US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 02/25/2015

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

US HIST CDL: National Clandestine Laboratory Register

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST
EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

Date of Government Version: 08/30/2013

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

EDR PROPRIETARY RECORDS

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR US Hist Cleaners: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.
Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

SUMMARY

Tierra Environmental Services, Inc. (Tierra) was contracted by Dyett & Bhatia Urban and Regional Planners (Dyett & Bhatia) in conjunction with the City of San Diego (City) to conduct a cultural resources constraints analysis in support of the Mission Valley Community Plan Update (Plan Update). The purpose of this document is to present the results of a background archival search and to classify prehistoric and historic cultural resources sensitivity for the area depicted within the Plan Update, and to provide community leaders with sufficient information to make informed planning decisions.

The community of Mission Valley is located along the San Diego River Valley and is bounded by the community of Grantville to the east and Interstate-5 to the west. The western half of the northern boundary of the community extends along Friars Road before reaching the mesa plateau in the east. The southern boundary is bounded by the natural geographical transition between the San Diego River Valley and the San Diego Mesa where the communities of Uptown, North Park, Mid-City can be found.

This constraints analysis was undertaken in association with the update of the Mission Valley Community Plan for the City of San Diego. To achieve this analysis, archival data, geographical and environmental aspects, and correspondence with the local Native American tribes were reviewed. The archival research consisted of literature and records searches at local archaeological repositories, in addition to an examination of historic maps, aerial photographs, and historic site inventories. This information was used to identify previously recorded resources within the study area. A records search was conducted at the South Coastal Information Center (SCIC) at San Diego State University on July 20, 2015 and updated by qualified City staff in December 2018. The results of the records search indicated that 157 previous investigations have been conducted and 57 cultural resources have been previously recorded within the community of Mission Valley. Of these, 27 are prehistoric, 2 are multi-component resources, 20 are historic archaeological resources, and 7 are built historic resources. In addition, several key areas have been identified that may be of high level of interest to local Native American communities because of proximity to the CPU, such as but not limited to the prehistoric Rancheria of *Kosti/Cosoy/Kosaii/Kosa'aay,* the Presidio de San Diego, and the ethnohistoric route through the valley often referred to as the Kumeyaay Highway, and the Mission San Diego de Alcalá which is within the CPU boundary.

A Sacred Lands File check was requested of the Native American Heritage Commission (NAHC) in August 2015 which indicated that no sacred lands have been identified within the vicinity of the community plan boundaries. The NAHC provided a list of local tribal entities and other interested parties, and a Native American contact program was conducted to gather similar information, resulting in responses from two local Native American tribes requesting copies of the report and noting areas of interest within the community of Mission Valley.

Based on the results of the records search, the NAHC Sacred Lands File check, correspondence with the local Native American Kumeyaay community, and known regional environmental factors, certain areas within the community of Mission Valley are considered culturally sensitive for the presence of archaeological resources. Beginning with early Spanish establishment of the Presidio, the areas known today as Old Town and Mission Valley played a pivotal role in the historic development of the San Diego

region. Prior to the arrival of the Spanish, these areas were extensively occupied and exploited by Native Americans, further contributing to the rich cultural heritage and sensitivity for archaeological resources in the San Diego River Valley. For the reasons noted above, the archaeological sensitivity levels for the community of Mission Valley are comprised of areas determined to represent low, moderate and high sensitivities as shown in Figure 4.

Participation of the local Native American community is crucial to the effective identification and protection of cultural resources within the community of Mission Valley in accordance with the City's Historical Resources Guidelines (City of San Diego 2001). Native American participation is required for all levels of future investigations in the community of Mission Valley, including those areas that have been previously developed, unless additional information can be provided to demonstrate that the property has been graded to a point where no resources could be impacted. Areas that have not been previously developed should be surveyed to determine potential for historical resources to be encountered, and whether additional evaluation is required. In areas that have been previously developed, additional ground-disturbing activities may require further evaluation and/or monitoring.

I. INTRODUCTION

The City of San Diego (City) is preparing an update to the Mission Valley Community Plan and requires a constraints analysis and cultural sensitivity analysis for archaeological and tribal cultural resources to support the environmental review process for the Plan Update. The community of Mission Valley is located along the San Diego River Valley and is bounded by the Navajo Community Planning area neighborhood of Grantville to the east and Interstate-5 to the west. The western half of the northern boundary of the community extends along Friars Road before reaching the mesa plateau in the east. The southern boundary is bounded by the natural geographical transition between the San Diego River Valley and the San Diego Mesa. The communities of Uptown (Mission Hills and Hillcrest), North Park (University Heights), Normal Heights and Kensington overlook the Plan Update area to the north from the San Diego Mesa.

A records search was conducted by the Tierra Environmental Services, Inc. (Tierra) using the California Historical Resources Information System (CHRIS) in 2015 and updated in 2018 by qualified City staff in support of the community plan update, along with a literature review update at the South Coastal Information Center (SCIC) and a records search at the San Diego Museum of Man. This report documents the relevant records search and literature review results and identifies the archaeological resources sensitivity for the community of Mission Valley.

A. Project Personnel

This cultural resources constraints analysis was prepared by Tierra, whose cultural resources staff meets federal, state, and local requirements. Dr. Michael G. Baksh served as Principal Investigator and provided overall project management. Dr. Baksh has a Ph.D. in Anthropology from the University of California at Los Angeles and has more than 35 years conducting archaeological investigations in the southwestern United States in compliance with the CEQA. Ms. Hillary Murphy served as primary report author. Ms. Murphy has a B.A. from California State University, Sacramento and over eleven years of experience in southern California archaeology.

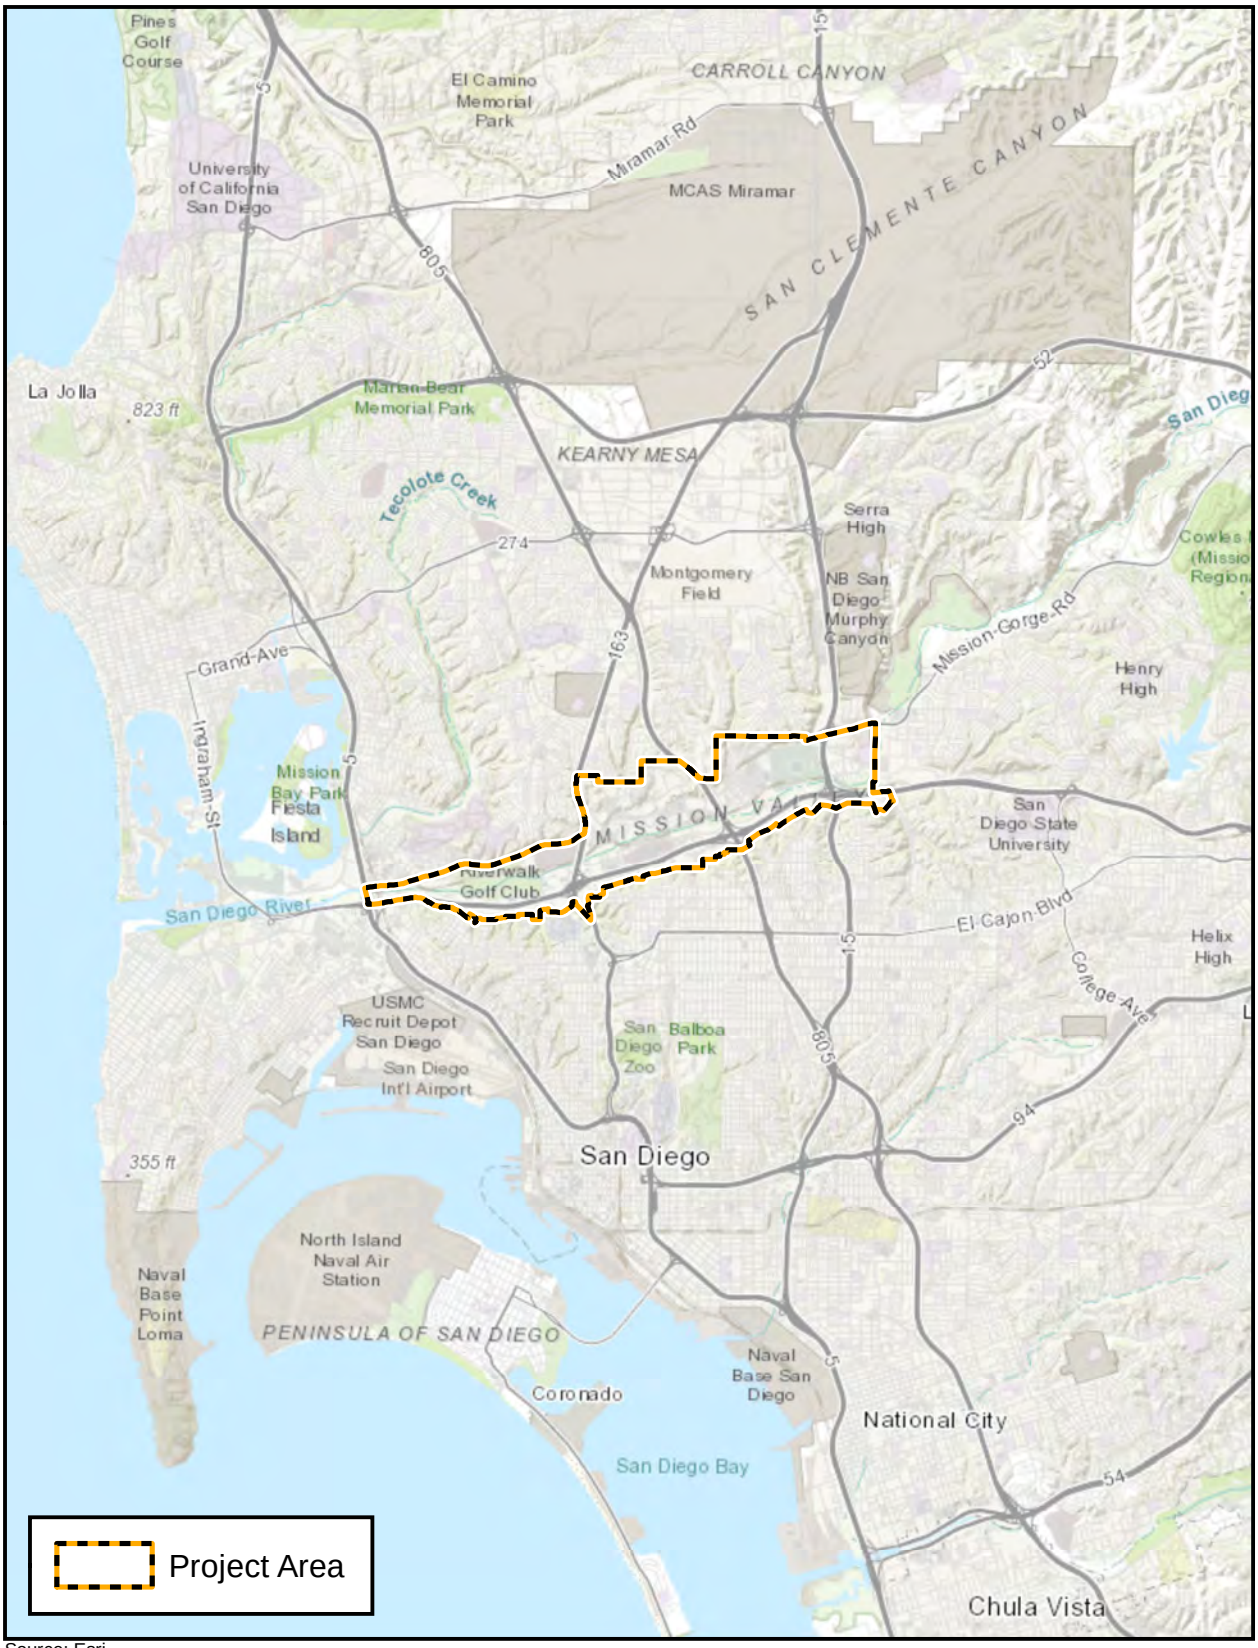
II. NATURAL AND CULTURAL SETTING

The following environmental and cultural background provides a brief context for the cultural resources analysis for coastal San Diego County.

A. Natural Setting

The area comprising the community of Mission Valley is located along the San Diego River Valley. Elevation across the Mission Valley community varies from 7 ft above median sea level (AMSL) and 365 ft AMSL. The landscape of the project area is largely a product of the region's geology. During the Jurassic and late Cretaceous (>100 million years ago), a series of volcanic islands paralleled the current coastline in the San Diego region. The remnants of these islands stand as Mount Helix, Black Mountain, and the Jamul Mountains, among others. This island arc of volcanoes spewed out vast layers of tuff (volcanic ash) and breccia that have since been metamorphosed into hard rock of the Santiago Peak Volcanic formation. These fine-grained rocks provided a regionally important resource for Native American flaked stone tools. Similar materials were created during Miocene volcanism in the Jacumba area. Known as the Table Mountain Gravels, these volcanic rocks provided a more local source of lithic material that was utilized by Native Americans throughout the County.

Paleoenvironmental Setting



The early Holocene was a time of environmental transition, with a number of global climatic trends resulting in biotic and habitat adjustments in what is now coastal Southern California. Although temperatures in the Northern Hemisphere were characterized by pronounced warming in the early Holocene (West et al. 2007), local climates in the area that is now San Diego may have been relatively cool and wet due to the influence of coastal fog produced by upwelling and the resultant cold sea surface temperatures (Pope et al. 2004). In general, however, the early Holocene was a time of climatic warming in what is now coastal California, resulting in a number of changes to biotic communities, most prominently the retreat of coniferous forests and the expansion of oak woodland throughout most of the region.

The most significant environmental change at this time, however, was likely the stabilization of sea levels. At the time of the first observed archaeological evidence of prehistoric occupation in what is now the Old Town area, sea levels had been rising rapidly for several thousand years, pausing only briefly at approximately 11,500 years before present (B.P.) for the Younger Dryas re-glaciation and again for another global cooling event at approximately 8200 B.P. (Masters and Aiello 2007). This rapid transgression flooded coastal drainages, resulting in a series of deep embayments along the coast of what is now San Diego County during the early Holocene. Current data suggest, however, that the sea level rise, which had reached maximum rates of 2 to 4 meters per century, began to stabilize by approximately 8000 B.P., and approached the current level by approximately 6000 B.P. This slowing of the transgression allowed the accumulation of sediment at lagoon margins, resulting in a complex mosaic of biotic habitats that provided prehistoric populations with a wide array of marine, riparian, and terrestrial resources.

The middle Holocene climate in what is now coastal Southern California was marked by pronounced warming and increased aridity between approximately 7800 and 5000 B.P. (Carbone 1991), which was consistent with a broader warming trend seen elsewhere during this interval. This was followed by a cool, moist interval that persisted until approximately 2,000 years ago in what is now coastal Southern California (Davis 1992).

Due largely to their more recent occurrence, climatic changes in what is now coastal Southern California during the past 2,000 years are much better understood. Among the clearest of these records is a 1,600-year tree-ring record reported by Larson and Michaelson (1989) for the Transverse Ranges, and the pollen record from San Joaquin Marsh. During the early portion of their sequence (A.D. 500 to 1000), Larson and Michaelson record relatively high variability in yearly precipitation totals. During the first 150 years of their reconstruction, approximately A.D. 500 to 650, climatic conditions were characterized by moderately low precipitation levels. This period was followed by very low rainfall levels, which lasted from approximately A.D. 650 to 800. Extreme drought was experienced between approximately A.D. 750 and 770. The succeeding 200 years, approximately A.D. 800 to 1000, was a sustained high-interval period unmatched in the entire 1,600-year reconstruction.

The climate of the region can generally be described as Mediterranean, with cool wet winters and hot dry summers. Rainfall limits vegetation growth, but coastal sage scrub and riparian vegetal communities are particularly adapted to the climate of the area and dominated the area around the community of Mission Valley historically. Paleoclimatic records from a wide variety of contexts consistently indicate that the period between approximately 1,000 and 700 years ago (A.D. 1000 to 1300) was characterized by generally higher temperatures and periods of extreme drought. This event, known as the Medieval Warm Period or the Medieval Climatic Anomaly, has received considerable attention, due both to the apparent severity of the droughts and to its apparent coincidence with important cultural changes described throughout the prehistoric archaeological record of California (Jones et al. 1999; Raab and Larson 1998). Evidence of severe drought and increasing temperatures at this time is documented for the Sierra Nevada area by Stine (1990, 1994) and Graumlich (1993), and is documented along the Southern California coast by Larson and Michaelson (1989). Larson and Michaelson's (1989) data indicate that the interval between approximately A.D. 1100 and 1250 was one of continued drought, particularly between approximately A.D. 1120 and 1150.

B. Cultural Setting

Prehistory and Ethnohistory

The prehistoric cultural sequence for what is now San Diego County is generally thought of as three basic periods: Paleoindian, locally characterized by the San Dieguito complex; Archaic, characterized by the cobble and core technology of the La Jollan and Pauma complexes; and Late Prehistoric, marked by the appearance of ceramics, small arrow points, and cremation burial practices. Late Prehistoric materials in southern San Diego County, known as Yuman I and Yuman II, are believed to represent the ancestral Kumeyaay, (also known as the Ipay/Tipay).

Paleoindian Period

The earliest well documented prehistoric sites in southern California are identified as belonging to the Paleoindian period, which has locally been termed the San Dieguito complex/tradition. The Paleoindian period is thought to have occurred between 9,000 years ago (or earlier), and 8,000 years ago in this region. Although varying from the well-defined fluted point complexes such as Clovis, the San Dieguito complex is still seen as a hunting focused economy with limited use of seed grinding technology. The economy is generally seen to concentrate on highly ranked resources such as large mammals and relatively high mobility, which may be related to following large game. Archaeological evidence associated with this period has been found around inland dry lakes, on old terrace deposits of the California desert, and also near the coast, where it was first documented at the Harris Site.

Archaic Period

Native Americans during the Archaic period had a generalized economy which focused on hunting and gathering. In many parts of North America, Native Americans chose to replace this economy with types based on horticulture and agriculture. Coastal southern California economies remained largely dependent on wild resource use until European contact (Willey and Phillips 1958). Changes in hunting technology and other important elements of material culture have created two distinct subdivisions within the Archaic period in southern California.

The Archaic period is differentiated from the earlier Paleoindian period by a shift to a more generalized economy and an increased focus on the use of grinding and seed processing technology. At sites dated between approximately 8,000 and 1,500 years before present, the increased use of groundstone artifacts and atlatl dart points, along with a mixed core-based tool assemblage, identify a range of adaptations to a more diversified set of plant and animal resources. Variations of the Pinto and Elko series projectile points, large bifaces, manos and portable metates, core tools, and heavy use of marine invertebrates in coastal areas are characteristic of this period, but many coastal sites show limited use of diagnostic atlatl points. Major changes in technology within this relatively long chronological unit appear limited. Several scientists have considered changes in projectile point styles and artifact frequencies within the Archaic period to be indicative of population movements or units of cultural change (Moratto 1984), but these units are poorly defined locally due to poor site preservation.

Late Prehistoric Period

Around 2,000 before present (B.P.), Yuman-speaking people from the eastern Colorado River region began migrating into southern California, representing what is called the Late Prehistoric Period. The Late Prehistoric Period in San Diego County is recognized archaeologically by smaller projectile points, the replacement of flexed inhumations with cremation, the introduction of ceramics, and an emphasis on inland plant food collection and processing, especially acorns (True 1966). Inland semi-sedentary villages were established along major water courses, and montane areas were seasonally occupied to exploit acorns and piñon nuts, resulting in permanent milling features on bedrock outcrops. Mortars for acorn processing increased in frequency relative to seed grinding basins. This period is known archaeologically in southern San Diego County as the Yuman (Rogers 1945) or the Cuyamaca Complex (True 1970).

The Kumeyaay (formerly referred to as Diegueño) who inhabited the southern region of San Diego County, western and central Imperial County, and northern Baja California (Almstedt 1982; Gifford 1931; Hedges 1975; Luomala 1976; Shipek 1982; Spier 1923) are the direct descendants of the early Yuman hunter-gatherers. Kumeyaay territory encompassed a large and diverse environment which included marine, foothill, mountain, and desert resource zones. The Kumeyaay language is a dialect of the Yuman language and related to the large Hokan super family.

There seems to have been considerable variability in the level of social organization and settlement pattern during this period. The Kumeyaay were organized by patrilineal, patrilocal lineages that claimed prescribed territories but did not own the resources except for some minor plants and eagle aeries (Luomala 1976; Spier 1923). Some lineages occupied procurement ranges that required considerable residential mobility, such as those in the deserts (Hicks 1963). In the mountains, some of the larger groups inhabited a few large residential bases that would be occupied biannually in Cuyamaca in the summer and fall, and in Guatay or Descanso during the rest of the year (Almstedt 1982; Rensch 1975). According to Spier (1923), many Eastern Kumeyaay spent the period of time from spring through autumn in larger residential bases in the upland procurement ranges and wintered in mixed groups in residential bases along the eastern foothills on the edge of the desert (i.e., Jacumba and Mountain Springs). This variability in settlement mobility and organization reflects the great range of environments in the territory.

Acorns were the single most important food source used by the Kumeyaay. Their villages were usually located near water, which is necessary for leaching acorn meal. Other storable resources such as mesquite or agave were equally valuable to groups inhabiting desert areas, at least during certain seasons (Hicks 1963; Shackley 1984). Seeds from grasses, Manzanita, sage, sunflowers, lemonadeberry, chia and other plants were also used, in addition to various wild greens and fruits. Deer, small game, and birds were hunted and fish and marine foods were eaten. Houses were arranged in the village without apparent pattern. The houses in primary villages were conical structures covered with tule bundles that had excavated floors and central hearths. Houses constructed at the mountain camps generally lacked any excavation, probably due to the summer occupation. Other structures included sweathouses, ceremonial enclosures, ramadas, and acorn granaries. The material culture included ceramic cooking and storage vessels, baskets, flaked lithic and ground stone tools, arrow shaft straighteners, and stone, bone, and shell ornaments.

Hunting implements included the bow and arrow, curved throwing sticks, nets, and snares. Shell and bone fishhooks, as well as nets, were used for fishing. Lithic materials including quartz and metavolcanics were commonly available throughout much of the Kumeyaay territory. Other lithic resources, such as obsidian, chert, chalcedony and steatite, occur in more localized areas and were acquired through direct procurement or exchange. Projectile points including the Cottonwood Series points and Desert Side-notched points were commonly produced.

Kumeyaay culture and society remained stable until the advent of missionization and displacement by Hispanic populations during the eighteenth century. The effects of missionization, along with the introduction of European diseases, greatly reduced the native population of southern California. By the early 1820s, California was under Mexico's rule. The establishment of ranchos under the Mexican land grant program further disrupted the way of life of the native inhabitants.

Ethnohistoric Period

The Ethnohistoric period refers to a brief period when Native American culture was initially being affected by Euroamerican culture and continued through the Spanish and Mexican periods and into the American period. Historical records on Native American activities during this time were limited. By the time Spanish colonists began to settle in Alta California in 1769, the areas that are now part of the CPU area and the adjacent community of Old Town were within the territory of the Kumeyaay people, a cultural group comprised of exogamous, nontotemic territorial bands with patrilineal descent, often also referred to as Northern and Southern Diegueño, because of their association with the San Diego Mission. The founding of Mission San Diego de Alcalá in 1769 brought about profound changes in the lives of the Kumeyaay after being brought into the mission system. The Kumeyaay speak a Yuman language which differentiates them from the Luiseño to the north, who speak a Takic language (Kroeber 1925). Both of these groups were hunter-gatherers with highly developed social systems. European contact introduced disease that dramatically reduced the Native American population and helped to break down cultural institutions. The transition to a largely Euroamerican lifestyle occurred relatively rapidly in the nineteenth century.

Villages and campsites were generally located in areas where water was readily available, preferably on a year-round basis. The San Diego River, which bisects the CPU area, provided an important resource not only as a reliable source of water, but as a major transportation corridor through the region. Major coastal villages were known to have existed along the San Diego River, including the village of *Kosaii* (also known as *Cosoy* or *Kosa'aay*) near the mouth of the San Diego River (Gallegos et al. 1998; Kroeber 1925), which took its name from the Kumeyaay word for drying place or dry place (Dumas 2011). This ranchería appears in the earliest of Spanish travelogues for the area, and was the village closest to the Presidio. Although the actual location of the village is unknown, it has been described as being near the mouth of the San Diego River, and also reported by Bancroft in 1884, that a site called *Cosoy*/*Kosaii*/*Kosa'aay* by the Native Americans was in the vicinity of Presidio Hill and Old Town. Several investigations have identified possible locations for the village of *Cosoy*/*Kosaii*/*Kosa'aay* (Clement and Van Bueren 1993; Felton 1996), but the actual site has never been found. Several additional large villages have been documented along the San Diego River through ethnographic accounts and

archaeological investigations in the area. These include *Nipaquay*, located near present-day Mission San Diego de Alcalá (Kyle 1996); El Corral, located near present-day Mission Gorge; Santee Greens, located in present-day eastern Santee (Berryman 1981); and El Capitan, located approximately 25 miles upstream from the CPU, now covered by the El Capitan Reservoir (Pourade 1961). To the north of the CPU was *onap,* a ranchería of a large settlement located in Rose Canyon; west of the I-5 was a large village known as *hamo, jamo or Rinconada de Jamo,*in present-day Pacific Beach*;* and further to the north was a prominent rancheria located in present-day Sorrento Valley known *as Ystagua* or *istagua*, a Spanish gloss of *istaawah* or *istawah*, and means worm's (larvae) house.

Native Places and Place Names on the Land

The Kumeyaay have roots that extend thousands of years in the area that is now San Diego County and northern Baja California, and there are hundreds of words that describe a given landform, showing a close connection with nature. There are also stories associated with the land. The San Diego area in general, including Old Town, the River Valley and the City as it existed as late as the 1920s, was known as *qapai* (meaning uncertain). According to Kumeyaay elder Jane Dumas, some native speakers referred to what is now I-8 as *oon-ya*, meaning trail or road, describing one of the main routes linking the interior of San Diego with the coast. The floodplain from the Mission San Diego de Alcalá to the ocean was *hajir* or *qajir* (Harrington; 1925, 1927), and the modern-day Mission Valley area was known as *Emat kuseyaay,* which means spirit land, land with spirits, or place of spirit person, and may have been in reference to the presence of Spanish priests in the valley after 1769 (Robertson 1982). The narrows of Mission Gorge within present-day Mission Trails Regional Park carries the name *Ewiikaakap,* meaning rocks where the river narrows (Robertson 1982).

Although the river valley itself was extensively used and occupied by Native Americans prior to and during the historic periods and well into the 20th century, development prompted by the construction of I-8 has left little evidence of this occupation behind. However, in the culturally rich alluvial nature of the western river valley, the archaeological record has provided evidence demonstrating the importance of this area to the local Kumeyaay community through further research, including testing, data recovery and construction monitoring efforts.

Spanish, Mexican and Early American Periods

Cultural activities within San Diego County between the late 1700s and the present provide a record of Native American, Spanish, Mexican, and American control, occupation, and land use. An abbreviated history of San Diego County is presented for the purpose of providing a background on the presence, chronological significance, and historical relationship of cultural resources within the county. Native American control of the southern California region ended in the political views of western nations with Spanish colonization of the area beginning in 1769. De facto Native American control of the majority of the population of California did not end until several decades later. In southern California, Euroamerican control was firmly established by the end of the Garra uprising in the early 1850s (Phillips 1975).

The Spanish Period (1769-1821) represents a period of Euroamerican exploration and settlement. Dual military and religious contingents established the San Diego Presidio and the San Diego and San Luis Rey

Missions. The Mission system used Native Americans to build a footing for greater European settlement. The Mission system also introduced horses, cattle, other agricultural goods and implements, and provided construction methods and new architectural styles. The cultural and institutional systems established by the Spanish continued beyond the year 1821, when California came under Mexican rule.

The Mexican Period (1821-1848) includes the retention of many Spanish institutions and laws. The Mission system was secularized in 1834, which dispossessed many Native Americans and increased Mexican settlement. After secularization, large tracts of land were granted to individuals and families and the rancho system was established. Cattle ranching dominated other agricultural activities, and the development of the hide and tallow trade with the United States increased during the early part of this period. Grants were also made to towns seeking formal recognition by the Mexican government as established pueblos with a city council. In 1834, permission to establish a municipal government was granted to three pueblos which had grown out of the original military presidios (San Diego, San Francisco and Santa Barbara (Crane 1991). Through a period of brief population decline, in the late 1830s, the pueblo of San Diego lost its town council in favor of a governor appointed sub-prefect named Santiago Arguello. Arguello commissioned that a survey of the San Diego Pueblo lands be undertaken which was made in August of 1845. The details of this survey including boundaries, landmarks, and a map were provided to Governor Pio Pico for his signature in May 1846. The signing of this authorization provided the pueblo of San Diego with approximately 48,000 acres, more than any other city in California. Shortly thereafter, the Mexican Period ended when Mexico ceded California to the United States after the Mexican-American War of 1846-48.

Soon after American control was established (1848-present), gold was discovered in California. The tremendous influx of American and Europeans that resulted quickly drowned out much of the Spanish and Mexican cultural influences and eliminated the last vestiges of de facto Native American control. Few Mexican ranchos remained intact because of land claim disputes, and the homestead system increased American settlement beyond the coastal plain. While the Treaty of Guadalupe was supposed to ensure that the grants awarded during the Spanish and subsequent Mexican rule were to remain intact, the U.S. Government established a three person commission in 1851 to review these grants and determine the validity of the claimant's petition. However, in practice, it was incumbent on the grantee to prove to the commission that they were entitled to the land in question. This resulted in years of appeals often resulting in the forfeiture of the claimant's withholdings. Even the pueblo of San Diego was not spared the process whereby interested parties and squatters petitioned for the greatly desirable 48,000 acre land grant. However, according to the United States jurisdiction over California began on July 7, 1846, two months after Governor Pio Pico signed the authorization granting the pueblo the land. This, coupled with the detail mapping initiated by Arguillo, enabled the pueblo to retain its extraordinarily land grant following a 23 year legal battle. The community of Mission Valley lies within the central portion of the San Diego Pueblo land grant, see Figure 4.

Cultural Resource Definition

Cultural resources are physical features, both natural and constructed, that reflect past human existence and are of historical, archaeological, scientific, educational, cultural, architectural, aesthetic, or traditional significance. These resources may include such physical objects and features as archaeological sites and artifacts, buildings, groups of buildings, structures, districts, street furniture, signs, cultural properties, and landscapes. Cultural resources in the San Diego region span a timeframe of at least the last 10,000 years and include both the prehistoric and historic periods, and can be divided into three categories: archaeological resources (prehistoric and historic), architectural resources, and tribal cultural resources. Archaeological and tribal cultural resources are the main focus of this study and are further described below.

Archaeological Resources (Prehistoric and Historic)

Archaeological resources include prehistoric and historic locations or sites where human actions have resulted in detectable changes to the area. This can include changes in the soil, as well as the presence of physical cultural remains. Archaeological resources can have a surface component, or a subsurface component, or both. Prehistoric resources are those that typically predate AD 1540, European contact, in San Diego County and may include those centered around food production, tool stone acquisition and reduction or even temporary camps. Prehistoric archaeological resources likely to be encountered within the community of Mission Valley include artifact scatters, campsites, ceramic scatters, lithic scatters, village sites, and burials.

Historic archaeological resources are those from the post-European contact period after AD 1540 in San Diego County, and greater than 45 years of age, under City guidelines. These resources may include subsurface features such as wells, cisterns, or privies. Other historic archaeological remains that could be encountered in the community of Mission Valley can include artifact concentrations, building foundations, or remnants of structures.

Tribal Cultural Resources

Tribal cultural resources (TCR) is defined under the recently enacted Assembly Bill 52 (AB52) of the California Environmental Quality Act (CEQA) as a site, feature, place cultural landscape, sacred place, or object that is of cultural value to a Native American tribe and is either on or eligible for listing on the national, State or a local historic register, or which the lead agency, at its discretion, chooses to identify as a Tribal Cultural Resource. Archaeological sites, locations of events, sacred places, and resource areas, including hunting or gathering areas, may be also be considered tribal cultural resources that could be encountered within the community of Mission Valley.

C. Archival Research

This constraints analysis incorporates the findings obtained through archival and other background studies. The archival research consisted of literature and records searches at local archaeological repositories, in addition to an examination of historic maps, aerial photographs, and historic site

inventories. This information was used to identify previously recorded resources within the study area. The methods and results of the archival research are described below.

The records and literature search for the analysis was conducted at the South Coastal Information Center (SCIC) at San Diego State University on July 20, 2015 and updated in December 2018 by qualified City staff. The records search was focused within the community of Mission Valley but incorporates information on sites which are directly adjacent to and/or extend into the plan boundaries. Copies of historic maps were also provided by the SCIC.

Historical research included an examination of a variety of resources. The current listings of the National Register of Historic Places were checked through the National Register of Historic Places website. The California Inventory of Historic Resources (State of California 1976) and the California Historical Landmarks (State of California 1992) were also checked for historic resources. Historic maps consulted included the 1872 County of San Diego (1:100,000 scale), 1769-1885 Historic Roads and Trails (1:100,000 scale), 1903 La Jolla (1:62,500 scale), 1953 La Jolla and 1953 La Mesa (1:24,000 scale) USGS map.

The records search provided by SCIC revealed that 157 studies have been previously conducted within community plan area. Based on the records search results, 57 archaeological and cultural resources have been previously recorded within the CPU area. These include 16 historic archaeological resources; 21 prehistoric archaeological resources; 2 multi-component sites with both prehistoric and historic period artifacts; 10 isolated prehistoric and historic artifacts; and one modern site. In addition, several key areas have been identified that may be of high level of interest to local Native American communities because of proximity to the CPU, such as but not limited to the prehistoric Rancheria of *Kosti/Cosoy*/*Kosaii*/*Kosa'aay,* the Presidio de San Diego, and the ethnohistoric route through the valley known today as the Kumeyaay Highway, and the Mission San Diego de Alcalá which is within the CPU boundary. Several of these are listed on the City's Historical Resources Register or identified as "Landmarks" on the California Register of Historic Resources and the National Register of Historic Places, or have not been formally recognized to date. Despite ethnohistoric and historic information about the prehistoric Rancheria of *Kosti/Cosoy*/*Kosaii*/*Kosa'aay* and presence of the Kumeyaay in the San Diego River Valley and surrounding area, the Sacred Lands File check from the Native American Heritage Commission (NAHC) indicated that no sacred lands have been identified within the vicinity of the community of Mission Valley. Studies conducted within the community of Mission Valley (n=157) are detailed below in Table 1.

Previously Recorded Cultural Resources

The 157 investigations above addressed a total of 57 cultural resources within the community of Mission Valley (Figure 5 – confidential figures; Confidential Appendix B). The 57 cultural resources were comprised of prehistoric sites (n=27), historic resources, including the Mission San Diego de Alcalá (n=27), mixed-component sites with both prehistoric and historic period artifacts (n=2), a modern site (n=1). Previously recorded cultural resources are further described in Tables 2 through 5 below.

Resources Within the Project Area

The cultural resources identified within the study area (the shaded line items summarized above in Table 2) are discussed in greater detail below with the exception of isolated artifacts. Isolated artifacts do not meet the necessary criteria to be considered a significant cultural resource on Local, State and Federal guidelines.

P-37-00004

This resource was originally recorded in 1955 by Martin A. Baumhoff in one of the clover-leaf on-ramps (site dimensions unknown) at the intersection of Friars Road and State Route-163 (SR-163). While the

original site record does not disclose the artifact assemblage, Baumhoff refers to the site as "One of (George) Carter's 'artifact' bearing areas." Carter was an archaeology professor and professional in the mid 1900's who sought to prove the establishment of a prehistoric culture from 80,000 to 100,000 years ago in California. "His work has been discredited by modern archaeologists and his cobble-based stone technology as naturally occurring cobble beach deposits (Moratto 1984, Baumhoff 1955)". Many of these cobble formations were found throughout Mission Valley and have since been developed over. P-37-00004 was revisited in 2001 and 2012 by ASM Affiliates (ASM). In both visits, the area was noted to have been disturbed through mechanical grading and obscured by ice plant ground cover. In both instances, ASM concluded the site was presumably destroyed due to lack of evidence of cultural materials (Cordova *et al* 2012).

P-37-000035

This resource consists of the Mission San Diego de Alcalá (Mission) located at 10818 San Diego Mission Road. The site was initially recorded in 1912 by Nels C. Nelson, although the first site record on file was completed in 1949 by Arnold Pilling. In addition to the historic component of the site, an update to the site record in 1976 by Ken Hedges noted this location as also the prehistoric site of the Kumeyaay village, Nipaguay, citing "a full range of artifacts from aboriginal, Hispanic, and American occupations of the site area encountered" (Hedges 1976). Hedges further notes the "reconstruction of the Mission and modern features including associated church buildings, roads and commercial developments have occurred on the site area." Subsequent updates to the site record over the years include multiple testing efforts at various locations within the Mission's compound. The Mission has been listed on both the California Register of Historic Resources (California Register) and the National Register of Historic Places (National Register) as well as being recognized as both a California Historic Landmark and a National Historic Landmark.

P-37-000041

This resource was originally recorded by Nels C. Nelson as a large village site (123 m N/S by 159 m E/W) according to firsthand accounts in the early 1900's (no date provided). Nelson notes that no evidence was observed to substantiate long term occupancy. The site is located at the intersection of Interstate-8 (I-8) and Interstate-5 (I-5). The site record states that "since the initial documentation, the site location has been tested…". However the testing did not produce evidence of the site and no cultural resources were observed during a site visit in 2011 by Garcia and Associates as well (GANDA) (Greenlee and Letter, 2011). The location of the site is recorded within the currently developed I-8/I-5 intersection right-of-way (ROW) that includes on-ramps and landscaping, as well as adjacent paved parking lots.

P-37-000202

The site record for P-37-000202 fails to document any information regarding the resource. There is nothing regarding the size, nature, composition or even the year recorded and author. The only information present on the record indicates the resource is adjacent to P-37-000035.

P-37-000239

This site (dimensions unknown) was originally recorded in 1951 by E. Hall as a prehistoric artifact scatter including obsidian and chert flakes, shell and pottery. The site is recorded on a hillside northwest of P-37-000035 and Hall noted that modern area development likely covers a portion of the site. While no

update is on file for this site, the site's recorded location has since been developed with condominiums.

P-37-004675
This resource was originally recorded in 1976 by Dr. James Moriarty and consisted of prehistoric lithic tools. The site (dimensions unknown) was recorded along Hotel Circle west of the Stardust Country Club and north of I-8; however, the site location data is incomplete. Based on the maps, the site appears to have been located where the current Riverwalk Golf Club (formerly the Stardust Golf Course) is located or where the adjacent developed parking lots and commercial buildings are located. No site record update is on file at the SCIC to confirm the site's specific location.

P-37-011055
The earliest site record for P-37-011055 on file at the SCIC was completed by Herbert Minshall in 1977; however, Minshall noted that the location had been previously excavated in 1973 by "Carter, Moriarty and Minshall" (Minshall 1977). The site is recorded as a prehistoric temporary camp (38m N/S x 12m E/W) that included thermal features, ash lenses, and lithic artifacts along an alluvial fan as it slopes downhill and north into Mission Valley. An update in 1982 by George Carter reported the site in similar condition, but notes "adjacent areas being destroyed by commercial development". The northern half of this site falls within the current study area and much of it has been commercially developed. Approximately, half of the site remains undeveloped; however, there is not a recent update on file with the SCIC to ascertain the current conditions of the site.

P-37-011056
This resource was originally recorded by Affinis (no date provided) as a prehistoric artifact scatter (site dimensions unknown). While the site record yields little information, the site is recorded as a "river terrace camp of probable permanence" but notes that local collectors had removed most of the surface resources (Affinis, n.d.). A low-density shell midden and obsidian projectile point were also recorded. This resource is recorded along the northern side of the San Diego River in an area which has since been completely developed with condominiums. Historic aerials show a trailer park in the region dating back to 1964. The trailer park was removed in 1981 and by 1989 the area was largely developed with paved access roads and condominiums (historicaerials.com 2015).

P-37-011766
This resource was originally recorded in 1990 by ERC Environmental as an artifact and shell scatter (30 m N/S by 20 m E/W). The site was recorded within the current boundary of the Riverwalk Golf Club, just south of the northern fence line. During a site visit in 1992 by Danielle Huey and Ed Baker, the site was subsequently reduced since only the shell scatter was observed. This site has not been tested nor has a more recent survey been conducted to update the record with the site's current condition.

P-37-011767
This site was originally recorded in 1990 by ERC Environmental as a shell scatter (100 m N/S by 70 m E/W). An update in 1992 by Gallegos & Associates observed the shell scatter in conjunction with an artifact scatter. The site is located within the Riverwalk Golf Club. According to a 2012 site record update by ASM, portions of the site were capped during the construction of an adjacent housing project. The 2012 ASM investigation only documented the northern portion of the site, the current condition of the

southern portion remains unknown.

P-37-012126
This resource was originally recorded in 1992 by Gallegos & Associates as a small shell scatter (37 m N/S by 26 m E/W) located within the Riverwalk Golf Club, just south of Friars Road. Updates to the site record conducted in 1996 by RECON identified prehistoric habitation debris in addition to the shell scatter. The testing program conducted by RECON, identified artifacts just below the golf course sod in three concentrations. Carbon-14 dating was conducted on a shell sample resulting in the age of 1530+/-60 BP. Additionally, groundstone and lithic artifacts were collected. Archival information provided by the SCIC regarding the results of this site's testing for eligibility on the National Register and California Register was not included.

P-37-012127
This resource was originally recorded in 1992 by Huey and Baker of Gallegos & Associates as a small shell scatter (15 m N/S by 45 m E/W) within the boundary of the Riverwalk Golf Club. Huey and Baker noted the site's surface was obscured by the golf course's turf. There is no update on file to confirm the site's current condition.

P-37-012128
This resource was recorded in 1992 by Huey and Baker of Gallegos & Associates as prehistoric shell midden (15 m N/S by 30 m E/W) within the boundary of the Riverwalk Golf Club. Huey and Baker noted the site's surface is obscured by the golf course's turf. There is no modern update on file to confirm the site's current condition.

P-37-012129
This resource was recorded in 1992 by Huey and Baker of Gallegos & Associates as a prehistoric shell scatter (15 m by 15 m) within the boundary of the Riverwalk Golf Club. Huey and Baker noted the site's surface was obscured by the golf course's turf. There is no modern update on file to confirm the site's current condition.

P-37-012132
This resource was recorded in 1992 by Huey and Baker of Gallegos & Associates as a prehistoric shell scatter (75 m by 75 m) within the boundary of the Riverwalk Golf Club. Huey and Baker noted the site's surface was obscured by the golf course's turf. There is no modern update on file to confirm the site's current condition.

P-37-012220
This site was originally recorded in 1991 by Andrew Pigniolo as a prehistoric temporary habitation site (20 m N/S by 20 m E/W) within the boundary of the Riverwalk Golf Club. A site revisit conducted in 1992 by Huey and Baker of Gallegos & Associates observed a shell scatter solely. There is no current update on file for this resource to confirm the site's present condition.

P-37-012862
Originally recorded in 1973 by Stanley Berryman as a possible prehistoric campsite with an artifact

scatter, this site (15 m N/S by 30 m E/W) was recorded along the northern half of the Riverwalk Golf Club and extending to the north side of Friar's Road. The site record also noted a letter from Ken Hedges, dated 1976, that stated that testing at the site found no evidence of a prehistoric occupation, but rather modern refuse deposits. According to the site record, this site was tested again in 1991 by Andy Pigniolo and found to not be significant under CEQA criteria. During a subsequent site visit in 1992 by Huey and Baker, prehistoric lithics were once again observed.

P-37-014380

This site was recorded in 1996 by Jerry Schaefer of ASM as a village site (50 m by 60 m) located in the western portion of the Mission Valley river valley (Schaefer 1996). Artifacts observed included lithics, groundstone, thermal features, and midden soils. The site, referred to as the Heron Site, was discovered during archaeological monitoring the removal of alluvial sediments for the Biological Wetlands Mitigation Area of the Mission Valley West Light Rail Transit Project. An initial test indicated the site was significant and potentially eligible for the NRHP, and data recovery was implemented. Excavations revealed a temporary camp on a sand bar of the San Diego River, adjacent to a marshy wetlands and riparian environment. The site was found to consist of two components – a lower, well-preserved occupation area and an upper, less discrete horizon – separated by sandy alluvium. (Schaefer *et al* 1997)

Discrepancies were found between radiocarbon dates derived from shell and charcoal, but the artifact assemblage is typical of the Late Prehistoric period. Schaefer identified this to be located at and ancestral to the ethnohistorically known village of *Cosoy* (additional spellings include: *Kotsi/ Kosaii*/*Kosa'aay*), the first settlement encountered and described by Spaniards when they founded the San Diego presidio and mission in 1769. The Heron Site has revealed important information about the nature and dynamics of settlement and subsistence systems in the lower San Diego River Valley.

P-37-024558

This resource was originally recorded in 1996 by RECON as a prehistoric burial with associated funerary items (4 m in length by 2 m in width). Observed during construction monitoring, the resource appeared undisturbed but was partially destroyed during trenching. Shell observed with the burial was collected and a C-14 analysis conducted. The C-14 testing resulted in 1390+/-60 B.P. dates. The burial was observed at a depth of approximately 12 ft below the current golf course surface. The site record noted the original location of the burial was mismapped and provided new locational data (Gilmer 1996). However, the new locational data was not provided in industry standard format and was not supported in the documentation but left as a series of coordinate numbers with no defining coordinate system. SCIC attempted to provide the data in standard format, but given the resource locational data possesses very general whole numbers, it would appear that locational accuracy has been compromised resulting in the burial location being approximated.

In 2002 Nina Harris recorded a shell scatter at this location (7 m N/S by 10 m E/W) yet cited the shell may be natural deposits from periodic river flooding. A 2007 update to the site record recommended the burial become its own site and not be affiliated with the shell scatter recorded by Harris. However, at the present time, both resources have the same designation but are mapped as different locations and not affiliated.

P-37-024559
This resource was recorded in 2002 by Nina Harris as a shell scatter (22 m N/S by 4 m E/W) in the San Diego River west of the Presidio ball fields. No other cultural artifacts were observed during the survey effort and Harris documented the site as being the product of natural deposits from flooding. There is no modern update on file to ascertain the site's current condition.

P-37-024560
This resource was recorded in 2002 by Nina Harris as a shell scatter (site dimensions unknown) in the San Diego River east of the Presidio ball fields. No other cultural artifacts were observed during the survey effort. There is no recent update on file to ascertain the site's current condition.

P-37-026842
This resource was recorded in 2004 by Fred Beecher as redeposited historic refuse deposit. Beecher cites the "isolated artifacts are a result of multiple episodes of fill soil importation. None of the artifacts collected derived from a primary context" (Beecher 2004).

P-37-029700
This resource was recorded in 2008 by Jose Aguilar as a low-density shell scatter with midden soils and fire-affected rock (82 m N/S by 33 m E/W). The site was located south of I-8 in Hotel Circle and according to Aguilar, it may extend underneath the interstate and frontage roads as midden soils are visible in locations free of asphalt or ground cover. Testing of the site resulted in fire-affect rock being identified at a depth of 1.8m. Aguilar notes the site's integrity as being fair in spite of the extensively developed area. Archival information provided by the SCIC regarding the results of this site's testing for eligibility on the National Register and California Register was not included.

P-37-029807
This resource was originally recorded in 2008 by Mary Robbins-Wade and Stephen Van Wormer of Affinis as a historic bridge. The bridge is comprised of steel-reinforced concrete approximately 1000 ft long. The bridge was constructed in 1946 on SR-163 traversing the San Diego River. The bridge has been evaluated and recommended not eligible for listing in the National Register or California Register due to questions of integrity following alterations to the bridge.

P-37-030935
This site was recorded in 2008 by Elizabeth Davidson of Laguna Mountain Environmental as a historic refuse deposit with a possible historic "foundation" feature (2 ft N/S by 1.5 ft E/W) during construction monitoring in Hotel Circle. The historic refuse was comprised of whole and broken domestic bottles which were collected. Redwood boards were encountered beneath a layer of fill, above native soils. The boards were not collected.

P-37-030936
This site was recorded in 2008 by Elizabeth Davidson of Laguna Mountain Environmental as a historic refuse deposit (3 ft by 2 ft) identified during construction monitoring in Hotel Circle. Artifacts were collected and consisted of liquor bottles and a kettle. Makers' marks dated the bottles to the 1920's and 1930's.

P-37-030937
This site was recorded in 2008 by Elizabeth Davidson of Laguna Mountain Environmental as a historic refuse deposit (20 ft N/S by 20 ft E/W) and well (4.8 ft in diameter by 8.7 ft long) during construction monitoring in Hotel Circle. Artifacts were collected and consisted of a vase, tile, bicycle seat, and glass shards, ceramic sherds, and metal fragments. Makers' marks dated the artifacts to the 1940's.

P-37-030938
This site was recorded in 2008 by Laguna Mountain Environmental as a historic refuse deposit (5 ft N/S by 1.5 ft E/W) during construction monitoring in Hotel Circle. Artifacts were collected and consisted of a medicine bottle, ceramic fragments, and metal fragments. The bottle's makers' mark dated to the 1880's.

P-37-030939
This site was recorded in 2008 by Laguna Mountain Environmental as a historic refuse deposit (9 ft N/S by 3 ft E/W) during construction monitoring in Hotel Circle. Artifacts were collected and consisted of glass, ceramic and metal fragments, a necklace, a cat statue, and miscellaneous metal items. Makers' marks dated the artifacts to the 1940's and 1950's.

P-37-030940
This site was recorded in 2008 by Laguna Mountain Environmental as a historic refuse deposit (4 ft N/S by 2 ft E/W) during construction monitoring in Hotel Circle. Artifacts were collected and consisted of kitchenware, shell and metal fragments. Charcoal, melted glass and partially burnt wood pieces would suggest that this refuse deposit was burned prior to being discarded. Makers' marks dated the artifacts from the 1920's to the 1950's.

P-37-030941
This site was recorded in 2008 by Laguna Mountain Environmental as a historic refuse deposit (2 ft N/S by 1.5 ft E/W) during construction monitoring in Hotel Circle. Artifacts were collected and consisted of glass bottles and fragments, kerosene lamp fragments, and ceramic fragments. Makers' marks dated the artifacts to the 1910's and 1960's.

P-37-030942
This site was recorded in 2008 by Laguna Mountain Environmental as historic retaining wall fragments (7 ft long by 1 ft wide) during construction monitoring in Hotel Circle. The wall fragments were collected and constructed of cement and cobbles with two iron pipes exiting at an exposed end.

P-37-030943
This site was recorded in 2008 by Laguna Mountain Environmental as a historic refuse deposit (2 ft N/S by 1 ft E/W) during construction monitoring in Hotel Circle. Artifacts were collected and consisted of kitchenware, light bulb remnants, saw-cut animal bone, and brick. Makers' marks dated the artifacts to the 1910's and 1960's.

P-37-030944
This site was recorded in 2008 by Laguna Mountain Environmental as a "modern, soon to be historic"

refuse deposit (dimensions unknown) during construction monitoring in Hotel Circle. Artifacts observed, but not collected, included beer cans, pebble flooring, glass and metal fragments. There is no detail on the site form to indicate the date upon which the site will become a historic site. At present, this site does not meet the requirement s as listed in CEQA as a historic-era resource.

P-37-030945
This site was recorded in 2008 by Laguna Mountain Environmental as a historic refuse deposit (20 ft N/S by 5 ft E/W) during construction monitoring in Hotel Circle. Artifacts were collected and consisted of consumer items, garments and kitchenware. Makers' marks dated the artifacts to the 1920's and 1950's.

P-37-031962
This resource was recorded in 2011 by Jennifer Kraft of Brian Smith & Associates as a multi-component site (500 m long by 20 m wide) during construction monitoring along City of San Diego sewer pipelines. Resources observed at five locations along the 500 m corridor include a prehistoric and historic scatter, a brick feature (possible cistern), and three historic refuse deposits. All resources were observed within existing manhole boundaries. Kraft cites the brick cistern to have been constructed in 1875 as part of the private San Diego Water Company's assets and retrofitted in 1886. While the cistern was buried under approximately 10 ft of fill, the artifact scatters were collected during the monitoring effort.

P-37-034320
This resource was recorded in 2011 by Garcia & Associates as a historic-era bridge, Caltrans Bridge #57C0239. The bridge measures 938 feet in length and 65 feet in width and is a steel stringer multi-bean girder bridge. The bridge was originally built in 1933 and widened in 1952. Caltrans previously evaluated the bridge and determined it to be ineligible for listing on the NRHP.

P-37-034472
This resource was recorded in 2014 by ASM Affiliates as a prehistoric lithic scatter. The site measures 55 meters (E/W) by 15 meters (N/S). Subsurface testing was conducted and found the site to be predominately a light surface scatter with no subsurface component.

P-37-035171
This resource was recorded in 2013 by Crawford Historic Services as a historic-era sports arena/stadium. The stadium is a multi-level, oval shaped, asymmetrical, Modern style, open-air sports arena built in approximately 1967. Formerly known as Jack Murphy Stadium and Qualcomm Stadium, the stadium is currently named SDCCU Stadium. Major renovations to the structure occurred in 1997. The site was evaluated and found to not be eligible for listing on the NRHP.

P-37-035941
This resource was recorded in 2015 by Crawford Historic Services as a historic-era multi-story commercial building. This structure is the Macy's Department Store located at Fashion Valley Mall. The building has a glazed tile exterior, flat roof, and reinforced concrete foundation. The building was constructed, as part of the greater mall, in 1969 and was originally The Broadway department store. Macy's Federated Department Stores bought out the former and occupied the building in 1996. Due to multiple alterations, the building does not meet the necessary criteria to be considered eligible for

listing on the NRHP.

P-37-037007
This resource was recorded in 2015 by Crawford Historic Services as a historic-era multi-story commercial building. This structure is the Macy's Department Store located at Mission Valley Shopping Center. The structure is a three-story, asymmetrical, irregular shaped, Modern Contemporary style department store. The building was built during the post-World War II commercial development of the 1950's. Due to alterations, the building does not meet the necessary criteria to be considered eligible for listing on the NRHP.

P-37-037009
This resource was recorded in 2016 by AECOM as a historic-era hotel/motel complex known as the Town and Country property. The complex consists of various buildings supporting hotel rooms, a lobby, offices, restaurants, a gift shop, a spa, laundry, landscaping, engineering, and maintenance facilities, conference meeting rooms, and shipment receiving rooms. The initial buildings were constructed between 1953-1955 with additions constructed between 1956-1962, 1969-1975, 1979, and 2006-2007. The multitude of buildings display an array of architectural styles including Tiki-Polynesian, Futuristic, Brutalism, Ranch, and Contemporary. The evaluation of Town and Country determined that portions of the property meet the necessary criteria to be considered eligible for listing on the CRHP and Historic Resources Board. At the time of this document, the resource is currently undergoing considerable renovations, including the demolition of some of the buildings within the complex.

P-37-037631
This resource was recorded in 2018 by Laguna Mountain Environmental as a prehistoric temporary campsite consisting of hearths, shell midden, lithic scatters, charcoal and fire-affected rock. The site measures 81 meters by 71 meters. A testing and evaluation program was conducted and observed a considerable subsurface component. Artifacts observed during the testing were collected. The site record notes that much of the site has been graded and that much of the site's deposits have been removed. The site's integrity has been degraded to poor on account of disturbances.

P-37-037632
This resource was recorded in 2018 by Laguna Mountain Environmental as a historic-era refuse deposit consisting of glass bottles and shards, including sun-colored amethyst, ceramic dish fragments, kitchen items, building materials, and consumer containers. The site measures 264 feet (E/W) by 153 feet (N/S). As the deposit consists primarily of milk bottles and dish fragments, it is posited the site was a dumping location of a hotel or restaurant. The items date between 1877-1926. Much of the site was collected during construction monitoring. The site's integrity has been degraded to poor on account of disturbances.

P-37-037633
The resource was recorded in 2018 by Laguna Mountain Environmental as a historic-era refuse deposit measuring 5'4 (N/S) by 5 feet (E/W). This deposit was observed during construction monitoring and was collected. The deposit consists of glass bottles and fragments, metal fragments, kitchen items, and a pair of leather shoes. Portions of the site appear to have been graded previously during the construction of a

motel in 1956. The items appear to have been discarded in the mid-1920s. The site's integrity has been degraded to poor on account of disturbances.

P-37-037634
This resource was recorded in 2018 by Laguna Mountain Environmental as a historic-era refuse deposit measuring 7'4 (N/S) by 6'2 (E/W). The site's assemblage consists largely of fragmented glass milk bottles followed with kitchenware, houseware, metal fragments, and a mass of slag. The makers marks on the bottles denote manufacturing between 1925-1927. It appears the top portion of this refuse dump was graded during the construction of a motel at this location in 1956. The site form notes The Holsom Dairy operated on a ranch located in this vicinity between the 1920s to 1943 (Pigniolo 2018). Much of the site was collected during construction monitoring. The site's integrity has been degraded to poor on account of disturbances.

P-37-037635
This resource was recorded in 2018 by Laguna Mountain Environmental as a historic-era well and refuse deposit measuring 6'8 (N/S) by 6'6 (E/W). The cobble-walled well measures 6'8 in diameter. The well was initially filled with debris and soil, however as three feet of soil was removed, the refuse was located. The refuse largely consists of glass milk bottles dating to the late 1920s and seemingly the deposit of a dairy that once occupied this space in the 1920s. In addition to the glass bottles, a concrete box, a wooden-lined wall, fragments of window glass, ceramic dishes, metal fragments, and other miscellaneous items were observed. The top portion of this resource was graded during the construction of a motel at this location in 1956. The items were collected during the construction monitoring and the site's integrity has been degraded to poor on account of disturbances.

Historical Addresses

P-37-016279
This resource consists of the Cabrillo Freeway, SR-163, as it heads north through Mission Valley. Only a portion of this resource is within the current study area. Originally recorded in 1996 by Frank Lortie of Caltrans, the freeway and associated elements including: landscaping, roadway, Cabrillo Bridge, and on/off-ramps make up the Cabrillo Freeway Historic District. Lortie nominated the district to the National Register and California Register in 1996. The site record does not state if the district was accepted. In reviewing the National Register and California Register, the district does not appear to be listed on either.

I-8 Mission Valley Freeway also falls under this Cabrillo Freeway Historic District where the bridge connects the two highways.

10818 San Diego Mission Road
This address is that of the aforementioned Mission San Diego de Alcalá. See above P-37-000035 for information regarding this historical address/resource.

Table 6 below outlines the cultural resources' evaluation status.

Table 6. Status of Cultural Resources within the Community of Mission Valley

Resource	Description	Recorder; Date	Current Status of Resource	Evaluated?	*Integrity Level	**NRHP /CRHP Eligibility
P-37-000004	Historic: "Old Mission Site"	Baumhoff; 1955	Site could not be relocated during 2001 and 2012 revisit	No	P	N

D. Native American Contact Program

In addition to the literature search, a Sacred Lands File Check was requested of the Native American Heritage Commission (NAHC) in August 2015 for potential sacred sites within the community of Mission Valley. A response was received from the NAHC, dated January 25, 2016, citing that the search for sacred lands resulted in a negative finding. The NAHC forwarded a list of local Native American contacts with potential interest and/or additional information regarding cultural resources in the vicinity of Mission Valley. Letters were mailed on January 26, 2016 to all tribal entities, and emails were sent to tribal entities with email addresses on January 28, 2016. Two responses were received and are detailed below. All correspondence between Tierra, the NAHC, and local Tribes is documented in Appendix C.

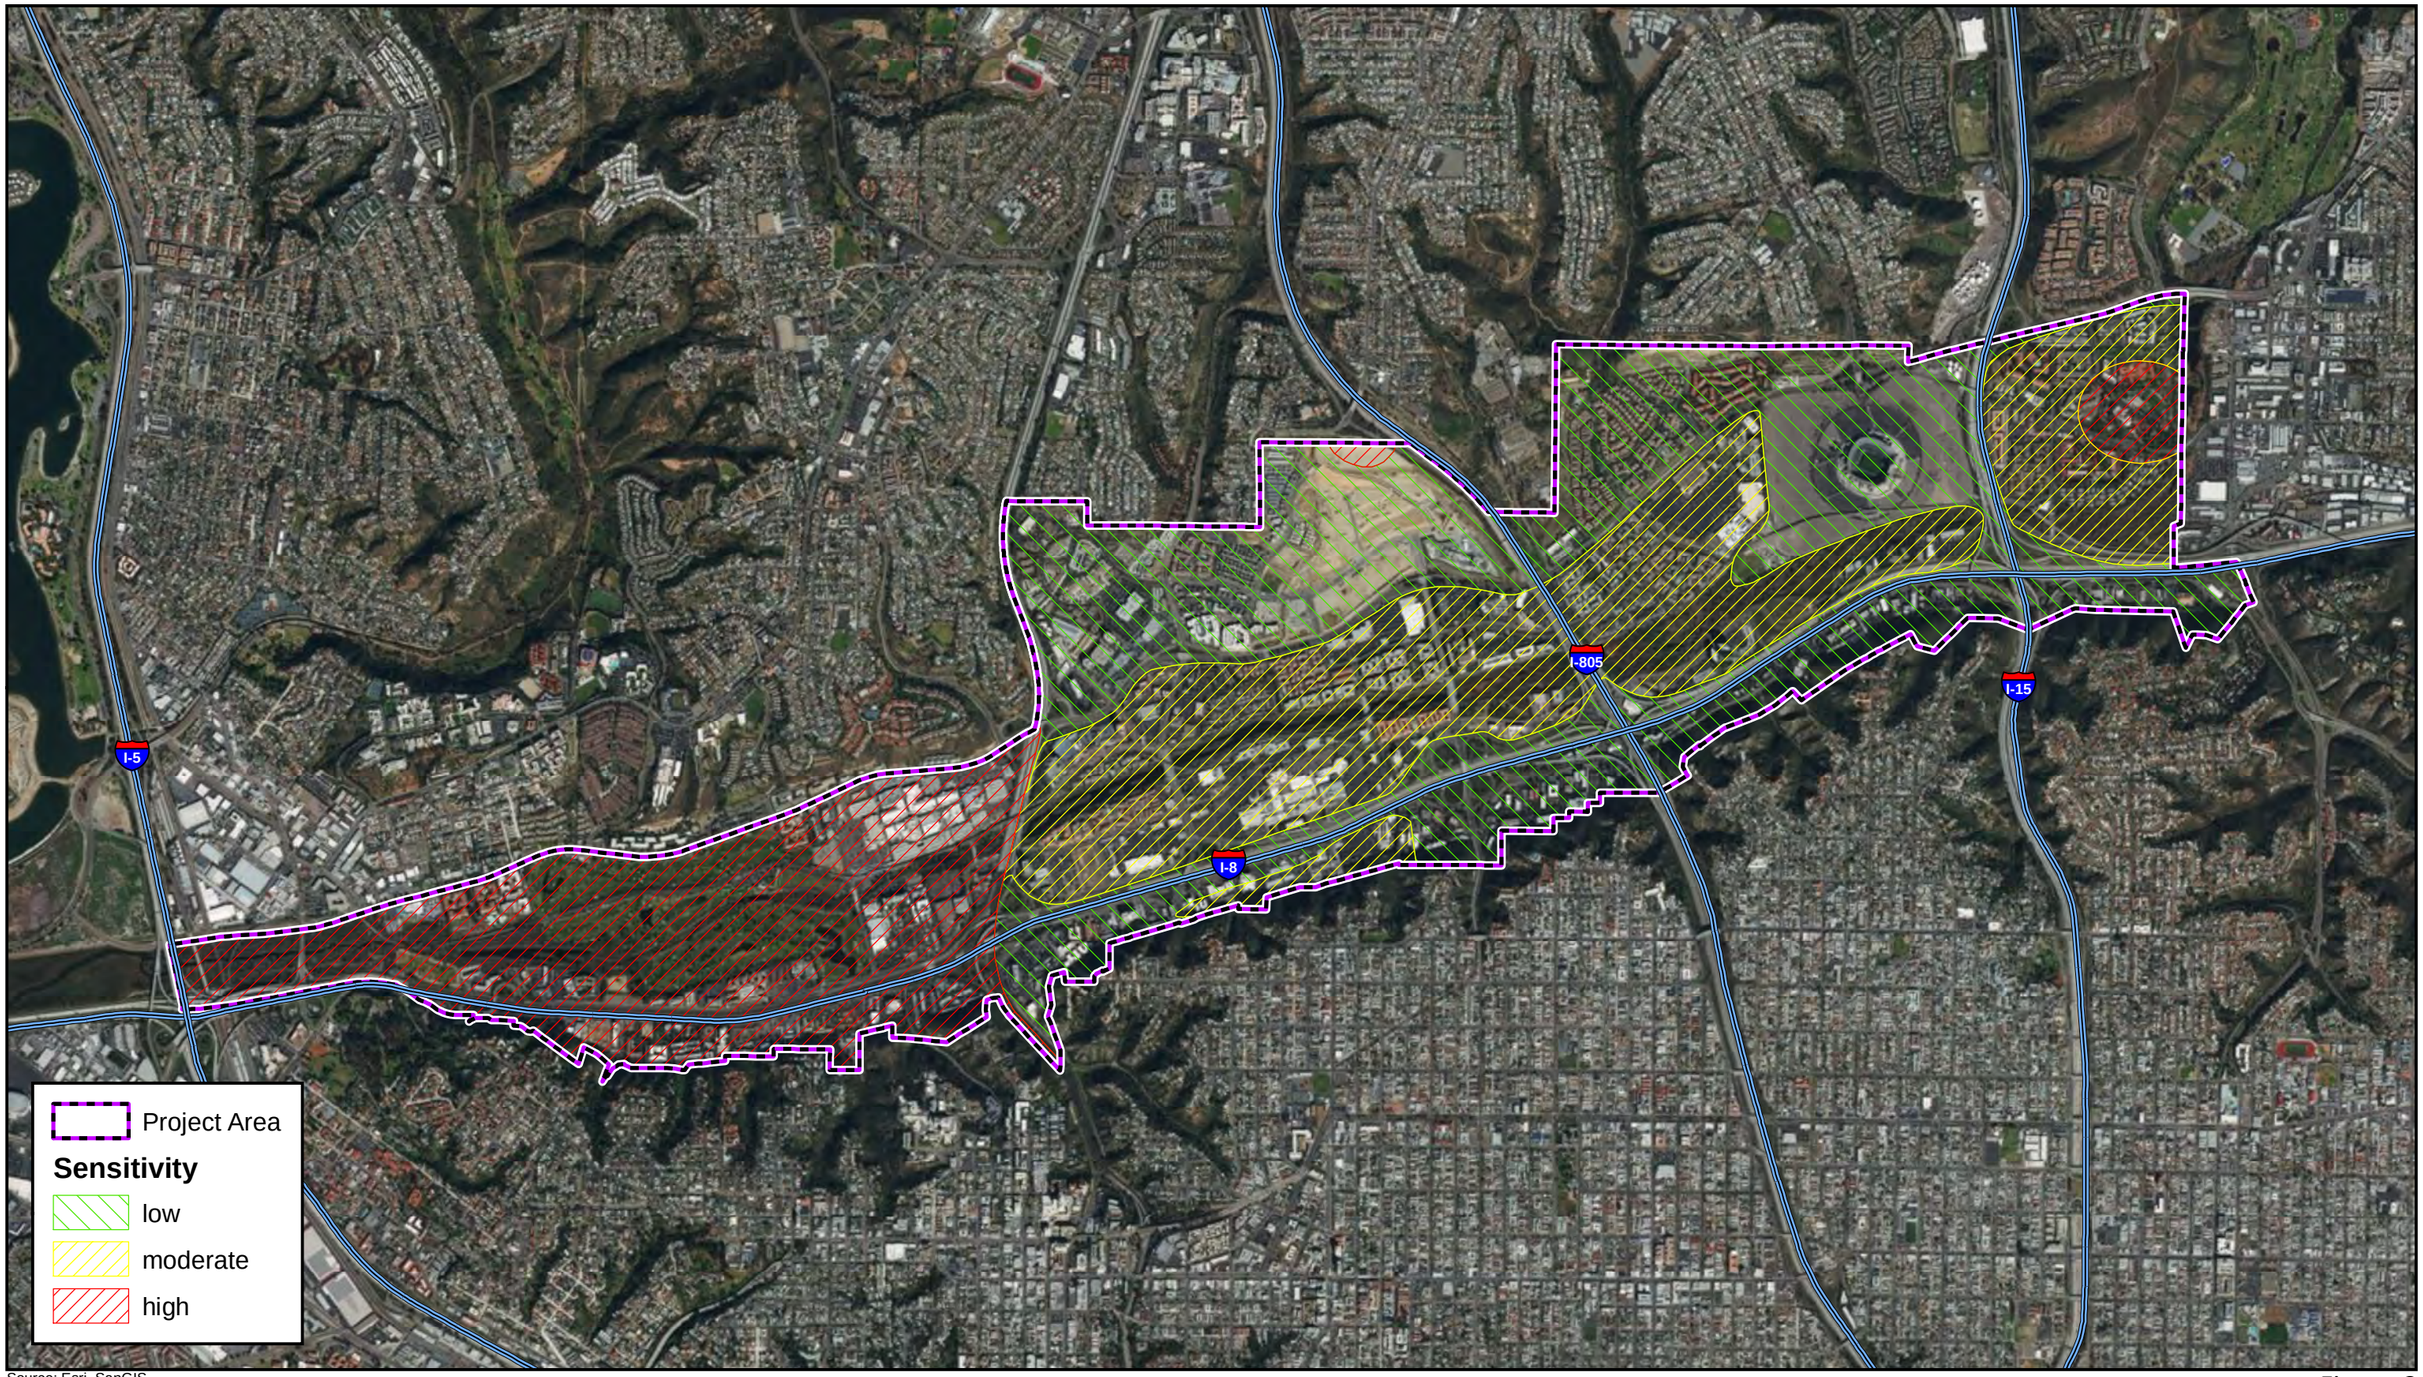
An email response was received by Mr. Clint Linton, Director of Cultural Resources for the Iipay Nation of Santa Ysabel, on February 2, 2016. Mr. Linton addressed a few areas of concern, stating his extensive experience working in the San Diego River Valley on previous projects and is very familiar with the location of the village of *Kosti/Cosoy/Kosaii/Kosa'aay* (P-37-014380). Mr. Linton offered to "share which areas are of most concern as needed" and provided information regarding the discovery of human remains during project-related monitoring in the community plan area. Mr. Linton also stressed the need for a large buffer zone around the Mission San Diego de Alcalá. Lastly, Mr. Linton included "that all projects within the boundary of this analysis should be subject to Kumeyaay [Native American Monitor]

involvement, giving the [Native American Monitors] a chance to review individual projects and request their involvement as appropriate" (Linton 2016). Ms. Murphy replied via email on February 3, 2016 that his concern has been included in this document.

An email response was received from the Viejas Band of Kumeyaay Indians on February 2, 2016. The letter requested that they receive a copy of the "Cultural Resource report … in order to make an informed decision/recommendation on the matter". Ms. Murphy replied via email on February 3, 2016 that their concern would be included in this document.

Consultation with local Native American tribes, in accordance with Senate Bill 18 (SB 18) and Assembly Bill 52 (AB 52) for this Community Plan Update has been conducted by the City of San Diego and is on-going. Information previously provided by culturally affiliated tribes in San Diego County has been incorporated into this report, the Mitigation Framework, and the Community Plan policies addressing Tribal Cultural Resources.

III. CULTURAL SENSITIVITY ANALYSIS



The cultural sensitivity analysis of the Mission Valley community is comprised of areas determined to represent low, moderate and high sensitivities. These areas were determined by examining the archival data, including the records search from the SCIC, the sacred lands file from the NAHC, and correspondence with the local Native American community, as well as regional environmental factors. Sensitivity ratings may be adjusted based on the amount of disturbance that has occurred which may have previously impacted archaeological resources.

A low sensitivity rating indicates that minimal or no previously recorded cultural resources were identified in these areas by the archival analysis. Potential resources in these areas are unlikely to be substantial in artifact assemblage frequency and/or content based off of the archival data and environmental factors. Additionally, in some cases these resources were collected prior to commercial disturbance (ie: P-37-014959). As a result, probability is low for the identification of resources in these areas. Low sensitivity areas are depicted with a forward-slash green fill in Figure 6.

A moderate sensitivity rating indicates areas where archival data illustrates multiple previously recorded resources. The resources may be more complex or have more substantive elements and frequencies as supported by the information provided by the SCIC. The probability for the identification of resources in these areas is moderate. Moderate sensitivity areas are depicted with a back-slash yellow fill in Figure 6. It should be noted that a few prehistoric and historic sites have been recorded in areas depicted in yellow. However, the areas where these sites were recorded has been subsequently impacted reducing their potential from highly sensitive to moderate sensitivity due to integrity concerns (ie: P-37-004675).

Areas identified as having high cultural sensitivity would indicate that the record search identified several previously recorded sites within the study area. The resources in these areas are generally complex in nature with unique and/or abundant artifact assemblages. In some cases, the resources in this category may have been determined to be significant under local, State or Federal guidelines. The potential for the identification of resources in areas of high sensitivity is likely. Areas of high sensitivity are represented with a forward-slash red fill in Figure 6. The high sensitivity on the western end is particularly due to archaeological evidence of extensive prehistoric use of this area, which is also supported by physical attributes associated with the ethnohistoric village of *Kosti/Cosoy/Kosaii/Kosa'aay (P-37-014380)*. The far eastern end is considered sensitive due to the physical and well-documented evidence associated with the ethnohistoric and historic occupation of the San Diego Mission de Alcalá (P-37-000035).

While much of the community of Mission Valley has been developed, it consists of a heavily active, depositional river valley utilized over thousands of years and the potential for intact cultural deposits at depth is probable at many locations. As is illustrated by the high density of cultural resources (Tables 2 through 5 in Section II), the area represents a prehistorically and historically active environment. Considering these factors in conjunction with Native American correspondence, much of the community of Mission Valley has been determined to be of either moderate or high cultural sensitivity.

Community Plan Update - Mission Valley

Figure 6
Mission Valley
Cultural Sensitivity Areas - Cultural Resources

IV. RECOMMENDATIONS

This constraints analysis was undertaken in association with the update of the Mission Valley Community Plan for the City of San Diego. To achieve this analysis, archival data, geographical and environmental aspects, and correspondence with the local Native American tribes were reviewed.

While the community of Mission Valley has been extensively developed during the modern era, records also show the vicinity to have been a highly utilized area over time. Due to continued use and development, there is no doubt that numerous prehistoric and historical resources in the community of Mission Valley have been disturbed over the years. However, as indicated in previous sections, any remaining undisturbed soils up to several feet deep anywhere along the San Diego River Valley have the potential to contain sensitive cultural resources, as is the case with P-37-024558, a prehistoric burial identified at a depth of 12 feet observed during modern trenching activities. This highlights the potential for significant cultural resources within this depositional environment. Considering this type of environment coupled with the known sites in the region, the village of *Kosti/Cosoy/Kosaii/Kosa'aay* (P-37-014380) and P-37-024558 in particular, the community of Mission Valley maintains moderate and high sensitivity levels and therefore it is recommended that a qualified archaeologist and Native American monitor be present for all ground disturbing activities, especially within areas depicted with the yellow or red slash fills on Figure 6.

Additionally, the following recommendations are made to better integrate and interpret the prehistoric and historic archaeological resources within the community of Mission Valley:

- Recognize the Native American habitation and land use of the community of Mission Valley and its surrounding vicinity. Their ties to their ancestral lands should be honored.
- Recognize the role of Native American and Spanish, Mexican, and early American settlers in the formation of the presidio, the Pueblo of San Diego, the Mission San Diego de Alcalá, Old Town and Mission Valley.
- Ensure that members of local Native American tribes and interested individuals are incorporated into the planning process in a meaningful way.
- Acknowledge the place names and places important to Native Americans and Spanish, Mexican, and early American settlers who inhabited the community of Mission Valley. This could be accomplished through signage and/or narratives in brochures and handouts.
- Expand the perception that the community of Mission Valley was a place where local Kumeyaay people consider important to their cultural history.

Future discretionary projects within the community of Mission Valley should be evaluated by a qualified archaeologist following the Mitigation Framework detailed below to determine the potential for the presence or absence of buried archaeological resources. Because the majority of the community of Mission Valley is developed, many prehistoric and archaeological resources are buried. Buried deposits offer a unique opportunity to broaden our understanding of the lives, culture, and lifeways of the diverse occupation of the community through time. As such, the following recommendations area made to ensure that buried resources are identified and documented:

- Conduct extensive, non-intrusive investigations to better located potential undocumented burials that may exist within the community
- Require archaeological and Native American monitoring during all construction related ground-disturbing activities within the community of Old Town. Such projects include, but are not limited to, installation of water, sewer, or utility lines; building demolition projects; new construction projects; and road paving or repairs that require subsurface disturbance.

