Subject: Phase I Environmental Site Assessment
West Hills
NW Corner of Roscoe Boulevard and Fallbrook Avenue
Los Angeles, California 90670
Partner Project No. 20-288877.1

Dear Mr. Jacobs:

Partner Engineering and Science, Inc. (Partner) is pleased to provide the results of the *Phase I Environmental Site Assessment* (Phase I ESA) report of the abovementioned address (the "subject property"). This assessment was performed in conformance with the scope and limitations as detailed in the ASTM Practice E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property ownership, site manager, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate the opportunity to provide environmental services to you. If you have any questions concerning this report, or if we can assist you in any other matter, please contact me at 310-622-8855.

Sincerely,

Debbie Stott
Principal

EXECUTIVE SUMMARY

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in accordance with the scope of work and limitations of ASTM Standard Practice E1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) and set forth by Staley Point Capital for the property located on the northwest corner of Roscoe Boulevard and Fallbrook Avenue, Los Angeles, Los Angeles County, California (the "subject property"). The Phase I Environmental Site Assessment is designed to provide SCIND Fallbrook Point LLC with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property.

Property Description

The subject property is located on the north side of Roscoe Boulevard, west of Fallbrook Avenue, within a commercial and residential area of Los Angeles County. Please refer to the table below for further description of the subject property:

Subject Property Data	
Address:	No address assigned
Historical Address:	8433 Fallbrook Avenue (Former Hughes Missile Systems Group Facility) and 22801 Roscoe Boulevard (Former DeVry University)
Additional Address:	22815 and 22825 West Roscoe Boulevard (reported on ZIMAS)
Property Use:	Commercial - Parking Lot
Land Acreage (Ac):	7.027 Ac
Number of Buildings:	No buildings
Assessor's Parcel Number (APN):	2005-002-018 (Current); 2005-002-013 and 2005-002-001 (Historical)
Current Tenants:	Vacant
Site Assessment Performed By:	Robin Blanchard of Partner
Site Assessment Conducted On:	August 13, 2020

The subject property is currently developed as a portion of a larger paved parking area, adjacent to the east of the Thermo-Fisher Scientific facility (22801 Roscoe Boulevard). In addition to the paved parking spaces and driving areas, the property is improved with landscaping, lighting, and an exercise path.

No evidence of the use, storage or management of reportable quantities of hazardous substances or petroleum products was observed on the subject property. No evidence of current or former ASTs or USTs was observed during the site reconnaissance.

According to review of available historical data, it appears that the subject property was agriculturally developed or vacant land from 1903 to 1952. By 1959, the subject property appears to be unpaved, vacant land located on the southeast corner of the larger Hughes Missile Systems Facility (part of 86-acre parcel). According to the regulatory records and previous reports, Bunker Ramo, an electrical component design and testing company, was the sole occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes Aircraft Company/Hughes Missile Systems (Hughes) Facility, an aerospace research and development company, was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes (currently known as Raytheon Company (Raytheon), its successor, purchased the

entire site in the mid-1970s and operated there until the mid-1990s. From 1978-1994, Hughes Building 275 was located on the north side of the subject property. The remainder of the subject property appears to be unpaved, vacant land. By 1999, subject property has been developed as a paved parking lot initially utilized by the adjacent DeVry University at 22801 Roscoe Boulevard (part of 15.25 acre parcel). The subject property remains a paved parking lot today.

The only information related to Building 275 indicates that it was a single-story building. Prior investigations did not include or discuss environmental concerns with Building 275 leading to the conclusion that this location was not of concern. Based on building permits included with the 2006 ESA for DeVry University, this building was demolished in 1998 when the adjacent DeVry University building and parking lot were being constructed.

The subject property, as part of a larger parcel, is identified on the GeoTracker database under two cases, Case No. SL2043T1572 and Case No. T10000011111. Raytheon Company is the responsible party for clean-up activities. According to information from the GeoTracker database, the subject property was a parcel located on the southeast corner of the former 86-acre Hughes Missile Systems facility, also referred to as the Former Canoga Park Facility and Raytheon Canoga Park Site. The facility is being jointly investigated by the Regional Water Quality Control Board (RWQCB) and the Department of Toxic Substances Control (DTSC). The RWQCB oversees the investigation and remediation of groundwater contamination at the site and the DTSC has jurisdiction to oversee the site soil contamination. Subsequently, the northern and southern portions of the former 86-acre facility were separated into different groundwater cases for investigation purposes but remain together for soil investigation. The subject property is located on the southeast corner of the former 86-acre facility and the southern investigation area referred to as the Southern Parcels of the Former Hughes Missile Systems Co.

A summary of the cases is provided below:

RWQCB Case No. SL2043T1572/DTSC Case Nos. 80001366 & CAD041162124 for Hughes Missiles Co./Raytheon Systems Co. (8433 Fallbrook Avenue): Currently Open, Corrective Action Case with the DTSC and RWQCB - monitoring ongoing. Responsible Party is Raytheon.

Since 1988, remedial efforts have been implemented to treat groundwater and saturated soils that contain residual volatile organic compounds (VOCs) at the Site. Chemicals of concern include Tetrachloroethene (PCE), Trichloroethene (TCE), cis-1,2-Dichloroethene (cis-1,2-DCE), 1,1-Dichloroethane (1,1-DCA), and 1,2-Dichloroethane (1,2-DCA). Groundwater remediation with injection wells has been underway at the Site since 1995 to achieve cleanup criteria. Under the oversight of the RWQCB, the primary objective of the remediation program is to accelerate the degradation of VOCs to concentrations below the cleanup goals established in the 1992 Corrective Action Plan (CAP), with the most recent Addendum to the CAP (CAP Addendum No. 5) in 2016. Remediation techniques used at the Site have included remedial excavation, a groundwater recovery and treatment system, a soil vapor extraction system, and an air sparge system. Enhanced in-situ bioremediation (EISB) was implemented in 2005 to 2020. Based on the attached figures, the majority of the treatment areas, known as Northwest Area, North-Central Area, Former Building 269 Area, and Well CM-8D Area, are located to the northwest (0.17-mile from the subject property) of the subject property and along the northwestern boundary (0.34-mile from the subject property) of the Former Canoga Park Facility.

According to a December 15, 2017 Letter to the Raytheon Company from DTSC, additional investigations and/or submittals may be requested by the DTSC for the subject property since they are the lead regulatory agency to oversee the corrective action to soil at the Southern Parcels at the Raytheon Canoga Park Site. Further investigation of the identified Areas of Concern (AOCs) identified in the RCRA Facility Assessment Report dated January 30, 2008 was required by DTSC. The 2008 RCRA Facility Assessment Report indicated that AOCs including Solid Waste Management Unit (SWMU)-9 (Sanitary Sewer) and AOC-12 (Storm Sewers) were identified at the subject property, as discussed below:

- SWMU-9 is defined as the Site wide sewer line. Releases to soil near soil boring BSL-4. Constituents include arsenic. The report notes that the Site wide assessment in 1991 did not show any metal contamination at detection limits. One sample had a trace (0.009 milligram per kilogram (mg/kg)) of toluene. Sample B-SL had 0.3 mg/kg of toluene. No other VOCs were detected. DTSC concluded that there was a need to determine if any issues remain.
- AOC-12 is defined as the Site wide storm water system. Releases are suspected.

Partner notes that the DTSC has not conducted or required further investigation of the Southern Parcels (including the subject property).

Soil at the subject property and larger Corporate Pointe at West Hills (Former Canoga Park Facility) are being managed under a Soil Management Plan prepared by Environ International Corporation dated May 12, 2008.

RWQCB Case No. T10000011111: Southern Parcels -Former Hughes Missile Systems Co. (8433 Fallbrook Avenue): Closed Case – No further action for groundwater with RWQCB as of March 22, 2018. Current open case with the DTSC for potential soil impacts.

According to information from the GeoTracker database, the subject property is located on the southeast corner of the investigation area referred to as the Southern Parcels of the Former Hughes Missile Systems Co. The groundwater closure request affected the southern parcels identified by APNs 2005-002-014, APN 2005-002-901, APN 2005-002-013. The subject property is located within the boundary of APN 2005-002-013.

According to the July 31, 2012 Confirmation Sampling Report and other documents, trichlorofluoromethane (Freon 11) was detected in soil and groundwater underlying the southern parcels. Freon 11 was historically used in refrigeration devices and as a solvent. Historically, concentrations of trichlorofluoromethane were detected up to 300 micrograms per Liter (µg/L), above the California drinking water maximum contaminant level (MCL) of 150 µg/L, in groundwater well CM-10. Based on report figures, groundwater monitoring wells, CM-17 and CM-10, were located along the eastern boundary of the subject property.

A 1998 Figure attached to a prior ESA report depicted:

- Former Hughes Building 275 was formerly located on the northern portion of the subject property.
- A former southeast trending sewer line is shown onsite crossing to the south of Building 275 to a municipal sewer discharge point discharge on the eastern portion of the subject property.

- A drainage ditch is depicted along the eastern border of the subject property, adjacent to Fallbrook Avenue. Soil gas sampling points collected in June and August 1995 along the sewer line and at Well CM-10 are shown as Non-Detected (ND) (<1 µg/L).
- An area with Freon 11 concentrations in soil gas ranging from 100 – 1,000 µg/L is depicted on/and or adjacent to the northwest of the subject property.
- Former Hughes Buildings 274, 265, and 276 are shown to the northwest and west to the subject property.

Follow-up characterization activities were conducted between 1993 and 1998 in the area near Buildings 274 and 276, which is upgradient from well CM-10 and adjacent to the northwest of the subject property. to identify the source of the Freon 11 concentrations. The investigations indicated that an area of Freon 11 concentrations greater than 1,000 µg/L in soil gas was delineated in the former parking lot and southeast of former Building 274 (thereafter termed "the Freon 11 Area"). In 1998, three temporary wells and one permanent well (MW-31) were installed within the Freon 11 Area.

In August 1993, a monitoring well and soil borings were completed within the area enclosed by Buildings 276 and 274 and Well CM-10. One boring (B-SL-10) advanced immediately northwest of well CM-10 had no Volatile Organic Compounds (VOCs) reported above their respective detection limits in the soil samples collected at 10, 20, and 30 feet below ground surface (bgs).

In June 1995, soil gas surveys were conducted to delineate the lateral extent of Freon 11-impacted soil. Soil gas probes were installed at four locations within the immediate area of well CM-10, one was located at an on-site sewer junction within the vicinity of well CM-10, and one was located immediately southeast of the former Building 274 cooling unit. All probes were set at approximately 5 feet bgs. Freon 11 was detected at the on-site sewer junction and adjacent to the cooling unit for the former Building 274 at concentrations of 183 µg/L and 6 µg/L. No Freon 11 was detected above the reporting limit at the soil gas probes installed within the immediate area of well CM-10 (this is on the east side of the subject property).

In May 1998, soil and groundwater samples were collected for analytical laboratory analysis during well installation of temporary and permanent monitoring wells. Temporary and permanent monitoring wells were installed in the vicinity of well CM-10 and the Freon 11 Area located to the northwest of the subject property.

Soil and groundwater analytical results indicated no VOC concentrations had been detected above the MCLs for drinking water in groundwater samples from each of the monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31) located on or in the vicinity of the Southern Parcels for more than 10 years of groundwater monitoring. Moreover, samples from all wells, except for wells CM-10 and MW-31, have been non-detect for the Site constituents of concern (chlorinated VOCs), for more than 15 years.

In a response to a June 27, 2006, memorandum requesting removal of Southern Parcel monitoring wells and NFA status for the Southern Parcels, the RWQCB issued a letter dated January 22, 2007, approving the removal of several wells from the monitoring program, but did not approve their abandonment, citing concerns about the potential presence of manmade radiological isotopes in wells CM-10, CM-12 and CM-17 based on community concerns with previous data.

Between March 2008 and August 2009, Raytheon, OTIE, and the RWQCB worked together to evaluate radiological conditions in the Southern Parcels. A radiological evaluation was performed; the results of the radiological evaluation indicated that the presence of low-level radiological isotopes were attributable to naturally-occurring sources in the underlying soil, bedrock, and groundwater. The RWQCB concurred, and issued a NFA letter with regard to radioactivity in groundwater for the Southern Parcels on October 30, 2009.

In addition to the radiological sampling, OTIE performed a confirmation sampling event including VOCs for wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30, and MW-31 in November 2008. Analytical results from this confirmation sampling event were non-detect for all VOCs (CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, and MW-30) or below the MCL for the only detected VOC, Freon 11. Freon 11 was detected only in wells CM-10 (onsite) and MW-31 (offsite to the north.

Based on the findings of the NFA for radiological parameters and confirmation results for VOCs in the Southern Parcel wells, Raytheon sought NFA status from the RWQCB for the Southern Parcels once again in a technical memorandum dated July 8, 2010. The RWQCB responded in a letter dated May 13, 2011 and requested Raytheon to better define vertical and lateral extent of the Freon 11 plume detected in wells MW-31 and CM-10. Additional characterization identified a Freon 11 Area (>1,000 µg/L in soil gas) located around MW-31 that may have extended to the southeast on to the northwest corner of the subject property. According to 2012 groundwater sampling data, the Freon was the only VOC detected previously above MCL in groundwater in the Southern Parcels of the Site. A concentration of 35 µg/L was detected in Well CM-10 (screened interval of 34-52 feet) and at 120 µg/L in MW-31 (screened interval of 45-72 feet).

OTIE stated that the concentration distributions indicated that the Freon 11 Area was limited to the area southeast of former Building 274. The postulated release of Freon 11 occurred in an unpaved area adjacent to the parking lot southeast of former Building 274, which may have been used as a maintenance area, up-gradient of the subject property. This area was identified by shallow soil gas investigations in 1995, which delineated an area of elevated Freon 11 greater than 1,000 µg/L. Therefore, OTIE concluded it was likely that surface releases of Freon 11 infiltrated the vadose zone in this area, and migrated vertically to groundwater, then migrated laterally in groundwater in the dissolved phase. Groundwater impacted by Freon 11 was localized to the area of well MW-31 and downgradient to well CM-10.

At the request of the DTSC, MW-31 and CM-10 located in and down-gradient of the former Freon 11 Area of Concern were monitored on January 22, 2018. Only one sample was collected from MW-31 and analyzed for VOCs. Well CM-10 was dry at the time of sampling. Freon 11 was detected at a concentration of 64 µg/L, below the MCL of 150 µg/L. No other VOCs were detected in MW-31.

On March 22, 2018, the RWQCB concluded that the southern portion of the facility had met the Regional Board requirements for groundwater closure and issued a NFA letter on March 22, 2018. On July 17, 2018, the RWQCB approved Raytheon's request to destroy 13 wells on the Southern Parcels including onsite wells CM-10 and CM-17 which were removed on September 6 and 10, 2018.

The subject property is located within a commercial/residential area of Los Angeles County. During the vicinity reconnaissance, Partner observed the following land use on properties in the immediate vicinity of the subject property:

Immediately Surrounding Properties

North: Paved parking and driveway access, commercial multi-tenant building and parking for commercial center (8401-8413 Fallbrook Avenue).

South: Roscoe Boulevard, followed by residential properties(houses fronting on Roscoe: 22816-22852 Roscoe Boulevard, 8247 Fallbrook Avenue), Yoga By the Sea (22824 Roscoe Boulevard), and a multi-tenant retail building 22750 Roscoe Boulevard and 8240 Fallbrook Avenue).

East: Fallbrook Avenue, followed by residential properties (8344-8362 Fallbrook Avenue; 8301-8311 Maynard Ave).

West: Paved parking lot and Thermo Fisher Scientific (22801 Roscoe Boulevard).

According to information obtained from the State Water Resources Control Board GeoTracker online database for the adjacent property (Case Number SL2043T1572 – Hughes Missiles Co. (Former) at 8433 Fallbrook Avenue, Remedial Progress Report for the Second Quarter 2018, OTIE July 30, 2018), groundwater in monitoring wells MW-25 and MW26 in the vicinity of the subject property is present at a depths ranging from 41.40 to 48.38 feet below ground surface (bgs) and flows toward the southeast.

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment. The following was identified during the course of this assessment:

- Partner did not identify any recognized environmental conditions during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. The following was identified during the course of this assessment:

- Partner did not identify any controlled recognized environmental conditions during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- Groundwater beneath the subject property has been impacted by historical releases associated with the former Hughes' operations, these impacts have been investigated and characterized under RWQCB regulatory oversight. On March 22, 2018, the RWQCB concluded that the southern

portion of the former Hughes facility had met the Regional Board requirements for groundwater closure and issued a NFA letter on March 22, 2018. Onsite wells CM-10 and CM-17 were removed on September 6 and 10, 2018. Based on the analytical results and regulatory case closure, the impacts to groundwater beneath the subject property are considered to be HRECs.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following was identified during the course of this assessment:

- The subject property is located within the boundary of the open Corrective Action Case for the former Hughes Missile Systems facility. Additional investigations and/or submittals may be requested by the DTSC for the subject property since two AOCs including Solid Waste Management Unit (SWMU)-9 (Sanitary Sewer) and AOC-12 (Storm Sewers), were identified at the subject property in the 2008 RCRA Facility Assessment Report and remain uninvestigated. Closure certification and completion corrective action are outstanding. Partner notes that the DTSC has not investigated or required investigation of the sanitary and storm sewers.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of the property located on the northwest corner of Roscoe Boulevard and Fallbrook Avenue, Los Angeles, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed evidence of a historical recognized environmental condition and environmental issues in connection with the subject property. Based on the conclusions of this assessment, Partner recommends the following:

- Further evaluation of subsurface environmental conditions is not warranted at this time.
- Manage any disturbance of onsite soils with existing Soil Management Plan as needed.
- Further assessment of onsite soils in the vicinity of the sewer lines may be required in the future by DTSC as part of ongoing open, Corrective Action Case for the former Hughes Missiles Co./Raytheon Systems Co. Facility. Note that the DTSC has not yet required investigation of these areas.

1.0 INTRODUCTION

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Standard Practice E1527-13 and the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located on the northwest corner of Roscoe Boulevard and Fallbrook Avenue, Los Angeles, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this scope of work are described in the report.

1.1 Purpose

The purpose of this ESA is to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E1527-13) affecting the subject property that: 1) constitute or result in a material violation or a potential material violation of any applicable environmental law; 2) impose any material constraints on the operation of the subject property or require a material change in the use thereof; 3) require clean-up, remedial action or other response with respect to Hazardous Substances or Petroleum Products on or affecting the subject property under any applicable environmental law; 4) may affect the value of the subject property; and 5) may require specific actions to be performed with regard to such conditions and circumstances. The information contained in the ESA Report will be used by Client to: 1) evaluate its legal and financial liabilities for transactions related to foreclosure, purchase, sale, loan origination, loan workout or seller financing; 2) evaluate the subject property's overall development potential, the associated market value and the impact of applicable laws that restrict financial and other types of assistance for the future development of the subject property; and/or 3) determine whether specific actions are required to be performed prior to the foreclosure, purchase, sale, loan origination, loan workout or seller financing of the subject property.

This ESA was performed to permit the *User* to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "*landowner liability protections*," or "*LLPs*"). ASTM Standard E1527-13 constitutes "*all appropriate inquiry* into the previous ownership and uses of the *property* consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

1.2 Scope of Work

The scope of work for this ESA is in accordance with the requirements of ASTM Standard E1527-13. This assessment included: 1) a property and adjacent site reconnaissance; 2) interviews with key personnel; 3) a review of historical sources; 4) a review of regulatory agency records; and 5) a review of a regulatory database report provided by a third-party vendor. Partner contacted local agencies, such as environmental health departments, fire departments and building departments in order to determine any current and/or former hazardous substances usage, storage and/or releases of hazardous substances on the subject property. Additionally, Partner researched information on the presence of activity and use limitations (AULs) at these agencies. As defined by ASTM E1527-13, AULs are the legal or physical restrictions or limitations on the use of, or access to, a site or facility: 1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil or groundwater on the subject

property; or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls (IC/ECs), are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil or groundwater on the property.

If requested by Client, this report may also include the identification, discussion of, and/or limited sampling of asbestos-containing materials (ACMs), lead-based paint (LBP), mold, and/or radon.

1.3 Limitations

Partner warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist on the subject property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. Partner believes that the information obtained from the record review and the interviews concerning the subject property is reliable. However, Partner cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the Client. No other warranties are implied or expressed.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

This practice does not address requirements of any state or local laws or of any federal laws other than the all appropriate inquiry provisions of the LLPs. Further, this report does not intend to address all of the safety concerns, if any, associated with the subject property.

Environmental concerns, which are beyond the scope of a Phase I ESA as defined by ASTM include the following: ACMs, LBP, radon, and lead in drinking water. These issues may affect environmental risk at the subject property and may warrant discussion and/or assessment; however, are considered non-scope issues. If specifically requested by the Client, these non-scope issues are discussed in Section 6.3.

1.4 User Reliance

Staley Point Capital engaged Partner to perform this assessment in accordance with an agreement governing the nature, scope and purpose of the work as well as other matters critical to the engagement. All reports, both verbal and written, are for the sole use and benefit of Staley Point Capital, SCIND Fallbrook Point LLC, its parent, affiliates, subsidiaries and their successors, and assigns, each of such parties' counsel and lenders, are entitled to rely upon this Report and to use its contents and conclusions as may be appropriate. Either verbally or in writing, third parties may come into possession of this report

or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors or assigns. Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client and their respective officers, employees, vendors, successors and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees) and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

1.5 Limiting Conditions

The findings and conclusions contain all of the limitations inherent in these methodologies that are referred to in ASTM E1527-13.

Specific limitations and exceptions to this ESA are more specifically set forth below:

- Interviews with past owners, operators and occupants were not reasonably ascertainable and thus constitute a data gap. Based on information obtained from other historical sources (as discussed in Section 3.0), this data gap is not expected to alter the findings of this assessment.

2.0 SITE DESCRIPTION

2.1 Site Location and Legal Description

The subject property at 22815-22825 Roscoe Boulevard in Los Angeles, California is located on the northwest corner of Roscoe Boulevard and Fallbrook Avenue. According to the provided Preliminary Title Company issued by Chicago Title, the subject property is legally described as APN 2005-002-018. According to the Los Angeles County Assessor and the Preliminary Title Company, the subject property is legally described as Tract PM 7115, BK 276-1/4, Lot A and ownership is vested in BSREP West Hills Office Campus LLC.

Please refer to Figure 1: Site Location Map, Figure 2A: Site Plan, Figure 2B Historical Well Location Map, Figure 3: Topographic Map, and Appendix A: Site Photographs for the location and site characteristics of the subject property.

2.2 Current Property Use

The subject property is currently developed as a portion of a larger paved parking area, adjacent to the east of the Thermo-Fisher Scientific facility (22801 Roscoe Boulevard). In addition to the paved parking spaces and driving areas, the property is improved with landscaping, lighting, and an exercise path.

The subject property is designated for light industrial development by the City of Los Angeles.

2.3 Current Use of Adjacent Properties

During the vicinity reconnaissance, Partner observed the following land use on properties in the immediate vicinity of the subject property:

Immediately Surrounding Properties

North: Paved parking and driveway access, commercial multi-tenant building and parking for commercial center (8401-8413 Fallbrook Avenue).

South: Roscoe Boulevard, followed by residential properties (houses fronting on Roscoe: 22816-22852 Roscoe Boulevard, 8247 Fallbrook Avenue), Yoga By the Sea (22824 Roscoe Boulevard), and a multi-tenant retail building 22750 Roscoe Boulevard and 8240 Fallbrook Avenue).

East: Fallbrook Avenue, followed by residential properties (8344-8362 Fallbrook Avenue; 8301-8311 Maynard Ave).

West: Paved parking lot and Thermo Fisher Scientific office building (22801 Roscoe Boulevard).

2.4 Physical Setting Sources

2.4.1 Topography

The United States Geological Survey (USGS) *Calabasas, California* Quadrangle 7.5-minute series topographic map was reviewed for this ESA. According to the contour lines on the topographic map, the subject property is located at approximately 842 feet above mean sea level (MSL). The contour lines in the area of the subject property indicate the area is sloping toward the southeast.

A copy of the most recent topographic map is included as Figure 3 of this report.

2.4.2 Hydrology

According to information obtained from the State Water Resources Control Board GeoTracker online database for the adjacent property (Case Number SL2043T1572 – Hughes Missiles Co. (Former) at 8433 Fallbrook Avenue, Remedial Progress Report for the Second Quarter 2018, OTIE July 30, 2018), groundwater in monitoring wells MW-25 and MW26 in the vicinity of the subject property is present at depths ranging from 41.40 to 48.38 feet below ground surface (bgs) and flows toward the southeast.

The nearest surface waters in the vicinity of the subject property is Less Lake located approximately 0.28-mile to the northwest and the Chatsworth Creek located approximately 0.19-mile to the west of the subject property. No settling ponds, lagoons, surface impoundments, wetlands or natural catch basins were observed at the subject property during this assessment.

2.4.3 Geology/Soils

The site is located in the north-central portion of the Peninsular Ranges physiographic province. The Peninsular Ranges is bounded to the east by the Colorado Desert, to the south by the Mexican Border, to the west by the Pacific Ocean, and to the north by the Transverse Ranges and the Los Angeles Basin. The Peninsular Ranges contain minor Jurassic and extensive Cretaceous igneous rocks associated with Nevadan plutonism. Marine Cretaceous sedimentary rocks are well represented and post-Cretaceous rocks form a restricted veneer of volcanic, marine and non-marine sediments.

On August 27, 2020, Partner conducted a Geotechnical Investigation at the subject property. Fill material consisting of clayey silt was encountered from the surface to approximately 11 feet bgs. Native sandy soil was encountered beneath the fill.

2.4.4 Flood Zone Information

Partner performed a review of the Flood Insurance Rate Map, published by the Federal Emergency Management Agency. According to Community Panel Numbers 06037C1275F and 06037C1280F, dated September 26, 2008, the subject property appears to be located in Zone X, an area located outside of the 100-year and 500-year flood plains.

3.0 HISTORICAL INFORMATION

Partner obtained historical use information about the subject property from a variety of sources. Information regarding past land use was obtained by a review of historical aerial photographs, historical Sanborn Fire Insurance maps, city directories, and historical topographic maps of the subject property and surrounding area obtained from Environmental Data Resources (EDR). Copies of the historical resources are included in Appendix B. EDR reported that Sanborn™ Fire Insurance Maps were not available for the subject property. A chronological listing of the historical data found is summarized in the table below.

Date	Scale or Address	Source	Summary
1903	1:62,500	Topographic Map	The subject property and immediately surrounding area are depicted as vacant land. Chatsworth Reservoir is located further to the north. Various improved roads and railroad lines are shown throughout the surrounding area.
1925, 1927, 1928, 1929, 1932, 1933, 1944, 1947	1:24,000	Topographic Map	The subject property and surrounding area appear to be vacant land. Roscoe Street is located adjacent to the south and Fallbrook Avenue is located to the south of Roscoe Boulevard. Chatsworth Reservoir is located further to the north. By 1927/1928, a dirt road is located to the west and scattered structures are depicted in the site vicinity. By 1932/1933, Fallbrook Avenue is depicted as a dirt road adjacent to the east of the subject property. By 1944, agriculturally developed land is shown adjacent to the south of Roscoe Boulevard.
1928-1952	1"=500'	Aerial Photograph	The subject property and adjacent properties were vacant land or agriculturally developed. A Circular dirt road is located to the north and west. Less Lake is located further to the northwest. Scattered residential/farm related buildings are located to the north, east and southwest.
1952	1:24,000	Topographic Map	The subject property and surrounding properties to the north and west appear to be vacant land. Agriculturally developed land is depicted to the east and southeast. A driveway

Date	Scale or Address	Source	Summary
			and structure are located to the north.
1959-1970	1"=500'	Aerial Photograph	The subject property appears to be unpaved, vacant land located on the southeast corner of the Bunker-Ramo and later Hughes Missile Systems (Hughes)/Raytheon Facility (part of 86-acre parcel). Possible stormwater ditch is located on and adjacent to the western side of the subject property. An entrance driveway, Fallbrook Avenue and Roscoe Boulevard are located adjacent to the north, east and south. Access driveways, a dirt parcel, and Hughes Buildings including Buildings 274/255 are located to the west-northwest of the subject property.
1967	1:24,000	Topographic Map	The subject property and surrounding properties to the north and west are developed with the Hughes facility. Residential properties are located to the east and south.
1978-1994	1"=500'	Aerial Photograph	Hughes Building 275 is located on the north side of the subject property. The remainder of the subject property appears to be unpaved, vacant land (part of 86-acre parcel). An entrance driveway, Fallbrook Avenue and Roscoe Boulevard are located adjacent to the north, east and south. Access driveways, parking lots, and Hughes Buildings including Buildings 274/255 are located to the west-northwest of the subject property. By 1983, a baseball diamond is located adjacent to the west. By 1989, Hughes Building 276 is located to the northwest.
1999-2006	22801 Roscoe Boulevard	Previous Report	DeVry University parking lot (part of 15.25 acre parcel)

Date	Scale or Address	Source	Summary
2002-2016	1"=500'	Aerial Photograph	Subject property is developed as a paved parking lot as seen during the site visit. An entrance driveway, Fallbrook Avenue and Roscoe Boulevard are located adjacent to the north, east and south. Commercial building (22801 Roscoe Boulevard) and associated parking lot are located to the west. Commercial buildings (Former Hughes Buildings 276 and 265) at 8403 and 8401 and parking lots are located to the west-northwest of the subject property.
2012	1:24,000	Topographic Map	The current street configuration is depicted.

According to review of available historical data, it appears that the subject property was agriculturally developed or vacant land from 1903 to 1952. By 1959, the subject property appears to be unpaved, vacant land located on the southeast corner of the larger Hughes Missile Systems Facility (part of 86-acre parcel). According to the regulatory records and previous reports, Bunker Ramo, an electrical component design and testing company, was the sole occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes Aircraft Company/ Hughes Missile Systems (Hughes) Facility, an aerospace research and development company, was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes (currently known as Raytheon Company (Raytheon), its successor, purchased the entire site in the mid-1970s and operated there until the mid-1990s. From 1978-1994, Hughes Building 275 is located on the north side of the subject property. The remainder of the subject property appears to be unpaved, vacant land. By 1999, subject property has been developed as a paved parking lot initially utilized by the adjacent DeVry University at 22801 Roscoe Boulevard (part of 15.25 acre parcel). The subject property remains a paved parking lot today.

The only information related to Building 275 indicates that it was a single-story building. Prior investigations did not include or discuss environmental concerns with Building 275 leading to the conclusion that this location was not of concern. Based on building permits included with the 2006 ESA for DeVry University, this building was demolished in 1998 when the adjacent DeVry University building and parking lot were being constructed.

4.0 REGULATORY RECORDS REVIEW

4.1 Regulatory Agencies

4.1.1 Health Department

Regulatory Agency Data	
Name of Agency:	Los Angeles County Fire Department- Health and Hazardous Materials Department (LACFD-HHMD)
Point of Contact:	N/A
Agency Address:	1320 N. Eastern Avenue, Los Angeles, California 90063
Agency Phone Number:	(323) 881-2411
Date of Contact:	August 25, 2020
Method of Communication:	Online Databases https://fire.lacounty.gov/public-records-requests/
Summary of Communication:	No records regarding current hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the LACFD-HHMD.

4.1.2 Fire Department

Regulatory Agency Data	
Name of Agency:	Los Angeles Fire Department (LAFD)- Underground Storage Tank Division (UGT) and the Hazardous Materials Division (HazMat)
Point of Contact:	N/A
Agency Address:	200 North Main Street, 17th Floor, Los Angeles, California 90012
Agency Phone Number:	(213) 978-3691
Date of Contact:	August 25, 2020
Method of Communication:	Online http://www.lafd.org/public-records
Summary of Communication:	No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on listed on the LAFD online databases of UST, AST, or hazardous materials sites.

4.1.3 Air Pollution Control Agency

Regulatory Agency Data	
Name of Agency:	South Coast Air Quality Management District (SCAQMD)
Point of Contact:	N/A
Agency Address:	21865 Copley Drive, Diamond Bar, California 91765
Agency Phone Number:	(909) 396-2000
Date of Contact:	August 25, 2020
Method of Communication:	Online review of records http://www3.aqmd.gov/webappl/fim/prog/search.aspx
Summary of Communication:	No Permits to Operate (PTOs), Notices to Comply or Notices of Violations (NTCs and NOVs) or records of USTs, AULs, or hazardous materials at the subject property were identified on the SCAQMD FINDS database.

4.1.4 Regional Water Quality Agency

Regulatory Agency Data	
Name of Agency:	Regional Water Quality Control Board (RWQCB)
Point of Contact:	N/A
Agency Address:	320 West 4th Street, Suite 200, Los Angeles, California
Agency Phone Number:	(213) 576-6600
Date of Contact:	August 25, 2020
Method of Communication:	Online review of records http://geotracker.waterboards.ca.gov/
Summary of Communication:	

The subject property, as part of a larger parcel, is identified on the GeoTracker database under two cases, Case No. SL2043T1572 and Case No. T10000011111. Raytheon Company is the responsible party for clean-up activities. According to information from the GeoTracker database, the subject property was a parcel located on the southeast corner of the former 86-acre Hughes Missile Systems facility, also referred to as the Former Canoga Park Facility and Raytheon Canoga Park Site. The facility is being jointly investigated by the Regional Water Quality Control Board (RWQCB) and the Department of Toxic Substances Control (DTSC). The RWQCB oversees the investigation and remediation of groundwater contamination at the site and the DTSC has jurisdiction to oversee the site soil contamination. Subsequently, the northern and southern portions of the former 86-acre facility were separated into different groundwater cases for investigation purposes but remain together for soil investigation. The subject property is located on the southeast corner of the former 86-acre facility and the southern investigation area referred to as the Southern Parcels of the Former Hughes Missile Systems Co.

Historically, in 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. In 1995, the former facility was purchased by Coast Federal Bank. The southern parcels were subsequently bought by DeVry (APN # 2005-002-901) and the Los Angeles Metropolitan Police Department (APN # 2005-2002-011). The subject property is located on the southeast corner of the investigation area referred to as the Southern Parcels of the Former Hughes Missile Systems Co. In 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Site through a merger with Hughes in 1997. Since 1995, the property was redeveloped with several commercial office buildings. On April 3, 2020, United Technologies Corporation acquired Raytheon Company. United Technologies Corporation changed its corporate name to Raytheon Technologies Corporation and Raytheon Company continues to exist as a subsidiary of Raytheon Technologies Corporation and the legal entity responsible for the Former Canoga Park site.

A summary of the cases is provided below:

RWQCB Case No. SL2043T1572/DTSC Case Nos. 80001366 & CAD041162124 for Hughes Missiles Co./Raytheon Systems Co. (8433 Fallbrook Avenue): Currently Open, Corrective Action Case with the DTSC and RWQCB - monitoring ongoing. Responsible Party is Raytheon.

Since 1988, remedial efforts have been implemented to treat groundwater and saturated soils that contain residual volatile organic compounds (VOCs) at the Site. Chemicals of concern include Tetrachloroethene (PCE), Trichloroethene (TCE), cis-1,2-Dichloroethene (cis-1,2-DCE), 1,1-Dichloroethane (1,1-DCA), and 1,2-Dichloroethane (1,2-DCA). Groundwater remediation with injection wells has been underway at the Site since 1995 to achieve cleanup criteria. Under the oversight of the RWQCB, the primary objective of the remediation program is to accelerate the degradation of VOCs to concentrations below the cleanup goals established in the 1992 Corrective Action Plan (CAP), with the most recent Addendum to the CAP (CAP Addendum No. 5) in 2016. Remediation techniques used at the Site have included remedial excavation, a groundwater recovery and treatment system, a soil vapor extraction system, and an air sparge system. Enhanced in-situ bioremediation (EISB) was implemented in 2005 to 2020. Based on the attached figures, the majority of the treatment areas, known as Northwest Area, North-Central Area, Former Building 269 Area, and Well CM-8D Area, are located to the northwest (0.17-mile from the subject property) of the subject property and along the northwestern boundary (0.34-mile from the subject property) of the Former Canoga Park Facility.

According to a December 15, 2017 Letter to the Raytheon Company from DTSC, additional investigations and/or submittals may be requested by the DTSC for the subject property since they are the lead regulatory agency to oversee the corrective action to soil at the Southern Parcels at the Raytheon Canoga Park Site. Further investigation of the identified Areas of Concern (AOCs) identified in the RCRA Facility Assessment Report dated January 30, 2008 was required by DTSC. The 2008 RCRA Facility Assessment Report indicated that AOCs including Solid Waste Management Unit (SWMU)-9 (Sanitary Sewer) and AOC-12 (Storm Sewers) were identified at the subject property, as discussed below:

- SWMU-9 is defined as the Site wide sewer line. Releases to soil near soil boring BSL-4. Constituents include arsenic. The report notes that the Site wide assessment in 1991 did not show any metal contamination at detection limits. One sample had a trace (0.009 milligram per kilogram (mg/kg)) of toluene. Sample B-SL had 0.3 mg/kg of toluene. No other VOCs were detected. DTSC concluded that there was a need to determine if any issues remain.
- AOC-12 is defined as the Site wide storm water system. Releases are suspected.

Partner notes that the DTSC has not conducted or required further investigation of the Southern Parcels (including the subject property).

Soil at the subject property and larger Corporate Pointe at West Hills (Former Canoga Park Facility) are being managed under a Soil Management Plan prepared by Environ International Corporation dated May 12, 2008.

RWQCB Case No. T10000011111: Southern Parcels -Former Hughes Missile Systems Co. (8433 Fallbrook Avenue): Closed Case – No further action for groundwater with RWQCB as of March 22, 2018. Current open case with the DTSC for potential soil impacts.

According to information from the GeoTracker database, the subject property is located on the southeast corner of the investigation area referred to as the Southern Parcels of the Former Hughes Missile Systems Co. The groundwater closure request affected the southern parcels identified by APNs 2005-002-014,

APN 2005-002-901, APN 2005-002-013. The subject property is located within the boundary of APN 2005-002-013.

According to the July 31, 2012 Confirmation Sampling Report and other documents, trichlorofluoromethane (Freon 11) was detected in soil and groundwater underlying the southern parcels. Freon 11 was historically used in refrigeration devices and as a solvent. Historically, concentrations of trichlorofluoromethane were detected up to 300 micrograms per Liter (µg/L), above the California drinking water maximum contaminant level (MCL) of 150 µg/L, in groundwater well CM-10. Based on report figures, groundwater monitoring wells, CM-17 and CM-10, were located along the eastern boundary of the subject property.

Aa 1998 Figure attached to a prior ESA depicted:

- Former Hughes Building 275 was formerly located on the northern portion of the subject property.
- A former southeast trending sewer line is shown onsite crossing to the south of Building 275 to a municipal sewer discharge point discharge on the eastern portion of the subject property.
- A drainage ditch is depicted along the eastern border of the subject property, adjacent to Fallbrook Avenue. Soil gas sampling points collected in June and August 1995 along the sewer line and at Well CM-10 are shown as Non-Detected (ND) (<1 µg/L).
- An area with Freon 11 concentrations in soil gas ranging from 100 – 1,000 µg/L is depicted on/and or adjacent to the northwest of the subject property.
- Former Hughes Buildings 274, 265, and 276 are shown to the northwest and west to the subject property.

Follow-up characterization activities were conducted between 1993 and 1998 in the area near Buildings 274 and 276, which is upgradient from well CM-10 and adjacent to the northwest of the subject property. to identify the source of the Freon 11 concentrations. The investigations indicated that an area of Freon 11 concentrations greater than 1,000 µg/L in soil gas was delineated in the former parking lot and southeast of former Building 274 (thereafter termed "the Freon 11 Area"). In 1998, three temporary wells and one permanent well (MW-31) were installed within the Freon 11 Area.

In August 1993, a monitoring well and soil borings were completed within the area enclosed by Buildings 276 and 274 and Well CM-10. One boring (B-SL-10) advanced immediately northwest of well CM-10 had no Volatile Organic Compounds (VOCs) reported above their respective detection limits in the soil samples collected at 10, 20, and 30 feet below ground surface (bgs).

In June 1995, soil gas surveys were conducted to delineate the lateral extent of Freon 11-impacted soil. Soil gas probes were installed at four locations within the immediate area of well CM-10, one was located at an on-site sewer junction within the vicinity of well CM-10, and one was located immediately southeast of the former Building 274 cooling unit. All probes were set at approximately 5 feet bgs. Freon 11 was detected at the on-site sewer junction and adjacent to the cooling unit for the former Building 274 at concentrations of 183 µg/L and 6 µg/L. No Freon 11 was detected above the reporting limit at the soil gas probes installed within the immediate area of well CM-10 (this is on the east side of the subject property).

In May 1998, soil and groundwater samples were collected for analytical laboratory analysis during well installation of temporary and permanent monitoring wells. Temporary and permanent monitoring wells were installed in the vicinity of well CM-10 and the Freon 11 Area located to the northwest of the subject property.

Soil and groundwater analytical results indicated no VOC concentrations had been detected above the MCLs for drinking water in groundwater samples from each of the monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31) located on or in the vicinity of the Southern Parcels for more than 10 years of groundwater monitoring. Moreover, samples from all wells, except for wells CM-10 and MW-31, have been non-detect for the Site constituents of concern (chlorinated VOCs), for more than 15 years.

In a response to a June 27, 2006, memorandum requesting removal of Southern Parcel monitoring wells and NFA status for the Southern Parcels, the RWQCB issued a letter dated January 22, 2007, approving the removal of several wells from the monitoring program, but did not approve their abandonment, citing concerns about the potential presence of manmade radiological isotopes in wells CM-10, CM-12 and CM-17 based on community concerns with previous data.

Between March 2008 and August 2009, Raytheon, OTIE, and the RWQCB worked together to evaluate radiological conditions in the Southern Parcels. A radiological evaluation was performed; the results of the radiological evaluation indicated that the presence of low-level radiological isotopes were attributable to naturally-occurring sources in the underlying soil, bedrock, and groundwater. The RWQCB concurred, and issued a NFA letter with regard to radioactivity in groundwater for the Southern Parcels on October 30, 2009.

In addition to the radiological sampling, OTIE performed a confirmation sampling event including VOCs for wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30, and MW-31 in November 2008. Analytical results from this confirmation sampling event were non-detect for all VOCs (CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, and MW-30) or below the MCL for the only detected VOC, Freon 11. Freon 11 was detected only in wells CM-10 (onsite) and MW-31 (offsite to the north.

Based on the findings of the NFA for radiological parameters and confirmation results for VOCs in the Southern Parcel wells, Raytheon sought NFA status from the RWQCB for the Southern Parcels once again in a technical memorandum dated July 8, 2010. The RWQCB responded in a letter dated May 13, 2011 and requested Raytheon to better define vertical and lateral extent of the Freon 11 plume detected in wells MW-31 and CM-10. Additional characterization identified a Freon 11 Area (>1,000 µg/L in soil gas) located around MW-31 that may have extended to the southeast on to the northwest corner of the subject property. According to 2012 groundwater sampling data, the Freon was the only VOC detected previously above MCL in groundwater in the Southern Parcels of the Site. A concentration of 35 µg/L was detected in Well CM-10 (screened interval of 34-52 feet) and at 120 µg/L in MW-31 (screened interval of 45-72 feet).

OTIE stated that the concentration distributions indicated that the Freon 11 Area was limited to the area southeast of former Building 274. The postulated release of Freon 11 occurred in an unpaved area

adjacent to the parking lot southeast of former Building 274, which may have been used as a maintenance area, up-gradient of the subject property. This area was identified by shallow soil gas investigations in 1995, which delineated an area of elevated Freon 11 greater than 1,000 µg/L. Therefore, OTIE concluded it was likely that surface releases of Freon 11 infiltrated the vadose zone in this area, and migrated vertically to groundwater, then migrated laterally in groundwater in the dissolved phase. Groundwater impacted by Freon 11 was localized to the area of well MW-31 and downgradient to well CM-10.

At the request of the DTSC, MW-31 and CM-10 located in and down-gradient of the former Freon 11 Area of Concern were monitored on January 22, 2018. Only one sample was collected from MW-31 and analyzed for VOCs. Well CM-10 was dry at the time of sampling. Freon 11 was detected at a concentration of 64 µg/L, below the MCL of 150 µg/L. No other VOCs were detected in MW-31.

On March 22, 2018, the RWQCB concluded that the southern portion of the facility had met the Regional Board requirements for groundwater closure and issued a NFA letter on March 22, 2018. On July 17, 2018, the RWQCB approved Raytheon's request to destroy 13 wells on the Southern Parcels including onsite wells CM-10 and CM-17 which were removed on September 6 and 10, 2018.

4.1.5 Department of Toxic Substances Control

Regulatory Agency Data	
Name of Agency:	California Department of Toxic Substances Control (DTSC), Envirostor and Hazardous Waste Tracking System (HWTS)
Point of Contact:	http://www.envirostor.dtsc.ca.gov/public/and http://hwts.dtsc.ca.gov/report_search.cfm?id=5
Agency Address:	5796 Corporate Avenue, Cypress California
Agency Phone Number:	(800) 728-6942
Date of Contact:	August 25, 2020
Method of Communication:	Online Database http://www.envirostor.dtsc.ca.gov/public/ http://hwts.dtsc.ca.gov/report_search.cfm?id=5
Summary of Communication:	No records regarding current hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the HWTS databases.

As discussed in Section 4.1.4, the subject property parcel was previously located on the southeast corner of the former 86-acre Hughes Missile Systems facility. Two DTSC cases are associated with the former Hughes facility.

- **DTSC Case No. CAD041162124- for Raytheon Systems Co. (8433 Fallbrook Avenue)**: Raytheon, Canoga Park facility is listed as an inactive RCRA facility with a Closure Certification Report (CCR) being reviewed by DTSC. Two known permitted units, a hazardous waste storage area (HWSA) and a waste oil tank T3 were identified but are not located on the subject property. As of August 2007, the CCR was being reviewed for closure. An RCRA Facility Assessment (RFA) was being drafted in anticipation of a Corrective Action Consent Agreement (CA) which is to address the hazardous waste storage area (HWSA), a waste oil tank T3, Solid Waste Management Units (SWMUs), and Areas of Concern (AOCs). As discussed above, SWMU-9 (Sanitary Sewer) and

AOC-12 (Storm Sewers) were identified at the subject property and may require further investigation at the subject property.

- **DTSC Case No. 80001366 for Raytheon Systems Co. (8433 Fallbrook Avenue)**: Raytheon, Canoga Park facility is an inactive facility and DTSC requires the facility to undergo the closure process. The Closure Plan was submitted in February 1995 and revised August 1995, as a result of Notices of Deficiencies (NODs) issued to Hughes Missile System Company (HMSC) by DTSC dated December 21, 1994 and June 6, 1995. On December 1995, the DTSC modified the Closure Plan dated August 1995 to reflect changes in the closure performance standards for certain VOCs, background from metals, and conditions under the Health and Safety Plan. The cleanup status is listed as active as of June 15, 2009. Potential contaminants of concern are listed as metals, VOCs, radioactive isotopes, Total Petroleum Hydrocarbons as diesel.

4.1.6 Building Department

Regulatory Agency Data	
Name of Agency:	Los Angeles Department of Building and Safety (LADBS)
Point of Contact:	N/A
Agency Address:	201 North Figueroa Street, 4th Floor, Los Angeles, California 90012
Agency Phone Number:	(213) 482-6862
Date of Contact:	August 25, 2020
Method of Communication:	Online http://ladbsdoc.lacity.org/idispublic/
Summary of Communication:	Records were available for review, as further discussed in the following table:

Building Records Reviewed for 22815-22825 West Roscoe Boulevard (Subject Property)		
Year(s)	**Owner/Applicant**	**Description**
1955-2016	Various	Permits for construction of adjacent medical research building in 1955 and conversion to Thermo-Fisher Scientific campus in 2016 – Not applicable to subject parking lot. Emergency electrical generator and nitrogen tank noted as permitted in 2016 and 2017 adjacent to the subject property.
2016	Not Reported	Affidavit for maintenance of a building (APN Reference is 2005002011)
2017	Not Reported	Affidavit terminating prior Affidavit 161545988 not provided
2018	Not Reported	Affidavit for a community driveway for 8401-8403 Fallbrook and 22818-22825 Roscoe Boulevard

4.1.7 Planning Department

Regulatory Agency Data	
Name of Agency:	City of Los Angeles Planning Department Zone - Information Map Access System (ZIMAS)
Point of Contact:	N/A
Agency Address:	200 North Spring Street, Los Angeles, California 90012
Agency Phone Number:	(213) 978-1455
Date of Contact:	August 17 2020
Method of Communication:	Online http://zimas.lacity.org/

Summary of Communication:	According to records reviewed, the subject property is currently identified by APN 2005-002-018 and zoned (T)(Q) M1-1 for light industrial development by the City of Los Angeles. The following addresses are listed for the subject property parcel: 22815 and 22825 Roscoe Boulevard. The site is not located within a Methane Zone.

4.1.8 Oil & Gas Exploration

Regulatory Agency Data	
Name of Agency:	California Division of Oil, Gas and Geothermal Resources (DOGGR)
Point of Contact:	N/A
Agency Address:	5816 Corporate Avenue, Suite 200, Cypress, California
Agency Phone Number:	(714) 816-6847
Date of Contact:	August 17, 2020
Method of Communication:	http://maps.conservation.ca.gov/doggr/index.html
Summary of Communication:	According to DOGGR, no oil or gas wells are located on or adjacent to the subject property.

4.1.9 Assessor's Office

Regulatory Agency Data	
Name of Agency:	Los Angeles County Office of the Assessor (LACOA)
Point of Contact:	N/A
Agency Address:	500 W Temple Street, Los Angeles, California 90012
Agency Phone Number:	(213) 974-3211
Date of Contact:	August 17, 2020
Method of Communication:	Online review of records
Summary of Communication:	According to records reviewed, the subject property is identified by Assessor Parcel Number (APN) 2005-002-018.

Copies of pertinent documents are included in Appendix B of this report.

4.2 Mapped Database Records Search

Information from standard federal, state, county, and city environmental record sources was provided by Environmental Data Resources, Inc. (EDR). Data from governmental agency lists are updated and integrated into one database, which is updated as these data are released. The information contained in this report was compiled from publicly available sources and the locations of the sites are plotted utilizing a geographic information system, which geocodes the site addresses. The accuracy of the geocoded locations is approximately +/-300 feet.

Using the ASTM definition of migration, Partner considers the migration of hazardous substances or petroleum products in any form onto the subject property during the evaluation of each site listed on the radius report, which includes solid, liquid, and vapor.

4.2.1 Regulatory Database Summary

Radius Report Data

Database	Search Radius (mile)	Subject Property	Adjacent Properties	Sites of Concern
Federal NPL or Delisted NPL Site	1.00	N	N	N
Federal CERCLIS Site	0.50	N	N	N
Federal CERCLIS-NFRAP Site	0.50	N	N	N
Federal RCRA CORRACTS Facility	1.00	N	**Y**	N
Federal RCRA TSDF Facility	0.50	N	N	N
Federal RCRA Generators Site (LQG, SQG, CESQG)	0.25	**Y**	**Y**	N
Federal IC/EC Registries	0.50	N	N	N
Federal ERNS Site	Subject Property	N	N	N
State/Tribal Equivalent NPL	1.00	N	N	N
State/Tribal Equivalent CERCLIS	1.00	N	N	N
State/Tribal Landfill/Solid Waste Disposal Site	0.50	N	N	N
State/Tribal Leaking Storage Tank Site	0.50	N	**Y**	N
State/Tribal Registered Storage Tank Sites (UST/AST)	0.25	N	**Y**	N
State/Tribal Voluntary Cleanup Sites (VCP)	0.50	N	N	N
State/Tribal Spills	0.50	N	N	N
Federal Brownfield Sites	0.50	N	N	N
State Brownfield Sites	0.50	N	N	N
Envirostor	Subject Property	**Y**		
EDR MGP	Varies	N	N	N
EDR US Hist Auto Station	Varies	N	**Y**	N
EDR US Hist Cleaners	Varies	N	N	

4.2.2 Subject Property Listings

The subject property is identified in the regulatory database report, as discussed below:

- The subject property was located within the boundary of the former Hughes Missile Systems facility (EDR Map ID: C7, C9, C10, C11, C12,C13), identified at 8433 Fallbrook Avenue. The facility was identified as a Envirostor, UST, HIST UST, SLIC, LUST, RCRA, CERS, NPDES, SEMS-Archive, CORRACTS, RCRA-TSDF, and HWP databases. As discussed in Sections 4.1.4, 4.1.5, and 5.2.6, the subject property is located within the southern boundary of the open Corrective Action Case for the former Hughes facility. In 2018, the RWQCB issued a closure letter for the groundwater impacts on the southern portion of the former Hughes facility. Corrective action and investigations of soil impacts on the northern and southern portions of the former Hughes facility are open and ongoing. A Freon 11 impacted area was identified adjacent to the northwest of the subject property.

  Additional investigations and/or submittals may be requested by the DTSC for the subject property is regards to soil impacts. Groundwater remediation at the northern portion of the facility is ongoing under the oversight of the RWQCB. Based on a review of groundwater data and

the case closure for the southern portion of the former Hughes facility, the up-gradient impacted groundwater is not considered to have created an environmental concern to the subject property.

