitation and many have also considered the beneficial effects from CO_2 fertilisation, in particular at the global level. This makes the models more likely to exhibit realistic responses to climate change than this was the case for many earlier studies, which followed less integrative approaches.

Nevertheless, the particular approach that many current state-of-the-art impact models follow may lead to biases. First in cases where the climate change was assumed to remain constant after having reached ΔT_g, the impact models that have

not yet reached the new equilibrium tend to underestimate the impacts. Secondly, if the magnitude of climate change exceeds rapidly certain tolerances, i.e. the fundamental niches, of impacted species, even long-lived species such as trees are likely to suffer mortalities before they are replaced by newly arriving, other species for which the new, climatic situations are more benevolent. Thus, in general the more rapid climate change, the more likely such transient ecosystem degradations become. Indeed, the modelling approaches generally followed do incompletely mimic such effects and for these reasons tend to rather underestimate than overestimate impacts. Finally, for other processes such as coral bleaching and local extinction of sensitive species, which can occur within a relatively short time span of a few years, transient temperature peaks might be very critical. If emissions are reduced in a manner such that there is transient overshooting of the final equilibrium temperature, impacts may then be considerably greater than indicated in Tables 2, 3, 4 and 5.

Therefore we consider the results from our meta-analysis to be in general rather conservative and it appears to be unlikely that they are biased towards overestimating the severity of the consequences of climate change for ecosystems. However, critical uncertainties remain, in particular because most impact models depend to a large extent on knowledge about the realized niches only. Should fundamental niches be significantly larger than the realized ones, overestimations of climate change impacts are bound to result. Indeed, the difficulties to assess the true fundamental niches of most species remain a relevant source of uncertainty (Kirschbaum and Fischlin 1996), a fact that still significantly constrains the ability of most currently used kinds of ecological models to assess climate change impacts.

5 Conclusions

A literature-based integrated assessment of the effects of climate change upon a wide range of ecological systems has shown that the negative impacts accrue as annual global mean temperature rise as little as 1.6°C (low end of the likely range of IPCC scenarios,[1] IPCC 2007) above the pre-industrial level, already with several examples of projected severe damages, range losses, and extinctions. As global temperatures reach and exceed 2°C above pre-industrial levels, negative impacts rapidly increase. This includes increases in range losses and extinctions and increasing damage to some critical ecosystem structure and functioning. As global temperatures increase further beyond 2°C above pre-industrial, the literature and models increasingly project impacts accruing to entire systems and becoming more widespread across a range of different species groups and regions. Several critical aspects of ecosystem functioning are projected to begin to collapse at a temperature of 2.5°C (Table 4). These represent either the potential collapse of entire ecosystems e.g. wide-spread impoverishment of coral reefs, or comprise impacts, which are in our judgement dangerous, because they likely imply irreversible damages, such as extinctions of key species, or the onset of positive feedbacks, such as CO_2 emissions, accelerating climate change. In our judgement, risking the widespread collapse of multiple global

[1]This value considers the multi-model projected lower end of the likely range of the IPCC SRES B1 scenario (IPCC 2007, Table SPM.3) of +1.1°C warming by 2100 relative to 1980–1999 and adding +0.5°C already realized global warming for period 1980–1999 relative to preindustrial climate.

ecosystems (Table 4) represents "dangerous anthropogenic interference" and would comprise a breach of compliance with Article 2 of the United Nations Framework Convention on Climate Change.

This meta-analysis confirms and expands upon the results of other assessments (Houghton et al. 2001; Hare 2006; Warren 2006; Fischlin et al. 2007), which have shown that climate change is a threat to ecosystems and species worldwide, with coral reef, Arctic, Mediterranean, and mountain ecosystems including many biodiversity hotspots being particularly at risk. Hare (2006) also identified substantial increases in risks to ecosystems and species beyond the EU 2°C target using "burning ember" diagrams. We consider that our study, with a more extensive literature review, using a tabular approach and including some uncertainty analysis, provides further strong justification for policies constraining annual global mean temperature change relative to preindustrial climate to no more than 2°C—at least from an ecosystem preservation point of view. This temperature would avoid the projected breaching of the aforementioned large-scale ecosystem collapses, as well as a large proportion of the onset of many of the projected negative impacts such as range losses, extinctions, ecosystem damages including disruptions of their structure and functioning. Since we identified some significant impacts in biodiversity hotspots such as amphibian extinctions in tropical forests and wide spread coral bleaching in reefs below a 2°C warming, protection of the majority of ecosystems would however require a more stringent target, as argued by Rosentrater (2005) for the Arctic.

Many of the impacts tabulated here appear to be clearly in conflict with Article 2 of the United Nations Framework Convention on Climate Change in not allowing ecosystems to adapt naturally. Minimising the rate of climate change is expected to also reduce the risks of climate change for ecosystems, although this aspect can not yet be well analysed with current techniques available to assess impacts. According to the precautionary principle it appears that a reduction in current and future land use change will give ecosystems and species the best chance to adapt to the climate changes that are projected to occur in the twenty-first century even under stringent mitigation policy. In particular, avoided deforestation is a policy which meets both these goals, although alone this policy is of course not sufficient to constrain climate change to 2°C above pre-industrial levels. Further analyses of many of the findings from this study made in an even broader context of climate change impacts on ecosystems can be found in Fischlin et al. (2007).

Acknowledgements We are very grateful to Tim Osborn for the use of downscaling software, and to Carol Turley for the provision of information related to impacts of ocean acidification. We would also like to thank both of these people, as well as Andrew Watkinson and Bill Hare, for the helpful discussions.

Appendix

The Table 6 below contains detailed information concerning the underlying studies used in each entry of Tables 2–5, where column 1 is identical to column 1 of Tables 2–5, and the following abbreviations are used: **E** indicates an empirical derivation, **M** indicates a modelling study, a **number** refers to how many GCMs were used in the original literature. Other codes indicate if model projections included precipitation (**P**), ocean acidification (**pH**), sea ice (**SI**), sea level rise (**SLR**), sea

surface temperature (**SST**) or anthropogenic water use (**W**); dispersal assumptions from the literature. **D**—estimate assumes dispersal; **ND**—estimate assumes no dispersal; **NR**—not relevant since species/ecosystem has nowhere to disperse to in order to escape warming (e.g. habitat is at top of isolated mountain or at southern extremity of austral landmass). **IMAGE**, **BIOME4**, **LPJ**, **MAPSS** refer to specific models as used in the study, to assess climate change impacts, e.g. LPJ denotes the Lund–Potsdam–Jena dynamic global vegetation model (Sitch et al. 2003). **DVGM** refers to dynamic global vegetation model. GCM abbreviations used here: **H2**—HadCM2, **H3**—HadCM3, **GF**—GFDL, **EC**—ECHAM4, **CS**—CSIRO, **CG**—CG, **PCM**—NCAR PCM. Lower case a–h refers to how the literature was addressed in terms of up/downscaling and these are defined in Table 1. The GCM outputs used in the upscaling calculations are those used in the IPCC Third Assessment Report (TAR IPCC 2001) and are at 5° resolution: HadCM3 A1FI, A2, B1, B2 where A2 is an ensemble of 3 runs and B2 is an ensemble of 2 runs; ECHAM4 A2 and B2 (not ensemble runs); CSIRO mark 2 A2, B1, B2; NCAR PCM A2 B2; CGCM2 A2 B2 (each an ensemble of 2 runs). Where GCM scenario names only were provided further details were taken from: HadCM2/3 (Mitchell et al. 1995; Hulme et al. 1999; Arnell et al. 2004), http://ipcc-ddc.cru.uea.ac.uk.

Table 6 Supplementary to Tables 2, 3, 4 and 5: the table below contains detailed information on models and how the upscaling and downscaling were performed for each entry in Tables 2, 3, 4 and 5 and uses the same numbering scheme

Table no.	Entry no.	Details on type of study, models, model results, and methods used to derive the sensitivities as tabulated in Tables 2–5 for each table entry
2	1, 4, 9	M, 5, ND, c; ref. quotes 13.8% loss in Rocky Mountains for each 1°C rise in JJA temperature, upscaled with CS, PCM, CG
2	2, 15	M, 5, IMAGE, a; authors confirmed temperature baseline is year 2000 which is 0.1°C warmer than 1990
2	3	M, D, b; no GCM used in ref.; upscaled with H3, EC, CS, PCM, CG
2	14, 32	M, P, GDD, D&ND, a; ref uses B1 and A2 of H3 with ΔT rise of 2.4°C and 3.7°C respectively compared to the 1961–1990 mean
2	6, 7	M, P, NR, e; upscaled at several sites using H3, EC, CS, PCM, CG
2	5	M, H3, E4, P, D&ND, a; GFDL based estimates omitted due to lack of access to global temperature time series
2	10	M, H3, W, a; ref. uses B2 of H3 in 2070 that has a ΔT rise of 2.1°C with respect to the 1961–1990 mean
2	11	M, P, D, d; UKCIP02 high emission scenario used as central value; upscaled for Hampshire from UKCIP02 (Hulme et al. 2002) regional maps using H3, EC, CS
2	12	M, SLR, a; analysis based on transient 50% probability of sea level rise using the US EPA scenarios for ΔT of 2°C above 1990 baseline

Table 6 (continued)

Table no.	Entry no.	Details on type of study, models, model results, and methods used to derive the sensitivities as tabulated in Tables 2–5 for each table entry
2	13	M, H3, SLR, a; IS92a median ΔT 2.0°C above 1990 (Kattenberg et al. 1996, Fig. 6.20) and range 1.4–3.0°C
2	16	M, GE, P, NR, d; GENESIS GCM with 2.5°C rise for CO_2 doubling from 345 to 690ppm, 345 ppm corresponds quite closely to the 1961–1990 mean; upscaling then gives the range; across locations variously used H3, EC, CS, CG
2	17	M, NR, b; upscaled with H3, EC, CS, and CG
2	18	M, P, D, HadCM3, ECHAM4, GFDL, a; Huntley et al. (2006) give 2.5°C relative to 1961–1990 mean
2	19	M, 2, P, d, g; range is due to importance of ΔP, GFDL CO_2 doubling is from 300 ppm which is close to 1900 climate sensitivity in ref of 3.7; UKMO in 2050 is 1.6°C above 1961–1990 mean, 1.9°C above preindustrial
2	20, 21	M, H2, BIOME4, P, NR, c; A1 scenario of H2GS has ΔT of 2.6°C relative to 1961–1990 mean
2	22	M, BIOME3, P, d, f; H2 2080s has global ΔT of 2.6°C above 1961–1990 mean
2	23	M, H3, W, a; ref. uses A2 of H3 in 2070 that has a ΔT of 2.7°C with respect to the 1961–1990 mean and hence 2.5°C with respect to 1990
2	24	M, H3, GF, EC, P, D&ND, a
2	25	M, CS, P, d; upscaled with H3, EC, CS, CG
2	26	M, H2, SLR, NR, a; H2 2080s without aerosols has global ΔT of 3.4°C above pre-industrial (Hulme et al. 1999)
2	27	M, 2, P, D, d; study used CO_2 doubling scenarios—CCC ΔT at doubling is 3.5°C relative to 1900 whilst GFDL R30 is 3.3°C relative to 1900; upscaling gives range H3, EC, CG
2	28	M, D, b; upscaled with H3, EC, CS
2	29	M, CCC, P, D, d; CO_2 equilibrium doubling scenario has ΔT of 3.5°C relative to 1900; downscaled with CGCM and upscaled with H3, EC, CS, CG
2	30	M, 5, IMAGE, P,a; authors confirmed temperature baseline is year 2000 which is 0.1°C warmer than 1990
2	31	M, P, D (based on empirical calibration), d; upscaled with H3, EC, CS, PCM, CG
2	33	M, D, f; Meehl et al. (2007), Fig. 10.3.5 shows this occurs for ΔT ≥3.5°C above 1990
2	12, 34	M, D&ND, P, HadCM3, a; Ohlemüller et al. (2006) use HadCM3 projections quoted as '2.0, 4.8°C above 1931–1960 mean for entries 12, 34 respectively, add 0.1°C to convert to pre-industrial

Table 6 (continued)

Table no.	Entry no.	Details on type of study, models, model results, and methods used to derive the sensitivities as tabulated in Tables 2–5 for each table entry
2	35	M, 3, P, a
2	36	M, SLR, a; US EPA scenario of 4.7°C above 1990.
3	37	E
3	38	M, D&ND, a; 18% matches minimum expected climate change scenarios which Table 3 of Thomas et al. (2004a) lists as ΔT of 0.9°–1.7°C (mean 1.3°C) above 1961–1990 mean; 8 of 9 sub-studies used H2
3	39, 55, 71, 78, 82	M, D, a;
3	40	M, H2, P, ND, d; table 3 of Thomas et al. (2004a) gives global ΔT of 1.35°C above 1961–1990; HHGSDX of H3; downscaled with H3 then upscaled with H3, EC, CS, PCM, CG
3	41	M, H2, P, D&ND, d; Beaumont and Hughes (2002) give global mean temperature rise of 1.8°C relative to the 1961–1990 mean
3	42	M, D, P, a
3	43	M, D, b; upscaled using H3, EC, CS, PCM, CG
3	44	M, H3, P, D, d; H3 2050 SRES mean
3	45	M, H2, P, D, d, g; table 3 of Thomas et al. (2004a) gives global ΔT of 1.35°C above 1961–1990; upscaled with H3, EC, CS, PCM, CG; uses a local ΔT range across Australia
3	46	M, H3, P, D&ND, d; ref. uses B1 of H3 in 2050 with a ΔT of 1.8°C above the 1961–1990 baseline; downscaled with H3 and then upscaled with H3, EC, CG
3	47	M, H2, P, D&ND, d; studies used global annual mean ΔT of 1.7–2.0°C above 1961–1990 mean
3	48	M, P, D&ND, a; table 3 of Thomas et al. (2004a) mid-range climate scenarios have a mean ΔT of 1.9°C above 1961–1990
3	49	M, H2, P, D&ND, d; ref. refers to A2 of H3 in 2050 that has a ΔT of gives as 1.9°C above 1961–1990 (Arnell et al. 2004); downscaled with H3 then upscaled with H3, EC, CS, PCM, CG
3	50	H; upscaled using maps from WGI, chapter 10
3	51	M, 2, P, NR, d; scenarios on CRU website used with ΔT of 2.0°C above 1961–1990, agrees with Table 3 of Thomas et al. (2004a) which gives ΔT of 2.0°C above 1961–1990 mean; downscaled with H3 then upscaled with H3, EC, CS, PCM, CG
3	52	M, H2, P, D, d; the 66% is from a suite of 179 representative species, table 3 of Thomas et al. (2004a) lists global ΔT of 2.0°C above 1961–1990 mean, upscaled with H3, EC, CS, CG
3	53	M, H2, P, D&ND, d; table 3 of Thomas et al. (2004a) which gives ΔT of 2.0°C above 1961–1990 mean using HHGGAX; downscaled with H3 then upscaled with H3, EC, CS, PCM, CG

Table 6 (continued)

Table no.	Entry no.	Details on type of study, models, model results, and methods used to derive the sensitivities as tabulated in Tables 2–5 for each table entry
3	54	M, H2, P, ND, d; table 3 of Thomas et al. (2004a) which gives ΔT of 2.0°C above 1961–1990 mean using HHGGAX; downscaled with H3 then upscaled with H3, EC, CS, PCM, CG
3	56	M, IMAGE, P, D&ND; Bakkenes et al. (2002) gives the global temperature change relative to 1990
3	57	M, P, D&ND; ref. uses B1 in H3 in 2080s from (Arnell et al. 2004)
3	58	M, SST, h
3	59	M, H2, D&ND, d; ref. uses global ΔT of 2.3°C above 1961–1990 mean; downscaled with H3 and upscaled with H3, EC, CG
3	60, 76	M, P, D & ND, a
3	61	M, 15, SI, a; Arzel et al. (2006) uses 15 GCMs with A1B for 2080s, ΔT A1B 2080s multi-model from WGI, chapter 10, Fig. 10.3.2 is 2.5°C above 1990; ACIA uses 4 GCMs with B2, multi-model ΔT is 2.2°C over 1961–1990 or 2.0°C above 1990
3	62	M, P, D, HadCM3, ECHAM4, GFDL, a; Huntley et al. (2006) give 2.5°C relative to 1961–1990 mean
3	63	M, 10, P, D, d, g; Beaumont and Hughes (2002) give global mean temperature rise of 2.6°C relative to the 1961–1990 mean
3	64	M, P, D, ND, a; Table 3 of Thomas et al. (2004a) maximum climate scenarios have a mean ΔT of 2.6°C above 1961–1990 or 2.3°C above 1990
3	65	M, SST, h
3	66	M, P, NR, e; upscaled for several sites taken from maps in ref., using H3, EC, CS, CG
3	67	M, NR
3	68	M, 3, a, P, cloudiness, D & ND
3	69	M, NR, b; % derived from Table 1 in Benning et al. (2002) for all forest areas combined on the 3 islands studied; upscaling considers changes averaged over 3 islands and uses H3, EC, CS, CG
3	70	M, H3, P, D&ND, d, f; table 3 of Benning et al. (2002) lists global ΔT of 3°C above 1961–1990 mean
3	72	M, 7, BIOME3, MAPSS, P, D&ND, a; uses CO_2 doubling scenarios from Neilson and Drapek (1998) Table 2; control concentrations were obtained directly from modellers; thus deduced mean global mean ΔT for this study
3	73	M, H3, P, D&ND, d; ref. uses A2 in H3 in 2080 that has a ΔT of 3.3°C above 1961–1990 (Arnell et al. 2004)
3	74	M, H3, P, D, d, f; ref. lists ΔT of 3.6°C for A1 in H3 in 2080 relative to 1961–1990, downscaled with H3 and upscaled with H3, EC, CG

Table 6 (continued)

5	90	E, SI
5	91	M, SST, h
5	92	M, P, NR, d; HadRM3PA2 in 2050, Fig. 13 in Moriondo et al. (2006) shows ΔT matching B2 of H3 of 1.6°C above 1961–1990 mean; downscaled with H3 and upscaled with H3, EC, CS, PCM, CG
5	93	M, P, D (based on empirical calibration), d, upscaled with H3, EC, CS, PCM, CG
5	94	E, P, D, b; upscaled using H3, EC, CS, PCM, CG
5	95	M, H2 with aerosols in 2050, a, 6 DVGMs, global temperature taken from Raper et al. (2001).
5	96	E, P, NR, a
5	97	M, a; Williams et al. (2007) use the B1 scenario from a mean of 9 GCM simulations used in IPCC (2007) which have a global temperature increase of 1–2.5°C averaging approximately 1.9°C above 1990 (hence 2.4 above pre-industrial)
5	98	M, d; upscaled using H3, EC, CS, PCM, CG
5	99	M, P, NR, d; HadRM3PA2 in 2050, taken from Fig. 13 of Moriondo et al. (2006)
5	100	M, CS, b; upscaled with H3, EC, CS, PCM, CG
5	101	M, 15, SI, a; Arzel et al. (2006) uses 15 GCMs with A1B for 2080s, ΔT A1B 2080s multi-model from WGI, chapter 10, Fig. 10.3.2 is 2.5°C above 1990; ACIA uses 4 GCMs with B2, multi-model ΔT is 2.2°C over 1961–1990 or 2.0°C above 1990
5	102, 103	pH, g; IS92a in 2100 has 788 ppm CO_2 and ΔT of 1.1–3.6°C above 1990
5	104	M, a;
5	105	E, P, D, e; upscaled with H3, EC, CS
5	106	M, H2 with aerosols in 2100, a, 6 DVGMs, global temperature taken from Raper et al. (2001)

Table 6 (continued)

Table no.	Entry no.	Details on type of study, models, model results, and methods used to derive the sensitivities as tabulated in Tables 2–5 for each table entry
5	107	pH, a; impact is at CO_2 doubling, T range given by IPCC (2007) for equilibrium climate sensitivity
5	108	M, a; Williams et al. (2007) use the A2 scenario from a mean of 9 GCM simulations used in IPCC (2007) which have a global temperature increase of 2–4°C averaging approximately 3.5°C above 1990 (hence 4°C above pre-industrial)

Response to Comment Letter O11 – Center for Biological Diversity and Sierra Club

O11-1 Introductory comments are noted for the record. The commenter provides a general introduction and states a general concern regarding individual and cumulative impacts to air quality, greenhouse gas emissions, sensitive receptors, land use and noise. All attachments to the comment letter have been received. As the attachments are intended to support specific comments in the letter, responses to the letter also fully respond to the attachments.

O11-2 General information related to the purposes of the Center for Biological Diversity and the Sierra Club is noted for the record. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O11-3 The commenter's summary of the Project is noted for the record. The County disagrees with the commenter's assertion that the Project would double warehouse space in the "region." According to the SCAQMD's Second Draft Staff Report for Rules 2305 and 316, there are approximately 45,000 industrial buildings of any size located in the SCAQMD region, totaling about 1.6 billion square feet. The proposed Project represents 0.4 percent of the warehouse space in the region. Therefore, the Project would not double the warehouse space in the region. It should be noted that the cumulative project list is not a summary of the warehouse space in the region. The cumulative projects list only includes past projects under construction and reasonably foreseeable discretionary projects within an area where a cumulative impact could occur.

O11-4 The comment erroneously makes general assertions that the Project's impacts related to air quality, greenhouse gas emission, sensitive receptors, land use and noise have not been considered and mitigated but includes no basis for this claim. All feasible mitigation has been included within the Draft EIR. Responses regarding the commenter's claims on these topics are addressed in responses to specific comments below. The commenter has not raised any issues which would necessitate recirculation pursuant to State CEQA Guidelines Section 15088.5. Therefore, no further action is required at this time.

O11-5 A Heath Risk Assessment (HRA) for the Project was prepared to evaluate impacts to sensitive receptors in accordance with the SCAQMD Guidance: *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis* (August 2003) and SCAQMD Modeling Guidance for AERMOD (https://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance) and is located in Draft EIR *Appendix C*. The commenter states that trucks would be routed through residential neighborhoods. However, Project Objective 4 includes limiting truck traffic disruption to sensitive receptors within the surrounding region. Furthermore, the City of Fontana has designated Cherry Avenue, Arrow Route, and San Bernardino Avenue as truck routes[9] and the County of San Bernardino designates these roadways as Major Divided Highways[10]. Project truck traffic would primarily use

[9] City of Fontana, Local Truck Routes, February 6, 2004.
[10] See Draft EIR Appendix L, Figure 4a.

these designated roadways and Project truck traffic would not occur within the sensitive receptor neighborhoods. The HRA evaluated truck exhaust emissions from both tailpipes and transport refrigeration units (TRUs) and analyzed pollutant concentrations at the closest sensitive receptors to the project site, which included residences and Redwood Elementary School which is 1,370 feet from the Project site. As discussed in the Draft EIR and HRA, impacts would be less than significant with mitigation incorporated. (see Draft EIR at pages 4.3-43 to 4.3-53). It should be noted that Live Oak Elementary School, Beech Avenue Elementary School and Almond Elementary School mentioned in the comment are further away than Redwood Elementary School (and all range from approximately 4,800 to 5,400 feet away). As pollutant concentrations decline further away from the Project site, impacts at these locations would be lower than what was identified in the Draft EIR. The Draft EIR also determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46).

The comment also notes that the Project is adjacent to census tracts that are designated as SB 535 Disadvantaged Communities. It should be noted that SB 535 does not include project specific requirements or prohibit developments in proximity to the designated communities. SB 535 directs 25 percent of the proceeds from the Greenhouse Gas Reduction Fund (i.e., funds from the AB 32 cap-and-trade program) to go to projects that provide a benefit to disadvantaged communities (as identified by the OEHHA mapping).

O11-6 The comment generally discusses regional air quality and public health concerns, which was discussed within *Section 4.3.2, Environmental Setting*, of the Draft EIR. The comment does not raise a specific issue with the adequacy of the Draft EIR or raise any other CEQA issue. Master Response 2 explains that the Draft EIR analyzed and disclosed Project regional and localized air quality impacts as well as health risk impacts and identified all feasible mitigation to reduce those impacts. Regarding impacts to sensitive receptors (including young children), the health risk assessment was prepared in accordance with SCAQMD and OEHHA guidance and included age sensitivity factors to account for the most sensitive populations. As described in Draft EIR *Section 4.3*, health risk impacts would be less than significant with implementation of MM AQ-1 and MM AQ-9. Furthermore, it should be noted that the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3 53), which indicates that the regional increases shown in Draft EIR *Tables 4.313* through *4.3-17* would not necessarily cause an exceedance of the ambient air quality standards. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O11-7 The comment generally discusses regional trends in warehouse development and goods movement. The comment does not raise a specific issue with the adequacy of the Draft EIR or raise any other CEQA issue. As noted in Master Response 2, the Draft EIR analyzed and mitigated the Project's air quality, health risk, and GHG emissions in accordance with the State CEQA

Guidelines. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O11-8 (This response also responds to Exhibit 1) See Responses O3-13 and O11-5. The commenter refers to conflicts between warehouses, schools and homes in the Project's vicinity and states that the community is experiencing transformation from primarily open, residential area to logistics. The Project site is located in the County's Policy Plan Commercial (C) Land Use Category and in the Special Development - Commercial (SD-COM) Zoning Designation. Neither a General Plan Amendment nor a Zone Change is required to allow or authorize the uses permitted in the Specific Plan area. Although the Project site currently contains a commercial land use designation, the underlying special development zoning allows for combination of residential, commercial, industrial, agricultural, open space and recreation uses, and similar and compatible uses. A text and map amendment to the Development Code and General Plan will be made to identify the Specific Plan designation on the official map. Additionally, the HRA prepared for the Draft EIR evaluated pollutant concentrations at the closest sensitive receptors to the project site, which included residences and Redwood Elementary School. As discussed in the Draft EIR and HRA, impacts would be less than significant with mitigation incorporated. (see Draft EIR pages 4.3-43 to 4.3-53). It should be noted that Live Oak Elementary School, Beech Avenue Elementary School and Almond Elementary School mentioned in the comment are further away than Redwood Elementary School. As noted in Response O11-5, Redwood Elementary School is approximately 1,370 feet away and Live Oak Elementary School, Beech Avenue Elementary School and Almond Elementary School (and all range from approximately 4,800 to 5,400 feet away). As pollutant concentrations decline further away from the Project site, impacts at these locations would be lower than what was identified in the Draft EIR. The Draft EIR also determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46).

Furthermore, it should be noted that the proposed Project would be located within an area that is already developed and associated with the existing Speedway and is surrounded by industrial and Speedway related uses. The closest sensitive receptors, which include a single-family residence is located approximately 410 feet away and the majority of sensitive receptors are located more than 1,000 feet away. Therefore, as the Project would be adjacent to existing warehouse and related uses, it would not result in a patchwork of conflicting land uses. Therefore, no further response is required.

O11-9 The comment states that the community is impacted by pollution per the California Communities Environmental Health Screening Tool (CalEnviroScreen) and lists three census tracts in the area as being the most polluted in the state. CalEnviroScreen has been developed by the Office of Environmental Health Hazard Assessment (OEHHA) and California Environmental Protection Agency (CalEPA). While CalEnviroScreen can assist CalEPA in prioritizing resources and helping promote greater compliance with environmental laws, it is important to note some of its

limitations. The tool's output provides a relative ranking of communities based on a selected group of available datasets, through the use of a summary score. Unlike the Health Risk Assessment (HRA) prepared for the Project, the CalEnviroScreen score is not an expression of health risk and does not provide quantitative information on increases in cumulative impacts for specific sites or projects. Further, as a comparative screening tool, the results do not provide a basis for determining when differences between scores are significant in relation to public health or the environment. Accordingly, CalEnviroScreen is not intended to be used as a health or ecological risk assessment for a specific area or site. Also refer to Master Response 2.

The Project HRA discusses the CalEnviroScreen rankings (refer to Draft EIR *Appendix C*). According to CalEnviroScreen, the Project site and the nearest residences to the northeast are located within Census Tract 6071002204, which is within the 93rd percentile overall for the CalEnviroScreen Score, which considers pollution burden (average of exposure and environmental effects) and population characteristics (average of sensitive populations and socioeconomic factors). The County does not dispute the data from CalEPA's CalEnviroScreen. These results are presented for comparative purposes and cannot be used (and are not intended to be used) to determine a whether a project will result in a significant impact for purposes of CEQA. The fact that the Project is located in an area that CalEnviroScreen identifies as in the 93rd percentile for pollution burden is not indicative of a CEQA impact. However, the Project's cumulatively significant air quality impact is acknowledged and discussed at pages 4.3-54 to 4.3-55 of the Draft EIR.

The comment summarizes the demographic makeup of the census tract and asserts that the community may have a lower high school graduation rate and income level than the Fontana average. However, as noted above and in the Draft EIR, the Project would not result in significant health effects. Additionally, whether individuals within a community may or may not graduate from high school and therefore have a lower income level is not an environmental issue required to be considered under CEQA. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O11-10 The commenter provides a summary of CARB requirements and general discussion of industrial buffering distance guidelines. The Project is consistent with the General Plan and existing zoning and proposes uses that are allowed by the Development Code. It should be noted that the CARB Air Quality and Land Use Handbook recommendation of a 1,000-foot buffer from distribution centers is for general planning purposes to determine when a site-specific health risk assessment may be required. Page ES-3 specifically notes that "these guidelines are not regulatory or binding on local agencies, we took a more qualitative approach in developing the distance-based recommendations." Furthermore, page ES-3 also notes: "[t]hese recommendations are advisory and should not be interpreted as defined 'buffer zones.' We recognize the opportunity for more detailed site-specific analyses always exists, and that there is no 'one size fits all' solution to land use planning". As noted above and in Master Response 2, an HRA was prepared for the Draft EIR, which evaluated pollutant concentrations at the closest sensitive receptors to the Project site. As

discussed in the Draft EIR and HRA, impacts would be less than significant with mitigation incorporated. (see Draft EIR pages 4.3-43 to 4.3-53). While the Project's air quality and greenhouse gas effects were found to be significant and unavoidable, mitigation was included within the Draft EIR to reduce these impacts to the maximum extent feasible.

O11-11 The comment generally summarizes climate change. The comment does not raise a specific issue with the adequacy of the Draft EIR or raise any other CEQA issue. As discussed in Master Response 2, the Project is subject to the County's GHG Reduction Plan. Draft EIR Table 4.8-4 demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. MM GHG-1 requires the Project to apply reduction measures identified in the County's GHG Screening Tables so that each building would achieve a minimum of 100 points.

The County's 2021 GHG Emissions Reduction Plan Update states that any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and its corresponding GHG emissions.

O11-12 Refer to Response O11-11 and Master Response 2. As noted above, the comment generally summarizes climate change and State GHG regulations and policy. The comment does not raise a specific issue with the adequacy of the Draft EIR or raise any other CEQA issue. However, as noted above, the Project would be consistent with the GHG Reduction Plan, which would ensure that the County would be consistent with the State's long-term goal to achieve statewide carbon neutrality by 2045.

O11-13 Refer to Response O11-11 and Master Response 2. As noted above, the comment generally discusses the cumulative nature of GHG impacts. The comment does not raise a specific issue with the adequacy of the Draft EIR or raise any other CEQA issue. However, as noted above, the Project would be consistent with the GHG Reduction Plan, which would ensure that the County would be consistent with the State's long-term goal to achieve statewide carbon neutrality by 2045. Additionally, the Draft EIR discloses, analyzes, and mitigates the Project's GHG emissions in *Section 4.8*.

O11-14 Refer to Response O11-11 and Master Response 2. The comment incorrectly states that the Draft EIR does not fully disclose, analyze, mitigate, or consider alternatives to reduce the Project's climate change effects. The Draft EIR discloses, analyzes, and mitigates the Project's GHG emissions in *Section 4.8*. Project alternatives are evaluated in Draft EIR *Section 6.0*. As discussed in Master Response 2, the Project is subject to the County's GHG Reduction Plan. Draft EIR *Table 4.8-4: San Bernardino County GHG Reduction Measures Screening Table* demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent

with the GHG Reduction Plan. MM GHG-1 requires the Project to apply reduction measures identified in the County's GHG Screening Tables so that each building would achieve a minimum of 100 points, which would be consistent with the State's GHG reduction goals. Achieving 100 points on the County's GHG Screening Tables requires the implementation of numerous measures. For example, the tables require various measures to improve building energy efficiency such as installing upgraded building insulation, windows, cool roofs, air filtration, indoor space efficiencies, space heating, water cooling, daylighting, efficient lighting, building placement, and shading. The tables also require various water efficiency measures to reduce energy related GHG emissions. To reduce mobile source emissions and encourage the use of ZEVs, the Screening Tables require electric vehicle chargers and bike and pedestrian amenities. To reduce GHG emissions from solid waste, the Screening Tables require increased recycling.

The Draft EIR also requires the project to implement solar energy generation (MM GHG-2), requires energy efficient buildings that exceed the building code standards (MM GHG-3), requires the solid waste diversion (MM GHG-4), and requires the use of 100 percent electrically powered landscape equipment (MM GHG-5).

State regulations requiring the implementation of near zero or zero emission trucks are expected to substantially reduce the Project's GHG emissions over time, although such reductions are not factored into the Draft EIR's quantification of GHG emissions.

Additionally, mitigation in the Draft EIR Air Quality section (*Section 4.3*) includes numerous measures that would also reduce GHG emissions. Applicable air quality mitigation measures include a TDM Program to reduce vehicle trips/miles (MM AQ-3), constructing EV infrastructure (MM AQ-4), conduit for Transport Refrigeration plugins (MM AQ-5), idle limits (MM AQ-6), energy efficient vendor trucks (MM AQ-7), EV charging stations and carpool parking (MM AQ-8), electric/zero emission cargo handling equipment (MM AQ-9), and compliance with SCAQMD Rule 2305 (MM AQ-10) which is a program to incentivize the purchase of cleaner trucks and charging/fueling infrastructure for the project and in the nearby community. Therefore, the Draft EIR GHG mitigation measures comply with State CEQA Guidelines Section 15041 and go above and beyond to meet the essential nexus and rough proportionality standards.

O11-15 The comment incorrectly states that the Project failed to fully evaluate the Project's significant environmental impacts or adequately describes the project in detail. The Project is consistent with the General Plan and existing zoning and proposes uses that are allowed by the Development Code. While the Project's air quality and greenhouse gas effects were found to be significant and unavoidable, mitigation was proposed to reduce these impacts to the maximum extent feasible. Furthermore, Draft EIR *Section 4.8, Greenhouse Gas Emission*, *Table 4.8-4*, demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and resulting emissions. The Project's significant and unavoidable impacts and its consistency with the Countywide goals and policies and the SCAG RTP/SCS goals are documented in *Section 4.11, Land Use and Planning*, of the Draft EIR. The Project Description, found in Draft EIR *Section 3.0, Project Description* is

accurate and stable and provides adequate detail to evaluate Project impacts. Under CEQA, the EIR must contain a general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals, if any, and supporting public service facilities. (CEQA Guidelines, Section 15124(c)). CEQA also states that the project description should not supply extensive detail beyond that needed for evaluation and review of the proposed project's potentially significant environmental impacts. (CEQA Guidelines, Section 15124). See Master Response 1.

O11-16 See Response O11-15 above.