If it is determined that a resource is historically significant, it should be referred to the City's Historical Resources Board for possible designation. Mitigation measures should be initiated for all significant sites, either through avoidance or data recovery.

All phases of future investigations, including survey, testing, data recovery, and monitoring efforts, would require the participation of local Native American tribes. Early consultation is an effective way to avoid unanticipated discoveries and local tribes may have knowledge of religious and cultural significance of resources in the area. In addition, Native American participation would help ensure that cultural resources within the community of Mission Valley are protected and properly cared for. A current list of local tribes can be obtained through the NAHC for all future projects.

Mitigation Framework

The following Mitigation Framework has been adapted from the Historical Resources Guidelines located in the City's Land Development Manual (City of San Diego 2001).

Archaeological and Tribal Cultural Resources

Prior to issuance of any development permit for a subsequent project tiering from the Community Plan Update (CPU) that could directly affect an archaeological or tribal cultural resource; the City shall require the following steps be taken to determine: (1) the presence of archaeological or tribal cultural resources and (2) the appropriate mitigation for any significant resources which may be impacted by a development activity. Sites may include, but are not limited to, privies, trash pits, building foundations, and industrial features representing the contributions of people from diverse socioeconomic and ethnic backgrounds. Resources may also include resources associated with prehistoric Native American activities.

Initial Determination

The environmental analyst shall determine the likelihood for the project site to contain historical resources by reviewing site photographs and existing historic information (e.g., Archaeological Sensitivity Maps, the Archaeological Map Book, and the California Historical Resources Inventory System and the City's "Historical Inventory of Important Architects, Structures, and People in San Diego") and may conduct a site visit. A cultural resources sensitivity map was created from the record search data as a management tool to aid in the review of future projects within the CPU area which depicts three levels of sensitivity (Figure 6). Review of this map should be done at the initial planning stage of a specific project to ensure that cultural resources are avoided and/or impacts are minimized in accordance with

the Historical Resources Guidelines. These levels, which are described below, are not part of any federal or state law.

- **High Sensitivity:** These areas contain known significant cultural resources and have a potential to yield information to address a number of research questions. These areas may have buried deposits, good stratigraphic integrity, and preserved surface and subsurface features. If a project were to impact these areas, a survey and testing program is required to further define resource boundaries subsurface pressure or absence and determine level of significance. Mitigation measures such as an Archaeological Data Recovery Plan (ADRP) and construction monitoring shall also be required.
- **Moderate Sensitivity:** These areas contain recorded cultural resources or have a potential for resources to be encountered. The significance of the cultural resources within these areas is not known. If a project impacts these areas, a survey and significance evaluation is required if cultural resources were identified during the survey. Mitigation measures may also be required.
- **Low Sensitivity:** These areas have slopes greater than 25 degrees. Steep slopes have a low potential for archaeological deposits because they were not occupied by prehistoric peoples but rather used for gathering and other resource procurement activities. Many of these activities do not leave an archaeological signature. If a project impacts these areas, a survey is needed to confirm the lack of cultural resources. Should cultural resources be identified, a significance evaluation is required followed by mitigation measures.

Review of this map shall be done at the initial planning stage of a project to ensure that cultural resources are avoided and/or impacts are minimized in accordance with the City's Historical Resources Guidelines. If there is any evidence that the project area contains archaeological or tribal cultural resources, then an archaeological evaluation consistent with the City's Guidelines would be required. All individuals conducting any phase of the archaeological evaluation program must meet professional qualifications in accordance with the City's Historical Resources Guidelines.

Step 1

Based on the results of the initial determination, if there is evidence that the project area contains archaeological resources, preparation of an evaluation report is required. The evaluation report could generally include background research, field survey, archaeological testing, and analysis. Before actual field reconnaissance would occur, background research is required that includes a record search at the South Coastal Information Center (SCIC) at San Diego State University. A review of the Sacred Lands File maintained by the NAHC shall also be conducted at this time. Information about existing archaeological collections should also be obtained from the San Diego Archaeological Center and any tribal repositories or museums.

Once the background research is complete, a field reconnaissance shall be conducted by individuals whose qualifications meet City standards. Consultants shall employ innovative survey techniques when conducting enhanced reconnaissance including, but not limited to, remote sensing, ground penetrating radar, human remains detection canines, LiDAR, and other soil resistivity techniques as determined on a

case-by-case basis by the tribal representative during the project-specific AB 52 consultation process. Native American participation is required for field surveys when there is likelihood that the project site contains prehistoric archaeological resources or tribal cultural resources. If, through background research and field surveys, resources are identified, then an evaluation of significance, based on the City's Guidelines, shall be performed by a qualified archaeologist.

Step 2

Where a recorded archaeological site or tribal cultural resource (as defined in the PRC) is identified, the City shall initiate consultation with identified California Indian tribes pursuant to the provisions in PRC sections 21080.3.1 and 21080.3.2, in accordance with AB 52. It should be noted that during the consultation process, tribal representative(s) will be involved in making recommendations regarding the significance of a tribal cultural resource which also could be a prehistoric archaeological site. A testing program may be recommended which requires reevaluation of the proposed project in consultation with the Native American representative, which could result in a combination of project redesign to avoid and/or preserve significant resources, as well as mitigation in the form of data recovery and monitoring (as recommended by the qualified archaeologist and Native American representative). The archaeological testing program, if required, shall include evaluating the horizontal and vertical dimensions of a site, the chronological placement, site function, artifact/ecofact density and variability, presence/absence of subsurface features, and research potential. A thorough discussion of testing methodologies including surface and subsurface investigations can be found in the City of San Diego's Historical Resources Guidelines. Results of the consultation process will determine the nature and extent of any additional archaeological evaluation or changes to the proposed project.

The results from the testing program shall be evaluated against the Significance Thresholds found in the Historical Resources Guidelines. If significant historical resources are identified within the area of potential effects, the site may be eligible for local designation. However, this process will not proceed until such time that the tribal consultation has been concluded and an agreement is reached (or not reached) regarding significance of the resource and appropriate mitigation measures are identified. The final testing report shall be submitted to Historical Resources Board (HRB) staff for designation. The final testing report and supporting documentation will be used by HRB staff in consultation with qualified City staff to ensure that adequate information is available to demonstrate eligibility for designation under the applicable criteria. This process shall be completed prior to distribution of a draft environmental document.

An agreement on the appropriate form of mitigation is required prior to distribution of a draft environmental document. If no significant resources are found and site conditions are such that there is no potential for further discoveries, then no further action is required. Resources found to be non-significant as a result of a survey and/or assessment will require no further work beyond documentation of the resources on the appropriate Department of Parks and Recreation site forms and inclusion of results in the survey and/or assessment report. If no significant resources are found, but results of the initial evaluation and testing phase indicates there is still a potential for resources to be present in portions of the property that could not be tested, then mitigation monitoring is required.

Step 3

Preferred mitigation for archaeological resources is to avoid the resource through project redesign. If the resource cannot be entirely avoided, all prudent and feasible measures to minimize harm shall be taken. For archaeological resources where preservation is not an option, a Research Design and Data Recovery Program is required, which includes a Collections Management Plan for review and approval. When tribal cultural resources are present and also cannot be avoided, appropriate and feasible mitigation will be determined through the tribal consultation process and incorporated into the overall data recovery program, where applicable, or project-specific mitigation measures incorporated into the project. The data recovery program shall be based on a written research design and is subject to the provisions as outlined in CEQA Section 21083.2. The data recovery program shall be reviewed and approved by the City's Environmental Analyst prior to distribution of a draft CEQA document and shall include the results of the tribal consultation process. Archaeological monitoring may be required during building demolition and/or construction grading when significant resources are known or suspected to be present on a site but cannot be recovered prior to grading due to obstructions such as, but not limited to, existing development or dense vegetation.

A Native American observer must be retained for all subsurface investigations, including geotechnical testing and other ground disturbing activities whenever a tribal cultural resource or any archaeological site located on City property, or within the area of potential effects of a City project, would be impacted. In the event that human remains are encountered during data recovery and/or a monitoring program, the provisions of California Public Resources Code Section 5097 shall be followed. In the event that human remains are discovered during project grading, work shall halt in that area and the procedures set forth in the California Public Resources Code (Section 5097.98) and State Health and Safety Code (Section 7050.5), and in the federal, State, and local regulations described above shall be undertaken. These provisions shall be outlined in the Mitigation Monitoring and Reporting Program included in a subsequent project-specific environmental document. The Native American monitor shall be consulted during the preparation of the written report, at which time they may express concerns about the treatment of sensitive resources. If the Native American community requests participation of an observer for subsurface investigations on private property, the request shall be honored.

Step 4

Archaeological Resource Management reports shall be prepared by qualified professionals as determined by the criteria set forth in Appendix B of the Historical Resources Guidelines. The discipline shall be tailored to the resource under evaluation. In cases involving complex resources, such as traditional cultural properties, rural landscape districts, sites involving a combination of prehistoric and historic archaeology, or historic districts, a team of experts will be necessary for a complete evaluation. Specific types of historical resource reports are required to document the methods (see Section III of the Historical Resources Guidelines) used to determine the presence or absence of historical resources; to identify the potential impacts from proposed development and evaluate the significance of any identified historical resources; to document the appropriate curation of archaeological collections (e.g., collected materials and the associated records); in the case of potentially significant impacts to historical resources, to recommend appropriate mitigation measures

that would reduce the impacts to below a level of significance; and to document the results of mitigation and monitoring programs, if required.

Archaeological Resource Management reports shall be prepared in conformance with the California Office of Historic Preservation "Archaeological Resource Management Reports: Recommended Contents and Format" (see Appendix C of the Historical Resources Guidelines), which will be used by Environmental staff in the review of archaeological resource reports. Consultants must ensure that archaeological resource reports are prepared consistent with this checklist. This requirement will standardize the content and format of all archaeological technical reports submitted to the City. A confidential appendix must be submitted (under separate cover), along with historical resource reports for archaeological sites and tribal cultural resources, containing the confidential resource maps and records search information gathered during the background study. In addition, a Collections Management Plan shall be prepared for projects that result in a substantial collection of artifacts, which must address the management and research goals of the project, and the types of materials to be collected and curated based on a sampling strategy that is acceptable to the City of San Diego. Appendix D (Historical Resources Report Form) may be used when no archaeological resources were identified within the project boundaries.

Step 5

For Archaeological Resources: All cultural materials, including original maps, field notes, non-burial related artifacts, catalog information and final reports recovered during public and/or private development projects must be permanently curated with an appropriate institution, one which has the proper facilities and staffing for insuring research access to the collections consistent with State and federal standards unless otherwise determined during the tribal consultation process. In the event that a prehistoric and/or historical deposit is encountered during construction monitoring, a Collections Management Plan shall be required in accordance with the project's Mitigation Monitoring and Reporting Program. The disposition of human remains and burial- related artifacts that cannot be avoided or are inadvertently discovered is governed by State (i.e., AB 2641 [Coto] and California Native American Graves and Repatriation Act [NAGPRA] of 2001 [Health and Safety Code 8010-8011]) and federal (i.e., federal NAGPRA [USC 3001-3013]) law, and must be treated in a dignified and culturally appropriate manner with respect for the deceased individual(s) and their descendants. Any human bones and associated grave goods of Native American origin shall be turned over to the appropriate Native American group for repatriation.

Arrangements for long-term curation of all recovered artifacts must be established between the applicant/property owner and the consultant prior to the initiation of the field reconnaissance. When tribal cultural resources are present, or non-burial-related artifacts associated with tribal cultural resources are suspected to be recovered, the treatment and disposition of such resources will be determined during the tribal consultation process. This information must then be included in the archaeological survey, testing, and/or data recovery report submitted to the City for review and approval. Curation must be accomplished in accordance with the California State Historic Resources Commission's Guidelines for the Curation of Archaeological Collections (dated May 7, 1993) and, if federal funding is involved, Title 36 of the Code of Federal Regulations Part 79. Additional information

regarding curation is provided in Section II of the Historical Resources Guidelines.

Resumes of Key Personnel

MICHAEL G. BAKSH, PH.D.
Principal Anthropologist/Archaeologist
Tierra Environmental Services

Education

University of California, Los Angeles, Doctor of Philosophy, Anthropology, 1984
University of California, Los Angeles, Master of Arts, Anthropology, 1977
San Diego State University, Bachelor of Arts, Anthropology, 1975

Professional Experience

1993-Present	Principal Anthropologist/Archaeologist, Tierra Environmental Services, San Diego, California
1993-Present	Adjunct Professor, Department of Anthropology, San Diego State University
1990-1993	Senior Anthropologist/Archaeologist, Brian F. Mooney Associates, San Diego, California
1985-1990	Research Anthropologist, University of California, Los Angeles
1980-1985	Consulting Anthropologist, Brian F. Mooney Associates, San Diego, California
1976-1983	Research Assistant, Department of Anthropology, University of California, Los Angeles
1973-1975	Supervisory Archaeologist, San Diego State University, San Diego, California
1970-1973	Assistant Archaeologist, San Diego State University, San Diego, California

Professional Affiliations

Fellow, American Anthropological Association
Member, American Ethnological Society
Member, Association of Environmental Professionals
Member, Society for California Archaeology
Advisory Council Member, San Diego Archaeological Center
Permitted by Bureau of Land Management for Cultural Resource Surveys in California
Principal Investigator, City of San Diego
Member, City of San Diego Historic Resources Board

Qualifications

Dr. Michael Baksh received his Ph.D. in Anthropology from the University of California at Los Angeles in 1984. He has been Principal Anthropologist/Archaeologist at Tierra Environmental Services for 22 years. Dr. Baksh's area of specialty is cultural resource management, and he has conducted numerous archaeological surveys, testing projects, and data recovery programs throughout southern California. He has also conducted numerous Native American consultation and ethnohistoric projects throughout the southwestern United States in compliance with Section 106 of the National Historic Preservation Act. He has established an excellent rapport with Native Americans on a wide range of cultural resource management, land use, and planning projects.

Relevant Projects

Ocotillo Express Wind Archaeological Construction Monitoring *(Pattern Energy).*
Dr. Baksh managed the archaeological construction monitoring for the Ocotillo Express Wind Project in Ocotillo, California. The Ocotillo Express Wind Project involved a year-long construction of 112 wind turbines, more than 30 miles of new roads, and numerous associated facilities on desert lands managed by the U.S. Bureau of Land Management. Tierra employed approximately 20 full-time archaeologists and 10 Native Americans for the project.

As-Needed City of San Diego Cultural Resources *(Helix Environmental).*
Dr. Baksh is managing a multi-year As-Needed Cultural Resources contract for the City of San Diego (through Helix Environmental). Commencing in 2011, numerous task orders have been issued for archaeological studies including surveys, testing programs, monitoring projects, historic evaluations, and records searches throughout the City. In addition to providing archaeological staff Tierra is also responsible for coordinating and retaining Native American monitors. Tierra also coordinates with the San Diego Archaeological Center to ensure that all collections resulting from the As-Needed project are properly curated.

Sunrise Powerlink *(San Diego Gas & Electric).*
Dr. Baksh managed the Native American monitoring of the 2010-2012 construction of the Sunrise Powerlink project. The project included the construction of a 118-mile-long 230-kV/500kV transmission line between SDG&E's Imperial Valley Substation near El Centro, Imperial County, to its Sycamore Canyon Substation near Interstate 15 in San Diego, California, and a new substation in Alpine, California. Native Americans monitored whenever ground-disturbing activities occurred within 50 feet of known cultural resource sites. The U.S. Bureau of Land Management served as lead federal agency under NEPA and the National Historic Preservation Act, and the California Public Utilities Commission served as lead state agency under CEQA from October 2010 to June 2012. Tierra retained 43 Native Americans from six Tribes who worked on a daily basis and logged 24,913 hours.

Caltrans As-Needed Cultural Resource Services *(California Department of Transportation).*
Dr. Baksh served as Principal Anthropologist on the Caltrans District 11 (San Diego and Imperial County) As-Needed Cultural Resources contracts from 1992 through 2010. He managed several archaeological surveys and testing programs and was responsible for coordinating Native American involvement and input on specific task orders. One task order included the development of a comprehensive list of Native Americans capable of providing archaeological monitoring and/or ethnographic consultation services on future Caltrans cultural resource management projects. In consultation with over 20 reservations including Kumeyaay, Luiseño, and Quechan Indians, Dr. Baksh prepared a list for Caltrans to draw upon during future projects and thereby help ensure compliance Section 106 of the National Historic Preservation Act and other regulations. Development of the list also involved consultation with the Native American Heritage Commission and local cultural resource management firms.

Model Marsh Archaeological Studies *(California State Coastal Conservancy)*.
Dr. Baksh managed several archaeological studies associated with the construction of the 20-acre Model Marsh located in the Tijuana Estuary. These resulted in the identification of a historic resource that was found to be associated with the Naval Electronic Laboratory on Point Loma. Tierra subsequently conducted monitoring and during construction of the Model Marsh and discovered a buried prehistoric site. Tierra tested the site, found it to be significant, and implemented a data recovery program. A total of 41 one-square-meter units were excavated in a timely manner to allow completion of project construction. The investigations were conducted in compliance with all federal, state, and local cultural resource laws and in close coordination with State Parks and the U.S. Army Corps of Engineers.

IID Niland to Blythe Powerline Replacement *(Greystone).*
Dr. Baksh managed the archaeological survey of an approximately 60-mile transmission line corridor along an existing transmission line between substations near Blythe and Niland. Archaeological and historical research included a review of records and literature searches and an archaeological field inventory of the transmission line corridor. The BLM and Department of Defense served as Federal lead agencies for NEPA and NHPA compliance, and the Imperial Irrigation District served as the lead agency for CEQA compliance. The survey of the 60-mile-long 500-foot-wise corridor identified 20 previously located sites and 170 new sites including prehistoric flaking stations, lithic scatters, trails, rock rings, pottery scatters, and rock shelters, and historic trash dumps, military encampments, building foundations, cairns, and survey markers. Dr. Baksh also managed the project's Native American consultation.

Sabre Springs *(Parsons Brinckerhoff).*
Tierra conducted a cultural resource study for the proposed Sabre Springs Project adjacent to Interstate 15 and Ted Williams Parkway in the community of Sabre Springs. The project includes the construction of a Transit Center and access road on a 6.2-acre property. The environmental review was conducted in accordance with the California Environmental Quality Act (CEQA) and the City of San Diego Land Development Code. The Metropolitan Transit Development Board (MTDB) will serve as lead agency for CEQA compliance, and Caltrans served as agent for the Federal Highway Administration (FHA) and federal review.

Carroll Canyon *(Parsons Brinckerhoff).*
Tierra conducted several cultural resource studies for the proposed Carroll Canyon Road Extension Project in the area of Interstate 805. These studies have included general cultural surveys, archaeological testing and historic evaluations, and Native American consultation. The City of San Diego has served as the lead agency for CEQA review and Caltrans has served as the lead agency for NEPA review and compliance with the National Historic Preservation Act.

Black Mountain Pipeline *(City of San Diego).*
Dr. Baksh managed the archaeological studies associated with the construction of the Black Mountain Pipeline in the Mira Mesa and Penasquitos communities of San Diego. The project included several miles of pipeline constructed in Black Mountain Road and several adjacent streets. Tierra conducted construction monitoring of the project for a nearly two-year period.

Penaquitos Sewer *(BRG).*
Dr. Baksh conducted the archaeological studies associated with the Penasquitos trunk sewer for the City of San Diego. The project site consisted of a pipeline route of approximately two miles adjacent to Penasquitos Canyon. The study included a records search, Native American consultation, an archaeological survey, and an archaeological testing program.

City Trunk Sewers *(EarthTech).*
Dr. Baksh managed the archaeological studies for trunk sewers and access routes located in 18 canyons the City of San Diego. The goal of the project was to identify any cultural resources that could be impacted by routine maintenance and emergency repairs to aging sewer lines throughout the City. Records searches and archaeological surveys were conducted for all 18 canyons.

City Sewers As-Needed *(BRG).*
Dr. Baksh managed the archaeological studies for the City of San Diego on an As-Needed contract in 2004-2005. Most of the effort involved construction monitoring during the replacement of sewer lines in City streets.

City Water Group Jobs *(Arrieta, BRG, RBF).*
Dr. Baksh managed the archaeological studies for numerous City Water Group Jobs including 689, 744, 903, 904, and 905. Most of the effort associated with these projects involved construction monitoring during the replacement of water pipelines in existing City streets.

San Diego Water Repurification *(Montgomery Watson).*
Dr. Baksh prepared an archaeological feasibility study for the San Diego Water Repurification Project proposed by the City of San Diego Water Utilities Department. This project included analyses of records searches and existing archaeological studies, as well as field reconnaissance studies, for several alternative pipeline conveyance corridors and Advanced Water Treatment Facilities located between the North City Water Reclamation Plant and San Vicente Reservoir.

Mt. Israel Reservoir and Pipelines *(Olivenhain Municipal Water District and Bureau of Land Management).*
Dr. Baksh served as Senior Archaeologist for preparation of the cultural resources study for this proposed reservoir, flood control channel, and pipeline project in San Diego County. The cultural resource study also included record search analyses and intensive surveys of four alternative access roads. Located in an area traditionally utilized by the Luiseño Indians, this project included ethnohistoric research in addition to the archaeological survey.

SDCWA As-Needed Cultural Resources *(San Diego County Water Authority).*
Dr. Baksh served as the Project Ethnographer on the SDCWA As-Needed Cultural Resource Services contract. Task orders focused on Native American consultation and ethnographic research related to an archaeological test excavation and subsequent data recovery program at the Harris Site in association with Pipeline 5.

As Needed Archaeological Services For The MTDB Light Rail Project *(Metropolitan Transit Development Board).*
Dr. Baksh managed the As-Needed archaeological services for the San Diego Metropolitan Transit Development Board for construction of the Mission Valley Light Rail Project between Old Town and Fashion Valley. As-needed services included on-going construction monitoring, site testing, and data recovery activities. During monitoring, a buried prehistoric archaeological site was found at a location scheduled for immediate construction. In consultation with the Army Corps of Engineers and the City of San Diego, a testing project was implemented within days and the site was determined to be significant. Dr. Baksh managed the preparation of an evaluation and treatment plan (for the Heron site) and coordination with the ACOE and City. The plan was approved and Dr. Baksh managed the data recovery fieldwork, which was completed in less than one month after initial discovery of the site and just prior to crucial construction deadlines. He subsequently managed all phases of data analysis and preparation of the draft and final reports.

Clean Water Program/Native American Memorandum Of Understanding *(City of San Diego Metropolitan Waste Water Department).*
Dr. Baksh prepared a Memorandum of Understanding (MOU) between the Metropolitan Waste Water Department and Native American groups in San Diego County. The MOU specifies Native American involvement in archaeological investigations and the treatment of archaeological and human remains associated with construction of CWP facilities in San Diego County.

HILLARY MURPHY

Archaeologist
Tierra Environmental Services

Education

Certificate in Archaeology, San Diego City College
B.A., Interior Design with an Art History Minor, California State University, Sacramento

Professional Experience

July 2007- Current	Project Archaeologist, Tierra Environmental Services, Inc.
March 2008- 2010	On-call Associate Archaeologist, ICF International
June 2007-July 2007	Archaeological field and lab crew, Programme for Belize, Belize
January 2007-June 2007	Archaeology Field School, Rancho Peñasquitos site, CA-SDI-8125 San Diego City College

Qualifications

Ms. Murphy has a variety of experience in cultural resources management in southern California and Central America. Ms. Murphy has been involved in surveys for a number of infrastructure and development related projects. She has served as Project Manager and Crew Chief for various projects including fieldwork regarding survey, testing, data recovery, monitoring, site recording, site and artifact illustration, and lab analysis. Additionally, she has authored and co-authored many technical reports.

Relevant Projects

Ocotillo Express Wind Energy Project – Geotechnical Construction Monitoring Effort
Following the completion of the archaeological survey effort, Ms. Murphy oversaw the monitoring effort and authorized the geotechnical report for the preliminary testing of the proposed turbine locations. Additionally, Ms. Murphy participated in the coordination and preparation of the construction monitoring effort. Per the request of the BLM, Ms. Murphy authored a Tribal Participation Plan to convey details of the proposed monitoring efforts by the participating Native American Tribes, Kumeyaay and Colorado River Tribes. Ms. Murphy also assisted with the authoring of the Archaeological Management Plan for the same effort. This phase of the project is expected to commence May of 2012 at which point Ms. Murphy will assist with the coordination of the monitoring crews and assist with the monitoring reports.

Ocotillo Express Wind Energy Project - Archaeological Survey
Ms. Murphy served as co-project archaeologist for the Ocotillo Wind Express Project. The project consisted of a Class II and Class III survey totaling 12,436 acres for the proposed installation of 112 wind turbines in Imperial County, CA. Ms. Murphy coordinated field crews, both field technicians and Native American monitors, and served as liaison between the office and the field. When needed, Ms. Murphy accompanied Native Americans during site visits. Ms. Murphy assisted with the post-survey analysis of the data and the authorization of the technical report.

Sunrise Powerlink Final Environmentally Superior Southern Route
Ms. Murphy served as Native American Coordinator for the construction monitoring effort for the Sunrise Powerlink; an 118-mile transmission line from San Diego Gas & Electric (SDG&E) Imperial Valley Substation near El Centro, Imperial Valley, to SDG&E's Sycamore Canyon Substation in coastal San

Diego, California. Ms. Murphy coordinated and scheduled monitors from the Kumeyaay Indian Tribes and the Cocopah Indian Tribe. Ms. Murphy discussed with and matched cultural monitors with construction activities in potentially culturally sensitive locations based on proximity and/or Tribal interest. Ms. Murphy authored technical Native American monitoring report upon completion of the project.

Palm Avenue Bridge
Ms. Murphy served as project archaeologist for the survey of the proposed the improvements of the Palm Avenue Bridge at the Interstate-805 interchange. Ms. Murphy also authored the report under Caltrans guidelines.

SR-76 Monitoring
Ms. Murphy served as monitor and authored the report for the widening and realignment efforts extending approximately 5 miles along State Route 76 in northern San Diego County. The monitoring effort extended intermittently over a period of 14 months.

La Posta Pipeline
Ms. Murphy served as crew chief for the La Posta Pipeline Project for the La Posta Band of Mission Indians. The survey resulted in one prehistoric bedrock milling site adjacent to the proposed pipeline. Ms. Murphy authored the Department of Parks and Recreation site forms for the resource, as well as co-authored the technical report.

Campo Homes
Ms. Murphy served as crew chief for a survey of six one-acre parcels of land for prospective new homes of residents in the Campo Indian Reservation. The survey resulted in two sites containing bedrock milling features and lithic scatters. The larger of the two sites contained a massive abundance of both lithic and ceramic scatter, including chalcedony and obsidian. Ms. Murphy authored the site forms and assisted in the preparation of the report.

Salton Sea City Landfill
Ms. Murphy served as monitor, field crew, and report co-author for cultural resources studies related to 320 acres allotted for the development of the Salton City Landfill. The survey resulted in approximately 25 resources ranging from historic refuse deposits to prehistoric fish traps, habitation sites, and lithic and ceramic scatters. A data-test and recovery program was implemented to fully mitigate the resources prior to demolition and Ms. Murphy served as crew, lab analysis and report co-author for this as well. Additionally, as the Landfill's progression continues in the future with various ground disturbing activities, Ms. Murphy will serve as monitor.

Boulevard Apartments
Ms. Murphy served as cultural resources monitor for the ground disturbing activity associated with the implementation of a new low income apartment building within the city of San Diego. The project was located in an urban setting between existing structures and streets. The entire project last over a year and resulted in negative findings.

Campo Homes
Ms. Murphy served as survey crew for six one-acre parcels of land for the prospective new homes of residents in the Campo Indian Reservation. The survey resulted in two sites containing bedrock milling features and lithic scatters. The larger of the two sites contained a massive abundance of both lithic and ceramic scatters including chalcedony and obsidian. Ms. Murphy authored the site forms and assisted in the preparation of the report.

Santa Ysabel Homes
Ms. Murphy served as survey crew for seven parcels of land proposed for the development of single family houses on the Santa Ysabel Indian Reservation. Each parcel surveyed consisted of a one-acre allotment for the housing. One of which resulted in the location of a historic house once used at the Camp Kearny Training Base during World War I, circa 1917-1920. Ms. Murphy assisted in the completion of the report and site forms.

Augustine Land Transfer
Ms. Murphy served as survey crew for the 120-acre land transfer of three parcels on the Augustine Indian Reservation in Coachella, California, which resulted in the location of seven cultural resources including lithic scatters and a potential burial. Historic artifact scatters and deposits were located, as well. Ms. Murphy co-authored the report and site forms.

Jacumba Water System Rehabilitation Project
Ms. Murphy assisted in the survey and monitoring of over 8,500 linear feet for the project. The survey resulted in the recording of seventeen historic and prehistoric archaeological sites including a turn-of the-century stone house, 1920s hotel, and prehistoric habitation sites. Information from the survey was used to direct the planning effort in order to avoid sensitive cultural resources. Ms. Murphy participated in the laboratory analysis of the artifact collection recovered during monitoring for the project. She was responsible for identification and cataloguing of the artifact assemblage.

Niland Waste Water
Ms. Murphy assisted as crew for surveying two linear miles in preparation of new waste water lines and treatment facility to be implemented. She then assisted in the preparation and completion of the report.

Santiago Sedimentation Basin Project
Served as crew for the survey of 21 acres for a housing development upon which two isolated flakes were observed. Ms. Murphy completed the site forms and assisted in the preparation of the report.

Bishop Water System Upgrade
Ms. Murphy authored site forms and participated in the completion of the report for the survey of a new well and water line project that resulted in the location of seven cultural resources.

Ocotillo RV Project
Ms. Murphy assisted in the survey and monitoring of 5-acres proposed for development as an RV storage center. The survey resulted in the recording of two in-situ lithic scatters. Information from the survey was used to direct the planning effort in order to avoid sensitive cultural resources. Ms. Murphy participated in the laboratory analysis of the artifact collection recovered during monitoring for the project. She was responsible for identification and cataloguing of the artifact assemblage.

Programme for Belize, Blue Creek, Belize
Participated in field excavation and laboratory analysis of the University of Texas, Austen's excavation of the third largest Mayan site in Belize, La Milpa, under the supervision of Dr. Fred Valdez Jr. Attempts have been made to understand the chronology of the sites in the northwest region over a period of 15 years.

Rancho Peñasquitos, **CA-SDI-8125**
Participated in the field excavation under the supervision of Dr. Steve Bouscaren to unveil an eighteenth century Spanish zanja in hopes of better understanding the early water works, both agricultural and natural elements, at this historic and prehistoric site.

Re: Mission Valley Community Plan Information Project

Dear Ms. Sanchez,

Tierra Environmental Services, Inc. (Tierra) has been retained to conduct a cultural resources constraints report for the Mission Valley Community Plan Project located in western San Diego County (Figure 1). The proposed project is located within unsectioned Pueblo Lands of San Diego as depicted on the La Mesa and La Jolla USGS 7.5' quadrangles (Figure 2).

Archaeological site record and literature reviews have been requested from the South Coastal Information Center at San Diego State University.

In addition to informing you about this project, a major purpose of this letter is to request a search of the sacred lands files in possession of the NAHC. Any information you may have about cultural resources on the property would greatly benefit our study.

If I can provide any additional information, please contact me immediately at (858) 578-9064. Thank you for your assistance.

Sincerely,

HMurphy

Dear S. Spagnolo:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE. Other sources of cultural resources information should be contacted regarding known and recorded sites.

Please contact all of the people on the attached list. The list should provide a starting place to locate areas of potential adverse impact within the APE. I suggest you contact all of those listed, if they cannot supply information, they might recommend others with specific knowledge. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 373-3711.

Sincerely,

Rob Wood

RE: Mission Valley Community Plan Update – Cultural Resources Constraints Analysis

Dear Mr. LaChappa,

Tierra Environmental Services (Tierra) has been obtained to conduct a cultural resources constraints analysis for the update of Mission Valley's Community Plan (Figure 1). This analysis report is for informational purposes, not intended for specific construction activities at this time. The City of San Diego serves as Lead Agency for this analysis. The analysis study area encompasses Mission Valley within the unsectioned Pueblo Lands of San Diego of the USGS La Jolla and La Mesa 7.5' California Quadrangles (Figure 2), extending from Fairmount Avenue on the East to Interstate 5 on the west.

A records search has been conducted at the South Coastal Information Center at San Diego State University for the analysis area plus a half-mile radius buffer.

In addition to informing you about this project's status, a major purpose of this letter is to request any information that you and other tribal elders may have regarding cultural resources located in the vicinity of the study area, pursuant to AB52 of the California Environmental Quality Act (CEQA). Any information you may have about cultural resources on the property would greatly benefit our study. If you or other tribal members have any knowledge about cultural resources located in the study area, please contact me.

If I can provide any additional information, please contact me immediately at (858) 578-9064 or tierraenv@aol.com. Thank you for your assistance.

Sincerely,

HMurphy

Hi Clint,

Thank you so much for your response and shared information regarding the Constraints Analysis for the Mission Valley Community Plan Update. Your project area familiarity is essential and we wish to include as much information as you feel comfortable providing for this document to help protect future proposed work from impacting or affecting potential resources. Just to reiterate, since this is a constraints analysis we don't want to include any information that could compromise site confidentiality, but we would want to include anything you might feel is relevant and pertinent to the reporting. Along those lines we are already including your comments and concerns that you have provided thus far into the current draft analysis. Toward this end, please feel free to include anything else you might feel be important to include in the constraints analysis.

Thanks again,

Hillary

Subject: Re: Mission Valley Community Plan Update Notification

Hi Hillary,

With regard to the attached constraints analysis I would like to point out a few areas of particular concern.
1-The village of Kosoy is located in the western portion of this analysis. Having worked on the Hotel Circle South project with Laguna Mt Env I am very familiar with the village boundaries and am happy to share which areas are of most concern as needed.
2-At Bachman Drive and Hotel Circle South we had an inadvertent discovery of human remains across the intersection. These remains were part of a slope wash and migrated down hill to the intersection at some point in time.
3-Mission de Alcala' is located in the far eastern portion of this analysis. No baptized burials are located outside the mission proper and a large buffer zone for their protection should be implemented when finalizing this analysis.

As additional comments I would like to state that all projects within the boundaries of this analysis should be subject to Kumeyaay NAM involvement, giving the NAMs a chance to review individual projects and request their involvement as appropriate.

Thank you,

Clint

Subject: RE: Mission Valley

Dear Ms. Hagen and the Viejas Band of Kumeyaay Indians,

Thank you for your recent response to our inquiry for information regarding the Mission Valley Community Plan Update submitted to you on January 28, 2016. Your contact information was provided to us by the Native American Heritage Commission during the initial fact finding phase of our work and as such the constraints analysis technical document report is still in draft format. As per the guidelines of the data collection phase, we will include in the document your concern for the project area and your request to have a final document provided to you by the lead agency, the City of San Diego.

Should you have any additional comments or concerns that you would like included in the report, please contact us at your earliest convenience.

Sincerely,

Hillary Murphy

SECTION I PROJECT OVERVIEW

A. INTRODUCTION

The Mission Valley Historic Context Statement was prepared for Dyett & Bhatia and the City of San Diego to provide a historical overview of the Mission Valley Community Plan area as an initial step to the plan update. The original Mission Valley Community Plan was adopted in 1985 and is undergoing a comprehensive update.

The intent of the Mission Valley historic context statement is to provide an analytical framework for identifying and evaluating resources of the built environment by focusing on the aspects of geography, history, and culture that significantly shaped the physical development of a community's land use patterns over time. This Historic Context Statement of Mission Valley's built environment will focus on pre-history through 1970, which coincides with the City of San Diego Municipal Code's 45 year threshold to review properties which may be adversely impacted by development.

The report identifies periods, events, themes, and patterns of development. It also provides a framework for evaluating individual historic properties and districts in accordance with the National Register of Historic Places, the California Register of Historical Resources, and the San Diego Register of Historical Resources.

Although the report will note key historical themes that shaped development of the Mission Valley Community Plan area, it is not a comprehensive history of the community, nor is it a definitive listing of all community's significant resources. Instead, it provides a general discussion of the principal influences that created the built environment; why the resources are important; and what characteristics they should have to be considered an important representation of their type and context.

Study Lists have been included under each theme to aid in the identification and evaluation of properties within the Mission Valley Community. Properties in these Study Lists should be evaluated at some level to determine whether they are significant; however, their inclusion in a Study List does not mean that these properties have been determined significant by this study. In addition, properties not included in these Study Lists may nevertheless be eligible for designation and should be evaluated if it appears that the property could be significant under one or more of the City's Designation Criteria.

B. PROJECT STUDY AREA

The Mission Valley Community Plan area encompasses approximately 3,216 acres and is located near the geographic center of the City of San Diego. It is bounded on the west by Interstate 5 (I-5), on the north by Friars Road west of State Route 163 (SR-163) and by the northern slopes of the valley east of SR-163, on the east by eastern bank of the San Diego River, and on the south by approximately the 150-foot elevation contour line.

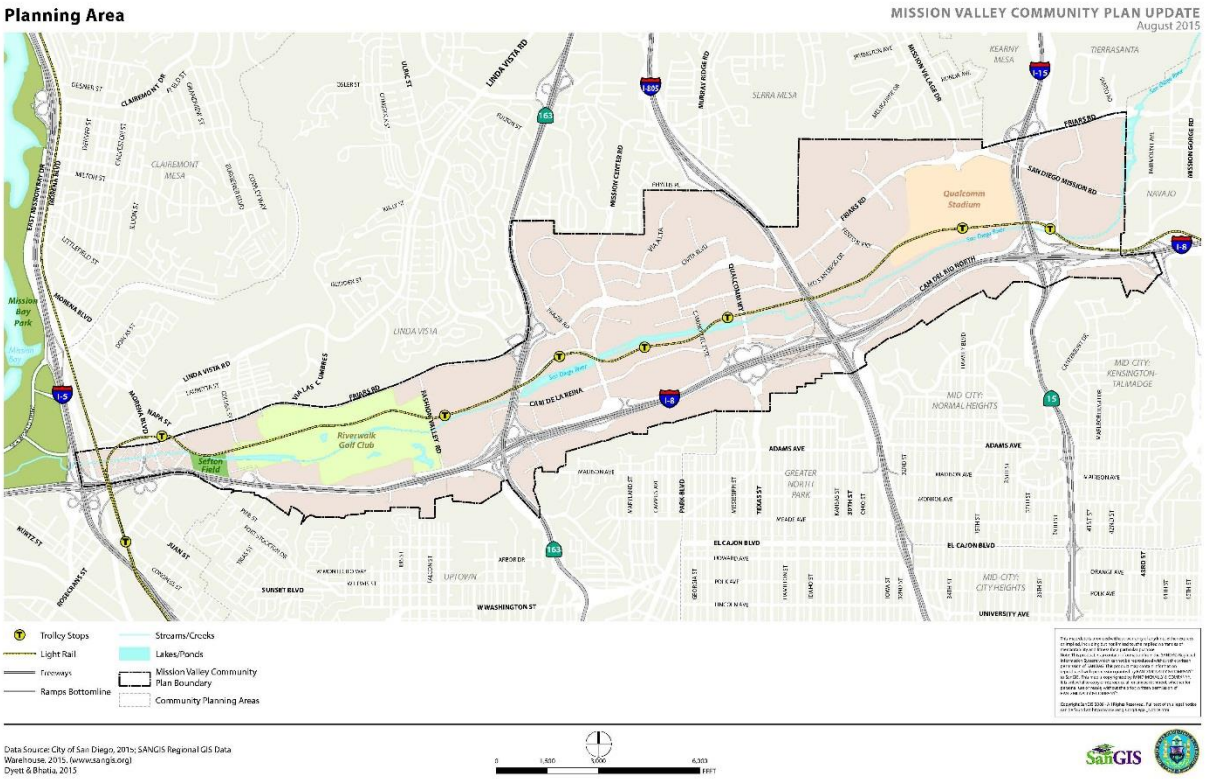

Figure 1-1: Mission Valley Community Plan project study area.

C. METHODS

The development of a historic context statement is a critical first step in assessing historical resources. The content and organization are prepared in accordance with the following guidelines established by the National Park Service:

- National Register Bulletin 15: *How to Apply the National Register Criteria for Evaluation*
- National Register Bulletin 16A: *How to Complete the National Register Form*
- National Register Bulletin 16B: *How to Complete the National Register Multiple Property Documentation*
- National Register Bulletin 24: *Guidelines for Local Surveys: A Basis for Preservation Planning*

In addition, the following guidelines were consulted:

- *Instructions for Recording Historical Resources*, California Office of Historic Preservation
- "Writing Historic Contexts", California Office of Historic Preservation
- "Historic Resources Survey Guidelines," City of San Diego
- "San Diego Modernism Historic Context Statement," City of San Diego

This report was prepared using primary and secondary sources related to the development history of Mission Valley. Archival research was conducted to determine the location of previously documented historic and architectural resources within the project study area and to help establish a context for resource significance. National, state, and local inventories of architectural/historic resources were examined in order to identify significant local historical events and personages, development patterns, and unique interpretations of architectural styles.

Information was solicited regarding the location of historic properties in the project area from local governments, public and private organizations, online repositories, and other parties likely to have knowledge of or concerns about such resources. The following inventories, sources, and persons were consulted in the process of compiling this report:

- National Register of Historic Places
- California Historical Resources Information System (CHRIS) Information Center
- California Historical Landmarks
- California Points of Historical Interest
- California Register of Historic Resources
- City of San Diego Historical Resources Board
- San Diego History Center Research Library
- San Diego Central Public Library, California Room
- Modernsandiego.com

Materials included documentation of previous reports, photographs, news articles, and maps. Published sources focusing on local history were consulted, as well as material relating to federal, state, and location designation requirements. Research for the report was not intended to produce a large compendium of historical and genealogical material, but rather to provide selected information necessary to understanding the evolution of the area and its significance.

[This page intentionally left blank.]

SECTION II HOW TO USE THIS DOCUMENT

A. PURPOSE OF A HISTORIC CONTEXT STATEMENT

According to the Secretary of the Interior's *Standards and Guidelines for Archaeology and Historic Preservation*, "the development of historic context statements is the foundation for decisions about the identification, evaluation, registration, and treatment of historic properties, and surveys." They provide the basis for evaluating significance and integrity.

B. OVERVIEW OF DISIGNATION PROGRAMS

Federal, state, and local historic preservation programs provide specific criteria for evaluating the potential historic significance of a resource. Although the criteria used by the different programs (as relevant here, the National Register of Historic Places, the California Register of Historical Resources, and the City of San Diego's Local Register of Historical Places) vary in their specifics, they focus on many of the same general themes. In general, a resource need only meet one criterion in order to be considered historically significant.

Another area of similarity is the concept of integrity — generally defined as the survival of physical characteristics that existed during the resource's period of significance. Federal, state, and local historic preservation programs require that resources maintain integrity in order to be identified as eligible for listing as historic.

To date, the Mission San Diego de Alcalá is the only resource within the Mission Valley Community Plan area that has been identified and is listed in the National Register of Historic Places, the California Register of Historical Resources, and the City of San Diego's Local Register of Historical Places.

1. National Register of Historic Places

The National Register of Historic Places (commonly referred to as the "National Register" or "NRHP") is a Congressionally-authorized inventory of buildings, structures, objects, sites, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, state, or local level. According to the *National Register Bulletin Number 15, How to Apply the National Register Criteria for Evaluation*, resources over fifty years of age are typically eligible for listing if they meet any one of four significance criteria and if they possess historic integrity. The following are the four basic criteria set forth by the National Register (listed alphabetically):

> **Criterion A**: Properties that are associated with events that have made a significant contribution to the broad patterns of our history; or
>
> **Criterion B**: Properties that are associated with the lives of persons significant in our past; or
>
> **Criterion C**: Properties that embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; possess high artistic values; or

represent a significant and distinguishable entity whose components may lack individual foundation; and

Criterion D: Properties that have yielded or is likely to yield information important in prehistory or history.

Criteria Considerations
According to the National Register, not all property types are eligible for listing in the National Register. However, these properties can be eligible *if* they meet specific requirements, or Criteria Considerations, as well as meeting one or more of the four evaluation criteria described previously. These National Register Criteria Considerations are:

Criteria Consideration A: A religious property deriving primary significance from architectural or artistic distinction or historical importance; or

Criteria Consideration B: A building or structure removed from its original location but which is primarily significant for architectural value, or which is the surviving structure most importantly associated with a historic person or event; or

Criteria Consideration C: A birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building directly associated with his or her productive life; or

Criteria Consideration D: A cemetery which derives its primary importance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or

Criteria Consideration E: A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or

Criteria Consideration F: A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; or

Criteria Consideration G: A property achieving significance within the past 50 years if it is of exceptional importance.

2. California Register of Historical Resources

The California Register of Historical Resources ("California Register" or "CRHR") is an authoritative guide to California's significant historical and archaeological resources to be used by state and local agencies, private groups, and citizens in identifying the existing historical resources of the state, and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change. The California Register includes:

- Resources formally determined eligible for, or listed in, the National Register
- State Historical Landmarks number 770 or higher;
- Points of Historical Interest recommended for listing by the State Historical Resources Commission;

- Resources nominated for listing and determined eligible in accordance with criteria and procedures adopted by the State Historical Resources Commission, including
    - Individual historic resources and historic districts;
    - Resources identified as significant in historical resources surveys which meet certain criteria; and
    - Resources and districts designated as city or county landmarks pursuant to a city or county ordinance when the designation criteria are consistent with California Register criteria.

Resources eligible for listing include buildings, site, structure, objects, or historic districts that retain historic integrity and are historically significant at the local, state, or national level under one of the following four criteria:

> **Criterion 1**: Properties that are associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;
>
> **Criterion 2**: Properties that are associated with the lives of persons important to local, California, or national history;
>
> **Criterion 3**: Properties that embody the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possess high artistic values; or
>
> **Criterion 4**: Properties that have yielded or has the potential to yield information important in prehistory or history of the local area, California, or the nation.

In addition to having significance, resources must have integrity for the period of significance. The period of significance is the date or span of time within which significant events transpired, or significant individuals made their important contributions.

The California Register does not have strict Criteria Considerations as the National Register and are more flexible for properties that have been relocated, properties less than fifty years of age, and reconstructed buildings.

> For **moved properties**, the California Register may consider eligibility if the resource was moved to prevent demolition at the former location and if the new location is compatible with the original character and use of the historic resource. The historical resource should retain its historic features and compatibility in orientation, setting, and general environment.
>
> Properties that are have **achieved significance within the past fifty years** may be considered for listing in the California Register if it can demonstrate that sufficient time has passed to understand the resource's historical importance.
>
> **Reconstructed buildings** are those buildings not listed in the California Register under the criteria stated above. A reconstructed building less than fifty years old may be eligible if it embodies traditional building methods and techniques that play an important role in a community's historically rooted beliefs, customs, and practices.

3. City of San Diego Register of Historical Resources

The Historical Resources Guidelines of the City of San Diego's Land Development Manual (LDM) identifies the criteria under which a resource may be historically designated. It states that any improvement, building, structure, sign, interior element and fixture, site, place, district, area, or object, typically over 45 years old, regardless of whether they have been altered or continue to be used, may be designated a historical resource by the City of San Diego Historical Resources Board (HRB) if it meets one or more of the following designation criteria listed below and retains sufficient integrity to convey its significance.

> **HRB Criterion A:** Exemplifies or reflects special elements of the City's, a community's, or a neighborhood's, historical, archaeological, cultural, social, economic, political, aesthetic, engineering, landscaping or architectural development;
>
> **HRB Criterion B:** Is identified with persons or events significant in local, state or national history;
>
> **HRB Criterion C:** Embodies distinctive characteristics of a style, type, period, or method of construction or is a valuable example of the use of indigenous materials or craftsmanship;
>
> **HRB Criterion D:** Is representative of the notable work or a master builder, designer, architect, engineer, landscape architect, interior designer, artist, or craftsman;
>
> **HRB Criterion E:** Is listed or has been determined eligible by the National Park Service for listing on the National Register of Historic Places or is listed or has been determined eligible by the State Historical Preservation Office for listing on the State Register of Historical Resources; or
>
> **HRB Criterion F:** Is a finite group of resources related to one another in a clearly distinguishable way or is a geographically definable area or neighborhood containing improvements which have a special character, historical interest or aesthetic value or which represent one or more architectural periods or styles in the history and development of the City.

4. Integrity

The concept and aspects of integrity are defined in "Section VIII. How to Evaluate the Integrity of a Property Historical Resource" in *National Register Bulletin Number 15: How to Apply the National Register Criteria for Evaluation.* According to the Bulletin, "Integrity is the ability of a property to convey its significance." The evaluation of integrity must be grounded in an understanding of a property's physical features, and how they relate to the concept of integrity. Determining which of these aspects are most important to a property requires knowing why, where, and when a property is significant. To retain historic integrity, a property must possess several, and usually most, aspects of integrity:

- *Location* is the place where the historic property was constructed or the place where the historic event occurred.

- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
- *Setting* is the physical environment of a historic property, and refers to the character of the site and the relationship to surrounding features and open space. Setting often refers to the basic physical conditions under which a property was built and the functions it was intended to serve. These features can be either natural or manmade, including vegetation, paths, fences, and relationship between other features or open space.
- *Materials* are the physical elements that were combined or deposited during a particular period of time, and in particular pattern or configuration to form a historic property.
- *Workmanship* is the physical evidence of crafts of a particular culture or people during any given period of history or prehistory, and can be applied to the property as a whole, or to individual components.
- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time. It results from the presence of physical features that, when taken together, convey the property's historic character.
- *Association* is the direct link between the important historic event or person and a historic property.

5. Applying Designation Criteria and Integrity

While it is understood that nearly all properties undergo change over time—and thus minor alterations or changes are not uncommon—a building must possess enough of its original features to demonstrate why it is significant. When evaluating a property's integrity, evaluators should look closely at characteristics such as massing, roof forms, the pattern of windows and doors, cladding materials, and neighborhood surroundings.

In order to convey its historical significance, a property that has sufficient integrity for listing in the national, state, or local historical register will generally retain a majority of its character-defining features. However, the necessary aspects of integrity also depend on the criteria for which the property is significant.

National Register of Historic Places / California Register of Historical Resources

National Register Bulletin Number 15, How to Apply the National Register Criteria for Evaluation describes what aspects of integrity are essential for each of the four National Register criteria. Although the National Register Bulletin does not address the California Register, the same principles are utilized.

> **NRHP A/CRHR 1** (Events): A property that is significant for its historic association is eligible if it retains the essential physical features that made up its character or appearance during the period of its association with the important event or historical pattern. If the property is a site (such as a treaty site) where there are no material cultural remains, the setting must be intact. Archeological sites eligible under these criteria must be in overall good condition with excellent preservation of features, artifacts, and spatial relationships to the extent that these remains are able to convey important associations with events.
>
> **NRHP B/CRHR 2** (Persons): A property that is significant for its historic association with an important person(s) is eligible if it retains the essential physical features that made up its

character or appearance during the period of its association with the person(s). If the property is a site where there are no material cultural remains, the setting must be intact. Archeological sites eligible under these criteria must be in overall good condition with excellent preservation of features, artifacts, and spatial relationships to the extent that these remains are able to convey important associations with persons.

NRHP C/CRHR 3 (Architecture): A property important for illustrating a particular architectural style or construction technique must retain most of the physical features that constitute that style or technique. A property that has lost some historic materials or details can be eligible if it retains the majority of the features that illustrate its style in terms of the massing, spatial relationships, proportion, pattern of windows and doors, texture of materials, and ornamentation. The property is not eligible, however, if it retains some basic features conveying massing but has lost the majority of the features that once characterized its style. Archeological sites eligible under this criterion must be in overall good condition with excellent preservation of features, artifacts, and spatial relationships to the extent that these remains are able to illustrate a site type, time period, method of construction, or work of a master.

NRHP D/CRHR 4 (Information Potential & Archaeology): For properties eligible under this criterion, including archeological sites and standing structures studied for their information potential, less attention is given to their overall condition, than if they were being considered for events, persons, or design. Archeological sites, in particular, do not exist today exactly as they were formed. There are always cultural and natural processes that alter the deposited materials and their spatial relationships.[1]

To summarize, properties significant under Events or Architecture criteria need only retain integrity of design, materials, and workmanship to the extent that they help the property convey integrity of feeling and/or association. Similarly, integrity of location and setting are crucial for properties significant under Events criteria, but are typically less important for properties significant under Persons or Architecture criteria. High priority is typically placed on integrity of design, materials, and workmanship for properties significant under Architecture criteria. For properties significant under any of these criteria, however, it is possible for some materials to be replaced without drastically affecting integrity of design as long as these alterations are subordinate to the overall character of the building. For example, minor alterations such as window replacement may be acceptable in residential districts but are less so for individual properties designed by a master architect.

Evaluations of integrity should also include some basis of comparison. In other words, the evaluator should understand the general extent of alterations common to each property type--especially for properties that are particularly old or rare. Conversely, properties that are less rare or not as old should retain all or nearly all of their original features to qualify for historic listing. *National Register Bulletin Number 15, How to Apply the National Register Criteria for Evaluation*, states that:

"...comparison with similar properties should be considered during the evaluation of integrity. Such comparison may be important in deciding what physical features are essential to properties of that type. In instances where it has not been determined what physical features a property must possess in order for it to reflect

[1] National Park Service. *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation*, p. 48.

> the significance of a historic context, comparison with similar properties should be undertaken during the evaluation of integrity. This situation arises when scholarly work has not been done on a particular property type or when surviving examples of a property type are extremely rare."[2]

Properties that have undergone few or no alterations and retain all aspects of integrity are more likely to be eligible for listing in state or national historic registers. These properties should also be given high priority in preservation planning efforts. Finally, it should be stressed that historic integrity and condition are not the same. Buildings with evident signs of deterioration can still retain eligibility for historic listing as long as it can be demonstrated that they retain enough character-defining features to convey their significance.

City of San Diego

The City of San Diego's Guidelines for the Application of Historical Resources Board Designation Criteria (adopted 27 August 2009) outlines significant aspects of integrity related to each criterion:

> **Criterion A** (Events & Archeology): The significant aspects of integrity for a property significant under Criterion A may vary depending upon the aspect of development for which the resource is significant. For instance, design, materials, workmanship and feeling may be especially important for aspects of aesthetic, engineering, landscape and architectural development. Location, setting, feeling and association may be especially important for aspects of historical, archaeological, cultural, social, economic, and political development. It is critical for the evaluator to clearly understand the context and why, where, and when the property is significant in order to identify which aspects of integrity are most important to the resource.
>
> **Criterion B** (Events & Persons): Location, setting, feeling and association are the most relevant aspects of integrity related to Criterion B. Integrity of design and workmanship might not be as important, and would not be relevant if the property were a site. A basic integrity test for a property associated with an important event or person is whether a historical contemporary would recognize the property as it exists today.
>
> **Criterion C** (Architecture): Retention of design, workmanship, and materials will usually be more important than location, setting, feeling, and association. Location and setting will be important; however, for those properties whose design is a reflection of their immediate environment.
>
> **Criterion D** (Master Architect/Builder): property important as a representative example of the work of a Master must retain most of the physical features and design quality attributable to the Master. A property that has lost some historic materials or details can be eligible if it retains the majority of the features that illustrate its style in terms of the massing, spatial relationships, proportion, pattern of windows and doors, texture of materials, and ornamentation. The property is not eligible, however, if it retains some basic features conveying massing but has lost the majority of the features that once characterized its style and identified it as the work of a Master.

C. DOCUMENT ORGANIZATION

The Mission Valley Historic Context Statement identifies development patterns and significant properties in the area. The document is organized as follows:

- **Section I – Introduction** provides an introduction to the document and defines the geographical boundaries of the study area.
- **Section II – How to Use this Document** provides an overview of the purpose of historic contexts, regulatory designation programs, and report organization.
- **Section III – Historic Context, Significant Themes, and Related Property Types** includes a narrative of the area's developmental history. The history is broken down into periods which are defined by events, themes, and development trends. Property types associated with each of the periods are identified and analyzed. Analysis includes an architectural description, a list of character-defining features, an evaluation of historic significance, a summary of integrity considerations, and associated property study list.
- **Section IV – Appendix** includes a section on architectural styles and a study list of properties of architecture or thematic interest within Mission Valley.

SECTION III HISTORIC CONTEXT, SIGNIFICANT THEMES, AND RELATED PROPERTY TYPES

INTRODUCTION

This section provides a discussion of each of the historic themes important to the development of Mission Valley and the property types that are associated with those themes in a significant way. Mission Valley includes all of the land between overlying mesas on the lower ten miles of the San Diego River from the rocky construction of Mission Gorge to the lowlands of Mission Bay. The San Diego River, which runs through the center of Mission Valley and empties out into the San Diego Bay, played a key role on how Mission Valley has developed to the present time.

PRE- SETTLEMENT (Pre-1769)

The history of Mission Valley began long before the arrival of Spanish missionaries and soldiers in 1769. Originally home of the Kumeyaay tribes, the area had been inhabited for thousands of years prior to the development of the area by Europeans. Villages and settlements, such as Kosaii/Kosa'aay/Cosoy and Nipaguay, were located at modern-day Mission Valley, dotted the valley floor for centuries, as the groups were drawn by the water of the river and the abundance of plant and animal life.[1]

Mission Valley was known to the Spanish as "La Canada de San Diego," translated as "The Glen of San Diego" and the San Diego River was the center of life. The first mention of the San Diego River was in the diary of explorer Sebastian Vizcaino. In 1602, Vizcaino left San Diego Bay to explore False Bay (now Mission bay) and reported that it was a "good port, although it had at its entrance a bar of little more than two fathoms depth, and there was a very large grove at an estuary which extended into the land, and many Indians."[2]

Associated Property Types

No built environment is known to exist from Mission Valley's pre-contact period. The pre-contact and associated Tribal cultural and archaeological resources are addressed in the Cultural Resources Constraints Analysis of the Mission Valley Community Plan Update.

SPANISH AND MEXICAN PERIOD (1769-1847)

When the Spanish returned in 1769 with the intent to settle the area, Mission Valley and the San Diego River was found to be a "river with excellent water" by Captain Vincente Vila of the ship *San Carlos.*[3] Soon thereafter a land expedition led by Gaspar de Portola reached San Diego Bay, where they met

those who had survived the trip by sea on the *San Antonio* and the *San Carlos*. Initially, camp was made on the shore of the bay in the area that is now downtown San Diego. However, lack of water at this location led to moving the camp to a small hill closer to the San Diego River near the Kumeyaay village of Kosaii/Kosa'aay/Cosoy. The Spanish built a primitive mission and presidio structure on the hill near the river. The first chapel and shelters were built of wooden stakes and brush, with roofs of tule reeds.

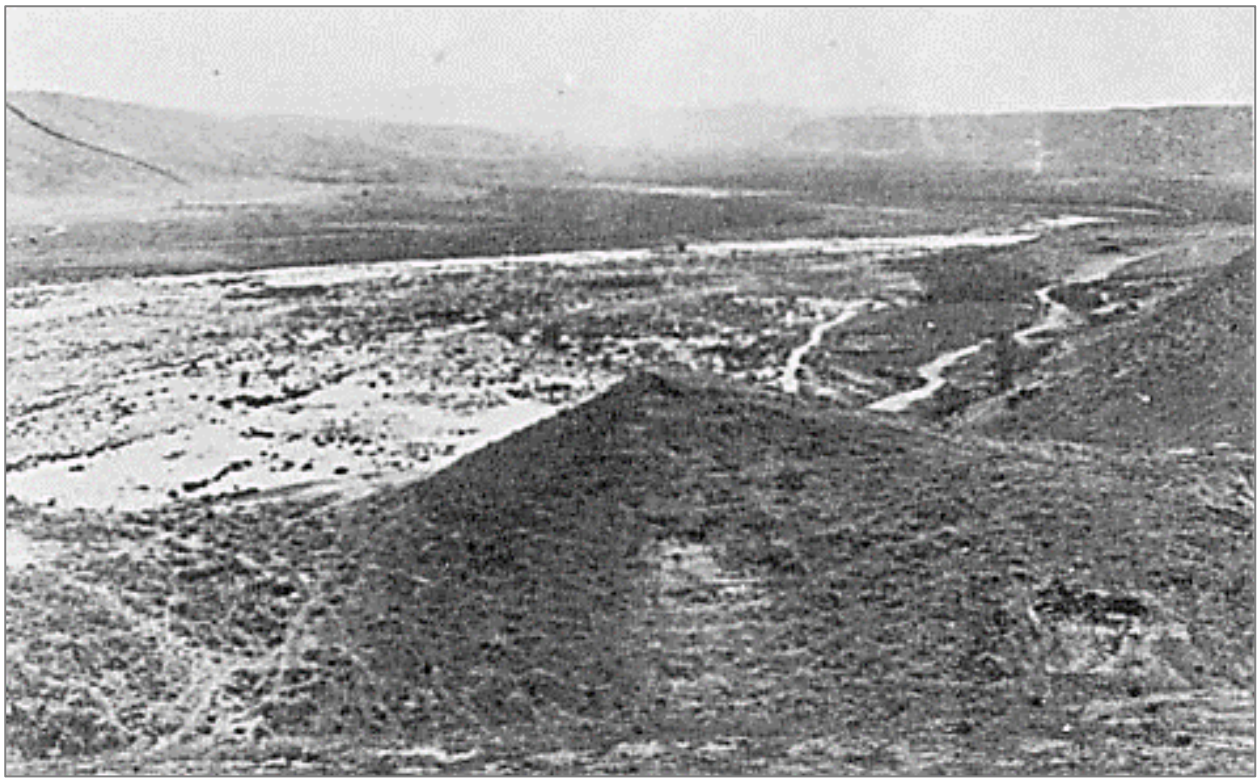

Figure 3-1: Mission Valley, dated 1847. Source: San Diego History Center.

Ill feelings soon developed between the native Kumeyaay and the soldiers, resulting in construction of a stockade. The original log and brush huts were gradually replaced with buildings made of adobe bricks. Pitched roofs with rounded roof tiles eventually replaced flat earthen roofs. Clay floors were eventually lined with fire brick.

Theme: Establishment of the Mission

The padres recommended that the Mission be moved further east in the valley. According to Father Serra's first report of the Mission, "It is determined to move the Mission within the same Canada of the port toward the northeast of the presidio, at a distance of a little less than two leagues. The place is much more suitable for a population, on account of the facility of obtaining necessary water, and

on account of the vicinity of good land for cultivation. The place is called Nipaguay."[4] The move was accomplished in August of 1774 and Mission Valley became its permanent location.[5]

Figure 3-2: Mission Valley looking northeast towards the Mission San Diego de Alcala, n.d. Source: Heritage Architecture & Planning Archives.

The first chapel at that location was built of willow poles, logs, and tule. After it was burnt down during the Kumeyaay uprising of November 5, 1775, the first adobe chapel was completed in October 1776 followed by construction of the present church in 1777. A succession of building programs through 1813 resulted in the final quadrangle where the church formed one side with housing and

classrooms forming the other three sides. The Mission grounds included a church, bell tower, sacristy, courtyard, residential complex, workshops, corrals, gardens, and cemetery. [6]

Life for the new settlers at the San Diego presidio was isolated and difficult. The arid desert climate and conflicts with Native American population made life difficult for the Spanish settlers. According to British Captain George Vancouver who visited in 1794, the military were supported by the fields and labors of the missionaries and the Native Americans.[7] They raised cattle and sheep, gathered fish and seafood, and did some subsistence farming along the San Diego River valley.[8]

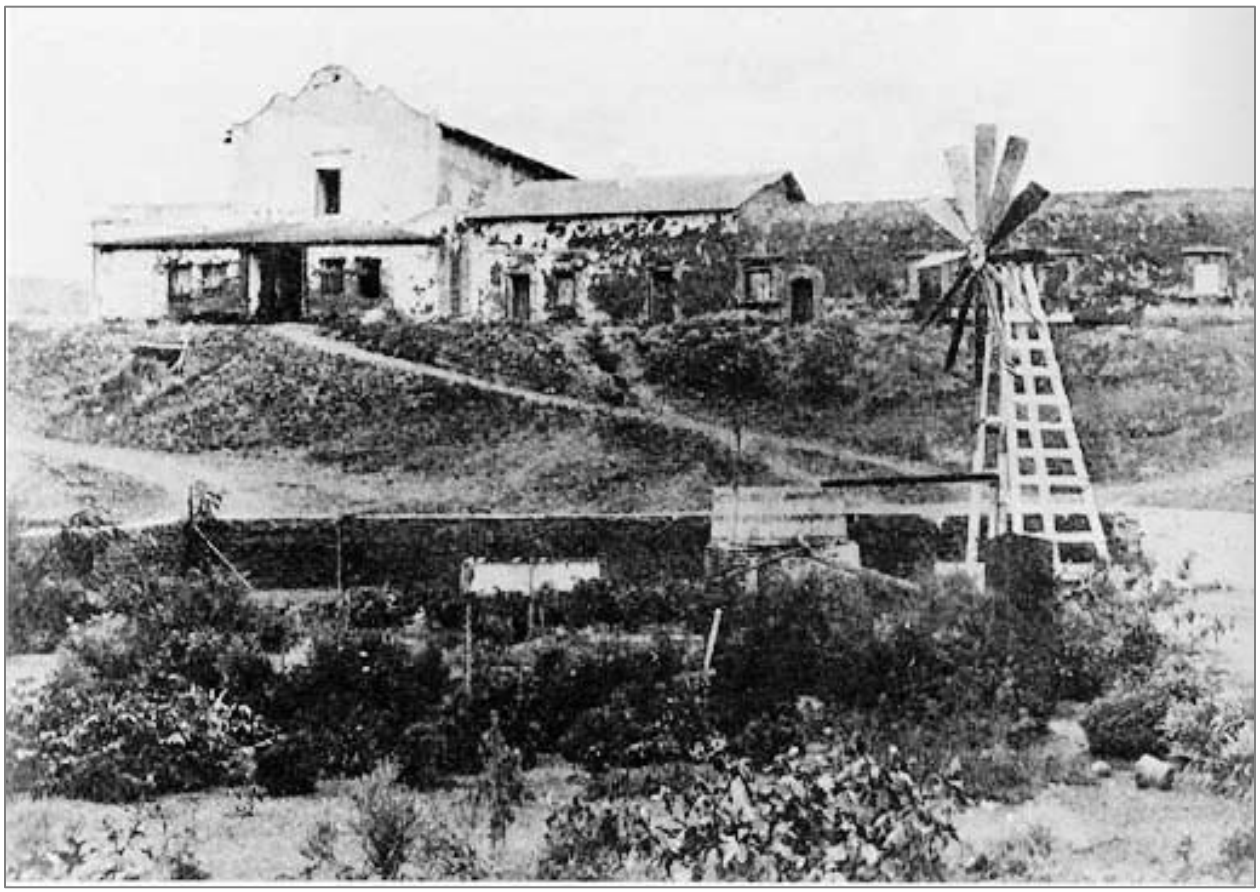

Figure 3-3: Mission San Diego de Alcala, dated 1874. Source: San Diego History Center.

A dam and aqueduct were started in 1807 using Native American labor. The River was dammed at the head of Mission Gorge and an aqueduct was run nearly six miles through a rugged canyon to the fields of the Mission. At the Mission, the water was stored in a small basin. Construction of the flume involved creation of an earthworks system sufficient to support the mission tiles and bricks used to

line the canal.[9] With the advent of a more reliable water supply, Mission agriculture flourished. Vineyards, orchards and crops were successful, as were herds of cattle.[10]

In 1822, Mexico declared its independence from Spanish rule, and San Diego became part of the Mexican Republic. Mexican independence led to the final demise of California's mission system and in 1834, the Mexican government secularized the San Diego mission. The Act of Secularization and the Decree of Confiscation removed the administration of the mission from the Franciscans to the Mexican administrators.

The Mexican government opened California to foreign trade bringing manufactured goods from Europe in exchange for California's cattle hides. As the hide trade grew so did the need for additional grazing lands. Privatized land grants were issued establishing the rancho system of large agricultural estates.

Native Mexican Franciscan Francisco Garcia Diego y Moreno became the first Bishop of the California occupying the Mission until 1842 but only a few of the main buildings were habitable. In 1846, Governor Pio Pico sold the lands of Mission San Diego de Alcalá to prominent Californio Santiago Arguello, a former commandante of the Presidio from 1830-1835.[11] The land grant known as the Rancho Ex-Mission San Diego was approximately 58,875 acres. Arguello never lived on the former mission lands; but made his home at Rancho Tia Juana. In 1848, California was ceded by Mexico to the United States under the Treaty of Guadalupe Hidalgo.

During this period, definite paths developed between the Mission and the Presidio, and essentially the present network of roads in Mission Valley was created.[12] The La Playa Trail is known as the earliest European trail in the western United States, although the Kumeyaay have traversed this roadway prior to 1769. The Trail stretches from the harbor entrance at Point Loma to the Mission San Diego de Alcala in Mission Valley, and beyond.[13]

Portions of the La Playa Trail run through Mission Valley and is the main link between the Mission and La Playa, in present day Point Loma. In the 1930s, the San Diego Historical Society developed a program of marking the 12-mile trail. A marker is located at the Mission site.

In the valley, the path along the northern side of the River became known as Friars Road in remembrance of the Mission's priests. The path on the southern side was referred to as Mission Road.

Associated Property Types

Property types comprise of individual resources including religious buildings (Mission/Church), cemeteries, and sites. The property types within this context are significant in the areas of exploration/settlement, social history, and ethnic history for their association with important events families, and/or persons dating from the Spanish and Mexican era settlement.

Character-Defining Features:

- Adobe construction
- Arcade
- Curved, pedimented gables
- Terraced bell towers
- Wide, projecting eaves
- Unadorned wall surfaces
- Tile roofs

The property types associated with the Spanish and Mexican period have been listed and include historic sites and reconstructed buildings including the Mission San Diego de Alcalá (HRB#113; NR 1970-04-15). The Mission San Diego de Alcalá is known as the Mother of the Missions as it was the first of 21 Spanish missions established, in part, by Father Junipero Serra. The mission was founded in 1769. The present church is the fifth in the history of the mission, four of which were on the mission's present site. The fourth and final reconstruction of the Mission Church took place in the

1930s and is built of reinforced concrete. The decorative and adobe tiles within the Church are reproductions of the originals, hand hewn timbers and lintels make up the roof, and wrought iron hardware is of the style of the Mission era. The Mission is located at 10818 San Diego Mission Road.

AMERICAN PERIOD (1848-1975)

At the conclusion of the Mexican-American War, California was ceded by Mexico to the United States under the Treaty of Guadalupe Hidalgo in 1848. The transfer of control of California from Mexico to the United States would represent a significant turning point in the development of San Diego. Prosperity for the city would be elusive for many years as American interests after 1850 were focused on the gold fields of the Sierra Nevada as well as opportunities in San Francisco and Los Angeles.

By 1850, San Diego began to develop under land speculators like William Heath Davis and Alonzo Horton. Davis, along with Andrew Gray and several investors, began purchasing 160 acres and laid out a subdivision named New San Diego. Davis, the wealthier of the partners, paid for the construction of the wharf and imported prefabricated houses to stimulate sales. The enterprise, however, failed and within years New San Diego became known as "Davis' Folly."[14] In 1867, growth of San Diego became realized with the arrival of Alonzo Horton who acquired 800 acres in present-day downtown. Horton had a subdivision map drawn, went back to San Francisco, opened a real estate office, and began to sell land. By 1870, 2,300 people lived in New Town San Diego.[15] The city would continue to grow as the promise of the railroad made commercial and economic success viable. The city underwent a "boom and bust" cycle in the 1880s but recovered and continued to grow into one of the largest cities in the United States. As the expansion of New Town and its surrounding communities gained momentum, Mission Valley, remained predominately rural.

In his survey of the San Diego River in 1853, Lt. George H. Derby records the area as Mission Valley due to the proximity of the Mission San Diego de Alcalá.[16] By 1870, Mission Valley becomes the adopted name.[17]

Due to earlier political separation of Mission Valley between the presidio and the mission, individual land patents were necessary for the city and county portions. The eastern portion of Mission Valley was included in the land patent for Ex-Mission lands belonging to the county and were divided into irregular lots. The western portion of Mission Valley was covered in the land patent for the Pueblo Lands of the city of San Diego and were divided in quadrangles. The border appears to be where the I-805 currently runs through the valley but has since disappeared as a result of later development.

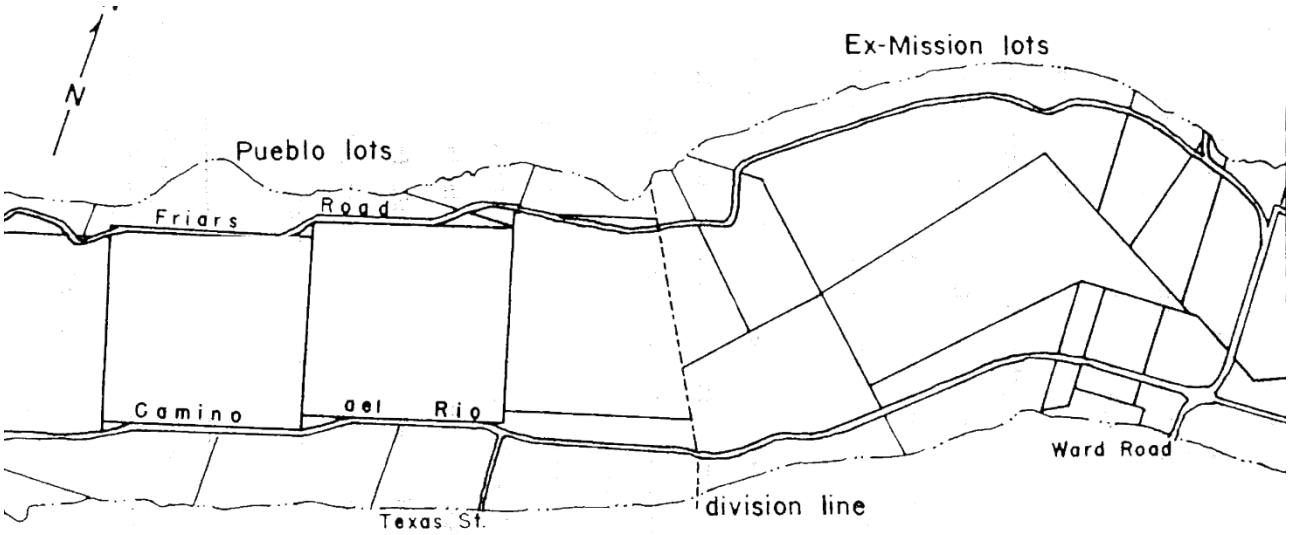

Figure 3-6: Detail of the division line between the Pueblo lots and Ex-Mission lots. Source: Virgil Raymon Henson,"Mission Valley, San Diego County, California: A Study in Changing Land-Use from 1769-1960."

Following the Treaty of Guadalupe Hildalgo, the United States military set up post in the abandoned Mission San Diego de Alcalá from 1846-1862. The army divided the church into two stories, using the top for dormitories and the bottom as stables. After the military left, the church fell into ruins and the mission was returned to the church and utilized as a school from 1887-1907.[18] In 1891, Father Ubach began the efforts to restore the Mission.

Theme: Development of Natural Resources (1850-1968)

Other parts of the San Diego River valley began to draw homesteaders with interest in dry farming which utilized specific cultivation techniques for lands associated with drylands, that is, areas characterized by a cool wet season followed by a warm dry season. Dry farm crops in the valley included oats, barley, and alfalfa. During the next few years as the ranchers continued to work and cultivate their land, many began to sell their surplus crops, operating as local truck gardens which raise and sell fresh produce at local markets. The farm lands were intensively cultivated, producing tons of vegetables each year. The farmers added poultry, orchards, and vines to the list of products produced in the valley. City/County Directories dating to 1887-1888 reveal the following Mission Valley ranchers: Serano D. Allen, H.J. Cleveland, C.B. Baskill, J. Hornback, John Varney, and George Vasey. Most were located at the south side of the River, but there were a few that were located at the northern

portion. Sandrock Grade, known as Texas Street today, was one of the few roads that crossed the San Diego River. Grocer C.W. Sandrock operated his store at the foot of Sandrock Grade.[19]

Figure 3-7: Mission Valley, 1890. Source: San Diego History Center

As little money could be made in truck farming, soon dairies became a part of Mission Valley's landscape. The valley provided the large, flat areas needed for dairy operations. In addition, the cost for land in the valley was cheap, as most people feared the floods from the San Diego River.[20] An 1893 *Union* advertisement offered 400 acres of level land in Mission Valley for $60 an acre.[21]

The first commercially successfully dairy farm was the Allen Dairy owned by Sereno Allen from Kansas. The Dairy initially delivered milk door-to-door on horseback as early as the 1880s.[22] By the 1920s and 1930s, the Allens sent their milk trucks up to Mission Hills and Hillcrest via the steep canyon path near their dairy known as "Allen Road" or "Allen's Dairy Road" up towards Fort Stockton Drive. Portions of this road still exist as Allen Road Trail. The dairy prospered under sons Fred and Harvey, who also owned two ranches in the valley and kept a retail shop in Hillcrest.[23] The Allen Dairy operated in Mission Valley until 1957 when it relocated to El Cajon.