4.2.3 Adjacent Property Listings

The following adjacent properties were identified in the regulatory database report, as discussed below:

- Quest Diagnostics Inc., AT&T Mobility (EDR Map ID: A1, A2, A3, A6) is listed at 8401 Fallbrook Avenue, adjacent to the northwest and hydrologically up-gradient of the subject property. The facility is identified in the RCRA-LQG, AST, HAZMAT, HWTS, CERS, CERS Tanks, and CERS Haz Waste databases. The AT&T facility is listed as inactive as of June 1, 2019. According to the HWTS, the Quest facility is described as a Diagnostic Imaging Centers facility. No RCRA violations are listed. Hazardous waste generated at the facility between 2011 and 2019. Based on the regulatory status, these listings are not considered to have created an environmental concern to the subject property.
- Thermo-Fisher Scientific Corporation (EDR Map ID: B4, B5) is listed at 22801 Roscoe Boulevard, adjacent to the west and hydrologically up-gradient of the subject property. The facility is identified in the RCRA-NonGen, CERS, CERS Tanks, and CERS Haz Waste databases. No RCRA violations are listed. Aboveground Petroleum Storage is identified on the CERS Tanks database. The facility was last inspected by the Los Angeles County Fire Department in September 2019 and the following violations were noted failure to properly label hazardous waste accumulation containers, failure to meet the following conditions of satellite accumulation regulations, and general Hazardous Waste Generator Program requirements. The facility returned to compliance on 10/18/2019. Based on the regulatory status, these listings are not considered to have created an environmental concern to the subject property.
- Faulkner Harry & Dolores (EDR Map ID: F30) is listed at 22750 Roscoe Boulevard, adjacent to the southeast and hydrologically down-gradient of the subject property. The facility is identified in the EDR Historical Auto database. The facility is identified as a gas station in 1969-1978. Based on the regulatory status and down-gradient direction, these listings are not considered to have created an environmental concern to the subject property.

Based on the findings, groundwater in the site vicinity is impacted with VOCs and the impacts may impact soil vapor.

4.2.4 Sites of Concern Listings

No sites of concern are identified in the regulatory database report.

4.2.5 Orphan Listings

Six orphan listings are identified in the regulatory database report. No orphan listings of concern were identified.

A copy of the regulatory database report is included in Appendix C of this report.

5.0 USER PROVIDED INFORMATION AND INTERVIEWS

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *Brownfields Amendments*), the *User* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The *User* should provide the following information to the *environmental professional*. Failure to provide this information could result in a determination that *all appropriate inquiries* is not complete. The *User* is asked to provide information or knowledge of the following:

- Review Title and Judicial Records for Environmental Liens and AULs
- Specialized Knowledge or Experience of the User
- Actual Knowledge of the User
- Reason for Significantly Lower Purchase Price
- Commonly Known or *Reasonably Ascertainable* information
- Degree of Obviousness
- Reason for Preparation of this Phase I ESA

Fulfillment of these user responsibilities is key to qualification for the identified defenses to CERCLA liability. Partner requested our Client to provide information to satisfy User Responsibilities as identified in Section 6 of the ASTM guidance.

Pursuant to ASTM E1527-13, Partner requested the following site information from SCIND Fallbrook Point LLC (User of this report).

User Responsibilities

Item	Provided By User	Not Provided By User	Discussed Below	Does Not Apply
Environmental Pre-Survey Questionnaire			**X**	
Title Records, Environmental Liens, and AULs			**X**	
Specialized Knowledge			**X**	
Actual Knowledge			**X**	
Valuation Reduction for Environmental Issues			**X**	
Identification of Key Site Manager	**Section 5.1.3**			
Reason for Performing Phase I ESA	**Section 1.1**			
Prior Environmental Reports			**X**	
Other			**X**	

5.1 Interviews

5.1.1 Interview with Owner

The owner of the subject property, was not available to be interviewed at the time of the assessment.

5.1.2 Interview with Report User

Please refer to Section 5.2 below for information requested from the Report User.

5.1.3 Interview with Key Site Manager

A key site manager was not available to be interviewed at the time of this assessment.

5.1.4 Interviews with Past Owners, Operators and Occupants

Interviews with past owners, operators and occupants were not conducted since information regarding the potential for contamination at the subject property was obtained from other sources.

5.1.5 Interview with Others

As the subject property is not an abandoned property as defined in ASTM 1527-13, interview with others were not performed.

5.2 User Provided Information

5.2.1 Title Records, Environmental Liens, and AULs

Partner was provided by LBA with a Commitment for Title Insurance issued by Chicago Title Company and dated July 24, 2020. According to the Preliminary Title Report, the title to the subject property is currently vested in BSREP West Hills Office Campus LLC, a Delaware limited liability company. No apparent environmental liens or AULs were identified for the subject property based on the review of the Commitment for Title Insurance.

Copies of pertinent pages are included in Appendix B of this report.

5.2.2 Specialized Knowledge

The User provided knowledge of environmental conditions associated with the subject property as described in Section 5.2.6.

5.2.3 Actual Knowledge of the User

The User was not aware of environmental liens and/or AULs encumbering the subject property or in connection with the subject property at the time of the assessment.

5.2.4 Valuation Reduction for Environmental Issues

The User was not aware of any reductions in property value due to environmental issues.

5.2.5 Commonly Known or Reasonably Ascertainable Information

The User did provide information that is commonly known or *reasonably ascertainable* within the local community about the subject property at the time of the assessment (See Section 5.2.6).

5.2.6 Previous Reports and Other Provided Documentation

The following information was reviewed by Partner during the course of this assessment:

Phase I Environmental Site Assessment, Coast West Hills Property, 8433 Fallbrook Avenue, Lot B, Canoga Park, California, Geocon Environmental Consultants, Inc. (February 8, 1999)

Phase I/II Environmental Site Assessment, West Hills Corporate Village, West Hills Phase II, 8501 Fallbrook Avenue Canoga Park, California, Environ International Corporation (March 29, 2002)

Phase I Environmental Site Assessment, Dry University, 22801 Roscoe Boulevard, West Hills, California, Geocon Environmental Consultants, Inc. (July 26, 2006)

Phase I Environmental Site Assessment, Corporate Point at West Hills, 8401, 8403, 8407, 8411, 8413, 8415, 8501, 8511, 8521 and 8531 Fallbrook Avenue, Los Angeles, California, Hillman Consulting, LLC (February 4, 2013)

The above assessments were performed on a larger parcel of land that included the subject property. Pertinent information is summarized below:

In 1999, the subject property is located within "Lot A" and developed with former Hughes Building 275 on the northern portion of the site, a secondary pump station on the southwest corner, and a DeVry Institute classroom building. A recreation area is located on or adjacent to the west side of the property.

By 2012, the subject property was identified by APN 2005-002-018 and consisted of a paved parking lot located in the southeast corner of the Corporate Point at West Hills commercial park, adjacent to the intersection of Roscoe Boulevard and Fallbrook Avenue. A figure included in the appendices depicted an existing sanitary easement that crosses the northern portion and an existing stormwater easement located along to east and southern boundary of the subject property.

According to the previous reports, the larger parcel was developed by Hughes Aircraft Company (currently known as Raytheon Company, its successor, to test missile defense systems from the late-1950s until the mid-1990s. Hazardous substances and petroleum products were utilized on-site in association with the former missile defense system testing operations and resulted in the generation of USEPA RCRA regulated hazardous wastes. These activities resulted in releases to the environmental that caused a subsurface impact to the property. The releases at the site were discovered by investigations triggered by RCRA permitting at the facility in the late 1980's with the lead regulatory agency reported as the DTSC.

In the early 1990s, a site investigation began followed by subsequent remediation activities. Hughes and now Raytheon, was the responsible party for all remediation on the property pursuant to a set of recorded remediation covenants that run with the land. Site investigations at the property have identified thirteen Areas of Concern (AOCs) and seven Solid Waste Management Units (SWMUs) throughout the site. The most significant concern at the site is a plume of chlorinated solvent groundwater contamination located on the northwest corner of the former Hughes site and which may extend slightly offsite to the north (referred to as the "northwest plume"). Groundwater remediation has been ongoing on the Property since 1995 when a Pump and Treat system was installed in the northwest area. The system was shut down in 2005 in favor of "in-situ" bio remediation groundwater treatments.

Hillman reviewed the groundwater remediation and monitoring progress report dated November 15, 2012. That report has indicated that at least four "enhanced in-site bioremediation" (EISB) treatments have occurred since 2009, the latest having occurred in September 2012. Contaminant levels at the northwest plume have been trending downwards but remain above the site specific cleanup criteria (SPCC) of 60 ug/L VOCs set by the RWQCB.

Hillman concluded that it appeared that Raytheon appears to be meeting its obligations as responsible party for the remediation. The progress of Raytheon should be monitored with regard to the completion of remedial actions in order to achieve regulatory closure for all AOCs and SWMUs. The property owner should continue to cooperate with Raytheon in accordance with the reported access agreement to allow the necessary site access to conduct remedial actions. The property owner should request from Raytheon to be copied on all pertinent regulatory data and correspondences generated by the remedial activities at the site, as has been the case to date.

The existing Soil Management Plan (SMP) should continue to be adhered to by property management. In the event of transfer of ownership, the new owner should confirm to DTSC that it agrees to the terms and will comply with the SMP.

6.0 SITE RECONNAISSANCE

The weather at the time of the site visit was sunny and clear. Refer to Section 1.5 for limitations encountered during the field reconnaissance and Sections 2.1 and 2.2 for subject property operations. The table below provides the site assessment details:

Site Assessment Data	
Site Assessment Performed By:	Robin Blanchard
Site Assessment Conducted On:	August 13, 2020

Partner was not accompanied during the field reconnaissance activities.

No potential environmental concerns were identified during the onsite reconnaissance.

6.1 General Site Characteristics

6.1.1 Solid Waste Disposal

Solid waste is not currently generated.

6.1.2 Sewage Discharge and Disposal

There are no sanitary discharges to the subject property which is a paved parking lot with no structures. The City of Los Angeles services the subject property vicinity. No wastewater treatment facilities or septic systems were observed or reported on the subject property.

6.1.3 Surface Water Drainage

Storm water is removed from the subject property primarily by sheet flow action across the paved surfaces towards storm water drains located throughout the subject property and in the public right of way. The subject property is connected to a municipal owned and maintained sewer system.

The subject property does not appear to be a designated wetland area, based on information obtained from the United States Fish & Wildlife Service; however, a comprehensive wetlands survey would be required in order to formally determine actual wetlands on the subject property. No surface impoundments, wetlands, natural catch basins, settling ponds, or lagoons are located on the subject property. No drywells were identified on the subject property.

6.1.4 Source of Heating and Cooling

Electricity and natural gas are provided to the subject property and vicinity by LADWP and The Gas Company.

6.1.5 Wells and Cisterns

No aboveground evidence of wells or cisterns was observed during the site reconnaissance.

6.1.6 Wastewater

Domestic wastewater is not generated at the subject property. No industrial process is currently performed at the subject property.

6.1.7 Septic Systems

No septic systems were observed or reported on the subject property.

6.1.8 Additional Site Observations

No additional general site characteristics were observed during the site reconnaissance.

6.2 Potential Environmental Hazards

6.2.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

No hazardous substances or petroleum products were observed on the subject property during the site reconnaissance.

6.2.2 Aboveground & Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)

No evidence of current or former ASTs or USTs was observed during the site reconnaissance.

6.2.3 Evidence of Releases

No spills, stains or other indications that a surficial release has occurred at the subject property were observed.

6.2.4 Polychlorinated Biphenyls (PCBs)

No potential PCB-containing equipment (transformers, oil-filled switches, hoists, lifts, dock levelers, hydraulic elevators, etc.) was observed on the subject property during Partner's reconnaissance.

6.2.5 Strong, Pungent or Noxious Odors

No strong, pungent or noxious odors were evident during the site reconnaissance.

6.2.6 Pools of Liquid

No pools of liquid were observed on the subject property during the site reconnaissance.

6.2.7 Drains, Sumps and Clarifiers

No drains, sumps, or clarifiers, other than those associated with storm water removal, were observed on the subject property during the site reconnaissance.

6.2.8 Pits, Ponds and Lagoons

No pits, ponds or lagoons were observed on the subject property.

6.2.9 Stressed Vegetation

No stressed vegetation was observed on the subject property.

6.2.10 Additional Potential Environmental Hazards

No additional environmental hazards, including landfill activities or radiological hazards, were observed.

6.3 Non-ASTM Services

6.3.1 Asbestos-Containing Materials (ACMs)

The subject property is a paved parking lot with no onsite structures at the time of the site visit; therefore, ACMs were not included in the scope of this assessment.

6.3.2 Lead-Based Paint (LBP)

The subject property is a paved parking lot with no onsite structures at the time of the site visit; therefore, LBP was not included in the scope of this assessment.

6.3.3 Radon

Radon is a colorless, odorless, naturally occurring, radioactive, inert, gaseous element formed by radioactive decay of radium (Ra) atoms. The US EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, according to the table below:

EPA Radon Zones		
EPA Zones	**Average Predicted Radon Levels**	**Potential**
Zone 1	Exceed 4.0 pCi/L	Highest
Zone 2	Between 2.0 and 4.0 pCi/L	Moderate
Zone 3	Less than 2.0 pCi/L	Low

It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the US EPA recommends site-specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Radon sampling was not conducted as part of this assessment. Review of the US EPA Map of Radon Zones places the subject property in Zone 2. Based upon the radon zone classification, radon is not considered to be a significant environmental concern.

6.3.4 Lead in Drinking Water

According to available information, a public water system operated by the Los Angeles Department of Water and Power (LADWP) serves the subject property vicinity. According to a representative of the LADWP, shallow groundwater directly beneath the subject property is not utilized for domestic purposes. The sources of public water for the City of Los Angeles are primarily surface water from sources in Northern California and from the Colorado River as well as from local deep groundwater wells. According to the 2019 Annual Water Quality Report, water supplied to the subject property vicinity is in compliance with all State and Federal regulations pertaining to drinking water standards, including lead and copper. Water sampling was not conducted to verify water quality.

6.3.5 Mold

The subject property is a paved parking lot with no onsite structures at the time of the site visit; therefore, mold was not included in the scope of this assessment.

6.4 Adjacent Property Reconnaissance

The adjacent property reconnaissance consisted of observing the adjacent properties from the subject property premises. With the exception of an emergency electrical generator and nitrogen tank at the adjacent Thermo-Fisher Scientific facility to the west, no items of environmental concern were identified on the adjacent properties during the site assessment, including hazardous substances, petroleum products, ASTs, USTs, evidence of releases, PCBs, strong or noxious odors, pools of liquids, sumps or clarifiers, pits or lagoons, stressed vegetation, or any other potential environmental hazards.

6.4.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

The adjacent facility to the west (Thermo-Fisher Scientific) operates a diesel-fueled emergency electrical generator and maintains a nitrogen AST. No concerns are identified from the current use of these features.

7.0 FINDINGS AND CONCLUSIONS

Findings

A *recognized environmental condition (REC)* refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment. The following was identified during the course of this assessment:

- Partner did not identify any recognized environmental conditions during the course of this assessment.

A *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. The following was identified during the course of this assessment:

- Partner did not identify any controlled recognized environmental conditions during the course of this assessment.

A *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. The following was identified during the course of this assessment:

- Groundwater beneath the subject property has been impacted by historical releases associated with the former Hughes' operations, these impacts have been investigated and characterized under RWQCB regulatory oversight. On March 22, 2018, the RWQCB concluded that the southern portion of the former Hughes facility had met the Regional Board requirements for groundwater closure and issued a NFA letter on March 22, 2018. Onsite wells CM-10 and CM-17 were removed on September 6 and 10, 2018. Based on the analytical results and regulatory case closure, the impacts to groundwater beneath the subject property are considered to be HRECs.

An *environmental issue* refers to environmental concerns identified by Partner, which do not qualify as RECs; however, warrant further discussion. The following was identified during the course of this assessment:

- The subject property is located within the boundary of the open Corrective Action Case for the former Hughes Missile Systems facility. Additional investigations and/or submittals may be requested by the DTSC for the subject property since two AOCs including Solid Waste Management Unit (SWMU)-9 (Sanitary Sewer) and AOC-12 (Storm Sewers), were identified at the subject property in the 2008 RCRA Facility Assessment Report and remain uninvestigated. Closure certification and completion corrective action are outstanding. Partner notes that the DTSC has not investigated or required investigation of the sanitary and storm sewers.

Conclusions, Opinions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of the property located on the northwest corner of Roscoe Boulevard and Fallbrook Avenue, Los Angeles, Los Angeles County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed evidence of a historical recognized environmental condition and environmental issues in connection with the subject property. Based on the conclusions of this assessment, Partner recommends the following:

- Further evaluation of subsurface environmental conditions is not warranted at this time.
- Manage any disturbance of onsite soils with existing Soil Management Plan as needed.
- Further assessment of onsite soils in the vicinity of the sewer lines may be required in the future by DTSC as part of ongoing open, Corrective Action Case for the former Hughes Missiles Co./Raytheon Systems Co. Facility. Note that the DTSC has not yet required investigation of these areas.

8.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Partner has performed a Phase I Environmental Site Assessment of the property located on the northwest corner of Roscoe Boulevard and Fallbrook Avenue, Los Angeles, Los Angeles County, California in conformance with the scope and limitations of the protocol and the limitations stated earlier in this report. Exceptions to or deletions from this protocol are discussed earlier in this report.

By signing below, Partner declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR §312. Partner has the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. Partner has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Partner Engineering and Science, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # 0CC7-4F90-993F

PO # 20-288877.1

Project 20-288877.1

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 0CC7-4F90-993F

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

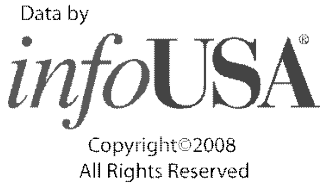
Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2015. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.



RESEARCH SUMMARY

Facility History

Raytheon, Canoga Park facility is an inactive facility and currently DTSC is reviewing its Closure Certification Report (CCR). It has two known permitted units, a hazardous waste storage area (HWSA) and a waste oil tank T3. The HWSA is used to store containerized hazardous wastes such as flammables, nonflammables, and corrosives. The Tank T3 has a capacity of 4,000 gallons and was used to store waste oils and waste oil mixed with solvents. T3 was removed in 1988.

The Closure Plan was submitted in February 1995 and revised August 1995, as a result of Notices of Deficiencies (NODs) issued to Hughes Missile System Company (HMSC) by DTSC dated December 21, 1994 and June 6, 1995. On December 1995, the DTSC modified the Closure Plan dated August 1995 to reflect changes in the closure performance standards for certain VOCs, background from metals, and conditions under the Health and Safety Plan.

Raytheon submitted the Closure Certification Report (CCR) for the HWSA in 2002 and shortly after Raytheon requested a change of Project Manager (PM). The project was then transfer from Southern California to Northern California. However, due to staff changes in Raytheon and DTSC, the CCR was not evaluated until the middle of 2006.

August 2007 update - The CCR is being reviewed for closure. An RCRA Facility Assessment (RFA) is being drafted in anticipation of a Corrective Action Consent Agreement (CA) which is to address all outstanding in the HWSA and T3 plus a number of other Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs).

1.0 INTRODUCTION

The 1984 Resource Conservation and Recovery Act (RCRA) amendments provide authority for the U.S. Environmental Protection Agency (USEPA) to require comprehensive corrective action on Solid Waste Management Units (SWMUs) and other areas of concern at facilities applying for a Part B permit and those with RCRA Interim Status or facilities that operated in a manner that required a hazardous waste facility permit even though the facility had not obtained or applied for a hazardous waste permit. The Hughes Missile Systems Company operated the Canoga Park Facility with two permitted interim status units. These units were closed with closure certification pending. Interim Remediation is currently being under taken under the Los Angeles Regional Water Quality Control Board (LARWQCB).

In 1997 the Raytheon Missile Systems Company acquired the Hughes Missile Systems Company which then merged with Raytheon in 1998 to become the Raytheon Systems Company (Raytheon). Raytheon subsequently sold off the Canoga Park site but retains responsibility for site cleanup.

In order to accomplish the objective of corrective action, a RCRA Facility Assessment (RFA) of the Canoga Park Facility was conducted. This assessment consisted of a preliminary review (PR) of documentation of past site investigations and a Visual Site Inspections (VSI). The VSI was conducted on June 13, 2007.

This report is a summary of the PR and the VSI. The PR is based upon information found in files and reports at the Department of Toxic Substances Control (DTSC) including the facility operation plan, closure plan, and documents provided by Hughes/Raytheon. The documents that form the basis for this RFA are referenced and are considered as supplemental documents.

2.0 SITE DESCRIPTION

2.1 Location

The Canoga Park Facility is located at 8433 Fallbrook Avenue in Canoga Park, California. The facility is located in the northwest portion of the San Fernando Valley of Los Angeles County, California. The site is approximately 86 acres in area and ranges in elevation from approximately 900 feet above mean sea level (MSL) in the north-central portion to approximately 840 feet above MSL at its southern boundary. The site is bounded to the east by Fallbrook Avenue, to the south by Roscoe Boulevard, to the north by open space land adjacent to the Chatsworth reservoir, and to the west by single family residential housing (Figure 1 - Aerial photo). Residential neighborhoods are located across Fallbrook Avenue and Roscoe Boulevard.

2.2 Ownership History

In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the Facility from 1959 until 1966. From 1966 to 1976, Hughes

Missile Systems Company (Hughes) was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Facility. The January 17, 1994 Northridge Earthquake (Mw 6.7) damaged several buildings at the property and led to Hughes moving people and activities to Tucson, Arizona. In May 1995, the Facility was purchased from Hughes by Coast Federal Bank (CFB). At this time, land use changed from research, development and "prototyping" to commercial office space. The northern portion of the Site was sold to Regent Properties, Inc. (Regent) in 1997. Regent completed a major development project that included building redevelopment, remodeling and re-grading to raise the elevation of a portion of the Site. Parcels within the southern portion of the Site were subsequently purchased by DeVry Incorporated, Los Angeles Metropolitan Police Department and Trammel Crow. DeVry initiated a development project that included new building construction and re-grading. In September 2001, Regent sold its portion of the Facility to Shamrock Holdings, Inc., who in turn, sold the property to MEPT West Hills Limited Liability Corporation (LLC) in June 2002. MEPT West Hills LLC is the current property owner, although Trammell Crow Company acts as property manager for the Facility. As stipulated in the sales agreement with CFB in 1995, Hughes (now Raytheon) continued to address environmental impacts resultant from its former operations.

2.3 Past Waste Management Activities

Small amounts of hazardous wastes were collected in 55 gallon drums and stored in the HWSA, where flammables were physically separated from corrosives. Wastes handled include acids, bases, iron, tin, fluorine, gasoline, diesel, copper, chromium, Freon, oils, cyanides, flammable solvents and chlorinated solvents. The curbed storage area had a reinforced concrete base with a grated sump. Security was controlled by masonry, chain link walls and gated access. The area had a tarpaulin roof. Wastes were accumulated, and full containers were periodically sent to a hazardous waste facility.

Hazardous waste oils and solvents were collected in a four thousand gallon underground storage tank (T3) just northwest of the HSWA. Wastes were accumulated and were periodically sent by tanker to a hazardous waste facility.

2.4 Current Waste Management Activities

Currently the site is used as office space for a multitude of tenants. The waste activities are chiefly the remediation of the soil and groundwater at the identified hot spots in the north west and the central east portions of the site. Since 1995 the groundwater and soil in the northwest plume has been treated by a groundwater recovery and treatment system, (GRTS), a solvent vapor extraction system(SVE) and later enhanced with an air sparge system (AS). The water was treated by air stripping and carbon absorption of the volatile organics. The soil vapor was extracted by vacuum volatilization and carbon absorption. These were shutdown because of asymptotic conditions and replaced with an enhanced in-situ bioremediation process (EISB) starting in October of 2005. The EISB process was also applied to a smaller plume in the northeast of the site in December of 2006.

Current operations involve ground water monitoring on a quarterly basis to monitor the effectiveness of the EISB process.

2.5 Permit History for Hazardous Waste Management Units

Hughes Missile Systems Group operated at the site since 1965 and was issued a Hazardous Waste Facility Permit on June 28, 1985 for the HWSA and T3 RCRA units. Operations ceased in 1994. A Closure and Post Closure Plan was approved in late1995. This plan included a report of the T3 closure. A closure certification report for the HWSA was submitted in November 8, 2002. Both of these closures were incomplete with soil and ground water contamination at depth.

3.0 ENVIRONMENTAL SETTING

3.1 Site Geology

The shallow geologic deposits of the western San Fernando Valley in the vicinity of the project site are comprised of predominantly unconsolidated sands, silts and clays with occasional gravels. These alluvial fill deposits are of Quaternary age and range in thickness from thin veneer at the valley margins to more than 700 feet in the central portion of the San Fernando Valley. In the western portion of valley, the unconsolidated alluvial fill deposits are unconformably underlain by consolidated bedrock of the Modelo and Chatsworth Formations, respectively. The Modelo Formation consists of grayish siltstone, clayey siltstone and shale, with minor interbedded diatomaceous shale. A relatively thin weathered zone exists along the top of the formation where it is in contact with the shallow alluvial deposits. The Chatsworth Formation is comprised primarily of a turbidite sandstone sequence with interbedded shale and minor conglomerates. The bedrock of the Chatsworth Formation, which is the major rock comprising the Simi Hills, forms the distinct outcrops north of Chatsworth Reservoir (McLaren, 1989). A major portion of the Former Raytheon Facility is constructed on consolidated bedrock of the Miocene Modelo Formation. Near surface (to 50 or 100 ft bg), deposits are highly weathered. Beds of the Modelo are seen in road cuts and in drill-hole samples to be dipping at up to 45° from horizontal. Generally, dip direction is toward the south or southwest.

In the northwestern portion of the Facility, to the west and northwest of Building 270 and at other locations on the site periphery, the shallow subsurface is comprised of unconsolidated alluvial valley fill of Quaternary age. This material is present to depths of at least 75 feet. The beds are flat-lying, and consist primarily of mixed silt and fine sand, with lesser amounts of clay. The Modelo Formation is believed to be unconformably present beneath the valley fill. A thin (up to 10-foot) layer of construction fill material is locally present at the surface overlying

3.2 Surface Water Hydrology

Primary surface drainage in the site vicinity is Chatsworth Creek, lying immediately west of the Site. Portions of Chatsworth Creek, north and south of Hidden Lake (formerly Lees Lake) are contained within large underground culverts. Other portions are contained in lined or unlined structured channels. The portion of Chatsworth Creek in

the site vicinity is contained in underground cement-lined tunnels. Water from Chatsworth Creek eventually flows into the Los Angeles River about 2.5 miles down gradient. Hidden Lake is the only active reservoir within a 1-mile radius of the site. Hidden Lake is used as a recreational area by residents of the surrounding housing development. It should be noted that storm drainage, including storm drain discharge, from the site flows to Chatsworth Creek, the majority of which enters south and downstream of Hidden Lake.

3.3 Groundwater Hydrology

Groundwater gradient direction within the vicinity of the site regionally flows from northwest to southeast, from the Simi Hills to the San Fernando Valley. The depth to groundwater is approximately 25 feet bg near Roscoe Boulevard. The hydraulic gradient of the regional groundwater is approximately 0.0047 feet per foot (ft/ft). The water bearing materials comprising the western portion of the valley are generally fine grained alluvial sediments, which contain naturally-occurring total dissolved solids (TDS) in excess of 1,000 milligrams per liter (mg/L), exceeding the recommended USEPA drinking water guidelines. Due to the relatively low yields and excessive TDS, there are no drinking water wells in the vicinity of the facility. Essentially all drinking water consumed in the western San Fernando Valley is derived from the State Water project and the Los Angeles Aqueduct, which delivers water to southern California from the Sierra Nevada Mountains. Although the Los Angeles Department of Water and Power (LADWP) supplements its water supply with groundwater from the San Fernando Basin, all of the groundwater production well fields are located in the eastern quarter of the basin. The nearest active production well for supply of potable water to the public is more than 15 miles down gradient from the Site. In the vicinity of the site, groundwater occurs between 10 and 65 ft bg, depending on the location on the property. Groundwater gradient direction is generally to the southeast (i.e., from the Simi Hills to the San Fernando Valley), but on the western side of the property, there is a westward component due to the local topography Quarterly groundwater gauging of onsite monitoring wells has been conducted since December 1991 (with previous monthly gauging from August 1990). The groundwater gradient in the northwest portion of the site, which contains the main volatile organic compound (VOC) plume, is consistently westward and ranges from 0.01 to 0.02 ft/ft. In the extreme northwest corner of the site, the gradient becomes less steep and a localized depression is often observed even under static non-pumping conditions. This is likely due to the lithologic change from the Modelo formation to the alluvial unit in this area. The apparent groundwater gradient over the remainder of the Site is towards the southwest, south and south-southeast, with gradients ranging from 0.01 to 0.04 ft/ft. Water depths, groundwater gradients, and apparent groundwater flow directions are generally consistent with minor localized changes due to pumping activities during GRTS operation. Average hydraulic conductivities were calculated to be approximately 9 gallons per day per square foot (gpd/ft^2) for the Modelo Formation ($4.24x10^{-4}$ centimeters per second or cm/sec) and approximately 270 gpd/ft^2 for the alluvial fill ($1.27x10^{-2}$ cm/sec) (GTI, 1993).

4.0 SOLID WASTE MANAGEMENT UNITS And AREAS Of CONCERN

This Assessment has included all Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) identified by DTSC in 2002 from in a previous draft Corrective Action Consent Agreement; Table 1. The northeast plume at well CM-8 was also considered as an AOC. These units are indicated on the site drawing, Figure 2.

4.1 SWMUs

4.1.1 SWMU-1 (aka Hazardous Waste Storage Area, HWSA)

This unit was used to store carboy and drum quantities of hazardous wastes containing solvents, acids, bases, plating solutions and paint.

This unit was addressed in the *Modified Closure Plan for the Hazardous Waste Storage Area and Tank T3* [1] which was accepted by DTSC and dated August 1995. A document titled *Closure Certification Report for the Hazardous Waste Storage Area*[2] and dated 11/08/2002 documents the action taken. The closure process discovered arsenic, cadmium and hexavalent chromium that exceeded Closure Performance Standards in the underlying soils. After excavation to 14.5 feet below the former HWSA pad there still were high levels of hexavalent chromium. The pit was lined with polyethylene and back filled. Latter the area was regraded with about 8-9 feet of additional soil and paved. Additional borings were made to help define the extent of the chromium plume[3,4]. High levels of hexavalent chromium were detected in a narrow plume below the former HWSA all the way to groundwater. Since August 1999 Raytheon has been monitoring the groundwater at nearby wells for hexavalent chromium.

The Closure Certification Report was not accepted by DTSC as of the present. The extent of high levels of hexavalent chromium in subsurface soil and water must be defined and considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

Table 1
SOLID WASTE MANAGEMENT UNITS AND AREAS OF CONCERN
RAYTHEON MISSLE SYSTEMS COMPANY
CANOGA PARK, CALIFORNIA

EPA and DTSC DESIGNATION	NAME	RELEASES
SWMU-1 (HWSA)	Hazardous waste storage area	Release to soil and groundwater. COCs include hexavalent chromium
SWMU-2 (T3)	Underground Storage Tank (UST) for Waste	Release to soil and groundwater. Constituents include dichloroethylene (DCE)
SWMU-3	Building 272	Volatile organic compounds (VOCs) identified in vapor survey.
SWMU-4	Building 282 Former Drum Storage Room	Soil tested positive for chlorinated VOC vapors
SWMU-5	Pits #1 and #2 near Building 269	Releases to soil of cadmium and Beryllium. Groundwater contaminated with tetrachloroethylene (PCE).
SWMU-6	Parking area between Buildings 274 & 276	Releases to soil and groundwater. Constituents include Freon-11
SWMU-7	Cooling Unit outside of Building 274	Releases to soil. Constituents include Freon-11
SWMU-8	Former USTs T-1/T2 pump island near Buildings 272 & 282	Releases to soil and groundwater. Constituents include petroleum hydrocarbons
SWMU-9	Site wide sewer line	Releases to soil near soil boring BSL-4. Constituents include arsenic.
AOC-1	Building 262 drains and feeder sewer lines	Suspected release. Building is up gradient of wells CM-8d, CM-9d and CM-18 which have 1,1 DCE for which no source has been determined.
AOC-2	Building 263 drains, sumps and feeder sewer lines	Suspected release. Building is near and up gradient of well CM-8d which have 1,1 DCE.
AOC-3	Building 265 drains and feeder sewer lines	Suspected release. Down gradient SWMU-4 has contaminated soil with Freon-11
AOC-4	Building 269 interior: plating pit, drains, sumps, degreaser exterior clarifier pit and feeder sewer lines	Releases to soil at exterior clarifier pit, SWMU-5

Table 1
SOLID WASTE MANAGEMENT UNITS AND AREAS OF CONCERN
RAYTHEON MISSLE SYSTEMS COMPANY
CANOGA PARK, CALIFORNIA

Continued …

EPA and DTSC DESIGNATION	NAME	RELEASES
AOC-5	Building 271 industrial waste clarifier, drains and feeder sewer lines	Suspected release. Building associated with UST T-4. CM-8d nearly down gradient and groundwater contaminated with Freon-11
AOC-6	Building 274 drains and feeder sewer lines	Unknown. Building was used to store/use solvents including 1,1, TCA, Freon-11 and hydraulic fluid. Up gradient of CM-10 which had Freon-11 in groundwater..
AOC-7	Building 276 drains and feeder sewer lines	Unknown. Soil gas data from parking area toward Building 274 shows vapor phaseFreon-11. Building is up gradient of CM-10 which had Freon-11 in groundwater.
AOC-8	Building 281 drains and feeder sewer lines	Unknown. Building is up gradient of CM-8d and cross gradient from CM-9d which had Freon-11 in groundwater. Also next to former diesel USTs
AOC-9	Former USTs T-5 & T-6	Suspected releases. T-5 used for storage of hazardous waste including waste oil and sulfuric acid.
AOC-10	Former USTs T-7, T-8 and T-9	Diesel fuel contaminated soil was excavated in this area
AOC-11	Above ground tank, T-14	Unknown. Tank was located inside Building 269 and stored solvent waste such as acetone, 1,1,1 TCA and isopropyl alcohol.
AOC-12	Site wide storm water system	Releases suspected
AOC-13	Northeast plume	1,1 DCE, Freon

4.1.2 SWMU-2 (aka T3)

This tank was used to store bulk quantities of hazardous wastes which consisted of machine cutting fluids, some solvents used for cleaning and maintenance of machinery, and machine lubricating oils. Hazardous constituents present in these wastes were 1,1,l-trichloroethane (TCA), acetone, and oils. Contaminants detected in the soil in vicinity of T3 include TPH, 1,1dichloroethylene (l,l-DCE), 1,1-dichloroethane (l,l-DCA), and TCA.

Tank T3 was permitted under RCRA when it was removed. The tank was removed in June 1988 and associated contaminated soils were removed in September 1991 under a Corrective Action Plan (CAP) approved on March 18, 1991 by the CalEPA Los Angeles Regional Water Quality Control Board (LARWQCB). The document, *Final Report, Remediation of Former T3 Tank Site*[5] (November 1991), discusses the extent of soils removed. The soil was excavated to 40 feet below ground surface in the vicinity of the former T3 by boring three foot holes on a triangular pitch. The excavation left a cookie cutter pattern of soil wedges behind unexcavated. The holes were backfilled with a cement and sand slurry. Later the area was regraded with about 7 feet of additional soil and paved. CAP goals were used to determine the extent of excavation. The LARWQCB approved cleanup action levels for remediation of impacted soils at the T3 site were:

LARWQCB Corrective Action Plan Cleanup Action Levels	
Total petroleum hydrocarbons (TPH)	100 ppm
Total volatile organic compounds (VOCs)	20 ppm
1, l-dichloroethylene (1, 1-DCE)	6 ppm

The groundwater in the area is contaminated with a range chlorinated VOCs and has been undergoing a series of interim remediation under LARWQCB guidance. From 1995 to 2005 ground water has been treated via a Pump and Treat system with the treated water used for on site irrigation needs. The soil has been treated via a Soil Vapor Extraction system (SVE) for the same period. Contaminant levels became asymptotic by 2000 and an Enhanced In-Situ Bioremediation approach (EISB) was instituted in 2005[6]. Final cleanup levels have not been determined under DTSC protocol.

The Closure Certification Report was not accepted by DTSC as of this document. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.3 SWMU-3 (Building 272)

Building 272 is a small building associated with the former gas pump area. The building has been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water

must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[7]

4.1.4 SWMU-4 (Building 282)

Building 282 is a former drum storage room associated with the former gas pump area. The building has been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[8]

4.1.5 SWMU-5 (Pits #1 and #2 near Building 269)

These pits received photographic wastes and neutralized acids. Releases to soil of Cadmium and Beryllium have been noted. Groundwater is contaminated with tetrachloroethylene (PCE). These pits have been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs and metals in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.6 SWMU-6 (Parking area between Buildings 274 & 276)

The 1991 Preliminary Assessment authorized under US EPA cites the presence of Freon-11 and elevated radioactivity in this area.[8] It has been contended that elevated radioactivity is due to natural geologic variation.[9] This area is in the SE part of the site. The contamination is suspected to have resulted from maintenance work on cooling units next to the former Building 274. According to a 1998 Fluor Daniel GTI Site Assessment report[10] the cooling unit at Building 274 used Freon 22 and only Buildings 263 used Freon 11. In any event the plume was delineated as centered at the edge of a former parking area. At the time of the report it was concluded that the Freon levels were declining and below drinking water standards. Need to determine if any issues remain.

4.1.7 SWMU-7 (Cooling Unit outside of former Building 274)

The presence of Freon-11 was detected in the soil. This area is in the SE part of the site. The contamination is suspected to have resulted from maintenance work on the cooling units.[11] Need to determine if any issues remain.

4.1.8 SWMU-8 (Former USTs T1 & T2 for the gasoline pump island)

The release of petroleum hydrocarbons to soil and groundwater occurred. The area is within the NW treatment area that includes the EISB areas A, B & C. The extent of hydrocarbon contamination was assesses in 1991.[12] The plume is within the larger VOC plume in the northwest corner of the site and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered

in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.9 SWMU-9 (Site wide sewer line)

Site wide assessment in 1991 did not show up any metal contamination at detection limits.[13] One sample had a trace (0.009 mg/kg) of toluene. Sample B-SL had 0.3 mg/kg of toluene. No other VOCs were detected. Need to determine if any issues remain.

4.2 AOCs

4.2.1 AOC-1 (Building 262 drains and feeder sewer lines)

This building is up gradient of a release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.2 AOC-2 (Building 263 drains sumps and feeder sewer lines)

This building is adjacent to an area of release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels. In 1992 wells near Building 263 tested above EPA Maximum Concentration Limit (MCL) for uranium.[14]

4.2.3 AOC-3 (Building 265 drains and feeder sewer lines)

This building is next to an area with Freon contamination and could be a source of the contamination. Final cleanup levels have not been determined under DTSC protocol. The presence of Freon in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.4 AOC-4 (Building 269 drains and feeder sewer lines)

This building was in an area where soil is contaminated with VOCs and the sewer line may have been a source. The building was removed by 1988. It was in the area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[8,15]

4.2.5 AOC-5 (Building 271 drains and feeder sewer lines)

This small building was associated with a large concrete water basin, T4. This building is adjacent to an area of release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB

guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.6 AOC-6 (Building 274 drains and feeder sewer lines)

This small building was use for solvent parts cleaning and stored 1,1,1 TCA, Freon, and Hydraulic fluid. The building has been removed. Nearby is an area with Freon contamination and it could be a source of the contamination. Final cleanup levels have not been determined under DTSC protocol. The presence of contamination in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.7 AOC-7 (Building 276 drains and feeder sewer lines)

This building had 2 active chemical use areas, solvent cleaning and photographic processing operations. Freon has been detected at a down gradient well, CM-10. Final cleanup levels have not been determined under DTSC protocol. The presence of contamination in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.8 AOC-8 (Building 281 drains and feeder sewer lines)

This building is adjacent to an area of release and could be a source of the contamination. Generally it handled small quantities of in a maintenance shop setting. Chemicals included dichloromethane, insecticides, mineral oil and ethylene glycol. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Also it is next to the former diesel USTs. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs and hydrocarbons in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.9 AOC-9 (T5 and T6)

These USTs were used to store waste oil and sulfuric acid. These were glass lined 500 gallon vessels that were contained in a concrete vault located west of building 263. The tanks were removed in 1984 along with the vaults and soil was excavated.[16] Residual contamination consisting of toluene and xylenes need to be considered in the HRA. The presence of VOCs and hydrocarbons in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.10 AOC-10 (T7, T8 & T9)

These USTs were used to store diesel fuel. The tanks were removed in1991.[17]. Subsequently the soil was excavated to remove contaminated soil.[18]. A clean-up level of 100 ppm of TPHD was used. Currently most of this area has been covered with a bi-level parking lot. Residual diesel should be considered in a health and environmental risk assessment.

4.2.11 AOC-11 (T14)

This AOC is an above ground tank that was located in building B269. Building 269 was removed by 1998. The area is within the contaminant plume in EISB treatment areas A & B. The plume there has been characterized and has undergone SVE, pump and treat and currently EISB. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.12 AOC-12 Site Wide Storm Sewer System.

The Storm sewer system has not been investigated. Key points where runoff could carry contaminants and where leaks are more likely to occur may need to be tested for contamination.

4.2.13 AOC-13 Northeast Plume between B263, B264 & B281

This plume has had definition and is currently undergoing interim measures by EISB in area D.

4.3 SUMMARY OF CONSOLIDATED SWMUS AND AOCS.

The various SWMUs and AOCs can be regrouped in to several zones for Risk assessment and treatment purposes (figure 3). The following zones are defined.

4.3.1 Zone 1 The contiguous Northwest Plume consisting of:

- SWMU-1 former HSWA
- SWMU-2 former T3
- SWMU-3 former B272 gas station bldg
- SWMU-4 former B282 drum stg bldg
- SWMU-5 former P1 & P2 at B269
- SWMU-8 former T1 &T2 gasoline tanks
- AOC-4 former B-269
- AOC-11 former AST in B269

This zone has a known contamination of VOCs, CVOCs, chromium^{+6} and potential cadmium and beryllium at SWMU-5.

4.3.2 Zone 2 Sewer system network consisting of

- SWMU-9 Sewer System
- AOC-1 B262 sewer drains and feeders
- AOC-2 B263 sewer drains and feeders
- AOC-3 B265 sewer drains and feeders
- AOC-5 B271 sewer drains and feeders
- AOC-6 B274 sewer drains and feeders
- AOC-7 B276 sewer drains and feeders
- AOC-8 B281 sewer drains and feeders

4.3.3 Zone 3 South plume area (Freon 11 contamination)

- SWMU-6 B274,276 parking lot
- SWMU-7 former B-274; Chiller building

4.3.4 Other areas that remain individual AOCs. These are:

- AOC-9 former T5,T6; oil, sulfuric acid tanks
- AOC-10 former T-7,8,9; diesel tanks
- AOC-12 Storm sewer system
- AOC-13 Northeast plume

5.0 EXPOSURE PATHWAYS

5.1 Surface Water

Nearest stream is in adjacent neighborhood to the west where a small stream, Chatsworth Creek, enters and exits a small lake, Hidden Lake (aka Lees Lake), via culverts and continues south via lined and unlined structured channels. The property is graded to drain to the SE through storm drains which empty into this stream.

5.2 Groundwater

Groundwater flows to the West at the NW corner of the property but generally to the SSE on the rest of the property into the San Fernando Valley. With measured TDS of over 1000 ppm the water is not likely to be used for drinking water. There may be interaction between the groundwater and Hidden Lake to the west.

5.3 Air

The area is paved, built upon or vegetated with irrigated beds. There is potential for soil gas intrusion into buildings. Buildings are being used commercially as office space.

5.4 Surface Soil

There is essentially no exposed soil due to paving and buildings. Soil exposure could occur when it is disturbed during construction activities.

6.0 VISUAL SITE INSPECTIONS

The site was visited on Wednesday June 13, 2007. The site is a well landscaped business office site. The vast majority of the area is covered with office buildings, roadways, parking lots and walkways. The remaining area consists of a central park area and narrow vegetated corridors that border and subdivide the property. The primary treatment area is in the north western corner of the site. A new parking structure was nearly completed in the north east corner of the site.

Visual Evidence of SWMUs, AOCs and treatment systems are minimal. The GRTS and SVE equipment are idle behind a small fenced area. Well heads are flush to ground level and covered. Observations are photo documented (See figures 4 to 11).

7.0 RECOMMENDATIONS FOR FURTHER ACTION

- Continue Groundwater Remediation

- Determine data gaps to developing a site wide heath risk assessment using the current DTSC-modified model. A site conceptual model needs to be developed to address all exposure routes.

- Collect samples needed to fill in the data gaps.

- Complete a soil vapor survey using old and new data as appropriate to model vapor intrusion. This work is to be in accordance with the Department's publications: GUIDANCE FOR THE EVALUATION AND MITIGATION OF SUBSURFACE VAPOR INTRUSION TO INDOOR AIR and ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS. As these documents are under going revision it is important that this investigation be done with close coordination with the project manager.

- Prepare site wide HRA for all modes of exposure to define remediation goals acceptable to DTSC.

- Modify remediation effort as required to meet the DTSC remediation goals or existing CAP goals whichever is the more stringent.

MEPT SOIL MANAGEMENT PLAN FOR A1 LANDSCAPING DECISION BY DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC); RAYTHEON SITE; CANOGA PARK (FORMERLY HUGHES); CAD 041162124

Dear Mr. Holdridge:

DTSC has reviewed the amended MEPT West Hills document titled SOIL MANAGEMENT PLAN, May 6, 2008. DTSC has also reviewed the amended CONTRACTOR HEALTH AND SAFETY PLAN (HASP), May 6, 2008. DTSC finds that the plans were deficient in two areas that I discussed with you over the phone:

- The DTSC request for an action level summary chart for the various field measurements (dust, PID and alpha, beta radiation). It is understood that the soil screening samples are broad and detection hits will be compared to industrial PRGs as the action levels.

- DTSC requested assurance that the existing monitoring wells will be not modified and will be protected and available to ongoing use by Raytheon.

DTSC has received via email the above two items, has reviewed them, and found them acceptable. These items are attached to this letter and are considered an integral part of the Soil Management Plan. DTSC approves the landscaping plan as prudently protective of the health of the public and workers and as protective of the existing environmental facilities at the site. The approved plan consists of the following documents:

1. SOIL MANAGEMENT PLAN, May 6, 2008
2. CONTRACTOR HEALTH AND SAFETY PLAN (HASP), May 6, 2008
3. TABLE 1. POTENTIAL CHEMICALS OF CONCERN (COCS) FOR CAFÉ AREA
4. WEST HILLS CAMPUS @ 8413 FALLBROOK AVENUE; PENDING LANDSCAPE WORK AT THE CAFE AREA AND GRADE ADJUSTMENTS OF EXISTING MONITORING WELLS, May 5, 2008

Printed on Recycled Paper

The plan is not intended to address the site wide cleanup issues which Raytheon is the lead responsible party. Approval of the plan by DTSC means that implementation of the plan should reasonably protect human health to public and employees from chemical exposure and does not address common physical hazards of construction. The contractor must follow local, state and federal regulations as applicable to the work place. Approval of the plan does not relieve the contractor from responsibility from unforeseen chemical hazards arising from the landscaping project.

Please forward a firm construction schedule as soon as possible so that DTSC can schedule a site visit. DTSC is particularly interested in the time when the soil over the plume area is exposed.

If you have any questions, please contact Mr. Martin Herrmann at (916) 255-3592 or by email at mherrman@dtsc.ca.gov.

Sincerely,

Memo

To: Martin Herrmann, DTSC & Ann Chang, RWQCB

From: Neal Holdridge

Date: May 5, 2008

Subject: West Hills campus @ 8413 Fallbrook Avenue; pending Landscape work at the Café area and grade adjustments of existing monitoring wells

---

MESSAGE:

Mr. Herrmann & Ms. Chang:

Trammell Crow Company, as developer for MEPT West Hills, LLC, has been in discussions with DTSC regarding landscaping and re-paving work that is pending in the Café area of the subject property. A diagram of the area of the property to be affected by this work was recently submitted in Environ's Soil Management Plan. DTSC has verbally indicated that any modifications to the existing Raytheon groundwater monitoring wells in the Café area will require advance notice and approval from DTSC and RWQCB.

The purpose of this memo is to inform you that no modifications to the well casings will be made by TCC or its contractors during the course of the Café area work at this time. After discussing the situation with representatives of Raytheon and their environmental consultant, TN & Associates (TN), it was agreed that TN would adjust well casings after the landscaping work is completed. In all instances the well casings will either be able to be maintained at their current respective elevations, or will require an extension be added to the casing of up to approximately 3-feet (maximum).

To allow for TN to extend the casings and re-survey their respective reference elevations (as appropriate), TCC's contractor (DPR Construction) will remove the existing 12-inch diameter well manholes from over the affected wells (see attached diagram) along with the paving that is to be replaced. DPR will then protect the well casings by physically boxing them out with form lumber and demarcating around each one to prevent the limited surficial grading activities that are to be conducted from damaging the casings. DPR will then place a 12-inch diameter sonotube (or like) rigid casing around each well casing. The sonotube will extend to sub-grade beneath the new pavement level and the previous removed well manholes will be reinstalled over the sonotube in the new pavement at the new grade levels. TN will then be able to access and extend (as applicable) the well casings within the sonotube following the completion of the Café area pavement placement.

Please provide your approval of the above measures so that the requisite materials can be purchased in preparation for this work.

Thank you.
TRAMMELL CROW COMPANY

DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC) ENVIRONMENTAL OVERSIGHT OF RAYTHEON CANOGA PARK SITE; CORPORATE POINTE AT WEST HILLS; WEST HILLS, CALIFORNIA (THE "PROPERTY"), CAD0411692124

Dear Mr. Plafkin:

DTSC received a letter from your office dated July 16, 2008 concerning the Property. DTSC understands that the City of Los Angeles, Department of City Planning (LADCP) is in the process of completing its environmental review associated with the application for General Plan Amendment, Zone Change, Conditional Use for Commercial Development and Site Plan review for the Property.

DTSC's understanding of the plans for development on the Property includes two new office buildings, a parking garage, retail space, and other modifications. The areas of the proposed developments are located primarily on the southern half of the Property near or within a Solid Waste Management Unit (SWMU) or an Area of Concern (AOC) (see attached map). DTSC's understanding is that there is no development proposed in the vicinity of the northwest groundwater plume located on the northwest portion of the Property.

The Property was formerly a portion of a Hughes Aircraft research facility. Hughes successor, Raytheon Corporation, has an agreement with the current owners for the continued responsibilities to address the environmental issues for the property. DTSC is the lead agency for environmental issues at the Property. The California Regional Water Quality Control Board (Regional Board) has been overseeing the Interim Remediation of groundwater at the Property. On July 15, 2008 the Regional Board issued an Order to Raytheon Corporation requiring a work plan for additional groundwater investigation at the Property.

Printed on Recycled Paper

In response to LACDP request for clarification and confirmation of the conditions on which the development can occur without impeding the investigation and cleanup of the Property, DTSC offers the following guidance:

1. There will be no restrictions on development in those areas on the Property not identified as an AOC or a SWMU in the document entitled, "RCRA Facility Assessment., Hughes Missile Systems Company, Canoga Park Facility (Raytheon), EPA ID – CAD041162124", dated January 30, 2008.

2. A soil sampling work plan will be submitted to DTSC for approval, before the issuance of a building permit for any construction in an identified AOC or SWMU within the Property.

3. Development and use of the Property may continue without further DTSC requirements, if DTSC determines that contaminants are at or below acceptable levels for the intended use of the particular areas of the Property

4. If DTSC determines that contaminants are above acceptable levels for the intended use on a particular area of the Property, DTSC would require submission and approval of a remediation plan to address the contamination prior to issuance of a building permit.

If you have any questions, please contact me at (818) 717-6597.

Sincerely,

Rodney Collins
Project Manager

Raytheon, Canoga Park facility is an inactive facility and currently DTSC is reviewing its Closure Certification Report (CCR).
It has two known permitted units, a hazardous waste storage area (HWSA) and a waste oil tank T3. The HWSA is used to store containerized hazardous wastes such as flammables, nonflammables, and corrosives. The Tank T3 has a capacity of 4,000 gallons and was used to store waste oils and waste oil mixed with solvents. T3 was removed in 1988.

The Closure Plan was submitted in February 1995 and revised August 1995, as a result of Notices of Deficiencies (NODs) issued to Hughes Missile System Company (HMSC) by DTSC dated December 21, 1994 and June 6, 1995. On December 1995, the DTSC modified the Closure Plan dated August 1995 to reflect changes in the closure performance standards for certain VOCs, background from metals, and conditions under the Health and Safety Plan.

Raytheon submitted the Closure Certification Report (CCR) for the HWSA in 2002 and shortly after Raytheon requested a change of Project Manager (PM). The project was then transfer from Southern California to Northern California. However, due to staff changes in Raytheon and DTSC, the CCR was not evaluated until the middle of 2006.

August 2007 update - The CCR is being reviewed for closure. An RCRA Facility Assessment (RFA) is being drafted in anticipation of a Corrective Action Consent Agreement (CA) which is to address all outstanding in the HWSA and T3 plus a number of other Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs).

EXECUTIVE SUMMARY

This Annual Groundwater Monitoring and Remediation Report, for the period of January through December of 2012, presents the results of the groundwater monitoring and sampling program performed for Raytheon Company (Raytheon) at the Former Canoga Park facility located at 8433 Fallbrook Avenue in Canoga Park, California (Site). This report was prepared by Oneida Total Integrated Enterprises (OTIE) to comply with Monitoring and Reporting Program (M&RP) No. CI-7483 issued by the California Regional Water Quality Control Board Los Angeles Region (LARWQCB), File Number 94-45. The M&RP was amended by the August 26, 1997 and January 22, 2007 LARWQCB letters which approved modifications to the sampling plan. M&RP No. CI-7483 was associated with Waste Discharge Requirements (WDR) Permit No. 95-012, which was issued in 1995. This WDR was officially rescinded by the LARWQCB in their letter dated September 16, 2010; however, monitoring in accordance with M&RP No. CI-7483 will continue on a voluntary basis until a new site-wide M&RP is established.