O11-17 The trip generation rate for e-commerce uses was based on actual counts for both passenger cars and trucks at local e-commerce facilities, which is the best indicator of the projected trip generation of the Project. In addition, ITE rates for High-Cube Warehouse, Warehousing and High-Cube Cold Storage Warehouse were used to validate our estimate of trip generation from the project; please refer to Response O3-7. The trip generation rates must closely align with the projected trip generation of the Project. A split of 60 percent E-commerce uses and 40 percent warehouse, high-cube warehouse, cold-storage warehouse uses is a conservative estimate of trips anticipated to be generated by the project as E-commerce land use has higher trips per building square footage compared to high-cube warehouse. The level of detail provided in the Draft EIR is appropriate for analysis of a Specific Plan. Specific data regarding the number of loading docks, trailer stalls or parking spaces is not known at this time. However, future individual development projects that are constructed pursuant to the Specific Plan, *Section 6, Implementation*, will be required to submit documentation to the County of San Bernardino to verify that the projected trips generated by the proposed uses are within the overall Specific Plan trip budget, as analyzed in the EIR technical studies. A trip generation budget will be created based on the LOS study and as each parcel develops, a consistency memo will be provided to the County to measure the trips generated by specific uses developed against the total trip budget.

O11-18 (This response also responds to Exhibit 2). The Project involves the development of speculative warehouse buildings and truck parking lots, and the end users are currently unknown. As such, the origins and destinations of the vehicle trips (including trucks) are unknown. Average truck trip lengths used for modeling purposes are based on substantial evidence within the CARB study, *Estimation Methodology for On-Road Diesel-Fueled Heavy-Duty Drayage Trucks at California Ports and Intermodal Rail Yards* (2007). The data within the CARB study is the basis for substantial evidence of a reasonably foreseeable average truck trip length. The truck trip length represents average distances in the South Coast Air Basin, where the Project is located. These are average trip lengths, meaning that some trips would be longer and some would be shorter.

A technical difficulty inherent in calculating mobile source emissions associated with any project is related to the estimation of trip length and vehicle miles traveled (VMT). VMT for a given project is calculated by the total number of vehicle trips to and from the project site multiplied by the average trip length. This method of estimating VMT for use in calculating vehicle emissions likely results in the overestimation and double-counting of emissions because, for high-cube logistics and e-commerce uses such as the Project, the land use is likely to attract (divert) existing vehicle

trips that are already on the circulation system as opposed to generating new trips. In this regard, the project would, to a large extent, redistribute existing mobile-source GHG emissions rather than generate new and additional mobile source emissions. As such, the estimation of the project's vehicular-source emissions is likely overstated in that no credit for, or reduction in, emissions is assumed based on diversion of existing trips.

The commenter incorrectly states that the County plans for all truck trips to only travel to and from the Port. As noted above, the Project involves speculative warehouses, and the end users are currently unknown. The comment asserts that all of the Project's trucks would only travel to or from the Ports of Los Angeles and Long Beach and not include other trip origins or destinations without providing any evidence to support this claim . According to research conducted by the National Cooperative Highway Research Program, average heavy truck trip lengths in the Los Angeles metropolitan planning organization are 24.1 miles, while average medium truck trip lengths are 13.1 miles, and average light truck trip lengths are 5.9 miles.[11] Depending on the Project's end users, the warehouses could be used to make local deliveries to other nearby warehouses. Additionally, truck trips could originate or end at other various locations within the region, such as the Ontario International Airport approximately 7 miles away, the Union Pacific Intermodal Facility approximately 6 miles away, or the BNSF San Bernardino Intermodal Facility approximately 14 miles away, among other locations. Furthermore, the Project includes 98 acres of truck and trailer storage, and every trip associated with these uses is also assumed to use the same average trip length, whereas, in reality, trucks and trailers from this facility would most likely serve the adjacent proposed buildings and surrounding area. It would be speculative to assume that the Project's trucks will only travel to or from the Ports and not include other trip origins or destinations. The estimated truck trip length in the Draft EIR likely results in a significant overestimation of the truck vehicle miles resulting from the project because it assumes that all truck trips to and from the project are "new" within the context of the air basin, rather than redistributed truck trips in the basin. Since the truck trip lengths are based on reasonable information (i.e., data provided by CARB), as presented in the Draft EIR, providing some greater unsubstantiated trip length that extends beyond what is evaluated in the Draft EIR would be speculative .

O11-19 The commenter provides a general summary of a legal case and State CEQA Guidelines regarding cumulative impact analysis and mitigation but does not provide any information to dispute the analysis provided in the Draft EIR. The Project's cumulative air quality impacts are discussed on pages 4.3-54 to 4.3-55 of the Draft EIR, and sensitive air quality receptors are identified on Draft EIR page 4.3-5. No additional response is necessary.

O11-20 The commenter states that the Draft EIR's HRA and mitigation measures fails to provide substantial evidence of the effectiveness of mitigation to reduce impacts. Any mitigation which is determined to be feasible and capable of avoiding or minimizing significant impacts will be included in the Project MMRP and *Section 3.0*, *Errata* of this Final EIR. The Draft EIR Air Quality

[11] J. Richard Kuzmyak, *Forecasting Metropolitan Commercial and Freight Travel,* 2008.

Section (*Section 4.3*) includes numerous construction and operational mitigation measures to reduce emissions. Construction mitigation measures include use of the cleanest equipment available and dust control (MM AQ-1) and low VOC paints (MM AQ-2). Additionally, operational mitigation includes a TDM Program to reduce vehicle trips/miles (MM AQ-3), constructing EV infrastructure (MM AQ-4), conduit for Transport Refrigeration plugins (MM AQ-5), idle limits (MM AQ-6), energy efficient vendor trucks (MM AQ-7), EV charging stations and carpool parking (MM AQ-8), electric/zero emission cargo handling equipment (MM AQ-9), and compliance with SCAQMD Rule 2305 (MM AQ-10) which is a program to incentivize the purchase of cleaner trucks and charging/fueling infrastructure for the project and in the nearby community. Therefore, the Draft EIR GHG mitigation measures comply with State CEQA Guidelines Section 15041 and go above and beyond what is required to meet the essential nexus and rough proportionality standards.

The Draft EIR's Health Risk Assessment and *Section 4.3* include a lengthy discussion regarding Diesel Particulate Matter (DPM). Draft EIR *Table 4.3-21: Carcinogenic Risk Assessment* shows the unmitigated and mitigated DPM health risk for the combined construction and operations of the Project for residential receptors, worker receptors, and student receptors. MM AQ-1 would reduce construction related DPM by requiring Tier 4 equipment and MM AQ-9 would reduce operational DPM by requiring zero emissions cargo handling equipment. Specifically, as shown in Draft EIR *Tables 4.3-9* through *4.3-12*, MM AQ-1 would reduce construction PM_{10} emissions by 60.89 pounds per day for Phase 1a, 49.37 pounds per day for Phase 1b, 50.52 pounds per day for Phase 2, and 13.06 pounds per day for the commercial phase. Additionally, as shown in Draft EIR Appendix C model outputs, MM AQ-1 would reduce on-site PM_{10} exhaust emissions (used as a proxy for DPM in the Health Risk Assessment) by approximately 1.08 tons per year (5.92 pounds per day for Phase 1a, approximately 0.72 tons per year (3.92 pounds per day for Phase 1b, approximately 0.58 tons per year (3.18 pounds per day for Phase 2, and approximately 0.06 tons per year (0.32 pounds per day for the commercial phase, for a total equipment exhaust reduction of 2.44 tons from MM AQ-1. Additionally, MM AQ-9 would require zero emissions operational cargo handling equipment, which would reduce operational DPM exhaust emissions by approximately 1.68 tons per year (9.19 pounds per day). The analysis found that implementation of MM AQ-1 and MM AQ-9 would reduce cancer risk from Project construction and operations to below the SCAQMD's 10 in one million threshold for all types of receptors. As such, impacts related to DPM would be less than significant with the implementation of MM AQ-1 and MM AQ-9. This conclusion is supported by modeling contained in Draft EIR *Appendix C*.

The comment incorrectly states that MM AQ-1 and MM AQ-9 do not commit to quantifiable emissions reductions. In fact, these reductions are quantified and shown in Draft EIR *Tables 4.3-9* through *4.3-17* and *Table 4.3-21*. Specifically, MM AQ-1 requires construction equipment to meet CARB Tier 4 emissions standards, which can reduce NO_X and particulate matter emissions by approximately 16 and 39 percent, respectively. Additionally, MM AQ-9 requires all on-site operational cargo handling equipment to be zero emission, which specifically eliminates an on-site source of DPM.

Despite the differing opinion offered by the commenter, the existence of disagreement among experts concerning the conclusions of an EIR or the propriety of the analytical methods employed in an EIR are not indicative of any deficiency. The County, as CEQA lead agency, is entitled to choose among conflicting expert opinions so long as the opinion relied upon by the County is supported by substantial evidence, which it is here. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 409; *Greenbaum v. City of Los Angeles* (1984) 153 Cal.App.3d at 412, 413; (*Browning-Ferris v. City Council* (1986) 181 Cal.App.3d 852 at 863).

O11-21 See Master Response 2 and refer to Response O11-20. The comment incorrectly states that the proposed mitigation measures do nothing to address cancer risk from diesel particulate matter. The effectiveness of the mitigation reducing diesel particulate matter is specifically shown in Draft EIR *Table 4.3-21*, which shows the reduction of cancer risk due to the proposed mitigation (i.e., reducing impacts to below the 10 in one million threshold). As noted in Response O11-20, MM AQ-1 would reduce construction related DPM by requiring Tier 4 equipment that would reduce equipment exhaust a total of 2.44 tons. MM AQ-9 would require zero emissions cargo handling equipment that would reduce operational DPM exhaust emissions by approximately 1.68 tons per year. This conclusion is supported by modeling contained in Draft EIR *Appendix C*. Furthermore, it should be noted that the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR *Tables 4.3-13* through *4.3-17* would not necessarily cause an exceedance of the ambient air quality standards. The Fontana General Plan mitigation measure referenced in the comment is inapplicable to the Project, including because the cancer risks are less than 10 per one million after mitigation.

O11-22 As noted in Master Response 2, the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant based on the current Project design (refer to Draft EIR pages 4.3-51 through 4.3-53). Project truck traffic would be directed to truck routes and away from residential neighborhoods as described under PDF AQ-21.

The comment fails to demonstrate that sensitive receptors would be impacted. The Project is located within an industrial area and buffered from sensitive receptors by distance. The closest sensitive receptors are located approximately 410 feet away and the majority of sensitive receptors are located more than 1,000 feet away. Draft EIR pages 4.13-17 and 4.13-19, referenced in the comment, are in the context of noise and the distances for the sensitive receptor are reported for the purpose of conservatively evaluating noise impacts. As noted in Draft EIR *Section 4.13*, *Noise*, the closest dock high doors are approximately 700 feet from the nearest sensitive receptors. This distance is used to calculate the loading dock noise levels. It should be noted that the City of Fontana has designated Cherry Avenue, Arrow Route, and San Bernardino Avenue as truck routes[12] and the County of San Bernardino designates these roadways as Major

[12] City of Fontana, Local Truck Routes, February 6, 2004.

Divided Highways[13]. Project truck traffic would primarily use on these designated roadways and Project truck traffic would not occur within the sensitive receptor neighborhoods. Additionally, the Draft EIR includes mitigation measures to reduce impacts to nearby sensitive receptors. As noted in Response O11-20, MM AQ-1 would reduce construction related DPM by requiring Tier 4 equipment that would reduce equipment exhaust a total of 2.44 tons. MM AQ-9 would require zero emissions cargo handling equipment that would reduce operational DPM exhaust emissions by approximately 1.68 tons per year. These mitigation measures would reduce health risk impacts to less than significant levels.

The Project's entry and exit driveways would not locate trucks adjacent to sensitive receptors. The primary truck access for buildings would be located off of internal streets and not near sensitive receptors.

O11-23 The comment references the California Attorney General's settlement agreement with the City of Fontana and SCAQMD's Policy Development for Cumulative Impacts. The Attorney General's settlement agreement with the City of Fontana is inapplicable to the Project for the reasons explained in Response O11-25. Additionally, the comment incorrectly states that the SCAQMD has proposed an approach for new guidance that would consider existing air pollution burdens. The SCAQMD has only initiated a working group and is currently in the information gathering and scoping stage. The SCAQMD has not developed any new guidance or draft guidance for the evaluation of cumulative air quality impacts. The SCAQMD web page cited in the comment includes the SCAQMD's current cumulative guidance (Potential Control Strategies to Address Cumulative Impacts from Air Pollution White Paper [2003]), which is what was used in the Draft EIR (refer to Draft EIR page 4.3-54 through 4.3-55). As noted in Master Response 2, the SCAQMD has not established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SCAQMD considers projects that do not exceed the project-specific thresholds to generally not be cumulatively significant. Therefore, impacts related to air quality-related health risk from the Project would be less than significant. Refer to Appendix C of the Draft EIR for additional information.

Additionally, as discussed on Draft EIR page 4.3-36, the Project would be required to comply with SCAQMD Rule 2305 (Warehouse Indirect Source Rule), which requires the Project operator to directly reduce NO_X and particulate matter emissions or to otherwise facilitate emission and exposure reductions of these pollutants in nearby communities. Alternatively, warehouse operators can choose to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby. Warehouse owners and operators are required to earn WAIRE Points each year. WAIRE points are a menu-based system earned by emission reduction measures. Warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. WAIRE points can be earned by completing actions from a menu that can include acquiring and using natural gas, Near-Zero Emissions and/or Zero-Emissions on-road

[13] See Draft EIR Appendix L, Figure 4a.

trucks, zero-emission cargo handling equipment, solar panels or zero-emission charging and fueling infrastructure, or other options. As noted in the Draft EIR, a preliminary WAIRE calculation indicates that the project would more than fulfill its Warehouse Points Compliance Obligation (WPCO). Compliance with SCAQMD Rule 2305 is also required per MM AQ-10. SCAQMD Rule 2305 applies to existing and proposed warehouses. Therefore, compliance with Rule 2305 would cumulatively reduce emissions.

O11-24 This comment provides a general overview of the CEQA Guidelines and the Draft EIR's conclusions regarding land use impacts but does not provide any information to dispute the analysis provided in the Draft EIR. No additional response is necessary.

O11-25 The Project is within the Fontana Sphere of Influence and therefore the Fontana General Plan was used to evaluate elements of the project related to traffic, trail connections, and other relevant polices in the Draft EIR. The preface of Ordinance No. 1891, adopted following Fontana's settlement with the Attorney General, specifically states that it is: "An ordinance of the City Council of the City of Fontana, California amending Chapter 9 of the Fontana Municipal Code to revise Article V for modifications and clarification to buffering and screening requirements, methods to improve traffic circulation, requirements for alternative energy, and improvements to construction requirements as it relates to industrial commerce centers throughout the City."

The Fontana Forward General Plan Update 2015 – 2035 Draft EIR expressly states "The Fontana Forward General Plan, will continue to serve as the blueprint for the City by setting forth goals, policies, and programs that will guide the long-term physical development and quality of life in the community."

The Project is not located within the City of Fontana but is located within unincorporated San Bernardino County. While the Project site neighbors the City of Fontana, it is not required to incorporate measures required by the Fontana General Plan Update or Fontana Ordinance No. 1891. Nor is the Project required to adhere to the City of Fontana Municipal Code or the mitigation measures outlined the City's General Plan EIR. Hence, the EIR is not required to analyze the Project's consistency with these City of Fontana documents.

The comment asserts that the EIR does not include analysis relevant to environmental justice issues in the City of Fontana's General Plan. SB 1000 contains requirements for cities and counties which contain disadvantaged communities to develop an environmental justice element, or related goals, policies, and objectives, and the County has fulfilled those requirements by adhering to the applicable environmental justice policies in the Countywide Plan. SB 1000 does not create obligations directly applicable to an individual project or Specific Plan. However, two environmental justice outreach workshops were held for the Project (*see* Draft EIR at 2-6 to 2-7). The Specific Plan's consistency with the applicable County Environmental Justice goals and policies is established in the Land Use section of the Draft EIR (see discussion of Policy TM-5.6 at Draft EIR p. 4.11-19 and Goal HZ-3: Environmental Justice and related policies at Draft EIR p. 4.11_25). SB 1000 functions separately from the Draft EIR process. Furthermore, the EIR isn't required to include analysis of potential environmental justice issues (aside from the consistency

analysis that was conducted), as Environmental Justice is not listed amongst the "Environmental Factors Potentially Affected" in Appendix G, Environmental Checklist Form, to the State CEQA Guidelines.[14] The County analyzed the Project's consistency with the Countywide goals and policies and incorporated elements of the findings from this analysis and the public outreach meetings to support the Countywide goals through additional programs, facilities and community benefits in the Specific Plan and in the analysis of the Draft EIR including enhancements of open space, mitigation measures to reduce pollution exposure, and more.

O11-26 See Responses O11-23 and O11-25. Mitigation Measure AQ-6 for the Project requires that idling restrictions be posted in accordance with State law. Likewise, MM AQ-9 requires that all outdoor cargo handling equipment be zero-emission. The Draft EIR also requires the Project to implement solar energy generation (MM GHG-2). The Project's Development Agreement also includes provisions for Transportation Demand Management (TDM) measures, on-site solar generation, as well as an electric truck and grant program.

O11-27 See Response O11-25. The Draft EIR requires energy efficient buildings that exceed the state's current building code standards (MM GHG-3). The Development Agreement also requires all buildings to be designed to meet Leadership in Energy and Environmental Design (LEED) standards, which will ensure that buildings are energy efficient. MM AQ-9 requires that all outdoor cargo handling equipment be zero-emission. Additionally, the project would comply with CalGreen (Title 24, Part 11, Section 5.106.5.3.3) (July 2021 supplement), which requires 10 percent EV spaces for sites with 201 parking spaces or more and Section 5.106.5.2 requires at least eight percent of the total parking spaces to be designated for low-emitting, fuel efficient, and carpool/vanpool vehicles. MM AQ-3 and the Development Agreement require a Transportation Demand Management (TDM) Program to reduce vehicle trips, which could also include requirements for additional carpool/vanpool parking designations.

Additionally, PDF AQ-9 requires that all heavy-duty trucks shall be zero emissions beginning in 2030 if such trucks are widely available and economically feasible and PDF AQ-10 requires the use of zero emissions light- and medium-duty trucks as part of business operations, if such trucks are widely available and economically feasible. PDF AQ-9 and PDF AQ-10 are included to promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment. Furthermore, the Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants.

O11-28 The loading dock noise levels quantified in the Draft EIR account for the nearest location loading dock activities would occur in relation to the closest residential receptors. The nearest residential

[14] Title 14. Natural Resources. (2018). Retrieved from: http://files.resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf.

receptor would be located east of the loading docks at Building 3, across Cherry Avenue. Due to the position and orientation of Building 3 and the expansive distance to other warehouse buildings on-site (over 1,700 feet from the nearest residential receptors), as well as the existing topography/elevation of the Cherry Avenue overcrossing and an approximately 25-foot tall warehouse building at the northeast corner of the Cherry Avenue and Merrill Avenue intersection, loading dock noise emanating from the northeastern-most portion of Building 3 was determined to be the most representative source/location to evaluate noise impacts at the nearest sensitive uses. In addition, the precise number of loading docks with loading/unloading activities for any particular day/hour is unknown at this time; therefore, the measured reference noise level obtained by Kimley-Horn and Associates from the La Palma Walmart loading dock area was used to calculate loading dock noise levels at the nearest sensitive receptor that would emanate from Building 3. Based on desktop research for large industrial warehouses, truck loading reference level noise measurements are similar (or lower)[15] than the reference level identified in the Draft EIR (64.4 dBA at 50 feet, see Draft EIR page 4.13-20). Therefore, utilizing a reference noise level for loading dock activities from a large industrial warehouse facility would not change the significance findings of the Draft EIR. As indicated in the Draft EIR, loading dock noise would be well below the County's most stringent nighttime noise standard of 45 dBA L_{eq}.

O11-29 As discussed in the Draft EIR, potential mitigation measures to reduce the Project's traffic noise impacted segments were determined to be infeasible due to a lack of County jurisdiction over the impacted roadways; physical/safety constraints to construct sound walls or barriers; disproportionate cost of sound walls/rubberized asphalt to mitigate a barely perceptible traffic noise increase along two roadway segments; no guarantee of approval of sound walls or upgraded windows[16] by impacted residences; and environmental and logistical issues of a variety of asphalt types for the County to maintain. Section 21061.1 defines feasible mitigation as "…capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." Given the limiting factors identified for potential mitigation above, no feasible mitigation was identified in the Draft EIR to reduce the Project's traffic noise impacts. The commenter suggests diverting truck traffic from Randall Avenue to other roadways in the Project vicinity as mitigation. However, re-routing truck traffic would still likely result in traffic noise impacts at different roadway segments. Therefore, diverting Project-generated traffic would not reduce the identified impact and would not be feasible in accordance with CEQA Guidelines Section 21061.1.

O11-30 The commenter provides a general summary of case law and CEQA Guidelines related to the analysis of cumulative impacts and claims that cumulative impacts would not be lessened by other cumulative projects' CEQA compliance. Other nearby projects are also required to comply with CEQA and implement mitigation; however, this discussion did not influence the Draft EIR's conclusions of significance. Cumulative air quality impacts are addressed in Draft EIR *Section 4.3.6*;

[15] Truck loading reference noise levels utilized in the *Moreno Valley Trade Center Warehouse Noise Impact Analysis*, (Urban Crossroads, January 10, 2021) range from 62.8 dBA (dry goods loading dock activity) to 65.7 dBA (cold storage loading dock activity) at 50 feet.

[16] As noted in the Draft EIR, interior noise levels from mobile traffic does not exceed the County's 45 dBA CNEL interior noise standard with windows and doors closed. As such, upgraded windows are not necessary and there is no nexus to require upgraded windows as mitigation.

cumulative GHG impacts are addressed in Draft EIR *Section 4.8.6*, and cumulative noise impacts are discussed in Draft EIR *Section 4.13.6*. The Draft EIR discloses that cumulative air quality, GHG and cumulative off-site traffic noise impacts will be significant and unavoidable.

O11-31 Refer to Master Response 2 and Response to Comment O11-30, above. As summarized in Master Response 2, the Draft EIR includes numerous mitigation measures to reduce emissions. The comment does not raise a specific issue with the adequacy of the Draft EIR or raise any other CEQA issue. No further response is required.

O11-32 See Master Response 3 which provides information on Project alternatives. This comment summarizes CEQA requirements related to the provision of a reasonable range of alternatives to the proposed Project which would avoid or substantially lessen any of the significant effects of the Project. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. However, the State CEQA Guidelines do not require a specific number of alternatives beyond those clearly stated in its requirements. An alternative site alternative may be forgone if the relocation of a project would be infeasible. In the case of the proposed Project, an alternative site alternative which fits the parameters required for the Project would not be feasible or identifiable. Additionally, it would be infeasible to develop the site with a project that reduces all of the significant unavoidable impacts to less than significant levels and still fully meet the Project objectives. The Project objectives are reasonably related to meeting regional logistics and e-commerce demand and have not been artificially narrowed to limit the scope of acceptable alternatives, as is claimed by the commenter.

O11-33 The commenter recites several of the Project objectives and claims that they are directed toward placement of a large warehouse at the Project site. The objectives listed for the Project are reasonably related to meeting regional logistics and e-commerce demand and have not been artificially narrowed to limit the scope of acceptable alternatives, as is claimed by the commenter. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

O11-34 A reasonable range of alternatives to the Project was considered for their ability to reduce environmental impacts and meet Project objectives. See Master Response 3 regarding alternatives. Refer also to Response O10-7. Alternatives assessed for the Project were based on State CEQA Guidelines and their potential feasibility. Furthermore, the Project was assessed for additional alternatives with none found to be feasible and warranting of additional discussion. The Project's objectives are not narrowly defined but are concrete statements which describe what the Project is trying to achieve and underly the Project purpose. Alternative 2 would generally meet the Project Objectives, to a lesser degree as compared to the Project, but would require a larger number of smaller facilities throughout the region to meet the demand for

industrial space[17], therefore increasing truck trips and traffic impacts since smaller warehouse space at the Project site would increase vehicle trips due to warehouse space being spread out throughout the County.

O11-35 The comment provides a general description of the CEQA Guidelines and case law. The comment makes generalized statements, reiterating previous assertions regarding alleged inadequacies of the Draft EIR. As noted in Master Response 2, the Draft EIR identifies all feasible mitigation measures to minimize Project emissions. Also refer to Responses O11-15 and O11-20 for a summary of Draft EIR air quality mitigation measures and Response O11-14 for a summary of GHG mitigation measures. Refer to the responses below that addresses specific comments.

O11-36 Refer to Master Response 2 and Response O11-11, regarding GHG emissions and mitigation. As noted in master Response 2, although GHG emissions would exceed the numerical threshold identified in the Draft EIR, the Project is subject to the County's GHG Reduction Plan. Draft EIR *Table 4.8-4: San Bernardino County GHG Reduction Measures Screening Table* demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. MM GHG-1 requires the Project to apply reduction measures identified in the County's GHG Screening Tables so that each building would achieve a minimum of 100 points.

The County's 2021 GHG Emissions Reduction Plan Update states that any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and its corresponding GHG emissions.

O11-37 Refer to Master Response 2, Response O11-11, and Response O11-14 regarding GHG emissions and mitigation. The Project's significant and unavoidable GHG impact is driven primarily by mobile source emissions. The commenter is incorrect that emissions from vehicles and emissions from construction are the same in terms of feasible mitigation; vehicle emissions standards are regulated by the State and federal government, over which the County has no authority. However, as noted in Response O11-27, PDF AQ-9 and PDF AQ-10 have been included to promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment. The Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of

[17] According to a Quarter 2 (Q2) 2022 report from CBRE, Inc.

standards for implementing these grants. While the County has no authority over vehicle emission standards, as described above the Project includes design measures and development agreement that will result in a reduction of vehicle emissions.

As discussed in Response O11-36, the Project is subject to the County's GHG Reduction Plan. The Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. which would be consistent with the State's GHG reduction goals. Achieving 100 points on the County's GHG Screening Tables requires the implementation of numerous measures. For example, the tables require various measures to improve building energy efficiency such as installing upgraded building insulation, windows, cool roofs, air filtration, indoor space efficiencies, space heating, water cooling, daylighting, efficient lighting, building placement, and shading. The tables also require various water efficiency measures to reduce energy related GHG emissions. To reduce mobile source emissions and encourage the use of ZEVs, the Screening Tables require electric vehicle chargers and bike and pedestrian amenities. To reduce GHG emissions from solid waste, the Screening Tables require increased recycling.

The Draft EIR also requires the Project to implement solar energy generation (MM GHG-2), requires energy efficient buildings that exceed the building code standards (MM GHG-3), requires the solid waste diversion (MM GHG-4), and requires the use of 100 percent electrically powered landscape equipment (MM GHG-5).

O11-38 Refer to Response R2-3 regarding the definition of "commercially available." The comment incorrectly asserts that the Draft EIR includes mitigation that is improperly deferred and lacks defined performance standards. The Draft EIR provides as much specific information as possible and does not defer mitigation and has not deprived the public from commenting on the adequacy of the mitigation.

CEQA defines "feasible" as capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors (refer to CEQA Section 21061.1 and CEQA Guidelines Section 15364). As discussed in Response R2-3, ZE vehicle technology is not commercially available and therefore, not feasible as CEQA mitigation. It should be noted that the comment quotes the terms when "feasible" and "as applicable" from the Project Design Features (PDFs) and not the mitigation measures. PDFs are specific design and/or operational characteristics proposed by the Master Developer that are incorporated into the Project and part of the Project description and Specific Plan. Because PDFs are incorporated into the Project, they do not constitute mitigation measures. It should be noted that these PDFs facilitate compliance with regulations and latest best practices. Additionally, the PDFs are supported by the Development Agreement, which requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants.

Establishing mitigation timing at tenant occupancy is necessary because the Project proposes speculative buildings where the Master Developer would only construct the building shell. The tenant would then conduct tenant improvements so that the building meets their needs. For example, MM AQ-3 requires the tenant to prepare/implement a Transportation Demand Management (TDM) Program. This is necessary in order for the tenant to implement TDM measures that are specific to their employees and operations. All measures are tied to County issuance of permits and are therefore fully enforceable. The comment fails to provide specific information on how the mitigation is deferred.

O11-39 The comment provides general statements about the commenter's view about feasible mitigation and the Draft EIR. As noted in Master Response 2, the Draft EIR identifies all feasible mitigation measures to minimize Project emissions, as required under Section 15126.4. Refer to Responses O11-40 to O11-45 for responses to specific comments.

O11-40 Refer to Response O11-25. The Lead Agency is the County of San Bernardino, and the Project is not located in the City of Fontana and is not subject to the City's ordinances.

It should be noted that Section 9-71 of Fontana Ordinance No. 1891 pertains to site design. The Project would be subject to the County's site design and review process. However, the Project would be consistent with the majority of the measures required in Sections 9-72 through 9-74 of Fontana Ordinance No. 1891.

Section 9-72 includes requirements restricting idling and truck routes. Draft EIR MM AQ-1 requires all construction equipment and delivery vehicles shall be turned off when not in use, or limit on-site idling for no more than 5 minutes in any 1 hour to achieve this measure. San Bernardino County Code Section 83.01.040 Air Quality and PDF AQ-1 require that on-site electrical power connections shall be provided for electric construction tools to eliminate the need for diesel-powered electric generators, where feasible.

The Project would comply with the 5-minute limit per CARB regulation/state law. Implementation of this measure is not quantifiable because CalEEMod does not allow for the adjustment of idle times. The Project includes MM AQ-6, which requires signage stating that drivers turn off engines when not in use, identifying the State's 5-minute idling limit (California Code of Regulations, Title 13, Division 3, Article 1, Chapter 10, Section 2485 [Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling]), and including telephone numbers of the building facilities manager and CARB to report violations.

PDF AQ-11 requires facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks. PDF AQ-14 requires facility operators to ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at California Air Resources Board-approved courses (such as the free, one-day Course #512)

Fontana Ordinance No. 1891 Section 9-73 includes requirements for alternative energy and EV charging. The Project includes numerous measures that would comply with these standards. For example, MM AQ-3, requires a TDM program to reduce vehicle trips and encourage alternative modes of transportation and provide associated amenities. MM AQ-4 accommodates the future installation of EV truck charging stations for when this technology becomes commercially available, and the buildings are being served by trucks with electric-powered engines. MM AQ-5 requires plug-in capable TRUs and electrical hookups at loading docks for tenants that require cold storage. MM AQ-8 requires the Project to include electric vehicle (passenger car) charging stations and a minimum of 12 percent carpool parking spaces at each building for employees and the public to use. MM AQ-9 requires all outdoor cargo handling equipment (including yard trucks, hostlers, yard goats, pallet jacks, and forklifts) to be powered by electricity (i.e., zero emission). MM AQ-11 requires Project compliance with SCAQMD Rule 2305 to facilitate the use of ZE and NZE trucks. The Draft EIR also requires the Project to implement solar energy generation (MM GHG-2), requires energy efficient buildings that exceed the building code standards (MM GHG-3).

Fontana Ordinance No. 1891 Section 9-74 includes measures related to construction and operations. The Project includes numerous measures that would comply with these standards as well. For example, MM AQ-1 includes using cleanest equipment available (i.e., Tier 4 or Level 3 particulate filters) and PDF-1 requires electric tools, electric equipment during construction. MM AQ-2 includes low-VOC requirements during construction. MM AQ-4 require electrical rooms to be sized to hold additional panels to accommodate future EV charging. MM AQ-7 requires information about the Carl Moyer Program and PDF AQ-19 requires SmartWay. MM GHG-4 requires recycling/diverting 75 percent solid waste.

O11-41 Refer to Response O11-23. As discussed above and on Draft EIR page 4.3-36, the Project would be required to comply with SCAQMD to directly reduce emissions. Alternatively, warehouse operators can choose to pay a mitigation fee. As noted in the Draft EIR, a preliminary WAIRE calculation indicates that the Project would more than fulfill its Warehouse Points Compliance Obligation (WPCO). Compliance with SCAQMD Rule 2305 is also required per MM AQ-10.

Additionally, PDF AQ-9 and PDF AQ-10 have been included to promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment. Furthermore, the Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants.

O11-42 This comment summarizes the California Attorney General document entitled Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act, which provides example mitigation measures. These mitigation measures were considered during Project design and have been included as design features or mitigation

measures if feasible for the Project. The following table identifies the recommended best practices listed in the Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act and addresses how the Project complies with each of the items noted in the comment.

Attorney General Measure	**Method of Project Incorporation**
Placing facility entry and exit points from the public street away from sensitive receptors, e.g., placing these points on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.	The Project is not immediately adjacent to sensitive receptors. The closest sensitive receptors are located approximately 410 feet away and the closest loading docks are approximately 760 feet away from this receptor. However, the majority of sensitive receptors are located more than 1,000 feet away. Therefore, facility entry and exit points would not locate trucks adjacent to sensitive receptors. Additionally, the primary truck access for buildings would be located off of internal streets and not near sensitive receptors. As noted in Response O11-20, MM AQ-1 and MM AQ-9 would reduce localized emissions to reduce health risk impacts to sensitive receptors. MM AQ-1 would reduce construction related DPM by requiring Tier 4 equipment that would reduce equipment exhaust a total of 2.44 tons. MM AQ-9 would require zero emissions cargo handling equipment that would reduce operational DPM exhaust emissions by approximately 1.68 tons per year.
Locating warehouse dock doors and other onsite areas with significant truck traffic and noise away from sensitive receptors, e.g., placing these dock doors on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.	As noted above, the Project is not adjacent to sensitive receptors and the dock doors would not be facing sensitive receptors. The majority of sensitive receptors are buffered from the project site by existing roadways as well as a railroad and detention basin to the north, and commercial uses to the east, west, and south.
Screening dock doors and onsite areas with significant truck traffic with physical, structural, and/or vegetative barriers that adequately prevent or substantially reduce pollutant dispersal from the facility towards sensitive receptors.	As noted above, sensitive receptors are not adjacent to dock doors and screening is not necessary.
Posting signs indicating that all parking and maintenance of trucks must be conducted within designated on-site areas and not within the surrounding community or public streets.	The Project would provide 98 acres of truck parking as well as additional onsite truck and employee parking for each building to eliminate the need for off-site parking. All parking and any maintenance activities would occur onsite.

Attorney General Measure	Method of Project Incorporation
Fully analyzing impacts from truck trips. CEQA requires full public disclosure of a project's anticipated truck trips, which entails calculating truck trip length based on likely truck trip destinations, rather than the distance from the facility to the edge of the air basin. Emissions beyond the air basin are not speculative, and, because air pollution is not static, may contribute to air basin pollution. Moreover, any contributions to air pollution outside the local air basin should be quantified and their significance should be considered.	Refer to Response O11-18. The Draft EIR fully analyzes impacts from truck trips. Specifically, refer to *Sections 4.3 Air Quality, 4.8 Greenhouse Gas Emissions, 4.13 Noise,* and *4.17 Transportation*.