The Ferraris established a dairy farm in Mission Valley with operations dating from 1914-1968. Louis Ferrari, an immigrant from Genoa, Italy initially purchased 60 acres of land in 1896 and began truck farming. While many of his neighboring ranchers turned to dairy farming, Ferrari eventually followed suit and turned to dairy farming. He initially started with 30 cows, his first barn, and several horse stables.[24] Ferrari later joined the Challenge Cream and Butter Association, which established a cooperative located at the southeast corner of the valley and eventually became a major retailer of dairy products. Ferrari's son, Pete Ferrari, later took over and expanded the business and by World War II, it became the biggest dairy in San Diego producing 600 gallons a day.[25] By the 1950s, Mission Valley had 20 dairy farms that dotted the landscape.[26]

38. Hilkowitz
39. Jaussauds
40. Teisseire
41. Barry Jakes
76. Summers

Aiding in the maintaining the rural landscape were sand and gravel plants littered throughout the valley. The sand and gravel industry in Mission Valley began modestly in 1913 and expanded in earnest in the 1920s-1930s. Sand and gravel operations and related activities once occupied about 596 acres within the valley. Primary sources were sands along the San Diego River and Murphy Canyon area, and the conglomerate rocks in adjacent Serra Mesa. These plants were essential to fostering materials utilized for construction and development of many of local neighborhoods throughout the city. Furthermore, although extraction of materials from the valley was not a recent practice, the development of the sand and gravel plants into large businesses during this period was influential. Some of these companies later diversified and included the V.R. Dennis Construction Company, Ed Denton's American Sand Plant, H.G. Fenton, Nelson and Sloane, Griffith Company, Caudell and Johnson, Woodward Sand Company, Daley Corporation, and R.E. Hazard Company. Many of these companies were highly influential in the development and construction of local buildings and infrastructure throughout the city with many of their names memorialized and stamped along city sidewalks.

Figure 3-11: Gravel pit in Mission Valley, ca. 1940s. Source: San Diego History Center.

Circulation networks during this period were generally dirt, gravel, or paved roads connecting the ranches to the primary roads. Improvements to the community's transportation network were undertaken beginning in the 1930s. Unlike the subdivisions of the communities located along the mesas, Mission Valley maintained much of their dirt roads which were often muddy and impassable during rainy seasons.

Early access roads to and from the valley to the upper mesas correspond to present-day roadways such as Ward Road at the east, which also provided a direct link to the Mission; Sandrock Grade (now Texas Street); and the 6th Street Extension also referred to as Mission Grade/Poor Farm Grade, now Hwy 163.

Along with these roads were private roads which included Allens Road, located a quarter mile east of the Presidio, which directly connected Allen's Dairy to Fort Stockton in Mission Hills. Today, only the south portion of the complete pathway has been paved. Bachman Place (sometimes referred to as Homeland Place) provided a route from the Valley to the County Hospital, just west of the 6th Street Extension (Highway 163). It is now a private road for UCSD Medical Center and connects to Hotel Circle South on the north end.

Early maps record west-to-east roads running parallel on both the north and south side of the San Diego River. The northern road was always referred to as Friars Road and the south side was initially known as Mission Road, but was later renamed Camino del Rio.[27] By the early 1930s, Camino del Rio's dirt road was replaced with a two-lane paved road by the San Diego County Highway Development Association and was constructed by the Work Projects Administration.[28] "Paving was of immeasurable value to farmers and dairymen, and would have probably served rural valley for years, but the roads also opened the valley to those who wished to reside there and commute to work in the urban portions of San Diego. The result was that the valley was made ready for the first serious encroachments of urbanism, non-farm residences."[29]

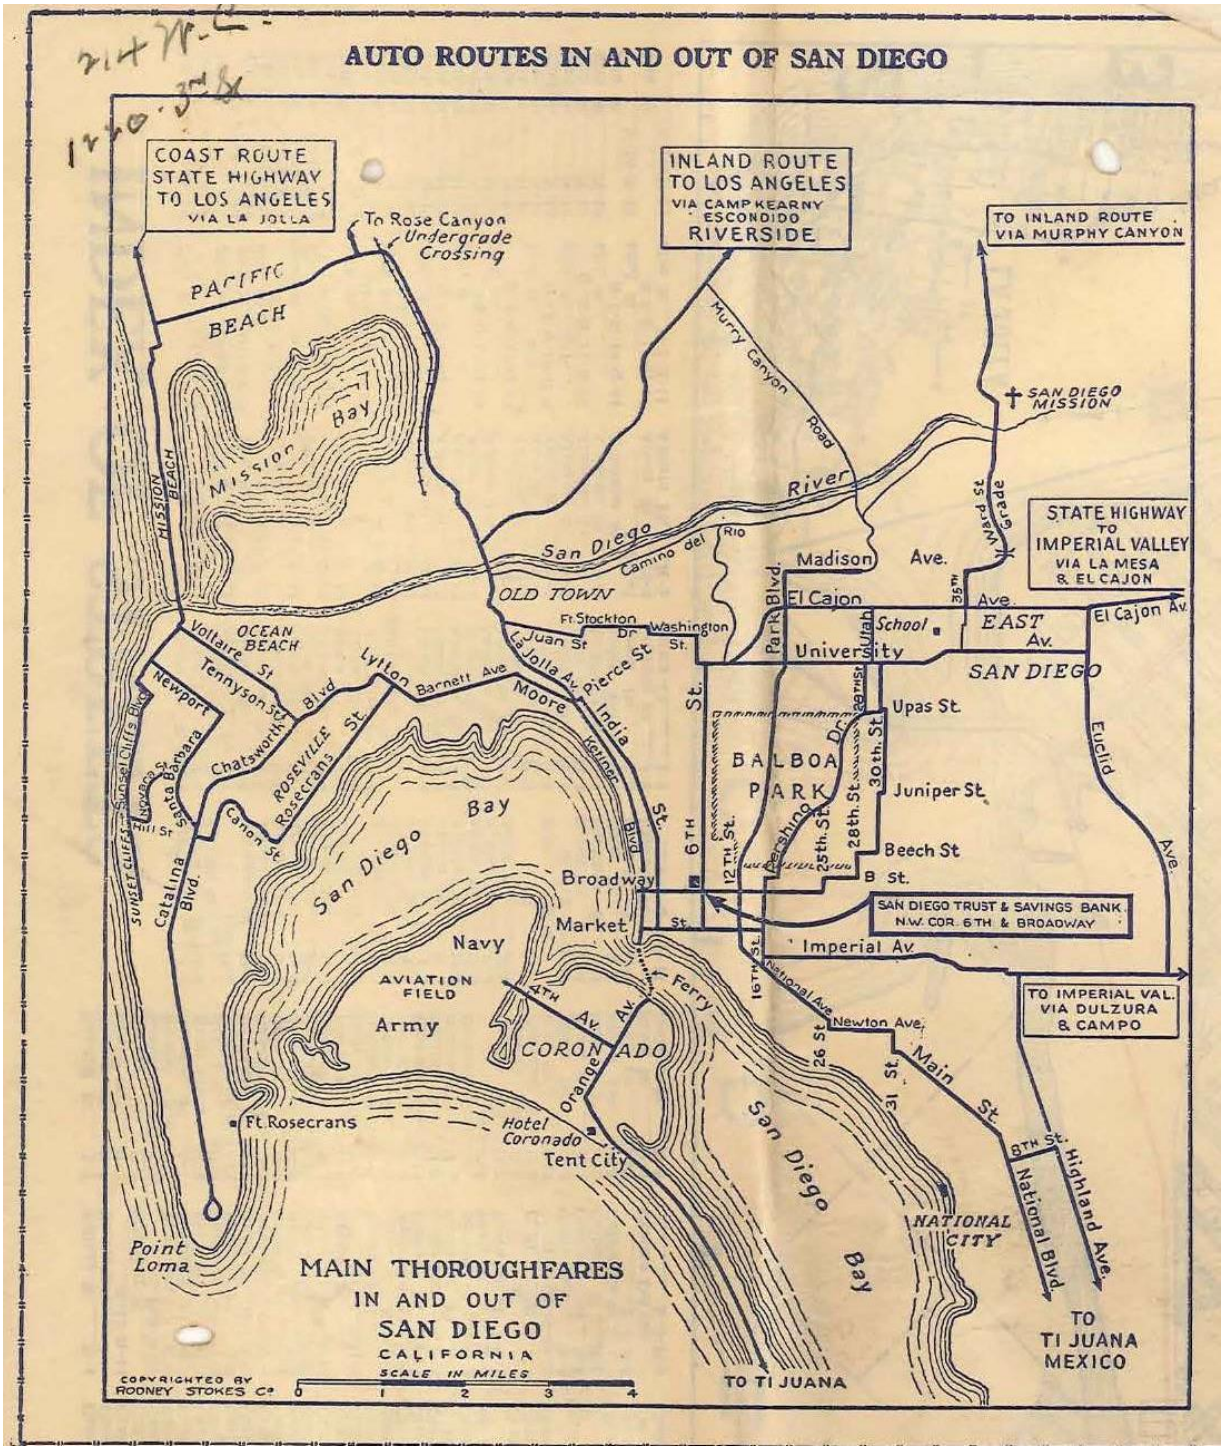

Figure 3-13: A portion of the 1926 Rodney Stokes map showing the early automobile routes to and from Mission Valley.

Associated Property Types

Ranches dominated the landscape during this period of development. Ranch sites encompassed a cluster of buildings generally containing a primary residence, typically of a simple, vernacular style; barns for livestock and equipment; stables; outbuildings reflecting the property's use; and housing for workers. Other buildings, structure, or objects designed for various functions associated with the property include cisterns, windmills, privies, and corrals for dairy cows or other animals.

Due to later development, most of these properties did not survive. The few buildings that may have survived, are primarily vernacular ranch houses, one- to two-story in height with wood siding, gabled roofs, and wood windows. In rare occasions, other related ranch buildings may still be extant. Properties are located on both Camino del Rio North and Camino del Rio South.

Character-Defining Features:

- Domestic buildings include vernacular primary residences, usually wood-framed and two-stories.
- Barns for housing and feeding livestock or storing equipment generally dominate the cluster in size and scale.
- Small-scale elements may include signs announcing the ranch's name, water and feeding troughs, corrals, windmills, and cattle guards.

Figure 3-14: Fagerheim Dairy, 1927. The ranch included a residence that was set back from Friars Road and four barns in front. Source: "Life Along the San Diego River." The Reader*, July 25, 2002.*

Eligibility Criteria and Integrity Thresholds

Significance Evaluation
The ranch site and its associated buildings, represents a critical component of the agricultural history of Mission Valley. Ranches may be individually significant under the NRHP Criterion A/CRHR Criterion 1 if they are associated with events that contributed to the broad patterns of local history, particularly in regard to the agricultural and dairy industry and development; or under HRB Criterion A if they represent special elements of the City's or Mission Valley's historical development.

Associated ranch sites and their resources may be individually significant under NRHP Criterion B/CRHR Criterion 2 or HRB Criterion B if the property was association with persons or a family significant in local history or have made a significant contribution to the dairy industry.

Eligibility under NRHP Criterion C/CRHR Criterion 3 if they embody the distinctive characteristics of a style, type, period, or method of construction; and/or HRB Criterion C as a resource that embodies the distinctive characteristics of a style, type, period, or method of construction. Because many of the buildings associated with the ranch's form and function are synonymous to their use, buildings may exhibit only a few character-defining features.

Significance under other criteria may be identified following future site-specific survey and evaluation.

Essential Factors of Integrity
Due to their relative rarity, extant ranch-related buildings may not retain their historic setting and still be eligible, particularly under local criteria. A property significant under NRHP Criterion A, CRHR Criterion 1, and HRB Criterion A may possess location, feeling, and association. Under NRHB Criterion B, CRHR Criterion 2, and HRB Criterion B, location, feeling, and association must also be present. For NRHP Criterion C, CRHR Criterion 3, and HRB Criterion C, design, materials, and feeling should be retained. In all cases, the building's original use may have changed.

Theme: Modern Commercialization, Tourism, and Commercialization of the Valley (1940-1970)

Mission Valley's character as it exists today, began to take shape during the Post-WWII era. Prior to World War II, commercial development around Mission Valley was random and sparse and mostly serviced the local farmers. Open areas around the major principle traffic arteries attracted early businesses, which were initially mostly recreational related. Resistence to development began as early as 1940 with the birth of the Mission Valley Improvement Association which hoped to prevent the area from development. However, with the ease of access in and out of the Valley by expansion of

the freeway system, developers began to scout undeveloped areas along the principal traffic arteries, namely Camino del Rio, Hotel Circle, and Friars Road.

A second wave of roadway and freeway expansions during this period facilitated commercial development along the valley which catered to both locals and tourists alike. It was these transportation networks through the valley connecting downtown and the suburbs with new Post-World War II auto-oriented suburbia, that helped set the stage for the development of Mission Valley as a commercial and recreational destination.

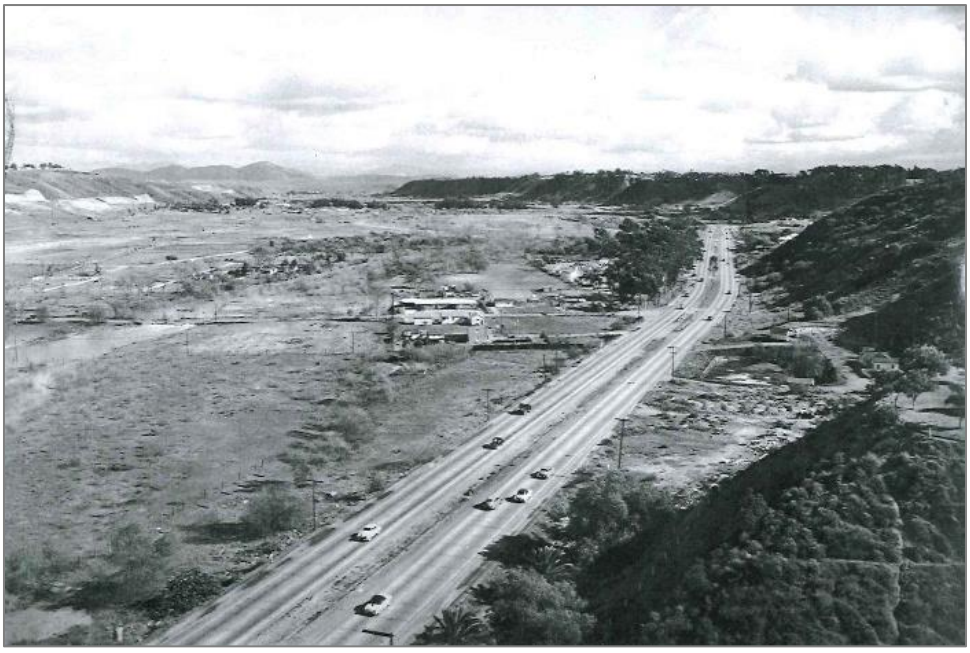

Figure 3-15: Mission Valley looking east, dated 1951. Source: San Diego History Center.

The increase in population brought on by World War II in the surrounding communities of La Mesa and El Cajon to the east and the development of Linda Vista and Kearney Mesa to the north created a need for additional east-west and north-south access routes through the city. This included the conversion of the 6th Street Extension into the Cabrillo Freeway (US Route 395, now SR-163) from 1946-1948. The two-lane Camino del Rio could no longer meet the high commute demand and eventually the Mission Valley Freeway (US 80, now I-8) was constructed and then expanded to include four lanes by 1953. Two years later, these routes were converted to full freeways with eight lanes resulting in large sections of Mission Valley land changed from farm use to transportation use. By 1960, over 350 acres had been switched to transportation. Over 50,000 vehicles a day passed through the Valley on these new highways and the traffic would grow continuously in the coming decades.

Planning for an inland north-south freeway mirrored the valley's development. In 1967, construction of the Interstate 805 began. It would cross both the I-8 and the San Diego River and would bisect Mission Valley at the center. The I-805 was a late addition to the freeway system in San Diego and was completed in 1971. The 3,900-foot Mission Valley Viaduct, the top stack of which was later named the Jack Schrade Interchange, a four-level symmetrically stacked interchange that allowed a smooth flow of traffic between the I-805 and I-8 freeways, was at one time the longest concrete box girder bridge in the world.

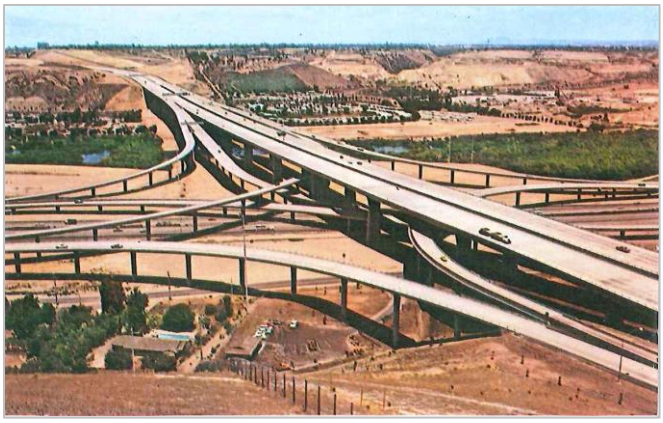

Figure 3-16: I-805 completed in 1971. Source: Heritage Architecture & Planning Archives.

The ease of access brought on by the freeways facilitated the growth and development of destinations for retirement- and tourist-related entertainment and recreation. It was to be an extension of Mission Bay, complete with golf courses, resort hotels, and open space.[30] Mission Valley's location for this type of land use was also key due to its close proximity to other major city tourist attractions and was incorporated into a "Tourist Loop" along with Balboa Park, Shelter Island, and Mission Bay that was envisioned by City Planners. [31]

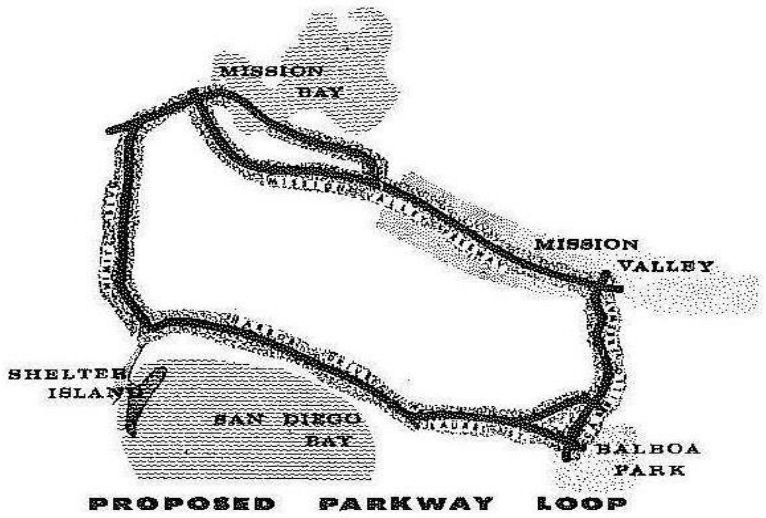

Figure 3-17: "Tourist Loop" as envisioned by City Planners, in their 1960 land use study.

[31] City of San Diego Planning Department, "Mission Valley Plan: A Land Use Study." November 1960.

The presence of the freeway contributed to the substantial numbers of commercial establishments in direct response to traffic along the route and along major roads such as Camino del Rio and Hotel Circle. These sites utilized Modernist architectural styles such as Ranch, Contemporary, Tiki-Polynesian, Futurist/Googie, and Brutalist in their design.[32] Developers such as Charles H. Brown and William Sample, Jr. of Atlas Hotel, Inc. and A.A. Stadmiller, Paul Borgerding, and Harry Handlery hired modernist architects and designers for their projects including Ronald K. Davis; Deems Lewis Martin & Associates; Frank L. Hope & Associates; John R. Mock; Richard Wheeler; Perkins, Will, Inwood; Leonard Veitzer; William Pereira; and Hal Sadler of Tucker, Sadler & Bennett.[33]

Sub-Theme: Sports, Recreation, & Leisure

In the 1940s, the rural environment of the valley attracted recreation and leisure activities such as horse farms, riding stables, and polo clubs. At that time, Mission Valley was advertised as a horse's paradise containing twenty miles of bridle trails.[35] In 1947, the Mission Valley Golf Club was established along the agricultural greenbelt of the San Diego River. Its popularity and challenging layout made it one of the best golf courses nationwide. It later attracted the professional golf tour in 1957 when it hosted the San Diego Open Invitational, in which Arnold Palmer won that same year. The club was renamed Stardust Country Club in 1962.

Commercial-recreational facilities were also encouraged. Bowling was a very popular sport and recreational activity during the 1950s. As a result, the Bowlero Bowling Alley opened in 1957 along Camino del Rio South. At the time of its construction it was the largest bowling center in the west and included 56-lanes and a lounge. By 1965, the bowling alley closed, and new ownership and occupancy was assumed by the Scottish Rite Valley of San Diego.

Figure 3-18: Bowlero, early 1960s. Source: www.pillartopost.org

[35] Ibid.

Businessman C. Arnholt Smith, owner of Westgate-California Tuna Packing Co., had acquired the Pacific Coast League (PCL) Padres and immediately began to make plans to develop a new, modern stadium for the minor league team in 1955. He set his eyes on the undeveloped Mission Valley. After approval by the City Council in 1956, an aggressive construction schedule began, which included the surfacing of Friars Road. Westgate Park was opened to the public on April 28, 1958.

Figure 3-19: Westgate Park, ca. 1958. Source: San Diego History Center.

That same time in 1958, the Los Angeles-based football team, the Chargers, expressed interest in moving their team to San Diego with hopes of a new, larger municipal stadium in Mission Valley.[36] They temporarily moved into the 1914 Balboa Stadium in Balboa Park and played their first game on August 6, 1961. In order to retain the national league football team, the City would have to provide a large facility. In November 1965, a $27 million bond was passed, allowing construction to begin on a new multi-purpose stadium. The stadium's location would be in "fast-growing Mission Valley."[37] "The…stadium is '20 minutes away from 90 percent of the population of San Diego County, making it the most accessible stadium anywhere."[38]

The construction of the San Diego Stadium (now SDCCU Stadium) from 1966-1967 by architect Frank L. Hope's office, took more of the valley land away for large parking lots and stadium grounds.[39] However, at its completion, the Stadium's design would mark the first ballpark to receive the distinguished National AIA Design Award and its televised exposure would aid in bringing national attention to the area. Westgate Park was demolished in 1967 to make room for Fashion

Valley Shopping Center following the Padres' relocation to the new joint use stadium.[40]

The San Diego Stadium's multi-purpose design concept departed from the "cookie-cutter" circular plan that was being used at the time. For many of the newer multi-purpose stadia, the "cookie-cutter" circular plan offered poor sight line angles for spectators at baseball and football games. Instead, the horseshoe shape, originally termed as "supercircle" by the architectural team, would incorporate eight radiuses. The "supercircle" was developed as a result of the architectural team's studies conducted nationwide on six of the most current stadiums built.[41] San Diego Stadium's design would allow spectators of both football and baseball to have an unobstructed sight line to the entire playing field, and to provide a greater quality of choice seats between extensions of the goal lines and first and third base lines.[42] It was a unique design shape of its time and influenced other similar designs such as the 1971 Veterans Stadium in Philadelphia, no longer extant. As part of the original design, the horseshoe shape would also "allow expansion to a total of 70,000 by extending the structure to completely enclose the field."[43] The Stadium development solidified Mission Valley as a regional sports and recreation-destination by establishing two professional sports teams that drew thousands of sports enthusiasts year around.

Associated Property Types

Sports, recreation, and leisure properties in the planning area includes stadiums, bowling alleys, and golf courses.

Character-Defining Features:

- Incorporates Modern architectural styles.
- Buildings were set-back from the public right of way.
- Incorporates ample surface parking with spaces adjacent to and surrounding the facilities.
- Large stadium seating capacities.
- Visitor amenities such as restaurants, lounges, snack bars, and small retail shops were located within the facilities.

Eligibility Criteria and Integrity Thresholds

Significance Evaluation

Sports, recreation, and leisure buildings may be individually significant under the NRHP Criterion A/CRHR Criterion 1 if they are associated with events that contributed to the broad patterns of local history, particularly in regard to commercial history and development; or under HRB Criterion A if

[40] Richard Crawford, "Westgate Park a Major Marvel as Home for Minor-League Padres." *The San Diego Union-Tribune.* April 9, 2009. http://www.sandiegouniontribune.com/news/2009/apr/09/1cz9history191218-westgate-park-major-marvel-home. Accessed July 7, 2015. Westgate Park was demolished in in 1967 when plans were made for a new shopping center, Fashion Valley, on site.

[41] The multi-purpose stadiums built in the 1960s include RFK Stadium (1961), Shea Stadium (1964-2009), Astrodome (1965, 2013 partial demolition), Atlanta-Fulton Co. Stadium (1965-1997), Oakland Coliseum (1966), Busch Stadium (1967-2005), and San Diego Stadium (1967).

[43] Ibid. "Stadium 95% Complete; Solve Scoreboard Problem: Board Reviews Progress." *The San Diego Union.* July 11, 1967.

they represent special elements of the City's or Mission Valley's historical and commercial development.

Eligibility under NRHP Criterion C/CRHR Criterion 3 if they embody the distinctive characteristics of a style, type, period, or method of construction; and/or HRB Criterion C as a resource that embodies the distinctive characteristics of a style, type, period, or method of construction. Candidates for individual listing should be a highly representative example of a significant type or style and/or contain high artistic value.

Significance under other criteria may be identified following future site-specific survey and evaluation.

Essential Factors of Integrity
A property significant under NRHP Criterion A, CRHR Criterion 1, and HRB Criterion A may possess location, setting, feeling, and association.

For NRHP Criterion C, CRHR Criterion 3, and HRB Criterion C, design, materials, and workmanship aspects of integrity are especially important and must be intact for a resource to be eligible. Resources evaluated under Criterion C should also retain most of the character-defining features of their construction types, as well as retain the primary character-defining features of any recognized style identified with the property.

Sports, Recreation, & Leisure Properties Study List

STREET NUMBER	STREET NAME	NOTES

Sub-Theme: Motels/Hotels

Figure 3-21: Looking west at Hotel Circle, ca. 1960, included the Stardust Motor Hotel, Town and Country, Kings Inn, Vagabond Inn, Mission Valley Inn, and Del Webb's Highway House (later Travelodge). Source: San Diego History Center.

The development of Hotel Circle was spearheaded by Charles H. Brown, a local developer, in an effort to increase property values and draw business towards Mission Valley and away from downtown. In the 1950s, Brown helped secure zoning variances from the San Diego City Council, founded Atlas Hotel, Inc. and began developing hotels and motels along the I-8. Conditional use permits were granted by the City Council under pressure, despite the City Planning Department's stance of wanting to preserve open space. To assuage the City's resistance to denser development in Mission Valley, the hotel developers committed to keeping a rural character in Mission Valley with low density, rustic, landscape, garden-themed hotels.[44]

The Town and Country Resort, located at 500 Hotel Circle North, was the first hotel in Mission Valley. It was initially developed by Charles J. Brown in 1953 as a 46-room motor inn. [45] Others soon followed such as the Mission Valley Lodge Stardust Hotel & Country Club. These garden motels along the route were one- and two-stories in height and were comprised of several buildings typically laid out in L or U shape and integrated modern architectural styles of the time.[46] They provided ample parking at the rear or sides of the building. Customers could easily access their car and their motel unit from the exterior doors.

[44] AECOM, "Historical Resource Technical Report for Town & Country Hotel and Convention Center Redevelopment Project San Diego, California." Prepared for Lowe Enterprises, Revised February 2016.
[45] Mary Lou Philips, ed. "Town and Country History." *Town and Country Cookbook.* n.d.
[46] In the postwar period, the terms motel and hotel are sometimes used interchangeably as the properties often had the same function, form, and materials.

Figure 3-22: The Town & Country Hotel was the first garden hotel developed in Mission Valley in 1956. Source: Heritage Architecture & Planning Archives.

Charles Brown, along with developers A.A. Stadtmiller, Paul Borgerding, and Harry Handlery, proposed zoning changes to permit denser hotel development in Mission Valley, with Brown claiming that "limitations of motel development less than 50 percent land coverage for 30 units an acre is not economically feasible," and that "planning staff is not qualified to make such recommendations to hotel men."[47] Brown and the developers were successful in convincing the City Planning Commission to recommend rezoning of western Mission Valley to permit denser development of motels, hotels, and recreational facilities in March 1959. This was followed by the rapid development of five additional hotels, the Stardust Motel, Rancho Presidio Hotel (Hanalei Hotel), Vagabond Hotel, Kings Inn, and Del Webb's Highway House. The seven hotels were located within a mile of each other along service roads on either side of the I-8 forming "Hotel Circle."[48] The low-density concept of the garden-themed hotels was quickly abandoned with the Hotel Circle developers requesting new zoning to allow multistory density in 1963.[49]

Associated Property Types

Figure 3-23: Kings Inn at 1333 Hotel Circle South.

Character-Defining Features:

- Incorporates Modern architectural styles.
- Designed and built as a planned unit.
- Buildings were set-back from the public right of way.
- Ample parking with spaces adjacent to and surrounding the buildings.
- One- to two-stories in height.
- Rooms typically accessed from the exterior door.
- Linear arrangement of buildings, typically I, U, or L-shaped plans.
- Large, free-standing signage near the road or attached to the building.
- Some provide guest amenities such as restaurants, lounges, and small retail shops in separate buildings or adjacent to the main lobby.
- Some incorporate garden features and pools.
- Later multi-story additions were usually located at the rear of the property.

Eligibility Criteria and Integrity Thresholds

Significance Evaluation

The motel industry developed as a hybrid between auto camps and conventional hotels in the 1920s. The combination of easy access to rooms and to the highway, reasonable prices, amenities, and privacy was an attraction to the industry. In the plan area, the convenience of the I-8 and the central location of Mission Valley to other local destinations, was an easy attraction for tourists.

The motel is a building type designed for temporary lodging with direct link between the automobile and the room. A motel evaluated under this sub-theme is significant in the area of commerce with most examples also significant under the area of architecture. They illustrate the evolution of the motel as a significant commercial building type related to the automobile and San Diego's flourishing car culture. They show how a building type's design is shaped by accommodating the needs of the automobile as well as the stylistic economic trends of the day. In most cases, travel accommodating motels should retain integrity of location, association, feeling, and setting as these are important to establish the property's relationship to the commercial development along the I-8 and the establishment of Hotel Circle. Extant, intact examples are becoming increasing rare.

Motels may also be individually significant under the NRHP Criterion A/CRHR Criterion 1 if they are associated with events that contributed to the broad patterns of local history, particularly in regard to commercial history and development; or under HRB Criterion A if they represent special elements of the City's or Mission Valley's historical and commercial development.

Associated motel properties may also be individually significant under NRHP Criterion B/CRHR Criterion 2 or HRB Criterion B if the property was association with persons in local history or have made a significant contribution in the category of commerce within the City.

Eligibility under NRHP Criterion C/CRHR Criterion 3 if they embody the distinctive characteristics of a style, type, period, or method of construction; and/or HRB Criterion C as a resource that

embodies the distinctive characteristics of a style, type, period, or method of construction. Candidates for individual listing should be a highly representative example of a significant type or style and/or contain high artistic value.

Significance under other criteria may be identified following future site-specific survey and evaluation.

Essential Factors of Integrity
A property significant under NRHP Criterion A, CRHR Criterion 1, and HRB Criterion A may possess location, setting, feeling, and association.

Under NRHB Criterion B, CRHR Criterion 2, and HRB Criterion B, location, setting, feeling, and association must also be present.

For NRHP Criterion C, CRHR Criterion 3, and HRB Criterion C, design, materials, and workmanship aspects of integrity are especially important and must be intact for a resource to be eligible. Resources evaluated under Criterion C should also retain most of the character-defining features of their construction types, as well as retain the primary character-defining features of any recognized style identified with the property.

Sub-Theme: Commercial Regional Shopping Centers and Office Development

The large span of open land in Mission Valley also began to attract the potentiality of a large regional shopping center at the center of the Valley. At the same time that the Hotel Circle was rezoned, other areas of Mission Valley were rezoned for general commercial construction, specifically for the Mission Valley Shopping Center developed by the May Company in 1958, which became the precedent for the broad commercialization of the community.

As early as 1954, May Company, based out of Los Angeles, began surveying the San Diego region. According to David May, executive vice president of the nation-wide department store, "San Diego is our first choice of five cities for building a new shopping center of this magnitude."[50] In October 1957, the May Company announced plans for an $18 million "major department store and shopping center in Mission Valley." The original site for the proposed Mission Valley Center included 80 acres located north of US 80 between US 395 and Texas Street which was utilized for truck farming and other agricultural purposes.[51]

[50] May Co. Bares Plan for Valley." *Tribune.* October 9, 1957.
[51] Zone Shift Sought for May Co. Unit." *Evening Tribune.* April. 10, 1958.

In April of 1958, the City Council approved the May Company's request to rezone the 90 acres in Mission Valley for commercial use. Although the project was opposed by a variety of groups, a poll taken in 1958 found that 79% of San Diego residents favored the project. When completed, the project was to provide "the largest and most complete facility for shopping south of downtown Los Angeles." Construction of the shopping center commenced in July 1959 and was completed in February of 1961.[52] Designed by William S. Lewis, FAIA of Deems Lewis Martin & Associates, the construction of the May Company building would change zoning and the community landscape within Mission Valley forever from agriculture to commercial. By the end of the decade, a second regional shopping center was developed by Ernest Hahn. Fashion Valley, partially located at the former Westgate Park property, would boast four anchor stores in 1969.

By the end of the 1960s, office building development began to take root in areas of Mission Valley, particularly along Camino del Rio South and portions of Camino del Rio North. They included low- and mid-rise standalone buildings with flexible interior spaces for single tenant occupancy or multiple tenants. Buildings were set back and surrounded by surface parking adjacent to buildings.

Associated Property Types

Regional Shopping Centers

Large regional shopping centers were retailing destinations that represented a radical break from traditional, individually owned buildings facing the street. The shopping centers were built to the full extent of the lot and were separated from the streets by large parking lots and often featured internal entrances and courtyards. Massive in scale, regional shopping centers were generally anchored by one or several department stores and numerous smaller retail shops. Unlike strip malls, shopping centers incorporated pedestrian courtyards and walkways, creating a unique shopping environment sheltered from traffic and parking lots. The grouping of stores in areas where parking could be made available and access from major highways was a growing trend in San Diego County.

Character-Defining Features:

- Incorporates Modern architectural styles, particularly with the anchor stores.
- Designed and built as a planned unit.
- Buildings were set-back from the public right of way.
- Dedicated surface parking lot on all sides.
- One- to two-stories or more in height.
- Two or more anchor department stores with numerous smaller retail shops placed along an inner, pedestrian walkway.
- Linear arrangement of buildings, typically I or T-shaped plans.
- Individualized, prominently-placed signage for each tenant.

[52] K.A. Crawford, "Macy's, 1702 Camino Del Rio North, San Diego, CA 92108 Draft HRRR." June 2014.

Figure 3-24: Mission Valley Shopping Center, ca. 1961, looking east. Source: San Diego History Center.

Office Buildings

Office buildings in Mission Valley during this period incorporated high-designed Modernist examples in Contemporary, Brutalist, and New Formalist sub-styles.

Character-Defining Features:

- Incorporates Modern architectural styles.
- Buildings were set-back from the public right of way.
- Dedicated surface parking lot adjacent to the building.
- Low- to mid-rise standalone buildings with varying massing. Some high-rise examples possible.

Figure 3-25: UFCW Local 135 offices along Camino del Rio South. Note the expanses of glass at the entry and the use of metal decorative metal grilles at the left.

Figure 3-26: San Diego Community College District Offices at 3375 Camino del Rio South. Note the building's symmetrical composition, simple geometric form, flat roof, clear expression of structure and materials, and large expanses of glass.

Eligibility Criteria and Integrity Thresholds

Significance Evaluation

The commercial, regional shopping centers, and office properties may be individually significant under the NRHP Criterion A/CRHR Criterion 1 if they are associated with events that contributed to the broad patterns of local history, particularly in regard to commercial history and development; or under HRB Criterion A if they represent special elements of the City's or Mission Valley's economic, cultural, and/or historical development. Resources should be considered in the context of significant companies, developers, or categories of commerce within the City.

Eligibility under NRHP Criterion C/CRHR Criterion 3 if they embody the distinctive characteristics of a style, type, period, or method of construction; and/or HRB Criterion C as a resource that embodies the distinctive characteristics of a style, type, period, or method of construction. Candidates for individual listing should be a highly representative example of a significant type or style and/or contain high artistic value. While some of the office development may be less than 45 years old, there may be early and/or exceptional examples that still merit designation.

Significance under other criteria may be identified following future site-specific survey and evaluation.

Essential Factors of Integrity

A property significant under NRHP Criterion A, CRHR Criterion 1, and HRB Criterion A may possess location, setting, feeling, and association.

For NRHP Criterion C, CRHR Criterion 3, and HRB Criterion C, design, materials, and workmanship aspects of integrity are especially important and must be intact for a resource to be eligible. Resources evaluated under Criterion C should also retain most of the character-defining features of their construction types, as well as retain the primary character-defining features of any recognized style identified with the property.

Commercial, Regional Shopping Centers, and Office Properties Study List

STREET NUMBER	STREET NAME	NOTES
3255	Camino del Rio South	County of San Diego Behavioral Health Services (originally Industrial Indemnity Co.)
3375	Camino del Rio South	Charles W. Patrick Building, San Diego Community College District Offices
2001	Camino del Rio South	UFCW Local 135
350	Camino de la Reina	San Diego Union-Tribune
7007	Friars Road	Fashion Valley
1640	Camino del Rio North	Westfield Mission Valley (formerly Mission Valley Shopping Center)

Sub-Theme: Residential – Apartments

Unlike other neighborhoods, residential properties within Mission Valley came much later following the commercialization of the valley. Briefly starting in the late 1960s with a brutalist designed apartment complex located on Friars Road, the complex was designed by Tucker Sadler and included views into the adjacent golf course site. A wave of residential development did not readily follow until the 1970s when apartment complexes began to develop further east above the Mission San Diego site along Rancho Mission Road. These later apartment developments were generally two-stories complexes that did not incorporate strong stylistic statements. The apartments were generally rectangular in shape with entry to units along the exterior.

Associated Property Types

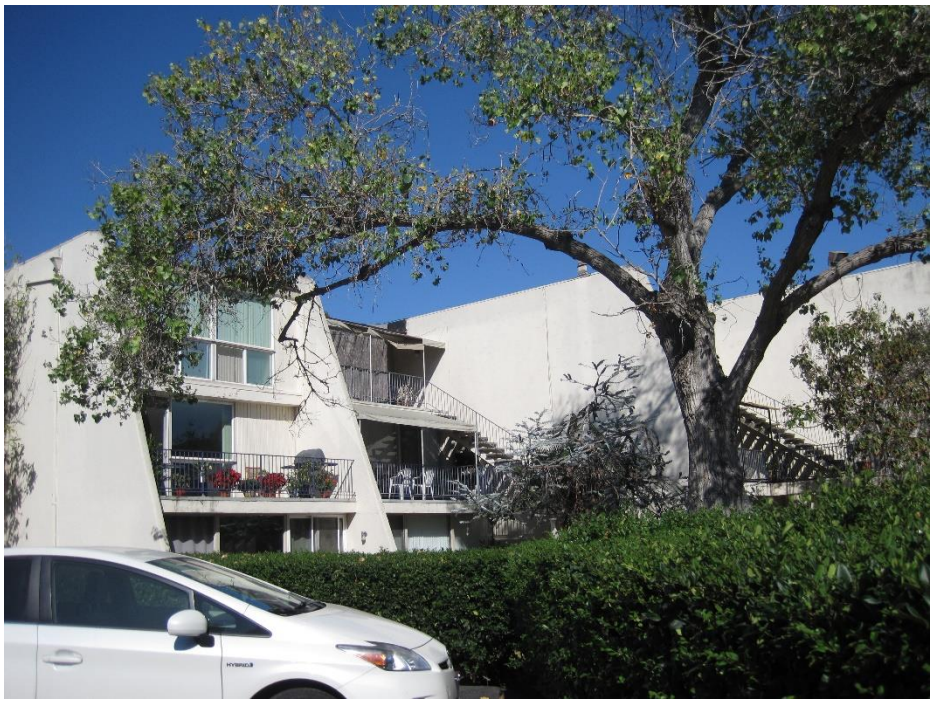

Figure 3-27: 1965 apartment complex designed by Tucker Sadler along Friars Road.

Character-Defining Features:

- 1960s apartments incorporate Modern architectural styles.
- Apartments were set-back from the public right of way.
- Dedicated surface parking or carports were provided for residents.
- Two- to three-stories buildings.

Eligibility Criteria and Integrity Thresholds

Significance Evaluation

Apartment complexes derive their eligibility under NRHP Criterion C/CRHR Criterion 3 if they embody the distinctive characteristics of a style, type, period, or method of construction; and/or HRB Criterion C as a resource that embodies the distinctive characteristics of a style, type, period, or method of construction. Candidates for individual listing should be a highly representative example of a significant type or style and/or contain high artistic value. While some of the apartment complexes may be less than 45 years old, there may be early and/or exceptional examples that still merit designation.

Significance under other criteria may be identified following future site-specific survey and evaluation.

Essential Factors of Integrity

For NRHP Criterion C, CRHR Criterion 3, and HRB Criterion C, design, materials, and workmanship aspects of integrity are especially important and must be intact for a resource to be eligible. Resources evaluated under Criterion C should also retain most of the character-defining features of their construction types, as well as retain the primary character-defining features of any recognized style identified with the property.

A. ARCHITECTURAL STYLES

Mission Valley exhibits a wide range of architectural styles. The styles discussed are those represented among the potentially historic resources within the Mission Valley Plan area. The following section, presented chronologically, describes the prominent styles and their character defining features. It does not establish historic significance, but rather provides a guidance to assist in the identification and evaluation of resources within the community plan area. The character defining features listed are intended to assist in resource identification but does not necessarily prescribe that all resources exhibit all the features listed. The descriptions of architectural styles are used in conjunction with Virginia and Lee McAlester's *A Field Guide to American Houses* (New York: Alfred A. Knopf, 1988) and the City of San Diego's *San Diego Modernism Historic Context Statement* (2007).

Mission/Spanish Colonial Revival

The Mission/Spanish Colonial Revival style, as its name implies, encompasses two major subcategories. The Mission Revival vocabulary, popular between 1890 and 1920, drew its inspiration from the missions of the Southwest.

Mission San Diego de Alcala, 10818 San Diego Mission Road.

Character-Defining Features:
- Quatrefoil windows
- Curved parapets
- Low-pitched, red-tiled roofs and coping, (usually with overhanging eaves)
- Arcaded porch supported by large, square piers, arches
- Smooth stucco wall surfaces

The Spanish Colonial Revival flourished between 1915 and 1940, reaching its apex during the 1920s and 1930s. The movement received widespread attention after the Panama-California Exposition in San Diego in 1915, where lavish interpretations of Spanish and Latin American prototypes were showcased.

Nazareth School, 10728 San Diego Mission Road.

Character-Defining Features:
- Low-pitched roofs, usually with little or no overhangs and red tile roof coverings,
- Flat roofs surrounded by tiled parapets;
- Smooth stucco wall surfaces

Craftsman Bungalow

The Craftsman Bungalow, also referred to as the "California Bungalow" in other areas of the country, was popular in the early 1900s for use on residential properties. It emerged out of the Arts and Crafts movement, the proponents of which desired to return to traditional building materials and techniques. The principles of honest design, often characterized by exposure of structural building elements, were applied to small homes (bungalows), many available from house-kit companies and pattern books to create the Craftsman Bungalow. The bungalow, with its simple structure and popular styling, made home ownership possible for many Americans at the beginning of the 20th century. The style is typically one to one-and-a-half stories, with low-pitched, gabled roof, has oversized eaves with exposed rafters, and windows place din groups or bands.

Character-Defining Features:

- Low-pitched, hipped or gable-front roof with oversized eaves and exposed decorative rafters
- Windows arranged in bands or singly; three-over-one or one-over-one; rectangular top
- Clad with clapboard, shingles, stone, or brick
- Porch, either large or small, supported by columns or piers that begin either at porch floor or from porch balustrade.

One of the few remaining single-family residences associated with the Dairy Industry is the Ferrari Residence, 3154 Camino del Rio South.

Ranch

Ranch construction were typically custom designed with a specific client in mind, mainly for custom homes. Designers of this style include such noted San Diego designers as Cliff May, Richard Wheeler, CJ Paderewski, and Weir Brothers Construction. Cliff May was instrumental in popularizing the Ranch style in California with his book and articles published by *Sunset Magazine*. The Ranch style became the era's most prevalent type of residential construction in San Diego and was also utilized in hotel/motel architecture, as seen in Mission Valley. Ranch buildings frequently included a large landscaped property, with a deep street setback. Materials and detailing on Ranch buildings are generally traditional. Typical exterior materials include wood siding, stone, concrete block, brick, and even adobe. Detailing may include

Inner courtyard at the Town & Country Hotel, 500 Hotel Circle North.

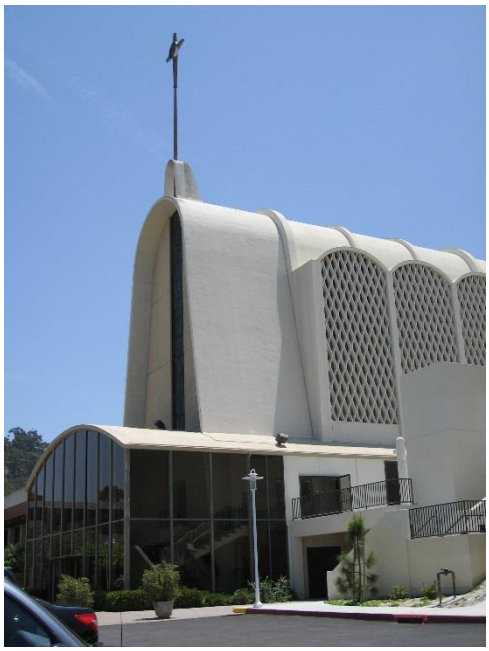
paneled wood doors, divided lite windows, and wood shutters. They offered "contemporary" styling, modern amenities, sprawling floor plans, included ranch style landscape features such as split-rail fences and wide lawns reminiscent of open fields.

Character-Defining Features:

- Horizontal massing
- Usually single-story
- Sprawling floor plan frequently "L" or "U" shaped around a central courtyard
- Large attached carports, porte-cocheres, or garages
- Prominent low-sloped gabled or hipped roofs with deep overhangs
- Traditional details (wood shutters, wood windows, and large prominent brick or stone chimneys)
- Traditional building materials (wood shingle roofing, wood siding, brick, and stone)

1960s postcard of the King's Inn, 1333 Hotel Circle South.

Futurist-Googie



The Futurist style of Modern architecture began after World War II as Americans became entranced with technology and the space age. At that time America was also being transformed by a car culture. As automobile use increased, roadside architecture evolved. It was intended to attract the consumer with bright colors, over-sized lighted signage, and exaggerated forms. In short, the building was the billboard. The Futurist style was used overwhelmingly on coffee shops, gas stations, motels, restaurants, and retail buildings.

Scottish Rite Event Center (formerly the Bowlero), 1895 Camino Del Rio South.

The name "Googie" comes from the well-known coffee shop in Los Angeles named Googies which was designed by renowned Modernist architect John Lautner in 1949. Futurist architecture is also

referred to as "Coffee House Modern," "Populuxe," "Doo-Wop," and "Space Age." Futurist architecture was popular throughout the 1950s and fell out of favor by the mid-60s, as America became more sophisticated in its understanding and interpretation of space travel and futurist technology. Futurist architecture often has sharp angles, boomerang or flying saucer shapes, large expanses of glass, exposed steel structural elements, and dramatic roof overhangs. The basic form and size of Futurist buildings varies significantly from building to building. An abstract arrangement of shapes and textures is typical.

In San Diego, examples of Futurist or Googie architecture generally have commercial uses such as retail, hotels, service stations, restaurants, and offices. These buildings can be found along commercial strips in many neighborhoods including Mission Valley.

First United Methodist Church, 2111 Camino Del Rio South.

Character-Defining Features:

- Building as billboard
- Abstract or angular shapes
- Prominent signage (neon or lighted)
- Prominent roof forms (flat, gabled, upswept, butterfly, parabolic, boomerang, or zig-zag)
- Asymmetrical facades
- Variety of exterior finishes including stucco, concrete block, brick, stone, and wood siding
- Bright colors
- Large windows (aluminum framed)
- Screen block and shadow block accents

Macy's at the Mission Valley Shopping Center (now Westfield Mission Valley), 1640 Camino Del Rio North.

Secondary:

- Variety of exterior finishes including stucco, concrete block, brick, stone, plastic, and wood siding
- Bright colors
- Screen block and shadow block accents
- Building as billboard
- Asymmetrical facades

Tiki-Polynesian

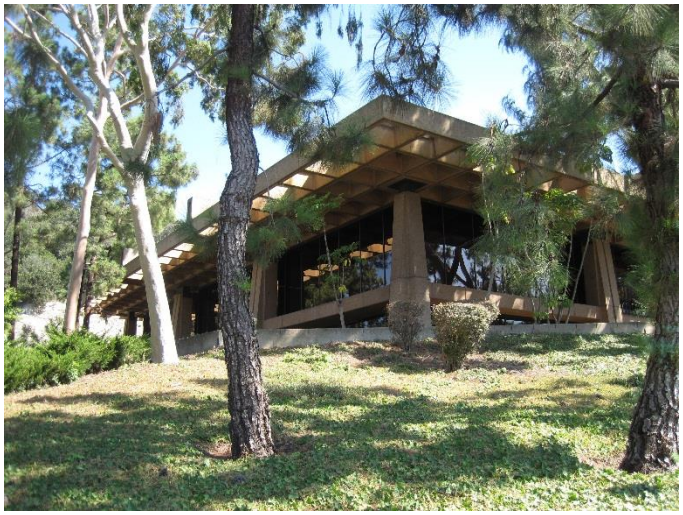
Tiki-Polynesian architecture is related to Futurist-Googie architecture in that it employed exaggerated forms to attract the consumer, but it does so using an island theme which has been reinterpreted with modern design elements. America's infatuation with native Polynesian style architecture was fueled by World War II GIs who had served in the South Pacific. The trend peaked at about the time of Hawaii's admission in to the Union in 1959 and waned by 1970. The Tiki theme was used frequently in hotels, restaurants, and retail buildings and was popular throughout southern California which already attracted visitors interested in the beaches and warm weather.

Early advertisement for the Hanalei Hotel, 2270 Hotel Circle North.

Tiki or Polynesian style architecture is characterized by strong roof lines often with a steep primary cross-gable marking the main entry. Roofs are generally wood shingled with exposed wood structural members. The ridge of the primary cross-gable may be straight or upswept to further accentuate the entry. Many Tiki buildings also incorporate a dramatic porte-cochere to further emphasize the main entry. The exterior wall finish is usually some type of un-painted wood siding, generally wide-width. It is also common for Tiki style buildings to have stone or rock wall features and accents. Tiki style buildings usually have a strong horizontal massing which is accentuated by the roof lines and horizontal bands of windows.

One of the major character-defining features of most Tiki style buildings is the surrounding landscape. Usually tropical with a variety of palms, and flowering plants, the landscape is an important component of Tiki architecture in that it reinforces the fantasy aspect of this style.

Interiors of Tiki-Polynesian buildings were intended to perpetuate the fantasy as much as the landscapes. Decorative features may include lighted signage, wood tikis, tribal motifs, wood carvings, bamboo accents, torch lights, boulders, and water features.



Character-Defining Features:

- Prominent roof forms. Usually gabled with a cross gable marking the main entry
- Pitched or upswept ridge beams
- Exposed heavy timber roof framing
- Horizontal massing
- Porte-cocheres
- Natural finishes (wood siding, wood shingles, and stone)
- Lush tropical landscaping

- Tropical accents (tikis, torch lights, and boulders)
- Lighted neon signage

Brutalist

The name "Brutalist" originated from the French *béton brut* which means "raw concrete". The style was largely inspired by Swiss architect Le Corbusier. Brutalist buildings are generally strikingly blockish, geometric, and composed of repetitive shapes. The predominant building material is concrete, frequently revealing the intentional textures of the wood formwork. The concrete is intended to be fully expressed as both the primary structural material and finish. Critics of the style argued that it disregarded the social environment, making such structures inhuman, stark, and out of place.

County of San Diego Behavioral Health Services, 3255 Camino Del Rio South.

The Brutalist style is most represented by Qualcomm Stadium (Frank Hope and Associates, 1965).

Character-Defining Features:

- Monumental concrete massing
- Exposed concrete as building finish
- Angular and rectilinear forms
- Repetitive patterns

Secondary:

- Repetitive patterns
- Intentional avoidance of traditional elements or ornament

A 31-unit ca. 1965 condominium, 6855 Friars Road.

Utilitarian Industrial

Utilitarian Industrial refers to buildings whose architecture is significantly determined by the use of the building. For instance, a utilitarian industrial style manufacturing facility may have a particular roof built to accommodate the interior crane. Utilitarian style structures are of various sizes, roof styles, and clad in different materials, but what distinguishes them is that the builder has made no attempt to impose any detailing or ornamentation besides those that are deemed necessary for the business of the building. Utilitarian buildings includes factories, warehouses, and storage sites and usually are industrial structures. Most industrial buildings built from the mid-20th century to the present are utilitarian.

Character-Defining Features:

- Various roof types
- Various window types
- Masonry, corrugated metal, or stucco siding
- No ornamentation
- Design based on use of the building

Kinder Morgan Mission Valley, 9950 San Diego Mission Road.

B. STUDY LIST

No formal survey was undertaken as part of this study. However, the following study list represents properties of architecture or thematic interest within Mission Valley. This is not an exhaustive list of all eligible properties, but a representation of potentially eligible resources identified during the archival research and limited fieldwork conducted in the development of this historic context statement. Conversely, a resource's presence on this study list does not automatically constitute eligibility.

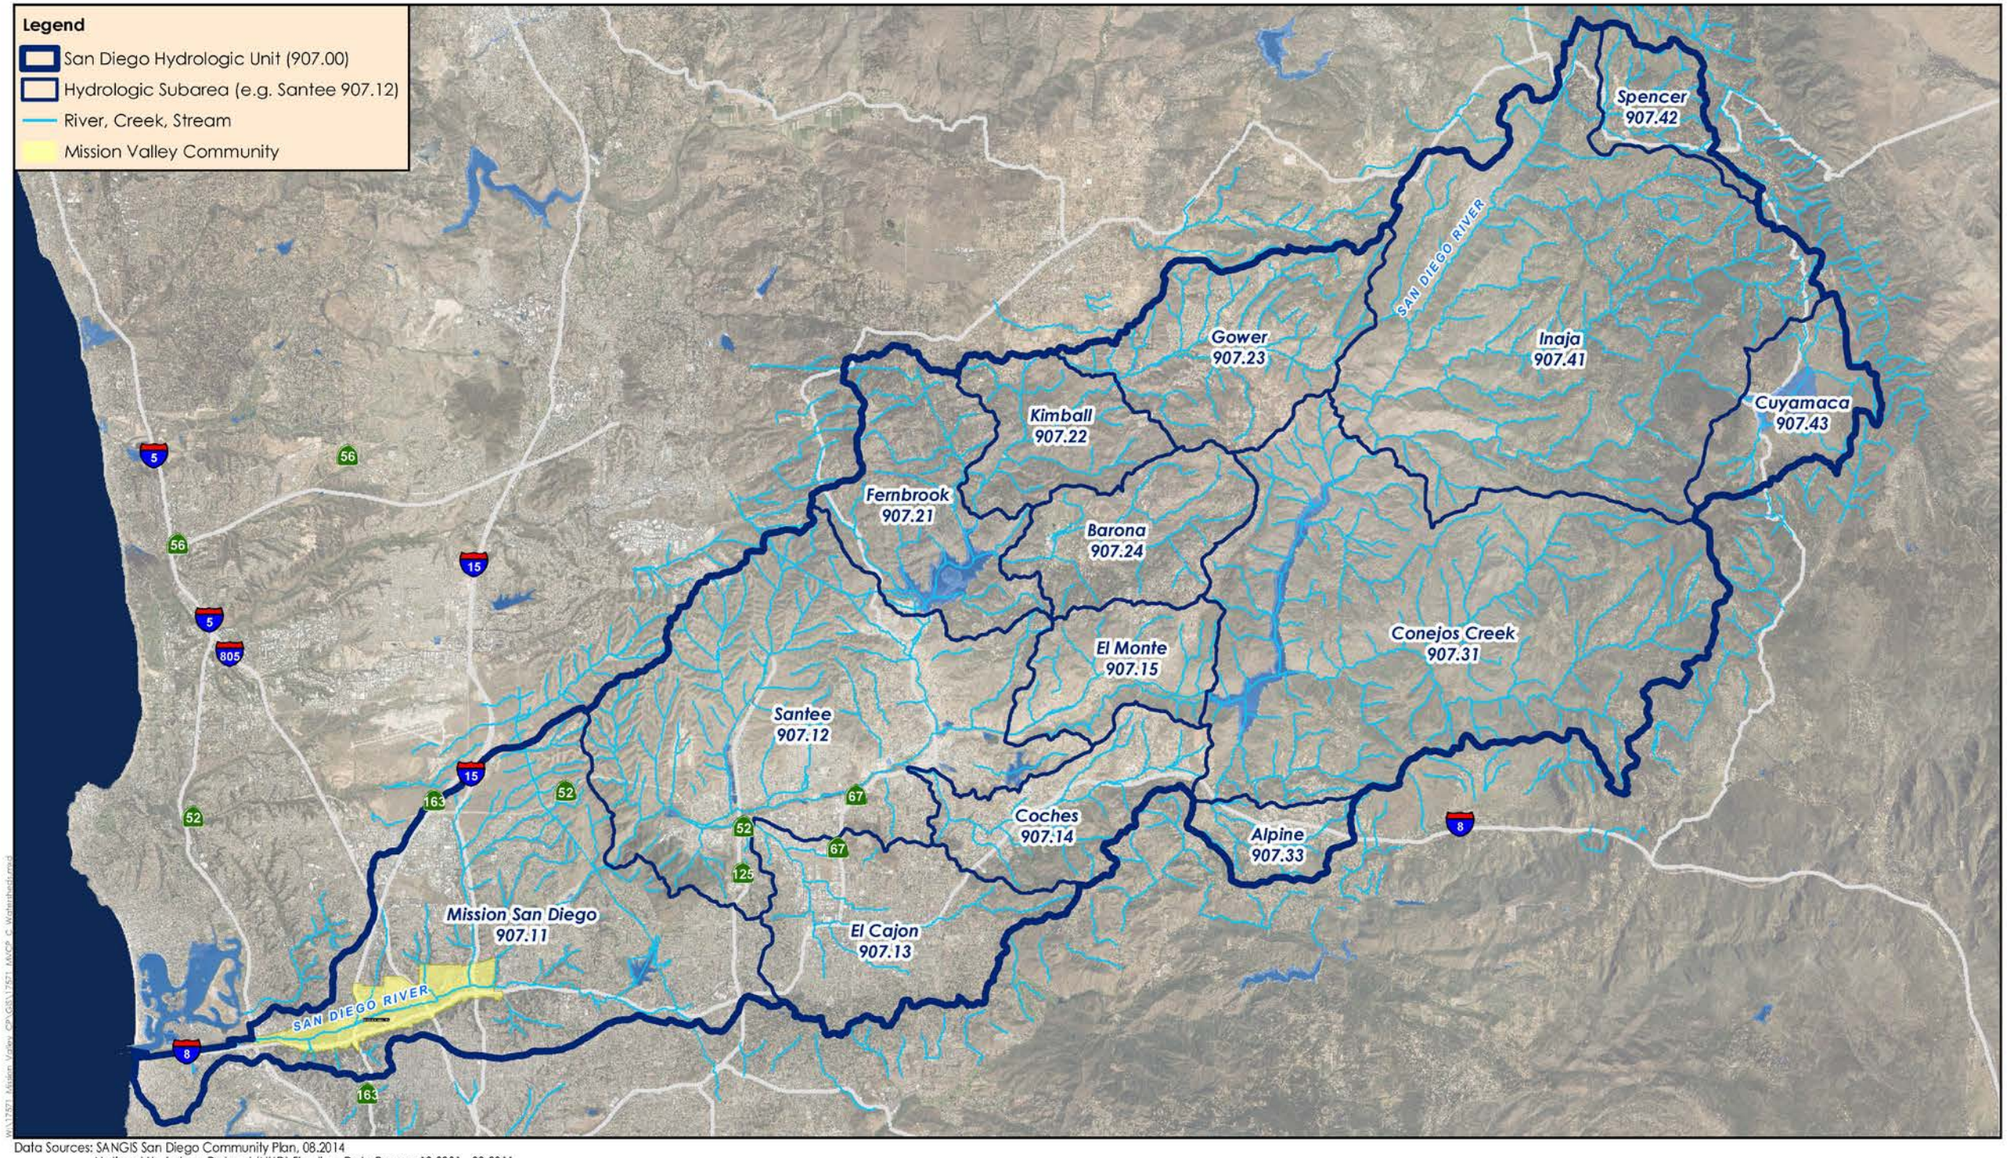
1.0 INTRODUCTION

This report describes existing storm water drainage and storm water quality conditions within the Community of Mission Valley in the City of San Diego, California. The Community of Mission Valley (herein "Mission Valley") includes approximately 2,418 acres (3.8 square miles) and is located near the geographic center of the City of San Diego. Mission Valley is bounded on the north by Friars Road and the northern slopes of the valley, on the east by the eastern banks of the San Diego River, on the south by the southern slopes of the valley, and on the west by Interstate 5. The vicinity map, Figure 1.1 shows the boundaries of Mission Valley. This report is in support of a Programmatic Environmental Impact Report (PEIR) for the Mission Valley Community Plan Update. The Mission Valley Community Plan Update will update land use policies in order to create a plan for future development, and a long term vision for Mission Valley.

Storm water drainage is discussed in Section 2 of this report. The storm water drainage discussion addresses local surface runoff patterns and floodplains. Storm water quality is discussed in Section 3, including quality of local surface runoff and quality of receiving waters. Section 4 describes regulations, policies and programs applicable to storm water drainage, floodplain management, and storm water quality in the City of San Diego that will dictate design criteria and standards for development projects within Mission Valley. Section 5 will provide an overview of the development constraints for San Diego City-Owned properties within Mission Valley.

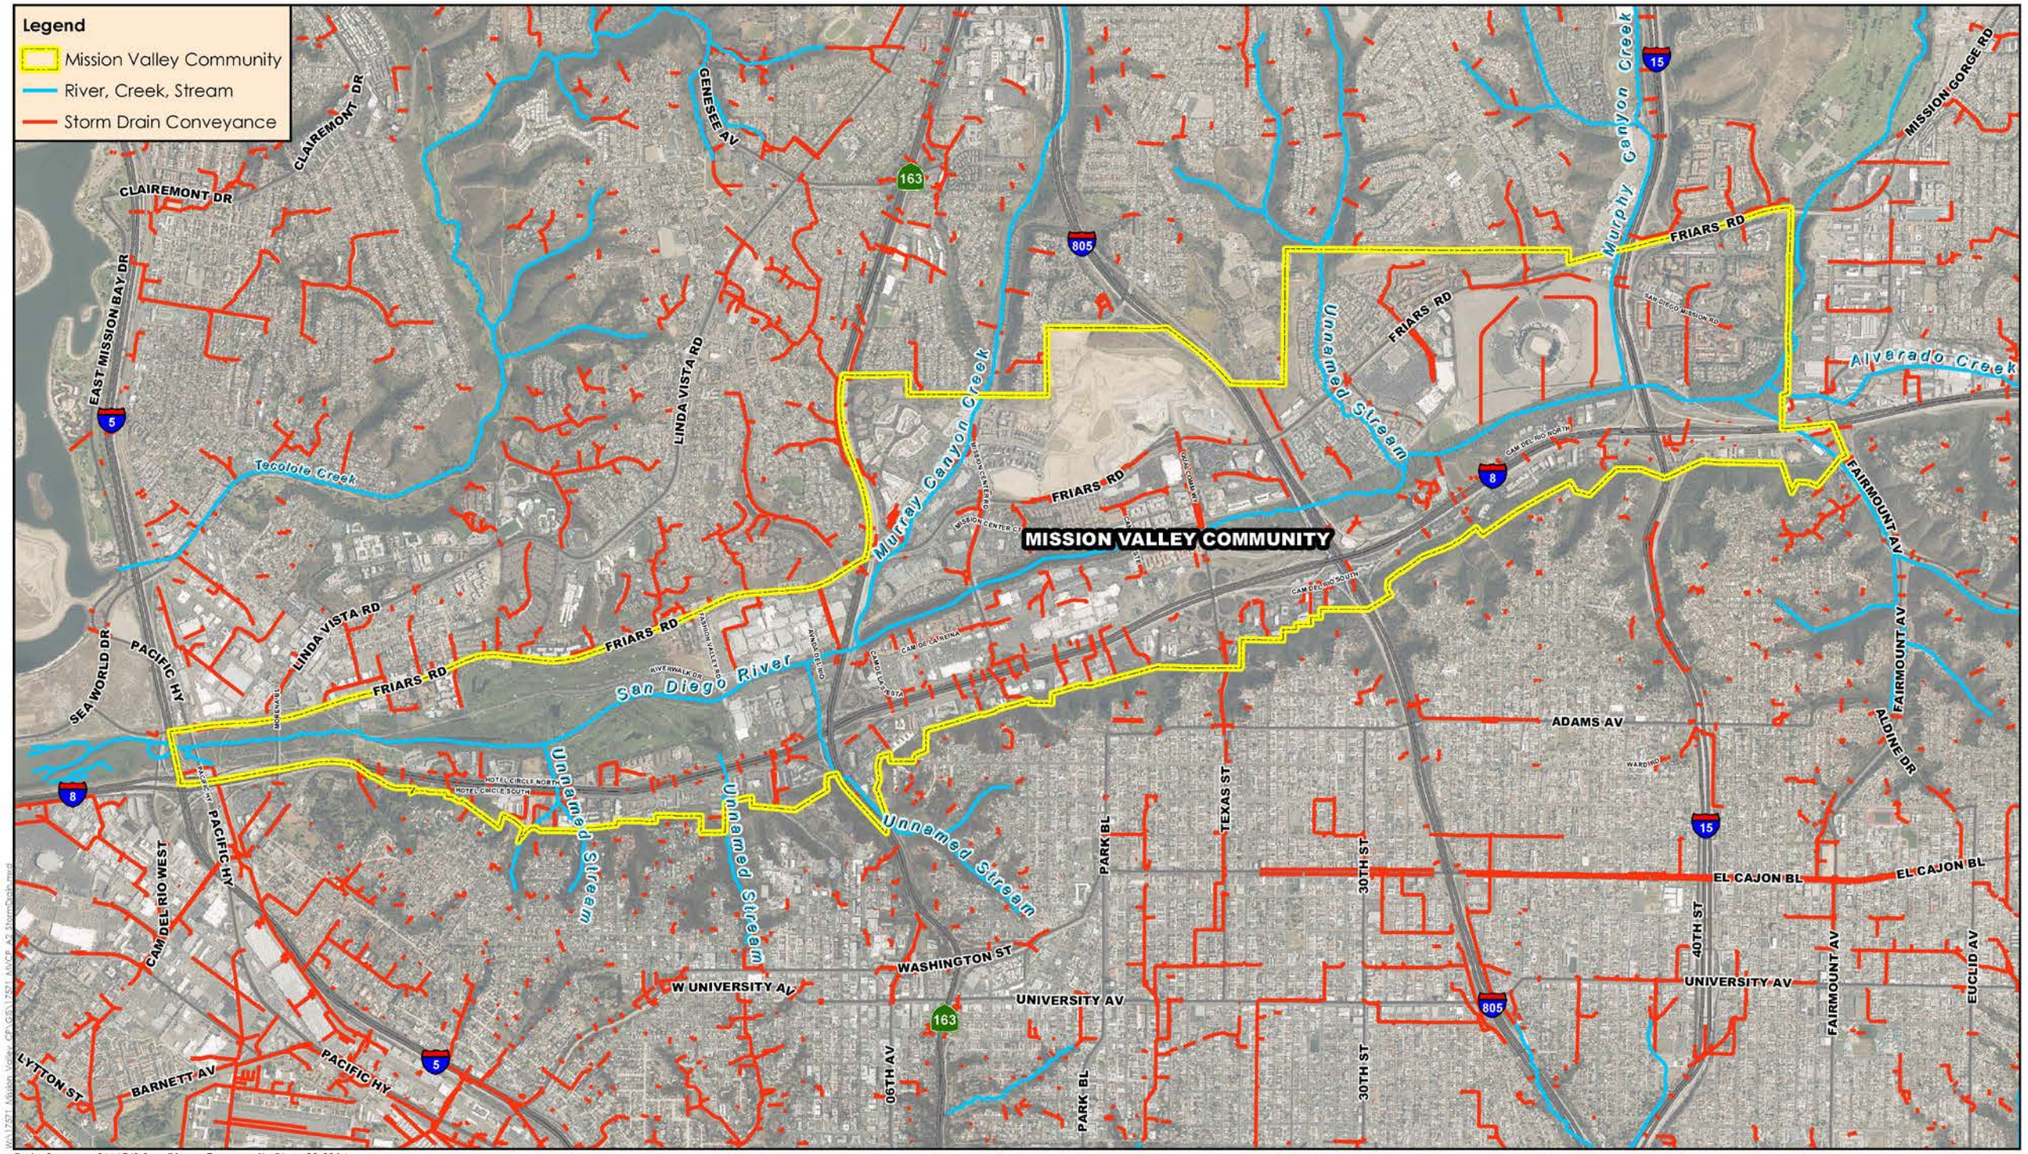
Figure 1 – Vicinity Map



Hydrologic Setting

The Community of Mission Valley is in the San Diego River Watershed. For purposes of tracking water quality, according to the San Diego Basin Plan[1], Mission Valley is within the Mission San Diego Hydrologic Subarea (907.11) of the Lower San Diego Hydrologic Area (907.1) of the San Diego Hydrologic Unit (907.00). A hydrologic unit represents an entire watershed. A hydrologic area, and hydrologic subarea further divide a hydrologic unit (watershed) into smaller areas. Figure 2, Hydrologic Unit Map, shows the San Diego River Watershed.

The San Diego Hydrologic Unit (watershed) has an area of approximately 440 square miles. It contains portions of the cities of San Diego, El Cajon, La Mesa, and Santee, and several unincorporated communities of San Diego County.



The Community of Mission Valley encompasses the lower 6.5 miles of the San Diego River. The San Diego River flows from east to west through the center of the community. The San Diego River enters Mission Valley at the community's northeast boundary, east of Interstate 15 (I-15), and flows southerly along the community's east boundary. Then before reaching Interstate Highway 8 (I-8), it turns and flows westerly through the center of Mission Valley to the Pacific Ocean. In general, storm water runoff in Mission Valley travels towards the San Diego River. There are three major creeks, Alvarado Creek, Murphy Canyon Creek, and Murray Canyon Creek, that flow into the San Diego River within Mission Valley. Figure 3, River, Creek, Stream, and Storm Drain Map, shows drainage patterns within Mission Valley. Figure 4, Mission Valley Community, Adjacent Communities, and USGS 40-Foot Contours, displays topography for the area.

2.0 EXISTING DRAINAGE CONDITIONS

Local Surface Runoff Patterns

The Community of Mission Valley is surrounded by steep hills on its north and south sides, sloping toward the San Diego River, as shown on Figure 3. Considering the topographic characteristics of Mission Valley, the local storm water runoff originating within the community stays within the boundary of the community and drains toward the San Diego River. Storm water runoff originating in Mission Valley is conveyed to the San Diego River in streets, gutters, cross gutters, open channels, and storm drain systems. Existing storm drain locations that are included in the City of San Diego's storm drain inventory are shown on Figure 2. The runoff is then conveyed in the San Diego River to the Pacific Ocean.

Mission Valley is mostly developed and is highly impervious, except for the San Diego River channel and Riverwalk Golf Course. Nearly all rainfall landing on the developed areas of Mission Valley can be expected to become runoff because there are minimal opportunities for infiltration. Typical runoff response from highly impervious areas is flashy with high peak flow rates for short durations.

The San Diego River watershed area is greater than the community of Mission Valley. This makes Mission Valley the recipient of storm water runoff from its adjacent communities. Neighboring communities to Mission Valley are shown on Figure 2.1.

Major drainage inputs to Mission Valley are Alvarado Creek, Murphy Canyon Creek, Murray Canyon Creek, San Diego River, and a few unnamed creeks. Numerous storm drain pipes and open channels also cross the Mission Valley Community boundary, to direct the drainage from adjacent communities toward the San Diego River. Surface drainage (e.g: overland flow, flow in road gutters) from adjacent communities is also a source of storm water input to Mission Valley Community.

Floodplains

The four major water bodies draining through the Mission Valley Community, San Diego River, Alvarado Creek, Murphy Canyon Creek, and Murray Canyon Creek, have been studied and documented in the Federal Emergency Management Agency (FEMA) "Flood Insurance Study for San Diego County, California and Unincorporated Areas," dated May 16, 2012, hereafter referred to as "San Diego County 2012 FIS". The river and creeks are mapped on Flood Insurance Rate Maps (FIRMs). Attachment A includes an exhibit showing effective FEMA Flood Hazard Areas (floodways, 100-year floodplains, and 500-year floodplains) for Mission Valley based on the National Flood Hazard Layer (NFHL) published by FEMA. Attachment A also includes copies of effective FIRMs that encompass Mission Valley. The FIRMs are annotated with Mission Valley Community boundary. FEMA Flood Hazard Zones within Mission Valley include Zone AE, Zone A, and Zone X (shaded).

Zones AE and A are Special Flood Hazard Areas (SFHAs) subject to inundation by the 1% annual chance flood (100-year flood). Zone AE means Base Flood Elevations (BFEs) and floodway extents have been determined. The BFEs and floodway are shown on the FIRMs (see Attachment A). The BFE is the water surface elevation of the 1% annual chance flood. The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights. Zone A means no BFEs have been determined (i.e., a detailed hydraulic study to establish BFEs has not been prepared) and floodway is not established. Most of the SFHA in Mission Valley has BFEs established and is mapped as Zone AE. Only isolated pockets of Zone A exist where no study has been prepared.

Zone X (shaded) indicates "Other Flood Areas" which could be "areas of 0.2% annual chance flood [500-year]; areas of 1% annual chance of flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees

from 1% annual chance flood." Most of the Zone X (shaded) areas in Mission Valley are areas protected from the San Diego River by levees, which are discussed in detail below.

Below is a discussion of each riverine flooding source (San Diego River, Alvarado Creek, Murphy Canyon Creek, and Murray Canyon Creek).

San Diego River

The primary source of riverine flooding in Mission Valley Community is the San Diego River. Based on the San Diego County 2012 FIS, the San Diego River watershed drains approximately 433 square miles at its mouth in Mission Bay, and conveys 36,000 cubic feet per second (cfs) through Mission Valley in the 1% annual chance flood.

