Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Lead Agency:	SAN DIEGO COUNTY LOP
Case Worker:	CF
Local Agency:	SAN DIEGO COUNTY LOP
RB Case Number:	Not reported
LOC Case Number:	H11498-002
File Location:	Local Agency
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	An unauthorized release was discovered during removal of two underground storage tanks (USTs) associated with a pest control business on October 29, 1998. Each of the USTs had a 10,000-gallon capacity and had contained gasoline to service company vehicles. The former USTs were located adjacent to a two-story building that parallels the southeastern property boundary. The concrete block building is occupied by a garage on the first floor with office space located on the second floor. Upon removal of the USTs, the County DEH inspector noted the presence of groundwater that had accumulated at the base of the excavation. A hydrocarbon sheen was observed on the water and staining was present on excavation soils. Analytical results for soil samples collected during the removal inspection indicated that an unauthorized release of gasoline had occurred. Five hundred gallons of a product/water mixture were removed from the excavation by vacuum truck and transported offsite for disposal. Approximately 423 tons of petroleum hydrocarbon-impacted soil were then removed from the excavation and disposed of at recycling facility. The former tanks were replaced with a 12,000-gallon capacity UST. Donan Environmental Services, Inc (DES) submitted a UST closure report to DEH in March 2001. DEH Case #H11498-002 was opened

LLOYD PEST CONTROL (Continued) **1000441289**

following review of the reported soil sample analytical results. DES subsequently estimated that 699 tons (approximately 466 cubic yards) of petroleum hydrocarbon-impacted soil remained in place at the site. Five groundwater monitoring wells were installed at the site in November 2002 to depths of 20 feet below ground surface (bgs). Analytical results for groundwater samples collected in January 2003 indicated that the chemicals of concern (COCs) at the site were benzene, toluene, ethylbenzene, and xylene (BTEX) and the fuel oxygenates methyl-tert-butyl ether (MTBE) and tert-amyl-methyl ether (TAME). Soil vapor samples were collected at three locations below the foundation slab of the garage in December 2004. None of the COCs were detected in the soil vapor samples. Two additional on-site groundwater monitoring wells were installed in August 2005 and three were installed in November 2007. A well was installed immediately west of the subject property in November 2009. Groundwater sampling of this off-site well in January 2010 indicated the detection of MTBE at a concentration of 111 micrograms per liter (g/l). In order to assess the lateral extent of dissolved MTBE, four borings were advanced in the Custer Street right-of-way, approximately 250 to 300 feet west of the off-site well. Groundwater grab samples were collected from the borings and analyzed by a mobile laboratory. MTBE was detected in three of the grab samples and the most westerly boring was converted to a monitoring well. MTBE was detected at a concentration of 3 g/l when the well was sampled in February 2012. Based on the MTBE result, the consultant concluded that the dissolved contaminant plume had been adequately delineated. DES submitted a Corrective Action Plan (CAP) for the site on August 1, 2012. Analytical results for the February 2012 groundwater monitoring and sampling round indicated that benzene was not detected in groundwater samples. Trend analyses presented in the CAP show decreasing trends for MTBE concentrations. DES estimates that MTBE concentrations will fall below its Primary Maximum Contaminant Level (MCL, 13 g/l) in 13 years and its Secondary MCL in 20 years. Although groundwater beneath the site is designated for potential municipal use, it flows into a non-beneficial use basin approximately 1,500 feet downgradient of the site. Based on the lack of detection of benzene in the most recently collected groundwater samples, the lack of human health risk, and the decreasing concentrations of MTBE in groundwater, DES has recommended no further action and case closure. DEH concurs with these recommendations.

SDCTY-POLICE WESTERN (Continued) **S103987198**

Local Agency:	SAN DIEGO COUNTY LOP
RB Case Number:	9UT759
LOC Case Number:	H01782-001
File Location:	Local Agency
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	The Western Division Police Station became operational around May 1984, and is currently utilized as a fueling station and maintenance garage. In late 1986, gasoline odors were reported in local bathrooms, and free floating product (gasoline) was reported in an abandoned sewer line leading to the site. The sewer line was subsequently plugged with concrete. In February 1987, it was determined that there was a leaking turbine pressure feed line from one of the five underground storage tanks at the site (UST #2), and an estimated 41,000 to 55,000 gallons of gasoline was released. An Official Notice was issued to the City of San Diego on February 25, 1987. Product extraction wells were installed at the site in 1987, and a vapor survey was conducted. In addition, the City operated a vapor extraction system (VES) at the site from approximately 1990 to 1997. An estimated 60,674 pounds of petroleum hydrocarbons were extracted from the site and destroyed by oxidation. Three of the five USTs were removed in 1998 (2 gas, one diesel), and during the tank removal activities, a reported 200 cubic yards of impacted soil was excavated. The other 2 USTs (waste oil and motor oil) were later removed. A total of 20 extraction and/or groundwater monitoring wells have been installed at the site between 1987 and 2007, along with soil borings, to help define the extent of soil and groundwater contamination at the site. Groundwater at the site is generally present at a depth of between approximately 11 to 17 feet below grade, with a west to southwest flow direction. The groundwater has designated beneficial uses, and some reported contaminant concentrations, including benzene and MTBE, exceed their respective Maximum Contaminant Levels (MCLs). The City of San DIego plans for the 2010/11 fiscal year include conducting further soil gas monitoring, conducting semiannual groundwater monitoring and sampling, and preparing a Corrective Action Plan (CAP) for site mitigation.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Classification: Large Quantity Generator

Violation Status: No violations found

Evaluation Action Summary:
Evaluation date: 03/22/2004
Evaluation: COMPLIANCE EVALUATION INSPECTION ON-SITE
Area of violation: Not reported
Date achieved compliance: Not reported
Evaluation lead agency: State Contractor/Grantee

FINDS:

Registry ID: 110002653361

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

LUST:
Region: STATE
Global Id: T10000001812
Latitude: 32.7650689
Longitude: -117.197746
Case Type: LUST Cleanup Site
Status: Open - Site Assessment
Status Date: 02/08/2010
Lead Agency: SAN DIEGO COUNTY LOP
Case Worker: CH
Local Agency: SAN DIEGO COUNTY LOP
RB Case Number: Not reported
LOC Case Number: H39730-002
File Location: Not reported
Potential Media Affect: Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern: Diesel, Gasoline
Site History: This case was opened in February 2010, after the laboratory results from a Supplemental Subsurface Assessment Report dated September 2008 indicated that soil and groundwater in the general area of the former underground storage tanks were impacted with petroleum hydrocarbons. Total petroleum hydrocarbons (TPH) as gasoline were detected at a maximum of 6,600 mg/kg in the soil and TPH as diesel was detected a maximum of 1,500 mg/kg. Gasoline related compounds, benzene (5,300 ug/l), ethylbenzene (970 ug/l), toluene (8,910 ug/l) and tert-butyl alcohol (3,300 ug/l) were also detected in groundwater. The site was a Texaco Station prior to 1979.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site History:	Soil investigations were performed beneath a former transmission

AAMCO TRANSMISSIONS (FORMER) (Continued) **S104747892**

repair facility at 5251 Linda Vista Road, San Diego., in November 1999 and January 2014. The facility was located at the western end of a strip mall near the intersection of Linda Vista Road and Napa Street in Mission Valley. The strip mall is accessed from Linda Vista Road and an alley that adjoins its south side. Two underground storage tanks (USTs) had reportedly been located beneath or adjacent to the former repair facility. Waste oil had been stored in one of the tanks and the other had reportedly contained solvents. No information was available regarding the exact locations of the USTs at the time of the 1999 soil investigation. During the November 1999 investigation, eight angle borings and one vertical boring were advanced adjacent to the former transmission repair facility. The borings were located adjacent to the western and southern walls of the building and along the eastern wall shared with an adjoining unit. Petroleum hydrocarbon odors were noted at distances of 5 to 19 feet from the ground surface during advancement of four of the angle borings. These four borings originated at locations in the alley adjoining the southern wall of the facility. Analytical results indicated the detection of Total Recoverable Petroleum Hydrocarbons (TRPH) at a maximum concentration of 17,000 milligrams per kilogram (mg/kg). Halogenated volatile organic compounds (HVOCs), including solvents, were not detected in the soil samples. Groundwater was not encountered in the borings. Case #H13561-001 was opened under the Voluntary Assistance Program on November 30, 1999, based on the TRPH results for the soil samples. Additional subsurface investigation at the site was performed on January 7, 2014, to assess whether the former USTs were still present in the subsurface, the lateral extent of impacts from the release, the composition of the release, and to determine if groundwater was impacted. The former USTs were not detected in the subsurface by ground-penetrating radar. Seven borings were advanced within the building interior: one of the interior borings was advanced in the adjoining unit and two were advanced inside the former transmission repair facility. The three interior borings terminated at a depth of 9 feet. Four of the attempted borings encountered a condition of refusal at a depth of less than 3 feet. Four exterior borings were sampled to a depth of 20 feet. Groundwater was encountered at a depth of approximately 13 feet in the exterior borings. Analytical results indicated the highest gasoline and diesel concentrations were detected in soil samples collected from beneath a service bay in the south-central area of the former transmission repair facility. However, soil impacts did not extend beyond the building footprint to the north, east, or west. Gasoline- and diesel- range organics were detected in a soil sample collected near the capillary fringe from a boring located in the alley (i.e., south of the facility). The detected concentrations were 1,500 and 1,300 mg/kg, respectively. Gasoline-range and diesel-range organics were detected in a depth-discrete groundwater sample collected from the boring at concentrations of 1.0 and 0.55 milligrams per liter (mg/l), respectively. VOCs indicative of degraded gasoline (e.g., trimethlybenzenes, n-butylbenzene) and the fuel oxygenate TBA were detected at low concentrations in the groundwater sample. Metals concentrations in the groundwater sample were either not detected or were at low levels. The findings of the soil and groundwater investigations suggest that, prior to 1999, a petroleum hydrocarbon release occurred in the service bay of the former transmission repair facility. The release appears to have included gasoline, which has devolatilized and degraded, and

AAMCO TRANSMISSIONS (FORMER) (Continued) **S104747892**

diesel-range compounds. Analytical results for samples collected from two borings (located within the service bay and in the alley, respectively) suggest that the release migrated in a southerly direction but was of limited extent. Aromatic hydrocarbons, including benzene, were not detected in the downgradient groundwater sample. Degradation of volatile gasoline components indicates the lack of a health risk to occupants of the commercial space and limited potential to adversely impact potential water supply. Based on these considerations, the consultant has recommended no further action and case closure. DEH concurs with these recommendations.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal

SHARP PATHOLOGY LABORATORY (Continued) **1000246795**

facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	Report of a leaking vapor assist hose at the gasoline station located at 1083 Morena Boulevard, San Diego, resulted in the opening of DEH Case #04834-002 on April 5, 1993. Initial site assessment activities were performed in September 1993 and entailed the drilling and sampling of four borings. The analytical result for a soil sample collected beneath a heavily-corroded product line near the southern dispenser island confirmed that a release of petroleum hydrocarbons had occurred. The detected concentration of petroleum hydrocarbons in the soil sample was 1,500 milligrams per kilogram (mg/kg). Three underground storage tanks (USTs) that had stored gasoline were removed from the site on June 24, 1994. Two of the USTs had 10,000-gallon capacities and one had a capacity of 6,000 gallons. Soil samples collected during the removal inspection from the tank excavation, the product piping trenches, and an oil/water separator indicated petroleum hydrocarbon impacts. Additional borings were drilled around the perimeter of the site in April 1996 that indicated petroleum hydrocarbon impacts at the capillary fringe to concentrations up to 22,000 mg/kg. Impacts to the capillary fringe (located at approximately 18 feet below ground surface [bgs]) were reported to extend offsite beneath Morena Boulevard. Seventeen groundwater monitoring wells were installed at the site from July 1994 through June 2008. Free product was detected in one of the wells installed in 1994 with an apparent thickness of 0.76 feet. However, the apparent thickness decreased to a sheen which was last observed in February 2003. Analytical results for groundwater samples indicated that the chemicals of concern (COCs) for the site are gasoline, the aromatic hydrocarbons benzene, toluene, ethylbenzene, and xylenes (BTEX), naphthalene, and the fuel oxygenate methyl-tert-butyl ether (MTBE). These wells were monitored and sampled on a quarterly basis until a semi-annual schedule was initiated in 2009. Two additional monitoring wells were installed in May 2010 to complete delineation of the dissolved plume. Although the site is in an area excepted from use for municipal supply purposes,

ULTRAMAR STATION #1-740 (Continued) **S104578171**

groundwater beneath flows southwesterly into a hydrologic area that is designated for potential municipal use. Four soil vapor extraction (SVE) wells and one groundwater recovery well/SVE well were installed at the site in July 1994. A Corrective Action Plan (CAP) is currently being prepared for the site.