Characterization and monitoring activities at the Site have been ongoing since 1988 and a groundwater remediation program has been underway since 1995 to achieve cleanup criteria established in the original Corrective Action Plan (CAP) (Hughes, 1992). Soil vapor extraction, air sparging and groundwater extraction activities occurred from 1995 through 2006 and an enhanced in-situ bioremediation (EISB) program was implemented in 2005. EISB activities are currently reported under Waste Discharge Requirements (WDR) Order No. R4-2007-0019 (Series No. 092), M&RP No. CI-8947, under separate cover. The most recent EISB report was the *Enhanced In Situ Bioremediation and In Situ Chemical Reduction Progress Report, Fourth Quarter and 2012 Annual Summary*, (OTIE, 2013) submitted to LARWQCB in February 2013.

The results and observations for the first and second semiannual 2012 groundwater monitoring events and activities at the former Canoga Park facility are as follows:

<u>First Semiannual 2012 Event</u>

- Static groundwater depths for the monitoring wells were gauged on May 29, 2012. Depths to groundwater in the wells ranged from 10.88 feet (MW-19D) to 61.62 feet (CM-19) below top of casing (TOC). The groundwater gradient in the northwest portion of the site was to the west-southwest at 0.0182 feet per foot (ft/ft). The groundwater gradient was essentially flat in the extreme northwest corner of the Site. In the north-central and northeast portions of the Site, the gradient ranged from 0.0212 ft/ft to the south to 0.0133 ft/ft to the southeast. Depth to water measurements and average groundwater gradients for this event are consistent with historical trends.

- Per M&RP No. CI-7483, wells CM-7D, CM-8D, CM-16, MW-15, MW-16, MW-19S, MW-19D and MW-20S were purged and sampled for volatile organic compound (VOC) analysis between May 30 and June 7, 2012. Well MW-37 was also sampled during this event for additional groundwater data.

- Results for the monitoring well samples indicated that none contained VOC concentrations above the detection limit except for wells CM-8D and MW-37. The sample from well CM-8D contained 1.2 micrograms per liter (µg/L) of 1,1-Dichloroethane (1,1-DCA), 17 µg/L of 1,1-Dichloroethene (1,1-DCE), and 7.4 µg/L of trichloroethene (TCE). Concentrations of VOCs detected in the sample from well MW-37 were 52 µg/L of 1,1-DCE, 46.2 µg/L of TCE, and 5.7 µg/L of chloroform. Additionally, the sample from well MW-20S contained only a

concentration of acetone (30 µg/L), which is a possible lab contaminant. No VOC concentration exceeded the CAP goals.

- During the May-June 2012 semiannual sampling event, recovery wells RW-01, RW-02, RW-04, RW-05, RW-06, RW-07, RW-08, RW-09, RW-10, RW-11, RW-13, RW-14, RW-15, and RW-16 were also sampled. Samples from wells RW-02, RW-05, RW-07, RW-09, and RW-13 were below detection limits for all VOCs. CAP goals were only exceeded in 3 of the 14 wells sampled: RW-01, RW-11, and RW-14. Samples from wells RW-01, RW-11 and RW-14 contained 1,1-DCE concentrations exceeding the 60 µg/L CAP goal at 160 µg/L, 70 µg/L and 80 µg/L, respectively. VOCs detected in the recovery well samples below CAP goals included tetrachloroethene (PCE); 1,1-DCE; TCE; *cis*-1,2-dichloroethene (*cis*-1,2-DCE); 1,1-DCA; 1,2-Dichloroethane (1,2-DCA); vinyl chloride (VC); and toluene at concentrations ranging from 0.51 µg/L (1,2-DCA in RW-01) to 100 µg/L (VC in RW-10).

Second Semiannual and Annual 2012 Event

- Semiannual gauging was performed for the second half of 2012 on December 12, 2012, when 59 monitoring wells were gauged. Depths to water ranged from 10.06 feet (well MW-21D) to 62.79 feet below TOC (well CM-19). The overall average groundwater elevation was 1.29 feet lower in December 2012 as compared to the May 2012 average elevation (when comparing the same wells). Apparent groundwater gradient in the northwest portion of the Site ranged from 0.0143 ft/ft southwest to 0.016 ft/ft northeast, while the groundwater gradient was essentially flat in the extreme northwest corner of the Site. The apparent groundwater gradient over the north-central and northeast portions of the Site ranged from 0.138 ft/ft northwest to 0.020 ft/ft southwest to 0.021 ft/ft southeast. In the southern portion of the Site, the gradient ranged from 0.021 ft/ft to 0.0485 ft/ft southeast. Depth to water measurements and average groundwater gradients for this event are consistent with historical trends.

- Results of the December 2012 sampling event indicated that concentrations of VOCs were identified in 9 of the 25 monitoring wells sampled. Samples from monitoring wells CM-7D, CM-9D, CM-13, CM-14, CM-16, CM-18, MW-15, MW-16, MW-17, MW-19S, MW-19D, MW-20S, MW-24, MW-25, MW-26, and MW-27 were below detection limits for all analytes. Eleven different analytes were detected in the nine samples and none exceeded the CAP goals. 1,1-DCE was detected in five wells with concentrations ranging from 1.8 µg/L (CM-2D) to 47 µg/L (MW-37). Concentrations of TCE were detected in samples from only two wells: CM-8D (6.5 µg/L) and MW-37 (5.4 µg/L). Concentrations of *cis*-1,2-DCE were not detected in any wells. Concentrations of VC were detected in samples from wells M-1 (40 µg/L), CM-4D (1.3 µg/L), MW-23 (80 µg/L), and MW-36 (1.2 µg/L). As VC was not detected prior to the initiation of EISB at the Site, there is no CAP goal for it. VC levels are a by-product of the EISB process and are expected to diminish over time.

- All 14 of the accessible recovery wells were sampled during the second semiannual event in December 2012. Sampled wells include RW-01, RW-02, RW-04 through RW-11, and RW-13 through RW-16. Eight of the 14 recovery wells sampled (RW-01, RW-04, RW-06, RW-10, RW-11, RW-14, RW-15, and RW-16) contained detectable levels of VOCs. Results from recovery wells RW-02, RW-05, RW-07, RW-08, RW-09, and RW-13 were below detection limits for all VOCs. The samples from wells RW-01, RW-11, RW-14, and RW-15 exceeded the 60 µg/L CAP goal for 1,1-DCE at 280 µg/L, 70 µg/L, 370 µg/L, and 63 µg/L, respectively. VC concentrations were detected in wells RW-01, RW-04, RW-06, RW-10, RW-14, RW-15 and RW-16 at levels ranging from 0.54 µg/L (RW-15) to 78 µg/L (RW-14).

The semiannual data indicate generally stable or decreasing concentrations, sustained decreases below CAP goals in the vicinity of wells CM-8D and MW-37, and only three areas that remain above CAP goals: two in the northwest area (wells RW-01 and RW-11) and one in the former Tank T3 area in the north-central portion of the Site (near well RW-14).

The lateral extent of the VOC plume is generally stable or decreasing with significant sustained decreases in concentrations within the plume's interior due to the implementation of the EISB program. None of the 25 monitoring wells sampled and four of the 14 recovery wells sampled (RW-01, RW-11, RW-14, and RW-15) had concentrations exceeding CAP goals. Some notable changes in 2012 data include a significant decrease in VOCs in well CM-2D, where 1,1,-DCE decreased from 71 µg/L in December 2011 to 1.8 µg/L in December 2012, and well CM-19 contained a 1,1-DCE concentration of 21 µg/L, which while below the CAP goal, is the highest concentration to date in that well.

The next monitoring event for M&RP CI-7483 is the first semiannual 2013 event and is scheduled for June 2013. Results will be presented in the first semiannual 2013 groundwater monitoring and remediation report to be submitted by October 30, 2013.

1.0 INTRODUCTION

Oneida Total Integrated Enterprises, LLC (OTIE), has prepared this Annual Groundwater Monitoring and Remediation Report to present the results of the groundwater monitoring and sampling program and remediation activities performed in 2012 for Raytheon Company (Raytheon) at the former Canoga Park facility located at 8433 Fallbrook Avenue in Canoga Park, California ("Site") (Figure 1). This report complies with Monitoring and Reporting Program (M&RP) No. CI-7483 issued by the California Regional Water Quality Control Board Los Angeles Region (LARWQCB), File Number 94-45. The M&RP was amended by the August 26, 1997 and January 22, 2007 LARWQCB letters which approved modifications to the sampling plan. M&RP No. CI-7483 was associated with Waste Discharge Requirements (WDR) Permit No. 95-012, which was issued in 1995. This WDR was officially rescinded by the LARWQCB in their letter dated September 16, 2010; however, monitoring in accordance with M&RP No. CI-7483 will continue on a voluntary basis until a new site-wide M&RP is established.

Several remediation techniques have been used to remove volatile organic compounds (VOCs) from shallow groundwater (generally between 25 feet and 50 feet below ground surface [bgs]) and the unsaturated soil zone underlying the northwestern portion of the Site. The primary constituents of concern (COCs) at the Site are 1,1-dichloroethene, trichloroethene, and their daughter products.

Characterization and monitoring activities at the Site have been ongoing since 1988 and a groundwater remediation program has been underway since 1995 to achieve cleanup criteria established in the original Corrective Action Plan (CAP) (Hughes, 1992). Clean up goals for the COCs in groundwater are summarized below:

Chemical of Concern	CAP Goal (micrograms per liter [µg/L])
Tetrachloroethene (PCE)	50
Trichloroethene (TCE)	50
cis-1,2-Dichloroethene (*cis*-1,2-DCE)	60
1,1- Dichloroethene (1,1-DCE)	60
1,1-Dichloroethane (1,1-DCA)	50
1,2-Dichloroethane (1,2-DCA)	5

The monitoring program and remediation at the former Canoga Park facility are under the coordination of:

Mr. Jacques Marcillac, CHG
OTIE
317 East Main Street
Ventura, California 93001
(805) 585-2110

All consultant work was performed under the review of:

Mr. Daniel Samorano, P.E.
Raytheon Company
PO Box 11337, Building 845
Tucson, Arizona 85734-1337
(520) 794-9026

The lead agency for the monitoring and remediation is the LARWQCB. The current LARWQCB project manager is:

Ms. Emily Wong
Site Cleanup Unit
Regional Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, CA 90013
(213) 620-6070

1.1. SITE OWNERSHIP AND REDEVELOPMENT HISTORY

In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes Missile Systems Company (Hughes) was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. The former Raytheon Facility was purchased from Hughes Missile Systems Company by Coast Federal Bank in May 1995. Parcels were subsequently purchased by DeVry and the Los Angeles Metropolitan Police Department (LAMPD). The northern portion of the Site was sold to Regent Properties, Inc. in 1997. Regent sold its portion of the property to Shamrock Holdings, Inc. in 2001, who in turn, sold the property to MEPT West Hills, LLC (MEPT) in June 2002. In 2007, MEPT purchased the DeVry parcel and they remain the property owner for the entire property except for the LAMPD parcel. CB Richard Ellis is the current property manager and is the primary contact for Site logistical issues. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Site. Agency-approved closure of the Site continues to be sought by Raytheon.

1.2. REMEDIATION SYSTEM DESCRIPTION

Raytheon implemented a groundwater recovery and treatment system (GRTS), a soil vapor extraction (SVE) system, and an air sparge (AS) system, which began operation in 1995 to remove VOCs from the shallow groundwater and the unsaturated soil zone underlying the Site.

All systems were shut off in December 1998 due to construction activities at the Site. The GRTS was re-started in July 1999 and the SVE and AS systems were restarted in December 2000. The SVE/AS systems operated until September 2005 when they were shut off for the implementation of an *in situ* remedy (see Section 5.0 below). The GRTS was shut down in April 2006 due to low and asymptotic influent levels and elevated naturally occurring sulfate levels in the effluent. A letter from the LARWQCB dated January 25, 2007 approved the interim-shutdown status (LARWQCB, 2007b).

A detailed summary of the GRTS, SVE, and AS systems installation and operation can be found in the *Annual Groundwater Monitoring and Groundwater Remediation System Report, January-*

December 2006, Former Raytheon Facility, 8433 Fallbrook Avenue, Canoga Park, California, (TN&A, 2007) submitted to the LARWQCB in 2007.

1.3. SITE PHYSICAL SETTING

1.3.1. Geology

The geologic deposits of the western San Fernando Valley in the vicinity of the study area are comprised of predominantly unconsolidated sands, silts and clays with occasional gravels. These alluvial fill deposits are of Quaternary age and range in thickness from a thin veneer at the valley margins to more than 700 feet in the central portion of the San Fernando Valley (McLaren Hart, 1990). In the western portion of valley, the unconsolidated alluvial fill deposits are underlain by consolidated bedrock of the Miocene Modelo and Cretaceous Chatsworth Formations, respectively. The Modelo Formation consists of grayish siltstone, clayey siltstone and shale, with minor interbedded diatomaceous shale. A relatively thin weathered zone exists along the top of the formation where it is in contact with the shallower alluvial deposits. The Chatsworth Formation is comprised primarily of a turbidite sandstone sequence with interbedded shales and minor conglomerates. The bedrock of the Chatsworth Formation is the major rock comprising the Simi Hills and from the distinct outcrops north of Chatsworth Reservoir (McLaren Hart, 1990).

The major portion of the Former Canoga Park Facility is constructed on consolidated bedrock of the Miocene Modelo Formation. Near surface (to 50 or 100 feet below grade), deposits are highly weathered. Beds of the Modelo are seen in road cuts and in drill-hole samples to be dipping at up to 45 degrees from horizontal. Generally, dip direction is the south or southwest.

In the northwestern portion of the Facility, to the west and northwest of Building 8531 (Former Building 270) (Figure 2), and at other locations on the Site periphery, the shallow subsurface is comprised of unconsolidated alluvial valley fill of Quaternary age. This material is present to depths of at least 75 feet. The beds are flat-lying, and consist primarily of mixed silt and fine sand, with lesser amounts of clay. The Modelo Formation is believed to be unconformably present beneath the alluvium. A thin (up to 10-foot) layer of construction fill material is locally present at the surface overlying the Modelo Formation or alluvium.

1.3.2. Surface Water Hydrology

Primary surface drainage in the Site vicinity is towards Chatsworth Creek, lying immediately west of the Site. Portions of Chatsworth Creek, north and south of Hidden Lake (formerly Lees Lake), are contained within large underground culverts. Other portions are contained in lined or unlined structured channels. The portion of Chatsworth Creek in the Site vicinity is contained in underground cement-lined tunnels. Water from Chatsworth Creek eventually flows into the Los Angeles River about 2.5 miles downgradient.

Hidden Lake is the only surface body of water within a 1-mile radius of the Site. Hidden Lake is used as a recreational area by residents of the surrounding housing development. Storm drainage, including storm drain discharge from the Site flows to the channelized Chatsworth Creek, the majority of which enters south and downstream of Hidden Lake.

It should be noted that the comparison of survey data for the water level of Hidden Lake collected in March 2002 (849.60 feet above mean sea level [amsl]) and the potentiometric surface in shallow groundwater in wells near the reservoir (840 to 842 feet amsl in May 2009) concluded that the potentiometric groundwater surface was approximately eight to ten feet

below the surface water elevation. This indicates that the reservoir is a "losing" body of water, meaning that the groundwater does not recharge the reservoir.

1.3.3. Hydrogeology

Groundwater gradient direction within the vicinity of the Site regionally flows from northwest to southeast, from the Simi Hills to the San Fernando Valley. The depth to groundwater is approximately 25 feet bgs near Roscoe Boulevard. The hydraulic gradient of the regional groundwater is approximately 0.0047 feet per foot (ft/ft).

The water bearing materials comprising the western portion of the valley are generally fine-grained alluvial sediments, which contain naturally-occurring total dissolved solids (TDS) in excess of 1,000 milligrams per liter, exceeding the recommended United States Environmental Protection Agency (U.S. EPA) drinking water guidelines. Due to the relatively low yields and excessive TDS, there are no drinking water wells in the vicinity of the Facility. Essentially all drinking water consumed in the western San Fernando Valley is derived from the State Water project and the Los Angeles Aqueduct, which delivers water to southern California from the Sierra Nevada Mountains.

Although the Los Angeles Department of Water and Power does supplement its water supply with groundwater from the San Fernando Basin, all of the groundwater production well fields are located in the eastern quarter of the basin. The nearest active production well for supply of potable water to the public is more than 15 miles downgradient from the Site.

In the vicinity of the Site, groundwater occurs between 10 and 65 feet bgs, depending on the location on the property. The groundwater gradient direction is generally to the southeast (i.e., from the Simi Hills to the San Fernando Valley), but on the western side of the property, there is a westward component due to the local topography.

Routine groundwater gauging of onsite monitoring wells has been conducted since December 1991 (with previous monthly gauging from August 1990). Groundwater gradient in the northwest portion of the Site is consistently westward until reaching the western edge of the property where it turns southward. Gradients in this portion generally range from 0.01 to 0.02 ft/ft. The apparent groundwater gradient over the remainder of the Site is towards the southwest, south and south-southeast, with historic gradients ranging from 0.01 to 0.04 ft/ft. Water depths, groundwater gradients, and apparent groundwater flow directions are generally consistent with minor localized changes due to pumping activities during GRTS operation.

Two rounds of aquifer tests (and 1991 and 1993) were performed at the Site to determine aquifer hydraulic parameters as a prerequisite to groundwater modeling and conceptual design of the groundwater remediation system. Average hydraulic conductivities were calculated to be approximately 9 gallons per day per square foot (gpd/ft^2) for the Modelo Formation ($4.24x10^{-4}$ centimeters per second [cm/s]) and approximately 270 gpd/ft^2 for the alluvial fill ($1.27x10^{-2}$ cm/s) (Groundwater Technology, Inc., 1993).

2.0 GROUNDWATER GAUGING

In accordance with M&RP No. CI-7483 (p. T-2, condition 3g) as modified by the January 22, 2007 LARWQCB letter (LARWQCB, 2007a), groundwater elevations are measured in accessible groundwater monitoring wells on a semiannual basis. Groundwater levels were measured using an electric water level meter that was cleaned between each well during gauging as outlined within sampling and analysis plan. Semiannual gauging was performed for the first half of 2012 in May.

On May 29, 2012, 36 site monitoring wells were gauged. Depths to groundwater in the wells ranged from 10.88 feet (MW-19D) to 61.62 feet (CM-19) below top of casing (TOC). The groundwater gradient in the northwest portion of the site was to the west-southwest at 0.0182 ft/ft. The groundwater gradient was essentially flat in the extreme northwest corner of the Site. In the north-central and northeast portions of the Site, the gradient ranged from 0.0212 ft/ft to the south to 0.0133 ft/ft to the southeast. The May 29, 2012 groundwater elevation measurements are summarized in Table 1A and plotted and contoured on Figure 2.

Semiannual gauging was performed for the second half of 2012 on December 12, when 59 monitoring wells were gauged. In December, depths to water ranged from 10.06 feet (well MW-21D) to 62.79 feet below TOC (well CM-19). The overall average groundwater elevation was 1.29 feet lower in December 2012 as compared to the May 2012 average elevation (when comparing the same wells). Apparent groundwater gradient in the northwest portion of the Site ranged from 0.0143 ft/ft southwest to 0.016 ft/ft northeast, while the groundwater gradient was essentially flat in the extreme northwest corner of the Site. The apparent groundwater gradient over the north-central and northeast portions of the Site ranged from 0.138 ft/ft northwest to 0.020 ft/ft southwest to 0.021 ft/ft southeast. In the southern portion of the Site, the gradient ranged from 0.021 ft/ft to 0.0485 ft/ft southeast. Groundwater elevation measurements collected on December 12, 2012 are summarized in Table 1B. The groundwater elevation contours were drawn using only shallow groundwater elevation data from the monitoring wells located both on and off the Site (Figure 3).

Hydrographs for 38 monitoring wells are provided in Graphs 1 through 5. The field gauging documentation for December 2012 is included in Appendix A, and a summary of water level data for January 1996 through present is provided in Appendix B. Well completion information for all Site wells is presented in Table 1C.

3.0 SEMIANNUAL SAMPLING, ANALYSES, AND RESULTS

Several groundwater monitoring events were conducted concurrently in May-June 2012. In addition to the semiannual event, remedial progress monitoring (RPM) events for Phase IV and VI injections were performed under Waste Discharge Requirements (WDR) Permit No. R4-2007-0019 (Series No. 092). As some of the semiannual wells are also RPM wells, the sampling of the eight perimeter monitoring wells (CM-7D, CM-8D, CM-16, MW-15, MW-16, MW-19S, MW-19D and MW-20S) was conducted on May 31 and June 6 for the first semiannual 2012 event. The selected wells are sampled because they are located upgradient, downgradient and cross-gradient of the dissolved-phase VOC concentrations. All eight required wells were sampled during this semiannual sampling event. Well MW-37 was also sampled concurrently for continued enhanced *in situ* bioremediation (EISB) remedial progress monitoring downgradient of well CM-8D (injection area "D").

The GRTS recovery wells have also been sampled on a semiannual basis during most of the system's operating history for remedial progress data. However, recovery well sampling is only required on an annual frequency per M&RP requirements. In the May-June 2012 semiannual sampling event, all accessible recovery wells were sampled for VOC analysis (EPA Method 8260B) to supplement the data set for the northwest portion of the site.

3.1. FIELD ACTIVITIES AND ANALYSES

The following sections summarize purging and sampling wells and field quality control and quality assurance.

3.1.1. Purging and Sampling

Between May 30 and June 7, 2012, monitoring and recovery wells CM-7D, CM-8D, CM-16, MW-15, MW-16, MW-19S, MW-19D, MW-20S, MW-37, RW-01, RW-02, RW-04, RW-05, RW-06, RW-07, RW-08, RW-09, RW-10, RW-11, RW-13, RW-14, RW-15, and RW-16 were all purged and sampled for this semiannual event. All collected samples were analyzed for VOCs using EPA Method 8260B. Prior to sampling, wells RW-01, RW-10, RW-11, RW-13, and RW-15 were purged using a "low-flow" technique with a portable electric submersible pump (monsoon) and dedicated tubing. Wells RW-04, RW-05, RW-06, RW-07, RW-08, RW-09, RW-14, and RW-16 were purged and sampled using the dedicated extraction pumps and tubing, while well RW-02 was sampled with a peristaltic pump due to root obstructions. Field water quality parameters, including pH, temperature, oxidation reduction potential, dissolved oxygen, total dissolved solids, and salinity, were measured periodically during purging with a calibrated water quality meter equipped with a flow cell and recorded during purging onto monitoring well purge / sample logs. All undedicated or non-disposable, downhole equipment was decontaminated prior to purging and sampling each well. Monitoring well purge / sample logs were provided in Appendix A of the first semiannual 2012 report (OTIE, 2012).

Following stabilization of field water quality parameters, samples were collected into laboratory supplied containers appropriate for the analyses. The containers were filled, labeled, and then placed on ice inside a secured cooler. Samples were delivered by courier to CalScience Environmental Laboratories, Inc., of Garden Grove, California, a California State certified analytical laboratory. All samples were analyzed for VOCs using EPA Method SW 5030/8260B.

Water generated during purging and sampling wells was temporarily collected into a trailer mounted, 300-gallon polyethylene storage tank, owned and operated by OTIE. The purge water was transferred from the temporary storage tank to the on-site groundwater remediation system, treated, and stored for use as mixing water for future *in situ* injections.

3.1.2. Field Quality Assurance/Quality Control Samples

Field quality assurance / quality control (QA/QC) samples collected during the first semiannual 2012 monitoring event included two trip blanks and three field duplicate samples. All QA/QC samples were analyzed for VOCs.

Trip blanks are used to evaluate representativeness by identifying any VOCs that may have been introduced to the samples' environment during shipment, handling, or storage on site and at the laboratory. Two laboratory-supplied trip blanks were placed in the cooler with other groundwater samples for the following shipments to the laboratory by courier on May 30 and June 7, 2012. The trip blanks were labeled as TB3-5-30-12 for May 30, 2012 and as TB1-6-7-12 for June 7, 2012.

Field duplicate samples are collected and analyzed to evaluate the accuracy and precision of the contract laboratory. Three duplicate samples were collected concurrently with the primary samples at these wells: CM-8D, RW-11, and RW-14 and labeled as DUP1-6-6-12, DUP3-5-30-12 and DUP2, respectively.

3.2. LABORATORY RESULTS

Results of the May-June 2012 semiannual sampling event indicated that none of the samples from the monitoring wells contained concentrations of chemicals of concern above the detection limits except for wells CM-8D and MW-37. Concentrations of VOCs detected in the sample from well CM-8D were 1.2 µg/L of 1,1-DCA, 17 µg/L of 1,1-DCE, and 7.4 µg/L of TCE. Concentrations of VOCs detected in the sample from well MW-37 were 52 µg/L of 1,1-DCE, 6.2 µg/L of TCE, and 5.7 µg/L of chloroform. Additionally, the sample from well MW-20S contained only a concentration of acetone (30 µg/L), which could be attributed to lab contamination. None of the VOC concentrations exceeded the CAP groundwater clean-up goals established for the Site (Hughes, 1992).

Nine of the 14 recovery wells sampled (RW-01, RW-04, RW-06, RW-08, RW-10, RW-11, RW-14, RW-15, and RW-16) contained trace to moderate concentrations of VOCs ranging from 0.51 µg/L (1,2-DCA in RW-01) to 160 µg/L (1,1-DCE in RW-01). Results for recovery wells RW-02, RW-05, RW-07, RW-09, and RW-13 were all below detection limits for all VOC analytes. Samples from wells RW-01, RW-11, and RW-14 exceeded the CAP goal for 1,1-DCE with concentrations of 160 µg/L, 70 µg/L, and 80 µg/L, respectively.

Detected VOCs in recovery wells that were below CAP goals were as follows:

- 1,1-DCA was detected in wells RW-01, RW-10, and RW-14 at concentrations of 1.3 µg/L, 1.5 µg/L and 2.0 µg/L, respectively;
- 1,2-DCA was detected in wells RW-01 and RW-14 at a concentration of 0.51 µg/L and 1.1 µg/L, respectively;
- 1,1-DCE was detected in wells RW-06, RW-08, and RW-15 at concentrations of 25 µg/L, 4.0 µg/L, and 24 µg/L, respectively;
- *cis*-1,2-DCE was detected in wells RW-06, RW-14, and RW-16 at concentrations of 2.3 µg/L, 1.6 µg/L and 1.9 µg/L, respectively;
- PCE was detected only in well RW-15 at a concentration of 2.1 µg/L;

- TCE was detected in wells RW-01, RW-06, RW-14, and RW-15 at concentrations ranging from 1.2 µg/L to 6.4 µg/L;
- Vinyl chloride (VC) concentrations were detected in wells RW-01, RW-04, RW-06, RW-08, RW-10, RW-14, and RW-16 at concentrations ranging from 0.71 µg/L (RW-08) to 100 µg/L (RW-10). VC was not previously detected at the Site until EISB activities commenced in 2004. The VC concentrations are an intermediate daughter product, resulting from the EISB dechlorination process and are anticipated to eventually dissipate as further treatment is completed; and
- The sample from well RW-16 contained a concentration of toluene at 3.7 µg/L.

Results of the May-June 2012 sampling event are summarized in Table 2A of the first semiannual 2012 report (OTIE, 2012) and also included in Tables 3 and 4 of this report (historical results). The laboratory reports and chain-of-custody documentation for these results are provided in Appendix D of the first semiannual 2012 report.

3.3. FIELD AND LABORATORY QUALITY ASSURANCE/QUALITY CONTROL RESULTS

Field QA/QC samples for the groundwater sampling event included two trip blanks and three field duplicates. No VOCs were detected in the trip blank samples. Field duplicate samples are collected and analyzed to provide an indication of overall precision of the contract laboratory. Evaluation of the precision was accomplished by calculating the relative percent difference (RPD) of detected compounds in the field sample and field sample duplicate. The field duplicate RPDs ranged from 0% to 143% with all except one sample pair within established control limits of less than 35%. The 1,1-DCE results for the sample pair for CM-8D exceeded the RPD limit and were J-flagged.

Duplicate and primary sample results are summarized in Table 2B of the first semiannual 2012 report. All groundwater samples were shipped under appropriate chain of custody protocol at the method-specified temperature limit (4°C ± 2°C). All sample analyses were completed within the prescribed holding time.

Laboratory QA/QC procedures were carried out in accordance with U.S. EPA method specifications and the data was accepted based on the QA/QC criteria established by the U.S. EPA. Laboratory QA/QC samples included method blanks, laboratory control samples (LCS), LCS duplicates (LCSD), matrix spike samples (MS), MS duplicate (MSD) samples, post-digestion spike (PDS), and post-digestion spike duplicate (PDSD).

All laboratory quality control samples (method blanks, spike/spike duplicate, PDS/PDSD, and LCS/LCSD) were within their respective control limits with the following exceptions:

- 1,1-DCE in the spike/spike duplicate sample were outside of their control limits in sample batch 120601S01. As a result, all 1,1-DCE detects in that sample batch were “J” flagged.

4.0 ANNUAL SAMPLING, ANALYSES AND RESULTS – DECEMBER 2012

Several groundwater monitoring events were conducted concurrently in December 2012. In addition to the annual event, RPM events for Phase IV, VI, and VII injections were performed under WDR Permit No. R4-2007-0019 (Series No. 092). As some of the annual wells are also RPM wells, the sampling of the all the perimeter monitoring wells was conducted between December 6 and December 20 for the annual 2012 event. Eight semiannual monitoring wells and 15 annual monitoring wells were monitored and sampled. All 14 of the accessible recovery wells were also sampled during the annual event in December 2012.

4.1. FIELD ACTIVITIES AND ANALYSES

4.1.1. Groundwater Monitoring Well Sampling

Between December 11 and 20, 2012, 15 monitoring wells in the annual sampling program and 8 semiannual wells were sampled per the modified WDR permit and the M&RP requirements, in addition to wells MW-37 and MW-38. The 25 wells sampled include: M-1, CM-2D, CM-4D, CM-7D, CM-8D, CM-9D, CM-13, CM-14, CM-16, CM-18, CM-19, MW-15, MW-16, MW-17, MW-19S, MW-19D, MW-20S, MW-23 through MW-27, MW-36, MW-37, and MW-38.

The wells were purged and monitored as described above in Section 3.1.1. All groundwater samples were transported to Calscience Environmental Laboratory via courier to be analyzed for VOCs (EPA Method 8260B) following chain-of-custody protocol. Field sampling data sheets for this sampling event are provided in Appendix A.

Water generated from well purging was collected and placed into drums pending off-site disposal.

4.1.2. Recovery Well Sampling

As in May-June 2012 for the semiannual sampling event, all 14 recovery wells (RW-01, RW-02, RW-04, RW-05, RW-06, RW-07, RW-08, RW-09, RW-10, RW-11, RW-13, RW-14, RW-15, and RW-16) were sampled between December 6 and 20, 2012 for the annual event.

The wells were purged and monitored as described above in Section 3.1.2. Groundwater samples were transported to Calscience Environmental Laboratory via courier following chain-of-custody protocol for VOC analysis by EPA Method 8260B. Field sampling data sheets are provided in Appendix A.

Water generated from well purging was collected and placed into drums pending off-site disposal.

4.2. LABORATORY RESULTS

4.2.1. Monitoring Well Results

Results of the December 2012 sampling event indicated that concentrations of VOCs were identified in 9 of the 25 monitoring wells sampled. Samples from monitoring wells CM-7D, CM-9D, CM-13, CM-14, CM-16, CM-18, MW-15, MW-16, MW-17, MW-19S, MW-19D, MW-20S, MW-24, MW-25, MW-26, and MW-27 were below detection limits for all analytes.

Eleven different analytes were detected in the nine samples and none exceeded the CAP goals. 1,1-DCE was detected in five monitoring wells with concentrations ranging from 1.8 µg/L (CM-2D) to 47 µg/L (MW-37). Concentrations of TCE were detected in samples from only two

wells: CM-8D (6.5 µg/L) and MW-37 (5.4 µg/L). Concentrations of *cis*-1,2-DCE were not detected in any wells. Concentrations of VC were detected in samples from wells M-1 (40 µg/L), CM-4D (1.3 µg/L), MW-23 (80 µg/L), and MW-36 (1.2 µg/L). As VC was not detected prior to the initiation of EISB at the Site, there is no CAP goal for it. VC levels are a by-product of the EISB process and are expected to diminish over time.

Although no California MCLs were exceeded for any of these analytes, minor concentrations of toluene; chloroform; 1,1-DCA; 1,2-DCA; and PCE were also detected in several wells at levels of 1.1 µg/L to 4.6 µg/L. Acetone, 2-butanone (or methyl ethyl ketone, MEK), and 2-hexanone were also detected in two wells. Acetone was detected in wells M-1 and MW-36 at concentrations of 810 µg/L and 59 µg/L, respectively. Well M-1 also contained 1,000 µg/L of MEK and 310 µg/L of 2-hexanone. MEK and acetone are products of the EISB degradation process. There are no California MCLs for any of these three analytes.

Results of the December 2012 sampling event are summarized in Table 2A and laboratory reports and chain-of-custody documentation are included in Appendix C.

Historical (1996 through present) concentration results for 11 selected compounds in groundwater monitoring wells are summarized in Table 3. Concentrations of select VOCs versus time in Site monitoring wells are illustrated on Figure 4 and in Graphs 7 through 42.

4.2.2. Recovery Well Results

Eight of the 14 recovery wells sampled (RW-01, RW-04, RW-06, RW-10, RW-11, RW-14, RW-15, and RW-16) contained detectable levels of VOCs. Results from recovery wells RW-02, RW-05, RW-07, RW-08, RW-09, and RW-13 were below detection limits for all VOCs. The samples from wells RW-01, RW-11, RW-14, and RW-15 exceeded the 60 µg/L CAP goal for 1,1-DCE at 280 µg/L, 70 µg/L, 370 µg/L, and 63 µg/L, respectively.

Detected VOCs in recovery wells that were below CAP goals were as follows:

- PCE was detected only in well RW-15 with a concentration of 3.7 µg/L;
- TCE was detected in recovery wells RW-01, RW-06, RW-14, and RW-15 at concentrations of 4.4 µg/L, 1.5 µg/L, 2.7 µg/L, and 14 µg/L, respectively;
- 1,1-DCE was also detected below CAP goal in wells RW-04 and RW-06 with values of 3.2 µg/L and 14 µg/L, respectively;
- *cis*-1,2-DCE was detected in wells RW-06 and RW-14 with concentrations of 2.0 µg/L and 2.8 µg/L, respectively;
- VC concentrations were detected in wells RW-01, RW-04, RW-06, RW-10, RW-14, RW-15 and RW-16 at levels ranging from 0.54 µg/L to 78 µg/L. VC was not detected at the Site until EISB activities commenced in 2004. The VC concentrations are a transient daughter product resulting from the EISB dechlorination process and will likely dissipate over time as treatment is completed;
- Trace concentrations of 1,1-DCA (2.3 µg/L and 3.8 µg/L) and 1,2-DCA (0.9 µg/L and 2.68 µg/L) in wells RW-01 and RW-14, respectively.

Results of all detected VOCs for the December 2012 recovery well sampling are summarized in Table 2A. Photocopies of the laboratory reports are provided in Appendix C.

Historical (1995 through present) recovery well concentration results for 11 constituents of concern are summarized in Table 4. Concentrations of select VOCs versus time in the Site's recovery wells are illustrated in Graphs 43A-B through 45A-B.

5.0 *IN SITU* BIOREMEDIATION

On February 23, 2009 the LARWQCB approved T N & Associates, Inc.'s (TN&A's) *Corrective Action Plan Addendum #3: Work Plan for Additional Enhanced In Situ Bioremediation and In Situ Chemical Reduction Activities* (TN&A, 2008) to implement additional EISB efforts in three treatment areas and *in situ* chemical reduction (ISCR) activities in a fourth treatment area. WDR Permit No. R4-2007-0019 (Series No. 092) was obtained in September 2009 and the injection activities were initiated.

In October 2009, the Phase IV EISB injections were implemented in the "Northwest Area" of the Site. A total of four RPM wells were included in M&RP No. CI-8947, and nine post-injection monitoring events have been completed since the injections, the most recent being Month #36 in December 2012.

The Phase V ISCR injection was implemented at the Former Hazardous Waste Storage Area (HWSA) in June 2010. A total of six RPM wells were included in M&RP No. CI-8947 and eight post-injection monitoring events have been completed. The most recent event was Month #30 in December 2012.

In May 2011, the Phase VI EISB injections were implemented in the "Former Bldg 269 Area" of the Site. A total of three RPM wells were included in M&RP No. CI-8947 and six post-injection monitoring event has been completed since the injections, the most recent being Month #18 in December 2012.

In September 2012, the Phase VII EISB injections were implemented in the "Former Tank T3 Area" of the Site. A total of three RPM wells were included in M&RP No. CI-8947 and two post-injection monitoring event have been completed since the injections, the most recent being Month #3 in December 2012.

All historical EISB program information and associated data were summarized in the *Enhanced In Situ Bioremediation and In Situ Chemical Reduction Progress Report, Fourth Quarter and Annual 2012 Summary, Former Canoga Park Facility, 8433 Fallbrook Avenue, Canoga Park, California* (OTIE, 2013), which was submitted in February 2013. Please refer to this document for information pertaining to the EISB program.

Monitoring events in 2013 will include Phase VII EISB Month #6 in March 2013; Phase IV EISB Month #42, Phase V ISCR Month #36, Phase VI EISB Month #24, and Phase VII EISB Month #9 in May-June 2013; and Phase IV EISB Month #48, Phase V ISCR Month #42, Phase VI EISB Month #30, and Phase VII EISB Month #15 in November-December 2013.

6.0 FIELD AND LABORATORY QUALITY ASSURANCE/QUALITY CONTROL

Field QA/QC samples for water matrix for the sampling event in December 2012 included five trip blanks, one field blank, and six field duplicates. Trip blanks are used to evaluate representativeness by identifying any VOCs that may have been introduced to the samples' environment during shipment, handling, or storage on Site and at the laboratory. Field blanks are used to evaluate decontamination procedures. No VOCs were detected in any of the six trip or field blank samples. Field duplicate samples are collected and analyzed as an indication of overall precision. Field duplicates were collected from monitoring wells CM-2D (DUP-A12a-121412), MW-37 (DUP-A12b-121812), CM-4D (DUP-269) and recovery wells RW-01 (identified as DUP-NW121012), RW-06 (identified as DUP-RW-12612) and RW-14 (sample DUP-T3-121012).

Evaluation of the precision was accomplished by calculating the RPD of detected compounds in the field sample and field sample duplicate. Field duplicate RPDs were within established control limits (<35%) all six sample sets, with two exceptions. For 1,1-DCE concentrations in the CM-2D sample pair, the primary sample contained a detectable concentration while the duplicate sample did not. Therefore the sample pair was flagged with a “J.” Additionally, VC in the pair from well RW-01 had an RPD of 50% which exceeds the control limit. Both results were flagged with a “J.”

Laboratory QA/QC samples for water matrix included method blanks, LCS, LCSD, MS, and MSD. No contamination was detected in the method blanks. All percent recoveries and RPD values for LCS/LCSD and were within method-specified control limits.

Results for QA/QC samples are included in Table 2B.

7.0 INVESTIGATION DERIVED WASTE

The generated water during purging and sampling wells in June 2012 was temporarily collected into a trailer-mounted, 300-gallon polyethylene storage tank, owned and operated by OTIE. The purge water was transferred from the temporary storage tank to the on-site groundwater remediation system, treated, and stored for use as mixing water for future *in situ* injections.

Water generated in June 2012 was used in the Phase VII injections in Former Tank T3 Area in September 2012. As no other injections are currently scoped, purge water generated during sampling in December 2012 was placed into 55-gallon drums. The drums were labeled as non-hazardous and stored on site pending disposal. On December 20, 2012, American Integrated Services, Inc. picked up the drums and transported them under manifest to a state-certified waste facility, Crosby and Overton, Inc., in Long Beach California, where the water was recycled. The manifest for the waste water is included in Appendix D.

8.0 SUMMARY AND CONCLUSIONS

This report was prepared for Raytheon to comply with M&RP No. CI-7483 issued by the LARWQCB, File Number 94-45. This report is also in accordance with the August 26, 1997 and January 22, 2007 LARWQCB letters, approving modifications to the M&RP. M&RP No. CI-7483 was associated with WDR Permit No. 95-012, which was issued in 1995. This WDR was officially rescinded by the LARWQCB in their letter dated September 16, 2010; however, monitoring in accordance with M&RP No. CI-7483 will continue on a voluntary basis until a new site-wide M&RP is established The results and observations for 2012 groundwater monitoring and remedial operations at the Site are as follows:

First Semiannual 2012 Event

- Static groundwater depths for the monitoring wells were gauged on May 29, 2012. Depths to groundwater in the wells ranged from 10.88 feet (MW-19D) to 61.62 feet (CM-19) below TOC. The groundwater gradient in the northwest portion of the site was to the west-southwest at 0.0182 ft/ft. The groundwater gradient was essentially flat in the extreme northwest corner of the Site. In the north-central and northeast portions of the Site, the gradient ranged from 0.0212 ft/ft to the south to 0.0133 ft/ft to the southeast. Depth to water measurements and average groundwater gradients for this event are consistent with historical trends.

- Per M&RP No. CI-7483, wells CM-7D, CM-8D, CM-16, MW-15, MW-16, MW-19S, MW-19D and MW-20S were purged and sampled for VOC analysis between May 30 and June 7, 2012. Well MW-37 was also sampled during this event for additional groundwater data.

- Results for the monitoring well samples indicated that none contained VOC concentrations above the detection limit except for wells CM-8D and MW-37. The sample from well CM-8D contained 1.2 µg/L of 1,1-DCA, 17 µg/L of 1,1-DCE, and 7.4 µg/L of TCE. Concentrations of VOCs detected in the sample from well MW-37 were 52 µg/L of 1,1-DCE, 46.2 µg/L of TCE, and 5.7 µg/L of chloroform. Additionally, the sample from well MW-20S contained only a concentration of acetone (30 µg/L), which is a possible lab contaminant. No VOC concentration exceeded the CAP goals.

- During the May-June 2012 semiannual sampling event, recovery wells RW-01, RW-02, RW04, RW-05, RW-06, RW-07, RW-08, RW-09, RW-10, RW-11, RW-13, RW-14, RW-15, and RW-16 were also sampled. Samples from wells RW-02, RW-05, RW-07, RW-09, and RW-13 were below detection limits for all VOCs. CAP goals were only exceeded in 3 of the 14 wells sampled: RW-01, RW-11, and RW-14. Samples from wells RW-01, RW-11 and RW-14 contained 1,1-DCE concentrations exceeding the 60 µg/L CAP goal at 160 µg/L, 70 µg/L and 80 µg/L, respectively. VOCs detected in the recovery well samples below CAP goals included PCE; 1,1-DCE; TCE; *cis*-1,2-DCE; 1,1-DCA; 1,2-DCA; VC; and toluene at concentrations ranging from 0.51 µg/L (1,2-DCA in RW-01) to 100 µg/L (VC in RW-10).

Second Semiannual and Annual 2012 Event

- Semiannual gauging was performed for the second half of 2012 on December 12, 2012, when 59 monitoring wells were gauged. Depths to water ranged from 10.06 feet (well MW-21D) to 62.79 feet below TOC (well CM-19). The overall average groundwater elevation was 1.29 feet lower in December 2012 as compared to the May 2012 average elevation (when comparing the same wells). Apparent groundwater gradient in the northwest portion

of the Site ranged from 0.0143 ft/ft southwest to 0.016 ft/ft northeast, while the groundwater gradient was essentially flat in the extreme northwest corner of the Site. The apparent groundwater gradient over the north-central and northeast portions of the Site ranged from 0.138 ft/ft northwest to 0.020 ft/ft southwest to 0.021 ft/ft southeast. In the southern portion of the Site, the gradient ranged from 0.021 ft/ft to 0.0485 ft/ft southeast. Depth to water measurements and average groundwater gradients for this event are consistent with historical trends.

- Results of the December 2012 sampling event indicated that concentrations of VOCs were identified in 9 of the 25 monitoring wells sampled. Samples from monitoring wells CM-7D, CM-9D, CM-13, CM-14, CM-16, CM-18, MW-15, MW-16, MW-17, MW-19S, MW-19D, MW-20S, MW-24, MW-25, MW-26, and MW-27 were below detection limits for all analytes. Eleven different analytes were detected in the nine samples and none exceeded the CAP goals. 1,1-DCE was detected in five wells with concentrations ranging from 1.8 µg/L (CM-2D) to 47 µg/L (MW-37). Concentrations of TCE were detected in samples from only two wells: CM-8D (6.5 µg/L) and MW-37 (5.4 µg/L). Concentrations of *cis*-1,2-DCE were not detected in any wells. Concentrations of VC were detected in samples from wells M-1 (40 µg/L), CM-4D (1.3 µg/L), MW-23 (80 µg/L), and MW-36 (1.2 µg/L). As VC was not detected prior to the initiation of EISB at the Site, there is no CAP goal for it. VC levels are a by-product of the EISB process and are expected to diminish over time.

- All 14 of the accessible recovery wells were sampled during the second semiannual event in December 2012. Sampled wells include RW-01, RW-02, RW-04 through RW-11, and RW-13 through RW-16. Eight of the 14 recovery wells sampled (RW-01, RW-04, RW-06, RW-10, RW-11, RW-14, RW-15, and RW-16) contained detectable levels of VOCs. Results from recovery wells RW-02, RW-05, RW-07, RW-08, RW-09, and RW-13 were below detection limits for all VOCs. The samples from wells RW-01, RW-11, RW-14, and RW-15 exceeded the 60 µg/L CAP goal for 1,1-DCE at 280 µg/L, 70 µg/L, 370 µg/L, and 63 µg/L, respectively. VC concentrations were detected in wells RW-01, RW-04, RW-06, RW-10, RW-14, RW-15 and RW-16 at levels ranging from 0.54 µg/L (RW-15) to 78 µg/L (RW-14).

The semiannual data indicate generally stable or decreasing concentrations, sustained decreases below CAP goals in the vicinity of wells CM-8D and MW-37, and only three areas that remain above CAP goals: two in the northwest area (wells RW-01 and RW-11) and one in the former Tank T3 area in the north-central portion of the Site (near well RW-14).

The lateral extent of the VOC plume is generally stable or decreasing with significant sustained decreases in concentrations within the plume's interior due to the implementation of the EISB program. None of the 25 monitoring wells sampled and four of the 14 recovery wells sampled (RW-01, RW-11, RW-14, and RW-15) had concentrations exceeding CAP goals. Some notable changes in 2012 data include a significant decrease in VOCs in well CM-2D, where 1,1,-DCE decreased from 71 µg/L in December 2011 to 1.8 µg/L in December 2012, and well CM-19 contained a 1,1-DCE concentration of 21 µg/L, which, while below the CAP goal, is the highest concentration to date in that well.

The next monitoring event for M&RP CI-7483 is the first semiannual 2013 event and is scheduled for June 2013. Results will be presented in the first semiannual 2013 groundwater monitoring and remediation report to be submitted by October 30, 2013.

TABLE 1B

DEPTH TO WATER AND GROUNDWATER ELEVATION DATA - December 12, 2012

Former Raytheon Facility

8433 Fallbrook Avenue, Canoga Park, CA

Well I.D.	Depth to Water (ft, TOC)	Top of Casing Elevation (ft, MSL)	Screen Interval (ft, bgs)	Groundwater Elevation (ft, MSL)	Gauging Frequency	Sampling Frequency	Comments
MW-41	22.35	863.54	25-40	841.19	--	--	
MW-42	21.22	860.47	25-40	839.25	--	--	
MW-43	14.15	855.36	26-41	841.21	--	--	
MW-44	15.14	855.23	26-41	840.09	--	--	
VW-122	34.91	885.43	25-40	850.52	HWSA	HWSA	
RW-01	20.61	860.71	10-50	840.10	SA	SA	
RW-11	25.62	869.17	25-65	843.55	SA	SA	
RW-14	27.22	874.37	10-50	847.15	SA	SA	

Notes:

1) ft = feet
2) TOC = top of well casing
3) MSL = Mean Sea Level, National Geodetic Vertical Datum of 1929 (NGVD29)
4) bgs = below ground surface
5) A = annual; SA = semiannual; HWSA = former hazardous waste storage area; EISB = EISB remedial progress monitoring event; NS = not required to be sampled
6) -- = data not available.

Notes:
1) bgs = below ground surface; HAS = hollow stem auger; PVC = poly vinyl chloride; SS = stainless steel; CPVC = chlorinated poly vinyl chloride
2) '--' = not available.
3) Latitude/longitude in decimal degree format.
4) Only recently-installed wells surveyed using latitude/longitude. All other wells surveyed in State of California Plane Coordinate System Zone 5 (NAD83) using NGVD029 for a vertical datum; or surveyed using an arbitraty onsite datum. City of Los Angeles Benchmark 06-04499 (elevation 839.288 feet above mean sea level) used for most surveying activities.
5) " * " = Top of casing elevation at the time of installtion. Not necessarily current.

Notes:

1) All results in micrograms per liter (mg/L)

2) Only detectable concentrations of constituents of concern are shown; detections above reporting limit are **bolded**.

3) 1,1-DCA = 1,1-Dichloroethane; 1,2-DCA = 1,2-Dichloroethane; 1,1-DCE = 1,1-Dichloroethene; cis-1,2-DCE = 1,2-Dichloroethene; PCE =Tetrachloroethene; TCE = Trichloroethene; VC = Vinyl Chloride; MEK = 2-Butanone.

4) CAP Goals = Corrective Action Plan Groundwater Cleanup Goals (Hughes Environmental Systems, 1992); N = Normal Sample; FD = Field Duplicate Sample; "<" = not detected above the stated reporting limit.

5) Concentrations exceeding CAP Goals are shaded in gray

6) "N"- normal sample, "FD" - field duplicate

Notes:

1) All concentrations in µg/L.

2) All analyses done by EPA Method 8260, 8260B or 8021B.

3) '-- = not analyzed for parameter

4) Only wells with detectable concentrations of constituents of concern since March 1995 are shown.

5) 1,1-DCA = 1,1-Dichloroethane; 1,2-DCA = 1,2-Dichloroethane; 1,1-DCE = 1,1-Dichloroethene; cis-1,2-DCE = cis-1,2-Dichloroethene; PCE = Tetrachloroethene; 1,1,1-TCA = 1,1,1-Trichloroethane; TCE = Trichloroethene; TCFM = Trichlorofluoromethane; VC = Vinyl Chloride.

6) "J" - result qualified as estimated due to quality control issues.

Notes:

1) All concentrations in µg/L.

2) All analyses done by EPA Method 8260, 8260B or 8021B, except for TPHg by EPA Method 8015M.

3) '-- = not analyzed for this analyte.

4) Only wells with detectable concentrations of constituents of concern are shown.