The historical flooding for the San Diego River is documented in the San Diego County 2012 FIS:

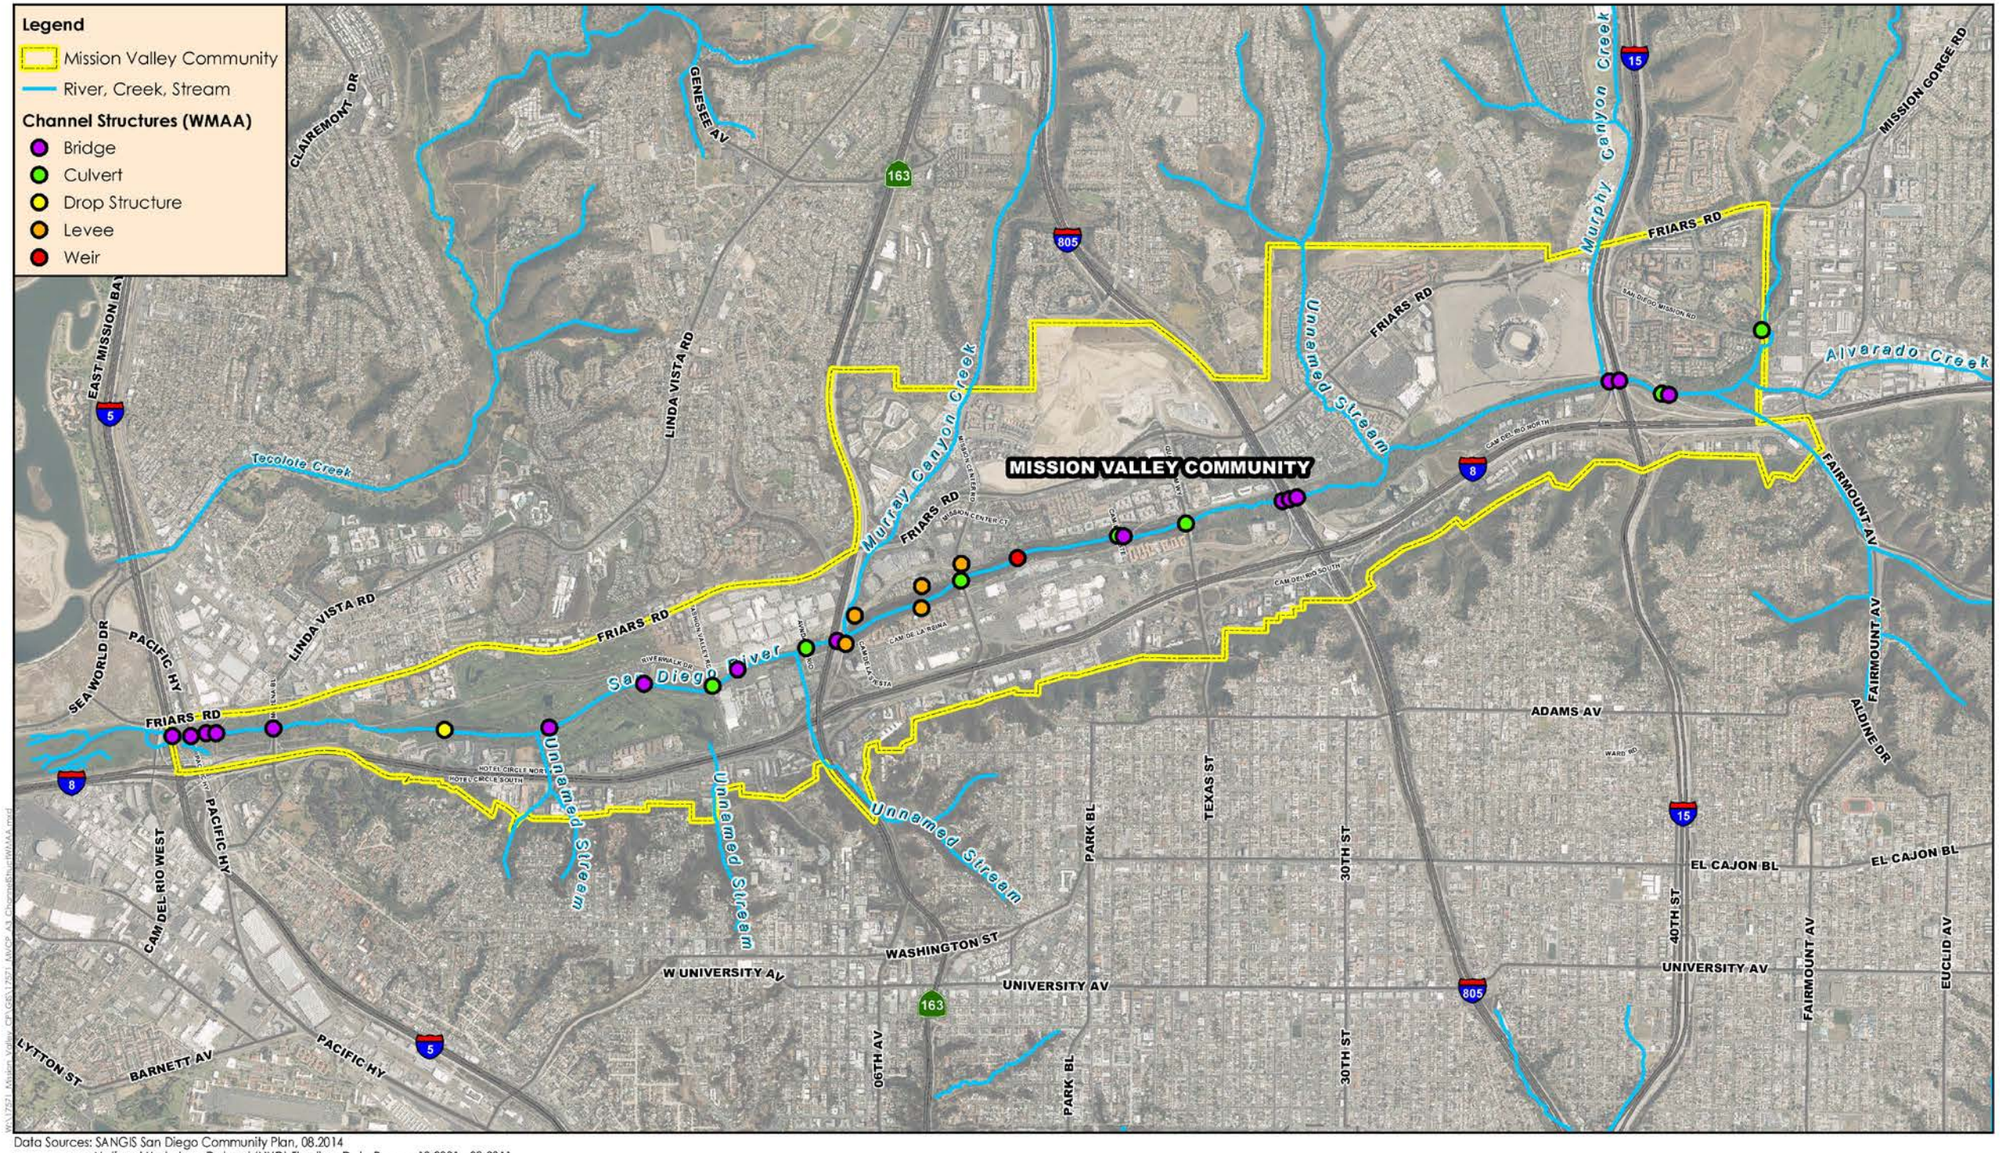
> "From available data concerning San Diego River, it is estimated that approximately a 1-percent annual chance frequency flood occurred in 1916 and approximately a 2-percent annual chance frequency flood occurred in 1927."
>
> "January-February 1980: In the 1980 storms, approximately 15 to 20 inches of precipitation accumulated over approximately six weeks, followed immediately by the storm of February 20-21. During this climax, most county reservoirs peaked and local streams reached maximum levels. Considerable evacuation was necessary, particularly in Lakeside and San Diego-Mission Valley."

As shown on the FIRMs provided in Attachment A, many areas of Mission Valley are in the 100-year floodplain of the San Diego River. This includes the following locations:

1. East of Interstate 15 (I-15) – portions of: Ward Road (bridge), San Diego Mission Road (low water crossing), Camino Del Rio North
2. West of I-15 – portions of Qualcomm Stadium Parking Lot (flooding is due to the San Diego River and Murphy Canyon Creek)
3. West of Interstate 805 (I-805) – a portion of Qualcomm Way, from Friars Road to the San Diego River (low water crossing often flooded during lower storm events)
4. Camino Del Este road crossing (low water crossing very frequently flooded during lower storm events)
5. Mission Center Road from Friars Road to the San Diego River (low water crossing often flooded during lower storm events).
6. Between I-805 and SR-163, south of the San Diego River – portions of: Camino De La Reina, Camino Del Rio North, Camino De La Siesta, Camino Del Arroyo
7. West of SR-163 –Avenida Del Rio and portions of Fashion Valley Road (low water crossings very frequently flooded during lower storm events),
8. Portions of Fashion Valley Mall parking (structures on south side of mall and west parking lot south of JC Penney)
9. Portions of: Camino De La Reina, Town and Country Resort and Convention Center, Riverwalk Golf Club, Handlery Hotel, Hotel Circle North, Hotel Circle South
10. Portions of I-8 between SR-163 and Interstate 5 (I-5)
11. YMCA along Friars Road
12. Trolley is in and out of the San Diego River all the way from Camino Del Rio North (east of I-15) to near I-5. While most of the length is elevated, at-grade stations at Morena Linda Vista, Mission Valley Center, Fenton Parkway, and Mission San Diego are subject to flooding, and access to elevated stations at Fashion Valley and Qualcomm Stadium may be interrupted due to flooding on local roads and parking areas. Hazard Center and Rio Vista stations are outside of the SFHA.

Bridges and Road Crossings/Culverts for the San Diego River

There are several existing bridges and road crossings/culverts across the San Diego River in the Mission Valley Community. Crossings are shown on Figure 5, Channel Structures on San Diego River.



Bridges (listed from east to west) include:

Ward Road
I-15
I-805
SR-163
Morena Boulevard
Pacific Highway
San Diego Metropolitan Transit System Trolley
Riverwalk Golf Course Bridges

Road Crossings/Culverts (listed from east to west) include:

San Diego Mission Road
Qualcomm Way
Camino Del Este
Mission Center Road
Avenida Del Rio
Fashion Valley Road

All of the road crossings/culverts listed above are low water crossings, also known as ford crossings. This means that the road is designed to allow crossing the river when the water is low, as when there is no storm event or during small storm events, and to temporarily flood or overtop (convey river flow across the roadway) during large storm events.

Data Sources: SANGIS San Diego Community Plan, 08.2014
National Hydrology Dataset (NHD) Flowline, Date Range: 10.2001 - 03.2011
SANGIS Assessor Parcels, 08.2015
Eagle Aerial Photo: 04.2013

Figure 5 – Channel Structures on San Diego River

The road crossings/culverts listed above, as well as Ward Road Bridge, will be impassable during some storm events. Avenida Del Rio, Fashion Valley Road, and San Diego Mission Road are the most susceptible to flooding. They could be expected to flood in approximately 5-year storm events and greater. Camino Del Este, Qualcomm Way, and Mission Center Road could be expected to flood in approximately 10-year storm events and greater. Ward Road crossing is a bridge rather than a low water crossing. However it is susceptible to flooding in approximately 20-year storm events and greater.

Because of the design of the road crossings, flooding of the San Diego River creates a major disruption to transportation in Mission Valley for temporary periods. When the San Diego River overtops the road crossings, it impacts public safety, traffic circulation and access to businesses. Public transportation must be re-routed or suspended. Flooding can also cause damage to the structures (e.g., the Fashion Valley Road crossing was destroyed in 2005). The impact of structure damage extends well beyond the duration of the storm event.

Levees for the San Diego River

There are three levees along the reach of the San Diego River within the Mission Valley Community. However, these levee systems are not accredited by FEMA. This means that they cannot be considered to provide flood protection because they do not meet FEMA's standards for levees. This affects the following areas, which are shown on the FIRM panels as Zone X (shaded) with a note that they are protected by a provisionally accredited levee:

1. North of the San Diego River from SR-163 to just west of the westerly terminus of Station Village Lane, including properties along Hazard Center Drive, portion of Frazee Road south of Friars Road, Mission Center Court, Caminito Gabaldon, and Caminito De Pizza.

2. South of the San Diego River from SR-163 to Qualcomm Way, including properties along Camino De La Reina, Camino Del Rio North, and Camino Del Este. This includes Mission Valley Mall.

The affected areas may be subject to flooding from the San Diego River in the 100-year storm event.

Below is a summary of the three levees in in the Mission Valley Community and their status with respect to the accreditation process:

- Levees 11 and 13 – Located north of the San Diego River, extending from SR-163 to Mission Center Road and from Mission Center Road to Qualcomm Way, respectively
- Levee 13 – Located south of the San Diego River, extending from SR-163 to Qualcomm Way

The effective FIRMs dated May 16, 2012 show that these levees are provisionally accredited levees (PALs). PAL designation means that the levee was recognized on FEMA's previous FIRMs; however the regulatory requirement for levee accreditation has since changed, and the levee is in the process of accreditation. In order for a levee to gain FEMA full accreditation, the community or levee owner must provide the proper documentation to certify that the levee continues to provide protection from the base flood, and that the levee still meets the minimum Federal requirements. The proper documentation for levee accreditation must be provided to FEMA within a 24-month timeframe from the date the community or levee owner has signed an agreement indicating the data and documentation required for compliance will be provided. If the 24-month PAL period expires and the community does not submit all of the required documentation, FEMA will consider the levee system as de-accredited and the impacted area will be mapped as high risk.

FIRM panels dated May 16, 2012 include this note for Provisionally Accredited Levees:

> "Provisionally Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee systems(s) shown as providing protection for areas on this panel. To maintain accreditation, the levee owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations by May 16, 2012. If the community or owner does not provide the necessary data and documentation or if the data and documentation provided indicate the levee system does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the levee system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA Website at http:ltwww.fema.gov/businesslnfip/indes/shtm"

Based on the FIRM panels, the timeframes for levee accreditation have passed. Therefore, the levees in the Mission Valley Community cannot be considered to provide flood protection because they do not meet FEMA's standards.

Alvarado Creek

Based on San Diego County 2012 FIS, the Alvarado Creek watershed encompasses approximately 14 square miles, measured to the San Diego River. Alvarado Creek flows through Mission Valley Community for just 400 feet before it confluences with (flows into) the San Diego River. FEMA Flood Zone for Alvarado Creek within the Community of Mission Valley is Zone AE. The short reach of Alvarado Creek within the Mission Valley Community does not include existing roads or structures impacted by flooding from Alvarado Creek.

Murphy Canyon Creek

Based on the San Diego County 2012 FIS, the Murphy Canyon Creek watershed encompasses approximately 12.1 square miles, measured to Friars Road. Murphy Canyon Creek flows southerly parallel to I-15 in the Mission Valley Community for 0.5 mile before it confluences with (flows into) the San Diego River.

FEMA Flood Zones for Murphy Canyon Creek within the Community of Mission Valley are Zone A, AE, and X. There are no records of historical flooding for Murphy Canyon Creek. The San Diego County 2012 FIS mentions the following Flood Protection Measure in the City of San Diego that is outside of the Mission Valley Community but affects the community:

> "On Murphy Canyon Creek, just upstream of Friars Road, there is an approximately 300-foot long concrete-lined trapezoidal channel downstream of a 1,900-foot long double, 8- by 14-foot reinforced concrete box culvert. Upstream of the double box culvert, there is an additional 600 feet of concrete-lined trapezoidal channel. This lined channel/box culvert structure will fully contain the 10- and 2-percent annual chance flood flows and will contain a major portion of the 1- and 0.2-percent annual chance flood flows. In addition to this structure, CALTRANS, in conjunction with the USACE, has installed a large corrugated metal pipe culvert at the Interstate Highway 15-Murphy Canyon Creek crossing. This corrugated metal pipe culvert restricts the flood flow, thereby causing the upstream valley to act as a detention pond. This detention pond greatly reduces the peak flood flows downstream, and is wholly contained within the Miramar Naval Air Station."

Qualcomm Stadium parking lot can be flooded from Murphy Canyon Creek. Overflow from Murphy Canyon Creek breaks out of the channel in an area north of the parking lot shown as Zone A on the FIRM, and comingles with overflow from the San Diego River in the parking lot. This flooding also affects the tank farm located between Friars Road, I-15, and San Diego Mission Road.

Murray Canyon Creek

Based on the San Diego County 2012 FIS, Murray Canyon Creek watershed encompasses approximately 3.93 square miles, measured to its mouth at the San Diego River. Murray Canyon Creek enters Mission Valley Community from the north, along Mission Center Road, in an existing underground culvert. Murray Canyon Creek flows through Mission Valley Community for approximately 1 mile, mostly in the existing culvert system, before it confluences with (flows into) the San Diego River. The entrance to the culvert system is just north of Sevan Court, off Mission Center Road, approximately 1,200 feet upstream of Mission Valley Community boundary. The culvert system that starts at Sevan Court daylights (outlets) in a low point just upstream of Friars Road, near SR-163. Murray Canyon Creek then immediately enters another existing underground culvert under Friars Road, which outlets downstream of Friars Road at the west side of Hazard Center Mall. From the Friars Road culvert outlet, an existing open channel with rock bank protection continues between Hazard Center Mall and SR-163 to the westerly terminus of Hazard Center Drive. Existing CMP culverts under Hazard Center Drive connect Murray Canyon Creek to the San Diego River.

FEMA Flood Zones for Murray Canyon Creek within Mission Valley are Zone AE and Zone X (shaded). Flooding from Murray Canyon Creek can occur when storm events greater than the existing culvert capacity cause breakouts at the culvert entrances. Floodwater that cannot enter the culvert at Sevan Court flows over Mission Center Road, which carries the overflow to the San Diego River. This is shown as Zone X (shaded) on Mission Center Road north of Friars Road on the FIRM Panel. While the FIRM Panels indicate the 1% annual chance flood discharge is contained by the culvert, any obstruction to the culvert entrance could cause breakouts. Breakouts can also occur at Friars Road, where the long culvert system from Sevan Drive daylights upstream of the Friars Road culvert entrance. Floodwater that cannot enter the Friars Road culvert will overtop Friars Road between SR-163 and Frazee Road. The portion of Friars Road affected by flooding from Murray Canyon Creek is shown as Zone AE on the FIRM Panel.

3.0 EXISTING WATER QUALITY CONDITIONS

San Diego River and the Pacific Ocean at San Diego River mouth are the "receiving waters" for storm water runoff from Mission Valley. The quality of storm water runoff from Mission Valley Community directly impacts the quality of the receiving waters. However, San Diego River watershed is much greater than the community of Mission Valley, so the San Diego River and the Pacific Ocean at San Diego River mouth are also impacted by the quality of storm water runoff from other communities of the City of San Diego, and other jurisdictions (El Cajon, La Mesa, Santee, and County of San Diego). Because of this, this Section is organized to discuss (1) local surface runoff, and (2) receiving water quality, which is a watershed-wide matter.

Local ("On-Site") Storm Water Quality

Mission Valley Community is mostly developed and is highly impervious. Land uses include a mixture of residential, commercial business, industrial uses, governmental agencies / institutional, recreational, park, open spaces, and transportation. Typical pollutants that can be expected from these land uses include sediment, nutrients, heavy metals, organic compounds, trash and debris, oxygen demanding substances, oil and grease, bacteria and viruses, and pesticides. Because storm water runoff originating in Mission Valley Community is conveyed to the receiving waters in streets and storm drain systems with little to no opportunity for infiltration, all of the pollutants in runoff originating from existing development in Mission Valley Community can be expected to be conveyed to the receiving water. The only exception would be storm water runoff from industrial sites that have implemented best management practices (BMPs) required by the Industrial General Permit[2] or individual waste discharge requirements (WDRs) issued by the California Regional Water Quality Control Board San Diego Region (SDRWQCB), or from development projects constructed since the City of San Diego adopted the Storm Water Standards Manual, requiring certain development projects

[2] California State Water Resources Control Board Order NPDES No. CAS000001, National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Industrial Activities

classified as "Priority Development Projects" (PDPs) to include permanent post-construction best management practices (BMPs) that treat storm water runoff prior to discharge from the project. The majority of existing development in Mission Valley Community was established prior to adoption of storm water regulations requiring protection and treatment of storm water runoff. Therefore, there are few existing BMPs for protection of storm water runoff quality.

All of the pollutants identified above are detrimental to receiving water quality and need to be addressed. Storm water runoff pollution can be addressed by implementing a variety of BMPs, including source control, site design (low impact development or LID), and structural BMPs. Further information about BMP requirements is presented in Section 4 of this report.

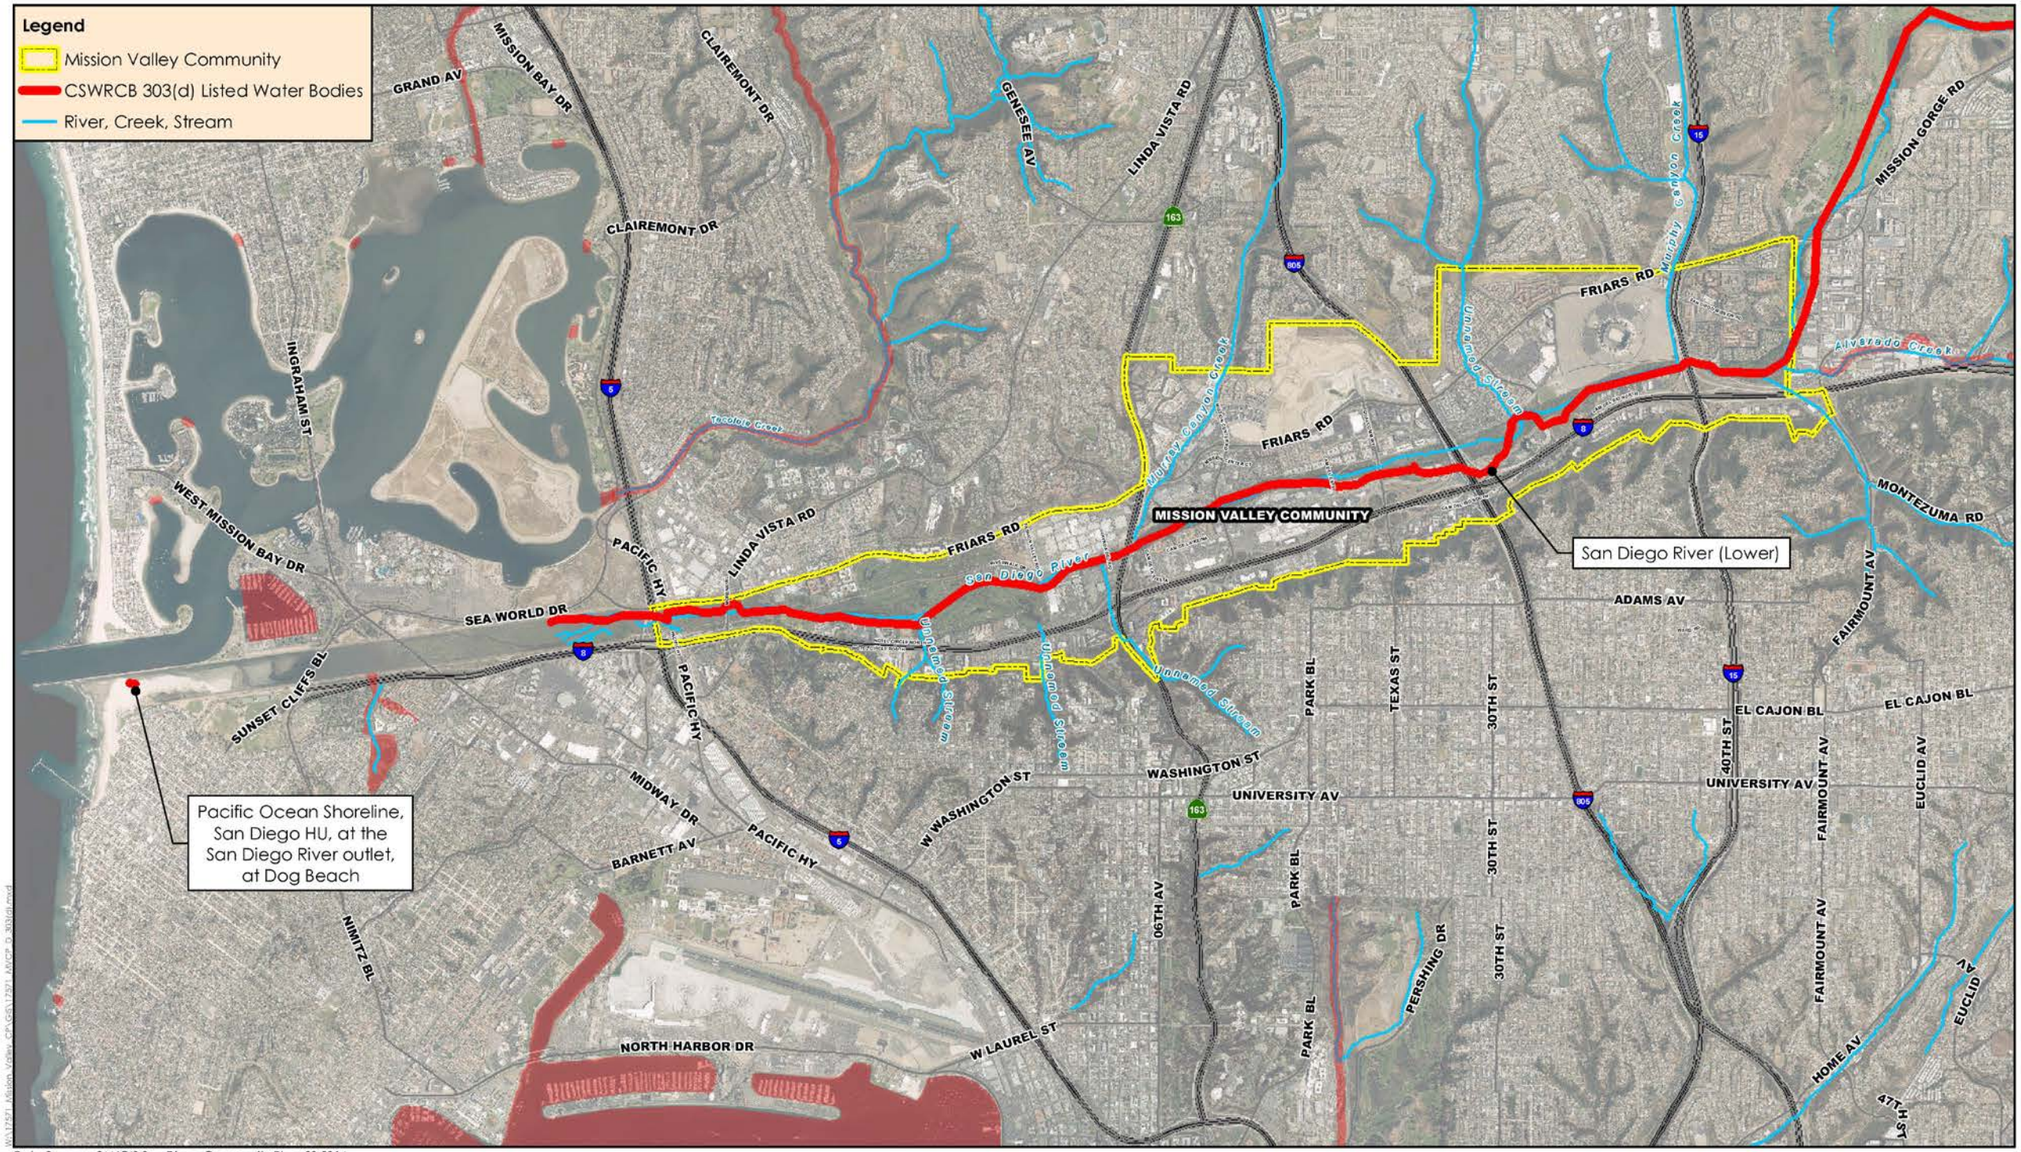
Certain pollutants are particularly significant because the receiving waters are known to be impacted by the pollutant. This means that the City of San Diego must implement programs to directly address these pollutants. Priority pollutants are identified below under Receiving Water Quality.

Receiving Water Quality

303(d) List of Impaired and Threatened Waters and TMDLs

Under Section 303(d) of the 1972 Clean Water Act, all states are required to develop a list of impaired and threatened waters (stream/river segments, lakes) for which the required pollution controls are not sufficient to attain or maintain applicable water quality standards. The states then develop an action plan called Total Maximum Daily Loads (TMDLs) to improve water quality. A TMDL is a quantitative assessment of water quality problems, and it represents the maximum amount of the pollutant of concern that a waterbody can receive and still attain water quality standards. The states establish priorities for development of TMDLs based on the severity of the pollution and the sensitivity of the uses to be made of the waters, among other factors.

The receiving waters in or downstream of Mission Valley Community that are listed as impaired based on the current (2010) 303(d) List are:



- San Diego River (Lower) – The pollutants/stressors causing impairment are enterococcus, fecal coliform, low dissolved oxygen, manganese, nitrogen, phosphorus, total dissolved solids, and toxicity.
- Pacific Ocean Shoreline, San Diego Hydrologic Unit (HU), at the San Diego River outlet, at Dog Beach –The pollutants/stressors causing impairment are enterococcus and total coliform.

Figure 6 provides a map showing the California State Water Resources Control Board, 303(d) Listed Water Bodies in Mission Valley Community. TMDLs have been established for enterococcus, fecal coliform, and total coliform for the Pacific Ocean Shoreline. TMDLs for other pollutants/stressors identified above have not been developed yet.

Water Quality Improvement Plan for the San Diego River

The City of San Diego and other agencies within the San Diego River watershed have collectively developed a Water Quality Improvement Plan for the San Diego River watershed[3] (San Diego River WQIP). As part of the development of the San Diego River WQIP, the agencies prepared an assessment of the impacts of storm drain discharges on receiving water quality that considers discharge prohibitions, available storm drain outfall data, locations, and discharge characteristics at storm drain outfalls to receiving waters. Based on these assessments, a list of priority water quality conditions was developed for the watershed, and the list was narrowed to identify the highest priority water quality condition. The highest priority water quality condition identified for the San Diego River watershed is bacteria, in both dry weather and wet weather conditions. Other priority water quality conditions are nitrogen and phosphorus, total dissolved solids, eutrophic conditions, and index of biological integrity in dry weather conditions.

[3] "San Diego River Watershed Management Area Water Quality Improvement Plan," submitted by City of El Cajon, City of La Mesa, City of San Diego, City of Santee, County of San Diego, and Caltrans, dated September 2015

4.0 REGULATIONS, POLICIES AND PROGRAMS

This Section discusses existing policies and regulations that apply to drainage and water quality in the City of San Diego, based on the City of San Diego's Land Development Code. Any development project in Mission Valley will be subject to requirements and design criteria outlined in the City of San Diego's Land Development Code and the City of San Diego's Land Development Manual, which establishes development standards and guidelines used in the review of applications. Drainage, floodplain management, and storm water runoff management requirements applicable to all development projects are discussed below. At the end of this Section is a discussion of other permits and programs that may affect specific activities or project sites.

Drainage

Drainage design policies and procedures for the City of San Diego are given in the City of San Diego's "Drainage Design Manual," dated April 1984, which is incorporated in the Land Development Manual as Appendix B. Pursuant to the Drainage Design Manual, the basic objectives are to "collect, transmit and discharge drainage in a manner to promote public safety and provide for low maintenance by:

1. Calculating the amount and frequency of storm runoff.
2. Determining the natural points of concentration and discharge and other hydraulic controls.
3. Determining the necessity for protection from floating trash and from debris moving under water.
4. Determining the requirements for energy dissipation and slope protections.
5. Analyzing the deleterious effects of corrosive soils and waters on drain pipe and structures.
6. Minimizing scour and siltation of natural stream beds, canyons and lagoons.
7. Preventing the diversion of drainage.
8. Providing for public health and safety.

9. Preventing property damage.
10. Comparing and coordinating proposed design with existing structures and systems handling the same flows.
11. Coordinating with other agencies the proposed designs for facilities.
12. Providing access for maintenance operations.
13. Providing for removal of detrimental amounts of subsurface water.
14. Design of the most efficient drainage facilities consistent with good drainage practices and considering economic considerations, ease and economy of maintenance, safety, legal obligations and aesthetics."

Development standards and guidelines to meet the objectives listed above are provided in the Drainage Design Manual. Development project applications must include a drainage study that calculates the amount of runoff expected and demonstrates how the project design adheres to the Drainage Design Manual requirements. The City of San Diego will be responsible for reviewing hydrologic and hydraulic studies and design features for conformance to the Drainage Design Manual for every map or permit for which discretionary approval is sought from the City of San Diego.

Floodplain Management

The City of San Diego is a participating Community in the National Flood Insurance Program (NFIP) administered by FEMA. The NFIP is a Federal program enabling property owners in participating communities to purchase insurance protection against losses from flooding. As a participant in NFIP, the City of San Diego is responsible to institute adequate land use and development control measures for preventing and reducing property damage from flooding. In addition, the City has to ensure that projects within or fringing on a floodway or floodplain comply with FEMA regulations and requirements.

The City has adopted development regulations for Special Flood Hazard Areas (SFHAs) in the Land Development Code (Sections 143.0145 and 143.0146). Excerpt of these policies and regulations are included in Attachment B. Following is a summary:

- Within the floodway (the floodway is the hatched portion of Zone AE shown on the FIRM Panels in Attachment A): the regulations set limitations on land uses, structures, and channelization or other alteration of the river, and require passage of the base flood. Permanent structures are not allowed. Development in floodways (e.g., road crossing) shall be offset by improvements or modifications to enable the passage of a base flood.
- Within the flood fringe (the flood fringe is the non-hatched portion of Zone AE shown on the FIRM Panels in Attachment A): permanent structures and fill for permanent structures, roads, and other development are allowed if certain conditions are met.

A large portion of Mission Valley is designated Zone X with a Provisionally Accredited Levee (PAL) note. Zone X is not a Special Flood Hazard Area (Zone X is designated "Other Flood Areas"). Zone X would not typically be subject to the regulations for the flood fringe. However, because the levees are no longer accredited, the areas that were considered to be protected by the levees need to be studied for potential map revision. The designation could change from Zone X to Zone AE, which means the areas could be considered part of the flood fringe, and regulations applicable to the flood fringe would apply.

The City of San Diego will be responsible for reviewing development project designs for conformance to the floodplain management regulations for every map or permit for which discretionary approval is sought from the City of San Diego.

Storm Water Quality

The City of San Diego is a Copermittee under the Municipal Storm Water Permit[4] issued by the California Regional Water Quality Control Board, San Diego Region. As a Copermittee, the City of San Diego must implement several storm water management programs, including programs designed to control storm water discharges from development projects both during construction and on a permanent basis post-construction. The City of San Diego has adopted a "Storm Water Management and Discharge Control Ordinance" to address these requirements. The following discussion describes construction measures and permanent, post-construction measures (best management practices or "BMPs") that are required for development projects and must be considered from the start of project planning.

Requirements During Construction

During the construction or demolition phase, any project that results in land surface disturbances of 1 acre or greater, or results in land surface disturbances of less than 1 acre but is part of a larger common plan of development, will be subject to the requirements of the Construction General Permit[5]. Projects less than one acre in size and not part of a larger common plan of development are not subject to the requirements of the Construction General Permit. However, the City of San Diego has construction storm water requirements that apply to all development activities, including projects less than one acre in size. Projects greater than one acre are required to prepare and implement a Construction Storm Water Pollution Prevention Plan (SWPPP) which identifies the pollution prevention measures that will be implemented during construction. Projects less than one acre are required to prepare and implement a Water Pollution Control Plan (WPCP) which identifies the pollution prevention measures that will be implemented

[4] SDRWQCB Order No. R9-2013-0001, "National Pollutant Discharge Elimination System (NPDES) Permit And Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds Within The San Diego Region, NPDES Permit No. CAS 0109266"

during construction. The City of San Diego's Storm Water Standards Manual provides guidance for compliance with these requirements and minimum BMPs to prevent discharges of pollutants associated with construction activity.

Based on the Storm Water Standards Manual, the major construction BMP categories are:

1. Project Planning;
2. Good Site Management "Housekeeping", including Waste Management;
3. Non Storm Water Management;
4. Erosion Control;
5. Sediment Control;
6. Run-on and Run-off Control; and
7. Active/Passive Sediment Treatment Systems, where applicable.

Permanent, Post-Construction BMP Requirements

The City of San Diego implements the permanent, post-construction BMP requirements for development projects through their "Storm Water Standards Manual." As described in the Storm Water Standards Manual, all development projects must include site design and source control BMPs. Certain projects that meet size thresholds defined in the Municipal Storm Water Permit are considered "priority development projects" (PDPs) (size threshold is typically 10,000 square feet of new impervious area for new development projects or 5,000 square feet of newly created and/or replaced impervious area for redevelopment projects, but may be lower, e.g., as low as 2,500 square feet, for some land uses or locations). All PDPs must implement structural BMPs for pollutant control in addition to the required site design and source control BMPs. Some PDPs must also implement structural BMPs for flow control (control of hydromodification, or erosion of receiving waters downstream of the project) depending on the receiving water that the project drains to.

[5] SWRCB Order No. 2009-0009-DWQ, "National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated With Construction and Land Disturbance Activities, NPDES Permit No. CAS000002"

Site design requirements are qualitative requirements that apply to the layout and design of all development project sites. Site design performance standards define minimum requirements for how a site must incorporate low impact development (LID) BMPs, including the location of BMPs and the use of integrated site design practices. The following site design practices must be implemented at all development projects, where applicable and technically feasible:

(a) Maintenance or restoration of natural storage reservoirs and drainage corridors (including topographic depressions, areas of permeable soils, natural swales, and ephemeral and intermittent streams)[6];

(b) Buffer zones for natural water bodies (where buffer zones are technically infeasible, require project applicant to include other buffers such as trees, access restrictions, etc.);

(c) Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils;

(d) Construction of streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided public safety is not compromised;

(e) Minimization of the impervious footprint of the project;

(f) Minimization of soil compaction to landscaped areas;

(g) Disconnection of impervious surfaces through distributed pervious areas;

(h) Landscaped or other pervious areas designed and constructed to effectively receive and infiltrate, retain and/or treat runoff from impervious areas, prior to discharging to the MS4;

(i) Small collection strategies located at, or as close as possible to, the source (i.e. the point where storm water initially meets the ground) to minimize the transport of runoff and pollutants to the MS4 and receiving waters;

(j) Use of permeable materials for projects with low traffic areas and appropriate soil conditions;

(k) Landscaping with native or drought tolerant species; and

(l) Harvesting and using precipitation.

Source control BMPs are features that must be implemented to address specific sources of pollutants. The following source control BMPs must be implemented at all development projects where applicable and feasible:

(a) Prevention of illicit discharges into the MS4;

(b) Storm drain system stenciling or signage;

(c) Protection of outdoor material storage areas from rainfall, run-on, runoff, and wind dispersal;

(d) Protection of materials stored in outdoor work areas from rainfall, run-on, runoff, and wind dispersal;

(e) Protection of trash storage areas from rainfall, run-on, runoff, and wind dispersal; and

(f) Use of any additional BMPs determined to be necessary by the City to minimize pollutant generation at each project.

Structural BMPs for pollutant control are permanent features that are designed to remove pollutants from storm water by measures such as retention, biofiltration, and/or flow-thru treatment by filtration or other pollutant removal mechanism. All PDPs must include structural BMPs for pollutant control. The standard for pollutant control is retention of storm water (intercept, store, infiltrate, evaporate, evapotranspire, or use storm water onsite). All PDPs must determine the feasibility to retain storm water onsite. If retention is infeasible, biofiltration of storm water runoff is required. If biofiltration is infeasible, storm water runoff must be treated by flow-thru BMPs (e.g., filtration BMPs), and the project must implement an offsite structural BMP to retain or biofilter storm water in another location in addition to implementing the onsite flow-thru treatment measures.

Structural BMPs for flow control (control of hydromodification) are permanent features that store runoff and control the outflow to mimic pre-development flow rates for a range of storm events. Structural BMPs for flow control are typically larger than structural BMPs for pollutant control and will dictate design elements in locations where

[6] Development projects proposing to dredge or fill materials in waters of the U.S. must obtain a Clean Water Act Section 401 Water Quality Certification. Projects proposing to dredge or fill waters of the state must obtain

downstream channels are susceptible to erosion from increases in storm water runoff discharge rates and durations. Typically in Mission Valley, storm water discharges are direct to the San Diego River, which is exempt from requirements for hydromodification management. However, if storm water is discharged to any other unlined channel prior to reaching the San Diego River, structural BMP requirements for flow control will apply.

The City of San Diego will be responsible for reviewing development project designs for conformance to the storm water management regulations for every map or permit for which discretionary approval is sought from the City of San Diego. Implementation of these requirements is one element of the City of San Diego's compliance with TMDL requirements and strategies for improving water quality under the San Diego River WQIP.

Other Permits

In addition to the requirements described above, other permits may be applicable to specific activities or project sites.

Industrial Storm Water Permit

Industrial facilities are subject to the requirements of the Industrial General Permit[7]. This general permit applies to operation of industrial facilities associated with nine broad categories of industrial activities. The Industrial General Permit requires the implementation of storm water management measures and development of a Storm Water Pollution Prevention Plan (SWPPP). This general permit may be reissued several times during the life of the Mission Valley Community Plan.

waste discharge requirements.

[7] California State Water Resources Control Board Order NPDES No. CAS000001, National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Industrial Activities

Temporary Groundwater Extraction

Groundwater extraction discharges to surface waters within the San Diego Region are subject to waste discharge requirements for groundwater extraction discharge[8]. Examples of activities covered under this general permit include discharge of groundwater to lower groundwater levels or pressures, control or eliminate groundwater seepage or leakage, stabilize slopes and other earth structures, construction and foundation dewatering, trench and ditch dewatering projects, monitoring wells, tank removal projects, groundwater remediation projects, permanent groundwater drainage and seepage control and other similar activities. This general permit may be reissued several times during the life of the Mission Valley Community Plan.

Alterations to Channels

Alteration to the channel of the San Diego River, Alvarado Creek, Murphy Canyon Creek, Murray Canyon Creek, or other channels would require permits issued at many levels from federal, state, and local agencies including Section 404 (of the Clean Water Act) Permit from the United States Army Corps of Engineers, Section 401 Water Quality Certification from the SDRWQCB, and several agreements and certifications from other agencies that are required as part of the Section 404 and/or Section 401 permitting process, including documentation and review under the California Environmental Quality Act (CEQA), as needed, project by project basis.

Other Programs

There are also other programs that either regulate or present guidelines and recommendations that affect urban runoff management or floodplain management in the Mission Valley Community.

[8] SDRWQCB Order No. R9-2015-0013, NPDES No. CAG919003, "General Waste Discharge Requirements for Groundwater Extraction Discharges to Surface Waters within the San Diego Region"

First San Diego River Improvement Project (FSDRIP) and Natural Resources Management Plan (NRMP) for FISDRIP

The First San Diego River Improvement Project (FSDRIP) Specific Plan was intended to implement and maintain a 100-year flood control channel, replant and permanently preserve natural riparian and upland habitat, and provide an urban corridor for transportation and recreation along approximately 7000 feet (~ 1.3 mile) of the San Diego River from Qualcomm Way (west of I-805) to SR-163, an area that covers approximately 45 acres.

U.S. Army Corps of Engineers implemented the flood control measures by reconfiguring the existing floodway, narrowing and deepening the floodway (by dredging the floodway by a depth of approximately 2 feet), and providing ponds for retention during storm events. The channel then was revegetated by a selection of indigenous native plants, which are required to be maintained in perpetuity within the limits of FSDRIP. The project was completed in 1988.

On February 2, 2004, the City of San Diego adopted "Natural Resources Management Plan (NRMP) for FSDRIP" to provide for the future protection and sustainable management of the natural resources within FSDRIP, pursuant to the Army Corps of Engineers' permit and conditions. The NRMP is the operational document for maintenance and management of FSDRIP and is consistent with the Mission Valley Community Plan (1985). The City of San Diego's Parks and Recreation Department is responsible for NRMP implementation.

Adjacent developments and maintenance activities must follow management and maintenance guidelines outlined in NRMP. Any activity which might result in habitat disturbance must follow mitigation restoration guidelines in NRMP. Other guidelines that would apply to development projects include fencing of FSDRIP limits during construction on adjacent properties, replanting of disturbed areas with appropriate native

plant species, and limited passive recreation use which excludes swimming, boating, hunting, and other active recreational activities within FSDRIP limits.

City of San Diego General Plan

The City of San Diego's General Plan, "City of San Diego General Plan," presents goals and policies for storm water infrastructure in the "Public Facilities, Services, and Safety Element (PF)" section of the Plan, and for floodplain management and urban runoff management in the "Conservation Element (CE)" section of the Plan. Mission Valley Planned District Ordinance is located in Chapter 15, Article 14, Division 1 through 4. Relevant excerpts from the General Plan are included in Attachment C.

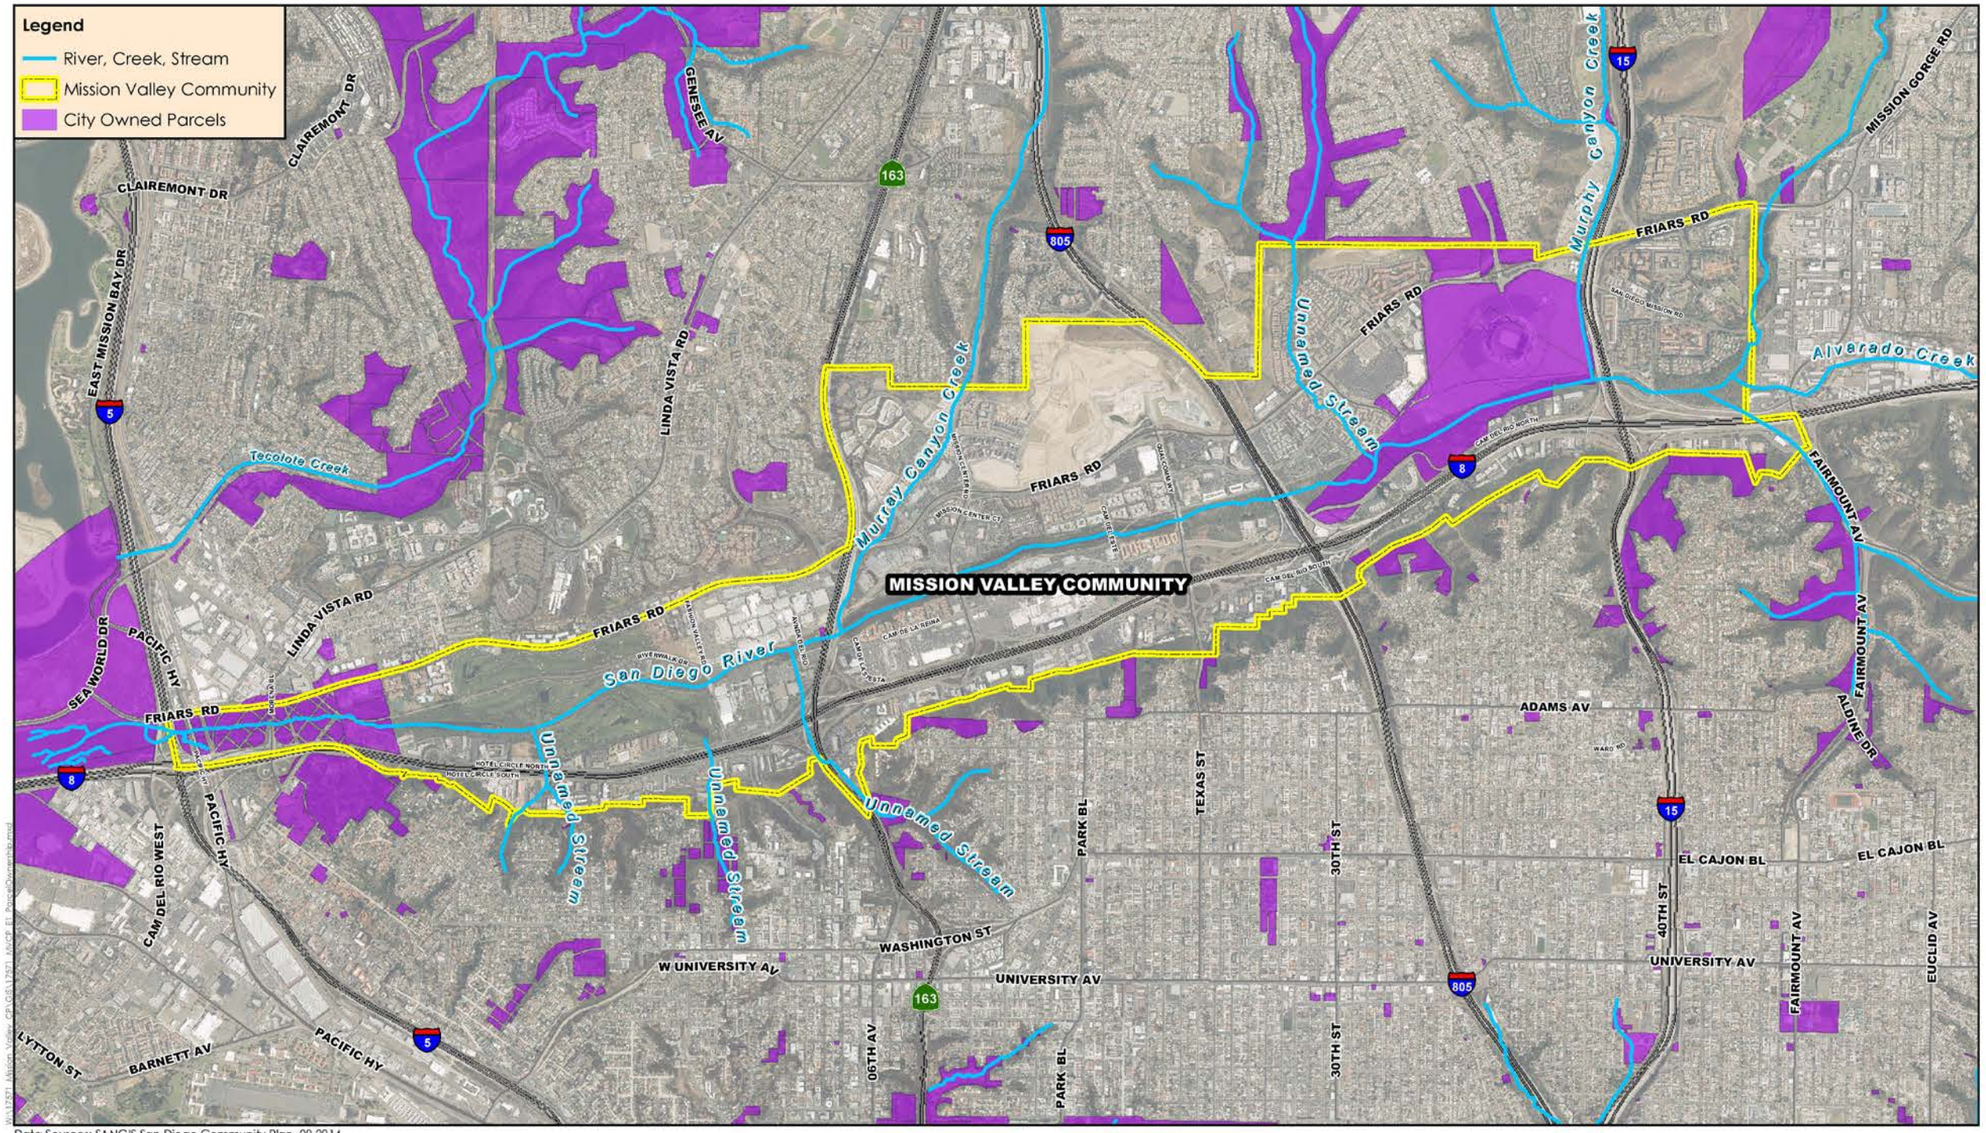
City of San Diego, San Diego River Park Master Plan

The City of San Diego has adopted "San Diego River Park Master Plan" in Resolution No. R-308196, on May 20, 2013. This document provides recommendations and guidelines to be considered when updating the Community Plans for the communities along the San Diego River, and is the primary policy document for land use policies along and adjacent to San Diego River. The design guidelines apply to the River Corridor Area and the River Influence Area only. The River Corridor Area is the 100-year Floodway (as mapped by the Federal Emergency Management Agency, FEMA), plus 35 feet on both sides of the floodway to accommodate a pathway corridor. The River Influence Area extends 200 feet beyond the River Corridor Area on both sides of the river. An excerpt of San Diego River Park Master Plan is included in Attachment D.

San Diego River Water Quality Improvement Plan

The San Diego River WQIP[9] identifies strategies that the City will implement for improving water quality for the San Diego River watershed. For development projects, compliance with the City of San Diego's Storm Water Standards Manual provides consistency with WQIP strategies. For some development projects, if onsite compliance with permanent, post-construction structural BMP requirements for retention or biofiltration of runoff is not feasible, offsite alternative compliance will be required.

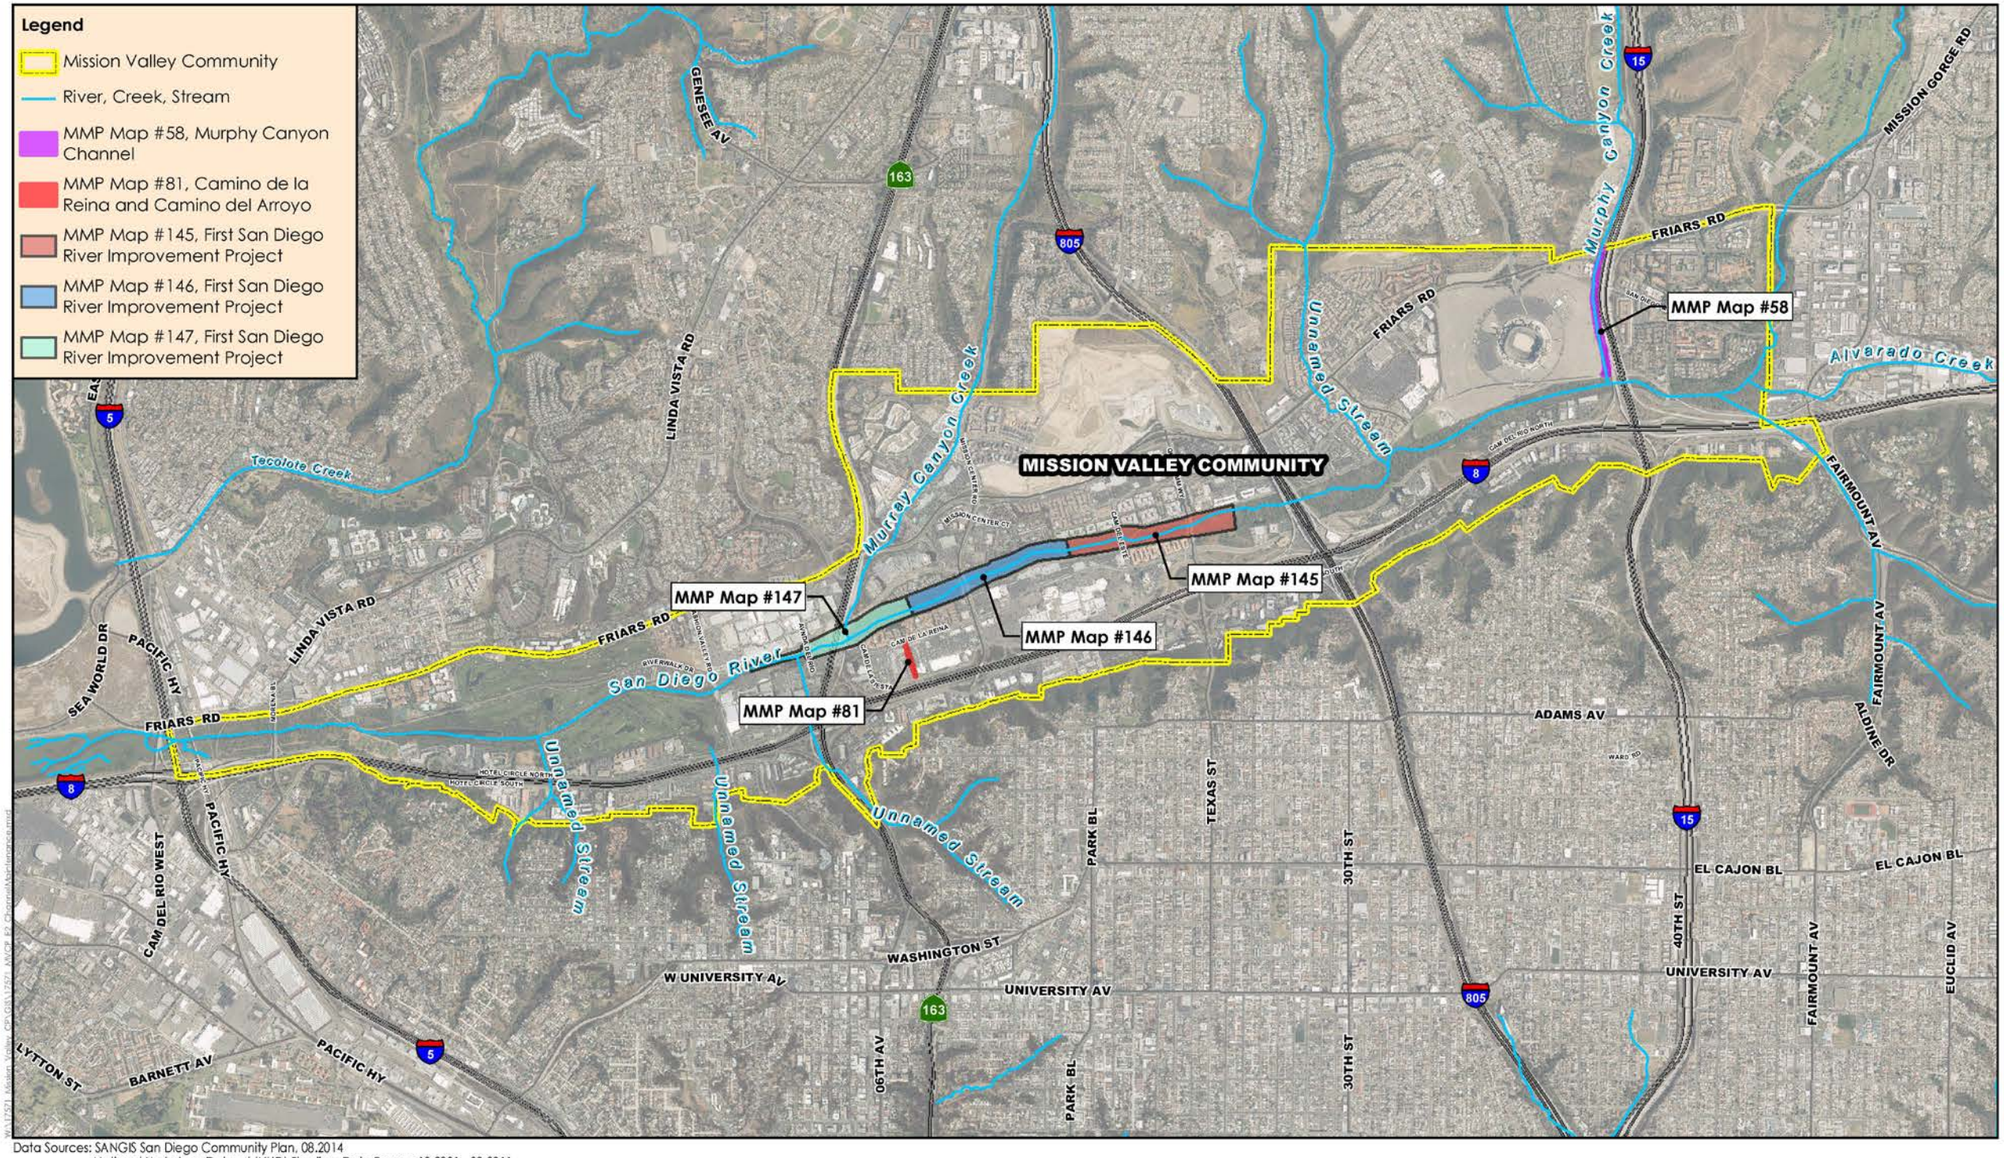
The San Diego River Watershed Management Area Analysis (WMAA), an element of the WQIP, identifies candidate projects that could potentially be used as offsite alternative compliance options in lieu of satisfying full onsite retention or biofiltration structural BMP requirements. Prior to implementing these candidate projects the project stakeholders must demonstrate that implementing such a candidate project would provide greater overall benefit to the watershed than requiring implementation of the onsite structural BMPs. WMAA is also intended to identify and/or prioritize areas where it is appropriate to allow certain exemptions from onsite hydromodification management BMPs. The WMAA provides the analysis that supports the exemption to hydromodification management BMPs for development projects that drain directly to the San Diego River.



[9] "San Diego River Watershed Management Area Water Quality Improvement Plan," submitted by City of El Cajon, City of La Mesa, City of San Diego, City of Santee, County of San Diego, and Caltrans, dated September 2015

5.0 DEVELOPMENT CONSTRAINTS FOR CITY OWNED PROPERTIES

Figure 7 provides an exhibit showing City-owned parcels within Mission Valley Community.



Many of the City-owned parcels are within the SFHA identified by the FEMA flood maps. The floodway portion of the SFHA must be reserved to allow passage of the 100-year flood. Land uses are restricted and development in floodways (e.g., road crossing) shall be offset by improvements or modifications to enable the passage of a base flood. Within the flood fringe (portion of the SFHA outside the floodway), permanent structures and fill for permanent structures, roads, and other development are allowed if certain conditions are met to protect from flooding. The City of San Diego may require approval of a Conditional Letter of Map Revision (CLOMR) from FEMA before construction or development begins within any Special Flood Hazard Area (SFHA). If the hydrologic and hydraulic analysis for CLOMR is approved by FEMA, this conditional letter informs the public that when the project is completed, it will qualify for a LOMR (Letter of Map Revision). A LOMR will still be required to officially change the NFIP map. The study for the development project must provide Base Flood Elevations (BFEs), floodway delineation and inclusion of other data needed to ensure that the building sites will be reasonably safe from flooding, and also that the proposed development does not increase the flood hazard on other properties. The City of San Diego also has regulation for required freeboard to ensure that the buildings are elevated above the BFE.

One City-owned property south of Fashion Valley Mall is within FSDRIP. The City-owned property within FSDRIP is subject to deed restriction and maintenance regulations by FSDRIP NRMP. Figure 8, “Storm Water Channels in the City of San Diego Master Storm Water System Maintenance Program (MMP), October 2011” shows the location of FSDRIP maintenance areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 11. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242** or visit its website at http://www.ngs.noaa.gov/.

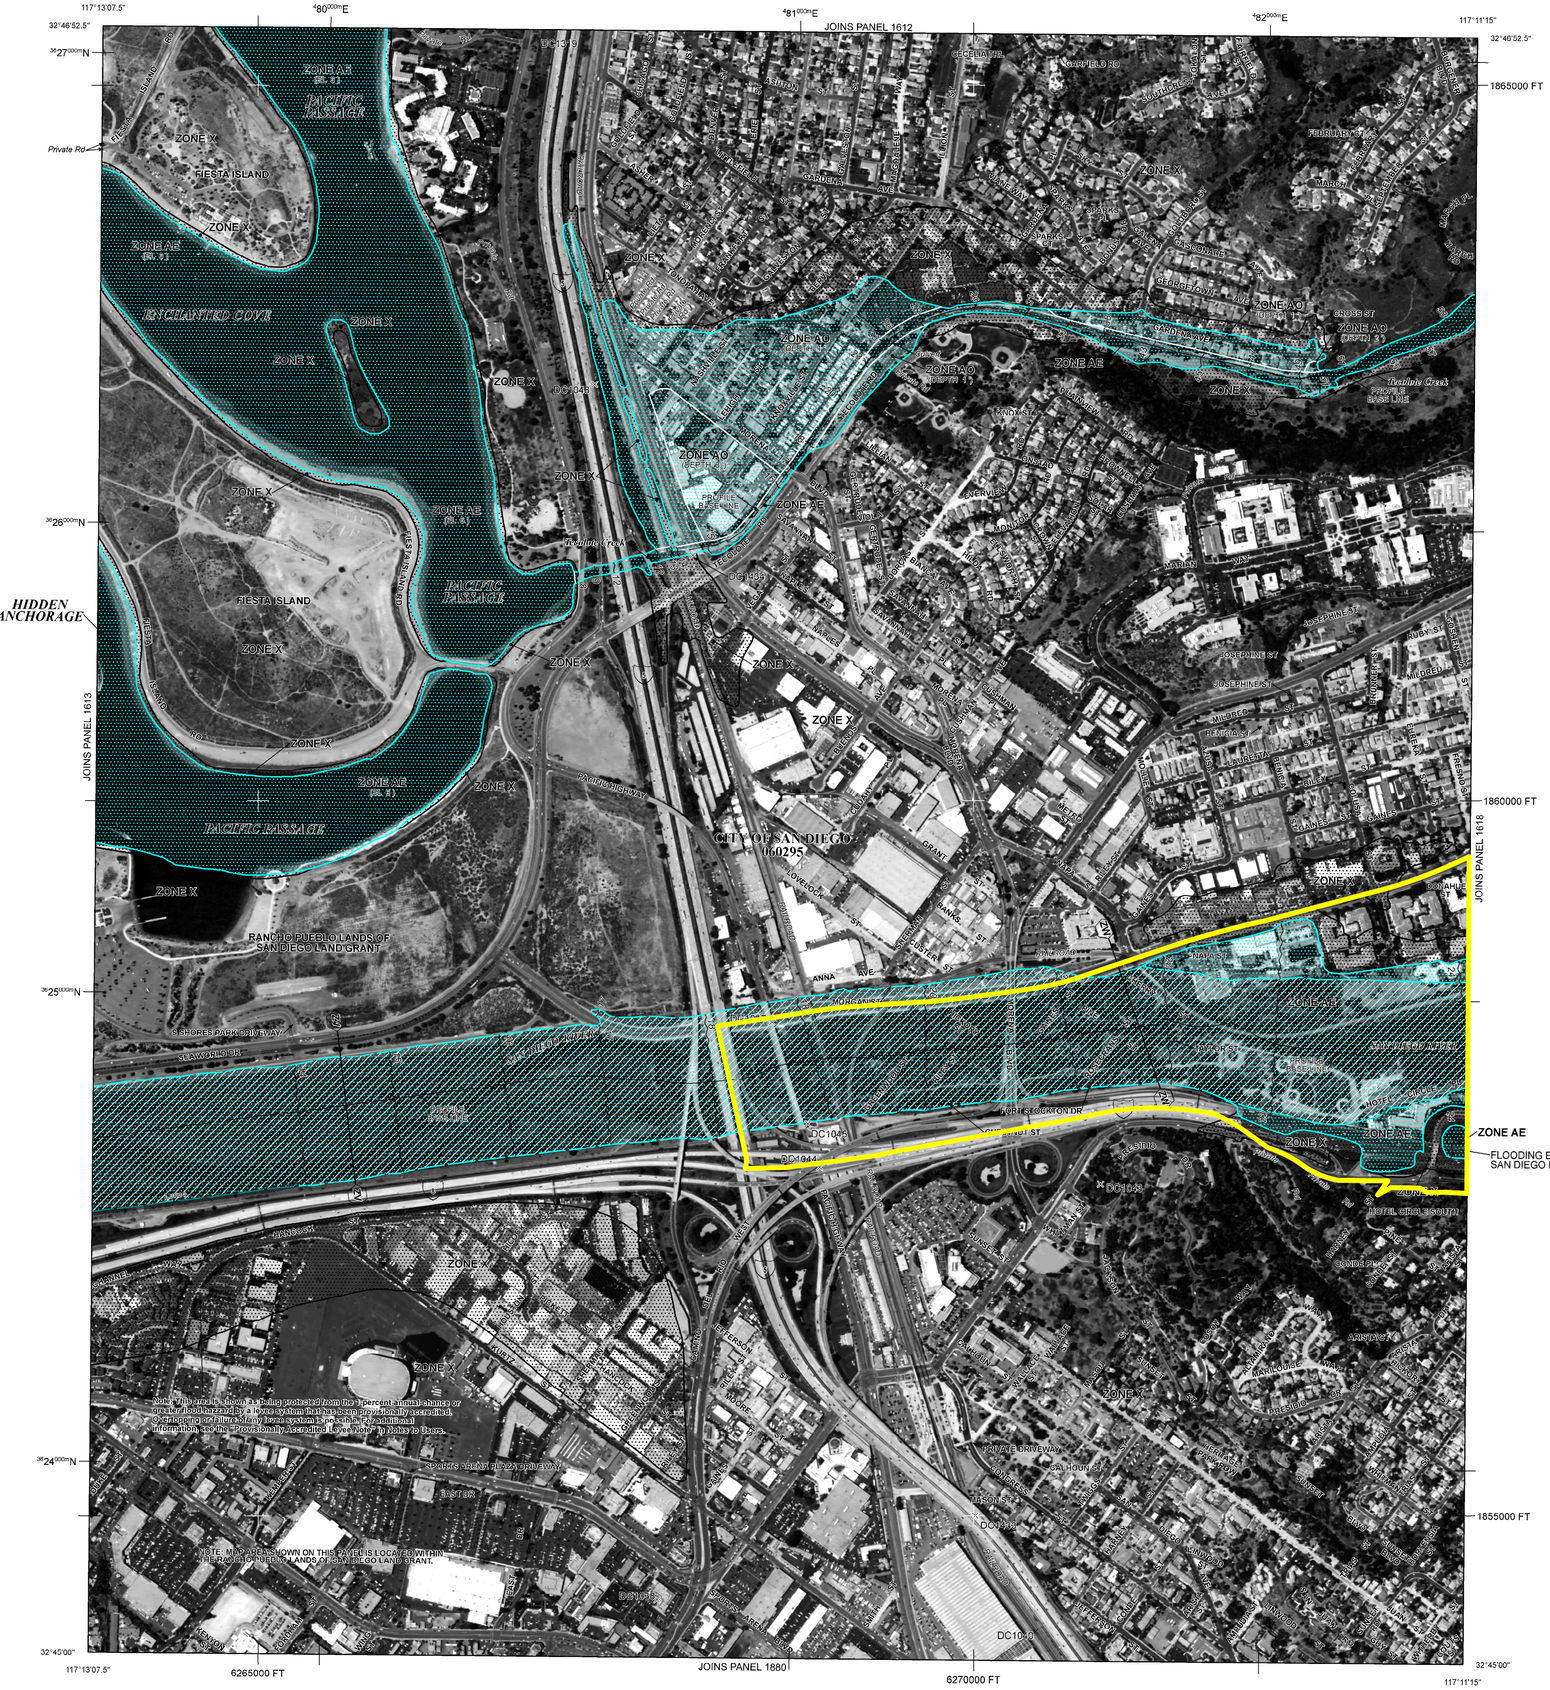
Base map information shown on this FIRM was provided in digital format by the USDA National Agriculture Imagery Program (NAIP). this information was photogrammetrically compiled at a scale of 1:24,000 from aerial photography dated 2009.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data)* may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-877-FEMA MAP (1-877-336-2627) for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov/.



If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/.

The **"profile base lines"** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the "profile base line", in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Provisionally Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimeated level of protection provided (which may exceed the 1-percent-annual chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To maintain accreditation, the levee owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations by July 23, 2009. If the community or owner does not provide the necessary data and documentation or if the data and documentation provided indicate the levee system does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the levee system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA Website at http://www.fema.gov/business/nfip/index/.shtm.

Legend

Mission Valley Community

LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 11. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242** or visit its website at http://www.ngs.noaa.gov/.

Base map information shown on this FIRM was provided in digital format by the USDA National Agriculture Imagery Program (NAIP). This information was photogrammetrically compiled at a scale of 1:24,000 from aerial photography dated 2009.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data)* may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-877-FEMA MAP (1-877-336-2627) for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/.

The **"profile base lines"** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the "profile base line", in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Provisionally Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To maintain accreditation, the levee owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations by July 23, 2009. If the community or owner does not provide the necessary data and documentation or if the data and documentation provided indicate the levee system does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the levee system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA Website at http://www.fema.gov/business/nfip/index.shtm.

LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths, or flood velocities
- 513 (EL 987) — Base Flood Elevation line and value; elevation in feet*
- Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988

- A — A — Cross section line
- 23 — 23 — Transect line
- 97°07'30", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western Hemisphere
- 4675000mE — 1000-meter Universal Transverse Mercator grid ticks, zone 11
- 6000000 FT — 5000-foot grid values: California State Plane coordinate system, Zone VI (FIPSZONE = 406), Lambert projection
- DX5510 — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths, or flood velocities
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988

- A — A — Cross section line
- 23 — 23 — Transect line
- 97°07'30", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western Hemisphere
- 4 275 000mE — 1000-meter Universal Transverse Mercator grid ticks, zone 11
- 6000000 FT — 5000-foot grid values: California State Plane coordinate system, Zone VI (FIPSZONE = 406), Lambert projection
- DX5510 — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

Federal Emergency Management Agency

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 11. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

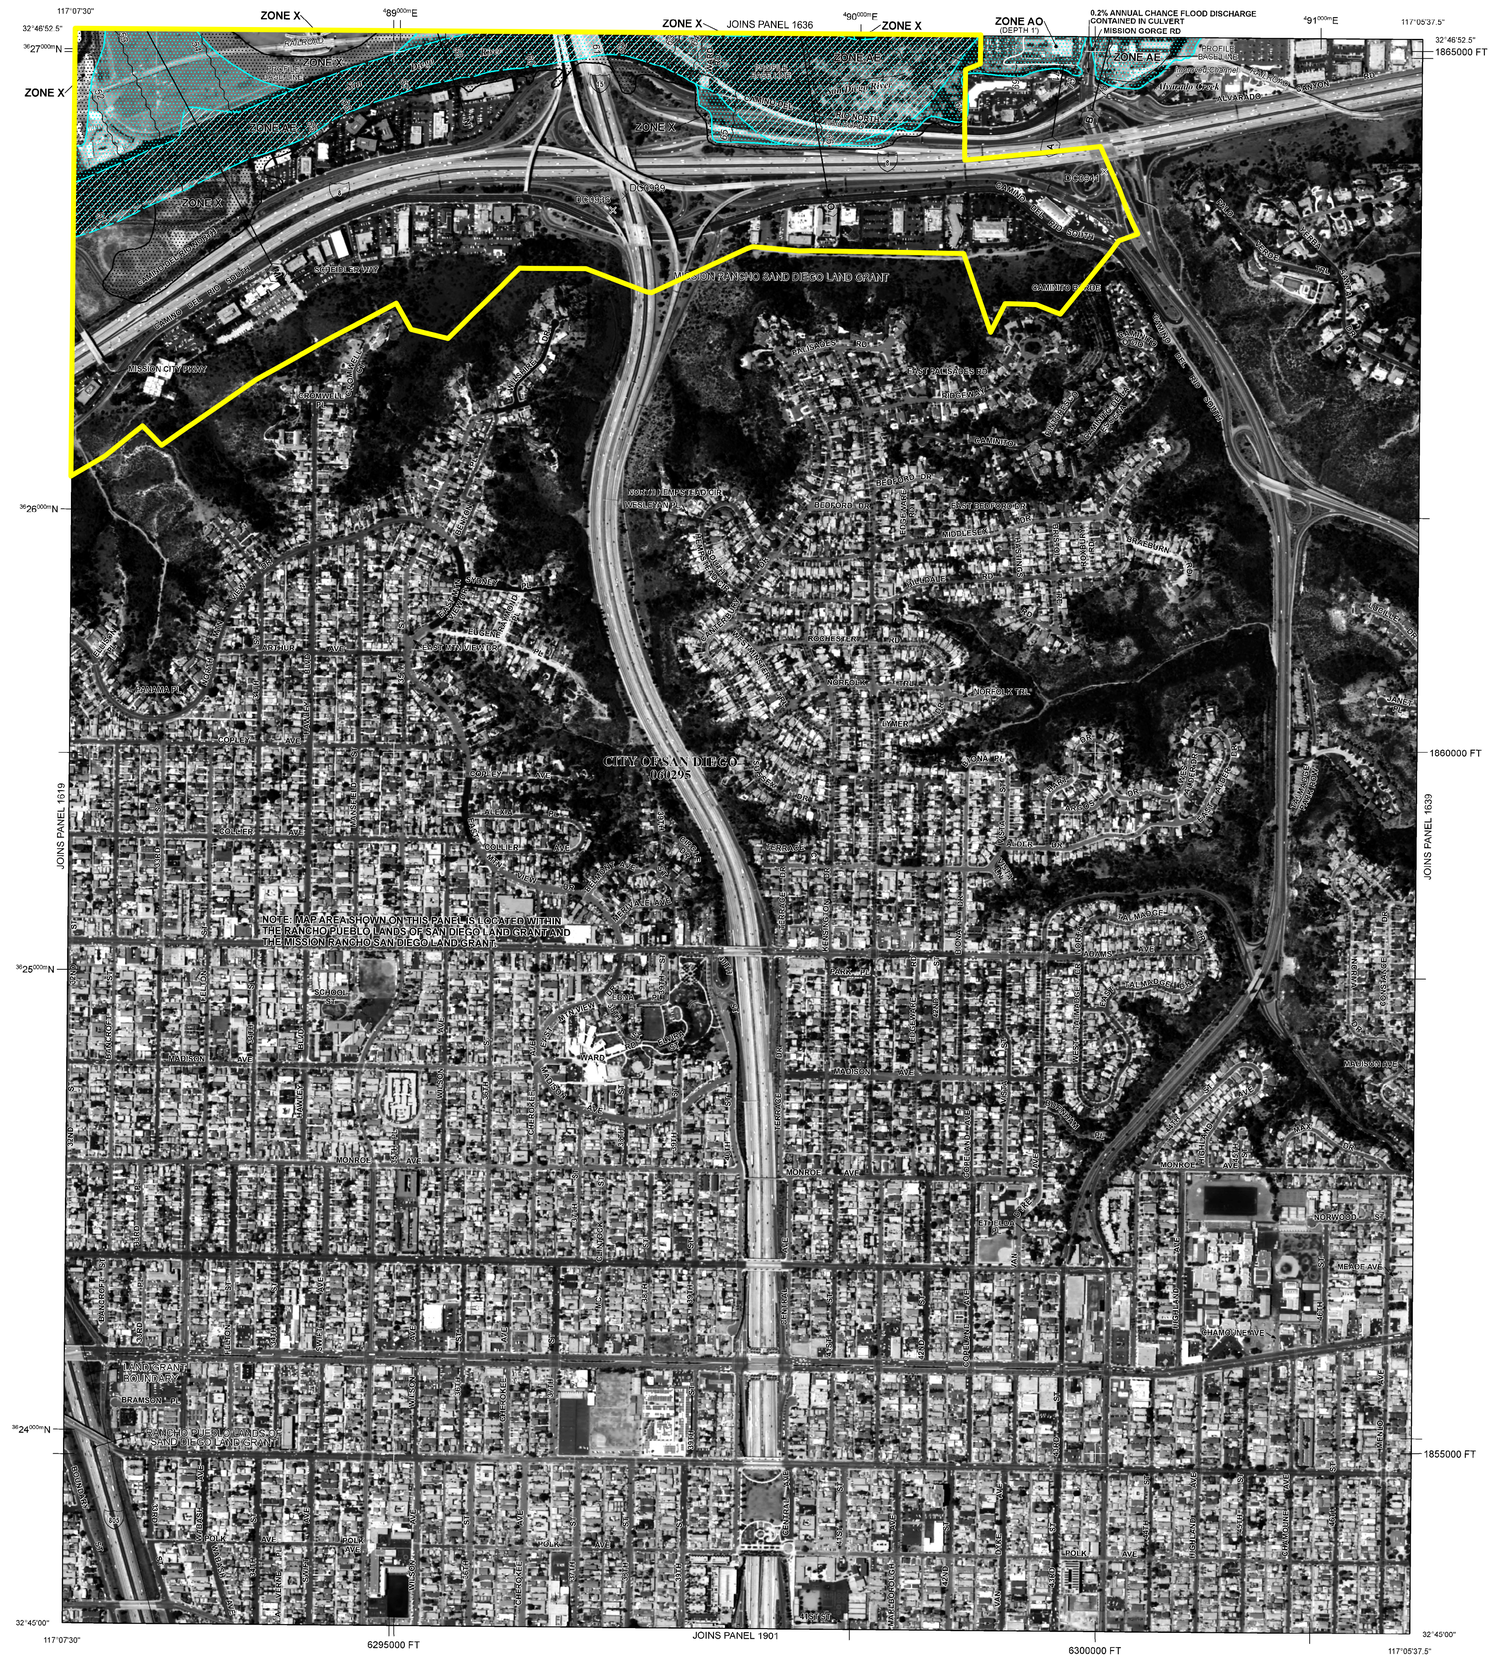
To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242** or visit its website at http://www.ngs.noaa.gov/.