LOC Case Number:	H13429-001
File Location:	Local Agency
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Waste Oil / Motor / Hydraulic / Lubricating
Site History:	Four USTs were removed from the site in 1989 (4,000-gallon gasoline; 4,000-gallon diesel; 1,000-gallon diesel; and 550-gallon waste oil). Soil sampling conducted during tank removal indicated total petroleum hydrocarbons as gasoline and diesel up to 50 mg/kg and 13,000 mg/kg respectively. A site assessment reprot was subitted in January 1990, which documented additional investigation and limited over excavation. Five groundwater monitoring wells were intalled in June 1990. Five additional wells were installed in 1991 to delineat the extent of free product. In January 1992 bailing was initiated to remove free product. Additional soil excavation was conducted in March 1994.

Comments:	SD County Environmental Assessment history indicates that the county overseeing a Preliminary Assessment as of 12/04/91. Tank case, soil contamination only. Local oversight program. NFA for DTSC.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Site Screening
Completed Date:	02/08/1991
Comments:	PA report was reviewed by Region 4 staff. The site consists of a 15,000 sf bldg., a paved storage area, & a concrete loading dock. 99% of chemicals handled were detergent, wax and window cleaner. Presently, the bldg is used as an auto parts warehouse by Volks Parts. A driveby in 1983 by SDDHS reported that concrete was eroded outside the bldg. No sampling was done to determine if there is a hazard at the site. Staff recommends PEARM to determine if there is a hazard DTSC should address.

Case Worker:	Not reported
Local Agency:	Not reported
RB Case Number:	9UT2722
LOC Case Number:	H05129-002
File Location:	Local Agency
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	This site has been an operating gas station since before 1969. It is currently an AM/PM convenience store and gasoline station with four 10,000 gallon underground storage tanks (USTs) and associated piping and dispensers. Two petroleum hydrocarbon related releases occurred on this site, resulting in two open releases, all case information was managed under case H05129-003. Case H05129-002 was opened in December 1994, following discovery of a fuel release during the removal of one 550 gallon UST. Case H05129-003 was subsequently opened in October 1995, following the detection of additional contamination during the removal of four 6,000 gallon USTs and one 8,000 gallon UST. Site investigation has continued from the time of the initial UST system removals through May 30, 2001, and has included 8 soil borings, the installation of 14 groundwater monitoring wells, and 6 remediation wells/air sparge wells. The site geology consists of silty sand with clayey sand with cobble deposits. The site is located approximately 1,000 feet north of the San Diego River. Site investigations to date identified significant soil and groundwater impacts in the area of the former USTs. Impacted soil extends 50 feet below ground surface (bgs). The volume of petroleum hydrocarbon impacted soil was estimated to be approximately 2,094 cubic yards. Stantec (formerly SECOR) estimated the total mass of petroleum hydrocarbons in place to be approximately 7,484 pounds prior to the operation of the on site remediation system. A soil vapor extraction/air sparge (SVE/AS) system was installed and operated as part of an Interim Remediation Action Plan (IRAP) at the site from November 1, 1997, through May 30, 2001. The system was shut down due to asymptotic hydrocarbon removal rates. Approximately 2,852 pounds of petroleum hydrocarbons were removed by this system. Approximately 4,632 pounds of petroleum hydrocarbons remain in place after the removal of the SVE/AS system. Groundwater was encountered at depths ranging from 20 to 37 feet bgs over the time that this site has been monitored. The groundwater gradient has consistently been to the southwest. Groundwater impacts are primarily occurring beneath the subject property and are currently bounded by monitoring wells on site. The greatest petroleum hydrocarbon impacts to soil and groundwater were found in the area of the former tank excavation and to the immediate south-west of the area. Free product has been observed historically in monitoring wells MW-2B and MW-8, located to the south-west of the former UST system. The maximum LPH thickness was 1.59 feet, observed in August 1996. SPH removal was conducted on site and approximately 8 gallons of separate-phase hydrocarbons were removed from wells MW-2, MW-2B, and MW-8. LPH has not been measured or observed at this site since July 1999. The primary contaminants of concern (COCs) were those compounds related to petroleum hydrocarbons. The COCs identified are gasoline range organics (GRO), benzene, toluene, ethylbenzene, xylenes, MTBE, TBA, and ethanol. A Corrective Action Plan (CAP) was submitted April 4, 2008, and

FASHION VALLEY ARCO AM PM (Continued) **S101308191**

accepted by DEH for implementation. According to Stantec remediation by natural attenuation is the most cost effective remedial alternative based on the past history of soil vapor extraction and air sparging on this site. A benzene and MTBE trend analysis was conducted by Stantec to estimate the time required for benzene and MTBE concentrations to reach the MCL of 1.0 ug/L and 13.0 ug/L respectively. Stantec estimates that benzene will reach the MCL of 1.0 ug/L in approximately 12 years, while MTBE is estimated to reach the MCL of 13.0 ug/L in approximately 36 years. A health risk assessment was performed on this site utilizing groundwater monitoring data for benzene (59 ug/L) from well MW-8, the nearest well to the building with detectable benzene. Stantec concluded that the residual soil and groundwater impacts remaining on site do not pose a threat to human health or the environment. DEH concurs with Stantecs recommendation for the closure of this case.

