# Notice of Preparation

303 East B Street, Ontario, California 91764 Phone: 909.395.2036 / Fax: 909.395.2420

**TO:** **Property Owners, Responsible Agencies, and Interested Parties**

**FROM:** **City of Ontario, Planning Department, 303 East "B" Street, Ontario, CA 91764**

**SUBJECT:** **Notice of Preparation of a Draft Focused Environmental Impact Report for the CenterPark Specific Plan**

---

NOTICE IS HEREBY GIVEN that the City of Ontario will be the Lead Agency and will prepare a focused environmental impact report for the project identified below. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the Focused EIR prepared by our agency when considering your permit or other approval for the project.

The Project description, location and the probable environmental effects are contained in the attached materials. A copy of the Initial Study ☐ is, ☒ **is not**, attached and is available at Ontario City Hall, Planning Department. Electronic format of the document can also be obtained online using the following link: https://www.ontarioca.gov/government/community-development/planning/environmental-documents.

The proposed project ☒ **is**, ☐ is not, considered a project of statewide, regional, or area-wide significance. The proposed project ☐ will, ☒ **will not**, affect highways or other facilities under the jurisdiction of the State Department of Transportation. A scoping meeting ☒ **will**, ☐ will not, be held by the lead agency.

**Scoping Meeting:** If the project meets the criteria requiring the scoping meeting, or if the agency voluntarily elects to hold such a meeting, the date, time, and location of the scoping meeting are as follows:

Date and Time: July 2, 2025, beginning at 6:00 p.m. and ending no later than 7:00 p.m.
Location (this meeting will be held as a virtual meeting via Zoom): The Zoom meeting link will be provided on a request basis.

**Review Period:** The 30-day review period for this Notice of Preparation begins on June 13, 2025. Comments will be received until the close of business day on July 14, 2025, at 5:30 p.m. Please send your response to the contact person identified below. Please be sure to include the name of a contact person for your agency.

Contact Person: Rafael Torres, City of Ontario Planning Department, 303 East B Street, Ontario, CA 91764, Phone: (909) 395-2979, Email: rtorres@ontarioca.gov

**Project Title/File No.:** Center Park Specific Plan Project/PSP24-002

**Project Location** The Project is located on a 257.34-acre site along the western boundary of the City, within San Bernardino County. The Project site is bounded to the north by a Southern California Edison (SCE) Easement located approximately 330 feet north of Edison Avenue, Eucalyptus Avenue to the south, Campus Avenue to the west, Walker Avenue to the east, and bisected by Edison Avenue (refer to ***Figure 1, Local Vicinity Map***). The Project site consists of 29 parcels that include the Assessor Parcel Numbers (APNs) presented in ***Table 1: Assessor Parcel Numbers for the Project Site***.

**Table 1: Assessor Parcel Numbers for the Project Site**

CLERK OF THE
BOARD OF SUPERVISORS
2025 JUN 13 AM 11:07
SAN BERNARDINO COUNTY
CALIFORNIA

Regional access to the Project site is provided by Euclid Avenue approximately 0.8 miles west, which connects State Route 60 (SR-60) and Interstate 10 (I-10) to the north. Interstate 15 (I-15) is approximately 4.0 miles to the east and State Route 71 (SR-71) is approximately 3.5 miles to the southwest. SR-71 connects the Project to State Route 91 (SR 91) in Riverside County.

**Project Description:** The Project consists of a Specific Plan to allow for a residential and mixed-used retail/office development on 29 parcels covering approximately 257.34 acres in the City. The development would include up to 250,919 square feet of commercial retail/office uses, up to 4,293 residential units across medium density and mixed-use residential uses, 67.26 acres of open space parkland/non-recreation uses, and associated on-site and off-site infrastructure improvements, as described further below; refer to **Figure 2, Existing Land Use Plan and Zoning**. The Project site is comprised of two "phases" (representing different ownership conditions) with 22 planning areas. The "Phase I" area (shown in **Figure 3: Project Area Ownership**) is owned by the applicant of the CenterPark Specific Plan. The "Phase II" area are parcels owned by others and are included as part of the Specific Plan. Phase I of the Project includes Planning Areas 5 and 7 through 18, which would allow for the development of up to 2,625 residential dwelling units and 55.98 acres of parkland use. This Focused EIR conservatively evaluates the maximum development potential for Phases I and II, as permitted in the proposed Specific Plan. Phase I is expected to start construction in 2026, with an anticipated opening year in 2029. This Focused EIR evaluates Phase II at a "programmatic" level, representing the potential future developments in Planning Areas 1 through 4 and 6. Planning Areas within Phase II do not propose any development at this time; Therefore, these Planning Areas would be developed at a future date. Phases I and II of the Project would allow for up to 250,919 square feet of Mixed-Use retail and office, 4,293 residential units, and 67.26 acres of open-space parkland and non-recreational uses, as shown in **Table 2: Maximum Project Buildout**, below.

**Table 2: Maximum Specific Plan Build-Out Summary**

| Planning Area | Land Use | TOP 2050 Acreage | Maximum Density Per TOP EIR | Maximum Units | Maximum Retail | Maximum Office |
|---|---|---|---|---|---|---|
| 1 | MDR (11.1 - 25.0 DU/AC) | 15.91 AC | 22.0 DU/AC | 350 DU | | |

| 19 | OS-NR (NON-RECREATION) | 2.26 AC | | | | |
| 20 | OS-NR (NON-RECREATION) | 2.68 AC | | | | |
| 21 | OS-NR (NON-RECREATION) | 2.96 AC | | | | |
| 22 | OS-NR (NON-RECREATION) | 3.38 AC | | | | |
| **Open Space Total** | | **67.26** | | | | |
| **Project Total** | | **257.34 AC** | | **4,293 DU** | **115,809 SF** | **135,110 SF** |

Notes:
1. The numbers were rounded to present a conservative estimate.
2. This Focused EIR evaluates the total maximum allowable development in the CenterPark Specific Plan.
3. Phase II uses are being evaluated at a programmatic level only; no specific development applications have been submitted; no specific development dates are known.
4. RETAIL in Mixed-Use areas = 20% of Mixed-Use acreage x 0.30 FAR; OFFICE in Mixed-Use areas = 10% of Mixed-Use acreage x 0.70 FAR

## Environmental Issues to be Evaluated in the Focused EIR

The following issues are anticipated to be addressed in the Focused EIR:

- Historic Resources

The City is processing this Project under a CEQA Guidelines Section 15183 Exemption, except for the issue of historic resources. The Project is consistent with The Ontario Plan Supplemental Program EIR (TOP SEIR), and does not represent any new significant impact, substantially more severe impact, or new significant off-site or cumulative impacts beyond what was evaluated in the TOP SEIR, except for historic resources. With respect to historical resources, the TOP SEIR assumed that there would not be any significant impacts to Tier I or Tier II historic resources. The Project site contains Tier I or II historic resources. City staff have determined that there may be a significant impact to historic resources even after consideration of proposed mitigation measures and compliance with the City's Historic Preservation Ordinance. Therefore, the Focused EIR will be limited to evaluating potential impacts associated with historic resources and will explore reasonable and feasible mitigation measures. The CEQA Guidelines 15183 Exemption Analysis will be an appendix to the Draft Focused EIR.

The Focused EIR will include other sections required by CEQA including sections on: Project Alternatives, Cumulative Impacts, Significant Unavoidable Impacts, Significant Irreversible Environmental Changes, EIR Preparers, EIR References, and EIR Technical Appendices.

**Cortese List Notice**: Pursuant to Public Resources Code §21092.6(a), the Project site is not included on a list of hazardous materials sites compiled pursuant to Government Code §65962.5 (California Department of Toxic Substances Control list of various hazardous sites).[1]

**Public Review Period**
In accordance with CEQA, this NOP will be circulated for a 30-day public review period. Should you have any comments, please provide a written response via mail or email to this NOP within the 30-day NOP public review period, which runs from June 13, 2025, through July 14, 2025. Please indicate a contact person for your agency or organization. Pursuant to CEQA Guidelines §15082, responsible and trustee agencies and other interested parties, including members of the public, must submit any comments in response to this notice no later than 30 days after receipt of the notice.

Please send any comments to:
City of Ontario Planning Department, c/o Rafael Torres
303 East B Street, Ontario, CA 91764
Email: rtorres@ontarioca.gov
Telephone: (909) 395-2979

**Public Scoping Meeting**
Pursuant to §21083.9(a)(2) of CEQA (California Public Resources Code, §21000 et seq.), scoping meetings are required for projects that may have statewide, regional, or area-wide environmental significance. A public scoping meeting will be held by the City on **Wednesday, July 2, 2025**, beginning at 6:00 PM via Zoom. In place of in-person attendance, members of the public can observe and offer comment at this meeting remotely in one of three ways:

1. PROVIDE PUBLIC TESTIMONY DURING THE MEETING: To participate, please email your full name and physical address to Rafael Torres at rtorres@ontarioca.gov prior to July 2, on the day of the meeting to receive the Zoom link and/or call-in phone number.

[1] Department of Toxic Substances Control. EnviroStor. (2021). Retrieved from: https://www.envirostor.dtsc.ca.gov/public/map/?myaddress=ontario.

2. E-MAIL: Please e-mail your comments to the City Contact no later than 5:00 PM on the day of the meeting.
3. TELEPHONE BEFORE THE MEETING: Please call the City Contact no later than 5:00 PM on the day of the meeting.

**Special Accommodations**
Should you require special accommodations at the public scoping meeting, such as assistance for the hearing impaired or an English translator, please contact the City no later than June 25, 2025 (see contact information above). If you do not wish to participate in the scoping meeting, but would like to comment on the project, please send your comments, including contact information, to Rafael Torres, Assistant Planner, Ontario Planning Department, 303 East "B" Street, Ontario, CA 91764, (909) 395-2979 or rtorres@ontarioca.gov no later than **Monday, July 14, 2025**.

# WELCOME

## Center Park Specific Plan
## Focused Environmental Impact Report
## Scoping Meeting

July 2, 2025

CITY OF ONTARIO

# Purpose of Scoping Meetings

- Early public consultation
- Learn about environmental concerns regarding the project from potentially affected agencies and individuals
- Opportunity to identify and address issues that might otherwise arise late in the process
- Help focus the Focused EIR's content and identify alternatives

CITY OF ONTARIO

# CEQA Process

- The California Environmental Quality Act (CEQA) is required for discretionary approvals.
- Purpose is to inform decision makers and the public of potential effects of project approval.
- NOP provides consultation and focuses subsequent efforts.

CITY OF ONTARIO

# Roles and Responsibilities

| | |
|---|---|
| ***Developer*** | Design and submit development proposal |
| ***City Staff*** | Review and evaluate Developer's project<br>Manage EIR Consultant<br>Make recommendations to Decision Makers |
| ***Environmental Consultant*** | Evaluate impacts of project approval on the existing environment |
| ***Decision Makers*** | Planning Commission and City Council<br>Evaluate and approve or disapprove project |

CITY OF ONTARIO

# Project Location Map

# The Project

The Proposed Project will Include:

- Residential and Mixed-Use developments on 257.34 net acres.
- Bound to the north by a Southern California Edison (SCE) Easement located approximately 330 feet north of Edison Avenue, Eucalyptus Avenue to the south, Campus Avenue to the west, Walker Avenue to the east, and bisected by Edison Avenue.
  - Maximum of 4,293 dwelling units, 115,809 s.f. of retail, and 135,110 s.f. of office.
  - Provide for supporting improvements such as roads, trails, parks, utilities, and landscaping.

- Tentative Tract Maps
  - Create 22 Planning Areas

- Development Agreement
  - Establish development rights, infrastructure financing, acquisition, and construction responsibilities

- Williamson Act Cancellation
  - Cancel the active Williamson Act Contracts

  - Adoption of the Center Park Specific Plan
  - Approval of Tentative Tract Maps
  - Approval of Development Agreements
  - Cancellation of Williamson Act Contracts

CITY OF ONTARIO

# EIR Focus Areas

Based on the NOP and public scoping, the following topic will be addressed in the Focused EIR:

- Historic Resources

Pursuant to CEQA Guidelines Section 15183, the City prepared a 15183 Consistency Analysis (which will be an appendix to the Focused EIR), to document that the proposed Project is consistent with the City's The Ontario Plan 2050 and its associated Supplemental EIR, and with the exception of potential impacts to historic resources, the Project is adequately addressed in the prior EIR and does not represent a new or more severe significant impact that is "peculiar" to the Project, nor does it represent a new or more severe impact related to off-site infrastructure or cumulative impacts.

The following topics will be addressed in the 15183 Consistency Analysis (which will be an appendix to the Focused EIR):

- Aesthetics
- Agriculture/Forestry Resources
- Air Quality
- Biological Resources
- **Cultural Resources**
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards/ Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

**The Project only focuses on the potential environmental impacts associated with Historic Resources. All other topics have been analyzed and reviewed through the CEQA 15183 Exemption and are consistent with The Ontario Plan (TOP) 2050.**

CITY OF ONTARIO

# Opportunities for Public Involvement

- Comments on the NOP will be accepted through July 14, 2025.
- 45-day Draft Focused EIR comment period is anticipated to run during Winter 2025.
- Responses to Draft Focused EIR comments will be provided to public agencies not less than ten days prior to public hearings.
- Notices will be provided on dates of Planning Commission and City Council hearings on Final Focused EIR.

CITY OF ONTARIO

# Questions or Comments?

If you have further questions or require additional information, please contact Rafael Torres, Assistant Planner, at RTorres@ontarioca.gov.

**From:** SCG SE Region Redlands Utility Request <SCGSERegionRedlandsUtilityRequest@semprautilities.com>
**Sent:** Thursday, June 26, 2025 7:07 AM
**To:** Rafael Torres <RTorres@ontarioca.gov>
**Cc:** SoCalGasTransmissionUtilityRequest <SoCalGasTransmissionUtilityRequest@semprautilities.com>
**Subject:** 6/26/25-City of Ontario Center Park Specific Plan

**This is a SoCalGas Distribution response. I am including SoCalGas Transmission SoCalGasTransmissionUtilityRequest@semprautilities.com as they may have facilities in the area and will need to review this project.**
Hello,
I just reviewed the documents regarding: **City of Ontario Center Park Specific Plan**
SoCalGas Distribution does have facilities in the area. Please note on case to have Developer contact 811 / USA at DigAlert | Utility Locating California | Underground Wire & Cable Locator [digalert.org] prior to any excavation / demolition activities so we can Locate & Mark out our facilities. **Any excavation activity within ten (10) feet of our High-Pressure facilities will require a SoCalGas employee standby.**
If the Developer needs new gas service, please have them contact our Builder Services group to begin the application process as soon as practicable, at https://www.socalgas.com/for-your-business/builder-services [socalgas.com].
**To avoid delays in processing requests and notifications, please have all Franchise correspondence sent to our Utility Request inbox, at SCGSERegionRedlandsUtilityRequest@semprautilities.com**

I cover the **Southeast Region – Redlands**
SCGSERegionRedlandsUtilityRequest@semprautilities.com would be your contact for requests in the southeastern ends of LA County, Riverside County, San Bernardino & Imperial Counties.

**Southeast Region - Anaheim** office which is all of Orange County and the southern ends of Los Angeles County; therefore, any Map and/or Will Serve Letter requests you have in these areas please send them to AtlasRequests/WillServeAnaheim@semprautilities.com

**Northwest Region – Compton HQ** For West and Central LA County, your Map Request and Will Serve Letters, will go to SCG-ComptonUtilityRequest@semprautilities.com

**Northwest Region - Chatsworth**
For any requests from the northern most parts of LA County all the way up to Visalia, San Luis Obispo, Fresno and Tulare you would contact NorthwestDistributionUtilityRequest@semprautilities.com

**Transmission**
For Transmission requests, please contact SoCalGas Transmission, at SoCalGasTransmissionUtilityRequest@semprautilities.com

**READ MORE .....**

**MINOR STREET IMPROVEMENT PROJECTS: (CHIP SEAL, SLURRY SEAL, GRIND & OVERLAY)**
**Please notify Southern California Gas Company 4 months prior to start of pavement projects for the gas company to complete leak survey & repair leaks if found.**

**MAJOR STREET IMPROVEMENT PROJECTS: (PROJECTS REQUIRING EXCAVATIONS GREATER THAN 9 INCHES, WIDENING OF EXISTING STREETS, INSTALLING NEW CURBS & GUTTERS, BUS PADS, TRAFFIC SIGNALS, REALIGNMENT, GRADE SEPARATION, ETC.)**
**&**
**PIPELINE PROJECTS: (STORM DRAIN, WATERLINE, WATER, SEWER, ELECTRICAL, TELECOMUNICATIONS, ETC.)**
**Please provide Southern California Gas Company with your signed designed plans with *gas company facilities posted* on your designs plans, 4-6 months prior to start of construction for possible relocation of SCG medium pressure facilities and 9-12 months for possible relocation of SCG high pressure facilities.**

**This time is needed to analyze plans and to design required alterations to any conflicting SCG gas facilities. Please keep us informed of any and all pre-construction meetings, construction schedules, etc., so that our work can be scheduled accordingly.**
**Potholing may be required to determine if a conflict exists between the proposed development and our facilities. If, for any reason, there are SCG facilities in conflict, and a request to be relocated is needed, it is important to send the request in writing. Please include all required information below:**

- **A Signed "Notice to Owner" request on Official Letterhead from the City, County, and/or company.**
- **Name, Title and Project Number.**
- **Address, Location, Start Date, Parameters & Scope of Entire Job/Project.**
- **Copy of Thomas Guide Page and/or Google Map Screenshot Highlighting Project Area.**
- **Requestor Company's Contact Name, Title, Phone Number, Email, and other pertinent information.**

Thank you,
Josh Rubal

**Notice of Preparation of a Draft Environmental Impact Report for the CenterPark Specific Plan Project (Proposed Project) (SCH No.: 2025060731)**

South Coast Air Quality Management District (South Coast AQMD) staff appreciate the opportunity to comment on the above-mentioned document. Our comments are recommendations on the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Environmental Impact Report (EIR). Please send a copy of the Draft EIR upon its completion and public release directly to South Coast AQMD as copies of the Draft EIR submitted to the State Clearinghouse are not forwarded. **In addition, please send all appendices and technical documents related to the air quality, health risk, and greenhouse gas analyses (electronic versions of all emission calculation spreadsheets, air quality modeling, and health risk assessment input and output files, not PDF files). Any delays in providing all supporting documentation for our review will require additional review time beyond the end of the comment period.**

**CEQA Air Quality Analysis**

The Lead Agency is recommended to rely on the guidance provided in the South Coast AQMD's CEQA Air Quality Handbook and website[1] when preparing the air quality and greenhouse gas analyses. It is also recommended that the Lead Agency use the California Air Pollution Control Officers Association's California Emissions Estimator Model (CalEEMod)[2] software, to quantify emissions of air pollutants from typical land use development project.

In addition, the South Coast AQMD has adopted regional air quality significance thresholds[3] as well as localized significance thresholds (LST).[4] If the Lead Agency has not adopted its own significance thresholds, the Lead Agency is recommended to rely on South Coast AQMD's adopted thresholds for determining whether the Proposed Project's air quality and greenhouse gas impacts are significant. It is important to note that the localized analysis can be conducted by either using the LST screening tables or performing air dispersion modeling.

---

1 South Coast AQMD's CEQA Air Quality Handbook and other resources for preparing air quality analyses can be found at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook.
2 CalEEMod is available free of charge at: www.caleemod.com.
3 South Coast AQMD's air quality significance thresholds can be found at: https://www.aqmd.gov/docs/default-source/ceqa/handbook/south-coast-aqmd-air-quality-significance-thresholds.pdf
4 South Coast AQMD's guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality and greenhouse gas impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality and greenhouse gas impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips, and hauling trips). Operation-related air quality and greenhouse gas impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers and air pollution control devices), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality and greenhouse gas impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis. Furthermore, if the Lead Agency elects to rely on South Coast AQMD's air quality significance thresholds, the emissions from the overlapping construction and operational activities should be combined and compared to South Coast AQMD's air quality significance thresholds for *operation* to determine the level of significance.

Also, if implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, spray booths, etc., one or more air permits from South Coast AQMD will be required, and the role of South Coast AQMD would change from a Commenting Agency under CEQA to a Responsible Agency as defined in CEQA Guidelines Section 15381. The assumptions in the air quality analysis in the EIR will be the basis for evaluating the air permit(s) under CEQA and imposing permit conditions and limits. Questions about air permit requirements should be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

In addition, CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of evaluating the applications for air permits. For these reasons, the EIR should include a discussion about any new stationary and portable equipment requiring South Coast AQMD air permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project, if applicable. Also, as set forth in CEQA Guidelines Section 15086, the Lead Agency is required to consult with all Responsible Agencies with discretionary approval power over the Proposed Project. Thus, if air permits are required and South Coast AQMD is identified as a Responsible Agency, please let this comment letter serve as South Coast AQMD's request to convene a meeting with the Lead Agency as required by CEQA Guidelines Section 15104 to discuss the scope and content of the environmental information that will need to be included in the Draft EIR.

To assist with identifying ways to minimize air quality impacts from the Proposed Project, the Lead Agency is also recommended to consult and apply the guidance from the California Air Resources Board (CARB) *Air Quality and Land Use Handbook: A Community Health Perspective*,[5] which is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. CARB has

[5] CARB's *Air Quality and Land Use Handbook: A Community Health Perspective* can be found at: https://www.aqmd.gov/docs/default-source/ceqa/handbook/california-air-resources-board-air-quality-and-land-use-handbook-a-community-health-perspective.pdf.

another helpful technical advisory, *Strategy to Reduce Air Pollution Exposure Near High-Volume Roadways*,[6] which contains additional guidance on strategies to reduce air pollution exposure of Proposed Projects located near high-volume roadways.

Since the Proposed Project is a Specific Plan involving local planning and land use decisions, the Lead Agency is recommended to review and consider applying the recommendations contained in the South Coast AQMD *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*,[7] which includes suggested policies that local governments can use in their General Plans or through local planning to prevent or reduce potential air pollution impacts and protect public health.