O11-43 This comment summarizes mitigation measures recommended in the Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act. These mitigation measures were considered during Project design and have been included as design features or mitigation measures if feasible for the Project. The following table identifies the recommended mitigation measures listed in the Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act and addresses how the Project complies with each measure.

Attorney General Measure	Method of Project Incorporation
Prohibiting off-road diesel-powered equipment from being in the "on" position for more than 10 hours per day.	Draft EIR MM AQ-1 requires all construction equipment and delivery vehicles shall be turned off when not in use, or limit on-site idling for no more than 5 minutes in any 1 hour to achieve this measure.
Providing electrical hook ups to the power grid, rather than use of diesel-fueled generators, for electric construction tools, such as saws, drills, and compressors, and using electric tools whenever feasible.	San Bernardino County Code Section 83.01.040 Air Quality and PDF AQ-1 require that on-site electrical power connections shall be provided for electric construction tools to eliminate the need for diesel-powered electric generators, where feasible.
Limiting the amount of daily grading disturbance area.	The Project would be required to comply with SCAQMD Rule 403, which limits daily grading disturbance area to minimize fugitive dust (see SC AQ-1 on Draft EIR page 4.3-37 and MM AQ-1 on Draft EIR page 4.3-39).
Prohibiting grading on days with an Air Quality Index forecast of greater than one hundred for particulates or ozone for the project area.	The emissions analysis for the Project determined that localized construction emissions would not exceed SCAQMD thresholds (see Draft EIR pages 4.3-43 through 4.3-46). Therefore, the Project would not have the potential to influence localized

Attorney General Measure	Method of Project Incorporation
	pollutant concentrations and implementation of this measure is not necessary.
Forbidding idling of heavy equipment for more than two minutes.	The Project would comply with the 5-minute limit per CARB regulation/state law. The Project includes MM AQ-6 requires signage stating that drivers turn off engines when not in use, identifying the State's 5-minute idling limit (California Code of Regulations, Title 13, Division 3, Article 1, Chapter 10, Section 2485 [Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling]), and including telephone numbers of the building facilities manager and CARB to report violations. Additionally, the Project includes design features to minimize idling. For example, PDF AQ-11 requires facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks. PDF AQ-14 requires facility operators to ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at California Air Resources Board-approved courses (such as the free, one-day Course #512).
Keeping onsite and furnishing to the lead agency or other regulators upon request, all equipment maintenance records and data sheets, including design specifications and emission control tier classifications.	MM AQ-1 (Draft EIR page 4.3-38) requires a copy of each unit's Best Available Control Technology (BACT) documentation (certified tier specification or model year specification), and CARB or SCAQMD operating permit (if applicable) to be provided to the County at the time of mobilization of each applicable unit of equipment. PDF AQ-12 (Draft EIR page 4.3-22) requires tenants train staff to keep vehicle records in diesel technologies and comply with CARB regulations. PDF AQ-13 (Draft EIR page 4.3-22) requires tenants to maintain records on its fleet equipment and vehicle engine maintenance to ensure that equipment and vehicles serving the warehouses within the Project are in good condition, and in

Attorney General Measure	Method of Project Incorporation
	proper tune pursuant to manufacturer's specifications.
Conducting an on-site inspection to verify compliance with construction mitigation and to identify other opportunities to further reduce construction impacts.	See PDF AQ-3 which requires construction contractors to keep all equipment maintenance records and data sheets, including design specifications and emission control tier classifications, on-site or at the contractor's office and shall furnish documents to the Lead Agency or other regulators, upon request. As noted above, compliance with SCAQMD rules are required as standard condition and would be enforced by SCAQMD inspection. Additionally, the emissions analysis for the Project determined that localized construction emissions would not exceed SCAQMD localized thresholds (see Draft EIR pages 4.3-43 through 4.3-46). CARB's In-Use Off-Road Diesel Vehicle Regulation ensures equipment meets standards.
Using paints, architectural coatings, and industrial maintenance coatings that have volatile organic compound levels of less than 10 g/L.	MM AQ-2 (Draft EIR pages 4.3-39 to 4.3-40) requires the Project to use "Super-Compliant" low volatile organic compound (VOC) paints (i.e., a VOC content of 10 g/L or less).
Requiring that all facility-owned and operated fleet equipment with a gross vehicle weight rating greater than 14,000 pounds accessing the site meet or exceed 2010 model-year emissions equivalent engine standards as currently defined in California Code of Regulations Title 13, Division 3, Chapter 1, Article 4.5, Section 2025. Facility operators shall maintain records on-site demonstrating compliance with this requirement and shall make records available for inspection by the local jurisdiction, air district, and state upon request.	Refer to PDF AQ-7 (Draft EIR page 4.3-22). which requires the tenant/facility operator to post both interior and exterior facing signs, including signs directed at all dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, SCAQMD, and the building manager. Additionally, CARB's Truck and Bus Regulation requires heavy vehicles to meet this standard by January 1, 2023.
Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations.	The Project includes PDF's and mitigation that would facilitate the use of ZE and NZE vehicles consistent with CARB and SCAQMD programs (e.g., Advanced Clean Truck Regulation, Sustainable Freight Action Plan, SCAQMD Rule 2305, etc.). MM AQ-11 requires Project compliance with SCAQMD Rule 2305 to facilitate the use of ZE and NZE trucks. Additionally, MM AQ-9 requires all

Attorney General Measure	Method of Project Incorporation
	outdoor cargo handling equipment (including yard trucks, hostlers, yard goats, pallet jacks, and forklifts) to be powered by electricity (i.e., zero emission). To promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment, PDF AQ-9 requires that all heavy-duty trucks shall be zero emissions beginning in 2030 if such trucks are widely available and economically feasible and PDF AQ-10 requires the use of zero emissions light- and medium-duty trucks as part of business operations, if such trucks are widely available and economically feasible. Furthermore, the Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants.
Forbidding trucks from idling for more than two minutes and requiring operators to turn off engines when not in use.	The Project would comply with the 5-minute limit per CARB regulation/state law. The Project includes MM AQ-6 requires signage stating that drivers turn off engines when not in use, identifying the State's 5-minute idling limit (California Code of Regulations, Title 13, Division 3, Article 1, Chapter 10, Section 2485 [Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling]), and including telephone numbers of the building facilities manager and CARB to report violations. PDF AQ-11 requires facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.

Attorney General Measure	Method of Project Incorporation
	PDF AQ-14 requires facility operators to ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at California Air Resources Board-approved courses (such as the free, one-day Course #512)
Posting both interior- and exterior-facing signs, including signs directed at all dock and delivery areas, identifying idling restrictions and contact information to report violations to CARB, the air district, and the building manager.	See MM AQ-6 which requires signage stating that drivers turn off engines when not in use, identifying the State's 5-minute idling limit (California Code of Regulations, Title 13, Division 3, Article 1, Chapter 10, Section 2485 [Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling]), and including telephone numbers of the building facilities manager and CARB to report violations on Draft EIR pages 4.3-41 to 4.3-43.
Installing and maintaining, at the manufacturer's recommended maintenance intervals, air filtration systems at sensitive receptors within a certain radius of facility for the life of the project.	A Project specific Health Risk Assessment was prepared for the Project and determined that with the implementation of MM AQ-1 (Tier 4 construction equipment) and MM AQ-9 (zero-emission cargo handling equipment), health risks would be reduced to less than significant levels. Therefore, mitigation requiring air filtration systems such as MERV 13 filters would not be required.
Installing and maintaining, at the manufacturer's recommended maintenance intervals, an air monitoring station proximate to sensitive receptors and the facility for the life of the project and making the resulting data publicly available in real time. While air monitoring does not mitigate the air quality or greenhouse gas impacts of a facility, it nonetheless benefits the affected community by providing information that can be used to improve air quality or avoid exposure to unhealthy air.	CARB currently operates the Fontana-Arrow Highway Monitoring Station located approximately 0.76 miles northeast of the Project site. This data is publicly available on CARB's website.
Constructing electric truck charging stations proportional to the number of dock doors at the project.	MM AQ-4 (Draft EIR page 4.3-41) accommodates the future installation of EV truck charging stations for when this technology becomes commercially available and the buildings are being served by trucks with electric-powered engines.

Attorney General Measure	Method of Project Incorporation
	MM AQ-10 requires compliance with SCAQMD Rule 2305. Rule 2305 requires the Project operator to directly reduce NO_X and particulate matter emissions or to otherwise facilitate emission and exposure reductions of these pollutants in nearby communities. Alternatively, warehouse operators can choose to pay a mitigation fee. Funds from the mitigation fee will be used to incentivize the purchase of cleaner trucks and charging/fueling infrastructure in communities nearby.
Installing solar photovoltaic systems on the project site of a specified electrical generation capacity, such as equal to the building's projected energy needs.	MM GHG-2 (Draft EIR page 4.8-32 to 4.8-33) requires the Project to provide at least 50 percent of the building load and the plug-load with on-site renewable energy (i.e., photovoltaic panels).
Requiring all stand-by emergency generators to be powered by a non-diesel fuel.	As the end users of the Project have not been identified, it is not known if backup generators would be needed for any of the potential buildings. If necessary, backup generators would only be used in the event of a power failure and would not be part of the Project's normal daily operations. If backup generators are required, the end user would be required to obtain a permit from the SCAQMD prior to installation. Emergency backup generators must meet SCAQMD's Best Available Control Technology (BACT) requirements and comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines), which would minimize emissions. As the end users and future tenants of the proposed Project are unknown, the need for emergency backup generators is speculative. Under CEQA Guidelines Section 15384, argument, speculation, unsubstantiated opinion or narrative, evidence that is not credible, and evidence of social and economic impacts does not constitute substantial evidence. As the proposed Project involves speculative warehouse buildings and the end users are unknown, prohibiting specific fuels for backup generators is not feasible, because it is unknown what the specific needs of an end user would be.
Requiring facility operators to train managers and employees on efficient scheduling and load	PDF AQ-11 (Draft EIR page 4.3-22) requires facility operators to train managers and employees on

Attorney General Measure	Method of Project Incorporation
management to eliminate unnecessary queuing and idling of trucks.	efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks. PDF AQ-12 (Draft EIR page 4.3-22) requires tenants train staff to keep vehicle records in diesel technologies and comply with CARB regulations.
Requiring operators to establish and promote a rideshare program that discourages single-occupancy vehicle trips and provides financial incentives for alternate modes of transportation, including carpooling, public transit, and biking.	MM AQ-3 (Draft EIR page 4.3-40) requires the implementation of a Transportation Demand Management (TDM) Program that would require operators to promote and support carpool/vanpool/rideshare use through parking incentives and administrative support, such as ride-matching service, among various other trip reduction measures.
Posting signs at every truck exit driveway providing directional information to the truck route.	PDF AQ-21 on Draft EIR page 4.3-23 requires site developers to install signs at each exit driveway, providing directional information to the County's truck route.
Improving and maintaining vegetation and tree canopy for residents in and around the project area.	The Project would be subject to the County's landscape requirements, which would be verified as part of the County's, design review, and plan approval process.
Requiring tenants to enroll in the United States Environmental Protection Agency's SmartWay program and requiring tenants to use carriers that are SmartWay carriers.	PDF AQ-19 (Draft EIR page 4.3-23) requires tenants/facility operators to enroll in the U.S. EPA's SmartWay program and for tenants to use carriers that are SmartWay carriers
Plant trees and vegetation near structures to shade buildings and reduce energy requirements for heating/cooling.	Shading of structures is required as part of the San Bernardino County GHG Reduction Measures Screening Table; refer to Draft EIR page 4.8-27.
Constructing physical, structural, or vegetative noise barriers on and/or off the project site.	Refer to Responses to Comments O11-28 and O11-29.
Preserve or replace onsite trees (that are removed due to development) as a means of providing carbon storage.	The Project would comply with County Code Chapter 88.01 (Plant Protection and Management) regarding tree removal and replacement. The Project is located in an industrial area that is already disturbed. The Project would be required to Provide landscaping, including trees, in accordance with County requirements (see Draft EIR page 4.4-22).
Locating or parking all stationary construction equipment as far from sensitive receptors as possible and directing emitted noise away from sensitive receptors.	As discussed on Draft EIR pages 4.13-13 through 4.13-18, the Project would not result in significant construction noise impacts; therefore, compliance with this measure is not required.
Verifying that construction equipment has properly operating and maintained mufflers	SC NOI-1 (Draft EIR page 4.13-24) would ensure that all construction equipment is equipped with

Attorney General Measure	Method of Project Incorporation
	properly operating and maintained mufflers and other State required noise attenuation devices, signs are posted near residences with contact information and dates of construction activities, construction notices are sent to adjacent residences, construction haul routes avoid sensitive uses where possible, and designating a noise disturbance coordinator to minimize and manage construction noise, among others.
Requiring all combustion-powered construction equipment to be surrounded by a noise protection barrier	As discussed on Draft EIR pages 4.13-13 through 4.13-18, the Project would not result in significant construction noise impacts; therefore, compliance with this measure is not required.
Limiting operation hours to daytime hours on weekdays.	See above. No construction noise impacts are anticipated. Construction of the Project would be limited to the daytime hours of construction permitted (between the hours of 7:00 a.m. to 7:00 p.m. and would not occur on Sundays or Federal holidays as stated in the County Building Code Standards (§ 150.003 Construction: Hours of Construction) (unless otherwise approved by the County), and nighttime lighting would only be required seasonally (see Draft EIR pages 4.13-10 and 4.13-14).
Paving roads where truck traffic is anticipated with low noise asphalt.	Refer to Responses to Comments O11-28 and O11-29.
Orienting any public address systems onsite away from sensitive receptors and setting system volume at a level not readily audible past the property line.	Operational noise impacts are discussed on Draft EIR pages 4.13-18 through 4.13-22 and on-site impacts would be less than significant.
Retrofit municipal water and wastewater systems with energy efficient motors, pumps, and other equipment, and recover wastewater treatment methane for energy production.	The Project does not propose the retrofit of municipal systems. However, the Project would be subject to applicable development impact fees that would contribute to these improvements. The Draft EIR requires the Project to comply with the County's GHG reduction measures, which include various energy efficiency and water efficiency measures.
Designing, clearly marking, and enforcing truck routes that keep trucks out of residential neighborhoods and away from other sensitive receptors.	See PDF AQ-21 Draft EIR page 4.3-23 which requires developers to install signs at each exit driveway, providing directional information to the County's truck route.
Installing signs in residential areas noting that truck and employee parking is prohibited.	The Project would provide 98 acres of truck parking as well as additional onsite truck and employee

Attorney General Measure	Method of Project Incorporation
	parking for each building to eliminate the need for off-site parking.
Constructing new or improved transit stops, sidewalks, bicycle lanes, and crosswalks, with special attention to ensuring safe routes to schools.	Refer to MM AQ-3, (Draft EIR page 4.3-40) which requires a TDM program to reduce vehicle trips and encourage alternative modes of transportation and provide associated amenities.
Consulting with the local public transit agency and securing increased public transit service to the project area.	As noted above, MM AQ-3, requires a TDM program to reduce vehicle trips and encourage transit.
Designating areas for employee pickup and drop-off.	Site design would be subject to the County's design review process. Additionally, designated employee pickup and drop-off areas may be determined applicable as part of the TDM program required by MM AQ-3.
Placing facility entry and exit points on major streets that do not have adjacent sensitive receptors.	The Project entry and exit points along Cherry Avenue and Napa Street which are not proximate to sensitive receptors. Additionally, the primary truck access for buildings would be located off of internal streets and not near sensitive receptors.
Restricting the turns trucks can make entering and exiting the facility to route trucks away from sensitive receptors.	See PDF AQ-21 (Draft EIR page 4.3-23) which requires_ developers to install signs at each exit driveway, providing directional information to the County's truck route
Preparing a construction traffic control plan prior to grading, detailing the locations of equipment staging areas, material stockpiles, proposed road closures, and hours of construction operations, and designing the plan to minimize impacts to roads frequented by passenger cars, pedestrians, bicyclists, and other non-truck traffic.	Construction traffic control is required in County Code Section 83.01.040 Air Quality. The Project would prepare a construction traffic control plan prior to any construction activities, per the County's requirements.
Appointing a compliance officer who is responsible for implementing all mitigation measures and providing contact information for the compliance officer to the lead agency, to be updated annually.	Mitigation measures would be enforced by the County through implementation of the Mitigation Monitoring and Reporting Program.
Creating a fund to mitigate impacts on affected residents, schools, places of worship, and other community institutions by retrofitting their property. For example, retaining a contractor to retrofit/install HVAC and/or air filtration systems, doors, dual-paned windows, and sound- and vibration-deadening insulation and curtains.	This would not be relevant to the project as a mitigation fund would be the responsibility of a jurisdiction (i.e., the County) and not a project. Additionally, as discussed in the Draft EIR and HRA, health risk impacts would be less than significant with mitigation incorporated. (see Draft EIR at 4.3-43 to 4.3-53). Therefore, there is no nexus for implementation of this measure. However, the Project would also be subject to SCQAQMD Rule

Attorney General Measure	Method of Project Incorporation
	2305, which requires warehouse operators, among other things, to acquire of Zero Emissions or Near Zero Emissions trucks, requires Zero Emission/Near Zero Emission truck visits, requires Zero Emission yard trucks, and install on-site Zero Emission charging/fueling infrastructure, or pay a mitigation fee to SCAQMD to be used to incentivize the purchase of Zero Emission/Near Zero Emission trucks and charging/fueling infrastructure in communities nearby or implement HVAC filtration systems in impacted communities.
Using cool pavement to reduce heat island effects.	The Project would redevelop an already urbanized area that consists of asphalt paved areas. The Project would be required to comply with the County's GHG Reduction Measures (refer to MM GHG-1), which includes requirements for enhanced cool roofs that would actually reduce the heat island effect. The Project would replace existing asphalt (i.e., black top) with new buildings that would be required to meet the latest building codes and County requirements for light-colored solar reflective roofs that reduce the heat island effect.
Installing climate control in the warehouse facility to promote worker well-being.	The Project would be subject to the California Building Code and the Green Building Standards Code, which includes requirements for insulation, shading, mechanical ventilation, and heating, ventilation, and air conditioning.
Installing air filtration in the warehouse facility to promote worker well-being.	Refer to the response above. The Project would be subject to the California Building Code and the Green Building Standards Code, which includes requirements for insulation, shading, mechanical ventilation, and heating, ventilation, and air conditioning.

O11-44 This comment summarizes the CARB's Recommended Air Pollution Emission Reduction Measures for Warehouses and Distribution relevant to construction. These construction mitigation measures were considered during Project design and have been included as design features or mitigation measures if feasible for the Project as described below.

CARB Measure	Method of Project Incorporation
Ensure the cleanest possible construction practices and equipment are used. This includes	MM AQ-1 requires construction equipment to meet CARB Tier 4 (cleanest available) emissions

CARB Measure	Method of Project Incorporation
eliminating the idling of diesel-powered equipment, and providing the necessary infrastructure (e.g., electrical hookups) to support zero and near-zero equipment and tools.	standards. Additionally, MM AQ-9 requires zero emission handling equipment.
Implement, and plan accordingly for, the necessary infrastructure to support the zero and near-zero emission technology vehicles and equipment that will be operating onsite. This includes the physical (e.g., needed footprint), energy, and fueling infrastructure for construction equipment, onsite vehicles and equipment, and medium-heavy and heavy-heavy duty trucks.	Mitigation in the Draft EIR Air Quality section (*Section 4.3*) includes numerous measures that would facilitate zero and near zero emissions technology. Applicable air quality mitigation includes constructing EV infrastructure (MM AQ-4), conduit for Transport Refrigeration plugins (MM AQ-5), energy efficient vendor trucks (MM AQ-7), EV charging stations and carpool parking (MM AQ-8), electric/zero emission cargo handling equipment (MM AQ-9), and compliance with SCAQMD Rule 2305 (MM AQ-10) which is a program to incentivize the purchase of cleaner trucks and charging/fueling infrastructure for the Project and in the nearby community.
In construction contracts, include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers, etc.) used during project construction be battery powered.	PDF AQ-1 requires electric hookups for generators and electric tools where available. Also refer to Response to Comment R2-3. The Project Applicant, in consultation with their construction contractor, identified the list of equipment necessary for construction of the Project, including which equipment may be alternatively fueled. The construction contractor reviewed the existing equipment in their fleet that would be used for the Project and contacted their subcontractors to determine the available equipment and trucks that would be used. Commercially available battery powered electric construction equipment have limited capacity and capabilities when viewed in the context of a major construction project like the proposed Project. The vast majority of earth moving activities at the Project site would require heavy-duty capabilities beyond those of the battery powered equipment identified in the comment.
In construction contracts, include language that requires all heavy-duty trucks entering the construction site, during either the grading or building construction phases be model year 2014 or later. Starting in the year 2022, all heavy-duty haul trucks should also meet CARB's lowest optional low-NOx standard,	PDF AQ-7 (Draft EIR page 4.3-22) requires heavy-duty trucks to meet model year 2010 standards in accordance with CARB's Truck and Bus Regulation, which requires heavy vehicles to meet this standard by January 1, 2023. Additionally, the California Attorney General's 2021 guidance Warehouse Projects: Best Practices and Mitigation Measures to

CARB Measure	Method of Project Incorporation
	Comply with the California Environmental Quality Act, also recommends 2010 model year trucks (see https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf, page 7).
In construction contracts, include language that requires all construction equipment and fleets to be in compliance with all current air quality regulations. CARB staff is available to provide assistance in implementing this recommendation.	As noted above, MM AQ-1 requires construction equipment to meet CARB Tier 4 (cleanest available) emissions standards.

O11-45 This comment summarizes the CARB's Recommended Air Pollution Emission Reduction Measures for Warehouses and Distribution. These operational mitigation measures were considered during Project design and have been included as design features or mitigation measures if feasible for the Project.

CARB Measure	Method of Project Incorporation
Include contractual language in tenant lease agreements that require tenants to use the cleanest technologies available, and to provide the necessary infrastructure to support zero-emission vehicles and equipment that will be operating onsite.	MM AQ-9 requires zero emission handling equipment.
Include contractual language in tenant lease agreements that requires all service equipment (e.g., yard hostlers, yard equipment, forklifts, and pallet jacks) used within the site to be electric or powered by compressed natural gas.	See above. MM AQ-9 requires zero emission handling equipment.
Include contractual language in tenant lease agreements that requires the tenant be in, and monitor compliance with, all current air quality regulations for on-road trucks including CARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation, Periodic Smoke Inspection Program (PSIP), and the Statewide Truck and Bus Regulation.	Operators and manufacturers are required to comply with CARB regulations. CARB's Tractor-Trailer Greenhouse Gas Regulation reduces greenhouse gas emissions by improving the aerodynamic performance and reducing the rolling resistance of tractor-trailers. CARB's Advanced Clean Trucks regulation is a manufacturer's ZEV sales requirement and a one-time reporting requirement for large entities and fleets. The Periodic Smoke Inspection Program (PSIP) is CARB's heavy-duty vehicle inspection program for in-use trucks and buses that includes roadside testing by CARB. The Statewide Truck and Bus Regulation requires fleets to upgrade to 2010 or newer model year engines by January 1, 2023. The suggested additional mitigation measures are already State regulation (i.e., mandatory). As such these

CARB Measure	Method of Project Incorporation
	measures are essentially part of the Project; and therefore, are not mitigation under CEQA. Additionally, the California Attorney General's 2021 guidance Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act, also recommends 2010 model year trucks (see https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf, page 7).
Include contractual language in tenant lease agreements that requires all heavy-duty trucks entering the project site to be model year 2014 or later.	Refer to response O3-20. CARB is addressing emissions from heavy duty vehicles through various regulatory programs including lower emission standards, restrictions on idling, the use of post-combustion filter and catalyst equipment, and retrofits for diesel truck fleets. These programs are expected to result in significant reductions in NO_X, ROG, PM_{10}, $PM_{2.5}$, and CO emissions as they are fully implemented by 2023. Federal and State agencies regulate and enforce vehicle emission standards. It is not feasible for San Bernardino County to effectively enforce a prohibition on trucks from entering the property that are otherwise permitted to operate in California and access other properties in the County, region, and State. Based on data from CARB, most heavy-duty trucks entering the Project site will meet or exceed 2010 model year emission standards by 2023. Specifically, according to CARB EMFAC inventories, approximately 50 percent of all instate heavy-heavy duty trucks met the 2010 engine standard in 2019, 59 percent in 2020, 62 percent in 2021. Additionally, 65 percent and 90 percent of trucks were projected to meet the 2010 engine standard in 2022 and 2023 respectively.
Include contractual language in tenant lease agreements that limits onsite TRU diesel engine runtime to no longer than 15 minutes. If no cold storage operations are planned, include contractual language and permit conditions that prohibit cold storage operations unless a health risk assessment is conducted, and the health impacts mitigated.	The Project would comply with the 5-minute limit per CARB regulation/state law. Implementation of this measure is not quantifiable because CalEEMod does not allow for the adjustment of idle times. The Project includes MM AQ-6 requires signage stating that drivers turn off engines when not in use, identifying the State's 5-minute idling limit (California Code of Regulations, Title 13, Division 3, Article 1, Chapter 10, Section 2485 [Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial

CARB Measure	Method of Project Incorporation
	Motor Vehicle Idling]), and including telephone numbers of the building facilities manager and CARB to report violations. Additionally, the Project includes design features to minimize idling. For example, PDF AQ-11 requires facility operators to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks. PDF AQ-14 requires facility operators to ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at California Air Resources Board-approved courses (such as the free, one-day Course #512).
Include contractual language in tenant lease agreements that requires all trucks entering the project site to meet CARB's lowest optional low-NOx standard.	The Project includes Project design features and mitigation that would facilitate the use of ZE and NZE vehicles consistent with CARB and SCAQMD programs (e.g., Advanced Clean Truck Regulation, Sustainable Freight Action Plan, SCAQMD Rule 2305, etc.). MM AQ-11 requires Project compliance with SCAQMD Rule 2305 to facilitate the use of ZE and NZE trucks. Additionally, MM AQ-9 requires all outdoor cargo handling equipment (including yard trucks, hostlers, yard goats, pallet jacks, and forklifts) to be powered by electricity (i.e., zero emission). To promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment, PDF AQ-9 requires that all heavy-duty trucks shall be zero emissions beginning in 2030 if such trucks are widely available and economically feasible and PDF AQ-10 requires the use of zero emissions light- and medium-duty trucks as part of business operations, if such trucks are widely available and economically feasible. Additionally, PDF AQ-9 and PDF AQ-10 have been included to promote the use of alternative fuels and clean fleets and facilitate future installation of

CARB Measure	Method of Project Incorporation
	electric vehicle supply equipment. Furthermore, the Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants.
Install rooftop solar panels, with a capacity that matches the maximum allowed for distributed solar connections to the grid.	MM GHG-2 (Draft EIR page 4.8-32 to 4.8-33) requires the Project to provide at least 50 percent of the building load and the plug-load with on-site renewable energy (i.e., photovoltaic panels).

O11-46 As discussed in Master Response 2, the Project is subject to the County's GHG Reduction Plan. Draft EIR Table 4.8-4 demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. MM GHG-1 requires the Project to apply reduction measures identified in the County's GHG Screening Tables so that each building would achieve a minimum of 100 points.

The County's 2021 GHG Emissions Reduction Plan Update states that any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the State's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and its corresponding GHG emissions.

It is acknowledged that the use of carbon offsets may be allowable as CEQA mitigation, if the purchased offset credits are genuine, quantifiable, additional, and verifiable. Even offset credits purchased from CARB-approved offset project registries have been determined in certain circumstances to not adequately assure that purchased offset credits accurately and reliably represent actual emissions reductions, or to not guarantee that such reductions already required by law. Other kinds of investments to make GHG reductions, such as the purchases of renewable energy credits, usually do not meet the criteria for effective carbon offset claims. Currently, there are no universal standards, and no single certification body has emerged to serve this market in the United States. Instead, several organizations offer certification, so the buyer must carefully

research a seller's claims for carbon reduction. In addition, the County of San Bernardino, the lead agency for the Project and the entity responsible for enforcing any mitigation measures incorporated into the Project to potentially reduce impacts, has no enforcement authority over offset credits that fund carbon reduction projects outside of the County. Many offset credits "sell" reductions in emissions generated outside of California and the United States, which may not be genuine or verifiable. Therefore, as a conservative measure, the use of carbon offsets has not been considered for the Project.

O11-47 The commenter's request for the Draft EIR's recirculation is noted for the record. However, the commenter has raised no substantial or substantiated criticisms of the Draft EIR which would necessitate recirculation pursuant to Section 15088.5 of the State CEQA Guidelines.

O11-48 The comment is noted for the record. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

Good Morning Mr. Valdez,

Please provide any updates to the above mentioned project.
I am requesting under Public Resource Code Section 21092.2 to add the email addresses and mailing address below to the notification list, regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project.

t.lucio57@gmail.com

phaninger1@gmail.com

jbourg2271@aol.com

jbourgeois029@gmail.com

asalcido.07@gmail.com

Mailing Address:

P.O. Box 79222

Corona, CA 92877

Please confirm receipt of this email.

Thank You,

Adam Salcido

Response to Comment Letter G1 – Adam Salcido

G1-1 The comment requests to be added to the notification list. When appropriate, noticing will be provided for the Project including public hearings or any future updates to the environmental documentation. The commenter's provided contacts are noted for the record and will be added to the notification list.

This page intentionally left blank.

Amparo Miramontes (G2)

ALL ARE WELCOME TO PROVIDE INPUT!

LEAVE A COMMENT FOR THE SPEEDWAY COMMERCE CENTER II ENVIRONMENTAL IMPACT REPORT

NAME: Amparo Miramontes

DATE: 07/09/2022

EMAIL: the.real.amparo@gmail.com

PHONE: (909)632-5208

This project is nothing short of a complete ~~discussion~~ disaster
Green House Gas Comments: The project fails to properly mitigate GHG. All warehouses should have 80% solar panels installed and ready to support 100% of the warehouse energy demands (Not Solar Ready that is a joke) All employee parking should be covered parking with solar panels. The solar panels should create a micro grid for the community to benefit from There needs to be bus stops that reflect the circulation plan so all employees can get to work easily All truck routes should be painted on the streets to ensure that all trucks remain on the correct paths & reduce idling & damage to residential communities. The truck routes should be Poke Yoked to dock doors to prevent idling. All Grass should by Eliminated from landscaping to reduce water usage & replaced the grass with Native Plants Cypress trees, Pine trees, & other PM2.5 filtering trees should be planted in MATURE FORM, no less than 15ft.

1
2
3

Additional information can be found at:
http://cms.sbcounty.gov/lus/Planning/Environmental/Valley.aspx
https://maps.kimley-horn.com/portal/apps/storymaps/stories/3f77c5d346a941dca99ab276d799d095
Or, us the QR code to access the Project website!

There should be better walking & bike paths all around the Community. Walking paths all around the warehouses. Break areas outdoors under shade providing solar panels to allow for charging. 4

Traffic Plan: This EIR fails to account for Speedway days, community traffic, & truck traffic. The Study needs to include true traffic. Mitigation does not include improved bus routes. The safety of cross walks is not considered. All Crosswalks should have a 6" raised cross walk with lights for safe ~~as~~ access for all roadway users. All bike routes need drastic improvement complete w/ a raised coned in boundry to protect bike riders. Improved lighting and solar covering at bus stops. 5

Water Mitigation: This is on septic all of it should be on main sewers and anyone in Fontana County should have a latteral hook up fee waiver as a community benefit for this project. Businesses get waivers all the time to hook to sewer, this project Should benefit from. This water ~~usage~~ does not reflect current water ~~usage~~ drawn ~~it~~ ~~us~~ levels & so is a ~~fact~~ misleading This project should pay for the wells it pulls from to have 100ft lower water pull level. No water use for conveyance Should be allowed. No water usage without being non-potable except for office drinking water. 6

Parks & Recreation: This project fails to address the need for 1 community center that has community spaces. This project Should include to ensure the community has a place to go during Black outs & Bad Air Quality. Once a month food Pantry. 7

Community: All businesses in this project Should have to have taxes in Fontana / San Bernardino County only.

Response to Comment Letter G2 – Amparo Miramontes

G2-1 The commenter provides introductory comments and states that the Project fails to properly mitigate greenhouse gas (GHG) emissions. The Draft EIR considered all feasible mitigation to minimize GHG emissions associated with Project implementation. These mitigation measures include the provision of photovoltaic panels or other sources of renewable energy generation on-site or require future building occupants to otherwise acquire energy from the local utility that has been generated by renewable sources, that would provide at least 50 percent of the expected energy for the total building load. This would be required within two years of building occupancy.

Draft EIR *Section 4.8, Greenhouse Gas Emission*, *Table 4.8-4: San Bernardino County GHG Reduction Measures Screening Table*, demonstrates that the Project would comply with the County's GHG Reduction Measures and would be consistent with the GHG Reduction Plan. To address the Project's GHGs, MM GHG-1 requires the Project to apply reduction measures identified in the County's GHG Reduction Plan Update Screening Tables so that each building would achieve a minimum of 100 points.

The County's 2021 GHG Emissions Reduction Plan Update states that any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the state's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045. Compliance with the mitigation measures and the County's GHG Emissions Reduction Plan would result in a less than significant impact related to GHG emissions.

In addition to the mitigation requiring compliance with all of the County's GHG reduction measures (MM GHG-1), the Draft EIR also requires the Project to implement solar energy generation (MM GHG-2), requires energy efficient buildings that exceed the building code standards (MM GHG-3), requires solid waste diversion (MM GHG-4), and requires the use of 100 percent electrical powered landscape equipment (MM GHG-5). Additionally, various other measures are included in the Draft EIR Air Quality Section (*Section 4.3*) such as a TDM Program to reduce vehicle trips/miles (MM AQ-3), constructing electric vehicle (EV) infrastructure (MM AQ-4), provide electrical conduits for Transport Refrigeration plugins (MM AQ-5), impose idle limits for trucks (MM AQ-6), require energy efficient vendor trucks (MM AQ-7), include EV charging stations and carpool parking (MM AQ-8), require electric/zero emission cargo handling equipment (MM AQ-9), and compliance with SCAQMD Rule 2305 (MM AQ-10) which is a program to incentivize the purchase of cleaner trucks and charging/fueling infrastructure for the Project in the nearby community. Therefore, the Draft EIR's suite of air quality and GHG mitigation measures comply with State CEQA Guidelines Section 15041 and go above and beyond to meet the essential nexus and rough proportionality standards.

The Project's Development Agreement also includes provisions for TDM measures, on-site solar generation, as well as an electric truck and grant program. Nonetheless, the Draft EIR conservatively concludes that impacts would remain significant and unavoidable due to the size of the Project and corresponding emissions. See Master Response 2.

G2-2 Omnitrans is a public transit agency in the County providing bus service throughout the San Bernardino Valley. There are no existing Omnitrans public transit routes or stops providing regular service adjacent to the Project site. The closest Omnitrans Transit System routes are Route 66 along W. Foothill Boulevard and Route 61 along San Bernardino Avenue. As the Project develops, Omnitrans may assess the Transit System for a potential increase in demand for these facilities and may establish new or extended routes in the area in the future. Coordination with Omnitrans has begun and will be ongoing as the Project builds out to determine the need for future bus service to the Project site.