Base map information shown on this FIRM was provided in digital format by the USDA National Agriculture Imagery Program (NAIP). this information was photogrammetrically compiled at a scale of 1:24,000 from aerial photography dated 2009.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data)* may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.



Contact the **FEMA Map Service Center** at 1-877-FEMA MAP (1-877-336-2627) for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/.

The **"profile base lines"** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the "profile base line", in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Legend

Mission Valley Community

LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equalled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

Excerpts from City of San Diego Municipal Code

§142.0134 Retaining Walls

Retaining walls shall comply with the height limits and construction material requirements in Chapter 14 Article 2, Division 3 (Fence Regulations).
(Retitled from "Retaining Walls and Structurally Enhanced Fill" and amended 1-9-2001 by O-18910 N.S.; effective 8-8-2001.)

§142.0135 Grading Within the *Special Flood Hazard Area*

Grading within the *Special Flood Hazard Area* shall comply with Chapter 14, Article 2, Division 2 (Drainage Regulations) and Chapter 14, Article 3, Division 1 (Environmentally Sensitive Lands Regulations).
(Amended 4-22-2002 by O-19051 N.S.; effective 10-8-2002.)

§142.0144 Grading Within Environmentally Sensitive Lands

Grading within *environmentally sensitive lands* shall comply with Chapter 14, Article 3, Division 1 (Environmentally Sensitive Lands Regulations).
(Added 12-9-1997 by O-18451 N.S.; effective 1-1-2000.)

§142.0145 Performance of Grading

All persons performing *grading* work shall be responsible to provide safe and stable slopes and to protect water quality.
(Added 12-9-1997 by O-18451 N.S.; effective 1-1-2000.)

§142.0146 Erosion, Sedimentation, and Water Pollution Control

(a) All *grading* work shall incorporate erosion and siltation control measures in accordance with Chapter 14, Article 2, Division 4 (Landscape Regulations) and the standards established in the Land Development Manual.

(b) All *development* shall be conducted to prevent erosion and stop sediment and pollutants from leaving the work site. The property owner is responsible to implement and maintain temporary and permanent erosion, sedimentation, and water pollution control measures to the satisfaction of the City Manager, whether or not such measures are a part of approved plans. The property owner shall install, monitor, maintain, and revise these measures, as appropriate, to ensure their effectiveness. Controls shall include measures outlined in Chapter 14, Article 2, Division 2 Storm Water Runoff Control and Drainage Regulations) that address the *development's* potential erosion and sedimentation impacts.

Article 2: General Development Regulations

Division 2: Storm Water Runoff and Drainage Regulations

(Retitled from "Drainage Regulations" on 9-10-2001 by O-18977 N.S.; effective 10-10-2001 outside the Coastal Overlay Zone; effective 11-16-2001 within the Coastal Overlay Zone.)

§142.0201 Purpose of Drainage Regulations

The purpose of this division is to regulate the *development* of, and impacts to, drainage facilities, to limit water quality impacts from *development*, to minimize hazards due to *flooding* while minimizing the need for construction of *flood* control facilities, to minimize impacts to *environmentally sensitive land*s, to implement the provisions of federal and state regulations, and to protect the public health, safety, and welfare.
(Amended 9-10-2001 by O-18977 N.S.; effective 10-10-2001 outside the Coastal Overlay Zone; effective 11-16-2001 within the Coastal Overlay Zone.)

§142.0202 When Drainage Regulations Apply

This division shall apply to all *development* in the City, whether or not a permit or other approval is required.
(Added 12-9-1997 by O-18451 N.S.; effective 1-1-2000.)

§142.0210 Construction Standards

All storm water runoff control, drainage, and *flood* control facilities shall be constructed in accordance with standards established in the Land Development Manual, the Standard Specifications for Public Works, and any City-adopted supplements.
(Amended 9-10-2001 by O-18977 N.S.; effective 10-10-2001 outside the Coastal Overlay Zone; effective 11-16-2001 within the Coastal Overlay Zone.)

EDITORS NOTE: **The Land Development Manual includes:**
Coastal Bluffs and Beaches Guidelines
Biology Guidelines
Historical Resources Guidelines
Submittal Requirements for Deviations within the Coastal Overlay Zone

See RR-292248 for the Coastal Bluffs and Beaches Guidelines of the Land

Development Code; RR-292249 for the Biology Guidelines of the Land Development Code; RR-292250 for the Historical Resources Guidelines of the Land Development Code; RR-292251 for the Submittal Requirements for Deviations within the Coastal Overlay Zone of the Land Development Code.

§142.0220 Storm Water Runoff Control

(a) All *development* shall comply with Municipal Code Chapter 4, Article 3, Division 3 (Stormwater Management and Discharge Control).

(b) All *development* shall be conducted to prevent erosion and stop sediment and pollutants from leaving the property to the maximum extent practicable. The property owner is responsible to implement and maintain temporary and permanent erosion, sedimentation, and water pollution control measures to the satisfaction of the City Manager, whether or not such measures are a part of approved plans. The property owner shall install, monitor, maintain, and revise these measures, as appropriate, to ensure their effectiveness. Controls shall include the following measures that address the *development*'s potential erosion, sedimentation, and water pollution impacts.

(1) Erosion prevention.

(2) Sediment control.

(3) Phased *grading.*

(Retitled from "Stormwater Management and Discharge Control" and amended 9-10-2001 by O-18977 N.S.; effective 10-10-2001 outside the Coastal Overlay Zone; effective 11-16-2001 within the Coastal Overlay Zone.)

§142.0230 Development Within the Special Flood Hazard Area

All *development* within a *Special Flood Hazard Area* shall comply with Chapter 14, Article 3, Division 1 (Environmentally Sensitive Lands Regulations).
(Amended 4-22-2002 by O-19051 N.S.; effective 10-8-2002.)

§143.0145 Development Regulations for Special Flood Hazard Areas

(a) *Special Flood Hazard Areas* within the City of San Diego are established in accordance with the report entitled "*Flood Insurance Study,* San Diego County, California," dated June 16, 1999 and the accompanying *Flood Insurance Rate Maps (FIRM),* published by the Federal Emergency Management Agency (FEMA), on file in the office of the City Clerk as Document Nos. 18910-1 and 18910-2, including any supplements, amendments, and revisions which are properly promulgated by FEMA or the Federal Insurance Administrator.

(b) For the purpose of Sections 143.0145 and 143.0146, the City Engineer is the designated Floodplain Administrator and shall administer, implement, and enforce these regulations.

(c) The degree of *flood* protection required by this section is considered reasonable for regulatory purposes and is based on scientific and engineering considerations. Larger *floods* can and will occur on rare occasions. It is possible that increased *flood* heights may result from man-made or natural causes. This section does not imply that land outside a *Special Flood Hazard Area* or uses permitted within such areas will be free from *flooding* or *flood* damages. This section shall not create liability on the part of the City, any officer or employee thereof, or the FEMA, for any *flood* damages that result from reliance on this chapter or any administrative decision lawfully made there under.

(d) The following development regulations and all other applicable requirements and regulations of FEMA apply to all *development* proposing to encroach into a *Special Flood Hazard Area*, including both the *floodway* and *flood fringe* areas or that does not qualify for an exemption pursuant to Section 143.0110(c):

(e) *Floodways*

(1) Within the *floodway* portion of a *premises*, development regulations are as set forth for the OF zone, pursuant to Section 131.0231.

(2) *Structures* associated with any allowed use shall comply with the following requirements:

(A) *Structures* shall not be attached to a foundation, in order to readily move them in case of *flood*; and

(B) *Structures* shall be removed upon imminence of *flooding*, as predicted by the National Weather Service or local public weather broadcast. If a *structure* is not removed and *flooding* occurs, the retrieval or salvage of the *structure* and repair of any damage caused by the *structure* shall be the responsibility of the owner.

(3) *Channelization* or other substantial alteration of rivers or streams shall be limited to that necessary for the following:

(A) Essential public service projects, where no other feasible construction method or alternative project location exists; and

(B) *Flood* control projects, where no other feasible method for protecting existing public or private *development* exists and where such protection is necessary for public safety.

(C) Projects where the primary function is the improvement of fish and wildlife habitat.

(4) *Development* in *floodways* shall be offset by improvements or modifications to enable the passage of a *base flood*, in accordance with the FEMA standards and regulations provided in Section 143.0146.

(5) *Development* that involves *channelization* or other substantial alteration of rivers or streams is subject to the following requirements.

(A) All requirements and relevant recommendations of hydrological studies for the watershed of the affected stream, as approved by the City Engineer, shall be incorporated into the project design and mitigation measures. These requirements include erosional characteristics, flow velocities, volume, sediment transport, and maintenance of hydrology.

(B) The channel shall be designed to ensure that the following occur:

(i) Stream scour is minimized;

(ii) Erosion protection is provided;

(iii) Water flow velocities are maintained as specified by the City Engineer;

(iv) There are neither significant increases nor contributions to downstream bank erosion and sedimentation of *sensitive biological resources*; acceptable techniques to control stream sediment include planting riparian vegetation in and near the stream and detention or retention basins;

(v) Wildlife habitat and corridors are maintained;

(vi) Resource management criteria are implemented consistent with applicable *land use plans*; and

(vii) Groundwater recharge capability is maintained or improved.

(C) Channels that accommodate a *base flood* shall do so without increasing the water surface elevation more than one foot at any point from the level of a nonconfined *base flood* in the natural undeveloped floodplain. Channels may accommodate less than a *base flood* (low-flow channels), but shall be designed and constructed in accordance with FEMA regulations.

(D) All artificial channels shall consist of natural bottoms and sides and shall be designed and sized to accommodate existing and proposed riparian vegetation and other natural or proposed constraints. Where maintenance is proposed or required to keep vegetation at existing levels compatible with the design capacity of the channel, a responsible party shall be identified and a maintenance and monitoring process shall be established to the satisfaction of the City Engineer.

(6) *Development* shall not significantly adversely affect existing *sensitive biological resources* on-site or off-site.

(7) Within the Coastal Overlay Zone, no *structure* or portion thereof shall be erected, constructed, converted, established, altered or enlarged, or no landform alteration *grading*, placement or removal of vegetation, except that related to a historic and ongoing agricultural operation, or land division shall be permitted, provided:

(A) Parking lots, new roadways and roadway expansions shall be allowed only where indicated on an adopted *Local Coastal Program land use plan.*

(B) *Floodway* encroachments for utility and transportation crossings shall be offset by improvements or modifications to enable the passage of the *base flood*, in accordance with the FEMA standards and regulations provided in Section 143.0146.

(f) *Flood Fringe*. The applicable development regulations are those in the underlying zone, subject to the following supplemental regulations:

(1) Within the *flood fringe* of a *Special Flood Hazard Area*, permanent *structures* and *fill* for permanent *structures*, roads, and other *development* are allowed only if the following conditions are met:

(A) The *development* or *fill* will not significantly adversely affect existing *sensitive biological resources* on-site or off-site;

(B) The *development* is capable of withstanding *flooding* and does not require or cause the construction of off-site *flood* protective works including artificial *flood* channels, revetments, and levees nor will it cause adverse impacts related to *flooding* of properties located upstream or downstream, nor will it increase or expand a *(FIRM)* Zone A;

(C) *Grading* and *filling* are limited to the minimum amount necessary to accommodate the proposed *development*, harm to the environmental values of the floodplain is minimized including peak flow storage capacity, and *wetlands* hydrology is maintained;

(D) The *development* neither significantly increases nor contributes to downstream bank erosion and sedimentation nor causes an increase in *flood* flow velocities or volume; and

(E) There will be no significant adverse water quality impacts to downstream wetlands, lagoons or other *sensitive biological resources*, and the *development* is in compliance with the requirements and regulations of the National Pollution Discharge Elimination System, as implemented by the City of San Diego.

(F) The design of the *development* incorporates the findings and recommendations of both a site specific and coastal watershed hydrologic study.

(2) All *development* that involves *fill*, *channelization*, or other alteration of a *Special Flood Hazard Area* is subject to the requirements for *channelization* in Section 143.0145(e)(5) and with FEMA regulations.

(Amended 4-22-2002 by O-19051 N.S.; effective 10-8-2002.)
(Amended 11-13-08 by O-19805 N.S; effective 12-13-2008.)

§143.0146 Supplemental Regulations for Special Flood Hazard Areas

All proposed *development* within a *Special Flood Hazard Area* is subject to the following requirements and all other applicable requirements and regulations of FEMA.

(a) *Development* and Permit Review

(1) Where *base flood elevation* data has not been provided by the *Flood Insurance Study*, the City Engineer shall obtain, review, and utilize *base flood elevation* and *floodway* data available from federal or state sources, or require submittal of such data from the *applicant*. The City Engineer shall make interpretations, where needed, as to the location of the boundaries of the areas of the *Special Flood Hazard Area*, based on the best available engineering or scientific information.

(2) Proposed *development* in a *Special Flood Hazard Area* shall not adversely affect the *flood* carrying capacity of areas where *base flood elevations* have been determined but the *floodway* has not been designated. "Adversely affect" as used in this section means that the cumulative effect of the proposed *development*, when combined with all other existing and anticipated *development*, will not increase the water surface elevation of the *base flood* more than one foot at any point.

(3) In all cases where a watercourse is to be altered the City Engineer shall do the following:

(A) Notify affected, adjacent communities and the California Department of Water Resources of any proposed alteration or relocation of a watercourse and submit evidence of the notice to the Federal Insurance Administration;

(B) Require that the *flood* carrying capacity of the altered or relocated portion of the watercourse is maintained; and

(C) Secure and maintain for public inspection and availability the *certifications*, appeals, and variances required by these regulations.

(4) The *applicant* shall grant a flowage easement to the City for that portion of the property within a *floodway*.

(5) Appropriate agreements shall be secured between the *applicant* and the City to assure participation by the *applicant* or any successor in interest in financing of future *flood* control works.

(6) *Development* in a *Special Flood Hazard Area* shall not increase or expand a *FIRM* Zone A.

(7) In In all *floodways*, any *encroachment*, including *fill*, new construction, significant modifications, and other *development* is prohibited unless *certification* by a registered professional engineer is provided demonstrating that *encroachments* will not result in any increase in *flood* levels during the occurrence of the *base flood* discharge except as allowed under Code of Federal Regulations Title 44, Chapter 1, Part 60.3(c)(13).

(b) Standards for *Subdivisions*

(1) All preliminary *subdivision* proposals shall identify the *Special Flood Hazard Area* and the elevation of the *base flood*.

(2) All final *subdivision maps* shall provide the elevation of proposed *structures* and pads. If the site is *filled* above the *base flood elevation*, the *lowest floor*, including *basement*, shall be certified to be 2 feet above the *base flood elevation* by a registered professional engineer or surveyor, and the *certification* shall be provided to the City Engineer.

(3) All *subdivisions* shall be designed to minimize *flood* damage.

(4) All *subdivisions* shall have public utilities and facilities such as sewer, gas, electrical, and water systems located and constructed to minimize *flood* damage.

(5) All *subdivisions* shall provide adequate drainage to reduce exposure to *flood* hazards.

(6) The final map shall bear the notation "Subject to Inundation" for those portions of the property with a *grade* lower than 2 feet above the *base flood elevation*.

(c) Standards of Construction

In all *Special Flood Hazard Areas*, the following standards apply for all *development*.

(1) All permitted, permanent *structures* and other significant improvements shall be anchored to prevent flotation, collapse, or lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy.

(2) All permitted permanent *structures* and other significant improvements shall be constructed with materials and utility equipment resistant to *flood* damage.

(3) Construction methods and practices that minimize *flood* damage shall be used.

(4) All electrical, heating, ventilation, plumbing, and air conditioning equipment and other service facilities shall be designed and located to prevent water from entering or accumulating within the equipment components during conditions of *flooding*.

(5) *Breakaway walls* shall be certified by a registered engineer or architect to meet all applicable FEMA requirements. The *certification* shall be provided to the City Engineer before final inspection approval.

(6) New construction or *substantial improvement* of any *structure* shall have the *lowest floor*, including *basement*, elevated at least 2 feet above the *base flood elevation*. Upon completion of the *development*, the elevation of the *lowest floor*, including *basement*, shall be certified by a registered professional engineer or surveyor to be properly elevated. The *certification* shall be provided to the City Engineer before final inspection approval. The City Engineer reserves the right to require a preliminary *certification* before foundation inspection approval.

(7) New construction or *substantial improvement* of any *structure* in *FIRM* Zone AH or AO shall have the *lowest floor*, including *basement*, elevated above the highest adjacent *grade* at least 2 feet higher than the depth number specified on the *FIRM*, or at least 4 feet if no depth number is specified. Upon the completion of the *structure* the elevation of the *lowest floor*, including *basement*, shall be certified by a registered professional engineer or surveyor, to be properly elevated. The *certification* shall be provided to the City Engineer before final inspection approval. The City Engineer may require a preliminary *certification* before foundation inspection approval.

(8) Permitted nonresidential construction shall either be elevated as required by Section 143.0146(c)(6) or (7) or, together with attendant utility and sanitary facilities, meet the flood proofing requirements of FEMA. *Certification* by a registered professional engineer or architect that such requirements are met shall be provided to the City Engineer before final inspection approval. The City Engineer may require a preliminary *certification* before foundation inspection approval.

(9) Fully enclosed areas below the *lowest floor* that are subject to *flooding* shall be certified by a registered professional engineer or architect that they comply with the flood proofing requirements of FEMA. The *certification* shall be provided to the City Engineer before final inspection approval.

(d) Standards for *Manufactured Homes*

All new and replacement *manufactured homes* and additions to *manufactured homes* are subject to the following regulations.

(1) The *lowest floor* shall be elevated at least 2 feet above the *base flood elevation*.

(2) *Manufactured homes* shall be securely anchored to a permanent foundation system to resist flotation, collapse, or lateral movement.

(3) A registered engineer or architect must certify that the conditions of this subsection have been met. The *certification* shall be provided to the City Engineer before final inspection approval.

(e) Standards for Utilities

Certification shall be provided to the City Engineer before final inspection approval that the following requirements have been met.

(1) All new and replacement water supply and sanitary sewage systems shall be designed to minimize or eliminate infiltration of *flood* waters into the system and discharge from systems into *flood* waters.

(2) On-site waste disposal systems shall be located and designed to avoid impairment to them or contamination from them during *flooding*.

(f) The City Engineer shall notify the San Diego District Offices of the Coastal Commission of any pending changes to the adopted Flood Insurance Rate Maps affecting property within the Coastal Overlay Zone when the City Engineer receives notification of such potential changes. The City Engineer shall notify the Commission staff when *costal development* within the City of San Diego's Coastal

Development Permit jurisdiction would require processing a change to the FIRM maps. The City Engineer shall assure the Commission's District Office has the most current effective Flood Insurance Rate Maps approved by FEMA by forwarding any revised maps affecting the Coastal Overlay Zone within thirty working days of City Engineer's receipt.

(Amended 4-22-2002 by O-19051 N.S.; effective 10-8-2002.)
(Amended 8-4-2011 by O-20081 N.S.; effective 10-6-2011.)

§143.0150 Deviations from Environmentally Sensitive Lands Regulations

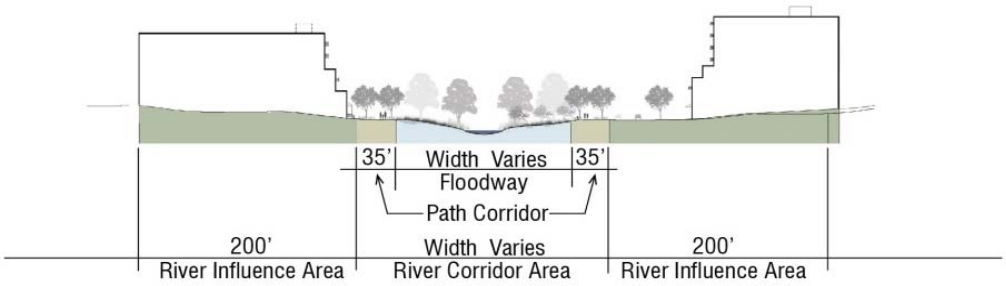
Plans submitted in accordance with this section shall, to the maximum extent feasible, comply with the regulations of this division. If a proposed *development* does not comply with all applicable development regulations of this division and a deviation is requested as indicated in Table 143-01A, the Planning Commission may approve, conditionally approve, or deny the proposed Site Development Permit in accordance with Process Four, subject to the following:

(a) Deviations from the regulations of this division may be granted only if the decision maker makes the *findings* in Section 126.0504(c).

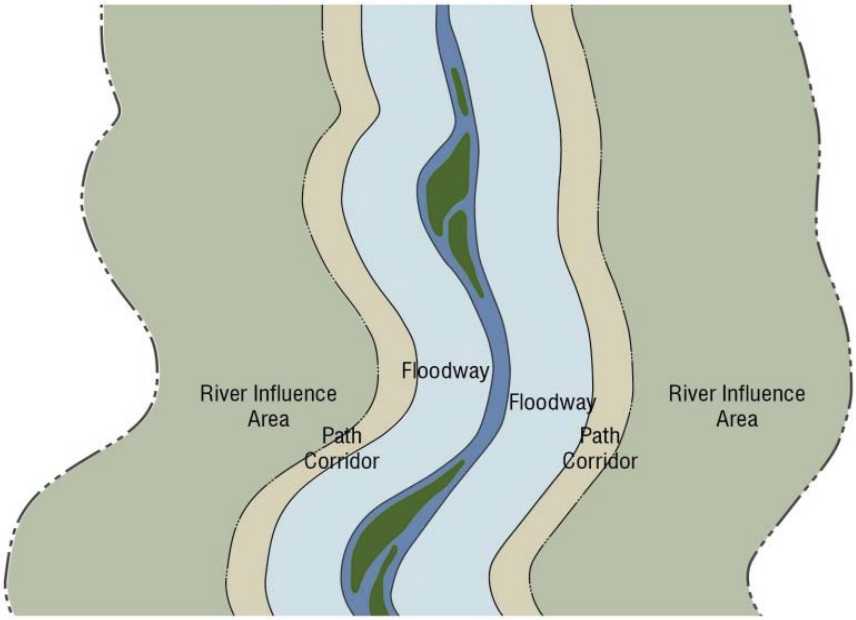
(b) Deviations from the Supplemental Regulations for Special Flood Hazard Areas in Section 143.0146 may be granted only if the decision maker makes the *findings* in Section 126.0504(d).

(c) Within the Coastal Overlay Zone, deviations from the Environmentally Sensitive Lands Regulations may be granted only if the decision maker makes the *findings* in Section 126.0708.

§1514.0302 San Diego River Subdistrict ("River Subdistrict")



(a) Purpose



It is the purpose of the River Park Subdistrict regulations to ensure that development along the San Diego River implements the San Diego River Park Master Plan and the Mission Valley Community Plan. It is also the intent of the River Park Subdistrict regulations to preserve and enhance the character of the San Diego River valley, to provide for sensitive rehabilitation and redevelopment, and to create the River Pathway.

(b) Boundaries

The River Park Subdistrict includes the River Corridor Area and the River Influence Area. The regulations of this subdistrict apply to any project fully or partially within these boundaries. See Appendix E and Diagram 1514-03A, San Diego River Park Subdistrict Components.

Diagram 1514-03A
San Diego River Park Subdistrict Components

(c) River Corridor Area

(1) Permitted Uses and Development

(A) Development within the Floodway shall be in accordance with Section 143.0145 (Development Regulations for Special Flood Hazard Areas).

(B) Within the Path Corridor, only the following development shall be allowed:

(i) The River Pathway,

(ii) Trails, in accordance with Section 1514.0302(c)(4), and

(iii) Development determined by the City Manager to be for passive recreational use, such as picnic areas, scenic and interpretive overlooks, fitness stations, seating, and educational exhibit areas.

(C) Within locations that are not mapped as Multi-Habitat Planning Area (MHPA), as identified by the City of San Diego Multiple Species Conservation Program (MSCP) Subarea Plan, or determined to be wetland buffers in accordance with Section 143.0141, the following development shall be allowed: children's play areas, multipurpose courts, turf fields, and development determined by the City Manager to be for active recreational use.

(D) Portions of the Path Corridor that are mapped as MHPA, as identified by the City of San Diego MSCP Subarea Plan, or determined to be wetland buffers in accordance with Section 143.0141 shall be developed in accordance with the MSCP Subarea Plan's Land Use Considerations and the Environmentally Sensitive Lands Regulations in Chapter 14, Article 3, Division 1.

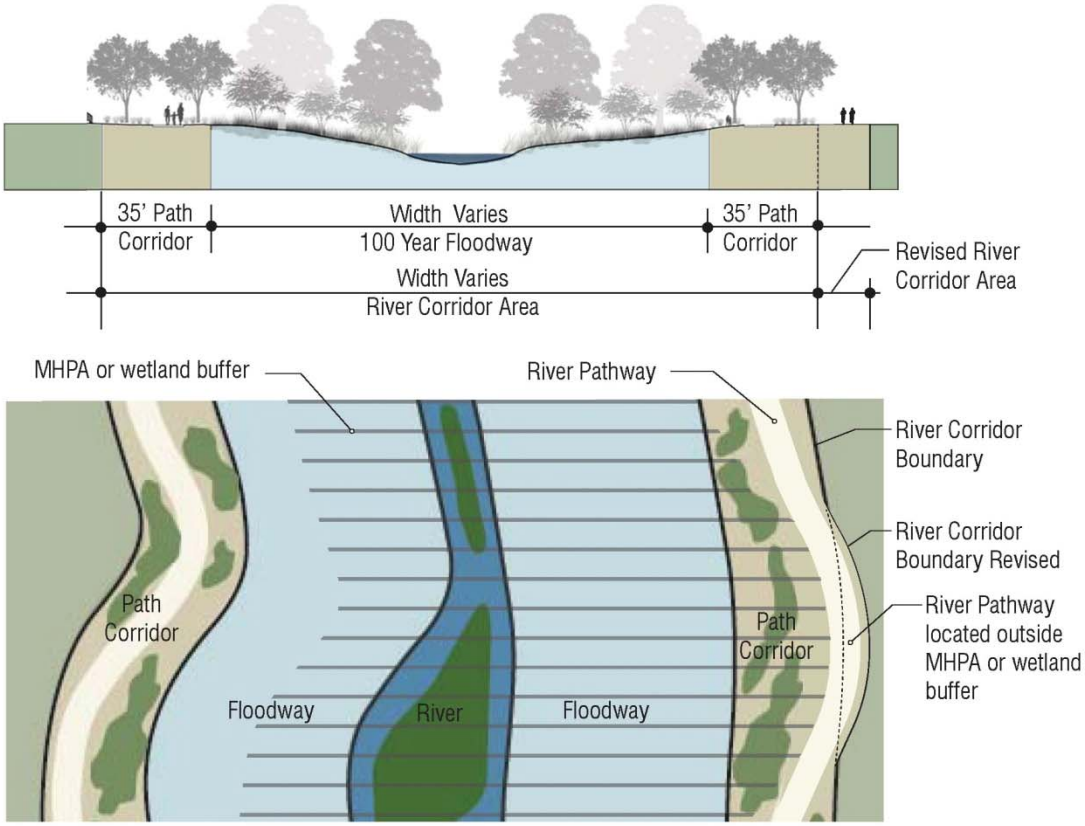
(2) Grading

(A) Grading within the Floodway shall be conducted in accordance with the MSCP Subarea Plan's Land Use Considerations and the Environmentally Sensitive Lands Regulations in Chapter 14, Article 3, Division 1.

(B) Grading within the Path Corridor shall, to the satisfaction of the City Manager:

(i) Avoid long, continuous engineered slopes with hard edges;

(ii) Provide gradual transitions at the top and bottom of slopes; and



(iii) Stabilize and revegetate slopes with native plants consistent with the surrounding habitat type.

(3) River Pathway

(A) Development on a lot located wholly or partially in the River Corridor Area shall include a River Pathway. The River Pathway shall meander, to the satisfaction of the City Manager.

(B) Where portions of the Path Corridor are mapped as MHPA, as identified by the City of San Diego MSCP Subarea Plan, or determined to be wetland buffers in accordance with Section 143.0141, the River Pathway shall be located (immediately adjacent to the Path Corridor) outside the portions of the MHPA and the wetland buffer. See Diagram 1514-03B, Path Corridor Realignment for MHPA and Wetland Buffer.

Diagram 1514-03B
Path Corridor Realignment for MHPA and Wetland Buffer

(C) The entire River Pathway shall be dedicated with an easement that allows public access.

(D) The River Pathway shall be completed in the first phase of any phased development.

(E) The River Pathway shall include the following features:

(i) A minimum10-foot wide pathway of concrete or similar material in a color that blends with the surrounding native soil;

(ii) A minimum 2-foot wide area of decomposed granite or similar material along each side of the River Pathway in a color similar to the River Pathway;

(iii) A minimum 10-foot wide landscape area between the Floodway and the River Pathway; and

(iv) A minimum 12-foot vertical clearance above finished grade of the River Pathway.

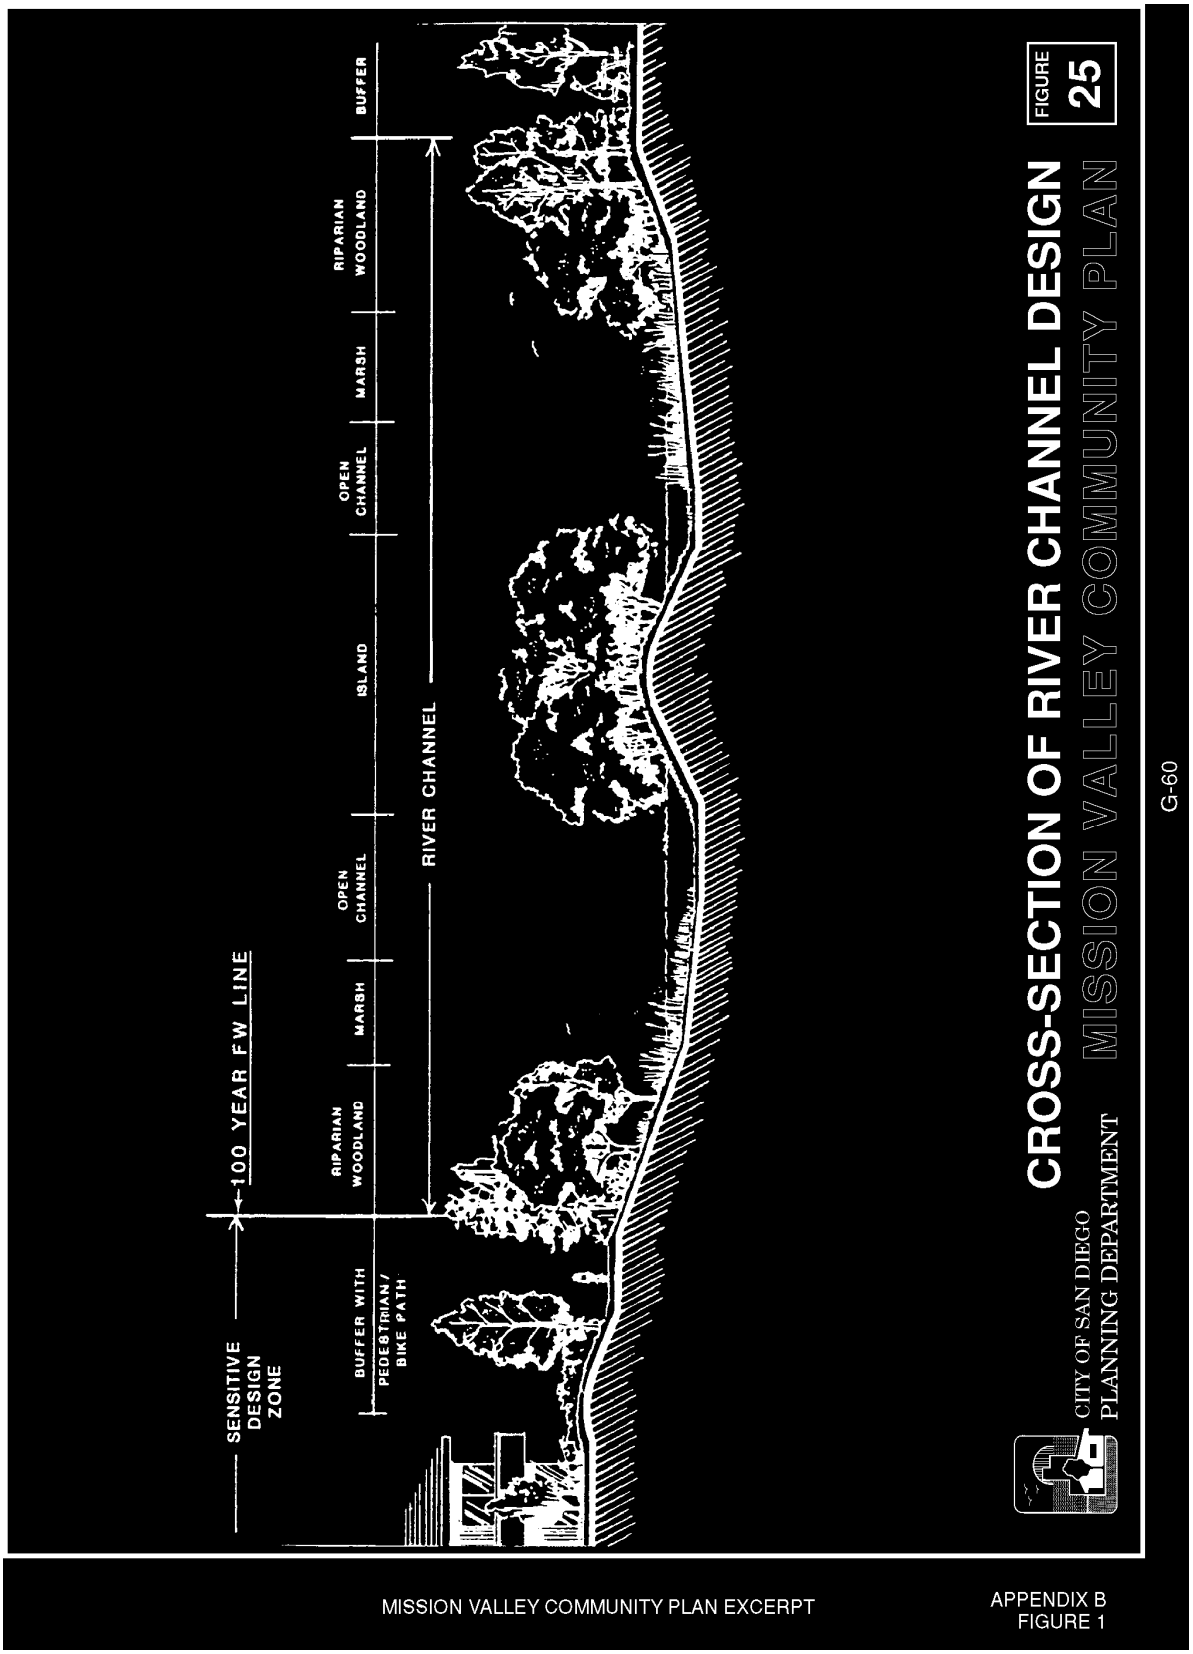
(4) Trails. Pedestrian-only trails may be located within the River Corridor Area in accordance with the following:

(A) Trail alignments shall mimic natural conditions and minimize grading and disturbance to vegetation.

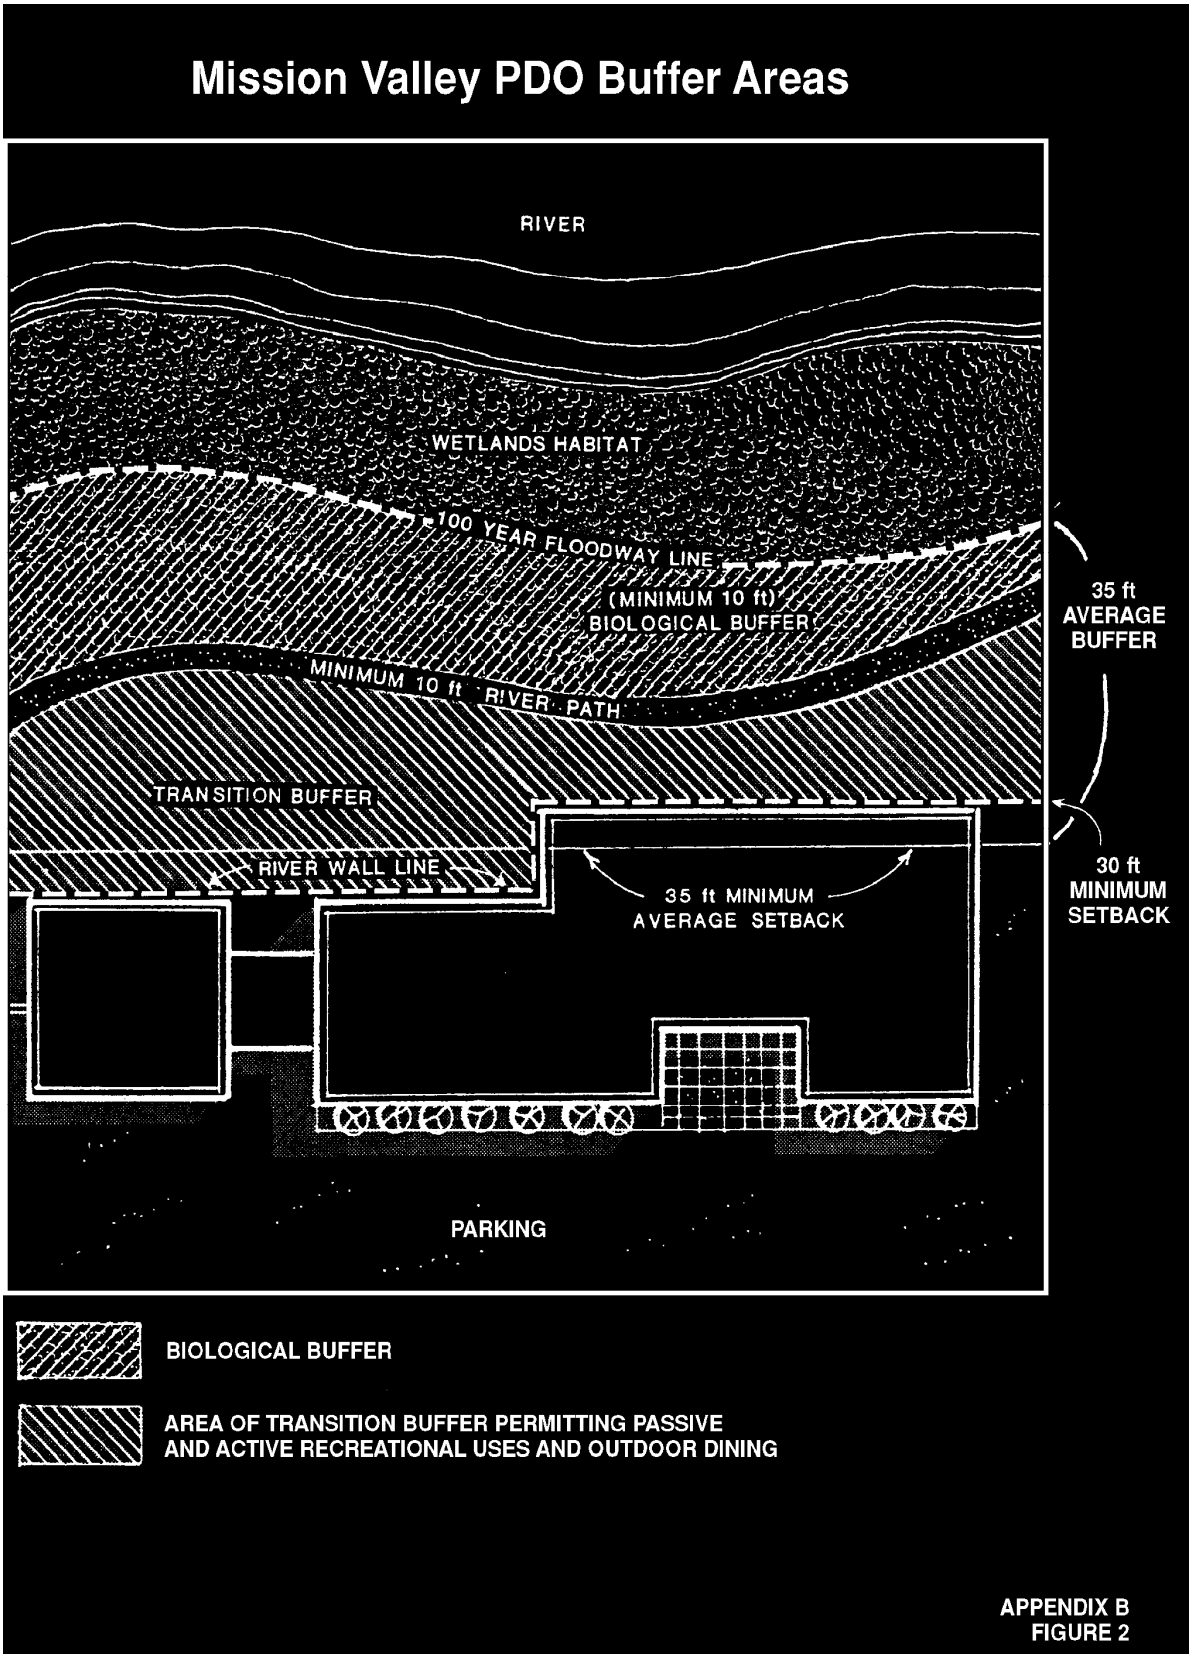
(B) Trails shall be designed to provide continuous loops to the River Pathway, with no trail alignment resulting in a dead end.

(C) Trails located in areas mapped as MHPA, as identified by the City of San Diego MSCP Subarea Plan, or determined to be wetland buffers in accordance with Section 143.0141, are subject to the MSCP Subarea Plan's Land Use Considerations and the Environmentally Sensitive Lands Regulations in Chapter 14, Article 3, Division 1.

(D) Trails shall include the following features:

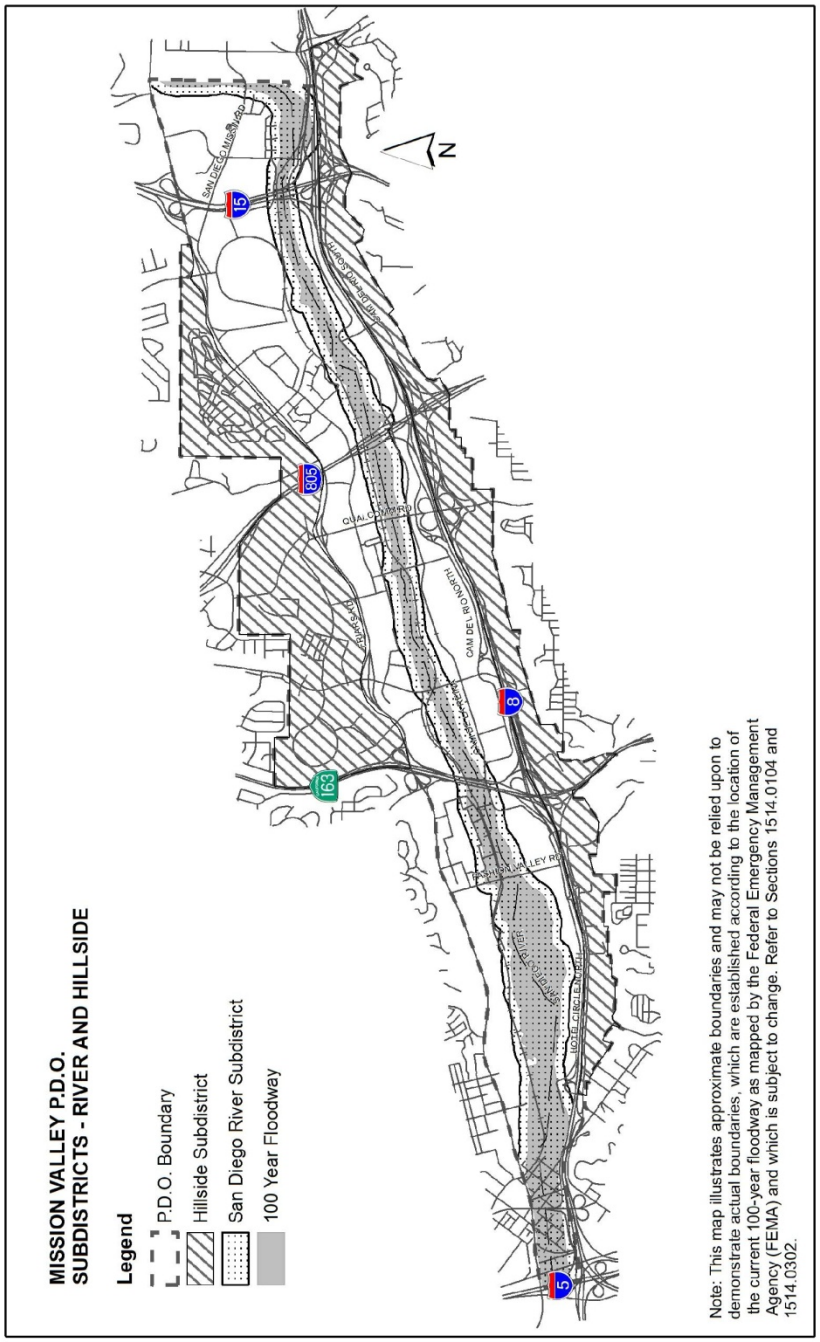


(i) A maximum 8-foot width;



(ii) An 8-foot vertical clearance above finished grade of the trail; and

(iii) Surface material of decomposed granite or similar material in a color that blends with the surrounding native soil.



(5) Picnic Areas and Overlooks

(A) Development on a lot located wholly or partially in the River Corridor Area shall include at least one picnic area or overlook along the River Pathway unless either exists less than one-half mile away.

Excerpts from City of San Diego General Plan

G. Storm Water Infrastructure

Goals

- Protection of beneficial water resources through pollution prevention and interception efforts.
- A storm water conveyance system that effectively reduces pollutants in urban runoff and storm water to the maximum extent practicable.

Discussion

City of San Diego storm drain

The City's storm water pollution prevention efforts and conveyance system strive to protect the quality of our recreational waters and potable water resources as mandated by the federal Clean Water Act of 1972 and the San Diego Regional Water Quality Control Board. The City also maintains compliance with the Water Quality Control Plan for the San Diego Region 9 also referred to as the Basin Plan, and with storm water permits. These functions require a multi-faceted approach that couples infrastructure improvements and maintenance, water quality monitoring, source identification of pollutants, land use planning policies and regulations, and pollution prevention activities such as education, code enforcement, outreach, public advocacy, and training. Additional discussion on Urban Runoff Management, Section E, is included in the Conservation Element.

The City has more than 39,000 storm drain structures and over 900 miles of storm drain pipes and channels serving approximately 237 square miles of urbanized development. Many storm water infrastructure projects do not have the opportunity to affect site design or implement other means to keep pollutants from entering storm drain flows. Therefore, prevention through education, outreach, code enforcement, and other efforts continues to be the most effective method of protecting water resources. Secondly, capital improvement investments in storm water structures (curbs, gutters, inlets, catch basins, pipes, and others) determined through Best Management Practices (BMP) are critical in order to reduce pollutant loading to acceptable levels. Public projects should be evaluated for their impact on the storm drain conveyance system and incorporate storm water quality and conveyance structures during the design process. Similarly, private development will mitigate the impacts of its development on the storm water conveyance system while overall system monitoring including the identification of needs is also performed by the City.

In addition to capital investments in storm water structures, operations and maintenance are equally critical to ensure governmental compliance and clean water resources. Furthermore, state regulations require that the City keep track of storm water structure locations and maintenance via inspections, and in some cases, collection and/or reporting of storm water quality monitoring data. The storm drain fee and other sources of funds are instrumental in ensuring compliance with legal mandates and maintaining storm water prevention and conveyance functions.

Policies

PF-G.1. Ensure that all storm water conveyance systems, structures, and maintenance practices are consistent with federal Clean Water Act and California Regional Water Quality Control Board NPDES Permit standards.

PF-G.2. Install infrastructure that includes components to capture, minimize, and/or prevent pollutants in urban runoff from reaching receiving waters and potable water supplies.

PF-G.3. Meet and preferably exceed regulatory mandates to protect water quality in a cost-effective manner monitored through performance measures.

PF-G.4. Develop and employ a strategic plan for the City's watersheds to foster a comprehensive approach to storm water infrastructure improvements.

PF-G.5. Identify and implement BMPs for projects that repair, replace, extend or otherwise affect the storm water conveyance system. These projects should also include design considerations for maintenance, inspection, and, as applicable, water quality monitoring.

PF-G.6. Identify partnerships and collaborative efforts to sponsor and coordinate pollution prevention BMPs that benefit storm water infrastructure maintenance and improvements.

The City's parks, open space, trails and pedestrian linkages are part of an integrated system that connect with regional and state resources and provide opportunities for residents and visitors to experience San Diego's open spaces. The Recreation Element describes the attributes of designated and dedicated park and open space lands for the provision of outdoor recreation. Some important open space areas are not preserved as dedicated park land, but are protected through regulations or other private property restrictions such as conservation or open space easements.
Open space that is designated in community plans and other land use plans is an important component of the open space system because of its value in protecting natural landforms, defining community boundaries, providing natural linkages between communities, providing visually appealing open spaces, and protecting habitat and biological systems of community importance that are not otherwise included in the MHPA.

Policies

CE-B.1. Protect and conserve the landforms, canyon lands, and open spaces that: define the City's urban form; provide public views/vistas; serve as core biological areas and wildlife linkages; are wetlands habitats; provide buffers within and between communities; or provide outdoor recreational opportunities.

a. Utilize Environmental Growth Funds and pursue additional funding for the acquisition and management of MHPA and other important community open space lands.

b. Support the preservation of rural lands and open spaces throughout the region.

c. Protect urban canyons and other important community open spaces including those that have been designated in community plans for the many benefits they offer locally, and regionally as part of a collective citywide open space system (see also Recreation Element, Sections C and F; Urban Design Element, Section A).

d. Minimize or avoid impacts to canyons and other environmentally sensitive lands, by relocating sewer infrastructure out of these areas where possible, minimizing construction of new sewer access roads into these areas, and redirecting of sewage discharge away from canyons and other environmentally sensitive lands.

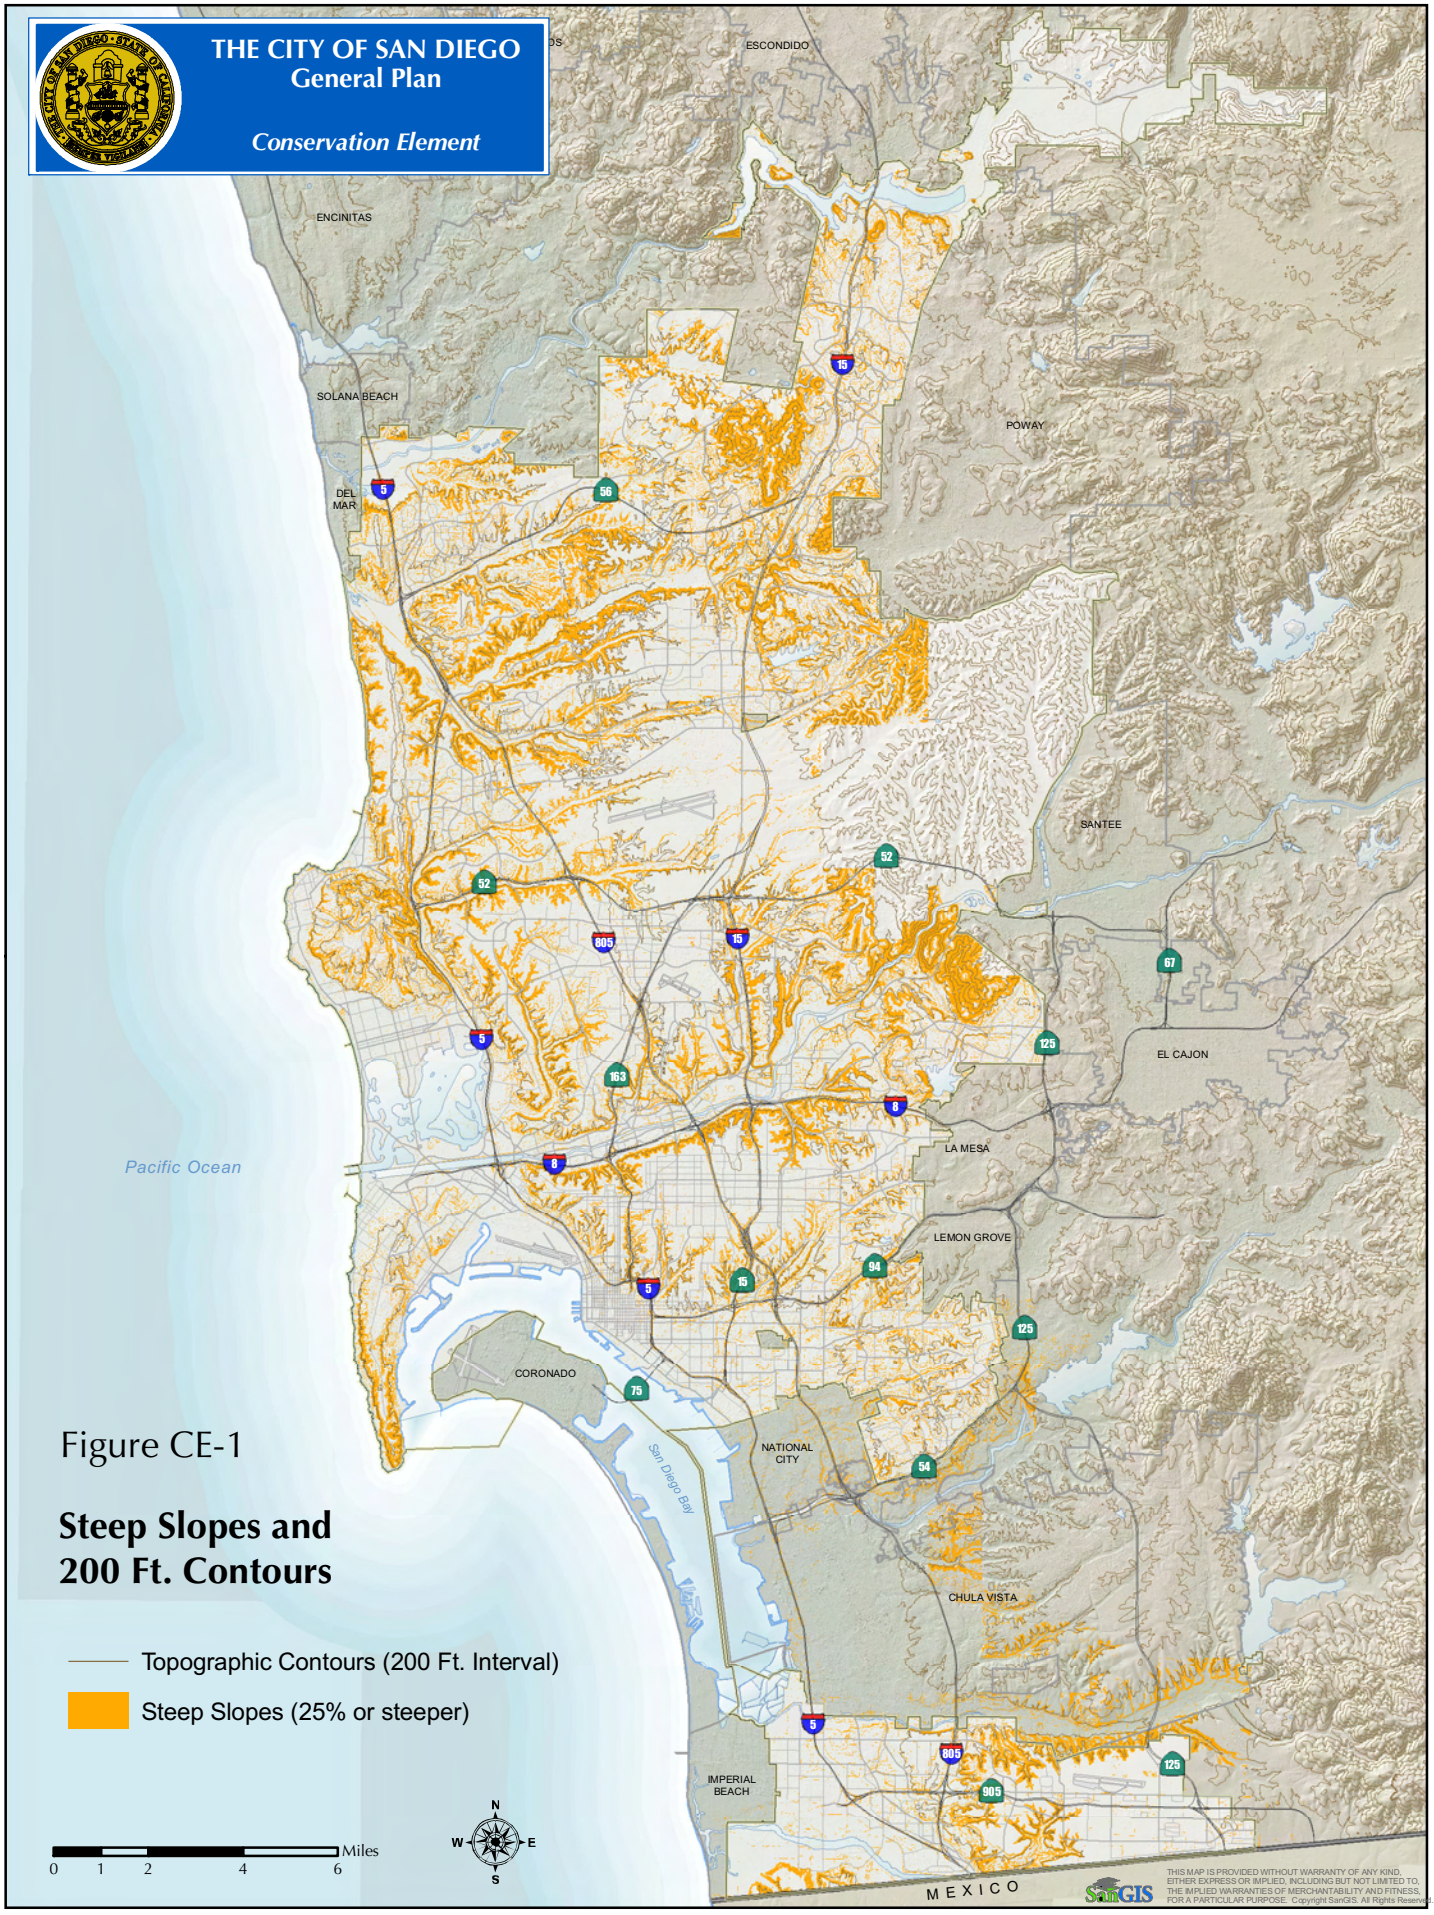
e. Encourage the removal of invasive plant species and the planting of native plants near open space preserves.

f. Pursue formal dedication of existing and future open space areas throughout the City, especially in core biological resource areas of the City's adopted MSCP Subarea Plan.

g. Require sensitive design, construction, relocation, and maintenance of trails to optimize public access and resource conservation.

CE-B.2. Apply the appropriate zoning and Environmentally Sensitive Lands (ESL) regulations to limit development of floodplains, sensitive biological areas including wetlands, steep hillsides, canyons, and coastal lands.

a. Manage watersheds and regulate floodplains to reduce disruption of natural systems, including the flow of sand to the beaches. Where possible and practical, restore water filtration, flood and erosion control, biodiversity and sand replenishment benefits.



b. Limit grading and alterations of steep hillsides, cliffs and shoreline to prevent increased erosion and landform impacts.

CE-B.3. Use natural landforms and features as integrating elements in project design to complement and accentuate the City's form (see also Urban Design Element, Section A).

CE-B.4. Limit and control runoff, sedimentation, and erosion both during and after construction activity.

CE-B.5. Maximize the incorporation of trails and greenways linking local and regional open space and recreation areas into the planning and development review processes.

CE-B.6. Provide an appropriate defensible space between open space and urban areas through the management of brush, the use of transitional landscaping, and the design of structures (see also Urban Design Element, Policy UD-A.3.o). Continue to implement a citywide brush management system.

THIS MAP IS PROVIDED WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Copyright SanGIS. All Rights Reserved.

The following policies address land development practices for erosion control, decreased use of impervious surfaces, and design that captures or reduces runoff from development sites. The policies also provide a summary of the City's overall water quality protection policies.

Policies

CE-E.1. Continue to develop and implement public education programs.

a. Involve the public in addressing runoff problems associated with development and raising awareness of how an individual's activities contribute to runoff pollution.

b. Work with local businesses and developers to provide information and incentives for the implementation of Best Management Practices for pollution prevention and control.

c. Implement watershed awareness and water quality educational programs for City staff, community planning groups, the general public, and other appropriate groups.

CE-E.2. Apply water quality protection measures to land development projects early in the process-during project design, permitting, construction, and operations-in order to minimize the quantity of runoff generated on-site, the disruption of natural water flows and the contamination of storm water runoff.

a. Increase on-site infiltration, and preserve, restore or incorporate natural drainage systems into site design.

b. Direct concentrated drainage flows away from the MHPA and open space areas. If not possible, drainage should be directed into sedimentation basins, grassy swales or mechanical trapping devices prior to draining into the MHPA or open space areas.

c. Reduce the amount of impervious surfaces through selection of materials, site planning, and street design where possible.

d. Increase the use of vegetation in drainage design.

e. Maintain landscape design standards that minimize the use of pesticides and herbicides.

f. Avoid development of areas particularly susceptible to erosion and sediment loss (e.g., steep slopes) and, where impacts are unavoidable, enforce regulations that minimize their impacts.

g. Apply land use, site development, and zoning regulations that limit impacts on, and protect the natural integrity of topography, drainage systems, and water bodies.

h. Enforce maintenance requirements in development permit conditions.

CE-E.3. Require contractors to comply with accepted storm water pollution prevention planning practices for all projects.

a. Minimize the amount of graded land surface exposed to erosion and enforce erosion control ordinances.

b. Continue routine inspection practices to check for proper erosion control methods and housekeeping practices during construction.

CE-E.4. Continue to participate in the development and implementation of Watershed Management Plans for water quality and habitat protection.

CE-E.5. Assure that City departments continue to use "Best Practice" procedures so that water quality objectives are routinely implemented.

a. Incorporate water quality objectives into existing regular safety inspections.

b. Follow Best Management Practices and hold training sessions to ensure that employees are familiar with those practices.

c. Educate City employees on sources and impacts of pollutants on urban runoff and actions that can be taken to reduce these sources.

d. Ensure that contractors used by the City are aware of and implement urban runoff control programs.

e. Serve as an example to the community-at-large.

CE-E.6. Continue to encourage "Pollution Control" measures to promote the proper collection and disposal of pollutants at the source, rather than allowing them to enter the storm drain system.

a. Promote the provision of used oil recycling and/or hazardous waste recycling facilities and drop-off locations.

b. Review plans for new development and redevelopment for connections to the storm drain system.

c. Follow up on complaints of illegal discharges and accidental spills to storm drains, waterways, and canyons.

CE-E.7. Manage floodplains to address their multi-purpose use, including natural drainage, habitat preservation, and open space and passive recreation, while also protecting public health and safety.

Excerpts from San Diego River Park Master Plan

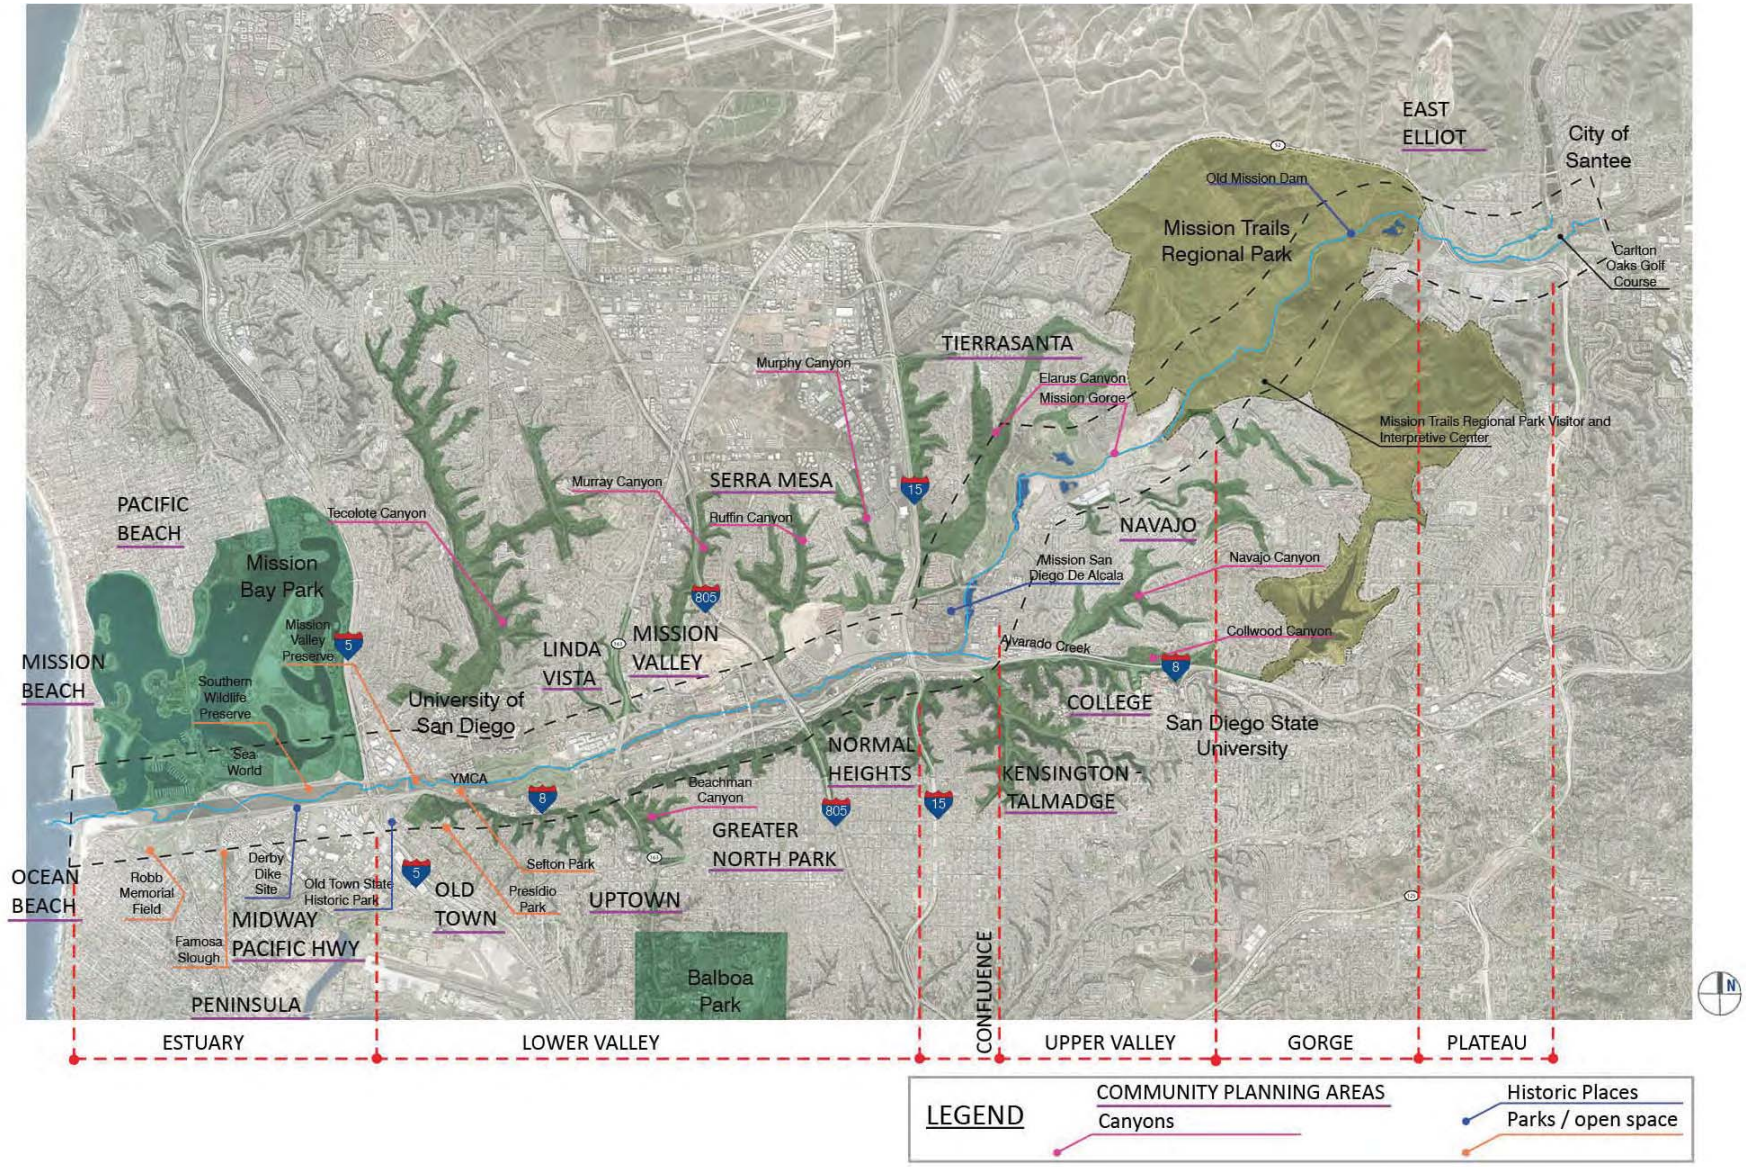

Figure 2. City of San Diego Context

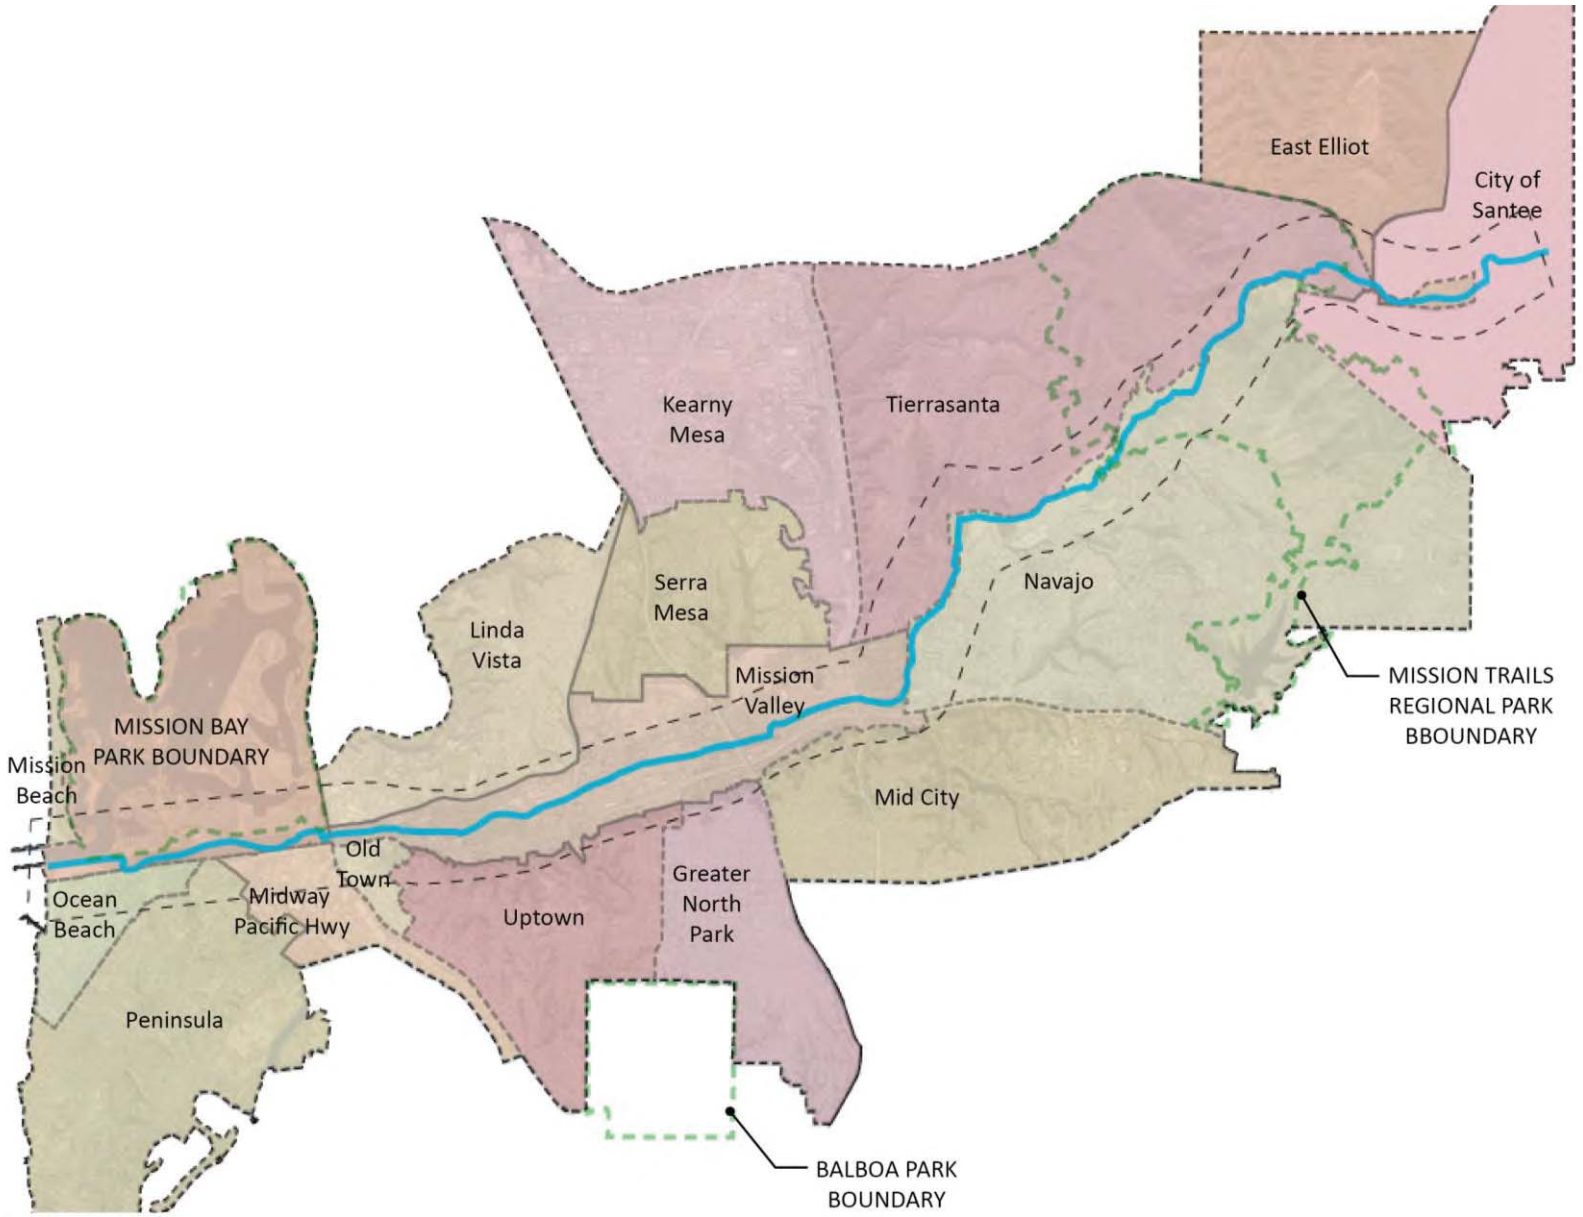

Figure 10. Community Planning Areas

3.2.2 LOWER VALLEY REACH

Overview

The Lower Valley includes the Mission Valley Preserve east to Interstate 15. The Lower Valley Reach is heavily urbanized; extensive paving in the form of parking lots and roadways, massive infrastructure projects and relatively high density development are within this reach. The river's presence is further marginalized by channelization and old mining ponds. Simple lack of space presents a severe hydrological constraint throughout the Lower Valley Reach, and exotic vegetation negatively impacts the reach's native ecosystems.