**Mitigation Measures**

In the event that the Proposed Project results in significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize these impacts. Any impacts resulting from mitigation measures must also be analyzed. Several resources to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project include South Coast AQMD's CEQA Air Quality Handbook,[8] South Coast AQMD's Mitigation Monitoring and Reporting Plan for the 2022 Air Quality Management Plan,[9] and Southern California Association of Governments' Mitigation Monitoring and Reporting Plan for the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy.[10]

**Health Risk Reduction Strategies**

Many strategies are available to reduce exposures, including, but not limited to, building filtration systems with MERV 13 or better, or in some cases, MERV 15 or better is recommended; building design, orientation, location; vegetation barriers or landscaping screening, etc. Enhanced filtration units are capable of reducing exposures. However, enhanced filtration systems have limitations. For example, in a study that South Coast AQMD conducted to investigate filters,[11] a cost burden is expected to be within the range of $120 to $240 per year to replace each filter panel. The initial start-up cost could substantially increase if an HVAC system needs to be installed and if standalone filter units are required. Installation costs may vary and include costs for conducting site assessments and obtaining permits and approvals before filters can be installed. Other costs may include filter life monitoring, annual maintenance, and training for conducting maintenance and reporting. In addition, because the filters would not have any effectiveness unless the HVAC system is running, there may be increased energy consumption that the Lead Agency should evaluate in the Draft EIR. It is typically assumed that the filters operate 100 percent of the time while residents are indoors, and the environmental analysis does not generally account for the

11 This study evaluated filters rated MERV 13 or better. Accessed at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf. Also see 2012 Peer Review Journal article by South Coast AQMD: https://onlinelibrary.wiley.com/doi/10.1111/ina.12013.

times when the residents have their windows or doors open or are in common space areas of the project. These filters have no ability to filter out any toxic gases. Furthermore, when used filters are replaced, replacement has the potential to result in emissions from the transportation of used filters at disposal sites and generate solid waste that the Lead Agency should evaluate in the Draft EIR. Therefore, the presumed effectiveness and feasibility of any filtration units should be carefully evaluated in more detail prior to assuming that they will sufficiently alleviate exposures to diesel particulate matter emissions.

South Coast AQMD staff is available to work with the Lead Agency to ensure that air quality, greenhouse gas, and health risk impacts from the Proposed Project are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact Danica Nguyen, Air Quality Specialist, at dnguyen1@aqmd.gov.

Sincerely,

*Sam Wang*

VIA EMAIL: RTORRES@ONTARIOCA.GOV
CITY OF ONTARIO, PLANNING DEPARTMENT
C/O RAFAEL TORRES
303 EAST B STREET
ONTARIO, CA 91764

Dear Mr. Torres:

NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE CENTER PARK SPECIFIC PLAN PROJECT, SCH# 2025060731

The Department of Conservation's (Department) Division of Land Resource Protection (Division) has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Center Park Specific Plan Project (Project).

The Division monitors and maps farmland conversion on a statewide basis, provides technical assistance regarding the Williamson Act, and administers various agricultural land conservation programs. Public Resources Code, section 614, subdivision (b) authorizes the Department to provide soil conservation advisory services to local governments, including review of CEQA documents.

Protection of the state's agricultural land resources is part of the Department's mission and central to many of its programs. The CEQA process gives the Department an opportunity to acknowledge the value of the resource, identify areas of Department interest, and offer information on how to assess potential impacts or mitigation opportunities.

The Department respects local decision-making by informing the CEQA process and is not taking a position or providing legal or policy interpretation.

We offer the following comments for consideration with respect to the project's potential impacts on agricultural land and resources within the Department's purview.

PROJECT ATTRIBUTES

The Project consists of a Specific Plan to allow for a residential and mixed-used retail/office development on 29 parcels covering approximately 257.34 acres in the City of Ontario. The development would include up to 250,919 square feet of commercial retail/office uses, up to 4,293 residential units across medium density and mixed-use residential uses, 67.26 acres of open space parkland/non-recreation uses, and associated on-site and off-site infrastructure improvements. The Project site contains

Prime Farmland, Farmland of Statewide Importance, and Unique Farmland as designated by DOC's Farmland Mapping and Monitoring Program.

PROJECT CONSIDERATIONS

The conversion of agricultural land represents a permanent reduction and impact to California's agricultural land resources. The Department generally advises discussion of the following in any environmental review for the loss or conversion of agricultural land:

- Type, amount, and location of farmland conversion resulting directly and indirectly from implementation of the proposed project.
- Impacts on any current and future agricultural operations in the vicinity; e.g., land-use conflicts, increases in land values and taxes, loss of agricultural support infrastructure such as processing facilities, etc.
- Incremental impacts leading to cumulative impacts on agricultural land. This would include impacts from the proposed project, as well as impacts from past, current, and likely future projects.
- Implementation of any City or County Agricultural Mitigation Plans, Programs, or Policies.
- Proposed mitigation measures for impacted agricultural lands within the proposed project area.

MITIGATING AGRICULTURAL LAND LOSS OR CONVERSION

Consistent with CEQA Guidelines, the Department advises that the environmental review address mitigation for the loss or conversion of agricultural land. An agricultural conservation easement is one potential method for mitigating loss or conversion of agricultural land. (*See* Cal. Code Regs., tit. 14, § 15370 [mitigation includes "compensating for the impact by replacing or providing substitute resources or environments, including through permanent protection of such resources in the form of conservation easements."]; *see also King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814.)

Mitigation through agricultural conservation easements can take at least two forms: the outright purchase of easements or the donation of mitigation fees to a local, regional, or statewide organization or agency whose purpose includes the acquisition and stewardship of agricultural easements. The conversion of agricultural land may be viewed as an impact of at least regional significance. Hence, the search for replacement lands may not need to be limited strictly to lands within the project's surrounding area. A helpful source for regional and statewide agricultural mitigation banks is the California Council of Land Trusts. They provide helpful insight into farmland mitigation policies and implementation strategies, including a guidebook with model policies and a model local ordinance. The guidebook can be found at:

California Council of Land Trusts

Of course, the use of conservation easements is only one form of mitigation, and the Department urges consideration of any other feasible measures necessary to mitigate project impacts.

Thank you for giving us the opportunity to comment on the Notice of Preparation of a Draft Environmental Impact Report for the Center Park Specific Plan Project. Please provide the Department with notices of any future hearing dates as well as any staff reports pertaining to this project. If you have any questions regarding our comments, please contact Farl Grundy, Associate Environmental Planner via email at Farl.Grundy@conservation.ca.gov.

Sincerely,

Monique Wilber

Subject: SCAG Staff Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Center Park Specific Plan (PSP24-002) [SCAG NO. IGR11219]

Dear Rafael Torres:

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the Center Park Specific Plan ("proposed project") to the Southern California Association of Governments (SCAG) for review. SCAG is responsible for providing informational resources to regionally significant plans, projects, and programs per the California Environmental Quality Act (CEQA) to facilitate the consistency of these projects with SCAG's adopted regional plans, to be determined by the lead agencies.[1]

Pursuant to Senate Bill (SB) 375, SCAG is the designated Regional Transportation Planning Agency under state law and is responsible for preparation of the Regional Transportation Plan (RTP), including the Sustainable Communities Strategy (SCS). SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of and alignment with adopted Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) goals and policies. Finally, SCAG is the authorized regional agency for Intergovernmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Center Park Specific Plan in San Bernardino County. The proposed project consists of construction of up to 4,293 residential units, 250,919 square feet of retail/office uses, and 67.26 acres of open space on 257.34 acres.

**When available, please email environmental documentation to IGR@scag.ca.gov providing, at a minimum, the full public comment period for review.**

If you have any questions regarding the attached comments, please contact the IGR Program, attn.: Ryan Bañuelos, Senior Regional Planner, at (213) 630-1532 or IGR@scag.ca.gov. Thank you.

Sincerely,

*Lijin Sun*

Lijin Sun
Planning Supervisor, Planning Strategy Department

[1] Local jurisdictions and other lead agencies shall have the sole discretion to determine a local project's or plan's consistency and/or alignment with Connect SoCal 2024 for the purpose of determining consistency for CEQA purposes.

**COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE CENTER PARK SPECIFIC PLAN (PSP24-002) [SCAG NO. IGR11219]**

**CONNECT SOCAL 2024**

Connect SoCal 2024 (Plan) is a long-range visioning plan for the six-county SCAG region, reflecting a continuation of the shift towards more efficient resource management including transportation infrastructure resources, land resources and environmental resources. The Plan highlights the existing land use and transportation conditions throughout the SCAG region and forecasts the region's evolving transportation needs between 2024 and 2050. The Plan identifies and prioritizes expenditures of the anticipated funding for transportation projects of all transportation modes: highways, streets and roads, transit, rail, bicycle, and pedestrian, as well as aviation ground access.

The Plan was developed to achieve greenhouse gas (GHG) per capita emission reduction targets, consistent with Senate Bill (SB) 375 and other regional goals. In accordance with federal fiscal constraint requirements, Connect SoCal 2024 is a financially constrained Plan in terms of transportation revenues and expenditures. Connect SoCal 2024 would reduce traffic congestion, improve air quality, and improve the region's long-term economic viability through more than $751 billion in transportation investments and a more sustainable regional development pattern. To view Connect SoCal 2024 and the accompanying technical reports, please visit the Connect SoCal 2024 webpage.

**Connect SoCal 2024 Vision and Goals**

The SCAG Regional Council fully adopted the Plan on April 4, 2024. Connect SoCal 2024 represents the vision for the region and reflects the planned transportation investments, policies, and strategies that integrate with the Forecasted Regional Development Pattern to achieve the Plan's goals. The Vision and Goals for Connect SoCal 2024 are rooted in the direction set forth by Connect SoCal 2020, reflecting both SCAG's statutory requirements, the emerging trends, and persistent challenges facing the region. Reflecting input from engagement with stakeholders and members of the public, SCAG's vision for Southern California in the year 2050 is "*A healthy, prosperous, accessible and connected region for a more resilient and equitable future.*" The following goals and subgoals helps the SCAG region to achieve this vision.

**Mobility:** ***Build and maintain an integrated multimodal transportation network***

- Support investments that are well-maintained and operated, coordinated, resilient and result in improved safety, improved air quality and minimized greenhouse gas emissions
- Ensure that reliable, accessible, affordable and appealing travel options are readily available, while striving to enhance equity in the offerings in high-need communities
- Support planning for people of all ages, abilities and backgrounds

**Communities:** ***Develop, connect and sustain communities that are livable and thriving***

- Create human-centered communities in urban, suburban and rural settings to increase mobility options and reduce travel distances
- Produce and preserve diverse housing types in an effort to improve affordability, accessibility and opportunities for all households

**Environment:** ***Create a healthy region for the people of today and tomorrow***

- Develop communities that are resilient and can mitigate, adapt to and respond to chronic and acute stresses and disruptions, such as climate change
- Integrate the region's development pattern and transportation network to improve air quality, reduce greenhouse gas emissions and enable more sustainable use of energy and water
- Conserve the region's resources

**Economy:** ***Support a sustainable, efficient and productive regional economic environment that provides opportunities for all residents***

- Improve access to jobs and educational resources
- Advance a resilient and efficient goods movement system that supports the economic vitality of the region, attainment of clean air and quality of life for our communities

For ease of review, SCAG staff encourages the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency, or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

| SCAG CONNECT SOCAL 2024 GOALS AND SUBGOALS | | |
|---|---|---|
| Goal/Subgoal | | Analysis |
| Mobility Goal: | *Build and maintain an integrated multimodal transportation network* | *Consistent: Statement as to why; Not-Consistent: Statement as to why; or Not Applicable: Statement as to why; DEIR page number reference* |
| Mobility Subgoal: | *Support investments that are well-maintained and operated, coordinated, resilient and result in improved safety, improved air quality and minimized greenhouse gas emissions* | *Consistent: Statement as to why; Not-Consistent: Statement as to why; or Not Applicable: Statement as to why; DEIR page number reference* |
| etc. | | etc. |

**Connect SoCal 2024 Key Elements**

Unique to this plan cycle, SCAG developed a set of Regional Planning Policies and Implementation Strategies to guide decision-making in the region toward integrated land use and transportation planning and other goals in Connect SoCal 2024. Eighty-eight Regional Planning Policies provide guidance for integrating land use and transportation planning to realize the vision of Connect SoCal 2024. The Implementation Strategies help the region to achieve this vision for the future and are priorities for SCAG efforts in fulfilling or going beyond the Regional Planning Policies. The Regional Planning Policies and Implementation Strategies were developed to achieve California's greenhouse gas emission reduction goals as set forth in SB 375 and federal Clean Air Act Section 176(c) requirements for transportation conformity while meeting the broader regional objectives, such as improved equity and resilience in addition to preservation of natural lands, improvement of public health, increased roadway safety, support for the region's vital goods movement industries and more efficient use of resources. The Plan also includes a detailed project list; strategic investments to bridge local plans with overarching regional performance targets and goals; a growth forecast and regional development pattern based on population, household and employment growth projections by 2050; and a transportation network including a list of transportation projects and investments.

Connect SoCal 2024 presents a summary of that work in five chapters of the Main Plan with additional details on Plan elements and analysis in the Plan's accompanying 15 Technical Reports. Connect SoCal 2024 builds upon the progress from previous RTP/SCS cycles, reflecting both SCAG's statutory requirements, the emerging trends, and persistent challenges facing the region. These policies offer a resource by which County Transportation Commissions (CTCs) or local jurisdictions within the SCAG region, when seeking resources from state or federal programs, can refer to specific policies to demonstrate alignment with the RTP/SCS.

**Regional Growth Forecast and Forecasted Regional Development Pattern**

As part of developing a Sustainable Communities Strategy per SB 375, SCAG must include a "forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies …" enables SCAG to reach its per capita GHG emission reduction target of 19 percent below 2005 levels by 2035. SCAG staff prepared a Forecasted Regional Development Pattern for Connect SoCal 2024 through 2050, the horizon year of the Plan. The regional growth forecast determines the projected increase in population, households, and jobs based on local general plans and known development entitlement agreements, including available data from 6th cycle housing element updates. The Connect SoCal 2024 Demographic and Growth Forecast Technical Report includes detailed discussions on socioeconomic data, including additional detail on the growth forecast, growth vision, and Sustainable Communities Strategy (SCS) consistency in Section of the Technical Report. The Connect SoCal 2024 Land Use and Communities Technical Report includes the most recent planning assumptions and estimates of population and housing.

SCAG's work helps facilitate implementation, but SCAG does not directly implement or construct projects or have land use authority. Achieving a sustained regional outcome depends upon informed and intentional local action. To access jurisdictional level growth estimates and forecasts for years 2035 and 2050, please refer to the Final Connect SoCal 2024 growth forecast data. The growth forecasts for the region and the applicable jurisdiction is below.

| | Adopted SCAG Region Growth Forecasts | | | | City of Ontario Growth Forecasts | | |
|---|---|---|---|---|---|---|---|
| | **Year 2019** | **Year 2030** | **Year 2035** | **Year 2050** | **Year 2019** | **Year 2035** | **Year 2050** |
| Population | 18,827,000 | 19,476,000 | 19,946,000 | 20,909,000 | 174,800 | 200,400 | 240,000 |
| Households | 6,193,000 | 7,006,000 | 7,311,000 | 7,814,000 | 50,500 | 76,700 | 95,500 |
| Employment | 8,976,000 | 9,609,000 | 9,885,000 | 10,276,000 | 122,000 | 164,100 | 187,700 |

**Consistency with Connect SoCal 2024**

SCAG provides informational resources to facilitate the lead agency's consistency determination of the proposed project with Connect SoCal 2024. For the purpose of determining consistency with CEQA, local jurisdictions shall have the sole discretion to determine a local project's or plan's consistency and/or alignment with Connect SoCal 2024[2].

**CEQA MITIGATION MEASURES**

The SCAG Regional Council certified the Final Program Environmental Impact Report for Connect SoCal 2024 (2024 PEIR) and adopted the Mitigation Monitoring and Reporting Program (MMRP), Findings of Fact, and a Statement of Overriding Considerations on April 4, 2024. The mitigation approach used in the 2024 PEIR recognizes the limits of SCAG's authority; distinguishes between SCAG commitments and project-level responsibilities and authorities; optimizes flexibility for project implementation; and facilitates CEQA streamlining (e.g., SB 375) and tiering where appropriate on a project-by project basis determined by each lead agency. Consistent with the approach, the 2024 PEIR identifies regional-level mitigation measures to be implemented by SCAG over the lifetime of the Plan as well as project-level mitigation measures that lead agencies can and should consider, as applicable and feasible, in subsequent project-specific design, CEQA review, and decision-making processes. Given that SCAG is not an implementing agency and has no decision-making authority over projects or any land use authority, it is ultimately up to each lead agency's own discretion to determine the appropriateness of mitigation measures, including exploring opportunities of voluntary regional advance mitigation programs, based on project-specific circumstances such as individual site conditions, project specific details, and community values. Therefore, SCAG staff recommends that the proposed project's CEQA lead agency review the 2024 PEIR for guidance, as appropriate.

**RE: NOTICE OF PREPERATION (NOP) FOR THE CENTER PARK SPECIFIC PLAN DRAFT ENVIRONMENTAL IMPACT REPORT**

Dear Mr. Torres:

Thank you for the opportunity to comment on the Notice of Preparation (NOP) for the City of Ontario's Specific Plan Project Draft Environmental Impact Report (DEIR). Eastvale values its relationship with neighboring jurisdictions and is not opposed to development of this site; however, this project has the potential to generate traffic and air quality impacts in Ontario and Eastvale. The City of Eastvale offers the following comments for your consideration:

- The Focused EIR and CEQA Guidelines Section 15183 Exemption Analysis should describe potential cumulative impacts resulting from the proposed project together with all other reasonably foreseeable, planned, and approved future projects producing related or cumulative impacts. To that end, the DEIR should consider and incorporate the City of Eastvale's General Plan ("Eastvale 2040") when evaluating cumulative effects of the Specific Plan Amendment. Eastvale 2040 is available on the City of Eastvale's website at: https://www.eastvaleca.gov/our-city/what-s-new/eastvale-2040.

- Although the project is over two miles from the City of Eastvale's northwestern city limits, a project involving 4,293 units, 115,809 square feet of mixed-use retail, and 135,11 square feet of mixed-use office could have potential to impact to City of Eastvale maintained roadways and intersections that should be considered.

If needed, City of Eastvale staff would be happy to meet to discuss these comments, potential solutions that address concerns for both cities, and initiate dialogue concerning fare share costs for any potential mitigations. Please feel free to contact me at (951) 703-0488 or dmurray@eastvaleca.gov with any follow up.

We look forward to working cooperatively with the City of Ontario on regional issues that affect our respective communities.

Sincerely,

David Murray
City Planner

Hello ,

California Department of Fish and Wildlife (CDFW) has received the Notice of Preparation for the Center Park Specific Park (SCH No. 2025060731). Please see the attached comment letter from CDFW. We also included the 2021 TOP 2050 NOP Comment Letter that the Department sent to the City on August 19, 2021, which includes figures depicting BUOW locations during that time.

Thank you,

Subject: Notice of Preparation of a Draft Focused Environmental Impact Report
Center Park Specific Plan
State Clearinghouse No. 2025060731

Dear Rafael Torres:

The California Department of Fish and Wildlife (CDFW) received a Notice of Preparation (NOP) of a Notice of Preparation (NOP) from the City of Ontario (City) for the Center Park Specific Plan (Project) pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.[1]

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

**CDFW ROLE**

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State. (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a).) CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (*Id.*, § 1802.) Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

[1] CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

CDFW is also submitting comments as a Responsible Agency under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), the Project proponent may seek related take authorization as provided by the Fish and Game Code.

## PROJECT DESCRIPTION SUMMARY

**Location**: The Project site contains approximately 257.24 acres within the southwestern portion of the City of Ontario, San Bernardino County, California. The Project site is bounded by Campus Avenue to the west, Walker Avenue to the east, Eucalyptus Avenue to the south (approximately 0.26 miles south of Project boundary), a Southern California Edison (SCE) easement to the north, and is bisected by Edison Avenue.

**Project Description**: The Project consists of a Specific Plan that encompasses residential and mixed-used retail/office development across 29 parcels and 22 planning areas within a 257.24 acre site. The proposed development would include 250,919 square feet (sqft) of commercial retail/office, up to 4,293 residential units across medium density and mixed-use residential, 67.26 acres of open space parkland/non-creation uses, and associated on-site and off-site infrastructure improvements.

The Project will be implemented in two phases. Phase I pertains to areas owned by the Specific Plan applicant, specifically Planning Areas 5 and 7 through 18, allowing for the development of up to 2,625 residential dwelling units and 55.98 acres of parkland use. Phase II includes parcels owned by third parties, covering Planning Areas 1 through 4 and 6, which will be evaluated at a programmatic level in this draft focused EIR. No development is currently proposed for Phase II, with future development anticipated at a later date.

## COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations below to assist the City of Ontario in adequately identifying, avoiding, and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. The EIR should provide adequate and complete disclosure of the Project's potential impacts on biological resources [Pub. Resources Code §21061; CEQA Guidelines, §§15003(i), 15151]. CDFW looks forward to commenting on the EIR when it is available.

### The Ontario Plan EIR & New Model Colony EIR

In 1998, the City of Ontario created a Master Plan known as the New Model Colony (NMC) Program EIR, now referred to as the Ontario Ranch community. The NMC would annex 8,200 acres of previous agricultural and dairy lands which would be entirely developed out into housing, retail, office, and schools. Given the NMC EIR would create significant impacts to raptors, waterfowl, Delhi Sands Flower-Loving Fly, and burrowing owls, and mitigation measures to reduce impacts to less than significant levels included: (MM BR-1) *2:1 Mitigation Waterfowl Habitat Mitigation*; and (MM BR-2) *Waterfowl and Raptor Conservation Area*. A lawsuit was filed against the City by the Endangered Habitats League, Inc. and Sierra Club challenging the City's CEQA compliance, where a settlement agreement was reached upon and agreed by all parties.