RB Case Number:	9UT3116
LOC Case Number:	H05129-003
File Location:	Local Agency
Potential Media Affect:	Aquifer used for drinking water supply, Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	This site has been an operating gas station since before 1969. It is currently an AM/PM convenience store and gasoline station with four 10,000 gallon underground storage tanks (USTs) and associated piping and dispensers. Two petroleum hydrocarbon related releases occurred on this site, resulting in two open releases, all case information was managed under case H05129-003. Case H05129-002 was opened in December 1994, following discovery of a fuel release during the removal of one 550 gallon UST. Case H05129-003 was subsequently opened in October 1995, following the detection of additional contamination during the removal of four 6,000 gallon USTs and one 8,000 gallon UST. Site investigation has continued from the time of the initial UST system removals through May 30, 2001, and has included 8 soil borings, the installation of 14 groundwater monitoring wells, and 6 remediation wells/air sparge wells. The site geology consists of silty sand with clayey sand with cobble deposits. The site is located approximately 1,000 feet north of the San Diego River. Site investigations to date identified significant soil and groundwater impacts in the area of the former USTs. Impacted soil extends 50 feet below ground surface (bgs). The volume of petroleum hydrocarbon impacted soil was estimated to be approximately 2,094 cubic yards. Stantec (formerly SECOR) estimated the total mass of petroleum hydrocarbons in place to be approximately 7,484 pounds prior to the operation of the on site remediation system. A soil vapor extraction/air sparge (SVE/AS) system was installed and operated as part of an Interim Remediation Action Plan (IRAP) at the site from November 1, 1997, through May 30, 2001. The system was shut

FASHION VALLEY ARCO AM PM (Continued) **S101308191**

down due to asymptotic hydrocarbon removal rates. Approximately 2,852 pounds of petroleum hydrocarbons were removed by this system. Approximately 4,632 pounds of petroleum hydrocarbons remain in place after the removal of the SVE/AS system. Groundwater was encountered at depths ranging from 20 to 37 feet bgs over the time that this site has been monitored. The groundwater gradient has consistently been to the southwest. Groundwater impacts are primarily occurring beneath the subject property and are currently bounded by monitoring wells on site. The greatest petroleum hydrocarbon impacts to soil and groundwater were found in the area of the former tank excavation and to the immediate south-west of the area. Free product has been observed historically in monitoring wells MW-2B and MW-8, located to the south-west of the former UST system. The maximum LPH thickness was 1.59 feet, observed in August 1996. SPH removal was conducted on site and approximately 8 gallons of separate-phase hydrocarbons were removed from wells MW-2, MW-2B, and MW-8. LPH has not been measured or observed at this site since July 1999. The primary contaminants of concern (COCs) were those compounds related to petroleum hydrocarbons. The COCs identified are gasoline range organics (GRO), benzene, toluene, ethylbenzene, xylenes, MTBE, TBA, and ethanol. A Corrective Action Plan (CAP) was submitted April 4, 2008, and accepted by DEH for implementation. According to Stantec remediation by natural attenuation is the most cost effective remedial alternative based on the past history of soil vapor extraction and air sparging on this site. A benzene and MTBE trend analysis was conducted by Stantec to estimate the time required for benzene and MTBE concentrations to reach the MCL of 1.0 ug/L and 13.0 ug/L respectively. Stantec estimates that benzene will reach the MCL of 1.0 ug/L in approximately 12 years, while MTBE is estimated to reach the MCL of 13.0 ug/L in approximately 36 years. A health risk assessment was performed on this site utilizing groundwater monitoring data for benzene (59 ug/L) from well MW-8, the nearest well to the building with detectable benzene. Stantec concluded that the residual soil and groundwater impacts remaining on site do not pose a threat to human health or the environment. DEH concurs with Stantecs recommendation for the closure of this case.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for

COURTESY CHEVROLET (Continued) **1000370081**

generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

UORS (California - Used Oil Recycling System). California Integrated Waste Management Board (CIWMB) helps communities establish and promote convenient collection opportunities for used oil and used oil filters.

CRITERIA AND HAZARDOUS AIR POLLUTANT INVENTORY

UORS (California - Used Oil Recycling System). California Integrated Waste Management Board (CIWMB) helps communities establish and promote convenient collection opportunities for used oil and used oil filters.

Registry ID: 110055799266

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Violations Active Permits:

Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	07/24/2006
Violation Code:	6HV0224
Violation:	MISMANAGED EMPTY CONTAINERS >5GALS.
Violation Citation:	Failed to mark date on empty container larger than 5 gallons and/or manage it within one year. 66261.7(e) & (f).
Activity:	ACTIVE

Facility Id:	103389
Update Date:	11/02/2012

JOHN HINE MAZDA (Continued) **1000305199**

Inspection Date:	07/24/2006
Violation Code:	6HV0227
Violation:	HAZWASTE TANK/CONTAINER W/O LABEL/DATE
Violation Citation:	Failed to properly label/date hazardous waste container &/or tank. 66262.34(f)
Activity:	ACTIVE
Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	07/24/2006
Violation Code:	6HV0301
Violation:	HAZWASTE:UNAUTHORIZED DISPOSAL
Violation Citation:	Disposal or causing the disposal of hazardous waste to an unauthorized point (ground, storm drain, sewer system, trash, or air). HSC 25189.5(a) or 25189(d)
Activity:	ACTIVE
Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	02/25/2005
Violation Code:	6HV1601
Violation:	HAZWASTE TANKS W/O P.E. ASSESSMENT
Violation Citation:	Failed to obtain a P.E. assessment for hazardous waste tank system. 66265.191(a) or 66265.192(a)
Activity:	ACTIVE
Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	07/08/2003
Violation Code:	6HV0210
Violation:	DID NOT CLEAN SPILL TO FLOOR
Violation Citation:	Failure to clean up hazardous waste off of floor surface. 66262.10b
Activity:	ACTIVE
Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	07/24/2006
Violation Code:	6HV0221
Violation:	DID NOT COMPLY W/SATELLITE REGS.
Violation Citation:	Failed to comply with satellite regulations. 66262.34(e)
Activity:	ACTIVE
Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	04/15/2008
Violation Code:	6HV0202
Violation:	WASTE CONTAINER W/O LABELS
Violation Citation:	Hazardous waste containers &/or tanks are missing labels, accumulation date and/or are improperly labeled. CCR 66262.34(a)(2); 66262.34(a)(3) & 66262.34(f)
Activity:	ACTIVE
Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	07/24/2006
Violation Code:	6HV0146
Violation:	NO ERM EXEMPTION CLAIM DOCUMENTS