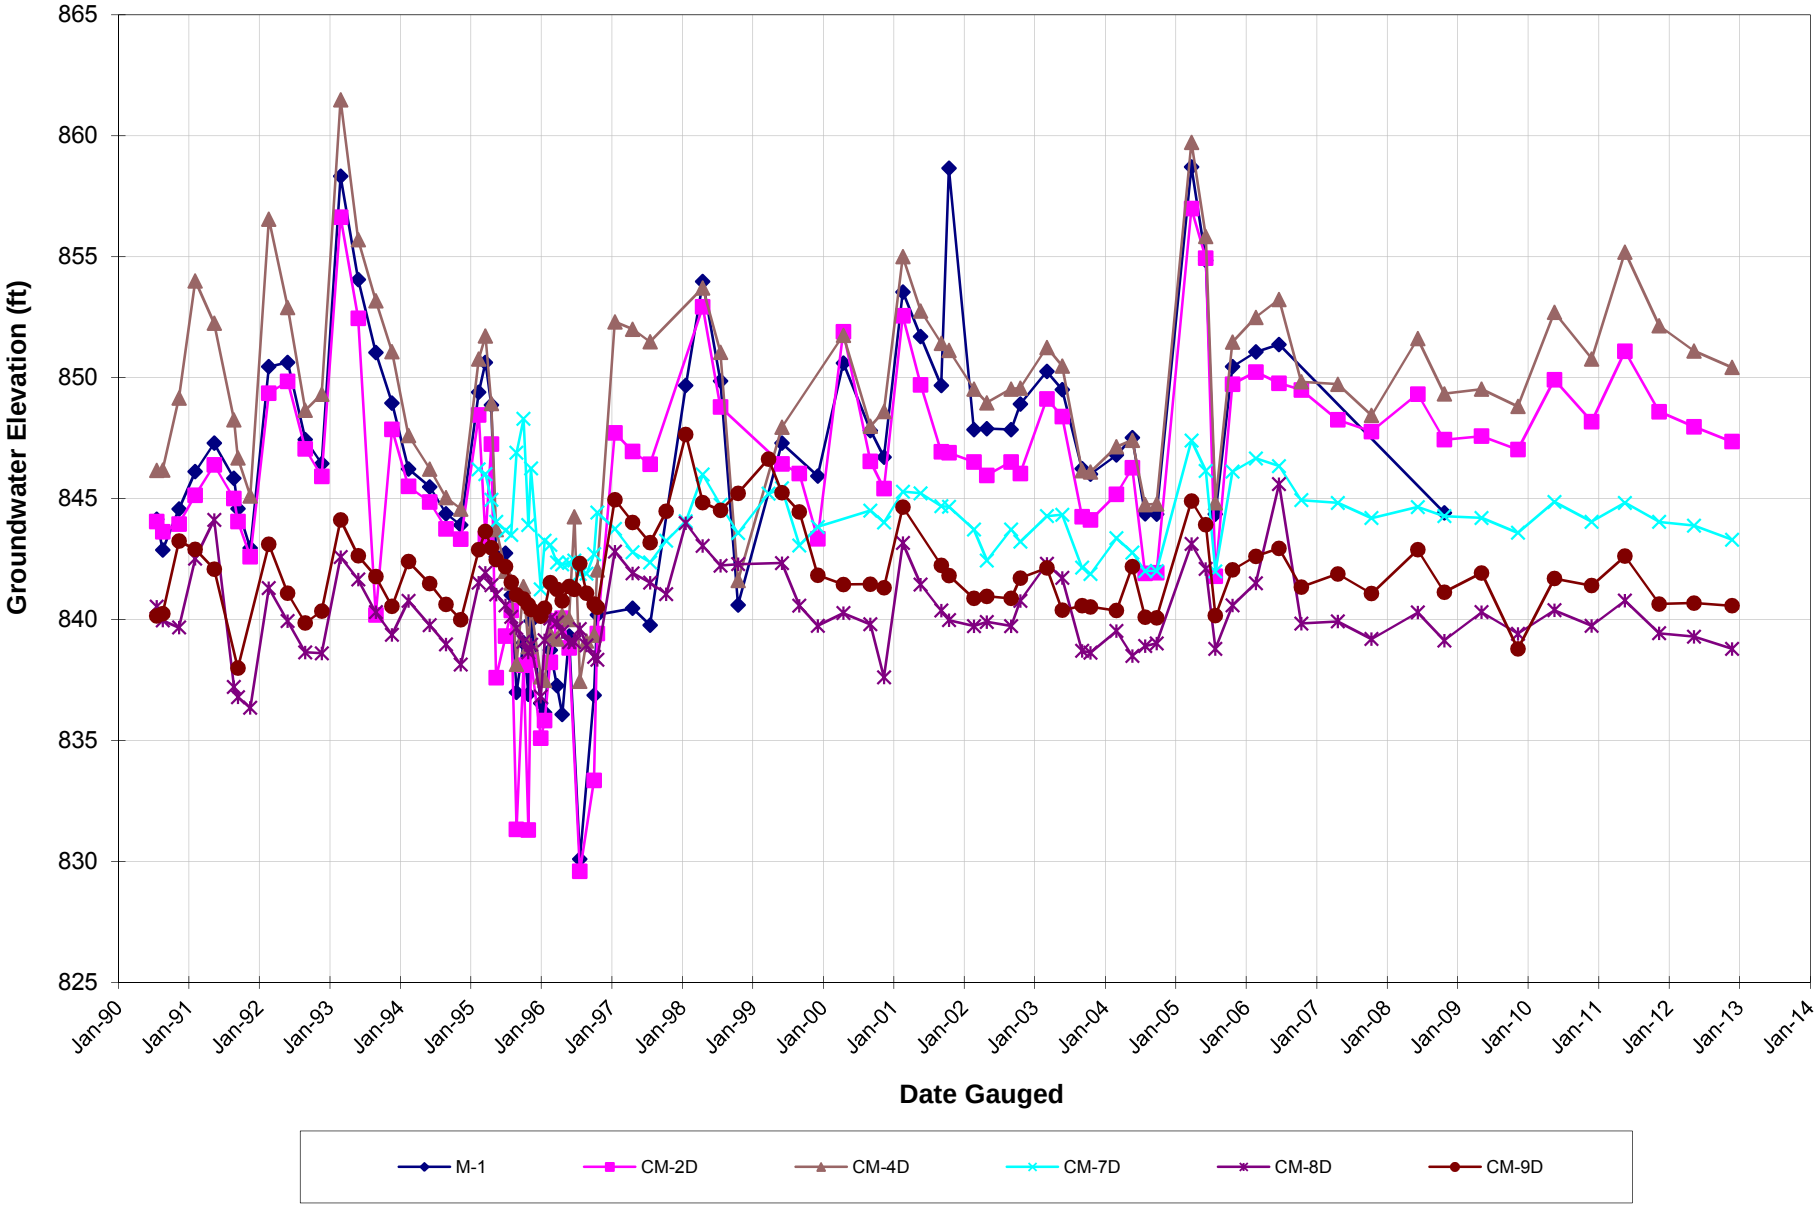
5) 1,1-DCA = 1,1-Dichloroethane; 1,2-DCA = 1,2-Dichloroethane; 1,1-DCE = 1,1-Dichloroethene; cis-1,2-DCE = cis-1,2-Dichloroethene; PCE = Tetrachloroethene; 1,1,1-TCA = 1,1,1-Trichloroethane; 1,1,2-TCA = 1,1,2-Trichloroethane; TCE = Trichloroethene; VC = vinyl chloride

GRAPHS

Graph 1: Hydrograph - Monitoring Wells M-1 through CM-9D

Former Canoga Park Facility

8433 Fallbrook Ave., Canoga Park, California

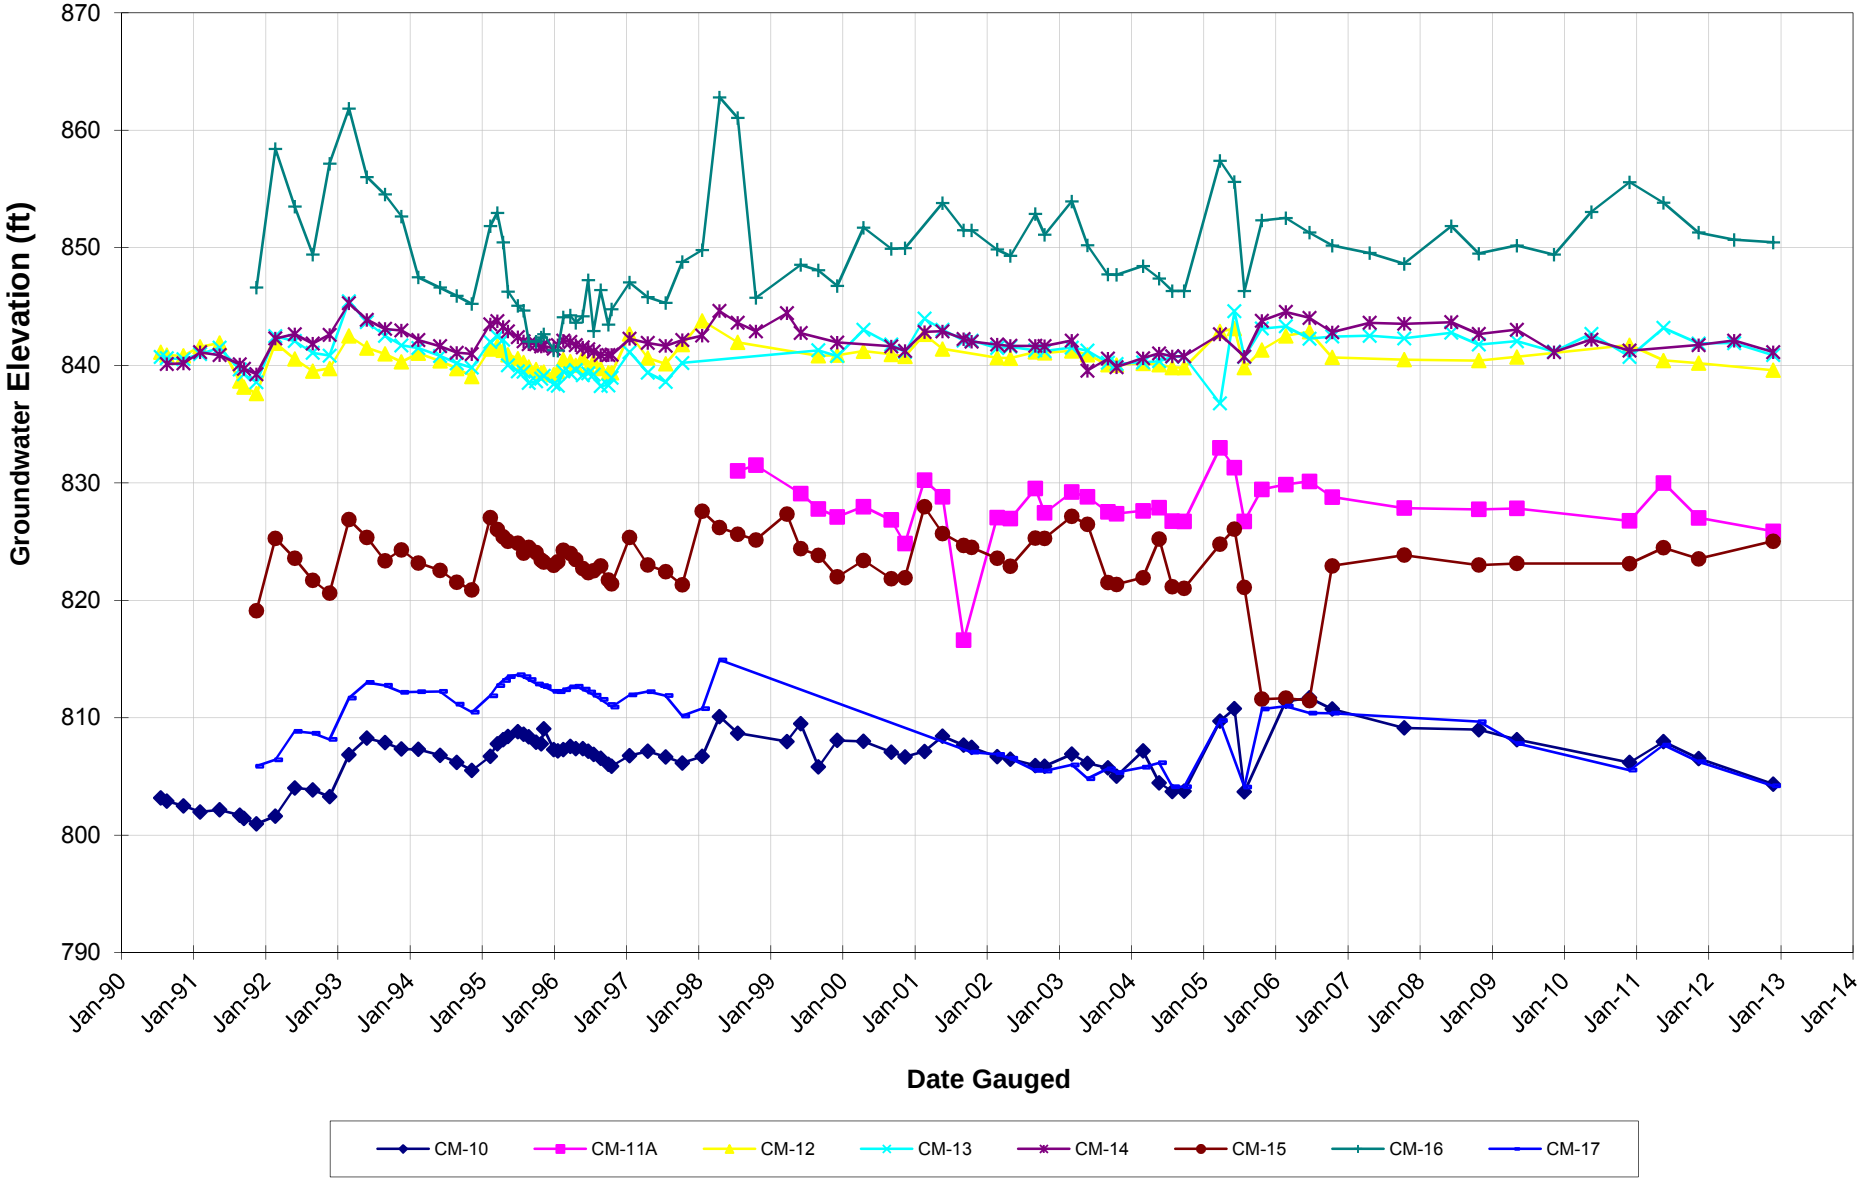


Data collected by GRC 1994-1995, by FDGTI 1996-1999 and by OTIE-TN&A 2000-present. Wells with missing data points were either dry or inaccessible at time of gauging.

Graph 2: Hydrograph - Monitoring Wells CM-10 through CM-17

Former Canoga Park Facility

8433 Fallbrook Ave., Canoga Park, California

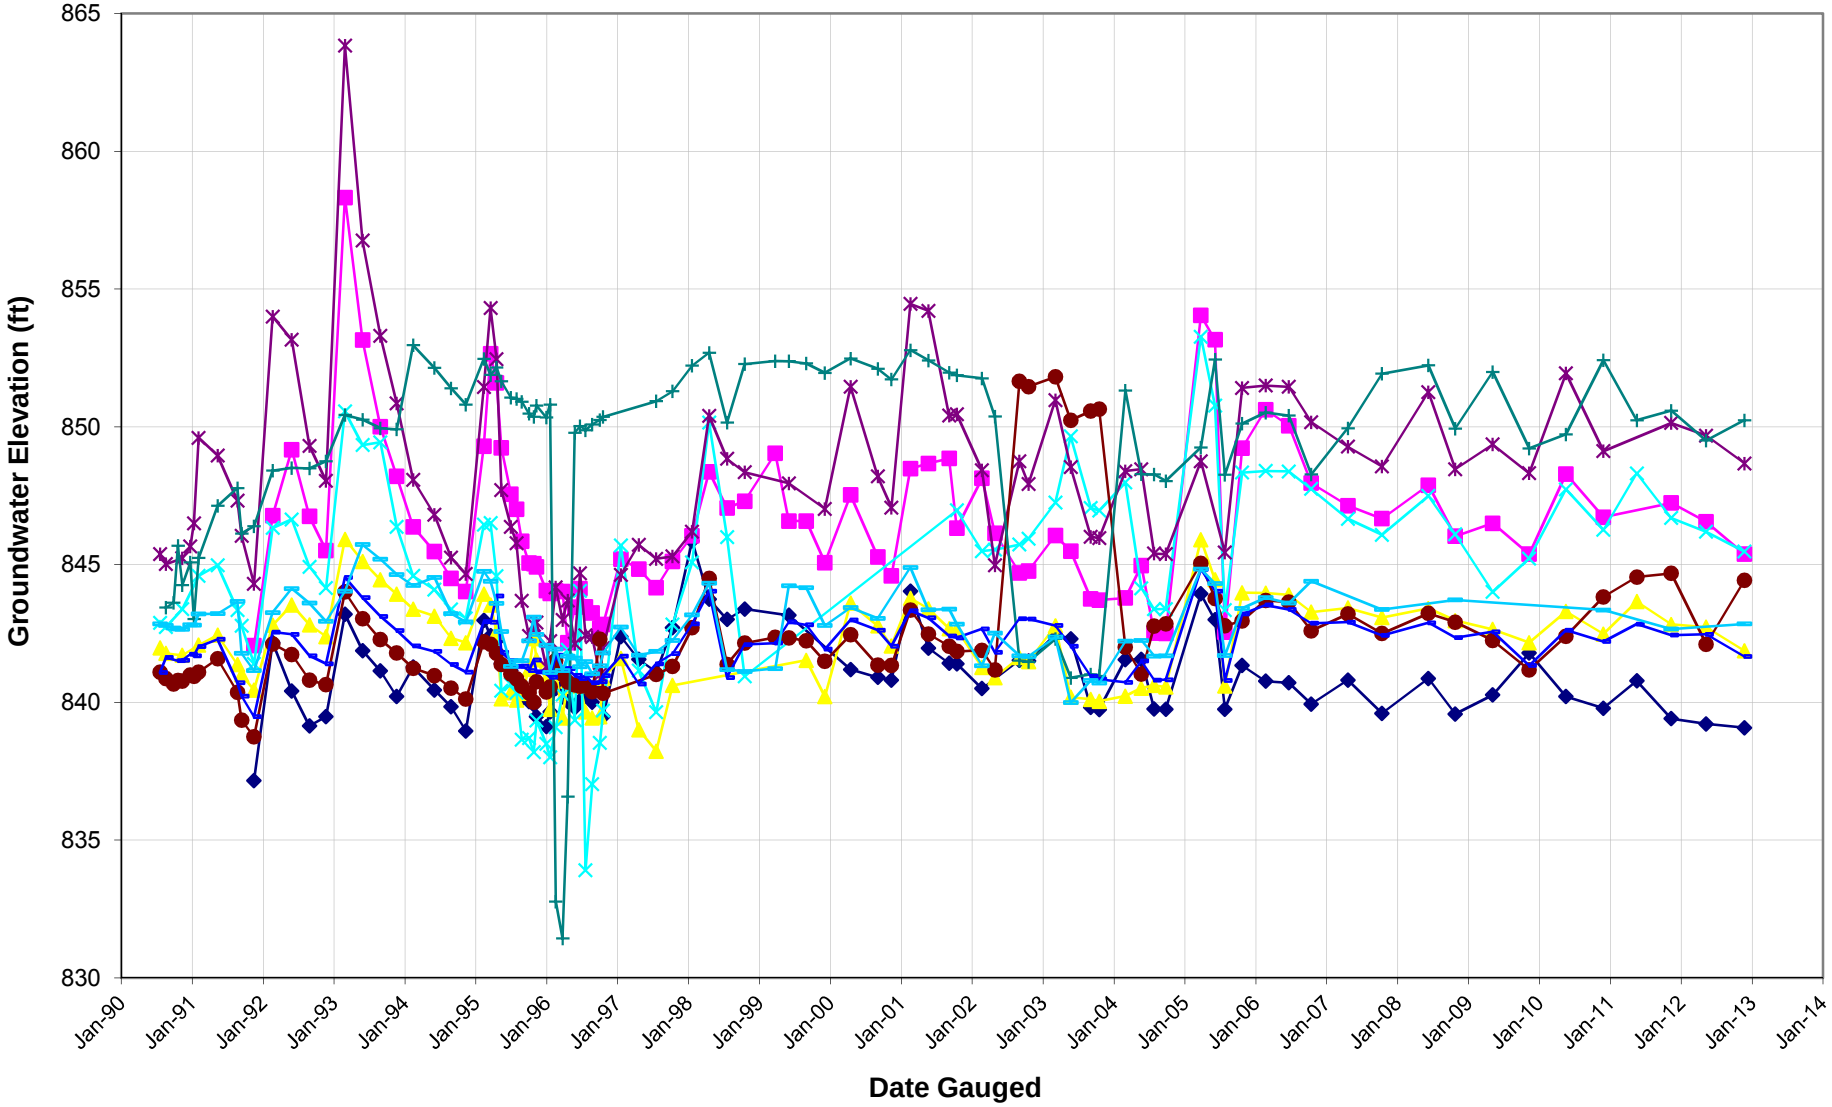


Data collected by GRC 1994-1995, by FDGTI 1996-1999 and by OTIE-TN&A 2000-present. Wells with missing data points were either dry or inaccessible at time of gauging.

Graph 3: Hydrograph - Monitoring Wells CM-18 through MW-20D

Former Canoga Park Facility

8433 Fallbrook Avenue, Canoga Park, CA

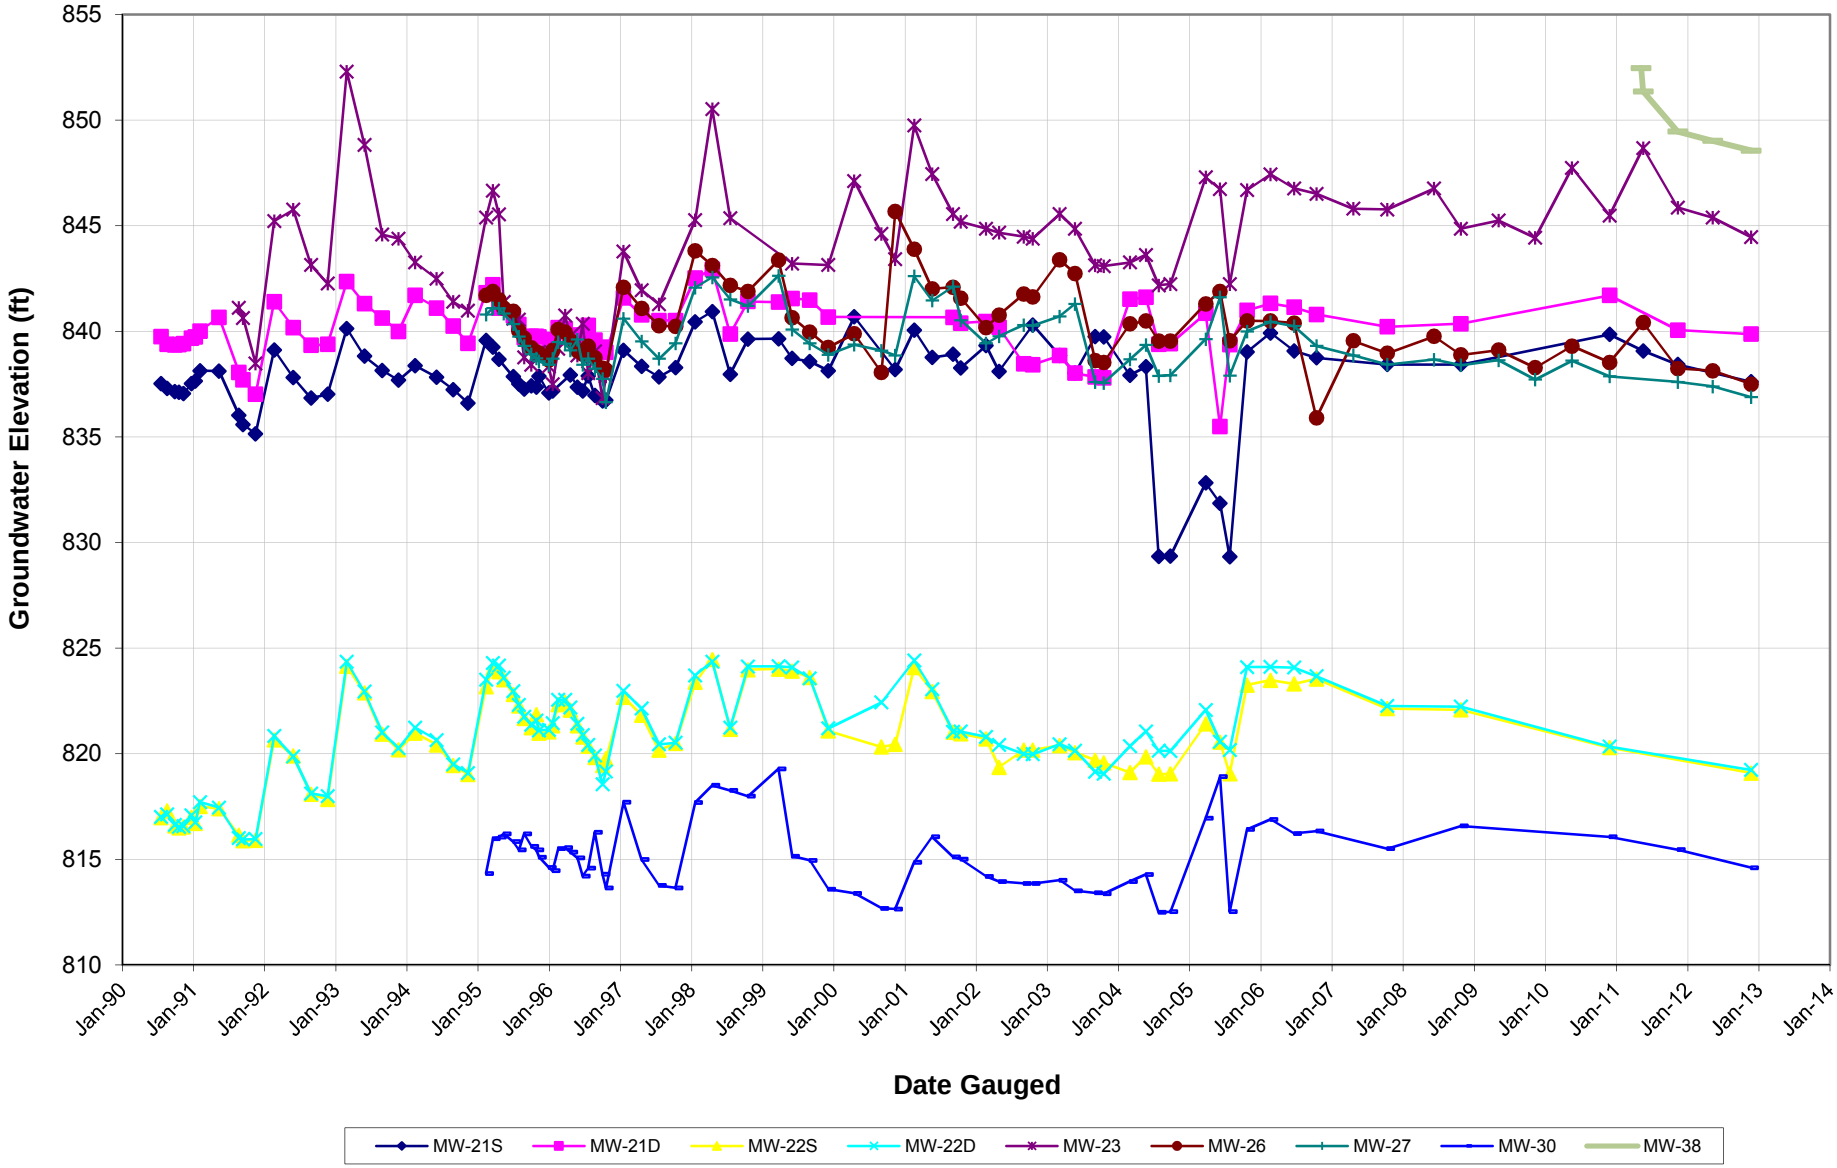


Data collected by GRC 1994-1995, by FDGTI 1996-1999 and by OTIE-TN&A 2000-present. Wells with missing data points were either dry or inaccessible at time of gauging.

Graph 4: Hydrograph - Monitoring Wells MW-21D through MW-30 and MW-38

Former Canoga Park Facility

8433 Fallbrook Avenue, Canoga Park, CA

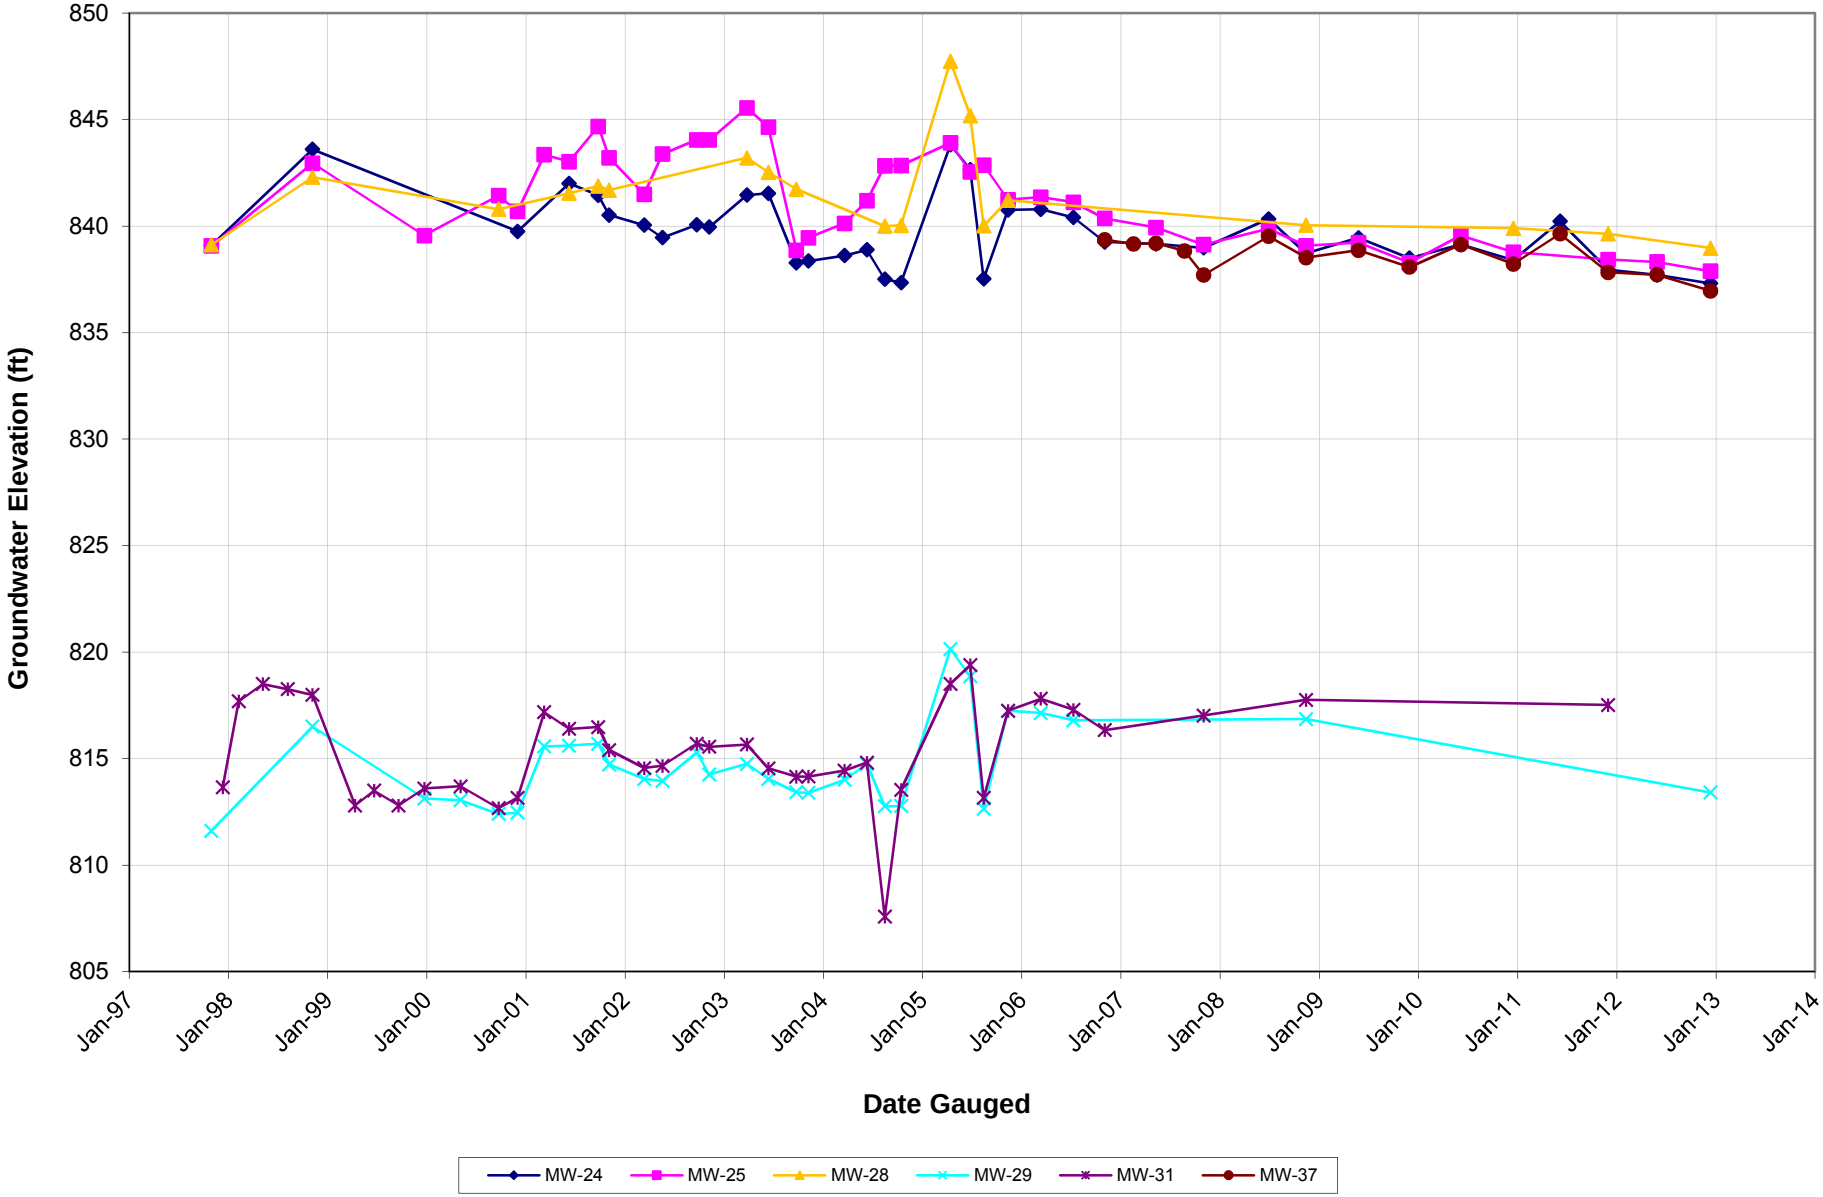


Data collected by GRC 1994-1995, by FDGTI 1996-1999 and by OTIE-TN&A 2000-present. Wells with missing data points were either dry or inaccessible at time of gauging.

Graph 5: Hydrograph - Monitoring Wells MW-24, MW-25, MW-28, MW-29, MW-31, and MW-37

Former Canoga Park Facility

8433 Fallbrook Avenue, Canoga Park, CA



Data collected by GRC 1994-1995, by FDGTI 1996-1999 and by OTIE-TN&A 2000-present. Wells with missing data points were either dry or inaccessible at time of gauging.

APPENDIX A

FIELD LOGBOOK DATA AND
GROUNDWATER WELL PURGE RECORDS

Daily Field Memorandum

Field Personnel: Bob Johnson
Date: 12-12-12
Project Name: Raytheon Canoga
Time Arrived Site:
Project/Phase/Task Number: 2009025
Time Left Site:
Project Manager:
Travel Time:

Regulator(s) on Site/Time: Ø

Client(s) on Site/Time: Ø

Tasks Completed/Equipment Used/Times: Annual Sample Monitor & Recovery wells.
12-6-12 - sample recovery wells,
Duplicate- dup RW12612 From RW-6,
RW-13 - no R.W. dedicated pump, use monsoon.
Purge water placed in drum.
12-12-12 - gauge site.
12-11-12 - gauge & sample DWP site.
12-14-12- start monitor well sample.
Duplicates- Dup A12a -121412 From CM-2D
Dup A12b- 121812 From MW-37
Trip Blanks - TB12612
TB 121112 (3 wells D.W.P.)
TB 122012
All purge water placed in drums,
AIS picks up 2 drums purge water on 12-20-12.
NO drums left on site.

Tasks Completed/Equipment Used/Times:

DEPTH TO WATER AND GROUNDWATER ELEVATION DATA

Former Raytheon Facility, 8433 Fallbrook Avenue, Canoga Park, CA

Date: 12-12-12

Time: _____ Technician: BJ

Well I.D.	Depth to Water (ft, TOC)	Top of Casing Elevation (ft, MSL)	Screen Interval (ft, bgs)	Gauging Frequency	Sampling Frequency	Comments

Additional Comments: Oil Thick cottage cheese in well. Add 45 gals H2O to well, 5 gals at a time. After every 5 gals H2O added, well was surged with plastic solid surge block. Cottage cheese is now a ~~soupy~~ soupy? liquid. Grab sample with set point bailer.

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-12-0402

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-12-0605

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-12-0606

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

TEMPERATURE: Thermometer ID: SC4 (Criteria: 0.0 °C – 6.0 °C, not frozen except sediment/tissue)

Temperature 2.6 °C - 0.3 °C (CF) = 2.3 °C ☑ Blank ☐ Sample

☐ Sample(s) outside temperature criteria (PM/APM contacted by: _____).

☐ Sample(s) outside temperature criteria but received on ice/chilled on same day of sampling.

☐ **Received at ambient temperature, placed on ice for transport by Courier.**

Ambient Temperature: ☐ Air ☐ Filter Initial: _____

CUSTODY SEALS INTACT:

☐ Cooler ☐_____ ☐ No (Not Intact) ☑ Not Present ☐ N/A Initial: _____

☐ Sample ☐_____ ☐ No (Not Intact) ☑ Not Present Initial: MS

SAMPLE CONDITION:	Yes	No	N/A
Chain-Of-Custody (COC) document(s) received with samples	☑	☐	☐
COC document(s) received complete	☑	☐	☐
☐ Collection date/time, matrix, and/or # of containers logged in based on sample labels.			
☐ No analysis requested. ☐ Not relinquished. ☐ No date/time relinquished.			
Sampler's name indicated on COC	☑	☐	☐
Sample container label(s) consistent with COC	☑	☐	☐
Sample container(s) intact and good condition	☑	☐	☐
Proper containers and sufficient volume for analyses requested	☑	☐	☐
Analyses received within holding time	☑	☐	☐
pH / Res. Chlorine / Diss. Sulfide / Diss. Oxygen received within 24 hours	☐	☐	☑
Proper preservation noted on COC or sample container	☑	☐	☐
☐ Unpreserved vials received for Volatiles analysis			
Volatile analysis container(s) free of headspace	☑	☐	☐
Tedlar bag(s) free of condensation	☐	☐	☑

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-12-0685

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-12-0688

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-12-1425

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

RE: Annual Groundwater Monitoring and Remediation Report
January – December 2012
Raytheon Company, former Canoga Park Facility, 8433 Fallbrook Avenue;
Monitoring and Reporting Program No. CI-7483, File No. 94-45

Dear Ms. Han;
This letter provides the certification statement for the referenced report, as required by Standard Provision No.19 of the Waste Discharge Requirements.

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

Sincerely,

RAYTHEON COMPANY

RAYTHEON CANOGA PARK SITE – 8433 FALLBROOK AVENUE, CANOGA PARK, CA 91304

Dear Mr. Samorano:

The Department of Toxic Substances Control (DTSC) received a notification from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding its determination to provide groundwater closure for the Southern Parcels at the Raytheon Site (Site) based on the information provided in the *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012. Please be aware that DTSC is the designated lead regulatory agency to oversee the corrective action at this facility.

Because DTSC does not have an agreement with Raytheon, DTSC cannot conduct a thorough review of the Report or determine whether requirements are met to provide closure for the southern parcels. Based on a limited review, DTSC has provided comments below.

Additionally, as previously stated in discussions with Raytheon, the Areas of Concern (AOCs) identified in the RCRA facility Assessment Report dated January 30, 2008 requires investigation. Please contact DTSC Project Manager, Jessy Fierro, to discuss entering into a Corrective Action Consent Agreement.

If you have any questions, please contact Jessy Fierro at (818) 717-6563 or me at (818) 717-6539.

Sincerely,

Juli Propes
Acting Branch Chief
Brownfields and Environmental Restoration Program – Chatsworth Office

DTSC COMMENTS

Document: *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012

1. Section 2.1 discusses previous characterization. Soil sampling was apparently conducted in August 1993 at borings B-RNDM-3, B-SL-8, and B-SL-10. The DTSC Geologic Service Branch (GSB) recommends that a map showing the location of these borings be attached to the confirmation sampling report. Additionally, it appears that no soil samples have been collected from within the area identified as the expected source of the Freon 11 contamination. Also, no soil impacted with Freon 11 was removed from the expected source area. However, the confirmation soil vapor samples collected in 2011 indicate that Freon 11 in soil vapor had decreased in the expected source area since soil gas samples first collected in 1995.

2. The last apparent groundwater sampling from existing wells in this area was in 2012. Monitoring well MW-31, located within the Freon 11 source has had reported concentrations less than the Freon-11 MCL since approximately 2000. As shown on Graph 1 data since approximately 2006 has shown a slightly increasing trend of Freon-11 with the last sample from April 30, 2012 to be 120 ug/L (see Table 2). Current groundwater concentrations are unknown since there is no reported data for the last 5 years. The GSB recommends that the existing groundwater monitoring wells in the area be resampled for VOCs prior to the LA RWQCB granting an NFA and allowing abandonment of the wells.

3. Table 1 - DTSC does not recommend using the Environmental Screening Levels (ESLs) established by Regional Water Quality Control Board, San Francisco Region (SFRWQCB),as these values are not representative of Southern California conditions. Soil gas screening levels (SLs) should be developed using DTSC Human Health Risk Assessment (HHRA) Note 3. If SLs are not available in HHRA Note 3, then DTSC recommends using USEPA Regional Screening Levels (RSLs). PCE showed slight exceedances for future residential scenario but no exceedance for future industrial use.

1.0 INTRODUCTION

The 1984 Resource Conservation and Recovery Act (RCRA) amendments provide authority for the U.S. Environmental Protection Agency (USEPA) to require comprehensive corrective action on Solid Waste Management Units (SWMUs) and other areas of concern at facilities applying for a Part B permit and those with RCRA Interim Status or facilities that operated in a manner that required a hazardous waste facility permit even though the facility had not obtained or applied for a hazardous waste permit. The Hughes Missile Systems Company operated the Canoga Park Facility with two permitted interim status units. These units were closed with closure certification pending. Interim Remediation is currently being under taken under the Los Angeles Regional Water Quality Control Board (LARWQCB).

In 1997 the Raytheon Missile Systems Company acquired the Hughes Missile Systems Company which then merged with Raytheon in 1998 to become the Raytheon Systems Company (Raytheon). Raytheon subsequently sold off the Canoga Park site but retains responsibility for site cleanup.

In order to accomplish the objective of corrective action, a RCRA Facility Assessment (RFA) of the Canoga Park Facility was conducted. This assessment consisted of a preliminary review (PR) of documentation of past site investigations and a Visual Site Inspections (VSI). The VSI was conducted on June 13, 2007.

This report is a summary of the PR and the VSI. The PR is based upon information found in files and reports at the Department of Toxic Substances Control (DTSC) including the facility operation plan, closure plan, and documents provided by Hughes/Raytheon. The documents that form the basis for this RFA are referenced and are considered as supplemental documents.

2.0 SITE DESCRIPTION

2.1 Location

The Canoga Park Facility is located at 8433 Fallbrook Avenue in Canoga Park, California. The facility is located in the northwest portion of the San Fernando Valley of Los Angeles County, California. The site is approximately 86 acres in area and ranges in elevation from approximately 900 feet above mean sea level (MSL) in the north-central portion to approximately 840 feet above MSL at its southern boundary. The site is bounded to the east by Fallbrook Avenue, to the south by Roscoe Boulevard, to the north by open space land adjacent to the Chatsworth reservoir, and to the west by single family residential housing (Figure 1 - Aerial photo). Residential neighborhoods are located across Fallbrook Avenue and Roscoe Boulevard.

2.2 Ownership History

In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the Facility from 1959 until 1966. From 1966 to 1976, Hughes

Missile Systems Company (Hughes) was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Facility. The January 17, 1994 Northridge Earthquake (Mw 6.7) damaged several buildings at the property and led to Hughes moving people and activities to Tucson, Arizona. In May 1995, the Facility was purchased from Hughes by Coast Federal Bank (CFB). At this time, land use changed from research, development and "prototyping" to commercial office space. The northern portion of the Site was sold to Regent Properties, Inc. (Regent) in 1997. Regent completed a major development project that included building redevelopment, remodeling and re-grading to raise the elevation of a portion of the Site. Parcels within the southern portion of the Site were subsequently purchased by DeVry Incorporated, Los Angeles Metropolitan Police Department and Trammel Crow. DeVry initiated a development project that included new building construction and re-grading. In September 2001, Regent sold its portion of the Facility to Shamrock Holdings, Inc., who in turn, sold the property to MEPT West Hills Limited Liability Corporation (LLC) in June 2002. MEPT West Hills LLC is the current property owner, although Trammell Crow Company acts as property manager for the Facility. As stipulated in the sales agreement with CFB in 1995, Hughes (now Raytheon) continued to address environmental impacts resultant from its former operations.

2.3 Past Waste Management Activities

Small amounts of hazardous wastes were collected in 55 gallon drums and stored in the HWSA, where flammables were physically separated from corrosives. Wastes handled include acids, bases, iron, tin, fluorine, gasoline, diesel, copper, chromium, Freon, oils, cyanides, flammable solvents and chlorinated solvents. The curbed storage area had a reinforced concrete base with a grated sump. Security was controlled by masonry, chain link walls and gated access. The area had a tarpaulin roof. Wastes were accumulated, and full containers were periodically sent to a hazardous waste facility.

Hazardous waste oils and solvents were collected in a four thousand gallon underground storage tank (T3) just northwest of the HSWA. Wastes were accumulated and were periodically sent by tanker to a hazardous waste facility.

2.4 Current Waste Management Activities

Currently the site is used as office space for a multitude of tenants. The waste activities are chiefly the remediation of the soil and groundwater at the identified hot spots in the north west and the central east portions of the site. Since 1995 the groundwater and soil in the northwest plume has been treated by a groundwater recovery and treatment system, (GRTS), a solvent vapor extraction system(SVE) and later enhanced with an air sparge system (AS). The water was treated by air stripping and carbon absorption of the volatile organics. The soil vapor was extracted by vacuum volatilization and carbon absorption. These were shutdown because of asymptotic conditions and replaced with an enhanced in-situ bioremediation process (EISB) starting in October of 2005. The EISB process was also applied to a smaller plume in the northeast of the site in December of 2006.

Current operations involve ground water monitoring on a quarterly basis to monitor the effectiveness of the EISB process.

2.5 Permit History for Hazardous Waste Management Units

Hughes Missile Systems Group operated at the site since 1965 and was issued a Hazardous Waste Facility Permit on June 28, 1985 for the HWSA and T3 RCRA units. Operations ceased in 1994. A Closure and Post Closure Plan was approved in late1995. This plan included a report of the T3 closure. A closure certification report for the HWSA was submitted in November 8, 2002. Both of these closures were incomplete with soil and ground water contamination at depth.

3.0 ENVIRONMENTAL SETTING

3.1 Site Geology

The shallow geologic deposits of the western San Fernando Valley in the vicinity of the project site are comprised of predominantly unconsolidated sands, silts and clays with occasional gravels. These alluvial fill deposits are of Quaternary age and range in thickness from thin veneer at the valley margins to more than 700 feet in the central portion of the San Fernando Valley. In the western portion of valley, the unconsolidated alluvial fill deposits are unconformably underlain by consolidated bedrock of the Modelo and Chatsworth Formations, respectively. The Modelo Formation consists of grayish siltstone, clayey siltstone and shale, with minor interbedded diatomaceous shale. A relatively thin weathered zone exists along the top of the formation where it is in contact with the shallow alluvial deposits. The Chatsworth Formation is comprised primarily of a turbidite sandstone sequence with interbedded shale and minor conglomerates. The bedrock of the Chatsworth Formation, which is the major rock comprising the Simi Hills, forms the distinct outcrops north of Chatsworth Reservoir (McLaren, 1989). A major portion of the Former Raytheon Facility is constructed on consolidated bedrock of the Miocene Modelo Formation. Near surface (to 50 or 100 ft bg), deposits are highly weathered. Beds of the Modelo are seen in road cuts and in drill-hole samples to be dipping at up to 45° from horizontal. Generally, dip direction is toward the south or southwest.

In the northwestern portion of the Facility, to the west and northwest of Building 270 and at other locations on the site periphery, the shallow subsurface is comprised of unconsolidated alluvial valley fill of Quaternary age. This material is present to depths of at least 75 feet. The beds are flat-lying, and consist primarily of mixed silt and fine sand, with lesser amounts of clay. The Modelo Formation is believed to be unconformably present beneath the valley fill. A thin (up to 10-foot) layer of construction fill material is locally present at the surface overlying

3.2 Surface Water Hydrology

Primary surface drainage in the site vicinity is Chatsworth Creek, lying immediately west of the Site. Portions of Chatsworth Creek, north and south of Hidden Lake (formerly Lees Lake) are contained within large underground culverts. Other portions are contained in lined or unlined structured channels. The portion of Chatsworth Creek in

the site vicinity is contained in underground cement-lined tunnels. Water from Chatsworth Creek eventually flows into the Los Angeles River about 2.5 miles down gradient. Hidden Lake is the only active reservoir within a 1-mile radius of the site. Hidden Lake is used as a recreational area by residents of the surrounding housing development. It should be noted that storm drainage, including storm drain discharge, from the site flows to Chatsworth Creek, the majority of which enters south and downstream of Hidden Lake.

3.3 Groundwater Hydrology

Groundwater gradient direction within the vicinity of the site regionally flows from northwest to southeast, from the Simi Hills to the San Fernando Valley. The depth to groundwater is approximately 25 feet bg near Roscoe Boulevard. The hydraulic gradient of the regional groundwater is approximately 0.0047 feet per foot (ft/ft). The water bearing materials comprising the western portion of the valley are generally fine grained alluvial sediments, which contain naturally-occurring total dissolved solids (TDS) in excess of 1,000 milligrams per liter (mg/L), exceeding the recommended USEPA drinking water guidelines. Due to the relatively low yields and excessive TDS, there are no drinking water wells in the vicinity of the facility. Essentially all drinking water consumed in the western San Fernando Valley is derived from the State Water project and the Los Angeles Aqueduct, which delivers water to southern California from the Sierra Nevada Mountains. Although the Los Angeles Department of Water and Power (LADWP) supplements its water supply with groundwater from the San Fernando Basin, all of the groundwater production well fields are located in the eastern quarter of the basin. The nearest active production well for supply of potable water to the public is more than 15 miles down gradient from the Site. In the vicinity of the site, groundwater occurs between 10 and 65 ft bg, depending on the location on the property. Groundwater gradient direction is generally to the southeast (i.e., from the Simi Hills to the San Fernando Valley), but on the western side of the property, there is a westward component due to the local topography Quarterly groundwater gauging of onsite monitoring wells has been conducted since December 1991 (with previous monthly gauging from August 1990). The groundwater gradient in the northwest portion of the site, which contains the main volatile organic compound (VOC) plume, is consistently westward and ranges from 0.01 to 0.02 ft/ft. In the extreme northwest corner of the site, the gradient becomes less steep and a localized depression is often observed even under static non-pumping conditions. This is likely due to the lithologic change from the Modelo formation to the alluvial unit in this area. The apparent groundwater gradient over the remainder of the Site is towards the southwest, south and south-southeast, with gradients ranging from 0.01 to 0.04 ft/ft. Water depths, groundwater gradients, and apparent groundwater flow directions are generally consistent with minor localized changes due to pumping activities during GRTS operation. Average hydraulic conductivities were calculated to be approximately 9 gallons per day per square foot (gpd/ft^2) for the Modelo Formation ($4.24x10^{-4}$ centimeters per second or cm/sec) and approximately 270 gpd/ft^2 for the alluvial fill ($1.27x10^{-2}$ cm/sec) (GTI, 1993).

4.0 SOLID WASTE MANAGEMENT UNITS And AREAS Of CONCERN

This Assessment has included all Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) identified by DTSC in 2002 from in a previous draft Corrective Action Consent Agreement; Table 1. The northeast plume at well CM-8 was also considered as an AOC. These units are indicated on the site drawing, Figure 2.

4.1 SWMUs

4.1.1 SWMU-1 (aka Hazardous Waste Storage Area, HWSA)

This unit was used to store carboy and drum quantities of hazardous wastes containing solvents, acids, bases, plating solutions and paint.

This unit was addressed in the *Modified Closure Plan for the Hazardous Waste Storage Area and Tank T3* [1] which was accepted by DTSC and dated August 1995. A document titled *Closure Certification Report for the Hazardous Waste Storage Area*[2] and dated 11/08/2002 documents the action taken. The closure process discovered arsenic, cadmium and hexavalent chromium that exceeded Closure Performance Standards in the underlying soils. After excavation to 14.5 feet below the former HWSA pad there still were high levels of hexavalent chromium. The pit was lined with polyethylene and back filled. Latter the area was regraded with about 8-9 feet of additional soil and paved. Additional borings were made to help define the extent of the chromium plume[3,4]. High levels of hexavalent chromium were detected in a narrow plume below the former HWSA all the way to groundwater. Since August 1999 Raytheon has been monitoring the groundwater at nearby wells for hexavalent chromium.

The Closure Certification Report was not accepted by DTSC as of the present. The extent of high levels of hexavalent chromium in subsurface soil and water must be defined and considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

Table 1
SOLID WASTE MANAGEMENT UNITS AND AREAS OF CONCERN
RAYTHEON MISSLE SYSTEMS COMPANY
CANOGA PARK, CALIFORNIA

EPA and DTSC DESIGNATION	NAME	RELEASES
SWMU-1 (HWSA)	Hazardous waste storage area	Release to soil and groundwater. COCs include hexavalent chromium
SWMU-2 (T3)	Underground Storage Tank (UST) for Waste	Release to soil and groundwater. Constituents include dichloroethylene (DCE)
SWMU-3	Building 272	Volatile organic compounds (VOCs) identified in vapor survey.
SWMU-4	Building 282 Former Drum Storage Room	Soil tested positive for chlorinated VOC vapors
SWMU-5	Pits #1 and #2 near Building 269	Releases to soil of cadmium and Beryllium. Groundwater contaminated with tetrachloroethylene (PCE).
SWMU-6	Parking area between Buildings 274 & 276	Releases to soil and groundwater. Constituents include Freon-11
SWMU-7	Cooling Unit outside of Building 274	Releases to soil. Constituents include Freon-11
SWMU-8	Former USTs T-1/T2 pump island near Buildings 272 & 282	Releases to soil and groundwater. Constituents include petroleum hydrocarbons
SWMU-9	Site wide sewer line	Releases to soil near soil boring BSL-4. Constituents include arsenic.
AOC-1	Building 262 drains and feeder sewer lines	Suspected release. Building is up gradient of wells CM-8d, CM-9d and CM-18 which have 1,1 DCE for which no source has been determined.
AOC-2	Building 263 drains, sumps and feeder sewer lines	Suspected release. Building is near and up gradient of well CM-8d which have 1,1 DCE.
AOC-3	Building 265 drains and feeder sewer lines	Suspected release. Down gradient SWMU-4 has contaminated soil with Freon-11
AOC-4	Building 269 interior: plating pit, drains, sumps, degreaser exterior clarifier pit and feeder sewer lines	Releases to soil at exterior clarifier pit, SWMU-5

Table 1
SOLID WASTE MANAGEMENT UNITS AND AREAS OF CONCERN
RAYTHEON MISSLE SYSTEMS COMPANY
CANOGA PARK, CALIFORNIA

Continued …

EPA and DTSC DESIGNATION	NAME	RELEASES
AOC-5	Building 271 industrial waste clarifier, drains and feeder sewer lines	Suspected release. Building associated with UST T-4. CM-8d nearly down gradient and groundwater contaminated with Freon-11
AOC-6	Building 274 drains and feeder sewer lines	Unknown. Building was used to store/use solvents including 1,1, TCA, Freon-11 and hydraulic fluid. Up gradient of CM-10 which had Freon-11 in groundwater..
AOC-7	Building 276 drains and feeder sewer lines	Unknown. Soil gas data from parking area toward Building 274 shows vapor phaseFreon-11. Building is up gradient of CM-10 which had Freon-11 in groundwater.
AOC-8	Building 281 drains and feeder sewer lines	Unknown. Building is up gradient of CM-8d and cross gradient from CM-9d which had Freon-11 in groundwater. Also next to former diesel USTs
AOC-9	Former USTs T-5 & T-6	Suspected releases. T-5 used for storage of hazardous waste including waste oil and sulfuric acid.
AOC-10	Former USTs T-7, T-8 and T-9	Diesel fuel contaminated soil was excavated in this area
AOC-11	Above ground tank, T-14	Unknown. Tank was located inside Building 269 and stored solvent waste such as acetone, 1,1,1 TCA and isopropyl alcohol.
AOC-12	Site wide storm water system	Releases suspected
AOC-13	Northeast plume	1,1 DCE, Freon

4.1.2 SWMU-2 (aka T3)

This tank was used to store bulk quantities of hazardous wastes which consisted of machine cutting fluids, some solvents used for cleaning and maintenance of machinery, and machine lubricating oils. Hazardous constituents present in these wastes were 1,1,l-trichloroethane (TCA), acetone, and oils. Contaminants detected in the soil in vicinity of T3 include TPH, 1,1dichloroethylene (l,l-DCE), 1,1-dichloroethane (l,l-DCA), and TCA.