The NMC Program Final EIR was prepared with the intent that later environmental analysis of individual development projects would be tiered from this document. If the City of Ontario concluded that no new effects would occur, or no new mitigation measures would be required, they could approve the project as being within the scope covered by the program EIR, and no new environmental document(s) would be required. However, the NMC Final EIR clarified that it was not meant to fully satisfy the environmental review requirements that would be necessary for each development within the various planning subareas and therefore, individual specific plans would be prepared with separate environmental documentation.

Due to state law requiring local jurisdictions to update their General Plans every 10 years, the City prepared The Ontario Plan (TOP) DEIR (SCH 2008101140) which was finalized in July 2009. The TOP DEIR included the following biological mitigation measures with details of the settlement agreement included: (MM-1) *Mitigation Fee* of $4,320 per acre on proposed developments within the annexed area; (MM-2) *On Site Land Conservation or Owl Relocation*; (MM-3) *Land Conservation* using all mitigation fees collected; and (MM-4) *Land Easements* for long-term conservation value to benefit wildlife. It was also determined in the TOP EIR that after the collection of the mitigation fees for the acquisition and management of habitat, implementation of the proposed TOP would not have substantial adverse impacts on sensitive animal species, including burrowing owls. In 2021, the City updated their general plan, and prepared the TOP 2050 SEIR, which was finalized in 2022. The TOP 2050 relies on the TOP EIR, and follows the same environmental analysis on whether individual Projects would require new mitigation or not, and that no adverse impacts to sensitive species would occur.

CDFW submitted a NOP comment letter to the City of Ontario, as the Lead Agency, on August 19, 2021, in response to the preparation of TOP 2050 SEIR. In this letter CDFW raised concerns regarding the potential biological impacts associated with the TOP 2050 EIR, including impacts to burrowing owls, cumulative impacts to biological resources, and the need for appropriate mitigation measures. The letter also included several maps highlighting documented burrowing owl observations in the region gathered from past project-related CEQA documents and biological reports. Despite

these comments, the Final EIR did not incorporate any new biological mitigation measures, consider the information provided, nor did it include CDFW's NOP letter in Appendix A, which contains NOPs and comment letters.

Since the adoption of the TOP 2050 in 2022, burrowing owl have now been designated by the Fish and Game Commission as a candidate endangered species, protected under CESA on October 2024 given their decline in California. The agricultural preserve/ Ontario Ranch community has a well-documented history of supporting breeding, wintering, foraging, and migration stopover habitat for resident and migratory burrowing owls. This area remains one of the last strongholds for significant burrowing owl populations within the Inland Empire. Pursuant to CEQA Guidelines §§ 15380, 15064, 15065, 21001(c), 21083, lead agencies are required to make mandatory findings of significance when a project is likely to impact threatened or endangered species, and avoidance or mitigation measures must be presented to reduce impacts to less than significant levels. Additionally, Crotch's bumble bee, another designated candidate endangered species protected under CESA, has known occurrences within the annexed area, with a CNDDB sighting located within the vicinity of the proposed Project, and would also require avoidance or mitigation measures presented to reduce impacts to less than significant levels.

On Page 4 of the Center Park Specific Plan NOP, it states: "*The City is processing this Project under a CEQA Guidelines Section 15183 Exemption, except for the issue of historic resources. The Project is consistent with The Ontario Plan Supplement Program EIR (TOP SEIR), and does not represent any new significant impact […]*". Due to the recent candidacy of several species under CESA that have a high potential of being found within the project area, and the inadequate analysis and assessment of potential Project impacts to said species in the original environmental review, the Center Park Specific Plan should not be exempt from evaluating and mitigating for potential significant impacts to biological resources.

CDFW recommends the City of Ontario amend and recirculate their TOP EIR to include CDFW's 2021 NOP letter and fully assess the potential impacts to burrowing owls, Crotch's bumble bee, nesting birds, and cumulative impacts to natural resources. Appropriate mitigation measures for each species must be identified and incorporated. Mitigation Measures in the TOP EIR should also be amended to eliminate any language referencing burrowing owl relocation. Any relocation activities would be considered a form of "take", as described under CESA, and would require authorization and Project impacts to be fully mitigated (Incidental Take Permit, ITP).

**Assessment of Biological Resources**

Section 15125(c) of the CEQA Guidelines states that knowledge of the regional setting of a project is critical to the assessment of environmental impacts and that special

emphasis should be placed on environmental resources that are rare or unique to the region. To enable CDFW staff to adequately review and comment on the project, the DEIR should include a complete assessment of the flora and fauna within and adjacent to the Project footprint, with particular emphasis on identifying rare, threatened, endangered, and other sensitive species and their associated habitats.

The CDFW recommends that the DEIR specifically include:

1. An assessment of the various habitat types located within the project footprint, and a map that identifies the location of each habitat type. CDFW recommends that floristic, alliance- and/or association-based mapping and assessment be completed following *The Manual of California Vegetation*, second edition[2]. Adjoining habitat areas should also be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions.

2. A general biological inventory of the fish, amphibian, reptile, bird, and mammal species that are present or have the potential to be present within each habitat type onsite and within adjacent areas that could be affected by the project. CDFW's California Natural Diversity Database (CNDDB) in Sacramento should be contacted at (916) 322-2493 or CNDDB@wildlife.ca.gov or https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data to obtain current information on any previously reported sensitive species and habitat, including Significant Natural Areas identified under Chapter 12 of the Fish and Game Code, in the vicinity of the proposed Project.

   Please note that CDFW's CNDDB is not exhaustive in terms of the data it houses, nor is it an absence database. CDFW recommends that it be used as a starting point in gathering information about the *potential presence* of species within the general area of the project site.

3. A complete, *recent* inventory of rare, threatened, endangered, and other sensitive species located within the Project footprint and within offsite areas with the potential to be affected, including California Species of Special Concern (CSSC) and California Fully Protected Species (Fish & G. Code, § 3511). Species to be addressed should include all those which meet the CEQA definition (CEQA Guidelines § 15380). The inventory should address seasonal variations in use of the Project area and should not be limited to resident species. Focused species-specific surveys, completed by a qualified biologist and conducted at the appropriate time of

[2] Sawyer, J.O., T. Keeler-Wolf, and J.M. Evens. 2009. A Manual of California Vegetation, 2nd ed. California Native Plant Society Press, Sacramento, California. http://vegetation.cnps.org/

year and time of day when the sensitive species are active or otherwise identifiable, are required. Acceptable species-specific survey procedures should be developed in consultation with CDFW and the U.S. Fish and Wildlife Service, where necessary. Note that CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed Project may warrant periodic updated surveys for certain sensitive taxa, particularly if the Project is proposed to occur over a protracted time frame, or in phases, or if surveys are completed during periods of drought.

Species specific surveys for special status species that the Project footprint has the Potential to Support, including burrowing owl, Crotch's bumblebee, and tricolored blackbird.

Burrowing Owl (*Athene cunicularia*)

The Project site, as is expected for Annexed Area 163, has the potential to provide suitable foraging and/or nesting habitat for burrowing owl. According to CNDDB and eBird data, and data gathered from adjacent projects, burrowing owls have been observed on site and adjacent to the proposed Project.

On October 10, 2024, the Fish and Game Commission accepted a petition to list Western Burrowing Owl under CESA, determining the listing "may be warranted" and advancing the species to the candidacy stage of the CESA listing process (Fish & G. Code, § 2050 et seq.). During the candidacy period, western burrowing owl will be afforded the same protection as threatened and endangered species under CESA. If Project activities, including burrow exclusion and closure, could result in take, appropriate CESA authorization (i.e., Incidental Take Permit under Fish and Game Code section 2081) should be obtained prior to commencement of Project activities. Please reference the California Endangered Species Act section below for more guidance.

The City should be aware that burrowing owls may use an area for breeding, wintering, foraging, and/or migration stopovers. Because burrowing owls detected during nonbreeding season surveys may be year-round residents, young from the previous breeding season, pre-breeding territorial adults, winter residents, dispersing juveniles, migrants, and/or transients or new colonizers, burrowing owl seasonal residency status can be difficult to ascertain.

CDFW strongly encourages the City to follow the recommendations and guidelines provided in the *Staff Report on Burrowing Owl Mitigation* (Department of Fish and Game, March 2012); available for download from CDFW's website: https://www.wildlife.ca.gov/conservation/survey-protocols. The Staff Report on Burrowing Owl Mitigation, specifies three steps for project impact evaluations:

a. A habitat assessment;
b. Surveys; and
c. An impact assessment

As stated in the Staff Report on Burrowing Owl Mitigation, the three progressive steps are effective in evaluating whether a project will result in impacts to burrowing owls, and the information gained from the steps will inform any subsequent avoidance, minimization, and mitigation measures. Habitat assessments should be conducted to evaluate the likelihood that a site may be utilized by burrowing owls for different activities throughout the year, followed by both breeding and non-breeding burrowing owl surveys are highly recommended because they each provide necessary information to determine the potential effects of proposed projects and activities on wintering, resident, breeding, migratory and fledgling burrowing owls,, and to avoid take in accordance with Fish and Game Code sections 86, 3503, and 3503.5. Take is defined in Fish and Game Code section 86 as "hunt, pursue, catch, capture or kill, or attempt to hunt, pursue, catch, capture or kill." Impact assessments should determine the extent to which burrowing owls and their habitat may be impacted, directly or indirectly, on and within a reasonable distance of a proposed CEQA project activity or non-CEQA project. CDFW recommends that, at a minimum, the City should:

- Develop criteria for determining acceptable qualifications for individuals who perform burrowing owl habitat assessments, biological surveys, monitoring, and other relevant duties.
- Maintain a list of qualified biologists to cross reference when reviewing and approving CEQA documents.
- Require that project proponents submit survey data (e.g., survey reports, field notes, kmz or GIS files etc.) and survey protocol (survey methods, time, locations, and results) and ensure burrowing owl occurrences are entered into a database (e.g., California NaturalDiversity Database, CNDDB).

CDFW would like to remind the City, that the Ontario Regional Sports Complex EIR (SCH No. 2023110328), currently under construction, is located within two miles of the proposed Project site. The location of the Ontario Ranch Sports Complex site supported both wintering, year-round, and migratory burrowing owls, in addition to Crotch's bumble. Despite this documented presence, the City did not implement appropriate mitigation measures for burrowing owls. The City determined that

burrowing owls were not present on site based on a single non-breeding season survey, a conclusion CDFW expressed concern with. The City did not conduct burrowing owl focused surveys as specified in the 2012 Staff report, or the BOMP as stated and committed to in the adopted EIR.

Crotch's Bumble Bee

The project may impact suitable habitat for Crotch's bumble bee (*Bombus crotchii*), a CESA candidate species, and has the potential for take pursuant to California Fish and Game Code Section 2081(b). The Project could result in loss of suitable nesting and foraging habitat for Crotch's bumble bee. Project ground-disturbing activities may cause death or injury of adults, eggs, and larva; burrow collapse; nest abandonment; and reduced nest success. Crotch's bumble bee primarily nest in late February through late October underground in abandoned small mammal burrows but may also nest under perennial bunch grasses or thatched annual grasses, under-brush piles, in old bird nests, and in dead trees or hollow logs[3, 4] Overwintering sites utilized by Crotch's bumble bee mated queens include soft, disturbed soil[5] , or under leaf litter or other debris[6]. Ground disturbance and vegetation removal associated with Project implementation during the breeding season could result in the incidental loss of breeding success or otherwise lead to nest abandonment in areas adjacent to the Project site. Indirect, permanent impacts include conversion of habitat through the introduction of invasive species. Without sufficient avoidance, minimization, or mitigation measures, the Project activities may result in unmitigated temporal or permanent loss of colonies, and suitable nesting and foraging habitat.

The California Fish and Game Commission accepted a petition to list Crotch's bumble bee as endangered under CESA, determining the listing "may be warranted" and advancing the species to the candidacy stage of the CESA listing process. Crotch's bumble bee are granted protection as a threatened species under CESA. Take of any endangered, threatened, candidate species that results from the Project is prohibited, except as authorized by State law (Fish & G. Code, §§ 86, 2062, 2067, 2068, 2080, 2085; Cal. Code Regs., tit. 14, § 786.9). In addition, Crotch's bumble bee has a State ranking of S1/S2. This means that the Crotch's bumble bee is

---

[3] Williams, P. H., R. W. Thorp, L. L. Richardson, and S.R. Colla. 2014. Bumble bees of North America: An Identification guide. Princeton University Press, Princeton, New Jersey. 208pp.
[4] Hatfield, R., Jepsen, S., Foltz Jordan, S., Blackburn, M., Code, Aimee. 2018. A Petition to the State of California Fish and Game Commission to List Four Species of Bumblebees as Endangered Species.
[5] Goulson, D. 2010. Bumblebees: Behavior, Ecology, and Conservation. Oxford University Press, New York. 317pp.
[6] California Department of Fish and Wildlife. 2017. California Terrestrial and Vernal Pool Invertebrates of Conservation Priority. https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=148248&inline.

considered critically imperiled or imperiled and is extremely rare (often 5 or fewer populations). Crotch's bumble bee is listed as an invertebrate of conservation priority under the California Terrestrial and Vernal Pool Invertebrates of Conservation Priority.

Prior to any ground disturbance, CDFW recommends the Project conduct site specific surveys for Crotch's bumble bee in accordance with any Crotch's bumble bee survey protocol provided by CDFW (Survey Considerations for California Endangered Species Act Candidate Bumble Bee Species). If "take" or adverse impacts to Crotch's bumble bee cannot be avoided either during Project activities or over the life of the Project, the Project should obtain appropriate take authorization from CDFW pursuant to Fish and Game Code section 2081 subdivision (b).

Bats

The Project site has the potential to provide suitable habitat for several bat species (collectively, bats) potentially roosting (day, night and maternal) and foraging habitat, which may include some Species of Special Concern (SSC) including but not limited to:

- pallid bat (*Antrozous pallidus*) (SSC)
- Townsend's big-eared bat (*Corynorhinus townsendii*) (SSC)
- western mastiff bat (*Eumops perotis*) (SSC)
- small-footed myotis (*Myotis ciliolabrum*) (SSC)
- Yuma myotis (Myotis *yumanensis*) (SSC)
- pocketed free-tailed bat (*Myctinopops ferosaccus*) (SSC)
- big free-tailed bat (*Nyctinomops macrotis*) (SSC)

Project construction and activities may result in direct and indirect impacts to bats. Direct impacts include removal of structures occupied by roosting bats. This could result in injury or mortality to bats as well as loss of roosting habitat. Indirect impacts to bats and roosts could result from increased noise disturbances, human activity, dust, vegetation clearing, ground-disturbing activities (e.g., staging, mobilizing, excavating, and grading), and vibrations caused by heavy equipment.

Bats are considered non-game mammals and are afforded protection by State law from take and/or harassment (Fish & G. Code, § 4150; Cal. Code of Regs, § 251.1). Several bat species are considered SSC.

The DEIR should include results of specific surveys for bats for the Project area proposed to be directly or indirectly affected by Project activities and the results of the surveys included in the DEIR, along with avoidance, minimization and mitigation measures, if appropriate. CDFW recommends if active hibernacula or day roosts are identified in the work area or within 500 feet of the work area, during pre-

construction surveys, they be avoided to the extent feasible. For maternity roosts, Project construction will only occur between October 1 and February 28, outside of the maternity roosting season when young bats are present but are yet ready to fly out of the roost (March 1 to September 30). Maternity roosts shall not be evicted, excluded, removed, or otherwise disturbed.

4. A thorough, recent, floristic-based assessment of special status plants and natural communities, following CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (see https://www.wildlife.ca.gov/Conservation/Plants).

5. Information on the regional setting that is critical to an assessment of environmental impacts, with special emphasis on resources that are rare or unique to the region (CEQA Guidelines § 15125[c]).

6. A full accounting of all open space and mitigation/conservation lands within and adjacent to the Project.

**Analysis of Direct, Indirect, and Cumulative Impacts to Biological Resources**

The DEIR should provide a thorough discussion of the direct, indirect, and cumulative impacts expected to adversely affect biological resources as a result of the Project (including the plan's land use designations, policies and programs). To ensure that Project impacts to biological resources are fully analyzed, the following information should be included in the DEIR:

1. A discussion of potential impacts from lighting, noise, human activity (e.g., recreation), defensible space, and wildlife-human interactions created by zoning of development projects or other project activities adjacent to natural areas, exotic and/or invasive species, and drainage. The latter subject should address Project-related changes on drainage patterns and water quality within, upstream, and downstream of the Project site, including: volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-Project fate of runoff from the Project site.

2. A discussion of potential indirect Project impacts on biological resources, including resources in areas adjacent to the project footprint, such as nearby public lands (e.g., National Forests, State Parks, etc.), open space, adjacent natural habitats, riparian ecosystems, wildlife corridors, and any designated and/or proposed reserve or mitigation lands (e.g., preserved lands associated with a Natural Community Conservation Plan, or other conserved lands).

Please note that the Project area supports significant biological resources and contains habitat connections, providing for wildlife movement across the broader landscape, sustaining both transitory and permanent wildlife populations. CDFW encourages project design that avoids and preserves onsite features that contribute to habitat connectivity. The DEIR should include a discussion of both direct and indirect impacts to wildlife movement and connectivity, including maintenance of wildlife corridor/movement areas to adjacent undisturbed habitats.

3. An evaluation of impacts to adjacent open space lands from both the construction of the Project and any long-term operational and maintenance needs.

4. A cumulative effects analysis developed as described under CEQA Guidelines section 15130. The DEIR should analyze the cumulative effects of the plan's land use designations, policies and programs on the environment. Please include all potential direct and indirect Project related impacts to riparian areas, wetlands, vernal pools, alluvial fan habitats, wildlife corridors or wildlife movement areas, aquatic habitats, sensitive species and other sensitive habitats, open lands, open space, and adjacent natural habitats in the cumulative effects analysis. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

**Alternatives Analysis**

CDFW recommends the DEIR describe and analyze a range of reasonable alternatives to the Project that are potentially feasible, would "feasibly attain most of the basic objectives of the Project," and would avoid or substantially lessen any of the Project's significant effects (CEQA Guidelines § 15126.6[a]). The alternatives analysis should also evaluate a "no project" alternative (CEQA Guidelines § 15126.6[e]). The No Project alternative should evaluate how the changing environment, such as climate change and drought, may affect the community if a new or revised general plan were not adopted.

**Mitigation Measures for Project Impacts to Biological Resources**

The DEIR should identify mitigation measures and alternatives that are appropriate and adequate to avoid or minimize potential impacts, to the extent feasible. The City of Ontario should assess all direct, indirect, and cumulative impacts that are expected to occur as a result of the implementation of the Project and its long-term operation and maintenance. When proposing measures to avoid, minimize, or mitigate impacts, CDFW recommends consideration of the following:

1. *Fully Protected Species*: Fully protected species may not be taken or possessed at any time. Project activities described in the DEIR should generally be designed to completely avoid any fully protected species that have the potential to be present within or adjacent to the Project area. CDFW also recommends that the DEIR fully

analyze potential adverse impacts to fully protected species due to habitat modification, loss of foraging habitat, and/or interruption of migratory and breeding behaviors. CDFW recommends that the City of Ontario include in the analysis how appropriate avoidance, minimization, and mitigation measures will reduce indirect impacts to fully protected species.

2. *Sensitive Plant Communities*: CDFW considers sensitive plant communities to be imperiled habitats having both local and regional significance. Plant communities, alliances, and associations with a statewide ranking of S-1, S-2, S-3, and S-4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by querying the CNDDB and are included in *The Manual of California Vegetation* (Sawyer et al. 2009). The DEIR should include measures to fully avoid and otherwise protect sensitive plant communities from project-related direct and indirect impacts.

3. *California Species of Special Concern* (SSC): As previously stated, California SSC status applies to animals generally not listed under the federal Endangered Species Act or the CESA, but which nonetheless are declining at a rate that could result in listing, or historically occurred in low numbers and known threats to their persistence currently exist. SSCs should be considered during the environmental review process. SSCs have the potential or have been documented to occur within ot adjacent to the Project area, including but not limited to: XXX (*XX*).

4. *Mitigation*: CDFW considers adverse project-related impacts to sensitive species and habitats to be significant to both local and regional ecosystems, and the DEIR should include mitigation measures for adverse project-related impacts to these resources. Mitigation measures should emphasize avoidance and reduction of project impacts. For unavoidable impacts, onsite habitat restoration and/or enhancement, and preservation should be evaluated and discussed in detail. Where habitat preservation is not available onsite, offsite land acquisition, management, and preservation should be evaluated and discussed in detail.

   The DEIR should include measures to perpetually protect the targeted habitat values within mitigation areas from direct and indirect adverse impacts in order to meet mitigation objectives to offset project-induced qualitative and quantitative losses of biological values. Specific issues that should be addressed include restrictions on access, proposed land dedications, long-term monitoring and management programs, control of illegal dumping, water pollution, increased human intrusion, etc.

   If sensitive species and/or their habitat may be impacted from the Project, CDFW recommends the inclusion of specific mitigation in the DEIR. CEQA Guidelines section 15126.4, subdivision (a)(1)(8) states that formulation of feasible mitigation measures should not be deferred until some future date. The Court of Appeal in *San*

*Joaquin Raptor Rescue Center* v. *County* of *Merced* (2007) 149 Cal.App.4th 645 struck down mitigation measures which required formulating management plans developed in consultation with State and Federal wildlife agencies after Project approval. Courts have also repeatedly not supported conclusions that impacts are mitigable when essential studies, and therefore impact assessments, are incomplete *(Sundstrom* v. *County* of *Mendocino* (1988) 202 Cal. App. 3d. 296; *Gentry* v. *City* of *Murrieta (1995)* 36 Cal. App. 4th 1359; *Endangered Habitat League, Inc.* v. *County* of *Orange* (2005) 131 Cal. App. 4th 777).

CDFW recommends that the DEIR specify mitigation that is roughly proportional to the level of impacts, in accordance with the provisions of CEQA (CEQA Guidelines, §§ 15126.4(a)(4)(B), 15064, 15065, and 16355). The mitigation should provide long-term conservation value for the suite of species and habitat being impacted by the Project. Furthermore, in order for mitigation measures to be effective, they need to be specific, enforceable, and feasible actions that will improve environmental conditions.