Lower Valley looking northwest

At the very west end of the Lower Valley is the Mission Valley Preserve, which extends from the Interstate 5 to Sefton Field and the YMCA. The preserve is entirely within the floodplain of the San Diego River. Most of it is riparian in nature, including black willows, cottonwoods, and sycamores. The western edge is estuarine, due to the constant fluctuation of the ocean, with salt grass, pickleweed, and spiny rush. This preserve is home to many wetland species and home to the endangered Least Bell's Vireo, a tiny songbird that nests in the area after wintering in Baja California. The birds usually arrive in the spring, as early as mid-March, and stay until as late as September. The City of San Diego owns and maintains the preserve.

Lower Valley from University of San Diego looking southeast

The surrounding communities within the Lower Valley Reach are particularly deficient in community and neighborhood parks and the San Diego River Park should play a role in addressing this need. In 2009, Sefton Field was dedicated to the City as a 19-acre population-based park, of which 7.37 acres are usable for ball fields and children's play area and the remaining acreage is a mitigation site for the construction of the

Metropolitan Transit System (MTS) trolley. On the north side of the river, across from Sefton Field is the Mission Valley YMCA. This site, 8.3 acres, is owned by the City with a lease to the YMCA for recreation facilities including a recreation building, outdoor multi-use fields and a 50-meter pool. The San Diego River Pathway is located on the south side of the river from the Mission Valley Preserve to Sefton Field. East of Sefton Field, the San Diego River Pathway does not exist along the river. At Fashion Valley Road, the San Diego River Pathway begins again on the north side of the river only and continues under State Highway 163 to the First San Diego River Improvement Project (FSDRIP) at Hazard Center Drive. From Hazard Center Drive, the western boundary of FSDRIP, the San Diego River Pathway is on the north and south side of the river to the end of FSDRIP at Qualcomm Way. The San Diego River Pathway stops at all existing public street intersections within FSDRIP, creating several gaps in the pathway. The City has completed a feasibility study on above-grade connections for the San Diego River Pathway that would close all the gaps within FSDRIP. The next San Diego River Pathway gap occurs under Interstate I-805 due to a large drainage structure. From Interstate 805 to the east, the San Diego River Pathway does not exist as a formal paved path. If additional development occurs west of Fenton Parkway, the San Diego River Pathway will be continued to the Upper Valley Reach. Undeveloped space or public land exists within the lower valley reach, offering opportunities for the river to meander, for wildlife habitat to expand, and for the creation of the San Diego River Pathway and parks.

RECOMMENDATIONS

A. Support the goals of the Mission Valley Preserve and provide additional interpretive signs on the role of the San Diego River in the Preserve.

B. Provide a connection between the San Diego River Pathway and Presidio Park and a kiosk at Presidio Park to identify the San Diego River Pathway. Provide a connection between Sefton Field to the south of the river and the YMCA to the north.

C. Explore options at the Riverwalk Golf Course to extend the San Diego River Pathway along the trolley corridor as a short term measure until the Riverwalk Golf Course is redeveloped into a multi-use development. When the development occurs, extend the San Diego River Pathway along the River Corridor.

D. Pursue opportunities to address the hydrology of the river, to provide public parks and to orientate the new development toward the river in Specific Plan areas, if amended.

Lower Valley Reach

E. Coordinate with Caltrans to establish "green gateways" at the intersection of State Highway 163 and Interstate 805 and the river valley by revegetating the freeway rights-of-ways with native vegetation.

F. Construct bike and pedestrian crossings for the existing San Diego River Pathway at FSDRIP at public street intersections, including Mission Center Road, Camino del Este and Qualcomm Way.

G. Create trail connections to the southern canyons of the Lower Valley, including Buchanan and Normal Heights Canyon, and to the northern canyons, including Murray, Murphy and Ruffin Canyons.

H. Create the San Diego River Pathway connection from Fenton Parkway (on the south side of Mission Valley Library) to I-15 and pursue opportunities to provide a pedestrian/bicycle connection, over the river, from Qualcomm Way to Mission City Parkway.

I. Consider public recreation, the San Diego River Pathway and a naturalized open space along the river when planning any future use of the City's property at the Qualcomm Stadium site.

J. Provide interpretive signage along the San Diego River Pathway about the rich history of the Lower Valley including: the prehistoric Village of Kosa'aay (Cosoy) and Nipaguay; the first Spanish Mission in California; and the farming industry of the 1880's; the sand and gravel companies; the construction of the highway system; and the development of Qualcomm Stadium (formerly known as Jack Murphy Stadium).

The heavily suburbanized condition of the lower valley reach is deficient in developed public parks will require innovative park solutions. The San Diego River Park has the potential to combine "natural" programs, such as the healthy hydrology of the river and its ecological habitat, with "urban" programs, such as active and passive recreation and an accessible and urban corridor edge. By locating recreational activities, such as passive picnic areas or overlooks within the River Corridor Area and active recreational uses in the River Influence Area such as field sports or children's play areas, the river becomes a place of varied experiences. An active river scene will reach out to a large number of user groups and introduce the river's historic and modern faces to a broad spectrum of people. The rights-of-way, associated with the river valley's highways, presents key opportunities to establish green gateways into the river area and the surrounding communities, extending the color and texture of native plant communities along the river.

Space for the river must be sought out in the Lower Valley Reach. Open space easements and property acquisition where feasible are necessary for the San Diego River Park to become a success. The future developments of public land or undeveloped land are opportunities for creating parks and open space. Consistent recommendations regarding new development, streets and landscape should be established for the Lower Valley Reach. Establishing setbacks along the river will allow the San Diego River Park to provide for areas for passive uses as well as active uses.

3.2.3 CONFLUENCE REACH

Overview

The Confluence Reach is the area between Interstate 15 and Friars Road Bridge. It is where Murphy Canyon, Alvarado Canyon and two minor canyons once joined the San Diego River as it turned west to the Pacific Ocean. This place is not only a confluence of canyons and creeks, but a confluence of people and activity throughout the history of San Diego. This is where the El Camino Real met the east-west transportation route following the San Diego River near the Mission San Diego de Alcalá. This reach also acts as a gateway to multiple destinations, allowing users to access Murphy Canyon, Alvarado Canyon, Collwood Canyon, Navajo Canyon and the Mission San Diego de Alcala.

This reach is partially enclosed by a steep canyon wall on the west side and industrial uses on the east side of the river. Interstate 8 on the south further emphasizes the sense of enclosure. Within this reach, east of Interstate 15 on the south side of the river, is a large undeveloped parcel owned by the California Department of Fish and Wildlife. This parcel was owned by Caltrans, but was deeded over to the California Department of Fish and Wildlife during the expansion of Interstate 805. The site is a State Ecological Reserve and is open for public use during daylight hours for hiking on existing trails and fishing from certain areas.

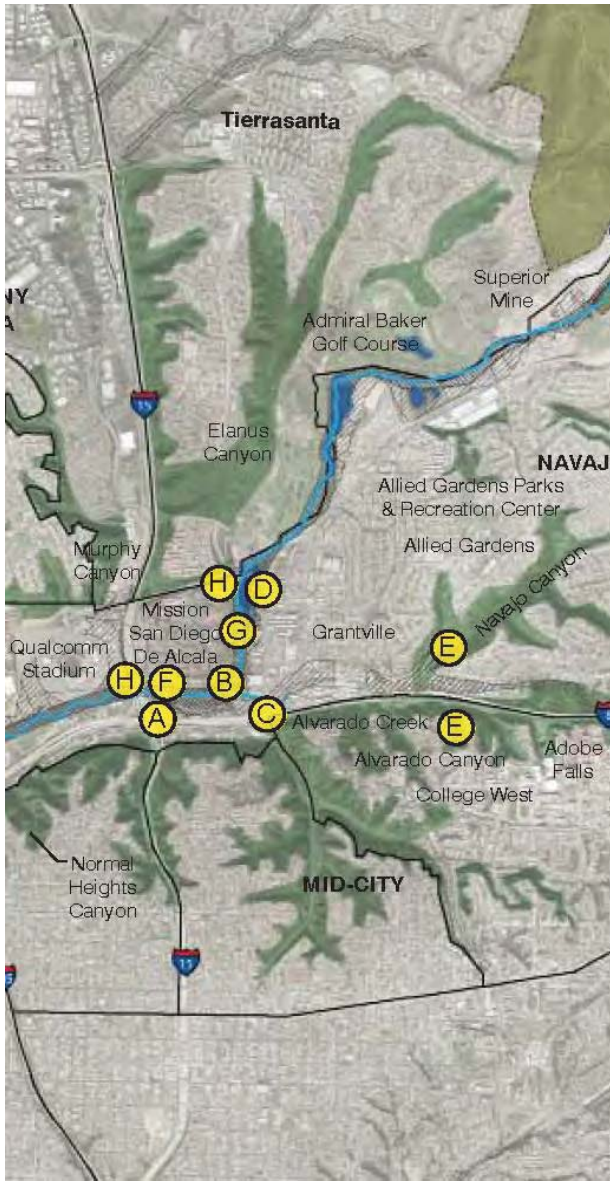
The river is also constrained by a series of old gravel mining ponds below the Friars Road Bridge; these ponds impede the normal hydrologic activities of the river system. Extensive exotic vegetation infestation is present both in the ponds (Ludwigia) and in the river (Arundo donax). As the river turns west, it is isolated by highway infrastructure, private property, and difficult physical terrain. The dense growth of Arundo further adds to the river's inaccessibility. The only section of the San Diego River Pathway constructed in this reach is along the east side of the river

River is choked by invasive vegetation

Development in Grantville should encourage new development to orient to the river

adjacent to some of the existing commercial development. Access to the Mission San Diego de Alcalá from the river is along the public sidewalk along San Diego Mission Road.

The Confluence Reach contains the Grantville Development Subarea A of the Navajo Community. This area is directly adjacent to the east side of the river and has been zoned and built with industrial uses that have turned their backs on the river and used the area as a storage yard and in some cases a waste storage area. Through development of Grantville, the area could to be rezoned with active uses that orient to the river and ensure that the river side of the structures includes plazas, public access and architecture that will step back and allow for air and sunlight to be part of the river corridor. Public parks to serve new residential uses along the river should be located adjacent to the river where possible and provide connections to the San Diego River Pathway.



RECOMMENDATIONS

A. Pursue a class I path along Rancho Mission Road and Ward Road and coordinate with the California Department of Fish and Wildlife for a San Diego River Pathway connection on the south side of the river just east of Interstate 15. If a pathway connection cannot be provided alternative connections should be considered. Ensure that trails are designed with safety in mind, and to encourage stewardship and litter prevention.

B. Provide for a San Diego River Pathway connection to San Diego Mission Road from the north side of the river at Rancho Mission Road.

C. Improve water flow under the bridge at Mission Gorge/Fairmount Avenue for the Alvarado Creek to connect to the San Diego River. Provide a pedestrian connection under or over the bridge for access to the San Diego River Pathway from Alvarado Creek.

D. Identify land for public parks and open space through land acquisition or open space easements and identify an alignment for the San Diego River Pathway as Grantville redevelops.

Confluence Reach

E. Improve open space and trail connections with Alvarado Canyon and Navajo Canyon.

F. Create a connection between the San Diego River Park Pathway and the Mission San Diego de Alcalá.

G. Study alternatives to improve the hydrology of the river where the river corridor is narrow and constrained by deep ponds that were created by past sand and gravel mining operations. Separating the river channel from the ponds is recommended where possible and feasible. In addition, it is recommended to remove barriers between pond sections to create a larger, deeper pond.

H. Provide interpretive signage along the San Diego River Pathway about the history of the Confluence Reach including; Mission San Diego de Alcalá and its role in building the first water conveyance system (San Diego Mission Flume), the Kumeyaay village of Nipaguay at the historic mission site, the formation of the large Mexican land grants and the history of the sand and gravel mines.

The development in the Grantville area will provide the tools to change the river landscape in the Confluence Reach. By engaging owners of under-utilized property on the east edge of the river corridor, the development of Grantville may create opportunities for the acquisition of land or establishing public access easements that could allow for a wider river corridor. The river corridor today is highly constrained, however by separating the existing ponds from the river; it may be feasible to accommodate space for a free flowing river. With the ponds separated from the river a more diverse aquatic habitat could be provided. A complementary action might be improving the ponds for recreation activity, such as fishing or non-motorized boating, with resource agency approval.

The west side of the river is steep and narrow, and does not have possibilities for trail construction; however, cantilevered construction may be considered, but could affect the river and habitat. The San Diego River Park pathway can be best accommodated on the east side of the river. There is significant potential to recreate an important wildlife habitat connection between the river valley, Murphy Canyon and Alvarado Creek. Such connections would represent a meaningful first step toward reestablishing the physiographic origins of the river valley. A trail and habitat/open space connection along Alvarado Canyon Creek would link Navajo Canyon with the river corridor, further unifying the river valley's recreational and interpretive resources.

Executive Summary

This report evaluates potential local and regional noise impacts associated with the proposed Mission Valley Community Plan Update (CPU). The CPU would update the adopted 1984 Mission Valley Community Plan. The CPU provides goals and supporting policies for future development within the planning area, consistent with the City of San Diego General Plan (General Plan), as well as a long-range, comprehensive policy framework for growth and development in the community through 2050.

The CPU encompasses a broad range of the land use designations defined in the General Plan and contains a more detailed description and distribution of land uses than the citywide General Plan. As related to the issue of noise, the CPU would allow for an increase to the existing number of multi-family dwelling units, which are a noise-sensitive land use. New policies within the CPU are intended to reflect and implement the general noise-reduction recommendations of the General Plan and strategies of other local plans. The CPU policies refine existing General Plan policies with site-specific recommendations applicable to the specific areas within the CPU.

The dominant source of noise in the CPU area is existing vehicle traffic noise from freeways and local roadways. Other sources of noise include trolleys, stationary noise (such mechanical equipment, emergency electrical generators; parking lot activities; and other activities associated with a given land use), and construction activities.

Increase in Ambient Noise

- A significant impact would occur if implementation of the CPU would result in or create a significant increase in the existing ambient noise levels. The CPU area is dominated by freeway noise. There are some roadway segments that experience calculated noise level increases that are 3 decibels (dB) or greater; however, due to the proximity to a freeway and its associated freeway noise, the actual increase in ambient noise levels attributable to the specified roadway would be less than 3 dB. Additionally, there are areas where there are no noise-sensitive land uses. A significant and unavoidable noise impact was identified for existing land uses adjacent to the following three roadway segments. Phyllis Place from Abbots Hill Road to Interstate 805 (I-805) southbound ramps
- Bachman Place from Hotel Circle South to Lewis Street
- Rancho Mission Road from San Diego Mission Road to Camino del Rio North

The increase in ambient noise levels adjacent to these three roadway segments would result in the exposure of existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant. Because the significant noise impacts are to existing homes and other noise-sensitive uses in an already urbanized area, there is no feasible mitigation. Thus, impacts to sensitive land uses would remain significant and unavoidable.

An existing regulatory framework and review process exists for new development in areas exposed to high levels of ambient noise. Policies in the proposed CPU and General Plan related to decibel levels, procedures in the San Diego Municipal Code (SDMC), and regulations including Title 24 would reduce traffic noise exposure, because they set standards for the siting of sensitive land uses. Site-specific noise analyses demonstrating that future development implemented under the proposed CPU would not subject sensitive receptors to existing or future noise levels exceeding the Land Use – Noise Compatibility Guidelines of the General Plan would be required as part of the review process for discretionary projects. With the implementation of these regulations and procedures, noise impacts applicable to new discretionary projects would be less than significant as exterior noise would be attenuated. However, in the case of ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts attributed to ministerial projects located in areas that exceed the applicable land use and noise compatibility level would be significant. As there is no procedure to ensure that exterior noise is adequately attenuated for ministerial projects, no feasible mitigation measures are available, and the impact would remain significant and unavoidable. Interior noise impacts for all projects, including ministerial projects, would be less than significant because building permit applicants must demonstrate compliance with the relevant interior noise standards through submission and approval of a Title 24 Compliance Report. The proposed CPU includes a policy encouraging retrofitting of older structures with noise sensitive land uses with acoustically rated windows and doors featuring higher Sound Transmission Class ratings, which is a measure of exterior noise reduction performance. However, because not all existing noise sensitive land uses would be retrofitted, impacts to existing sensitive land uses would be significant and unavoidable.

For all other street segments in the CPU area, the increase in ambient noise would be less than significant.

Land Use Compatibility

A significant impact would occur if implementation of the CPU would result in an exposure of people to current or future transportation noise levels that exceed guidelines established in the Noise Element of the General Plan.

In the CPU areas, noise levels for all land uses would be incompatible (i.e., greater than 75 CNEL) closest to the freeways. These areas are currently developed and the CPU would change the land use designations in some of these areas. While land uses in these areas would be exposed to noise levels that exceed General Plan standards, Section B of the General Plan Noise Element requires future residential uses in areas above 70 CNEL to include noise attenuation measures to ensure interior levels of 45 CNEL and that they be located in an area where a community plan allows multi-family and mixed-use residential uses.

The proposed CPU includes policies that would support site design strategies and noise reduction measures for new development within 500 feet of freeways. Additionally, policies in the General Plan Noise Element require the reduction of traffic noise exposure because

they set standards for the siting of sensitive land uses, while Title 24 requires that projects demonstrate that interior noise levels would be reduced to acceptable levels (45 CNEL or less). General Plan Noise Element policy NE-A.4 requires an acoustical study consistent with the Acoustical Study Guidelines (Table NE-4) for proposed developments in areas where the existing or future noise level exceeds or would exceed the "compatible" noise level thresholds as indicated on the Land Use – Noise Compatibility Guidelines. Future discretionary proposals within the CPU area would, therefore, be required to conduct site-specific exterior noise analyses to demonstrate that the proposed project would not place sensitive receptors in locations where the exterior existing or future noise levels would exceed the Land Use – Noise Compatibility Guidelines. Additionally, for all future discretionary and ministerial projects located in areas where exterior noise levels exceed the Land Use – Noise Compatibility Guidelines, site-specific interior noise analyses demonstrating compliance with the interior noise standards of the General Plan would be required. These requirements for site-specific noise analyses would be implemented through submission of a Title 24 Compliance Report to demonstrate interior noise levels of 45 CNEL. Through implementation of this regulatory framework, exterior traffic noise impacts associated with new discretionary development and interior traffic noise impacts for both ministerial and discretionary projects would be less than significant.

However, in the case of exterior noise impacts associated with ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts for ministerial projects located in areas where the noise level exceeds the applicable land use and noise compatibility level would be significant. As there is no procedure to ensure that exterior noise is adequately attenuated for ministerial projects, no feasible mitigation measures are available and impacts would remain significant and unavoidable. Regarding trolley noise, vehicle traffic noise would exceed the contribution of noise from trolley operations. Although vehicle traffic would be the dominant noise source, trolley noise levels in close proximity to the tracks would contribute to the overall exterior noise level, and the combined vehicle traffic and trolley exterior noise levels could exceed the Land Use – Noise Compatibility Guidelines. Future discretionary proposals within the CPU area would be required to conduct site-specific exterior noise analyses to demonstrate that the proposed project would not place sensitive receptors in locations where the exterior existing or future noise levels would exceed the Land Use – Noise Compatibility Guidelines. However, in the case of exterior noise impacts associated with ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts for ministerial projects located in areas where the noise level exceeds the applicable land use and noise compatibility level would be significant.

Interior noise impacts for both discretionary and ministerial projects would be less than significant because building permit applicants must demonstrate compliance with the relevant interior noise standards through submission and approval of a Title 24 Compliance Report.

The future Mid-Coast Trolley extension (Blue Line Trolley) is currently under construction along the western CPU boundary. The closest station to the CPU area would be located at West Morena Boulevard and Tecolote Road. It is anticipated that rail traffic would generate

a noise level of 60 CNEL at approximately 270 feet from the railway centerline. However, no sensitive land uses exist or are proposed in the CPU area adjacent to the Blue Line Trolley extension and, thus, there would be no noise impacts due to future Blue Line Trolley operations. The Mid-Coast Corridor Transit Project noise analysis also found noise impacts in this area to be less than significant (SANDAG 2014).

The Regional Plan's planned Purple Line Trolley would provide a new north-south transit connection through the Stadium Specific Plan area and would generally parallel to Interstate 15 (I-15). It is anticipated that noise levels due to future Purple Line Trolley operation would be similar to noise levels from the Blue and Green Line Trolleys. Vehicle traffic noise levels along I-15 would exceed 70 and 75 CNEL in the vicinity of the future Purple Line Trolley alignment. As with the Blue and Green Line Trolleys, vehicle traffic noise would exceed the contribution of noise from trolley operations. However, the exact alignment of the Purple Line Trolley is not known at this time, and it could be located in close proximity to noise sensitive land uses. As with the Green Line Trolley, although vehicle traffic would be the dominant noise source, trolley noise levels in close proximity to the tracks would contribute to the overall exterior noise level, and the combined vehicle traffic and trolley exterior noise levels could exceed the Land Use – Noise Compatibility Guidelines, resulting in a significant and unavoidable impact.

Stationary Noise

A significant impact could occur if implementation of the CPU resulted in the exposure of people to noise levels that exceed property line limits established in the Noise Abatement and Control Ordinance of the San Diego Municipal Code (SDMC). Implementation of the CPU would promote pedestrian-oriented mixed-use area. Mixed-use and areas where residential uses are located in proximity to commercial sites could result in exposure of sensitive receptors to additional noise. Although noise-sensitive residential land uses would be exposed to noise associated with the operation of commercial uses, future projects would be required to show compliance with the Noise Abatement and Control Ordinance to ensure noise compatibility between various land uses. Through enforcement of the Noise Abatement and Control Ordinance of the SDMC, impacts would be less than significant.

Construction Noise

Although no specific construction or development is proposed at this time, construction noise impacts could occur as future development within the CPU area occurs. Due to the developed nature of the CPU area, there is a high likelihood that construction activities would take place adjacent to existing structures and that sensitive receptors would be located in proximity to construction activities. The City regulates noise associated with construction equipment and activities through its Noise Abatement and Control Ordinance, which puts limits on the days of the week and hours of operation allowed for construction. Hourly average noise levels would be approximately 83 dB(A) one-hour equivalent noise level (L_{eq}) at 50 feet from the center of construction activity when assessing three pieces of common construction equipment working simultaneously. Construction noise levels of

would attenuate to 75 dB(A) L_{eq} at 120 feet. Therefore, significant impacts would occur if sensitive land uses are located closer than 120 feet from construction activities. Implementation of the mitigation measures specified in Section 8.4 of this analysis would reduce construction-related noise impacts. However, even with implementation of this mitigation, at the program level it cannot be known whether the noise reduction measures would be adequate to reduce noise levels to below a level of significance. Construction noise impacts would therefore be significant and unavoidable.

Vibration

Potential sources of ground-borne vibration could occur as a result of railway operations. The Mid-Coast Corridor Transit Project noise and vibration analysis found vibration impacts to be less than significant (SANDAG 2014). The east-west Green Line Trolley bisects the CPU area. The Federal Transit Administration (FTA) methodology and equations provided in their Transit Noise and Vibration Impact Assessment Manual (FTA 2018) were used to calculate potential site-specific vibration levels within the CPU area. Portions of the Green Line Trolley tracks are on elevated structures and do not cause significant vibration impacts to adjacent development. Areas where noise- and vibration-sensitive uses are located the closest to the tracks (as close as 25 feet) are at the existing trolley stations. Because all trolleys stop at each station, trolley speeds approaching and departing from the stations would be very low and would not cause significant vibration levels over existing levels. These screening distances are therefore conservative. Impacts related to trolley vibration associated with the Green Line trolley would be less than significant. The future Purple Line Trolley would run through the Stadium Specific Plan area. The exact alignment is not known at this time; however, vibration impacts and screening distances for the Purple Line Trolley are anticipated to be the same as those for the Green Line Trolley. Impacts would be less than significant.

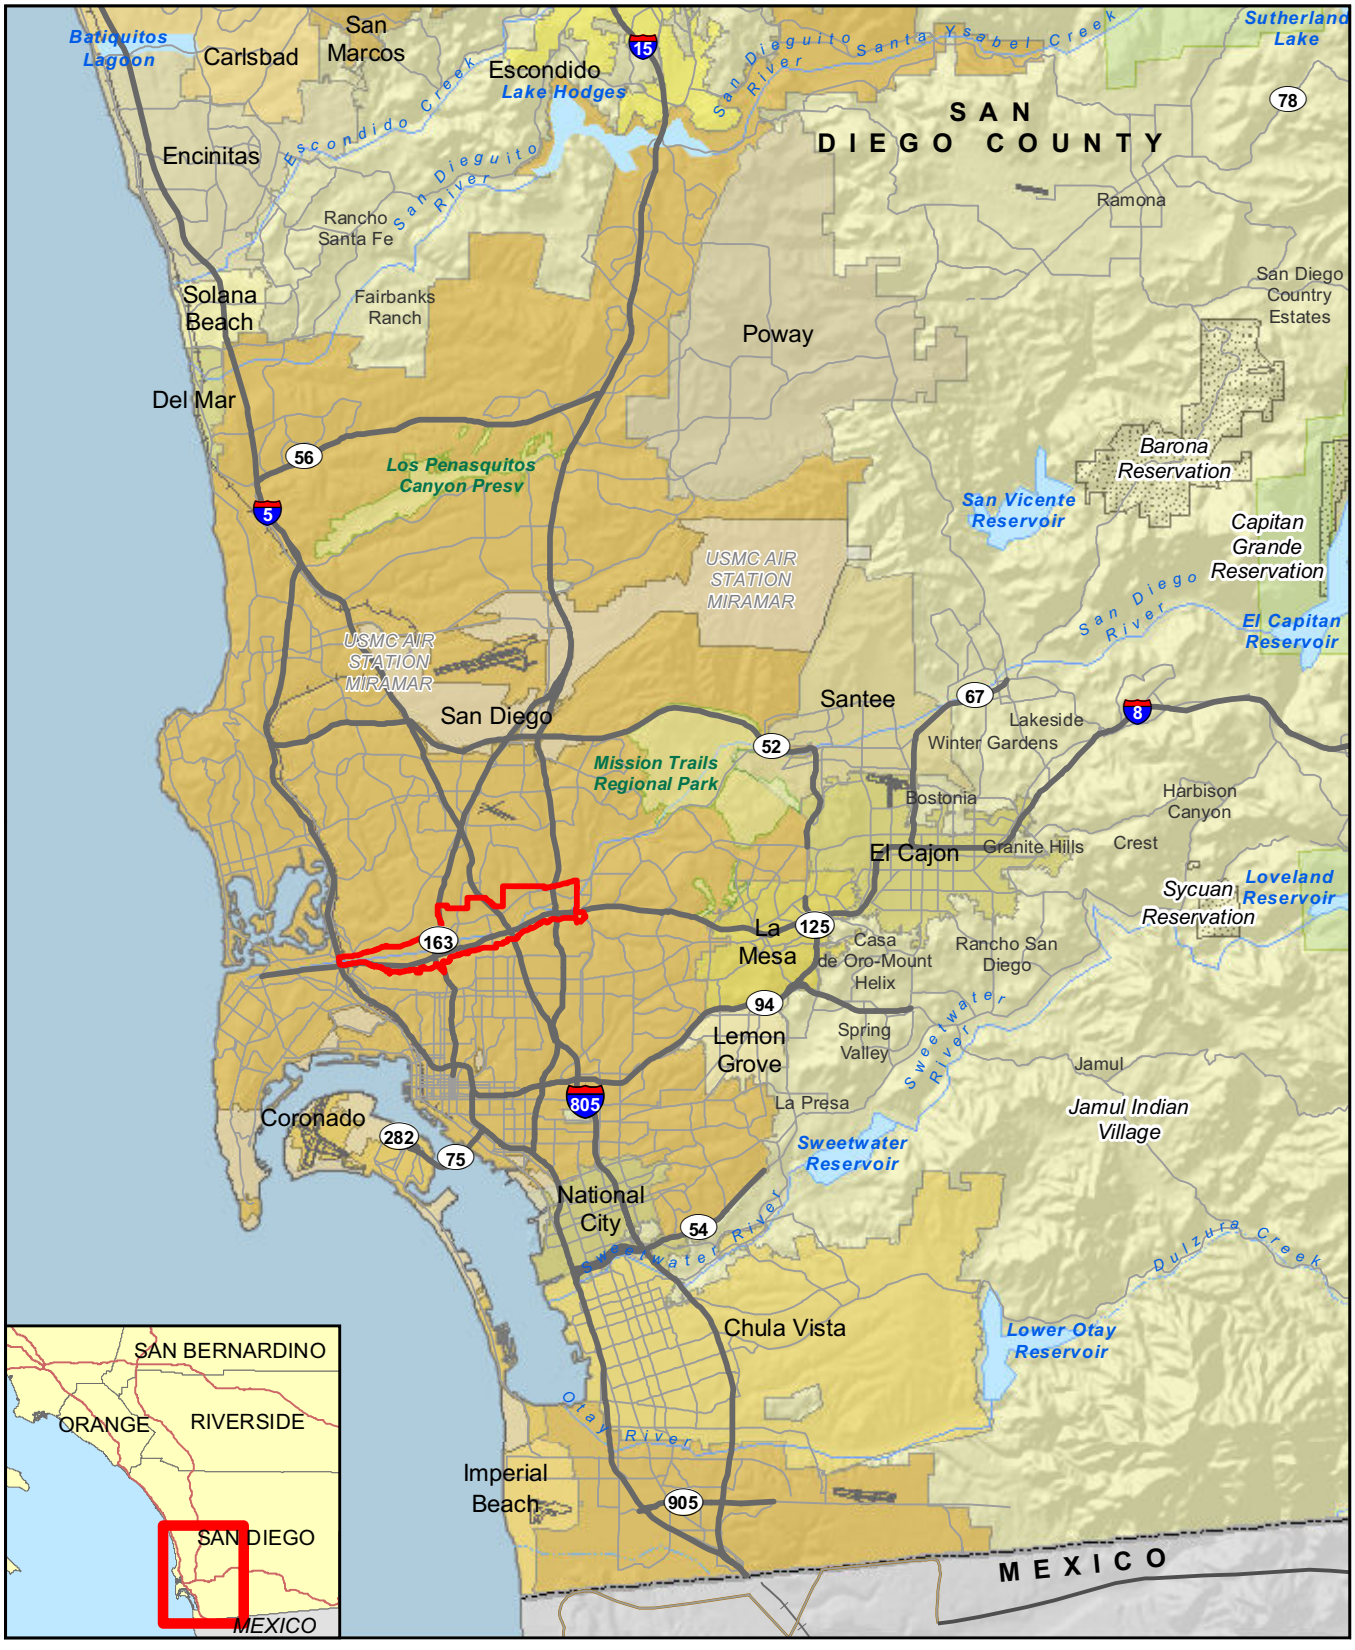
1.0 Introduction

The Mission Valley Community Plan Update (CPU) provides goals and supporting policies for future development within the planning area consistent with the 2008 General Plan and provides a long-range, comprehensive policy framework for growth and development in the community through 2050. The purpose of this study is to assess the potential for significant adverse noise impacts resulting from development that could occur with the CPU area.

2.0 Project Description

2.1 Project Location

Mission Valley is located at nearly the geographic center of the city of San Diego. The CPU area encompasses the valley formed by the San Diego River, a significant natural and recreational asset for the city. The CPU area sits at the crossroads of the regional freeway system, with access from Interstate 5 (I-5), Interstate 8 (I-8), Interstate 15 (I-15), Interstate 805 (I-805) and State Route 163 (SR-163). The CPU area is a regional center of offices, hotels, and retail sales. The CPU area is also a major regional visitor center, hosting a large number of hotels in close proximity to nearby tourist attractions such as Mission Bay, Sea World, and Balboa Park.



The CPU area encompasses 3,216 acres, or 2,428 acres not including rights-of-way, and is generally bounded by Friars Road and the northern slopes of the valley on the north, the eastern banks of the San Diego River on the east, the southern slopes of the valley on the south, and I-5 on the west. The CPU area is surrounded by several other community planning areas: Old Town San Diego, Uptown, Greater North Park, Normal Heights, Kensington–Talmadge, College Area, Navajo, Tierrasanta, Kearny Mesa, Serra Mesa, Linda Vista, and Mission Bay Park.

Figure 1 shows the regional location of the CPU area and Figure 2 shows an aerial photograph.

2.2 Project Overview

The CPU would update the adopted 1984 Mission Valley Community Plan. The CPU provides goals and supporting policies for future development within the CPU area, consistent with the General Plan, and a long-range, comprehensive policy framework for growth and development in the community through 2050.

The CPU addresses a range of topics, including land use; mobility; urban design; economic prosperity; public facilities, services, and safety; recreation; conservation; noise; historic preservation; and arts and culture.

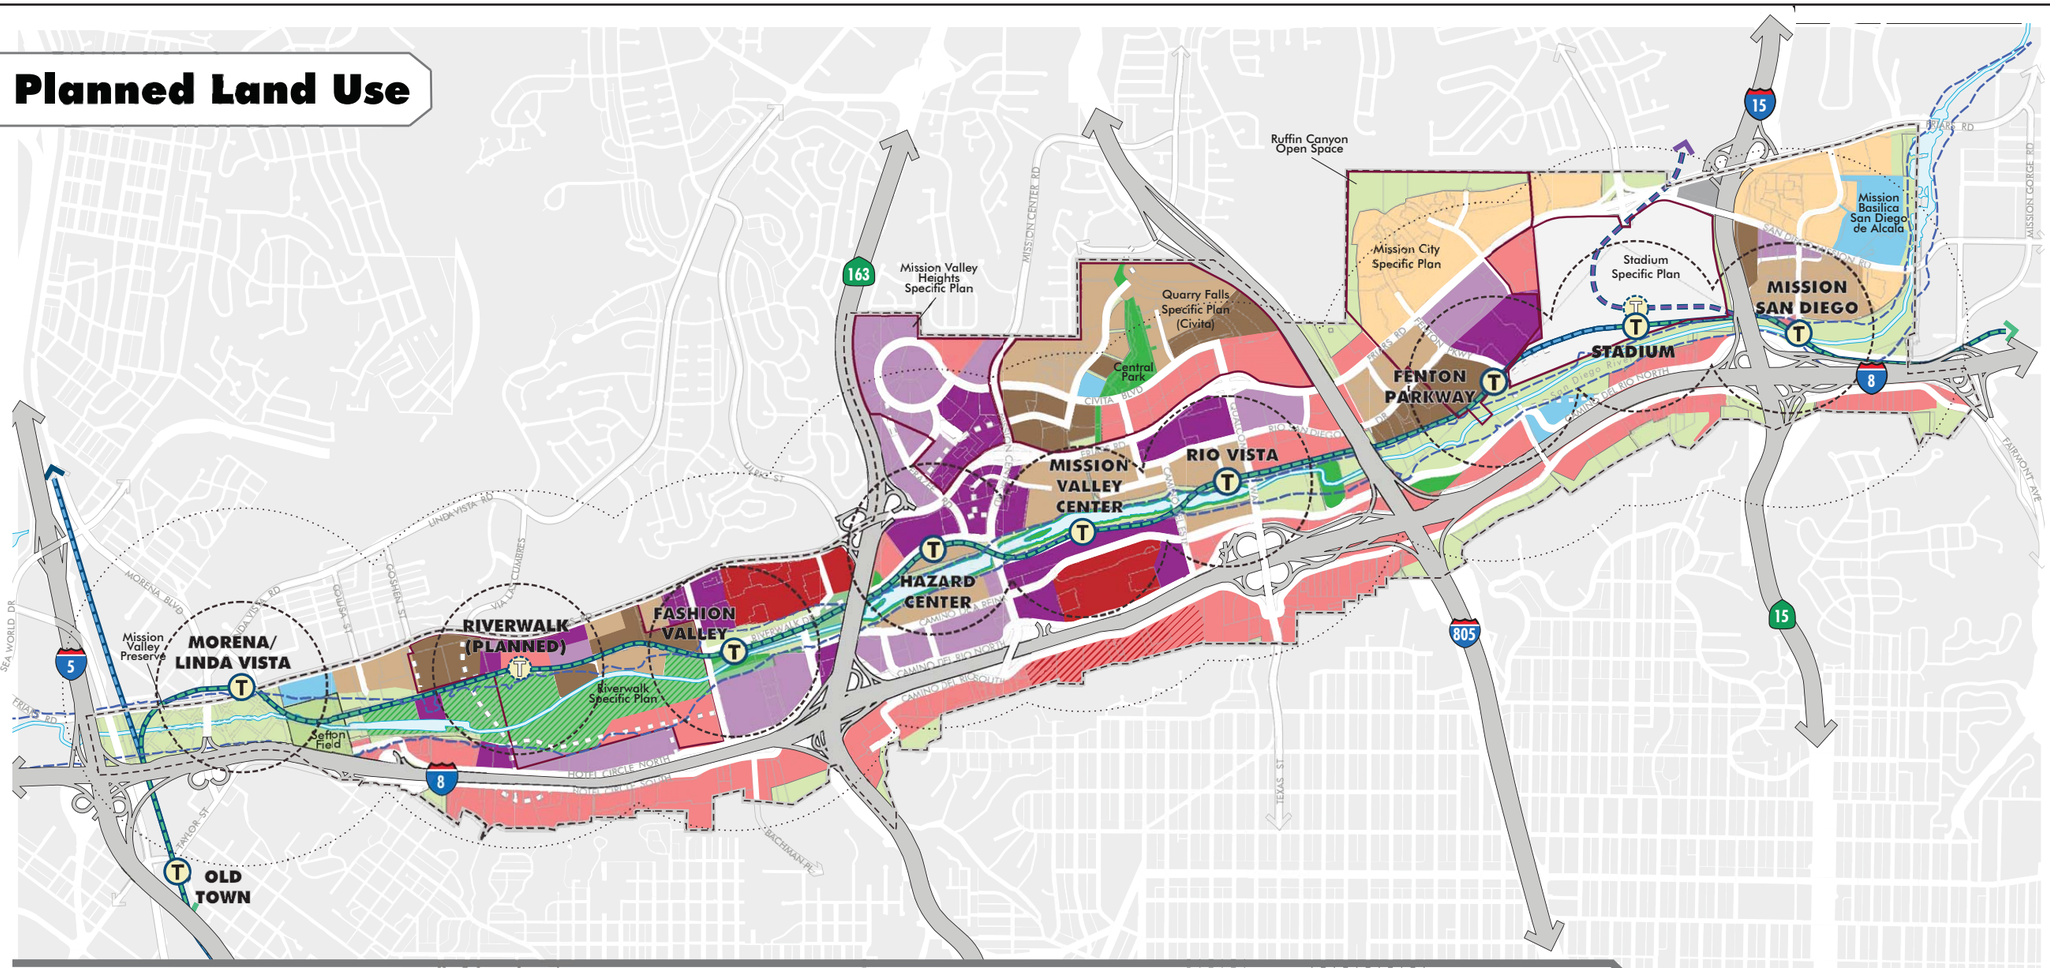
Existing Community Plan Land Use

The CPU evaluates existing conditions on a community-wide level and develops the long-term vision for Mission Valley. In addition to augmenting the General Plan and providing detailed land use guidance for the Mission Valley community, the CPU would also play a role in helping to achieve statewide regulatory objectives including reducing greenhouse gas emissions; promoting public health; improving air and water quality; reducing automobile use and fuel consumption; encouraging efficient development patterns; protecting natural and agricultural resources; encouraging infill and compact development; revitalizing urban and community centers; increasing availability of affordable housing; promoting water conservation; improving the infrastructure system; and promoting energy efficiency and conservation measures.



2.3 Development Summary

The CPU encompasses a broad range of the land use designations defined in the General Plan and contains a more detailed description and distribution of land uses than the citywide General Plan. Land uses for the base year (2012), the adopted Community Plan, and the proposed CPU build-out are summarized in Table 1. Figure 3 shows the proposed CPU land uses.

Table 1
Existing, Adopted, and Proposed Land Uses

Proposed CPU Land Uses

2.4 Policies and Implementing Actions

The CPU contains policies and implementing actions to guide future development within the CPU area. The following policies are related to noise:

Residential Development

- RES-5 Any residential development built within 500 feet of a freeway needs to be designed to minimize the exposure of freeway noise, including siting buildings and balconies perpendicular to the freeway, and using parking structures to shield units from noise.

Commercial Development

- COM-7 Any new commercial development sited adjacent to residential development should provide for the privacy and noise attenuation of adjacent homes.

Noise

- NOI-1 Beyond site planning strategies, new development within 500 feet of the freeway should include building design techniques that address noise exposure and the insulation of buildings to reduce interior noise levels to acceptable limits. Methods may include, but are not limited to, forced-air ventilation systems, double-paned or sound rated windows, sound insulating exterior walls and roofs, and attic vents.
- NOI-2 New development should include site planning techniques and landscaping to help minimize exposure of noise sensitive uses to rail corridor and trolley line noise.

Area Specific: Freeway Adjacent

- FAD-1 Buildings adjacent to a freeway should be buffered from the freeway by off-street parking or ample landscaping.
- FAD-2 Freeway-adjacent buildings should be oriented such that courtyards and residential units with operable windows and balconies face away from the freeway.
- FAD-3 All residential units should be located above the freeway elevation.
- FAD-4 All freeway-adjacent development should incorporate noise attenuation measures.

Implementing Actions: Public Facilities, Services, and Safety

- IA-91 Coordination. Work with the California Department of Transportation (Caltrans) to landscape freeway-highway rights-of-way buffers and install low noise pavement surfaces, berms, and noise barriers to mitigate state freeway and highway traffic noise.

- IA-92 Seek to reduce exposure, when parks are in noisier areas, through site planning, including locating the most noise sensitive uses, such as children's play areas and picnic tables, in the quieter areas of the site.
- IA-93 Exposure Mitigation. Limit future residential and other noise-sensitive land uses in areas exposed to high levels of noise.

3.0 Fundamentals of Noise and Vibration

3.1 Fundamentals of Noise

Sound levels are described in units called the decibel (dB). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. Thus, a doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dB; a halving of the energy would result in a 3 dB decrease.

Additionally, in technical terms, sound levels are described as either a "sound power level" or a "sound pressure level," which while commonly confused are two distinct characteristics of sound. Both share the same unit of measure, the dB. However, sound power, expressed as L_{pw}, is the energy converted into sound by the source. The L_{pw} is used to estimate how far a noise will travel and to predict the sound levels at various distances from the source. As sound energy travels through the air, it creates a sound wave that exerts pressure on receivers such as an ear drum or microphone and is the sound pressure level. Noise measurement instruments only measure sound pressure, and noise level limits used in standards are generally sound pressure levels.

The human ear is not equally sensitive to all frequencies within the sound spectrum. To accommodate this phenomenon, the A-scale, which approximates the frequency response of the average young ear when listening to most ordinary everyday sounds, was devised. When people make relative judgments of the loudness or annoyance of a sound, their judgments correlate well with the A-scale sound levels of those sounds. Therefore, the "A-weighted" noise scale is used for measurements and standards involving the human perception of noise. Noise levels using A-weighted measurements are designated with the notation dB(A).

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important. In addition, most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors has been developed. The noise descriptors used for this study are the one-hour equivalent noise level (L_{eq}), the community noise equivalent level (CNEL), and the sound exposure level (SEL). The CNEL is a 24-hour equivalent sound level. The CNEL calculation applies a 5 dB(A) penalty to noise occurring during evening hours, between 7:00 p.m. and 10:00 p.m., and a 10 dB(A) penalty is added to noise occurring during the night, between 10:00 p.m. and 7:00 a.m. These increases for certain times are intended to account for the added

sensitivity of humans to noise during the evening and night. The SEL is a noise level over a stated period of time or event and normalized to one second.

Sound from a small, localized source (approximating a "point" source) radiates uniformly outward as it travels away from the source in a spherical pattern, known as geometric spreading. The sound level decreases or drops off at a rate of 6 dB(A) for each doubling of the distance.

Traffic noise is not a single, stationary point source of sound. The movement of vehicles makes the source of the sound appear to emanate from a line (line source) rather than a point when viewed over some time interval. The drop-off rate for a line source is 3 dB(A) for each doubling of distance.

The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site (such as parking lots or smooth bodies of water) receives no additional ground attenuation, and the changes in noise levels with distance (drop-off rate) are simply the geometric spreading of the source. A soft site (such as soft dirt, grass, or scattered bushes and trees) receives an additional ground attenuation value of 1.5 dB(A) per doubling of distance. Thus, a point source over a soft site would attenuate at 7.5 dB(A) per doubling of distance.

Human perception of noise has no simple correlation with acoustical energy. A change in noise levels is generally perceived as follows: 3 dB(A) barely perceptible, 5 dB(A) readily perceptible, and 10 dB(A) perceived as a doubling or halving of noise (California Department of Transportation [Caltrans] 2013).

3.2 Fundamentals of Vibration

Vibration consists of energy waves transmitted through solid material (Federal Transit Administration [FTA] 2006). Groundborne vibration propagates from the source through the ground to adjacent buildings by surface waves. Vibration may be composed of a single pulse, a series of pulses, or a continuous oscillatory motion. The frequency of a vibrating object describes how rapidly it is oscillating, measured in hertz (Hz). The normal frequency range of most groundborne vibration that can be felt generally starts from a low frequency of less than 1 Hz to a high of about 200 Hz (FTA 2018).

Vibration energy spreads out as it travels through the ground, causing the vibration amplitude to decrease with distance away from the source. Groundborne vibration is measured by its peak particle velocity (PPV). The PPV is normally described in inches per second (inch/sec). PPV is appropriate for determining potential structure damage but does not evaluate human response to vibration. The ground motion caused by vibration may also be described in decibel notation (vibration decibels), referenced as VdB, which serves to compress the range of numbers required to describe vibration relative to human response. The general human response to different levels of groundborne vibration velocity levels is described in Table 2.

Table 2 Human Response to Different Levels of Groundborne Vibration	
Vibration Velocity Level	Human Reaction
65 VdB	Approximate threshold of perception for many people.
75 VdB	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find that transportation-related vibration at this level is unacceptable.
85 VdB	Vibration acceptable only if there are an infrequent number of events per day.
SOURCE: FTA 2018. VdB = vibration decibel	

Groundborne vibration can be a concern for nearby residents along a transit system route or maintenance facility, causing buildings to shake and rumbling sounds to be heard. In contrast to groundborne noise, described below, groundborne vibration is not a common environmental problem. It is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. Some common sources of groundborne vibration are trains; buses on rough roads; and construction activities such as blasting, pile-driving, and operating heavy earth-moving equipment.

The rumbling sound caused by the vibration of building structures is referred to as groundborne noise. Like broadband noise, groundborne noise is usually characterized with the A-weighted sound level, which is intended to represent the normal frequency response of the human ear. However, there are potential problems when characterizing low-frequency noise using A-weighting, because human hearing causes sounds dominated by low-frequency components to seem louder than broadband sounds that have the same A-weighted level. This is accounted for by setting the limits for groundborne noise lower than would be the case for broadband noise. The sound level accompanying vibration is generally 25 to 40 dB(A) lower than the vibration velocity level in VdB. Groundborne vibration levels of 65 VdB can result in groundborne noise levels up to 40 dB(A), which can disturb sleep. Groundborne vibration levels of 85 VdB can result in groundborne noise levels up to 60 dB(A), which can be annoying to daytime noise-sensitive land uses such as schools (FTA 2018).

4.0 Applicable Standards and Guidelines

The CPU area is exposed to noise from vehicle traffic on area roadways, trolley operations, construction, and from other local noise sources. Federal noise standards include transportation-related noise sources related to interstate commerce (i.e., aircraft, trains, and trucks) for which there are not more stringent state standards. State noise standards are set for automobiles, light trucks, and motorcycles. Local noise standards and guidelines are set for industrial, commercial, and construction activities subject to local noise ordinances and General Plan policies. The following is a detailed discussion of the applicable local regulations.

4.1 City of San Diego CEQA Thresholds

The noise section of the City of San Diego's Significance Determination Thresholds for the California Environmental Quality Act (CEQA) identifies thresholds for traffic noise (City of San Diego 2016). These noise levels are summarized in Table 3 below.

Table 3
Traffic Noise Significance Thresholds
(dB[A] CNEL)

Structure or Proposed Use that would be Impacted by Traffic Noise	Interior Space	Exterior Useable Space*	General Indication of Potential Significance
Single-family detached	45 dB	65 dB	Structure or outdoor useable area is <50 feet from the center of the closest (outside) lane on a street with existing or future ADTs >7,500
Multi-family, school, library, hospital, day care center, hotel, motel, park, convalescent home	Development Services Department ensures 45 dB pursuant to Title 24	65 dB	
Office, church, business, professional uses	n/a	70 dB	Structure or outdoor useable area is <50 feet from the center of the closest lane on a street with existing or future ADTs >20,000
Commercial, retail, industrial, outdoor spectator sports uses	n/a	75 dB	Structure or outdoor useable area is <50 feet from the center of the closest lane on a street with existing or future ADTs >40,000

SOURCE: City of San Diego 2016.
ADT = average daily traffic; dB = decibel
*If a project is currently at or exceeds the significance thresholds for traffic noise described above and noise levels would result in less than a 3 dB increase, then the impact is not considered significant.

4.2 California Code of Regulations

4.2.1 Noise Insulation Standards

Interior noise levels for habitable rooms are regulated by Title 24 of the California Code of Regulations (CCR; 2016), California Noise Insulation Standards. Title 24, Chapter 12, Section 1207 of the California Building Code requires that interior noise levels, attributable to exterior sources, not exceed 45 CNEL in any habitable room within a residential structure. A habitable room in a building is used for living, sleeping, eating, or cooking. Bathrooms, closets, hallways, utility spaces, and similar areas are not considered habitable rooms for this regulation (24 CCR 1207 2016).

4.2.2 California Green Building Standards Code – Environmental Comfort

For nonresidential structures, Title 24, Chapter 12, Section 1207.5 refers to 2016 California Green Building Standards (CALGreen), Chapter 5 – Nonresidential Mandatory Measures, Division 5.5 – Environmental Quality, Section 5.507 – Environmental Comfort, Subsection 5.507.4 – Acoustical Control. Pursuant to these standards, all nonresidential building construction shall employ building assemblies and components that achieve a composite sound transmission class rating of at least 50 or shall otherwise demonstrate that exterior noise shall not result in interior noise environment where noise levels exceed 50 A-weighted equivalent decibels [dB(A) L_{eq}] in occupied areas during any hour of operation (24 CCR 1207.5 2016).

4.3 City of San Diego General Plan

The Noise Element of the General Plan specifies compatibility guidelines for different categories of land use. The land use compatibility guidelines are summarized in Table 4. As shown in Table 4, for a particular land use category, noise levels are either considered compatible, conditionally compatible, or incompatible. A "compatible" land use indicates that standard construction methods will attenuate exterior noise to an acceptable indoor noise level and people can carry out outdoor activities with minimal noise interference. Evaluation of land use that falls into the "conditionally compatible" noise environment should have an acoustical study. For land uses indicated as conditionally compatible, structures must be capable of attenuating exterior noise to the indoor noise level shown in Table 4. For land uses indicated as incompatible, new construction should generally not be undertaken. Due to severe noise interference, outdoor activities are unacceptable and for structures, extensive mitigation techniques are required to make the indoor environment acceptable.

The City specifies that residential structures shall be designed to prevent the intrusion of exterior noises such that interior noise levels attributable to exterior sources do not exceed 45 CNEL in noise-sensitive interior rooms. This conforms to Title 24 of the CCR, which requires interior noise levels for habitable rooms due to exterior sources not to exceed 45 CNEL (see Section 4.2.1). The City also specifies that the interior noise level due to exterior sources is not to exceed 45 CNEL for institutional uses and is not to exceed 50 CNEL for office buildings and commercial uses.

	Compatible	Indoor Uses	Standard construction methods should attenuate exterior noise to an acceptable indoor noise level. Refer to Section I.
		Outdoor Uses	Activities associated with the land use may be carried out.
	Conditionally Compatible	Indoor Uses	Building structure must attenuate exterior noise to the indoor noise level indicated by the number for occupied areas. Refer to Section I.
		Outdoor Uses	Feasible noise mitigation techniques should be analyzed and incorporated to make the outdoor activities acceptable. Refer to Section I.
	Incompatible	Indoor Uses	New construction should not be undertaken.
		Outdoor Uses	Severe noise interference makes outdoor activities unacceptable.

SOURCE: City of San Diego General Plan 2015.
dB(A) = A-weighted decibels; CNEL = community noise equivalent level

In addition to the compatibility guidelines shown in Table 4, Section B of the Noise Element provides additional guidance for multi-family and mixed-use residential developments that is applicable to the CPU area. Section B of the Noise Element states that although not generally considered compatible, the City conditionally allows multi-family and mixed-use residential uses up to 75 CNEL with a requirement to include attenuation measures to ensure an interior noise level of 45 CNEL where a community plan allows multi-family and mixed-use. In addition, the General Plan contains the following policies regarding the preparation of acoustical studies and interior noise guidelines:

NE-A.4. Require an acoustical study consistent with Acoustical Study Guidelines (Table NE-4) for proposed developments in areas where the existing or future noise level exceeds or would exceed the "compatible" noise level thresholds as indicated on the Land Use – Noise Compatibility Guidelines (Table NE-3), so that noise mitigation measures can be included in the project design to meet the noise guidelines.

NE-I.1. Require noise attenuation measures to reduce the noise to an acceptable noise level for proposed developments to ensure an acceptable interior noise level, as appropriate, in accordance with California's noise insulation standards (CCR Title 24) and Airport Land Use Compatibly Plans.

NE-I.2. Apply CCR Title 24 noise attenuation measures requirements to reduce the noise to an acceptable noise level for proposed single-family, mobile homes, senior housing, and all other types of residential uses not addressed by CCR Title 24 to ensure an acceptable interior noise level, as appropriate.

NE-E.5. Implement night and daytime on-site noise level limits to address noise generated by commercial uses where it affects abutting residential and other noise-sensitive uses.

4.4 City of San Diego Municipal Code

While the General Plan Noise Element addresses land use compatibility of a proposed use with the surrounding noise environment, the City's Municipal Code addresses the noise generated on-site impacting adjacent properties. This includes both on-site stationary noise and temporary construction noise.

4.4.1 Stationary Noise

Impacts to sensitive receptors generated by activities at a given location are regulated by the City's Municipal Code. Section 59.5.0401 of the Noise Ordinance specifies maximum one-hour average sound level limits at the boundary of a property. These maximum one-hour sound level limits are the maximum noise levels allowed at any point on or beyond the property boundaries due to activities occurring on the property. Where two or more zones adjoin, the sound level limit is the arithmetic mean of the respective limits for the two zones. Table 5 shows the exterior noise limits specified in the City's Noise Control Ordinance.

Table 5 City of San Diego Property Line Noise Limits			
	Noise Level [dB(A)]		
Receiving Land Use Category	7:00 a.m. to 7:00 p.m.	7:00 p.m. to 10:00 p.m.	10:00 p.m. to 7:00 a.m.
Single-family Residential	50	45	40
Multi-family Residential (up to a maximum density of 1 dwelling unit/2,000 square feet)	55	50	45
All Other Residential	60	55	50
Commercial	65	60	60
Industrial or Agricultural	75	75	75
SOURCE: City of San Diego, Municipal Code Section 59.5.0401.			

4.4.2 Construction Noise

Construction noise is regulated by the City's Municipal Code. Section 59.5.0404 of the Municipal Code, the Noise Abatement and Control Ordinance, states that:

A. It shall be unlawful for any person, between the hours of 7:00 p.m. of any day and 7:00 a.m. of the following day, or on legal holidays as specified in Section 21.04 of the San Diego Municipal Code, with exception of Columbus Day and Washington's Birthday, or on Sundays, to erect, construct, demolish, excavate for, alter or repair any building or structure in such a manner as to create disturbing, excessive or offensive noise.

B. . . . it shall be unlawful for any person, including the City of San Diego, to conduct any construction activity so as to cause, at or beyond the property lines of any property zoned residential, an average sound level greater than 75 decibels during the 12-hour period from 7:00 a.m. to 7:00 p.m.

4.5 Vibration

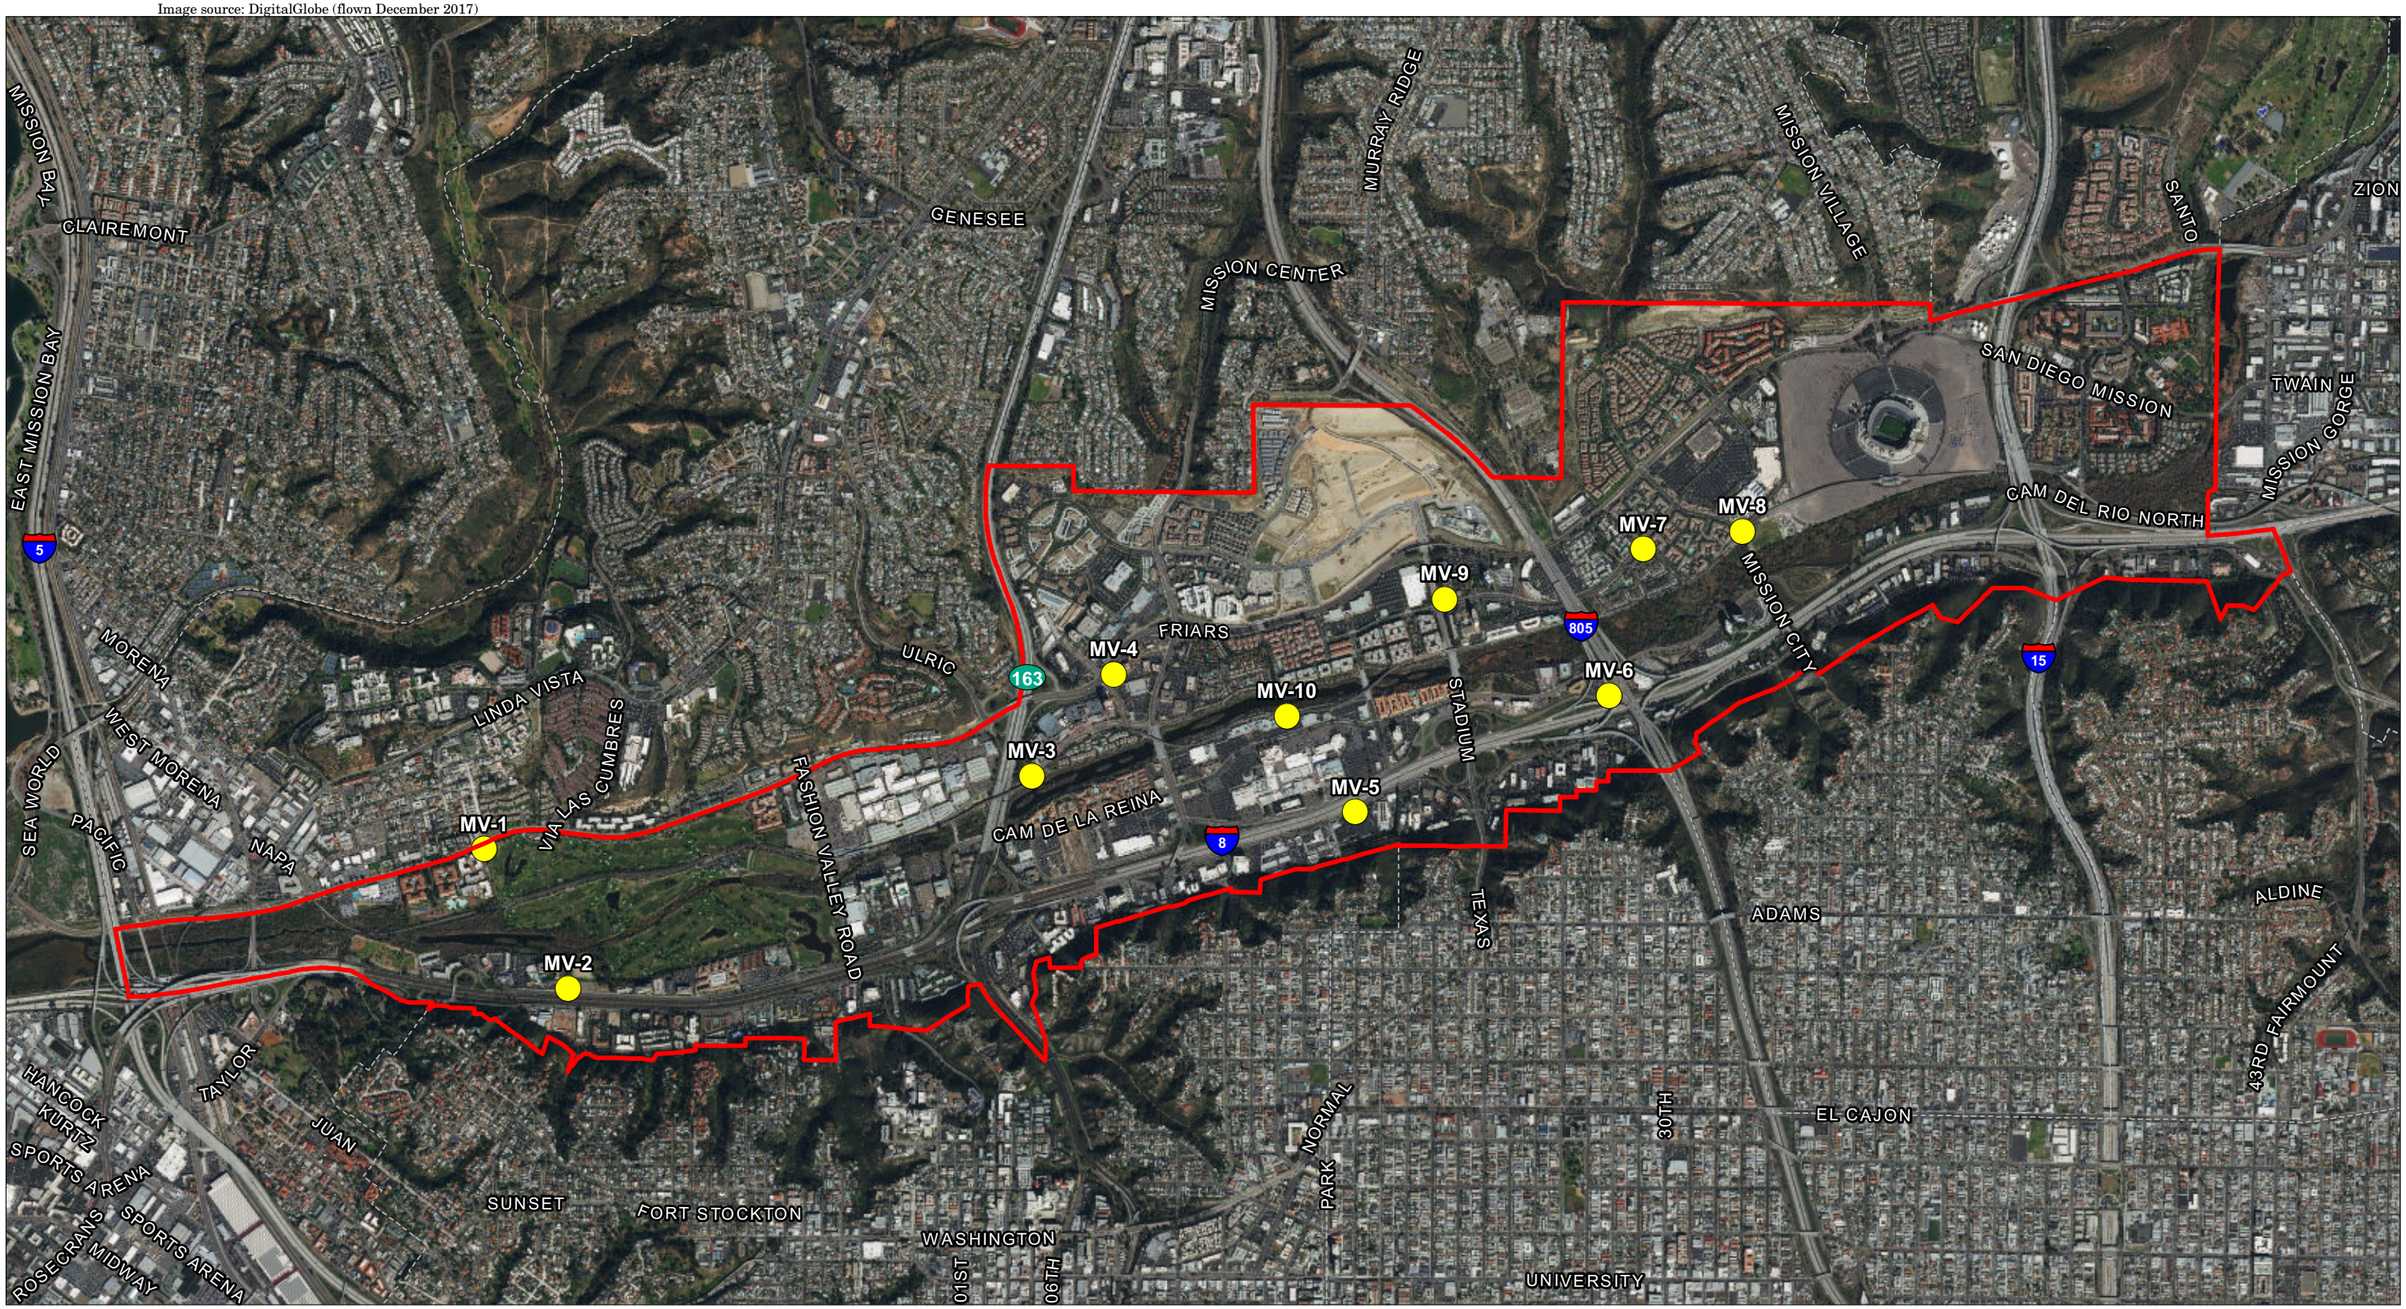
Numerous public and private organizations and governing bodies have provided guidelines to assist in the analysis of groundborne noise and vibration. While the City has not established specific groundborne noise and vibration standards, guidelines from the FTA and Caltrans serve as a useful tool to evaluate vibration impacts. Caltrans guidelines recommend that a standard of 0.2 inch/sec PPV not be exceeded for the protection of normal residential buildings and that 0.08 inch/sec PPV not be exceeded for the protection of old or historically significant structures (Caltrans 2004). With respect to human response within residential uses (i.e., annoyance, sleep disruption), FTA recommends a maximum acceptable vibration standard of 80 VdB (FTA 2018).

5.0 Existing Conditions

5.1 Noise Measurements

As part of this assessment, ambient noise levels were measured in the planning area to provide a characterization of the variability of noise and to assist in determining constraints and opportunities for future development. Ten 15-minute daytime noise level measurements were conducted throughout the study area. Noise measurements were taken with a Larson-Davis LxT Type 1 Integrating Sound Level Meters, serial numbers 3827. The following parameters were used:

Filter:	A-weighted
Response:	Slow
Time History Period:	5 seconds
Height of Instrument:	5 feet above ground level



Each measurement location is shown in Figure 4. A summary of the measurements is provided in Table 6, and traffic counts taken during measurements are summarized in Table 7. Noise measurement data are contained in Attachment 1. Based on the measurement data, daytime noise levels in the planning area are typical of an urban environment. Each measurement location and noise source observed during the measurements is discussed below.

Table 6
Noise Measurements

ID[1]	Location	Date	Time	L_{eq}
MV-1	Friars Road at Goshen Street	9/16/2015	1:07 p.m. – 1:22 p.m.	63.4
MV-2	Hotel Circle North east of the Crowne Plaza	9/16/2015	2:00 p.m. – 2:15 p.m.	65.1
MV-3	Hazard Center Drive west end	9/16/2015	2:41 p.m. – 2:56 p.m.	66.1
MV-4	Friars Road east of Frazee	9/16/2015	3:47 p.m. – 4:02 p.m.	65.2
MV-5	Camino del Rio South at the Scottish Right Event Center	9/16/2015	4:36 p.m. – 4:51 p.m.	73.0
MV-6	I-8 at I-805	9/16/2015	5:28 p.m. – 5:43 p.m.	76.4
MV-7	Rio San Diego Drive east of River Run Drive	9/17/2015	9:22 a.m. – 9:37 a.m.	56.2
MV-8	Fenton Parkway south end	9/17/2015	9:58 a.m. – 10:13 a.m.	59.9
MV-9	Qualcomm Way at Rio San Diego Drive	9/17/2015	11:03 a.m. – 11:18 a.m.	65.4
MV-10	San Diego Trolley east of Mission Valley Center Station	9/17/2015	12:12 p.m. – 12:27 p.m.	60.2

[1]Measurement locations are shown in Figure 4 and correspond to ID the provided above.

FIGURE 4

Aerial Photograph of CPU Vicinity and Noise Measurement Locations

Measurement MV-1 was taken on Friars Road south of Goshen Street. The main source of noise at this measurement location was vehicle traffic on Friars Road. Traffic volumes on Friars Road during Measurement MV-1 were counted and the results are shown in Table 7. Other sources of noise included vehicle traffic on Goshen Street and vehicles entering and exiting the Courtyards condominium complex. The average measured noise level was 63.4 dB(A) L_{eq}.

Measurement MV-2 was taken on Hotel Circle North east of the Crowne Plaza and west of the parking lot of Budget Truck Rental. The main source of noise at this measurement location was vehicle traffic on I-8. Other sources of noise included vehicle traffic on Hotel Circle North. Traffic volumes on Hotel Circle North during Measurement MV-2 were counted and the results are shown in Table 7. The average measured noise level was 65.1 dB(A) L_{eq}.

Measurement MV-3 was taken 100 feet west of the end of Hazard Center Drive and 50 feet north of the San Diego Trolley Line. The main source of noise at this measurement location was vehicle traffic on SR-163. Additionally, during this measurement a trolley passed by generating noise levels up to 75.0 dB(A). The average measured noise level was 66.1 dB(A) L_{eq}.

Measurement MV-4 was taken on Friars Road east of Frazee Road in front of Robbins Brothers Engagement Ring Store. The main source of noise at this measurement location was vehicle traffic on Friars Road. Traffic volumes on Friars Road during Measurement MV-4 were counted and the results are shown in Table 7. This included vehicles queueing at red lights and vehicles accelerating when lights turned green. Other sources of noise included vehicle traffic on Frazee Road. The average measured noise level was 65.2 dB(A) L_{eq}.

Measurement MV-5 was taken in the parking lot of the Scottish Rite Event Center overlooking Camino del Rio South. The main source of noise at this measurement location was vehicle traffic on I-8. Other sources of noise included vehicle traffic on Camino del Rio South. Traffic volumes on Camino del Rio South during Measurement MV-5 were counted and the results are shown in Table 7. The average measured noise level was 73.0 dB(A) L_{eq}.

Measurement MV-6 was taken in the parking lot north of I-8 and east of I-805. At this location, I-805 and associated on- and off-ramps are elevated above the measurement location. The main sources of noise at this measurement location were vehicle traffic on I-8 and ramps connecting I-8 and I-805. Other sources of noise included parking lot activities and construction equipment approximately 700 feet away. The average measured noise level was 76.4 dB(A) L_{eq}.

Measurement MV-7 was taken on Rio San Diego Drive between River Run Drive and Fenton Parkway. The main source of noise at this measurement location was vehicle traffic on Rio San Diego Drive. Traffic volumes on Rio San Diego Drive during Measurement MV-7 were counted and the results are shown in Table 7. Other sources of noise included activities associated with the adjacent Club River Run Apartment Homes complex such as a leaf blower approximately 200 to 300 feet away, movers loading furniture from a residence

approximately 300 feet away, and vehicles entering and exiting the parking lot approximately 50 feet way. Additionally, a plane flyover occurred during the measurement. The average measured noise level was 56.2 dB(A) L_{eq}.

Measurement MV-8 was taken on the sidewalk east of the south end of Fenton Parkway and immediately adjacent to the San Diego Trolley Line at Fenton Parkway Station. The main source of noise at this measurement location was trolley activity. During the measurement one eastbound and one westbound trolley pass-by occurred. Pass-bys resulted in noise levels of up to 72.6 dB(A). Other sources of noise included vehicle traffic on I-8 and Fenton Parkway. The average measured noise level was 59.9 dB(A) L_{eq}.

Measurement MV-9 was taken on Qualcomm Way, north of Rio San Diego Drive, on the walkway connecting Qualcomm Way to the parking lot for the U.S. Department of Veterans Affairs building. The main source of noise at this measurement location was vehicle traffic on Qualcomm Way. Traffic volumes on Qualcomm Way during Measurement MV-9 were counted and the results are shown in Table 7. Other sources of noise included vehicle traffic on Rio San Diego Drive. The average measured noise level was 65.4 dB(A) L_{eq}.

Measurement MV-10 was taken in the parking lot north of Camino de la Reina, west of Camino del Este. The measurement was taken approximately 25 feet south of the San Diego Trolley Line. The main source of noise at this measurement location was trolleys. During the measurement one eastbound and one westbound trolley pass-by occurred. Pass-bys resulted in noise levels of up to 80.3 dB(A). Other sources of noise included parking lot activities and vehicle traffic on Camino de la Reina (approximately 250 feet way). The average measured noise level was 60.2 dB(A) L_{eq}.