In accordance with project design feature (PDF) AQ-21, signs at each exit driveway shall be installed, providing directional information to the County's truck route. Text on the sign shall read "To Truck Route" with a directional arrow. Truck routes shall be clearly marked pursuant to County Municipal Code.

G2-3 The plant palette for the Specific Plan is comprised of a variety of plant material, including street and accent trees, shrubs, grasses, succulents, and groundcovers. Plants included within the preliminary plant list were selected for the unique aesthetic qualities which complement the architectural design themes throughout the Specific Plan area as well as their drought-tolerant nature.

G2-4 The Project includes a proposed 10-foot-wide multi-use path along Street "A" of the Specific Plan area. Additionally, sidewalks are provided on all streets within the Specific Plan area. Further, the Project includes opportunities for enhanced pedestrian walkway connections between the parking lots/drop lots and the Next Gen motorsports facility, with enhanced landscaping, signage or art installation, and pedestrian walkways. The Project also includes an opportunity for a wellness walk which includes walking paths that connect amenity areas throughout the Specific Plan.

G2-5 The commenter asserts that the Draft EIR fails to evaluate ACS traffic and truck traffic from the Project. As discussed in *Section 4.17, Transportation*, under Cumulative Impacts, traffic is anticipated to increate with the Project and during major race and ancillary events held at the Next Gen motorsports facility. In accordance with MM TRANS-1 and MM TRANS-2, a Transportation Management Association and Traffic Management Plan would be required to be prepared to address large events to ensure all intersections during race-related or ancillary events would function at level of service (LOS) E or better at midday and in the p.m. peak hour on Friday as well as all day Saturday and Sunday. See Master Response 2 for further discussion of the application of development impact fees and congestion management.

As discussed under Response G2-4, the Project includes opportunities for enhanced pedestrian walkway connections, wayfinding signage, and pedestrian walkways. This is to encourage and provide for safe crossings, access and routes during race events, concerts and other uses at the ACS. Further, Street "A," would be improved with a 10-foot multi-use path for internal connectivity. This multi-use path provides a Class I bicycle lane with a landscaped parkway area providing separation between cyclists and on-street vehicles. The multi-use path runs the full east/west length of the Specific Plan area from Cherry Avenue to the connection point at Napa

Street. The multi-use path also connects with both Public Street "B" and Public Street "C" to allow riders greater accessibility throughout the Specific Plan area.

G2-6 The commenter asserts that the Project is on septic and that the Project should be on sewer. As discussed in Draft EIR *Section 4.7, Geology and Soils*, the Project does not propose the use of septic tanks. The Project would connect to the public sewer mains and rely upon Inland Empire Utilities Agency (IEUA) for wastewater services. Water and wastewater systems and demand for water and wastewater conveyance and treatment are further discussed in Draft EIR *Section 4.19, Utilities and Service Systems*. Connection fee waivers for other projects are not a relevant consideration under CEQA.

The analysis in the Draft EIR was based on current water use standards presented in Fontana Water Company 2020 UWMP, which incorporates drought-conditions into its calculations. Additionally, a Water Supply Assessment (WSA) was prepared by FWC for the Project which outlined water service needs based on current water service availability. For information regarding availability of groundwater, please refer to Draft EIR page 4.19-3. The Project does not propose or require additional groundwater wells. Potable and recycled water (if available) would be conveyed throughout the Project site via water lines beneath Streets "A," "B," "C," and "D." The Project would also utilize existing water pipelines which run across Street "A" and along Cherry Avenue. New sewer and storm drainage facilities are proposed below Streets "A," "B," "C" and "D" with additional storm drainage placed along the western boundary of the Project site. Sewer facilities are also proposed along the eastern side of Parcels 7 and 21. Existing storm and sewer infrastructure would remain below Street "D" with connections immediately east of the intersection of Streets "B" and "D."

There is an existing recycled waterline located in Napa Street, west of the Specific Plan area. This recycled waterline was installed by IEUA with service provided by FWC. Recycled water supply is delivered at a lower cost than potable water, and is not interrupted during drought restriction periods, making it ideal for irrigation uses. As an alternative to using potable water for irrigation uses, new recycled water facilities may be installed in the backbone streets (Streets "A," "B," "C," and "D") to provide irrigation water for the Specific Plan area. Recycled water for irrigation may also be used along Cherry Avenue, VIP Access Road and San Bernardino Avenue.

G2-7 The comment requests the Project provide a community center and other community benefits. Although no specific concerns were raised regarding the adequacy of the Draft EIR, the Project would provide community benefits including a multi-use trail with exercise stations, public art, wayfinding signage, electric truck and car grant programs, employee wellness program (tenant based), publicly-accessible open space, and a job training partnership with local trade colleges. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. Please see also Master Response 1 Project Scope and Description.

This project is an insut to our community and shows people ~~that~~ how much we are valued. It shows us how big business benifit move ~~more~~ From our work than we do, and how they benifit on our downfall. I think that we should have trade centers so that kids like me could learn trades such as, electrical, mechanical, and automation, and everyone should be given free wifi so they can have move acess to infor-mation 1

Carolina Verduzco (G5) [English version available as comment letter G6]

Estimado Sr. Valdez

Mi nombre es Carolina Verduzco y le escribo para responder al Borrador del Informe de Impacto Ambiental del Plan Específico del Speedway Commerce Center II. Creo que este proyecto será malo para la comunidad. La región del interior ya está saturada de usos logísticos. En los últimos años, se han seguido construyendo más almacenes y más grandes en el radio de Fontana, Ontario, Rancho Cucamonga y el bolsillo del condado donde se ubicaría este Proyecto, lo que ha provocado un aumento drástico del tráfico de camiones y la consiguiente contaminación atmosférica que conllevan. 1

Este proyecto traería casi 10.000 viajes más de camiones por día para envenenar nuestro aire sin medidas de mitigación eficaces. Tal y como está, el proyecto ya está situado en una zona que es una de las más afectadas del estado según CalEnviroScreen, situándose en el percentil 93 en general, en el percentil 95 para el ozono, en el percentil 94 para las PM2,5 y en el percentil 90 para las partículas diésel. Sin embargo, el proyecto propone bombear cantidades asombrosas de estos mismos contaminantes en la comunidad a niveles que son hasta más de 13 veces los límites permitidos. Es incomprensible que esto se considere una situación aceptable y exijo que el condado rechace este proyecto.

Además, nos preocupa el impacto que la gran afluencia de tráfico para este proyecto tendría en la capacidad de la comunidad para desplazarse. Con casi 10.000 viajes de camiones y más de 25.500 viajes de coches al día, el proyecto amenaza con saturar las carreteras locales con atascos y, aunque se presentaron algunas opciones de mitigación, los planes no van lo suficientemente lejos como para reducir realmente el azote del tráfico: la simple ampliación de las carreteras no es un beneficio para la comunidad, sino que crea calles que son menos seguras y más hostiles para el uso y la actividad humana. Dado que el transporte es también la razón principal de que las emisiones de calidad del aire y de gases de efecto invernadero del proyecto superen los umbrales, incluso después de incluir medidas de mitigación, está claro que no se puede permitir la construcción del proyecto a menos que se haga algo más, no sólo para mitigar el aumento, sino para evitarlo activamente. 2

En lugar del proyecto propuesto, nos gustaría que el condado persiguiera un desarrollo más acorde con los usos comerciales de la zonificación existente. Esta es una oportunidad para que el Condado aporte más atractivo a la región del IE con nuevos desarrollos como salas de conciertos, plazas comerciales, centros comerciales, jardines, etc. Este proyecto propuesto se opone a la visión que la comunidad tiene de una zona simbólica como el Speedway. Las reuniones celebradas no fueron suficientes para garantizar la participación de la comunidad, lo que se demuestra en última instancia por la falta de beneficios para la comunidad de este proyecto.

Gracias por tomarse el tiempo de recibir esta carta y abordar las preocupaciones que plantea. Esperamos que nuestros comentarios contribuyan a dar forma al futuro de este desarrollo. 3

Response to Comment Letter G5 – Carolina Verduzco

G5-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics/e-commerce use and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G5-2 The Draft EIR determined that the Project would not exceed the Localized Significance Thresholds (LSTs) for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G5-3 Project alternatives evaluated for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

Corilyn Rodrick Meyer (G6)

Dear Mr. Valdez:

My name is CRM and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring *nearly **10,000** more truck trips per day* to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for $PM_{2.5}$, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to *more than 13 times the allowed limits*. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project.

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development. 3

EMAIL: sfccc2020@gmail.com

PHONE: (909) 786-7400

I ~~oppose~~ strongly oppose this project due to the negative environmental impacts it will have to the residents & communities nearby. I am concerned about the cummulative impacts it will have. Additionally, I am worried about the increase in truck traffic which will essentially contribute to the increase in greenhouse gas emissions, +VMT, pm 2.5, and pm 10. Furthermore, I worry about the work wages these developments will bring. Also, the underground infrastructure damages. Please reconsider and not build, until a more ~~Please reconsider~~ accurate analysis is completed – one that includes truck routes from the 60 Fwy - exiting country villa then using Mulberry & Santa Ana or Slover

Response to Comment Letter G8– Elizabeth Sena

G8-1 Due to the Project emissions and the fact that 86 percent of the emissions are from mobile sources, the Project's GHG emissions would be cumulatively considerable. Mobile source and warehouse emissions due to the Project are addressed in the Draft EIR and within parameters set by applicable agencies, including various CARB and SCAQMD regulations. Mitigation measures have been proposed to reduce Project emissions to the maximum extent feasible. However, despite Project Design Features, Standard Conditions of Approval, Mitigation Measures, and CARB and SCAQMD efforts to reduce mobile source emissions, the Project would result in a potentially significant cumulative GHG impact. Specifically, the Draft EIR proposes MM GHG-1, which requires the Project to apply reduction measures identified in the County's GHG Screening Tables so that each building would achieve a minimum of 100 points. According to the County's 2021 GHG Emissions Reduction Plan Update, any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the state's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions. Nonetheless, the Draft EIR conservatively concludes GHG impacts would remain significant and unavoidable due to the size of the Project.

However, Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also see Master Response 2.

G8-2 The Project applicant does not have authority over the wages set by state, federal, or tenant standards. Moreover, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. The commenter does not identify any specific concerns related to underground infrastructure that may occur as a result of the Project. The Project proposes new utility and roadway infrastructure *improvements*, and the Draft EIR evaluates impacts associated with Project construction, including underground infrastructure.

G8-3 The Project's roadway analysis is based on likely affected roadways and truck routes established for the area. The commenter has failed to present a substantiated claim against the veracity of the Draft EIR. No further response is necessary.

Response to Comment Letter G9 – Erma Gardner

G9-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics uses and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G9-2 The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G9-3 Alternatives assessed for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

Dear Mr. Valdez:

My name is Estela G Ballón and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring nearly 10,000 more truck trips per day to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for PM2.5, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to more than 13 times the allowed limits. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project.

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development. 3

Estela G Ballón

Response to Comment Letter G10 – Estela G. Ballon

G10-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics uses and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G10-2 The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G10-3 Alternatives assessed for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

Hello,

As a homeowner of Rancho Cucamonga, we really enjoy going to the speedway!

Please turn this into a family friendly destination.

That's just my take.

Thank you,
Glennie Ferry

Response to Comment Letter G11 – Glennie Ferry

G11-1 The commenter indicates support for the Project. The comment is noted for the record. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. The comment is noted and forwarded to the decision makers for their consideration.

Hello candyce,

I am a lifetime member of the city of fontana and as I am seeing the new plans for the speedway to be transitioned into the block of warehouses I have to say I'm somewhat shocked.

The city is starting to turn into a business district with some homes and small shopping centers near by. Cherry is already over run with traffic and the amount of warehouses we have in the city city is, at the very least, concerning.

If this is the direction the city is headed in im not sure this is what myself and alot other homeowners in the city want to continue to call home.

Sincerely
Hannah Ivey

To: Valdez, Steven <Steven.Valdez@lus.sbcounty.gov>
Subject: Public Comment: Draft EIR for the Speedway Commerce Center II Specific Plan

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Good afternoon, Mr. Valdez

My name is Janet Bernabe and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring *nearly **10,000** more truck trips per day* to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for $PM_{2.5}$, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to *more than 13 times the allowed limits*. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project. 3

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development.

Response to Comment Letter G14 – Jasmine Cunningham

G14-1 The Draft EIR proposed over 10 mitigation measures aimed at alleviating potential air quality and greenhouse gas impacts. While the effects were still found to be significant and unavoidable, mitigation was still proposed to reduce these impacts to the maximum extent feasible. Please see *Section 4.8, Greenhouse Gas Emissions Sub-Section 4.8.5, Impacts and Mitigation Measures* located in the Draft EIR.

G14-2 The Project would comply with applicable regulations such as SCAQMD Rule 403 which limits fugitive dust particulates. The Project would also comply with SCAQMD Rule 2305, which requires warehouse operators, among other things, to acquire Zero Emissions or Near Zero Emissions trucks, require Zero Emission/Near Zero Emission truck visits, requires Zero Emission yard trucks, and install on-site Zero Emission charging/fueling infrastructure, or pay a mitigation fee to SCAQMD to be used to incentivize the purchase of Zero Emission/Near Zero Emission trucks and charging/fueling infrastructure in communities nearby. Additionally, the Project would implement MM AQ-9, which requires electric outdoor cargo handling equipment (i.e., forklifts and yard trucks), which would reduce particulate exhaust from on-site equipment.

G14-3 The Project proposes mitigation which would be aimed at minimizing Project-related emissions. This includes MM GHG-2 which requires the Project to supply a minimum of 50 percent of the energy demand on-site from a renewable source (e.g., solar photovoltaic (PV) panels, etc.). This includes the Project's total Title 24 demand and the plug-load. Additionally, MM GHG-3 requires the Project to meet or exceed CALGreen Tier 2 standards (which exceeds code requirements). The Draft EIR also includes MM GHG-1, which requires the Project to apply reduction measures identified in the County's GHG Screening Tables so that each building would achieve a minimum of 100 points. According to the County's 2021 GHG Emissions Reduction Plan Update, any project that adopts at least 100 points of GHG performance standards listed in the proposed 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the state's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, and therefore, would result in a less than significant impact related to GHG emissions. See Response to G14-2 for additional information specific to what the Project is proposing to achieve net zero emissions.

G14-4 State regulation has created deadlines and requirements for the use of electric vehicles and zero emission vehicles. Also, PDF AQ-9 and PDF AQ-10 (see Draft EIR page 4.3-22) have been included to promote the use of alternative fuels and clean fleets and facilitate future installation of electric vehicle supply equipment. Furthermore, the Project's Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. (also described in more detail in Response R2-4)

G14-5 See Response G14-1 above regarding emission mitigation. Further, traffic from SR-60 was studied and is available in *Appendix L* of the Draft EIR.

G14-6 The Draft EIR acknowledged that race day traffic would exacerbate surrounding roadways when combined with the proposed Project. The Draft EIR determined that increased traffic during raceway events were found to generate potentially significant cumulative effects regarding emergency access. Therefore, mitigation MM TRANS-2 requires the development of a traffic management plan (TMP). The TMP would be reviewed and approved by the County Engineer with input from the Highway Patrol and neighboring cities. A traffic management plan would be developed after the Project's end-users have been identified and a specific development plan approved. The TMP will be event-specific and is required to be submitted to the County Engineer a minimum of 30 days prior to each race event. This measure is fully enforceable by the County.

Phone: (909) 387-4421

July 16, 2022

Dear Mr. Valdez,

My name is Jesus. I am a resident of Fontana.
I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe this Project is a poor decision and will be bad for the community at large. The Inland region is already overrun with logistics uses. In recent years larger warehouses have continued to be constructed in the radius of Fontana directly affecting residents as well as the safety of the general public as well as congestion in Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and air pollution that they bring. 1

This project would bring nearly 10,000 more truck trips per day to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for PM2.5, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to more than 13 times the allowed limits. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project. 3

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development.

Be disappointed in yourself and your position held for allowing and supporting such a gross act to our city. You are a disgrace to the well being of this city in supporting this and will effect generations to come and history that has been left.

Your support of this project is a highlight to your lack community you hold in your position and shows true colors that money is your only motive. Not the city.

Your support of this project is ABSOLUTELY HORRIFIC

The Fontana Speedway is being turned into 6.6 million square feet of warehouses.
This is a San Bernardino County Project!!!!!
Kimley-Horn is killing our community.
The track will be a tiny version more like kart racing! I don't understand why we don't deserve a place for entertainment! Great Cities have a place to spend your money, why do we only deserve warehouses. We could increase revenue to San Bernardino county by setting the speedway as the hub of entertainment!!! When we asked the developer questions they literally gave us misinformation!!
No more RV camping, history culture gone!

Kimley-Horn build us an entertainment center!

It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project. 3

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development.

Response to Comment Letter G18 – Lizette Mendoza

G18-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics uses and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G18-2 The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G18-3 Alternatives assessed for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

Subject: Public Comment Draft FIR for the Speedway Commerce Center || Specific Plan

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Dear Mr. Valdez:
My name is Louis Mendoza and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring *nearly **10,000** more truck trips per day* to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for $PM_{2.5}$, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to *more than 13 times the allowed limits*. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.
Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2
Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. Subject: Fontana Speedway Development

[You don't often get email from xoluisgarcia@gmail.com. Learn why this is important at https://aka.ms/LearnAboutSenderIdentification]

Hello,

My name is Luis Garcia and I am a resident of San Bernardino County. The Fontana Speedway is a place a lot of us residents cherish and have memories at.

Why must you people in office slowly agree to kill your residents with the approval of warehouse spaces such as these? Why are you in office if it isn't to help those under your care?

1

These types of developments bring dead end jobs to the residents. Not only that, but the toxins from the diesel trucks that will be coming through the area even more now, will lead to more cases of asthma, cancer, and even death for residents. Are you completely unaware that the Inland Empire has been voted worst air in the nation? Or are you purposely ignoring that fact in an effort to benefit yourselves?

The County of San Bernardino should be ashamed to continuously let their residents down.

2

LUIS GARCIA.
Resident of San Bernardino County for over 15 years.

Response to Comment Letter G20 – Luis Garcia

G20-1 The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

G20-2 The Draft EIR proposed mitigation in order to minimize potential air quality effects associated with future development and operations. Furthermore, the Project is subject to State regulated emissions standards established for onsite vehicles and equipment.

Maria Navarro (G24) [English version available as comment letter25]

Estimado Sr. Valdez

Mi nombre es _____ y le escribo para responder al Borrador del Informe de Impacto Ambiental del Plan Específico del Speedway Commerce Center II. Creo que este proyecto será malo para la comunidad. La región del interior ya está saturada de usos logísticos. En los últimos años, se han seguido construyendo más almacenes y más grandes en el radio de Fontana, Ontario, Rancho Cucamonga y el bolsillo del condado donde se ubicaría este Proyecto, lo que ha provocado un aumento drástico del tráfico de camiones y la consiguiente contaminación atmosférica que conllevan. 1

Este proyecto traería casi 10.000 viajes más de camiones por día para envenenar nuestro aire sin medidas de mitigación eficaces. Tal y como está, el proyecto ya está situado en una zona que es una de las más afectadas del estado según CalEnviroScreen, situándose en el percentil 93 en general, en el percentil 95 para el ozono, en el percentil 94 para las PM2,5 y en el percentil 90 para las partículas diésel. Sin embargo, el proyecto propone bombear cantidades asombrosas de estos mismos contaminantes en la comunidad a niveles que son hasta más de 13 veces los límites permitidos. Es incomprensible que esto se considere una situación aceptable y exijo que el condado rechace este proyecto.

Además, nos preocupa el impacto que la gran afluencia de tráfico para este proyecto tendría en la capacidad de la comunidad para desplazarse. Con casi 10.000 viajes de camiones y más de 25.500 viajes de coches al día, el proyecto amenaza con saturar las carreteras locales con atascos y, aunque se presentaron algunas opciones de mitigación, los planes no van lo suficientemente lejos como para reducir realmente el azote del tráfico: la simple ampliación de las carreteras no es un beneficio para la comunidad, sino que crea calles que son menos seguras y más hostiles para el uso y la actividad humana. Dado que el transporte es también la razón principal de que las emisiones de calidad del aire y de gases de efecto invernadero del proyecto superen los umbrales, incluso después de incluir medidas de mitigación, está claro que no se puede permitir la construcción del proyecto a menos que se haga algo más, no sólo para mitigar el aumento, sino para evitarlo activamente. 2

En lugar del proyecto propuesto, nos gustaría que el condado persiguiera un desarrollo más acorde con los usos comerciales de la zonificación existente. Esta es una oportunidad para que el Condado aporte más atractivo a la región del IE con nuevos desarrollos como salas de conciertos, plazas comerciales, centros comerciales, jardines, etc. Este proyecto propuesto se opone a la visión que la comunidad tiene de una zona simbólica como el Speedway. Las reuniones celebradas no fueron suficientes para garantizar la participación de la comunidad, lo que se demuestra en última instancia por la falta de beneficios para la comunidad de este proyecto.

Gracias por tomarse el tiempo de recibir esta carta y abordar las preocupaciones que plantea. Esperamos que nuestros comentarios contribuyan a dar forma al futuro de este desarrollo. 3

Además, nos preocupa el impacto que la gran afluencia de tráfico para este proyecto tendría en la capacidad de la comunidad para desplazarse. Con casi 10.000 viajes de camiones y más de 25.500 viajes de coches al día, el proyecto amenaza con saturar las carreteras locales con atascos y, aunque se presentaron algunas opciones de mitigación, los planes no van lo suficientemente lejos como para reducir realmente el azote del tráfico: la simple ampliación de las carreteras no es un beneficio para la comunidad, sino que crea calles que son menos seguras y más hostiles para el uso y la actividad humana. Dado que el transporte es también la razón principal de que las emisiones de calidad del aire y de gases de efecto invernadero del proyecto superen los umbrales, incluso después de incluir medidas de mitigación, está claro que no se puede permitir la construcción del proyecto a menos que se haga algo más, no sólo para mitigar el aumento, sino para evitarlo activamente. 2

En lugar del proyecto propuesto, nos gustaría que el condado persiguiera un desarrollo más acorde con los usos comerciales de la zonificación existente. Esta es una oportunidad para que el Condado aporte más atractivo a la región del IE con nuevos desarrollos como salas de conciertos, plazas comerciales, centros comerciales, jardines, etc. Este proyecto propuesto se opone a la visión que la comunidad tiene de una zona simbólica como el Speedway. Las reuniones celebradas no fueron suficientes para garantizar la participación de la comunidad, lo que se demuestra en última instancia por la falta de beneficios para la comunidad de este proyecto.

Gracias por tomarse el tiempo de recibir esta carta y abordar las preocupaciones que plantea. Esperamos que nuestros comentarios contribuyan a dar forma al futuro de este desarrollo. 3

Response to Comment Letter G26 – Martin Navarro

G26-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics uses and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G26-2 The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G26-3 Alternatives assessed for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

Name: _____Maxine Bowden _____
Date: ____7/18/22_____

Dear Mr. Valdez:

My name is ___Maxine Bowden___ and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring nearly 10,000 more truck trips per day to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for PM2.5, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to more than 13 times the allowed limits. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project. 3

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development. Thank you, Maxine Bowden

Melissa May (G28)

From: Melissa May <melissa.m@ccaej.org>
Sent: Monday, July 18, 2022 12:54 PM
To: Valdez, Steven <Steven.Valdez@lus.sbcounty.gov>
Subject: Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Dear Mr. Valdez:

My name is Melissa May and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring *nearly **10,000** more truck trips per day* to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for $PM_{2.5}$, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to *more than 13 times the allowed limits*. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project. 2

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all.

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project. 3

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development.

Response to Comment Letter G28 – Melissa May

G28-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics uses and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G28-2 The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G28-3 Alternatives assessed for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

Miramontes Family (G29)

7/18/2022

Miramontes Family
6643 Blanchard Ave
Fontana, CA 92336

Attention San Bernardino County Planning Department and Kimley-Horn

Our family resides in Fontana California and is composed of Dr. Kevin Miramontes, Amparo Munoz Miramontes, Ari Rene Miramontes (13), and LucasOrion Miramontes (9). We are involved in our community because of our children's health impacts as a direct result of PM2.5 impacts during my pregnancy, and in the time before we knew the cost of breathing deeply outside. We understand that the community is always presented the false choice of jobs over health, when it is clear CEQA, EPA, CARB, and California Statute requires that we use technology and innovation to brings clean jobs and mitigate the negative impacts to the community. 1

After reviewing the EIR Report, and after going to the public Environmental Justice Meeting, our family is strongly opposed to this developmental plan. First and foremost, this project fails to rise to the needs of the community for places of entertainment, shopping, and night life. The Speedway has limitless opportunities for revenue generation to the County of San Bernardino but installing 6.6 million square feet of warehouses has Environmental Impacts to our community that are not even being mitigated in the Kimley-Horn EIR Draft. Such detrimental impacts will cause exponential increases in community costs regarding, time to travel, gas prices, road destruction, underground infrastructure damage, increase childcare costs, as travel time increases, increase in food costs, and most importantly increase in health care as this developer destroys our communities air quality. 2

During the EJ Meeting that Kimley-Horn conducted with the community we found that Kimley-Horn lead a disinformation campaign and violated the spirit of the California Code Section 65302(h)(1) amended by SB1000. We have attached to articles, one is the power point presentation, and the other is scripted misinformation that the Kimely-Horn strategically provided to the community. As you can see this is in violation of the spirit of SB1000
(h)(1)An environmental justice element, or related goals, policies, and objectives integrated in other elements, that identifies **disadvantaged** communities within the area covered by the general plan of the city, county, or city and county, if the city, county, or city and county has a **disadvantaged** community. The environmental justice element, or related environmental justice goals, policies, and objectives integrated in other elements, shall do all of the following:
(A) Identify objectives and policies to reduce the unique or ***compounded health risks*** in **disadvantaged** communities by means that include, but are not limited to, the reduction of pollution exposure, including the improvement of air quality, and the promotion of public facilities, food access, safe and sanitary homes, and physical activity.
(B) Identify objectives and policies to promote civic engagement in the public decision-making process.
(C) Identify objectives and policies that prioritize improvements and programs that address the needs of **disadvantaged** communities. 3

(2) A city, county, or city and county subject to this subdivision shall adopt or review the environmental justice element, or the environmental justice goals, policies, and objectives in other elements, upon the adoption or next revision of two or more elements concurrently on or after January 1, 2018. 3

Green House Gas Mitigation: This project fails to properly mitigate GHG and instead is basing all its mitigation on the current CARB Draft plan. By stating that the project is mitigating GHG by putting in a few electric vehicle charging stations does not tip the scale for the millions of truck trips it will bring to our community a year. The community expects to see all 6.6 million square feet be covered in solar panels, thus REQUIRING the project to be 100% self-powered. Regarding SB 1000, the community demands that cumulative impacts are considered. To mitigate this, we propose all parking to be covered in Solar Panels, creating a micro grid for the community to have a source of shared power to the Fontana County Residents. This would show excellent partnership in the community and increase the community's confidence that we can partner with this developer. To mitigate VMT, the community is proposing that partnership with Transportation should include easy within the "Circulation Plan" to allow employees to be motivated to use public transportation to get to work, and that all EMPLOYERS on the property incentivize public transportation by offering it to their EMPLOYEES at no charge! 4

Traffic Mitigation: The EIR fails to account for the massive amount of truck traffic on Cherry, both off the 10 Freeway, off the 210, and the 15 Freeway Exit. There are no realistic mitigations that would provide a drivable pathway for both the project and the community. This project in its Draft EIR is in violation of California Code Section 65302 amended by SB1000 section (2)(A). Upon any substantive revision of the circulation element, the legislative body shall modify the circulation element to plan for a balanced, multimodal transportation network that meets the needs of all users of streets, roads, and highways for safe and convenient travel in a manner that is suitable to the rural, suburban, or urban context of the general plan.
(B) For purposes of this paragraph, "users of streets, roads, and highways" mean bicyclists, children, persons with disabilities, motorists, movers of commercial goods, pedestrians, users of public transportation, and seniors.
The community is demanding a more complete analysis that includes truck traffic both on and off the 10, 210, and 15 freeway. This project will need a DEDICATED truck exit, that is only for truck traffic. The community asks that this truck exit by subterranean to allow for pollutants to settle into a filtered trench, to protect the community. It is unrealistic to expect that trucks will not be idling as they try to exit the 10, 210, and 15 freeway especially as they traffic to and from the major streets of Cherry, San Bernardino, Napa, and Hickory. A subterraneous pathway is ideal, to allow residents access to streets at bridge points over the subterranean truck traffic trenches. 5

To increase compliance to California Code 65302, we ask that all truck routes be painted on the main streets of traffic. All truck routes should be painted and Poka-Yoke (mistake proofing with clear visual aids) to be able to clearly tell the Truck Driver what lanes they should enter to get to the specific dock doors. The community is asking that each dock door have a plan for entry from

the Freeway and as it transitions City to City along the streets surrounding the project. This will reduce idling time, and drivers from entering our communities and putting our community at risk of deadly truck accidents. The project should include a pathway once in the project to allow for the conveyance of trucks to the dock door through electric automation, to eliminate idling of any kind once on the project site. The project should include a location for drivers to use the bathroom and eat at a local restaurant to prevent the following:
The epidemic of **PISS BOTTLES** that litter our streets.
This is a biological hazard to our entire community.
This increases costs to our communities by Public Works having to exponentially increase services rather than hold the project accountable to properly plan for this.
The epidemic of trash littering our streets
Truck parking in the middle of the streets to be able to get a bite to eat.
Trucks being parked in residential communities.
Trucks being parked in parking lots designed for Class C driver.

5

When traffic concerns were brought to Kimley-Horn during our Environmental Justice Meeting the response was the project complied with the minimum requirements. Community asked questions regarding the impact to traffic on Speedway race days, they stated they did not have to address that in the EIR. The community asked for the true impact the project would have in addition to race day traffic, truck, and community traffic. Kimley-Horn stated they had met the minimum requirement. The community reminded them that SB1000 requires that roadways are accessible to multimodal traffic, and in its current state the traffic in the project did not meet that standard. Especially regarding safe walkways for students. This was their response:

6

Tran

Q: What intersections and roads were studied in the Traffic Study?

Frequently Asked Questions

A: A total of 72 intersections were studied in collaboration with San Bernardino County Staff, throughout Fontana, Rancho Cucamonga, and San Bernardino County. Some of these intersections, in the immediate vicinity of the Project, are shown in the circulation map.

Q: What are the truck routes? Are they near schools or homes?

A: Randall Avenue would be maintained as a truck route for the Project, avoiding congestion near homes and schools. Furthermore, the Project would adhere to Policy TM-5.6, which establishes local truck routes in unincorporated areas to efficiently funnel truck traffic to freeways while minimizing impacts on residents. Routes will be established where trucks are prohibited in unincorporated environmental justice focus areas and to avoid overlaps or conflicts with safe routes to schools. In addition, as indicated in MM TRANS-2, manual traffic control shall also be employed as determined by the County of San Bernardino in consultation with the California Highway Patrol; Cities of Fontana, Rancho Cucamonga, and Ontario; and the Fontana Unified School District, where needed, to safely move traffic through intersections affected by traffic.