5. *Habitat Revegetation/Restoration Plans*: Plans for restoration and revegetation should be prepared by persons with expertise in southern California ecosystems and native plant restoration techniques. Plans should identify the assumptions used to develop the proposed restoration strategy. Each plan should include, at a minimum: (a) the location of restoration sites and assessment of appropriate reference sites; (b) the plant species to be used, sources of local propagules, container sizes, and seeding rates; (c) a schematic depicting the mitigation area; (d) a local seed and cuttings and planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific success criteria; (h) a detailed monitoring program; (i) contingency measures should the success criteria not be met; and (j) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity. Monitoring of restoration areas should extend across a sufficient time frame to ensure that the new habitat is established, self-sustaining, and capable of surviving drought.

   CDFW recommends that local onsite propagules from the Project area and nearby vicinity be collected and used for restoration purposes. Onsite seed collection should be initiated in advance of project impacts in order to accumulate sufficient propagule material for subsequent use in future years. Onsite vegetation mapping at the alliance and/or association level should be used to develop appropriate restoration goals and local plant palettes. Reference areas should be identified to help guide restoration efforts. Specific restoration plans should be developed for various project components as appropriate.

   Restoration objectives should include protecting special habitat elements or re-creating them in areas affected by the Project; examples could include retention of

woody material, logs, snags, rocks, and brush piles.

6. *Nesting Birds and Migratory Bird Treaty Act:* Please note that it is the Project proponent's responsibility to comply with all applicable laws related to nesting birds and birds of prey. Fish and Game Code sections 3503, 3503.5, and 3513 afford protective measures as follows: Fish and Game Code section 3503 makes it unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by Fish and Game Code or any regulation made pursuant thereto. Fish and Game Code section 3503.5 makes it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by Fish and Game Code or any regulation adopted pursuant thereto. Fish and Game Code section 3513 makes it unlawful to take or possess any migratory nongame bird except as provided by the rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act of 1918, as amended (16 U.S.C. § 703 et seq.).

   CDFW recommends that the DEIR includes the results of avian surveys, as well as specific avoidance and minimization measures to ensure that impacts to nesting birds do not occur. Project-specific avoidance and minimization measures may include, but not be limited to: project phasing and timing (e.g., conducting work outside the peak nesting season), monitoring of project-related noise (where applicable), sound walls, and buffers, where appropriate. The DEIR should also include specific avoidance and minimization measures that will be implemented should a nest be located within the project site. If pre-construction surveys are proposed in the DEIR, the CDFW recommends that they be required no more than three (3) days prior to vegetation clearing or ground disturbance activities, as instances of nesting could be missed if surveys are conducted sooner. CDFW recommends that disturbance of occupied nests of migratory birds and raptors within the Project site and surrounding area be avoided any time birds are nesting on-site. CDFW therefore recommends the completion of nesting bird surveys *regardless of the time of year* to ensure compliance with all applicable laws pertaining to nesting and migratory birds.

7. *Moving out of Harm's Way:* To avoid direct mortality to any non-listed terrestrial wildlife, CDFW recommends that the lead agency condition the DEIR to require that a CDFW-approved qualified biologist be retained to be onsite prior to and during all ground- and habitat-disturbing activities to inspect the Project area prior to any Project activities. Any individuals found shall not be harassed and shall be allowed to leave the Project area unharmed. If needed, a qualified biologist may guide, handle, or capture an individual non-listed, non-fully protected wildlife species to move it to a nearby safe location within nearby refugium, or it shall be allowed to leave the Project site of its own volition. Movement of wildlife out of harm's way should be

limited to only those individuals that would otherwise by injured or killed, and individuals should be moved only as far a necessary to ensure their safety (i.e., CDFW does not recommend relocation to other areas). Only biologists with appropriate authorization by CDFW shall move CESA-listed species. Furthermore, it should be noted that the temporary relocation of onsite wildlife does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss.

8. *Translocation of Species*: CDFW generally does not support the use of relocation, salvage, and/or transplantation as mitigation for impacts to rare, threatened, or endangered species as studies have shown that these efforts are experimental in nature and largely unsuccessful.

**California Endangered Species Act**

CDFW is responsible for ensuring appropriate conservation of fish and wildlife resources including threatened, endangered, and/or candidate plant and animal species, pursuant to CESA. CDFW recommends that a CESA Incidental Take Permit (ITP) be obtained if the Project has the potential to result in "take" (California Fish and Game Code Section 86 defines "take" as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") of State-listed CESA species, either through construction or over the life of the project. It is the policy of CESA to conserve, protect, enhance, and restore State-listed CESA species and their habitats.

CDFW encourages early consultation, as significant modification to the proposed Project and avoidance, minimization, and mitigation measures may be necessary to obtain a CESA ITP. CDFW must comply with CEQA in order to issue a CESA ITP. CDFW therefore recommends that the DEIR addresses all Project impacts to listed species and specify a mitigation monitoring and reporting program that will meet the requirements of CESA.

Based on review of CNDDB and Biogeographic Information and Observation System (BIOS), and/or knowledge of the project site/vicinity/general area, CDFW is aware that the following CESA-listed species have the potential to occur onsite/have previously been reported onsite: western burrowing owl (*Athene cunicularia*), and Crotch's bumble bee (*Bombus crotchii*).

The DEIR should disclose the potential of the Project to take State-listed species and how the impacts will be avoided, minimized, and mitigated. Please note that mitigation measures that are adequate to reduce impacts to a less-than significant level to meet CEQA mitigation requirements may not be sufficient for "full mitigation" under CESA. To facilitate the issuance of an ITP, if applicable, CDFW recommends the DEIR include measures to minimize and fully mitigate the impacts to any State-listed species the Project has potential to take.

## ADDITIONAL COMMENTS AND RECOMMENDATIONS

### Landscaping

To ameliorate the water demands of this Project, CDFW recommends incorporation of water-wise concepts in any Project landscape design plans. In particular, CDFW recommends xeriscaping with locally native California species and installing water-efficient and targeted irrigation systems (such as drip irrigation). Native plants support butterflies, birds, reptiles, amphibians, small mammals, bees, and other pollinators that evolved with those plants, more information on native plants suitable for the Project location and nearby nurseries is available at CALSCAPE: https://calscape.org/. Local water agencies/districts and resource conservation districts in your area may be able to provide information on plant nurseries that carry locally native species, and some facilities display drought-tolerant locally native species demonstration gardens. Information on drought-tolerant landscaping and water-efficient irrigation systems is available on California's Save our Water website: https://saveourwater.com/.

### Construction Noise

Project-related construction has the potential to generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project. CDFW recommends that the DEIR include an analysis of impacts to wildlife from Project related construction noise, and appropriate avoidance, minimization, and mitigation measures that will reduce impacts to less than significant. Construction may result in substantial noise through road use, equipment, and other Project-related activities. This may adversely affect wildlife species in several ways as wildlife responses to noise can occur at exposure levels of only 55 to 60 dB[7]. Anthropogenic noise can disrupt the communication of many wildlife species including frogs, birds, and bats[8,9,10,11]. Noise can also affect predator-prey relationships as many nocturnal animals such as bats and owls primarily use auditory cures (i.e., hearing) to hunt. Additionally, many prey species increase their vigilance behavior when exposed to noise because they need to rely

more on visual detection of predators when auditory cues may be masked by noise[12,13]. Noise has also been shown to reduce the density of nesting birds[14] and cause increased stress that results in decreased immune responses[15]. The City should include measures in the DEIR to ensure the following: restricting the use of equipment to hours least likely to disrupt wildlife (e.g., not at night or in early morning); restricting the use of generators except for temporary use in emergencies; provide power to sites by solar PV (photovoltaic) systems, cogeneration systems (natural gas generator), small micro-hydroelectric systems, or small wind turbine systems; ensure the use of noise suppression devices such as mufflers or enclosure for generators; and sounds generated from any means must be below the 55-60 dB range within 50-feet from the source.

**Artificial Nighttime Lighting**

The Project will introduce new sources of artificial lighting. CDFW recommends that the DEIR include lighting design specifications for all artificial nighttime lighting that will be used by the Project, an analysis of the direct and indirect impacts of artificial nighttime lighting on biological resources, and appropriate avoidance, minimization, and mitigation measures that will reduce impacts to less than significant. The direct and indirect impacts of artificial nighttime lighting on biological resources including migratory birds that fly at night, bats, and other nocturnal and crepuscular wildlife should be analyzed, and appropriate avoidance and minimization measures should be included in the DEIR.

Artificial nighttime lighting often results in light pollution, which has the potential to significantly and adversely affect fish and wildlife. Artificial lighting alters ecological processes including, but not limited to, the temporal niches of species; the repair and recovery of physiological function; the measurement of time through interference with the detection of circadian and lunar and seasonal cycles; the detection of resources and natural enemies; and navigation[16]. Many species use photoperiod cues for communication (e.g., bird song[17]), determining when to begin foraging[18], behavioral

thermoregulation[19], and migration[20]. Phototaxis, a phenomenon that results in attraction and movement towards light, can disorient, entrap, and temporarily blind wildlife species that experience it. The City of Ontario should include measures in the DEIR to ensure the following: eliminate all nonessential lighting throughout the Project area; avoid or limit the use of artificial light during the hours of dawn and dusk when many wildlife species are most active; lighting for Project activities is fully shielded, cast downward, reduced in intensity to the greatest extent, and does not result in spill over onto other properties or upward into the night sky (see the International Dark-Sky Association standards at http://darksky.org; the use of LED lighting with a correlated color temperature of 3,000 Kelvins or less; proper disposal of hazardous waste; and recycling of lighting that contains toxic compounds with a qualified recycler.

## ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). Information can be submitted online or via completion of the CNDDB field survey form at the following link: https://wildlife.ca.gov/Data/CNDDB/Submitting-Data. The types of information reported to CNDDB can be found at the following link: https://wildlife.ca.gov/Data/CNDDB/Plants-and-Animals.

## FILING FEES

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.).

## CONCLUSION

CDFW appreciates the opportunity to comment on the NOP of a DFEIR for the Center Park Specific Plan (SCH No. 2025060731) and recommends that the City of Ontario address CDFW's comments and concerns in the forthcoming DFEIR.

Mr. Thomas Grahn
Senior Planner
City of Ontario
303 East B Street
Ontario, CA 91764

Subject: Notice of Preparation of a Draft Supplemental Environmental Impact Report
Ontario Plan (TOP) 2050 Project
State Clearinghouse No. 2021070364

Dear Mr. Grahn:

The California Department of Fish and Wildlife (CDFW) received a Notice of Preparation (NOP) of a Draft Supplemental Environmental Impact Report (SEIR) from the City of Ontario (City) for the Ontario Plan (TOP) 2050 Project (Project) pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.[1]

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

**CDFW ROLE**

CDFW is California's Trustee Agency for fish and wildlife resources, and holds those resources in trust by statute for all the people of the State. (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a).) CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (*Id.*, § 1802.) Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public

1 CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), the Project proponent may seek related take authorization as provided by the Fish and Game Code.

**PROJECT DESCRIPTION SUMMARY**

The Project is an update to the TOP to guide the City's development and conservation for the next 30 years through 2050. The proposed project is a focused effort, with particular emphasis on conducting technical refinements to the Policy Plan to comply with state housing mandates; conform with new state laws related to community health, environmental justice, climate adaption, resiliency, and mobility; bring long-term growth and fiscal projections into alignment with current economic conditions; and advance the Tracking and Feedback system and Implementation Plan.

Consistent with§ 15168 and§ 15163 of the CEQA Guidelines, the City will prepare a SEIR to address program-level environmental impacts associated with amendments to the City's previous TOP, which was adopted pursuant to the Final Ontario Plan Environmental Impact Report (Ontario Plan EIR) prepared in July 2009 (SCH 2008101140) and certified in January 2010. The proposed project is an update to the City's long-term plan of policies that will guide future development activities and City actions (TOP 2050). No specific development projects are proposed as part of this TOP 2050. However, the program-level SEIR can serve to streamline environmental review of future projects.

**COMMENTS AND RECOMMENDATIONS**

CDFW offers the comments and recommendations below to assist the City in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. CDFW recognizes that a supplement to an EIR only needs to contain the information necessary to make the previous EIR adequate for the revised project. *(S*tate CEQA Guidelines § 15163(b)) and that the SEIR need not be as detailed as CEQA documents prepared for specific projects that may follow (CEQA Guidelines § 15146). CDFW also recognizes that the level of detail should be reflective of the level contained in the SEIR or SEIR element being considered (Rio Vista Farm Bureau Center v. County of Solano (1992) 5

Cal.App.4th 351). However, please note that the City cannot defer the analysis of significant effects of the SEIR to later-tiered CEQA documents (Stanislaus Natural Heritage Project v. County of Stanislaus (1996) 48 Cal.App.4th 182).

CDFW recommends that the forthcoming SEIR address the following:

**Assessment of Biological Resources**

Section 15125(c) of the CEQA Guidelines states that knowledge of the regional setting of a project is critical to the assessment of environmental impacts and that special emphasis should be placed on environmental resources that are rare or unique to the region. To enable CDFW staff to adequately review and comment on the project, the SEIR should include a complete assessment of the flora and fauna within and adjacent to the Project footprint, with particular emphasis on identifying rare, threatened, endangered, and other sensitive species and their associated habitats.

The CDFW recommends that the SEIR specifically include:

1. An assessment of the various habitat types located within the project footprint, and a map that identifies the location of each habitat type. CDFW recommends that floristic, alliance- and/or association-based mapping and assessment be completed following *The Manual of California Vegetation*, second edition (Sawyer et al. 2009). Adjoining habitat areas should also be included in this assessment where site activities could lead to direct or indirect impacts offsite. Habitat mapping at the alliance level will help establish baseline vegetation conditions.

2. A general biological inventory of the fish, amphibian, reptile, bird, and mammal species that are present or have the potential to be present within each habitat type onsite and within adjacent areas that could be affected by the project. CDFW's California Natural Diversity Database (CNDDB) in Sacramento should be contacted at (916) 322-2493 or CNDDB@wildlife.ca.gov to obtain current information on any previously reported sensitive species and habitat, including Significant Natural Areas identified under Chapter 12 of the Fish and Game Code, in the vicinity of the proposed Project.

   Please note that CDFW's CNDDB is not exhaustive in terms of the data it houses, nor is it an absence database. CDFW recommends that it be used as a starting point in gathering information about the *potential presence* of species within the general area of the project site.

3. A complete, *recent* inventory of rare, threatened, endangered, and other sensitive species located within the Project footprint and within offsite areas with the potential to be affected, including California Species of Special Concern (CSSC) and California Fully Protected Species (Fish and Game Code § 3511). Species to be

addressed should include all those which meet the CEQA definition (CEQA Guidelines § 15380). The inventory should address seasonal variations in use of the Project area and should not be limited to resident species. Focused species-specific surveys, completed by a qualified biologist and conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, are required. Acceptable species-specific survey procedures should be developed in consultation with CDFW and the U.S. Fish and Wildlife Service, where necessary. Note that CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years. Some aspects of the proposed Project may warrant periodic updated surveys for certain sensitive taxa, particularly if the Project is proposed to occur over a protracted time frame, or in phases, or if surveys are completed during periods of drought.

Burrowing Owl

The Chino Agricultural Preserve (herein referred to as the Dairy Preserve) was 17,000 acres of dairy and agriculture that encompassed portions of the Cities of Chino and Ontario. In 1999, the City annexed nearly 8,200 acres, which was the catalyst for a dramatic increase in population growth. The City prepared a large master planned community, formerly known as the New Model Colony (NMC) and is currently referred to as the Ontario Ranch, that spans commercial and residential development over a 20-year period. Simarily, the City of Chino annexed the remaining portion of the Dairy Preserve, approximately 6,245 acres, into the City of Chino's Sphere of Influence where it was partitioned into a western and eastern section. The western part, the Chino College Park, or Subarea 1, consists of 1,810 acres; whereas the eastern portion, Subarea 2, or what is now known as ‘the Preserve’, includes approximately 5,435 acres (8.15 square miles). Of the 5,435 acres, 2,779 acres of the Preserve lies within the inundation area created by the raising of Prado Dam.

Burrowing owls (*Athene cunicularia*) have been detected throughout the Dairy Preserve and surrounding area (refer to Exhibit 1). CDFW strongly encourages the City to follow the recommendations and guidelines provided in the Staff Report on Burrowing Owl Mitigation (Department of Fish and Game, March 2012); available for download from CDFW’s website: https://www.wildlife.ca.gov/conservation/survey-protocols**.** The Staff Report specifies three steps for project evaluations: a habitat assessment, surveys, and an impact assessment. The three progressive steps are effective in evaluating whether a project will result in impacts to burrowing owls, and the information gained from the steps will inform any subsequent avoidance, minimization, and mitigation measures.

The City should be aware that burrowing owls may use an area for breeding, wintering, foraging, and/or migration stopovers. Because burrowing owls detected during non-breeding season surveys may be year-round residents, young from the previous

breeding season, pre-breeding territorial adults, winter residents, dispersing juveniles, migrants, and/or transients or new colonizers, burrowing owl seasonal residency status can be difficult to ascertain. Habitat assessments should be conducted to evaluate the likelihood that a site may be utilized by burrowing owls for different activities throughout the year, followed by surveys that provide the information needed to determine the potential effects of proposed projects and activities on burrowing owls, and to avoid take in accordance with Fish and Game Code sections 86, 3503, and 3503.5.

Impact assessments should determine the extent to which burrowing owls and their habitat may be impacted, directly or indirectly, on and within a reasonable distance of a proposed Project. To adequately assess project impacts to burrowing owls and determine appropriate mitigation to offset those affects, CDFW recommends that, at a minimum, the City should:

- Develop criteria for determining acceptable qualifications for individuals who perform burrowing owl habitat assessments, biological surveys, monitoring, and other relevant duties.
- Maintain a list of qualified biologists to cross reference when reviewing and approving CEQA documents.
- Require that project proponents submit data (e.g., survey reports, field notes, etc.) and survey locations and results (e.g. GIS and kmz shape files) and ensure burrowing owl occurrences are entered into a database (e.g., California Natural Diversity Database, CNDDB).

**Analysis of Direct, Indirect, and Cumulative Impacts to Biological Resources**

The SEIR should provide a thorough discussion of the direct, indirect, and cumulative impacts expected to adversely affect biological resources as a result of the Project (including the plan's land use designations, policies and programs). To ensure that Project impacts to biological resources are fully analyzed, the following information should be included in the SEIR:

1. A discussion of potential impacts from lighting, noise, human activity (e.g., recreation), defensible space, and wildlife-human interactions created by zoning of development projects or other project activities adjacent to natural areas, exotic and/or invasive species, and drainage. The latter subject should address Project-related changes on drainage patterns and water quality within, upstream, and downstream of the Project site, including volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-Project fate of runoff from the Project site.

   With respect to defensible space: please ensure that the SEIR fully describes and identifies the location, acreage, and composition of defensible space *within* the

proposed Project footprint. Please ensure that any graphics and descriptions of defensible space associated with this project comply with the appropriate agency, (e.g., San Bernardino County Fire, Cal Fire) regulations/ requirements. The City, through its planning processes, should be ensuring that defensible space is provided and accounted for *within proposed development areas*, and not transferred to adjacent open space or conservations lands. CDFW requests that the SEIR clearly identify: (1) if lands are being proposed as mitigation to offset impacts associated with the project; and (2) if these lands are also proposed to serve as defensible space. Please note that lands proposed to be managed for defensible space purposes will have lower conservation resource value as they require in-perpetuity vegetation management.

2. A discussion of potential indirect Project impacts on biological resources, including resources in areas adjacent to the project footprint, such as nearby public lands (e.g. National Forests, State Parks, etc.), open space, adjacent natural habitats, riparian ecosystems, wildlife corridors, and any designated and/or proposed reserve or mitigation lands (e.g., preserved lands associated with a Natural Community Conservation Plan, or other conserved lands).

   Please note that the Project area supports significant biological resources and contains habitat connections, providing for wildlife movement across the broader landscape, sustaining both transitory and permanent wildlife populations. CDFW encourages project design that avoids and preserves onsite features that contribute to habitat connectivity. The SEIR should include a discussion of both direct and indirect impacts to wildlife movement and connectivity, including maintenance of wildlife corridor/movement areas to adjacent undisturbed habitats.

3. An evaluation of impacts to adjacent open space lands from both the construction of the Project and any long-term operational and maintenance needs.

4. A cumulative effects analysis developed as described under CEQA Guidelines section 15130. The SEIR should analyze the cumulative effects of the plan's land use designations, policies and programs on the environment. Please include all potential direct and indirect Project related impacts to riparian areas, wetlands, vernal pools, alluvial fan habitats, wildlife corridors or wildlife movement areas, aquatic habitats, sensitive species and other sensitive habitats, open lands, open space, and adjacent natural habitats in the cumulative effects analysis. General and specific plans, as well as past, present, and anticipated future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

Burrowing Owl and Raptor Habitat

The City Council approved a General Plan Amendment and associated Final EIR for the Sphere of Influence for the NMC in January 1998 (termed 'NMC Final EIR'). Before mitigation, the NMC Final EIR determined that significant impacts would occur to waterfowl and waterfowl habitat; raptors and raptor habitat; and the Delhi Sands Flower-Loving Fly Ontario Recovery Unit. The mitigation measures to reduce impacts to less than significance included:

*EIR Mitigation Measure BR-1 – 2:1 Mitigation Waterfowl Habitat Mitigation:* Modify the General Plan to require the creation of new waterfowl habitat and specified a mitigation ratio of 2:1 for each acre of such habitat lost. This is off-site mitigation in the Prado Basin.

*EIR Mitigation Measure BR-2 – Waterfowl and Raptor Conservation Area:* The City shall create a Waterfowl and Raptor Conservation Area (WRCA) off-site in the Prado Basin.

Subsequent to the adoption of the NMC Final EIR, a lawsuit was filed against the City by the Endangered Habitats League, Inc. (EHL) and Sierra Club challenging the City's CEQA compliance and approval of the General Plan Amendment. A settlement agreement was reached and agreed to by all parties that set forth revised mitigation measures for potential impacts in the NMC (referred to as Annexation Area 163). Because state law requires that local jurisdictions update their General Plans every 10 years, measures from the settlement agreement were detailed within the Ontario Plan DEIR (Section 5 *Environmental Analysis*) that included:

*DEIR Mitigation Measure 1- Mitigation Fees:* Prior to issuance of grading permits, the City shall impose a $4,320 per acre Mitigation Fee on proposed developments in Annexation Area 163 that require discretionary approval or permitting from the City.