Table 7
15-minute Traffic Counts

Measurement	Roadway	Direction	Autos	Medium Trucks	Heavy Trucks	Buses	Motorcycles
1	Friars Road	Westbound	128	1	0	1	2
		Eastbound	142	4	1	0	0
2	Hotel Circle North	Westbound	28	0	0	1	0
		Eastbound	23	0	0	2	0
4	Friars Road	Westbound	420	2	0	0	1
		Eastbound	660	3	0	0	7
5	Camino del Rio South	Westbound	156	1	0	0	0
		Eastbound	69	0	0	0	0
7	Rio San Diego Drive	Westbound	53	1	0	0	0
		Eastbound	44	0	0	0	0
9	Qualcomm Way	Northbound	97	6	3	0	1
		Southbound	79	5	2	0	0

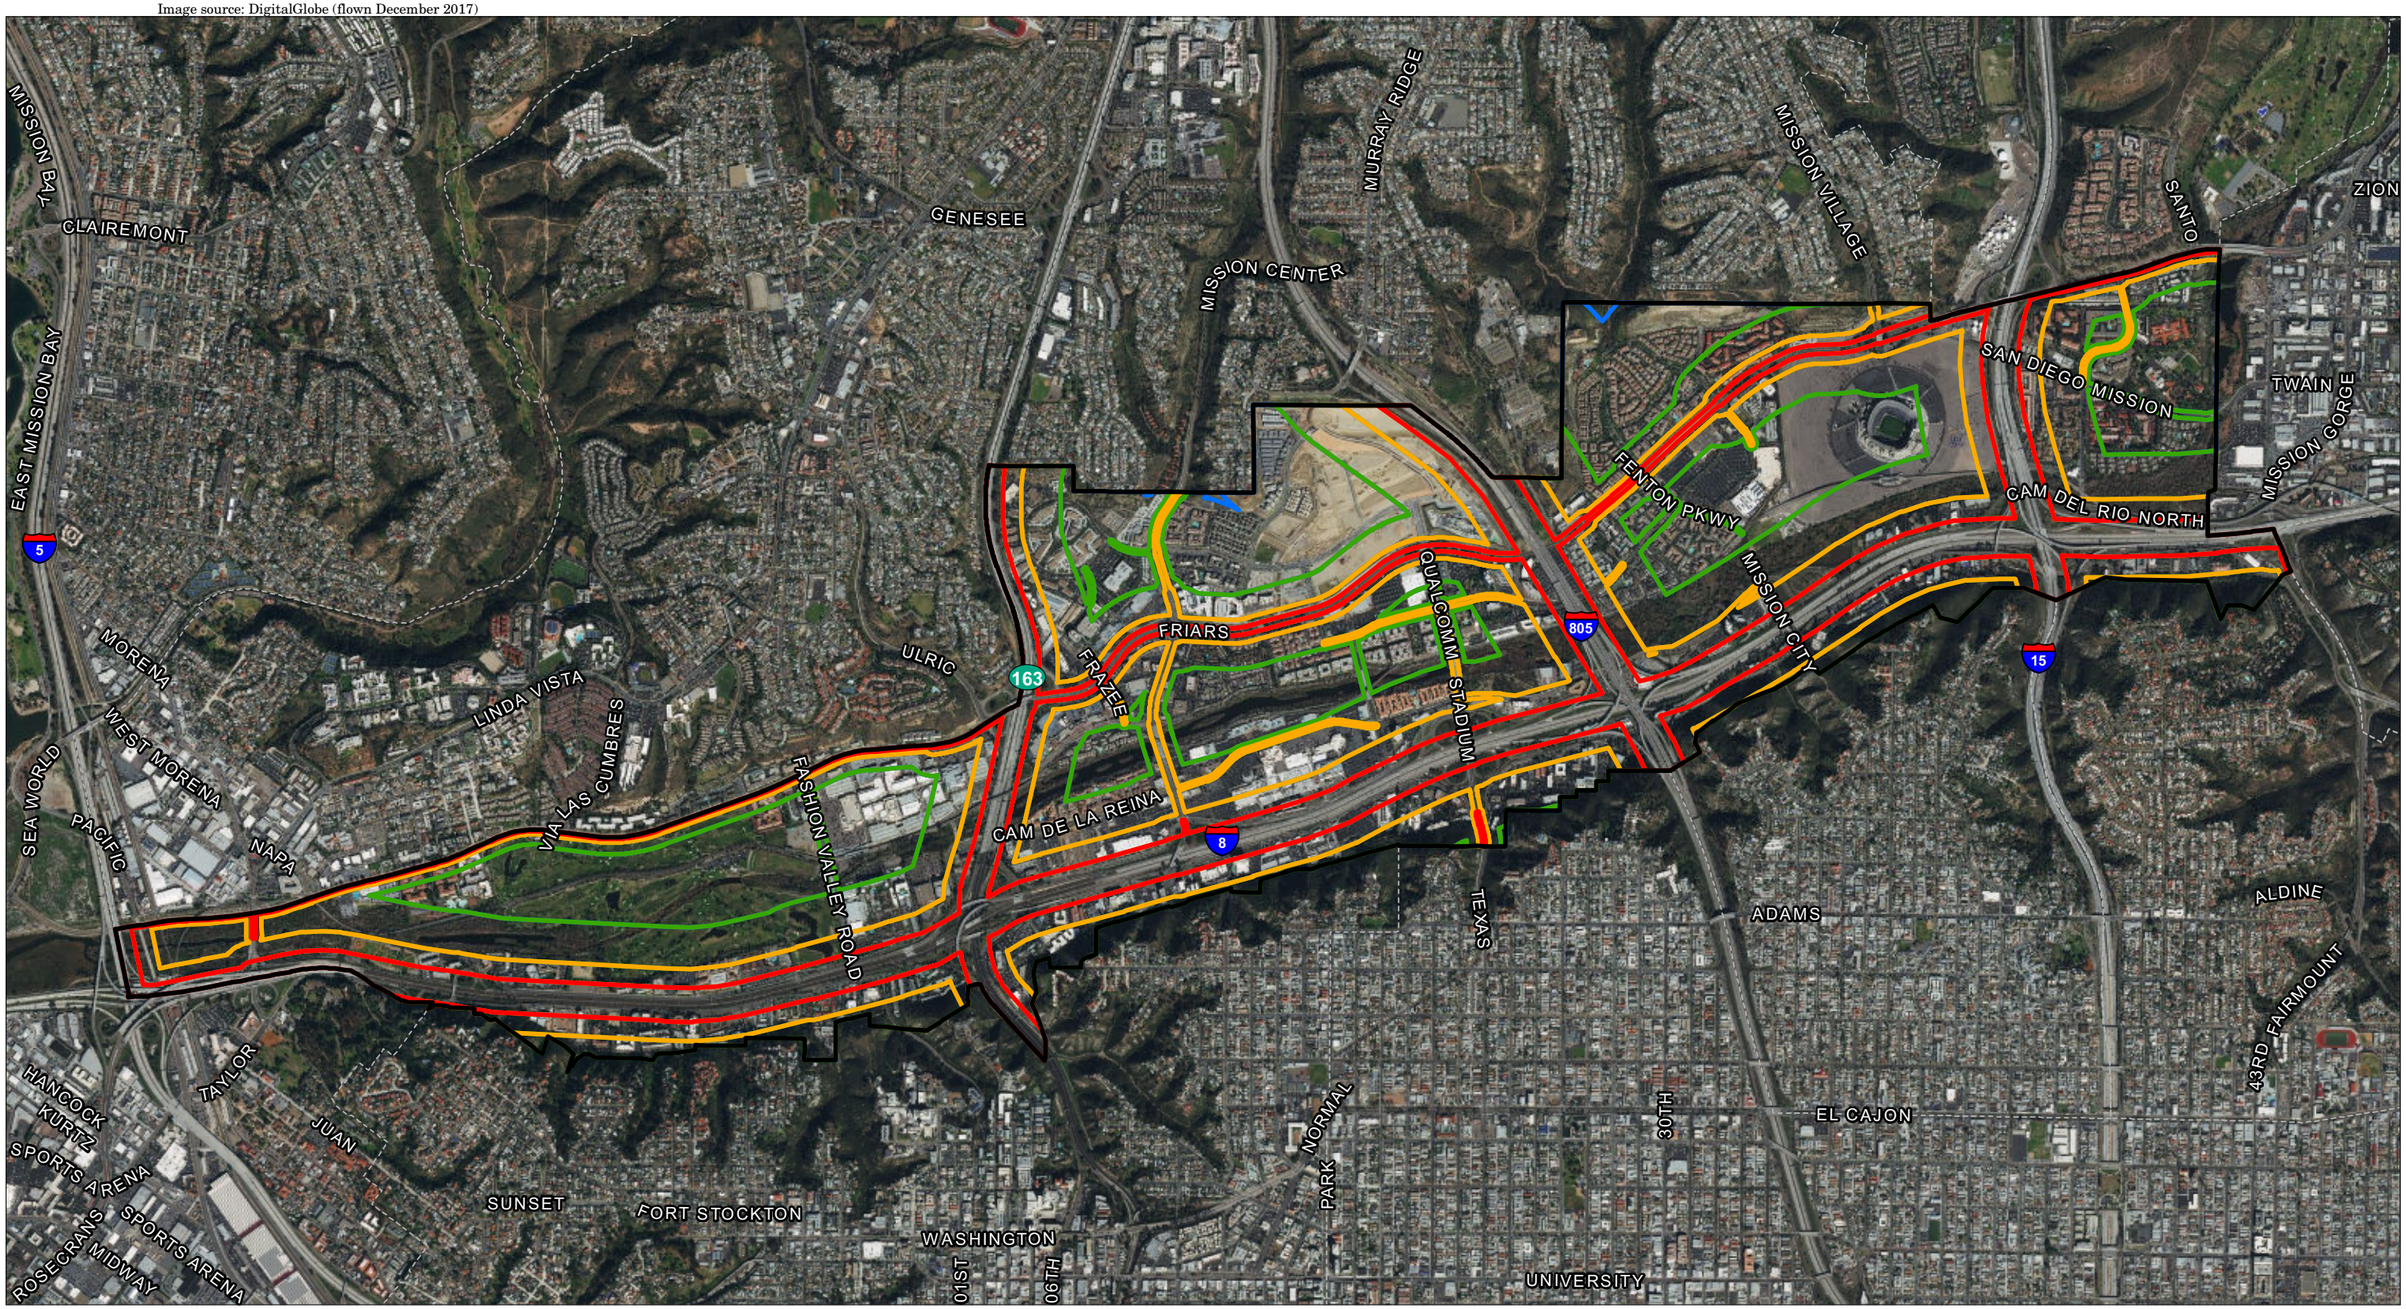
NOTE: Traffic counts were not conducted during Measurements 3, 6, 8, or 10. The main source of noise during Measurements 3 and 10 was vehicle traffic on freeways and freeway traffic volumes could not be manually counted. The main source of noise during Measurements 6 and 8 was trolley activity.

5.2 Existing Vehicle Traffic Noise Contours

The roads generating the greatest noise level in the CPU area are I-5, I-8, I-15, I-805, SR-163, and Friars Road. The noise contour distances represent the predicted noise level for each roadway without the attenuating effects of noise barriers, structures, topography, or dense vegetation. As intervening structures, topography, and dense vegetation would affect noise exposure at a particular location, the noise contours should not be considered site-specific but are rather guides to determine when detailed acoustic analysis should be undertaken.

Figure 5 shows the existing vehicle traffic noise contours for the CPU area. As shown, existing noise levels throughout the community exceed 60 CNEL. The local freeways are the dominant noise sources in the CPU area. Noise contours from the freeways in many cases overlap with and encompass the noise contours from local roadways. The distances to various traffic CNEL noise contours for these major roads are provided in Attachment 2.

5.3 Existing Trolley Noise Contours



The San Diego Metropolitan Transit System (MTS) Green Line Trolley traverses an east-west railway alignment that includes nine trolley stops in the CPU area. On weekdays, 96 trolley passes occur during daytime hours (7 a.m. to 7 p.m.), 19 trolley passes occur during evening hours (7 p.m. to 10 p.m.), and 33 trolley passes occur during nighttime hours (10 p.m. to 7 a.m.). There are fewer trolley pass-bys on Saturdays and Sundays, therefore, the worst-case weekday scenario was modeled. Existing contour distances were calculated. Figure 6 shows the existing trolley noise contours for the CPU area. As shown, the 60 CNEL contour extends up to approximately 270 feet from the center of the trolley tracks between the Old Town and Grantville trolley stations, and the 65 CNEL contour extends up to approximately 85 feet of the trolley tracks. Trolley contours noise calculation data is provided in Attachment 3.

6.0 Noise Sources and Analysis Methodology

6.1 Vehicle Traffic Noise

Traffic noise occurs adjacent to every roadway and is directly related to the traffic volume, speed, and mix of vehicles. Traffic volumes and speeds for the local roadways were obtained from the traffic impact analysis prepared for the CPU (Chen Ryan Associates 2018). Existing freeway volumes were obtained from Caltrans traffic counts (Caltrans 2016a). Future freeway volumes were obtained from the San Diego Association of Governments' Transportation Forecast Information Center (SANDAG 2018).

FIGURE 6

Trolley Noise Contours

The traffic mix (i.e., autos, medium trucks, and heavy trucks) for I-5, I-8, I-15, I-805, and SR-163 were derived from Caltrans truck counts (Caltrans 2016b). The traffic mixes are summarized in Table 8 along with the vehicle traffic parameters used in this analysis for each roadway segment. For local roadways in the CPU area, a traffic mix of 96 percent cars, 3 percent medium trucks, and 1 percent heavy trucks was modeled. This is consistent with traffic counts taken during the existing noise measurements, and similar to Caltrans truck counts for most area freeways.

The Federal Highway Administration (FHWA) Traffic Noise Model algorithms were used to calculate distances to noise contours for each roadway. The FHWA model takes into account traffic mix, speed, and volume; roadway gradient; relative distances between sources, barriers, and sensitive receptors; and shielding provided by intervening terrain or structures.

The analysis of the noise environment considered that the topography was flat with no intervening terrain between sensitive land uses and roadways. Because modeled predicted noise levels do not account for obstructions, they are higher than those which would actually occur. In actuality, buildings and other obstructions along the roadways would shield distant receivers from the traffic noise. Existing and future vehicle traffic noise calculations are provided in Attachment 2.

6.2 Trolley Noise

Noise associated with trolley operations was modeled using the FTA recommended Chicago Rail Efficiency and Transportation Efficiency (CREATE) railroad noise model (Harris Miller Miller & Hanson, Inc. 2006).

The San Diego MTS provides trolley service along a railway alignment designated the "Green Line." The Green Line Trolley generally parallels I-8 throughout the planning area. The trolleys travel between 15 and 60 miles per hour (mph). This is based on the distances between trolley stations and the average timing between stations obtained from published trolley schedules. Noise contour distances were calculated assuming flat-site conditions and no intervening buildings that would provide noise attenuation.

6.3 Stationary Noise

Stationary sources of noise include activities associated with a given land use. The CPU area includes multiple land uses, including residential, commercial, and mixed-use land uses as well as recreational and institutional uses. Various land uses contain on-site stationary noise sources, including rooftop heating, ventilation, and air conditioning (HVAC) equipment; mechanical equipment; emergency electrical generators; parking lot activities; loading dock operations; and recreation activities. Stationary noise is considered a "point source" and attenuates over distance at a rate of 6 dB(A) for each doubling of distance. The exact location and nature of future stationary noise sources is not known at this time and can, therefore, not be calculated in this analysis. Impacts are assessed in this analysis by identifying potential types of stationary sources and locations of mixed-use land use interfaces and identifying applicable regulations and mitigation framework for addressing impacts.

6.4 Construction Noise

No specific construction or development is proposed under the CPU at this time but would occur when future development under the CPU is proposed. Future development as allowed under the proposed CPU could potentially result in temporary ambient noise increase due to construction activities.

Construction noise has the potential to result in temporary ambient noise increase due to construction activities. Construction noise is generated by diesel-powered construction equipment used for site preparation and grading, removal of existing structures and pavement, loading, unloading, and placing materials and paving. Diesel engine-driven trucks also bring materials to the site and remove the spoils from excavation. Table 9 summarizes typical construction equipment noise levels.

Table 9 Typical Construction Equipment Noise Levels		
Equipment	Noise Level at 50 Feet [dB(A) L_{eq}]	Typical Duty Cycle
Auger Drill Rig	85	20%
Backhoe	80	40%
Blasting	94	1%
Chain Saw	85	20%
Clam Shovel	93	20%

Pumps	77	50%
Rock Drill	85	20%
Roller	74	40%
Scraper	85	40%
Tractor	84	40%
Vacuum Excavator (vac-truck)	85	40%
Vibratory Concrete Mixer	80	20%
Vibratory Pile Driver	95	20%
SOURCE: FHWA 2006. dB(A) L_{eq} = A-weighted decibels average noise level		

Construction equipment would generate maximum noise levels between 70 and 95 dB(A) L_{max} at 50 feet from the source when in operation. During excavation, grading, and paving operations, equipment moves to different locations and goes through varying load cycles, and there are breaks for the operators and for non-equipment tasks, such as measurement. Average construction noise levels were calculated for the simultaneous operation of three common pieces of construction equipment: backhoe, excavator, and loader. The usage factors were applied to the maximum noise level at 50 feet for each piece of equipment, and then noise levels were added logarithmically. Hourly average noise levels would be approximately 83 dB(A) L_{eq} at 50 feet from the center of construction activity when assessing three pieces of common construction equipment working simultaneously. Noise levels would vary depending on the nature of the construction including the duration of specific activities, nature of the equipment involved, location of the particular receiver, and nature of intervening barriers.

Impacts are assessed in this analysis by identifying potential construction noise levels and buffer distances at which construction noise levels would be less than the noise levels identified in the City's Noise Abatement and Control Ordinance (75 dB).

6.5 Vibration

Potential sources of ground-borne vibration could come from railway operations. For conventional commuter railroad traffic such as the train and freight traffic that occurs on the railway at the western CPU area boundary, the FTA provides generalized screening distances for land uses that may be subject to vibration impacts (FTA 2018). For Category 1 uses such as vibration sensitive equipment, the screening distance from the right-of-way is 600 feet. For Category 2 land uses such as residences and buildings where people would normally sleep, the screening distance is 200 feet. The screening distance for Category 3 land uses such as institutional land uses with primarily daytime uses, is 120 feet. These screening distances were used to assess vibration impacts due to the railway at the western CPU area boundary.

The east-west tracks that bisect the CPU area provide only trolley service (Green Line Trolley) and do not include larger commuter trains or freight trains. Trolleys do not generate the same vibration levels as larger trains. Additionally, portions of the Green Line Trolley are elevated above grade and would not cause significant vibration at adjacent uses. Thus, the screening distances discussed above would be overly conservative. Therefore, for portions of the railway that are at-grade, rather than using the generalized screening distances for conventional commuter railroad traffic, FTA methodology and equations provided in their Transit Noise and Vibration Impact Assessment Manual (FTA 2018) were used to calculate potential site-specific vibration levels within the CPU area.

7.0 Future Acoustical Environment and Impacts

7.1 Increase in Ambient Noise

As discussed in Section 5.1, Noise Measurements, existing noise levels were measured in the CPU area to identify existing ambient noise conditions (refer to Table 6).

Traffic noise generally dominates the noise environment around the CPU area. Future development implemented under the CPU would increase traffic along local roadways due to increased allowable density and intensity of uses throughout the CPU area. Traffic noise increases may affect various noise-sensitive land uses, including residences. Using the traffic parameters summarized in Section 6.1, a traffic noise analysis has been completed for the build-out of the CPU. Table 10 summarizes the existing and build-out traffic noise levels along various roadway segments in the CPU area. Roadway noise is measured in CNEL at 50 feet from the roadway centerline.

A significant impact would occur if build-out of the CPU would result in traffic noise levels that exceed the City's significance thresholds for traffic noise (see Table 3). Per the City's significance thresholds, if a land use is currently at or exceeds the significance thresholds for traffic noise, then an increase of more than 3 dB is considered significant.

Bold = 2035 noise level would exceed the established exterior compatibility level for the surrounding land use and noise levels would increase by 3 dB or more, or future noise levels would be below 65 dB(A) CNEL but ambient noise levels would increase by more than 5 dB over existing noise levels.

The CPU area is dominated by freeway noise. There are some roadway segments that experience noise level increases that are 3 dB or greater as shown in Table 10; however, due to the proximity to a freeway and its associated freeway noise, the actual increase in ambient noise levels attributable to the specified roadway would be less than 3 dB. Additionally, there are areas where there are no noise-sensitive land uses. In order to specifically identify where noise impacts would occur, the surrounding land uses as well as their proximity to freeways were more closely examined to determine if the noise level increase along identified roadway segments would be significant.

A less than significant impact would occur adjacent to the following roadway segments:

- **Mission Valley Road from Metropolitan Drive to Mission Center Road**

  No noise-sensitive land uses are located adjacent to this segment. Commercial uses are located adjacent to this segment. Noise levels would not exceed the significance

threshold of 75 CNEL for commercial land uses; therefore, impacts would be less than significant.

- **Civita Boulevard from Mission Center Road to Via Alta**

  Multi-family uses are located adjacent to this segment. However, noise levels would not exceed the significance threshold of 65 CNEL for multi-family residential land uses; therefore, impacts would be less than significant.

- **Hotel Circle North from I-8 Westbound Off-ramp to I-8 Westbound On-ramp**

  Hotel and commercial land uses are located adjacent to this segment. However, existing noise levels due to vehicle traffic on I-8 exceed 75 CNEL. Although an increase of 3.7 to 5.9 dB is shown with a future noise level up to 70 CNEL, when combined with existing traffic from I-8, the actual noise increase due to Hotel Circle North would be less than 1 dB. Therefore, impacts would be less than significant.

- **Camino del Rio North from Camino de la Siesta to Mission Center Road**

  Multi-family uses are located adjacent to this segment. However, existing noise levels due to vehicle traffic on I-8 exceed 75 CNEL. Although an increase of 3.8 dB is shown with a future noise level of 67 CNEL, when combined with existing traffic from I-8, the actual noise increase due to Camino del Rio North would be less than 1 dB. Therefore, impacts would be less than significant.

- **Hotel Circle South from Street "J" to I-8 Eastbound On-ramp**

  Hotel and commercial uses are located adjacent to this segment. However, existing noise levels due to vehicle traffic on I-8 exceed 75 CNEL. Although an increase of 3.9 dB is shown with a future noise level of 71 CNEL, when combined with existing traffic from I-8, the actual noise increase due to Hotel Circle South would be less than 1 dB. Therefore, impacts would be less than significant.

- **Fashion Valley Road from Levi-Cushman Street "B" to Hotel Circle North**

  Hotel uses and a golf course are located adjacent to this segment. However, existing noise levels due to vehicle traffic on I-8 range from 70 to 75 CNEL. Although an increase of 3.9 dB is shown with a future noise level of 70 CNEL, when combined with existing traffic from I-8, the actual noise increase due to Fashion Valley would be less than 3 dB. Therefore, impacts would be less than significant.

- **Avenida del Rio from Fashion Valley Parking Lot to Camino de la Reina**

  Commercial uses are located adjacent to this segment. Noise levels would not exceed the commercial significance threshold of 75 CNEL. Additionally, existing noise levels due to vehicle traffic on SR-163 are 70 CNEL. Although an increase of 3.4 dB is shown with a future noise level of 69 CNEL, when combined with existing traffic from SR-163, the actual noise increase due to Avenida del Rio would be less than 3 dB. Therefore, impacts would be less than significant.

- **Metropolitan Drive from Mission Valley Road to Murray Canyon Road**

  Commercial uses are located adjacent to this segment. Future noise levels would not exceed the commercial significance threshold of 75 CNEL for commercial land uses; therefore, impacts would be less than significant.

- **Via Alta from Franklin Ridge Road to Westside Drive**

  Multi-family land uses are located adjacent to this segment. However, existing noise levels due to vehicle traffic on I-805, Friars Road, and Mission Center Road exceed 65 CNEL. Although an increase of 6.8 to 9.1 dB is shown with a future noise level up to 64 CNEL, when combined with existing traffic from I-805, the actual noise increase due to Via Alta would be less than 3 dB. Therefore, impacts would be less than significant.

- **Murray Ridge Road from I-805 Northbound Ramps to I-805 Southbound Ramps**

  Single-family land uses are located adjacent to this segment. However, existing noise levels due to vehicle traffic on I-805 exceed 75 CNEL. Although an increase of 3.2 dB is shown with a future noise level of 70 CNEL, when combined with existing traffic from I-805, the actual noise increase due to Murray Ridge Road would be less than 3 dB. Therefore, impacts would be less than significant.

- **Russell Park Way from Friars Road to Civita Boulevard**

  The lots adjacent to this segment are currently undeveloped. Existing noise levels due to vehicle traffic on Friars Road exceed 65 CNEL. Although an increase of 8.6 dB is shown with a future noise level of 64 CNEL, when combined with existing traffic from Friars Road, the actual noise increase due to Russell Park Way would be less than 3 dB. Therefore, impacts would be less than significant.

- **Qualcomm Way from Friars Road Westbound Ramps to Friars Road Eastbound Ramps**

  This roadway segment is under the Friars Road overpass and there are no existing or planned immediately adjacent land uses. Therefore, impacts would be less than significant.

- **Qualcomm Way from Friars Road Eastbound Ramps to Rio San Diego Drive**

  Commercial uses are located adjacent to this segment. Future noise levels would not exceed the commercial significance threshold of 75 CNEL for commercial land uses; therefore, impacts would be less than significant.

- **Qualcomm Way from Camino del Rio North to I-8 Westbound Ramps**

  This segment is within the I-8 right-of-way and there are no existing or planned immediately adjacent land uses. Therefore, impacts would be less than significant.

- **Mission Village Drive from Friars Road Westbound Ramps to Friars Road Eastbound Ramps**

  This segment is the Friars Road overpass accessing the stadium parking lot, and there are no existing or planned immediately adjacent land uses, as it is within the Friars Road right-of-way. Therefore, impacts would be less than significant.

- **Santo Road from the Northern Terminus to Friars Road**

  Multi-family land uses are located adjacent to this segment; however, they are set back approximately 120 feet from the centerline of Santo Road. Noise levels at this distance would be less than 65 CNEL (59 CNEL in the existing condition and 63 CNEL at build-out). Therefore, impacts would be less than significant.

- **Riverdale Street from Friars Road to Vandever Avenue**

  Commercial uses are located adjacent to this segment. Future noise levels would not exceed the commercial significance threshold of 75 CNEL for commercial land uses; therefore, impacts would be less than significant.

A significant noise impact would occur adjacent to the following three roadway segments.

- **Phyllis Place from Abbots Hill Road to I-805 Southbound Ramps**

  Single- and multi-family residential uses are located towards the western terminus of Phyllis Place. Noise levels are dominated by vehicle traffic on I-805, with existing noise contours ranging from 65 to 75 CNEL. However, because noise levels due to vehicle traffic on Phyllis Place would increase from 57 to 69 CNEL and would result in a 3 dB increase in ambient noise levels even when taking existing traffic noise from I-805 into account, noise impacts would be significant.

- **Bachman Place from Hotel Circle South to Lewis Street**

  Residential, hospital, and hotel land uses are located adjacent to this segment of Bachman Place. Noise levels currently exceed the significance threshold of 65 CNEL, and future vehicle traffic would increase ambient noise levels by more than 3 dB. Noise impacts would be significant.

- **Rancho Mission Road from San Diego Mission Road to Camino del Rio North**

  Residential land uses are located adjacent to this segment of Rancho Mission Road. Existing noise levels due to I-15 would range from 65 to 75 CNEL. However, even when taking existing traffic from I-15 into account, future vehicle traffic noise along this roadway segment could increase by 3 dB. Noise impacts would be significant.

The increase in ambient noise levels adjacent to these three roadway segments would result in the exposure of existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant. Possible noise-reduction measures would include retrofitting older structures with acoustically rated windows and doors featuring

higher Sound Transmission Class ratings, which is a measure of exterior noise reduction performance. However, there is no mechanism in place for implementing such a retrofit program. Because the significant noise impacts are to existing homes and other noise-sensitive uses in an already urbanized area, there is no feasible mitigation. Thus, impacts to existing sensitive land uses would remain significant and unavoidable.

An existing regulatory framework and review process exists for new development in areas exposed to high levels of ambient noise. Policies in the proposed CPU and General Plan related to decibel levels, procedures in the SDMC, and regulations including Title 24 would reduce traffic noise exposure, because they set standards for the siting of sensitive land uses. Site-specific noise analyses demonstrating that future development implemented under the CPU would not subject sensitive receptors to existing or future noise levels exceeding the General Plan's Land Use – Noise Compatibility Guidelines would be required as part of the review process for discretionary projects. With the implementation of these regulations and procedures, noise impacts applicable to new discretionary projects would be less than significant as exterior noise would be attenuated. However, in the case of ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts attributed to ministerial projects located in areas that exceed the applicable land use and noise compatibility level would be significant and unavoidable. Interior noise impacts for all projects, including ministerial projects, would be less than significant because building permit applicants must demonstrate compliance with the relevant interior noise standards through submission and approval of a Title 24 Compliance Report.

While future discretionary projects have a framework in place that would ensure exterior noise levels are appropriately attenuated to meet the General Plan Compatibility Standards, there is no similar mechanism in place for ministerial projects, resulting in a significant impact. This impact and mitigation is discussed further under Section 7.2.

7.2 Land Use Compatibility

A significant impact could occur if implementation of the CPU resulted in an exposure of people to current or future motor vehicle traffic noise levels that exceed standards established in the Noise Element of the General Plan. The General Plan's Land Use – Noise Compatibility Guidelines are presented in Table 4. The CPU proposes multi-family residential, visitor accommodations, commercial, institutional, industrial, and park and open space land uses, which are compatible with the following noise levels.

- Multi-family residential and mixed uses are compatible up to 60 CNEL and conditionally compatible up to 70 CNEL.

- Additionally, as stated in Section B of the Noise Element, although not generally considered compatible, the City conditionally allows multi-family and mixed-use residential uses up to 75 CNEL in areas affected by motor vehicle traffic noise with existing residential uses. Any future residential use exposed to noise levels up to 75 CNEL must include attenuation measures to ensure an interior noise level of 45

CNEL and be located in an area where a community plan allows multi-family and mixed-use residential uses.

- Visitor accommodations are compatible up to 60 CNEL and conditionally compatible up to 75 CNEL.
- Sales, commercial services, and office uses are compatible up to 65 CNEL and conditionally compatible up to 75 CNEL.
- Institutional uses are compatible up to 60 CNEL and conditionally compatible up to 65 or 70 CNEL depending on the type of institutional use.
- Industrial uses are compatible up to 75 CNEL.
- Neighborhood parks are compatible up to 70 CNEL and conditionally compatible up to 75 CNEL.

7.2.1 Vehicle Traffic Noise

Traffic noise generally dominates the noise environment around the CPU area. The freeways generating the greatest noise levels in the CPU area are I-5, I-8, I-15, I-805, and SR-163, and the roadway segments generating the greatest noise levels include Friars Road, Mission Center Road, Qualcomm Way, and Fairmount Avenue, among others. The distances to the 60, 65, and 70 CNEL noise contours in the build-out condition for freeways and major roadways in the CPU area are shown in Table 11. Distances to the roadway noise contours are based on a hard, flat site with no intervening barriers or obstructions (worst-case analysis). Future horizon year (2050) noise contours for the CPU area are shown in Figure 7.

Table 11

FIGURE 7

Future Vehicle Traffic Noise Contours

At any specific location the actual existing noise depends on the source noise level and the nature of the path from the source to the sensitive receptor. Buildings, walls, dense vegetation, and other barriers would block the direct line of sight and reduce noise levels at the receptor. As an example, a first row of buildings would reduce traffic noise levels at receptors by 3 to 5 dB(A) behind those structures depending on the building-to-gap ratio. Large continuous structures can provide substantially greater attenuation of traffic noise.

While the General Plan Noise Element has a compatibility level of 60 CNEL or less for residential uses, noise levels up to 65 CNEL for single-family residential and up to 70 CNEL for multi-family residential are considered conditionally compatible, since interior noise levels can be reduced to 45 CNEL through simple means, such as closing/sealing windows and providing mechanical ventilation. Additionally, as stated in Section B of the General Plan Noise Element, although not generally considered compatible, the General Plan conditionally allows multi-family and mixed-use residential uses up to 75 CNEL in areas affected by motor vehicle traffic noise with existing residential uses. Any future residential use exposed to noise levels up to 75 CNEL must include attenuation measures to ensure an interior noise level of 45 CNEL and be located in an area where a community plan allows multi-family and mixed-use residential uses. Project design features such as noise walls adjacent to freeways and roadways can usually reduce exterior noise levels to comply with General Plan Noise Element guidelines. Some residential land uses planned for the CPU area would be located between the 70 and 75 CNEL contours. Multi-family and mixed-use residential uses that meet the requirements of Section B of the General Plan Noise Element would be conditionally compatible up to 75 CNEL and would also be required to provide structural attenuation to reduce noise levels at interior locations.

As shown in Figure 7, noise levels would exceed 60 CNEL in the entire CPU area at build-out (2050), and noise levels would exceed 65 CNEL in a majority of the CPU area. Noise levels greater than 75 CNEL are generally considered incompatible for all land use types. Land uses located within 239 to 288 feet of I-5, 163 to 320 feet of I-8, 262 to 315 feet of I-15, 292 to 325 feet of I-805, and 190 to 262 feet of SR-163 would potentially be exposed to noise levels greater than 75 CNEL and would be considered incompatible.

The CPU area is generally developed; however, implementation of the CPU would result in changes to the land uses, which would introduce new noise-sensitive land uses in areas exceeding the Land Use – Noise Compatibility Guidelines. Therefore, impacts associated with future development within these areas would be significant.

The CPU includes policies that would require site design strategies and noise reduction measures for new development within 500 feet of freeways (see Section 2.0). Additionally, as detailed in Section 4.0, policies in the General Plan Noise Element and CCR Title 24 require the reduction of traffic noise exposure because they set standards for the siting of sensitive land uses. General Plan Noise Element policy NE-A.4 requires an acoustical study consistent with Acoustical Study Guidelines (Table NE-4) for proposed developments in areas where the existing or future noise level exceeds or would exceed the "compatible" noise level thresholds as indicated on the Land Use – Noise Compatibility Guidelines. Future discretionary proposals within the CPU area would, therefore, be required to

conduct site-specific exterior noise analyses to demonstrate that the proposed project would not place sensitive receptors in locations where the exterior existing or future noise levels would exceed the Land Use – Noise Compatibility Guidelines of the General Plan Noise Element. Additionally, for all future discretionary and ministerial projects located in areas where exterior noise levels exceed the Land Use – Noise Compatibility Guidelines as defined in the General Plan Noise Element, Table N-3, site-specific interior noise analyses demonstrating compliance with the interior standards of the General Plan would be required. These requirements for site-specific noise analyses would be implemented through submission of a Title 24 Compliance Report to demonstrate interior noise levels of 45 CNEL. Through implementation of this regulatory framework, exterior traffic noise impacts associated with new discretionary development and interior traffic noise impacts for both ministerial and discretionary projects would be less than significant.

However, in the case of exterior noise impacts associated with ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts for ministerial projects located in areas where the noise level exceeds the applicable land use and noise compatibility level would be significant and unavoidable.

7.2.2 Trolley Noise

Figure 6 shows the existing noise contours for the Green Line Trolley operations. Future Green Line Trolley operations are anticipated to continue similar to the existing schedule. The 60, 65, and 70 CNEL contour distances for the Green Line Trolley are summarized in Table 12. As shown, the 60 CNEL contour extends up to approximately 272 feet from the center of the trolley tracks between the Stadium and Fenton Parkway trolley stations, and the 65 CNEL contour extends up to approximately 86 feet from the trolley tracks.

Table 12
Green Line Trolley Noise Contour Distances

Stations	Noise Level at 50 feet (CNEL)	Distance to Noise Contour (feet)		
		70 CNEL	65 CNEL	60 CNEL
Grantville to Mission San Diego	63	10	33	105
Mission San Diego to Stadium	58	3	10	32
Stadium to Fenton Parkway	67	27	86	272
Fenton Parkway to Rio Vista	64	12	37	117
Rio Vista to Mission Valley Center	63	10	33	105
Mission Valley Center to Hazard Center	63	10	33	105
Hazard Center to Fashion Valley	61	7	22	68
Fashion Valley to Morena/Linda Vista	64	13	41	130
Morena/Linda Vista to Old Town	63	10	33	105

NOTE: Calculation data provided in Attachment 3.
CNEL = community noise equivalent level

The nearest noise-sensitive land uses would be located on both sides of the trolley alignment, with some uses abutting the right-of-way at distances as close as 25 feet from the centerline. Although noise-sensitive land uses would be in close proximity to the trolley

tracks, as shown in Figure 7, vehicle traffic noise along the freeways would exceed 60 CNEL in the entire CPU area. The vehicle traffic noise would exceed the contribution of noise from trolley operations. However, although vehicle traffic would be the dominant noise source, trolley noise levels in close proximity to the tracks would contribute to the overall exterior noise level, and the combined vehicle traffic and trolley exterior noise levels could exceed the Land Use – Noise Compatibility Guidelines. As discussed above, future discretionary proposals within the CPU area would be required to conduct site-specific exterior noise analyses to demonstrate that the proposed project would not place sensitive receptors in locations where the exterior existing or future noise levels would exceed the Land Use – Noise Compatibility Guidelines. However, in the case of exterior noise impacts associated with ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts for ministerial projects located in areas where the noise level exceeds the applicable land use and noise compatibility level would be significant. As discussed above, interior noise impacts for both discretionary and ministerial projects would be less than significant because building permit applicants must demonstrate compliance with the relevant interior noise standards through submission and approval of a Title 24 Compliance Report. Therefore, interior noise impacts resulting from trolley operations would be less than significant.

The future Mid-Coast Trolley extension (Blue Line Trolley) is currently under construction along the western CPU boundary. Once constructed, this trolley extension would provide trolley service from the Old Town Transit Center to the University of California, San Diego and University Town Center along the rail corridor parallel to I-5. The closest station to the CPU area would be located at West Morena Boulevard and Tecolote Road. Sound level distances from future San Diego MTS Trolley service were derived from SANDAG's Noise and Vibration Impacts Technical Report for the Mid-Coast Corridor Transit Project (SANDAG 2014). Freight and passenger train noise levels were based on Amtrak, Coaster, and freight train assumptions provided by the Los Angeles–San Diego–San Luis Obispo (LOSSAN) Rail Corridor Agency (LOSSAN 2012). Based on these studies, it is anticipated that rail traffic would generate a noise level of 60 CNEL at approximately 270 feet from the railway centerline. However, no sensitive land uses exist or are proposed in the CPU area adjacent to the Blue Line Trolley extension. The area adjacent to the tracks is designated Open Space (San Diego River). Additionally, noise levels in the vicinity of the western CPU boundary are dominated by vehicle traffic noise from I-5 and I-8. There would be no noise impacts due to future Blue Line Trolley operations. The Mid-Coast Corridor Transit Project noise analysis also found noise impacts in this area to be less than significant (SANDAG 2014).

The planned Purple Line Trolley would provide a new north-south transit connection through the Stadium Specific Plan area and would generally parallel to I-15. It is anticipated that noise levels due to future Purple Line Trolley operation would be similar to noise levels from the Blue and Green Line Trolleys. Noise levels along I-15 would exceed 70 and 75 CNEL along the future Purple Line Trolley. As with the Blue and Green Line Trolley, vehicle traffic noise would exceed the contribution of noise from trolley operations. However, the exact alignment of the Purple Line Trolley is not known at this time, and it could be located in close proximity to noise sensitive land uses. As with the Green Line

Trolley, although vehicle traffic would be the dominant noise source, trolley noise levels in close proximity to the tracks would contribute to the overall exterior noise level, and the combined vehicle traffic and trolley exterior noise levels could exceed the Land Use – Noise Compatibility Guidelines, resulting in a significant impact.

7.3 Stationary Noise

A significant impact could occur if implementation of the CPU resulted in the exposure of people to noise levels that exceed property line limits established in the Noise Abatement and Control Ordinance of the SDMC. Stationary sources of noise include activities associated with a given land use. For example, noise sources from commercial land uses would include car washes, fast food restaurants, auto repair facilities, parking lots, and a variety of other uses.

Implementation of the CPU could result in pedestrian-oriented mixed-use areas and areas where residential uses could be located in proximity to commercial sites that could expose sensitive receptors to additional noise. The noise associated with these types of land uses is generally produced by pedestrian traffic, parking lot activity, and public gatherings, but could also include loading docks, mechanical equipment (such as HVAC equipment and generators), deliveries, trash-hauling activities, and customer and employee use of commercial facilities. Noise generated by residential or commercial uses is generally short-lived and intermittent, while noise generated by auto-oriented commercial and industrial uses is usually sporadic, highly variable, and spatially distributed.

The land uses proposed by the CPU would be similar to the land uses that currently exist in the CPU area, although with greater density. Because noise levels in the CPU area are dominated by vehicle traffic on freeways and heavily traveled area roadways, noise levels from stationary sources throughout the CPU area would not be expected to increase the hourly or daily average sound level with respect to current conditions. While noise-sensitive residential land uses would be exposed to noise associated with the operation of commercial uses, future projects would be required to show compliance with the Noise Abatement and Control Ordinance to ensure noise compatibility between various land uses. As detailed in Section 4.4, the City regulates specific noise level limits allowable between land uses including the requirement for noise studies, limits on hours of operation for various noise-generating activities, and standards for the compatibility of various land uses with the existing and future noise environment. Through enforcement of the Noise Abatement and Control Ordinance of the SDMC, impacts would be less than significant.

7.4 Construction Noise

A significant impact could occur if implementation of the CPU resulted in the exposure of people to significant temporary construction noise. Future development implemented under the CPU could result in a temporary ambient noise increase due to construction activities.

Although no specific construction or development is proposed at this time, construction noise impacts could occur as future development within the CPU area occurs. Due to the

developed nature of the CPU area, there is a high likelihood that construction activities would take place adjacent to existing structures and that sensitive receptors would be located in proximity to construction activities.

Construction noise typically occurs intermittently and varies depending upon the nature or phase of construction (e.g., demolition; land clearing, grading, and excavation; erection). Construction noise would be short term and would include noise from activities such as site preparation, truck hauling of material, pouring of concrete, and the use of power tools. Noise would also be generated by construction equipment use, including earthmovers, material handlers, and portable generators, and could reach high noise levels for brief periods.

As discussed in Section 6.4, hourly average noise levels would be approximately 83 dB(A) L_{eq} at 50 feet from the center of construction activity when assessing three pieces of common construction equipment working simultaneously. Noise levels would vary depending on the nature of the construction activities including the duration of specific activities, the equipment involved, the location of the sensitive receivers, and the presence of intervening barriers. Construction noise levels of 83 dB(A) L_{eq} at 50 feet would attenuate to 75 dB(A) L_{eq} at 120 feet. Therefore, significant impacts could occur if sensitive land uses are located closer than 120 feet of construction activities.

The City regulates construction noise through its Noise Abatement and Control Ordinance, which puts limits on the days of the week and hours of operation allowed for construction. The City also imposes requirements for building and grading permits related to construction noise. However, there is also a procedure in place that allows for a permit to deviate from the noise ordinance. Due to the highly developed nature of the CPU area with sensitive receivers potentially located in proximity to construction sites, there is a potential for the construction of future projects to expose existing sensitive receptors to significant noise levels. This would result in a potentially significant impact.

NOISE-1: Future discretionary projects within the CPU area shall implement the following measures to minimize short-term noise levels caused by construction activities. Measures to reduce construction noise shall be included in the contractor specifications and shall include, but not be limited to, the following:

- Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.
- Locate stationary noise-generating equipment (e.g., compressors) as far as possible from adjacent residential receivers.
- Acoustically shield stationary equipment located near residential receivers with temporary noise barriers.
- Utilize "quiet" air compressors and other stationary noise sources where technology exists.

- The contractor shall prepare a detailed construction plan identifying the schedule for major noise-generating construction activities. The construction plan shall identify a procedure for coordination with adjacent residential land uses so that construction activities can be scheduled to minimize noise disturbance.

- Designate a "disturbance coordinator" that shall be responsible for responding to any complaints about construction noise. The disturbance coordinator will determine the cause of the noise complaint (e.g., bad muffler, etc.) and will require that reasonable measures be implemented to correct the problem.

However, even with implementation of this mitigation, at the program level it cannot be known whether the noise reduction measures would be adequate to reduce noise levels to below a level of significance. Construction noise impacts would, therefore, be significant and unavoidable.

7.5 Vibration

As discussed, potential sources of ground-borne vibration could occur as a result of railway operations. For frequent events such as trolley operations, a vibration level of 65 VdB or less at buildings where vibration would interfere with interior operations (Category 1), a vibration level of 72 VdB or less at residential uses and places where people normally sleep (Category 2), and a vibration level 75 VdB or less at institutional uses with primarily daytime use (Category 3) would be considered acceptable (FTA 2018).

There are no Category 1, 2, or 3 land uses located within 600 feet of the right-of-way of the railway located at the western CPU boundary. Additionally, the Mid-Coast Corridor Transit Project noise and vibration analysis also found vibration impacts in this area to be less than significant (SANDAG 2014).

The east-west Green Line Trolley bisects the CPU area; however, no freight trains or larger commuter trains utilize this railway. Vibration levels were calculated using FTA methodology. Vibration levels are a function of trolley speed and distance to the nearest structure, among other factors. Table 13 summarizes the trolley vibration screening distances, and calculations are provided in Attachment 3. As discussed, portions of the Green Line Trolley tracks are on elevated structures and do not cause significant vibration impacts to adjacent development. Areas where noise- and vibration-sensitive uses are located the closest to the tracks (as close as 25 feet) are at the existing trolley stations. Because all trolleys stop at each station, trolley speeds approaching and departing from the stations would be very low and would not cause significant vibration levels over existing levels. These screening distances are therefore conservative.

Table 13 Trolley Vibration Screening Distances				
Trolley Speed (mph)	Vibration Level at 25 Feet (VdB)	Distance to (feet)		
		75 VdB (Category 3)	72 VdB (Category 2)	65 VdB (Category 1)
15	67	1	9	33
20	70	6	14	48
25	72	11	21	63
30	73	16	28	77
35	74	21	35	90
40	76	26	42	102
45	77	31	49	114

55	78	41	62	136
60	79	45	68	147
Source: Attachment 3.				

As discussed, the future Purple Line Trolley would run through the Stadium Specific Plan area. The exact alignment is not known at this time, however, vibration impacts and screening distances for the Purple Line Trolley are anticipated to be the same as those for the Green Line Trolley. Impacts would be less than significant; therefore, no mitigation measures are required.

8.0 Summary of Impacts and Mitigation

8.1 Increase in Ambient Noise

The CPU area is dominated by freeway noise. There are some roadway segments that experience noise level increases that are 3 dB or greater as shown in Table 10; however, due to the proximity to a freeway and its associated freeway noise, the actual increase in ambient noise levels attributable to the specified roadway would be less than 3 dB. Additionally, there are areas where there are no noise-sensitive land uses. A significant noise impact was identified adjacent to the following three roadway segments.

- Phyllis Place from Abbots Hill Road to I-805 Southbound Ramps

  Single- and multi-family residential uses are located towards the western terminus of Phyllis Place. Noise levels are dominated by vehicle traffic on I-805, with existing noise contours ranging from 65 to 75 CNEL. However, because noise levels due to vehicle traffic on Phyllis Place would increase from 57 to 69 CNEL and would result in a 3 dB increase in ambient noise levels even when taking existing traffic noise from I-805 into account, noise impacts would be significant.

- Bachman Place from Hotel Circle South to Lewis Street

  Residential, hospital, and hotel land uses are located adjacent to this segment of Bachman Place. Noise levels currently exceed the significance threshold of 65 CNEL, and future vehicle traffic would increase ambient noise levels by more than 3 dB. Noise impacts would be significant.

- Rancho Mission Road from San Diego Mission Road to Camino del Rio North

  Residential land uses are located adjacent to this segment of Rancho Mission Road. Existing noise levels due to I-15 would range from 65 to 75 CNEL. However, even when taking existing traffic from I-15 into account, future vehicle traffic noise along this roadway segment could increase by 3 dB. Noise impacts would be significant.

The increase in ambient noise levels adjacent to these three roadway segments would result in the exposure of existing noise-sensitive receptors to a significant increase in ambient noise levels, and impacts would be significant. Because the significant noise impacts are to existing homes and other noise-sensitive uses in an already urbanized area, there is no feasible mitigation. Thus, impacts to existing sensitive land uses would remain significant and unavoidable.

An existing regulatory framework and review process exists for new development in areas exposed to high levels of ambient noise. Site-specific noise analyses demonstrating that future development implemented under the CPU would not subject sensitive receptors to existing or future noise levels exceeding the General Plan's Land Use – Noise Compatibility Guidelines would be required as part of the review process for discretionary projects. With the implementation of these regulations and procedures, noise impacts applicable to new discretionary projects would be less than significant as exterior noise would be attenuated. However, in the case of ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts attributed to ministerial projects located in areas that exceed the applicable land use and noise compatibility level would be significant and unavoidable. Interior noise impacts for all projects, including ministerial projects, would be less than significant because building permit applicants must demonstrate compliance with the relevant interior noise standards through submission and approval of a Title 24 Compliance Report.

The proposed CPU includes a policy encouraging retrofitting of older structures with noise sensitive land uses with acoustically rated windows and doors featuring higher Sound Transmission Class ratings, which is a measure of exterior noise reduction performance. However, because not all existing noise sensitive land uses would be retrofitted, impacts to existing sensitive land uses would be significant and unavoidable. No feasible mitigation has been identified at the program level to reduce this impact to less than significant.

For future noise sensitive land uses, while some projects may adequately attenuate exterior noise, there could still be new noise sensitive land uses located in areas that would experience a significant increase in ambient noise levels exceeding the applicable Land Use

– Noise Compatibility Guidelines, and therefore impacts would be significant and unavoidable.

8.2 Land Use Compatibility

8.2.1 Vehicle Traffic Noise

Noise levels greater than 75 CNEL are generally considered incompatible for all land use types. Land uses located within 239 to 288 feet of I-5, 163 to 320 feet of I-8, 262 to 315 feet of I-15, 292 to 325 feet of I-805, and 190 to 262 feet of SR-163 would potentially be exposed to noise levels greater than 75 CNEL and would be considered incompatible. Implementation of the CPU would result in changes to the land uses, which would introduce new noise-sensitive land uses in areas exceeding the Land Use – Noise Compatibility Guidelines. Therefore, impacts associated with future development within these areas would be significant.

Future discretionary proposals within the CPU area would be required to conduct site-specific exterior noise analyses to demonstrate that the proposed project would not place sensitive receptors in locations where the exterior existing or future noise levels would exceed the Land Use – Noise Compatibility Guidelines of the General Plan Noise Element. Additionally, for all future projects located in areas where exterior noise levels exceed the Land Use – Noise Compatibility Guidelines as defined in the General Plan Noise Element, Table N-3, site-specific interior noise analyses demonstrating compliance with the interior standards of the General Plan would be required. These requirements for site-specific noise analyses would be implemented through submission of a Title 24 Compliance Report to demonstrate interior noise levels of 45 CNEL. Through implementation of this regulatory framework, exterior traffic noise impacts associated with new development requiring discretionary approvals and interior traffic noise impacts for both ministerial and discretionary projects would be less than significant.

However, in the case of exterior noise impacts associated with ministerial projects, there is no procedure to ensure that exterior noise is adequately attenuated. Therefore, exterior noise impacts for ministerial projects located in areas that exceed the applicable land use and noise compatibility level would be significant and unavoidable.

8.2.2 Trolley Noise

It is anticipated that noise levels due to future Purple Line Trolley operation would be similar to noise levels from the Blue and Green Line Trolleys. Noise levels along I-15 would exceed 70 and 75 CNEL along the future Purple Line Trolley. As with the Blue and Green Line Trolley, vehicle traffic noise would exceed the contribution of noise from trolley operations. However, the exact alignment of the Purple Line Trolley is not known at this time, and it could be located in close proximity to noise sensitive land uses. As with the Green Line Trolley, although vehicle traffic would be the dominant noise source, trolley noise levels in close proximity to the tracks would contribute to the overall exterior noise

level, and the combined vehicle traffic and trolley exterior noise levels could exceed the Land Use – Noise Compatibility Guidelines, resulting in a significant impact.

8.3 Stationary Noise

The land uses proposed by the CPU would be similar to the land uses that currently exist in the CPU area, although with greater density. Because noise levels in the CPU area are dominated by vehicle traffic on freeways and heavily traveled area roadways, noise levels from stationary sources throughout the CPU area would not be expected to increase the hourly or daily average sound level with respect to current conditions. While noise-sensitive residential land uses would be exposed to noise associated with the operation of commercial uses, future projects would be required to show compliance with the Noise Abatement and Control Ordinance to ensure noise compatibility between various land uses. As detailed in Section 4.4, the City regulates specific noise level limits allowable between land uses including the requirement for noise studies, limits on hours of operation for various noise-generating activities, and standards for the compatibility of various land uses with the existing and future noise environment. Through enforcement of the Noise Abatement and Control Ordinance of the SDMC, impacts would be less than significant.

8.4 Construction Noise

Although no specific construction or development is proposed at this time, construction noise impacts could occur as future development within the CPU area occurs. Due to the developed nature of CPU area, there is a high likelihood that construction activities would take place adjacent to existing structures and that sensitive receptors would be located in proximity to construction activities. The City regulates noise associated with construction equipment and activities through its Noise Abatement and Control Ordinance, which puts limits on the days of the week and hours of operation allowed for construction. The construction noise levels of 83 dB(A) L_{eq} at 50 feet would attenuate to 75 dB(A) L_{eq} at 120 feet. Therefore, significant impacts would occur if sensitive land uses are located closer than 120 feet of construction activities. The following mitigation measure would be implemented to address potential construction noise impacts:

NOISE-1: Future discretionary projects within the CPU area shall implement the following measures to minimize short-term noise levels caused by construction activities. Measures to reduce construction noise shall be included in the contractor specifications and shall include, but not be limited to, the following:

- Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.

- Locate stationary noise-generating equipment (e.g., compressors) as far as possible from adjacent residential receivers.

- Acoustically shield stationary equipment located near residential receivers with temporary noise barriers.

- Utilize "quiet" air compressors and other stationary noise sources where technology exists.

- The contractor shall prepare a detailed construction plan identifying the schedule for major noise-generating construction activities. The construction plan shall identify a procedure for coordination with adjacent residential land uses so that construction activities can be scheduled to minimize noise disturbance.

- Designate a "disturbance coordinator" that shall be responsible for responding to any complaints about construction noise. The disturbance coordinator will determine the cause of the noise complaint (e.g., bad muffler, etc.) and will require that reasonable measures be implemented to correct the problem.

Implementation of this mitigation measure would reduce construction-related noise impacts for future discretionary projects implemented under the proposed CPU. However, in the case of ministerial projects, there is no procedure to ensure that construction-related noise impacts are mitigated. Even with implementation of NOISE-1, significant construction noise impacts may still occur, therefore this impact would be significant and unavoidable.

8.5 Vibration

Potential sources of ground-borne vibration could occur as a result of trolley operations. Portions of the Green Line Trolley tracks are on elevated structures and do not cause significant vibration impacts to adjacent development. It should be noted that the areas where noise- and vibration-sensitive uses are located the closest to the tracks (as close as 25 feet) are at the existing trolley stations. Impacts related to trolley vibration associated with the Green Line trolley would be less than significant.

The future Purple Line Trolley would run through the Stadium Specific Plan area. The exact alignment is not known at this time, however, vibration impacts and screening distances for the Purple Line Trolley are anticipated to be the same as those for the Green Line Trolley. Impacts would be less than significant; therefore, no mitigation measures are required.

FHWA Existing and Future Vehicle Traffic Contour Distance Calculations

FHWA RD-77-108

Traffic Noise Prediction Model

Data Input Sheet

Project Name : Mission Valley CPU
Project Number : 7899
Modeled Condition : Existing

Surface Refelction: CNEL
Assessment Metric: Hard
Peak ratio to ADT: 10.00
Traffic Desc. (Peak or ADT) : ADT

Segment	Roadway	Segment From	Segment To	Traffic Vol.	Speed (Mph)	Distance to CL	% Autos	%MT	% HT	Day %	Eve %	Night %	K-Factor

FHWA RD-77-108
Traffic Noise Prediction Model
Predicted Noise Levels

Project Name : Mission Valley CPU
Project Number : 7899
Modeled Condition : Existing
Assessment Metric: Hard

				Noise Levels, dBA Hard				Distance to Traffic Noise Level Contours, Feet

FHWA RD-77-108
Traffic Noise Prediction Model
Predicted Noise Levels

Project Name : Mission Valley CPU
Project Number : 7899
Modeled Condition : 2050
Assessment Metric: Hard

Segment	Roadway	From	To	Noise Levels, dBA Hard				Distance to Traffic Noise Level Contours, Feet					
				Auto	MT	HT	Total	75 dB	70 dB	65 dB	60 dB	55 dB	50 dB

Subject: ESTIMATED NUMBER OF STUDENTS GENERATED BASED ON THE POTENTIAL FUTURE HOUSING CAPACITY OF THE PROPOSED MISSION VALLEY COMMUNITY PLAN UPDATE

Dear Ms. Pascual:

We are in receipt of your August 30, 2018 request for potential student generation information for the proposed Mission Valley Community Plan Update. In this letter we address your questions and provide requested information.

Existing Housing Units and Proposed Future Additional Housing Units

From information provided in your request, the number of existing housing units in the base year (2012) and the number of future additional housing units in the future buildout year (2050) have been determined. They are noted in Table 1.

TABLE 1. Number of Existing Housing Units and Proposed Future Additional Housing Units

Housing Type	Number of Existing Units (2012)	Number of Future Units (2050)	Change
Single Family	1	0	-1
Multi Family	11,243	39,157	27,914
Total	**11,244**	**39,157**	**27,913**

Estimated Student Generation

Student generation rates vary based on the type of project, number of units, bedroom mix, affordable or senior housing components, proximity to schools and other amenities, neighborhood, and other factors. There are not district standard or school-specific rates.

Typically, to provide student generation rates for a new residential development, we research similar nearby developments and their student generation rates, as a guide for how many students the new development may generate. This request, however, is not for a specific project, but rather for a potential increase in total housing units in a specific Community Plan Area at a future point in time. Many factors are not yet determined, such as the specific type of housing and bedroom mix that may be constructed.

Therefore, our best strategy to estimate the number of students potentially generated by future buildout of the Mission Valley Community Plan Area is to reference the number of existing housing units in the CPA and the number of students who reside in the CPA (based on San Diego Unified School District data) to determine current student generation rates. Since the base year is 2012, we use 2012-13 school year student numbers.

TABLE 2. Student Generation Rates from Existing Housing Units

Housing Type	Number of Existing Units (2012)	2012-13 students (K-5, 6-8, 9-12, and K-12)	Student Generation Rate
Single Family	1	None	None
Multi Family	11,243	K-5: 362 6-8: 103 9-12: 133 **K-12: 598**	K-5: 0.032 6-8: 0.009 9-12: 0.012 **K-12: 0.053**

Based on the information in Tables 1 and 2, potential student generation from future buildout of additional housing units as called for in the Mission Valley Community Plan update is shown in Table 3. The current rate is the low range and the high range is double the low range.

TABLE 3. Potential Student Generation Rates from Future Additional Housing Units

Housing Type	Number of Additional Housing Units	Estimated Student Generation Rates	Number of Potential Students
Single Family	None	Not applicable	Not applicable
Multi Family	27,914	K-5: 0.032-0.064 6-8: 0.009-0.018 9-12: 0.012-0.024 **K-12: 0.053-0.106**	K-5: 893-1,786 6-8: 251-502 9-12: 335-670 **K-12: 1,479-2,958**

A key assumption is future additional housing units will generate students at a rate similar to current housing units. If future additional housing units are significantly more attractive to families than the current housing is, the number of students could be higher than estimated.

The potential increase in students from the future additional housing units suggested in the Community Plan update is likely to impact district facilities to the point of reaching capacity. Measures such as reduction of non-resident students would need to be undertaken to ensure space is available for future resident growth. Attendance boundary changes may also be needed. In addition, San Diego Unified is planning a new elementary school within the Civita development, which will increase capacity.

Please keep us apprised of revisions to development plans as new information may result in changes to the information stated in this letter. Thank you.

Sincerely,

Sarah Hudson
Demographer

THE CITY OF SAN DIEGO

M E M O R A N D U M

DATE: November 29, 2018

TO: Elena Pascual, Environmental Planner, Planning Department

FROM: Khuram Shah, Associate Engineer, Long-Range Planning & Water Resources Division

SUBJECT: Water Supply Assessment for the Mission Valley Community Plan Update (IO #21004103))

In response to your request, please find attached a Water Supply Assessment (WSA) for the Mission Valley Community Plan Update approved by the Interim Director of Public Utilities Department.

The Public Utilities Department (Department) prepared this WSA to assess whether sufficient water supplied is, or will be, available to meet the projected water demands of the Project. The findings verify that there is sufficient water supply to serve the existing water demands, projected water demands, and future water demands of the Project within the Department's water service area, in normal and dry year forecasts during a 20-year projection.

Note that per California Water Code Section 10910, the formation adoption of the WSA is required by the San Diego City Council.

If you have any questions, please call me at (619) 533-4222.

KS/ks

Khuram Shah

Section 1 - Purpose

On January 1, 2002, Senate Bill 610 (SB 610) and Senate Bill 221 (SB 221) took effect. The intent of SB 610 and SB 221 was to improve the link between information on water supply availability and certain land use decisions made by cities and counties. Under SB 610 (codified in the Water Code beginning at Section 10910), a water supply assessment (WSA) must be furnished to cities and counties for inclusion in any environmental documentation of projects (defined in the Water Code) that propose to construct 500 or more residential units, or that will use an amount of water equivalent to what would be used by 500 residential units, and are subject to the California Environmental Quality Act (CEQA). Under SB 221, approval by a city or county of certain residential subdivisions requires an affirmative written verification of sufficient water supply or water supply verification (WSV).

Not every project that is subject to the requirements of SB 610 is subject to the mandatory water verification of SB 221. Conversely, not every project that is subject to the requirements of SB 221 is subject to SB 610.

A foundational document for compliance for both SB 610 and SB 221 is the Urban Water Management Plan (UWMP) of the relevant water agency. Both SB 610 and SB 221 identify the UWMP as a planning document that can be used by a water supplier to meet the standards set forth in both statutes. Thorough and complete UWMPs will allow water suppliers to fulfill the specific requirements of the two statutes. Cities, counties, water districts, property owners, and developers utilize their respective UWMPs when planning for and proposing new projects. It is crucial that cities, counties, and water suppliers work together when developing and updating these planning documents. The City of San Diego's 2015 UWMP was developed in collaboration with the San Diego County Water Authority (Water Authority) and adopted by the San Diego City Council in June 2016, and serves as the basis for this Water Supply Assessment Report (Report).

The City of San Diego Planning Department (Planning Department) requested that the City of San Diego Public Utilities Department (PUD) prepare this Report as part of the environmental review for the Mission Valley Community Plan Update Project (Project). A more detailed description of the Project is provided in Section 2 of this Report. This Report evaluates water supplies that are or will be available during normal, single-dry year, and multiple-dry water years during a 20-year projection to meet the projected demands of the Project, in addition to existing and planned future water demands of the PUD. This Report provides an assessment of the availability of water supplies for the Project only, and does not constitute approval of the Project.

This Report also includes identification of existing water supply entitlements, water rights, water service contracts, or agreements relevant to the identified water supply for the Project and quantities of water received in prior years pursuant to those entitlements, rights, contracts, and agreements.

This Report has been prepared in compliance with the requirements under SB 610 by the PUD in consultation with the Planning Department, the Water Authority, and the Metropolitan Water District of Southern California (MWD).

Section 2 - Project Description

The Mission Valley Community Plan Update Project (Project) encompasses an area of approximately five (5) square miles and is bounded by Friars Road and the northern slopes of the valley on the north, the eastern banks of the San Diego River on the east, the southern slopes of the valley on the south, and Interstate-5 on the west. The Project is bordered by several other community planning areas: Old Town San Diego, Uptown, Greater North Park, Normal Heights, Kensington-Talmadge, College Area, Navajo, Tierrasanta, Kearny Mesa, Serra Mesa, Linda Vista, and Mission Bay Park. The Project area is regionally accessible from Interstate-5, Interstate-8, Interstate-15, Interstate-805, and State Route-221. The Project vicinity map is shown in Figure 2-1.

FIGURE 2-1
VICINITY MAP OF PROJECT

The Project is a comprehensive update of the Mission Valley Community Plan, which was originally adopted in 1985 and has undergone over 20 amendments. The Project area is a regional center of offices, hotels, and retail businesses, with a growing residential community. The San Diego Rivers lies at the foot of the valley, flowing east to west.

The Project is anticipated to include policies and actions to foster a mixed-use, transit-oriented, and pedestrian-friendly Mission Valley community, promote additional housing, enhance the San Diego River, and provide additional open spaces.

Section 3 - Findings

Water Assessment

Project:
This Report identifies that the proposed water demand projections for the Project are included in the regional water resource planning documents of the City, Water Authority and MWD. Current and future water supplies, as well as actions necessary to develop the future water supplies, have been identified. This Report demonstrates that there will be sufficient water supplies available during normal, single-dry year, and multiple-dry water years over a 20-year projection to meet the unanticipated demands of the Project.

Based on the City's and Water Authority's respective 2015 UWMPs, there is sufficient water planned to supply the Project's estimated annual average usage (Table 3-1). The estimated water demands of the Project are 7,034,136 gallons per day (GPD), or 7,879.3 acre-feet per year (AFY). In the City's 2015 UWMP, the planned water demand of this project site is 7,344,053 GPD (8,226.4 AFY) in 2040. As such, there is no demand for use of the Accelerated Forecasted Growth (AFG), nor any net unanticipated demands for the Project.

TABLE 3-1
WATER DEMAND ANALYSIS

City Planned Water Demands for Project (2015 UWMP)			
Category	**Quantity** (units/employees)	**Estimated Potable Water Demand**	
		Gallons per Day (GPD)	**Acre-Foot per Year (AFY)**
SANDAG SERIES 13: 2040			
Multi-Family Units[1]	18,388	3,236,288	3,625.1
Single-Family Units[2]	1,688	607,005	679.9
Employees[3]	58,346	3,500,760	3,921.4
Total		**7,344,053**	**8,226.4**
Projected Water Demands for Community Plan Update by Year 2040			
Category	**Quantity** (units/employees)	**GPD**	**AFY**
Multi-Family Units[1]	20,076	3,533,376	3,957.9
Single-Family Units[2]	0	0	0
Employees[3]	58,346	3,500,760	3,921.4
Total		**7,034,136**	**7,879.3**
Net Water Demands			
Projected Demand		7,034,136	7,879.3
City of San Diego 2015 UWMP – Planned Demand		7,344,053	8,226.4
Water Authority AFG – Planned Demand		0	0
Net Unanticipated Demands		0	0

Table 3-1 Notes:

1. 80 gpcd is the standard for multi-family unit water consumption (includes small landscaping water demands). The standard for multi-family housing density is 2.2 persons per unit.
2. 116 gpcd is the standard for single-family unit water consumption (includes nominal landscaping water demands). The standard for single-family housing density is 3.1 persons per unit.
3. The utilization of 60 gallons per person per day is the standard for employment water use (includes nominal landscaping water demand).

Existing and Future Developments Planned to Occur by 2040:
The City's 2015 UWMP demonstrates there will be sufficient water supplies available to meet demands for existing and planned future developments that are projected to occur by 2040. Based on a normal water supply year, the estimated water supply projected in five-year increments for a 20-year projection will meet the City's projected water demand of 200,984 acre-feet[A] (AF) in 2020 to 273,408 AF in 2040 (**Table 6-6**) for these developments. Similarly, based on a single-dry year forecast (**Table 6-7**), the estimated water supply will meet the projected water demand of 290,292 AF (2040). Based on a multiple-dry year, third year supply (**Table 6-8**), the estimated water supply will meet the projected demands of; 208,665 AF (2020); 251,402 AF (2025); 275,139 AF (2030); 284,412 AF (2035); and 284,058 AF (2040).

Conclusion

In summary, these findings substantiate that there is sufficient planned water supply to serve this Project's future water demands within the PUD's water service area in normal, single-dry year, and multiple-dry water year forecasts.

Therefore, this Report concludes that the projected level of water demand for this Project is within the regional water resource planning documents of the City, Water Authority, and MWD. Current and future water supplies, as well as the actions necessary to develop these supplies, have been identified in the water resources planning documents of the PUD, Water Authority, and MWD to serve the projected demands of the Project, in addition to existing and planned future water demands of the PUD.

[A] An acre-foot of water equals 325,851 gallons, which is enough water for two (2) average families of four (4) for one (1) year.

Section 4 - City of San Diego Public Utilities Department

The City purchased its initial water system in 1901, from the privately owned San Diego Water & Telephone Company. Since then, continual expansion of the water system has been required to meet the demands of the growing population of the City. To meet the demand, the PUD purchased a number of reservoirs between 1913 and 1935 to supplement local water supplies. Despite low annual precipitation in the area (approximately 10 inches per year), these reservoirs supplied the City's growing demands until 1940.

The need to import water emerged with the increased demand generated by the presence of the United States Navy prior to and during World War II, and the ensuing population growth. As a result, the PUD and other local retail water distributors formed the Water Authority in 1944 for the purpose of purchasing Colorado River water from MWD. The PUD and other local retail water distributors began receiving imported water from the Colorado River in 1947.

Today, the PUD treats and delivers more than 162,000 AFY of water to approximately 1.39 million residents. The water system extends over 400 square miles, including 330 square miles in the City. The PUD potable water system serves the City and certain surrounding areas, including both retail and wholesale customers. The Project is located within the PUD's water service area.

In addition to delivering potable water, the City has a recycled water program. Its objectives are to: optimize the use of local water supplies, lessen reliance on imported water, and free up capacity in the potable system. Recycled water provides the City a dependable, year-round, locally produced and controlled water resource.

4.1 Overview of Potable System Facilities

The water system consists of: nine (9) raw water storage facilities with over 566,000 AF of storage capacity, three (3) water treatment plants, 29 treated water storage facilities, and over 3,295 miles of transmission and distribution lines.

The PUD maintains and operates nine (9) local surface raw water storage facilities, which are connected to the City's water treatment operations. The Lower Otay, Barrett and Morena Reservoirs (132,566 AF total capacity) service the Otay Water Treatment Plant (Otay WTP) in south San Diego; the El Capitan, San Vicente, Sutherland, and Lake Murray Reservoirs (396,357 AF total capacity) service the Alvarado Water Treatment Plant (Alvarado WTP) in central San Diego; and the Miramar Reservoir (6,682 AF total capacity) services the Miramar Water Treatment Plant (Miramar WTP) in north San Diego. Lake Hodges Reservoir has a total capacity of 30,632 AF and is connected to Olivenhain Reservoir, which is owned by the Water Authority. Olivenhain Reservoir is connected to the Water Authority's second aqueduct. Through this connection, Hodges water can be delivered to all City treatment plants. The City has the ability to access 50 percent of the local water available in Hodges Reservoir via the Water Authority's delivery system.

The PUD maintains and operates three (3) water treatment plants mentioned above with a combined total rated capacity of 423,637 AFY, or 378.2 million gallons per day (MGD). The Miramar WTP, originally constructed in 1962, has a rated capacity of 161,300 AFY (144 MGD), with the ability to increase to 240,830 AFY (215 MGD) in the future. Construction to replace the two (2) old clearwells at the plant began in June 2016, and is scheduled to be completed in August 2020. The Miramar WTP generally serves the City's geographical area north of the San Diego River (north San Diego). The Alvarado WTP, operational since 1951, had an initial

capacity rating of 134,417 AFY (120 MGD). Several hydraulic improvements and upgrades were completed in 2011, which increased the capacity of the plant to 224,028 AFY (200 MGD). The State Water Resources Control Board (SWRCB) has approved this rating for the Alvarado WTP. The plant generally serves the geographical area from National City to the San Diego River (central San Diego). The Otay Water Treatment Plant (Otay WTP) was constructed in 1940, and has a current rated capacity of 38,309 AFY (34.2 MGD). The Otay WTP has hydraulic capacity to increase to 67,209 AFY (60 MGD) in the future. Upgrade work was completed in 2012, including the construction of a third (3rd) flocculation and sedimentation basin, filter piping, and media improvements. The Otay WTP generally serves the geographical area bordering Mexico (south San Diego) and parts of the southeastern portion of central San Diego.

The PUD maintains and operates 29 treated water storage facilities including steel tanks, standpipes, concrete tanks and rectangular concrete reservoirs, with capacities varying from less than one to 35 million gallons.

The water system consists of more than 3,295 miles of pipelines, including transmission lines up to 84 inches in diameter and distribution lines as small as four (4) inches in diameter. Transmission lines are pipelines 16 inches and larger in diameter that convey raw water to the water treatment plants and convey treated water from the water treatment plants to the treated water storage facilities. Distribution lines are pipelines 16 inches and smaller in diameter that directly service the retail users connected to a meter. In addition, the PUD maintains and operates 49 water pump stations that deliver treated water from the water treatment plants to approximately 280,044 metered service connections in 129 individual pressure zones in the City's retail service area. PUD also maintains several emergency connections to and from neighboring water agencies, including the Santa Fe Irrigation District (connected to Miramar WTP), the City of Poway (connected to Miramar WTP), Olivenhain Municipal Water District (connected to Miramar WTP), the Cal-American Water Company (connected to Alvarado and Otay WTPs), Sweetwater Authority (connected to Otay WTP), and the Otay Water District (connected to Otay WTP).

4.2 Overview of Recycled System Facilities

The City's recycled water system consists of two (2) water reclamation plants with a combined total wastewater treatment capacity of 50,406 AFY (45.00 MGD), and three (3) recycled water storage facilities with over 12 million gallons of storage capacity, and more than 98 miles of transmission and distribution lines.

Located in the Miramar area, the North City Water Reclamation Plant (NCWRP) treats an average of 17,754 AFY (15.85 MGD) of wastewater, and has an ultimate treatment capability of 33,604 AFY (30.00 MGD). In fiscal year (FY) 2017, a total of 7,438 AFY (6.64 MGD) was beneficially reused. The PUD maintains and operates the Northern Service Area distribution system which consists of approximately 94.7 miles of recycled water pipeline, two (2) storage facilities (reservoirs), and two (2) pump stations. By the end of FY 2017, 704 meters were served by the recycled water distribution system. PUD staff continues to work with potential "in-fill" customers interested in using recycled water for irrigation and/or industrial purposes, who are located within close proximity of the recycled water distribution system.

Located at the end of Dairy Mart Road, near the International Border with Mexico, the South Bay Water Reclamation Plant (SBWRP) treats an average of 8,379 AFY (7.48 MGD) of wastewater. The SBWRP has a treatment capability of 16,802 AFY (15.0 MGD). In FY 2017, an average of 4,256 AFY (3.80 MGD) was beneficially reused. The PUD maintains and operates the Southern Service Area distribution system which consists of three (3) miles of recycled water

pipeline, one (1) storage tank, one (1) pump station and service to five (5) meters. Due to the limited size of the distribution system, the majority of the recycled water is sold to the Otay Water District.

Section 5 - Existing and Projected Supplies

The PUD relies on purchased water from a regional wholesale water provider, the Water Authority, as its major water supply source. The Water Authority is a public agency that is governed by its 24 member retail water agencies, including the City of San Diego. The Water Authority maintains a diverse portfolio of water supplies including purchases of imported water from a large wholesale water provider, the Metropolitan Water District of Southern California (MWD). The Water Authority, in turn, is a member agency of MWD and participates in its governance along with 25 other water agencies. The statutory authorities granted to the Water Authority and MWD, establish the scope of the PUD's entitlements to water. Due to the PUD's reliance on purchased water from these two (2) agencies, this Report relies and includes information on the existing and projected supplies, supply programs, and related projects of the Water Authority and MWD.

The City relies on the long-term water resources planning documents of the Water Authority and MWD to support the work on this Report. Each agency must update its Urban Water Management Plan every five (5) years. The 2015 UWMPs were completed and submitted to the State on July 1, 2016, and are the most current point of reference. The 2015 UWMP documents are available at the following websites and contacts:

San Diego County Water Authority – Contact:

http://mwdh2o.com/PDF_About_Your_Water/2.4.2_Regional_Urban_Water_Management_Plan.pdf

Until the 1990s, the Water Authority was 95 percent dependent on imported water supplies from MWD to meet demands in the San Diego region. In 1991, the Water Authority faced a potential 50 percent cutback in supplies from MWD that was abated by the "March Miracle" rains. Immediately following, the Water Authority embarked upon an aggressive water supply diversification strategy coupled with an aggressive water storage program that has resulted in much greater water supply reliability for the region. Additionally, MWD has increased its regional storage ten-fold, and has provided financial incentives towards local water supply development by its member agencies. A brief overview of MWD and the Water Authority, including the PUD relationship to these agencies, is included below.

A description of local surface and local recycled water supplies available to the PUD can be found in Section 5.4 of this Report.

5.1 Metropolitan Water District of Southern California

The MWD was created in 1928, under the authority of the Metropolitan Water District Act[B] (the "MWD Act"). MWD's primary purpose is to provide a supplemental supply of wholesale water for domestic and municipal uses to its constituent agencies. When MWD began delivering water, its service area consisted of approximately 625 square miles. Its service area has increased by 4,575 square miles since that time. The expansion is primarily the result of annexation of the service areas of member agencies.

Today, MWD's service area comprises approximately 5,200 square miles. It includes portions of six (6) counties: Los Angeles, Orange, Riverside, San Bernardino, San Diego and Ventura. There are 26 member agencies of MWD, consisting of 14 cities, 11 municipal water districts and the Water Authority. The Water Authority is MWD's largest customer, purchasing or exchanging 28.3 percent of all water flowing through MWD's system[C].

