Subject: Revised Desktop Geotechnical and Geologic Hazard Evaluation
Mission Valley Community Plan Update
San Diego, California

Dear Mr. Bhatia,

We are pleased to submit our Geotechnical and Geologic Hazard Study report. The report was prepared in support of the Mission Valley Community Plan Update and includes identification of geotechnical and geologic hazards within the Study Area and the significance of these hazards to existing and future land uses of the Study Area. Our original report prepared in July 2017, has been revised herein to include review of the most recent Mission Valley Community Plan Update and to incorporate comments from the City of San Diego.

Respectfully submitted,

THE BODHI GROUP, INC.

EXECUTIVE SUMMARY

This Geotechnical and Geologic Hazard Evaluation (Study) identifies geotechnical and geologic hazards that could have potential adverse effects on the area of the Mission Valley Community Plan Update (Study Area). For this study, we reviewed relevant geologic maps and guidelines published by the City of San Diego Guidelines, State of California, and the United States Geologic Survey. In-house resources were also reviewed. A summary of the geology and geologic hazards is provided below.

- In increasing order of age, soils in the Study Area consist of artificial fill (both documented and undocumented), young alluvium, young colluvium, old alluvium, Old paralic deposits (Unit 6), and formational soils of the San Diego and Mission Valley Formations, Stadium Conglomerate, and the Friars and Scripps Formations. Undocumented fill, young alluvium, and young colluvium are not considered suitable in their current state for support of improvements. To mitigate the potential for future settlement, these soils may need to be removed and replaced as compacted fill, if future structures are planned in these areas. The formational materials contain layers of cemented gravel and cobbles which may be difficult to excavate and may impact trenching operations.
- The closest known active fault is the Rose Canyon Fault, strands of which are located within and near the western end of the Study Area. The Study Area, like the rest of San Diego, is in a region of active faults and will be subject to strong ground motion in the event of an earthquake on these faults. Surface rupture caused by faulting can be mitigated by setting back structures for human occupancy away from the surface trace of clearly-defined active fault traces. Adverse effects of ground shaking can be mitigated through ground improvement and/or the use of proper engineering design.
- According to City of San Diego maps, most of the lower elevation portions of the Study Area (areas close to San Diego River) are defined as having a high potential for liquefaction (Geologic Hazard Category 31). Mitigation may include removal of loose soils and replacement with compacted fill, supporting structures on deep foundations which extend through the liquefiable materials, or suitable ground improvement techniques such as stone columns or deep dynamic compaction.
- Landslide hazards are mapped both by the State of California and the City of San Diego. The State of California and City of San Diego use differing systems to indicate the severity of the landslide hazard and the categories used by the two systems are not coincident. According to the State of California (Tan, 1995), most the Study Area is classified as being marginally susceptible to landsliding (Designation 2). Some portions of the Study Area are classified as being generally susceptible or most susceptible to landsliding (Designations 3-1, 3-2, 4-1 and 4-2). These generally susceptible or most susceptible areas occur on the slopes on both the north and south sides of Mission Valley. Per Tan (1995) a mapped landslide occurs on the southern slope of the valley on a side canyon just west of Texas Street (Figure 3). Per Tan and Kennedy (2008) a landslide is mapped south of the western end of the study area on the slopes south of Mission Valley (Figure 3). According to the City of San Diego Seismic Safety Study most sloping portions of the Study Area are mapped as being at low to moderate risk for landsliding (Hazard Categories 51, 52, and 53). Some areas (dominantly on the eastern side of the Study Area) are mapped as being underlain by the potentially slide-prone Friars Formation. Mitigating this designation though these areas of the Friars Formation lie in zones with neutral or favorable geologic structure (Geologic Hazard Category 23). Mitigation of landslides can be accomplished through avoidance, removal of the deposits, or geotechnical and/or structural engineering.

- Most the Study Area consists of soils that are not expansive in nature. But some expansive, clayey soils may be found in areas underlain by the Friars Formation and in areas underlain by soils of the Olivenhain and Huerhuero Soil Series (UC Davis, 2017). In areas of potential expansive soils, measures including capping or replacement, special grading techniques, or chemical treatment of expansive soils can mitigate these problems for new construction.
- Most the Study Area consists of soils that are not anticipated to be corrosive in nature. However, per available soil maps (UC Davis, 2017) potentially corrosive soils may be present in some localized areas underlain by former marine terrace deposits and in areas near the San Diego River. Mitigation measures may include the use of specialized concrete and consultation with a corrosion engineer.

1. INTRODUCTION

The Bodhi Group has completed a Geotechnical and Geologic Hazards Study (Study) of the Mission Valley Community Plan Update area (Study Area). The Study was performed at a California Environmental Quality Act (CEQA) level for the Study Area. This report presents the results of our "desktop" evaluation of the geotechnical and geologic hazards potentially affecting the Study Area. The purpose of our evaluation was to identify geotechnical and geologic conditions or hazards that might affect future development and/or redevelopment within the Study Area. The following services were provided.

- Reviewed the Mission Valley Community Plan Update (2018).
- Reviewed relevant published geologic maps, State of California-issued geologic hazard maps, the City of San Diego Seismic Safety Study Geologic Hazards and Faults maps, and the City of San Diego Guidelines for Geotechnical Reports
- Reviewed and summarized regional and local geology and identified potential geotechnical and geologic hazards.
- Researched and identified relevant geologic hazards listed in the "Guidelines for Geologic/Seismic Consideration in Environmental Impact Reports," California Geological Survey (California Division of Mines and Geology) Note 46 and "Guidelines for Preparing Geologic Reports for Regional-Scale Environmental and Resource Management Planning," California Geological Survey (California Division of Mines and Geology) Note 52, as amended or updated.
- Researched other City and County resources, and our in-house library of geotechnical and geological hazards such as faulting, seismicity, liquefiable soils, etc.
- Prepared this technical report that identifies geotechnical and geologic hazards. Included in this report is a map of the regional and Study Area geology showing distribution of surficial deposits and geologic units (Figure 1); a map of the faults in the Study Area vicinity (Figure 2); and a geohazards map (Figure 3) identifying areas susceptible to the potential geologic hazards described in this report.

1.1. Significant Assumptions

Documentation and data provided by the client or from the public domain, and referred to in the preparation of this study, are assumed to be complete and correct and have been used and referenced with the understanding that the Bodhi Group assumes no responsibility or liability for their accuracy. The conclusions contained herein are based upon such information and documentation. Because conditions may change, and additional data may become available, data reported, and conclusions drawn in this report are limited to current conditions and may not be relied upon on a significantly later date or if changes have occurred at the Study Area.

Reasonable CEQA-level efforts were made during the Study to identify geologic hazards. "Reasonable efforts" are limited to information gained from information readily-accessible to the public. Such methods may not identify Study Area geologic or geotechnical issues that are not listed in these sources. In the preparation of this report, the Bodhi Group has used the degree of care and skill ordinarily exercised by a reasonably prudent environmental professional in the same community and in the same time frame given the same or similar facts and circumstances. No other warranties are made to any third party, either expressed or implied.

2. PROJECT LOCATION AND DESCRIPTION

The Study Area comprises approximately 3,216 acres and is near the geographic center of the City of San Diego. It encompasses a portion of the San Diego River floodplain, it is generally bounded by Friars Road and the northern slopes of the valley on the north, the eastern banks of the San Diego River on the east, the southern slopes of the valley on the south, and Interstate 5 on the west (City of San Diego, 1985).

The current Mission Valley Community Plan Update was approved in 1985 and last amended in 2013. The community is now a regional center of office, hotels, retail sales, and a growing residential population. Public transportation within the area is provided by the Metropolitan Transit System and includes buses and the San Diego Trolley Green Line. Major thoroughfares include Interstate Highway 8 and Friars Road and Camino del Rio (running east-west through the area) and Interstate Highways 805 and 15 and California Route 163 (running north-south through the area).

The current Mission Valley Community Plan provides the detailed framework to guide development in Mission Valley. Originally adopted in 1985, the plan has undergone over 20 amendments in the intervening years. According to the City of San Diego website (2017), the Community Plan update seeks to bring the plan up-to-date by: analyzing current land use, development, and environmental characteristics; evaluating changes in demographics that may affect land use needs; understanding demand for housing and commercial development; working with community members and stakeholders to determine key issues of concern, desires, and preferences to establish a vision and objectives for the plan update; evaluating the "fit" of current Community Plan policies to achieve community goals and regulatory requirements; and ensuring that policies and recommendations remain in harmony with the General Plan and citywide policies, as well as regional policies.

3. HISTORY

Throughout the history of Mission Valley, the San Diego River has been a primary attraction, first as a source of fresh water and later as a scenic recreational asset. After the Kumeyaay Indians, came the Spaniards, who first named the area La Canada de San Diego. The Spaniards founded the Mission San Diego de Alcala on Presidio Hill in 1769 (City of San Diego, 1985); however, in 1774 it was moved to its present location on San Diego Mission Road in Mission Valley.

In 1870, the name of the area was changed to Mission Valley. Truck farming, sheep herding, and bee keeping were introduced into the valley. By 1880, 20 dairies had been established in the valley. Sand and gravel extraction was introduced in 1913 and began in earnest about 1923. The Mission Valley Oil Enterprise Company unsuccessfully explored for oil at the foot of Texas Street in 1930.

Residential development was approved for Mission Valley in 1940 by local authorities. The Mission Valley Golf Club was established in 1947. In 1953-1954 the Town and Country Hotel and Mission Valley Country Club (now the Handlery Hotel) opened.

In 1958, the Planning Department issued a preliminary study for the valley favoring hotels over dense residential and commercial uses. The construction of U.S. 80 (now Interstate 8) provided an impetus for commercial development in Mission Valley, and for displacement of the agricultural economy. Other significant projects include San Diego Stadium (now Qualcomm Stadium) which was completed in 1967. Major urban development followed, primarily because of improvements in the regional highway network (City of San Diego, 1985).

4. GEOLOGY

San Diego is located within the western (coastal) portion of the Peninsular Ranges Geomorphic Province of California. The Peninsular Ranges encompass an area that roughly extends from the Transverse Ranges and the Los Angeles Basin, south to the Mexican border, and beyond another approximately 800 miles to the tip of Baja California (Norris and Webb, 1990; Harden, 1998). The geomorphic province varies in width from approximately 30 to 100 miles, most of which is characterized by northwest-trending mountain ranges separated by subparallel fault zones. In general, the Peninsular Ranges are underlain by Jurassic-age metavolcanic and metasedimentary rocks and by Cretaceous-age igneous rocks of the southern California batholith. Geologic cover over the basement rocks in the westernmost portion of the province in San Diego County generally consists of Upper Cretaceous-, Tertiary-, and Quaternary-age sedimentary rocks

Structurally, the Peninsular Ranges are traversed by several major active faults. The Elsinore, San Jacinto, and the San Andreas faults are major active fault systems located northeast of San Diego and the Rose Canyon, San Diego Trough, Coronado Bank and San Clemente faults are major active faults located within or west-southwest of San Diego. Major tectonic activity associated with these and other faults within this regional tectonic framework is generally right-lateral strike-slip movement. These faults, as well as other faults in the region, have the potential for generating strong ground motions in the project area. Further discussion of faulting relative to the Study Area is provided in following sections of this report.

Figure 1, modified from Kennedy and Tan (2008), shows the regional geology. Figure 2 shows the proximity of the Study Area to nearby mapped Quaternary faults. A Quaternary fault is defined by the State of California (2007) as a fault that shows evidence of movement in the last 1.6 million years. Quaternary (Holocene and Pleistocene) faults can be classified as either active or potentially active faults. Active faults are those Quaternary Holocene faults which have been shown to have ruptured in the last 11,000 years. Potentially active faults are those Quaternary Pleistocene faults which have been shown to have ruptured during the 1.6 million years but not within the last 11,000 years.

4.1. Local Geology

In increasing order of age, soils in the Study Area consist of artificial fill (both documented and undocumented), young alluvium, young colluvium, old alluvium, Old paralic deposits (Unit 6), and formational soils of the San Diego and Mission Valley Formations, Stadium Conglomerate, and the Friars and Scripps Formations. Descriptions of the general characteristics of these units are presented below.

- Af Artificial fill (late Holocene). These consist of fill deposits resulting from human construction, mining, or quarrying activities. These include both documented and undocumented and/or non-engineered fill. Large areas of Artificial Fill deposits are shown on the map but, although present, some areas of artificial fill are not large enough to be shown at the scale of the map. The mapped areas of Artificial Fill are coincident with the route of Interstate Highway I-8 and its interchanges with State Highway CA-163 and Qualcomm Way within the Study Area. A mapped Artificial Fill Area is also shown to underlie the area where Interstate Highway I-805 traverses the Study Area.
- Qya – Young alluvial flood-plain deposits (Holocene and late Pleistocene). Young alluvial flood-plain deposits are characterized as poorly consolidated, poorly sorted, permeable floodplain deposits of sandy, silty, or clay-bearing alluvium. These deposits occur along the floodplain of the San Diego River down the central axis of Mission Valley.