*DEIR Mitigation Measure 2 – On Site Land Conservation or Owl Relocation:* The City, in consultation with CDFW, will identify through CEQA review, lands occupied by burrowing owl and suitable as long-term habitat. The City will require avoidance of those lands to maintain a viable territory and require long-term maintenance through dedication in fee or grant of easement to the Land Trust. If the site is not viable long-term habitat, the developer shall pay the mitigation fee and make provisions for relocation of the owls.

*DEIR Mitigation Measure 3 – Land Conservation:* All mitigation fees collected shall be used for the above-described purposes and may be used to purchase property, conservation easements, or other land with long-term conservation value for the environmental impacts; enhance/restore lands with such values; maintain and

operates these lands; and pay for related administrative costs (not to exceed 10 percent of the total fees).

*DEIR Mitigation Measure 4 - Land Easements:* Land/easements dedicated, conveyed, or purchased to benefit wildlife, waterfowl, raptors/and or burrowing owl must have long-term conservation value for those species and must be managed by the Land Trust. The parcels must be located within the Habitat Area designated as part of the settlement agreement. Unacceptable properties are those that would otherwise by purchased by another entity or group as open space mitigation for environmental impacts.

According to the Ontario Plan DEIR (Chapter 6 *Significant Unavoidable Adverse Impacts*), because buildout of the Ontario Plan will "*convert 3,269 acres of California Resource Agency designated Prime Farmland, Unique Farmland, and Farmland of Statewide Importance to residential, commercial, mixed-use, and industrial land uses, it was determined that impacts to agricultural resources would remain significant, unavoidable, and adverse even after mitigation measures have been applied*". Conversely, it was determined that "*after the collection of the mitigation fees for the acquisition and management of habitat, implementation of the proposed Ontario Plan would not have substantial adverse impacts on sensitive animal species, including the burrowing owl"*. The City prepared the NMC Final EIR with the intent that later environmental analysis of individual development projects would be tiered from this document. To accomplish this, feasible mitigation measures and alternatives developed in the NMC Final EIR needed to be implemented. When the City concluded that no new effects would occur, or no new mitigation measures would be required, the project was approved as being within the scope covered by the NMC Final EIR.

CDFW has reviewed many of the project-specific CEQA documents and accompanying biological reports, as well as, mapped known burrowing owl occurrences compiled from accessible databases (CNDDB, EBird). A comprehensive table (refer to Table 1) and a corresponding color-coded reference illustration were prepared (Exhibit 2) and have been provided by CDFW in past CEQA comments to the City. CDFW continues to maintain that the burrowing owl and raptor foraging habitat has, and continues to be, removed throughout the City and the surrounding area. CDFW strongly encourages the City to include any new substantial information that was not known at the time the previous Ontario Plan EIR was certified into the SEIR so that when it is reviewing future projects as a lead agency, it can rely on a more robust analysis to fully satisfy the necessary environmental review requirements.

Current scientific literature supports the conclusion that mitigation for burrowing owl habitat loss necessitates replacement with an equivalent or greater habitat area for breeding, foraging, wintering, and dispersal. For mitigation measures to be effective, they must be specific, enforceable, and feasible actions that will improve environmental

conditions (e.g., presence of burrows, burrow surrogates, presence of fossorial mammal dens, and abundant and available prey within close proximity to the burrow). CDFW is unclear of the details and implementation status of many of the mitigation measures that pertain to the NMC Final Program EIR, Ontario Plan DEIR, or any subsequent CEQA documents from individual development projects that tiered from these documents (refer to Table 2). Specifically, the SEIR should identify past cumulative impacts that have occurred, past mitigation commitments and what conservation measures, if any, have been/are being conducted, and future opportunities not only within the City (see #1-3 below), but the adjacent lands (#4), including, but not limited to, the following:

1) *NMC/Ontario Ranch* - The Rivers and Land Conservancy (RLC) prepared a report in 2008 that identified strategies and opportunities for habitat protection and restoration within the NMC, with a portion of the mitigation fees being identified to benefit "*the burrowing owl, restore wetlands, and provide connections between the Prado Basin and Chino Hills State Park*". Following consultation with EHL and the Sierra Club, on March 16, 2010, the City Council chose RLC as the land trust. The SEIR should clearly describe where the conservation areas are located, how they have been secured, how they are functioning as habitat for owls, and how accounting records of mitigation money collected and spent are tracked.

2) *Milliken Landfill* - Within the Ontario Plan EIR, the City identified a number of Interest Areas, or prospective mitigation lands, with parts of the closed Milliken Waste Disposal Site being considered for preservation or enhancement to offset loss of burrowing owl habitat. In 2005, 16 adult burrowing owls were observed, with seven breeding pairs of burrowing owls being identified (Tom Dobson 2005). In 2006, three pairs and one individual were observed (MBA, 2006). Prior to grading for the California Commerce Center, eight temporary artificial burrows were constructed along the southern boundary of the project site and all burrowing owls banded (refer to Exhibit 3 and Exhibit 3a). Known burrowing owl occupancy occurs north of the landfill within the Ontario International Airport and in smaller, undeveloped parcels throughout the City and surrounding area. Although no follow up surveys have been conducted since construction commenced, it is reasonable to assume that these owls may have moved onto the Milliken landfill or nearby suitable habitat.

   There have been landfills within northern (e.g., Mountainview, Sunnyvale, and Palo Alto), central (Lemoore), and southern (El Sobrante) California that have implemented enhancement and/or restoration activities for burrowing owls. A summary of the current use and burrowing owl objectives for these landfills is provided in Table 3. The SEIR should include an update on the status of the Milliken landfill (burrowing owl occupation, enhancement activities, etc.) and whether this has, or will, be used for burrowing owl conservation.

3) *Ontario International Airport* - Nonbreeding burrowing owl surveys (Helix, February 2020) were performed on the 322-acre Ontario International Airport, resulting in three active burring owls being detected, along with several suitable burrows being observed (see Exhibit 4). The Pomona Valley Audubon Society members have monitored owl nesting within the adjacent open fields east of Haven Avenue owned by the Ontario International Airport. A number of active burrows, ranging from 12 to 14, have been detected on the 234 acres over the last five years (Exhibit 4a). Burrowing owls are often found in association with airfields and airports, and their presence at such facilities is sometimes considered to conflict with those operations. CDFW has reviewed management plans and long-term studies monitoring burrowing owls on airports and military air bases, with the results suggesting that the maintenance of burrowing owl populations is not necessarily at odds with safe airfield operations (refer to Table 4). The SEIR should include any past, current, and future known impacts to burrowing owls on Ontario Airport owned lands, mitigation strategies for these owls, if necessary, and other pertinent information that can be disclosed for public transparency and planning.

4) *Surrounding Lands* – A number of burrowing owls within the local area have been impacted through loss of habitat within the lands adjacent to the City. To mitigate for these losses, the City of Chino has identified potential conservation areas. For the Preserve, "*300 acres of high-quality wildlife habitat is to be provided* in *three separate areas that are to be located generally below the 566-foot inundation line and within the Preserve boundaries*" (Preserve – Chino Sphere of Influence-Subarea 2 EIR Burrowing Owl Resources Management Plan). New development projects (e.g., Miramonte development, Pine Avenue Expansion) have been planned within two of the three proposed burrowing owl conservation area(s).

   Kimball Bickmore Natural Treatment System (NTS) has also been proposed as a partial regional mitigation area for burrowing owl impacts. Fifty-three artificial burrowing owl burrows were constructed, 20 of which mitigated for impacts to 10 occupied burrows for a development project that was constructed immediately east of the NTS facilities, while an additional 33 burrows were installed to maximize the number of burrows available for burrowing owls within the region. CDFW believes that it is not appropriate to place additional artificial burrows for mitigation to compensate for other impacts to burrowing owls in an area that has already been conserved and is already constricted by surrounding development and other land uses (e.g., water treatment, recreation, etc.), nor does it make sense to establish a high density of artificial burrows in a location where the carrying capacity (primarily food resources) is likely exceeded.

   Finally, the College Park EIR included development impacts to 710 acres. Three water quality basins, approximately 23.6 acres, is managed by a homeowner's association to provide benefits to burrowing owls, while 31.3 acres along Cypress

Channel and within an existing Southern California Edison easement was enhanced to provide a 'wildlife movement corridor'. CDFW is concerned that these designated mitigated areas have not been properly designed or maintained, and that the ecological process and biological values necessary to support burrowing owls are limited. The SEIR should include a full assessment of the cumulative impacts, as well as the mitigation to date for owls that preside and utilize areas within the Dairy Preserve.

Mitigation must be roughly proportional to the level of impacts, including cumulative impacts, in accordance with the provisions of CEQA (CEQA Guidelines, §§ 15126.4(a)(4)(B), 15064, 15065, and 16355). CDFW strongly encourages that mitigation for impacts to nesting, occupied, and satellite burrows, as well as habitat used for foraging, wintering, and migratory stop-overs be on, adjacent, or proximate to the impact site as long as the habitat is sufficient to support the burrowing owls present. If mitigation occurs offsite, it should be adequate in acreage and include permanent conservation of similar vegetation communities (grassland, scrublands, desert, urban, and agriculture) to provide for burrowing owl nesting, foraging, wintering, and dispersal (i.e., during breeding and non-breeding seasons) comparable to, or better than, that of the impact area.

The SEIR should include:

- An updated burrowing owl mitigation strategy based on reliable data and information;
- The location, acreage, and management status of areas that have been conserved in the City and within the general vicinity; and
- Measure(s) for Lead/Agency/future project proponents to identify and/or use conserved habitat before passive relocation occurs.

**Alternatives Analysis**

CDFW recommends the SEIR describe and analyze a range of reasonable alternatives to the Project that are potentially feasible, would "feasibly attain most of the basic objectives of the Project," and would avoid or substantially lessen any of the Project's significant effects (CEQA Guidelines § 15126.6[a]). The alternatives analysis should also evaluate a "no project" alternative (CEQA Guidelines § 15126.6[e]). The no Project alternative should evaluate how the changing environment, such as climate change and drought, may affect the community if a new or revised general plan were not adopted.

**Mitigation Measures for Project Impacts to Biological Resources**

The SEIR should identify mitigation measures and alternatives that are appropriate and adequate to avoid or minimize potential impacts, to the extent feasible. The City should

assess all direct, indirect, and cumulative impacts that are expected to occur as a result of the implementation of the Project and its long-term operation and maintenance. When proposing measures to avoid, minimize, or mitigate impacts, CDFW recommends consideration of the following:

1. *Fully Protected Species*: Fully protected species may not be taken or possessed at any time. Project activities described in the SEIR should be designed to completely avoid any fully protected species that have the potential to be present within or adjacent to the Project area. CDFW also recommends that the SEIR fully analyze potential adverse impacts to fully protected species due to habitat modification, loss of foraging habitat, and/or interruption of migratory and breeding behaviors. CDFW recommends that the Lead Agency include in the analysis how appropriate avoidance, minimization, and mitigation measures will reduce indirect impacts to fully protected species.

2. *Sensitive Plant Communities*: CDFW considers sensitive plant communities to be imperiled habitats having both local and regional significance. Plant communities, alliances, and associations with a statewide ranking of S-1, S-2, S-3, and S-4 should be considered sensitive and declining at the local and regional level. These ranks can be obtained by querying the CNDDB and are included in *The Manual of California Vegetation* (Sawyer et al. 2009). The SEIR should include measures to fully avoid and otherwise protect sensitive plant communities from project-related direct and indirect impacts.

3. *California Species of Special Concern* (CSSC): CSSC status applies to animals generally not listed under the federal Endangered Species Act or the CESA, but which nonetheless are declining at a rate that could result in listing, or historically occurred in low numbers and known threats to their persistence currently exist. CSSCs should be considered during the environmental review process.

4. *Mitigation*: CDFW considers adverse project-related impacts to sensitive species and habitats to be significant to both local and regional ecosystems, and the SEIR should include mitigation measures for adverse project-related impacts to these resources. Mitigation measures should emphasize avoidance and reduction of project impacts. For unavoidable impacts, onsite habitat restoration and/or enhancement, and preservation should be evaluated and discussed in detail. Where habitat preservation is not available onsite, offsite land acquisition, management, and preservation should be evaluated and discussed in detail.

   The SEIR should include measures to perpetually protect the targeted habitat values within mitigation areas from direct and indirect adverse impacts in order to meet mitigation objectives to offset project-induced qualitative and quantitative losses of biological values. Specific issues that should be addressed include restrictions on

access, proposed land dedications, long-term monitoring and management programs, control of illegal dumping, water pollution, increased human intrusion, etc.

If sensitive species and/or their habitat may be impacted from the Project, CDFW recommends the inclusion of specific mitigation in the SEIR. CEQA Guidelines section 15126.4, subdivision (a)(1)(8) states that formulation of feasible mitigation measures should not be deferred until some future date. The Court of Appeal in *San Joaquin Raptor Rescue Center* v. *County* of *Merced* (2007) 149 Cal.App.4th 645 struck down mitigation measures which required formulating management plans developed in consultation with State and Federal wildlife agencies after Project approval. Courts have also repeatedly not supported conclusions that impacts are mitigable when essential studies, and therefore impact assessments, are incomplete *(Sundstrom* v. *County* of *Mendocino* (1988) 202 Cal. App. 3d. 296; *Gentry* v. *City* of *Murrieta (1995)* 36 Cal. App. 4th 1359; *Endangered Habitat League, Inc.* v. *County* of *Orange* (2005) 131 Cal. App. 4th 777).

CDFW recommends that the SEIR specify mitigation that is roughly proportional to the level of impacts, in accordance with the provisions of CEQA (CEQA Guidelines, §§ 15126.4(a)(4)(B), 15064, 15065, and 16355). The mitigation should provide long-term conservation value for the suite of species and habitat being impacted by the Project. Furthermore, in order for mitigation measures to be effective, they need to be specific, enforceable, and feasible actions that will improve environmental conditions.

5. *Habitat Revegetation/Restoration Plans*: Plans for restoration and revegetation should be prepared by persons with expertise in southern California ecosystems and native plant restoration techniques. Plans should identify the assumptions used to develop the proposed restoration strategy. Each plan should include, at a minimum: (a) the location of restoration sites and assessment of appropriate reference sites; (b) the plant species to be used, sources of local propagules, container sizes, and seeding rates; (c) a schematic depicting the mitigation area; (d) a local seed and cuttings and planting schedule; (e) a description of the irrigation methodology; (f) measures to control exotic vegetation on site; (g) specific success criteria; (h) a detailed monitoring program; (i) contingency measures should the success criteria not be met; and (j) identification of the party responsible for meeting the success criteria and providing for conservation of the mitigation site in perpetuity. Monitoring of restoration areas should extend across a sufficient time frame to ensure that the new habitat is established, self-sustaining, and capable of surviving drought.

   CDFW recommends that local onsite propagules from the Project area and nearby vicinity be collected and used for restoration purposes. Onsite seed collection should be initiated in order to accumulate sufficient propagule material for subsequent use in future years. Onsite vegetation mapping at the alliance and/or association level

should be used to develop appropriate restoration goals and local plant palettes. Reference areas should be identified to help guide restoration efforts. Specific restoration plans should be developed for various project components as appropriate.

Restoration objectives should include protecting special habitat elements or re-creating them in areas affected by the Project; examples could include retention of woody material, logs, snags, rocks, and brush piles.

6. *Nesting Birds and Migratory Bird Treaty Act:* Please note that it is the Project proponent's responsibility to comply with all applicable laws related to nesting birds and birds of prey. Fish and Game Code sections 3503, 3503.5, and 3513 afford protective measures as follows: Fish and Game Code section 3503 makes it unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by Fish and Game Code or any regulation made pursuant thereto. Fish and Game Code section 3503.5 makes it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by Fish and Game Code or any regulation adopted pursuant thereto. Fish and Game Code section 3513 makes it unlawful to take or possess any migratory nongame bird except as provided by the rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act of 1918, as amended (16 U.S.C. § 703 et seq.).

   CDFW recommends that the SEIR include the results of avian surveys, as well as specific avoidance and minimization measures to ensure that impacts to nesting birds do not occur. Project-specific avoidance and minimization measures may include, but not be limited to: project phasing and timing, monitoring of project-related noise (where applicable), sound walls, and buffers, where appropriate. The SEIR should also include specific avoidance and minimization measures that will be implemented should a nest be located within the project site. If pre-construction surveys are proposed in the SEIR, the CDFW recommends that they be required no more than three (3) days prior to vegetation clearing or ground disturbance activities, as instances of nesting could be missed if surveys are conducted sooner.

7. *Moving out of Harm's Way:* To avoid direct mortality, CDFW recommends that the lead agency condition the SEIR to require that a CDFW-approved qualified biologist be retained to be onsite prior to and during all ground- and habitat-disturbing activities to move out of harm's way special status species or other wildlife of low or limited mobility that would otherwise be injured or killed from project-related activities. Movement of wildlife out of harm's way should be limited to only those individuals that would otherwise by injured or killed, and individuals should be moved only as far a necessary to ensure their safety (i.e., CDFW does not recommend

relocation to other areas). Furthermore, it should be noted that the temporary relocation of onsite wildlife does not constitute effective mitigation for the purposes of offsetting project impacts associated with habitat loss.

8. *Translocation of Species*: CDFW generally does not support the use of relocation, salvage, and/or transplantation as mitigation for impacts to rare, threatened, or endangered species as studies have shown that these efforts are experimental in nature and largely unsuccessful.

**California Endangered Species Act**

CDFW is responsible for ensuring appropriate conservation of fish and wildlife resources including threatened, endangered, and/or candidate plant and animal species, pursuant to CESA. CDFW recommends that a CESA Incidental Take Permit (ITP) be obtained if the Project has the potential to result in “take” (California Fish and Game Code Section 86 defines “take” as “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill”) of State-listed CESA species, either through construction or over the life of the project. CESA identifies that it is the policy of the state to conserve, protect, enhance, and restore State-listed CESA species and their habitats.

CDFW encourages early consultation, as significant modification to the proposed Project and avoidance, minimization, and mitigation measures may be necessary to obtain a CESA ITP. CDFW is required to comply with CEQA for issuance of a CESA ITP. CDFW therefore recommends that the SEIR addresses all Project impacts to listed species and specifies a mitigation monitoring and reporting program that will meet the requirements of CESA.

**Lake and Streambed Alteration Program**

Fish and Game Code section 1602 requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following: Substantially divert or obstruct the natural flow of any river, stream or lake; Substantially change or use any material from the bed, channel or bank of any river, stream, or lake; or Deposit debris, waste or other materials that could pass into any river, stream or lake. Please note that "any river, stream or lake" includes those that are episodic (i.e., those that are dry for periods of time) as well as those that are perennial (i.e., those that flow year-round). This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water.

Upon receipt of a complete notification, CDFW determines if the proposed Project activities may substantially adversely affect existing fish and wildlife resources and whether a Lake and Streambed Alteration (LSA) Agreement is required. An LSA

Agreement includes measures necessary to protect existing fish and wildlife resources. CDFW may develop measures to protect fish and wildlife resources.

CDFW's issuance of an LSA Agreement is a "project" subject to CEQA (see Pub. Resources Code 21065). To facilitate issuance of an LSA Agreement, if necessary, the SEIR should fully identify the potential impacts to the lake, stream, or riparian resources, and provide adequate avoidance, mitigation, and monitoring and reporting commitments. Early consultation with CDFW is recommended, since modification of the proposed Project may be required to avoid or reduce impacts to fish and wildlife resources. To obtain a Lake or Streambed Alteration notification package, please go to https://www.wildlife.ca.gov/Conservation/LSA/Forms.

**ADDITIONAL COMMENTS AND RECOMMENDATIONS**

To ameliorate the water demands of this Project, CDFW recommends incorporation of water-wise concepts in project landscape design plans. In particular, CDFW recommends xeriscaping with locally native California species, and installing water-efficient and targeted irrigation systems (such as drip irrigation). Local water agencies/districts, and resource conservation districts in your area may be able to provide information on plant nurseries that carry locally native species, and some facilities display drought-tolerant locally native species demonstration gardens (for example the Riverside-Corona Resource Conservation District in Riverside). Information on drought-tolerant landscaping and water-efficient irrigation systems is available on California's Save our Water website: http://saveourwater.com/what-you-can-do/tips/landscaping/

**ENVIRONMENTAL DATA**

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). Information can be submitted online or via completion of the CNDDB field survey form at the following link: https://wildlife.ca.gov/Data/CNDDB/Submitting-Data. The completed form can be mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. The types of information reported to CNDDB can be found at the following link: https://wildlife.ca.gov/Data/CNDDB/Plants-and-Animals.

**FILING FEES**

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination

by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.).

**CONCLUSION**

CDFW appreciates the opportunity to comment on the NOP of a SEIR for the Ontario Plan 2050 Project (SCH No. 2008101140) and recommends that the City address the CDFW's comments and concerns in the forthcoming SEIR. If you should have any questions pertaining to the comments provided in this letter, please contact Kim Romich, Senior Environmental Scientist, Specialist, at (760) 937-1380 or at kimberly.romich@wildlife.ca.gov.