Tank T3 was permitted under RCRA when it was removed. The tank was removed in June 1988 and associated contaminated soils were removed in September 1991 under a Corrective Action Plan (CAP) approved on March 18, 1991 by the CalEPA Los Angeles Regional Water Quality Control Board (LARWQCB). The document, *Final Report, Remediation of Former T3 Tank Site*[5] (November 1991), discusses the extent of soils removed. The soil was excavated to 40 feet below ground surface in the vicinity of the former T3 by boring three foot holes on a triangular pitch. The excavation left a cookie cutter pattern of soil wedges behind unexcavated. The holes were backfilled with a cement and sand slurry. Later the area was regraded with about 7 feet of additional soil and paved. CAP goals were used to determine the extent of excavation. The LARWQCB approved cleanup action levels for remediation of impacted soils at the T3 site were:

LARWQCB Corrective Action Plan Cleanup Action Levels	
Total petroleum hydrocarbons (TPH)	100 ppm
Total volatile organic compounds (VOCs)	20 ppm
1, l-dichloroethylene (1, 1-DCE)	6 ppm

The groundwater in the area is contaminated with a range chlorinated VOCs and has been undergoing a series of interim remediation under LARWQCB guidance. From 1995 to 2005 ground water has been treated via a Pump and Treat system with the treated water used for on site irrigation needs. The soil has been treated via a Soil Vapor Extraction system (SVE) for the same period. Contaminant levels became asymptotic by 2000 and an Enhanced In-Situ Bioremediation approach (EISB) was instituted in 2005[6]. Final cleanup levels have not been determined under DTSC protocol.

The Closure Certification Report was not accepted by DTSC as of this document. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.3 SWMU-3 (Building 272)

Building 272 is a small building associated with the former gas pump area. The building has been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water

must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[7]

4.1.4 SWMU-4 (Building 282)

Building 282 is a former drum storage room associated with the former gas pump area. The building has been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[8]

4.1.5 SWMU-5 (Pits #1 and #2 near Building 269)

These pits received photographic wastes and neutralized acids. Releases to soil of Cadmium and Beryllium have been noted. Groundwater is contaminated with tetrachloroethylene (PCE). These pits have been removed. The area is within the NW treatment area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs and metals in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.6 SWMU-6 (Parking area between Buildings 274 & 276)

The 1991 Preliminary Assessment authorized under US EPA cites the presence of Freon-11 and elevated radioactivity in this area.[8] It has been contended that elevated radioactivity is due to natural geologic variation.[9] This area is in the SE part of the site. The contamination is suspected to have resulted from maintenance work on cooling units next to the former Building 274. According to a 1998 Fluor Daniel GTI Site Assessment report[10] the cooling unit at Building 274 used Freon 22 and only Buildings 263 used Freon 11. In any event the plume was delineated as centered at the edge of a former parking area. At the time of the report it was concluded that the Freon levels were declining and below drinking water standards. Need to determine if any issues remain.

4.1.7 SWMU-7 (Cooling Unit outside of former Building 274)

The presence of Freon-11 was detected in the soil. This area is in the SE part of the site. The contamination is suspected to have resulted from maintenance work on the cooling units.[11] Need to determine if any issues remain.

4.1.8 SWMU-8 (Former USTs T1 & T2 for the gasoline pump island)

The release of petroleum hydrocarbons to soil and groundwater occurred. The area is within the NW treatment area that includes the EISB areas A, B & C. The extent of hydrocarbon contamination was assesses in 1991.[12] The plume is within the larger VOC plume in the northwest corner of the site and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered

in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.1.9 SWMU-9 (Site wide sewer line)

Site wide assessment in 1991 did not show up any metal contamination at detection limits.[13] One sample had a trace (0.009 mg/kg) of toluene. Sample B-SL had 0.3 mg/kg of toluene. No other VOCs were detected. Need to determine if any issues remain.

4.2 AOCs

4.2.1 AOC-1 (Building 262 drains and feeder sewer lines)

This building is up gradient of a release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.2 AOC-2 (Building 263 drains sumps and feeder sewer lines)

This building is adjacent to an area of release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels. In 1992 wells near Building 263 tested above EPA Maximum Concentration Limit (MCL) for uranium.[14]

4.2.3 AOC-3 (Building 265 drains and feeder sewer lines)

This building is next to an area with Freon contamination and could be a source of the contamination. Final cleanup levels have not been determined under DTSC protocol. The presence of Freon in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.4 AOC-4 (Building 269 drains and feeder sewer lines)

This building was in an area where soil is contaminated with VOCs and the sewer line may have been a source. The building was removed by 1988. It was in the area that includes the EISB areas A, B & C. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.[8,15]

4.2.5 AOC-5 (Building 271 drains and feeder sewer lines)

This small building was associated with a large concrete water basin, T4. This building is adjacent to an area of release and could be a source of the contamination. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB

guidance. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.6 AOC-6 (Building 274 drains and feeder sewer lines)

This small building was use for solvent parts cleaning and stored 1,1,1 TCA, Freon, and Hydraulic fluid. The building has been removed. Nearby is an area with Freon contamination and it could be a source of the contamination. Final cleanup levels have not been determined under DTSC protocol. The presence of contamination in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.7 AOC-7 (Building 276 drains and feeder sewer lines)

This building had 2 active chemical use areas, solvent cleaning and photographic processing operations. Freon has been detected at a down gradient well, CM-10. Final cleanup levels have not been determined under DTSC protocol. The presence of contamination in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.8 AOC-8 (Building 281 drains and feeder sewer lines)

This building is adjacent to an area of release and could be a source of the contamination. Generally it handled small quantities of in a maintenance shop setting. Chemicals included dichloromethane, insecticides, mineral oil and ethylene glycol. It is near the area that includes the EISB areas D, a small plume of VOCs. The contamination there is well defined and is currently undergoing interim remediation under LARWQCB guidance. Also it is next to the former diesel USTs. Final cleanup levels have not been determined under DTSC protocol. The presence of VOCs and hydrocarbons in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.9 AOC-9 (T5 and T6)

These USTs were used to store waste oil and sulfuric acid. These were glass lined 500 gallon vessels that were contained in a concrete vault located west of building 263. The tanks were removed in 1984 along with the vaults and soil was excavated.[16] Residual contamination consisting of toluene and xylenes need to be considered in the HRA. The presence of VOCs and hydrocarbons in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.10 AOC-10 (T7, T8 & T9)

These USTs were used to store diesel fuel. The tanks were removed in1991.[17]. Subsequently the soil was excavated to remove contaminated soil.[18]. A clean-up level of 100 ppm of TPHD was used. Currently most of this area has been covered with a bi-level parking lot. Residual diesel should be considered in a health and environmental risk assessment.

4.2.11 AOC-11 (T14)

This AOC is an above ground tank that was located in building B269. Building 269 was removed by 1998. The area is within the contaminant plume in EISB treatment areas A & B. The plume there has been characterized and has undergone SVE, pump and treat and currently EISB. The presence of VOCs in subsurface soil and water must be considered in a health and environmental risk assessment in order to determine final closure cleanup levels.

4.2.12 AOC-12 Site Wide Storm Sewer System.

The Storm sewer system has not been investigated. Key points where runoff could carry contaminants and where leaks are more likely to occur may need to be tested for contamination.

4.2.13 AOC-13 Northeast Plume between B263, B264 & B281

This plume has had definition and is currently undergoing interim measures by EISB in area D.

4.3 SUMMARY OF CONSOLIDATED SWMUS AND AOCS.

The various SWMUs and AOCs can be regrouped in to several zones for Risk assessment and treatment purposes (figure 3). The following zones are defined.

4.3.1 Zone 1 The contiguous Northwest Plume consisting of:

- SWMU-1 former HSWA
- SWMU-2 former T3
- SWMU-3 former B272 gas station bldg
- SWMU-4 former B282 drum stg bldg
- SWMU-5 former P1 & P2 at B269
- SWMU-8 former T1 &T2 gasoline tanks
- AOC-4 former B-269
- AOC-11 former AST in B269

This zone has a known contamination of VOCs, CVOCs, chromium^{+6} and potential cadmium and beryllium at SWMU-5.

4.3.2 Zone 2 Sewer system network consisting of

- SWMU-9 Sewer System
- AOC-1 B262 sewer drains and feeders
- AOC-2 B263 sewer drains and feeders
- AOC-3 B265 sewer drains and feeders
- AOC-5 B271 sewer drains and feeders
- AOC-6 B274 sewer drains and feeders
- AOC-7 B276 sewer drains and feeders
- AOC-8 B281 sewer drains and feeders

4.3.3 Zone 3 South plume area (Freon 11 contamination)

- SWMU-6 B274,276 parking lot
- SWMU-7 former B-274; Chiller building

4.3.4 Other areas that remain individual AOCs. These are:

- AOC-9 former T5,T6; oil, sulfuric acid tanks
- AOC-10 former T-7,8,9; diesel tanks
- AOC-12 Storm sewer system
- AOC-13 Northeast plume

5.0 EXPOSURE PATHWAYS

5.1 Surface Water

Nearest stream is in adjacent neighborhood to the west where a small stream, Chatsworth Creek, enters and exits a small lake, Hidden Lake (aka Lees Lake), via culverts and continues south via lined and unlined structured channels. The property is graded to drain to the SE through storm drains which empty into this stream.

5.2 Groundwater

Groundwater flows to the West at the NW corner of the property but generally to the SSE on the rest of the property into the San Fernando Valley. With measured TDS of over 1000 ppm the water is not likely to be used for drinking water. There may be interaction between the groundwater and Hidden Lake to the west.

5.3 Air

The area is paved, built upon or vegetated with irrigated beds. There is potential for soil gas intrusion into buildings. Buildings are being used commercially as office space.

5.4 Surface Soil

There is essentially no exposed soil due to paving and buildings. Soil exposure could occur when it is disturbed during construction activities.

6.0 VISUAL SITE INSPECTIONS

The site was visited on Wednesday June 13, 2007. The site is a well landscaped business office site. The vast majority of the area is covered with office buildings, roadways, parking lots and walkways. The remaining area consists of a central park area and narrow vegetated corridors that border and subdivide the property. The primary treatment area is in the north western corner of the site. A new parking structure was nearly completed in the north east corner of the site.

Visual Evidence of SWMUs, AOCs and treatment systems are minimal. The GRTS and SVE equipment are idle behind a small fenced area. Well heads are flush to ground level and covered. Observations are photo documented (See figures 4 to 11).

7.0 RECOMMENDATIONS FOR FURTHER ACTION

- Continue Groundwater Remediation

- Determine data gaps to developing a site wide heath risk assessment using the current DTSC-modified model. A site conceptual model needs to be developed to address all exposure routes.

- Collect samples needed to fill in the data gaps.

- Complete a soil vapor survey using old and new data as appropriate to model vapor intrusion. This work is to be in accordance with the Department's publications: GUIDANCE FOR THE EVALUATION AND MITIGATION OF SUBSURFACE VAPOR INTRUSION TO INDOOR AIR and ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS. As these documents are under going revision it is important that this investigation be done with close coordination with the project manager.

- Prepare site wide HRA for all modes of exposure to define remediation goals acceptable to DTSC.

- Modify remediation effort as required to meet the DTSC remediation goals or existing CAP goals whichever is the more stringent.

TECHNICAL MEMORANDUM

Date: October 1, 2018

Prepared For: Emily Wong, Regional Water Quality Control Board, Los Angeles
Sue Han, CHG, Regional Water Quality Control Board, Los Angeles

RE: Southern Parcels Well Destruction
Former Canoga Park Facility
8433 Fallbrook Avenue, Canoga Park, California
SCP No. 0693A, Site ID No. 2043T00

1.0 INTRODUCTION

Oneida Total Integrated Enterprises, LLC (OTIE) has prepared this technical memorandum on behalf of Raytheon Company documenting groundwater monitoring well destruction. The wells were destroyed on the Southern Parcels of Raytheon's Former Canoga Park Facility located at 8433 Fallbrook Avenue, Canoga Park, California (Figure 1), hereafter referred to as the "Site."

The well destruction request was approved by the Los Angeles Regional Water Quality Control Board (LARWQCB) in a No Further Action (NFA) for Groundwater letter dated March 22, 2018 (Attachment A). The work was performed in accordance with California Department of Water Resources Bulletins 74-81 and 74-91 (California Well standards).

Activities described herein include the following:

- Pre-field activities, including obtaining required permits and notifying Underground Service Alert of Southern California (USA);
- Destruction of wells; and
- Profiling and disposal of investigation-derived waste (IDW).

Well destruction activities were conducted between August 30 and September 11, 2018.

2.0 PRE-FIELD ACTIVITIES

Utility line clearance was completed prior to beginning any drilling activities. Underground Service Alert was notified on August 29, 2018 of the intent to drill, as required by law, and ticket number A182411647-00A was issued. Drilling areas were also cleared using geophysical methods by a subcontractor (Spectrum Geophysics) on August 30, 2018.

Well destruction permit #0156926was obtained from the Environmental Health Division of Los Angeles County.

A copy of the permit is provided in Attachment A.

3.0 WELL DESTRUCTIONS

The following section describes well destruction activities at the Site. All field activities were conducted in accordance with the SOP and the site specific safety and health plan. The site-specific safety and health plan was implemented during field activities (OTIE, 2009 and 2015). Waste management documents will be submitted under separate cover following disposal of soil.

In their letter dated March 22, 2018, the LARWQCB-approved Raytheon's request to destroy the following 13 wells in the Southern Parcels: CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW, 29, MW-30, and MW-31 (Attachment A). Well CM-12 was not destroyed at this time due to its use in contouring groundwater across the Site. Wells MW-22S and MW-22D were unable to be destroyed due to pending access agreement with Los Angeles Department of Water and Power. The locations of the destroyed wells are presented on the Site Plan (Figure 2).

Wells were destroyed using a CME 75 hollow stem auger drilling rig. At each location, destruction started with the removal of the well box. Of the 10 wells destroyed, 6 wells were constructed with PVC (CM-10, CM-11A, MW-28, MW-29, MW-30, and MW-31) and 4 wells with stainless steel (CM-15, CM-17, MW-21S, and MW-21D) (Attachment B).

Well destruction activities are summarized below and in Table 1.

- Wells were measured to verify total depths and approximate groundwater depths.
- PVC wells were overdrilled with auger larger than the original borehole; either 10- or 12-inch outside diameter (OD) auger.
  - Wells were overdrilled using a "guide bit" or "stinger" to ensure the auger did not wander off the borehole and that all well pipe and annular material was removed.
  - Boreholes were backfilled from bottom to near surface with bentonite-Portland cement grout using a tremie pipe.
- Stainless steel wells were grouted under pressure until the well and formation would not take additional grout.
  - Following pressure grouting, well casings were overdrilled to 5 feet below ground and the remaining borehole was grouted to surface.
- Approximate grout volumes used for each well are presented in Table 1.
- For each well/borehole, grout was allowed to settle overnight. Where settlement occurred, the borehole was topped off with bentonite chips and hydrated from the surface. Pea gravel was placed over the hydrated bentonite to reduce the risk of swelling.

- The borehole for each well location was completed to match the surrounding surface materials. All wells were finished with concrete except well CM-15, located within a planter, which was finished with soil and cobbles.

Well destruction logs and the driller's Well Completion Reports are included in Attachment B.

4.0 WASTE MANAGEMENT

Overdrilled well materials and soil were considered IDW and were placed in a labeled, plastic-lined, 20-yard soil bin equipped with a closing top provided by Waste Management of South Gate, California. The bin was stored onsite pending characterization and off-site disposal.

Contents of the bin were characterized and profiled as non-hazardous waste. Soil analytical data are included in Attachment C. Waste profile and waste disposal manifests will be submitted under separate cover once completed.

Please contact the undersigned if you have questions or comments at 805-585-2110.

Sincerely,
Oneida Total Integrated Enterprises, LLC.

Claim No. 7016 0750 0000 3359 3034

SUBJECT: NO FURTHER ACTION FOR GROUNDWATER

CASE/SITE: SOUTHERN PARCELS OF FORMER HUGHES MISSILE SYSTEMS COMPANY FACILITY, 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693A, SITE ID NO. 2043T00)

Dear Mr. Samorano:

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) is the state agency with primary responsibility for the protection of groundwater and surface water quality within major portions of Los Angeles and Ventura counties, including the referenced site. To accomplish this, the Regional Board oversees the investigation and cleanup of discharges of waste that may affect the quality of waters of the state as authorized by the Porter-Cologne Water Quality Control Act (California Water Code [CWC], Division 7).

This site has been jointly lead by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) and the Department of Toxic Substances Control (DTSC). The Regional Board has been overseeing the investigation and remediation of groundwater contamination at the site, while the DTSC has jurisdiction to address the site soil contamination as a result of the historical operations under various Resource Conservation and Recovery Act (RCRA) permits.

Regional Board staff have reviewed the July 31, 2012, *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* prepared and submitted by your environmental consultant, Oneida Total Integrated Enterprise, and other relevant information regarding the southern parcels of former Hughes Missile System Facility (site). The following information is presented in the submitted reports:

1. The subject site consists of three parcels, with current Los Angeles County Assessor Identification (Parcel) Numbers 2005-002-014, 2005-002 -901, and 2005-002 -013 (Attachment 1). The site is part of an approximately 56-acre property that was occupied and operated as an industrial park from 1959 through 1994. In 1959, the 56-acre property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. From 1966 through 1994, the former Hughes Missile Systems operated the 56-acre property as an aerospace research and development facility. Since 1995, the site has been redeveloped with several commercial office buildings.

Since the early 1990s, numerous investigations and remedial activities have been conducted at the 56-acre property. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the 56-acre property.

2. During the 56-acre property-wide environmental investigation activities in the early 1990s, concentrations of Trichlorofluoromethane (also known as Freon-11) were detected up 300 micrograms per liter (µg/L), above its California drinking water maximum contaminant level (MCL) of 150 µg/L, in groundwater well CM-10. Monitoring well CM-10 is located within Parcel No.2005-002-013 of the site.

3. From 1993 to 1998, additional site characterization activities were conducted at and within the vicinity of well CM-10 to identify the source area and further define the extent of the Freon-11 plume. Based on the results of the soil, soil vapor, and groundwater investigations, the former parking lot, located between former Buildings 274 and 276, was identified as a source area. Historical operations in Buildings 274 and 276 included solvent cleaning using Freon-11.

4. In 2007, the Regional Board approved the removal of nine wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-28, MW-29, MW-30, and MW-31) located at and in and vicinity of the site (Parcels 2005-002-014, 2005-002-013, and 2005-002-901) from the 56-acre property-wide groundwater monitoring program. Based on the cumulative groundwater monitoring data collected from these wells, the concentrations of VOCs had been consistently below MCLs or non-detect for several years and concentrations of Freon-11 in groundwater had decreased over the last several years and continued to be below its MCL of 150 µg/L.

5. In 2012, as part of the confirmation sampling activities, additional groundwater sampling was conducted both on-site and off-site. The results of this confirmation sampling indicates that the extent of Freon-11 impacted groundwater has been adequately defined. All detected concentrations of Freon-11 in groundwater during this confirmation sampling were below its MCL of 150 µg/L

6. The results of the source investigation and groundwater monitoring and sampling are summarized as follows:

    A. The occurrence of Freon-11 in well CM-10 has been adequately investigated and the source was identified. Since the associated former on-site building was demolished and operations stopped, there is no active or continued source at the site.

    B. The lateral and vertical extents of the Freon-11 groundwater impact have been fully assessed and defined both in the vicinity of the identified Freon Source Area and off-site downgradient direction.

    C. The groundwater monitoring data collected from 1993 to 2012 show decreasing trends of Freon-11 concentrations to levels continuously below its MCL of 150 µg/L.

    D. Groundwater investigation and continued monitoring data do not indicate any significant residual Freon-11 contamination that warrants further monitoring or remediation.

A Notice of Opportunity to Comment on the no further action determination was sent out on November 13, 2017, inviting comments. The due date to submit comments to this Regional Board was December

15, 2017. By the specified due date, the Regional Board received only one response letter, which was from the DTSC and is summarized below:

On December 15, 2017, the Regional Board received a comment letter from the DTSC, which was addressed to Raytheon (Attachment 2). In the letter, the DTSC recommended that the existing groundwater monitoring wells in the area be resampled for VOCs prior to the Regional Board granting an NFA and allowing well abandonment.

In response to the DTSC's recommendation, Raytheon's consultant monitored two related wells MW-31 and CM-10, which are located in and downgradient of the former area of concern. The results of this confirmation monitoring are presented in the February 8, 2018 technical memorandum titled *Additional Groundwater Sampling for Southern Parcel Closure* (Memo). The Memo indicates that wells MW-31 and CM-10 were monitored on January 22, 2018. Due to dryness of well CM-10, only one confirmation groundwater sample was collected from MW-31 and analyzed for VOCs. Freon-11 was detected at concentration of 64 µg/L, which was below its MCL of 150 µg/L. No other VOCs were detected in the sample collected from well MW-31.

No Further Action Determination

Based upon information provided to the Regional Board, and with the provision that the information was accurate and representative of site conditions, the Regional Board requires no further action (NFA) for groundwater beneath the site (APNs: 2005-002-013, 2005-002-901, and majority of 2005-002-014) at this time. However, the site owners/operators must notify the Regional Board immediately, following up with notification letter within 72 hours, if additional waste in soil and/or groundwater is encountered at the site.

Well Abandonment and Destruction

All monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30, and MW-31) shall be abandoned in accordance with the California Department of Water Resources, Bulletin 74-81 and Bulletin 74-90, *California Well Standards*. For well abandonment, you must comply with the following:

A. Well abandonment permits must be obtained from the Los Angeles County, Public Health Department, Environmental Health Division, Drinking Water Program. Any other necessary permits must be obtained from the appropriate agencies prior to the start of field work.

B. A well abandonment report shall be submitted to this Regional Board by **July 31, 2018**. This report must include, at a minimum, as site map showing the well location, a description of the well abandonment process and waste handling, and copies of all signed permits.

The jurisdiction requirements of other agencies, such as the United States Environmental Protection Agency, are not affected by the Regional Board's issuance of a NFA letter at the site. Such agencies may choose to make their own determination concerning this site.

We would like to take this opportunity to thank you for your full cooperation with the Regional Board during the course of the site assessment. Should you have any questions regarding this matter, please contact Ms. Emily Wong, Project Manager, at (213) 576-6736, emily.wong@waterboards.ca.gov, or Ms. Su Han, Unit Chief, at (213) 576-6735, su.han@waterboards.ca.gov.

Sincerely,

Samuel Unger, P.E.
Executive Officer

RAYTHEON CANOGA PARK SITE – 8433 FALLBROOK AVENUE, CANOGA PARK, CA 91304

Dear Mr. Samorano:

The Department of Toxic Substances Control (DTSC) received a notification from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding its determination to provide groundwater closure for the Southern Parcels at the Raytheon Site (Site) based on the information provided in the *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012. Please be aware that DTSC is the designated lead regulatory agency to oversee the corrective action at this facility.

Because DTSC does not have an agreement with Raytheon, DTSC cannot conduct a thorough review of the Report or determine whether requirements are met to provide closure for the southern parcels. Based on a limited review, DTSC has provided comments below.

Additionally, as previously stated in discussions with Raytheon, the Areas of Concern (AOCs) identified in the RCRA facility Assessment Report dated January 30, 2008 requires investigation. Please contact DTSC Project Manager, Jessy Fierro, to discuss entering into a Corrective Action Consent Agreement.

If you have any questions, please contact Jessy Fierro at (818) 717-6563 or me at (818) 717-6539.

Sincerely,

Juli Propes
Acting Branch Chief
Brownfields and Environmental Restoration Program – Chatsworth Office

DTSC COMMENTS

Document: *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012

1. Section 2.1 discusses previous characterization. Soil sampling was apparently conducted in August 1993 at borings B-RNDM-3, B-SL-8, and B-SL-10. The DTSC Geologic Service Branch (GSB) recommends that a map showing the location of these borings be attached to the confirmation sampling report. Additionally, it appears that no soil samples have been collected from within the area identified as the expected source of the Freon 11 contamination. Also, no soil impacted with Freon 11 was removed from the expected source area. However, the confirmation soil vapor samples collected in 2011 indicate that Freon 11 in soil vapor had decreased in the expected source area since soil gas samples first collected in 1995.

2. The last apparent groundwater sampling from existing wells in this area was in 2012. Monitoring well MW-31, located within the Freon 11 source has had reported concentrations less than the Freon-11 MCL since approximately 2000. As shown on Graph 1 data since approximately 2006 has shown a slightly increasing trend of Freon-11 with the last sample from April 30, 2012 to be 120 ug/L (see Table 2). Current groundwater concentrations are unknown since there is no reported data for the last 5 years. The GSB recommends that the existing groundwater monitoring wells in the area be resampled for VOCs prior to the LA RWQCB granting an NFA and allowing abandonment of the wells.

3. Table 1 - DTSC does not recommend using the Environmental Screening Levels (ESLs) established by Regional Water Quality Control Board, San Francisco Region (SFRWQCB),as these values are not representative of Southern California conditions. Soil gas screening levels (SLs) should be developed using DTSC Human Health Risk Assessment (HHRA) Note 3. If SLs are not available in HHRA Note 3, then DTSC recommends using USEPA Regional Screening Levels (RSLs). PCE showed slight exceedances for future residential scenario but no exceedance for future industrial use.

Please contact the following DTSC staff for questions regarding these comments:

Wendy Arano, PG – DTSC Geologist: Wendy.Arano@dtsc.ca.gov
Donald Greenlee, PhD – DTSC Toxicologist: Donald.Greenlee@dtsc.ca.gov
Jessy Fierro – Project Manager: Jessy.Fierro@dtsc.ca.gov

July 17, 2018

SUBJECT: APPROVAL EXTENSION REQUEST TO SUBMIT A TECHNICAL REPORT FOR GROUNDWATER MONITORING WELLS ABANDONMENT ACTIVITIES IN SOUTHERN PARCELS

CASE/SITE: RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY) 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693A, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff received an extension request letter to submit a technical report (Report) presenting the results of groundwater monitoring wells abandonment activities in the southern parcels of the site (Letter). The Letter was prepared and submitted by your consultant Oneida Total Integrated Enterprise (OTIE) on July 6, 2018. The Letter indicates the wells abandonment activities have been delayed due to limited budget/funding available to implement the field work. Therefore, the Letter requests a 60-day extension to submit the Report. The original due date of July 31, 2018 was specified in the Regional Board's letter dated March 22, 2018. Based on the information submitted, Regional Board staff approves the submittal of the Report from July 31, 2018 to **October 1, 2018**.

Should you have any questions, please contact me at (213) 576-6736 (emily.wongewong@waterboards.ca.gov).

Sincerely,

Emily Wong
Water Resource Control Engineer
Site Cleanup Unit I

Work Plan Approval

TO BE COMPLETED BY APPLICANT:

WORK SITE ADDRESS	CITY	ZIP	EMAIL ADDRESS FOR WELL PERMIT APPROVAL
8433 Fallbrook Ave	Canoga Park	91304	ksawyer@otie.com

NOTICE:

- WORK PLAN APPROVALS ARE VALID FOR 180 DAYS. 30 DAY EXTENSIONS OF WORK PLAN APPROVALS ARE CONSIDERED ON AN INDIVIDUAL (CASE-BY-CASE) BASIS AND MAY BE SUBJECT TO ADDITIONAL PLAN REVIEW FEES (HOURLY RATE AS APPLICABLE).
- WORK PLAN MODIFICATIONS MAY BE REQUIRED IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED AT THE SITE INSPECTION ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.
- WORK PLAN APPROVALS ARE LIMITED TO COMPLIANCE WITH THE CALIFORNIA WELL STANDARDS AND THE LOS ANGELES COUNTY CODE AND DOES NOT GRANT ANY RIGHTS TO CONSTRUCT, RENOVATE, OR DECOMMISSION ANY WELL. THE APPLICANT IS RESPONSIBLE FOR SECURING ALL OTHER NECESSARY PERMITS SUCH AS WATER RIGHTS, PROPERTY RIGHTS, COASTAL COMMISSION APPROVALS, USE COVENANTS, ENCROACHMENT PERMISSIONS, UTILITY LINE SETBACKS, CITY/COUNTY PUBLIC WORKS RIGHTS OF WAY, ETC.
- ALL FIELD WORK MUST BE CONDUCTED UNDER THE DIRECT SUPERVISION OF A PROFESSIONAL GEOLOGIST LICENSED IN THE STATE OF CALIFORNIA.
- THIS PERMIT IS NOT COMPLETE UNTIL ALL OF THE FOLLOWING REQUIREMENTS ARE SIGNED BY THE DEPUTY HEALTH OFFICER. WORK SHALL NOT BE INITIATED WITHOUT A WORK PLAN APPROVAL STAMPED BY THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.
- ***ONCE APPROVED NOTIFY BELINDA LARSEN AT*** { HYPERLINK "mailto:blarsen@ph.lacounty.gov" } ***PREFERABLY 4 BUSINESS DAYS BEFORE WORK IS SCHEDULED TO BEGIN.***

TO BE COMPLETED BY DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM:

X WORK PLAN APPROVED DATE: 8-24-2018

ADDITIONAL APPROVAL CONDITIONS:

On 8-16-2018, $735.00 was paid for permit # 0156926 to decommission 10 monitoring wells. Follow the work plan submitted and maintain any setback requirements. Follow all requirements set forth in the California Well Standards bulletins 74-81 and 74-90. Six wells (CM-10, CM-11A, MW-28, MW-29, MW-30, and MW-31) will be over drilled from the ground surface to the total depth. Wells (CM-15, CM-17, MW-21S, and MW-21D) will be pressure grouted in place. Notify me at blarsen@ph.lacounty.gov prior to start of field work.

Eurofins Calscience (Calscience) certifies that the test results provided in this report meet all NELAC Institute requirements for parameters for which accreditation is required or available. Any exceptions to NELAC Institute requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 18-09-0421 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 09/07/18. They were assigned to Work Order 18-09-0421.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

DoD Projects:

The test results contained in this report are accredited under the laboratory's ISO/IEC 17025:2005 and DoD-ELAP accreditation issued by the ANSI-ASQ National Accreditation Board. Refer to certificate and scope of accreditation ADE-1864.

Glossary of Terms and Qualifiers

Work Order: 18-09-0421 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

1.0 INTRODUCTION

Oneida Total Integrated Enterprises (OTIE), formerly T N & Associates, Inc. (TN&A), has prepared this report on behalf of Raytheon Company (Raytheon), documenting the recent groundwater investigation to verify current radioactivity conditions at the former facility located at 8433 Fallbrook Avenue in Canoga Park, California, as illustrated in Figure 1 ("Former Canoga Park Facility"). The work was conducted following the work plan titled *Work Plan Revision 01 for Groundwater Investigation to Verify Current Radioactivity Conditions* prepared by TN&A (TN&A, 2008b) and submitted to the California Regional Water Quality Control Board, Los Angeles Region (LARWQCB) in December 2008.

Raytheon's predecessor, Hughes Missile Systems, Inc., conducted a comprehensive investigation in 1990 and 1991 at the request of the LARWQCB to determine radioactivity levels in groundwater at the site including eight sampling events between September 1990 and December 1991. These findings were submitted to the LARWQCB in 1992 (GRC, 1992) and indicated that a subset of the well samples had radiological parameters exceeding California Maximum Contaminant Levels (MCLs), but that the concentrations were naturally occurring based on the relative abundances of the individual uranium isotopes. After 1992, no additional testing for radiological parameters was done as there was no further correspondence from the LARWQCB concerning the subject. Therefore, Raytheon considered the investigation to be complete and continued efforts remediating the Volatile Organic Compound (VOC) concentrations in shallow groundwater underlying the northwest portion of the site.

On March 5, 2008, the LARWQCB requested additional information and a work plan for an investigation to assess the current conditions for radioactivity in groundwater (LARWQCB, 2008a, Appendix A). Raytheon responded and provided LARWQCB with the requested site information in addition to all the historical radiological data in a letter dated April 3, 2008 (Raytheon, 2008a; Appendix A). The LARWQCB subsequently requested additional information from Raytheon during a teleconference on May 21, 2008. This information was provided in a June 3, 2008 letter from Raytheon to the LARWQCB (Raytheon, 2008b; Appendix A).

Based on the LARWQCB review of the requested data, a letter was then issued on July 15, 2008, re-iterating the requirement for Raytheon to submit a work plan for a site-wide groundwater investigation to verify current radioactivity conditions at the site (LARWQCB, 2008b; Appendix A). TN&A prepared a work plan for the sampling and submitted it on September 12, 2008 (TN&A, 2008a). The LARWQCB reviewed the work plan and provided comments in a letter dated October 21, 2008 (LARWQCB, 2008c; Appendix A), mainly discussing the specific laboratory methodologies and sample collection protocols. These comments were addressed by coordinating a collaborative effort between Raytheon, OTIE-TN&A, the LARWQCB, and the California Department of Public Health (CDPH). Through a series of conference calls and e-mail correspondence that occurred between October 2008 and December 2008, OTIE-TN&A developed a sampling and analytical program that met the data quality objectives for all stakeholders involved. A revised work plan entitled: *Work Plan Revision 01 for Groundwater Investigation to Verify Current Radioactivity Conditions* (TN&A, 2008b) was then prepared, incorporating all the agreed upon sampling protocols and analytical methodologies, and submitted to the LARWQCB in December 2008. The revised work plan was approved by the LARWQCB in their January 29, 2009 letter (LARWQCB, 2009; Appendix A).

The field activities and laboratory analyses documented in this report are in accordance with the approved December 2008 work plan.

2.0 GROUNDWATER SAMPLING AND ANALYSIS

Groundwater samples were collected from 11 site wells (wells MW-16, MW-19S, MW-20D, MW-21S, MW-21D, CM-8D, CM-9D, CM-10, CM-12, CM-17, and CM-18) at locations shown on Figure 2, as required by the LARWQCB. The wells were sampled following OTIE-TN&A's standard operating procedures as presented in the approved work plan. As required by the LARWQCB, both filtered and unfiltered groundwater samples were collected to allow comparison and to determine whether the suspended sediments have any affect on the analytical results. In all, 28 groundwater samples were submitted for analysis: 11 unfiltered well samples, 11 filtered well samples, field duplicates from two wells (each with an unfiltered and filtered sample) and two equipment rinsate blanks. Samples were submitted to Calscience Environmental Laboratory (CEL) (NELAP ID# 03220CA) and GPL laboratory, LLC (GPL) (NELAC ID #NLC080001) for analysis.

2.1 GROUNDWATER SAMPLING

Groundwater sampling for radiological analyses was conducted concurrent with the semiannual groundwater sampling event between May 26 and May 27, 2009. Prior to sampling, each well was gauged for depth to water measurements on May 26, 2009 and then purged using a "low-flow" technique with a decontaminated submersible pump and dedicated tubing, as described in the OTIE-TN&A's Standard Operating Practice (SOP) No. TNFLD008F (previously submitted in the work plan). During purging, the groundwater was monitored for the stabilization of pH, temperature, oxidation reduction potential (ORP), dissolved oxygen, conductivity, and turbidity. Field measurements were recorded on well sampling sheets for each well and are included in Appendix B. Upon stabilization of the field parameters, the unfiltered samples were decanted into the appropriate laboratory-supplied containers described in the work plan. Samples designated for field-filtering were filtered using a disposable 0.45-micron filter prior to decanting into the appropriate laboratory-supplied containers. Each sample container was labeled with sample identification, requested analysis, date and time of collection and placed on ice in a cooler in accordance with OTIE-TN&A's SOP No. TNFLD010C (previously submitted). Samples were shipped priority overnight under chain-of-custody protocol to the two laboratories (CEL and GPL) at temperatures between 2 and 6 degrees Celsius.

2.2 INVESTIGATION DERIVED WASTE

Well purge water generated from this event was containerized in an UN-approved 55-gallon drum. The drum was properly labeled and stored on site pending treatment/disposal. A sample of the purge water was collected and analyzed for VOCs and metals to confirm that the material was not a Resource Conservation and Recovery Act (RCRA) Federal hazardous waste or California hazardous waste. Waste characterization data is provided in Appendix C. Results indicated that the purge water is not a RCRA or California Hazardous waste. Disposal of IDW will be performed in accordance with applicable state and federal regulations. Profiling and manifest documentation will be kept on file by Raytheon and OTIE, and available at LARWQCB request.

2.3 SAMPLE ANALYSIS

Each of the 28 groundwater samples was analyzed for total dissolved solids (TDS) at CEL in Chatsworth, California. The remaining sample containers were submitted to GPL in Montgomery, Alabama for analysis of gross beta, total uranium, radium-226 (Ra-226) and radium-228 (Ra-228). Gross alpha analysis was performed after receipt of the TDS results. If the TDS value for a sample was less than 500 milligrams per liter (mg/L), the corresponding

sample at GPL was analyzed for gross alpha by EPA Method 900.0. If TDS concentration was greater than 500 mg/L, the sample was analyzed for gross alpha using Method SM 7110C. Samples for Isotopic uranium were also submitted to GPL from each well for potential analysis. If the total uranium concentration for any sample exceeded the MCL of 20 picocuries per liter (pCi/L), it was then further speciated for their respective isotopes (U^{234}, U^{235}, and U^{238}).

Samples were analyzed by the following methods:

Parameter	**Method**
total dissolved solids (TDS)	SM 2540C
gross alpha* (method based on TDS results)	EPA 900.0 (if TDS <500 mg/L) or SM 7110C (if TDS >500 mg/L)
gross beta	EPA 900.0
uranium	EPA 908.0
Ra-226	EPA 903.1
Ra-228	EPA 904.0
uranium Isotopes (U^{234}, U^{235}, and U^{238})	NTIS 7500-UC-00

* - Natural uranium was used as calibration standard for gross alpha determination by EPA 900.0 for samples with solid content below 500 mg/L and SM 7110C for samples with solid content above 500 mg/L. Use of the natural uranium standard is not the standard operating procedure for the method, but was requested by the LARWQCB in e-mail correspondence between Dr. Ann Chang of the LARWQCB and Ms. Ewelina Mutkowska of OTIE-TN&A on December 12, 2008.

3.0 QUALITY ASSURANCE AND QUALITY CONTROL PROGRAM

OTIE assessed the quality of field data through collection and analysis of field quality control (QC) samples. Laboratory QC samples were analyzed in accordance with referenced analytical method protocols to ensure that laboratory procedures and analyses were conducted properly to meet data quality objectives.

3.1 FIELD QC SAMPLES

QC samples were collected in the field and analyzed to check sampling and analytical precision, accuracy, and representativeness. The following section discusses the types of field QC samples that were collected for this project.

3.1.1 Field Duplicates

Field duplicate samples were collected from two wells. Samples CP-0905023 (filtered) and CP-0905024 (unfiltered) were collected from well MW-16. Samples CP-0905025 (filtered) and CP-0905026 (unfiltered) were collected from well CM-17. These four duplicate samples were submitted for identical analyses.

3.1.2 Equipment Rinsate Samples

Two equipment rinsate samples were collected during the sampling program, one for each day of sampling. Samples CP-0905027 and CP-0905028 were not filtered and were submitted for the same analyses as the normal samples.

The equipment rinsate blanks were prepared by pouring steamed distilled water over the recently decontaminated sampling equipment into appropriate sample containers and sent to the laboratory for analysis.

3.2 LABORATORY QC SAMPLES

Laboratory QC samples were prepared and analyzed at the laboratory to evaluate the effectiveness of sample preparation and analysis and to assess analytical precision and accuracy. Method blanks and laboratory control samples were used for this project by the laboratories. Samples CP-0905006 (from well CM-8D, filtered) and CP-0905019 (from well CM-17, unfiltered) were submitted as matrix spike and matrix spike duplicate samples. The two samples were analyzed for Ra-226 and Ra-228. Additional details on the laboratory QC are included in the data validation section below.

4.0 RADIOLOGICAL DATA VALIDATION

Upon receipt of the radiological laboratory data from GPL, the data packages were submitted to third-party consultant Laboratory Data Consultants, Inc. (LDC) of Carlsbad, California, for the data validation.

Radiological data validation was conducted in accordance with the Final Multi-Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (USEPA, 2004a), Evaluation of Radiochemical Data Usability (ERDU) Guidelines (USDOE, 1997), and National Functional Guidelines (NFGs) for Inorganic Data Evaluation (USEPA, 2004b). Copies of these documents are provided on a CD-ROM in Attachment C of the work plan (TN&A, 2008b.)

Analytical data validation, including field and laboratory data review, is defined as a systematic process, performed external from the data generator (i.e., analytical laboratory performing analyses), which applies a defined set of performance-based criteria to a body of data, which may result in qualification of the data. Data validation provides a level of assurance, based on a technical evaluation, that an analyte is present or absent, and if present, the level of uncertainty associated with the measurement, and occurs prior to drawing a conclusion from a body of data.

Analytical data validation for radiochemistry includes a technical review of a laboratory data package covering the evaluation of quality-indicator samples, the identification and quantitation of analytes, and the effect of deficiencies in quality control on analytical sample data.

4.1 VALIDATION PROCEDURES

The following aspects of the data were reviewed by LDC for data validity:

- Custody of Samples and Sample Documentation;
- Sample Preservation;
- Holding Time Requirements;
- Aliquant Size;
- Chemical Separation (Yield);
- Initial Calibration and Calibration Verification;
- Quality-Indicator Samples;
- Laboratory Control Sample;
- Laboratory Duplicate;
- Field Duplicates;
- Matrix Spike;
- Method Blank;
- Equipment Blank; and
- Nuclide Identification and Quantification

LDC's Radiological data validation report is provided in Appendix D.

4.2 DATA VALIDATION QUALIFIERS AND REASON CODES

Data qualifier flags are used in an effort to best describe the quality of each piece of data to the data user. These flags are letter codes appended to the numerical data. A series of standard remarks is used to give a more detailed explanation of the data. The following data qualifiers along with the United States Environmental Protection Agency (USEPA) definitions were used during the data validation process.

The following qualifiers are used during the data validation process to identify data points that do not meet the project QA/QC limits or other analytical process requirements listed in this report and/or referenced guideline documents:

- **U** - The radionuclide was analyzed for but not detected. The value preceding the U is the minimum detectable activity (MDA).
- **J** - The identification of the analyte is acceptable, but the quality assurance criteria indicate that the quantitative values may be outside the normal expected range of accuracy (i.e., the quantitative value is considered estimated).
- **R** - Data are considered to be rejected and shall not be used. This flag denotes the failure of quality control criteria such that it cannot be determined if the analyte is present or absent from the sample. Re-sampling and analysis are necessary to confirm or deny the presence of the analyte.
- **UJ** - This flag is a combination of the U and J qualifiers, which indicates that the analyte is not present. The reported value is considered to be an estimated MDA.

4.3 DATA VALIDATION REPORT

A validation report including the results of validation activities in accordance with procedures described in the work plan (TN&A, 2008b) was completed by the data validator, LDC (Appendix D). Justification for each qualified data is provided using either reason code or additional explanations for qualification only if the reason codes do not adequately describe justification for qualification. The data validation report includes a narrative, data validation checklist, chain of custody copies, and pages of the laboratory report with assigned validation qualifiers and reasons for the qualifiers where applicable.

5.0 RESULTS

For all radiological analytical results, the laboratory provided the activity value (result), a total error, and the MDA. As a conservative measure, the activity results were adjusted based on the error provided and are referred to as "adjusted results" in the discussion herein, as is standard practice in the industry. Table 1 presents the results, the adjusted results, and the California MCLs for each of the radiological analytes, as well as the TDS results. The results are also summarized on Figure 2. For discussion purposes, the radiological results presented below refer to the adjusted results corresponding with the highest detected values between the filtered and unfiltered samples.

5.1 MONITORING WELL LABORATORY SAMPLE RESULTS

Detected gross alpha concentrations ranged from 3.87 pCi/L (well MW-19S) to 64.89 pCi/L (well MW-21D). For the gross alpha results to be compared to the MCL value of 15 pCi/L, the adjusted total uranium value was subtracted from the adjusted gross alpha concentration, per the California Department of Public Health (CDPH, 2008). Of the 11 wells sampled, the MCL was exceeded in samples from three wells: MW-16, MW-20D, and MW-21D (Table 1).

Gross beta results ranged from 4.77 pCi/L (MW-19S) to 54.77 pCi/L (CM-18). None of the samples exceeded the MCL of 20,000 pCi/L for gross beta.

Detected Ra-226 concentrations ranged from 0.885 pCi/L (CM-17) to 16.12 pCi/L (well MW-21D), while Ra-228 values ranged from 1.46 pCi/L (well MW-20D) to 2.81 pCi/L (well MW-19S). The MCL for radium is the sum of Ra-226 and Ra-228 at 5.0 pCi/L. Combined radium values in the 11 wells sampled ranged from 2.11 pCi/L (CM-17) to 18.62 pCi/L (MW-21D). Two of the 11 wells sampled had concentrations exceeding the MCL of 5.0 pCi/L (MW-20D and MW-21D).

Total uranium concentrations ranged from 3.17 pCi/L (CM-17) to 126.5 pCi/L (CM-10). Sixteen samples from seven wells (CM-8D, MW-21S, CM-9D, CM-10, CM-12, CM-17 and CM-18) exceeded the MCL of 20 pCi/L. The 16 samples exceeding the uranium MCL were also speciated for isotopic uranium (U^{234}, U^{235} and U^{238}) as summarized in Table 1. The isotopic analyses were performed in order to calculate the relative mass ratios to determine if the origin of the uranium was man-made (enriched or depleted) or was consistent with naturally occurring sources. This evaluation technique is an industry standard and was agreed upon per the LARWQCB-approved revised work plan (TN&A, 2008b). Table 2 presents ratios for the three isotopes for the May 2009 samples along with the relative mass ratio calculations. The average mass ratio values for all of the samples were: U-234 (0.0055%); U-235 (0.6712%) and U-238 (99.3233%). These are consistent with typical "natural isotopic mass ratios" which are U-234 (0.0055%); U-235 (0.7200%) and U-238 (99.27%) according to the United States Department of Energy's *Guide of Good Practices for Occupational Radiological Protection in Uranium Facilities* (USDOE, 2004). The same calculations were previously performed for the October 1991 and December 1991 analytical results and yielded similar ratios.

All historical radiological analytical data for the 11 groundwater monitoring wells sampled for this event were tabulated and are presented in Table 3. Laboratory reports for the May 2009 event are included on CD in Appendix C.

5.2 MONITORING WELL FIELD PARAMETER RESULTS

The key geochemical field parameters collected during the purging sequence are summarized in Table 4 and include the following ranges:

- ORP: +189 milli-volts (mV) (CM-10) to -372 mV (MW-21D)
- pH: 7.72 (CM-10) to 8.16 (CM-12)
- turbidity: 8.2 nephelometric turbidity units (NTU) (CM-10) to 59.6 NTU (CM-18).

5.3 QA/QC RESULTS

The relative percent difference (RPD) between field duplicate pair samples was calculated (by LDC) to evaluate precision. The RPDs were found to range from 7% to 200%. RPDs for the Ra-228 analyses ranged from 9% to 200%. The Ra-228 results were flagged due to exceedence in percent recovery.

Validation report number 21179 generated by LDC dated August 10, 2009 was reviewed by OTIE-TN&A to assess data quality, data qualification decisions, and validation completeness. A memo summarizing the review is included in Appendix D. No major issues were identified. Minor issues include qualification for blank contamination, tracer recovery deficiencies, and chemical surrogate recovery deficiencies. Minor validation deficiencies are summarized in Table 2 (in memo, Appendix D). Laboratory data reporting forms, along with handwritten data qualifications, where warranted, are included in Attachment 1 of the memo (Appendix D).

The analytical results meet the data quality objectives defined by the applicable method and validation guidance documentation and are of sufficient quality to meet the project objectives.

6.0 SUMMARY

The data presented in this report fulfills the request by the LARWQCB to verify the current radiological conditions at the Former Canoga Park Facility located at 8433 Fallbrook Ave, Canoga Park, California, as stated in the March 5, 2008 letter. All work was performed by OTIE, on behalf of Raytheon, as described in the LARWQCB-approved work plan (TN&A, 2008b).

The following bullets summarize the activities and data findings for the verification of current radiological conditions at the site.

- On May 26 and May 27, 2009, the following 11 wells were sampled: CM-8D, CM-9D, CM-10, CM-12, CM-17, CM-18, MW-16, MW-19S, MW-20D, MW-21S and MW-21D and the samples analyzed for radiological parameters;
- A total of 28 groundwater samples were collected and submitted for analysis: 11 unfiltered well samples, 11 filtered well samples, field duplicates from 2 wells (each with an unfiltered and filtered sample) and 2 equipment rinsate blanks. All samples were analyzed for TDS (SM 2540C), gross alpha (EPA 900.0 or SM 7110C), gross beta (EPA 900.0), Ra-226 (EPA 903.1), Ra-228 (EPA 904.0), and Total uranium (EPA 908.0) Select samples were also analyzed for Isotopic uranium by Method NTIS 7500-UC-00. TDS analysis was performed at CEL and the radiological analyses were performed at GPL;
- Third party data validation was conducted by Laboratory Data Consultants, Inc., between July 20 and August 10, 2009;
- TDS values in the 26 well samples (filtered and unfiltered) ranged from 975 mg/L (CM-12, filtered) to 3,440 mg/L (CM-10, filtered);
- Detected Ra-226 concentrations ranged from 0.855 pCi/L (CM-17, unfiltered) to 16.12 pCi/L (sample MW-21D, unfiltered);
- Detected Ra-228 values ranged from 0.47 pCi/L (CM-10, filtered) to 2.81 pCi/L (MW-19S, unfiltered);
- Combined radium results (Ra-226 + Ra-228) indicate that two of the 11 wells (MW-20D and MW-21D) exceed the combined radium MCL of 5 pCi/L;
- Detected gross alpha concentrations ranged from 3.87 pCi/L (MW-19S, unfiltered) to 64.89 pCi/L (MW-21D, unfiltered), adjusting these results by subtracting total adjusted uranium per the California MCL protocol, indicated that three of the 11 wells (MW-16, MW-20D and MW-21D) exceeded the MCL for gross alpha particle activity;
- Detected gross beta results ranged from 4.77 pCi/L (MW-19S, unfiltered) to 54.77 pCi/L (CM-18, unfiltered), none of the samples exceeded the MCL of 20,000 pCi/L;
- Total detected uranium concentrations ranged from 3.17 pCi/L (MW-19S, unfiltered) to 126.5 pCi/L (CM-10, filtered) and indicated that seven of the 11 wells (CM-8D, MW-21S, CM-9D, CM-10, CM-12, CM-17 and CM-18) exceeded the MCL of 20 pCi/L; and
- All isotopic uranium results indicated that the relative mass ratios were consistent with a naturally occurring source (i.e., not enriched or depleted) per USDOE evaluation protocol.

7.0 DATA EVALUATION DISCUSSION

As indicated by the results listed above, there is no consistent pattern between the distribution of wells with samples that exceeded MCLs for radiological parameters. For example, wells exceeding the radium or gross alpha MCLs are different from the wells that exceed the uranium MCL. Furthermore, the distribution of concentrations are not consistent with a site release and transport via groundwater flow as there is not a defined area where the concentrations in wells on site are markedly higher than the concentrations detected in the perimeter wells. All of the concentrations exceeding MCLs are generally of the same order of magnitude, more indicative of naturally occurring ambient levels, possibly associated with the distribution of native minerals comprising the aquifer material and/or the distribution of varying geochemical conditions within the aquifer zones.

Heterogeneities in these geochemical parameters could be related to the heterogeneities in the radiological parameter levels. To evaluate this premise, OTIE-TN&A compared the differences in concentrations of combined radium, gross alpha and uranium with the different sampling methods (filtered versus unfiltered), the levels of TDS, and against other field parameters (pH, turbidity and ORP). A discussion of the results for these analyses are provided below.

7.1 EVALUATION OF FILTERED VERSUS UNFILTERED CONCENTRATIONS

A comparison was made with filtered versus unfiltered laboratory results for combined radium gross alpha and total uranium. Radium was only detected in both filtered and non-filtered samples from wells MW-20D and MW-21D, of which the filtered sample was higher in the MW-20D pair and the unfiltered sample was higher between the MW-21D pair (Graph 1).

The gross alpha result comparison (Graph 2) showed that of the 11 sample pairs, results for two of the sample pairs were identical, six of the sample pairs had higher concentrations in the unfiltered sample, and three of the pairs had higher concentrations in the filtered sample.

Of the 11 sample pairs analyzed for uranium, concentrations were higher in the unfiltered sample in five of the pairs and higher in the filtered sample in four pairs (Graph 3). Uranium was undetected in two sample pairs.

Based on these comparisons, no consistent correlation was able to be drawn between the filtered versus unfiltered sample results.