- Qyc – Young colluvial deposits (Holocene and late Pleistocene). These consist of young poorly consolidated and poorly sorted sand and silt slopewash deposits and are mapped throughout the Study Area (dominantly on the south side of the valley).
- Qoa – Old alluvial flood-plain deposits (late to middle Pleistocene). These are dominantly fluvial sediments deposited on canyon floors consisting of moderately well consolidated, poorly sorted, permeable, commonly slightly dissected gravel, sand, silt, and clay-bearing alluvium. Per the referenced map these deposits are present in portions of the eastern side of the valley (near Qualcomm Stadium).
- Qop6 – Old paralic deposits, Unit 6 (late to middle Pleistocene). Unit 6 of the old paralic deposits is characterized as poorly sorted, moderately permeable, reddish-brown, interfingered strandline, beach, estuarine, and colluvial deposits composed of siltstone, sandstone, and conglomerate. Per the referenced map these deposits are restricted to small areas on the north side of the Study Area.
- Tsd – San Diego Formation, undivided (early Pleistocene and late Pliocene). The San Diego Formation is characterized as predominantly yellowish-brown and gray, fine- to medium-grained, poorly indurated fossiliferous marine sandstone and reddish-brown transitional marine and non-marine pebble and cobble conglomerate, both divided and undivided. Undivided portions of the formation are exposed on the southern slopes of Mission Valley.
- Tmv – Mission Valley Formation (middle Eocene). The Mission Valley Formation is present throughout the Study Area but it is most exposed on the northern flank of Mission Valley. It consists predominantly of light olive-gray, soft and friable, fine- to medium-grained marine and non-marine sandstone containing cobble conglomerate tongues. The Mission Valley Formation has a maximum thickness of nearly 200 feet.
- Tst – Stadium Conglomerate (middle Eocene). The Stadium Conglomerate is present throughout the Mission Valley area but it most exposed on the northern flank of the valley. It consists of massive cobble conglomerate with a dark-yellowish brown, coarse-grained sandstone matrix. The conglomerate contains slightly metamorphosed volcanic and volcaniclastic rocks and quartzite. The Stadium Conglomerate is approximately 150 feet thick at its type section, located near Qualcomm Stadium (Kennedy and Tan, 2008; after Kennedy and Moore, 1971).
- Tf – Friars Formation (middle Eocene). This formation consists of yellowish-gray, medium-grained, massive, poorly indurated non-marine and lagoonal sandstone and claystone with tongues of cobble conglomerate. Within the Study Area it is exposed on the north side of Mission Valley at its eastern end.
- Tsc – Scripps Formation (middle Eocene). The Scripps Formation is present throughout the Study Area but is most exposed on the northern flank of the valley. It consists of pale-yellowish-brown, medium-grained sandstone with some interbedded cobble-conglomerate.

5. HYDROGEOLOGY

Based on a review of available hydrogeologic data from the California Regional Water Quality Control Board San Diego Region (RWQCB, 1994), the Study Area is located in the Mission San Diego Hydrologic Subarea within the Lower San Diego Hydrologic Area (907.11) of the San Diego Hydrologic Unit (907.00). The existing beneficial uses of groundwater in the Study Area include agricultural supply, industrial service supply, and industrial process supply (RWQCB, 1994). Municipal supply is identified in the basin plan as a potential beneficial use (RWQCB, 1994).

The San Diego County Water Authority has classified the Mission Valley portion of the San Diego River to be a principal alluvial aquifer (referred to as the Mission Valley Aquifer). Presently, the City of San

Diego, the local water purveyor, is not using this alluvial aquifer for municipal water supply; however, in the future the City may evaluate potential groundwater use from this aquifer. The details of future groundwater development are not known at this time. Golf courses in the Study Area are the principal users of groundwater for irrigation.

Per information available on the State of California, Department of Water Resources, Water Data Library (2017) and the Geotracker (2017) website there are few public wells located within the Study Area. However, numerous groundwater wells have been installed throughout the Study Area for environmental evaluations conducted to assess contaminated soil and groundwater. Based on that research groundwater is present at relatively shallow depths (less than 10 feet below the adjacent surface) in areas within the Study Area.

6. GEOLOGIC HAZARDS

This section identifies geologic hazards that may affect proposed policies and programs of the Mission Valley Community Plan Update and proposed land use. The proposed land uses were not available at the time of preparation of this report. These hazards include surface fault rupture; seismicity and ground motion; liquefaction; seismically-induced settlement and lateral spread; tsunamis, seiches, and dam failure; slope instability; and expansive and corrosive soils. These hazards, with the possible exception of dam failure, can be mitigated through administrative controls (e.g., avoiding building in hazard-prone areas or structure setback) and/or engineering improvements (e.g., ground improvement, ground restraints, or appropriate structure foundation). Site-specific and hazard-specific geotechnical investigations would be required to evaluate the appropriate mitigation measure or combination of measures.

The City of San Diego Seismic Safety Study summarizes the city's known and suspected geologic hazards and faults to "comply with California regulations requiring cities to adopt a Seismic Safety Element within their general plan" (City of San Diego 2008). The intent of the study was to categorize areas in the city by hazard type (shown on maps) and to assign levels of risk to development. The maps can be used to identify possible or likely types and risk of geologic hazards for a site. The Explanation for the map was updated in 2018. The Study Area encompasses all or portions of map Sheets 21, 22, 26, and 27 of the City of San Diego Seismic Safety. Identified hazards are described below.

6.1. Surface Fault Rupture

Surface fault rupture is the result of movement on an active fault reaching the surface. Figure 2 shows the Study Area in relation to nearby known active faults, of which the Rose Canyon Fault is the most significant. The Rose Canyon Fault is capable of producing a magnitude 7.2 earthquake (Cao et al, 2003). Active portions of the Rose Canyon Fault, some of which are concealed, are located within and near the western end of the Study Area. In addition, as shown on the City of San Diego Seismic Safety map sheets there are several faults noted as being "Potentially Active, Inactive, Presumed Inactive, or Activity Unknown" (Geologic Hazard Category 12; City of San Diego, 2008) that lie within the Study Area. Similar faults are also shown on the web accessible maps available from SANDAG (SANDAG, 2017). Newer fault discoveries have been plotted based on maps available online at the San Diego Association of Geologists (2018). Areas underlain by north-south trending faults in this category are located at locations on the south side of Mission Valley near Texas Street and between Mission Center Road and Interstate Highway 805; and on the north side of Mission Valley near the intersection of Interstate Highway 15 and

Friars Road. The postulated Mission Gorge fault has been mapped paralleling the axis of Mission Valley (Figure 2). The "fault" was postulated to exist due to changes in stratigraphy on either side of Mission Valley. Richard Threet (1973) showed conclusively that the apparent differences in stratigraphy were the result of a shallow southerly regional dip and the presence of the edges of depositional basins (San Diego Formation).

Although the Study Area is not within a State of California Earthquake Fault Zone (State of California, 2003) or the City of San Diego- designated "Downtown Special Fault Zone," strands of the active Rose Canyon fault underlie the western end of the Study Area. The area is currently planned for use as a passive park or open space. No construction is planned in the area underlain by the Rose Canyon fault zone. Should plans change, the City of San Diego will require site-specific fault investigations for construction of any type. The fault investigations will evaluate whether the development overlies an active fault strand capable of surface rupture and will provide recommendations to avoid the hazard or mitigate its effects.

6.2. Seismicity and Ground Motion

An active fault is defined by the State Mining and Geology Board as one that has experienced surface displacement within the Holocene epoch, i.e., during the last 11,000 years (California Geological Survey, 2007). The Study Area is subject to potential ground shaking caused by activity along faults located within and near the Study Area.

The Rose Canyon Fault can produce a magnitude 7.2 earthquake (Cao et al, 2003). Portions of the Elsinore and San Jacinto Fault zones, located east of San Diego, have the capacity to produce earthquakes at maximum magnitudes from 6.4 to 7.2 (Cao et al, 2003).

Ground shaking during an earthquake can vary depending on the overall magnitude, distance to the fault, focus of earthquake energy, and the type of geologic material underlying the area. The composition of underlying soils, even those relatively distant from faults, can intensify ground shaking. Areas that are underlain by bedrock tend to experience less ground shaking than those underlain by unconsolidated sediments such as artificial fill or unconsolidated alluvial fill.

As noted, the Study Area is subject to ground shaking hazards caused by earthquakes on regional active faults. Based on a Probabilistic Seismic Hazards Ground Motion Interpolator provided by the California Department of Conservation (2008), the Study Area is located in a zone where the horizontal peak ground acceleration having a 10 percent probability of exceedance in 50 years ranges from 0.450g (where g represents the acceleration of gravity) to 0.582g. Within the Study Area the higher value occurs at the west end and the lower value occurs at the east end.

6.3. Liquefaction, Seismically Induced Settlement, and Lateral Spread

Liquefaction is a phenomenon whereby unconsolidated and/or near-saturated soils lose cohesion as a result of severe vibratory motion. The relatively rapid loss of soil shear strength during strong earthquake shaking results in temporary, fluid-like behavior of the soil. Soil liquefaction causes ground failure that can damage roads, pipelines, underground cables, and buildings with shallow foundations. Research and historical data indicate that loose granular soils and non-plastic silts that are saturated by a relatively shallow groundwater table are susceptible to liquefaction.

Among the potential hazards related to liquefaction are seismically induced settlement and lateral spread. Seismically induced settlement is caused by the reduction of shear strength due to loss of grain-to-grain contact during liquefaction and may result in dynamic settlement on the order of several inches to several feet. Lateral spreading of the ground surface during an earthquake usually takes place along weak shear zones that have formed within a liquefiable soil layer. Lateral spreading has generally been observed to take place in the direction of a free-face (i.e., retaining wall, slope, channel, etc.) but has also been observed to a lesser extent on ground surfaces with gentle slopes. An empirical model developed by Bartlett and Youd (1995, revised 1999) is typically used to predict the amount of horizontal ground displacement within a site. For sites located in proximity to a free-face, the amount of lateral ground displacement is strongly correlated with the distance of the site from the free-face. Other factors such as earthquake magnitude, distance from the earthquake epicenter, thickness of the liquefiable layers, and the fines content and particle sizes of the liquefiable layers will also affect the amount of settlement or lateral ground displacement.

Large portions of the low-lying areas adjacent to the San Diego River lie within City of San Diego-designated liquefaction hazard zones (Geologic Hazard Map Symbol 31; City of San Diego, 2008) as shown on Figure 3. As noted, liquefiable soils can settle or spread as a result of earthquake energy.

6.4. Tsunamis, Seiches, and Dam Failure

A tsunami is a sea wave generated by a submarine earthquake, landslide, or volcanic action. Submarine earthquakes are common along the edge of the Pacific Ocean, thus exposing all Pacific coastal areas to the potential hazard of tsunamis. However, no portion of the Study Area lies within a mapped tsunami inundation zone. A seiche is an earthquake-induced wave in a confined body of water, such as a lake, reservoir, or bay. However, no portion of the Study Area lies near a confined body of water on which a seiche could be expected to occur.

An earthquake-induced dam failure can result in a severe flood event. When a dam fails, a large quantity of water is suddenly released with a great potential to cause human casualties, economic loss, lifeline disruption, and environmental damage. Based on review of the 2010 San Diego County Multi-Jurisdictional Hazard Mitigation Plan Dam Failure map, the Study Area may be subject to dam inundation as it is downstream of dams and reservoirs that were constructed on the San Diego River. These include Lake Murray, Santee Lakes, El Capitan Reservoir, and other smaller impoundments.

6.5. Slope Instability

Slopes steeper than 2:1 (horizontal:vertical) are susceptible to landslides or slope failure. Slope failure is dependent on topography and underlying geologic materials, as well as factors such as rainfall, excavation, or seismic activities that can precipitate slope instability. Earthquake motions can induce significant horizontal and vertical dynamic stresses along potential failure surfaces within a slope.

Landslide hazards are mapped both by the State of California and the City of San Diego. The State of California and City of San Diego use differing systems to indicate the severity of the landslide hazard and the categories used by the two systems are not coincident. According to the State of California (Tan, 1995), most the Study Area is classified as being marginally susceptible to landsliding (Designation 2). However, some portions of the Study Area are classified as being generally susceptible or most susceptible to landsliding (Designations 3-1, 3-2, 4-1 and 4-2). These generally susceptible or most susceptible areas occur on the slopes on both the north and south sides of Mission Valley. Per Tan (1995)

a mapped landslide occurs on the southern slope of the valley on a side canyon just west of Park Boulevard and south of Interstate 8. Per Tan and Kennedy, 2008, there is a mapped landslide at the western end of the Study Area on the southern slopes just east of Interstate Highway 5 and south of Interstate 8 (Figure 3). It should be noted that neither of these landslides are shown on the City of San Diego Seismic Safety Study maps.

According to the City of San Diego Seismic Safety Study most sloping portions of the Study Area are mapped as being at low to moderate risk for landsliding (Hazard Categories 51, 52, and 53). However, some areas (dominantly on the eastern side of the Study Area) are mapped as being underlain by the potentially slide-prone Friars Formation.

6.6. Subsidence

Subsidence typically occurs when extraction of fluids (water or oil) cause the reservoir rock to consolidate. Water extraction is minimal in the Study Area and the geologic materials area well consolidated. Subsidence is not a hazard in the Study Area.