Sincerely,

**Table 3 - Landfills that have implemented burrowing owl measures.**

| Landfill | Operation Status | Current Use | Burrowing Owl Objectives | Supporting Documents |
|---|---|---|---|---|
| Mountainview Landfill<br><br>Mountainview, CA | Class III Landfill Closed 1983 | 750- acre Shoreline Park with refuse still remaining beneath 440 acres. | • Manage and maintain at least 300 acres of medium- to high-quality habitat.<br>• Monitor population and habitat conditions.<br>• Protect owls from project impacts.<br>• Provide more on-site support from biologists than is currently provided by the part-time biologist.<br>• Actively control predators, especially nonnative and nuisance species.<br>• Support an average breeding season population of at least 10 pairs of owls.<br>• Nest success rate of approximately 50% to 75%. | Burrowing Owl Preservation Plan |
| Sunnyvale Landfill Sunnyvale, CA | Class III Landfill Closed 1993 | 93-acre open space habitat | • Monitor the number and location of owls at the landfill.<br>• Manage vegetation height to ≤ 6 inches at occupied owl burrows and leave islands of taller, denser vegetation to support prey populations.<br>• Improve prey base by planting native perennials in uplands and constructing rock/brush piles.<br>• Install additional artificial burrow mounds.<br>• Implement non-native predator control measures. | Biological Constraints and Opportunities Analysis |
| El Sobrante Landfill Corona, CA | Class III Landfill Active since 1986 | 1,322 acres with 688 acres actively managed as a habitat preserve | • Pay 1 million per year to the Western Riverside County Multiple Species Habitat Conservation Plan.<br>• Full-time biologist employed to oversee the completion of monthly, annual and three-year reports that track progression with the HCP and conservation goals.<br>• 'Rolling closures' where areas are closed and restored in phases and monitored.<br>• Weeding several times each year and reseeding areas to ensure success criteria (plant cover, species diversity and minimal weeds) are being met.<br>• Installation of artificial burrows. | Citizen Oversight Power Point |

| | | | | |
|---|---|---|---|---|
| Lemoore Naval Air Station Lemoore, CA | Class III Landfill Closed 1993 | Of the 18,784 acres, approximately 14,000 acres are allocated to agricultural production and 50 acres provide wildlife habitat from a reclaimed landfill that is designated as Fresno kangaroo habitat. | • Restoration of native grassland.<br>• Implementation of grazing and mowing.<br>• 6 clusters of 3 artificial burrows were established to augment the owl population, with owls successfully nesting in most of these burrows. | Burrowing Owl Adaptive Management Plan |
| Palo Alto Landfill Palo Alto, CA | Class III Landfill Closed 2014 | The entire 137-acre landfill will eventually be converted to park use | • Installation of artificial burrows.<br>• Mow habitat to less than 5 inches.<br>• Implement a nonnative removal program. | Palo Alto Byxbee Proposed Plan |
| Yuma Landfill Yuma, CA | Class III Landfill Closed 1970 | Converted 110 acres into West Wetlands Park with refuse beneath. | • Establish 20 artificial burrows for relocated burrowing owls and built a viewing platform for public observation. | West Wetlands Park Information |

**Table 4 - Burrowing owl occurrences, findings, and management actions on military air bases and airports.**

| Location | State | Management Plan | Comments |
|---|---|---|---|
| | | **Military** | |
| Kirkland Airforce Base | NM | N/A Study (2021) | The number of breeding pairs of Burrowing Owls increased from one pair in 2013 to 28 pairs in 2019 and 2020, and the number of fledglings produced increased from one in 2013 to 84 in 2019 and 61 in 2020. The recovery was not uniform across all areas of Kirtland Air Force Base, and some formerly occupied areas remained unoccupied. We documented dispersal outside the Air Force base boundary and that the number of breeding pairs was more strongly influenced by the number of offspring produced in the prior year than the number of owls returning from prior years, which indicated that the population is part of a larger metapopulation. Our results demonstrate that the maintenance of Burrowing Owl populations is not necessarily at odds with safe airfield operations, that Burrowing Owls exhibit complex population dynamics, and can rapidly recolonize previously occupied areas if habitat and nest sites remain suitable. |
| NAS Lemoore | CA | 2009 | Surveys of burrowing owls at NAS Lemoore in 1997-2000, and again in 2008. 43 - 85 active nests were observed each year and were located in 5 primary areas clustered around the wildlife areas, runway strips in Air Operations, buffer strips near the runways, the capped landfill, and occasionally a nest was seen at the receiver or transmitter site. Many of the owl nest sites were located within 10 m of runways. |
| NAF El Centro | CA | 2005 | Unlike other airfields such as Moffett Federal Airfield in San Jose or NAS Lemoore in the San Joaquin Valley, NAF El Centro does not provide critical habitat in a matrix of unsuitable or poor-quality habitat for the burrowing owl. Management therefore does not need to be focused on maintaining a resident population, but primarily on preventing owl occupancy of areas where they potentially pose a threat to human safety due to bird aircraft strike hazard. Maintenance of owl populations in parts of NAF El Centro away from the airfield is desirable. Although burrowing owls appear to pose only a small hazard to aircraft relative to other avian species in the region such as egrets and gulls, risk due to burrowing owl presence in the airfield can be easily reduced than for these other species. The primary method for reducing risk is is discussed where aircraft altitude is low but engines are at full power for takeoff. |

| | | | |
|---|---|---|---|
| Naval Airforce Base North Island (Coronado) | CA | 2013 | Largest colony of burrowing owl in San Diego County prior to 2007, between 8-30 pairs annually. Management Plan is being developed to maintain owls while reducing likelihood of potential air strikes. Continue mowing and monitoring of owls and burrows. |
| Cannon AFB | NM | | DoD Legacy funded-project evaluating migratory linkages of Burrowing Owls in western North America.200 6- use stable isotopes of owl feathers, genetics from blood samples, and radio telemetry to quantify the importance of DoD lands to Burrowing Owl populations in the region, document the extent to which Burrowing Owls disperse between populations, identify where owls breeding on DoD installations spend the winter, and quantify land-use of migrating and wintering owls in the region. |

## CULTURAL RESOURCES ASSESSMENT

# Cultural Resources Inventory and Evaluation Report for the Center Park Specific Plan Project, City of Ontario, San Bernardino County, California

October 16, 2025

**Prepared By:**

Jessica Mauck & Jamie Parra

Cultural Resources Management

Kimley-Horn and Associates, Inc.

3801 University Ave, Suite 300

Riverside, CA 92501

Kimley»Horn

## EXECUTIVE SUMMARY

Kimley-Horn and Associates, Inc. (Kimley-Horn) is under contract to complete a Cultural Resources Inventory and Evaluation Report for the proposed Center Park Specific Plan Project (Project) in City of Ontario (City), San Bernardino County, California. The proposed Project consists of a land use plan for residential and mixed-used retail/office development and is being reviewed pursuant to California Environmental Quality Act (CEQA) with the City of Ontario acting as the Lead Agency. This report is intended to support the City's review and consideration of the Project and potential impacts it may have on the environment specifically as it relates to cultural resources.

Kimley-Horn conducted research and cultural resources records searches through the Native American Heritage Commission (NAHC), South Central Coastal Information Center (SCCIC), California Office of Historic Preservation (OHP), and the City for the Project area and vicinity. Kimley-Horn staff identified 15 cultural resources in the Project area during the record search, all of which consist of historic-period dairy farms and associated homes. Kimley-Horn also conducted a survey of the Project area and revisited all 15 identified resources. As a result of the record search and survey, it was noted that some previously recorded sites had missing or incomplete records, to include missing data related to the original delineation of site boundaries. As such, Kimley-Horn re-created the site boundaries where possible based on record search data, while creating new ones for those with missing or incomplete information, based on the results of research and survey. Additionally, Kimley-Horn prepared preliminary evaluations for each site's eligibility for listing in the CRHR and local inventory. After survey and initial evaluations were completed, Kimley-Horn was notified that the City had obtained Urbana Preservation & Planning, LLC (Urbana) to complete an updated inventory and evaluation for the broader Ontario Ranch/New Model Colony Area, including the Project area. As such, recordation and evaluation efforts were undertaken in conjunction with Urbana for each resource to identify their potential eligibility for listing in the California Register of Historical Resources (CRHR) and/or designation as City of Ontario Historic Landmark.

As a result of these efforts, a total of 12 cultural resources with historic structures in the Project were identified as a result of this study. Three (3) of the identified resources are recommended eligible for listing in the CRHR and/or for designation as a City of Ontario Historic Landmark, and are considered historical resources under CEQA. Conditions related to reducing impacts to significance historic built environment resources are recommended, though with the understanding that such actions may not reduce impacts to these resources to less than significant. This study also concludes that the Project area has a high sensitivity for historic archaeological resources associated with the dairy farming industry, though maintains a relatively low sensitivity for buried prehistoric archaeological resources as a result of prior disturbance. However, both due to the high sensitivity of historic archaeological resources and due to the fact that the Project area was underlain by Holocene-age soils that would have maintained a moderate-to-high potential for prehistoric archaeological resources prior to disturbance, it is recommended that conditions related to archaeological monitoring during Project implementation and the process for inadvertent discoveries be included as a part of the proposed Project. With these conditions in place, impacts to unique archaeological resources would be reduced to less than significant.

## INTRODUCTION

Kimley-Horn and Associates, Inc. (Kimley-Horn) is under contract to complete a Cultural Resources Inventory and Evaluation Report for the proposed Center Park Specific Plan Project (Project) in the City of Ontario (City), San Bernardino County, California. The Project is subject to review pursuant to California Environmental Quality Act (CEQA) with the City of Ontario acting as the Lead Agency. This report is intended to support the City's review and consideration of the Project and potential impacts it may have on the environment specifically as it relates to cultural resources. Efforts conducted for this assessment include a pedestrian survey of the Project area, cultural resources records searches, a Sacred Lands File (SLF) search, literature review, a review of cultural databases and repositories, and a review of historic maps and imagery, as well as recordation and evaluation of each resource. Due to a concurrent effort being conducted by Urbana Preservation & Planning, LLC (Urbana) to update inventories and evaluations of the broader Ontario Ranch/New Model Colony Area, recordation and evaluations for resources within the Project area were completed in conjunction with Urbana and the City. This report presents the results of these collective efforts, as well as recommended mitigation measures for the Project.

## PROJECT DESCRIPTION

The Project area is in the southwestern portion of the City of Ontario within San Bernardino County (**Figure 1**). The Project area is bounded to the north by a Southern California Edison (SCE) Easement located approximately 330 feet north of Edison Avenue/Ontario Ranch Road, Eucalyptus Avenue to the south, Campus Avenue to the west, and Walker Avenue to the east (**Figure 2**). The Project area is made up of 29 existing parcels totaling 257.34 acres. The proposed Project consists of a Specific Plan to allow for a residential and mixed-used retail/office development on the existing 29 parcels. The development would include up to 250,919 square feet of commercial retail/office uses, up to 4,293 residential units across low, low-medium, and mixed-use residential uses, 67.26 acres of open space parkland/non-recreation uses, and associated on-site and off-site infrastructure improvements, as described further below. The Project area is anticipated to be developed in four phases within 22 planning areas.

## REGULATORY SETTING

### California Environmental Quality Act

The California Environmental Quality Act (CEQA) applies to all discretionary projects undertaken or subject to approval by the state's public agencies (California Code of Regulations 14(3), § 15002(i)). Under CEQA, "A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (Cal. Code Regs. Tit. 14(3), § 15064.5(b)). Guidelines for Implementation of the California Environmental Quality Act (State CEQA Guidelines) section 15064.5(a) defines a "historical resource" as a resource that meets one or more of the following criteria:

- Listed in, or eligible for listing in, the California Register of Historical Resources (California Register)
- Listed in a local register of historical resources (as defined at Cal. Public Res. Code § 5020.1(k))
- Identified as significant in a historical resource survey meeting the requirements of § 5024.1(g) of the Cal. Public Res. Code

Figure 1: Project Vicinity Map

Figure 2: Project Area Map

- Determined to be a historical resource by a project's lead agency (Cal. Code Regs. Tit. 14(3), § 15064.5(a))

A historical resource consists of "Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California… Generally, a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing in the California Register of Historical Resources" (Cal. Code Regs. Tit. 14(3), § 15064.5(a)(3)). The significance of a historical resource is impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for the California Register. If an impact on a historical or archaeological resource is significant, CEQA requires feasible measures to minimize the impact (State CEQA Guidelines § 15126.4 (a)(1)). Mitigation of significant impacts must lessen or eliminate the physical impact that the project will have on the resource. Section 5024.1 of the Cal. Public Res. Code established the California Register. Generally, a resource is considered by the lead agency to be "historically significant" if the resource meets the criteria for listing in the California Register (Cal. Code Regs. tit. 14(3), § 15064.5(a)(3)).

Finally, CEQA requires that significant effects on unique archaeological resources be considered and addressed. CEQA defines a unique archaeological resource as any archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information.
- Has a special and particular quality such as being the oldest of its type or the best available example of its type.
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

CEQA Guidelines Section 15064.5 Appendix G includes significance criteria relative to archaeological and historical resources. These have been utilized as thresholds of significance here, and a project would have a significant environmental impact if it would:

- Cause a substantial adverse change in the significance of a historical resource as defined in section 10564.5;
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 10564.5;
- Disturb any human remains, include those interred outside of formal cemeteries.

**California Public Resources Code**

California Public Resources Code (PRC) § 5024.1 establishes the California Register of Historical Resources (CRHR). The register lists all California properties considered to be significant historical resources. The

CRHR also includes all properties listed or determined eligible for listing in the NRHP, including properties evaluated and determined eligible under § 106.

California Public Resources Code (PRC) § 5020 to 5029.5 continued the former Historical Landmarks Advisory Committee as the State Historical Resources Commission. The commission oversees the administration of the California Register of Historical Resources and is responsible for designating State Historical Landmarks and Historical Points of Interest.

California Public Resources Code (PRC) § 5079 to 5079.65 define the functions and duties of the Office of Historic Preservation, which administers federal- and state-mandated historic preservation programs in California as well as the California Heritage Fund.

California Public Resources Code (PRC) § 5097.9 to 5097.991 provide protection to Native American historical and cultural resources and sacred sites; identify the powers and duties of the Native American Heritage Commission (NAHC); require that descendants be notified when Native American human remains are discovered; and provide for treatment and disposition of human remains and associated grave goods.

**California Health and Safety Code**

California Health and Safety Code § 7050.5-7055 govern the process for reporting inadvertent discoveries of human remains to the County Coroner; the process for the County Coroner to report human remains of Native American descent to the Native American Heritage Commission (NAHC); and the protections offered against removal or desecration of human remains.

**California Code of Regulations**

The California Code of Regulations govern the nomination of resources to the California Register of Historical Resources (CRHR) (14 California Code of Regulations [CCR] § 4850). The regulations set forth the criteria for eligibility as well as guidelines for assessing historical integrity and resources that have special considerations.

**California Register of Historical Resources (CRHR)**

The State Historical Resources Commission has designed this program for use by state and local agencies, private groups, and citizens to identify, evaluate, register, and protect California's historical resources. The California Register of Historic Resources (CRHR) is the authoritative guide to the state's significant historical and archeological resources.

The California Register of Historic Resources (CRHR) program encourages public recognition and protection of resources of architectural, historical, archeological, and cultural significance; identifies historical resources for state and local planning purposes; determines eligibility for state historic preservation grant funding; and affords certain protections under the California Environmental Quality Act (CEQA). To be eligible for listing in the CRHR, a resource must meet at least one of the following criteria:

- Is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
- Is associated with the lives of persons important to local, California, or national history.
- Embodies the distinctive characteristics of a type, period, region, or method of construction; represents the work of a master; or possesses high artistic values.
- Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

In addition to having significance, resources must have integrity for the period of significance. The period of significance is the date or span of time within which significant events transpired or significant individuals made their important contributions. Integrity is the authenticity of a historical resource's physical identity as evidenced by the survival of characteristics or historic fabric that existed during the resource's period of significance. Alterations to a resource or changes in its use over time may change its historical, cultural, or architectural significance. Simply, resources must retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. A resource that has lost its historic character or appearance may still have sufficient integrity for the CRHR if, under Criterion 4, it maintains the potential to yield significant scientific or historical information or specific data.

Isolated finds, such as a single artifact with no other associated cultural materials, are generally considered to be ineligible for listing in the CRHR. However, the nature of the isolated resource and any available ethnographic data regarding affiliated Native American populations should be carefully considered during the evaluation process, particularly as it relates to potential eligibility under Criterion 4.

**California Historical Landmarks**

California Historical Landmarks are buildings, structures, sites, or places that have been determined to have statewide historical significance. The resource must be approved for designation by the County Board of Supervisors or the City/Town Council in whose jurisdiction it is located; be recommended by the State Historical Resources Commission; and be officially designated by the Director of California State Parks. A resource must meet at least one of these following criteria:

- Be the first, last, only, or most significant of its type in the state or within a large geographic region (Northern, Central, or Southern California).
- Be associated with an individual or group having a profound influence on the history of California.
- Be a prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in a region of a pioneer architect, designer, or master builder.

**California Points of Historical Interest**

California Points of Historical Interest are sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. Points of Historical Interest designated after

December 1997 and recommended by the State Historical Resources Commission are also listed in the CRHR. No historical resource may be designated as both a landmark and a point. If a point is subsequently granted status as a landmark, the point designation is retired. To be eligible for designation as a Point of Historical Interest, a resource must meet at least one of the following criteria:

- Be the first, last, only, or most significant of its type within the local geographic region (city or county).
- Be associated with an individual or group having a profound influence on the history of the local area.
- Be a prototype of, or an outstanding example of, a period, style, architectural movement or construction or be one of the more notable works or the best surviving work in the local region of a pioneer architect, designer or master builder.

**California Historic Building Code**

The California Historic Building Code—California Code of Regulations, Title 24, Part 8—provides regulations for the preservation, restoration, rehabilitation, relocation, or reconstruction of buildings or properties designated as qualified historical buildings or properties. The California Historic Building Code is intended to provide solutions for the preservation of qualified historical buildings or properties, to promote sustainability, to provide access for persons with disabilities, to provide a cost-effective approach to preservation, and to provide for the reasonable safety of the occupants or users.

**City of Ontario**

The City of Ontario is a Certified Local Government (CLG) and a Preserve America Community that maintains a robust Historic Preservation Program (HPP) governed by the City's Historic Preservation Ordinance (HPO) and Article 26 of the City's Development Code. Per the City's process, all aspects of historic preservation are overseen by planning staff, the Historic Preservation Commission (HPC), and the Historic Preservation Subcommittee (HPSC). Cultural resources within the City are subject to evaluation for local listing under the City's Historic Landmark designation criteria:

a. It exemplifies or reflects special elements of the City's history;
b. It is identified with persons or events significant in local, state, or national history;
c. It is representative of the work of a notable builder, designer, architect, or artist;
d. It embodies distinguishing architectural characteristics of a style, type, period, or method of construction;
e. It is a noteworthy example of the use of indigenous materials or craftsmanship;
f. It embodies elements that represent a significant structural, engineering, or architectural achievement or innovation;
g. It has a unique location, a singular physical characteristic, or is an established and familiar visual feature of a neighborhood, community or the City; or
h. It is one of the few remaining examples in the City, region, state, or nation possessing distinguishing characteristics of an architectural or historical type or specimen.

Pursuant to Chapters 4 and 7 of the City's Development Code, minor alterations, restoration, rehabilitation, and demolition of historic resources listed in the local register require issuance of a

Certificate of Appropriateness with findings and an approved replacement structure/building prior to impact. Additionally, as outlined in Subsections G and H of Chapter 4, listed/eligible properties are designated a tier from a 3-tier system by the Historic Preservation Commission (or potentially a subcommittee of the commission) that helps identify a mitigation fee for properties based on size, type, and significance.

*Subsection G: Historic Resources Tiering System*

1. Tier I consists of historic resources that should not be demolished or significantly altered under any circumstances, regardless of their designation status, as they are the City's most significant historical or cultural resources:
    a. A resource listed on the Ontario Register that meets at least one of the criteria within the Architecture/Form category, and 3 criteria within the History category, listed in Subsection H; or
    b. A contributing resource within a district that meets at least one of the criteria within the Architecture/Form Category and 3 criteria within the History Category as listed below.
2. Tier II consists of historic resources wherein demolition of these properties should be avoided:
    a. Any historic resource listed or determined eligible for listing in the National Register of Historic Places;
    b. Any historic resource listed or determined eligible for listing in the California Register of Historic Resources;
    c. A historic resource listed on the Ontario Register and meets at least 2 criteria within the Architecture/Form or History categories, listed in Subsection H; or
    d. A contributing resource within an eligible historic district wherein the district meets at least 2 of the criteria in either the Architecture/Form or History categories as listed in Subsection H (Historic Resource Tiering Criteria) of this Section.
3. Tier III consists of historic resources that are Designated Local Historic Landmarks, are contributing properties within Designated Local Historic Districts, or are eligible historic resources. Demolition of these resources should be avoided where possible but may be appropriate under certain circumstances.

*Subsection H: Historic Resources Tiering Criteria*

1. Local Historic Landmark
    *a.* Architecture/Form
        (1) The resource is prototypical, or one of the finest examples, of a period, style, architectural movement, or construction in the City of a particular style of architecture, building type, or historical or archeological object. Only preeminent examples should be considered. Good representative examples of a style, period or method of construction are not appropriate; or
        (2) The resource is the first, last, only, or one of the finest examples, notable works, or the best surviving work by an architect or designer of major importance to the City, State or Nation.

*b.* History

(1) The resource is the location of a historic event(s) that has significantly contributed to the history of the City, State, or Nation;

(2) The resource is associated with a business, company, or individual that has made a significant cultural, social, or scientific contribution to the City, State, or Nation;

(3) The resource is identified with a person(s) who has exerted a major influence on the heritage or history of the City, State, or Nation;

(4) The resource embodies the ideals or principles of the "Model Colony" or furthers the ideals or principals established by the Chaffey Brothers;

(5) The resource has a direct relationship to one of the principal historic contexts in the City's history, including the "Model Colony," (includes the Chaffey Brothers, the Ontario Land and Improvement Company, or the citrus industry), the Guasti Winery or the wine industry, or the Dairy Preserve or the dairy industry;

(6) The resource is related with a business, company, or individual significant in the agricultural history of the City;

(7) The resource is related to the archeological past of the region.

2. Local Historic Districts

*a.* Architecture/Form

(1) The district contains resources that are a prototype of, or one of the finest examples of, or the first, last, only, or few remaining groupings of a period, style, architectural movement, or construction in the City of a particular style of architecture, building type, or historical or archeological object. Only preeminent examples should be considered. Good representative examples of a style, period or method of construction are not appropriate; or

(2) The district contains resources that are the first, last, only, or the finest examples, notable works, or the best surviving work by an architect or designer of major importance to the City, State or Nation.