Health Impacts: In the Environmental Justice element the project is required to consider the cumulative impacts and mitigate them. This Draft EIR presents no solution when there are considerable steps that can be taken. 6

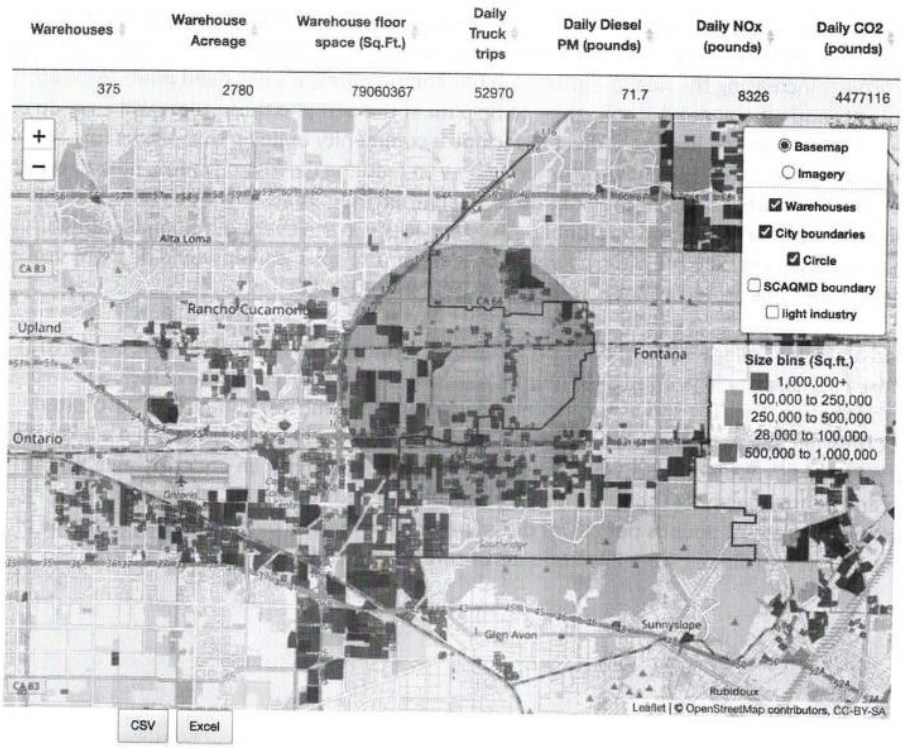
Landscaping: There should be no grass on this project site. The project should instead have all native plants to encourage wildlife to create a habitat in native species. The community proposes having Cypress Trees encircle the entire project. Cypress Trees and Pine Trees are excellent PM2.5 filters, and specifically Cypress Trees will reduce the noise of this project (another failed element for mitigation). All plants should be planted as MATURE, with a minimum height of 15-20 feet based on species. This project does not take time to pollute our community, so we do not have time to wait for mature trees to start doing their job. 7

Health Impacts
Industrial development, such as the proposed Project, can result in high daily volumes of heavy-duty diesel truck traffic and operation of on-site equipment (e.g., forklifts and yard tractors) that emit toxic diesel emissions, and contribute to regional air pollution and global climate change. The Project will expose our communities to elevated levels of air pollution. Residences are located north and west of the Project with the closest residences located within 1,550 feet from the Project's western boundary. In addition to residences, Live Oak Elementary School, Beech Avenue Elementary School, Redwood Elementary School, and Almond Elementary School are located within one mile of the Project. According to the California Communities Environmental Health Screening Tool Version 3.0/4.0 (CalEnviroScreen). This Draft EIR is also in violation of San Bernardino County General Plan, as this warehouse size far exceeds the size that is permissible to be located close to the sensitive receptors of schools. 8

Our community and children are already burdened by multiple sources of air pollution, and I am constantly changing pillowcases from bloody noses in my children's sleep. We are concerned with the potential cumulative health impacts associated with the construction and operation of the Project. In reviewing the data regarding NOP, our community is concerned about the air pollution and health risk impacts that would result from the proposed Project. This project is going to this community who is already in the 98-99% of Pollution Burden including our Air, Water, and overall, Health impacts according to Cal Enviro 3.0/4.0, to a higher burden level (Is that 100%). This project will decrease the life expectancy in our community and will increase the need for parents to take sick days. On average in the Inland Empire, parents take seven sick days per year to care for children negatively impacted by our pollution for things like: migraines, asthma attacks, respiratory issues, diabetes, and neurological disorders. All these medical issues according to the World Health Organization, the American Heart Association, the American Lung Association, and the American Pediatric Association have directly linked to diesel pollutants. This project would exponentially increase this burden. 9

and the community, as trades will be in high demand for this project's longevity, and trades provide excellent union careers that increase our community's disposable income. Regarding this project increasing the health burdens on our communities, we will need more respiratory therapists and we will need scholarships to help meet the demand this project will have on our community. We would like the project to include a community building that allows for educational clinics that teach the community how to read the CalEnviro Screen, how to take care of their health, and what they can do to strengthen their lungs. We would also like this building to be able to be used as a public space especially in the event of rolling blackouts, and or natural disasters. This building, powered by 100% onsite solar power would be a physical reminder that this project is not just about PROFITS, but PEOPLE! 10

Based on Pitzer College's Warehouse CITY Cumulative Impact Tool, numbers associated with this area are already high enough to merit a rejection of the project. We have included two graphics below. The first shows the estimated warehouse numbers, numbers of associated truck trips per day as well as associated emissions of carbon, PMs, and NOx within a 5 km radius of the Speedway Project. Even while these numbers are most likely an underestimation, the area and nearby neighborhoods are dealing with almost 53 thousand truck trips per day, emissions of over 70 pounds per day of diesel particulate matter, over 8 thousand pounds of NOx per day, and almost 4.5 million pounds of carbon emitted per day. 11



11

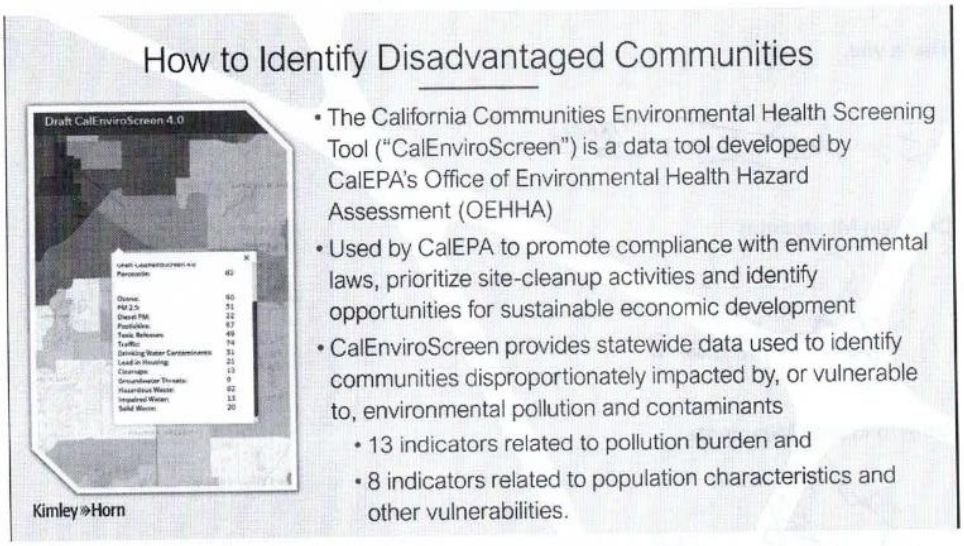
Kimley-Horn lead EIR Process Strategically Violated SB1000, CEQA, and the San Bernardino County General Plan Requirements:

It is important to note the Kimley-Horn strategical mislead the community during their Environmental Justice meeting by showing an image of CalEnviro to the community that was green and did not show the actual pollution of the community that the Draft EIR was reviewing. This is an absolute violation of SB 1000 and we would like to see Kimley-Horn taken to task, for strategically misleading the public when they should have shown the actual data in the Draft EIR. The entire objective of the meeting that they staged, was to properly show the community the outcomes of the Draft EIR. The Draft EIR was not onsite, and when the community asked about mitigations, Kimley-Horn stated that they did not have to talk about the EIR, but rather allow us to hand write our concerns. The community would like to address Kimley-Horn's violation of California Code Section 65302 that adopts the definition of "Disadvantaged Communities" from the California EPA Section 39711 Health and Safety Code:

"**Disadvantaged Communities**" means an area identified by the California Environmental Protection Agency pursuant to Section 39711 of the Health and Safety Code or an area that is a

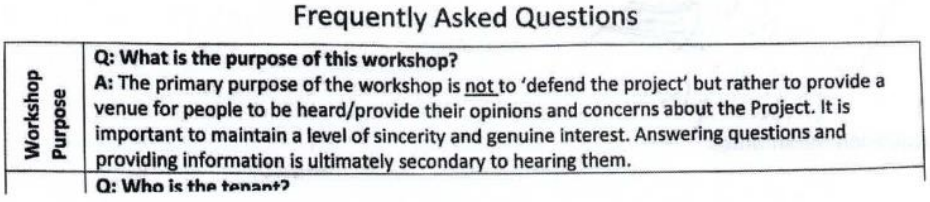
12

low-income area that is disproportionately affected by environmental pollution and other hazards that can lead to negative health effects, exposure, or environmental degradation. Kimley-Horn, instead chose to misrepresent the actual environmental pollutions and other hazards pursuant to the forementioned statute. The below represents the slide presented to the community. When Kimley-Horn was called out for misrepresentation, they said they complied with the minimum requirements by holding the meeting. The community would like further action to be taken, and we will be elevating our concerns to Attorney General Bonta.



12

In addition, Kimley Horn literally documented that they were not here to answer questions, in compliance with the forementioned requirements, but rather to "hear them."



13

We have attached the script being read to us by Kimley-Horn, and the power point presentation that they presented to the community.

In conclusion, the community asks for an Environmental Justice meeting that meets the requirements of SB1000 and presents the actual health impacts to this community. We ask that you meet or exceed all the mitigation outlined in this letter. We would also ask that you consider a different project in place of these warehouses.

Once again, the Miramontes Family opposes this project.

Thank you,

Propósito y Objetivos del Taller de Justicia Ambiental
Introducción al Proyecto
• El período de alcance de CEQA cierra el 13 de enero
Información sobre temas de la Justicia Ambiental
• Indicadores de calidad del aire y salud
• Infraestructura de Tráfico y Transporte
• Instalaciones Publicas
• Impacto Económico
• Participación de la Comunidad
Kimley»Horn

4

2

7/8/2022

Resumen del Taller Anterior de Justicia Ambiental

- Se llevo acabo el 12 de enero en el Cypress Neighborhood Center
- Recibimos comentarios y preguntas sobre tráfico y transporte
- Infraestructura, instalaciones públicas, impacto económico y participación de la comunidad

Kimley»Horn

5

Informe del Reporte del Impacto Ambiental

Kimley»Horn

6

3

7/8/2022

Sitio Del Proyecto

- El sitio del proyecto se encuentra en un área no incorporada del suroeste del condado de San Bernardino.
- El Proyecto SCCIISP facilitaría la reurbanización de aproximadamente 433 acres del sitio de 522 acres del Auto Club Speedway existente.
- Se retendrán aproximadamente 90 acres para el desarrollo y la operación de las instalaciones de deportes de motor "Next Gen In California" de NASCAR, aprobadas por el Condado de San Bernardino en junio de 2021 (la instalación de deportes de motor de 90 acres "no es parte" de este SCCIISP).

Kimley»Horn

7

Descripción General del Proyecto

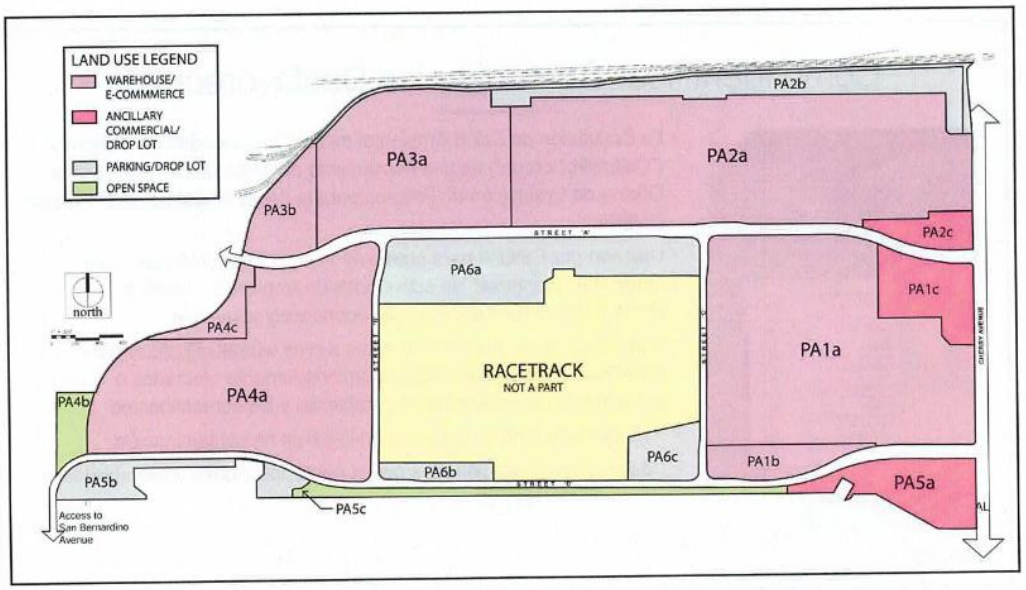
- El SCCIISP consta de seis áreas de planificación (AP) incluyendo:
  - Hasta 6,600,000 pies cuadrados de usos logísticos y de comercio electrónico de alto cubo,
  - Aproximadamente 261,000 pies cuadrados de usos comerciales accesorios,
  - 98 acres de áreas de estacionamiento / lote de caída de vehículos y espacios abiertos asociados y vías públicas internas, y
  - Mejoras de infraestructura
  - El Proyecto SCCII está buscando aprobaciones del Condado, incluyendo la adopción del Reporte del Impacto Ambiental
  - Aviso De Preparacion publicado diciembre 13, 2021
  - Aviso De Preparacion and periodo de estudio se cierra enero 13, 2022

Kimley»Horn

8

4

7/8/2022



9

Planificación de Justicia Ambiental

- El Proyecto de Ley del Senado 1000 (2016) estableció los requisitos de Justicia Ambiental para los planes generales bajo la Sección 65302 (h) del Código de Gobierno
  - Para abordar los "riesgos de salud únicos o compuestos" en las comunidades desfavorecidas mediante la disminución de la exposición a la contaminación y la mejora de la salud en general.

Kimley»Horn

10

5

7/8/2022

Cómo Identificar Comunidades Desfavorecidas

- La Evaluación de Salud Ambiental de las Comunidades de California ("CalEnviroScreen") es una herramienta de datos desarrollada por la Oficina de Evaluación de Peligros para la Salud Ambiental (OEHHA) de CalEPA.
- Utilizado por CalEPA para promover el cumplimiento de las leyes ambientales, priorizar las actividades de limpieza Y identificar oportunidades para el desarrollo económico sostenible
- CalEnviroScreen proporciona datos a nivel estatal utilizados para identificar comunidades desproporcionadamente afectadas o vulnerables a la contaminación ambiental y los contaminantes
- 13 indicadores relacionados con la carga de contaminación
- 8 indicadores relacionados con la población y otras vulnerabilidades.

Kimley»Horn

11

Acciones del Condado

- Como parte del Plan de todo el Condado, el Condado de San Bernardino identificó áreas de enfoque de Justicia Ambiental que incluyen el sitio de este proyecto
  - La parte occidental de Fontana esta en el la parte superior del factores de contaminación de acuerdo con CalEnviroScreen
  - Los factores de contaminación incluyen la calidad del aire, las emisiones tóxicas de la industria y los sitios de desechos peligrosos y sólidos
  - Los problemas de salud incluyen altos casos de asma y enfermedades auditivas, bajo nivel de educación, la pobreza y desempleo.

Kimley»Horn

12

6

7/8/2022

Normas de Justicia Ambiental

- El Condado prioriza las siguientes normas para a mejorar la salud, la recreación y las instalaciones públicas a través de:
  - Reducir de la exposición a la contaminación y mejorar de la calidad del aire
  - Promover instalaciones públicas, incluyendo la infraestructura y los servicios comunitarios
  - Promover el cuidado de salud
  - Promover el acceso a alimentos

Frequently Asked Questions

Workshop Purpose	**Q: What is the purpose of this workshop?** **A:** The primary purpose of the workshop is <u>not</u> to 'defend the project' but rather to provide a venue for people to be heard/provide their opinions and concerns about the Project. It is important to maintain a level of sincerity and genuine interest. Answering questions and providing information is ultimately secondary to hearing them.
Project Description	**Q: Who is the tenant?** **A:** The future tenant(s) are unknown and not subject to speculation. The EIR evaluates the 'worst case scenario' with highest allowable intensities of the proposes e-commerce logistics uses.
	Q: How long is construction going to take? **A:** Construction will occur intermittently through the next 5 to 10 years, though no residences would be exposed to significant levels of noise.
	Q: What are the hours of operation? Would it operate 24 hours? **A:** The Project could take deliveries late at night though there would be no noise impacts above 45 decibels – meaning noise from overnight activities would not impact homes.
	Q: Is the Project site publicly accessible? **A:** Yes, the Project would be publicly accessible – and would not be fenced off. Additionally, the public could reasonably access on-site electric charging stations and parking.
	Q: How will the Project benefit the community? **A:** Open space and electric charging stations would be accessible to the public. The Project will also contribute to infrastructure improvements (including signalization and signage), build underground utilities, and implement a Speedway-themed artwalk. Additionally, the Project will bring commercial activity where those uses are currently lacking.
	Q: Will Auto Club Speedway camping still happen? **A:** RV Camping related to the Auto Club Speedway would no longer occur with the Project.
Local Business	**Q: Will the Project displace small businesses? Particularly those that rely on the existing Speedway?** **A:** There are a couple of small businesses that exist on the existing Auto Club Speedway site – the Speedway owns the site and would negotiate with the small businesses however, we are not privy to that. We are unable to speculate on whether or not these small businesses will be compensated, as future redevelopment of the Speedway is not part of this Project.
	Q: Would the Project partner with small businesses? **A:** See above – we are not privy to any negotiations or partnerships the Speedway has with small businesses that are located within the ACS site.
	Q: Was there any analysis as to how the Project would affect businesses? **A:** *Not our Project*
	Q: I don't like how this Project is going to change/get rid of the ACS: **A:** The redesign of the ACS is already approved and was done by the owners. Its not going away, but they just don't need the parking lots. That's what's facilitating the redesign of the parking lots for our project, however, they are ultimately separate and independent Projects.
Transportation and Traffic	**Q: Will there be adequate parking to prevent overflow onto residential streets?** **A:** The Project will include approximately 98 acres of vehicle parking field/drop lots areas throughout each Planning Area, to accommodate ongoing Next Gen motorsport facility events on designated days as well as parking for permitted land uses. The Project site would also provide pedestrian sidewalks along street sections within the Project site including opportunities for enhanced pedestrian connections between parking fields/drop lots. Additionally, on street parking will be provided on the following streets: Beech Avenue, Whittram Avenue, and Merrill Avenue.
	Q: What intersections and roads were studied in the Traffic Study?

Frequently Asked Questions

	A: A total of 72 intersections were studied in collaboration with San Bernardino County Staff, throughout Fontana, Rancho Cucamonga, and San Bernardino County. Some of these intersections, in the immediate vicinity of the Project, are shown in the circulation map.
	Q: What are the truck routes? Are they near schools or homes? **A:** Randall Avenue would be maintained as a truck route for the Project, avoiding congestion near homes and schools. Furthermore, the Project would adhere to **Policy TM-5.6**, which establishes local truck routes in unincorporated areas to efficiently funnel truck traffic to freeways while minimizing impacts on residents. Routes will be established where trucks are prohibited in unincorporated environmental justice focus areas and to avoid overlaps or conflicts with safe routes to schools. In addition, as indicated in **MM TRANS-2**, manual traffic control shall also be employed as determined by the County of San Bernardino in consultation with the California Highway Patrol; Cities of Fontana, Rancho Cucamonga, and Ontario; and the Fontana Unified School District, where needed, to safely move traffic through intersections affected by traffic.
	Q: How will the Project affect traffic on Cherry Avenue? **A:** Cherry Avenue is the Project site's eastern boundary. Widening of Cherry Avenue along the Project frontage would be done to improve traffic movements at the intersections of Street "A"/Cherry Avenue and Street "D"/Cherry Avenue. The Project proposes improvements that would include future construction of pedestrian connections from Cherry Avenue to the parking field/drop lots, Rancho Vista, Napa Street, and the existing private VIP Access Road into the Project area and within the new right of way improvements that connect to each Planning Area and to the Next Gen motorsports facility. Additionally, a multi-use trail connection is proposed along Street "A" that would connect Cherry Avenue to Napa Street and support future local trail systems.
	Q: Will trucks be allowed on the site overnight? **A:** No, parking fields/drop lots would not accommodate overnight parking for trucking activity. This provision would reduce the need for overnight security as well as eliminate noise and lighting nuisances.
Noise and Hazards	**Q: How will the Project affect noise in the area?** **A:** While the Project is far enough away from sensitive uses such as residences and schools that it won't pose noise impacts, the Project structures would buffer noise from existing Speedway uses and proposed entertainment events that could take place at the Speedway in the future. It is important to note that significant noise impacts will still occur even without the Project. Significant noise impacts (above applicable County noise standards) would occur along Randall Avenue (from Cherry Avenue to Citrus Avenue) due to increased traffic noise.
	Q: Will Project noise be heard at residences or schools? **A:** The existing site is a flat parking lot, so building the project and adding landscape will actually reduce noise created on site – the only significant noise is from off-site traffic, particularly along Randall Avenue.
	Q: Will Project noise affect businesses? Was noise impacts on nearby businesses analyzed? **A:** An Acoustical Assessment was conducted for the Project – noise was measured at seven points surrounding the Project site in residential areas as well as the surrounding industrial. Significant impacts relating to noise where identified on Randall due to increase in truck traffic. While mitigation for this significant and unavoidable impact is not feasible, no other significant noise impacts were identified.
	Q: What will the Project do to mitigate noise? **A:** Significant noise impacts are anticipated to result from off-site truck traffic. Due to a lack of jurisdiction over affected roadways, no feasible mitigation is identified to address these

Frequently Asked Questions

	impacts. For all else, noise impacts are less than significant and below County thresholds for noise.
	Q: Is there adequate consideration to the prior industrial uses? To what standard was the soil cleaned? **A:** The Project site was previously used as a Kaiser Steel Mill (from 1942 to 1983) that generated various wastes that were disposed of on-site. The entire property was assessed and subject to subsequent investigations. While the majority of the site requires no further action, there are three sites that will undergo additional material removal or investigation and remediation. Groundwater monitoring has continued as a result.
	Q: Will there be private security? **A:** Private security would be present during construction, and more than likely each individual tenant will have gated truckyards and on-site security.
	Q: Where's the nearest police station or who would respond in the event of an emergency? **A:** The nearest San Bernardino County Sheriff's Department station that would respond in event of an emergency is the Fontana Station located at 17780 Arrow Boulevard, Fontana, CA 92335, approximately 4.6 miles to the east.
Environmental Impact Report (EIR)	**Q: What is an Environmental Impact Report (EIR)?** **A:** An Environmental Impact Report is a requirement of the California Environmental Quality Act (CEQA) to identify and disclose environmental impacts – including air quality, noise, and traffic – to decision makers tasked with approval of a given Project. The EIR is based on various technical studies and proposes measures to reduce identified impacts.
	Q: Will my comments during the Environmental Justice Workshop be recorded and sent to decision-makers? **A: No**, the purpose of this Environmental Justice Workshop is to provide community members with the opportunity to share concerns or opinions on the Project as well as an opportunity to learn more about the Project is a relaxed, family-friendly setting. While your concerns will be informally noted, this is not a method for providing official comment on the Project.
	Q: How do I provide official comment on the Project? **A:** Official comments on the Project and its EIR that will be made available to decision makers will take the form of emails or mailed letters. A mail-in form you can use to make official comments is provided at the "Environmental Impact Report" Table.
	Q: Where can I find more information on the Project EIR? **A:** More information can be found via the QR code on the flyer (will be provided day-of event) as well as via the County of SB planning website (URL on the flyer)
	Q: Has the Project been approved by the County yet? **A: No**, after the current public review period, final EIR certification and Specific Plan adoption will be at the discretion of County officials, who will be provided all official comments submitted for the EIR.
	Q: What is a Specific Plan and how does that play in to the EIR? **A:** The Specific Plan guides future development within the Project site through detailed development standards and implementation measures in a way that is consistent with the existing General Plan. The Specific Plan EIR, once approved, would cover worst-case environmental impacts resulting from future, planned development provided they are what's described in the Specific Plan without significant modification.

Frequently Asked Questions

Environmental Justice	**Q: How does the recent Fontana Attorney General settlement – protecting vulnerable communities from pollution by – affect the Project?** **A:** The April settlement required a Fontana warehouse project to adopt substantial mitigation measures to minimize impacts on the surrounding community. More broadly, the City of Fontana adopted an ordinance, as required by the settlement, setting stringent environmental standards for all future warehouse development in Fontana. This Project is in the unin
	Q: What makes our community an 'Environmental Justice' community? **A:** The general area occupied by the Project site (see DUC map) is designated as a Disadvantaged Unincorporated Community. This metric is a combination of various demographic data (such as income, ability to speak English, and minority population) as well as environmental factors (Calenviroscreen: a community more affected by poor air quality, hazards, poor water quality, etc.). Not everyone is at the workshop may be a part of this DUC, but the historically disadvantaged community may be larger than thought. It may be effective to ask what they feel most affected by, and what does Environmental Justice/Disadvantaged community mean to them?

This page intentionally left blank.

Response to Comment Letter G29 – Miramontes Family Response

G29-1 The commenter's comments are noted for the record. However, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

G29-2 The Project does not propose modifications to state wage regulations or those of its future tenants. Further, Project alternatives were analyzed for their validity within the Draft EIR. The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3 53). All feasible mitigation has been applied to mitigate all environmental impacts, including air quality and GHG emissions impacts. Development of land within the County is dependent on the will of the property owner, who in turn is subject to land use and zoning standards established by the County. Lastly, the comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

G29-3 In compliance with the County's General Plan policies two publicly noticed environmental justice outreach meetings were conducted as the Project is located within an Unincorporated Environmental Justice Focus Area. The outreach provided an opportunity for community engagement and additional analysis. As a result of these meetings and community input additional community benefits and facilities were added to the Project.

The comment states that materials developed for the environmental justice meeting, including a printed copy of the powerpoint presentation and a set of Frequently Asked Questions included as attachments to the comment letter, violated the spirit of SB 1000; however, no specific claims are presented. SB 1000 contains requirements for cities and counties which contain disadvantaged communities to develop an environmental justice element, or related goals, policies, and objectives, to be included in an adopted General Plan and the County fulfilled those requirements. The County's General Plan includes goals and policies that identify disadvantaged communities and address concerns associated with the health risks in these communities in the Hazards Element. SB 1000 does not create obligations directly applicable to a project or Specific Plan. The Specific Plan's consistency with the applicable County Environmental Justice goals and policies is established in the Land Use section of the Draft EIR.

G29-4 The Draft EIR *Section 4.8* (Greenhouse Gas Emission) evaluates GHG impacts, and as shown in *Table 4.8-4: San Bernardino County GHG Reduction Measures Screening Table*, the Project would comply with the County's GHG Reduction Measures and would be consistent with the County's GHG Reduction Plan. Specifically, MM GHG-2 requires the Project to supply a minimum of 50 percent of the energy demand on-site from a renewable source (e.g., solar photovoltaic (PV) panels, etc.). This includes the Project's total Title 24 demand and the electrical plug-load. Additionally, MM GHG-3 requires the Project to meet or exceed CALGreen Tier 2 standards (which exceeds current County code requirements). The Draft EIR also includes MM GHG-1, which

requires the Project to apply reduction measures identified in the County's GHG Screening Tables so each building would achieve a minimum of 100 points. According to the County's 2021 GHG Emissions Reduction Plan Update, any project that adopts at least 100 points of GHG performance standards listed in the 2021 Screening Tables, would be consistent with the County's GHG Emissions Reduction Plan to reduce emissions to 40 percent below 2007 levels. Meeting this reduction would be consistent with the state's long-term goal to achieve statewide carbon neutrality (zero net emissions) by 2045, resulting in a less-than-significant impact related to GHG emissions. The Draft EIR identifies numerous Standard Conditions, Project design features, and mitigation measures to minimize emissions to the maximum extent feasible (refer to Draft EIR pages 4.3-21 through 4.3-23, 4.3-38 through 4.3-42, and 4.8-31 through 4.8-33). Nonetheless, the Draft EIR conservatively concludes that impacts to GHG would remain significant and unavoidable due to the size of the Project and its corresponding emissions. The Draft EIR mitigation measures were developed in compliance with State CEQA Guidelines Section 15041 and the essential nexus and rough proportionality standards.

On-site solar generation is also required by the proposed Development Agreement that would be considered for approval by the County. The Development Agreement requires all buildings be designed to meet Leadership in Energy and Environmental Design (LEED) standards, which would ensure that buildings are energy efficient. The Project Development Agreement also requires the Master Developer to implement a Transportation Demand Management (TDM) program to reduce vehicle miles traveled (VMT) by reducing single occupant vehicle trips and encourage transit (also required by MM AQ-3).

Furthermore, the Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants which would further reduce GHG emissions.

G29-5 The traffic analysis was prepared in conformance with San Bernardino County VMT/Traffic guidelines and all feasible mitigation is being applied. The comment does not affect the adequacy of the EIR's analysis of CEQA-related analysis, impacts or mitigation measures. Further, the analysis is consistent with Countywide policy TM-5.6 as the Project evaluated all truck routes to reduce impacts within the Environmental Justice Focus Area (EJFA) area.

G29-6 The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

The health effects of the Project were evaluated in a Health Risk Assessment (HRA, see Draft EIR *Appendix C*). The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs)

would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53).

G29-7 The Project complies with all applicable landscaping standards adopted by the County, including local tree ordinances.

G29-8 As discussed above under Response G29-6, Project-related health risks were evaluated in a HRA (refer to Draft EIR *Appendix C*) and discussed on Draft EIR pages 4.3-51 through 4.3-53. It should be noted that the HRA also quantifies emissions from yard trucks and on-site equipment and identifies Mitigation Measure AQ-9, which requires zero emissions cargo handling equipment (e.g., forklifts, yard trucks, hostlers, etc.) to reduce on-site emissions. The HRA evaluated pollutant concentrations at the closest sensitive receptors to the Project site, which included residences and Redwood Elementary School. As discussed in the Draft EIR health risk impacts would be less than significant with mitigation incorporated. It should be noted that Live Oak Elementary School and Beech Avenue Elementary School mentioned in the comment are located farther away than Redwood Elementary School. As pollutant concentrations decline further away from the Project site, impacts at these locations would be lower than what was identified in the Draft EIR. Additionally, regarding the warehouse size per the San Bernardino County General Plan, Countywide Plan Policy LU-6.4 states that the County may allow for industrial amendments to the size of industrial projects through specific plans.

G29-9 Refer to Master Response 2 regarding CalEnviroScreen and rankings and cumulative impacts. Regarding localized impacts, the Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G29-10 The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

G29-11 Refer to Response O9-3 regarding Pitzer College's Warehouse CITY Cumulative Impact Tool. Additionally, cumulative impacts are addressed in Master Response 2.

G29-12 See Response G29-3. SB 1000 functions separately from the Draft EIR process. Additionally, the Draft EIR was made available for review online on the County's website, where it is still available for view. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

G29-13 The comment refers to frequently asked questions that were provided at the Environmental Justice workshops and requests the County hold another Environmental Justice meeting to

address health impacts to the community and consider a different project in lieu of warehouse development. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

[You don't often get email from eliza4393@gmail.com. Learn why this is important at https://aka.ms/LearnAboutSenderIdentification]

I have lived in Fontana my whole life and it is devastating watching you turn it into a warehouse. Because that all Fontana is now! We are just warehouses and the people that work there. Let's also mention how much more likely it is for people living around warehouses to get sick. You are ruining our city for money? Money that doesn't even go to helping our city. We have homeless that need help, we have no shelter for all the abandoned strays, and what help have we received from the city amidst a pandemic? NONE. If you tear down the speedway, may I add iconic speedway that has held multiple Hard Summers, races, and other events, you yould have finished killing Fontana! Why even build new houses? Invite more people to stay in the city if it's just going to be warehouses. Not to mention once people realize what you are trying to do with our speedway I doubt people will continue to move here. Our city is growing, it is becoming suburban paradise for some and you are ruining that by introducing warehouses! And lets also talk about how most, if not all, the warehouses are in Central and South Fontana, the lower income areas! What you are doing is disgusting! How do you even sleep at night? Is it in this city? The city you are destroying? You probably take the money from this deal and screw over your city and move somewhere else where there are no factories/ warehouses because again who would want to live near that! If you want another warehouse so badly why don't you simply build on empty lots instead of tearing down our city! 1

1

This page intentionally left blank.

Response to Comment Letter G31 – Nayri Tapia

G31-1 The commenter is expressing social and economic concerns regarding the City of Fontana as a whole and a dislike of warehouses. Please see Master Response 2 in response to the comment that it is more likely for people living around warehouses to get sick. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

1

This page intentionally left blank.

Response to Comment Letter G34 – Rosa Loredo

G34-1 The commenter is concerned the Project would generate more traffic along Redwood Avenue and is requesting speed bumps and sidewalks be provided. As indicated in the Draft EIR, sidewalk improvements are proposed for the immediate area surrounding the Project site along with intersection improvements in locations which are impacted by the Project. Draft EIR *Section 4.17, Transportation*, Impact 4.17-3, evaluated the Project's potential to impact roadways, intersections, drives aisles, and other traffic features in the area and determined impacts would be less than significant. Furthermore, *Section 4.15, Public Service*, Impact 4.15-1 noted that there would be a slight increase in calls for service, but with the improved access to and around the site, police and fire services would be improved.

This is a disgrace. We are a family community and the raceway is for families.

The Fontana Speedway is being turned into 6.6 million square feet of warehouses.
This is a San Bernardino County Project!!!!!
Kimley-Horn is killing our community.

Will the track be a tiny version more like kart racing? We deserve a place for entertainment! Great Cities have a place to spend money, why do we only deserve warehouses? We could increase revenue to San Bernardino county by setting the speedway as the hub of entertainment!!!
No more RV camping, history culture gone!
Kimley-Horn/Valdez build us an entertainment center!!!

1

This page intentionally left blank.

Response to Comment Letter G35 – Sandy Lundergan-Price

G35-1 The comment is providing general observations and appears to be requesting an entertainment center be developed in lieu of the Project. Please see Master Response 1. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. The comment is noted and forwarded to the decision makers for their consideration.

Sara Teran (G36)

From: Sara Teran <st9009597@gmail.com>
Sent: Monday, July 18, 2022 3:20 PM
To: Valdez, Steven <Steven.Valdez@lus.sbcounty.gov>
Subject: Public Comment: Draft EIR for the Speedway Commerce Center II Specific Plan

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Dear Mr. Valdez:

My name is Sara Teran and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring *nearly **10,000** more truck trips per day* to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for $PM_{2.5}$, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to *more than 13 times the allowed limits*. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.

Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project. 3

Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development.

Response to Comment Letter G36 – Sara Teran

G36-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics uses and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G36-2 The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G36-3 Alternatives assessed for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Stephen May
7/18/2022

Dear Mr. Valdez:
My name is Stephen May and I am writing to respond to the Draft Environmental Impact Report for the Speedway Commerce Center II Specific Plan. I believe that this Project will be bad for the community. The Inland region is already overrun with logistics uses. In recent years, more and bigger warehouses have continued to be constructed in the radius of Fontana, Ontario, Rancho Cucamonga, and the county pocket where this Project would be located, leading to a dramatic increase in truck traffic and the resultant air pollution that they bring. 1

This project would bring nearly 10,000 more truck trips per day to poison our air without effective mitigation measures. As it stands, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for PM2.5, and the 90th percentile for diesel particulate matter. Yet, the Project proposes to pump staggering amounts of these very same pollutants into the community at levels which are up to more than 13 times the allowed limits. It is incomprehensible that this would be seen as an acceptable state of affairs and I demand that the County reject this Project.
Additionally, we are concerned about the impact that the large influx of traffic for this Project would have on the ability for the community to get around. With nearly 10,000 truck trips and more than 25,500 car trips per day, the Project threatens to overwhelm local roads with gridlock and although some mitigation options were presented, the plans do not go far enough toward truly reducing the scourge of traffic—simply widening roads is not a community benefit but instead creates streets which are less safe and more hostile to human use and activity. Given that transportation is also the primary reason behind the Air Quality and Greenhouse Gas emissions for the Project exceeding the thresholds even after mitigation measures were included, it is clear that the Project cannot be allowed to be built unless it does more to not just mitigate the increase, but actively prevent it from happening at all. 2

Instead of the proposed Project, we would like to see the County pursue a development more in line with the commercial uses of the existing zoning. This is an opportunity for the County to bring more attraction to the region with new developments like concert halls, retail plazas, malls, gardens, etc. This proposed project opposes the vision that the community has for a symbolic area like the Speedway. The meetings held were not enough to ensure community participation which is ultimately demonstrated by the lack of community benefits from this project.
Thank you for taking the time to receive this letter and address the concerns it raises. We hope that our comments will help shape the future of this development. 3

Sincerely,
Stephen May

Response to Comment Letter G37 – Stephen May

G37-1 The Project proposes a Specific Plan which would allow for the development of high-cube logistics uses and commercial uses. The future development would be consistent with the County's development standards and those proposed within the Specific Plan. Please see Master Response 2.

G37-2 The Draft EIR determined that the Project's Localized Significance Thresholds (LSTs) for air quality and impacts would be less than significant (refer to Draft EIR pages 4.3-43 through 4.3-46) and health risk impacts would also be less than significant (refer to Draft EIR pages 4.3-51 through 4.3-53), which indicates that the regional increases shown in Draft EIR Tables 4.3-13 through 4.3-17 would not necessarily cause an exceedance of the ambient air quality standards. Also refer to Master Response 2.

G37-3 Alternatives assessed for the Project were based on State CEQA Guidelines. The Project is consistent with the County's General Plan land use designations and existing zoning for the site and proposes uses allowed under the County's Development Code. A commercial alternative was included in *Section 6.0, Alternatives* of the Draft EIR and found to not meet the Project Objectives as well as the Project. Also see Master Response 3.

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

I strongly oppose the building of more warehouse spaces where speedway is .
Please stop this as it will cause more pollution and traffic in the already crowded area.

Response to Comment Letter 38 – Sandy Singh

G38-1 The comment expresses opposition to the Project specifically the removal of the existing racetrack. To clarify, the Project does not involve the reduction of the existing Speedway racetrack footprint. That is a part of an already approved action that is separate from the proposed Project; please see Master Response 1. The comment does not provide any specific comments on the adequacy of the Draft EIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary. . The comment is noted and forwarded to the decision makers for their consideration.