Settlement of unconsolidated soil (fill or alluvium) may occur locally where new loads are imposed on previously uncompacted fill, compacted fill on unconsolidated alluvium, or unconsolidated alluvium.

6.7. Expansive or Corrosive Soils

Other potential geological hazards include expansive or corrosive soils. Expansion of the soil may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors. Soils with a relatively high fines content (clays dominantly) are generally considered expansive or potentially expansive.

7. IMPACT MITIGATION

The impacts summarized above may be mitigated through administrative controls (e.g., avoiding building in hazard-prone areas or structural setback areas) and/or engineering improvements (e.g., ground improvement, ground restraints, remedial grading or foundation design). Site specific geotechnical investigations are required to recommend the appropriate mitigation measure(s).

7.1. Seismicity and Ground Motion

The entire Study Area will be affected by seismicity and ground motion. Mitigation can be accomplished by geotechnical and structural engineering design. Geotechnical investigations should be conducted in accordance with City of San Diego Guidelines for Geotechnical Reports and State of California requirements. Most mitigation measures will involve foundation design and or ground improvement.

7.2. Liquefaction, Seismically Induced Settlement

Predicted liquefaction will occur near the existing San Diego River Channel Mitigation can be accomplished by ground improvement and or foundation design. Geotechnical investigations should be conducted in accordance with City of San Diego Guidelines for Geotechnical Reports and State of California requirements.

7.3. Tsunamis, Seiches, and Dam Failures

A dam failure would be difficult to mitigate. Future developments may be constructed at higher elevations to avoid flooding from dam failure; however, such administrative controls would have to be consistent with proposed policies, programs, and land use in the Mission Valley Community Plan Update.

7.4. Slope Instability

Mitigation may be achieved by avoidance of development on slopes or stabilizing the slopes through grading or using specially designed foundations. Geotechnical investigations should be conducted in accordance with City of San Diego Guidelines for Geotechnical Reports with an emphasis on slope stability. Additions to existing structures or development of ancillary structures to existing development will need independent geotechnical investigations if located within 25 feet of slopes in excess of 10 feet high, and on undocumented fills. The investigations should be applied in Hazard Categories 23 and 53.

Mitigation of landslides can be accomplished through avoidance, removal of the deposits, or geotechnical and/or structural engineering. Geotechnical studies specific to a future development will evaluate the risk of slope instability and landslides and provide recommendations to avoid the risk or identify measures for slope stabilization, if such a risk is present.

7.5. Subsidence

Construction of improvements in areas underlain by young colluvium, alluvium or fill should be designed to withstand settlement of unconsolidated soil. Geotechnical investigations for design of settlement resistant structures should be conducted in accordance with City of San Diego Guidelines for Geotechnical Reports. Mitigation measures typically include ground improvement and/or foundation design.

7.6. Expansive or Corrosive Soil

Expansive soil measures include specially reinforce foundations or removal and replacement of expansive soil with less expansive material. Roadways may need heavier pavement sections. Geotechnical investigations should be conducted in accordance with City of San Diego Guidelines for Geotechnical Reports to provide appropriate recommendations. Corrosive soil should be evaluated by a Corrosion Engineer for recommendations for soil replacement or cathodic protection.

7.7. Impermeable Soil

Infiltration potential should be evaluated in accordance with City of San Diego Storm Water Standards, Part 1, 2017 Edition (City of San Diego, 2017).

7.8. Groundwater

The effects of potential groundwater on construction should be evaluated by geotechnical investigations in accordance with City of San Diego Guidelines for Geotechnical Report. Recommendations for dewatering, temporary and permanent slope stabilization, and subsurface drainage should be discussed.

8. THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the CEQA Guidelines, the project will have significant effect on the environment if:

G-1: Expose people to potential substantial adverse effects, including the risk of loss, injury or death involving: a) fault rupture, b) seismic shaking, c) seismic ground failure, d) landsliding.

G-2: Result in substantial soil erosion or loss of top soil.

G-3 Be located in a geologic unit or soil that is unstable (landsliding, settlement, lateral spreading) or that would become unstable as a result of the project.

G-4: Be located on expansive soil causing substantial risk to life or property.

G-5: Having soils incapable of supporting the use of septic tanks where sewers are not available

8.1. Threshold G-1 a) Fault Rupture

No significant effect. There are no active or potentially active faults in the proposed development areas shown on the Mission Valley Community Plan Update maps.

8.2. Threshold G-1 b) Strong Seismic Ground Shaking

Less than significant effect. Construction of buildings and other civil works will be required to use seismic resistant designs in accordance with California and City standards and codes. If not constructed to these standards, the impact would be significant.

8.3. Threshold G-1 c) Seismic Ground Failure

Less than significant effect. Design of buildings or other civil works in areas where liquefaction is anticipated should be analyzed by geotechnical investigations performed in accordance with City of San Diego and State of California guidelines. The effects of liquefaction and seismic ground failure can be mitigated through foundation and structural design and or through ground improvement.

8.4. Threshold G-1 d) Seismic Induced Landsliding

Less than significant effect. Planned development will be within areas previously developed. Slopes within developed areas have been constructed in accordance with City of San Diego standards and codes and are assumed to be stable under static and pseudostatic conditions.

8.5. Threshold G-2 Substantial Soil Erosion and Loss of Topsoil

Less than significant effect. The Study Area is almost fully developed with landscaping, buildings, and paving. Areas not developed are dedicated open space areas that are well covered with natural vegetation. As a result, the potential for erosion is very low. Since construction will be required to follow City of San Diego standards and code that stipulate protection against temporary and permanent erosion, the impact of erosion and loss of topsoil is less than significant.

8.6. Threshold G-3 Unstable Soil (Landslide, Settlement, Lateral Spreading)

Landslide: Less than Significant. The Mission Valley Community Plan Update (MVCPU) shows planned development only in areas previously developed and are not in landslide prone formation.

Settlement: Less than Significant. Settlement prone soil within the MVCPU consists of young colluvium, alluvium, undocumented fills, and fills placed on settlement prone soil. The impact of these settlement prone soils will occur when additions or new fills place new loads on settlement prone soil. Geotechnical reports performed in accordance the City of San Diego Guidelines should be required for ANY new development that would add additional loads on undocumented fills, fills placed on settlement prone soil.

Without changing the requirements for geotechnical investigation for minor additions or fills, the effects of Settlement Prone Soil on the planned development could be significant.

Lateral Spreading: Less than Significant. Lateral Spreading occurs in sloping liquefaction prone soil or liquefaction prone soil with an open face (slope). Liquefaction prone soil in the Study Area is overlain be fill or is confined to stream channel bottoms. The potential for lateral spreading in the Study Area is insignificant.

8.7. Threshold G-4 Expansive Soil

Less than Significant. Expansive soil is present on the mesa portions of the Study Area. This area has been heavily modified by previous development, so the distribution of the expansive soil will be site dependent. Geotechnical investigations as required by the City of San Diego will identify the effects of expansive soil on the planned development. Typical remediation measures include removal of unsuitable soil and replacement with non-expansive soil, chemical treatment of expansive clay, or specially designed and reinforced foundations.

8.8. Threshold G-5 Soil Unsuitable for Onsite Sewage Disposal Systems

Less than Significant. Soil and geologic formations with poor percolation characteristics are widespread in the Study Area. The Study Area is currently well served by existing sewer systems. The use of onsite sewage disposal systems is not anticipated.

9. CONCLUSIONS

Conclusions of this Study are listed below.

- There are no geologic hazards that cannot be avoided or mitigated
- There are no policies or recommendations of the MVCPU which will have a direct or indirect significant environmental effect with regard to geologic hazards.
- The proposed land uses are compatible with the known geologic hazards.
- There are no potential impacts related to geologic hazards from the implementation of the MVCPU that can't be avoided, reduced to an acceptable level of risk, or reduced below a level of significance through mandatory conformance with applicable regulatory requirements or the recommendations of this technical report.
- The draft EIR and MVCPU plan (January 7, 2019) are in general conformance with the findings and conclusions of this Study.

10. LIMITATIONS

This report was prepared in general accordance with current guidelines and the standard-of-care exercised by professionals preparing similar documents near the Study Area. No warranty, expressed or implied, is made regarding the professional opinions presented in this document. As this report represents a review of existing documentation on geotechnical conditions of the planning areas rather than in-depth on-site investigation, it cannot account for variations in individual site conditions or changes to existing conditions. Please also note that this document did not include an evaluation of environmental hazards.

The conclusions, opinions, and recommendations as presented in this document, are based on a desktop analysis of data, some of which were obtained by others. It is our opinion that the data, as a whole, support the conclusions and recommendations presented in the report.

The purpose of this study was to evaluate geologic and geotechnical conditions within the planning areas to assist in the preparation of environmental impact documents for the project. Comprehensive geotechnical evaluations, including subsurface exploration and laboratory testing, should be performed prior to design and construction of structural improvements. Any future projects on individual sites in the planning areas will require site-specific geotechnical studies as required by State and City regulations.

Subject: Hazardous Materials Technical Study
Mission Valley Community Plan Update
San Diego, California

Dear Mr. Winch:

We are pleased to submit our Hazardous Material Technical Study report. The report was prepared in support of the Mission Valley Community Plan Update and includes identification of hazardous materials release sites within the Study Area and the significance of these releases to existing and future land uses of the Study Area.

Respectfully submitted,
THE BODHI GROUP INC

EXECUTIVE SUMMARY

This Hazardous Materials Technical Study (Study) evaluated the presence and levels of hazardous chemicals that could have potential adverse effects to the planned land uses of the Mission Valley Study Area (Study Area). Sites where hazardous chemicals and petroleum have been used, stored, conveyed, or dispensed, and sites where there have been spills or unauthorized release of hazardous chemicals or petroleum to the subsurface were identified in the preliminary phase of this Study. State databases owned and maintained by the State Water Resources Control Board ("Geotracker"), the California Environmental Protection Agency Department of Toxic Substances Control ("Envirostor"), and CalRecycle ("Solid Waste Information System or SWIS") were queried to identify sites within the Mission Valley Study Area and immediate vicinity. In addition, a third-party vendor, "EDR," was retained to identify sites in and near the Study Area from Federal, State, local, and tribal databases. Over 2,200 sites were identified in the preliminary phase of the Study as having some documentation of hazardous materials use, storage, or release.

Of these, 1,478 sites were considered to have the potential to adversely affect human health or groundwater resources in the Study Area based on the type of chemical stored or released, potential pathways of contaminant migration into the Study Area, and data from wells along the Study Area perimeter. These sites are displayed on the Map HAZMAP-01.

Of the 1,478 sites, 46 were selected based on at least one of the criteria listed below. The remaining 1,432 sites either did not have releases or the releases did not result in potential adverse effects to human health or groundwater resources in the Study Area.

- Sites with known unauthorized releases of hazardous chemicals or petroleum under regulatory oversight.
- Sites with residual concentrations of chemicals in the subsurface (in the Study Area).
- Sites outside the Study Area but where chemicals in the subsurface had the potential to migrate beneath the Study Area.
- Regulatory status.

The degree of potential adverse effects to human health and/or groundwater resources differ based on the specifics of each release case and are influenced by the type and quantity of chemicals released (i.e., volatility, solubility, toxicity, persistence), affected media (i.e., soil, groundwater, soil gas), source area concentrations, physical characteristics of the site such as geology, hydrogeology, preferential pathways for contaminant migration, and whether the chemicals have effectively attenuated or have been actively remediated to levels that are less than significant.

Based on an evaluation of the above criteria and our experience, each of the 46 sites were assigned a hazard ranking from 5 (Very high) to 1 (Very low).

Rank	Hazard	Description	Consequences
5	Very high	Potentially acute threat to human health or environment	Immediate action needed to mitigate existing threat.
4	High	Potentially significant risk to human health or environment	Investigation or remediation needed for existing risk. Or, new development will be subject to remedial measures.

Rank	Hazard	Description	Consequences
3	Moderate	Potential threat/risk to human health or environment	Possible investigation needed for existing development. Residual contamination in soil and/or groundwater may necessitate re-opening of case based on potential adverse effects to human health (Vapor Intrusion pathway) or groundwater or if closure standards are revised.
2	Low	Less than significant threat/risk to human health or environment	Special management/notification in case of subsurface work. New development may necessitate verification of closure standards.
1	Very low	De Minimis conditions	No action or special management needed other than possible notification.

The 46 ranked sites are displayed on Map HAZMAP-02. A majority of the sites have achieved regulatory closure; however, the current standard of practice, improved understanding of the fate and transport of chemicals, improved knowledge of chemical toxicity and effects, levels of residual chemicals, and media affected were considered in assigning rank.

Seven sites were assigned a Rank of 1; twenty-six sites were assigned a Rank of 2; ten sites were assigned a Rank of 3; three sites were assigned a Rank of 4; and none of the sites were assigned a Rank of 5.

The results indicate that there are no hazardous sites in the Study Area that would result in very high hazards relative to planned use of the Area. Of the sites with Rank 4, two are associated with bulk petroleum releases at the Mission Valley Terminal and the resulting off-site migration of chemicals beneath the Qualcomm Stadium site.