*b.* History

(1) The district is the location of a historic event(s) that has significantly contributed to the history of the City, State, or Nation;

(2) The district is associated with a business, company, or individual that has made a significant, cultural, social, or scientific contribution to the City, State, or Nation;

(3) The district is identified with a person(s) who has exerted a major influence on the heritage or history of the City, State, or Nation;

(4) The district embodies the ideals or principles of the "Model Colony," or furthers the ideals or principals established by the Chaffey Brothers;

(5) The district has a direct relationship to one of the principal historic contexts in the City's history, including the "Model Colony," (includes the Chaffey Brothers, the Ontario Land and Improvement Company, or the citrus industry), the Guasti Winery or the wine industry, or the Dairy Preserve or the dairy industry, or the citrus industry; or

(6) The district is related with a business, company, or individual significant in the agricultural history of the City.

## ENVIRONMENTAL SETTING

The Project is situated in the northern Chino Valley region. The Chino Valley is characterized by a Mediterranean climate consisting of warm, dry summers and mild, wet winters. The Santa Ana River is located seven miles southeast of the Project area, and it originates in the San Bernardino Mountains and flows southwest through San Bernardino, Riverside, and Orange Counties to the Pacific Ocean. Elevation at the Project area is approximately 700 feet above mean sea level, and the topography is relatively flat across an alluvial fan. The late Quaternary Central Avenue fault line is located 5.5 miles to the west (U.S. Geological Survey 2024). Soil compositions consist mostly of Hilmar loamy fine sand (Hr) and Tujunga loamy sand (TuB) across the Project area (SoilWeb 2024). Geologic maps for this vicinity indicate that the Project area was originally underlaid by Holocene-age alluvial gravel and sand of valleys areas (Qa) (Dibblee and Ehrenspeck 2001; Dibblee and Minch 2002). However, the entire Project area has been graded and disced as a result of decades of agricultural activities. Minimal vegetation is present on the Project area as a result of the historic and modern agricultural disturbances, but this region would have once been a wet, lush valley that supported a variety of plant and animal resources. Surrounding land uses are also agricultural and rural land.

## CULTURAL AND HISTORICAL SETTING

### Ethnography

The proposed Project area is located within the ancestral territory of the Gabrieleño/Tongva. Although Alfred Kroeber recorded the territories of southern California tribes in 1925, the ancient territorial borders remain inexact for two reasons: first, territorial boundaries were flexible and, secondly, indigenous borders and land use were not recorded until after European settlements displaced many Native American communities. Although firm and defining borders cannot be known, archaeological, ethnographic, and historic evidence exists to support the prehistoric use by the Gabrieleño/Tongva in the Chino Valley.

The Gabrieleño/Tongva have a rich and diverse material culture, traditionally including shell set in asphaltum, carvings, painting, baskets, an extensive steatite industry, and a wide range of stone, shell, and bone materials. At the time of European colonization, they inhabited numerous permanent villages in fertile lowlands along waterways in sheltered areas along the coast, each of which held a population in the low hundreds. Smaller villages were also located at varying distances from these permanent villages, all of which were highly connected via economic, religious, and social ties (Bean and Smith 1978). Villages contained circular and domed homes made of tule mats, fern, or carrizo, as well as small, circular earth-covered sweathouses (Bean and Smith 1978; Kroeber 1925). Their hunting and gathering subsistence strategy included land and offshore efforts that resulted in the take of both small and large land animals, sea mammals, river and ocean fish, and a variety of plant resources. The population sometimes migrated between villages on a temporary basis throughout the year, returning to their permanent villages for ceremony or when resources needed to be replenished (Hudson and Blackburn 1982).

Records show that the long history of European colonization and harmful displacement of Native Americans initially began in 1542 as a result of Juan Rodríguez Cabrillo visiting the area during exploration. Following many subsequent Spanish visits to the region, the colonization of the indigenous population continued in 1769 around the same time as the establishment of Missions San Gabriel in 1771 and San

Fernando in 1797. Due in part to the introduction of new diseases, as well as the harsh conditions of mission life, the indigenous population quickly dwindled and cultural practices were lost. Following the secularization of the missions, most surviving Gabrieleño/Tongva became wage laborers on the ranchos of Mexican California and were later nearly completely wiped out as a result of a smallpox outbreak in the 1860s. The combination of removal, murder, disease, forced labor, and poor diet contributed to the harmful diaspora of the Gabrieleño/Tongva from established villages to scattered areas of the Los Angeles Basin for survival (Bean and Smith 1978). This history of displacement within their own ancestral lands has led to difficulty in attaining federal recognition. However, the 20th century found a revitalization of the Gabrieleño/Tongva people and culture, and though the communities remain unrecognized by the Federal government, they remain a very active people in their ancestral lands today.

**Prehistory**

Cultural theoretic frameworks for southern California archaeology are frequently debated and refined by archaeologists. The early chronologic models proposed by Wallace (1955, 1978) and Warren (1968) continue to be incorporated into current cultural studies with revisions. Archaeologists have developed the cultural frameworks in southern California by generally relying on relative dating methods using diagnostic artifacts, as opposed to absolute dating, due to a general lack of chronometric data available in the regional archaeological record. The framework proposed by Wallace introduced the Early Period, Millingstone Period, Intermediate Period, and Late Prehistoric Period, which generally follows the geologic time scale of Early, Middle and Late Holocene.

<u>Early Holocene (10,000-7500 calibrated years Before Present (cal BP)</u>

A gradual warming of the environment occurred during the Early Holocene. Researchers have proposed that groups from the Early Holocene were highly mobile and traveled across wide ranges. Cultural resources were portable or expedient to accommodate mobility. Archaeologists have recorded artifacts associated with hunting and plant processing at early Holocene sites, such as projectile points, bifaces, and groundstone tools.

<u>Middle Holocene (7500-3500 cal BP)</u>

The Millingstone Period during the Middle Holocene is characterized by new artifact types. The warming of the environment resulted in adaptations to changing environments and associated plant and animal resources. Temporary and seasonal camps were utilized during the Middle Holocene. Tools were intentionally cached, which indicate an intent to return to specific sites over time. Diagnostic artifacts have been recorded at Middle Holocene sites, such as Pinto and Silver Lake projectile points.

<u>Late Holocene (3500 cal BP through Historic Contact)</u>

Archaeological sites from the Late Holocene contain increasingly diverse artifact assemblages. Increased population is evident and multiple family groups likely coexisted within the communities. Proximity to water was an important factor for the seasonal and permanent settlements. Late Prehistoric archaeological sites contained diverse artifact assemblages, including projectile points, ceramics, pendants, incised stones, and shell beads. An increase in hunting efficiency occurred during the Late Prehistoric Period and Protohistoric Period, which is evident by the bow and arrow technology. An

abundance of mortars and pestles have been recorded at village sites and further indicate a transition towards sedentary habitation.

**History**

The Spanish first arrived at San Bernardino County in 1772 with the expedition of Pedro Fages. In 1774, Juan Bautista de Anza reached the San Bernardino Valley due to his commission to set up quarters at the Mission San Gabriel (Beck and Haase 1974). At this time, an estimated thousands of Native Americans, including the Gabrieleño/Tongva, were either taken to the Mission, removed to work as forced agricultural labor at the estancia in Redlands that served as outpost for the Mission, fled the region, or were killed (Beattie 1923). The Mission San Gabriel and its outposts resulted in a large pastoral empire that extended across the San Bernardino Valley. Cattle ranching became a major local industry during the Mission period.

In 1821, Mexico overthrew Spanish rule, and the Missions began to decline. By 1833, the Mexican government passed the Secularization Act and the Missions, reorganized as parish churches, lost their vast land holdings, and released the indigenous people that remained. Following this, land throughout present-day California was organized into Mexican land grants, and these large pastoral estates continued conducting cattle ranching during the Mexican or Rancho Period (Bacich 2017). One of the largest land grants in the area was the 22,000-acre Rancho Santa Ana del Chino, which encompassed the current Project area. In 1841, the Spanish governor Alvarado granted Rancho Santa Ana del Chino to his uncle, Antonio Maria Lugo. After receiving half of the ownership from Lugo, Isaac Williams built the Chino Ranch into an empire. The Treaty of Guadalupe Hidalgo in 1848 ended the Mexican-American War and the Mexican Rancho Period, triggering what is commonly referred to as the American Period (Del Castillo 1992).

California achieved statehood in the U.S. in 1850, which was quickly followed by the establishment of the County of San Bernardino in 1853. The arrival of the Southern Pacific Railroad to the San Bernardino Valley stimulated further development and settlement. The citrus industry continued to fuel the local economy and contributed to the regional land boom. The local area of Ontario began as a township founded in 1881 by two brothers George and William Chaffey. The local landowners and developers named the township after their hometown of Ontario, Canada. The Chaffey brothers purchased 6,000 acres of land with water rights in present-day Ontario to start the township. Part of the land included space for the Chaffey Agricultural College. The planned Ontario township was declared a “Model Colony” by an Act of Congress. The water rights, agricultural college, and access to transportation encouraged farmers to settle there (Brunzell 2023; City of Ontario 2024; Galvin and Associates 2024). Euclid Avenue was established as a main boulevard in the colony. Dairies were established in the local area in the 1890s after dairy cows came to the California market as a part of the Gold Rush (Brunzell 2023; City of Ontario 2024; Galvin and Associates 2024).

The City of Ontario was incorporated in 1891, during which time citrus crops were the staple of the successful agricultural community, with the local dairy industry only just beginning. The Steel and Green Dairy, which was comprised of adobe buildings at the location of the Battle of Chino, is considered to be

the first dairy developed in the area. Large, available tracts of land prime for agricultural uses in the area were a draw for dairy farmers from Los Angeles County, though citrus remained the dominate industry through the 1940s. Dairies remained smaller family-owned businesses during this period, and the 1920s saw an influx of Dutch immigrants establishing dairies in the areas. Despite the smaller sizes of the operations, the industry boomed alongside surrounding population growth, and dairies began switching from free grazing to dry-lot dairying and mechanized milking in order to optimize milk production and improve efficiency (Brunzell 2023; City of Ontario 2024; Galvin and Associates 2004).

After World War I, many dairies were plagued by tuberculosis in dairy cows, leading to new requirements around pasteurization. Around the same time, some of the industry in Ontario transitioned to aviation when aviation enthusiasts Waldo Waterman and Archie Mitchell established Latimer Field. Eventually, the fliers were moved east to Ontario World Airport, which operated as a training facility for pilots during World War II. During this time, the population across the Los Angeles basin began to grow into a large urban area, pushing dairy farms further into the Chino Valley. By 1949, dairies in the local area provided for over 33% of the dairy production within the County. In the 1950s, the City experienced the same post-World War II population and related housing boom that was so common across the region, and many farming families firmly settled in the area so that by the late 1950s/early 1960s, the Chino Valley was home to the most technologically advanced dairies in the entire country (Brunzell 2023; City of Ontario 2024; Galvin and Associates 2004).

During the post-World War II era, an increased popularity in utilizing Herringbone milk parlors that raised cows on platforms for milking became popular as a way of providing safer working conditions and controlling costs of labor. Prior to this in the 1920s through 1940s, milk parlors were more often constructed in an Art Deco style (1920s-1930s) followed by the Streamline Moderne style (1930s-1940). While the Art Deco milk parlors were more decorative with chevrons and zig-zags and maintained geometric and angular edges, the Streamline Moderne style milk parlors were more utilitarian and designed as two-part buildings with a large area for milking with a connected cooling area that would have maintained a smooth symmetrical style with a flat roof, stucco cladding, and glass block windows. The popularity of the glass block windows in milk parlors peaked in the 1950s, though continued to be constructed in the 1960s (Brunzell 2023; City of Ontario 2024; Galvin and Associates 2004).

In 1967, the County of San Bernardino designated 14,000 acres of Chino Valley agricultural land as an agricultural preserve and, by 1980, the local area had evolved into a world-class dairy center (City of Ontario 2024; Galvin and Associates 2004). However, the land was annexed into Ontario, Chino, and Chino Hills during the 1990s due to rising dairy operation costs and housing demands. The City of Ontario then began referring to their annexed 8,200 acres of the former San Bernardino Agricultural Preserve as the New Model Colony (NMC), which was named after the original Model Colony of Ontario established by the Chaffey brothers. The NMC is also modernly known as Ontario Ranch (City of Ontario 2024; Galvin and Associates 2004).

Ontario’s diverse history of irrigation, agriculture, viticulture, dairy, aeronautics, and World War II production transitioned the City to the next stage of expansive growth, which was focused primarily on

service industries and warehouses in the second half of the 20th century. The City's modern economic base is primarily focused on industrial and manufacturing operations and transportation (freeway, rail, and airport). Today, the City is approximately 32,000 acres in size and continues to be a booming and thriving community (City of Ontario 2024; Galvin and Associates 2004).

## METHODS

All efforts made for the completion of this report were completed pursuant to requirements set forth in the California Environmental Quality Act (CEQA). This study is intended to identify whether cultural resources are located within the Project area, whether any cultural resources are potentially significant pursuant to the above-referenced regulations and standards, and to develop specific recommendations that will address potential impacts to existing or potential resources. Tasks completed include:

- A Sacred Lands Files (SLF) search through the Native American Heritage Commission (NAHC) and a cultural records search through the South Central Coastal Information Center (SCCIC),
- A review of local, state, and national registers and inventories,
- A review of the City's 2004 Historic Context and 2025 draft Historic Context,
- Outreach to the California Office of Historic Preservation (OHP), the City, and GPA Consulting (formerly Galvin & Associates),
- A review of historical and topographic maps and other available literature,
- A pedestrian survey of the Project area,
- Recordation and evaluation of identified cultural resources, and
- Development of recommendations and/or mitigation measures for cultural resources identified or potentially unrecorded within the Project area.

## RESEARCH

### Sacred Lands File Search

The NAHC conducted a search of SLFs for the Project area and vicinity at the request of Kimley-Horn. The NAHC responded on June 10, 2024 and indicated that the results are positive for documented sacred lands in or near the Project area. The results are included in **Appendix A** of this report. The NAHC also provided a list of Native American Tribes who should be contacted for further information. The City of Ontario is responsible for conducting the applicable Assembly Bill (AB) 52 and Senate Bill (SB) 18 Tribal consultation with the Native American Tribes. The results of any Tribal consultation conducted by the City, and any information about Tribal Cultural Resources provided during consultation, will be outlined in the environmental documents prepared for the proposed Project.

### Cultural Resource Records Search

Kimley-Horn cultural resources management staff conducted a cultural resource records search at the SCCIC for the Project area plus a 0.5-mile buffer (record search area) on June 10, 2024 (**Figure 3**). No cultural resources were identified within the Project area during the records search at SCCIC, though two (2) cultural resources were identified within the 0.5-mile buffer: two (2) Southern California Edison transmission lines originally constructed during the historic period. According to the SCCIC's records, four (4) previous cultural studies have occurred in the Project area. However, the studies incorporated large-

scale linear surveys for proposed utility projects and covered very little of the Project area. The results of the records search are outlined in **Table 1** and **Table 2** below, as well as in **Appendix B** of this report.

**Table 1: Previously Recorded Cultural Resources in the Record Search Area**

| Resource | Resource Name | Age | Type | Approximate Location |
|---|---|---|---|---|
| P-36-025440 | Chino-Mira Loma No. 1 Transmission Line | Historic | Structure | 0.35 miles northwest of Project area |
| P-36-026051 | Hayfield-Chino 220kV Transmission Line | Historic | Structure | 0.05 miles north of Project area |

**Table 2: Previous Cultural Studies Identified in the Record Search Area**

| Report | Year | Author | Title |
|---|---|---|---|
| SB-01499 | 1985 | Foster, John M. and Roberta S. Greenwood | Cultural Resources Overview: California Portion, Proposed Pacific Texas Pipeline Project |
| SB-03012* | 1995 | Owen, Shelley Marie | Cultural Resources Survey and Impact Assessment for The Cajon/EPTC Pipeline Project Located in Portions of Los Angeles, San Bernardino, And Orange Counties, CA |
| SB-06095 | 2009 | Applied Earthworks | Confidential Cultural Resources Specialist Report for The Tehachapi Renewal Transmission Project |
| SB-07956* | 2007 | Doolittle, Christopher J. | Archaeological Survey Report for Southern California Edison's G.O. 131-D Assessment of The Chino A-Bank System and System Split Project San Bernadino County, CA |
| SB-07968* | 2011 | Holm, Lisa and John Holson | Supplemental Archaeological Survey Report: Tehachapi Renewable Transmission Project Segment 8 East (Phases 2 And 3) And West (Phase 4), Los Angeles/San Bernardino Counties, CA |
| SB-07977* | 2010 | Panich, Lee, Tsim D. Schneider, and John Holson | Supplemental Archaeological Survey Report: Tehachapi Renewable Transmission Project Segment 8 East (Phases 2 And 3), San Bernardino County, CA |

**Intersects Project Area*

**Local, State, and National Registers and Inventories**

Staff conducted a review of the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), National Historic Landmarks list (NHL), and the Built Environment Resource Directory (BERD). The BERD listed five (5) built environment resources located within the Project area:

- 7587 Edison Avenue
- 7721 Edison Avenue
- 7914 Edison Avenue
- 8185 Edison Avenue
- 14213 Bon View Avenue

Figure 3: Record Search Area Map

Each resource was assigned a California Historical Resource Status Code of 7R, which indicates they were identified during a reconnaissance level survey but not evaluated for significance. Many additional buildings located in the Project vicinity, but outside of the Project area, were also listed in the BERD, specifically along Edison Avenue, Bon View Avenue, and Grove Avenue.

**2004 Historic Context Review**

In 2024, Kimley-Horn staff reviewed the Historic Context for the City of Ontario dairy industry prepared by Galvin and Associates in 2004. The historic context examined the New Model Colony (NMC) across 711 individual parcels and 8,200 acres, an area now known as Ontario Ranch. The current Project area is entirely located within the Ontario Ranch community. The NMC historic context identified three (3) distinct periods in local and regional dairy farming: 1) Free Grazing, 2) Dry Lot to Mechanization, and 3) Intense High Technology. Most of the dairy properties in their study area encompassed, at the minimum, a single-family residence and a milking parlor (barn). The authors also identified six (6) architectural styles or influences within their study area:

1. Victorian (1870-1915) and Italianate (1890-1935) influences
2. Craftsman Bungalow style (1905-1930)
3. Art Deco/Art Moderne style (1920-1940)
4. Minimal traditional style (1930-1960)
5. Ranch style (1935-1990)
6. Utilitarian buildings (no specific date)

Using this data, Galvin and Associates (2004) defined nine (9) historic contexts for the NMC study area:

1. Pre-1930: Rural Residential or Free-Grazing Dairy Properties
2. 1920-1940: Art Deco or Streamline Moderne Milk Parlors
3. 1930-1949: Dry Lot Dairying with Mechanization
4. Post-1950: Scientific, Large Capacity Dairies
5. No date specified: Dairy Support Industries or Other Commercial Properties
6. No date specified: Ranch Style Houses
7. No date specified: Craftsman Style Houses
8. No date specified: Buildings with Portuguese Design Influence, and
9. No date specified: Buildings with Dutch Design Influences

Galvin and Associates' 2004 study identified 15 properties within the current Project area. The 15 properties consist of the following addresses, also identified in **Table 3** below:

- 14213 Bon View Avenue
- 14283 Bon View Avenue
- 7587 Edison Avenue
- 7691 Edison Avenue
- 7721 Edison Avenue
- 7891 Edison Avenue
- 7914 Edison Avenue
- 8061 Edison Avenue
- 8185 Edison Avenue
- 8292 Edison Avenue
- 8311 Edison Avenue
- 8381 Edison Avenue
- 8485 Edison Avenue
- 14049 Grove Avenue
- 14117 Grove Avenue

The 2004 study indicated each property was recorded, though no site records were located at the SCCIC during the record search. As such, Kimley-Horn contacted the City on Ontario, OHP, and GPA Consulting (formerly Galvin and Associates) to request copies of any existing documentation of the 15 cultural resources. GPA Consulting indicated that the records were digitized in the City's internal California Historical Resources Inventory Database (CHRID) and that they did not have copies of the records. OHP was able to identify and provide DPR forms for four (4) resources, and the City of Ontario was able to provide one (1) additional site record. The City of Ontario also directed Kimley-Horn to the City's digital database, CHRID, to see if any additional information could be obtained for the sites. The platform is no longer managed and, therefore, the majority of the data is no longer retrievable. However, nine (9) of the addresses were located within CHRID and their records did provide data related to the original Assessor Parcel Numbers (APNs) that were recorded as a part of each site. As such, Kimley-Horn staff were able to re-create the majority of the original site boundaries to facilitate early stages of research for this study. More detail related to data available for each resource is located in **Table 3** below, excluding information related to the SCCIC, as the record search did not produce any relevant site data.

| **Color Key for Table 3 (below)** |
|---|
| No records were located |
| A record was located, but is missing key details, such as site information, site boundary data, etc. |
| A record was located and maintains sufficient site information, site boundary data, etc. |

**Table 3: Results of Record Searches and Record Outreach for Each Property**

| Address | CHRID | City of Ontario | OHP |

As a result of outreach to the City, it was noted that an update to the 2004 historic context, which would include recordation and evaluation of all historic-era structures in the NMC area, was in development by

Urbana Preservation & Planning, LLC (Urbana) and that site records for the Project area would be available for utilization in this report. As such, Kimley-Horn conducted a review of the updated 2025 historic context as a part of this study, the results of which are noted below. Additionally, site information compiled as a result of both Kimley-Horn and Urbana surveys is included later in this report, and copies of all site records prepared by Urbana can be found in **Appendix C**.