JOHN HINE MAZDA (Continued) **1000305199**

Violation Citation:	Failed to have adequate records demonstrating claim of exemption for Excluded Recyclable Material (ERM). 25143.2(f) & 66261.2(g)
Activity:	ACTIVE
Facility Id:	103389
Update Date:	11/02/2012
Inspection Date:	07/24/2006

70 **MONTGOMERY WARD SVC CENTER** **CA LUST S103627419**
1288 CAMINO DEL RIO N **CA SWEEPS UST N/A**
SAN DIEGO, CA 92108

LUST:
Region: STATE
Global Id: T06019759260
Latitude: 32.7679163769478
Longitude: -117.153289318085
Case Type: LUST Cleanup Site
Status: Open - Eligible for Closure
Status Date: 12/20/2015
Lead Agency: SAN DIEGO COUNTY LOP
Case Worker: EM
Local Agency: SAN DIEGO COUNTY LOP
RB Case Number: Not reported
LOC Case Number: H13036-001
File Location: Local Agency
Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Benzene, Toluene, Xylene, Gasoline
Site History: The site (Former Montgomery Ward Automobile Service Center location) is located at 1640Camino Del Rio North, San Diego, California, in a commercial area. The former petroleum fuel underground storage tanks (USTs) were located near the northern property boundary, adjacent to Camino De La Reina and the shopping center driveway entrance to the east. The property was previously operated as a Montgomery Ward Automotive Center with gasoline dispensing facilities (e.g., three USTs, their associated buried product and vapor recovery lines, and dispenser islands), hydraulic lifts, and a waste oil UST. All known components of the gasoline dispensing facility have been removed. The site has recently been redeveloped with two new buildings. The two buildings are occupied by restaurants and retail shops. The site is level and lies at an elevation of approximately 35 feet above mean sea level (MSL). PREVIOUS ENVIRONMENTAL ACTIVITIES September of 1986, three 10,000-gallon petroleum fuel USTs and one 550-gallon waste-oil UST were removed from the subject site. Based on observation at the time of UST removal, nounauthorized release case was opened. January

MONTGOMERY WARD SVC CENTER (Continued) **S103627419**

2006, Ami Adini&Associates (AA&A) supervised the drilling of soil borings B1 through B24. Soil samples were collected at 5, 10, 15 and 20 feet bgs from each boring to assess the lateral and vertical extent of gasoline impact reported in a Phase II environmental site assessment performed in 2001. AA&A identified petroleum hydrocarbon impact in the vicinity of what were believed to be the former fuel UST and dispenser island locations along the north side of the former automobile center building (AA&A, February 2006). Additionally, groundwater grab samples were collected at six locations (B7, B8, B11, B12, B15, and B20). Soil and groundwater grab samples were analyzed for TPHg, TPHd, and TPHo using EPA Test Method 8015 modified. Soil samples were also analyzed for volatile organic compounds (VOCs), BTEX, MTBE and other fuel oxygenates using EPA Test Method 8260B. July 2006, AA&A supervised the drilling of soil borings B25 through B43 to 20 feet bgs and soil samples were collected from each borehole. Ten of the soil borings were completed as groundwater monitoring wells (MW-1 through MW-10). Selected soil and groundwater samples were analyzed for TPHg, TPHd TPHo, BTEX, MTBE, and other constituents. Soil and groundwater analytical results are summarized on Tables 1 and 2, respectively. AA&A concluded soil impact was present predominantly on-site and primarily in a smear zone from 13 to 20 feet bgs. Dissolved hydrocarbon concentrations in groundwater, were delineated to the north and south, and separate-phase hydrocarbons (SPH) and gasoline oxygenates (including MTBE) were not detected at the site in soil or groundwater. After reviewing the AA&A conclusions and recommendations, the SAM requested a work plan for quarterly groundwater sampling and additional soil and groundwater delineation. A work plan dated October 31, 2006, was submitted by AA&A for the excavation of soil in the area of the proposed buildings. A subsequent/replacement work plan dated January 4, 2007, was submitted by SECOR for assessment and interim remedial activities, and approved by the SAM in a letter dated February 26, 2007. June 2007, SECOR sampled groundwater from MW-4 through MW-10. Dissolved GRO concentrations were reported in MW-5 through MW-7. One or more of benzene, ethylbenzene and xylenes were reported in MW-6 and MW-7. No MTBE concentrations above laboratory reporting limits (LRLs) were reported for any of the monitoring wells sampled. Quarterly groundwater monitoring and sampling has been conducted at the site since July 2006. From January 15 through 25, 2007, hydrocarbon-impacted soil was excavated from two areas of the site. Soil was temporarily stockpiled, sampled, and soil samples were analyzed for petroleum constituents, and removed from the site. Excavation activities in the western portion of the site (western excavation) were performed as part of the grading activities at the site. Excavation activities took place in the eastern portion of the site (eastern excavation) for installation of the grease interceptors and removal of hydrocarbon impacted soil identified during previous assessment activities. REVIEW OF PREVIOUS ASSESSMENT REPORTS AND AERIAL PHOTOGRAPH RESEARCH In the course of conducting remedial excavation activities, steel piping and soil impacted with hydrocarbons were encountered, particularly in the southern half of the eastern excavation. The steel piping was approximately 2 feet bgs and was removed. Based on the quantity and diameter, the piping appeared to be the remains of product lines and UST vent piping. The level of hydrocarbon impact encountered was surprising since previous assessment reports had not identified any known or suspected source in the eastern excavation area. A review of previous assessment

MONTGOMERY WARD SVC CENTER (Continued) **S103627419**

reports and aerial photographs was performed to evaluate possible historical locations of UST components that had not been identified in previous documents for the site. SECOR (now Stantec) and EnviroApplications personnel, reviewed data to evaluate the historical site layout, available analytical data and sample locations, agency database records, and aerial photographs. Two similarly sized concrete pads to the north and east of the former building were observed in aerial photographs and likely represent former dispenser islands. The USTs were most likely between concrete pads, in the northwest corner. The locations of the USTs and dispenser islands appear to have been incorrectly identified in previous reports for the site. In aerial photographs, a square concrete pad immediately north of the building is present with a discolored oval-oblong shape in the center, which appears to correspond to a dispenser island footprint. Additionally, a concrete square pad similar in size and with a discolored oval-oblong shape can be seen on the eastern side of the building in the location of the eastern excavation. This data in conjunction with field observations is believed to be sufficient to conclude that a second dispenser island was located on the east side of the former Montgomery Ward Automobile Center, and that the USTs were located further east than has been documented in previous assessment reports. CAP submitted 2014 for NFA. Concur with Closure. ITC letter sent out 12/20/2014

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US Emissions & Generation Resource Database (EGRID) contains data on emissions and resource mix for virtually every power plant and company that generates electricity in the United States.

Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	A commercial service station has been in operation at the northeast corner of Adams Avenue and Mountain View Drive in San Diego since at least 1953. The layout of the service station includes one building and three dispenser islands beneath a canopy and has not changed

VALERO STATION #3741 (Continued) **S104746016**

appreciably since 1964. On January 8, 1987, one steel, 10,000-gallon underground storage tank (UST) and one 280-gallon waste oil UST were removed from the 0.25-acre property. The 10,000-gallon UST had been located immediately north of the station canopy, while the waste oil UST was located in the northeast portion of the property behind the service station store building. Two additional 10,000-gallon USTs located beneath the canopy structure at the station were subsequently abandoned in place with concrete slurry, presumably after April 1987, although the date of the UST closures is unknown. The three 10,000-gallon USTs had stored gasoline and were replaced by three, fiberglass-clad, steel USTs. The excavation for the 10,000-gallon UST that was removed was enlarged between the dispenser islands/canopy and the store building to accommodate the three replacement USTs. Analytical results for soil samples collected at the base of the gasoline and waste oil UST excavations indicated petroleum hydrocarbon releases had occurred and an unauthorized release case (#H04752-001) was opened for the site on January 13, 1987. Subsurface exploration indicated that petroleum hydrocarbon impacts extended to a depth of approximately 65 feet below the ground surface (bgs). Soil vapor extraction, accompanied by use of an incinerator, was implemented to mitigate the petroleum hydrocarbon-impacted soil at the site. Because groundwater was estimated to occur at a depth of greater than 100 feet in the area, it was not investigated. The case was closed on February 3, 1994, after soil sample analytical results for a confirmation boring located north of the new UST excavation indicated no detection of petroleum hydrocarbons to a depth of 75 bgs. In December 2001, the dispensers and piping at the service station were upgraded. Nine soil samples were collected from beneath the three former dispenser islands at depths of approximately 2 to 2.5 feet bgs, while three soil samples were collected beneath former product lines. An additional three samples were collected beneath the westernmost former dispenser island in order to assess the vertical extent of petroleum hydrocarbon-impacted soil encountered during sampling activities. Each of the dispenser island samples indicated impacts by gasoline, benzene, toluene, ethylbenzene, and xylenes (BTEX), as well as the fuel oxygenates methyl-tert-butyl ether (MTBE) and tert-butyl alcohol (TBA). The highest concentrations of these chemicals of concern were detected in the samples collected beneath the former center dispenser island. The analytical results for soil samples collected beneath the product piping indicated impacts by gasoline and MTBE. Based on these data, DEH Case #H04752-002 was opened on February 1, 2002. Site assessment activities were initiated with the installation of three onsite groundwater monitoring wells to depths of 110, 118, and 120 feet bgs, respectively. Liquid-phase hydrocarbons (LPH) were detected in one of the newly-installed monitoring wells. Analytical results for groundwater samples collected from the remaining two wells indicated that groundwater had been impacted by the gasoline release. Groundwater monitoring and sampling were subsequently performed on a quarterly basis. LPH was detected in a second well for the first time in June 2005. An additional onsite groundwater monitoring well and two off-site monitoring wells were installed in September and October 2006. The maximum thickness of LPH (5.70 feet) was measured in an on-site well in 2007. LPH was also detected in a third onsite well in 2007 during one monitoring round at a thickness of 0.18-foot. A semi-annual monitoring andsampling schedule was initiated in the second half of 2009. Three additional off-site groundwater monitoring wells were

VALERO STATION #3741 (Continued) **S104746016**

installed in April 2010, and one off-site well was installed in February 2012. Hand-bailing of LPH from the two onsite wells was performed intermittently from 2007 through 2011, and absorbent socks were deployed from 2009 through 2012. Delineation of the dissolved contaminant plume was achieved upon analysis of groundwater samples collected in April 2012. The sampling round included the newly-installed monitoring well located south of the site. TPH as gasoline, BTEX, and fuel oxygenates were not detected in the groundwater sample collected from the well. LPH thicknesses two onsite wells were measured as 0.04 and 0.05-foot, respectively. Geologic logging for borings and wells installed at the site indicate the presence of a silty clay layer to a depth of approximately 8 feet beneath the site, which is underlain by interbedded sands and cobbles to the total depth explored. Horizon Environmental, Inc. (Horizon), the consultant for Ultramar, Inc., submitted a Corrective Action Plan (CAP) for the site in March 2013. The CAP was revised and resubmitted in May 2013. Trend analyses for groundwater contaminant concentrations indicate decreasing trends for benzene, MTBE, and TBA, particularly since 2010. Horizon estimates that contaminant concentrations will fall below their respective Maximum Contaminant Levels (MCLs) within 5 to 30 years. Although the site is located within a hydrologic basin with beneficial uses, the nearest production well is located approximately 5,500 feet northwest of the site in Mission Valley. Based on the decreasing contaminant concentration trends, the stability of the dissolved contaminant plume, the decrease in LPH thickness to less than 0.1-foot, and the lack of sensitive receptors in the area, Horizon has recommended remediation of site soil and groundwater by natural attenuation, no further action, and case closure. DEH concurs with these recommendations.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Description:	RP states that a manhole overflowed due to a blockage in the line resulting in the release of 6000 gallons of sewage. Caller states that 4650 gallons of the release has been recovered and 1350 gallons was lost to the storm drain system. The release is contained and cleanup is complete. Caller states that the storm drain leads to a grassy area along WB I-8 @ Hotel Circle North exit. No waterways have been impacted.