Remedial measures at the locations affected by the Mission Valley Terminal releases have been successful. However, not all chemicals have been completely removed and residual levels of contaminants may result in some adverse effects to human health and/or groundwater resources. There is a risk that rising water levels could mobilize residual chemicals. This risk can be mitigated and/or managed by the continued operation of the remedial system.

The other site with Rank 4, the former Montgomery Ward site, has a remedial measure in place that will need to be re-implemented for future use of the area affected by releases at that site.

Sites with a Rank of 3 may require additional investigation (possibly Vapor Intrusion assessment), and in a few cases, additional remediation if the current standard of practice indicate significant risks to future receptors. The need for additional investigation may be triggered by redevelopment, development of groundwater resources, discovery of contamination that was previously unknown, or changes in science and an increase in knowledge of chemical fate, transport, and toxicity that may indicate an increase in potential adverse effects to human health and/or groundwater resources.

Sites with a Rank of 2 may result in potential adverse effects to human health and/or groundwater resources, if the affected media (soil, groundwater) is excavated, extracted, or otherwise disturbed for redevelopment. In addition, regulations may require that contaminated soil and groundwater be managed with conditions, and, if needed, disposed of properly.

Sites with a Rank of 1 may require no action, other than possible notification to relevant parties.

1. INTRODUCTION

The Bodhi Group has completed a hazardous materials technical study (Study) of the Mission Valley Community Plan Update area (Study Area). The Study was performed at a California Environmental Quality Act (CEQA) level for the Community Plan Update. The evaluation includes an Environmental Data Resources (EDR) Area search of the Study Area, a search of pertinent Federal, State and local regulatory agency database records, search of regulatory records, and historical land use information from readily available public records. The EDR report is included as Appendix A.

The Consultant conducted a preliminary field visit to view select sites from public access points (streets, parking lots) identified during the database research. However, since the hazards at these sites are subsurface, the field visit did not provide further information other than confirmation of the presence of physical features (e.g., aboveground storage tanks or ASTs) or the presence of a business.

Further study would confirm or revise the findings of this study of the presence of hazardous materials and petroleum constituents below ground. This report also includes a list of local, state and federal laws and regulations governing hazardous materials. The list of applicable regulations is included as Appendix B.

1.1. Significant Assumptions

Although the search identified known sites and locations where hazardous materials have been stored, dispensed, conveyed, or spilled, only sites with documented hazardous material releases and oversight by a regulatory agency (local or State agency) were considered to have conditions that could present a risk to human health or the environment.

Documentation and data provided by the client, other interested third parties, or from the public domain, and referred to in the preparation of this assessment, are assumed to be complete and correct and have been used and referenced with the understanding that the Bodhi Group assumes no responsibility or liability for their accuracy. The conclusions contained herein are based upon such information and documentation and on our observations of Study Area conditions, as they existed on the date of this report. Because the Study Area conditions may change significantly over a short period of time and additional data may become available, data reported and conclusions drawn in this report are limited to current conditions and may not be relied upon on a significantly later date or if changes have occurred in the Study Area.

1.2. Limitations and Exceptions

Reasonable CEQA-level efforts were made during the Study to identify sites of potential environmental concern. “Reasonable efforts” are limited to information gained from recorded database information and regulatory records readily-accessible to the public. Such methods may not identify contaminant sources that are not listed in these sources.

This Study was not a Phase I Environmental Site Assessment or environmental compliance audit. While some observations and discussion in this report may address conditions and/or operations that may be regulated, the regulatory compliance of those conditions and/or operations is outside the scope of this investigation. Nothing in this report constitutes a legal opinion or legal advice.

This Study does not address asbestos-containing materials, radon, lead in drinking water, wetlands, protected environments and habitat, threatened or endangered species, industrial hygiene concerns, human health risk assessment, indoor air quality, high voltage power lines, geotechnical conditions,

cultural and historical resources, health and safety, and mold. The Study may render an opinion on the need for a health risk assessment. Monetary valuation was not performed for this assessment.

1.3. User Reliance

This report was prepared for use solely and exclusively by the Dyett & Bhatia Urban and Regional Planners and the City of San Diego. The report is not for the use or benefit of, nor may it be relied upon by, any other person or entity for any purpose without the advance written consent of the Bodhi Group. No other use or disclosure is intended or authorized by the Bodhi Group. In the preparation of this report, the Bodhi Group has used the degree of care and skill ordinarily exercised by a reasonably prudent environmental professional in the same community and in the same time frame given the same or similar facts and circumstances. No other warranties are made to any third party, either expressed or implied.

2. SITE DESCRIPTION

2.1. Location and Description

The Study Area, shown on Map HAZMAP-01, comprises approximately 3,216 acres and is near the geographic center of the City of San Diego. Part of the San Diego River floodplain, it is generally bounded by Friars Road and the northern slopes of the valley on the north, the eastern banks of the San Diego River on the east, the southern slopes of the valley on the south, and Interstate 5 on the west (City, 1985).

The current Mission Valley Community Plan Update was approved in 1985. The community is now a regional center of office, hotels, retail sales, and a growing residential population. Public transportation within the area is provided by the Metropolitan Transit System and includes buses and the San Diego Trolley Green Line. Major thoroughfares include Interstate 8 and Friars Road and Camino del Rio (running east-west through the area) and Interstates 805 and 15 and California Route 163 (running north-south through the area).

2.2. History of Mission Valley

Throughout the history of Mission Valley, the San Diego River has been a primary attraction, first as a source of fresh water and later as a scenic recreational asset. After the Kumeyaay Indians, came the Spaniards, who first named the area La Canada de San Diego. The Spaniards established the Mission San Diego de Alcala on Presidio Hill in 1769 (City, 1985); in 1774 the Mission moved to its present location on San Diego Mission Road in Mission Valley.

In 1870, the name of the area was changed to Mission Valley. Truck farming, sheep herding, and bee keeping were introduced into the valley. By 1880, 20 dairies had been established in the valley. Sand and gravel extraction was introduced in 1913, and began in earnest about 1923. The Mission Valley Oil Enterprise Company unsuccessfully explored for oil at the foot of Texas Street in 1930.

Residential development was approved for Mission Valley in 1940 by local authorities. The Mission Valley Gold Club was established in 1947. In 1953-1954 the Town and Country Hotel and Mission Valley Country Club (now the Handlery Hotel) open.

In 1958, the Planning Department issued a preliminary study for the valley favoring hotels over dense residential and commercial uses. The construction of U.S. 80 (now Interstate 8) provided an impetus

for commercial development in Mission Valley, and for displacement of the agricultural economy. Other significant projects include San Diego Stadium (now Qualcomm Stadium) which was completed in 1967. Major urban development followed, primarily as a result of improvements in the regional highway network (City, 1985).

2.3. Regional Hydrogeologic Setting

Based on a review of available hydrogeologic data from the California Regional Water Quality Control Board San Diego Region (RWQCB, 1994), the Study Area is located in the Mission San Diego Hydrologic Subarea within the Lower San Diego Hydrologic Area of the San Diego Hydrologic Unit. The existing beneficial uses of groundwater in the Study Area include agricultural supply, industrial service supply, and industrial process supply (RWQCB, 1994). Municipal supply is identified in the basin plan as a potential beneficial use (RWQCB, 1994).

The San Diego County Water Authority has classified the Mission Valley portion of the San Diego River to be a principal alluvial aquifer (referred to as the Mission Valley Aquifer). Presently, the City of San Diego, the local water purveyor, is not using this alluvial aquifer for municipal water supply; however, in the future the City may evaluate potential groundwater use from this aquifer. The details of future groundwater development are not known at this time. Golf courses in the Study Area are the principal users of groundwater for irrigation.

3. ENVIRONMENTAL DATABASE REVIEW

The following sections summarize records reviewed for the Site.

3.1. Standard Environmental Record Sources

The Bodhi Group obtained and reviewed an environmental database search conducted by EDR, dated July 2015 (EDR, 2015a). The environmental databases searched ("standard environmental record sources"), corresponding search radii, and properties within specific search radii and identified on environmental databases are provided in the environmental database report in Appendix A. The identified properties were analyzed and the results are summarized in Section 5 of this report.

3.2. Water Wells

The EDR Report mapped 16 water well locations in the Study Area; some of these are/were nested (EDR, 2015b). Of these 14 were installed by the United States Geological Survey to monitor groundwater levels (some may have been destroyed). Two wells are permitted by the State and produce water for landscape irrigation (MAP-HAZ02).

3.3. Oil and Gas Wells

The EDR Report mapped 2 oil and gas well locations in the Study Area (EDR, 2015b). Both the wells were destroyed in 1999. There is no information on these wells other than there are no unauthorized release of contaminants associated with the wells (MAP-HAZ02).

4. REGULATORY RECORDS REVIEW

Sites regulated for unauthorized releases of chemicals were identified through a search of the State Water Resources Board-managed Geotracker website, the California Environmental Protection Agency

Department of Toxic Substances Control (DTSC)-managed Envirostor, and the CalRecycle-managed Solid Waste Information Systems (SWIS).

Geotracker provides information on sites regulated by the RWQCB and the County of San Diego Department of Environmental Health (DEH), Envirostor provides information on sites regulated by DTSC, and SWIS provides information on solid waste disposal sites regulated by CalRecycle, the County of San Diego Solid Waste Local Enforcement Agency (LEA), and the City of San Diego LEA. Properties with unauthorized releases regulated by a State or local agency were further analyzed and are discussed in Section 5.

5. EVALUATION AND CLASSIFICATION OF HAZARDOUS MATERIALS

Over 2,200 sites were identified in the EDR database search and the regulatory records search as having some documentation of hazardous materials use, storage, or release (discussed in Sections 3 and 4). Of these, 1,478 sites were considered to have the potential for adverse effects on human health and/or groundwater resources in the Study Area based on the type of chemical stored or released, potential pathways of contaminant migration into the Study Area, and data from wells within the Study Area or along the Study Area perimeter. These sites are displayed on the Map HAZMAP-01.

From these 1,478 sites, 46 (all in the City of San Diego) were selected based on at least one of the criteria listed below and are discussed in detail in this Section. The remaining 1,432 sites either did not have releases or the releases did not result in potential adverse effects to human health or groundwater resources in the Study Area.

- Sites with known unauthorized releases of hazardous chemicals or petroleum under regulatory oversight.
- Sites with residual concentrations of chemicals in the subsurface (in the Study Area).
- Sites outside the Study Area but where chemicals in the subsurface had the potential to migrate beneath the Study Area.
- Regulatory status.

The degree of potential adverse effects differ based on the specifics of each release case and are influenced by the type and quantity of chemicals released (i.e., volatility, solubility, toxicity, persistence), affected media (i.e., soil, groundwater, soil gas), source area concentrations, physical characteristics of the site such as geology, hydrogeology, preferential pathways for contaminant migration, and whether the chemicals have effectively attenuated or have been actively remediated to levels that are less than significant.

Based on an evaluation of the above criteria and our experience, each of the 46 sites were assigned a hazard ranking from 1 to 5, with 5 being the highest hazard and 1, the lowest. The 46 sites are discussed in the following report sections, organized by hazard ranking of 1 through 5, with a brief summary of the unauthorized release, residual contamination, degree of potential adverse effects, and hazard ranking. Each site has been assigned a Map ID number which corresponds with the number labeled on the HAZMAP-02 map. Unless noted otherwise, the contamination at the sites involved releases to soil only.

Table 1 – Hazard Ranking Criteria

Rank	Hazard	Description	Consequences
5	Very high	Potentially acute threat to human health or environment	Immediate action needed to mitigate existing threat.
4	High	Potentially significant risk to human health or environment	Investigation or remediation needed for existing risk. Or, new development will be subject to remedial measures.
3	Moderate	Potential threat/risk to human health or environment	Possible investigation needed for existing development. Residual contamination in soil and/or groundwater may necessitate reopening of case based on human health (Vapor Intrusion pathway) or adverse effects to groundwater and revised closure standards.
2	Low	Less than significant threat/risk to human health or environment	Special management/notification in case of subsurface work. New development may necessitate verification of closure standards.
1	Very low	De Minimis conditions	No action or special management needed other than possible notification.

6. SITES WITH VERY HIGH HAZARD RANKING

None of the sites in the Study Area were assigned a Hazard Rank of 5 (Very High).

7. SITES WITH HIGH HAZARD RANKING

Three sites in the Study Area were assigned a Hazard Rank of 4 (High).

7.1. Former Montgomery Ward – Map ID 1

The DEH opened an unauthorized release case based on subsurface petroleum contamination observed in 1986 during removal of one waste oil and three fuel USTs from the former Montgomery Ward automobile service center at 1288 Camino Del Rio North.

Subsequent soil and groundwater investigations characterized and delineated subsurface contamination, including the presence of free product on groundwater. The site was remediated by removing contaminated soil and addressing free product with a soil vapor extraction system. A VI study indicated significant long term risk to indoor occupants from contaminant vapors migrating through concrete floors. To mitigate this risk, the DEH required that future buildings include a sub-slab vapor barrier. The DEH closed the case in 2014.