Re: Response to County's Final EIR - Speedway Commerce Center II Specific Plan Project (PROJ - 2021 00150, SCH No. 2021120259)

Dear Mr. Valdez,

This letter is submitted on behalf of the members and families represented by Local 1932 of the International Brotherhood of Teamsters ("Local 1932"). Local 1932 and our sibling locals represent thousands of workers in the logistics industry in San Bernardino County. Teamster members not only work in this industry, but many live in the neighborhoods and communities most directly affected by this industry's physical development. For the last few years, Local 1932, along with its sibling locals across California have made a commitment to ensure that this industry which impacts both the work and community life of so many workers, their families and their neighbors meets the best standards, and limits its negative impacts.

The County's responses to comments submitted to the draft EIR ("DEIR") are not satisfactory and do not meet the statutory or substantive requirements of CEQA in numerous instances. This letter will briefly outline the ways in which the Final EIR responses ("FEIR"; "Responses") are inadequate.

1. Summary

The County should not adopt the FEIR as it was circulated to the public. As it stands, the FEIR is incomplete, full of stand-ins and blanks that omit key information that is necessary for the public and decision-makers to adequately understand the County's rationale and

substantive support for the DEIR analysis. The DEIR does not adequately address issues of air quality baselines for evaluation, VMT analysis, mitigation measures, and contains deficient project descriptions and alternatives analyses. The FEIR fails to competently, fully or adequately address these deficiencies and therefore the FEIR and the entitlements related to it should not be adopted.

2. The Responses Do Not Appear to be Complete.

A general problem with the Responses is that the County seems either to not have circulated the final version of the Responses or did not fully complete the responses. There are several dozen instances of key internal references, citations, or terms omitted either with "XXX" or with blank lines (e.g., "_____"). There are at least 45 instances of this, including a dozen just in the responses to Comment O4. This makes it difficult, if not impossible, to fully understand the County's individual responses and shifts the burden to the public and decision-makers to discern the reasoning, explanation, and evidence that is meant to support the County's claim for the adequacy of the DEIR. An appropriate, completed set of Responses needs to be recirculated so that the public and the decision-makers can make a properly informed decision regarding the document.

3. The Project Description Remains Inadequate for Purposes of CEQA

Several commenters noted that the DEIR's project description is inadequate. (See e.g., Comment O1, O4, O7). The FEIR Responses generally counter these comments by referring to "Master Response 1," which purports to explain and justify the DEIR's project description. However, Master Response does not go into detail about why the project description is adequate, given that substance of the objections.

For example, comment O3 details how the project description failed to adequately address the potential specific impacts of likely end-users that were reasonably foreseeable. This entails analyzing the impact of consumer-facing e-commerce uses, where deliveries are made to consumers' homes, for example Amazon or a similar e-commerce retailer. Given

the size and scope of the planned e-commerce facilities, there is a known range of end-users: currently, Amazon owns approximately 38% of the market-share of e-commerce retailers; Wal-Mart is second in market-share with 6%, followed by Apple and eBay at approximately 4%. Each of these e-commerce retailers have existing facilities which can be studied to predict, with more accuracy, their impacts. Amazon, which has a greater intensity of use, uses particular commercial vehicles, has a predictable number of routes and vehicles using those routes, and a standardized logistical model, has impacts distinct from, e.g., Wal-Mart or Apple, which serve different markets and have different intensity of uses. Master Response 1, upon which the FEIR Responses heavily rely, does not address at all the objection that the DEIR failed to account for the predictable and likely uses. As the FEIR Responses failed to respond to these objections adequately, the DEIR needs to be redrafted and recirculated.

4. The FEIR Responses Failed to Respond to Particularized Objections by Experts in Comment O3.

Comment O3, provided by attorneys representing CARE-CA, included several appendices which went into further detail regarding technical and legal deficiencies with the DEIR (see FEIR starting at 2.0-136). While some of the matters contained in these expanded expert reports are summarized in CARE-CA's comment letter, many of the specifics are not–for example, the mitigation measures regarding trucks to be used during construction (at 2.0-141), or the air quality baseline used for analysis (at 2.0-1401).

Similarly, the FEIR Responses does not address the July 18 report prepared by Smith Engineering and Management (at 2.0-178), which details the failure to adequately study LOS at relevant locations. (at 2.0-179).

These failures to adequately address specific objections leaves the FEIR deficient.

5. The FEIR's Responses to the Deficient Alternative Analysis is Unsatisfactory

The FEIR purports to respond to numerous commenters who raised issues with the DEIR's alternative analysis (see e.g., O8-4 at 545; O9-3 at 552-3). In at least one instances, the response is filled with blanks (Responses at 545) which leave out seemingly key information meant to explain why the alternatives analysis is adequate.

Responses O9-7 to O9-9 do not adequately address the objection that the DEIR's alternatives analysis lacks objective criteria upon which decisions were made to either reject the alternative or regarding which alternative to choose. Instead, the responses simply reiterate that the alternatives were rejected because they were not optimal, i.e., because they were not large *enough* given the infrastructure cost. (see 2.0-553). However, there is no explication of the objective criteria upon which "largeness" or differential in cost were evaluated, or the specific decline in impacts that was desirable with respect to the chosen decrease in scale.

6. Conclusion

For the foregoing reasons, we respectfully request that the FEIR Responses be adequately completed, or in the alternative, that the DEIR be recirculated after addressing the objections raised by the numerous commenters to the Project.

Sincerely,

Shaun Martinez
Teamsters Local 1932

Response to Comment Letter A1 – Shaun Martinez, Teamsters Local 1932

The comment letter was received after circulation of the Draft EIR and prior to the Planning Commission meeting. The commenter notes that the draft Final EIR circulated for public review contained draft version of the responses to comments which were incomplete. As a procedural matter, CEQA does not require any public comment period for a Final EIR. Section 15089 of the CEQA Guidelines provides that a lead agency *may* (but is not required to) provide an opportunity for public review of the Final EIR prior to approving a project. The draft version of the Final EIR provided with the staff report was provided for informational purposes only. The County will fully comply with the requirements of Public Resource Code Section 21092.5 by providing complete written responses to the comments submitted by public agencies at least 10 days prior to certification of the Final EIR.

The substantive issues raised by these comments were addressed during public comment at the Planning Commission meeting, during the applicant's response to public comments by the Project attorney and by technical experts regarding the information provided in the comment. No new information was presented that wasn't previously addressed or analyzed in the previous responses to Comment O10 and therefore no further response is necessary. The letter is provided in the Final EIR and in the Planning Commission report and has been responded to as part of the Planning Commission hearing record.

My family and I sent this letter out for suggested mitigations.

We never received a response and we can see that none of our mitigation measures were taken into consideration based on the presentation now given to us from Anne Miles.

This is extremely disappointing and appears to once again ignore true mitigation considerations.

The Miramontes Family

7/18/2022

Miramontes Family
6643 Blanchard Ave
Fontana, CA 92336

Attention San Bernardino County Planning Department and Kimley-Horn

Our family resides in Fontana California and is composed of Dr. Kevin Miramontes, Amparo Munoz Miramontes, Ari Rene Miramontes (13), and LucasOrion Miramontes (9). We are involved in our community because of our children's health impacts as a direct result of PM2.5 impacts during my pregnancy, and in the time before we knew the cost of breathing deeply outside. We understand that the community is always presented the false choice of jobs over health, when it is clear CEQA, EPA, CARB, and California Statute requires that we use technology and innovation to brings clean jobs and mitigate the negative impacts to the community.

After reviewing the EIR Report, and after going to the public Environmental Justice Meeting, our family is strongly opposed to this developmental plan. First and foremost, this project fails to rise to the needs of the community for places of entertainment, shopping, and night life. The Speedway has limitless opportunities for revenue generation to the County of San Bernardino but installing 6.6 million square feet of warehouses has Environmental Impacts to our community that are not even being mitigated in the Kimley-Horn EIR Draft. Such detrimental impacts will cause exponential increases in community costs regarding, time to travel, gas prices, road destruction, underground infrastructure damage, increase childcare costs, as travel time increases, increase in food costs, and most importantly increase in health care as this developer destroys our communities air quality.

During the EJ Meeting that Kimley-Horn conducted with the community we found that Kimley-Horn lead a disinformation campaign and violated the spirit of the California Code Section 65302(h)(1) amended by SB1000. We have attached to articles, one is the power point presentation, and the other is scripted misinformation that the Kimely-Horn strategically provided to the community. As you can see this is in violation of the spirit of SB1000
(h)(1)An environmental justice element, or related goals, policies, and objectives integrated in other elements, that identifies **disadvantaged** communities within the area covered by the general plan of the city, county, or city and county, if the city, county, or city and county has a **disadvantaged** community. The environmental justice element, or related environmental justice goals, policies, and objectives integrated in other elements, shall do all of the following:
(A) Identify objectives and policies to reduce the unique or ***compounded health risks*** in **disadvantaged** communities by means that include, but are not limited to, the reduction of pollution exposure, including the improvement of air quality, and the promotion of public facilities, food access, safe and sanitary homes, and physical activity.
(B) Identify objectives and policies to promote civic engagement in the public decision-making process.
(C) Identify objectives and policies that prioritize improvements and programs that address the needs of **disadvantaged** communities.

(2) A city, county, or city and county subject to this subdivision shall adopt or review the environmental justice element, or the environmental justice goals, policies, and objectives in other elements, upon the adoption or next revision of two or more elements concurrently on or after January 1, 2018.

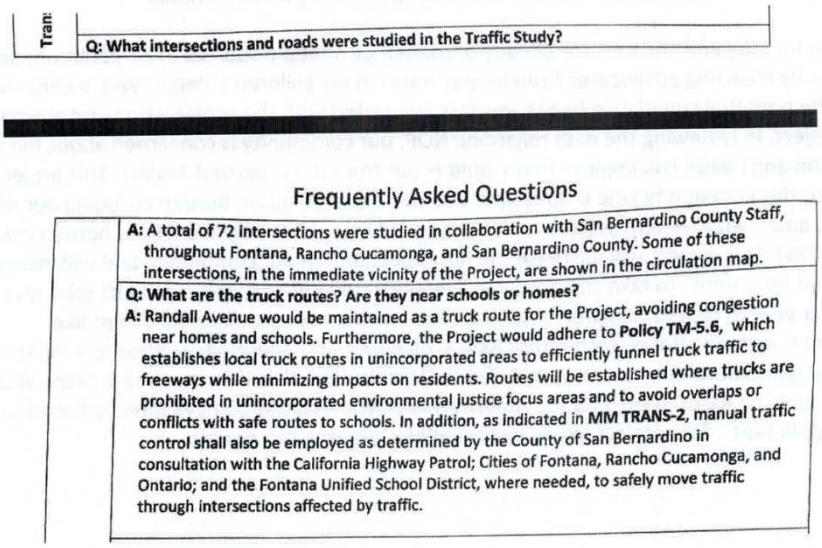
Green House Gas Mitigation: This project fails to properly mitigate GHG and instead is basing all its mitigation on the current CARB Draft plan. By stating that the project is mitigating GHG by putting in a few electric vehicle charging stations does not tip the scale for the millions of truck trips it will bring to our community a year. The community expects to see all 6.6 million square feet be covered in solar panels, thus REQUIRING the project to be 100% self-powered. Regarding SB 1000, the community demands that cumulative impacts are considered. To mitigate this, we propose all parking to be covered in Solar Panels, creating a micro grid for the community to have a source of shared power to the Fontana County Residents. This would show excellent partnership in the community and increase the community's confidence that we can partner with this developer. To mitigate VMT, the community is proposing that partnership with Transportation should include easy within the "Circulation Plan" to allow employees to be motivated to use public transportation to get to work, and that all EMPLOYERS on the property incentivize public transportation by offering it to their EMPLOYEES at no charge!

Traffic Mitigation: The EIR fails to account for the massive amount of truck traffic on Cherry, both off the 10 Freeway, off the 210, and the 15 Freeway Exit. There are no realistic mitigations that would provide a drivable pathway for both the project and the community. This project in its Draft EIR is in violation of California Code Section 65302 amended by SB1000 section (2)(A). Upon any substantive revision of the circulation element, the legislative body shall modify the circulation element to plan for a balanced, multimodal transportation network that meets the needs of all users of streets, roads, and highways for safe and convenient travel in a manner that is suitable to the rural, suburban, or urban context of the general plan.
(B) For purposes of this paragraph, "users of streets, roads, and highways" mean bicyclists, children, persons with disabilities, motorists, movers of commercial goods, pedestrians, users of public transportation, and seniors.
The community is demanding a more complete analysis that includes truck traffic both on and off the 10, 210, and 15 freeway. This project will need a DEDICATED truck exit, that is only for truck traffic. The community asks that this truck exit by subterranean to allow for pollutants to settle into a filtered trench, to protect the community. It is unrealistic to expect that trucks will not be idling as they try to exit the 10, 210, and 15 freeway especially as they traffic to and from the major streets of Cherry, San Bernardino, Napa, and Hickory. A subterraneous pathway is ideal, to allow residents access to streets at bridge points over the subterranean truck traffic trenches.

To increase compliance to California Code 65302, we ask that all truck routes be painted on the main streets of traffic. All truck routes should be painted and Poka-Yoke (mistake proofing with clear visual aids) to be able to clearly tell the Truck Driver what lanes they should enter to get to the specific dock doors. The community is asking that each dock door have a plan for entry from

the Freeway and as it transitions City to City along the streets surrounding the project. This will reduce idling time, and drivers from entering our communities and putting our community at risk of deadly truck accidents. The project should include a pathway once in the project to allow for the conveyance of trucks to the dock door through electric automation, to eliminate idling of any kind once on the project site. The project should include a location for drivers to use the bathroom and eat at a local restaurant to prevent the following:
The epidemic of **PISS BOTTLES** that litter our streets.
This is a biological hazard to our entire community.
This increases costs to our communities by Public Works having to exponentially increase services rather than hold the project accountable to properly plan for this.
The epidemic of trash littering our streets
Truck parking in the middle of the streets to be able to get a bite to eat.
Trucks being parked in residential communities.
Trucks being parked in parking lots designed for Class C driver.

When traffic concerns were brought to Kimley-Horn during our Environmental Justice Meeting the response was the project complied with the minimum requirements. Community asked questions regarding the impact to traffic on Speedway race days, they stated they did not have to address that in the EIR. The community asked for the true impact the project would have in addition to race day traffic, truck, and community traffic. Kimley-Horn stated they had met the minimum requirement. The community reminded them that SB1000 requires that roadways are accessible to multimodal traffic, and in its current state the traffic in the project did not meet that standard. Especially regarding safe walkways for students. This was their response:



Tran

Q: What intersections and roads were studied in the Traffic Study?

[redacted]

Frequently Asked Questions

A: A total of 72 intersections were studied in collaboration with San Bernardino County Staff, throughout Fontana, Rancho Cucamonga, and San Bernardino County. Some of these intersections, in the immediate vicinity of the Project, are shown in the circulation map.

Q: What are the truck routes? Are they near schools or homes?

A: Randall Avenue would be maintained as a truck route for the Project, avoiding congestion near homes and schools. Furthermore, the Project would adhere to **Policy TM-5.6**, which establishes local truck routes in unincorporated areas to efficiently funnel truck traffic to freeways while minimizing impacts on residents. Routes will be established where trucks are prohibited in unincorporated environmental justice focus areas and to avoid overlaps or conflicts with safe routes to schools. In addition, as indicated in **MM TRANS-2**, manual traffic control shall also be employed as determined by the County of San Bernardino in consultation with the California Highway Patrol; Cities of Fontana, Rancho Cucamonga, and Ontario; and the Fontana Unified School District, where needed, to safely move traffic through intersections affected by traffic.

Health Impacts: In the Environmental Justice element the project is required to consider the cumulative impacts and mitigate them. This Draft EIR presents no solution when there are considerable steps that can be taken.

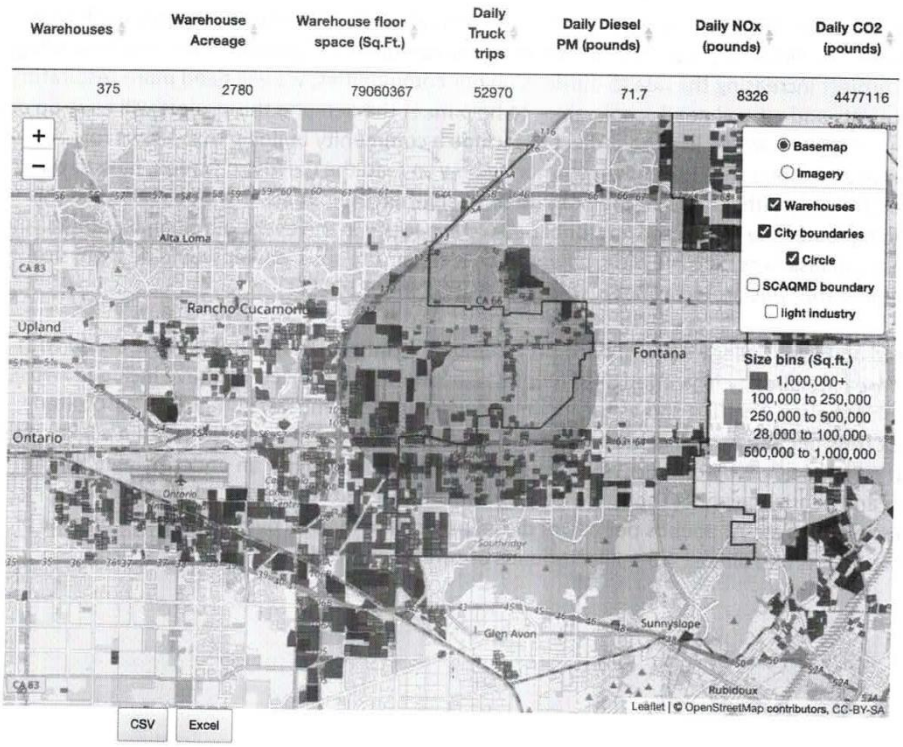
Landscaping: There should be no grass on this project site. The project should instead have all native plants to encourage wildlife to create a habitat in native species. The community proposes having Cypress Trees encircle the entire project. Cypress Trees and Pine Trees are excellent PM2.5 filters, and specifically Cypress Trees will reduce the noise of this project (another failed element for mitigation). All plants should be planted as MATURE, with a minimum height of 15-20 feet based on species. This project does not take time to pollute our community, so we do not have time to wait for mature trees to start doing their job.

Health Impacts
Industrial development, such as the proposed Project, can result in high daily volumes of heavy-duty diesel truck traffic and operation of on-site equipment (e.g., forklifts and yard tractors) that emit toxic diesel emissions, and contribute to regional air pollution and global climate change. The Project will expose our communities to elevated levels of air pollution. Residences are located north and west of the Project with the closest residences located within 1,550 feet from the Project's western boundary. In addition to residences, Live Oak Elementary School, Beech Avenue Elementary School, Redwood Elementary School, and Almond Elementary School are located within one mile of the Project. According to the California Communities Environmental Health Screening Tool Version 3.0/4.0 (CalEnviroScreen). This Draft EIR is also in violation of San Bernardino County General Plan, as this warehouse size far exceeds the size that is permissible to be located close to the sensitive receptors of schools.

Our community and children are already burdened by multiple sources of air pollution, and I am constantly changing pillowcases from bloody noses in my children's sleep. We are concerned with the potential cumulative health impacts associated with the construction and operation of the Project. In reviewing the data regarding NOP, our community is concerned about the air pollution and health risk impacts that would result from the proposed Project. This project is going to this community who is already in the 98-99% of Pollution Burden including our Air, Water, and overall, Health impacts according to Cal Enviro 3.0/4.0, to a higher burden level (Is that 100%). This project will decrease the life expectancy in our community and will increase the need for parents to take sick days. On average in the Inland Empire, parents take seven sick days per year to care for children negatively impacted by our pollution for things like: migraines, asthma attacks, respiratory issues, diabetes, and neurological disorders. All these medical issues according to the World Health Organization, the American Heart Association, the American Lung Association, and the American Pediatric Association have directly linked to diesel pollutants. This project would exponentially increase this burden.

and the community, as trades will be in high demand for this project's longevity, and trades provide excellent union careers that increase our community's disposable income. Regarding this project increasing the health burdens on our communities, we will need more respiratory therapists and we will need scholarships to help meet the demand this project will have on our community. We would like the project to include a community building that allows for educational clinics that teach the community how to read the CalEnviro Screen, how to take care of their health, and what they can do to strengthen their lungs. We would also like this building to be able to be used as a public space especially in the event of rolling blackouts, and or natural disasters. This building, powered by 100% onsite solar power would be a physical reminder that this project is not just about PROFITS, but PEOPLE!

Based on Pitzer College's Warehouse CITY Cumulative Impact Tool, numbers associated with this area are already high enough to merit a rejection of the project. We have included two graphics below. The first shows the estimated warehouse numbers, numbers of associated truck trips per day as well as associated emissions of carbon, PMs, and NOx within a 5 km radius of the Speedway Project. Even while these numbers are most likely an underestimation, the area and nearby neighborhoods are dealing with almost 53 thousand truck trips per day, emissions of over 70 pounds per day of diesel particulate matter, over 8 thousand pounds of NOx per day, and almost 4.5 million pounds of carbon emitted per day.

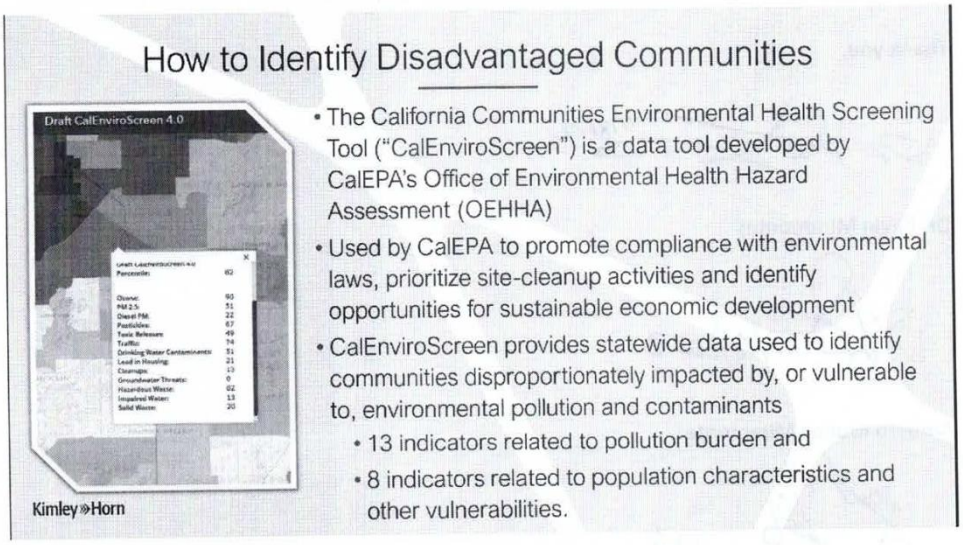


Kimley-Horn lead EIR Process Strategically Violated SB1000, CEQA, and the San Bernardino County General Plan Requirements:

It is important to note the Kimley-Horn strategical mislead the community during their Environmental Justice meeting by showing an image of CalEnviro to the community that was green and did not show the actual pollution of the community that the Draft EIR was reviewing. This is an absolute violation of SB 1000 and we would like to see Kimley-Horn taken to task, for strategically misleading the public when they should have shown the actual data in the Draft EIR. The entire objective of the meeting that they staged, was to properly show the community the outcomes of the Draft EIR. The Draft EIR was not onsite, and when the community asked about mitigations, Kimley-Horn stated that they did not have to talk about the EIR, but rather allow us to hand write our concerns. The community would like to address Kimley-Horn's violation of California Code Section 65302 that adopts the definition of "Disadvantaged Communities" from the California EPA Section 39711 Health and Safety Code:

"**Disadvantaged Communities**" means an area identified by the California Environmental Protection Agency pursuant to Section 39711 of the Health and Safety Code or an area that is a

low-income area that is disproportionately affected by environmental pollution and other hazards that can lead to negative health effects, exposure, or environmental degradation. Kimley-Horn, instead chose to misrepresent the actual environmental pollutions and other hazards pursuant to the forementioned statute. The below represents the slide presented to the community. When Kimley-Horn was called out for misrepresentation, they said they complied with the minimum requirements by holding the meeting. The community would like further action to be taken, and we will be elevating our concerns to Attorney General Bonta.



In addition, Kimley Horn literally documented that they were not here to answer questions, in compliance with the forementioned requirements, but rather to "hear them."

Frequently Asked Questions

Workshop Purpose	**Q: What is the purpose of this workshop?** **A: The primary purpose of the workshop is not to 'defend the project' but rather to provide a venue for people to be heard/provide their opinions and concerns about the Project. It is important to maintain a level of sincerity and genuine interest. Answering questions and providing information is ultimately secondary to hearing them.**
	Q: Who is the tenant?

We have attached the script being read to us by Kimley-Horn, and the power point presentation that they presented to the community.

In conclusion, the community asks for an Environmental Justice meeting that meets the requirements of SB1000 and presents the actual health impacts to this community. We ask that you meet or exceed all the mitigation outlined in this letter. We would also ask that you consider a different project in place of these warehouses.

Once again, the Miramontes Family opposes this project.

Thank you,

7/18/22

7/8/2022

Resumen del Taller Anterior de Justicia Ambiental

- Se llevo acabo el 12 de enero en el Cypress Neighborhood Center
- Recibimos comentarios y preguntas sobre tráfico y transporte
- Infraestructura, instalaciones públicas, impacto económico y participación de la comunidad

Kimley»Horn

5

Informe del Reporte del Impacto Ambiental

Kimley»Horn

6

3

7/8/2022

Sitio Del Proyecto

- El sitio del proyecto se encuentra en un área no incorporada del suroeste del condado de San Bernardino.
- El Proyecto SCCIISP facilitaría la reurbanización de aproximadamente 433 acres del sitio de 522 acres del Auto Club Speedway existente.
- Se retendrán aproximadamente 90 acres para el desarrollo y la operación de las instalaciones de deportes de motor "Next Gen In California" de NASCAR, aprobadas por el Condado de San Bernardino en junio de 2021 (la instalación de deportes de motor de 90 acres "no es parte" de este SCCIISP).

Kimley»Horn

7

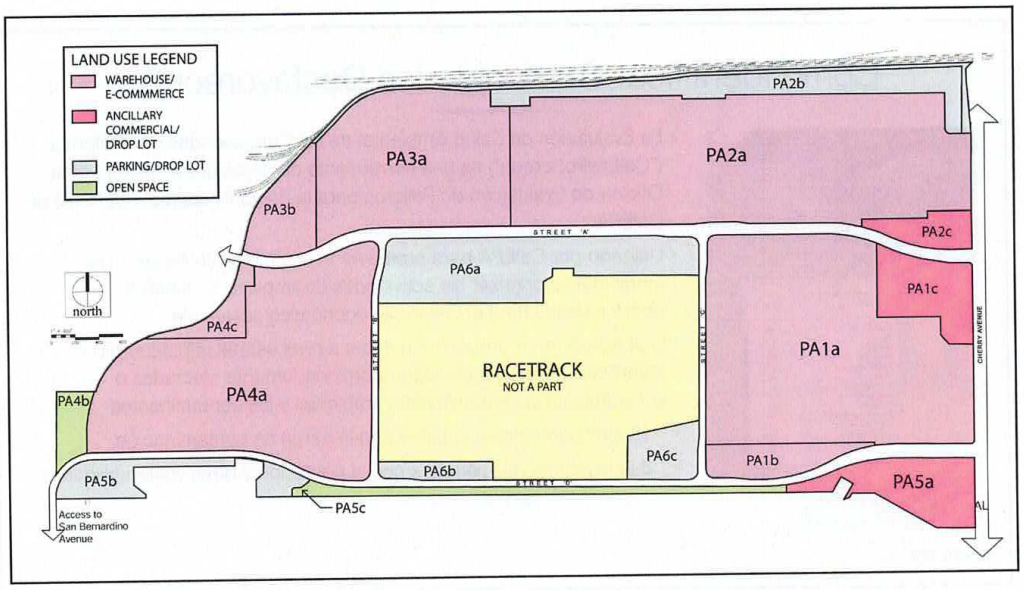
Descripción General del Proyecto

- El SCCIISP consta de seis áreas de planificación (AP) incluyendo:
  - Hasta 6,600,000 pies cuadrados de usos logísticos y de comercio electrónico de alto cubo,
  - Aproximadamente 261,000 pies cuadrados de usos comerciales accesorios,
  - 98 acres de áreas de estacionamiento / lote de caída de vehículos y espacios abiertos asociados y vías públicas internas, y
  - Mejoras de infraestructura
- El Proyecto SCCII está buscando aprobaciones del Condado, incluyendo la adopción del Reporte del Impacto Ambiental
- Aviso De Preparacion publicado diciembre 13, 2021
- Aviso De Preparacion and periodo de estudio se cierra enero 13, 2022

Kimley»Horn

8

7/8/2022



9

Planificación de Justicia Ambiental

- El Proyecto de Ley del Senado 1000 (2016) estableció los requisitos de Justicia Ambiental para los planes generales bajo la Sección 65302 (h) del Código de Gobierno
  - Para abordar los "riesgos de salud únicos o compuestos" en las comunidades desfavorecidas mediante la disminución de la exposición a la contaminación y la mejora de la salud en general.

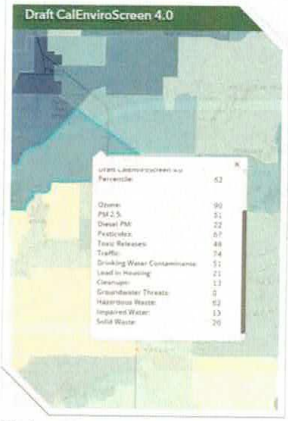
Kimley»Horn

10

5

7/8/2022

Cómo Identificar Comunidades Desfavorecidas



- La Evaluación de Salud Ambiental de las Comunidades de California ("CalEnviroScreen") es una herramienta de datos desarrollada por la Oficina de Evaluación de Peligros para la Salud Ambiental (OEHHA) de CalEPA.
- Utilizado por CalEPA para promover el cumplimiento de las leyes ambientales, priorizar las actividades de limpieza Y identificar oportunidades para el desarrollo económico sostenible
- CalEnviroScreen proporciona datos a nivel estatal utilizados para identificar comunidades desproporcionadamente afectadas o vulnerables a la contaminación ambiental y los contaminantes
- 13 indicadores relacionados con la carga de contaminación
- 8 indicadores relacionados con la población y otras vulnerabilidades.

Kimley»Horn

11

Acciones del Condado

- Como parte del Plan de todo el Condado, el Condado de San Bernardino identificó áreas de enfoque de Justicia Ambiental que incluyen el sitio de este proyecto
  - La parte occidental de Fontana esta en el la parte superior del factores de contaminación de acuerdo con CalEnviroScreen
  - Los factores de contaminación incluyen la calidad del aire, las emisiones tóxicas de la industria y los sitios de desechos peligrosos y sólidos
  - Los problemas de salud incluyen altos casos de asma y enfermedades auditivas, bajo nivel de educación, la pobreza y desempleo.

Kimley»Horn

12

6

7/8/2022

Normas de Justicia Ambiental

- El Condado prioriza las siguientes normas para a mejorar la salud, la recreación y las instalaciones públicas a través de:
  - Reducir de la exposición a la contaminación y mejorar de la calidad del aire
  - Promover instalaciones públicas, incluyendo la infraestructura y los servicios comunitarios
  - Promover el cuidado de salud
  - Promover el acceso a alimentos
  - Promover viviendas seguras y sanitarias
  - Promover la actividad física

Kimley»Horn

13

Justicia Ambiental Participación de la Comunidad

- El Condado requiere que el solicitante organice reuniones comunitarias enfocadas en la Justicia Ambiental
- Proveer información:
  - Este es el segundo de los dos talleres previstos
  - Folletos enviados por correo el 6 de julio
  - El Sitio de Web : https://maps.kimley-horn.com/portal/apps/storymaps/stories/3f77c5d346a941dca99ab276d799d095

Frequently Asked Questions

Workshop Purpose	**Q: What is the purpose of this workshop?** **A:** The primary purpose of the workshop is <u>not</u> to 'defend the project' but rather to provide a venue for people to be heard/provide their opinions and concerns about the Project. It is important to maintain a level of sincerity and genuine interest. Answering questions and providing information is ultimately secondary to hearing them.
Project Description	**Q: Who is the tenant?** **A:** The future tenant(s) are unknown and not subject to speculation. The EIR evaluates the 'worst case scenario' with highest allowable intensities of the proposes e-commerce logistics uses.
	Q: How long is construction going to take? **A:** Construction will occur intermittently through the next 5 to 10 years, though no residences would be exposed to significant levels of noise.
	Q: What are the hours of operation? Would it operate 24 hours? **A:** The Project could take deliveries late at night though there would be no noise impacts above 45 decibels – meaning noise from overnight activities would not impact homes.
	Q: Is the Project site publicly accessible? **A:** Yes, the Project would be publicly accessible – and would not be fenced off. Additionally, the public could reasonably access on-site electric charging stations and parking.
	Q: How will the Project benefit the community? **A:** Open space and electric charging stations would be accessible to the public. The Project will also contribute to infrastructure improvements (including signalization and signage), build underground utilities, and implement a Speedway-themed artwalk. Additionally, the Project will bring commercial activity where those uses are currently lacking.
	Q: Will Auto Club Speedway camping still happen? **A:** RV Camping related to the Auto Club Speedway would no longer occur with the Project.
Local Business	**Q: Will the Project displace small businesses? Particularly those that rely on the existing Speedway?** **A:** There are a couple of small businesses that exist on the existing Auto Club Speedway site – the Speedway owns the site and would negotiate with the small businesses however, we are not privy to that. We are unable to speculate on whether or not these small businesses will be compensated, as future redevelopment of the Speedway is not part of this Project.
	Q: Would the Project partner with small businesses? **A:** See above – we are not privy to any negotiations or partnerships the Speedway has with small businesses that are located within the ACS site.
	Q: Was there any analysis as to how the Project would affect businesses? **A:** *Not our Project*
	Q: I don't like how this Project is going to change/get rid of the ACS: **A:** The redesign of the ACS is already approved and was done by the owners. Its not going away, but they just don't need the parking lots. That's what's facilitating the redesign of the parking lots for our project, however, they are ultimately separate and independent Projects.
Transportation and Traffic	**Q: Will there be adequate parking to prevent overflow onto residential streets?** **A:** The Project will include approximately 98 acres of vehicle parking field/drop lots areas throughout each Planning Area, to accommodate ongoing Next Gen motorsport facility events on designated days as well as parking for permitted land uses. The Project site would also provide pedestrian sidewalks along street sections within the Project site including opportunities for enhanced pedestrian connections between parking fields/drop lots. Additionally, on street parking will be provided on the following streets: Beech Avenue, Whittram Avenue, and Merrill Avenue.
	Q: What intersections and roads were studied in the Traffic Study?