Status:	Completed - Case Closed
Status Date:	11/29/2010
Lead Agency:	SAN DIEGO COUNTY LOP
Case Worker:	EB
Local Agency:	SAN DIEGO COUNTY LOP
RB Case Number:	9UT3944
LOC Case Number:	H21151-004
File Location:	Local Agency
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	This case was opened due to soil contamination discovered during station upgrade activities in December 1999. Soil samples collected near the fill port on the eastern tank contained a maximum concentration of Total petroleum hydrocarbons as gasoline (TPHg) of 9417 mg/kg. A maximum of 1800 mg/kg TPHg were detected in the tank excavation samples. Monitoring wells were installed in 2000. Groundwater monitoring began in January 2001. There are nine wells associated with site. See Environmental Data for additional information.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 02/08/1991
Comments: The PA Report was reviewed by Region 4 staff. The property was

SACKETT & PENDLEBURY BOAT BUILDERS (Continued) **S110498157**

purchased in the '70s by Wilber & Betty Hanger. In 1980 they built a commercial building with 4 small warehouses for rent. From 1980 to 1983, Sackett & Pendlebury Boat Builders rented office space. The boat building was done accross the street at Clark Custom Boats. No evidence of any handling of hazardous substances at the site. Staff recommends NFA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

RB Case Number:	9UT2814
LOC Case Number:	H14312-003
File Location:	Local Agency
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Diesel
Site History:	A release of approximately 800 to 900 gallons of diesel fuel occurred near two underground storage tanks (USTs) in December of 1991, reportedly the result of overfilling of the tanks during an integrity test. Approximately 630 gallons of fuel was recovered by pumping from the vaults immediately following the release. Subsequently, Unauthorized Release H14312-003 was opened. Between September 17,1998 and January 28,1999, seven USTs were removed from the site under the supervision of the DEH. During the UST removal, cracks, and perforations were observed along the bottom of four of the USTs. When tank No. 4 and 5 were removed, approximately 1.5 feet of water and 1-2 inches of free product (believed to be diesel), were observed in the bottom of the excavation. Approximately 1,500 gallons of water and free product were removed from the excavation and transported to the appropriate disposal facility. Site assessment activities have began in 1994 and have continued through 2009. Please see submitted ESI data for further details.

Registry ID: 110018920328

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

UCSD MEDICAL CENTER (Continued) **1007734523**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

STATE MASTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Biennial Reports:

Last Biennial Reporting Year: 2013

Annual Waste Handled:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF

UCSD MEDICAL CENTER (Continued) **1007199341**

LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 26982

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 285

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
Amount (Lbs): 247

Waste code: D004
Waste name: ARSENIC
Amount (Lbs): 247

Waste code: D007
Waste name: CHROMIUM

Background Info:	Space and Naval Warfare Systems Center, Old Town Campus (SPAWAR-OTC), an active satellite of SPAWAR Point Loma, is located north of the Marine Corps Recruit Depot and the San Diego International Airport. It encompasses approximately 60 acres and is 95% covere d by buildings or pavement. Occupied by Lockheed-Martin and the Navy, the base has been utilized for various aircraft, rocket, an d missile assembly and manufacturing. The contamination resulte d from past waste handling practices is encountered at various lo cations inside and outside of the buildings. Known or suspected contaminants in soil and ground- water include heavy metals, poly chlorinated biphenyls, volatile and semi-volatile organic compoun ds, and petroleum products.

Completed Sub Area Name:	S4
Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	02/13/1997
Comments:	A Preliminary Assessment/Site Inspection was performed at Site 4 in 1996. Field work was conducted in July 1996 using "Site Characteriztion and Analysis Penetrometer System (SCAPS), developed by NCCOSC. SCAPS used a 2 inch cone pentrometer housing a laser-induced fluorescence (LIF) detection devise and capable of grabbing soils and water samples. After drilling four 6-inch cores through the concrete, the SCAPS was pushed to groundwater. LIF measurements, soil samples and water samples were performed.

Completed Info:

Completed Area Name:	Sites With No Operable Unit
Completed Sub Area Name:	S4
Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	02/13/1997
Comments:	A Preliminary Assessment/Site Inspection was performed at Site 4 in 1996. Field work was conducted in July 1996 using "Site Characteriztion and Analysis Penetrometer System (SCAPS), developed by NCCOSC. SCAPS used a 2 inch cone pentrometer housing a laser-induced fluorescence (LIF) detection devise and capable of grabbing soils and water samples. After drilling four 6-inch cores through the concrete, the SCAPS was pushed to groundwater. LIF measurements, soil samples and water samples were performed.

Completed Area Name:	PROJECT WIDE

Completed Document Type:	Site Screening
Completed Date:	11/05/1992
Comments:	Site Screening was done by Region 4 staff. Site OT2, Leakin Outdoor PCB Transformers; early 1984, transformers at Bldg 27 were replaced; fluid drained into containers and disposed of at an approved haz. waste landfill in Ca. Gen. Dynamics directed cleanup of soils in 1986 following Cal/OHSA procedures. Site SS6, Used Oil Tank Spill: in 1983, 50 to 100 gals of oil were spilled. Oil was wet vacuumed and use of the tank discontinued. The other spills and leaking tanks were done between 1981 and 1988. Property is being transferred to the Dept. of the Navy.