The site has been developed with retail stores and restaurants. The buildings have sub-slab vapor barriers. Although the site has received regulatory closure, the residual contamination presents a significant long-term risk to human health and the environment, and as such will require proper mitigation measures both during and after construction.

Mitigation measures will include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered. In addition, all future structures will require a vapor barrier, or similar remedial measure, to preclude infiltration of volatile contaminants into indoor air through the building foundation and slab system.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 4 (High).

7.2. Mission Valley Terminal – Map ID 2

The Mission Valley Terminal is a 10.5-acre AST fuel farm at 9950 San Diego Mission Road. The terminal has been in operation since 1962. The site is under the current ownership of Kinder Morgan and has been leased to various tenants over the years. The facility has been the site of multiple unauthorized releases of fuel to the subsurface including approximately 200,000 gallons of gasoline released from holes in the northern manifold; petroleum releases from Texaco slop tanks; releases from a cracked underground T-junction operated by Shell; and gasoline releases from a failed pump seal in the vicinity of MV-14 transfer pump. The releases have contaminated soil and groundwater beneath the Mission Valley Terminal and have migrated and contaminated soil and groundwater at the nearby Qualcomm Stadium. Based on the releases and associated contamination, the RWQCB issued Cleanup and Abatement Order (CAO) 92-01. At present, a leak detection system is in place.

In response to CAO 92-01, responsible parties have recovered approximately 6,000 gallons of free product, removed 493,927 pounds of hydrocarbon by soil vapor extraction, and successfully remediated MTBE and benzene contamination in groundwater to smaller plumes with a groundwater pump and treat system. The regulatory case is currently open and the remediation systems are active.

Residual contamination include petroleum saturated soil in the vadose zone, dissolved petroleum constituents in groundwater, free product on groundwater, and potential vapor intrusion from volatile hydrocarbons into enclosed structures. One concern related to the on-going site remediation, common to both the Mission Valley Terminal and Qualcomm sites is the potential for recontamination of groundwater. Currently, due to the on-going pump and treat system, perhaps exacerbated by the drought, groundwater levels are depressed. Once the pump and treat system is shut down and with the return of average rainfall to the area, groundwater is expected to rise. This rising groundwater level can mobilize the currently immobile, but saturated levels of petroleum hydrocarbons in the vadose zone. This additional source of contamination can exacerbate potential adverse effects in groundwater and the potential for vapor intrusion into enclosed structures. At present, the Mission Valley Terminal continues to operate an AST fuel farm.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste

generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

Future structures, depending on the location relative to soil and groundwater contamination, may require a vapor mitigation system to (i) prevent vapors from migrating through building slabs and foundations and (ii) capture hydrocarbon vapors and vent, recover, or destroy the captured volatile hydrocarbons.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures will be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 4 (High).

7.3. Qualcomm Stadium Parking Lot Northeast – Map ID 3

In addition to groundwater contamination beneath the Qualcomm Stadium site (9449 Friars Road) from releases at the Mission Valley Terminal AST fuel farm regulated by the RWQCB (above), the DEH was requested to provide regulatory oversight of an ethanol spill caused by the overturning of an 8,000-gallon tanker truck at the intersection of San Diego Mission Road and Mission Village Drive. Approximately 2,000 gallons of ethanol was pumped out of the tanker and approximately, 2,500 gallons were recovered from puddles in the Stadium parking lot. However, sufficient ethanol with trace (1-5%) gasoline had contaminated the subsurface.

The groundwater pump and treat system at the Stadium parking lot site that has been in operation since 1994, was evaluated in 2002 and augmented with a soil vapor extraction system in 2003. Free product in groundwater migrating from the Mission Valley Terminal extends to the northeast portion of the Stadium parking lot. Plumes of fuel oxygenates such as MTBE and tert-butyl alcohol (TBA) extended downgradient but have been successfully controlled with the groundwater pump and treat system.

Similar to the Mission Valley Terminal site, the case is currently open and remediation is active. The current contamination at the Qualcomm Stadium site, primarily in groundwater and soil gas, does not preclude development at the site; however, mitigation measures, including active remediation will be needed for an extended period of time concurrent with site redevelopment. At present, the site continues to operate as a sporting venue.

These mitigation measures will include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered, continued operation of the groundwater pump and treat system, continued operation of the soil vapor extraction system, and installation, operation, and maintenance of a system to mitigate volatile vapors from entering enclosed structures.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures will be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 4 (High).

8. SITES WITH MODERATE HAZARD RANKING

Ten sites in the Study Area were assigned a Hazard Rank of 3 (Moderate).

8.1. Presidential Limousine Service (Former Arco) – Map ID 4

The DEH opened an unauthorized release case in 1984 based on observed subsurface petroleum hydrocarbons during removal of one waste oil and four gasoline USTs from the site (2085 Hotel Circle). Subsurface contamination was remediated with soil vapor extraction system that operated between 1994 and 1996. The DEH closed the case in 1999. Residual contamination remains in soil and groundwater. The site is currently undeveloped. There appears to be a soil pile covered with plastic liner on the site.

Although the site has received regulatory closure, the closure process did not include a VI study. Current standard of practice would require a VI study to evaluate the potential risk to receptors in enclosed structures at the site. Other mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.2. Stella Maris Corporation (Arco 3052) – Map ID 5

The site, at 6899 Friars Road, had operated as a gas station since 1969. There were two DEH cases associated with the site: one was opened in 1994 based on discovery of a release from a waste oil UST and the second in 1995 based on subsurface petroleum contamination observed during removal of five USTs.

Subsequent investigations indicated petroleum contamination in soil and groundwater (free product was observed). Approximately 1,246 tons of contaminated soil and 8 gallons of free product were removed during site remediation. Residual petroleum constituents remain in soil and groundwater. The DEH closed all cases by 2010 citing less than significant risks to human health and the environment. The site continues to be operated as an Arco gas station.

Although the site has received regulatory closure, the VI study performed for site closure may not meet the current standard of practice. Change in site use or regulatory environment may trigger a new VI study that may indicate potential risks to human health.

Other mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of

waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.3. Courtesy Chevrolet – Map ID 6

The DEH opened an unauthorized release case based on subsurface petroleum hydrocarbon contamination observed during removal of seven USTs in 1995 (waste oil, bulk oil, diesel, new oil, and anti-freeze) at the site (750 Camino Del Rio North). Approximately 30 cy of soil were removed for off-site disposal.

A regulatory notification of a waste motor oil release was made in 1992 at the former Daewoo dealership (same site, also referred to as Midway Jeep Chrylser, and Trevellyan Oldsmobile).

Minor concentrations of the chlorinated solvent, 1-2-DCA were detected in groundwater. Citing less than significant risk, the DEH issued case closure in 1997.

This site is currently occupied by Courtesy Chevrolet. Although the site received regulatory closure in 1997, new standards for evaluating potential adverse effects from residual contamination may require additional investigation at this location for redevelopment. These potential adverse effects include risk to indoor occupants from intrusion of contaminant vapors into enclosed structures.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, performing a Vapor Intrusion (VI) study, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.4. McBride's Mission Valley Arco (#03037) – Map ID 7

The DEH opened an unauthorized release case in 1988 based on observed subsurface petroleum contamination during removal of one waste oil and four gasoline USTs at the Arco station (915 Camino Del Rio South). Approximately 720 tons of petroleum-contaminated soil were removed for off-site disposal. A soil vapor extraction system was installed and operated between 1994 and 1996 to remove petroleum hydrocarbons in the unsaturated zone. Residual soil and groundwater contamination was detected at the site during investigations completed through 2006. The DEH issued case closure in 2006. A gas station continues to operate at the site.

Although the site has received regulatory closure, a VI study was not performed for the site. A VI study would be typically required under the current standard of practice. Other mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.5. Unocal Service Station (#4862) – Map ID 8

The DEH opened an unauthorized release case based on subsurface contamination observed during the removal of one waste oil and two gasoline USTs in 1994 and 1996 from the site (5050 Mission Center Road). An estimated 425 cy of contaminated soil were removed for off-site treatment. An additional 2,800 cy were removed after site characterization activities. Groundwater monitoring at the site indicated residual groundwater contamination. The DEH issued case closure in 2006. The site has since been developed with a restaurant and a strip mall.

Although the site has received regulatory closure, current standards for VI studies may necessitate re-evaluation of the VI potential to adversely affect receptors in enclosed spaces Other mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.6. Mobil 18-G6F – Map ID 9

The DEH opened an unauthorized release case in 1988 based on observed subsurface petroleum contamination during the removal of one waste oil and three fuel USTs from the Mobil station at 5494 Mission Center Road. Approximately 720 cy of contaminated soil were removed for off-site disposal. Subsequent investigations indicated soil and groundwater contamination. Free product was observed on groundwater. An initial soil gas investigation indicated significant concentrations of constituents in the gas phase; however a 2006 soil gas investigation did not detect these constituents. The DEH closed the unauthorized release case in 2011.

Although the site has received regulatory closure, current standards for VI study may require further investigation and a risk assessment. Other mitigation measures will depend on the type of

redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.7. Mission Center Texaco (Shell #121801) – Map ID 10

There are two DEH unauthorized release cases involved with this facility at 5465 Mission Center Road. The first involves a reported spill in 1994; the DEH closed the case in 1994. The second was associated with releases from a UST system that resulted in soil and groundwater contamination. Based on investigations through 2008, the DEH closed the case in 2011. A Shell station continues to operate at the site.

Although the site has received regulatory closure, an updated VI study may be needed consistent with the current standard of practice. Other mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.8. Murray Ridge Park – Map ID 11

This site in Mission Center, is regulated by the RWQCB, as a former burn dump site. The site has been closed with required land use controls and monitoring. Work in this location will require regulatory notification and oversight, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or burn ash, if encountered.

If the site has to be redeveloped, the burn dump site will require clean closure remediation to excavate and remove contaminated soil under regulatory oversight.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.9. Stadium Cleaners – Map ID 12

The DEH opened an unauthorized release (non-UST) case based on elevated concentrations of tetrachloroethylene (PCE, a chlorinated solvent) detected in the immediate vicinity of a floor sink in the boiler room of the dry cleaning establishment at 5694 Mission Center Road. The source of the PCE was attributed to the direct discharge of liquid condensate from the dry cleaning machine into the floor sink.

Approximately 14 cy of contaminated soil were removed. Residual concentrations of PCE remain in soil and groundwater. Citing less than significant adverse effects to human health and the environment, the DEH closed the case in 1997. The site continues to be operated by Stadium Cleaners with a Ralph grocery store on one side and a UPS store on the other.

Although the site has received regulatory closure, the standards for evaluating risk to human health and the environment have significantly changed since 1997. Current standards may necessitate performing a VI and sensitive receptor study.

Other mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

8.10. Marvin K Brown Cadillac – Map ID 13

The DEH opened an unauthorized release case in 1998 based on observed subsurface petroleum contamination below a dispenser during removal of a gasoline UST at the Marvin K Brown Cadillac dealership (1441 Camino Del Rio South). Approximately 20 tons of contaminated soil were removed for off-site disposal. Residual soil and groundwater contamination was detected. A VI study was performed that indicated no significant risk to receptors. The case was closed by the DEH in 2013. The site continues to be occupied by the Marvin K Brown Cadillac dealership.

Although the site has received regulatory closure, residual contamination was detected at levels that may require a more current VI study. Other mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 3 (Moderate).

9. SITES WITH LOW HAZARD RANKING

Twenty-six sites in the Study Area were assigned a Hazard Rank of 2 (Low).

9.1. Former Texaco Station – Map ID 14

The DEH opened an unauthorized release case in 2006 based on petroleum hydrocarbon contamination in soil and groundwater detected during a subsurface assessment of the former Texaco station at 845 Morena Boulevard. The site has not received regulatory closure.

The site has been developed with a fast food restaurant and a convenience store. Although the site is outside the Study Area, petroleum hydrocarbon contamination in groundwater could potentially migrate into the Study Area. Accordingly, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will include, but not be limited to, notifying exposed populations such as site workers during dewatering operations, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of contaminated groundwater, if extracted.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.2. Western Division Police Station – Map ID 15

The Western Division Police Station became operational around May 1984, and is currently utilized as a fueling station and maintenance garage. In late 1986, gasoline odors were reported in local bathrooms, and free floating product (gasoline) was reported in an abandoned sewer line leading to the site at 5215 Gaines Street (outside the Study Area). The site is being regulated by the DEH.

The sewer line was subsequently plugged with concrete. In February 1987, it was determined that there was a leaking turbine pressure feed line from one of the five USTs at the site and an estimated 41,000 to 55,000 gallons of gasoline was released. Product extraction wells were installed at the site in 1987, and a vapor survey was conducted. In addition, the City operated a soil vapor extraction remediation system at the site from approximately 1990 to 1997. Three of the five USTs were removed in 1998 (2 gas, one diesel), and during the tank removal activities, and 200 cy of contaminated soil were excavated. The other 2 USTs (waste oil and motor oil) were later removed. The case is currently open.

Significant residual soil and groundwater contamination remain at the site. Since the site is outside the Study Area, the soil contamination will not adversely affect the Study Area. However, a well downgradient of the site and near the Study Area reported detected concentrations of MTBE, a fuel oxygenate.