7.2 EVALUATION OF RADIUM VERSUS TOTAL DISSOLVED SOLIDS AND FIELD PARAMETERS

Graphs 4a through 4d present the combined radium concentrations against TDS, pH, turbidity and ORP values for each well sample, respectively. In reviewing the graphs, it is apparent that there is no correlation between radium levels and any of the geochemical parameters, except possibly for ORP where high radium levels appear to coincide with low negative ORP values.

To further evaluate a possible correlation, the detected radium levels were graphed against ORP levels and a regression analysis was performed by using the trend line fitting tool in Microsoft Excel® (polynomial, order 2). This is presented graphically in Graphs 4e and 4f. A valuable evaluation metric produced by the regression analysis is the coefficient of determination (R^2). In general, an R^2 value of 1.0 would indicate that the data is perfectly correlated, R^2 values over 0.80 indicate a generally good correlation and R^2 values between 0.6 and 0.8 are possibly correlated, but suspect (Bulmer, 1979). R^2 values below 0.6 indicate that there is unlikely any correlation between the data.

The regression analysis for combined radium versus ORP resulted in a R^2 values of 0.945 (filtered) and 0.871 (unfiltered). This indicates that there is likely a correlation; however, this is based on only 4 data points for each series as there were only a total of 8 detections out of the 22 samples analyzed.

7.3 Evaluation of Gross Alpha Versus Total Dissolved Solids and Field Parameters

Graphs 5a through 5d present the gross alpha concentrations against TDS, pH, turbidity and ORP values for each well sample, respectively. In reviewing the graphs, it is apparent that there is no correlation between gross alpha levels and any of the geochemical parameters, except possibly for TDS where high TDS appear to coincide with some of the elevated gross alpha levels. Therefore, a regression analysis was performed for TDS values versus gross alpha as illustrated in Graphs 5e and 5f. The regression analysis resulted in R^2 values of 0.254 (filtered) and 0.121 (unfiltered), indicating that there is not likely a correlation between TDS and gross alpha.

7.4 Evaluation of Uranium Versus Total Dissolved Solids and Field Parameters

Graphs 6a through 6d present the total uranium concentrations against TDS, pH, turbidity and ORP values for each well sample, respectively. In reviewing the graphs, it is apparent that there is no correlation between total uranium levels and any of the geochemical parameters, except possibly TDS and ORP, where high TDS and low negative ORP appears to coincide with some of the elevated uranium levels. Therefore, a regression analysis was performed for TDS versus total uranium and ORP versus total uranium, as illustrated in Graphs 6e through 6h. The regression analysis for TDS versus total uranium resulted in R^2 values of 0.542 (filtered) and 0.257 (unfiltered) and the regression analysis for ORP versus total uranium resulted in R^2 values of 0.800 (filtered) and 0.618 (unfiltered). These values indicate that there is not likely a correlation between TDS and total uranium, however, there is possibly a correlation between ORP and total uranium levels.

8.0 CONCLUSIONS

The data produced during this groundwater investigation are consistent with previous results collected in 1990 and 1991 (Table 3). Samples collected from 10 of the 11 wells exceeded one or more California MCL for gross alpha, combined radium and/or total uranium. However, from all the data collected to date, it is evident that the radiological parameters in groundwater are unrelated to a release at the former Canoga Park facility per the following lines of evidence:

1) The uranium isotopic relative mass abundances are consistent with naturally occurring sources according to the evaluation method published by the DOE, and accepted by the LARWQCB per the approved work plan.

2) None of the levels exceed more than one order of magnitude of the MCLs (i.e., no point source area with highly elevated levels exists per the data).

3) The distributions of the parameters exceeding MCL are not consistent with a site release.

4) An analysis of the geochemical parameters indicates that the elevated radiological levels for these parameters could possibly be related to the native geochemistry in regards to ORP conditions.

OTIE does not recommend any further action at the site relative to radiological parameters. This current investigation and the 1990/1991 investigation work have determined that the levels of radiological isotopes detected in groundwater at the former facility are attributable to naturally occurring sources in the underlying aquifer matrix and geochemical system.

Raytheon will continue to work with the LARWQCB and Department Toxics Substance Control (DTSC) to fully address the VOC levels that are currently being remediated in the northwest portion of the site and awaits the determination for NFA status for the southern parcels of the site. A request to the LARWQCB was sent on behalf of Raytheon in a June 27, 2006 technical memorandum (Appendix A) requesting a no further action “NFA” status for the southern portion of the site (Assessor Parcel Number’s 2005-02-009, 2005-02-011 and 2005-02-901), which contain wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-28, MW-29, MW-30 and MW-31. Samples from these wells have had VOC concentrations that were non-detectable or below California MCLs since 1999. Therefore, it was requested that the NFA status be given to those southern parcels and that those wells be abandoned. The LARWQCB allowed these wells to be removed from the monitoring program, however, the NFA status and abandonment approval was never received due to the concerns about the radiological parameters in groundwater previously reported in the 1992 GRC documents. Per the results of the verification sampling reported in this document, it is evident that there are no levels of radiological parameters that are related to historical uses at the Former Canoga Park facility, therefore, OTIE, on behalf of Raytheon, requests that an NFA status be given to the southern parcels of the site and that the LARWQCB accept the findings of the site wide radiological investigation as complete.

Notes

1.) Groundwater Samples were collected on May 26-27, 2009
2.) Filtered samples were collected using a 0.45 micron filter
3.) TDS = Total Dissolved Solids (Secondary Drinking water standard is 500 mg/L)
4.) pCi/L = picocuries per liter
5.) mg/L = milligrams per liter
6.) MCL = Maximum Contaminant Level, per California Dept of Public Health.
7.) * = Gross Alpha concentration shown excludes Total Uranium.
8.) U = undetected at concentration shown. J = estimated value
9.) Shaded concentrations exceed their respective MCLs
10.) All radiological concentration shown are adjusted. See Table 1 for more information.

Notes:

1. Adjusted Results = Uranium result + (0.84 * reported counting error)
2. Samples CP-0905027 and CP-0905028 were analyzed for Gross Alpha by EPA 900.0. All other samples by SM7110C.
3. (mrem/yr) results were calculated using = (results in pCi/L /20,000 pCi/yr for total body emission)* 4 mrem/yr
4. Gross Alpha results were adjusted by subtracting the total uranium value prior to comparison to the MCL value, per CDPH http://www.cdph.ca.gov/certlic/drinkingwater/Pages/Chemicalcontaminants.aspx.
5. MCL - Maximum Contaminant Level
6. pCi/L - picocuries per liter
7. mrem/yr - millirem per year
8. mg/L - milligrams per liter
9. TDS - Total Dissolved Solids
10. n/a - MCL values were not established for these analytes
11. N - Normal sample; FD - Field duplicate; EB - Equipment blank
12. Indicates that the reported result exceeded MCLs
13. U - undetected at concentration shown
14. J - estimated value

Notes:

1. "n/a" = because Total Uranium results did not exceed Maximum Contaminant Level Values, no Isotopic Uranium analysis was conducted on these samples.
2. "--" = Ratios not calculated for samples with non-detectable Uranium U-234 or U-235 Activity Concentrations
3. * = Activity/Mass Conversion Factors (Specific Activity Values Converted from Ci/g to pCi/L) and Typical Isotopic Abundances of Uranium Isotopes from Table 2-1 of DOE-STD-1136-2004, Page 2-2. Conversion calculation provided below:

A. Specific Activity of U-234

$$6.20\text{E-}03\ \frac{\cancel{\text{Ci}}}{\text{g}} \times \frac{1}{1.00\text{E-}12}\ \frac{\text{pCi}}{\cancel{\text{Ci}}} = 6.20\text{E+}09\ \frac{\text{pCi}}{\cancel{\text{g}}} \times \frac{1.00\text{E-}06\ \cancel{\text{g}}}{1\ \mu\text{g}} = \mathbf{6200}\ \frac{\mathbf{pCi}}{\mathbf{\mu g}}$$

B. Specific Activity of U-235

$$2.10\text{E-}06\ \frac{\cancel{\text{Ci}}}{\text{g}} \times \frac{1}{1.00\text{E-}12}\ \frac{\text{pCi}}{\cancel{\text{Ci}}} = 2.10\text{E+}06\ \frac{\text{pCi}}{\cancel{\text{g}}} \times \frac{1.00\text{E-}06\ \cancel{\text{g}}}{1\ \mu\text{g}} = \mathbf{2.10}\ \frac{\mathbf{pCi}}{\mathbf{\mu g}}$$

C. Specific Activity of U-238

$$3.30\text{E-}07\ \frac{\cancel{\text{Ci}}}{\text{g}} \times \frac{1}{1.00\text{E-}12}\ \frac{\text{pCi}}{\cancel{\text{Ci}}} = 3.30\text{E+}05\ \frac{\text{pCi}}{\cancel{\text{g}}} \times \frac{1.00\text{E-}06\ \cancel{\text{g}}}{1\ \mu\text{g}} = \mathbf{0.330}\ \frac{\mathbf{pCi}}{\mathbf{\mu g}}$$

Conversion Factors Used in Table

Bq = Becquerel, g = gram, µg = microgram, L = liter, Ci = Curie, pCi = picoCurie

Safety, Health, Environmental Affairs
Raytheon Company
P.O. Box 11337
Tucson, AZ 85834-1337

CALIFORNIA WATER CODE (CWC) SECTION 13267 – ORDER REQUIRING A GROUNDWATER INVESTIGATION WORK PLAN TO VERIFY CURRENT RADIOACTIVITY CONDITIONS – RAYTHEON SYSTEMS COMPANY (FORMER HUGHES MISSILE SYSTEM COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (WDR NO. 95-012, SLIC NO. 0693, SITE ID NO. 2043T00)

Dear Ms. Roberts:

In response to public concerns regarding radioactivity sampling results from the on-site groundwater monitoring wells, the Los Angeles Regional Water Quality Control Board (Regional Board) staff have reviewed the following reports, prepared by Groundwater Resources Consultants, Inc., for the referenced site:

- *Investigation of Radioactivity in Groundwater, October 1991*, dated January 23, 1992, and
- *Results of Radiological Sampling of Monitoring Wells, December 1991*, dated March 27, 1992

The referenced site was 86 acres and operated as an aerospace research and development facility from approximately 1959 to 1996. Hughes Missile System Company operated/owned the entire facility since the mid 1970's through 1996. Raytheon merged with Hughes in 1997 and since then the site has been known as the "Former Raytheon Facility, Canoga Park". Numerous site investigations and remedial activities have been conducted since the early 1990's. Volatile organic compounds (VOCs), mainly 1,1-dichoroethene (1,1-DCE), have been detected in groundwater across the site. A groundwater remediation program has been implemented at the site since 1995 to progress towards achieving cleanup criteria established in the Corrective Action Plan (1992) for the site. Remediation techniques used at the site include groundwater recovery and treatment, soil vapor extraction, and air sparging.

To assess the radioactivity conditions at the site, the groundwater monitoring wells were sampled for radioactivity. Based on review of the two reports submitted, the Regional Board staff have the following comments:

1. For both reports, please correct the remarks for adjusted gross alpha emitters and revise the California Maximum Contaminant Levels (MCLs) for uranium (with correct unit) and combined radium - 226+228 in tables titled EPA Proposed Maximum Contaminant Levels. See attachment titled Maximum Contaminant Levels and Regulatory Dates for Drinking Water.

2. For both reports, please revise tables titled Summary of Alpha Emitters and Adjusted Gross Alpha Levels corresponding with Comment 1.

3. The reports summarized that total dissolved solids (TDS) concentrations ranging from three to five times the drinking water secondary MCL of 500 mg/L at the facility. Please provide TDS groundwater concentrations throughout the site.

4. The reports summarized that an analysis of the isotopic mass percentages of the samples with elevated uranium levels indicates that the percentages conform to the U.S. EPA definition of naturally occurring uranium. Please provide a copy of the U.S. EPA documentation, a copy of the cited source, and detailed calculations of the activity/mass equivalents.

5. Upon review of the summary tables, Regional Board staff conclude that the following wells have radioactive contaminant levels in excess of the California MCLs.

	California MCL	October 1991, 22 wells sampled	December 1991, 28 wells sampled
Gross Alpha particle activity (excluding radon & uranium)	15 pCi/L	MW-20D	none
Uranium	20 pCi/L	MW-19S, MW-21S, CM-8D, CM-9D, CM-10	CM-8D, CM-10, CM-12, CM-17, CM-18
Combined Radium - 226+228	5 pCi/L	MW-16, MW-20D, MW-21D	MW-16, MW-21D

Pursuant to Section 13267 of the CWC, you are required to submit a work plan for groundwater investigation to verify current radioactivity conditions. The groundwater monitoring wells shall be sampled for radioactivity analyses including gross alpha particle activity, uranium, combined radium - 226+228, and gross beta particle activity. At a minimum, the work plan shall contain those groundwater monitoring wells with radioactive contaminant levels in excess of the MCLs (see attachment of Excel Spread Sheets) and be submitted to the Regional Board by **May 1, 2008**.

Pursuant to Section 13268 of the CWC, failure to submit the required work plan by the due dates may result in civil liability administratively imposed by the Regional Board in an amount up to one thousand dollars ($1,000) for each day the work plan is not received.

Should you have any questions, please contact Dr. Ann Chang at (213) 620-6070, or Ms. Su Han at (213) 576-6735.

Sincerely,

Tracy J. Egoscue
Executive Officer

Subject: Response to Request for Investigation Work Plan to Verify Current Radioactivity Conditions at the Former Canoga Park Facility
8433 Fallbrook Avenue
Canoga Park, California

Dear Ms. Egoscue:

Raytheon is in receipt of the letter dated March 19, 2008 requesting a work plan pursuant to Section 13267 of the California Water Code to investigate the current radioactive conditions of groundwater at the Former Canoga Park Facility. On January 15, 1992, Raytheon submitted a work plan to Hank H. Yacoub of the California Regional Water Quality Control Board (RWQCB) to investigate the radioactivity of groundwater at the Former Canoga Park Facility. The results of the investigation were summarized to the RWQCB in *Investigation of Radioactivity in Groundwater at the Hughes Aircraft Company Canoga Park Facility, Canoga Park, California* (GRC Inc., January 23, 1992). Eight sampling events were performed and the analytical results submitted to E.G. Soloman of the RWQCB on June 18, 1992. The investigation and follow-on sampling events consistently determined that the levels of radioisotopes were attributable to naturally occurring sources in the underlying native soils and bedrock.

The data set produced by the eight sampling events and the evaluation of these data submitted to the RWQCB were conclusive to indicate that radioactivity in groundwater at the site is naturally occurring. For your convenience, data previously transmitted to the RWQCB are enclosed. In addition, a copy of the USEPA reference documentation (Federal Register, Vol. 56, No. 138, pp. 33050 - 33127, July18, 1991) used to prepare the reports is enclosed.

Raytheon

Missile Systems
PO Box 11337
Tucson, Arizona
85734-1337 USA
520.794.3000

The letter also requests Raytheon provide data on Total Dissolved Solids (TDS) and correct the tables in the two referenced reports for adjusted gross alpha and uranium units. The corrected tables and reference documents are enclosed

We trust the enclosed historical data, revised tables, and revised recalculations allow the RWQCB to evaluate the radioactivity condition of groundwater and concur with the results of the investigation. Should the RWQCB have any questions, Raytheon would be pleased to respond, either in writing or at a meeting. Please feel to contact Mr. Daniel Samorano of my staff at (520) 794-9026 with any questions.

Sincerely,

Joseph H. Johnson
Director
Environmental, Health, and Safety

Subject: Additional Information Regarding Request for Investigation Work Plan to Verify Current Radioactivity Conditions
Former Canoga Park Facility
8433 Fallbrook Avenue
Canoga Park, California

Dear Dr. Chang:

On April 30, 2008, Raytheon responded to the California Regional Water Quality Control Board's request for a groundwater investigation work plan to verify current radioactivity conditions at the Former Canoga Park Facility. Per our telephone on May 21, 2008, Raytheon is providing hard copy of the response enclosures. A table of contents has been provided with the three ring binder as well as the comment/response section below to guide the RWQCB to the appropriate enclosures.

Comment No. 1 – For both reports, please correct the remarks for adjusted gross alpha emitters and revise the California Maximum Contaminant Levels (MCLs) for uranium (with correct unit) and combined radium – 226+228 in tables titled EPA Proposed Maximum Contaminant Levels. See attached titled Maximum Contaminant Levels and Regulatory Dates for Drinking Water.

Response No.1: The tables titled "EPA Proposed Maximum Contaminant Levels" for both the January 23 and March 27, 1992 reports have been revised to include MCLs for both EPA and California. The revised Tables 2 and 3 are provided in the tab labeled "Revised Tables GRC Reports."

Raytheon

Missile Systems
PO Box 11337
Tucson, Arizona
85734-1337 USA
520.794.3000

Comment No. 2 – For both reports, please revise tables titled Summary of Alpha Emitters and Adjusted Gross Alpha Levels corresponding with Comment 1.

Response No.2 – The tables titled, "Summary of Alpha Emitters and Adjusted Gross Alpha Levels" for both the January 23 and March 27, 1992 reports have been revised to meet current regulations. The revised tables are provided in the tab labeled "Revised Tables GRC Reports."

Comment No. 3 – The reports summarized that total dissolved solids (TDS) concentrations ranging from three to five times the drinking water secondary MCL of 500 mg/L at the facility. Please provide TDS groundwater concentrations throughout the site.

Response No. 3 – TDS data has been collected at several wells throughout the site in the last few years. The average site-wide TDS value is approximately 1,500 mg/L. As requested, per our telephone conversion, TDS data (Table 3) from the Third Quarter 1991 Groundwater Monitoring Report (GRC, November 1991) is provided. These data are summarized in the tab labeled "Canoga Park TDS."

Comment No. 4 – The reports summarized that an analysis of the isotopic mass percentages of the samples with elevated uranium levels indicates that the percentages conform to the U.S. EPA definition of naturally occurring uranium. Please provide a copy of the U.S. EPA documentation, a copy of the cited source, and detailed calculations of the activity/mass equivalents.

Response No. 4 – Both reports reference the "Federal Register, Notice of Proposed Rule Making, National Primary Drinking Water Regulations: Radionuclides (Vol. 56, No. 138, pp. 33050 – 33127, July 18, 1991. This document states that uranium as a combination of uranium-234 plus uranium-235 plus uranium-238 has a varying isotopic composition, but typically is 0.006% uranium-234, 0.7% uranium-235, and 99.27% uranium-238. This ratio is further referenced on the EPA's website: http://www.epa.gov/radiation/radionuclides/uranium.html. The attached DOE Standard 1136-2004 dated December 2004 and titled "Guide of Good Practices for Occupational Radiological Protection in Uranium Facilities further support this information. Copies of the referenced documents and calculations are provided in the tabs labeled "56 Federal Register 138_33050-33127," "DOE-STD-1136-2004," and "Friedlander Reference."

The updated calculations for the activity/mass equivalents are provided in the tab labeled "Relative Mass U Isotopes."

Raytheon

Missile Systems
PO Box 11337
Tucson, Arizona
85734-1337 USA
520.794.3000

Comment No. 5 – Upon review of the summary tables, Regional Board staff concludes that the following wells have radioactive contaminants levels in excess of the California MCL.

Response No. 5 – As stated in the Raytheon response dated April 30, 2008, investigation and follow-on sampling events at the former Canoga Park Facility consistently determined that the levels of radioisotopes were attributable to naturally occurring sources in the underlying native soils and bedrock. The data set produced by the eight sampling events and the evaluation of these data submitted to the RWQCB were conclusive to indicate that radioactivity in groundwater at the site is naturally occurring. These reports and data sets are provided in the tabs labeled "Radioisotope Work Plan", Radioisotope Work Plan Results", and "McLaren Hart Isotope Report 10-28/-91."

Should the RWQCB have any questions please do not hesitate to contact me at (520) 794-9026.

Sincerely,

Daniel S. Samorano, P.E.

CALIFORNIA WATER CODE SECTION 13267 ORDER: REQUIRING A GROUNDWATER INVESTIGATION WORK PLAN TO VERIFY CURRENT RADIOACTIVITY CONDITIONS – RAYTHEON SYSTEMS COMPANY (FORMER HUGHES MISSILE SYSTEM COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (WDR NO. 95-012, SLIC NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

The California Regional Water Quality Control Board (Regional Board) staff have reviewed Raytheon's response to the Regional Board's Order dated March 19, 2008 requiring a groundwater investigation work plan to verify current radioactivity conditions at the Former Canoga Park Facility. The response presents additional information including historical data, revised tables, and recalculations for the Regional Board to evaluate the radioactivity condition of groundwater at the site. Based on review of the additional information submitted, the Regional Board staff have the following comments:

1. The Work Plan dated December 19, 1991 indicated that concentration of radioisotopes in groundwater may not be directly related to concentrations in the host rock or soil, but rather to water attributes such as pH, total dissolved solids, concentration of dissolved carbonate, oxidation/reduction potential, etc. On the contrary, the Raytheon response dated June 3, 2008, stated that investigation and follow-on sampling events at the former Canoga Facility consistently determined that the levels of radioisotopes were attributable to naturally occurring sources in the underlying native soils and bedrock. There is inconsistence between these two statements. In addition, the measurements of uranium did not indicate the elevated uranium levels in excess of the Maximum Contaminant Levels (MCLs) across the entire Facility.

2. Groundwater monitoring was conducted at the site by McLaren/Hart between March 1990 and June 1991. A total of 22 wells were sampled for gross alpha, gross beta, total uranium, and radium-226. Additionally, radium-228 was analyzed for samples with radium-226 exceeding 3 picocuries per liter (pCi/L). As indicated in the McLaren/Hart report dated October 28, 1991, gross alpha and gross beta radioisotope levels in groundwater beneath the Facility were generally consistent with those levels identified at other sites located in the San Fernando Valley area. However, uranium and radium-226 levels were broader in range and were elevated in comparison.

3. Two groundwater sampling events with isotopic analyses of uranium and radium were performed by GRC during October and December 1991. GRC recommended that no additional radionuclide sampling is warranted based on the USEPA 1991 proposed MCLs, which were different from the current USEPA MCLs and California MCLs. In addition, the documentation only indicated that the associated isotopic mass percentages fell within the range expected for naturally occurring uranium.

4. The uranium activity data presented in the two referenced GRC groundwater reports have been recalculated using conversion factors based on the specific activities referenced in the U.S. Department of Energy document. The site data are compared to the published values of typical isotopic abundances. The data indicates the isotopic mass percentages of the samples with elevated uranium levels support the USEPA definition of naturally occurring uranium.

Relative Abundance of Uranium Isotopes

Isotope	**U-238**	**U-235**	**U-234**
Natural Abundance (%)	99.27	0.72	0.0055

5. The Raytheon response dated June 3, 2008, stated that radioactivity in groundwater at the site was concluded to be naturally occurring based on the results of eight sampling events. However, there were only two sampling events (October 1991 and December 1991) with isotopic analysis of uranium to demonstrate the percentage of natural abundance of each natural uranium isotope for confirming its natural origin. In addition, there were only two sampling events with isotopic analysis of radium for measurements of radium-226 and radium-228 separately, to meet monitoring requirements for radium-228.

6. Upon review of the revised summary tables, Regional Board staff conclude that the following wells have radioactive contaminant levels in excess of the California MCLs.

	California MCL	October 1991, 22 wells sampled	December 1991, 28 wells sampled
Gross alpha particle activity (excluding radon & uranium)	15 pCi/L	MW-20D	none
Uranium	20 pCi/L	MW-19S, MW-21S, CM-8D, CM-9D, CM-10	CM-8D, CM-10, CM-12, CM-17, CM-18
Combined radium - 226+228	5 pCi/L	MW-16, MW-20D, MW-21D	MW-16, MW-21D

Pursuant to Section 13267 of the CWC, you are required to submit a work plan for a site-wide groundwater investigation to verify current radioactivity conditions. The groundwater monitoring wells shall be sampled for radioactivity including gross alpha particle activity, uranium, combined radium - 226+228, and gross beta particle activity. At a minimum, the work plan shall address those groundwater monitoring wells with radioactive contaminant levels in excess of the MCLs. The work plan must be submitted to the Regional Board by **September 15, 2008**.

Pursuant to Section 13268 of the CWC, failure to submit the required work plan by the due dates may result in civil liability administratively imposed by the Regional Board in an amount up to one thousand dollars ($1,000) for each day the work plan is not received.

Should you have any questions, please contact Dr. Ann Chang at (213) 620-6070, or Ms. Su Han at (213) 576-6735.

Sincerely,

David A. Bacharowski, AEO

COMMENTS ON DEFICIENT TECHNICAL REPORT – WORK PLAN FOR GROUNDWATER INVESTIGATION TO VERIFY CURRENT RADIOACTIVITY CONDITIONS PURSUANT TO CALIFORNIA WATER CODE SECTION 13267 ORDER – FORMER RAYTHEON FACILITY (HUGHES MISSILE SYSTEMS COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (WDR NO. 95-012, SLIC NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff received and reviewed the *Work Plan for Groundwater Investigation to Verify Current Radioactivity Conditions* (Work Plan), dated September 12, 2008, prepared by TN & Associates, Inc. for the referenced site. This Work Plan was required by the Regional Board in the July 15, 2008 California Water Code (CWC) Section 13267 order.

Based on review of the information submitted, Regional Board staff have the following comments which shall be addressed in a revised work plan:

1. The groundwater samples shall be submitted to a state certified laboratory with Field of Testing in Radiochemistry of Drinking Water. Provide proof of Environmental Laboratory Certification when the investigation report is submitted to the Regional Board.

2. The groundwater samples shall be analyzed for:

   - Total dissolved solids (TDS) by EPA Method 160.1
   - Gross alpha by EPA Method 900.0 or 900.1
   - Radium-226 by EPA Method 903.0 or 903.1
   - Radium-228 by EPA Method 904.0
   - Uranium by EPA Method 908.0
   - Gross beta by EPA Method 900.0

3. In EPA Method 900.0 for gross alpha and gross beta measurement, the solids concentration is very much a limiting factor in the sensitivity of the method for any given groundwater sample because the radioactivity of the sample is not separated from the solids of the sample. For groundwater samples with solids content greater than 500 milligrams per liter (mg/L), EPA Method 900.1 is recommended.

4. EPA Method 903.0 covers the measurement of the total soluble alpha emitting radioisotopes of radium, namely radium-223, radium-224, and radium-226. When the total radium alpha activity of a groundwater sample is greater than 5 picocuries per liter (pCi/L), then the radium-226 analysis by EPA Method 903.1 is required.

5. Include a table containing information on container types, sample volumes, preservatives, special handling, and analytical holding times for each analysis.

6. Because adjusted gross alpha activity is calculated by subtraction of the uranium measurement from the gross alpha measurement, specify which standard will be used for gross alpha measurement.

7. EPA Method 908.0 only covers the measurements of total uranium alpha particle activity. Specify the EPA approved method for isotopic analysis of uranium.

8. Collect both filtered and unfiltered groundwater samples for the purpose of comparison in order to determine whether the suspended sediments could affect analytical results.

9. Specify field QA/QC program for radioactivity analyses of groundwater samples and provide supporting documentation. However, equipment (rinsate) blanks should be collected as field QA/QC samples and field duplicates should be at least 10% of total samples per event for QA/QC purposes.

10. Specify laboratory QA/QC program for radioactivity analyses of groundwater samples and provide supporting documentation.

11. Specify data validation procedures for radioactivity analyses of groundwater samples and provide supporting documentation.

12. Explain why all liquid Investigation-Derived Wastes will be transferred from the storage tank to the on-site groundwater remediation system. It is our understanding that the groundwater recovery and treatment system was shut down in April 2006.

13. Provide documentation of all analytical methods.

14. Provide a Statement of Qualifications for professionals who will be responsible for preparing a revised work plan, indicating project experience related to chemical and radiochemical analyses of environmental samples.

Please adequately address the aforementioned comments and submit a revised work plan to the Regional Board by **November 17, 2008.** In addition, the Regional Board staff will meet with the representatives of the Raytheon Company and TN & Associates to further discuss the content of the revised work plan on November 4, 2008.

Pursuant to CWC Section 13268, failure to submit the required technical reports/documents by the due date specified may result in civil liability penalties administratively imposed by the Regional Board in an amount up to one thousand dollars ($1,000) for each day the technical reports/documents are not received.

Should you have any questions, please contact Dr. Ann Chang at (213) 620-6070, or Ms. Su Han at (213) 576-6735.

Sincerely,

for David A. Boehmke, AEO

CONDITIONAL APPROVAL OF WORK PLAN REVISION FOR GROUNDWATER INVESTIGATION TO VERIFY CURRENT RADIOACTIVITY CONDITIONS PURSUANT TO CALIFORNIA WATER CODE SECTION 13267 ORDER – FORMER RAYTHEON FACILITY (HUGHES MISSILE SYSTEMS COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff received and reviewed the *Work Plan Revision for Groundwater Investigation to Verify Current Radioactivity Conditions* (Work Plan), dated December 2008, prepared by TN & Associates, Inc. on behalf of Raytheon Company for the referenced site. The Work Plan proposes groundwater sampling and analysis for 11 site wells that had detected concentrations exceeding the current California Maximum Contaminant Levels (MCLs) for either gross alpha particle activity, uranium, and/or combined radium. The Work Plan was submitted in response to the Regional Board Order dated July 15, 2008 pursuant to California Water Code (CWC) Section 13267.

The Work Plan is approved with the following conditions:

- A site-specific Health and Safety Plan shall be available at the site and implemented during all field activities.
- All contaminated groundwater generated during well purging shall be managed in accordance with appropriate regulations.
- Pending the results of the proposed groundwater sampling and analysis, all wastes generated during field activities shall be properly manifested and disposed of in conformation with the State and Federal regulations.
- Please notify Regional Board staff at least 1 week before you start the proposed fieldwork.
- Following the completion of the groundwater sampling and analysis, a report summarizing the results of this investigation shall be submitted to the Regional Board by **May 30, 2009**. The report shall include the conclusions from this investigation and recommendations for additional assessments, as needed.

Pursuant to CWC section 13268, failure to submit the required technical report by the due date specified may result in civil liability penalties administratively imposed by the Regional Board in an amount up to one thousand dollars ($1,000) for each day the technical report is not received.

Should you have any questions, please contact Dr. Ann Chang at (213) 620-6070.

Sincerely,

Tracy J. Egoscue

TECHNICAL MEMORANDUM

Date: June 27th, 2006

Prepared For: Thizar-Tintut Williams
Los Angeles Regional Water Quality Control Board

Prepared By: T N & Associates, Inc.
Jacques Marcillac, R.G.
Project Geologist

Re: Request for Interim Shutdown of the Groundwater Recovery and Treatment System (GRTS), Modification to M&RP No. 7483 and Request for No Further Action for Southern Parcels
Former Raytheon Facility
8433 Fallbrook Avenue, Canoga Park, California
Compliance File No. CI-8567

Dear Ms. Williams,

This memorandum has been prepared on behalf of Raytheon Company (Raytheon) as a follow up to our April 20th, 2006 e-mail correspondence regarding operation of the groundwater recovery and treatment system (GRTS). In addition, this memorandum serves as a formal request to modify Monitoring and Reporting Program (MRP) No. 7483, which was originally implemented in December 1994 (associated with WDR Permit No. 95-012) and to request no further action status for areas of the former Raytheon facility where no groundwater impacts above MCLs have been well established. The following sections give an overview of the remedial activities at the site, summarize the requests and gives the rationale for each.

Remedial Activities Summary

Since the early 1990s, Raytheon has performed numerous remedial excavations at each of the areas were releases to soil were identified. Each excavation was completed to regulatory satisfaction thus removing a significant portion of the source material resultant from historical site operations. The most substantial remedial effort has been the installation of a site-wide soil and groundwater clean-up system that has been in operation since 1995 and continued to operate through 2006. The system consisted of an air sparge (AS) component, a soil vapor extraction (SVE) component and the GRTS. In 2005, the AS and SVE were shut down due to asymptotic and non-detect levels in the influent stream and to accommodate the implementation of an enhanced in-situ bioremediation program (EISB) where anaerobic conditions are necessary (AS/SVE is counter-productive for EISB activities). The GRTS system continued operation through 2005, but was scaled down to 2 of the original 17 extraction wells as approved in a March 21st, 2005 LARWQCB letter. Wells RW-01 and RW-02 continuously operated until April 2006 until the effluent sampling indicated that the naturally occurring sulfate levels exceeded the

waste discharge limit of 300 mg/L (effluent was 360 mg/L). A re-sampling event confirmed the elevated sulfate levels from these two wells at a concentration of 570 mg/L. The GRTS has remained shut down since April 2006 due to the sulfate issue.

The full scale EISB program for the northwest plume area at the site was implemented in two phases in October 2005 and May 2006 (see Figure 1). The second phase included treatment of the area directly upgradient to RW-01 and RW-02. RW-01 also serves as one of the 15 EISB monitoring points that is sampled quarterly to track remedial progress.

Request for Interim Shutdown of GRTS

Raytheon requests approval for interim shut down of the GRTS system be granted for the following reasons:

1) Recent EISB injection activities in the downgradient portion of the main plume. These activities will treat the leading edge of the groundwater plume

2) High sulfate levels. The sulfate levels for RW-01 and RW-02 exceed the WDR limits and cannot be feasibly treated to below the WDR limits.

3) Continued pumping in this area may adversely effect the EISB activities. This is due to the cyclic nature of the pumping were cascading well screens can aerate the groundwater causing localized aerobic conditions. Also, continued pumping will eventually extract the electron donating substrate in this area greatly reducing the effectiveness and longevity of the dechlorinating process.

4) Data from offsite wells CM-14, MW-19S, MW-19D, MW-20S and MW-20D have quantified that no significant offsite migration has ever occurred prior to the GRTS operation, during the GRTS operation and during sampling when the GRTS was shut down for approximately 1 year. This is likely due to plume stabilization from natural attenuation as well as the native state groundwater gradient in this area, which is very flat and often has a southward component, even when no pumping is occurring. This is consistent with the transition in geologic material from Modelo formation to alluvial sediments for this portion of the site.

5) The GRTS system has reached asymptotic influent levels since 2002 as illustrated in Graph 1.

The GRTS system will remain in operational condition to be used as a contingency measure if it is found that the EISB program in not effective.

Request for Modification to MRP No. 7483 and No Further Action for Southern Parcels

MRP No. 7483 was initiated in 1994 and included quarterly sampling of all site monitoring and extraction wells. This MRP was amended in an August 26th, 1997 LARWQCB letter reducing the sampling frequency to semi-annual for 10 selected wells (CM-7D, CM-8D, CM-10, CM-12, CM-16, MW-15, MW-16, MW-19S, MW-19D and MW-20S) and annual monitoring of wells M-1, CM-2D, CM-4D, CM-9D, CM-11A, CM-13, CM-14, CM-15, CM-17, CM-18, CM-19, MW-17, and

MW-23 through MW-31 and all recovery wells (RW-01 through RW-17) for VOCs by EPA Method 8260B. This program has been maintained consistently since September 1997 through the present. Monitoring data has indicated that several wells have been consistently below Maximum Contaminant Levels (MCLs) or non-detect for several years per the following:

Well ID	**Most Recent Date of Sample Above MCLs**
CM-7D	Always below MCLs
CM-9D	1998
CM-10	**1995**
CM-11A	**Always Non Detect**
CM-12	**2002**
CM-15	**Always below MCLs**
CM-16	Always below MCLs
CM-17	**2001**
CM-18	Always below MCLs
MW-15	Always below MCLs
MW-16	2002
MW-19S	Always below MCLs
MW-19D	Always Non Detect
MW-20S	Always Non Detect
MW-24	1998
MW-25	Always below MCLs
MW-26	1996
MW-27	Always below MCLs
MW-28	**1998**
MW-29	**1998**
MW-30	**Always below MCLs**
MW-31	**1999**

Thirteen of these wells (CM-7D, CM-9D, CM-16, CM-18, MW-15, MW-16, MW-19S, MW-19D, MW-20S, MW-24, MW-25, MW-26, MW-27) retain monitoring value as they are located in upgradient or downgradient positions from areas with on-going remediation, such as the northwest portion of the site and the "D Treatment Area" in the central-east portion of the site (Figure 1). However, nine of these wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-28, MW-29, MW-30, MW-31) have served their purpose as to quantify that natural attenuation mechanisms have successfully addressed the residual contaminant concentrations. These wells are all located in the southern parcels of the site. Wells CM-12 and CM-15 were originally installed as distal down gradient sentry wells. According to the monitoring data, these wells are not downgradient from any of the identified groundwater plumes and have always been non-detect for all constituents of concern (COCs), except for one anomalous detection from a CM-12 sample in 2002 (see Appendix A). This was likely laboratory cross contamination as other anomalous detections in wells MW-16 and CM-18 were detected during the same event The other wells (CM-10, CM-11A, CM-17, MW-28, MW-29, MW-30, MW-31) were originally installed to delineate/monitor concentrations of trichlorofluoromethane (TCFM or "Freon 11") in groundwater resultant from maintenance activities of cooling units that was performed in the parking lot adjacent to MW-31. TCFM concentrations in wells CM-10 and MW-31 were slightly above the MCL of 150 µg/L in 1995 and 1999, respectively, but since this time have shown a

consistent decrease over the last 6 years (see Graphs 14 and 39, Appendix A). Samples from all the other wells surrounding the MW-31 area (CM-11A, CM-17, MW-28, MW-29, MW-30) have consistently been non-detect.

Figure 2 illustrates the well locations referenced above and Figure 3 illustrates the parcel locations (APN's 2005-002-011 and 2005-002-901). In light of this data, it is requested that these wells be removed from the monitoring program and these parcels receive no further action status as no groundwater impacts above MCLs exist in these areas.

It is also requested that the quarterly site-wide gauging program be reduced to semi-annual. All other provisions of MRP No. 7483 will remain as well as the remedial monitoring progress program as specified by MRP CI 8947.

Request for Well Abandonment

If the above modifications to the MRP are approved, the wells listed above will be abandoned in accordance with state and local regulations as funding becomes available. In addition to these wells, there are several other wells that are not in the current MRP because they either were installed too shallow and are always dry, were installed offsite at distal locations not downgradient from any existing plumes or were pilot test wells. These are as follows:

Well ID	Abandonment Rationale
CM-2	Always Dry (screened above 20' bg)
CM-3	Always Dry (screened above 20' bg)
CM-4	Always Dry (screened above 20' bg)
CM-7	Always Dry (screened above 20' bg)
CM-8	Always Dry (screened above 20' bg)
CM-9	Always Dry (screened above 20' bg)
MW-21S	Offsite Downgradient from Southern Parcels
MW-21D	Offsite Downgradient from Southern Parcels
MW-22S	Offsite Downgradient from Southern Parcels
MW-22D	Offsite Downgradient from Southern Parcels
VE-2	Pilot Test Well Not Used
VE-3	Pilot Test Well Not Used

Figure 2 illustrates the well locations.

Due to the rationale listed above, Raytheon requests approval for these wells to be abandoned in accordance with state and local regulations upon available funding.

For your convenience, all historical data for each monitoring well is provided in tabular and graphical format in Appendix A. For any other groundwater related data, please refer to the Annual 2005 groundwater monitoring report for the site, which was submitted in March 2006.

Please contact me with any questions at (805) 585-6382.

Sincerely,

Jacques Marcillac, P.G.
Project Manager

Notes:

1.) All concentrations in µg/L.

2.) All analyses done by EPA Method 8260, 8260B or 8021B.

3.) -- = not analyzed for parameter

4.) Only wells with detectable concentrations of constituents of concern since March 1995 are shown.

5.) BDM = Bromodichloromethane; 1,2-DCA = 1,2-Dichloroethane; DCA = 1,1-Dichloroethane; DCE = 1,1-Dichloroethene; 1,2-DCE = 1,2-Dichloroethene-(cis); PCE = Tetrachloroethene; TCA = 1,1,1-Trichloroethane; TCE = Trichloroethene; TCFM = Trichlorofluoromethane.

6.) Due to matrix effects and/or other factors, detection limits for these samples have been raised by a factor of ^{A}=5, ^{B}=4, ^{C}=50, ^{D}=10.

Laboratory Reports

Calscience Environmental Laboratories, Inc.

June 02, 2009

Ewelina Mutkowska
OTIE
317 East Main Street
Ventura, CA 93001-2624

Subject: **Calscience Work Order No.: 09-05-2222**
Client Reference: Former Raytheon Site, Canaga Park / 2009025

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 5/26/2009 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Virendra R Patel

Calscience Environmental
Laboratories, Inc.
Virendra Patel
Project Manager

Calscience Environmental Laboratories, Inc.

ACCREDITED IN ACCORDANCE WITH nelac

Case Narrative for 09-05-2222

Sample Condition on Receipt

Fifteen (15) samples were received as part of this Work Order on May 26, 2009. All samples were transferred to the laboratory in an ice-chest following strict chain-of-custody procedures. The temperature (4.5 °C) of the samples was measured upon arrival in the laboratory and was within acceptable limits. The samples were logged into the Laboratory Information Management System (LIMS), given laboratory identification numbers, and stored in refrigeration units pending analysis.

Data Summary

The samples included in this report were analyzed in accordance with the attached chain-of custody records.

Holding Times
All holding time requirements were met.

Calibration
Frequency and control criteria for initial and continuing calibration verifications were met.

Blanks
The method blank data showed non-detectable levels for Solids, Total Dissolved.

Sample Duplicate
A sample duplicate has been provided as part of the QC deliverables package. The RPD on the duplicate sample was within acceptable limits.

Matrix Spikes
Matrix Spikes (MS) and Matrix Spike Duplicates (MSD) analyses are not performed for this method.

Laboratory Control Samples
The Laboratory Control Sample (LCS) and LCS Duplicate analyses are not performed for this method.

Surrogates
Surrogate recoveries are not performed for this method.

CALSCIENCE ENVIRONMENTAL LABORATORIES, INC.

Glossary of Terms and Qualifiers

Work Order Number: 09-05-2222

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.
	Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture.

Subject: **Calscience Work Order No.: 09-05-2305**
Client Reference: Raytheon Canoga / 2009025

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 5/27/2009 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Calscience Environmental
Laboratories, Inc.
Virendra Patel
Project Manager

Calscience Environmental Laboratories, Inc.

ACCREDITED IN ACCORDANCE WITH nelac

Case Narrative for 09-05-2305

Sample Condition on Receipt

Thirteen (13) aqueous samples were received as part of this Work Order on May 27, 2009. The samples were transferred to the laboratory in an ice-chest following strict chain-of-custody procedures. The temperature (2.4°C) of the samples was measured upon arrival in the laboratory and was within acceptable limits. The samples were logged into the Laboratory Information Management System (LIMS), given laboratory identification numbers, and stored in refrigeration units pending analysis.

Data Summary
The samples included in this report were analyzed in accordance with the attached chain-of-custody (COC) record.

Holding Times
All holding time requirements were met.

Calibration
Frequency and control criteria for initial and continuing calibration verifications were met.

Blanks
The method blank data showed non-detectable levels for Total Dissolved Solids.

Sample Duplicate
A sample duplicate has been provided as part of the QC deliverables package. The RPD on the duplicate sample was within acceptable limits.

Matrix Spikes
Matrix Spikes (MS) and Matrix Spike Duplicates (MSD) were not performed for this method.

Laboratory Control Samples
The Laboratory Control Sample (LCS) and LCS Duplicate analyses were not performed for this method.

Surrogates
Surrogate recoveries were not performed for this method.

CALSCIENCE ENVIRONMENTAL LABORATORIES, INC.

SAMPLE RECEIPT FORM

Cooler 1 of 1

CLIENT: OTE-TNSA DATE: 05/27/09

TEMPERATURE: (Criteria: 0.0 °C – 6.0 °C, not frozen)

Temperature 2.6 °C - 0.2 °C (CF) = 2.4 °C ☑ Blank ☐ Sample

☐ Sample(s) outside temperature criteria (PM/APM contacted by: _____).

☐ Sample(s) outside temperature criteria but received on ice/chilled on same day of sampling.

☑ **Received at ambient temperature, placed on ice for transport by Courier.**

Ambient Temperature: ☐ Air ☐ Filter ☐ Metals Only ☐ PCBs Only **Initial:** KG

CUSTODY SEALS INTACT:

☐ Cooler ☐_____ ☐ No (Not Intact) ☑ Not Present ☐ N/A **Initial:** KG

☐ Sample ☐_____ ☐ No (Not Intact) ☑ Not Present **Initial:** SM

SAMPLE CONDITION:	Yes	No	N/A
Chain-Of-Custody (COC) document(s) received with samples	☑	☐	☐
COC document(s) received complete	☑	☐	☐
☐ Collection date/time, matrix, and/or # of containers logged in based on sample labels.			
☐ COC not relinquished. ☐ No date relinquished. ☐ No time relinquished.			
Sampler's name indicated on COC	☑	☐	☐
Sample container label(s) consistent with COC	☑	☐	☐
Sample container(s) intact and good condition	☑	☐	☐
Correct containers and volume for analyses requested	☑	☐	☐
Analyses received within holding time	☑	☐	☐
Proper preservation noted on COC or sample container	☑	☐	☐
☐ Unpreserved vials received for Volatiles analysis			
Volatile analysis container(s) free of headspace	☐	☐	☑
Tedlar bag(s) free of condensation	☐	☐	☑

CONTAINER TYPE:

Solid: ☐4ozCGJ ☐8ozCGJ ☐16ozCGJ ☐Sleeve ☐EnCores® ☐TerraCores® ☐_____

Water: ☐VOA ☐VOA**h** ☐VOA**na$_2$** ☐125AGB ☐125AGB**h** ☐125AGB**p** ☐1AGB ☐1AGB**na$_2$** ☐1AGB**s** ☐500AGB ☐500AGJ ☐500AGJ**s** ☐250AGB ☐250CGB ☐250CGB**s** ☑1PB ☐500PB ☐500PB**na** ☐250PB ☐250PB**n** ☐125PB ☐125PB**znna** ☐100PB ☐100PB**na$_2$** ☐_____ ☐_____ ☐_____

Glossary of Terms and Qualifiers

Work Order Number: 09-05-2305

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.
	Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture.

Ms. Ewelina Mutkowska
OTIE-TN&A
317 E. Main St.
Ventura, CA 93001

Dear Ms. Mutkowska:

On May 27, 2009, 15 water samples were received for analysis at the GPL Laboratories Alabama, LLC. The samples were assigned Laboratory Report Identification Code 9067_9115. Enclosed is the Sample Data Package containing the radioanalytical results of the sample.

If you have any questions please do not hesitate to call.

Sincerely,

Richard Turner
Laboratory Director

CASE NARRATIVE

Laboratory Report Identification Number: 9067_9115

NELAC Certification ID: NLC080001 (AL001)

June 30, 2009

I. Introduction

On May 27, 2009, 15 water samples were received for analysis at the GPL Laboratories Alabama, LLC located in Montgomery, Alabama. The samples were analyzed in accordance with the GPL Laboratory Quality Assurance Plan.

The data in this report meets all NELAC requirements unless otherwise stated.

II. Analytical Methodology

The radioanalytical results reported for the sample include the site and laboratory sample identification numbers, collection date, method of analysis, and the quality control samples that were analyzed concurrently. The samples were analyzed by the following methods.

Radionuclide	Method Number	Method Name	Counting Method
Co-Precipitation	SM711C	Gross Alpha Radioactivity	Gas Proportional Counting
Gross Alpha (U)	EPA 900.0	Gross Alpha Radioactivity	Gas Proportional Counting
Gross Beta	EPA 900.0	Gross Beta Radioactivity	Gas Proportional Counting
Ra-226	EPA 903.1	Radium-226 Radon Emanation Technique	Radon Flask/Scaler
Ra-228	EPA 904.0	Radium-228	Gas Proportional Counting
Uranium	ACW03	Eichrom Industries Extraction Chromatography	Alpha Spectrometry

III. Analytical Results

Deficiencies

See *"Re-analysis"* section.

Matrix Interferences

There were no indications of matrix interference.

Detection Limits

The required detection limits (RDLs) were met for all sample analyses.

Re-analysis

Samples OTI09-9067-11 and OTI09-9067-12 exhibited low tracer recovery due to method error during chemistry process. The samples were reanalyzed as OTI09-9115-01 and OTI09-9115-02 with new QC. The re-analyses produced acceptable results and are reported in this document.

Upon further review of the package, the gross alpha detection limits were not met for some of the samples. Those samples were recounted at longer times to achieve detection limits.

Deviations from Protocols

There were no deviations from the written protocols and analytical methods.

Contacts with the Technical Representative

There was no contact with the Technical Representative regarding these samples.

IV. Quality Control

The analytical results of all quality control samples met the acceptance criteria specified in the GPL Laboratory Quality Assurance Plan.

GPL Laboratories Alabama, LLC

Ventura, CA 93001

Dear Ms. Mutkowska:

On May 28, 2009, 13 water samples were received for analysis at the GPL Laboratories Alabama, LLC. The samples were assigned Laboratory Report Identification Code 9068_9089. Enclosed is the Sample Data Package containing the radioanalytical results of the sample.

If you have any questions please do not hesitate to call.

Sincerely,

Richard Turner
Laboratory Director

CASE NARRATIVE

Laboratory Report Identification Number: 9068_9089

NELAC Certification ID: NLC080001 (AL001)

July 1, 2009

I. Introduction

On May 28, 2009, 13 water samples were received for analysis at the GPL Laboratories Alabama, LLC located in Montgomery, Alabama. The samples were analyzed in accordance with the GPL Laboratory Quality Assurance Plan.

The data in this report meets all NELAC requirements unless otherwise stated.

II. Analytical Methodology

The radioanalytical results reported for the sample include the site and laboratory sample identification numbers, collection date, method of analysis, and the quality control samples that were analyzed concurrently. The samples were analyzed by the following methods.

Radionuclide	Method Number	Method Name	Counting Method
Co-Precipitation	SM711C	Gross Alpha Radioactivity	Gas Proportional Counting
Gross Alpha (U)	EPA 900.0	Gross Alpha Radioactivity	Gas Proportional Counting
Gross Beta	EPA 900.0	Gross Beta Radioactivity	Gas Proportional Counting
Ra-226	EPA 903.1	Radium-226 Radon Emanation Technique	Radon Flask/Scaler
Ra-228	EPA 904.0	Radium-228	Gas Proportional Counting
Uranium	ACW03	Eichrom Industries Extraction Chromatography	Alpha Spectrometry

III. Analytical Results

Deficiencies

See *"Re-analysis"* section.

Matrix Interferences

There were no indications of matrix interference.

Detection Limits

The required detection limits (RDLs) were met for all sample analyses.

Re-analysis

Upon further review of the package, the gross alpha detection limits were not met for some of the samples. Those samples were recounted at longer times to achieve detection limits.

Deviations from Protocols

There were no deviations from the written protocols and analytical methods.

Contacts with the Technical Representative

There was no contact with the Technical Representative regarding these samples.

IV. Quality Control

The analytical results of all quality control samples met the acceptance criteria specified in the GPL Laboratory Quality Assurance Plan.

Arnold Schwarzenegger
Governor

October 30, 2009

Mr. Daniel S. Samorano
Raytheon Company
1151 East Hermans Road
TU, Bldg 826
Tucson, AZ 85706

NO FURTHER ACTION FOR RADIOACTIVITY ANALYSES IN GROUNDWATER PURSUANT TO CALIFORNIA WATER CODE SECTION 13267 ORDER – RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA 91304
(SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) is the State regulatory agency responsible for protecting water quality in Los Angeles and Ventura Counties. To accomplish this, the Regional Board issues investigative orders authorized by the Porter-Cologne Water Quality Control Act (California Water Code [CWC], Division 7).

At the request of the Regional Board, Raytheon's predecessor, Hughes Missile Systems, Inc., conducted eight groundwater sampling events between March 1990 and December 1991 to determine radioactivity levels in groundwater at the site. The results were submitted to the Regional Board in 1992 and indicated that a subset of the well samples had radiological parameters exceeding California Maximum Contaminant Levels (MCLs), but that the concentrations were naturally occurring based on the relative abundances of the individual uranium isotopes.

In response to public concerns regarding radioactivity sampling results from the on-site groundwater monitoring wells, the Regional Board issued a CWC section 13267 Order on March 5, 2008, requiring submittal of a work plan for a site-wide groundwater investigation to verify current radioactivity conditions. The revised work plan was reviewed and conditionally approved by the Regional Board on January 29, 2009. Subsequently, Regional Board staff have received and reviewed the *Groundwater Investigation Report to Verify Current Radioactivity Conditions* (Report), dated August 2009, prepared by Oneida Total Integrated Enterprises (OTIE) on behalf of Raytheon Company for the referenced site.

The Report presents the results of the groundwater sampling from 11 site wells for radioactivity analyses in May 2009. Gross alpha particle activity, uranium, combined radium - 226+228, and gross beta particle activity were detected up to 61.12 pCi/L, 126.5 pCi/L, 18.62 pCi/L, and 54.77 pCi/L, respectively, which exceeded their California MCLs of 15 pCi/L, 20 pCi/L, 5 pCi/L, and 50pCi/L, respectively.

The data produced during 2009 groundwater investigation are consistent with previous results collected in 1990 and 1991. This current investigation and the 1990/1991 investigation work have demonstrated that the levels of radiological isotopes detected in groundwater at the former Raytheon facility are attributable to naturally occurring sources in the underlying aquifer matrix and geochemical system. OTIE recommends no further action for radioactivity analyses in groundwater at the site.

Based on review of the submitted information and radionuclides related documentation, Regional Board staff have the following findings:

1. **No Suspected Releases of Radioisotopes from Historical Operations at the Site**

   The Regional Board has jurisdiction for the investigation and remediation of groundwater contamination at the former Raytheon site, while the Department of Toxic Substances Control (DTSC) has jurisdiction to address environmental contamination in soil as a result of historic operations. On March 4, 2009, DTSC issued the following responses to public comments:

   > "DTSC has obtained records submitted by Raytheon which includes information on the types radioisotopes used at the site, and the buildings in which the radioisotopes were used. The records indicate that only small amounts of radioactive materials were present, primarily in measurement devices, and that licenses were properly terminated and materials were properly disposed of more than twenty (20) years ago."