A Board of Directors, currently numbering 38 members, governs MWD. Each constituent agency has at least one (1) representative on the MWD Board. Representation and voting rights are based upon the assessed valuation of property within each constituent agency. The Water Authority has four (4) members represented on the MWD Board with 17.47 percent of the weighted vote. The total population of the MWD service area is currently estimated at more than 19 million people.

MWD's existing water supplies have been historically sufficient to meet demands within its service area during years of normal precipitation. Although MWD plans and manages reserve supplies to account for normal occurrences of dry conditions, regulatory actions, including, but not limited to, restrictions under the Federal and California Endangered Species Acts, have at times placed limitations on MWD's ability to provide water to its member agencies. Extreme drought conditions have also caused MWD supply restrictions occasionally.

In the future, population growth, regulatory restrictions, and other factors such as climate change could impact MWD's ability to supply its member agencies even in normal years. However, it is important to note that the cost of MWD's water supplies is approaching a point at which the development of local water supplies is increasingly cost-competitive. As such, major initiatives are underway by retail water agencies to develop local water supplies and reduce MWD deliveries. This suggests that a new scenario may be emerging in which MWD may have surplus water supplies on a more regular basis as its member retail water agencies increasingly roll off imported water supplies in favor of available, more reliable, local water supplies.

MWD Water Supply

The Water Authority has preferential rights to 18.42 percent of MWD's water supplies, which currently include water from its two (2) sources, the Colorado River and the State Water Project (SWP).

Colorado River Water

The Colorado River was MWD's original source of water after its establishment in 1928. MWD owns and operates the 242 mile-long Colorado River Aqueduct, which starts at Lake Havasu in Arizona, and terminates at Diamond Valley Lake in Riverside County.

[B] California Statutes 1927, Chapter 429, as reenacted in 1969 as Chapter 209, as amended
[C] http://www.mwdh2o.com/PDF_Who_We_Are/2015-MWD-Annual-Report-web.pdf, page 139

Under numerous compacts, federal laws, court decisions and decrees, contracts, and regulatory guidelines, collectively known as the "Law of the River," that govern the use of water from the Colorado River, California is entitled to 4.4 million acre-feet of Colorado River water annually. Additionally, California is entitled to one-half (1/2) of any surplus water that may be available for shared use with Arizona and Nevada as determined on an annual basis by the United States Secretary of the Interior. Under the priority system that governs the distribution of Colorado River water made available to California, MWD holds the fourth (4^{th}) priority right of 550,000 acre-feet per year, and a fifth (5^{th}) priority right of 662,000 acre-feet per year. MWD's fourth (4^{th}) priority right is within California's basic annual apportionment of 4.4 million acre-feet; however, the fifth (5^{th}) priority right is outside of this entitlement and is not considered a firm supply of water. MWD also retains a "call" on 100,000 acre-feet per year on water transferred to the Coachella Valley Water District and the Desert Water Agency, if needed, so long as they pay for the financial obligations associated with the water during the call period.

Several fish and other wildlife species either directly or indirectly have the potential to affect Colorado River operations, thus changing the amount of water deliveries to the Colorado River Aqueduct. A number of species that are on either "endangered" or "threatened" lists under the federal and/or California Endangered Species Acts (ESAs) are present in the area of the Lower Colorado River. MWD and other stakeholder agencies have developed a multi-species conservation program that allows MWD to obtain federal and state permits for any incidental take of protected species resulting from current and future water and power operations of its Colorado River facilities, and to minimize any uncertainty from additional listings of endangered species.

In order to maximize the potential for Colorado River supplies, MWD has established partnering opportunities with the Imperial Irrigation District to fund and implement a joint agricultural conservation program.

State Water Project

The State Water Project is owned by the State of California and operated by the State Department of Water Resources (DWR). The SWP's source waters originate in Northern California with water captured from the Feather River Watershed behind Lake Oroville Dam. The Oroville Dam releases water into the Feather River which is tributary to the Sacramento River, where it combines with other drainages from the western Sierras in the Sacramento-San Joaquin River Delta east of the San Francisco Bay Estuary. MWD receives water pumped from the Harvey O. Banks Pumping Plant in the southern portion of the Sacramento-San Joaquin River Delta, via the 444 mile-long California Aqueduct, to four (4) delivery points near the northern and eastern boundaries of MWD. MWD is one (1) of 29 agencies (Contractors) that have long-term contracts for water service from DWR, and is the largest agency in terms of the population served, the share of SWP water to which it is entitled, and the total amount of annual payments made to DWR. MWD's contract with DWR provides for the ultimate delivery of up to 1,911,400 acre-feet per year (46 percent of the total SWP entitlement). The SWP was originally intended to meet demands of 4.2 million acre-feet per year. Initial SWP facilities were completed in the early 1970s, and it was envisioned that additional facilities would be constructed as contractor demands increased. Several factors, including public opposition, increased costs, and increased non-SWP demands for limited water supplies, combined to delay the construction of additional facilities.

The quantity of SWP water available for delivery each year is controlled by hydrology, environmental and operational considerations. In addition to its importance to urban and agricultural water users, the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (Bay-Delta) is of critical ecological importance. The Bay-Delta is the largest estuary on the west coast of the United States and provides habitat for more than 750 plant and animal species. One-hundred-fifty (150) years of human activity have contributed to the destruction of habitat, the decline of several estuarine and anadromous fish species, and the deterioration of water quality. These activities include: increasing water demands from urban and agricultural uses, the dredging and filling of tidal marshes, the construction of levees, urban runoff, agricultural drainage, runoff from abandoned mines, and the introduction of non-native species, thus affecting the supply and reliability of this source.

California Water Fix

The California Department of Water Resources (DWR) is in the process of introducing a plan known as the *California Water Fix.* Which would construct 35 miles of twin tunnels capable of transferring 9,000 cubic feet per second of freshwater from three intake facilities north of the Delta to the expanded Clifton Court Forebay located south of the Delta. There two (2) pumping plants would be constructed to maintain optimal water levels in the forebay for the existing State Water Project (SWP) and Central Valley Project (CVP) pumping facilities to better facilitate water exports during times of large rain events.

The proposed project is expected to provide additional water supply reliability for water importers, although the benefits will still be weather dependent.

DWR has altered the operations of the SWP to accommodate species of fish listed under the ESAs. These changes in project operations have reduced SWP deliveries. The impact on total SWP operations attributable to the ESA listed Delta smelt and salmon species biological opinions combined is estimated to be one (1) million acre-feet in an average year, reducing SWP deliveries from approximately 3.3 million acre-feet to approximately 2.3 million acre-feet for the year under average hydrology. The reduction in SWP deliveries attributable to these biological opinions can vary greatly depending on the level of precipitation and are estimated to range from 0.3 million acre-feet during critically dry years to 1.3 million acre-feet in above normal water years.

The year 2016 proved to be an extremely difficult water year for California as it endured a fifth (5th) year of drought and record high temperatures.

On November 13, 2015, Governor Brown issued Executive Order B-36-15 calling for an extension of urban water use restrictions (based on Executive Order B-29-15) until October 31, 2016, should drought conditions persist through January 2016. The State Water Board modified the restrictions at its February 2, 2016 meeting to allow credit to a water agency's conservation standard for growth, climate and the development of local drought-resilient supplies, with a cap of eight (8) percent total credit. The City of San Diego was credited eight (8) percent for the development of desalinated seawater supplies at Carlsbad. As a result, San Diego's conservation standard was reduced from 16 percent to 8 percent – compared to 2013 water demands. On May 18, 2016 the State Water Board adopted a statewide water conservation approach that allowed urban water supplies to replace their previously assigned reduction target with a local stress test approach, if the supplier could show that they had at least a three (3) year water

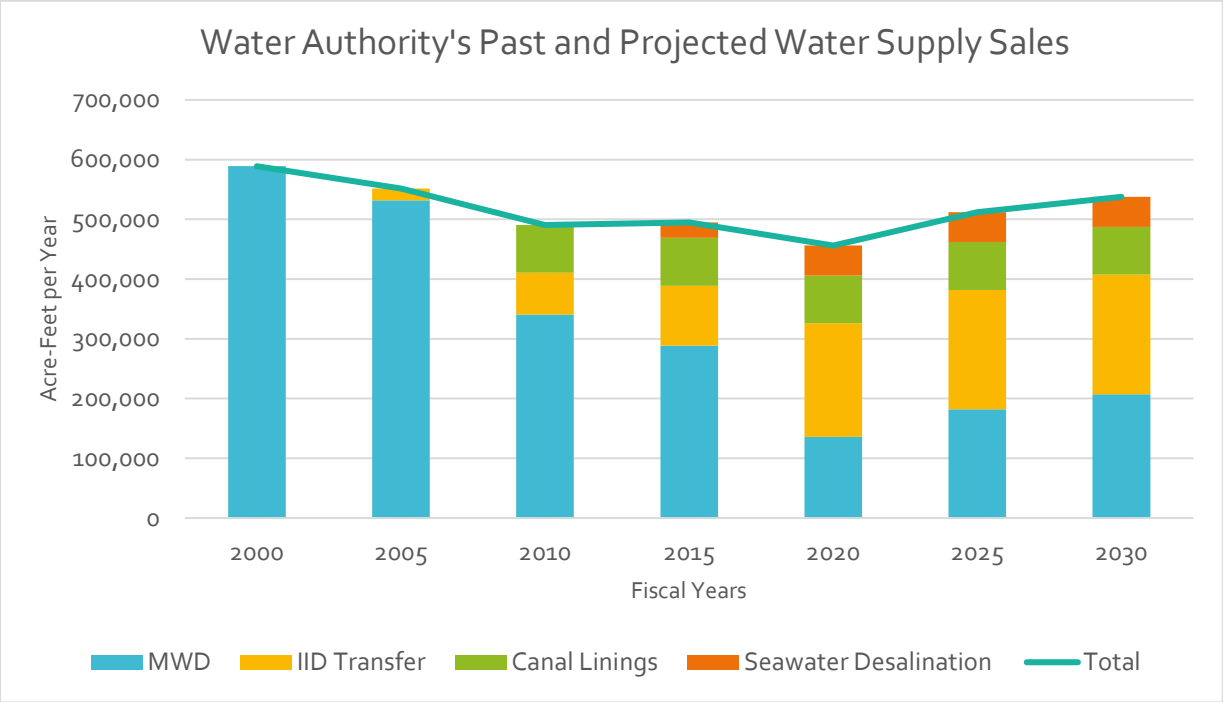
supply under extended drought conditions[D]. The City was able to meet the stress test analysis requirements and moved to a zero (0) percent conservation requirement by the State, but locally the City is still enforcing permanent restrictions and conservation as a lifestyle for residents.

The 2016-2017 water year has been unusually wet, with precipitation in most parts of the State trending at levels exceeding the wettest year on record. On January 18, 2017, Governor Brown declared a State of Flood Emergency in 50 counties, including San Diego, as a result of the immense and persistent rain events. On April 7, 2017 Governor Brown declared an end to the drought conditions in California with Executive Order B-40-17, which rescinded the State of Emergency proclamation for most counties[E]. Current prohibitions against wasteful water use practices and requirements for monthly water use reporting remain in place. Executive Order B-37-16 remains in effect and directed State staff to develop a report to the legislature entitled "Making Water Conservation a California Way of Life." The report[F] was finalized in April 2017 and was submitted to the legislature.

5.2 San Diego County Water Authority

The Water Authority service area lies within the foothill and coastal areas of the westerly third (3rd) of San Diego County, encompassing 952,208 acres (1,488 square miles). When the Water Authority was established in 1944, its service area consisted of 94,707 acres. Of the total population of San Diego County, 97 percent live within the Water Authority's service area. Growth has primarily resulted from the addition and annexation of service areas by member agencies. The City, with a population of approximately 1.38 million served, and a service area of 210,726 acres, is by far the Water Authority's largest member agency and customer.

The Water Authority's service area is a semi-arid region where the natural occurrence of water from rainfall and groundwater provides a firm water supply for only a small portion of the water demands of the current population. Since 1990, the Water Authority has provided an average of 85 to 91 percent of the water supply within its service area. As a wholesaling entity, the Water Authority has no retail customers, only water delivery, storage and treatment services to its member agencies.



The Water Authority's mission is to provide its member agencies with a safe and reliable water supply. Historically, the principal source of supply for the Water Authority's service area has been water purchased from MWD for sale to the Water Authority's member agencies. However, drought conditions and population growth in the Water Authority's service area have highlighted the need for diversification of the region's water supplies. Consistent with its mission statement, the Water Authority has actively pursued a strategy of supply diversification that includes the acquisition and importation of additional water supplies, the development of additional local water supply projects and augmentation of its water supply via local and regional water storage capacity – as seen in Figure 5-1.

[D] http://www.sdcwa.org/regional-supply-sufficiency

[E] The drought emergency was lifted in all of California counties except Fresno, Kings, Tulare, and Tuolumne, where emergency drinking water projects continue to help address diminished groundwater supplies.

FIGURE 5-1
WATER AUTHORITY'S HISTORIC AND PROJECTED WATER SALES

Sources: Water Authority's 2015 and 2007 Comprehensive Annual Financial Reports (CAFR) and 2015 UWMP

Water supplies utilized within the Water Authority service area originate from two sources: (1) water imported by the Water Authority that is either purchased directly from MWD or from proprietary sources of the Colorado River water that are transported via MWD's conveyance system, and (2) local supplies that are produced by the retail member agencies or is desalinated seawater purchased from Poseidon Water as part of the public-private partnership. Although MWD remains the Water Authority's largest source of water, recent years have also seen the diversification of sources of local and imported water, such that purchases of water from MWD are expected to decrease to represent only 10 to 15 percent of the region's water supply portfolio in 2021.

The Water Authority also invests in water conservation and orchestrates regional responses to drought emergencies. The 2016 demands for water purchased from the Water Authority dropped by 39 percent (or 250,000 AFY) from a high in 2007. As the State of California institutes a long-term framework for water-use efficiency in 2017, it is expected that per capita water use will remain lower than historical averages.

<u>The Quantification Settlement Agreement</u>
The Quantification Settlement Agreement (QSA) for the Colorado River was completed in October 2003. This historic agreement was enacted to help settle disputes regarding the persistent over-drafting of the state's 4.4 million acre-foot basic annual apportionment of Colorado River water. The agreement includes a long-term transfer of conserved water from the Imperial Irrigation District (IID) to the Water Authority. The QSA also commits the state to a restoration path for the environmentally sensitive Salton Sea and provides full mitigation for these water supply programs. Specific programs under the QSA that directly benefit the Water Authority include the Water Authority-IID water transfer agreement, which currently transfers 100,000 acre-feet of high priority Colorado River water to the Water Authority and

will provide up to 200,000 acre-feet of water a year through water conservation measures in Imperial Valley in 2021. The QSA also allows for the transfer of water from the IID for water conserved through the implementation of the Water Authority performed projects to install concrete linings on portions of the previously earthen All-American and Coachella Canals. The canal lining projects reduced the losses of water that historically occurred through seepage. MWD assigned to the Water Authority its right to develop approximately 77,700 acre-feet of conserved Colorado River water annually.

The QSA ensures that the San Diego region receives a minimum of 75 years of stable Colorado River water supplies. On November 5, 2003, the IID filed a validation action in Imperial County Superior Court, seeking a judicial determination that thirteen (13) agreements associated with the Water Authority-IID water transfer and the QSA are valid, legal and binding. Other lawsuits also were filed contemporaneously challenging the execution, approval and implementation of the QSA on various grounds. All of the QSA cases were coordinated in the Sacramento Superior Court. A final judgment, invalidating eleven (11) of the thirteen (13) agreements in Phase 1 of the trial, was entered on February 11, 2010, and subsequently appealed. On December 7, 2011, the Court of Appeal issued its opinion reversing the judgment and remanding to the trial court for further proceedings. The appellate Court decision resolved many issues in the case, including the validity and constitutionality of the QSA. A trial on compliance with the California Environmental Quality Act was held in November 2012. On June 4, 2013, the court validated the 2003 QSA and related 12 agreements regarding transfers and exchanges of Colorado River water between southern California water agencies. The IID, Coachella Valley Water District, MWD, and Water Authority all sought validation of the agreements from the court under California Water Code, Section 22762, and California Code of Civil Procedure, Section 860 et seq., quantifying the amount of Colorado River water each agency may divert and subsequently transfer. The court found the agreements to be valid and adopted in compliance with the requirements of the Brown Act and the California Environmental Quality Act (CEQA).

Conserved Water from Canal Lining Projects

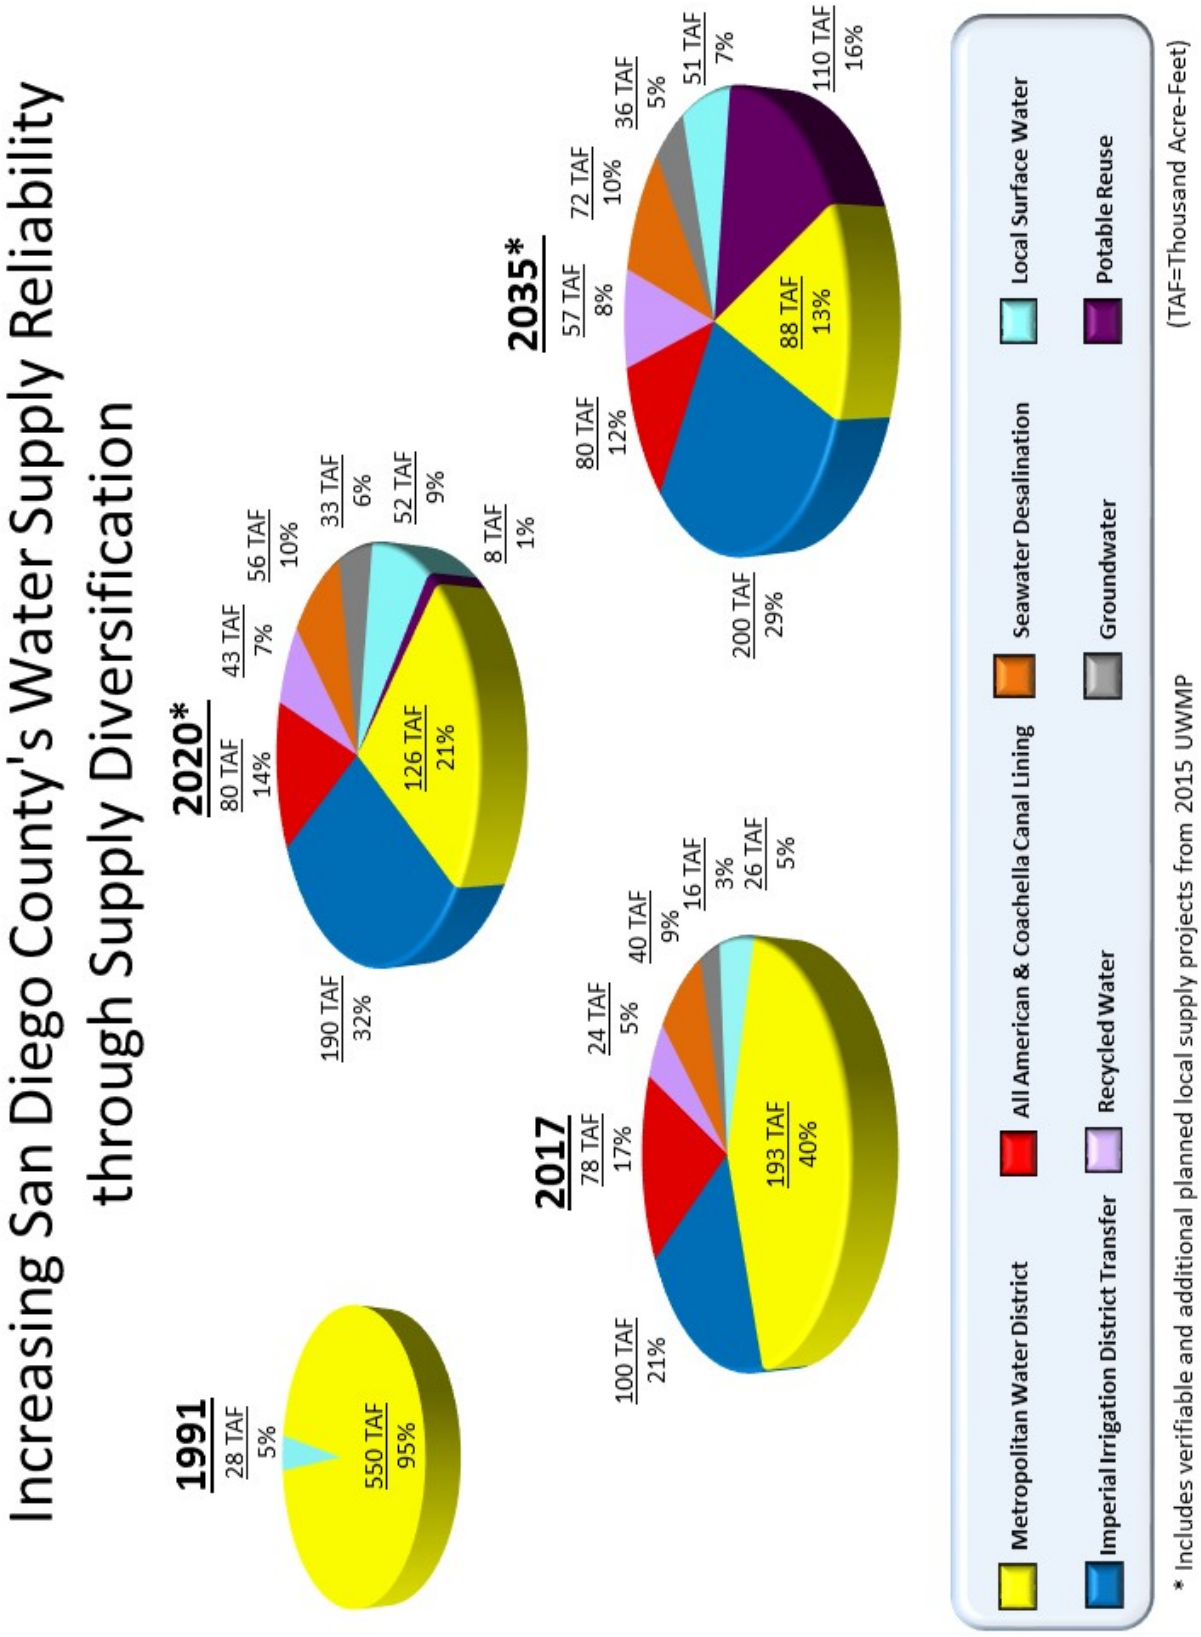
In 2003, as part of the execution of the QSA on the Colorado River, the Water Authority contracted for 77,700 AFY of conserved water from projects to line the All American Canal (AAC) and Coachella Canal (CC). Deliveries of this conserved water from the CC reached the region in 2007, and deliveries from the AAC reached the region in 2010.

Seawater Desalination

In late November 2012, the Water Authority's Board of Directors approved a 30-year Water Purchase Agreement with Poseidon Water, a private investor-owned company, to purchase water from the proposed Carlsbad Desalination Plant, which is a fully-permitted ocean desalination plant and conveyance pipeline. The plant began producing 50 MGD in December 2015, and is now operating at full-scale. The Water Authority has contracted to purchase between a minimum of 42,000 AFY and a maximum of 50,000 AFY while two of the Water Authority's retail member agencies (Carlsbad and Vallecitos MWD) have contracted to purchase 6,000 AFY, for a total available production of 56,000 AFY.

In addition to developing its own regional supplies of water, the Water Authority has also encouraged the development of additional local water supply projects such as water recycling and groundwater projects, through the award of Local Water Supply Development (LWSD) incentives of up to $200 per acre-foot for recycled water and groundwater produced and beneficially reused within the Water Authority's service area. The purpose of the Water Authority's LWSD program is to promote the development of cost-effective water recycling and groundwater projects that prevent or reduce a demand for imported water and improve

regional water supply reliability. The LWSD Program reimburses member agencies for all, or a portion of the difference between the actual per acre-foot cost of producing recycled water, and the revenue generated by the LWSD participant through the sale of that acre-foot of recycled water (not to exceed $200 per acre-foot). In February 2008, the program was expanded to include funding for local brackish and seawater desalination projects. However, funding for new LWSD program projects is no longer appropriated in the Water Authority's budget.



Emergency and Carryover Storage Programs

In addition to the region's investments in new supplies, the Water Authority has also undertaken a multi-phased Emergency Storage Program (ESP) aimed at increasing the amount of water available in storage to help attenuate dry year availability of water. In 2003, the Water Authority completed construction of a dam, creating the Olivenhain Reservoir that created 24,000 AFY of emergency storage capacity. In 2015, the Water Authority raised the City owned and operated San Vicente Dam, to increase emergency and carryover storage in the region by 176,000 acre-feet (AF). The additional in-region storage capacity will allow the Water Authority and its member agencies to be prepared for emergency conditions and also to buffer against dry year reductions in deliveries from imported supplies. Additionally, the Water Authority has rights to an additional 70,000 AF of groundwater storage in the Central Valley. These accounts with the Semitropic-Rosalind Water Bank Authority and the Semitropic Original Water Bank allow for annual withdrawals of 14,000 AFY.

As a result of the efforts undertaken by the Water Authority and its member agencies to diversify supplies and augment local storage, the region was able to certify supply sufficiency and achieve a zero percent conservation standard in response to the State Water Board's May 18, 2016 adopted rule requiring stress test analyses[E].

[G] http://www.sdcwa.org/regional-supply-sufficiency

FIGURE 5-2
SAN DIEGO COUNTY WATER AUTHORITY'S WATER SUPPLY DIVERSIFICATION

5.3 2009 Comprehensive Water Package

On November 4, 2009, the California State Legislature passed a comprehensive package of water legislation (the "2009 State Water Legislation") that included five (5) bills (four (4) of which were subsequently signed by Governor Schwarzenegger) addressing California's statewide water situation, with particular emphasis on the San Francisco Bay/Sacramento-San Joaquin-Delta (Bay-Delta). The 2009 State Water Legislation included an urban water conservation mandate of 20 percent for most localities in the State by 2020 (also known as the "20x2020 requirement"), and new regulations establishing strategic monitoring of groundwater levels around the state. The 2009 State Water Legislation also created two (2) new governmental agencies – the Delta Stewardship Council and the Sacramento-San Joaquin Delta Conservancy. The Delta Stewardship Council is charged with developing and implementing a Delta Plan, which would include the Bay Delta Conservation Plan, upon meeting certain conditions. The Sacramento-San Joaquin Delta Conservancy will implement ecosystem restoration activities in the Bay-Delta. In addition, the 2009 State Water Legislation included legislation addressing unauthorized Bay-Delta water diversions. At this time, it is not known what effect the 2009 State Water Legislation will have on future water supplies.

Additionally, the 2009 Legislation package included an $11.1 billion State general obligation bond measure. The water bond measure was originally certified to be on the State's 2010 ballot, but was subsequently pulled due to unfavorable public polling. That same bond measure was subsequently delayed twice. During the previous 2013-2014 legislative session, several bills were introduced with the intent of reducing and reconfiguring the dedicated expenditures in the original water bond measure. In late 2014, the legislature introduced the "Water Quality, Supply, and Infrastructure Improvement Act of 2014," which proposed a trimmed down version of the 2009 bond measure for a total of $7.5 billion. It was subsequently placed on the November 4, 2014 statewide ballot as Proposition 1, and approved by voters. Proposition 1 is a general obligation bond measure to fund a variety of state water supply infrastructure projects, such as public water system improvements, surface and groundwater storage, drinking water protection, water recycling and advanced water treatment technology, water supply management and conveyance, wastewater treatment, drought relief, emergency water supplies, and ecosystem and watershed protection and restoration. The bond funds will be distributed through a competitive grant process overseen by various state agencies, including the DWR, the SWRCB, and the California Water Commission. The State is in the process of developing and adopting guidelines for the various funding programs contained in Proposition 1. Some have been completed (such as the Water Recycling Funding Program/WRFP), and others are still in development (such as the Water Storage Investment Program/WSIP).

5.4 Public Utilities Department

The PUD currently purchases approximately 90 percent of its water from the Water Authority, which supplies the water (raw and treated) through two (2) aqueducts consisting of five (5) pipelines. While the PUD imports the majority of its water, it also uses four (4) local supply sources to meet or offset potable demands: local surface water, groundwater, conservation, and recycled water (Figure 5-2).

The adequacy of water supplies to serve existing and planned uses within the PUD's service area is demonstrated in the prior discussion on the water supply reliability of MWD and the Water Authority. The City has been receiving water from the Water Authority since 1947, and purchased between 155,300 and 228,300 AFY during the past 20 years. In FY 2017 water

purchases totaled approximately 162,100 AF. Depending on demands, growth and the success of local water supply initiatives, the volume purchases may remain constant, or increase to a projected maximum of 295,998 AFY in 2035 during normal years. For the purpose of this analysis the maximum is used.

5.4.1 Demonstrating the Availability of Sufficient Supplies

Imported Supplies

Section 5, Subdivision 11, of the County Water Authority Act, states that the Water Authority "as far as practicable, shall provide each of its member agencies with adequate supplies of water to meet their expanding and increasing needs." Depending on local weather and supply conditions, the Water Authority provides between 75 to 95 percent of the total supplies used by its 24-member agencies.

Local Surface Water Supplies

The PUD maintains and operates nine (9) local surface raw water storage reservoirs which are connected directly or indirectly to water treatment operations. In the San Diego region, approximately 13 percent of local precipitation produces surface run-off to streams that supply PUD reservoirs. Approximately half of this run-off is used for the municipal water supply, while the remainder evaporates during reservoir storage. In very wet years, the run-off remainder may spill over the reservoir dams and return to the Pacific Ocean. Average rainfall produces less than half (1/2) of the average run-off in San Diego. The local climate requires about average rainfall to saturate the soils sufficiently for significant surface run-off to occur. Therefore, most of the run-off to reservoirs is produced in years with much greater than average rainfall. Some flooding may occur even during average or below average rainfall years if the annual rainfall is concentrated in a few intense storms.

The use of local water is affected by availability and water resource management policies. The PUD's policy is to use local water first to reduce imported water purchases and costs. The PUD also operates emergency and seasonal storage programs in conjunction with its policy.

The purpose of emergency storage is to increase the reliability of the water supply system. This is accomplished by maintaining an accessible amount of stored water that could provide an uninterrupted supply of water to the City's water treatment facilities, should an interruption to the supply of imported water occur. The management of reservoirs is guided by Council Policy 400-04, which outlines the City's Emergency Water Storage Program. The policy mandates that the PUD store sufficient water in active, available storage to meet six-tenths (6/10) of the normal annual (7.2 months) City water demand requirements (conservation is not included). Active, available storage is that portion of the water that is above the lowest usable outlet of each reservoir.

The volume specific to the emergency storage requirement is adjusted monthly, based on the upcoming seven (7) months anticipated water demand. This results in a seasonally fluctuating emergency storage requirement, generally peaking in April and reaching its minimum in October. This seasonally fluctuating requirement makes a portion of the required emergency storage capacity available for impounding or seasonal storage.

The purpose of seasonal storage is to increase imported water supply. This is done by storing surplus imported water in the wet winter season for use during the dry summer season. This may also be accomplished by increased use of imported water in lieu of local water in the

winter when local water may be saved in reservoirs or groundwater basins for summer use. In addition to increased water yield, this type of seasonal operation also reduces summer peaking on the imported water delivery system.

Conservation

The PUD's Water Conservation Program is effective in promoting permanent water savings. Established by the City Council in 1985, the Water Conservation Program accounts for more than 31,240 acre-feet of potable water savings in FY 2017. This savings has been achieved by creating a water conservation ethic, adopting programs, policies and ordinances designed to promote water conservation practices, and implementing comprehensive public information and education campaigns.

The City offers a broad range of conservation methods to help meet the needs of our residential and commercial water customers. These include, but are not limited to, the following:

- Rebate programs for high efficiency toilets, washing machines and residential and commercial water saving devices
- Rebates for replacing grass with water wise landscapes, micro-irrigation systems and weather based irrigation controllers
- Rain barrel and downspout redirection rebates
- Graywater rebates
- Incentives to replace malfunctioning pressure regulating valves
- Indoor commercial water use surveys
- Residential interior/exterior and commercial landscape survey programs
- Public education and outreach

Research conducted by the City, the Water Authority, and the Water Research Foundation has shown that prior to the current drought, more than half (1/2) of residential water-use is outdoors. Therefore, the City implemented outdoor water conservation programs to focus on water efficient landscaping and irrigation management, which provides the best opportunity to achieve significant water savings.

Tools and services available for customers include:
Commercial and Residential Water Use Survey Programs: This service includes an account for all water-use on the property. The surveyor also checks to see if the irrigation system is functioning properly and for uniform coverage. On average, residential surveys result in a savings in water of 15 percent, while commercial surveys, depending on type of facility, can achieve 15 to 25 percent water savings.

Together with the Transportation & Storm Water Department, the PUD has implemented a popular rain barrel and downspout redirect rebate program. Rain barrels are used to collect rainwater from hard surfaces such as household rooftops, while downspout redirects are used to channel rain water to landscape areas rather than draining into the streets. When citizens install a rain barrel at their home, they are helping to maintain a healthy urban watershed by reducing the demand on the potable water system, while also reducing the amount of wet weather runoff that is collected and sent into the public storm water system.

San Diego Municipal Code (SDMC) 67.06 Water Submeters was adopted in April 2010, to encourage water conservation in multi-family residential and mixed use buildings by requiring the use of water submeters for each individual residential unit. Billing individual

residential units based on the actual amount of water consumed in the unit creates a financial incentive for residents of multi-family residential units to conserve water.

As discussed in Section 5.1, the SWRCB revised the City's conservation requirement in February and May 2016. However, the City continues to maintain an active water conservation program, which has consistently resulted in water savings when compared to the baseline usage in 2013.

Planning efforts to increase water conservation is an ongoing process. The aforementioned water conservation programs undergo periodic reevaluation to ensure the realization of forecasted savings. Additionally, changes in water conservation technologies may require reassessment of long-range plans. The PUD continues to work with proven water conservation programs, while including irrigation management programs to maximize water savings; regularly examines new technologies and annually assesses progress toward conservation goals; and, continues to work collaboratively with MWD and the Water Authority to formulate new conservation initiatives. The City's most recent water conservation report is available at http://www.sandiego.gov/water/pdf/purewater/2014/fy14annualwater140101.pdf. The report provides an ongoing assessment and status update, redirecting or enhancing efforts as needed.

Recycled Water Supplies

In FY 2017, the beneficial reuse of the recycled water was 11,317 AF (6,956 AF from the NCWRP and 4,361 AF from the SBWRP). Landscape irrigation continues to be the leading use of the recycled water. However, the customer base has become more varied over the years with an increase in the number of industrial and dual plumbed meter connections.

Proactive marketing activities targeting existing irrigation customers to encourage them to convert their cooling systems to recycled water, coupled with outreach efforts to connect new customers have been successful. Recycled water meter connections have increased over 63 percent over the last 10 years. By the end of FY 2017, the City is providing recycled water service to 704 retail meters and five (5) wholesale meter connections, including the City of Poway, Olivenhain Municipal Water District (three (3) connections) and Otay Water District. The FY 2017 top 10 retail customers included: the City's Park & Recreation Department, University of California San Diego (UCSD), Santaluz Golf Course, Miramar Marine Corps Air Station, El Camino Memorial Park, California Department of Transportation (Caltrans), Del Sur Community Home Owners Association (HOA), the Irvine Company, Qualcomm, and La Jolla Colony Association.

In FY 2017, financial incentives from the sale of recycled water resulted in over $2.06 million in savings towards imported water purchases. The financial incentives are a result of the Local Water Supply Development Program and the Local Resources Program agreements with the Metropolitan Water District and the San Diego County Water Authority.

The PUD, in cooperation with the Park & Recreation Department, has aggressively pursued the retrofitting of City parkland, street landscaping and open space to use recycled water for irrigation. Sites fronting recycled water distribution pipelines were targeted. By the end of FY 2017, the number has grown to 110 meter connections.

Groundwater Supplies

There are several groundwater basins in the San Diego region that PUD is planning to develop or is developing for municipal water supply or other beneficial use. Due to the recent addition of groundwater to PUD's water diversification portfolio, the annual groundwater that can be beneficially used is 500 AFY, which began in the year 2010 and has remained constant since. Currently, this usage is estimated to remain constant into the future.

Public Utilities Department's Capital Improvement Program

The PUD reevaluates the Water projects contained in the Capital Improvements Program (CIP) and the timing thereof periodically. Changes to the CIP are made to reflect changing priorities within the water system and occur as a result of project scope changes, date revisions, project sequencing, and operational considerations. The PUD expended approximately $920 million from July 1, 2008 through June 30, 2017 on CIP projects. Improvements included projects to upgrade and expand water treatment plants, rehabilitate raw and treated water storage facilities, construct major transmission pipelines, replace and/or upgrade existing pump stations, replace cast iron water mains citywide, expand the recycled water system, and other new supply initiatives. In November 2015, the City Council adopted water rate increases of 9.8 percent that began on January 1, 2016, and subsequent water rate increases for the next five (5) years. For Fiscal Year 2017, water rates will increase by 6.62 percent over the 12-month period. These rate increases will provide needed revenue to fund the upgrade and expansion of the water system in order to ensure a reliable water supply for all City residents, and to meet the SWRCB mandates.

The PUD updated the Water Facilities Master Plan in December 2015, and has identified 93 projects through the master planning effort for CIP implementation from fiscal years 2016-2035. The prioritization of CIP projects is based on City Council Policy 800-14.

Summary of Supplies

Historic imported water deliveries from the Water Authority to the PUD and local surface water, groundwater, conservation savings and recycled water deliveries are shown in **Table 5-1.**

Table 5-1
Historic Imported, Local and Recycled Water Demands*
Public Utilities Department

Fiscal Year	Imported Water (acre-feet)	Local Surface Water (acre-feet)	Conservation[1] (acre-feet)	Recycled Water (acre-feet)	Groundwater (acre-feet)	Total[2] (acre-feet)
1990	233,158	22,500	-	-	-	255,658
1995	162,404	59,024	8,914	-	-	230,342
2000	207,874	39,098	17,410	3,250	-	267,632
2005	204,144	26,584	29,410	4,294	-	264,432
2010	188,337	13,117	34,317	12,173	500	248,444

Table 5-1 Notes:
[1]Conserved water results in savings and is not a direct supply.
[2]Total includes water supplied and conserved.
*Includes retail and wholesale demands.

5.4.2 Plans for Acquiring Additional Supplies

Future Supplies

On December 10, 2013, the City Council approved 2012 Long-Range Water Resources Plan (2012 LRWRP), which is a high level strategy document that evaluates water supply and demand-side objectives against multiple planning objectives. The 2012 LRWRP was crafted based on a stakeholder-driven process that evaluated over 20 water supply options such as water conservation, recycled water, groundwater storage, brackish groundwater desalination, rainwater harvesting, graywater and potable reuse. The plan takes a long-range viewpoint through the year 2035 in addressing risk and the uncertainty of future water supply conditions. It is a plan that sets the tone or direction of where the City places its efforts in developing local water supplies.

Conservation and water recycling programs have been implemented and are under investigation for ways to be expanded or increased. The PUD is also actively developing groundwater resources and potable reuse.

Conservation

Like many agencies in California, the City is committed to reducing its per capita water consumption by at least 20 percent by the year 2020. Aside from the existing programs listed in Section 5.4.1 of this report, the City is also implementing the following programs to help reduce overall water consumption:

Conservation-oriented rate structures: A new rate structure, which took effect in January 2014, added a fourth (4^{th}) new tier for single-family residential customers that recognizes water conservation efforts, and increases the rates for higher tiers to discourage high volume usage. The City Council voted to maintain this four (4) tier residential rate structure through FY 2019.

Advanced Metering Infrastructure (AMI): The PUD has completed the installation of a citywide AMI fixed network, and the installation of all AMI meters is expected to be completed by February 2018. Data from the AMI system/endpoint became available to customers and customer service staff in July 2016. This information gives customers an additional tool to manage their water use and help detect leaks.

Potable Reuse / Pure Water San Diego

The City has taken multiple actions in recent years to investigate and expand its recycled water use. Based on the past recycled water investigations, the City has developed long-term water resources strategies that recommended the maximization of recycled water to be most cost-effectively achieved through potable reuse.

Potable Reuse is an approach the City is considering for maximizing the use of recycled water. Recycled water that is used for non-drinking uses, like irrigation and industrial processes, would undergo advanced water purification (AWP) to render it safe for reuse as a drinking water supply. The City's specific AWP process uses multiple treatment barriers to remove contaminants from the water and prevent them from re-entering the water supply. It begins with ozonation, biological filtration, membrane filtration, followed by reverse osmosis, and ends with advanced oxidation. The result is purified water that meets all drinking water standards, and is similar in quality to distilled water.

There are two (2) types of potable reuse: Indirect Potable Reuse (IPR) and Direct Potable Reuse (DPR). With IPR, the purified water is sent either a reservoir or groundwater basin, both of which act as an environmental buffer. The City's concept is to send the water to a reservoir and subsequently treat it at a drinking water treatment plant before distributing for drinking purposes. Direct potable reuse differs in that there is no environmental buffer, and instead, additional treatment above and beyond the AWP process would provide the buffer. In 2016, the SWRCB determined that it is feasible to establish uniform DPR criteria, but further research is still needed to set actual criteria. The research is currently being done, and the City will continue to monitor how future DPR regulations might influence potable reuse implementation.

The City's Water Purification Demonstration Project (2013) showed that IRP with reservoir augmentation (IPR/RA) is feasible and would create a local and sustainable source of water for San Diego. City Council unanimously adopted the final project report in April 2013; the report is available at the following link: www.purewatersd.org/projectreports. The City Council also directed staff to develop an implementation plan and schedule that considers potable reuse options for maximizing local water supply and reduced flows to the PLWTP. The plan is being implemented as the Pure Water San Diego Program (Pure Water) and will deliver 83 million gallons per day (MGD) of water by 2035; this will be a third of the City's water need. Pure Water will be built in phases. In Phase 1 a new Pure Water facility will be built at North City and produce 30 MGD of purified water to be conveyed to the Miramar Reservoir. The water will be treated at the adjacent Miramar Water Treatment Plant before being distributed. Phase 1 will be online in 2021.

Pure Water's remaining 53 MGD will be produced all in the central area of the City, or both the central and southern areas. Under all scenarios the water will be treated again at a drinking water plant before being distributed for consumption.

The City's application for a modified National Pollution Discharge Elimination Permit (modified permit) for the PLWTP was received by the USEPA and the Regional Water Quality Control Board (RWQCB) in January 2015. The current permit expired on July 31, 2015. In the interim, regulators administratively continue the present permit until final action on the renewal is taken. In October, 2016, the USEPA announced their tentative decision to approve the renewal of the modified permit. This action initiated the public hearing process that culminates in a final decision. Following several public meetings, RWQCB approved the modified permit in April 2017, citing the benefits of Pure Water as a new source of potable water, while also reducing the discharge to the ocean. Thereafter the California Coastal Commission also approved the permit in May 2017. During the summer of 2017 the USEPA will be dealing with the required consultations with National Marine Fisheries and anticipates signing the permit in August 2017. The new permit should be effective in September 2017 and would be in place for the following five (5) years.

Pure Water is integral to both the application to renew PLWTP's permit and the proposed permanent solution for future permits to be considered a secondary equivalent.

Groundwater

There are several groundwater basins in the San Diego region that the City has water rights, concerns, jurisdiction and an interest in developing for municipal water supply or other beneficial use. These basins are:

- San Pasqual Valley Basin
- Mission Valley Basin
- San Diego River Valley Basin (also known as Santee/El Monte Basin)
- Coastal Plain of San Diego (formerly known as the San Diego Formation, which includes the Sweetwater Valley Basin, Otay Valley Basin, and Tijuana Basin)[F]

The City of San Diego is committed to protecting its groundwater resources and preserving its established Pueblo water rights throughout the San Diego River Valley Basin and in the Coastal Plain of San Diego, which extend outside the municipal boundary. This right attaches to it, the use of all surface waters and groundwater of the streams that flowed through the original pueblo, including their tributaries, from their source to their mouth. The City's Pueblo right protects its ability to extract water from the basin to the extent of the needs of its inhabitants.

The City is currently finalizing several CIPs to utilize basin groundwater, which confirms the City's intent to develop and assert its right to develop any and all available groundwater needed for its inhabitants. The location of groundwater wells throughout the City's aforementioned basins can also be viewed as evidence of the City's intent, ability and on-going efforts to develop basin groundwater resources.

The groundwater quality from these basins is predominantly brackish. Technological improvements over the last few decades have enhanced the treatability of certain water sources, such as brackish groundwater, and reduced the associated costs. As mentioned previously, groundwater development is part of the City's planning and CIP efforts and remains a viable and economic water resource. Local water supply projects, particular groundwater supply exploration, offer multiple benefits to City rate payers; including, protection against drought, interruptions in imported water supplies, and local control.

Furthermore, the Sustainable Groundwater Management Act (SGMA) of 2014 provides a framework for sustainable management of groundwater supplies by local authorities. Under guidance of DWR, local agencies involved in SGMA implementation were required to form local groundwater sustainability agencies (GSAs) for each basin by June 2017.

The City has two groundwater basins that need to be effectively managed by forming a GSA and that are governed by SGMA legislation: San Pasqual Valley Groundwater Basin and the San Diego River Valley Groundwater Basin. On June 27, 2017, City Council approved forming a GSA and the preparation of a Groundwater Sustainability Plan (GSP) for each basin to comply with the requirements of SGMA. The GSPs must be adopted by 2022. By 2040, groundwater agencies in critically overdrafted basins should achieve sustainable groundwater management

[H] As part of the Sustainable Groundwater Management Act of 2014, a "Basin Boundary Modification" was submitted to the California Department of Water Resources (DWR) in 2016 requesting a modification to the boundaries of the Sweetwater Valley, Otay Valley, and Tijuana Valley groundwater basins as defined by DWR Bulletin 118. The requested Modification was approved in October 2016, and the three (3) basins were consolidated to include the whole of the underlying San Diego Formation aquifer as a 'new' groundwater basin – referred to as the "Coastal Plain of San Diego."

to avoid undesirable results, such as chronic depletion of groundwater, reduction of groundwater storage, degradation of water quality, depletion of surface water, or subsidence.

In general, the groundwater basins in the San Diego region are characterized by stable groundwater levels, with a notable exception in the San Pasqual Valley Basin. Groundwater quality in the San Diego region is often brackish, with total dissolved solids, chloride, and sodium impairing its use as a potable supply.

Groundwater Basin Descriptions

San Pasqual Valley Basin
The San Pasqual Valley Basin is an alluvial aquifer that underlies the designated agricultural preserve San Pasqual Valley. San Pasqual Valley Basin is valued for its groundwater and surface water resources. Nearly all the land overlaying San Pasqual Valley Basin is owned and managed by the City. Much of this property is leased to individuals for various agricultural and commercial land uses. The San Pasqual Valley Basin is located approximately 25 miles northeast of downtown San Diego. The total surface area of the groundwater basin is approximately 4,540 acres, with storage capacity of 58,000 acre-feet, and a safe yield of approximately 5,800 acre-feet per year.

The City is the Monitoring Entity for the San Pasqual Valley Basin as identified by the California Statewide Groundwater Elevation Monitoring (CASGEM) program. Working cooperatively with the DWR, the City established a network of monitoring wells for CASGEM to regularly and systematically track seasonal and long-term trends in groundwater elevations for this alluvial groundwater basin. Included in the monitoring network plan are three (3) multi-level monitoring wells that were installed by the United States Geological Survey (USGS) under a cooperative agreement with the City. Participation in the statewide CASGEM program allows basin groundwater data to be maintained and readily available through DWR's public data base.

The City has completed several feasibility studies to understand the enhancement of the long-term sustainability and quality of surface and groundwater within the basin. Currently, the City is exploring synergistic opportunities for regional water use amongst North County agencies and water districts surrounding the San Pasqual Valley Basin. The City continues to explore opportunities for protecting the groundwater resources for beneficial uses, including: water supply, agriculture, and the environment.

Mission Valley Basin
The City has been investigating the Mission Valley Basin. Topographically, Mission Valley is a narrow, east-west trending valley carved out by the San Diego River as it drains westward from Mission Gorge to the Pacific Ocean. The most conducive portion of the aquifer lies within the extent of a historical well field where the City has retained ownership of the property and where a substantial portion is overlain by Qualcomm Stadium and its parking lot.

In 1963 a fuel tank farm was built in Mission Valley at the mouth of Murphy Canyon, known as Mission Valley Terminal (MVT). Underground fuel contamination was suspected to begin in 1986. From 1986 to 1991, approximately 200,000 gallons of gasoline was released underground from the MVT located upstream of Qualcomm Stadium and contaminated the aquifer. The contamination extended from the tank farm, beneath Qualcomm property, to approximately where Interstate 805 crosses the San Diego River. Although remediation of the Mission Valley Basin had been ongoing for a period of time prior to the fuel tank contamination spill, the City had been waiting for the remediation to be completed by the

litigation settlement before moving forward with any plans for development in the Basin. Since the settlement agreement for the contamination was finalized in June 2016, the City has resumed its plans for development of the aquifer for municipal supply.

The basin is currently classified as a low priority on DWR's Basin Priority List. The City, in coordination with the USGS, installed a monitoring well in 2004. Following this installation, the City installed several additional monitoring wells in 2011 to gather hydrogeological and water quality data.

San Diego Valley Basin (also known as Santee / El Monte Basin)
The City has been producing groundwater from the San Diego River Valley Basin, which is located in the upper reach of the San Diego River. The City's existing San Vicente Production Well was constructed in 2004 and pumps a maximum of 600 gallons per minute. The well conveys groundwater directly to the City's existing raw water line and ultimately to the City's Alvarado Treatment Plant. The City is evaluating the expansion of groundwater facilities near the San Vicente Production Well, in addition to a well downstream of El Capitan Reservoir.

Similar to the San Pasqual Valley Basin, the City is the approved Monitoring Entity for the DWR's CASGEM program for the San Diego River Valley Basin. In July 2015, a Memorandum of Understanding establishing a Voluntary Cooperative Groundwater Monitoring Association was executed with Padre Dam Municipal Water District, Lakeside Water District, and Helix Water District. On file with DWR is an approved San Diego River Valley Basin monitoring plan.

Coastal Plain of San Diego (formerly known as the San Diego Formation)
The Coastal Plain of San Diego is a groundwater basin covering much of National City and the City of Chula Vista in the southern portion of San Diego County. The Coastal Plain of San Diego is a confined groundwater basin that underlies the Otay Valley Basin, Sweetwater Valley Basin, and Tijuana Basin as identified by DWR in Bulletin 118. The City desires to use the Coastal Plain of San Diego for groundwater municipal supply and seeks to manage the safe yield of the groundwater system in a prudent and efficient manner.

The City has been investigating the Coastal Plain of San Diego for many years to gain a better understanding of the Basin and its possibilities. The City has been better able to characterize the water quality and quantity in the Coastal Plain of San Diego through aquifer testing and monitoring well installation that has occurred since 2007. In addition, the City has been working with the USGS to develop an integrated and comprehensive understanding of the geology and hydrology of the Coastal Plain of San Diego, and to use this understanding to evaluate a sustainable, long-term environmentally sound use of the basin for municipal supply.

In 2013, Sweetwater Authority reached an agreement with the City to share potable water from the Richard A. Reynolds Desalination Facility, after its expansion, and jointly fund the project. The Expansion Project, completed in June 2017, increased the capacity of the brackish groundwater desalination facility from 3,600 AFY to 8,800 AFY. Under the terms of this agreement, the City receives 50 percent of any water produced over 3,600 AFY at the facility. Beginning in 2020, the projected volume will be approximately 2,600 AFY. Even with the projected supply reaching 2,600 AFY, the City is assumed to average 1,900 AFY. Sweetwater Authority is responsible for owning, and operating the brackish groundwater desalination facility.

Section 6 - Projected Demands

Approximately every three (3) years the PUD calculates projected water demands within its service area for planning purposes. A computer model is used (IWR-MAIN) to break down water-use by four (4) major sectors: commercial, industrial, residential and public uses. Using past water-use data from the PUD and demographic data provided by SANDAG land use, the model is able to correlate the data to determine sector water demands. Using this correlated data, forecasted demographic data is used to project water demands. The model also accounts for water conservation, weather and water rate changes.

In addition to the PUD, the Water Authority and MWD use regional growth forecasts to calculate projected water demands within their respective service areas. This provides for consistency between the retail and wholesale agencies projected water demands, thereby ensuring that adequate supplies are being planned for the PUD's existing and future water users. The SANDAG forecasts are based on adopted community plan land use, but not citywide zoning. SANDAG forecasts the number of residents, dwelling units, and employees in an area, but not square footage, hotel rooms, or visitors (non-residents or non-employees). For urban areas the smallest forecast geography is typically at the block level, but the forecast geography can be larger for suburban and less developed areas. SANDAG typically updates the regional growth forecast every three (3) to four (4) years.

The PUD water demand projections, based on the SANDAG Series 13 Forecast land use, are incorporated in the City's 2015 UWMP, which is updated every five (5) years. The 2015 UWMP was completed and adopted in June 2016. The time extension was mandated by Assembly Bill 2067 and implemented by DWR.

The projections with the City's 2015 UWMP were forwarded to the Water Authority for use in the preparation of the Water Authority's UWMP, which is subsequently incorporated into MWD's UWMP to calculate the ultimate water demands of the region (**Figure 6-1**).

Recently, water demands for the City have been greatly suppressed due to mandatory water use restrictions and public education that were put in place by the City as a result of the current statewide mandate for conservation in response to emergency drought conditions. Because of these suppressed demands, the City developed near-term water demand projections for its 2015 Cost of Service Study, which was needed to set water rates through 2020.

A method was developed to bridge the gap between the short-term water demand projections and long-term water demand forecast. This method assumes that once mandatory water use restrictions are lifted, water demands would return to pre-drought (2008) levels within fifteen (15) years. In past droughts, it took 5 to 7 years for water demands to return to pre-drought levels; but because of the severity of the current drought it was assumed that it will take longer for the bounce back in water demands to occur.

The demands from the 2015 UWMP are used throughout this Report. The historical and projected water demands for a normal year are shown in **Table 6-1.**

As part of the requirement for complying with SB 610, Table 6-7 and Table 6-8, show the single-dry year and consecutive multiple-dry year demands. All tables in this section are based on data from the 2015 UWMP.

FIGURE 6-1
WATER DEMAND PROJECTIONS

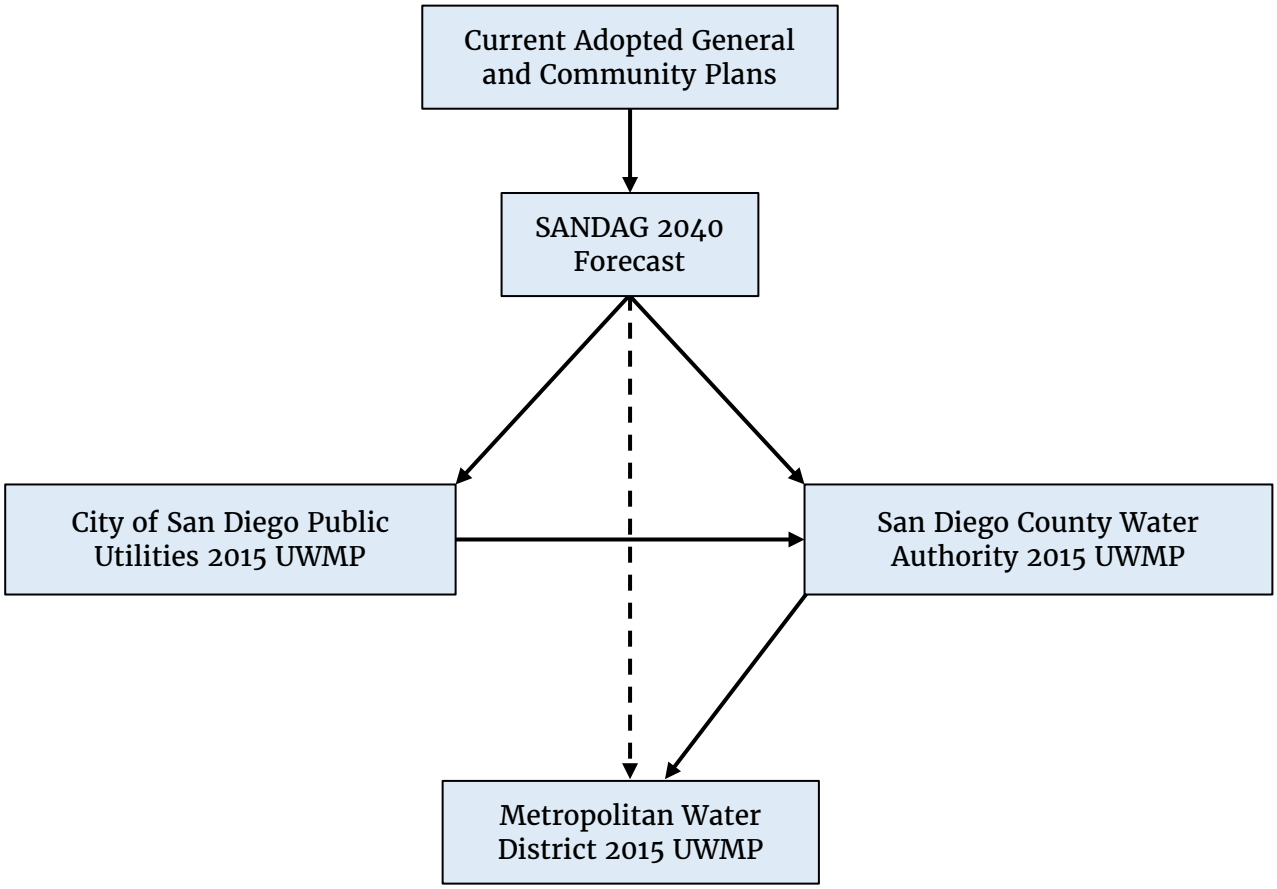


TABLE 6-1
PAST, CURRENT, AND PROJECTED WATER DELIVERIES

Sector	Type of Use	Treatment Level	Water Use (AFY)			
			2010		2015	
			Meters	Use	Meters	Use
Single-Family Residential	Indoor and outdoor uses	Drinking Water	219,555	67,267	224,162	60,573
Multifamily Residential	Indoor and outdoor uses	Drinking Water	28,992	40,124	30,471	37,799
CII	Indoor and outdoor uses	Drinking Water	15,539	46,350	17,064	46,072
Irrigation	Landscape irrigation	Drinking Water	7,359	23,537	7,679	22,668
Other	Dust mitigation, cleaning	Drinking Water	214	89	464	0
Subtotal of Retail Area			**271,659**	**177,367**	**279,840**	**167,112**

Sector	Water Use (AFY)				
	2020	2025	2030	2035	2040
Single-family Residential	62,638	80,762	86,340	87,932	87,180
Multifamily Residential	56,766	73,191	90,080	95,841	95,786
CII	48,936	48,238	47,542	47,755	48,014
Sub-Total (Retail Area)	**168,340**	**202,191**	**223,962**	**231,528**	**230,980**

Note: The billing categories shown in the 2020 to 2040 water deliveries do not include the irrigation category that was shown in the 2010 and 2015 water deliveries as that water use was distributed among the multifamily (to account for irrigation of common association property) and CII sectors.

Source: 2020 to 2030 is extrapolation from 2015 Cost of Service Study; 2030 and after is from City's Update of Long-Term Water Demand Forecast, July 2015

Table 6-2 Summarizes the current and planned water sources the City is relying on to meet future demands.

TABLE 6-2
PLANNED WATER SUPPLY SOURCES

Basin	Average Year Water Supply (AFY)					
	2015*	2020	2025	2030	2035	2040
Verifiable Supply (Existing and Planned)						
Surface Water	6,279	22,900	22,800	22,700	22,600	22,500
Groundwater	500	3,100	3,100	3,100	3,100	3,100
Recycled Water (non-potable)	8,195	13,650	13,650	13,650	13,650	13,650
Total Verifiable Local Water Supplies	**14,974**	**39,650**	**39,550**	**39,450**	**39,350**	**39,250**
SDCWA Water Purchases with Verifiable Regional Water Supplies	**173,754**	**161,334**	**202,488**	**225,390**	**234,398**	**234,158**
Total Verifiable Water Supplies	**198,957**	**200,984**	**242,038**	**264,840**	**273,748**	**273,408**

*2015 represents actual supplies under very dry hydrologic conditions – resulting in very low surface water supplies.

6.1 Water Sales to Other Agencies

Potable Water

The City, through past agreements, sells treated water to the California American Water Company (Cal-Am), which provides water service to the cities of Coronado and Imperial Beach, and Naval Air Station North Island. The population of Naval Station North Island is located within the City of Coronado, whereas the other military bases that the City serves are within the City. The City also sells untreated water to Santa Fe Irrigation District and San Dieguito Water District. **Table 6-3** presents the water sales to other agencies.

Per the agreement between the City and Cal-Am, only local surface water is sold to Cal-Am to provide water to supply Cal-Am customers. A portion of City residents in the South Bay area are also served by Cal-Am, and can be served by imported water as well. Per the agreement between the City and the City of Del Mar, the City takes deliveries of water, which the City of Del Mar purchases from the Water Authority, through the Second Aqueduct Connection at Miramar. This water is then treated at the City's Miramar WTP and transported to the City of Del Mar through several interconnections.

The City has agreements to provide surplus treated water to Otay Water District, and untreated exchange water to Ramona Municipal Water District. These water deliveries occur infrequently and for short periods of time, and are therefore not shown in **Table 6-3**.

TABLE 6-3
SALES TO OTHER AGENCIES-POTABLE

Sector	Water Use (AFY)					
	2015	2020	2025	2030	2035	2040
Wholesale Water Sales	10,229	12,200	14,106	15,453	15,759	15,821

Source: 2020 to 2030 is extrapolation from 2015 Cost of Service Study; 2030 and after is from City's Update of Long- Term Water Demand Forecast, July 2015

Recycled and Non-Revenue Water

The City has three (3) separate agreements to sell recycled water. Olivenhain Municipal Water District and the City of Poway are provided recycled water from the City's North City Water Reclamation Plant, while Otay Water District receives recycled water from the City's South Bay Water Reclamation Plant.

Non-Revenue Water (NRW) is the difference between the potable water supplied to the system (also known as potable water production), and the potable water sold to customers (also known as metered water deliveries). NRW typically includes legitimate uses that are not metered, such as street cleaning, line flushing and fire suppression, as well as unaccounted for water. Unaccounted for water can be attributed to unauthorized consumption, meter inaccuracies, data errors, leakage on mains, leakage and overflow at storage, and leakage at service connections. Typically, NRW is presented as a percentage of total potable water production. Historically, the City reported 4.3 percent of NRW in the 2005 UWMP, and 9.0 percent of NRW in the 2010 UWMP. Non-Revenue Water for 2015 was determined to be 7.4 percent (estimated at 13,421 AFY), based on the American Water Works Association's Water Audit Software, as required by the 2015 UWMP.

TABLE 6-4
ADDITIONAL WATER USES AND LOSSES

Use	Water Use (AFY)						
	2010	2015	2020	2025	2030	2035	2040
Non-Revenue Water	12,593	13,421	15,700	18,809	18,020	18,613	18,576
Recycled Water[1]	7,951	8,195	13,650	13,650	13,650	13,650	13,650

1. Excludes wholesale recycled water that City provides outside of its service area.

Table 6-5 is a summary of and displays City's past water use/demand from 2010 and 2015 with projected water use/demand shown for 2020 thru 2040.

TABLE 6-5
TOTAL WATER-USE

Use	Water Demand (AFY)						
	2010	2015	2020	2025	2030	2035	2040
Retail Potable Water Sales	177,368	167,112	168,340	202,191	223,962	231,528	230,980
Wholesale Potable Water Sales	11,493	10,229	12,200	14,106	15,453	15,759	15,821
Non-Revenue Water	12,593	13,421	15,700	18,809	18,020	18,613	18,576
Sub-Total (Potable)	**201,454**	**190,762**	**196,240**	**235,106**	**257,435**	**265,900**	**265,377**
Recycled Water (Non-Potable)	7,951	8,195	13,650	13,650	13,650	13,650	13,650
Total Demand	**209,405**	**198,957**	**209,890**	**248,756**	**271,085**	**279,550**	**279,027**

The analysis in **Table 6-6** compares the projected normal water supply and customer demands from 2010 to 2040, in five-year increments.

TABLE 6-6
PROJECTED NORMAL SUPPLY AND DEMAND COMPARISON

Normal Year Demands/Supplies	Demand and Supplies (AFY)				
	2020	2025	2030	2035	2040
Water Demand (with wholesale and conservation)	**200,984**	**242,038**	**264,840**	**273,748**	**273,408**
Local Water Supplies					
Recycled Water (City service area only)	13,650	13,650	13,650	13,650	13,650
Local Surface Supply	22,900	22,800	22,700	22,600	22,500
Groundwater	3,100	3,100	3,100	3,100	3,100
Sub-Total Local Supplies	**39,650**	**39,550**	**39,450**	**39,350**	**39,250**
Water Supply from SDCWA (purchased water)	161,334	202,488	225,390	234,398	234,158
Total City Water Supplies	**200,984**	**242,038**	**264,840**	**273,748**	**273,408**
Estimated Water Shortages	0	0	0	0	0

6.2 Projected Single-dry Year Water Supply and Demand

Table 6-7 provides a comparison of a single-dry year water supply with projected total water demand over the next 25 years, in five (5)-year increments. The City's demands in single-dry years are projected to be higher similar in proportion to the increase in regional water demands projected in the Water Authority's 2015 UWMP. An increase in demand for landscape irrigation accounts for most of the increase in demands. It is assumed that recycled water demands would not increase in single-dry years. The wholesale water supplies from the Water Authority are assumed to increase to meet the difference between the City's increased water demands and reduced local water supplies.

TABLE 6-7
PROJECTED SINGLE-DRY YEAR SUPPLY AND DEMAND COMPARISON

Single-Dry Year (1990) Demands/Supplies	Demand and Supplies (AFY)				
	2020	2025	2030	2035	2040
Water Demand (with wholesale and conservation)	**213,161**	**256,883**	**281,167**	**290,654**	**290,292**
Local Water Supplies					
Recycled Water (City service area only)	13,650	13,650	13,650	13,650	13,650
Local Surface Supply	16,657	16,584	16,512	16,439	16,366
Groundwater	3,100	3,100	3,100	3,100	3,100
Sub-Total Local Supplies	**33,407**	**33,334**	**33,262**	**33,189**	**33,116**
Water Supply from SDCWA (purchased water)	179,754	223,549	247,906	257,466	257,176
Total City Water Supplies	**213,161**	**256,883**	**281,167**	**290,654**	**290,292**
Estimated Water Shortages	0	0	0	0	0

6.3 Projected Multiple-dry Year Water Supply and Demand

Table 6-8 compares the total water supply available in multiple-dry water years with projected total water demand over the next 25 years. The City's demands in multiple-dry years are projected to be higher, similar in proportion to the increase in regional water demands projected in Water Authority's 2015 UWMP. It is presumed that recycled water demands would not increase in multiple-dry years. The wholesale water supplies from Water Authority are assumed to increase to meet the difference between the City's increased water demands and reduced local water supplies. Multiple-dry year scenarios represent hot, dry weather periods which may generate urban water demands that are greater than normal.

No extraordinary conservation measures are reflected in the demand projections. The recycled water supplies are assumed to experience no reduction in a dry year.

TABLE 6-8
PROJECTED SUPPLY AND DEMAND COMPARISON DURING MULTIPLE DRY YEAR PERIOD ENDING IN 2040

Dry Year 1 (1990) Demands/Supplies	Demand and Supplies (AFY)				
	2020	2025	2030	2035	2040
Water Demand (with wholesale and conservation)	**213,161**	**256,883**	**281,167**	**290,654**	**290,292**
Local Water Supplies					
Recycled Water (City service area only)	13,650	13,650	13,650	13,650	13,650
Local Surface Supply	16,657	16,584	16,512	16,439	16,366
Groundwater	3,100	3,100	3,100	3,100	3,100
Sub-Total Local Supplies	**33,407**	**33,334**	**33,262**	**33,189**	**33,116**
Water Supply from SDCWA (purchased water)	179,754	223,549	247,906	257,466	257,176

Total City Water Supplies	**208,665**	**251,402**	**275,139**	**284,412**	**284,058**
Estimated Water Shortages	0	0	0	0	0

Section 7 - Conclusion - Availability of Sufficient Supplies

The Project is consistent with water demand assumptions in the regional water resource planning documents of the City, the Water Authority and MWD. The PUD receives the majority of its water supply from MWD through the Water Authority. In addition, MWD and the Water Authority have developed water supply plans to improve reliability and reduce dependence upon existing imported supplies. MWD's Regional Urban Water Management Plan and Integrated Resources Plan, the Water Authority's 2015 UWMP and annual water supply report include projects that meet long-term supply needs through securing water from the State Water Project, Colorado River, local water supply development and recycled water.

The forecasted normal year water demands compared with projected supplies for the PUD are shown in **Table 7-1**. This demonstrates that with existing supplies and implementation of the projects discussed in the three agencies' planning documents there will be adequate water supplies to serve all anticipated growth (existing and future planned uses) and development.

TABLE 7-1
PROJECTED SUPPLY AND DEMAND COMPARISON – NORMAL YEAR

Normal Year Demands/Supplies	Demand and Supplies (AFY)				
	2020	2025	2030	2035	2040
Water Demand (with wholesale and conservation)	**200,984**	**242,038**	**264,840**	**273,748**	**273,408**
Local Water Supplies					
Recycled Water (City service area only)	13,650	13,650	13,650	13,650	13,650
Local Surface Supply	22,900	22,800	22,700	22,600	22,500
Groundwater	3,100	3,100	3,100	3,100	3,100
Sub-Total Local Supplies	**39,650**	**39,550**	**39,450**	**39,350**	**39,250**
Water Supply from SDCWA (purchased water)	161,334	202,488	225,390	234,398	234,158
Total City Water Supplies	**200,984**	**242,038**	**264,840**	**273,748**	**273,408**
Estimated Water Shortages	0	0	0	0	0

Table 7-2 provides a comparison of a single-dry year water supply with projected total water use/demand over the next 25 years, in five (5)-year increments.

TABLE 7-2
PROJECTED SINGLE-DRY YEAR SUPPLY AND DEMAND COMPARISON

Single-Dry Year (1990)	Demand and Supplies (AFY)				
	2020	2025	2030	2035	2040
Water Demand (with wholesale and conservation)	**213,161**	**256,883**	**281,167**	**290,654**	**290,292**
Local Water Supplies					
Recycled Water (City service area only)	13,650	13,650	13,650	13,650	13,650
Local Surface Supply	16,657	16,584	16,512	16,439	16,366
Groundwater	3,100	3,100	3,100	3,100	3,100
Sub-Total Local Supplies	**33,407**	**33,334**	**33,262**	**33,189**	**33,116**
Water Supply from SDCWA (purchased water)	179,754	223,549	247,906	257,466	257,176
Total City Water Supplies	**213,161**	**256,883**	**281,167**	**290,654**	**290,292**
Estimated Water Shortages	0	0	0	0	0

The multiple-dry year scenarios, within a 25-year projection, are shown in **Table 7-3**. This demonstrates that supplies will be adequate to meet all anticipated growth (existing and future planned uses) and development in multiple-dry year periods.

In summary, this Report demonstrates that there are sufficient water supplies over a 25-year planning horizon to meet the projected demands of the Project as well as the existing and other planned development projects within the PUD service area in normal, dry year, and multiple-dry year forecasts. This Project is proposing water demands which are included in the regional water resource planning documents of the City, the Water Authority, and MWD.

TABLE 7-3
PROJECTED SUPPLY AND DEMAND COMPARISON DURING MULTIPLE DRY YEAR PERIOD ENDING IN 2040

Dry Year 1 (1990) Demands/Supplies	Demand and Supplies (AFY)				
	2020	2025	2030	2035	2040
Water Demand (with wholesale and conservation)	**213,161**	**256,883**	**281,167**	**290,654**	**290,292**

FROM: Elena Pascual, Assistant Planner, Planning Department

SUBJECT: Request for the preparation of a Water Supply Assessment for the Mission Valley Community Plan Update (IO #21004103)

This memo is an update to the previous Water Supply Assessment request dated December 11, 2017. The build out numbers for the Mission Valley Community Plan Update Project have been revised and the Planning Department requests that the Water Supply Assessment be updated to reflect this change.

The CEQA & Environmental Policy team from the Planning Department has made a determination that the above referenced project is required to complete a water supply assessment in conformance with Senate Bill (SB) 610. The determination of whether SB 610 and/or SB 221 apply was made by reviewing Water Code Section 10912 and Government Code Section 65867.5 in consultation with the Public Utilities Department. We would appreciate your department's review of the project regarding conformance with SB 610 and SB 221. The following information is provided to aid in the assessment process:

PROJECT DESCRIPTION

The project is a comprehensive update of the Mission Valley Community Plan, which was originally adopted in 1985 and has since undergone over 20 amendments. The updated Community Plan is anticipated to include policies and actions to foster a mixed-use, transit-oriented, and pedestrian-friendly Mission Valley community, promote additional housing to accommodate a diverse range of household sizes and incomes, enhance the San Diego River, and provide additional open spaces.

PROJECT LOCATION

The Community Plan Planning Area is generally bounded by Friars Road and the northern slopes of the valley on the north, the eastern banks of the San Diego River on the east, the southern slopes of the valley on the south, and I-5 on the west, encompassing an area of approximately five square miles. Mission Valley is bordered by several other community planning areas: Old Town San Diego, Uptown, Greater North Park, Normal Heights, Kensington-Talmadge, and College Area to the south; Navajo to the east; Tierrasanta, Kearny Mesa, Serra Mesa, and Linda Vista to the north; and Mission Bay Park to the west. As of 2012,

Mission Valley has approximately 12,649,873 square feet of commercial uses (retail and office) and 11,244 dwelling units.

FORECAST

The SANDAG Series 13 – 2050 Regional Forecast shows that by the year 2050 Mission Valley could have 20,734 total housing units. The SANDAG Series 13 Forecast represents the long-term development of the adopted community plan. The draft community plan is calculated to have a total build out of 39,157 housing units. This is a potential increase of 18,423 total housing units above the SANDAG 2050 forecasted amount. The draft community plan build out is a theoretical calculation of build out which could occur after 2050 rather than a forecasted amount. The draft community plan estimated build out assumes 1,717 fewer single-family homes and 20,140 additional multifamily units from the forecast at the year 2050. The draft community plan estimated build out assumes 1,688 fewer single-family homes from the forecast at the year 2040. The draft community plan build out assumes that the 1,688 units would be developed as multifamily units rather than single-family units.

The 2015 Urban Water Management Plan bases the projected demand for water on the SANDAG Series 13 Forecast for the year 2040. The SANDAG Series 13 Forecast indicates that Mission Valley could have 20,076 housing units by the year 2040 which is 658 fewer housing units than SANDAG is forecasting for the year 2050. The SANDAG forecasts takes economic trends in the market and demographic changes, which affects demand for housing for the region and the community together. The Forecast shows that by 2040 there is an adequate supply of housing to meet the demand without utilizing the full forecasted housing capacity. Thus, the theoretical draft community plan build out, which would add 18,423 additional housing units, would occur beyond the 2050 forecast. The utilization of the capacity could happen at 2050 or beyond. This is to say, if the additional supply of multifamily units was included into the forecast, it would not occur prior to 2040 since an increase in supply is not going to significantly affect the increase in demand for infill housing in an urban area.

The draft community plan build out estimates that Mission Valley will have 72,440 people living in an occupied housing unit at build out, which is 36,451 people more than the SANDAG Series 13 Forecast for the year 2050. The draft community plan build out used an assumption of a vacancy rate of 9.1 percent and a 1.91 persons per household for all structure types which is consistent with the SANDAG forecast.

The SANDAG Series 13 Forecast shows that Mission Valley could have 59,447 total employees by 2050. The draft community plan update build out is estimating 64,591 employees which is an increase of 5,144 employees above the 2050 Forecast. The SANDAG forecast indicates that Mission Valley could have 58,346 employees by the year 2040 which is 1,101 fewer employees than the SANDAG forecast for the year 2050. The Forecast shows that by 2040 there is an adequate supply of jobs to meet the demand without utilizing the forecasted employment at 2050. The utilization of the additional draft community plan update employment capacity could happen at 2050 or beyond.

	SANDAG Series 13 - 2050 Forecast			Draft Plan
	2012	2040	2050	Build out
Multifamily	10,163	18,388	19,017	39,157
Single Family	1,070	1,688	1,717	–
Mobile Homes	0	0	0	0
Total Housing Units	**11,233**	**20,076**	**20,734**	**39,157**
Household Population	**18,712**	**35,034**	**35,989**	**72,440**
Employees	**45,197**	**58,346**	**59,447**	**64,591**