During construction of the West Light Rail Extension, contaminated soil and groundwater were encountered originating from the Police Station site. RWQCB oversight was requested during construction and the case was subsequently closed in 20013

Although the site is outside the Study Area, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement. Mitigation measures will consist of notifying exposed populations such as site workers prior to earthwork of dewatering, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.3. Jeff and Cindy Cavignac – Map ID 16

The DEH opened an unauthorized release case in 1989 based on a reported diesel release at the site (4314 Altamarino Way). The DEH issued case closure in 2000. The location is currently developed with residential housing.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.4. River Valley Sports Center – Map ID 17

There are two DEH unauthorized release cases associated with this site (2440 Hotel Circle Place). The first was associated with soil contamination observed during UST removals in 1995. The second was associated with DEH oversight of a VAP case for construction of a two-story commercial office building at the former gas station site. Low level diesel contamination was observed in soil during construction. The DEH issued case closure in 2003. The site is currently occupied by office buildings.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement, similar to those taken during site construction in 2003.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers prior to earthwork, implementing appropriate health and safety precautions to minimize exposure to residual

contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.5. Exxon Service Station – Map ID 18

The DEH opened an unauthorized release case in 1987 based on regulatory notification of a gasoline leak at the Exxon service station (2432 Hotel Circle North). The site is currently occupied by a Motel 6. The DEH issued case closure in 1999.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.6. Former Handlery Hotel and Country Club – Map ID 19

A petroleum leak was reported in 1990 and a DEH case was opened for the site at 5900 Friars Road. This location was also referred to as Stardust Golf Course Maintenance Yard in local agency records (EDR, 2015a). The case was subsequently closed in 1990. The site has been redeveloped with an office building.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.7. Chevron #90158 – Map ID 20

The DEH opened an unauthorized release case based on soil contamination observed during upgrades to one waste oil and three gasoline USTs in 1998 at the Chevron station at 755 Hotel Circle South. Approximately 160 tons of petroleum-contaminated soil were excavated for off-site disposal.

Residual petroleum hydrocarbon contamination in soil and groundwater were detected during subsequent site investigations. Groundwater contamination was monitored between 2001 and 2005. Citing less than significant risk to human health and the environment, the DEH issued case closure in 2010.

This location has been redeveloped with a mini-mart, restaurant, and motel. Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.8. Town and Country Resort Hotel – Map ID 21

The RWQCB issued a CAO to Town and Country Hotel (500 Hotel Circle North) for discharge of soil and earthen waste into and along San Diego River and failure to cleanup waste during a parking lot expansion. The site likely does not pose a significant long-term risk to human health and the environment; however, some mitigation measures may be required for redevelopment or site improvements. The site is currently occupied by the Town and Country Resort Hotel.

In addition, a gasoline spill was reported at the site in 1992 (504 Hotel Circle North referred to as Hotel Circle 76). That case was subsequently closed in 1992 based on less than significant risk to human health and the environment.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to properly managing, treating, and/or disposing of waste generated through excavation of the waste or contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.9. Firestone #22F2 – Map ID 22

The DEH opened an unauthorized release case in 1987 based on regulatory notification of a petroleum and waste oil leak at the Firestone #22F2 site at 6977 Friars Road. The DEH issued case closure in 1989. The site is currently occupied by the Firestone automotive care center.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.10. Union Tribune Publishing Company – Map ID 23

There were three unauthorized release cases associated with this site at 350 Camino De La Reina. The first case was associated with subsurface contamination observed during removal of four USTs in 1986. The release was attributed to holes in the USTs. Investigations indicated contamination in soil and groundwater. Groundwater remediation efforts between 1988 and 1996 consisted of pumping and treating contaminated groundwater and then recycling the treated groundwater into the newspaper publishing process.

The second case was associated with diesel contamination in soil observed during an inspection for piping upgrades in 1997. The contamination was attributed to the first UST release case. The third case was associated with diesel and heavy oil contamination detected in soil during removal of a UST in 1996. Approximately 25 cy of contaminated soil were removed for disposal. The DEH issued case closure for all the cases by 2008. The site continues to be occupied by the San Diego Union Tribune offices.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.11. Witt Lincoln Mercury – Map ID 24

The DEH opened an unauthorized release case in 1992 based on reported leak of petroleum at the site (588 Camino Del Rio North). The case was subsequently closed in 1992 based on less than significant risk to human health and the environment. The site continues to be occupied by Witt Lincoln Mercury.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers prior to earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.12. Bob Baker Ford (Bob Baker Ford Chrysler) – Map ID 25

Bob Baker Ford (also known as Bob Baker Ford Chrysler) at 730 Camino Del Rio North, San Diego is listed in the DEH Site Assessment and Mitigation (SAM) database as a petroleum release site.

Based on odors from the UST excavation observed during the removal of gasoline and waste oil underground storage tanks (USTs) in 2005, the DEH opened an unauthorized release case. Elevated levels of heavy-end petroleum hydrocarbons were detected in soil in a 2007 investigation. Results of groundwater sample analysis did not indicate petroleum constituents; however, 1,2-dichloroethane (1,2-DCA), a chlorinated solvent, was detected in groundwater at trace concentrations. Soil samples were collected after removal of hydraulic lifts that had been initially installed in 1965 to evaluate soil contamination. Minor concentrations of polynuclear aromatic hydrocarbons (PAHs) and polychlorinated biphenyls (PCBs) were detected in soil. Some soil was removed for off-site disposal.

The site enrolled in the DEH voluntary assistance program (VAP) in May 2015 for regulatory oversight during decommissioning of the auto dealership. Based on soil, soil gas, and groundwater sampling and analysis, the DEH issued case closure in June 2015, citing less than significant risks to human health and the environment. The site is being redeveloped into a mixed-use residential and office complex.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.13. R.E. Hazard Contracting Company – Map ID 26

The DEH opened an unauthorized release case in 1986 based on reported leak of petroleum at the site (7501 Friars Road). The case was subsequently closed in 1993 based on less than significant risk to human health and the environment. The site has been redeveloped with office buildings and restaurants.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers prior to earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.14. Hazard Center Chevron (#90091) – Map ID 27

The site, at 7698 Friars Road, has been operating as a gas station since 1972. In 1993, the DEH opened an unauthorized release case based on observed subsurface petroleum hydrocarbon contamination during the removal of one waste oil, one diesel, and three gasoline USTs. Approximately 1,510 cy of contaminated soil were removed for off-site disposal. Residual soil and groundwater contamination remain at the site. Citing no significant long term threat to human health and the environment, the DEH issued case closure in 2007. The site continues to operate as a gas station, selling non-branded fuel.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.15. U S Rentals – Map ID 28

The DEH opened an unauthorized release case in 1993 based on reported leak of gasoline at the site (1544 Frazee Road). The case was subsequently closed in 1993 based on less than significant risk to human health and the environment. The site is currently occupied by offices belonging to the San Diego Community College District.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers prior to earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.16. San Diego Mesa College – Map ID 29

The DEH opened an unauthorized release case in 1989 based on reported leak of petroleum at the site (7250 Mesa College Drive). The case was subsequently closed in 1989 based on less than significant risk to human health and the environment. The site continues to be occupied by San Diego Mesa College.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers prior to earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.17. H.G. Fenton Material Company at Murphy Canyon Road – Map ID 30

During batch operations at the former H.G. Fenton Material Company asphalt plant at 7400 Murphy Canyon Road, soil was contaminated by a diesel and asphalt spill, which resulted in an unauthorized release case with DEH oversight. Approximately 7,625 cy of soil was removed. Groundwater was monitored but no contamination was detected. Some residual soil contamination may be present. DEH issued case closure in 1998.

The site has been developed as a strip mall. Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.18. Mission Heights – Map ID 31

The DEH opened an unauthorized release case based on a reported diesel leak in 1998 at this facility on Murray Canyon Road. The case was closed in 1998.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential

hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.19. H.G. Fenton Material Company at Mission Valley Road – Map ID 32

The DEH opened an unauthorized release case in 1994 based on a reported petroleum spill at 7243 Mission Valley Road. The case was closed in 1994. The site is currently developed with office buildings. Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.20. Cal Mat Company – Map ID 33

The DEH opened an unauthorized release case based on subsurface petroleum contamination observed during UST upgrades in 2005 at the site (5745 Mission Center Road). The petroleum contamination was attributed to releases from the fuel dispensers. Approximately 2,442 tons of soil were removed for off-site disposal. Only MTBE was detected in groundwater at trace concentrations. Based on less than significant risk to human health and the environment, the DEH issued case closure in 2008.

This site has been redeveloped with residential multi-family housing. Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.21. Industrial Asphalt – Map ID 34

The DEH opened an unauthorized release case in 1992 based on a reported diesel leak at the site (8150 Friars Road). The case was subsequently closed in 1992. The site is being redeveloped with residential properties.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.22. Mission Valley Chevron (#94991) – Map ID 35

The DEH opened an unauthorized release case in 1993 based on observed subsurface petroleum hydrocarbon contamination during the removal of four USTs at the Chevron site at 2290 Camino Del Rio North. Petroleum hydrocarbons were detected at significant concentrations beneath the former waste oil UST, gasoline UST, and pump islands. Approximately 245 cy of soil was excavated and removed for off-site disposal.

Subsequent site investigation, including quarterly groundwater monitoring between 1993 and 2001 indicated that soil and groundwater contamination were limited in aerial extent. Based on the investigation results, the DEH issued case closure in 2004. The site continues to operate a Chevron-branded gas station.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.23. Caltrans Texas Street Hook Ramp – Map ID 36

Prior to construction of Interstate 8, a sand and gravel operation was located in the area. The operation used an underground fueling system. A leak in the system was discovered in 1991 and reported to the DEH, which opened an unauthorized release case.

Based on subsequent investigations, localized petroleum hydrocarbon contamination in soil and groundwater were detected at the site. Citing less than significant risk to human health and the environment, the DEH issued case closure in 2010.

Since this site is near a freeway ramp, it is unlikely there will be a change in land use. Accordingly, the only potential hazards are to construction workers performing subsurface work. Mitigation measures may include, but not be limited to, notifying site workers of potential hazards prior to earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil or extraction of contaminated groundwater, if encountered.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

9.24. H.G. Fenton Material Company at Friars Road – Map ID 37

The H.G. Fenton Material Company operations at 9300 and 9310 Friars Road reported a diesel spill in 1993 and a gasoline spill in 1998, which resulted in unauthorized release cases with DEH oversight. Both cases were closed by the DEH. The site is currently developed as a construction yard and a Fire Station.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers and the public of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.25. National University – Map ID 38

The DEH opened an unauthorized release case to assess the effects of a hydraulic oil leak from an elevator shaft at the site (4007 Camino Del Rio South). The assessment determined that the leak had contaminated soil to a maximum depth of 13 feet and that groundwater had not been contaminated. The DEH closed the case in 1999. Residual soil contamination remains at the site. The site is currently occupied by the Point Loma Nazarene University.

Although the site has received regulatory closure and the residual contamination does not pose a significant long-term risk to human health and the environment, it is recommended that proper mitigation measures be taken prior to construction for redevelopment or site improvement.

Mitigation measures will depend on the type of redevelopment or site improvement and may include, but not be limited to, notifying exposed populations such as site workers of potential hazards during earthwork, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of waste generated through excavation of contaminated soil, if encountered.

This site has been assigned a Hazard Rank of 2 (Low).

9.26. Former Unocal 76 – Map ID 39

The site, at 10385 Friars Road, has been undergoing remediation activities under DEH oversight since 1994 with the removal of 1,171 gallons of free product, 3,000 gallons of groundwater, and 909 cy of contaminated soil. Three fuel USTs were removed in 2001. Free product and MTBE were detected in groundwater beneath the site and MTBE was detected in San Diego River, downstream of the site. Citing less than significant risk to human health and the environment, the DEH issued case closure in 2007.

The site has been developed with an auto dealership and a strip mall. Although the site has received regulatory closure and is outside the Study Area, petroleum hydrocarbon contamination in groundwater could potentially migrate beneath the Study Area. Accordingly, it is recommended that proper mitigation measures be taken prior to construction for re-development or site improvement.

Mitigation measures will include, but not be limited to, notifying exposed populations such as site workers during dewatering operations, implementing appropriate health and safety precautions to minimize exposure to residual contamination, and properly managing, treating, and/or disposing of contaminated groundwater, if extracted.

If the Mission Valley Aquifer is developed as a source of groundwater for municipal use and groundwater is extracted from the site, additional investigation and remedial measures may be needed to treat contaminated groundwater prior to beneficial use.

This site has been assigned a Hazard Rank of 2 (Low).

10. SITES WITH VERY LOW HAZARD RANKING

Seven sites in the Study Area were assigned a Hazard Rank of 1 (Very Low).

10.1. Lloyd Pest Control – Map ID 40

The DEH opened an unauthorized release case in 1998 based on observed subsurface petroleum contamination at the site (935 Sherman Street) during removal of two gasoline USTs. Approximately 423 tons of contaminated soil and 500 gallons of petroleum product were removed. Free product was observed on groundwater.