   Regional Board staff has also reviewed the *Supporting Documentation for the Radioactive Materials Investigation at Hughes Aircraft Company-MSG-CP*, dated May 1992, documenting the information on radioactive materials being used at the site approximately from 1964 to 1992. Based on review of the information provided, Regional Board staff concurs with DTSC's statement. Following further consultation with DTSC, Regional Board staff concludes that there is no evidence suggesting that releases of radionuclides resulted from the historical operations at the former Raytheon facility.

2. **Naturally Occurring Uranium and Radium**

   During the 2009 groundwater investigation, isotopic uranium analyses were conducted to calculate the relative mass ratios in order to determine if the origin of the uranium was man-made (enriched or depleted) or was consistent with naturally occurring sources. The results of the 2009 groundwater investigation were compared to the published values of typical isotopic abundances. These values were obtained from both the United States Department of Energy's *Guide of Good Practices for Occupational Radiological Protection in Uranium Facilities* (USDOE, 2004) and the United States Environmental Protection Agency's *Depleted Uranium Technical Brief* (USEPA, 2006).

The isotopic analysis of uranium demonstrates that the isotopic mass percentages for the 2009 groundwater samples with elevated uranium levels fall within the range expected for naturally occurring uranium as shown in the table below. The same calculations were previously performed for the October 1991 and December 1991 analytical results and yielded similar ratios. The 2009 groundwater data strongly support the statement that naturally occurring uranium is encountered in groundwater at the site.

Relative Abundance of Uranium Isotopes

Isotope	**U-238**	**U-235**	**U-234**
Natural Abundance (%)	99.27	0.72	0.0055
October 1991 Sampling Results	99.10 to 99.42	0.57 to 0.88	0.0053 to 0.0067
December 1991 Sampling Results	99.14 to 99.55	0.44 to 0.84	0.0051 to 0.0064
May 2009 Sampling Results	99.13 to 99.50	0.48 to 0.85	0.0050 to 0.0062

Based on the information obtained from the USEPA website at: http://www.epa.gov/radiation/radionuclides/index.html, uranium and radium occur naturally in the environment. They are present in virtually all rock, soil, and water. Uranium, radium and their compounds are soluble in water. As a result, groundwater in areas where concentrations of uranium and radium are high in aquifer materials and in surrounding bedrock typically has relatively high uranium and radium content.

Based upon the information provided to the Regional Board, and with the provision that the information was accurate and representative of site conditions, the Regional Board finds that the May 2009 groundwater investigation for radioactivity analyses carried out at the site is in compliance with the requirements of the CWC section 13267 Order issued to Raytheon Company on March 5, 2008 and that no further action for radioactivity analyses in groundwater is required at the site at this time. However, if new information indicates potential releases of radionuclides from the former Raytheon facility, the Regional Board may require groundwater monitoring for radioactivity analyses at the site.

If you have any questions, please contact Dr. Ann Chang at (213) 620-6070 or nchang@waterboards.ca.gov.

Sincerely,

Samuel Unger AEO for

EXECUTIVE SUMMARY

Oneida Total Integrated Enterprises, LLC, on behalf of the Raytheon Company (Raytheon), has prepared this report of confirmatory characterization of trichlorofluoromethane (Freon 11) in soil and groundwater underlying the southern parcels of the Former Canoga Park Facility located at 8433 Fallbrook Avenue, Canoga Park, California, hereafter referred to as the "Site."

The purpose of the activities described in this document was to collect confirmation data in order for the Los Angeles Regional Water Quality Control Board (LARWQCB) to make an informed decision per a No Further Action (NFA) status request for the southern parcels of the Site (herein referred to as Southern Parcels), namely Assessor Parcel Numbers (APN #'s) 2005-002-011 and 2005-002-901. The report provides background information on previous investigations, a regulatory synopsis, conceptual site model (CSM) information, and a summary of results for the 2012 confirmation sampling activities.

The confirmatory sampling included nine CPT borings (six onsite and three offsite), six locations where discrete depth groundwater samples were collected (three onsite and three offsite) and two existing groundwater monitoring wells (CM-10 and MW-31) were sampled. In addition, three multi-depth soil vapor probes were installed within the postulated source area where elevated Freon 11 concentrations in shallow soil vapor were previously delineated. All samples were analyzed for volatile organic compounds, including Freon 11.

In reviewing the analytical results from this confirmatory sampling, and also evaluating the previous assessments and monitoring data that has been collected over the last 20 years, the following conclusion statements can be made:

- No VOC concentrations have been detected above the MCLs for drinking water in groundwater samples from each of the monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31) located on or in the vicinity of the Southern Parcels for more than 10 years of groundwater monitoring. Moreover, samples from all wells, except for wells CM-10 and MW-31, have been non-detect for the Site constituents of concern (chlorinated VOCs), for more than 15 years.
- The only detected VOC in groundwater historically exceeding a California MCL was Freon 11, which is not identified as a carcinogen and is low in toxicity.
- Data from previous investigations and the off-site confirmatory sampling documented in this report completely delineate the vertical and lateral extent of Freon 11-impacted groundwater at the Site.

The following lines of evidence are provided below to support an NFA status:

- Soil gas concentrations of Freon 11 in the postulated source area collected in 2012 were below all available Environmental Screening Levels (ESLs).
- No significant increase of Freon 11 concentrations with depth was observed in soil vapor samples collected in the postulated release area down to the groundwater table and the low detections above the groundwater table are well below calculated threshold levels that could impact groundwater above MCLs.

- Groundwater sampling in the Southern Parcels indicated that lateral and vertical distribution of Freon 11 is consistent with the previous site conceptual model, e.g., CM-10 is approximately centerline with the axis of Freon 11 concentration distributions, and Freon 11 concentrations are limited to shallow groundwater per the non-detect in the deeper sample collected offsite underlying Schoenborn Street.
- Concentrations of Freon 11 in samples collected from wells CM-10 and MW-31 have been below the California MCL since 1995 and 1999, respectively, quantifying that natural attenuation has been effective.
- Comparing groundwater elevations and Freon 11 concentrations in wells MW-31 and CM-10, indicate that there is no correlation between increased groundwater elevations and increased Freon 11 concentrations, the inverse is generally true (e.g., higher elevations correspond with decreased concentrations). This supports the premise that no soil “source” exists in the vadose zone that could impact groundwater quality above MCLs.
- Off-Site groundwater sampling indicated Freon 11 concentrations attenuate significantly away from MW-31, as concentrations are at or very near the reporting limit of 10 µg/L.

From these converging lines of evidence, it is apparent that the Freon 11 concentrations do not pose a significant impact to the Site or surrounding area; therefore, Raytheon respectfully requests that NFA status be issued for APN’s 2005-002-011 and 2005-002-901 and as such, authorization to abandon wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31 be granted.

1.0 INTRODUCTION

Oneida Total Integrated Enterprises, LLC (OTIE), on behalf of the Raytheon Company (Raytheon), has prepared this report of confirmatory characterization of trichlorofluoromethane (Freon 11) in soil and groundwater underlying the southern parcels of the Former Canoga Park Facility located at 8433 Fallbrook Avenue, Canoga Park, California (Figure 1), hereafter referred to as the "Site."

1.1 PROJECT CONTACTS

The following table lists the key individuals of the project team during implementation of the confirmatory sampling event:

Contact	Organization	Phone #
Daniel Samorano, PE	Raytheon	520-794-9026
Su Han, CHG	LARWQCB	213-576-6735
Jacques Marcillac, CHG	OTIE	805-585-6382

1.2 PURPOSE AND OBJECTIVES

The purpose of the activities described in this document was to collect confirmation data in order for the Los Angeles Regional Water Quality Control Board (LARWQCB) to make an informed decision per a No Further Action (NFA) status request for the southern parcels of the Site (herein referred to as Southern Parcels), namely Assessor Parcel Numbers (APN #'s) 2005-002-011 and 2005-002-901. The report provides background information on previous investigations, a regulatory synopsis, conceptual site model (CSM) information, and a summary of results for the 2012 confirmation sampling activities. The objective of the report is to present the sampling methodologies, sample locations, results, and provide a data discussion to support the NFA status recommendation for the southern parcels.

2.0 SITE BACKGROUND

In 1959, the 8433 Fallbrook Avenue property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. Bunker-Ramo was the sole occupant of the facility from 1959 until 1966. From 1966 to 1976, Hughes Missile Systems Company was a co-occupant with Rocketdyne, a division of Rockwell International, and Bunker-Ramo. Hughes Missile Systems purchased the entire Site in the mid-1970s and became the sole occupant, operating as an aerospace research and development facility. The Former Canoga Park facility was purchased from Hughes Missile Systems Company by Coast Federal Bank in May 1995. Parcels were subsequently purchased by DeVry and the Los Angeles Metropolitan Police Department. The northern portion of the Site was sold to Regent Properties, Inc., in 1997. Regent Properties sold its portion of the property to Shamrock Holdings, Inc., in 2001, who in turn, sold the property to MEPT West Hills, LLC, in June 2002. MEPT West Hills, LLC, is the current property owner; however, CB Richard Ellis is the current property manager and is the primary contact for Site logistical issues. Through a merger with Hughes Missile Systems in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the Site.

2.1 PREVIOUS CHARACTERIZATION ACTIVITIES

Environmental investigations in the early 1990s identified Freon 11 concentrations exceeding the maximum contaminant level (MCL) of 150 micrograms per liter (µg/L) for drinking water. These data were indicated by samples from monitoring well CM-10, located in the southeastern portion of the property (Figure 2). Follow-up characterization activities were conducted between 1993 and 1998 in the area near Buildings 274 and 276, which is upgradient from well CM-10 to identify the source of the Freon 11 concentrations. The investigations indicated that an area of Freon 11 concentrations greater than 1,000 µg/L in soil gas was delineated in the former parking lot and southeast of former Building 274 (thereafter termed “the Freon 11 Area”) (Figure 2). In 1998, three temporary wells and one permanent well (MW-31) were installed within the Freon 11 Area. In addition, several other wells (CM-11, CM-11A, MW-28, MW-29 and MW-30) were installed at various times in the Southern Parcels area to further characterize groundwater underlying the former facility. A routine monitoring of these wells was implemented in the early 1990s. The following are brief summaries of previous investigations conducted between 1993 and 1998 concerning Freon 11 in the Southern Parcels.

In August 1993, a monitoring well and soil borings were completed within the area enclosed by Buildings 276 and 274 and well CM-10. The following soil borings were advanced in the area between Buildings 276 and 274 and southeast of well MW-29: B-RNDM-3, B-SL-8, and B-SL-9. At each boring, soil samples were collected at 10, 20, and 30 feet below ground surface (bgs); no VOCs were detected above their respective reporting limits for these soil samples (GTI 1994). One boring (B-SL-10) advanced immediately northwest of well CM-10 had no VOCs reported above their respective detection limits in the soil samples collected at 10, 20, and 30 feet bgs (GTI 1994). During the advancement of the boring for well MW-29, soil samples were collected and analyzed for VOCs at 45 and 50 feet bgs; no VOCs were detected above their respective reporting limits in either sample (GTI 1994).

In June 1995, soil gas surveys were conducted to delineate the lateral extent of Freon 11-impacted soil (GTI 1995a). Soil gas probes were installed at four locations within the immediate area of well CM-10, one was located at an on-site sewer junction within the vicinity of well CM-10, and one was located immediately southeast of the former Building 274’s cooling unit. All probes were set at approximately 5 feet bgs. Freon 11 was detected at the on-site

sewer junction and adjacent to the cooling unit for the former Building 274 at concentrations of 183 µg/L and 6 µg/L, respectively. No Freon 11 was detected above the reporting limit at the soil gas probes installed within the immediate area of well CM-10 (GTI 1995a).

In August 1995, additional soil gas probes were installed to the southeast of former Building 274 at depths of approximately 5 feet bgs (GTI 1995b) in the Freon 11 Area. Historical soil gas VOC results are provided in Appendix A.

In May 1998, soil and groundwater samples were collected for analytical laboratory analysis during well installation of temporary and permanent monitoring wells. Temporary and permanent monitoring wells were installed in the vicinity of well CM-10 and the Freon 11 Area (FDGTI 1998). Well identifications, locations, and screened intervals are summarized as follows:

- The temporary wells are identified as WP-265-1, WP-276 -1, and WP-DEV-1 and were installed in northwest (upgradient), southwest (crossgradient), and southeast (downgradient) locations, respectively, of the Freon 11 Area. Each temporary well was screened from 45 to 70 feet bgs (WP-265-1), 75 to 100 feet bgs (WP-276 -1), and 35 to 60 feet bgs (WP-DEV-1).
- The permanent well, identified as MW-31, is located within the Freon 11 Area, and is screened from 45 to 70 feet bgs.

Soil and groundwater analytical results are summarized as follows:

- Soil samples selected for laboratory analysis were collected at various depths (typically at 10-foot intervals from 10 to 70 feet bgs). Freon 11 was the only VOC detected above the reporting limit, and only in one soil sample, at a concentration of 7.2 micrograms per kilogram (WP-276-1 at a depth of 50 feet bgs). The presence of Freon 11 in this sample was possibly due to interference by groundwater in the saturated soil sample.
- Groundwater samples were also collected from these wells following well development and submitted for chemical analysis. Freon 11 was detected in the groundwater samples collected from wells WP-DEV-1 and MW-31 at concentrations of 23 µg/L and 150 µg/L, respectively (FDGTI 1998).

Previous investigative results for the Southern Parcels are summarized on Figure 2.

2.2 GROUNDWATER MONITORING AND REGULATORY SUMMARY

No VOC concentrations have been detected above the MCLs for drinking water in groundwater samples from each of the monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31) located on or in the vicinity of the Southern Parcels for more than 10 years of groundwater monitoring. Moreover, samples from all wells, except for wells CM-10 and MW-31, have been non-detect for the Site constituents of concern (chlorinated VOCs), for more than 15 years. In a response to a June 27, 2006, memorandum requesting removal of Southern Parcel monitoring wells and NFA status for the Southern Parcels, the LARWQCB issued a letter dated January 22, 2007, approving the removal of several wells from the monitoring program, but did not approve their abandonment, citing concerns about the potential presence of manmade radiological isotopes in wells CM-10, CM-12 and CM-17 based on community concerns with previous data (GRC 1992).

Between March 2008 and August 2009, Raytheon, OTIE, and the LARWQCB worked together to evaluate radiological conditions in the Southern Parcels. A radiological evaluation was performed; the results of the radiological evaluation indicated that the presence of low-level radiological isotopes were attributable to naturally-occurring sources in the underlying soil,

bedrock, and groundwater. The LARWQCB concurred, and issued a NFA letter with regard to radioactivity in groundwater for the Southern Parcels on October 30, 2009 (OTIE 2009a).

In addition to the radiological sampling, OTIE performed a confirmation sampling event including VOCs for wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30, and MW-31 in November 2008. Analytical results from this confirmation sampling event were nondetect for all VOCs (CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, and MW-30) or below the MCL for the only detected VOC, Freon 11 (only in wells CM-10 and MW-31).

Based on the findings of the NFA for radiological parameters and confirmation results for VOCs in the Southern Parcel wells, Raytheon sought NFA status from the LARWQCB for the Southern Parcels once again in a technical memorandum dated July 8, 2010. The LARWQCB responded in a letter dated May 13, 2011, and requested Raytheon to better define vertical and lateral extent of the Freon 11 plume detected in wells MW-31 and CM-10. The additional characterization described herein was performed to address the LARWQCB request.

Past regulatory documents are provided in Appendix B.

2.3 PHYSICAL SETTING

The Site is located immediately northwest of the intersection of Roscoe Boulevard and Fallbrook Avenue in the western part of the San Fernando Valley, adjacent the Simi Hills. The Site includes APN #s 2005-002-901 and 2005-002-011 and is currently occupied by two office buildings, one for DeVry (2005-002-901) and the other for Los Angeles Metropolitan Police Department (2005-2002-011). The Site is currently zoned as Limited Manufacturing per the City of Los Angeles.

The Site is centered on a north-south oriented knoll, with hilly regions to the north and west, and relatively flat valley floor to the south and east. The Chatsworth Creek drainage lies immediately west of the Site. Elevations range from approximately 840 (along the edges of the property) to approximately 897 feet above mean sea level (amsl) (at the top of the knoll). Land uses adjacent to the Site, include commercial/light industrial to the north and south, and residential to the east and west.

2.4 SURFACE WATER HYDROLOGY

Primary surface drainage in the Site vicinity flows towards Chatsworth Creek, lying immediately west of the Site. Portions of Chatsworth Creek, north and south of Hidden Lake (formerly Lees Lake), are contained within large underground culverts. Other portions are contained in lined or unlined structured channels. The portion of Chatsworth Creek in the Site vicinity is contained in underground cement-lined tunnels. Water from Chatsworth Creek eventually flows into the Los Angeles River about 2.5 miles downstream.

Hidden Lake is the only surface body of water within a 1-mile radius of the Site. Hidden Lake is used as a recreational area by residents of the surrounding housing development. Storm drainage, including storm drain discharge from the Site flows to the channelized Chatsworth Creek, the majority of which enters south and downstream of Hidden Lake.

It should be noted that the comparison of survey data for the water level of Hidden Lake measured in March 2002 (849.60 amsl) and the potentiometric surface of shallow groundwater in wells near the reservoir (840 to 842 feet amsl in May 2009) concluded that the potentiometric groundwater surface was approximately eight to ten feet below the surface water elevation. This

indicates that Hidden Lake is a “losing” body of water; therefore, groundwater does not recharge Hidden Lake.

2.5 SITE GEOLOGY

The geologic deposits of the western San Fernando Valley in the vicinity of the study area are comprised of predominantly unconsolidated sands, silts and clays with occasional gravels. These alluvial fill deposits are of Quaternary age and range in thickness from a thin veneer at the valley margins to more than 700 feet in the central portion of the San Fernando Valley (McLaren Hart 1990). In the western portion of valley, the unconsolidated alluvial fill deposits are underlain by consolidated bedrock of the Miocene Modelo and Cretaceous Chatsworth Formations, respectively. The Modelo Formation consists of grayish siltstone, clayey siltstone and shale, with minor interbedded diatomaceous shale. A relatively thin weathered zone exists along the top of the formation where it is in contact with the shallower alluvial deposits. The Chatsworth Formation is comprised primarily of a turbidite sandstone sequence with interbedded shales and minor conglomerates. The bedrock of the Chatsworth Formation is the major rock comprising the Simi Hills and from the distinct outcrops north of Chatsworth Reservoir (McLaren Hart 1990).

The major portion of the Site is constructed on consolidated bedrock of the Miocene Modelo Formation. Near surface (to 50 or 100 feet bgs), deposits are highly weathered. Beds of the Modelo are seen in road cuts and in drill-hole samples to be dipping at up to 45 degrees from horizontal. Generally, the dip direction is to the south or southwest.

In the northwestern portion of the Site, to the west and northwest of Building 8531 (former Building 270), and at other locations on the Site periphery, the shallow subsurface is comprised of unconsolidated alluvial valley fill of Quaternary age. This material is present to depths of at least 75 feet. The beds are flat-lying, and consist primarily of mixed silt and fine sand, with lesser amounts of clay. The Modelo Formation is believed to be unconformably present beneath the alluvium. A thin (up to 10-foot) layer of construction fill material is locally present at the surface overlying the Modelo Formation or alluvium.

2.6 SITE HYDROGEOLOGY

Groundwater gradient direction within the vicinity of the Site regionally flows from northwest to southeast, from the Simi Hills to the San Fernando Valley. The depth to groundwater is approximately 25 feet bgs near Roscoe Boulevard. The hydraulic gradient of the regional groundwater is approximately 0.0047 feet per foot (ft/ft).

The water-bearing materials comprising the western portion of the valley are generally fine-grained alluvial sediments, which contain naturally-occurring total dissolved solids in excess of 1,000 milligrams per liter, exceeding the recommended United States Environmental Protection Agency (US EPA) drinking water guidelines. Due to the relatively low yields and excessive total dissolved solids, there are no drinking water wells in the vicinity of the Site. Essentially all drinking water consumed in the western San Fernando Valley is derived from the State Water project and the Los Angeles Aqueduct, which delivers water to southern California from the Sierra Nevada Mountains.

Although the Los Angeles Department of Water and Power does supplement its water supply with groundwater from the San Fernando Basin, all of the groundwater production well fields are located in the eastern portion of the basin. The nearest active production well for supply of potable water to the public is in excess of 15 miles downgradient from the Site.

In the vicinity of the Former Hughes Facility, groundwater occurs between 10 and 65 feet bgs, depending on the location on the property. The groundwater gradient direction is generally to the southeast (that is, from the Simi Hills to the San Fernando Valley), but on the western side of the property, there is a westward component due to the local topography.

Routine groundwater gauging of onsite monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30, and MW-31) has been conducted since December 1991 (with previous monthly gauging from August 1990). Groundwater flow in the northwest area of the Site is consistently westward until reaching the western edge of the property where it heads southward. Gradients in this area generally range from 0.01 to 0.02 ft/ft. The apparent groundwater flow across the remainder of the Site is towards the southwest, south, and south-southeast, with historic hydraulic gradients ranging from 0.01 to 0.04 ft/ft. Depths to groundwater, groundwater gradients, and apparent groundwater flow directions are generally consistent with minor localized changes due to pumping activities during operation of the groundwater recovery and treatment system.

Aquifer tests were conducted in 1991 and 1993 to determine hydraulic parameters of the aquifer as a prerequisite to groundwater modeling and conceptual design of the groundwater remediation system. Average hydraulic conductivities were estimated at approximately 9 gallons per day per square foot for the Modelo Formation (4.24×10^{-4} centimeters per second) and approximately 270 gallons per day per square foot for the alluvial fill (1.27×10^{-2} centimeters per second) (GTI 1993).

2.7 Nature and Extent of the Chemical Release

The only VOC detected previously above MCL in groundwater in the Southern Parcels of the Site is Freon 11. Freon 11 was historically used in refrigeration devices and as a solvent.

The current understanding of the concentration distributions indicates that the Freon 11 Area is limited to the southeast of former Building 274 (GTI 1995a and GTI 1995b). The postulated release of Freon 11 occurred in an unpaved area adjacent to the parking lot southeast of former Building 274, which may have been used as a maintenance area (FDGTI 1998). This area was identified by shallow soil gas investigations in 1995, which delineated an area of elevated Freon 11 greater than 1,000 μg/L (Figure 2). Therefore, it is likely that surface releases of Freon 11 infiltrated the vadose zone in this area, and migrated vertically to groundwater, then migrated laterally in groundwater in the dissolved phase. Groundwater impacted by Freon 11 is localized to the area of well MW-31 and downgradient to well CM-10. Because of the low average hydraulic conductivity of 9 gallons per day per square foot for the Modelo Formation (GTI 1993), the movement of dissolved-phase Freon 11 in the Southern Parcels was believed to be mainly in the discontinuous discrete sand stringers in the Modelo Formation, which limited its lateral migration. Vertical migration was likely hindered by the low permeabilty of the siltsones in the Modelo Formation, as well as the limited volume of Freon 11 that was released. This is supported by the relatively low concentrations detected in groundwater (max: 360 µg/L) compared to Freon 11's solubility limit of 1,100,000 µg/L (CalEPA, 1997).

3.0 DESCRIPTION OF FIELD ACTIVITIES

Soil gas and groundwater data were collected to further characterize the lateral and vertical extent of Freon 11 in the subsurface. The following sections describe the field activities for the confirmation sampling.

3.1 PRE-FIELD ACTIVITIES

- Underground Service Alert of Southern California was notified of the intent to drill and issued the following ticket numbers: A20961187-00A, A21420522-02A, and A21510963-01A.
- A geophysical utility locator was contracted to clear the drilling locations prior to any drilling activities by identifying subsurface utilities or other subsurface anomalies, under the direction of an OTIE geologist.
- Well permit number 890438-7-12 for discrete-depth groundwater samples was obtained from the Environmental Health Division of Los Angeles County.
- Excavation E-Permit number E-1281-0011 was obtained from the City of Los Angeles Department of Public Works for borings within the City of Los Angeles right-of-way, located in Fallbrook Avenue and Schoenborn Street.

Copies of the Underground Service Alert of Southern California tickets, well permit, and excavation permit are located in Appendix C.

3.2 CONE PENETRATION TESTING

A cone penetration testing (CPT) rig was used to perform the investigative work. CPT is a process of advancing a probe into the subsurface that measures sleeve friction and cone penetration resistance. The ratio of sleeve friction to cone penetration resistance predicts the subsurface lithology (Robertson, 1998). The CPT provides a rapid, consistent method of predicting soil stratigraphy, relative density, and hydrogeologic information (that is, static and dynamic pore pressure and hydraulic conductivity). The ability to determine soil stratigraphy continuously to total depth is beneficial for understanding the movement of groundwater at the Site by identifying spatial distribution of sand stringers. The CPT data allows for subsurface identification of these sand stringers and, therefore, a more accurate prediction of groundwater flow zones beneath the Southern Parcels. The CPT rig was operated by Gregg Drilling and Testing, Inc. (Gregg) of Signal Hill, California, under the supervision of an OTIE geologist. All CPT borings were cleared for utilities using a hand auger to a depth between 5 and 8 feet bgs prior to invasive activity. Soil generated during hand augering was used to backfill each respective boring to provide support for advancing the CPT probe.

A total of nine CPT borings were advanced during field activities.

- Three CPT borings were advanced in the vicinity of the Freon 11 Area on April 12, 2012 (borings AGW2011-1, AGW2011-2, and AGW2011-3).
- Three CPT borings were advanced along a transect in the vicinity of well CM-10 on April 13, 2012 (borings BGW2011-1, BGW2011-2, and BGW2011-3).
- Three CPT borings were advanced along a transect off Site on Fallbrook Avenue and Schoenborn Street on May 30, 2012, and June 5, 2012 (borings FLBGW2012-1, FLBGW2012-2, and SHBGW2012-3).

Locations of CPT borings are presented on Figure 3. CPT reports, including detailed CPT logs, are provided in Appendix D.

3.3 SOIL GAS INVESTIGATION

The following section discusses the construction and sampling of temporary soil gas probes installed in the Freon 11 Area.

3.3.1 Construction of Temporary Soil Gas Probes

Borings were advanced within the vicinity of the Freon 11 Area for collecting soil gas samples at discrete depths using either CPT or direct-push technology (DPT) rigs, operated by Gregg, between April 12 and 16, 2012. All soil gas borings were cleared for utilities prior to drilling using a hand auger to a depth of 5 feet bgs. Soil generated during hand augering was used to backfill boring to provide support for advancing the CPT/DPT rods. Depth to groundwater was measured at approximately 52 feet bgs in well MW-31, in the immediate vicinity of the Freon 11 Area. Total depth of soil gas borings were limited by bedrock refusal and ranged in depth from 33.8 (SG2011-1) to 48.2 feet bgs (SG2011-2).

Each temporary soil gas probes was installed at 10-foot depth intervals, beginning at approximately 6 feet bgs, and subsequently placed every 10 feet to the total depth of the boring. Soil gas probes were constructed using a 1-inch long perforated stainless-steel probe connected to nylon tubing. The stainless-steel probes were surrounded by one foot of sand, overlain by one foot of dry granular bentonite, and then discrete, hydrated lifts of granular bentonite to the surface, in accordance with *Active Soil Gas Investigation Advisory* (Cal/EPA 2003). Because only three soil vapor probes could fit in one boring, an additional boring was advanced in the immediate area for installing two additional probes.

Locations of soil gas borings are presented on Figure 3.

3.3.2 Sampling of Temporary Soil Gas Probes

Soil gas probes were sampled using low flow sampling procedures as described in *Active Soil Gas Investigation Advisory* (Cal/EPA 2003) after a minimum of 24 hours between installation and sampling of probes. Soil gas probes were sampled on April 17, 2012. Each temporary soil gas probe was purged with a low flow pump at an approximate flow rate of 200 milliliters per minutes until three system volumes had been evacuated. Following purging, a sample was collected in a polyvinyl fluoride bag and screened with a calibrated organic vapor meter equipped with a flame ionization detector (FID). FID readings ranged from 0.0 to 13.0 parts per million with the highest reading measured at boring SG2011-2 at a depth of 14.9 feet bgs. FID readings from the probes were compared to ambient air at the surface of each soil gas sampling location. FID readings of ambient air at the Southern Parcels ranged from 0 to 9.6 parts per million with the highest reading measured at boring SG2011-2 at a depth of 25.0 feet bgs. Samples were collected in laboratory-supplied stainless steel electropolished passivated vessels (SUMMA Canisters®) with flow control valve set at 200 milliliters per minutes for VOC analysis using US EPA TO-15. A duplicate sample was collected at boring SG2011-1 at a depth of 33.3 feet bgs. Samples were labeled and shipped under chain-of-custody procedures via courier to Calscience Environmental Laboratories, Inc.(Calscience) of Garden Grove, California.

The temporary soil gas probe was removed, the boring backfilled with hydrated bentonite chips, and the surface restored with the appropriate material to match the existing surface on April 18, 2012.

Locations of soil gas borings are presented on Figure 3. A copy of the soil gas sampling log is provided in Appendix E.

3.4 DISCRETE-DEPTH GROUNDWATER SAMPLING

Discrete-depth groundwater samples were collected to characterize the vertical and lateral extent of Freon 11 from borings advanced along the two on-Site transects using a CPT rig operated by Gregg :

- Three CPT borings (BGW2011-1, BGW2011-2, and BGW2011-3) in the vicinity of well CM-10, were sampled on April 16, 2012, and
- Three CPT borings (FLBGW2012-1, FLBGW2012-2, and SHBGW2012-3), off Site, and downgradient of well CM-10 on Fallbrook Avenue and Schoenborn Street. Boring SHBGW2012-3 was sample on May 30, 2012, and borings FLBGW2012-1 and FLBGW2012-2 were sampled on June 5, 2012.

Groundwater samples were collected at discrete depths as follows:

Boring Identification	Depth(s) of Groundwater Sample (feet bgs)
BGW2011-1	56
BGW2011-2	56
BGW2011-3	56 and 72
FLBGW2012-1	50 and 64
FLBGW2012-2	52 and 62
SHBGW2012-3	48 and 60

For collecting the discrete-depth groundwater sample, the CPT rod was driven to the desired depth, then retracted three feet to expose three feet of ¾-inch outer diameter polyvinyl chloride 0.020-inch slot screen. A clean stainless steel bailer was used to collect samples in laboratory-supplied containers appropriate for US EPA 8260B VOC analysis. A separate boring was advanced for collecting each discrete-depth groundwater sample, with the exception of boring BGW2011-3 (which both samples were collected in the same boring). Samples were labeled and shipped under chain-of-custody procedures via courier to Calscience.

Locations of discrete-depth groundwater borings are presented on Figure 3.

3.5 SAMPLING OF SELECT GROUNDWATER MONITORING WELLS

Two groundwater monitoring wells, MW-31 and CM-10, historically exhibiting concentrations of Freon 11 were sampled on April 30, 2012, using low flow groundwater sampling procedures, which were identical to routine groundwater monitoring, per Monitoring and Reporting Program Number CI-7483. Samples were collected on stabilization of groundwater indicator parameters in laboratory-supplied containers appropriate for US EPA 8260B VOC analysis. Trip blanks were shipped with samples. Samples were labeled and shipped under chain-of-custody procedures via courier to Calscience. Sampling records are provided in Appendix E.

Purged groundwater was containerized and disposed in the on-Site groundwater treatment system.

3.6 FIELD QUALITY CONTROL SAMPLES

3.6.1 Soil Gas Samples

A field duplicate sample was collected and analyzed to evaluate the accuracy and precision of the contract laboratory. The field duplicate sample for soil gas was collected concurrently with the primary sample from boring SG2011-1 at a depth of 33.3 feet bgs. The field duplicate was labeled as “SG2011-1A-33.3” and was analyzed for VOCs.

3.6.2 Groundwater Samples

A groundwater field duplicate sample was collected concurrently with the primary sample from boring SHBGW2012-3 at a depth of 60 feet bgs. The field duplicate was labeled as “SHBGW2012-3A-60” and was analyzed for VOCs.

Trip blanks are used to evaluate whether the samples were contaminated by VOCs during shipping and handling, storage on Site or at the laboratory. Trip blanks accompanied every shipment of groundwater samples to Calscience and were labeled as “TB-1,” “QCTB20120530,” “field blank,” and “QCTB20120605.”

4.0 CONFIRMATORY SAMPLING RESULTS

The following section describes the analytical results from the soil gas investigation in the vicinity of the Freon 11 Area, discrete-depth groundwater samples collected along the two transects, and samples collected from the two groundwater monitoring wells.

4.1 SOIL GAS ANALYTICAL RESULTS

Eleven VOCs were detected in the 14 primary soil gas samples collected in temporary soil gas probes located in the vicinity of the Freon 11 Area. Freon 11 was the only VOC that was reported at elevated concentrations (exceeding 1 µg/L). The following is a summary of detected VOCs:

- Freon 11 was detected in all soil gas samples ranging in concentrations from 0.081 (at boring SG2011-3 at a depth of 45.5 feet bgs) to 260 µg/L (at boring SG2011-1 at a depth of 33.3 feet bgs.
- Tetrachloroethlene was detected in all soil gas samples with the exception of the soil gas sample collected from SG2011-3 at a depth of 45.5 feet bgs, which was nondetect at or above a reporting limit of 0.0034 µg/L. Detected tetrachloroethlene concentrations in samples ranged from 0.095 (at boring SG2011-2 at a depth of 6.0 feet bgs) to 0.78 µg/L (at boring SG2011-1 at a depth of 33.3 feet bgs).
- 1,1,2-Trichloro-1,2,2-trifluoroethane was detected in 11 of 14 primary soil samples. Detected 1,1,2-trichloro-1,2,2-trifluoroethane concentrations in samples ranged from 0.84 (at boring SG2011-3 at a depth of 15.4 feet bgs) to 0.33 µg/L (at boring SG2011-2 at a depth of 25.0 feet bgs). 1,1,2-Trichloro-1,2,2-trifluoroethane was nondetect at or above the reporting limit in samples collected at borings SG2011-1 at a depth of 14.6 feet bgs (reporting limit of 0.460 µg/L), SG2011-2 at a depth of 6.0 feet bgs (reporting limit of 0.180 µg/L), and SG2011-3 at a depth of 45.5 feet bgs (reporting limit of 0.011 µg/L).
- Acetone was detected in 11 of the 14 primary samples. Detected acetone concentrations in samples ranged from 0.17 (at boring SG2011-3 at a depth of 25.2 feet bgs) to 0.66 µg/L (at boring SG2011-2 at a depth of 6.0 feet bgs).
- Other detected VOCs were benzene, toluene, 2-butanone, chloromethane, ethylbenzene, total xylenes, and dichlorodifluoromethane. Detected concentrations of these VOCs in soil gas samples ranged from 0.0023 (for chloromethane in boring SG2011-3 at a depth of 45.5 feet bgs) to 0.10 µg/L (for total xylene in borings SG2011-2 at a depth of 14.9 feet bgs).

Soil gas analytical results are provided on Table 1. Soil gas analytical results are presented on Figure 4. Laboratory reports are provided in Appendix F.

4.2 GROUNDWATER ANALYTICAL RESULTS

Only two VOCs, Freon 11 and chloroform, were detected in discrete-depth groundwater samples:

- Freon 11 was detected in 7 of the 10 discrete-depth groundwater samples. Detected Freon 11 concentrations ranged from 11 (at borings FLBGW2012-2 at depths of 52 feet bgs and 62 feet bgs and SHBGW2012-3 at a depth of 48 feet bgs) to 29 µg/L (at boring BGW2011-3 at depth of 56 feet bgs). Freon 11 was not detected at or above the reporting limit of 10 µg/L in the remaining discrete-depth samples.

- Chloroform was detected in the sample collected from BGW2011-1 at a depth of 56 feet bgs at a concentration of 2.6 µg/L.

Freon 11 and chloroform were also the only two VOCs detected in the groundwater samples collected from the monitoring wells MW-31 and CM-10:

- Freon 11 was detected in samples collected from wells MW-31 and CM-10 at concentrations of 120 µg/L and 35 µg/L, respectively.
- Chloroform was detected at a concentration of 1.1 µg/L in the sample collected from well CM-10.

Groundwater analytical results are provided on Table 2. Groundwater analytical results are presented on Figure 5. Historical concentrations of Freon 11 and groundwater elevations in wells MW-31 and CM-10 are presented on Graphs 1 and 2, respectively. Laboratory reports are provided in Appendix F.

4.3 DATA QUALITY

4.3.1 Soil Gas Samples

Fourteen soil gas samples were collected on April 17, 2012, with one field duplicate sample. All soil gas samples were shipped under appropriate chain-of-custody protocol. All samples were analyzed within the method-specific holding time.

The calculated relative percent difference for the duplicate pair did not exceed 40 percent.

Laboratory quality assurance/quality control (QA/QC) procedures were within US EPA method specifications, and data were accepted based on the QA/QC criteria established by the US EPA including method blanks, laboratory control sample (LCS), and laboratory control sample duplicates (LCSD).

All method blanks were free of contamination.

LCS/LCSD samples were within their respective control limits with the exception of one LCS/LCSD sample. One LCS/LCSD sample with the batch number 120420L01 was detected with Freon 11 exceeding the Marginal Exceedance Control Limit. However, the allowable number of Marginal Exceedance compounds is 3 per 60 analytes, and the number of Marginal Exceedance compounds detected was one per 60 analytes. Therefore, the sample passed the LCS Marginal Exceedance Control Limit validation, so associated samples are unqualified.

The laboratory analytical QA/QC results were reviewed by OTIE's chemist. Additionally, OTIE's chemist reviewed the laboratories certification to ensure that the laboratory was certified by California Department of Public Health for the analyses for this soil gas sampling event.

4.3.2 Groundwater Samples

A total of 11 discrete-depth groundwater samples (including a duplicate) were collected during three sampling events on April 16, 2012, May 30, 2012, and June 5, 2012. Two monitoring wells were sampled on April 30, 2012.

All groundwater samples were shipped under appropriate chain-of-custody protocol at the method-specified temperature limit (4 degrees Celsius +/- 2 degrees Celsius) to Calscience. All samples were analyzed within the method-specific holding time.

Trip blanks accompanied each of the four sampling events to Calscience. No contaminants were detected in the analyzed trip blanks.

The calculated relative percent difference for the duplicate pair did not exceed 40 percent.

Laboratory QA/QC procedures were within US EPA method specifications, and data were accepted based on the QA/QC criteria established by the US EPA including method blanks, laboratory control samples and laboratory control samples duplicates. All method blanks were free of contamination. All LCS and LCSD were within their respective control limits. The laboratory analytical QA/QC results were reviewed by OTIE's chemist. Additionally, OTIE's chemist reviewed the laboratories certification to ensure that the laboratory was certified by California Department of Public Health for the analyses for these groundwater samples

5.0 DATA DISCUSSION

5.1 FREON 11 IN SOIL GAS

There are no readily available environmental screening levels (ESLs) for Freon 11 in soil gas because it has not been identified as a carcinogen (USEPA, 2012) and is generally low in toxicity (Cal/EPA 2003). Therefore, ESLs for Freon 11 in soil gas were calculated based on US EPA screening levels for commercial/industrial and residential indoor air using published attenuation factors, and on the California groundwater MCL for Freon 11 converted to a vapor concentration. Calculated ESLs are as follows:

1. Using the quotient of US EPA regional screening level for commercial/industrial air (3.1 µg/L) (US EPA 2012) and the Cal/EPA attenuation factor for future industrial air (0.0005) (Cal/EPA 2011), the calculated ESL for commercial/industrial air is 6,200 µg/L.
2. Using the quotient of US EPA regional screening level for residential air (0.730 µg/L) (US EPA 2012) and the Cal/EPA attenuation factor for future residential air (0.001) (Cal/EPA 2011), the calculated ESL for residential air is 730 µg/L.
3. The California groundwater MCL of 150 µg/L for Freon 11 was converted to an air concentration using Henry's Law, which was calculated to be 687 µg/L.

Additional information on these calculations is provided in Appendix G.

None of the Freon 11 concentrations in soil gas samples collected during this confirmatory sampling event exceed these three calculated ESLs. The highest Freon 11 concentration was 260 µg/L (encountered in a sample at boring SG2011-1 at a depth of 33.3 feet bgs),which was well below the calculated ESLs of 6,200 µg/L for commercial/industrial air, 730 µg/L for residential air, and 687 µg/L for the California groundwater MCL converted to air. In addition, there is no significant increase in concentration with depth, all concentrations are within the same order of magnitude and appear to be diffuse. This indicates that there is no significant source of Freon 11 in the vadose zone that could come into contact with groundwater when groundwater elevations increase seasonally.

5.2 FREON 11 IN GROUNDWATER

Freon 11 concentrations in all groundwater samples did not exceed the California MCL of 150 µg/L. Wells MW-31 and CM-10 have been below the California MCL since December 1999 and June 1995, respectively. The six off-Site discrete-depth groundwater samples collected on Fallbrook Avenue and Schoenborn Street were below the California MCL with the highest concentration of 15 µg/L in the sample collected at boring FLBGW2012-1 at a depth of 62 feet bgs.

Based on CPT boring profiles and boring logs for wells MW-31 and CM-10, a cross section was compiled between the Freon 11 Area and the boring SHBGW2012-3, which is approximately 270 feet east of the eastern property line of the Site (Figure 5). The cross section illustrates coarse-grained zones (primarily poorly graded sand with gravel), groundwater level, and the approximate depth of the Modelo Formation. Lithologic logs indicate that coarse-grained zones are not interconnected in the Modelo Formation as they are outside of the Formation in the vicinity of the Freon 11 Area southeast to boring SHBGW2012-3 on Schoenborn Street. Movement of dissolved phase Freon 11 is restricted in the Modelo Formation due to isolated discrete coarse-grained zones of limited lateral and vertical extent.

6.0 SUMMARY AND CONCLUSION

Soil and groundwater investigations have occurred in the Site's Southern Parcels over the course of the last 20 years. The only detected VOC in groundwater historically exceeding a California MCL was Freon 11, which is not identified as a carcinogen and is low in toxicity. Elevated concentrations were first detected in well CM-10 in the early 1990s, this was followed by an extensive soil gas investigation in 1995, which defined the Freon 11 Area in the shallow vadose zone. In 1998, a series of additional groundwater investigations defined the onsite extent of Freon 11-impacted groundwater in every direction except towards the southeast. Off-site samples collected in 2012 documented in this report, filled the data gap by defining the vertical and lateral extent of Freon 11-impacted groundwater towards the southeast.

The following lines of evidence are provided below to support an NFA status:

- Soil gas concentrations of Freon 11 in the postulated source area collected in 2012 were below all available ESLs.
- No significant increase of Freon 11 concentrations with depth was observed in soil vapor samples collected in the postulated release area down to the groundwater table. Based on calculated threshold levels, no concentration detected in soils overlying groundwater could potentially impact groundwater above MCLs in the future.
- Groundwater sampling in the Southern Parcels indicated that lateral and vertical distribution of Freon 11 is consistent with the previous site conceptual model, e.g., CM-10 is approximately centerline with the axis of Freon 11 concentration distributions, and Freon 11 concentrations are limited to shallow groundwater per the non-detect in the deeper sample collected offsite underlying Schoenborn Street.
- Concentrations of Freon 11 in samples collected from wells CM-10 and MW-31 have been below the California MCL since 1995 and 1999, respectively, quantifying that natural attenuation has been effective.
- Comparing groundwater elevations and Freon 11 concentrations in wells MW-31 and CM-10 (Graphs 1 and 2), indicate that there is no correlation between increased groundwater elevations and increased Freon 11 concentrations, the inverse is generally true (e.g., higher elevations correspond with decreased concentrations). This supports the premise that no soil "source" exists in the vadose zone that could impact future groundwater quality above MCLs.
- Off-Site groundwater sampling indicated Freon 11 concentrations attenuate significantly away from MW-31, as concentrations are at or very near the reporting limit of 10 µg/L.

From these converging lines of evidence, it is apparent that the Freon 11 concentrations do not pose a significant impact to the Site or surrounding area; therefore, Raytheon respectfully requests that NFA status be issued for APN's 2005-002-011 and 2005-002-901 and as such, authorization to abandon wells CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30 and MW-31 be granted.

Legend

- Property Line
- MW-# / CM-#: Groundwater Monitoring Well
- MW-# / CM-#: Abandoned Groundwater Monitoring Well
- B-#: Soil Boring Location, 1993
- SG-# 183: Soil Gas Sample Point at approximately 5 ft bgs, June 1995 with Freon 11 Concentration (ug/L)
- SG-# 1300: Soil Gas Sample Point at approximately 5 ft bgs, August 1995 with Freon 11 Concentration (ug/L)
- WP-#: Temporary Well Location, 1998
- Freon 11 Area (>1,000 ug/L in soil gas)

Graph Legend

- Benzene
- Chloroform
- 1,1-Dichloroethane (1,1-DCA)
- 1,2-Dichloroethane (1,2-DCA)
- Tetrachloroethene (PCE)
- 1,1-Dichloroethene (1,1-DCE)
- 1,1,1-Trichloroethane (TCA)
- Toluene
- Trichloroethene (TCE)
- Trichlorofluoromethane (Freon-11)

Regional Screening Levels (RSLs)				
Resident Soil (Freon 11)	Ingestion Screening Level	Dermal Screening Level	Inhalation Screening Level	Noncarcinogenic Screening Level
	23,000 mg/kg	--	810 mg/kg	790 mg/kg
Protection of Groundwater (Freon 11)	Risk-based Soil Screening Level		MCL-based Soil Screening Level	
	0.83 mg/kg		0.83 mg/kg	

California Maximum Contaminant Levels (MCLs)	
Chemical	MCL (ug/L)
Tetrachloroethene	5
Trichloroethene	5
cis-1,2-Dichloroethene	6
1,1-Dichloroethene	5
1,2-Dichloroethane	0.5
1,1-Dichloroethene	6
Trichlorofluoromethane	150

Notes

1.) "ug/L" = micrograms per liter; "ug/kg" = micrograms per kilogram; "ND" = not detected above the laboratory reporting limits; "ft bgs" = feet below ground surface; "S" = sewer line; "mg/kg" = milligrams per kilograms; "vs" = versus.

2.) Non-detected values graphed as half the detection limit.

3.) Freon 11 Area approximated from previous report (GTI 1995b).

4.) Locations of 1993 soil borings, 1995 soil gas sample, and 4998 temporary wells are approximated from previous reports (GTI 1994; GTI 1995a; GTI 1995b; and Fluor Daniel GTI 1998).

5.) *The Freon 11 detection in the soil sample collected at 50 ft bgs at boring WP-276-1 is likely due to groundwater, as it was a saturated soil sample.

NOTES:

1) Trichlorofluoromethane = Freon 11

2) **Bolded** results indicate positive detections

3) ug/L = micrograms per liter

4) SFRWQCB ESLs = Environmental screening levels (ESLs) established by Regional Water Quality Control Board, San Francisco Region (SFRWQCB), in their Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater, Table E, Interim Final (SFRWQCB, 2007) for Indoor Air and Soil Gas Screening Levels (Vapor Intrusion Concerns), which are converted from parts per billion volume to micrograms per cubic meter.

5) Duplicate sample was collected at SG2011-1-33.3 was identified as SG2011-1A-33.3 . Identified as "dup" in depth column of table.

6) Total Xylenes is the summation of both orthoxylene and para/metaxylenes.

7) NE = not established.

8) *The Freon 11 ESL is based on the quotient of United States Environmental Protection Agency's Regional Screening Levels for industrial air (3.1 ug/L) and residential air (0.730 ug/L) dated April 2012 and California Environmental Protection Agency's Attenuation Factor for future industrial air (0.0005) and future residential air (0.001) dated October 2011 (refer to Appendix G for additional information on conversion).

9) **CA MCL Converted to Air was determined using Henry's Law to convert the California groundwater MCL of 150 ug/L to an air concentration (refer to Appendix G for additional information on conversion).

Table 2
Summary of Groundwater Analytical Results
Former Canoga Park Facility,8433 Fallbrook Avenue, Canoga Park, California

January 22, 2007

Ms. Jean Roberts, Manager
Safety, Health, Environmental Affairs
Raytheon Company
P.O. Box 11337
Tucson, AZ 85834-1337

Dear Ms. Roberts:

REVISED MONITORING AND REPORTING PROGRAM NO. CI-7483 – RAYTHEON SYSTEMS COMPANY (FORMER HUGHES MISSILE SYSTEM COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SLIC NO. 0693, SITE ID NO. 2043T00)

On January 23, 1995, the Los Angeles Regional Water Quality Control Board (Regional Board) adopted a site specific Waste Discharge Requirements Order No. 95-012 to discharge treated groundwater to an existing onsite landscape irrigation system at the above-referenced site. On August 26, 1997, the Regional Board revised the monitoring and sampling requirements.

On July 27, 2006, Mr. Jacques Marcillac of T N & Associates, Inc., on your behalf, requested a modification of the Monitoring and Reporting Program (MRP) No. CI-7483 as follows:

1. Monitoring data indicated that several wells have been consistently below Maximum Contaminant Levels or non-detect for several years for volatile organic compounds; and concentrations of trichlorofluoromethane in groundwater have decreased over the last six years. Therefore, remove nine groundwater monitoring wells, CM-10, CM-11A, CM-12, CM-15, CM-17, MW-28, MW-29, MW-30, and MW-31, from the monitoring program, and
2. Perform semi-annual basis on site-wide gauging instead of quarterly.

Based on our review of the information submitted, the Regional Board approved change of Monitoring and Reporting Program No. CI-7483 as you requested. All monitoring reports shall be sent to the Regional Board, ATTN: Information Technology Unit. When submitting monitoring or technical reports to the Regional Board per these requirements, please include a reference to "Compliance File No. CI-7483", which will assure that the reports are directed to the appropriate file and staff. Submit each type of report as a separate document. Please do not combine other reports with your monitoring reports.

Should you have any questions, please contact Ms. Thizar Tintut-Williams at (213) 576-6723.

Sincerely,

for David A. Bacharowski, AEO

January 26, 2007

Ms. Jean Roberts, Manager
Safety, Health, Environmental Affairs
Raytheon Company
P.O. Box 11337
Tucson, AZ 85834-1337

Dear Ms. Roberts:

REQUEST TO ABANDON SELECTED GROUNDWATER MONITORING WELLS – RAYTHEON SYSTEMS COMPANY (FORMER HUGHES MISSILE SYSTEM COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SLIC NO. 0693, SITE ID NO. 2043T00)

The Los Angeles Water Quality Control Board (Regional Board) staff received and reviewed, *Request for Interim Shutdown of the Groundwater Recovery and Treatment System (GRTS), Modification to M&RP No. 7483 and Request for No Further Action for Southern Parcels, Former Raytheon Facility, 8433 Fallbrook Avenue, Canoga Park, California, Compliance File No. CI-8567*, dated June 28, 2006, prepared by TN & Associates, Inc. on your behalf, for the above-referenced location (Site). In the letter, you also requested to abandon some groundwater monitoring wells.

Please note that in this letter, the Regional Board is responding to your request for abandoning groundwater monitoring wells only; and the Regional Board have responded or will be responding to the others in a separate letter(s) upon completion of the reviews.

Raytheon began operating the GRTS in 1995 under Waste Discharge Requirements (WDR) Order No. 95-012, and Monitoring and Reporting Program (MRP) No. CI-7483. The system was shut down in 1998 to accommodate redevelopment activities at the Site. The GRTS was re-started in 1995 until recently shut down in April 2006 due to low influent volatile organic compounds (VOCs) levels and higher sulfate levels as required in the WDR. In September 2003, a pilot test was performed to assess the potential for EISB to further remediate the VOC concentrations in groundwater. This pilot test included the injection of lactic acid, and based on the EISB pilot test results, Raytheon implemented a full-scale EISB program to accelerate degradation of chlorinated ethenes in shallow groundwater. This program is being performed under the WDR Order No. R4-2005-0030, MRP No. CI-8947. Soil Vapor Extraction (SVE) and air sparge (AS) systems were also used for remediation on site, and they were shut down in 2005 to prepare for the implementation of an enhanced in-situ bioremediation (EISB) program. On January 25, 2007, the Regional Board approved an interim shut-down of GRTS and required that the GRTS system remains in operational condition to be used as a contingency measure if it is found that the EISB program is not effective.

Raytheon requests to abandon groundwater wells, CM-2, CM-3, CM-4, CM-7, CM-8, CM-9, MW-21S, MW-21D, MW-22S, MW-22D, VE-2, and VE-3 because they were either installed too shallow and are always dry, were installed at distal locations not down gradient from any existing plumes or were pilot test wells.

Based on our review of the information submitted, we approve your request to abandon the groundwater wells, CM-2, CM-3, CM-4, CM-7, CM-8, CM-9, VE-2, and VE-3. However, the groundwater monitoring wells, MW-21S, MW-21D, MW-22S, and MW-22D, shall remain on-site and continue to monitor annually until our review of your request for "No-Further Action" for Southern Parcels is complete.

Please follow the proper well abandonment procedures as stated in Department of Water Resources Bulletin 74-90. You are required to submit a well abandonment report to the Regional Board sixty-days after completing the proper abandonment procedures for the above referenced wells in the area.

Should you have any questions, please contact Thizar Tintut-Williams at (213) 576-6723.

Sincerely,

for David A. Bacharowski, AEO
Jonathan S. Bishop
Executive Officer

NO FURTHER ACTION FOR RADIOACTIVITY ANALYSES IN GROUNDWATER PURSUANT TO CALIFORNIA WATER CODE SECTION 13267 ORDER – RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA 91304
(SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) is the State regulatory agency responsible for protecting water quality in Los Angeles and Ventura Counties. To accomplish this, the Regional Board issues investigative orders authorized by the Porter-Cologne Water Quality Control Act (California Water Code [CWC], Division 7).