Frequently Asked Questions

	A: A total of 72 intersections were studied in collaboration with San Bernardino County Staff, throughout Fontana, Rancho Cucamonga, and San Bernardino County. Some of these intersections, in the immediate vicinity of the Project, are shown in the circulation map.
	Q: What are the truck routes? Are they near schools or homes? **A:** Randall Avenue would be maintained as a truck route for the Project, avoiding congestion near homes and schools. Furthermore, the Project would adhere to **Policy TM-5.6**, which establishes local truck routes in unincorporated areas to efficiently funnel truck traffic to freeways while minimizing impacts on residents. Routes will be established where trucks are prohibited in unincorporated environmental justice focus areas and to avoid overlaps or conflicts with safe routes to schools. In addition, as indicated in **MM TRANS-2**, manual traffic control shall also be employed as determined by the County of San Bernardino in consultation with the California Highway Patrol; Cities of Fontana, Rancho Cucamonga, and Ontario; and the Fontana Unified School District, where needed, to safely move traffic through intersections affected by traffic.
	Q: How will the Project affect traffic on Cherry Avenue? **A:** Cherry Avenue is the Project site's eastern boundary. Widening of Cherry Avenue along the Project frontage would be done to improve traffic movements at the intersections of Street "A"/Cherry Avenue and Street "D"/Cherry Avenue. The Project proposes improvements that would include future construction of pedestrian connections from Cherry Avenue to the parking field/drop lots, Rancho Vista, Napa Street, and the existing private VIP Access Road into the Project area and within the new right of way improvements that connect to each Planning Area and to the Next Gen motorsports facility. Additionally, a multi-use trail connection is proposed along Street "A" that would connect Cherry Avenue to Napa Street and support future local trail systems.
	Q: Will trucks be allowed on the site overnight? **A:** No, parking fields/drop lots would not accommodate overnight parking for trucking activity. This provision would reduce the need for overnight security as well as eliminate noise and lighting nuisances.
Noise and Hazards	**Q: How will the Project affect noise in the area?** **A:** While the Project is far enough away from sensitive uses such as residences and schools that it won't pose noise impacts, the Project structures would buffer noise from existing Speedway uses and proposed entertainment events that could take place at the Speedway in the future. It is important to note that significant noise impacts will still occur even without the Project. Significant noise impacts (above applicable County noise standards) would occur along Randall Avenue (from Cherry Avenue to Citrus Avenue) due to increased traffic noise.
	Q: Will Project noise be heard at residences or schools? **A:** The existing site is a flat parking lot, so building the project and adding landscape will actually reduce noise created on site – the only significant noise is from off-site traffic, particularly along Randall Avenue.
	Q: Will Project noise affect businesses? Was noise impacts on nearby businesses analyzed? **A:** An Acoustical Assessment was conducted for the Project – noise was measured at seven points surrounding the Project site in residential areas as well as the surrounding industrial. Significant impacts relating to noise where identified on Randall due to increase in truck traffic. While mitigation for this significant and unavoidable impact is not feasible, no other significant noise impacts were identified.
	Q: What will the Project do to mitigate noise? **A:** Significant noise impacts are anticipated to result from off-site truck traffic. Due to a lack of jurisdiction over affected roadways, no feasible mitigation is identified to address these

Frequently Asked Questions

	impacts. For all else, noise impacts are less than significant and below County thresholds for noise.
	Q: Is there adequate consideration to the prior industrial uses? To what standard was the soil cleaned? **A:** The Project site was previously used as a Kaiser Steel Mill (from 1942 to 1983) that generated various wastes that were disposed of on-site. The entire property was assessed and subject to subsequent investigations. While the majority of the site requires no further action, there are three sites that will undergo additional material removal or investigation and remediation. Groundwater monitoring has continued as a result.
	Q: Will there be private security? **A:** Private security would be present during construction, and more than likely each individual tenant will have gated truckyards and on-site security.
	Q: Where's the nearest police station or who would respond in the event of an emergency? **A:** The nearest San Bernardino County Sheriff's Department station that would respond in event of an emergency is the Fontana Station located at 17780 Arrow Boulevard, Fontana, CA 92335, approximately 4.6 miles to the east.
Environmental Impact Report (EIR)	**Q: What is an Environmental Impact Report (EIR)?** **A:** An Environmental Impact Report is a requirement of the California Environmental Quality Act (CEQA) to identify and disclose environmental impacts – including air quality, noise, and traffic – to decision makers tasked with approval of a given Project. The EIR is based on various technical studies and proposes measures to reduce identified impacts.
	Q: Will my comments during the Environmental Justice Workshop be recorded and sent to decision-makers? **A: No**, the purpose of this Environmental Justice Workshop is to provide community members with the opportunity to share concerns or opinions on the Project as well as an opportunity to learn more about the Project is a relaxed, family-friendly setting. While your concerns will be informally noted, this is not a method for providing official comment on the Project.
	Q: How do I provide official comment on the Project? **A:** Official comments on the Project and its EIR that will be made available to decision makers will take the form of emails or mailed letters. A mail-in form you can use to make official comments is provided at the "Environmental Impact Report" Table.
	Q: Where can I find more information on the Project EIR? **A:** More information can be found via the QR code on the flyer (will be provided day-of event) as well as via the County of SB planning website (URL on the flyer)
	Q: Has the Project been approved by the County yet? **A: No**, after the current public review period, final EIR certification and Specific Plan adoption will be at the discretion of County officials, who will be provided all official comments submitted for the EIR.
	Q: What is a Specific Plan and how does that play in to the EIR? **A:** The Specific Plan guides future development within the Project site through detailed development standards and implementation measures in a way that is consistent with the existing General Plan. The Specific Plan EIR, once approved, would cover worst-case environmental impacts resulting from future, planned development provided they are what's described in the Specific Plan without significant modification.

Frequently Asked Questions

Environmental Justice	**Q: How does the recent Fontana Attorney General settlement – protecting vulnerable communities from pollution by – affect the Project?** **A:** The April settlement required a Fontana warehouse project to adopt substantial mitigation measures to minimize impacts on the surrounding community. More broadly, the City of Fontana adopted an ordinance, as required by the settlement, setting stringent environmental standards for all future warehouse development in Fontana. This Project is in the unin
	Q: What makes our community an 'Environmental Justice' community? **A:** The general area occupied by the Project site (see DUC map) is designated as a Disadvantaged Unincorporated Community. This metric is a combination of various demographic data (such as income, ability to speak English, and minority population) as well as environmental factors (Calenviroscreen: a community more affected by poor air quality, hazards, poor water quality, etc.). Not everyone is at the workshop may be a part of this DUC, but the historically disadvantaged community may be larger than thought. It may be effective to ask what they feel most affected by, and what does Environmental Justice/Disadvantaged community mean to them?

Response to Comment Letter A2 –Miramontes Family

The comment letter was received after circulation of the Draft EIR and prior to the Planning Commission meeting. The comment letter references previous comments dated July 18, 2022. Additional comments were received from the commenter during the public comment period of the public hearing regarding the comments provided in the attached comment letter. Comments were addressed during the public comment period by the Project attorney and technical experts regarding information addressed during the public hearing. No new information was presented that wasn't previously addressed or analyzed in the previous responses to Comments G2, G3, and G29 and therefore no further response is necessary. The letter is provided in the Final EIR and in the Planning Commission report and has been responded to as part of the Planning Commission hearing record.

Re: Action Item No. 2 - Speedway Commerce Center II Specific Plan (PROJ-2021-00150)

Dear Honorable Chair Weldy, Vice Chair Stoffel, Commissioner Haughey, Commissioner Gongora and Mr. Valdez:

We submit these comments on behalf of Californians Allied for a Responsible Economy ("CARE CA") in response to the Staff Report ("Staff Report") prepared for the September 8, 2022 Planning Commission ("Commission") hearing on Action Item No. 2 – Project No. PROJ-2021-00150 – Speedway Commerce Center II Specific Plan Project ("Project") proposed by Candyce Burnett of Kimley Horn & Associates, Inc. ("Applicant"). These comments also include preliminary comments on the Final Environmental Impact Report ("FEIR").

The Project proposes to develop 6,600,000 square feet of a mix of high cube and e-commerce warehousing, approximately 261,369 square feet of accessory commercial uses, and approximately 98 acres of vehicle parking/drop lot areas and associated open space and internal public roadways.[1] The approximately 433-acre

[1] Speedway Commerce Center II Specific Plan Project, Draft Environmental Impact Report, State Clearinghouse No. 2021120259, Prepared for: Steven Valdez, Senior Planner, Land Use Services Department, San Bernardino County, Prepared by: Kimley-Horn and Associates, Inc. (June 2022).
6192-006acp

printed on recycled paper

Project site is within the 522-acre site currently developed with the Auto Club Speedway ("ACS"), formerly known as the California Speedway. The Project site is located at 9300 Cherry Avenue, Fontana California 92335 between Arrow Boulevard and San Bernardino Avenue in the unincorporated portion of San Bernardino County within the City of Fontana Sphere of Influence. The Project site comprises ten Assessor Parcel Numbers (APNs) 0231-011-09, 0231-011-10, 0231-011-11, 0231-011-12, 0231-111-06, 0231-111-10, and 0231-111-17, 0231-111-18, 0231-111-19, and 0231-111-20.

On July 18, 2022, CARE CA submitted extensive written comments on the Project's Draft Environmental Impact Report ("DEIR"), including expert comments, which identified significant errors, omissions, and fatal defects in the document.

CARE CA and their experts have reviewed the Staff Report prepared for the September 8, 2022 Planning Commission hearing and have conducted a preliminary review of the FEIR. These comments address the ongoing deficiencies in the County's environmental analysis and proposed mitigation for the Project. These comments are supported by substantial evidence in the form of technical comments from qualified experts identifying significant, unmitigated air quality, health risk, GHG, and traffic, that the FEIR fails to adequately address. These comments were prepared with the assistance of air quality and hazardous resources expert James J. Clark, Ph.D., and traffic and transportation expert Daniel T. Smith, Jr., M.S.[2]

Although the County nominally responded to public comments, the Responses to Comments on the DEIR which are included in the FEIR ("Responses to Comments") are wholly inadequate under CEQA.[3] The County failed to adequately respond to CARE CA's DEIR comments, and the comments of its experts, on significant environmental issues, in violation of CEQA.[4]

The FEIR and the Staff Report do not resolve a number of issues raised in our prior comments. As a result, it is premature to recommend that the Board of Supervisors take action on the Project. We urge the Planning Commission to decline to make any recommendation to the Board of Supervisors at this time. Instead, the Commission should remand the Project to Staff to revise and recirculate a legally

6192-006acp

printed on recycled paper

adequate EIR which adequately analyzes and mitigates Project impacts and appropriately responds to public comments.

The Project must not be rescheduled for a further public hearing before the Commission until all of the issues raised in these comments, and in the comments of other members of the public, have been fully addressed. We reserve the right to supplement these comments at a later date, and at any later proceedings related to this Project.[5]

I. STATEMENT OF INTEREST

CARE CA is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential public and worker health and safety hazards, and the environmental impacts of the Project. The coalition includes San Bernardino County residents Derek Brill, Nicholas Corrigan, Justin Dempsey, Anthony Diaz, the District Council of Ironworkers, Southern California Pipe Trades DC 16, along with their members, their families, and other individuals who live and work in San Bernardino County.

CARE CA advocates for protecting the environment and the health of their communities' workforces. CARE CA seeks to ensure a sustainable construction industry over the long-term by supporting projects that offer genuine economic and employment benefits, and which minimize adverse environmental and other impacts on local communities. CARE CA members live, work, recreate, and raise their families in San Bernardino County and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work on the Project itself. They will be first in line to be exposed to any health and safety hazards that exist onsite.

In addition, CARE CA has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused

printed on recycled paper

construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

II. THE PROJECT DESCRIPTION REMAINS INADEQUATE

CARE CA previously commented that the DEIR failed to include an accurate and complete Project description because the DEIR failed to identify reasonably foreseeable uses of the Project site, rendering the DEIR's impact analysis inadequate. The FEIR fails to correct this omission, and the Staff Report perpetuates it, stating that "[p]otential tenants and end users are unknown at this time; therefore, the exact square footage allocation between high-cube logistics and e-commerce uses cannot be determined at this time."[6] The failure to clarify the square footage used for high-cube logistics and e-commerce uses continues to result in a failure to adequately inform the public about the Project's basic purpose and of the nature and extent of the Project's impacts.

The County states that the Project is being developed for unknown future tenants. However, the Project is being developed for reasonably foreseeable future uses, the impacts of which were required to be fully analyzed in the FEIR, but were not. The FEIR refers to "future development of high-cube logistics and e-commerce uses within the Project site."[7] These uses, as pointed out by CARB, can result in highly significant environmental impacts: "Freight facilities, such as warehouse and distribution facilities, can result in high daily volumes of heavy-duty diesel truck traffic and operation of on-site equipment (e.g., forklifts and yard tractors) that emit toxic diesel emissions, and contribute to regional air pollution and global climate change."[8] The impacts generated by the particular operations of different users within this broad category can also result in significant impacts. The adverse impacts generated by cold storage warehouses, for example, are far more severe than those from a high-cube warehouse without cold storage.[9] Warehouses with cold storage capabilities and the ability to accommodate refrigerated trucks, or Transport Refrigeration Units ("TRUs"), require more truck trips per square foot and have higher energy demands due to the low temperatures required by the

printed on recycled paper

trucks, whose refrigeration units are most often powered by diesel internal combustion engines.[10]

Though the DEIR does not name the Project's specific end user tenants, the Project is being constructed to support warehouse, distribution, and cold storage uses. The FEIR's ongoing omission of information about the reasonably foreseeable operations at the Project site that could have significant impacts is a violation of CEQA.

CEQA requires that an EIR "set forth a project description that is sufficient to allow an adequate evaluation and review of the environmental impact."[11] An accurate project description is necessary for an intelligent evaluation of the potential environmental effects of a proposed activity.[12] "An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."[13] Accordingly, a lead agency may not hide behind its failure to obtain a complete and accurate project description.[14]

"Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal ... and weigh other alternatives in the balance."[15] As articulated by the court in *County of Inyo v. City of Los Angeles*, "a curtailed, enigmatic or unstable project description draws a red herring across the path of public input."[16] Without a complete project description, the environmental analysis under CEQA is impermissibly limited, thus minimizing the project's impacts and undermining meaningful public review.[17]

The purpose of an EIR is to reveal to the public "the basis on which its responsible officials either approve or reject environmentally significant action," so

printed on recycled paper

that the public, "being duly informed, can respond accordingly to action with which it disagrees."[18] Further, "[t]o be adequate, the EIR must include sufficient detail to enable those who did not participate in its preparation to understand and 'meaningfully' consider the issues raised by the proposed project."[19] The County's failure to provide the square footage breakdown between high-cube logistics and e-commerce uses is a violation of CEQA. Without an accurate project description, the EIR fails as an informational document under CEQA. A revised EIR must be recirculated for public review.

III. THE FEIR STILL FAILS TO ADEQUATELY ANALYZE IMPACTS AND INCORPORATE ALL FEASIBLE MITIGATION MEASURES AND ALTERNATIVES AS REQUIRED BY CEQA

CEQA's purpose is to "[p]revent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the chances to be feasible."[20] CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures.[21]

"CEQA establishes a duty for public agencies to avoid or minimize environmental damage where feasible."[22] A public agency cannot approve a project if there are feasible alternatives or mitigation measures available that would substantially lessen any significant effects that the project would have on the environment.[23] CEQA defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors."[24]

printed on recycled paper

"The core of an EIR is the mitigation and alternatives sections."[25] The CEQA Guidelines define mitigation as a measure which (1) avoids the impact altogether by not taking a certain action or parts of an action, (2) minimizes the impact by limiting the degree or magnitude of the action and its implementation, (3) rectifies the impact by repairing, rehabilitating, or restoring the impacted environment, (4) reduces or eliminates the impact overtime by preservation and maintenance operations during the life of the action, and (5) compensates for the impact by replacing or providing substitute resources or environments.[26] "In deciding whether changes in a project are feasible, an agency may consider specific economic, environmental, legal, social, and technological factors."[27]

A lead agency is prohibited from approving a project with significant impacts unless it makes one or more of three findings:

(1) Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.[28]
(2) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.[29]
(3) Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.[30]

Findings as to mitigation measures must be supported by substantial evidence.[31] Substantial evidence means "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached."[32] Substantial evidence "shall include facts, reasonable assumptions predicated upon

facts, and expert opinion supported by facts,"[33] but it should not include "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment."[34] The DEIR should be revised and recirculated to incorporate all feasible mitigation measures recommended by Commenters to reduce the Project's significant impacts.

A. The FEIR Does Not Include All Feasible Mitigation to Reduce Air Quality Impacts to the Greatest Extent Feasible

CARE CA previously commented that the DEIR failed to adequately mitigate the Project's construction and operational air quality impacts, which the DEIR had concluded were significant and unavoidable. Both CARB and Dr. Clark proposed additional feasible mitigation that would further reduce these impacts. The FEIR failed to adopt the recommended measures, and still does not include all feasible mitigation, leaving the County without substantial evidence to support a statement of overriding considerations.

The Staff Report provides that:

> [D]espite implementation of all feasible mitigation, construction of the Project would result in NOx and CO emissions ***above the SCAQMD threshold*** for construction Phase 1a; and NOx emissions ***above the SCAQMD threshold*** for Phase 1b and Phase 2. (Draft EIR, p. 4.3-27 to 4.3-29). Likewise, as shown in Draft EIR Table 4.3-13: Phase 1a Operational Emissions, Table 4.3-14: Phase 1b Operational Emissions, Table 4.3-15: Phase 2 Operational Emissions and Table 4.3-17: Project Buildout Emissions, despite implementation of all Standard Conditions, Project Design Features and feasible mitigation, operational emissions ***would still exceed applicable SCAQMD thresholds*** for ROG, NOx, PM10 and PM2.5 for Phase 1a; ROG, NOx and PM10 for Phase 1b; ROG and NOx for Phase 2; and ROG, NOx, PM10 and PM2.5 under Project Buildout conditions.

The FEIR only provides that "Construction on-road haul trucks shall be model year 2010 or newer if diesel-fueled."[35] Dr. Clark concludes that changing the requirement to model year 2014 or later for all heavy-duty vehicles entering or

[33] 14 CCR § 15384(b).
[34] 14 CCR § 15384(a).
[35] DEIR, p. 1-11 (emphasis added).

printed on recycled paper

operated on the Project site – a clearly feasible measure in 2022 – would reduce Project emissions below SCAQMD thresholds.[36] Specifically, Dr. Clark finds that changing the minimum allowable model year from 2010 to 2014 or 2018 would result in:

- 31% reduction in running NOx emissions (NOx RUNEX) from trucks operating on site if the vehicles were restricted to model year 2014 or later.
- A 44% reduction in running NOx emissions (NOx RUNEX) from trucks operating on site if the vehicles were restricted to model year 2018 or later.
- A 27.5% reduction in DPM emissions from trucks measured as PM2.5 operating on site (PM2.5 RUNEX) if the vehicles were restricted to model year 2014 or later.
- A 46.8% reduction in DPM emissions from trucks measured as PM2.5 operating on site (PM2.5 RUNEX) if the vehicles were restricted to model year 2018 or later.
- A 9.5% reduction in ROGs from trucks operating on site (ROG RUNEX) if the vehicles were restricted to model year 2014 or later.
- A 14.8% reduction in ROGs from trucks operating on site (ROG RUNEX) if the vehicles were restricted to model year 2018 or later.

The imposition of all feasible air quality mitigation for the Project is mandatory given that the FEIR concludes that the Project will result in significant air quality impacts due to exceedances of SCAQMD significance thresholds.[37] Yet, the FEIR fails to evaluate whether additional mitigation beyond a 2010 model year cut-off is feasible despite the substantial emission reductions from such a change and the feasibility of enforcing a revised cut-off date to 2014 or 2018 through the tenant agreement.[38] Accordingly, the County lacks substantial evidence to support the FEIR's conclusion that construction emissions are significant and unavoidable, and substantial evidence from CARB and Dr. Clark demonstrates that the FEIR has not incorporated all feasible mitigation measures to minimize the Project's significant impacts on air quality. The FEIR therefore remains deficient. The FEIR must be revised and recirculated to include all feasible mitigation to reduce construction air emissions, including model year 2014 or 2018 or newer construction on-road diesel haul trucks.

6192-006acp

printed on recycled paper

Next, the County provides no evidence to support its conclusion that "Requiring non-diesel fueled emergency generators is not considered feasible because non-diesel emergency generators are typically not available in the size/horsepower necessary to support warehouse buildings."[39] As Dr. Clark explained, natural gas generators are commercially available, and feasible for implementation at the Project site. The County's conclusion is therefore unsupported.

The County similarly disregards feasible mitigation proffered by other commenters, which suggested that utilizing local state-certified apprenticeship program or a skilled and trained workforce with a local hire component can result in significant air pollution reductions.[40] SWAPE commented, "vehicle emissions can be reduced by decreasing the average overall trip length, by way of a local hire requirement or otherwise."[41] The County concludes that there is no feasible method for them to implement such a measure, but this is unsupported. The County provides no response to the proposal that this measure could feasibly be included in applicable bid documents where successful contractors must demonstrate the ability to provide for local hire. This would be similar to Mitigation Measure AQ-1 where the County requires that Tier 4 Final equipment and the option for Level 3 VDECS shall be included in applicable bid documents and successful contractors must demonstrate the ability to supply such equipment.[42] Yet again, the County offers mere conclusory statements to disregard feasible mitigation measures proffered by members of the public. The FEIR must be revised and recirculated to include *all* feasible mitigation.

B. The FEIR Relies on Impermissibly Deferred Mitigation for Traffic Impacts

The FEIR still contains improperly deferred mitigation which lacks performance standards, in violation of CEQA. MM TRANS-2 proposes to provide a comprehensive traffic management plan to manage traffic to and from the Next Gen motorsports facility and SCCIISP Project *only* during race weekends and as required for ancillary events, but MM TRANS-2 provides no performance standards for the comprehensive traffic management plan. Thus, the comprehensive traffic management plan constitutes impermissibly deferred mitigation. "Impermissible

[42] Staff Report, p. 77 of 255.

6192-006acp

printed on recycled paper

deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR."[43] The County has not included performance standards to guide the preparation of the traffic management plan, nor clarified why specifying performance standards was impractical or infeasible at the time the EIR was certified.[44]

CEQA prohibits deferring identification of mitigation measures when there is uncertainty about the efficacy of those measures.[45] An agency may only defer formulation of mitigation measures when there is a clear commitment to mitigation that will be measured against specific performance criteria.[46] Since the proposed MM TRANS-2 is not enforceable and lacks specific performance criteria that defines "where possible", or that reduction of disturbed areas is even feasible, this measure violates CEQA and the DEIR fails to support with evidence that impacts will be mitigated below the threshold of significance.

"By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage in the planning process."[47] The EIR must be revised and recirculated to include adequate analysis and mitigation of the Project's traffic and transportation impacts.

The CEQA Guidelines provide that "[t]he specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review…"[48] The EIR does not state why specifying the traffic management plan was impractical or infeasible at the time the DEIR was drafted. In *Preserve Wild Santee v. City of Santee,* the city impermissibly deferred mitigation where the EIR did not state why

printed on recycled paper

specifying performance standards for mitigation measures "was impractical or infeasible at the time the EIR was certified."[49] The court determined that although the City must ultimately approve the mitigation standards, this does not cure these informational defects in the EIR.[50] Further, the court in *Endangered Habitats League, Inc. v. County of Orange*, held that mitigation that does no more than require a report to be prepared and followed, or allow approval by a county department without setting any standards is inadequate.[51] Here, the fact that the traffic management plan will be approved later by the County does not cure the informational defects in the EIR.[52]

IV. GREENHOUSE GAS EMISSIONS IMPACTS ARE SIGNIFICANT AND UNMITIGATED

The Responses to Comments provides that the Development Agreement requires the Master Developer to implement an Electric Truck and Car Grant Program. "The Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. These grants provided by the Project Master Developer would also facilitate the adoption of zero emissions vehicles in the area and provide a clear set of standards for implementing these grants."[53] The Development Agreement has not been made available for public review and scrutiny and thus the public cannot be certain this measure will be implemented to reduce emissions as the County suggests.

Dr. Clark's comments provide substantial evidence that the Electric Truck and Car Grant Program is neither legally enforceable nor would sufficiently mitigate the Project's significant GHG emissions because the Program would not reduce operational GHG emissions significantly. The Grant Program requires that the Master Developer provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. But, implementation of the grants would allow for the purchase of 7 heavy duty trucks, 6 medium trucks, and 6 local delivery trucks.[54] Dr. Clark concludes that this will

6192-006acp

printed on recycled paper

hardly impact the emissions from the operations at the site.[55] The County must consider and adopt additional mitigation measures to further reduce the Project's significant GHG impacts.

V. HAZARDOUS CONTAMINATION REMAINS POTENTIALLY SIGNIFICANT AND UNMITIGATED

Dr. Clark's comments on the DEIR explained that the Project's construction phase will disturb large quantities of soils in areas that were identified in the DEIR as former process areas that contained measurable concentrations of COPCs from the Kaiser Steel Mill.[56] Mechanically disturbing the soils will release impacted soils that will migrate offsite to the residences nearby.[57] Dr. Clark concluded that this may result in a significant and unmitigated hazards impact. Dr. Clark recommended that the County must perform a Phase I and Phase II Environmental Site Assessment to analyze the full extent of the soil contamination onsite.

The Responses to Comment fail to meaningfully respond to Dr. Clark's comments, and lack any quantitative analysis of onsite soil contamination. Instead, the Responses offer merely conclusory dismissals of CARE CA's comments and do not clarify why the County has neglected to conduct additional soil sampling even though substantial evidence supports the conclusion that "[t]he Project's construction phase will disturb large quantities of soils in areas that were identified in the DEIR's appendices to represent former process areas that contained measurable concentrations of COPCs from the Kaiser Steel Mill."[58]

The County must assess the concentrations of contaminants that will be released offsite and calculate the potential health risks from those exposures.[59] The County must revise the hazardous materials section and health risk analysis of the FEIR and present the results in a revised EIR.

VI. THE FEIR FAILS TO ADEQUATELY RESPOND TO PUBLIC COMMENTS

CEQA requires that a lead agency evaluate and prepare written responses to comments in a FEIR.[60] The attached comments by Dr. Clark and Dan Smith describe in detail the County's failure to respond to their technical comments on the DEIR.

A lead agency under CEQA is required to substantively respond in detail to comments raising significant environmental issues, explaining, where applicable, why specific suggestions were not accepted by the agency.[61] Agencies are required to provide "detailed written response to comments . . . to ensure that the lead agency will fully consider the environmental consequences of a decision before it is made, that the decision is well informed and open to public scrutiny, and the public participation in the environmental review process is meaningful."[62] When a comment raises a "significant environmental issue," the written responses must describe the disposition of each such issue raised by commentators.[63] Specifically, the lead agency must address the comment "in detail giving reasons why" the comment was "not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice."[64] The need for a reasoned, factual response is especially important when comments are made by agencies or experts.[65] Failure of a lead agency to respond to comments raising significant environmental issues before approving a project frustrates CEQA's informational purpose and may render the EIR legally insufficient.[66]

In *King & Gardiner Farms*, the Court of Appeal held that Kern County failed to separately address clustering of oil wells and other infrastructure as a possible

6192-006acp

printed on recycled paper

mitigation measure when feasible and therefore failed to provide the "detailed, reasoned analysis" required by CEQA Guidelines section 15088(c).[67] In response to the comment, Kern County said that the General Plan did not require the proposed mitigation and said that competing policies were on balance better served by the proposed project than by an alternative.[68] However, this response did not separately address the clustering of wells and infrastructure and why the County did not find the proposal suitable.[69] This failure to address the substance of the comment head-on in a detailed and reasoned analysis resulted in a prejudicial abuse of discretion under CEQA because an EIR must describe and impose feasible mitigation measures to minimize or eliminate significant impacts.[70]

The County's Responses to Comments from CARE CA and other comments are nonspecific and general, dismissing CARE CA's comments through conclusory and unsupported responses.

Not only does the FEIR include inaccurate analysis of the Project's impacts as described above, the Responses to Comments contain numerous errors of their own. The County left numerous sections of the Responses blank, with "XXs" and Underlines to mark where additional information should go, but was never included. For example, one response on page 545 had 6 blank sections in it, making the whole response unintelligible.

The paragraph on page 2.0-545 is completely incomprehensible, it reads:

> Alternatives developed for the Project were based on State CEQA Guidelines Section XXX which requires_____. As evaluated in Section 6.0, Alternatives of the Draft EIR, a commercial alternative was developed which assumed _____. The Commercial Alternative did not meet a majority of the Project Objectives and XXXX. In addition the No Project Alternative assumed the Project site would be developed . printed on recycled paper

There are so many errors and omissions in this one paragraph as to make uncertain what the County is even referring to.

There are upwards of 60 empty placeholders in the Responses rendering other entire paragraphs and sections unintelligible. The Responses to Comment do not appear to be "final", but rather appear to be a working draft that the County intended to fill in the blanks later on. The sloppy and incomplete work contained in the FEIR fails to meet CEQA's basic informational requirements, and renders the FEIR's analysis and Responses legally inadequate.

CEQA requires that an EIR include technical data and similar relevant information to permit the full assessment of significant environmental impacts by reviewing agencies and members of the public.[71] An EIR cannot rely on information that is neither included in the document nor adequately described therein.[72] The Responses to Comments section of the FEIR has so many typos, errors, and omissions as to render the County's responses inadequate for failure to meet the requirement of a detailed response to comments. "The requirement of a detailed analysis in response [to comments] ensures that stubborn problems or serious criticism are not swept under the rug."[73]

The County must revise the missing information and clear errors in its Responses to Comments in a revised and recirculated EIR to comply with CEQA before the Project can be referred to the Board of Supervisors for approval.

CEQA also requires that "all documents referenced in the environmental impact report" be available for review and "readily accessible" to the public.[74] A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decision-making and informed public participation, thereby thwarting the statutory goals of the EIR process."[75] The County's failure to input the citations in the Responses to Comments violates CEQA, because it disallows the public from cross-referencing the County's citations. For example, the FEIR's

[71] CEQA Guidelines § 15147.
[72] Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova (2007) 40 Cal.4th 412, 442.
[73] Santa Clarita Organization for Planning the Environment v. County of Los Angeles (2nd Dist. 2003) 106 Cal.App.4th 715, 732.
[74] Pub. Resources Code § 21092(b)(1); CEQA Guidelines § 15087(c)(5).

6192-006acp

printed on recycled paper

responses to comments leaves numerous citation sections blank, thus disabling the public from checking the County's work.

> G14-3 The Project proposes mitigation which would be aimed at minimizing Project-related emissions. This includes MM GHG-2 which requires the Project to supply a minimum of 50 percent of the energy demand on-site from a renewable source (e.g., solar photovoltaic (PV) panels, etc.). This includes the Project's total Title 24 demand and the plug-load. Additionally, MM GHG-3 requires the Project to meet or exceed CALGreen Tier 2 standards which require _____(which exceeds code requirements)…[76]

> G29-3 In compliance with the County's General Plan policies X and X, that require _____, two publicly noticed environmental justice outreach meetings were conducted as the Project is located within an Unincorporated Environmental Justice Focus Area. The outreach provided an opportunity for community engagement and additional analysis. As a result of these meetings and community input additional community benefits and facilities were added to the Project. These include _____[77]

These blank sections deprive the public from checking the County's work to ensure that the mitigation measures are fully integrated in the FEIR and fully enforceable through permit conditions, agreements, or other legally binding instruments, as required by CEQA.[78] The County's failure to provide citations for its Responses to Comments is a failure to proceed in a manner required by law.

The court in *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* determined that a reader of the EIR could not reasonably be expected to ferret out an unreferenced discussion in an earlier document, interpret that discussion's unexplained figures without assistance, and spontaneously incorporate them into the EIR's own discussion.[79] The court held "[t]he data in the EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project."[80]

6192-006acp

printed on recycled paper

Further, "information scattered here and there in EIR appendices or a report buried in an appendix, is not a substitute for a good faith reasoned analysis."[81] The requirement of a detailed analysis ensures that stubborn problems or serious criticism are not "swept under the rug."[82] Here, the FEIR references policies and regulations that are not only not available in the FEIR itself, but are not able to be located by the public due to the County's failure to provide citations.

The FEIR must be revised and recirculated to include the reference information undergirding the County's analysis in its Responses to Comments.

VII. CONCLUSION

For the foregoing reasons, CARE CA respectfully requests the Planning Commission remand the Project to Staff to remedy the errors and omissions in the EIR before the Project can be recommended for approval. Please include these comments in the record of proceedings for the Project.

Sincerely,

Kelilah D. Federman

Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080

Attn: Ms. Kelilah Federman

Subject: Comments On Final Environmental Impact Report (FEIR) For Speedway Commerce Center II Specific Plan (SCCIISP Project), State Clearinghouse Number 2021120259

Dear Ms. Federman:

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the August 26, 2002 Staff Report and August, 2022 County of San Bernardino's (the County's) FEIR of the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

The conclusion from the County that the significant impacts are unavoidable is not supported by the facts of the Project. There are substantial impacts that are not addressed in the County's analysis that must be addressed in a supplemental final environmental impact report (S-FEIR).

Specific Comments:

1. **The County's Master Response 2 regarding the CalEnviroScreen analysis of air quality impacts in the surrounding census tracts to the Proposed Project ignores the value of defining the existing pollution burden on the census tracts while planning a Project.**

While a health risk analysis (HRA) provides project specific information on the emissions from the project and the resulting health risks, the analysis presented by the County fails to consider the cumulative impact from the existing health burdens in the Community. As was noted by several commenters to the DEIR, the Project is already located in an area which is one of the most impacted in the state per CalEnviroScreen, falling in the 93rd percentile overall, the 95th percentile for ozone, the 94th percentile for $PM_{2.5}$, and the 90th percentile for diesel particulate matter. The County's response that the CalEnviroScreen score is simply a screening tool and does not provide quantitative information on increases in cumulative impacts for specific sites or projects points to the need for additional quantification of impacts from the County.

Recently the South Coast Air Quality Management District (SCAQMD) completed its multiple site monitoring program with ten stations, an updated emissions inventory of toxic air contaminants, and a modeling effort to characterize risk across the Basin (known as MATES V). The study focused on the carcinogenic risk from exposure to air toxics but did not estimate mortality or other health effects from particulate exposures. One of the monitoring sites of special concern to the SCAQMD is the Inland Valley San Bernardino monitoring site. This fixed monitoring station is located less than 0.4 miles north of the Project site.