In December 2004, volatile constituents of gasoline were either not detected or detected at trace concentrations in soil gas. Wells 400 feet north of the site had trace concentrations of MTBE. The case was closed in 2013. The site continues to be occupied by the pest control company.

Since the site is outside the Study Area, it is unlikely that petroleum contamination at the site will cause significant adverse effects in the Study Area. Mitigation measures may consist of notification to the Contractor performing subsurface work at the site.

This site has been assigned a Hazard Rank of 1 (Very low).

10.2. Radisson Hotel San Diego – Map ID 41

The DEH opened an unauthorized release case in 1999 based on reported leak of petroleum at the site (1433 Camino Del Rio South). The case was subsequently closed in 2001 based on less than significant risk to human health and the environment. The site is currently occupied by the Sheraton, Mission Valley hotel.

It is unlikely that petroleum contamination will cause significant adverse effects in the Study Area. Mitigation measures may consist of notification to the Contractor performing subsurface work at the site.

This site has been assigned a Hazard Rank of 1 (Very low).

10.3. John Hine Pontiac Mazda – Map ID 42

The DEH opened an unauthorized release case in 1989 based on notification of a petroleum leak at the facility at 1545 Camino del Rio South. The DEH closed the case in 2000.

This site continues to be occupied by the auto dealership. It is unlikely that petroleum contamination will cause significant adverse effects in the Study Area. Mitigation measures may consist of notification to the Contractor performing subsurface work at the site.

This site has been assigned a Hazard Rank of 1 (Very low).

10.4. Vantile Parcels – Map ID 43

This site covers 3 parcels on a 21 acre property that was formerly used for mining sand and gravel through the 1970s. A Phase I Environmental Site Assessment was completed in 1998 and subsequent soil sampling detected minor concentrations of recoverable petroleum hydrocarbons. A second Phase I Environmental Site Assessment completed in 2010 did not find significant environmental issues on site. A VAP case was opened for this site and the DEH issued case closure in 2011. The site has since been redeveloped with multi-family housing.

It is unlikely that the minor petroleum contamination will cause significant effects in the Study Area. However, to account for the presence of hydrocarbon contamination, mitigation measures may consist of notification to the Contractor performing work at the site.

This site has been assigned a Hazard Rank of 1 (Very low).

10.5. Midas – Map ID 44

The DEH opened an unauthorized release case in 1994 based on notification of a petroleum leak at the facility at 3848 Camino Del Rio West. The DEH closed the case in 1994. This site continues to be occupied by the Midas automobile service center.

It is unlikely that petroleum contamination will cause significant adverse effects in the Study Area. Mitigation measures may consist of notification to the Contractor performing subsurface work at the site.

This site has been assigned a Hazard Rank of 1 (Very low).

10.6. Body Beautiful Car Wash – Map ID 45

The DEH opened an unauthorized release case based on subsurface petroleum contamination observed at the Body Beautiful Car Wash site (4282 Camino Del Rio North) during piping upgrades to a UST system in 2002. Approximately 102 cubic yards (cy) of contaminated soil were removed. Residual concentrations of gasoline-range petroleum hydrocarbons (TPH-G) and a fuel oxygenate, methyl-tert butyl ether (MTBE), were detected in groundwater. The case was closed by the DEH in 2013.

This site is currently occupied by the Body Beautiful Car Wash and adjacent Mobil gas station. The site is outside the Study Area and it is unlikely that petroleum contamination will cause significant adverse effects in the Study Area. There is a low potential for contaminants in groundwater at this site to migrate into the Study Area. Mitigation measures may consist of notification to the Contractor performing dewatering in the Study Area closest to this site.

This site has been assigned a Hazard Rank of 1 (Very Low).

10.7. Rose Automotive Service – Map ID 46

There are multiple DEH unauthorized release cases associated with the site at 5957 Fairmont Avenue. The first case was associated with subsurface gasoline contamination in soil observed during removal of three USTs in 1995. Subsequent investigations indicated contamination to soil and groundwater at the site. The second case was related to soil contamination (not groundwater) observed during the removal of a UST in 1998.

A VAP case was opened in 2001 requesting DEH oversight of a Phase II Environmental Site Assessment. The Phase II Environmental Site Assessment under the VAP case indicated localized contamination in soil and groundwater. The DEH cases were closed by 2005.

The site has received regulatory closure and based on the distance of the site from the Study Area, it is unlikely that petroleum contamination at the site will result in significant adverse effects in the Study Area. However, to account for the low potential for groundwater contamination to migrate to the Study Area in an area where construction could occur, mitigation measures may consist of notification to the Contractor performing work at the site.

This site has been assigned a Hazard Rank of 1 (Very low).

11. FINDINGS

Over 2,200 sites were identified in through search of Federal, State, local databases and regulatory records as having some documentation of hazardous materials use, storage, or release. Of these 1,478 sites were considered to have the potential to adversely affect the Study Area based on the type of chemical stored or released, potential pathways of contaminant migration into the Study Area, and data from wells along the Study Area perimeter (HAZMAP-01).

A final list of 46 sites were selected if they had an unauthorized release of contaminants, were (or had been) under regulatory oversight, and had residual contamination with potential adverse effects in the Study Area. Depending on the degree of adverse effects, each of the 46 sites were assigned a hazard ranking from 5 to 1 (highest to lowers), with 5 having the highest hazard and 1 the lowest (HAZMAP-02).

There are no hazardous sites that would result in severe adverse effects relative to planned use of the Study Area. Of the three sites with Rank 4, two are associated with bulk petroleum releases at the Mission Valley Terminal and the resulting off-site migration and contamination beneath the Qualcomm Stadium site. Remedial measures at these locations have been successful. However, all chemical contamination has not been removed and residual levels will result in some adverse effects. These potential adverse effects can be managed for future use the locations affected by these petroleum releases. The other site with Rank 4 (former Montgomery Ward site) has a remedial measure in place that will need to be re-implemented for future use of this site.

The ten sites with a Rank of 3 may require additional investigation (possibly Vapor Intrusion assessment), and remediation, if the current standard of practice indicate significant risks to future receptors. The twenty-six sites with a Rank of 2 will result in some adverse effects if contaminated media (soil, groundwater) is excavated, extracted, or otherwise disturbed for redevelopment. The seven sites with a Rank of 1 may require no action, other than possible notification to relevant parties.