Status Date:	02/24/2014
Lead Agency:	SAN DIEGO COUNTY LOP
Case Worker:	CH
Local Agency:	SAN DIEGO COUNTY LOP
RB Case Number:	Not reported
LOC Case Number:	H39761-001
File Location:	Local Agency
Potential Media Affect:	Soil, Soil Vapor
Potential Contaminants of Concern:	Gasoline
Site History:	On October 28, 2010, DEH received a Drilling Completion Report detailing the results of soil sampling from 14 borings on site. The soil borings were completed as part of a Phase II investigation prior to sale of the property, and was completed due to the former use of the property as a gasoline station. Total petroleum hydrocarbons (TPH) from gasoline and motor oil were detected at 0.0837 and 853 milligrams per kilogram, respectively, from a soil sample in the area of the former fuel dispensers. Based upon this analytical data, DEH opened Unauthorized Release Case H37961-001. In response, the consultant provided five historical reports detailing the results of soil, soil vapor, and indoor air sampling and a risk assessment report. The risk assessment report provided an analysis of the risk of residual petroleum remaining at the site to groundwater and human health. The consultant calculated the residual saturation of TPH from gasoline and oil, and compared these values to the concentrations detected at the site. Since the concentrations of TPH from gasoline and oil at the site are lower than the calculated residual saturation, the consultant concludes that the TPH is not mobile as non-aqueous phase liquid (NAPL). Given the estimated depth to groundwater, the consultant concludes that the risk to groundwater is minimal, and that further action or risk mitigation is not warranted. The consultant also provided an assessment of the leaching potential of volatile organic compounds (VOCs) detected in soil samples at the site. Naphthalene was the only VOC detected in soil samples at the site, and the concentration was less than maximum allowable soil contamination as per Table 6-5 of the Site Assessment and Mitigation (SAM) Manual. The consultant concludes that existing concentrations of naphthalene are not considered a threat to groundwater quality. The human health risk evaluation included a comparison of concentrations of benzene, toluene, and naphthalene detected in shallow soil vapor and indoor air samples at the site to the California Human Health Screening Levels (CHHSLs). The CHHSLs were

925 FORT STOCKTON (Continued) **S110711901**

only exceeded for benzene and naphthalene in shallow soil vapor samples. To estimate the vapor risk to occupants of the building on site, the consultant used the Johnson and Ettinger Vapor Intrusion model to estimate the risk from benzene, toluene, and naphthalene, and the SAM Vapor Risk model to estimate the risk from benzene. The consultant used the highest constituent concentrations detected in shallow soil vapor and indoor air samples and a commercial scenario. Default parameters were used in the models, with the exception of the floor area, interior height, and air exchange rate, which were specific to the building on site. The results indicate that the concentrations of benzene, toluene, and naphthalene detected in soil vapor and indoor air samples represent a cancer risk less than the DEH threshold of one in one million and a hazard index less than the DEH threshold of one. DEH inspected the site on October 23, 2013 to observe the boring locations and site conditions. After thorough review of all documents provided, DEH concurs with the consultant that closure of the case is appropriate.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Longitude:	-117.199144363403
Case Type:	Cleanup Program Site
Case Worker:	KK
Local Agency:	SAN DIEGO COUNTY LOP
RB Case Number:	9UT201
File Location:	Local Agency
Potential Media Affected:	Soil Vapor
Potential Contaminants of Concern:	Gasoline
Site History:	The site consists of approximately 1.92 acres in the shape of a wedge located between Sports Arena Boulevard and Pacific Highway, approximately 500 feet northwest of their intersection. Pacifica Companies (now Pacific Groves LTD), entered the Department of Environmental Health (DEH), Voluntary Assistance Program (VAP) in January 2004 in anticipation of site redevelopment activities in areas where soil and groundwater impacts associated with underground storage tank (UST) cases H28826-001 and H28826-002 were known to exist. The VAP application indicated that the property owner intended to conduct a vapor risk evaluation and excavation of hydrocarbon-impacted soil at the site to alleviate any potential vapor risks. The majority of assessment activities related to VAP case H28826-003 were conducted under previous UST cases H28826-001 and H28826-002, which were closed in November 1991 and February 2007, respectively. The primary focus of this VAP case, H28826-003, was to evaluate vapor risk for the site, which had not been conducted in accordance with the Site Assessment and Mitigation Manual under the previous UST cases. Historically, the site was reportedly occupied by two large warehouse/storage facilities and one 550 gallon gasoline UST until the late 1980s. Prior to redevelopment to the existing configuration, the site was utilized as a Park-N-Ride facility with a single story garage. Currently the site is developed as a self storage center with three slab on grade structures and associated parking. Hydrocarbon-impacts observed at the subject site were primarily related to the property to the north, located at 4370 Pacific Highway, identified as unauthorized release case H28656-001. Hydrocarbon impacts, including liquid-phase hydrocarbons (LPH), migrated south impacting the subject site and were subsequently mitigated through excavation and groundwater pump and treat activities. These remedial activities significantly reduced hydrocarbon concentrations based on subsequent investigations, however soil vapor sampling indicated the presence of hydrocarbon impacts beneath the human occupied (office) portion of the existing storage facility. The detection of soil vapor impacts from soil vapor probes installed and sampled in 2005 and several insufficient vapor risk evaluations prompted DEH to request additional vapor risk evaluation be conducted. DEH staff ultimately completed the vapor risk evaluation utilizing default input values with the exception of the appropriate slab attenuation factor of 0.01. Taking a simple average of the most recent (2005) vapor risk data for benzene and ethylbenzene, collected from appropriate locations beneath or in close proximity to the existing human occupied portion of the building, the cumulative risk was calculated to be 7.73x10-7, which is less than the 1x10-6 SAM risk threshold. The consultant concluded that the current site use as slab on grade commercial is protective of human health. It is the consultants opinion that no further action is necessary at the site. Based on the provided data, the County of San Diego, Department of Environmental Health agrees with this conclusion.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 03/26/2015
Date Data Arrived at EDR: 04/08/2015
Date Made Active in Reports: 06/22/2015
Number of Days to Update: 75

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/26/2015
Date Data Arrived at EDR: 04/08/2015
Date Made Active in Reports: 06/22/2015

Next Scheduled EDR Contact: 10/19/2015
Data Release Frequency: Quarterly

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994
Number of Days to Update: 56

Source: EPA

Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013
Date Made Active in Reports: 02/13/2014
Number of Days to Update: 94

Source: EPA
Telephone: 703-412-9810
Last EDR Contact: 05/29/2015
Next Scheduled EDR Contact: 09/07/2015
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013

Data Release Frequency: Quarterly

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

Date of Government Version: 02/18/2014

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/10/2015

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 03/10/2015
Date Data Arrived at EDR: 03/31/2015

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/10/2015
Date Data Arrived at EDR: 03/31/2015
Date Made Active in Reports: 06/11/2015

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

Date of Government Version: 03/10/2015