At the request of the Regional Board, Raytheon's predecessor, Hughes Missile Systems, Inc., conducted eight groundwater sampling events between March 1990 and December 1991 to determine radioactivity levels in groundwater at the site. The results were submitted to the Regional Board in 1992 and indicated that a subset of the well samples had radiological parameters exceeding California Maximum Contaminant Levels (MCLs), but that the concentrations were naturally occurring based on the relative abundances of the individual uranium isotopes.

In response to public concerns regarding radioactivity sampling results from the on-site groundwater monitoring wells, the Regional Board issued a CWC section 13267 Order on March 5, 2008, requiring submittal of a work plan for a site-wide groundwater investigation to verify current radioactivity conditions. The revised work plan was reviewed and conditionally approved by the Regional Board on January 29, 2009. Subsequently, Regional Board staff have received and reviewed the *Groundwater Investigation Report to Verify Current Radioactivity Conditions* (Report), dated August 2009, prepared by Oneida Total Integrated Enterprises (OTIE) on behalf of Raytheon Company for the referenced site.

The Report presents the results of the groundwater sampling from 11 site wells for radioactivity analyses in May 2009. Gross alpha particle activity, uranium, combined radium - 226+228, and gross beta particle activity were detected up to 61.12 pCi/L, 126.5 pCi/L, 18.62 pCi/L, and 54.77 pCi/L, respectively, which exceeded their California MCLs of 15 pCi/L, 20 pCi/L, 5 pCi/L, and 50pCi/L, respectively.

The data produced during 2009 groundwater investigation are consistent with previous results collected in 1990 and 1991. This current investigation and the 1990/1991 investigation work have demonstrated that the levels of radiological isotopes detected in groundwater at the former Raytheon facility are attributable to naturally occurring sources in the underlying aquifer matrix and geochemical system. OTIE recommends no further action for radioactivity analyses in groundwater at the site.

Based on review of the submitted information and radionuclides related documentation, Regional Board staff have the following findings:

1. **No Suspected Releases of Radioisotopes from Historical Operations at the Site**

   The Regional Board has jurisdiction for the investigation and remediation of groundwater contamination at the former Raytheon site, while the Department of Toxic Substances Control (DTSC) has jurisdiction to address environmental contamination in soil as a result of historic operations. On March 4, 2009, DTSC issued the following responses to public comments:

   > "DTSC has obtained records submitted by Raytheon which includes information on the types radioisotopes used at the site, and the buildings in which the radioisotopes were used. The records indicate that only small amounts of radioactive materials were present, primarily in measurement devices, and that licenses were properly terminated and materials were properly disposed of more than twenty (20) years ago."

   Regional Board staff has also reviewed the *Supporting Documentation for the Radioactive Materials Investigation at Hughes Aircraft Company-MSG-CP*, dated May 1992, documenting the information on radioactive materials being used at the site approximately from 1964 to 1992. Based on review of the information provided, Regional Board staff concurs with DTSC's statement. Following further consultation with DTSC, Regional Board staff concludes that there is no evidence suggesting that releases of radionuclides resulted from the historical operations at the former Raytheon facility.

2. **Naturally Occurring Uranium and Radium**

   During the 2009 groundwater investigation, isotopic uranium analyses were conducted to calculate the relative mass ratios in order to determine if the origin of the uranium was man-made (enriched or depleted) or was consistent with naturally occurring sources. The results of the 2009 groundwater investigation were compared to the published values of typical isotopic abundances. These values were obtained from both the United States Department of Energy's *Guide of Good Practices for Occupational Radiological Protection in Uranium Facilities* (USDOE, 2004) and the United States Environmental Protection Agency's *Depleted Uranium Technical Brief* (USEPA, 2006).

The isotopic analysis of uranium demonstrates that the isotopic mass percentages for the 2009 groundwater samples with elevated uranium levels fall within the range expected for naturally occurring uranium as shown in the table below. The same calculations were previously performed for the October 1991 and December 1991 analytical results and yielded similar ratios. The 2009 groundwater data strongly support the statement that naturally occurring uranium is encountered in groundwater at the site.

Relative Abundance of Uranium Isotopes

Isotope	**U-238**	**U-235**	**U-234**
Natural Abundance (%)	99.27	0.72	0.0055
October 1991 Sampling Results	99.10 to 99.42	0.57 to 0.88	0.0053 to 0.0067
December 1991 Sampling Results	99.14 to 99.55	0.44 to 0.84	0.0051 to 0.0064
May 2009 Sampling Results	99.13 to 99.50	0.48 to 0.85	0.0050 to 0.0062

Based on the information obtained from the USEPA website at: http://www.epa.gov/radiation/radionuclides/index.html, uranium and radium occur naturally in the environment. They are present in virtually all rock, soil, and water. Uranium, radium and their compounds are soluble in water. As a result, groundwater in areas where concentrations of uranium and radium are high in aquifer materials and in surrounding bedrock typically has relatively high uranium and radium content.

Based upon the information provided to the Regional Board, and with the provision that the information was accurate and representative of site conditions, the Regional Board finds that the May 2009 groundwater investigation for radioactivity analyses carried out at the site is in compliance with the requirements of the CWC section 13267 Order issued to Raytheon Company on March 5, 2008 and that no further action for radioactivity analyses in groundwater is required at the site at this time. However, if new information indicates potential releases of radionuclides from the former Raytheon facility, the Regional Board may require groundwater monitoring for radioactivity analyses at the site.

If you have any questions, please contact Dr. Ann Chang at (213) 620-6070 or nchang@waterboards.ca.gov.

Sincerely,

Samuel Unger AEO for

SUBJECT: RESPONSE TO REQUEST FOR GROUNDWATER CLOSURE FOR TWO SOUTHERN PARCELS

SITE/CASE: RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff reviewed the July 8, 2010, *Request for No Further Action Status for Southern Parcels* (Report), prepared by Oneida Total Integrated Enterprises, LLC (OTIE) for the reference site. Regional Board staff also reviewed the project files and recent submittals related to the source and extent of groundwater contamination beneath and in the vicinity of the two southern parcels. On May 3, 2011, Regional Board staff held a meeting with you and Mr. Jacques Marcillac of OTIE to discuss issues related to groundwater closure for two southern parcels of the site and data gaps that need to be addressed.

Based on the review of the Report and file documents and as discussed during the May 3, 2011 meeting, Regional Board staff have determined that groundwater closure for the southern parcels can not be granted at this time based on the following:

1. The lateral extent of the trichlorofluoromethane (Freon-11) plume in groundwater originating from the site and migrating through the southern parcels has not been adequately defined. During the groundwater sampling in June 1990, Freon-11 was detected at concentrations up to 360 micrograms per liter (µg/L) in monitoring well CM-10, which is located near the site boundary. This indicates that the Freon-11 groundwater plume originating from the site has migrated off site. To date, there have been no monitoring wells installed at appropriate locations cross- and down-gradient from monitoring well CM-10.

2. The vertical extent of the Freon-11 plume in groundwater has not been adequately defined. A review of the well construction details indicates that two monitoring wells, CM-10 and MW-31 that are located within the Freon-11 plume, have approximately the same screened interval lengths. These well screened lengths bottom are at approximately 10 to 25 feet below groundwater surface. To determine if multiple-depth groundwater monitoring wells are needed and to verify the vertical change trend of the Freon-11 plume in groundwater beneath the southern parcels and the vicinity of the site, discrete multiple-depth groundwater samples shall be

monitoring wells MW-31 (located near the identified source area) and CM-10 during the next scheduled site-wide groundwater monitoring event for the site.

3. The residual soil source of Freon-11 contamination has not been adequately addressed. It is our understanding that an active source of Freon-11 was removed from the site several decades ago. However, the magnitude and the lateral and vertical extent of Freon-11 soil contamination at the identified source area near the southern parcels has not been adequately characterized. The results of a 1995 shallow [(up to 5 feet below ground surface (bgs)] soil gas survey indicate that Freon-11 was detected at concentrations up to 1,300 µg/L in vapor samples collected from the identified source area. To assess the potential for vapor intrusion and continuing source of groundwater contamination from residual Freon-11 soil contamination, multiple-depth soil and soil vapor samples shall be collected from approximately 5 feet bgs to the water table at the identified source area. If the detected concentrations of residual Freon-11 in soil and soil vapor are greater than its site-specific soil and soil vapor screening levels that are protective of both human health and groundwater resource at the southern parcels and vicinity, active soil remediation or other mitigation measures may be required.

4. To confirm if the lateral and vertical extent of Freon-11 soil and groundwater contamination from releases at the site near the two southern parcels are adequately defined, please submit a work plan for soil/soil vapor and groundwater investigations at the identified source area near the southern parcels, and cross- and down-gradient from existing well CM-10 to the Regional Board by **October 15, 2011**, for review and approval.

Thank you for your continued efforts in working with the Regional Board staff and moving this project forward. If you have any questions, please contact Dr. Ann Chang at (213) 620-6070 (achang@waterboards.ca.gov).

SUBJECT: APPROVAL OF WORK PLAN FOR CONFIRMATION SAMPLING

SITE/CASE: RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY), 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff reviewed the September 2011, *WORK PLAN FOR CONFIRMATION SAMPLING FOR NO FURTHER ACTION STATUS IN THE SOUTHERN PARCELS* (Work Plan), submitted on your behalf by Oneida Total Integrated Enterprises, LLC (OTIE) on September 16, 2011, for the referenced site. The Work Plan is submitted in response to the Regional Board letter, dated May 13, 2011, requesting for trichlorofluoromethane (Freon-11) confirmation sampling.

The Work Plan presents the scope of work to collect discrete-depth soil gas samples at three locations in the previously identified Freon-11 impacted area and discrete-depth groundwater samples at six locations in the vicinity of existing groundwater monitoring wells CM-10 and MW-31. Based on the initial groundwater sampling results, additional groundwater samples may be collected from a selected off-site location down-gradient of well CM-10 if warranted.

Based on the review of the information submitted, Regional Board staff concurs with the scope of work proposed in the Work Plan, with the following additions:

1. Because this is a confirmation sampling, tedlar bags shall not be used to collect soil gas samples for volatile organic compound analysis. Please use the containers recommended in "*ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS*" dated January 28, 2003, or its latest version, developed by the California Department of Toxic Substances Control and the Regional Board. This document is available at the following website:

   http://www.waterboards.ca.gov/losangeles/water_issues/programs/ust/guidelines/03_0210_schools_advisory_active_soil_gas_investigations.pdf

2. Following the completion of field work and laboratory analysis, a report presenting the results of the Work Plan implementation shall be submitted/uploaded to GeoTracker by **January 15, 2012**.

Thank you for your continued efforts in working with the Regional Board staff and moving this project forward in a timely manner. If you have any questions, please contact me at (213) 576-6735 (shan@waterboards.ca.gov).

Sincerely,

SUBJECT: APPROVAL OF SECOND EXTENSION REQUEST FOR SUBMITTAL OF TECHNICAL REPORT FOR SOIL GAS AND GROUNDWATER CONFIRMATION SAMPLING IN SOUTHERN PARCELS

CASE/SITE: RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY) 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff have received a request for a 30-day extension to submit the technical report (Report) presenting the results of soil gas and groundwater confirmation samples conduced in 2012 (Request). The Request was prepared and submitted by your consultant Oneida Total Integrated Enterprise (OTIE) via email on May 14, 2012. Due to limited budget/funding available to implement the field work in 2011, the original Report due date of January 15, 2012 was extended to June 30, 2012, as indicated in the Regional Board's letter dated November 7, 2011.

On May 4, 2012, Regional Board staff held a meeting with you and OTIE and reviewed the preliminary results of soil gas and groundwater samples conducted on-site in April 2012. Based on the data, Regional Board staff discussed with you the need for additional off-site characterizations. The Request indicates that additional time is need for your consultant to obtain a permit from the City of Los Angeles for completing the off-site sampling. Therefore, Regional Board staff approves your due date extension request for the submittal of the Report from June 30, 2012 **to July 31, 2012**. The Report shall include the findings and results of both the on-site and off-site confirmation sampling activities.

Should you have any questions, please contact me at (213) 576-6736 (ewong@waterboards.ca.gov).

Cone Penetration Testing Reports

GREGG DRILLING & TESTING, INC.
GEOTECHNICAL AND ENVIRONMENTAL INVESTIGATION SERVICES

April 17, 2012

OTIE
Attn: Lucas Budny

Subject: CPT Site Investigation
Canoga Park
California
GREGG Project Number: 12-731SH

Dear Mr. Budny:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☒
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☒
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,

Peter Robertson
Technical Director, Gregg Drilling & Testing, Inc.

OTIE
Attn: Lucas Budny

Subject: CPT Site Investigation
Canoga Park
California
GREGG Project Number: 12-731SH – part 3

Dear Mr. Budny:

The following report presents the results of GREGG Drilling & Testing's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☐
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☒
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,

Peter Robertson
Technical Director, Gregg Drilling & Testing, Inc.

Cone Penetration Test Sounding Summary

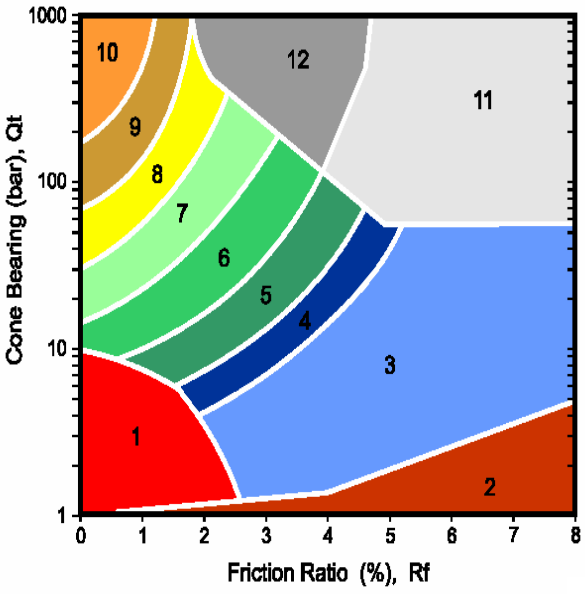
Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected from your site are presented in graphical form in the attached report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings extending greater than 50 feet, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBTn, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling & Testing Inc. do not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and do not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.



(After Robertson, et al., 1986)

Figure SBTn

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*. The soundings were conducted using a 20 ton capacity cone with a tip area of 15 cm^2 and a friction sleeve area of 225 cm^2. The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.80.

The cone takes measurements of cone bearing (q_c), sleeve friction (f_s) and penetration pore water pressure (u_2) at 5-cm intervals during penetration to provide a nearly continuous log. CPT data reduction and interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored on disk for further analysis and reference. All CPT soundings are performed in accordance with revised (2007) ASTM standards (D 5778-07).

The cone also contains a porous filter element located directly behind the cone tip (u_2). It consists of porous plastic and is 5.0mm thick. The filter element is used to obtain penetration pore pressure as the cone is advanced as well as Pore Pressure Dissipation Tests (*PPDT's*) during appropriate pauses in penetration. It should be noted that prior to penetration, the element is fully saturated with oil under vacuum pressure to ensure accurate and fast dissipation.

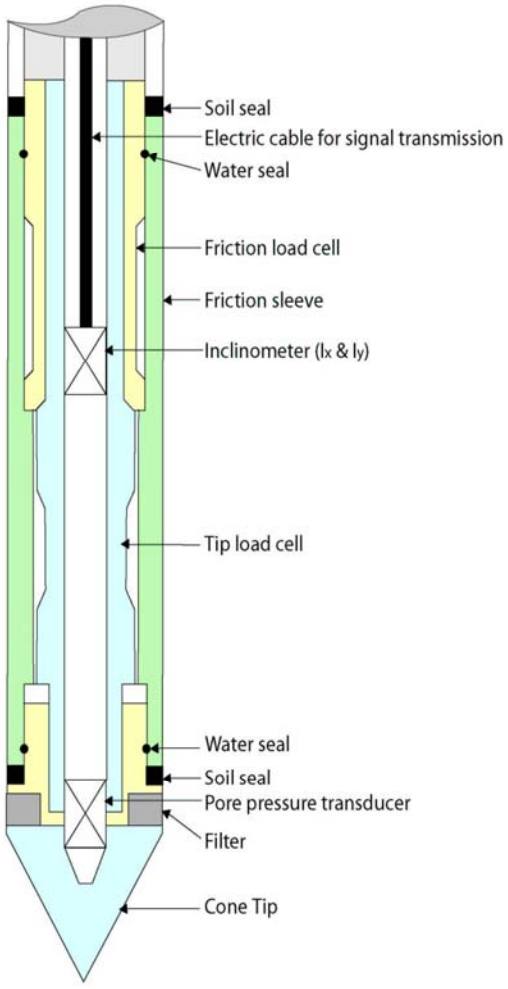

Figure CPT

The cone has the following accuracy:
1 tsf for q_c, 0.02 tsf for f_s and 0.5 psi for u_2. In soft clays, a lower capacity cone should be used for improved accuracy.

When the soundings are complete, the test holes are grouted. The grouting procedures generally consist of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

Cone Penetration Test (CPT) Interpretation

Gregg has recently updated their CPT interpretation and plotting software (2007). The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

Input:

1 Units for display (Imperial or metric) (atm. pressure, pa = 0.96 tsf or 0.1 MPa)
2 Depth interval to average results,(ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
3 Elevation of ground surface (ft or m)
4 Depth to water table, z_w (ft or m) – input required
5 Net area ratio for cone, a (default to 0.80)
6 Relative Density constant, C_{Dr} (default to 350)
7 Young's modulus number for sands, α (default to 5)
8 Small strain shear modulus number
  a. for sands, S_G (default to 180 for SBT_n 5, 6, 7)
  b. for clays, C_G (default to 50 for SBT_n 1, 2, 3 & 4)
9 Undrained shear strength cone factor for clays, N_{kt} (default to 15)
10 Over Consolidation ratio number, k_{ocr} (default to 0.3)
11 Unit weight of water, (default to γ_w = 62.4 lb/ft^3 or 9.81 kN/m^3)

Column

1 Depth, z, (m) – CPT data is collected in meters
2 Depth (ft)
3 Cone resistance, q_c (tsf or MPa)
4 Sleeve friction, f_s (tsf or MPa)
5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. u_2)
6 Other – any additional data, if collected, e.g. electrical resistivity or UVIF
7 Total cone resistance, q_t (tsf or MPa) $q_t = q_c + u\,(1\text{-}a)$

8	Friction Ratio, R_f (%)	$R_f = (f_s/q_t) \times 100\%$
9	Soil Behavior Type (non-normalized), SBT	see note
10	Unit weight, γ (pcf or kN/m^3)	based on SBT, see note
11	Total overburden stress, σ_v (tsf)	$\sigma_{vo} = \gamma z$
12	Insitu pore pressure, u_o (tsf)	$u_o = \gamma_w (z - z_w)$
13	Effective overburden stress, σ'_{vo} (tsf)	$\sigma'_{vo} = \sigma_{vo} - u_o$
14	Normalized cone resistance, Q_{t1}	$Q_{t1} = (q_t - \sigma_{vo}) / \sigma'_{vo}$
15	Normalized friction ratio, F_r (%)	$F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$
16	Normalized Pore Pressure ratio, B_q	$B_q = u - u_o / (q_t - \sigma_{vo})$
17	Soil Behavior Type (normalized), SBT_n	see note
18	SBT_n Index, I_c	see note
19	Normalized Cone resistance, Q_{tn} (n varies with Ic)	see note
20	Estimated permeability, k_{SBT} (cm/sec or ft/sec)	see note
21	Equivalent SPT N_{60}, blows/ft	see note
22	Equivalent SPT $(N_1)_{60}$ blows/ft	see note
23	Estimated Relative Density, D_r, (%)	see note
24	Estimated Friction Angle, ϕ', (degrees)	see note
25	Estimated Young's modulus, E_s (tsf)	see note
26	Estimated small strain Shear modulus, Go (tsf)	see note
27	Estimated Undrained shear strength, s_u (tsf)	see note
28	Estimated Undrained strength ratio	s_u/σ_v'
29	Estimated Over Consolidation ratio, OCR	see note

Notes:

1 Soil Behavior Type (non-normalized), SBT Lunne et al. (1997) listed below

2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)

3 Soil Behavior Type (Normalized), SBT_n Lunne et al. (1997)

4 SBT_n Index, I_c $I_c = ((3.47 - \log Q_{t1})^2 + (\log F_r + 1.22)^2)^{0.5}$

5 Normalized Cone resistance, Q_{tn} (n varies with Ic)

$Q_{tn} = ((q_t - \sigma_{vo})/pa)\ (pa/(\sigma'_{vo})^n$ and recalculate I_c, then iterate:

When $I_c < 1.64$, n = 0.5 (clean sand)
When $I_c > 3.30$, n = 1.0 (clays)
When $1.64 < I_c < 3.30$, $n = (I_c - 1.64)0.3 + 0.5$
Iterate until the change in n, $\Delta n < 0.01$

6 Estimated permeability, k_{SBT} (based on Normalized SBT_n)
(Lunne et al., 1997 and table below)

7 Equivalent SPT N_{60}, blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5\left(1 - \frac{I_c}{4.6}\right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60}\, C_{N,}$
where $C_N = (pa/\sigma'_{vo})^{0.5}$

9 Relative Density, D_r, (%) $D_r^2 = Q_{tn} / C_{Dr}$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

10 Friction Angle, ϕ', (degrees) $\tan\phi' = \frac{1}{2.68}\left[\log\left(\frac{q_c}{\sigma'_{vo}}\right) + 0.29\right]$
Only SBT_n 5, 6, 7 & 8 *Show'N/A' in zones 1, 2, 3, 4 & 9*

11 Young's modulus, E_s $E_s = \alpha\, q_t$
Only SBT_n 5, 6, 7 & 8 *Show 'N/A' in zones 1, 2, 3, 4 & 9*

12 Small strain shear modulus, Go
a. $G_o = S_G\,(q_t\ \sigma'_{vo}\ pa)^{1/3}$ *For SBT_n 5, 6, 7*
b. $G_o = C_G\, q_t$ *For SBT_n 1, 2, 3& 4*
Show 'N/A' in zones 8 & 9

13 Undrained shear strength, s_u $s_u = (q_t - \sigma_{vo}) / N_{kt}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

14 Over Consolidation ratio, OCR $OCR = k_{ocr}\, Q_{t1}$
Only SBT_n 1, 2, 3, 4 & 9 *Show 'N/A' in zones 5, 6, 7 & 8*

SBT Zones **SBT_n Zones**

The following updated and simplified SBT descriptions have been used in the software:

1	sensitive fine grained	1	sensitive fine grained
2	organic soil	2	organic soil
3	clay	3	clay
4	clay & silty clay	4	clay & silty clay
5	clay & silty clay		
6	sandy silt & clayey silt		
7	silty sand & sandy silt	5	silty sand & sandy silt
8	sand & silty sand	6	sand & silty sand
9	sand		
10	sand	7	sand

11	very dense/stiff soil*	8	very dense/stiff soil*
12	very dense/stiff soil*	9	very dense/stiff soil*

*heavily overconsolidated and/or cemented

Track when soils fall with zones of same description and print that description (i.e. if soils fall only within SBT zones 4 & 5, print 'clays & silty clays')

Estimated Permeability (see Lunne et al., 1997)

SBT_n	Permeability (ft/sec)	(m/sec)
1	$3x\ 10^{-8}$	$1x\ 10^{-8}$
2	$3x\ 10^{-7}$	$1x\ 10^{-7}$
3	$1x\ 10^{-9}$	$3x\ 10^{-10}$
4	$3x\ 10^{-8}$	$1x\ 10^{-8}$
5	$3x\ 10^{-6}$	$1x\ 10^{-6}$
6	$3x\ 10^{-4}$	$1x\ 10^{-4}$
7	$3x\ 10^{-2}$	$1x\ 10^{-2}$
8	$3x\ 10^{-6}$	$1x\ 10^{-6}$
9	$1x\ 10^{-8}$	$3x\ 10^{-9}$

Estimated Unit Weight (see Lunne et al., 1997)

SBT	Approximate Unit Weight (lb/ft^3)	(kN/m^3)
1	111.4	17.5
2	79.6	12.5
3	111.4	17.5
4	114.6	18.0
5	114.6	18.0
6	114.6	18.0
7	117.8	18.5
8	120.9	19.0
9	124.1	19.5
10	127.3	20.0
11	130.5	20.5
12	120.9	19.0

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

Work Order Number: 12-04-1150

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Revised COC received 04/25/2012 at 14:07

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-04-1151

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

SAMPLE ANOMALY FORM

SAMPLES - CONTAINERS & LABELS:

Comments:

- ☐ **Sample(s) NOT RECEIVED but listed on COC**
- ☐ **Sample(s) received but NOT LISTED on COC**
- ☐ **Holding time expired** – list sample ID(s) and test
- ☐ **Insufficient quantities for analysis** – list test
- ☐ **Improper container(s) used** – list test
- ☐ **Improper preservative used** – list test
- ☐ **No preservative noted on COC or label** – list test & notify lab
- ☐ **Sample labels illegible** – note test/container type
- ☐ **Sample label(s) do not match COC** – Note in comments
  - ☐ **Sample ID**
  - ☐ **Date and/or Time Collected**
  - ☐ **Project Information**
  - ☐ **# of Container(s)**
  - ☐ **Analysis**
- ☐ **Sample container(s) compromised** – Note in comments
  - ☐ **Water present in sample container**
  - ☐ **Broken**
- ☐ **Sample container(s) not labeled**
- ☐ **Air sample container(s) compromised** – Note in comments
  - ☐ **Flat**
  - ☐ **Very low in volume**
  - ☐ **Leaking (Not transferred - duplicate bag submitted)**
  - ☐ **Leaking (transferred into Calscience Tedlar® Bag*)**
  - ☐ **Leaking (transferred into Client's Tedlar® Bag*)**
- ☐ **Other:** _____

HEADSPACE – Containers with Bubble > 6mm or ¼ inch:

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-04-1844

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-05-2127

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

Calscience Environmental Laboratories, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Glossary of Terms and Qualifiers

ACCREDITED IN ACCORDANCE WITH nelac

Work Order Number: 12-06-0341

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
MPN - Most Probable Number

APPENDIX G

Calculated Environmental Screening Levels for Freon 11

Calculated Environmental Screening Level (ESL) for Shallow Soil Vapor Intrusion - Commercial/Industrial Air Scenario

Formula for converting ESL

$ESL_{soil\ vapor\ industrial} = (RSL_{soil\ vapor\ industrial} * Cf) \div AF_{industrial\ air}$

$ESL_{soil\ vapor\ industrial}$ =	Calculated Environmental Screening Level for shallow soil vapor in a industrial setting
$RSL_{soil\ vapor\ industrial}$ =	US EPA Region IX Regional Screening Level (RSL) for industrial Air
$AF_{soil\ vapor\ industrial}$ =	DTSC-Cal/EPA Attenuating Factor for Future commercial Air
Cf =	Conversion factor

source: SFRWQCB, November 2007 (Revised May 2008).

Chemical	Freon 11	
$RSL_{industrial\ air}$ =	3,100	Enter the US EPA Region IX RSL for Freon 11 for industrial Air (ug/m3)
Cf =	0.001	Conversion factor (1 liter = 0.001 cubic meters)
$AF_{industrial\ air}$ =	0.0005	Enter the DTSC-Cal/EPA attenuating factor for Future Commercial Air as a dimensionless unit

$ESL_{soil\ vapor\ industrial} = (RSL_{soil\ vapor\ industrial} * Cf) \div AF_{industrial\ air}$

$= (3{,}100 * 0.001) \div 0.0005$

$ESL_{soil\ vapor\ industrial}$ =	6,200	micrograms per liter

Calculated Screening Level for Deep Soil Gas Using Henry's Law Conversion

Groundwater to Soil Gas

Henry's Law Conversion

$C_{soil\ gas} = C_{groundwater} * H_c * Cf$

$C_{soil\ gas}$	concentration in soil gas
$C_{groundwater}$	concentration in groundwater
H_c	Henry's Law Constant
Cf	Conversion factor

source: Vapor Intrusion Guidance Document, DTSC - Cal/EPA, October 2011.

For	Freon 11	
H_c=	4.58	Enter the unitless Henry's Law Constant for your organic compound (as dimensionless value)
$C_{groundwater}$=	150	Enter the concentration of your organic compound as micrograms per liter (Freon 11 MCL of 150 ug/L used)
Cf=	1,000	Conversion factor (1 cubic meter = 1,000 Liters)

$C_{soil\ gas} = C_{groundwater} * H_c * Cf$

$= 150 * 4.58 * 1{,}000$

$C_{soil\ gas}$= 687,000 micrograms per cubic meter or 687 micrograms per liter

Sources:

1. Final Guidance For The Evaluation And Mitigation Of Subsurface Vapor Intrusion To Indoor Air (Vapor Intrusion Guidance). Department of Toxic Substances Control, California Environmental Protection Agency. October 2011.

2. Henry's Law Constant of 0.11 atm-m^3/mol at 20 degrees C is from Pesticide and Environmental Toxicology Section, Office of Environmental Health Hazard Assessment, Cal/EPA. Public Health Goal for Trichlorofluoromethane (FC-11) in Drinking Water. December 1997.

3. Henry's Law Constant is converted to dimensionless using USEPA's On-line Tools for Site Assessment Calculation (http://www.epa.gov/athens/learn2model/part-two/onsite/henryslaw.html)

4. Concentration of Freon 11 in groundwater is the California maximum contaminant level of 150 ug/L, per California Department of Public Health MCLs, DLRs, and PHGs for Regulated Drinking Water Contaminants table dated July 27, 2011.

Notes:

DTSC = Department of Toxic Substance Control; Cal/EPA = California Environmental Protection Agency; Freon 11 = trichlorofluoromethane; atm-m^3/mol = atmosphere-cubic meter per mole; C = Celsius; ug/L = micrograms per liter.

http://www.epa.gov/athens/learn2model/part-two/onsite/henryslaw.html

EPA On-line Tools for Site Assessment Calculation

Henry's law coefficients can be expressed in at least four sets of units. Two of these are nominally dimensionless, but because they represent either ratios of concentrations or ratios of mass fractions their values differ greatly.

Henry's Law Conversions

Input Henry's Law Constant 0.11 Hpc

Temperature 20.0 °C

Output 4.58 Hcc

Units for Henry's Law Constant Conversions

H_{cc} = Concentration/Concentration (dimensionless)
H_{yx} = Mole Fraction Y / Mole Fraction X (dimensionless)
H_{px} = Partial Pressure / Mole Fraction X (atmospheres)
H_{pc} = Parial Pressure / Concentration (atm m^3/mol)

RAYTHEON CANOGA PARK SITE – 8433 FALLBROOK AVENUE, CANOGA PARK, CA 91304

Dear Mr. Samorano:

The Department of Toxic Substances Control (DTSC) received a notification from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding its determination to provide groundwater closure for the Southern Parcels at the Raytheon Site (Site) based on the information provided in the *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012. Please be aware that DTSC is the designated lead regulatory agency to oversee the corrective action at this facility.

Because DTSC does not have an agreement with Raytheon, DTSC cannot conduct a thorough review of the Report or determine whether requirements are met to provide closure for the southern parcels. Based on a limited review, DTSC has provided comments below.

Additionally, as previously stated in discussions with Raytheon, the Areas of Concern (AOCs) identified in the RCRA facility Assessment Report dated January 30, 2008 requires investigation. Please contact DTSC Project Manager, Jessy Fierro, to discuss entering into a Corrective Action Consent Agreement.

If you have any questions, please contact Jessy Fierro at (818) 717-6563 or me at (818) 717-6539.

Sincerely,

Juli Propes
Acting Branch Chief
Brownfields and Environmental Restoration Program – Chatsworth Office

DTSC COMMENTS

Document: *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012

1. Section 2.1 discusses previous characterization. Soil sampling was apparently conducted in August 1993 at borings B-RNDM-3, B-SL-8, and B-SL-10. The DTSC Geologic Service Branch (GSB) recommends that a map showing the location of these borings be attached to the confirmation sampling report. Additionally, it appears that no soil samples have been collected from within the area identified as the expected source of the Freon 11 contamination. Also, no soil impacted with Freon 11 was removed from the expected source area. However, the confirmation soil vapor samples collected in 2011 indicate that Freon 11 in soil vapor had decreased in the expected source area since soil gas samples first collected in 1995.

2. The last apparent groundwater sampling from existing wells in this area was in 2012. Monitoring well MW-31, located within the Freon 11 source has had reported concentrations less than the Freon-11 MCL since approximately 2000. As shown on Graph 1 data since approximately 2006 has shown a slightly increasing trend of Freon-11 with the last sample from April 30, 2012 to be 120 ug/L (see Table 2). Current groundwater concentrations are unknown since there is no reported data for the last 5 years. The GSB recommends that the existing groundwater monitoring wells in the area be resampled for VOCs prior to the LA RWQCB granting an NFA and allowing abandonment of the wells.

3. Table 1 - DTSC does not recommend using the Environmental Screening Levels (ESLs) established by Regional Water Quality Control Board, San Francisco Region (SFRWQCB),as these values are not representative of Southern California conditions. Soil gas screening levels (SLs) should be developed using DTSC Human Health Risk Assessment (HHRA) Note 3. If SLs are not available in HHRA Note 3, then DTSC recommends using USEPA Regional Screening Levels (RSLs). PCE showed slight exceedances for future residential scenario but no exceedance for future industrial use.

Please contact the following DTSC staff for questions regarding these comments:

Re: **Additional Groundwater Sampling for Southern Parcel Closure**
Former Raytheon Site
8433 Fallbrook Ave, Canoga Park, California
LARWQCB SCP File No. 0693
M&RP No. CI-8947; Site ID WDR 100000974

INTRODUCTION

On behalf of the Raytheon Company (Raytheon), Oneida Total Integrated Enterprises, LLC (OTIE) has prepared this memorandum documenting the collection and analysis of groundwater samples from the former Raytheon Canoga Park site located at 8433 Fallbrook Ave in Canoga Park California ("the Site"). The Site is located on the northwest corner of the intersection of Fallbrook Avenue and Roscoe Boulevard, as shown on Figure 1.

GROUNDWATER MONITORING

This groundwater monitoring event was conducted in response to Comment #2 of the DTSC letter dated December 15, 2017 (Attachment A). LARWQCB directed Raytheon to collect samples from monitoring wells CM-10 and MW-31 (Figure 2) to confirm that concentrations of trichlorofluoromethane (Freon-11) remain below the California maximum contaminant level (MCL) of 150 micrograms per liter (ug/L).

The wells were monitored on January 22, 2018, by OTIE personnel. Wells MW-31 and CM-10 were gauged using an electric depth to water meter that was cleaned between wells. While depth to water was 52.69 feet below top of casing (ft btoc) in well MW-31, well CM-10 did not contain groundwater to its total depth of 52.7 ft btoc, and therefore, could not be sampled. Water level data for the two wells since 2006 are presented in Table 1.

Well MW-31 was purged using the low flow method with a submersible "mini-monsoon" pump. As the well had been unused for over five years, extra groundwater volumes were removed to ensure a representative sample was collected. Approximately 10 gallons of water from was purged and then placed into a 55-gallon United States Department of Transportation-approved steel drum that was properly labeled and temporarily stored on site pending offsite disposal.

Immediately following collection, the sample was placed on ice, maintained at 4°C ± 2°C and transported under appropriate chain-of-custody protocol to California State-certified analytical laboratory, Eurofins

Calscience Environmental Laboratories, Inc. (Calscience), located in Garden Grove, California. A trip blank sample was also submitted for Quality assurance/quality control

All groundwater samples were transported to Calscience via courier to be analyzed for VOCs by EPA Method 8260B, following chain-of-custody protocol. Well purge records are provided in Attachment B.

GROUNDWATER RESULTS

Analysis of the sample from well MW-31 yielded a detection of Freon-11 at 64 ug/L, which is below the MCL of 150 ug/L. No other VOCs were detected in the sample. No VOCs were detected in the trip blank sample.

Table 2 summarizes the results of the 2012 and 2018 samples collected from wells CM-10 and MW-31. The laboratory report for the current sample is provided in Attachment C.

RAYTHEON CANOGA PARK SITE – 8433 FALLBROOK AVENUE, CANOGA PARK, CA 91304

Dear Mr. Samorano:

The Department of Toxic Substances Control (DTSC) received a notification from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding its determination to provide groundwater closure for the Southern Parcels at the Raytheon Site (Site) based on the information provided in the *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012. Please be aware that DTSC is the designated lead regulatory agency to oversee the corrective action at this facility.

Because DTSC does not have an agreement with Raytheon, DTSC cannot conduct a thorough review of the Report or determine whether requirements are met to provide closure for the southern parcels. Based on a limited review, DTSC has provided comments below.

Additionally, as previously stated in discussions with Raytheon, the Areas of Concern (AOCs) identified in the RCRA facility Assessment Report dated January 30, 2008 requires investigation. Please contact DTSC Project Manager, Jessy Fierro, to discuss entering into a Corrective Action Consent Agreement.

If you have any questions, please contact Jessy Fierro at (818) 717-6563 or me at (818) 717-6539.

Sincerely,

Juli Propes
Acting Branch Chief
Brownfields and Environmental Restoration Program – Chatsworth Office

DTSC COMMENTS

Document: *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012

1. Section 2.1 discusses previous characterization. Soil sampling was apparently conducted in August 1993 at borings B-RNDM-3, B-SL-8, and B-SL-10. The DTSC Geologic Service Branch (GSB) recommends that a map showing the location of these borings be attached to the confirmation sampling report. Additionally, it appears that no soil samples have been collected from within the area identified as the expected source of the Freon 11 contamination. Also, no soil impacted with Freon 11 was removed from the expected source area. However, the confirmation soil vapor samples collected in 2011 indicate that Freon 11 in soil vapor had decreased in the expected source area since soil gas samples first collected in 1995.

2. The last apparent groundwater sampling from existing wells in this area was in 2012. Monitoring well MW-31, located within the Freon 11 source has had reported concentrations less than the Freon-11 MCL since approximately 2000. As shown on Graph 1 data since approximately 2006 has shown a slightly increasing trend of Freon-11 with the last sample from April 30, 2012 to be 120 ug/L (see Table 2). Current groundwater concentrations are unknown since there is no reported data for the last 5 years. The GSB recommends that the existing groundwater monitoring wells in the area be resampled for VOCs prior to the LA RWQCB granting an NFA and allowing abandonment of the wells.

3. Table 1 - DTSC does not recommend using the Environmental Screening Levels (ESLs) established by Regional Water Quality Control Board, San Francisco Region (SFRWQCB),as these values are not representative of Southern California conditions. Soil gas screening levels (SLs) should be developed using DTSC Human Health Risk Assessment (HHRA) Note 3. If SLs are not available in HHRA Note 3, then DTSC recommends using USEPA Regional Screening Levels (RSLs). PCE showed slight exceedances for future residential scenario but no exceedance for future industrial use.

Please contact the following DTSC staff for questions regarding these comments:

Wendy Arano, PG – DTSC Geologist: Wendy.Arano@dtsc.ca.gov
Donald Greenlee, PhD – DTSC Toxicologist: Donald.Greenlee@dtsc.ca.gov
Jessy Fierro – Project Manager: Jessy.Fierro@dtsc.ca.gov

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 18-01-1531 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 01/22/18. They were assigned to Work Order 18-01-1531.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 18-01-1531 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.
	Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
	Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.
	A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Claim No. 7016 0750 0000 3359 3034

SUBJECT: NO FURTHER ACTION FOR GROUNDWATER

CASE/SITE: SOUTHERN PARCELS OF FORMER HUGHES MISSILE SYSTEMS COMPANY FACILITY, 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693A, SITE ID NO. 2043T00)

Dear Mr. Samorano:

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) is the state agency with primary responsibility for the protection of groundwater and surface water quality within major portions of Los Angeles and Ventura counties, including the referenced site. To accomplish this, the Regional Board oversees the investigation and cleanup of discharges of waste that may affect the quality of waters of the state as authorized by the Porter-Cologne Water Quality Control Act (California Water Code [CWC], Division 7).

This site has been jointly lead by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) and the Department of Toxic Substances Control (DTSC). The Regional Board has been overseeing the investigation and remediation of groundwater contamination at the site, while the DTSC has jurisdiction to address the site soil contamination as a result of the historical operations under various Resource Conservation and Recovery Act (RCRA) permits.

Regional Board staff have reviewed the July 31, 2012, *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* prepared and submitted by your environmental consultant, Oneida Total Integrated Enterprise, and other relevant information regarding the southern parcels of former Hughes Missile System Facility (site). The following information is presented in the submitted reports:

1. The subject site consists of three parcels, with current Los Angeles County Assessor Identification (Parcel) Numbers 2005-002-014, 2005-002 -901, and 2005-002 -013 (Attachment 1). The site is part of an approximately 56-acre property that was occupied and operated as an industrial park from 1959 through 1994. In 1959, the 56-acre property was developed as an industrial park by Bunker-Ramo, an electrical component design and testing company. From 1966 through 1994, the former Hughes Missile Systems operated the 56-acre property as an aerospace research and development facility. Since 1995, the site has been redeveloped with several commercial office buildings.

Since the early 1990s, numerous investigations and remedial activities have been conducted at the 56-acre property. Through a merger with Hughes in 1997, Raytheon assumed management of the environmental investigations and remediation activities at the 56-acre property.

2. During the 56-acre property-wide environmental investigation activities in the early 1990s, concentrations of Trichlorofluoromethane (also known as Freon-11) were detected up 300 micrograms per liter (µg/L), above its California drinking water maximum contaminant level (MCL) of 150 µg/L, in groundwater well CM-10. Monitoring well CM-10 is located within Parcel No.2005-002-013 of the site.

3. From 1993 to 1998, additional site characterization activities were conducted at and within the vicinity of well CM-10 to identify the source area and further define the extent of the Freon-11 plume. Based on the results of the soil, soil vapor, and groundwater investigations, the former parking lot, located between former Buildings 274 and 276, was identified as a source area. Historical operations in Buildings 274 and 276 included solvent cleaning using Freon-11.

4. In 2007, the Regional Board approved the removal of nine wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-28, MW-29, MW-30, and MW-31) located at and in and vicinity of the site (Parcels 2005-002-014, 2005-002-013, and 2005-002-901) from the 56-acre property-wide groundwater monitoring program. Based on the cumulative groundwater monitoring data collected from these wells, the concentrations of VOCs had been consistently below MCLs or non-detect for several years and concentrations of Freon-11 in groundwater had decreased over the last several years and continued to be below its MCL of 150 µg/L.

5. In 2012, as part of the confirmation sampling activities, additional groundwater sampling was conducted both on-site and off-site. The results of this confirmation sampling indicates that the extent of Freon-11 impacted groundwater has been adequately defined. All detected concentrations of Freon-11 in groundwater during this confirmation sampling were below its MCL of 150 µg/L

6. The results of the source investigation and groundwater monitoring and sampling are summarized as follows:

    A. The occurrence of Freon-11 in well CM-10 has been adequately investigated and the source was identified. Since the associated former on-site building was demolished and operations stopped, there is no active or continued source at the site.

    B. The lateral and vertical extents of the Freon-11 groundwater impact have been fully assessed and defined both in the vicinity of the identified Freon Source Area and off-site downgradient direction.

    C. The groundwater monitoring data collected from 1993 to 2012 show decreasing trends of Freon-11 concentrations to levels continuously below its MCL of 150 µg/L.

    D. Groundwater investigation and continued monitoring data do not indicate any significant residual Freon-11 contamination that warrants further monitoring or remediation.

A Notice of Opportunity to Comment on the no further action determination was sent out on November 13, 2017, inviting comments. The due date to submit comments to this Regional Board was December

15, 2017. By the specified due date, the Regional Board received only one response letter, which was from the DTSC and is summarized below:

On December 15, 2017, the Regional Board received a comment letter from the DTSC, which was addressed to Raytheon (Attachment 2). In the letter, the DTSC recommended that the existing groundwater monitoring wells in the area be resampled for VOCs prior to the Regional Board granting an NFA and allowing well abandonment.

In response to the DTSC's recommendation, Raytheon's consultant monitored two related wells MW-31 and CM-10, which are located in and downgradient of the former area of concern. The results of this confirmation monitoring are presented in the February 8, 2018 technical memorandum titled *Additional Groundwater Sampling for Southern Parcel Closure* (Memo). The Memo indicates that wells MW-31 and CM-10 were monitored on January 22, 2018. Due to dryness of well CM-10, only one confirmation groundwater sample was collected from MW-31 and analyzed for VOCs. Freon-11 was detected at concentration of 64 µg/L, which was below its MCL of 150 µg/L. No other VOCs were detected in the sample collected from well MW-31.

No Further Action Determination

Based upon information provided to the Regional Board, and with the provision that the information was accurate and representative of site conditions, the Regional Board requires no further action (NFA) for groundwater beneath the site (APNs: 2005-002-013, 2005-002-901, and majority of 2005-002-014) at this time. However, the site owners/operators must notify the Regional Board immediately, following up with notification letter within 72 hours, if additional waste in soil and/or groundwater is encountered at the site.

Well Abandonment and Destruction

All monitoring wells (CM-10, CM-11A, CM-12, CM-15, CM-17, MW-21S, MW-21D, MW-22S, MW-22D, MW-28, MW-29, MW-30, and MW-31) shall be abandoned in accordance with the California Department of Water Resources, Bulletin 74-81 and Bulletin 74-90, *California Well Standards*. For well abandonment, you must comply with the following:

A. Well abandonment permits must be obtained from the Los Angeles County, Public Health Department, Environmental Health Division, Drinking Water Program. Any other necessary permits must be obtained from the appropriate agencies prior to the start of field work.

B. A well abandonment report shall be submitted to this Regional Board by **July 31, 2018**. This report must include, at a minimum, as site map showing the well location, a description of the well abandonment process and waste handling, and copies of all signed permits.

The jurisdiction requirements of other agencies, such as the United States Environmental Protection Agency, are not affected by the Regional Board's issuance of a NFA letter at the site. Such agencies may choose to make their own determination concerning this site.

We would like to take this opportunity to thank you for your full cooperation with the Regional Board during the course of the site assessment. Should you have any questions regarding this matter, please contact Ms. Emily Wong, Project Manager, at (213) 576-6736, emily.wong@waterboards.ca.gov, or Ms. Su Han, Unit Chief, at (213) 576-6735, su.han@waterboards.ca.gov.

Sincerely,

Samuel Unger, P.E.
Executive Officer

RAYTHEON CANOGA PARK SITE – 8433 FALLBROOK AVENUE, CANOGA PARK, CA 91304

Dear Mr. Samorano:

The Department of Toxic Substances Control (DTSC) received a notification from the Los Angeles Regional Water Quality Control Board (LARWQCB) regarding its determination to provide groundwater closure for the Southern Parcels at the Raytheon Site (Site) based on the information provided in the *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012. Please be aware that DTSC is the designated lead regulatory agency to oversee the corrective action at this facility.

Because DTSC does not have an agreement with Raytheon, DTSC cannot conduct a thorough review of the Report or determine whether requirements are met to provide closure for the southern parcels. Based on a limited review, DTSC has provided comments below.

Additionally, as previously stated in discussions with Raytheon, the Areas of Concern (AOCs) identified in the RCRA facility Assessment Report dated January 30, 2008 requires investigation. Please contact DTSC Project Manager, Jessy Fierro, to discuss entering into a Corrective Action Consent Agreement.

If you have any questions, please contact Jessy Fierro at (818) 717-6563 or me at (818) 717-6539.

Sincerely,

Juli Propes
Acting Branch Chief
Brownfields and Environmental Restoration Program – Chatsworth Office

DTSC COMMENTS

Document: *Confirmation Sampling Report for No Further Action Status in the Southern Parcels* (Report) dated July 31, 2012

1. Section 2.1 discusses previous characterization. Soil sampling was apparently conducted in August 1993 at borings B-RNDM-3, B-SL-8, and B-SL-10. The DTSC Geologic Service Branch (GSB) recommends that a map showing the location of these borings be attached to the confirmation sampling report. Additionally, it appears that no soil samples have been collected from within the area identified as the expected source of the Freon 11 contamination. Also, no soil impacted with Freon 11 was removed from the expected source area. However, the confirmation soil vapor samples collected in 2011 indicate that Freon 11 in soil vapor had decreased in the expected source area since soil gas samples first collected in 1995.

2. The last apparent groundwater sampling from existing wells in this area was in 2012. Monitoring well MW-31, located within the Freon 11 source has had reported concentrations less than the Freon-11 MCL since approximately 2000. As shown on Graph 1 data since approximately 2006 has shown a slightly increasing trend of Freon-11 with the last sample from April 30, 2012 to be 120 ug/L (see Table 2). Current groundwater concentrations are unknown since there is no reported data for the last 5 years. The GSB recommends that the existing groundwater monitoring wells in the area be resampled for VOCs prior to the LA RWQCB granting an NFA and allowing abandonment of the wells.

3. Table 1 - DTSC does not recommend using the Environmental Screening Levels (ESLs) established by Regional Water Quality Control Board, San Francisco Region (SFRWQCB),as these values are not representative of Southern California conditions. Soil gas screening levels (SLs) should be developed using DTSC Human Health Risk Assessment (HHRA) Note 3. If SLs are not available in HHRA Note 3, then DTSC recommends using USEPA Regional Screening Levels (RSLs). PCE showed slight exceedances for future residential scenario but no exceedance for future industrial use.

Please contact the following DTSC staff for questions regarding these comments:

Wendy Arano, PG – DTSC Geologist: Wendy.Arano@dtsc.ca.gov
Donald Greenlee, PhD – DTSC Toxicologist: Donald.Greenlee@dtsc.ca.gov
Jessy Fierro – Project Manager: Jessy.Fierro@dtsc.ca.gov

RE: Extension Request for Report Submittal
Southern Parcels Well Abandonment
Former Canoga Park Facility
8433 Fallbrook Avenue, Canoga Park, California
SCP No. 0693A, Site ID No. 2043T00

Dear Ms. Wong:

On behalf of the Raytheon Company, OTIE is requesting an extension for the submittal of the well abandonment report requested in your letter dated March 22, 2018. The current due date is July 31, 2018: we would like to request an extension for submittal to October 1, 2018.

This extension is necessary due to delayed contracting for the well abandonment task. As it was not included in the original scope of work for 2018, additional funds needed to be awarded before the work could be performed.

Sincerely,
Oneida Total Integrated Enterprises

Kim Sawyer, PG
Senior Geologist

SUBJECT: APPROVAL EXTENSION REQUEST TO SUBMIT A TECHNICAL REPORT FOR GROUNDWATER MONITORING WELLS ABANDONMENT ACTIVITIES IN SOUTHERN PARCELS

CASE/SITE: RAYTHEON COMPANY (FORMER HUGHES MISSILE SYSTEMS COMPANY) 8433 FALLBROOK AVENUE, CANOGA PARK, CALIFORNIA (SCP NO. 0693A, SITE ID NO. 2043T00)

Dear Mr. Samorano:

Los Angeles Regional Water Quality Control Board (Regional Board) staff received an extension request letter to submit a technical report (Report) presenting the results of groundwater monitoring wells abandonment activities in the southern parcels of the site (Letter). The Letter was prepared and submitted by your consultant Oneida Total Integrated Enterprise (OTIE) on July 6, 2018. The Letter indicates the wells abandonment activities have been delayed due to limited budget/funding available to implement the field work. Therefore, the Letter requests a 60-day extension to submit the Report. The original due date of July 31, 2018 was specified in the Regional Board's letter dated March 22, 2018. Based on the information submitted, Regional Board staff approves the submittal of the Report from July 31, 2018 to **October 1, 2018**.

Should you have any questions, please contact me at (213) 576-6736 (emily.wongewong@waterboards.ca.gov).

Sincerely,

Emily Wong
Water Resource Control Engineer
Site Cleanup Unit I

EXECUTIVE SUMMARY

On behalf of Raytheon Company (Raytheon), Oneida Total Integrated Enterprises, LLC has prepared this report for the Second Quarter 2020 to document remedial progress and waste discharge activities at the Former Canoga Park Facility (the Site). Remedial efforts have been implemented to treat groundwater and saturated soils that contain residual volatile organic compounds (VOCs) at the Site located at 8433 Fallbrook Avenue in Canoga Park, California. This report was prepared in accordance with the revised Monitoring and Reporting Program (M&RP) No. CI-8947 (December 7, 2018) issued by the Los Angeles Regional Water Quality Control Board (LARWQCB) and the Waste Discharge Requirements (WDR) Order No. R4-2014-0187 (Series No. 076). This document summarizes the results for the May 2020 Site-wide semiannual groundwater monitoring event, as well as remedial activities conducted between April and June 2020.

Groundwater remediation has been underway at the Site since 1995 to achieve cleanup criteria. The LARWQCB is the lead oversight agency for remediation activities at the Site (LARWQCB File No. 94-45). The primary objective of the remediation program is to accelerate the degradation of VOCs to concentrations below the cleanup goals established in the 1992 *Corrective Action Plan* (CAP).

Remediation techniques used at the Site have included remedial excavation, a groundwater recovery and treatment system, a soil vapor extraction system, and an air sparge system. Enhanced *in-situ* bioremediation (EISB) was first implemented in 2005. Recent *in-situ* remedies included EISB in the well CM-4D and well CM-8D areas implemented in November and December 2016, and *in-situ* chemical oxidation (ISCO) in the Northwest area implemented in March 2017. Injection programs followed OTIE's *CAP Addendum No. 5* dated December 2015. In their letter dated December 7, 2018, the LARWQCB revised the M&RP to discontinue post-injection monitoring at the CM-4D, CM-8D, and Northwest Areas, and to include the monitoring requirements for EISB injections planned at the North-Central Barriers and Former Tank T3 Area.

Pre-injection Baseline groundwater monitoring for the North-Central Barriers and Former Tank T3 Area EISB was conducted in March 2020 in accordance with M&RP No. CI-8947 and WDR Order No. R4-2014-0187. Raytheon conducted EISB injections at the North-Central Barriers and Former Tank T3 Area between April 13 and 24, 2020 and field activities are summarized herein.