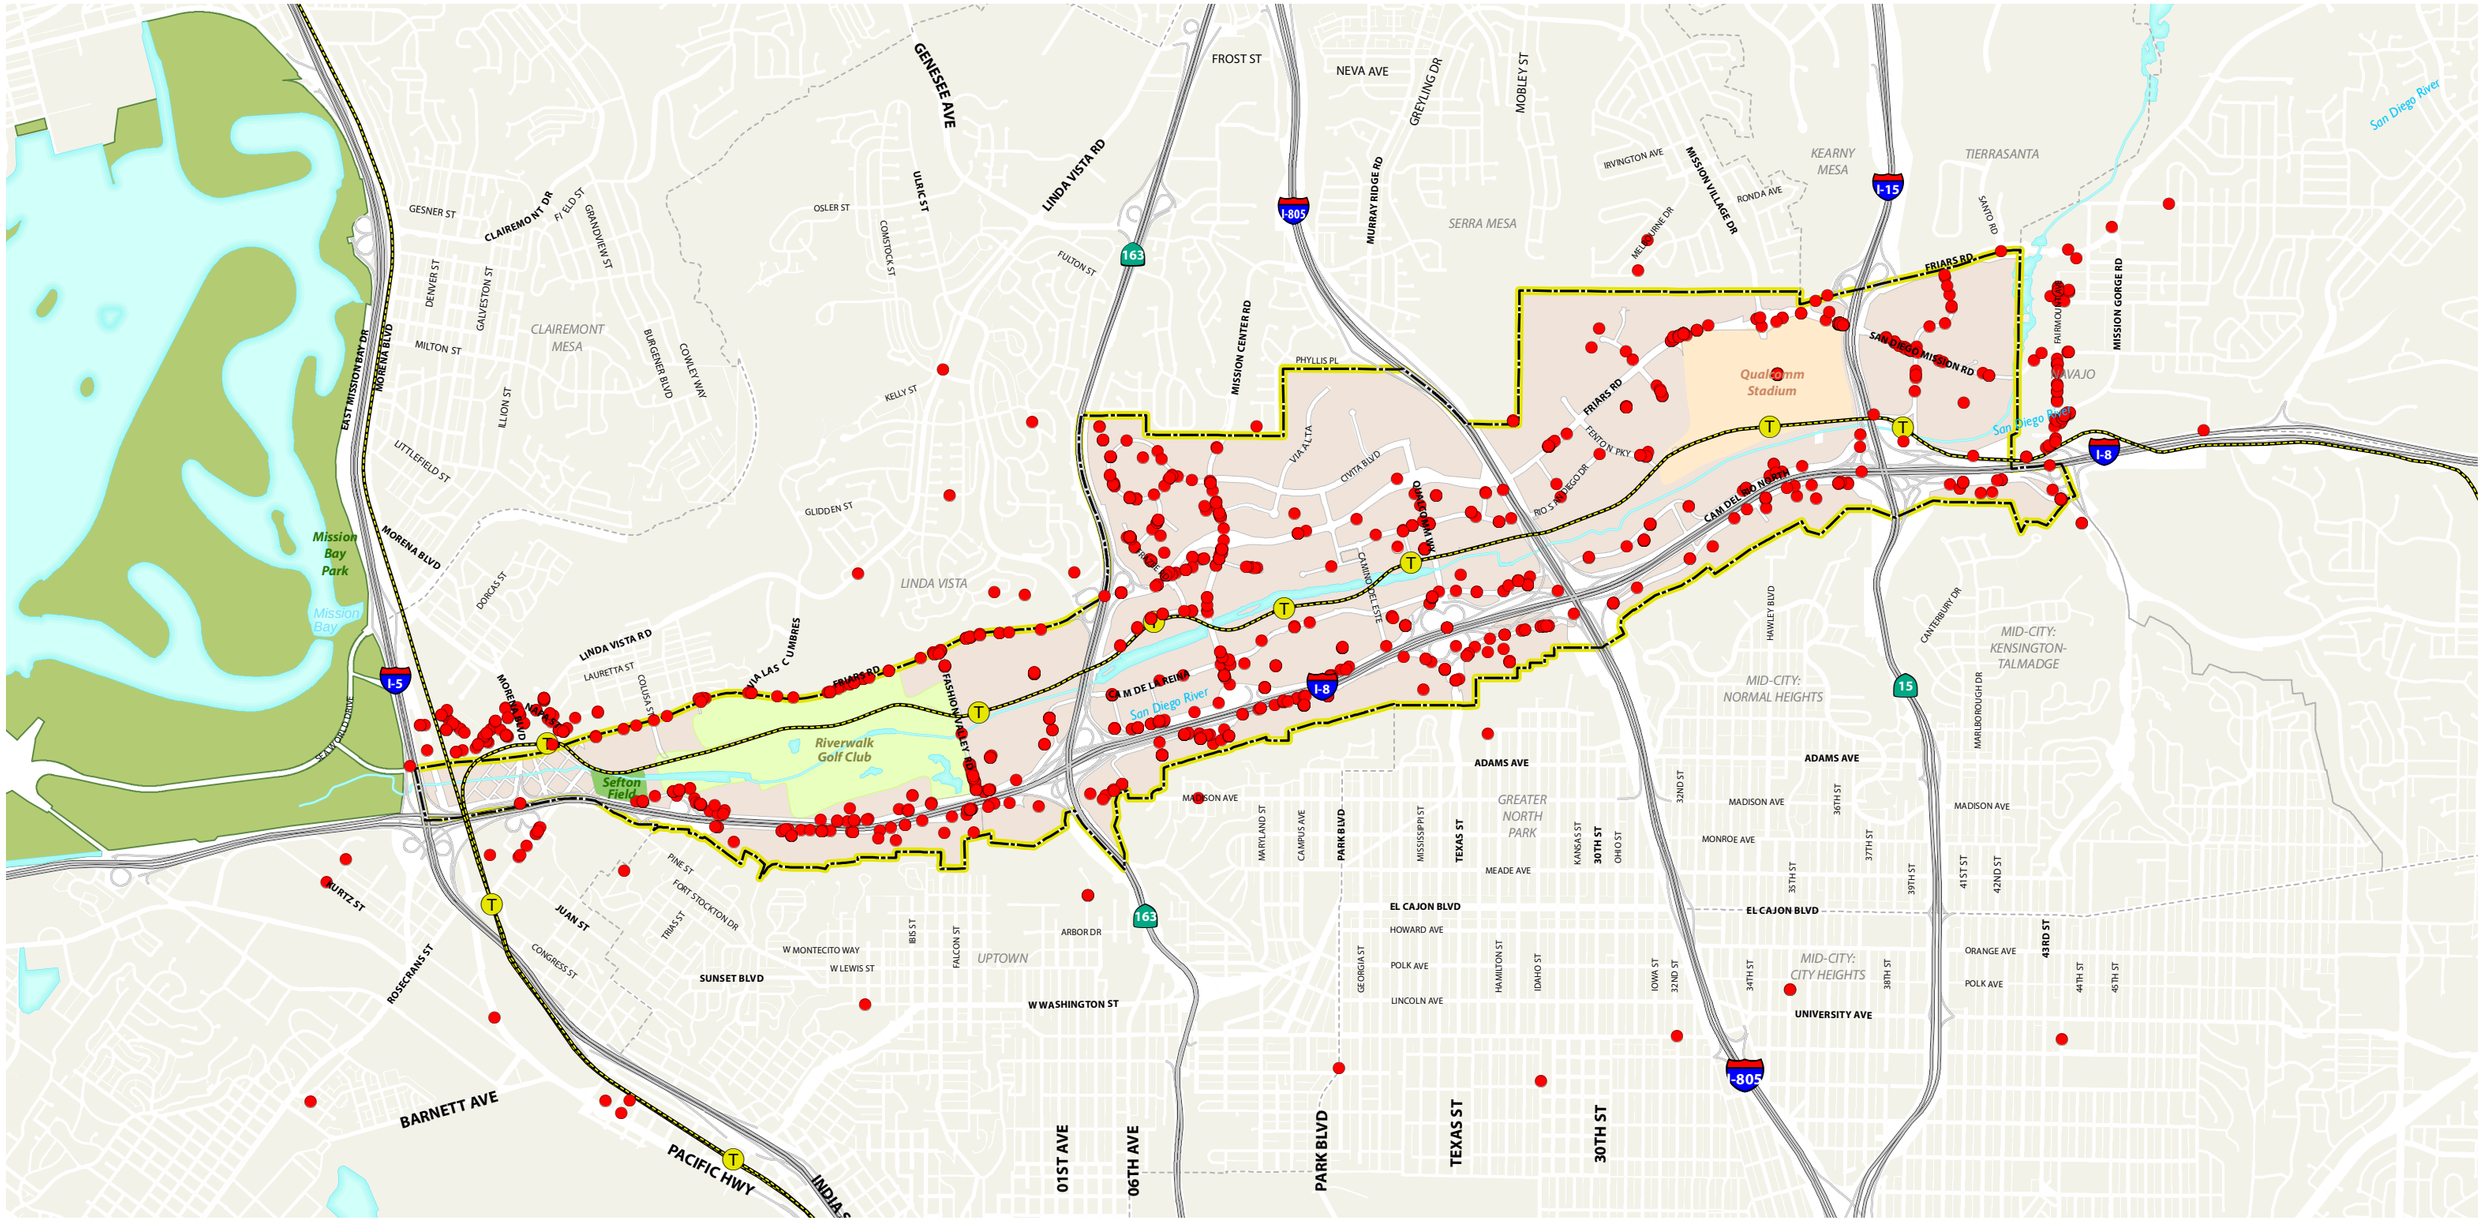
13. LIMITATIONS

This report was prepared in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants preparing similar documents in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this document. Variations in Site conditions will exist and conditions not observed or described in this document could be encountered during subsequent activities and Site work. Please also note that this document did not include an evaluation of geotechnical conditions or potential geologic hazards.

The conclusions, opinions, and recommendations regarding environmental conditions, as presented in this document, are based on an analysis of observed Site conditions and the referenced sources. Further assessment of environmental conditions at the Site may be accomplished by a more comprehensive assessment.



It should be understood that the conditions of a Site will change with time as a result of natural processes and the activities of man at the subject Site or nearby Sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this document may, therefore, be invalidated over time, in part or in whole, by changes over which the author has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. The author should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

Data presented in this report should not be relied on for bidding purposes. This document is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this document by parties other than the client is undertaken at said parties' sole risk.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there are

EXECUTIVE SUMMARY

6 CERC-NFRAP sites within the searched area.

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/10/2015 has revealed that there are 15 RCRA-LQG sites within the searched area.

EXECUTIVE SUMMARY

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/10/2015 has revealed that there are 9 RCRA NonGen / NLR sites within the searched area.

Not reported	FASHION VALLEY & FRI	69	1915

US CDL: A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

A review of the US CDL list, as provided by EDR, and dated 02/25/2015 has revealed that there is 1 US CDL site within the searched area.

HIST FTTS: A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

A review of the HIST FTTS list, as provided by EDR, and dated 10/19/2006 has revealed that there are 7 HIST FTTS sites within the searched area.

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 01/18/2015 has revealed that there are 88 FINDS sites within the searched area.

US AIRS: The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

A review of the US AIRS list, as provided by EDR, and dated 10/16/2014 has revealed that there is 1 US AIRS site within the searched area.

CA UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the CA UST list, as provided by EDR, and dated 06/15/2015 has revealed that there are 32 CA UST sites within the searched area.

CA HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the CA HAZNET list, as provided by EDR, and dated 12/31/2013 has revealed that there are 376 CA HAZNET sites within the searched area.

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 05/04/2015 has revealed that there are 33 CA ENVIROSTOR sites within the searched area.

EDR PROPRIETARY RECORDS

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 126 EDR US Hist Auto Stat sites within the searched area.

EXECUTIVE SUMMARY

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 38 EDR US Hist Cleaners sites within the searched area.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

File Location:	Local Agency
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	This case was opened when soil contamination was discovered in the underground storage tank (UST) excavation and the westernmost dispenser area during the removal of the underground storage tank system, when the station was decommissioned in October 1993. The tank area was excavated to a depth of 23 feet below ground surface and 406.71 tons (approximately 608 cubic yards) of hydrocarbon impacted soil was taken to TPST for recycling. Based on soil sample data the consultant estimated that there were 437 cubic yards of contaminated soil remaining following excavation. Concentrations of gasoline in excess of 100 mg/kg were encountered at depths ranging from 18 to 24 feet below ground surface (bgs) in the vicinity of the former USTs. Contaminated soil was found at four feet bgs at the westernmost dispenser island. Between 1995 and 2004, fourteen monitoring wells were installed associated with the site. Seven wells were located onsite and seven wells off-site to the west across Mission Gorge Road on the Village Square Retail Property located at 6628 Mission Gorge Road. Groundwater monitoring began in May 1, 1995 and continued through December 29, 2011. Dissolved phase gasoline, and its constituents: benzene, ethyl benzene, toluene, xylenes and additive, methyl tertiary butyl ether (MTBE) were detected in groundwater at the site. The maximum concentrations of contaminants were detected in wells (MW-2A) near the former dispenser islands, including the southernmost dispenser island (MW-8). Free product has not been detected at the site. In December 2012, the maximum concentration of gasoline (3,800 ug/l) was detected in well MW6. Benzene (120 ug/l), and tert-butyl alcohol (TBA) [100 ug/l], were detected in onsite well MW-8, and the maximum concentration of MTBE (23 ug/l) was detected in off-site well MW-12. Well MW-12 is the down-gradient well closest to

TEXACO (Continued) **S102438612**

the San Diego River. The consultant estimated the time it would take for contaminants to reach maximum contaminant levels (MCL) based on trend analyses, first order decay rate equations and the Thiessen polygon method for mass remaining. They estimated it would take at least 16 years for TBA to reach to the State notification level of 12 ug/l, at least 4 years for MTBE concentrations to reach the MCL of 13 ug/l, and at least 5 years for benzene to reach the MCL of 1 ug/l. In an effort to remediate soil and groundwater in the former gasoline UST area, a total of 1,845 pounds of oxygen releasing compound (ORC) were injected into the saturated zone in the former tank pit on July 28-29, 1997. Soil samples were collected in the saturated zone to document hydrocarbon concentrations (ORC1-ORC16) prior to injection. Well MP-1 was installed 5 feet west of the ORC injection area to monitor down-gradient dissolved oxygen and hydrocarbon concentrations. On July 7, 1998, nine confirmation Geoprobe borings (GP1-GP9) were installed to determine the effectiveness of the ORC. Soil samples were collected and submitted for laboratory analysis from three of the borings from the interval at 20 to 24 feet below grade. The consultant compared the confirmation boring data to the prior to injection data and concluded that ORC was effective in reducing hydrocarbon concentrations in soil by 52 to 97 percent. The consultant also collected a groundwater sample from well MP-1 and concluded that benzene was the only contaminant that showed a reduction in concentration in the ORC injection area. Seven enhanced fluid recovery events using a vacuum truck were conducted on wells MW-3, MW-6 and MW-8 to remove petroleum hydrocarbon impacted groundwater and vapor from December 2008 to December 2009. Approximately 3,715 gallons of groundwater and an unknown quantity of soil vapor were removed during these events. This technology was not effective in producing long-term reductions in contaminant concentrations in groundwater. The site is located in an area classified as beneficial for agricultural, industrial and process supply and potential municipal use. The City of San Diego (City) is presently assessing the development potential of all of its groundwater resources. The City reserves its right to consider and/or develop any and all available groundwater resources, including, but not limited to groundwater that may be available for extraction at any City property, including the property in the vicinity of the subject site. The City currently has no immediate plans to install wells within a half-mile radius of the site. In March 1999, a soil vapor survey was conducted in the area of the former tank excavation to assess potential risk to occupants of the building. Gasoline and volatile organic compounds were not detected; therefore, a risk assessment was not conducted. A sensitive receptor study was conducted for the site and three irrigation wells were identified at approximately 0.45, 0.58 and 0.78 miles north of the site. The consultant concluded based on the limited size of the plume and the rate of natural attenuation that it was unlikely that contaminants in the site groundwater pose a current or future threat to these irrigation wells. The consultant concluded that all other sensitive receptors (i.e. schools) did not have complete pathways and were eliminated from consideration. The consultant indicated that a sewer lateral that runs from the building south to Zion Avenue near well MW-8 was the only identified subsurface utility that may intersect groundwater and could potentially act as a preferential pathway for migration of contaminants. Additional investigation by the consultant including a field visit eliminated this pathway. The consultant

TEXACO (Continued) **S102438612**

concluded that it appears there would be at least 14 feet of clean soil between the sewer lateral and the water-table, therefore, the it does not appear that the sewer lateral could act as a preferential pathway for migration of contaminants. The San Diego River is located down-gradient, approximately 500 feet north and west of the site. In order to evaluate the possibility that the site groundwater could have impacted the river, several rounds of river water samples were collected from locations upstream and downstream from the site and analyzed for volatile organic compounds (BTEX, MTBE & oxygenates) and none were detected. The consultant concluded that the water in the San Diego River had not been impacted by the groundwater at the site. A Corrective Action Plan was prepared for the site which recommended remediation of the soil and groundwater by natural attenuation. The consultant concluded that there were no apparent risks to human health, utilities, or sensitive receptors from the remaining soil and groundwater contamination at the site. The consultant recommended no further action for the site and DEH concurs with this recommendation.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Lead Agency: SAN DIEGO COUNTY LOP
Case Worker: CH
Local Agency: SAN DIEGO COUNTY LOP
RB Case Number: 9UT2331
LOC Case Number: H15206-001
File Location: Local Agency
Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Benzene, Diesel, MTBE / TBA / Other Fuel Oxygenates
Site History: On December 1, 1992, an underground storage tank (UST) and approximately 18 cubic yards of soil were removed from the site. The results of Department of Environmental Health (DEH) directed soil sampling in the UST excavation indicated total petroleum hydrocarbon (TPH) impacts in the diesel range, and unauthorized release H15206-001 was opened. Further site assessment included installation of five soil borings on site and four groundwater monitoring wells both on and off site. Results of soil sampling from the borings and monitoring wells showed petroleum impacts extended approximately fifteen feet from the former UST excavation. The consultant attributed the localization of the contamination to the tight lithology observed on site. Results of groundwater sampling showed low concentrations of dissolved-phase contaminants in all monitoring wells; however, a thin layer of liquid-phase hydrocarbons (LPH) was observed in monitoring well 1 approximately one year after installation. A dual-phase extraction (DPE) pilot test was conducted to determine if this technique would be successful at removing LPH from monitoring well 1. The results of the pilot study showed that DPE removed very little contaminant mass, and the consultant concluded that DPE would not be an efficient or cost effective method of remediation. Therefore, periodic pump and treat with the use of a hydrophilic sock to mobilize and remove LPH followed by natural attenuation was proposed for site remediation and approved in the Corrective Action Plan (CAP) on April 17, 2009. Manual LPH removal was conducted in monitoring well 1 from May 29, 2009 through March 31, 2010, and was augmented through use of absorption socks from September 28, 2009 through February 1, 2010. Since the cessation of LPH removal activities, a maximum LPH thickness of 0.01 feet has been observed in monitoring well 1, and LPH has not been observed in this well since September 7, 2010. The consultant recommended case closure as LPH levels have been significantly reduced and the plume of dissolved phase contaminants is small, stable, and does not represent

SWAIN OIL (Continued) **S104748427**

a substantial threat to public health and safety or the environment. Although levels of benzene and methyl-tert-butyl ether (MTBE) currently exceed water quality objectives, the consultant has estimated that levels of these contaminants will meet maximum contaminant levels (MCLs) in approximately 2 years (benzene) and 13.5 years (MTBE) through natural attenuation. DEH concurs with the consultants conclusions and recommendation to close the case.

Environmental Interest/Information System
FRP

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