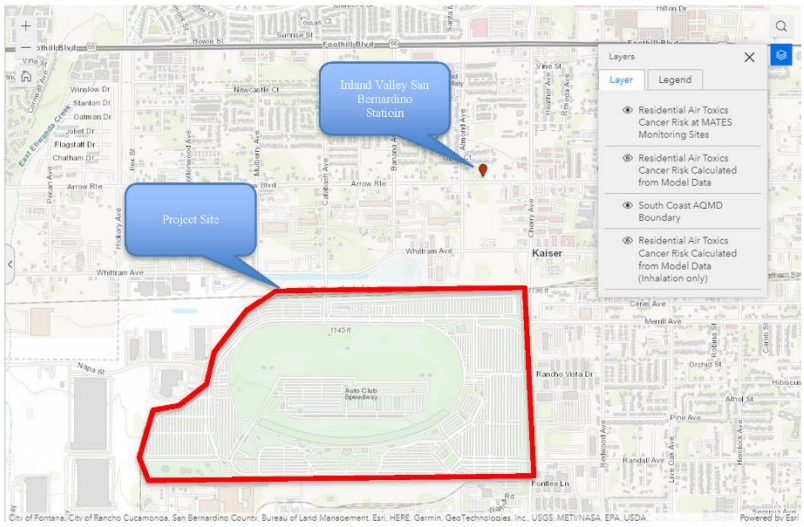

Figure 1: Location Inland Valley San Bernardino Monitoring Station From MATES V In Relation To Project Site

One of the chemicals measured over time in the MATES V fixed site monitoring is black carbon (BC), a fine particulate air pollutant which is generated from incomplete burning of biofuels, fossil fuels, and open biomass burning. BC is considered a good proxy for diesel particulate matter (DPM), the primary air toxin in the South California Air Basin (SCAB). DPM was estimated to account for 84% of the health risk calculated in the MATES III study and 68% of the health risk from the MATES IV study. In its most current study (MATES V), SCAQMD found that DPM accounted for 72% of the risk across the SCAB.

According to the MATES V study, the monitoring station with the highest air toxics cancer risk was the Inland Valley San Bernardino station.[1]

Table IX-7-10
Modeled Inhalation Cancer Risk at Monitoring Locations and Measured Risk

Location	MATES V CAMX RTRAC Simulation				
	Benzene	1,3-Butadiene	Diesel	Others	Total
Anaheim	49	14	307	56	426
Burbank Area	58	16	381	72	526
Central Los Angeles	65	21	499	82	667
Compton	53	15	381	70	519
Inland Valley San Bernardino	46	12	362	86	506
Huntington Park	57	20	408	75	559
Long Beach	52	16	359	65	492
Pico Rivera	50	11	368	63	492
Rubidoux	39	9	295	48	390
West Long Beach	60	20	455	80	615
10-Station Average Modeled	53	15	382	70	519
7-station+ Averaged Modeled	54	16	387	73	530
7-Station+ MATES V Average Measured*	62	56	362	114	593

*Including modeled species only, Risk from some measured species, such as carbon tetrachloride, chloroform and PAHs are excluded. Measured $EC_{2.5}$ was converted diesel PM as described in the Chapter 2.
+ Among the 10 monitoring stations, 3 stations, Anaheim, Los Angeles and Rubidoux do not have complete data. Therefore 7-station averages are used.

Adding to the health risk of the surrounding communities by allowing more diesel-powered vehicles to operate during the construction phase and operational phases of the Project seem incongruent with the goals of improving air quality for the Region as well the health of the residents

[1] MATES V. 2022. Appendix IX-89

nearby. The County must assess the health impacts in light of the additional burden the project will place on the community to assess the cumulative health impacts from DPM in a S-FEIR.

2. The County's Mitigation Measures (MMs) And Program Design Features (PDFs) Do Little To Curb The Primary Source of Air Toxics And Greenhouse Gases (GHG).

The summary by the County in the FEIR regarding Air Quality and GHG states that 86% of emissions are from mobile sources. Therefore, given the size of the Project it seems apparent that of all MMs and PDFs would focus on the primary source of those emissions – the trucks entering and exiting the Project. According to the DEIR and the FEIR, the Project would result in approximately 43,549 daily trips at full buildout, including approximately 9,865 daily truck trips. In response to the large number of vehicle trips the County is proposing to allow the Proponent to utilize grants for the down payments on electric vehicles. The Proposed Electric Truck and Car Grant Program requires the Master Developer to provide funding for the purchase of Class 8 heavy duty electric trucks, Class 4 through Class 7 medium duty trucks, light-duty (Class 1, 2, and 3) delivery vehicles, and local community and passenger vehicle grants. In total the grants would allow for the purchase of 7 heavy duty trucks, 6 medium trucks, and 6 local delivery trucks. These 19 vehicles would account for less than 0.19% of the daily truck trips. The measure would therefore have a negligible impact on the emission from the operational phase of the Project. The County must re-evaluate the MMs and PDFs to include measures that will actually reduce the Project impacts and report them in a S-FEIR.

3. The County's Response To The SCAQMD Regarding Changes to the LST Analysis And HRA Clearly Show That The Project Is Poorly Described And Was Not Accurately Assessed.

In the County's response to SCAQMD regarding changes to the LST Analysis and HRA, the County claims that "Potential tenants and end users are unknown at this time; therefore, the exact square footage allocation between high-cube logistics and e-commerce uses cannot be determined at this time." If the County cannot accurately define the square footage associated with the Project and therefore the associated emissions, that have not accurately described the Project in the manner required by CEQA. The County must provide a complete and accurate description in a S-FEIR..

4. The County's Response To The Availability of Electrified Construction Equipment Fails To Require The Use Of That Equipment When Available.

The response from the County that electrified construction equipment for ground works operations is not available at this time fails to require the Proponent to use that type of equipment when it does become available. This may mean that later phases of the Project will benefit from the use of the equipment. Equipment not currently being available does not mean that the County should require it for later phases of the Project. The Proponent should commit to using the equipment as soon as it is available. The County should require this stipulation in an S-FEIR.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant unmitigated impacts if the FEIR is approved. The County must re-evaluate the significant impacts identified in this letter by requiring the preparation of a supplemental final environmental impact report.

Sincerely,

EXHIBIT B

SMITH ENGINEERING & MANAGEMENT

September 6, 2022

Ms. Kelilah Federman
Adams Broadwell Joseph & Cardozo
601 Gateway Boulevard, Suite 1000
South San Francisco, CA 94080-7037

Subject: Speedway Commerce Center II Specific Plan FEIR P22013

Dear Ms. Federman:

Per your request, I reviewed the Final Environmental Impact Report (the "FEIR") for the Speedway Commerce Center II Specific Plan Project (the "Project") in the County of San Bernardino (the "County"). My review is with respect to transportation and circulation considerations and focuses on the County's responses to my comments of July 18, 2022 which were included as Exhibit C to your letter of comment on the Draft Environmental Impact Report on that same date.

My qualifications to perform this review were thoroughly documented in my letter of July 18 and my professional resume was attached thereto.

The FEIR Fails to Respond Directly to Any of My Comments

The FEIR fails to respond directly to any of my comments. This is an evasion tactic sometimes employed by the preparers of environmental documents to avoid responding to the depth and evidentiary support of the commenting experts. In this instance, my comments were focused and brief, but the evasion is clearly evident in the failure to respond directly to the substantive and evidence-backed comments of other experts documented as Exhibits A and B of your comments.

TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

The County's VMT Significance Threshold Is Unreasonably Lenient and Not Based on Substantial Evidence. The More Rigorous Threshold Recommended By OPR Would Result In Findings of Significant Impact

My comment on this topic is similar to your comment now marked 03-27 in the FEIR response. That response asserts that the County's VMT threshold was based on evidence that was identified as an appropriate threshold through an undescribed exercise completed by Fehr & Peers as part of the General Plan process. However, the County has not presented a shred of such evidence in this response. The appropriate reaction to the response is that, if VMT can only be reduced by 4 percent below currently high levels of VMT generation in the unincorporated areas of the County, massive projects such as the one under consideration should only be undertaken in the more urbanized incorporated areas of the County where lower VMT may be feasible.

Comment and Response 03-26.

Your comment now labeled 03-26 in the FEIR response concerned improper deferral of mitigation. The County's response to the issue was to state that the deferral was not improper since the only instances where mitigation is necessary is event-specific to times of events at the raceway and that these traffic management plans can only be prepared when the time and nature (perhaps estimated attendance) of the events become known. The traffic management plans are deferred mitigation because the FEIR does not provide performance standards or specify why performance standards cannot be developed at this time.

Contrary to the County's claim traffic management plans for the raceway events are not the only matters that have been deferred. As we noted in our comments, roadway improvements related to the Project involve improving and converting two private rail crossings to public crossings and improving another public rail crossing. These are involved and time consuming matters involving negotiations with the California Public Utilities Commission and the consent of the involved railroads. Those negotiations do not always succeed in achieving the local public agency's intentions or the private developers' desired results.

The DEIR states at page 4.17-22 that "This application process would be conducted after approval of the Final EIR in conjunction with applicable agencies." Hence, there is no assurance that key elements of the Project's access and circulation system or alternative mitigation will be implemented in a manner that is timely if ever. Because this involves public safety at rail crossings, this is a reviewable matter under CEQA.

Conclusion

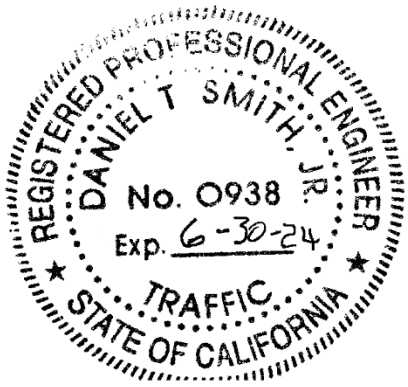
TRAFFIC • TRANSPORTATION • MANAGEMENT
5311 Lowry Road, Union City, CA 94587 tel: 510.489.9477 fax: 510.489.9478

Ms. Kelilah Federman
Adams Broadwell Joseph & Cardozo
September 6, 2022
Page 3

Given the above, the FEIR's response is inadequate, and it should not be certified.

Sincerely,

Smith Engineering & Management
A California Corporation



Daniel T. Smith Jr., P.E.
President

Response to Comment Letter A3 – Alisha C. Pember and Kelilah D. Federman, Adams Broadwell Joseph & Cardozo

The comment letter was received after circulation of the Draft EIR and prior to the Planning Commission meeting, and provides preliminary comments on the Final EIR and the Planning Commission staff report, as well as reiterating previous comments on the Draft EIR. Further, the commenter provided public comments during the public hearing public comment period of the Planning Commission meeting. Comments were addressed during the public comment period by the Project attorney and technical experts regarding information received in the comment letter. No new information was presented that wasn't previously addressed or analyzed in the previous responses to Comments O1, O2, and O3 and therefore no further response is necessary. The letter is provided in the Final EIR and in the Planning Commission report and has been responded to as part of the Planning Commission hearing record. Please also refer to response to Comment Letter A1 regarding public review of a Final EIR.

Subject: RE: Speedway Commerce Center II Specific Plan
Importance: High

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you can confirm the sender and know the content is safe.

Hi Steve,

Could you also read the letter I submitted this morning around 10 am into the record? I have included the text below:

These comments are submitted on behalf of the Center for Biological Diversity (the "Center") regarding the Planning Commission's consideration of the Speedway Commerce Center II Specific Plan (SCH # 2021120259) (Project). The Center maintains that the EIR is defective for the reasons explained in our comments. The County has not fixed the issues we identified, and the EIR still fails to disclose and mitigate the Project's environmental impacts.

Under the DEIR's own admission, this one facility will **double** the existing warehouse square footage in the area (as defined by the DEIR's cumulative impacts analysis). (See DEIR at Table 4-1, 4-14 [existing 37 warehouse facilities identified in the cumulative projects list total 6.4 million sq ft, as compared to this Project's 6.6 million sq ft of warehouse uses].) This Project will compound air quality impacts in a region already suffering from the worst air quality in the nation. Yet, the Project fails to incorporate basic project design features and mitigation measures that have become standard best practice for warehouses in the region.

Furthermore, the County did not upload the Center's comment and the County's response until September 7th, the day before the meeting. During the meeting, Commissioner Gongora noted that the Commissioners had not received this most recent version of the Response to Comments, which the County's attorney confirmed. It appears that the County failed to provide our comments to the Commission, which address in detail Commissioner Gongora's concerns regarding the unmitigated air quality and greenhouse gas impacts.

We urge the Commission to protect the public health and overall quality of life of the people of San Bernardino and recommend a denial of the Project. Thank you.

Cc: Valdez, Steven <Steven.Valdez@lus.sbcounty.gov>
Subject: RE: Speedway Commerce Center II Specific Plan

Hello,

I would also like to add that the County posted its response to comments last week, but inexplicably omitted our comments and its response at that time. Yesterday – the day before the hearing – the County posted a new version of its response to comments ("Version 3") that included our comments and the County's response. The County's inexplicable decision to withhold its response to our comment means that we have been deprived adequate time to review that response before the Planning Commission hearing. And as Commissioner Gongora noted, this also deprived the Commission the opportunity to review our comments and responses before the hearing.

Please include this in the record as well. Thank you.

Thank you.

Best,
Hallie

3.0

Errata

Kimley»Horn

Section 3.0 Errata

In accordance with California Environmental Quality Act (CEQA) Guidelines Sections 15132 and 15088.5(b), this section of the Final Environmental Impact Report (EIR) provides additional information that provide clarification, amplification and/or insignificant modifications presented in the Draft EIR. Changes to the Draft EIR are noted below. The changes to the Draft EIR do not affect the overall conclusions of the environmental document, but instead are a result of public and responsible agency comments on the Draft EIR. These clarifications and corrections do not warrant Draft EIR recirculation pursuant to CEQA Guidelines Section 15088.5. As set forth further below and elaborated upon in the respective Response to Comments, none of the Errata below reflect a new significant environmental impact, a "substantial increase" in the severity of an environmental impact for which mitigation is not adopted to reduce the impact to a level of insignificance, or a new feasible Project alternative or mitigation measure considerably different from others previously analyzed that would clearly lessen significant environmental impacts but is not adopted, nor do the Errata reflect a "inadequate" or "conclusory" Draft EIR.

Changes in this Errata Section are listed by chapter, page, and (where appropriate) by paragraph. Added or modified text is shown with double underline (example) while deleted text is shown with strikethrough (~~example~~).

2.1 SECTION 1.0, EXECUTIVE SUMMARY

Page 1-3, Subsection "Project Description," second bullet point.

Project Description

The Project proposes the development of a mixed-use development that would consist of a mix of the following land uses:

- Approximately 433 acres of the existing approximately 522-acre Auto Club Speedway (ACS) located in San Bernardino County.
- Up to approximately 6.6 million square feet of high-cube logistics and e-commerce development spread across ~~four~~ six planning areas.

Page 1-4, Objective 9, second sentence

Objective 9: Facilitate the establishment of design guidelines and development standards that create a unique, well-defined identity for the proposed Project. Enhance Project ~~project~~ identity through architecture, landscaping, walls, fencing, signage and entry treatments.

Page 1-4, Objective 10

Objective 10: Develop and operate a large format high-cube logistics ~~center~~ and e-commerce center that limits truck traffic disruption to residential areas within Southwestern San Bernardino County and neighboring jurisdictions.

Page 1-18, Table 1-1, Row 11, Column 3

Impact 4.5-3 Would the project disturb any human remains, including those interred outsides of dedicated cemeteries?	Less than Significant Impact with Mitigation Incorporated	Refer to **MM TCR~~TRC-4~~** below.

2.2 SECTION 2.0, INTRODUCTION

Page 2.5, Subsection "Native American Consultation," third paragraph

The ~~City~~ County sent AB 52 and SB 18 notification to representatives of the following tribes on February 22, 2022:

2.3 SECTION 3.0, PROJECT DESCRIPTION

Page 3-2, Section 3.2 "Project Overview," added as 2nd paragraph on page 3-2

Neither a General Plan Amendment nor a Zone Change is required to allow or authorize the uses permitted in the Specific Plan area. Although the Project site currently contains a commercial land use designation, the underlying special development zoning allows for combination of residential, commercial, industrial, agricultural, open space and recreation uses, and similar and compatible uses. A text and map amendment to the Development Code and General Plan will be made to identify the Specific Plan designation on the official map.

Page 3-2, Section 3.3 "Project Background," first paragraph of the section, fifth sentence

The existing ACS has been hosting NASCAR races and other motorsports and entertainment events since 1997. The Project would be constructed on approximately 433 acres of the existing site. The remaining approximately 90 acres are not a part of this Project, and plan to be developed as the "Next Gen in California Project" (Next Gen motorsports facility) which was separately approved by the County in June 2021.

Page 3-21, Table 3-2: Proposed Land Uses, Row 7, Column 2

Total	Approximately 433 acres	NA

Page 3-23, Table 3-3: Land Use Plan, Row 28, Column 3

Total	**--**	**Approximately 433 acres**	**Up to 6,600,000 sf High-cube Logistics/E-Commerce 261,360 sf Ancillary Commercial**	**0.55 (max)[3]**

Page 3-26, Subsection "Vehicular Circulation, 5th paragraph, second sentence

Widening of Cherry Avenue entries along the Project frontage would also be done to improve traffic movements at the intersections of Street "A"/Cherry Avenue and Street "D"/Cherry Avenue. ~~No other~~ If additional off-site improvements are ~~planned~~ necessary either along Cherry Avenue or Napa Street, it is

anticipated that these improvements would generally occur within the existing improved rights-of-way. Therefore, minimal impacts to biological resources, cultural resources, and air quality or GHG would occur. All relevant mitigation measures identified in this EIR would apply to the construction of any off-site circulation improvements by the Project.

Page 3-31, Subsection "Water Supply," first paragraph of the subsection, first two sentences

Potable and recycled water services for the ~~The~~ Project site would be provided ~~is served~~ by Fontana Water Company (FWC) ~~and Inland Empire Utilities Agency (IEUA)~~. To meet water supply demand, the portions of the County that are operated by the FWC ~~Fontana Water Company~~ receive water supply from Lytle Creek surface flow and from wells in the Lytle Basin, Chino Basin, and Rialto-Colton Basin ~~another groundwater basin known as No Man's Land~~.

Page 3-31, Subsection "Water Supply," second paragraph of the subsection

There is an existing 16~~18~~-inch waterline that runs through the Project site, connecting existing water facilities in Napa Street to Cherry Avenue. A portion of this existing waterline would need to be removed with the development of the Project site. New water facilities would be installed in the backbone streets (Streets "A," "B," "C," and "D"). The proposed new water facilities would connect to existing FWC waterlines located in Cherry Avenue and Napa Street to provide water for the Project site. The need for a new backbone main in Cherry Avenue was also identified as was new water production, storage, and distribution infrastructure. Although there are existing mains in the vicinity of the Project to provide both potable and recycled water, FWC's water system requires capacity improvements in order to meet the potable and recycled water demands for the Project. FWC also has a 16-inch waterline and rights of way that exist within the Project area that are required to be abandoned and relocated. These improvements would generally occur within the existing improved rights-of-way on Cherry Avenue which is generally improved or built out. Therefore, minimal impacts to biological resources, cultural resources, and air quality or GHG would occur. All relevant mitigation measures identified in this EIR would apply to the construction of any off-site water/wastewater improvements by the Project.

Page 3-31, Subsection "Recycled Water," first paragraph of subsection, second sentence

There is an existing recycled waterline located in Napa Street, west of the Project site. The recycled waterline was installed by the IEUA with service being provided by FWC. Recycled water supply is delivered at a lower cost than potable water and is not interrupted during drought restriction periods, making it ideal for irrigation uses. In accordance with the SWRCB Emergency Order published in May 2022, the use of potable water for landscaped areas will be prohibited. Therefore, ~~As an option to using potable water~~ for irrigation uses, new recycled water facilities would ~~may~~ be installed in the backbone streets (Streets "A," "B," "C," and "D") to provide irrigation water for the Project site. Recycled water for irrigation may also be used along Cherry Avenue, VIP Access Road and San Bernardino Avenue.

Page 3-32, Subsection "Site Utilities/Infrastructure," second sentence

To meet water supply demand, the portions of the County that are operated by the FWC receive water supply from Lytle Creek surface flow and from wells in the Lytle Basin, Chino Basin, and Rialto-Colton Basin ~~another groundwater basin known as No Man's Land~~.

Page 3-32, Subsection "Site Utilities/Infrastructure", second paragraph

The Project site is minimally served by water, power, and natural gas. ~~The Project site would tie into existing utility lines within the existing roadways and right-of-ways adjacent to the site.~~ The Project would be required to connect to the following utilities:

Page 3-34, Section 3.7: Approvals Requested as Part of the Project, added as Requested Approvals

Development Code Amendment: A text and map amendment to the Development Code will be made to identify the Specific Plan designation of SC/SP-COM on the official zoning map.

General Plan Amendment: A map amendment to the General Plan will be made to Special Development (SD) on the official land use map, which is the land use category used to identify Specific Plan areas.

2.4 SECTION 4.0, ENVIRONMENTAL IMPACT ANALYSIS

Page 4-7, Table 4-1: Cumulative Projects List

Table 4-1: Cumulative Projects List

Proj #	Description	Land Use	Quantity	Units	Trip Generation Estimates						
					Daily	AM Peak Hour			PM Peak Hour		
						In	Out	Total	In	Out	Total
San Bernardino County											
Entitled/Project Site											
113	Next Gen In California	Entertainment	90	AC	*A TIA was prepared for the 1995 EIR for the California Speedway Event Center Development Plan (Auto Club Speedway)						

* The 1995 FEIR determined that Friday race days would generate 6,814 Average Daily Traffic (ADT) (3,407 trips in and 3,407 trips out), Saturday race days would generate 33,122 ADT (18,347 trips in and 14,775 trips out), and Sunday race days would generate 69,096 ADT (33,655 trips in and 35,441 trips out). The Next Gen in California Project (Next Gen motorsports facility) attendance would decrease from the original maximum of 107,000 people (including spectators in grandstands, suites, or sky boxes, team members, race officials, workers, and media) for a premier race event, to a maximum total attendance of approximately 50,000 people for such events.

2.5 SECTION 4.3, AIR QUALITY

Page 4.3-19, first paragraph, second third and fourth sentences

The Project site would consist of up to approximately 6.6 million square feet of high-cube logistics and e-commerce uses with 261,360 square feet of ancillary commercial uses, and approximately 98 acres of parking fields/drop lot areas as well as ancillary open space. However, for purposes of trip generation and associated ~~air quality~~ traffic analysis, a conservative approach was used in the trip generation which assumes 2,641,000 ~~million~~ square feet of high-cube logistics and 2,773,050 ~~million~~ square feet of e-commerce uses, for a total of 5,414,050 million sf of combined high-cube logistics and e-commerce uses. This scenario provides for the maximum number of trips and related traffic ~~air quality~~ impacts that could be associated with the Project. For instance, if the Project were to develop with 6.6 million square feet of high-cube logistics uses only, the number of trips associated with the Project would be less than if the Project were to develop with the assumed 2,641,000 ~~million~~ square feet of high-cube logistics and

2,773,050 ~~million~~ square feet of e-commerce uses due to the higher intensity of trips generated with e-commerce uses.

Page 4.3-20, first paragraph, second sentence

provides for the maximum number of trips and related air quality impacts that could be associated with the Project. For instance, if the Project were to develop with up to approximately 6.6 million square feet of high-cube logistics uses only, the number of trips associated with the Project would be less than if the Project were to develop with the assumed 2,641,000 million square feet of high-cube logistics and 2,773,050 million square feet of e-commerce uses due to the higher intensity of trips generated with e-commerce uses.

Page 4.3-20, first paragraph, second sentence

For purposes of construction emissions modeling, the maximum potential development of up to approximately 6.6 million square feet building area was modeled to reflect the maximum square footage of building construction potential.

Page 4.3-25, third paragraph, last sentence

The Project would approve the Specific Plan for the property to allow for the development of up to approximately 6.6 million square feet of high-cube logistics/e-commerce uses and approximately 261,360 sf of ancillary commercial uses, as well as ancillary open space to support to the Project development.

Page 4.3-37, first paragraph, second sentence

conditions and requirements include compliance with the provisions of the Building Code, SCAQMD Rules, etc. The ~~City~~ County may impose additional conditions during the approval process, as appropriate.

Page 4.3-38, MM AQ-1

MM AQ-1 Prior to the issuance of grading permits, the County Engineer shall confirm that the Grading Plan and Specifications require all construction contractors to incorporate the following measures to minimize construction emissions. ~~These features shall be included in applicable bid documents and included on the grading plans.~~

- All off-road diesel-powered construction equipment greater than 50 horsepower meets California Air Resources Board Tier 4 Final off-road emissions standards or incorporate CARB Level 3 Verified Diesel Emission Control Strategy (VDECS). Requirements for Tier 4 Final equipment and the option for Level 3 VDECS shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. A copy of each unit's Best Available Control Technology (BACT) documentation (certified tier specification or model year specification), and CARB or SCAQMD operating permit (if applicable) shall be provided to the County at the time of mobilization of each applicable unit of equipment. This equipment shall be used when commercial models that meet the construction needs of the proposed Project are commercially available from local suppliers/vendors. The

determination of commercial availability of such equipment shall be made by the County, based on applicant-provided evidence from expert sources, such as construction contractors in the region.

- Construction equipment shall be properly maintained according to manufacturer specifications.
- All diesel-powered construction equipment, delivery vehicles, and delivery trucks shall be turned off when not in use. On-site idling shall be limited to three minutes in any one hour.
- Construction on-road haul trucks shall be model year 2010 or newer if diesel-fueled.
- Information on ridesharing programs shall be made available to construction employees.
- During construction, lunch options shall be provided on-site.
- A publicly visible sign shall be posted with the telephone number and person to contact regarding dust complaints per SCAQMD Standards.
- All construction contractors shall be provided information on the South Coast Air Quality Management District Surplus Off-road Opt-In "SOON" funds which provides funds to accelerate cleanup of off-road diesel vehicles.
- The Project shall demonstrate compliance with SCAQMD Rule 403 concerning fugitive dust and provide appropriate documentation to the County of San Bernardino.
- All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, unpaved access roads) shall be watered two times per day.
- All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
- All visible mud or dirt track-out onto adjacent public roads shall be removed using wet-power vacuum street sweepers at least once per day. The use of dry-power sweeping shall be prohibited.
- All vehicle speeds on unpaved roads, driveways, or driving surfaces shall be limited to 15 miles per hour.
- All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible.
- Building pads shall be laid as soon as possible after grading, unless seeding or soil binders are used.
- A publicly visible sign shall be posted with the telephone number and the name of the person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The phone number of the SCAQMD shall also be visible to ensure compliance.

Page 4.3-40, MM AQ-3

MM AQ-3 Prior to issuance of tenant occupancy permits, the tenant/facility operator shall prepare and submit a Transportation Demand Management (TDM) program detailing strategies that would reduce the use of single occupant vehicles by employees by increasing the number of trips by walking, bicycle, carpool, vanpool, and transit. The TDM shall include, but is not limited to the following:

- Provide a transportation information center and on-site TDM coordinator to educate residents, employers, employees, and visitors of surrounding transportation options.
- Promote bicycling and walking through design features such as showers for employees, self-service bicycle repair area, etc. around the Project site.
- Each building shall provide secure bicycle storage space equivalent to two percent of the automobile parking spaces provided.
- Each building shall provide a minimum of two shower and changing facilities as part of the tenant improvements.
- Promote and support carpool/vanpool/rideshare use through parking incentives and administrative support, such as ride-matching service.
- Incorporate incentives for using alternative travel modes, such as preferential load/unload areas or convenient designated parking spaces for carpool/vanpool users.
- Provide meal options on-site or shuttles between the facility and nearby meal destinations.
- Each building shall provide preferred parking for electric, low-emitting, and fuel-efficient vehicles equivalent to at least eight percent of the required number of parking spaces.

This mitigation measure applies only to tenant occupancy/tenant improvements and not the building shell approvals and/or limited speculative tenant improvements installed for marketing purposes.

Page 4.3-41, MM AQ-4

MM AQ-4 The applicability of this Mitigation Measure applies in part to the tenant and in part to the Site Developer, as noted below:

Prior to the issuance of a building permit: for tenant improvements by tenant/facility operator for cold storage uses, the Planning Department shall confirm that the Project is designed to include the following:

- ~~Prior to issuance of a Building Permit for the Shell Design, the buildings' electrical room shall be sufficiently sized to hold additional panels that may be needed to supply power for the future installation of electric vehicle (EV) truck charging stations on the site. Conduit should be installed from the electrical room to tractor trailer parking~~

~~spaces in a logical location(s) on the site determined by the Site Developer during construction document plan check, for the purpose of accommodating the future installation of EV truck charging stations at a central location within the truck court at such time this technology becomes commercially available, and the buildings are being served by trucks with electric-powered engines.~~

- The buildings' electrical room shall be sufficiently sized to hold additional panels that may be needed in the future to supply power to trailers with transport refrigeration units (TRUs) during the loading/unloading of refrigerated goods, if required by future tenants who utilize cold storage. Conduit should be installed from the electrical room to the loading docks ~~in a location~~ determined by the ~~tenant~~ Project Applicant during construction document plan check as the logical location(s) to receive trailers with TRUs.

Prior to the issuance of a building permit: for the Shell Design by Site Developer, the Planning Department shall confirm that the Project is designed to include the following:

- Prior to issuance of a Building Permit for the Shell Design, the buildings' electrical room shall be sufficiently sized to hold additional panels that may be needed to supply power for the future installation of electric vehicle (EV) truck charging stations on the site. Conduit should be installed from the electrical room to tractor trailer parking spaces in a logical location(s) on the site determined by the Site Developer during construction document plan check, for the purpose of accommodating the future installation of EV truck charging stations at a central location within the truck court at such time this technology becomes commercially available and the buildings are being served by trucks with electric-powered engines.

~~This mitigation measure applies only to tenant improvements and not the building shell approvals.~~

Page 4.3-41, MM AQ-5

MM AQ-5 Prior to the issuance of tenant occupancy permits for cold storage uses, the Planning Department shall confirm that tenant lease agreements include contractual language that requires all Transport Refrigeration Units (TRUs) entering the Project site be plug-in capable. Conduit for electrical hookups shall be provided as part of the tenant improvements for any tenant that requires cold storage. The conduit for electrical hookups shall be provided at select loading bays for future transportation refrigeration units if required by future tenants who utilize cold storage. Electrical hookups allow for truckers to plug in any onboard auxiliary equipment and power refrigeration units while their truck is stopped. This mitigation measure applies only to tenant occupancy/tenant improvements and not the building shell approvals and/or limited speculative tenant improvements installed for marketing purposes.

Page 4.3-41, MM AQ-6

MM AQ-6 Prior to the issuance of a tenant occupancy permit, the Planning Department shall confirm that all truck access gates and loading docks within the Project site have a sign posted that states:

- Truck drivers shall turn off engines when not in use.
- Truck drivers shall shut down the engine after five minutes of continuous idling operation (pursuant to Title 13 of the California Code of Regulations, Section 2485). Once the vehicle is stopped, the transmission is set to "neutral" or "park," and the parking brake is engaged.
- Telephone numbers of the building facilities manager and CARB to report violations.
- Signs shall also inform truck drivers about the health effects of diesel particulates, the California Air Resources Board diesel idling regulations, and the importance of being a good neighbor by not parking in residential areas.

This mitigation measure applies only to tenant occupancy/tenant improvements and not the building shell approvals and/or limited speculative tenant improvements installed for marketing purposes.

Page 4.3-42, MM AQ-7

MM AQ-7 Prior to the issuance of a tenant occupancy permit, the Planning Department shall confirm that the Project plans and specifications shall include requirements (by contract specifications) that vendor trucks for the industrial buildings include energy efficiency improvement features through the Carl Moyer Program—including truck modernization, retrofits, and/or aerodynamic kits and low rolling resistance tires—to reduce fuel consumption. This mitigation measure applies only to tenant occupancy/tenant improvements and not the building shell approvals and/or limited speculative tenant improvements installed for marketing purposes.

Page 4.3-42, MM AQ-8

MM AQ-8 Prior to the issuance of a tenant occupancy permit, the Planning Department shall confirm that the Project plans and specifications for the industrial buildings shall include electric vehicle (passenger car) charging stations and a minimum of 12 percent carpool parking spaces at each building for employees and the public to use. This mitigation measure applies only to tenant occupancy/tenant improvements and not the building shell approvals and/or limited speculative tenant improvements installed for marketing purposes.

Page 4.3-42, MM AQ-9

MM AQ-9 Each building shall include the necessary charging stations for cargo handling equipment. Prior to the issuance of a tenant occupancy permit, the Planning Department shall confirm that the Project plans and specifications show that all outdoor cargo handling equipment

(including yard trucks, hostlers, yard goats, pallet jacks, and forklifts) are zero emission/powered by electricity. Note that SCAQMD Rule 2305 (Warehouse Indirect Source Rule) Warehouse Actions and Investments to Reduce Emissions (WAIRE) points may be earned for electric/zero emission yard truck/hostler usage. This mitigation measure applies only to tenant occupancy/tenant improvements and not the building shell approvals and/or limited speculative tenant improvements installed for marketing purposes.

2.6 SECTION 4.4, BIOLOGICAL RESOURCES

Page 4.4-5, final paragraph, second sentence

A BRA was prepared for the Next Gen motorsports facility project; see *Section 3.0 Project Description* for details. The Project would surround the separate Next Gen motorsports facility. The Project would be constructed on approximately 433 acres of the existing site.

2.7 SECTION 4.5, CULTURAL RESOURCES

Page 4.5-8, first paragraph, second and third sentences.

Archival information also suggests that the Metropolitan Water District's Upper Feeder ~~Aqueduct~~ was constructed through the southern portion of the Project site in the 1930s. The Project is not anticipated to impact the built environment resource ~~buried historic-era water pipeline~~.

Page 4.5-16, first paragraph, seventh and eighth sentences.

Archival information also determined that the Metropolitan Water District of Southern California's Upper Feeder ~~Aqueduct~~ was constructed through the Project area in the 1930s. Project implementation is not anticipated to impact the built environment resource ~~buried historic-era water pipeline~~ and construction activities will not alter, demolish, or relocate the existing feature.

Page 4.5-17, MM CUL-1.

MM CUL-1 If archaeological or cultural resources are exposed during construction of the Project, all ground disturbing activities within ~~50~~ 60 feet of the potential resource(s) shall be suspended. A qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards, shall evaluate the significance of the find and determine whether or not additional study is warranted. Depending upon the significance of the find, the archaeologist may simply record the find and allow work to continue. If the discovery proves significant under CEQA, additional work, such as preparation of an archaeological treatment plan, testing, or data recovery, may be warranted and shall be submitted to the Development Services Director or his/her designee. If the resource(s) are determined to be Native American in origin, the Project archaeologist shall notify the appropriate Native American Tribe(s) from a list provided by the County.

Additionally, the Yuhaaviatam of San Manuel Nation Cultural Resources Department (YSMN) shall be contacted regarding any pre-contact and/or historic-era finds and be

provided information after the archaeologist makes his/her initial assessment of the nature of the find, so as to provide Tribal input with regards to significance and treatment.

MM CUL-2 If significant pre-contact and/or historic-era cultural resources, as defined by CEQA (as amended, 2015), are discovered and avoidance cannot be ensured, the archaeologist shall develop a Monitoring and Treatment Plan, the drafts of which shall be provided to YSMN for review and comment. The archaeologist shall monitor the remainder of the Project and implement the Plan accordingly.

MM CUL-3 If human remains or funerary objects are encountered during any activities associated with the Project, work in the immediate vicinity (within a 100-foot buffer of the find) shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5 and that code enforced for the duration of the Project.

Page 4.5-19, fourth paragraph, third sentence.

Further, Project implementation would not be anticipated to impact the built environment resource ~~buried historic-era water pipeline~~, associated with the Metropolitan Water District's Upper Feeder ~~Aqueduct~~.

2.8 SECTION 4.6, ENERGY

Page 4.6-14, first paragraph, third sentence