**2025 Draft Historic Context Review**

Kimley-Horn staff reviewed the draft Historic Context for the City of Ontario dairy industry prepared by Urbana in 2025. This historic context served as an update to the 2004 study described above and examined the same 8,200-acre area that makes up the NMC, now known as Ontario Ranch. During review of the 2004 study for a nearby project in 2023, BCR Consulting identified issues with data availability within the historic context and argued that actual construction of Streamline Moderne Milking Parlors did not take place within the Art Deco era (1920-1940). Instead, their study resulted in the recordation and evaluation of this building type with an associated period of significance of 1940-1965 (Brunzell 2023). During the efforts made for the 2025 historic context update, Urbana recognized a similar error in the 2004 study, though differently from BCR Consulting, concluded that both the Art Deco and Streamline Moderne styles were utilized from the 1920s through the 1960s. Additionally, Urbana's investigations identified inaccuracies with the year-built data utilized in the 2004 report, noting that many properties were developed later than what was recorded. As such, the 2025 study not only provides an updated historical narrative for the regional dairy industry but also includes necessary corrections to the prior context.

The 2025 study identified six (6) distinct themes and associated time periods in local and regional dairy farming: 1) Early Dairy Farms in Ontario, 1900s-1929, 2) Depression-Era and Wartime Dairies, 1930s-1945, 3) Postwar, Large-Capacity Dairies, 1945-1980, 4) Consolidation of Dairy Operations, 1980s-1998, 5) Important Persons, Families, and Ethnic Groups, and 6) Historic Architectural Styles, 1880s-1980s. Though significant people and ethnic groups were noted in the 2004 study, the 2025 study provides a much more detailed summary with an emphasis on Mexican, Portuguese, Basque, and Dutch immigrants. Additionally, the 2025 study includes an updated overview of significant architectural styles, categories, and influences for Ontario Ranch:

- Utilitarian, Vernacular Agricultural Architecture (1880s-1930s)
- Folk Victorian (1880s-1915)
- Craftsman (1900s-1930s)
- Art Deco (1920-1960s)
- Streamline Moderne Style (1930-1960s)
- Minimal Traditional Style (1930-1960)
- Ranch Style (1950-1980)
    - Dutch Influences
    - Portuguese Influences

In addition to updates to the historical context, the 2025 study included a large-scale survey of the Ontario Ranch area. The survey effort included recordation and evaluations of historic-era resources using the

updated historic context, significant themes, and architectural styles. As a result of the survey, Urbana identified 14 properties within the current Project area. The information in **Table 4** below includes the addresses for each of these properties, as well as details regarding their relationship to the 15 properties recorded in 2004.

| **Table 4: Properties Identified in 2025 Historic Context and Their Relationship to 2004 Properties** | |
|---|---|
| **Addresses/Name** | **Relationship to 2004 Properties** |
| 13839-13905 Bon View Ave | Not previously recorded within Project area; consists of 3 APNs, though the 1 APN within the Project area does not contain structures |
| 7587-7697 Edison Ave | Includes 2 previously recorded properties (7587 and 7691 Edison Ave) that were recorded separately; now combined |
| 14213-14297, 14333-14353, 14450, and 14451 Bon View Ave | Includes 2 previously recorded properties (14213 and 14283 Bon View Ave) that were recorded separately; now combined |
| 7914 Edison Ave | Previously recorded with the same address |
| 7595 Schaefer Ave and 13752 Bon View Ave | Not previously recorded within Project area; consists of 7 APNs, though the 2 APNs within the Project area do not contain structures |
| 13715-13751 Grove Ave, 13817-13819 Grove Ave, 8270-8292 Edison Ave | Includes 1 previously recorded property (8292 Edison Ave) in the Project area; 8270 Edison Ave was not previously recorded in the Project area; remainder of the properties are not located in the Project area |
| 8040 Schaefer Ave and 14050 Grove Ave | Not previously recorded within the Project area, though resides entirely within the Project area and contains historic structures |
| 8061 Edison Ave | Previously recorded with the same address |
| 7721-7891 Edison Ave | Includes 2 previously recorded properties (7721 and 7891 Edison Ave) that were recorded separately; now combined |
| 8185 Edison Ave | Includes 2 previously recorded properties (8185 Edison Ave and 14117 Grove Ave) that were recorded separately; now combined |
| 8311 Edison Ave | Previously recorded with the same address |
| 8335-8381 Edison Ave | Previously recorded as separate properties; now combined; consists of 4 APNs, though only 2 APNs that make up 8381 Edison Ave are within the Project area; 8335 Edison Ave was not previously recorded in the Project area |
| 8485 Edison Ave and 14350 Walker Ave | Previously recorded only as 8485 Edison Ave; now combined with 14350 Walker Ave, which was not previously recorded |
| 14049 Grove Ave | Previously recorded with the same address |

As indicated in the above table, Urbana's study made numerous changes to the site boundary delineation of the previously recorded properties, including separating resources, combining resources, and adding new APNs to resources, though all of the previously recorded properties in the current Project area were included in the updated inventory. The resource names and site boundaries reported within the 2025 Urbana study are henceforth utilized within this report for consistency.

It is important to note that while 13839-13905 Bon View Avenue and 7595 Schaefer Avenue/13752 Bon View Avenue both overlap with the Project area, the portions of the properties within the Project area consist of vacant land and there are no recorded historic-era features (i.e., buildings or structures) from these properties within the Project area. Therefore, there is no potential to impact these properties as potential historical resources, as defined under CEQA, and these properties will not be reported as cultural resources within the current Project area for the purposes of this study. As such, Kimley-Horn identified 12 cultural resources with historic structures in the Project area via the review of Urbana's 2025 study.

**Archival and Historical Research**

Kimley-Horn conducted a review of historic maps and imagery to determine the land use history across the Project area, as shown in **Figures 4-9** below (Historic Aerials 2024).

Figure 4: Historic Aerial Image of Project Area (1938)

Figure 5: Historic Aerial Image of Project Area (1946)

Figure 6: Historic Aerial Image of Project Area (1959)

Figure 7: Historic Aerial Image of Project Area (1966)

Figure 8: Historic Aerial Image of Project Area (1980)

Figure 9: Historic Aerial Image of Project Area (2020)

**Cultural Field Survey**

On June 13, July 3, July 10, and July 16, 2024, a pedestrian survey was conducted for the Project area by Kimley-Horn cultural resources management staff utilizing intensive-level and reconnaissance methods (**Figure 10**). All surface exposures were carefully inspected for the presence of cultural resources. Digital photographs were taken at various points in the Project area. Reconnaissance methods were incorporated when access was impeded by active dairy operations or landowner permissions. Survey was limited to the public right-of-way at parcels where access was not granted.

The Project area remains an active dairy and agricultural area. As such, ground visibility ranged widely during the pedestrian survey but averaged 80%. While visibility was excellent in the agricultural pastures,

the Project area also contained many paved areas that affected surface soil visibility. It was also noted that the portions of the Project area with visible soil have been heavily disturbed due to over a century of dairy and agricultural activities. Additionally, while most of the parcels were in use for active dairy operations, some parcels had been modernly developed.

Staff observed multiple building types during the survey, including single-family residences, milk parlors, ancillary buildings (garages, storage sheds), and ancillary dairy farm structures (pole barns, shade structures, troughs, holding tanks). Numerous architectural styles or influences were identified in the Project area during the survey, such as Craftsman, Ranch, Midcentury Modern, Minimal Traditional, Vernacular, Streamline Moderne, and Art Deco. Staff noted that many of the milk parlors and adjacent residences corresponded in their architectural styles. All historic-era structures were photographed and notes were taken for later use in the report. No prehistoric archaeological resources were observed during the survey.

Figure 10: Project Area Overview

Urbana surveyed the entire Ontario Ranch area between October 2024 and April 2025 for the City's updated historic context, with a focus on dairy farms and properties developed and utilized through the 1980s. Their survey observed the Project area in similar condition as the Kimley-Horn surveys.

**Resource Summary**

As noted previously, many of the previously recorded resources within the Project area had either missing or incomplete site records when Kimley-Horn initiated this study in 2024. As such, Kimley-Horn prepared new site descriptions as a result of record search and survey efforts for use in this report. Additionally, Kimley-Horn prepared preliminary evaluations of each resource, though these were conducted utilizing the 2004 historic context. However, upon receiving copies of the updated 2025 historic context and new site records prepared by Urbana from the City, Kimley-Horn made extensive updates within this report to

ensure consistency with the resource names/addresses, boundaries, site descriptions, and evaluations reflected in Urbana's documents.

As a result of this study, a total of 12 cultural resources were identified within the Project area. A list of each resource, including the address and associated APNs for each resource, is included below in **Table 5** below. Additionally, the exact location of all 12 resources, plus the two (2) resources that were excluded from the study due to lack of historic structures in the Project area, can be viewed on **Figure 11** on page 37 of this report.

| **Table 5: List of Properties (Addresses and APNs) Identified within the Project Area** | |
|---|---|
| **Addresses/Name** | **APNs** |
| 7587-7697 Edison Ave | 105337101, 105337102, and 105353101 |
| 14213-14297, 14333-14353, 14450, and 14451 Bon View Ave | 105335101, 105335102, 105354101, 105354102, 105357101, and 105357102 |
| 7914 Edison Ave | 105317101, 105332102, 105332103, and 105317106 |
| 13715-13751 Grove Ave, 13817-13819 Grove Ave, 8270-8292 Edison Ave | 021631105, 021631104, 021631103, 021631108, and 021631109 |
| 8040 Schaefer Ave and 14050 Grove Ave | 105332101 |
| 8061 Edison Ave | 105333101, 105333102, 105333103, 105333104, 105334101, and 105334102 |
| 7721-7891 Edison Ave | 105336101, 105336102, and 105336103 |
| 8185 Edison Ave | 021632103 |
| 8311 Edison Ave | 021632108 |
| 8335-8381 Edison Ave | 021632201, 021632202, 021632203, and 021632204 |
| 8485 Edison Ave and 14350 Walker Ave | 021632205 and 021632210 |
| 14049 Grove Ave | 021631101 and 021631102 |

**RESOURCE DESCRIPTIONS AND EVALUATIONS**

The 12 cultural resources identified within the Project area are briefly described below, along with conclusion made as to their eligibility for listing in the California Register of Historical Resources (CRHR) and designation as a City of Ontario Historic Landmark. Much of the below narrative was retrieved directly from the respective site record prepared by Urbana located in **Appendix C**, though each record contains additional detailed information for each resource.

*7587-7697 Edison Ave*

This property includes three (3) parcels that total 46.58 acres located south of Edison Avenue between Sultana and Bon View Avenues. It includes a Craftsman Bungalow style dwelling and detached garage, a

Ranch style milk parlor, a Ranch style dwelling, several ancillary structures/features associated with dairy operations (silos, troughs, feeding gates, sheds, pole structures, etc.), and a paved driveway. The property dates to pre-1935 with later developments between 1959 and 1966 and was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The pre-1935 Craftsman house has an asymmetrical façade with a one-and-a-half-story irregular floor plan. The exterior is clad in tan stucco with red trim on the windows and doors. The high-pitched, side-gabled roof is covered in composition shingles and includes a wide eave overhang, open eaves, decorative wood brackets below the gable end, and exposed rafter ends. A stucco chimney rises from the front roof slope. The fenestration consists of wood-framed, one-over-one, double-hung and fixed windows with red-painted lintels and sills. The main (north) elevation features a full-width front porch beneath the main roofline, supported by tapered wood/concrete beams, as well as a gabled dormer centered on the roof slope. At the rear (south) elevation, a two-story addition was added to the southwest corner in the late 1970s, which has a gabled roof, aluminum sliding sash windows, and a tan stucco façade. It is easily distinguishable from the original structure but is compatible with the dwelling's historic character and did not result in the removal of original character-defining features. East of the dwelling is a detached one-car garage with a rectangular floorplan, tan stucco facade, and gabled roof.

The Ranch style dwelling at 7587 Edison Avenue and the associated Ranch style milk parlor were constructed between 1959 and 1966. The milk parlor features a horizontal floor plan with two milking parlor wing sections separated by a breezeway. The front section exhibits Ranch style characteristics, including a hip-and-gable roof with wood shake shingles, stucco walls, metal fixed and casement windows, and a stone veneer. The breezeway has metal doors on both the east and west elevations. South of the breezeway, the milking parlor sections have low sloped gable roofs oriented along an east-west axis. Ventilation is provided by horizontal louvered metal shutters on the north and south elevations, positioned between concrete walls. Additional features include a metal door at the main (north) entryway, a circular driveway, and a bulk tank in front with two silos are located at the rear. The dwelling has an asymmetrical façade and a one-story horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with a stone veneer on the main (north) elevation. The moderately pitched hip-and-gable roof is topped with composition shingles and has a moderate eave overhang, boxed eaves, a cupola above the breezeway, and a stone chimney on the rear roof slope. The fenestration consists of a mix of aluminum fixed and sliding sash windows and vinyl units. The primary elevation features a recessed entryway below the main roofline with two double half-lite wood doors, a small concrete stoop, a stone planter, and box bay windows accented by red horizontal wood siding. A wide, open breezeway on the east elevation connects the three-car garage to the dwelling.

- The entire property is eligible under CRHR and City of Ontario criteria 1/a for its significant association with the "Postwar, Large-Capacity Dairies, 1945–1980" theme.
- The pre-1935 Craftsman Bungalow is individually eligible under CRHR and City of Ontario criteria 3/d within the "Craftsman Bungalow Style, 1900s–1930s" context with a period of significance of 1920s-1930s.

- The Ranch style dwelling is individually eligible under CRHR and City of Ontario criteria 3/d within the "Ranch Style, 1950–1970s" context with a period of significance of 1959-1966.
- The Ranch style milk parlor is not individually significant, though remains a contributor to the overall significance of the property as a Postwar Large Capacity Dairy complex.

*14213-14297, 14333-14353, 14450, and 14451 Bon View Ave*

This property includes six (6) parcels that total 56.47 acres located east of Bon View Avenue between Euclid and Eucalyptus Avenues. It includes two (2) Ranch style milk parlors, two (2) Minimal Traditional residences, two (2) Craftsman Bungalow residences, two (2) Ranch style dwellings, and multiple geometrically spaced ancillary storage structures located to the rear of the buildings. The property dates to pre-1935 with later improvements between the 1950s and 1990s, and was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

Both Craftsman Bungalows were constructed before 1935. One (1) bungalow located at 14213 Bon View Avenue is a one-and-a-half-story dwelling that has a compact rectilinear floorplan and an asymmetrical façade. The exterior is clad in tan stucco with brown trim on the windows. The high-pitched, cross-gabled roof is topped with composition shingles and features a moderate eave overhang, support brackets below the gable, open eaves with exposed rafter ends, and a shed dormer on the main (west) elevation. The fenestration consists primarily of aluminum sliding sash windows and wood panel doors. The main elevation includes a full-length porch supported by two (2) metal columns, a small stoop, and four (4) concrete square columns approximately four (4) feet in height. The rear (east) elevation features an early addition that was added between 1938 and 1946 and features a stucco façade, gabled roof topped with composition shingles, open eaves with exposed rafter ends, and aluminum windows. It likely originally featured wood-framed, double-hung windows as well as columns composed of a different material, which were removed or altered. The other bungalow at 14343 Bon View Avenue features a rectangular footprint and an asymmetrical façade with a tan stucco exterior. The high-pitched, side-gabled roof is topped with composition shingles and includes a minimal eave overhang, boxed eaves, and two (2) gabled dormers on the north and south elevations. The fenestration primarily consists of aluminum sliding sash windows. An addition was constructed at the east elevation between 1959 and 1966. The dwelling exhibits minimal decorative detailing throughout. A few feet north of the dwelling is a one-car garage, which features a front-gabled roof and a metal overhead door.

A Ranch style milk parlor and two (2) Minimal Traditional residences at 14213-14297 Bon View Avenue were constructed between 1959 and 1966. The milk parlor is a one-story structure that has been substantially altered and now consists of three (3) sections: the front milk house with an addition to the south elevation, the original rear milking parlor to the east of the milk house, now modified as a storage shed, and a new milking parlor section extending from the milk house addition. The milk house and milking parlor are separated by a breezeway which features a metal sliding barn door with a handle on the south elevation. Additional elements include metal doors at the front, a dairy association sign below the gable, and a circular driveway in front of the milk parlor. Both associated Minimal Traditional residences feature asymmetrical façades and rectilinear floorplans atop concrete foundations. The 14283 Bon View Avenue

dwelling has a tan stucco exterior, a hipped roof topped with composition shingles, moderate eave overhang, and boxed eaves. The main entryway is recessed, with a partial porch that includes a small stoop and decorative iron railing and columns. Fenestration consists of aluminum sliding sash windows and paneled doors. The 14297 Bon View Avenue dwelling features a tan stucco façade, a side-gabled roof with composition shingles, and an attached narrow garage with an overhead metal door. The main elevation includes a half-width porch supported by decorative metal columns and railing, a small stoop, aluminum sliding sash windows, and paneled doors.

The Ranch style dwellings were both constructed between 1968 and 1975. The dwelling at 14353 Bon View Avenue features an asymmetrical, horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in tan-painted stucco with brown window trim. The low-pitched hipped roof is topped with terracotta tiles and features a minimal eave overhang with boxed eaves. The fenestration is mostly obscured from the public right-of-way but appears to consist of fixed multi-lite or single pane picture windows. A detached one-car garage is situated south of the dwelling, featuring a tan stucco façade, a hipped roof with terracotta tiles, and a metal overhead door. The dwelling at 14451 Bon View Avenue has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with a brick veneer and a planter on the main (west) elevation. The low-pitched hipped roof is topped with composition shingles, featuring a moderate eave overhang, boxed eaves, and a stone chimney on the rear roof slope. The main elevation showcases a recessed entryway beneath the roofline, with two (2) decorative wood-paneled doors and box bays accented by horizontal wood siding. The fenestration throughout consists primarily of vinyl sliding sash windows.

The Ranch style milk parlor at 14450 Bon View Avenue was constructed between 1968 and 1975. It is a one-story milk parlor with a front milk house and rear milking parlor separated by a breezeway. The milk house features modest Ranch style elements, including a hip-and-gable roof with wood shake shingles, a stucco façade with stone accents along the corners of the main (west) elevation, and metal casement windows on the north elevation. The fenestration throughout has since been boarded up. East of the breezeway, the building is divided into a milking area and a wider holding area. The milking area features louvered horizontal shutters on the north and south elevations, set atop concrete walls. The holding area, which extends outward beyond the milking area, is partially open and supported by concrete walls and metal poles. Both sections have gabled roofs oriented along an east-west axis. Additional features include two (2) glass industrial doors at the front, a circular driveway in front of the milk parlor, and a dairy association sign.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- Though the property retains integrity of location, setting, feeling, and association, several buildings have been subjected to extensive alteration and, therefore, the property does not retain integrity of design, materials, or workmanship.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

*7914 Edison Ave*

This property includes four (4) parcels that total 18.79 acres located north of Edison Avenue between Bon View and Grove Avenues. It includes two (2) Ranch style dwellings and a Streamline Moderne milk parlor. One (1) Ranch style residence and the milk parlor were constructed between 1952 and 1959, while the second residence was added between 1966 and 1980. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The older Ranch style residence has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with brick and wood shiplap veneer on the main elevation. The low-pitched hipped roof is topped with composition shingles, has a moderate eave overhang, boxed eaves, and a brick chimney along the roof slope at the rear (north) elevation. The fenestration consists of metal casement windows and sliding sash windows. The main elevation features a partial-width porch beneath a shed roof supported by decorative metal beams, a small stoop, and additional decorative metal details. To the west side of the dwelling is a one-car garage installed by the 1980s with a brown paneled overhead door. The Streamline Moderne milk parlor is directly west of the residence, though retains only the front milk house section. The rear milking parlor section was demolished by April 2022.

The second Ranch style residence has an asymmetrical façade and a mostly rectilinear floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with a partial brick veneer on the main (south) elevation. The low-pitched hipped roof features a moderate eave overhang and boxed eaves. The fenestration primarily consists of vinyl sliding sash windows, which replaced the original aluminum units in 2022. The main (south) elevation features a recessed main entryway with decorative double wood-paneled doors, a small stoop, a decorative metal beam beneath the roofline and entryway, and an attached garage on the west side with an overhead door.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- While the Streamline Moderne milk parlor may have once been a distinctive example of this architectural type, the building has been subjected to extensive alteration/demolition and, therefore, no longer retains integrity of design, materials, workmanship, feeling, or association.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

*13715-13751 Grove Ave, 13817-13819 Grove Ave, 8270-8292 Edison Ave*

This property includes five (5) parcels that total 46.80 acres located east of Grove Avenue between Schaefer and Edison Avenues. It includes two (2) Ranch style dwellings and two (2) associated milk parlors with Dutch style characteristics, as well as two (2) Minimal Traditional style dwellings. The older Minimal Traditional style residences were constructed between 1948 and 1952, while the Ranch Style structures were constructed between 1959 and 1966. It was historically associated with dairy operations and retains

that association today. Historical aerials indicate the built environment has remained the same since that time period.

The first Ranch-style residence features an asymmetrical façade with a one-story horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in yellow painted stucco with horizontal wood siding on a portion of the main (west) elevation, accented by white trim around the windows and doors. The low-pitched cross-gabled roof is covered with composition shingles and features a moderate eave overhang, open eaves with exposed rafter tails, and decorative scalloped barge board at the gable ends. The fenestration visible from the public right-of-way consists of wood single-hung windows and a wood half-lite diamond patterned door. The main (west) elevation exhibits Northern European or Dutch influences, such as the diamond-patterned door, scalloped barge board, wood spindle porch supports, and a square cupola. The attached two-car garage is connected to the residence by a breezeway on the south elevation. Additional features include a stone planter and concrete steps at the main entryway.

A milk parlor is located south of the residence. The building has a horizontal floor plan and is divided into two sections: the front milk house and a rear milking parlor, separated by an open breezeway. The front section reflects Ranch style characteristics, featuring a front-gabled roof with wood shake shingles, yellow painted stucco walls, and metal casement and fixed windows. An open breezeway separates this front section from the rear portion of the building. South of the breezeway, the milking parlor has a gable roof oriented along a north-south axis, topped with corrugated sheet metal. Ventilation is provided by horizontal louvered metal shutters on the east and west elevations, positioned above concrete walls and along the gable ridge. Additional features include a circular driveway, metal doors at the main entryway, and a stone planter. The main (west) elevation of the front section also displays Northern European or Dutch influences, such as diamond-patterned fixed windows and a gabled shed roof above the main entryway supported by curved knee brackets.

The second Ranch-style residence also features an asymmetrical façade with a one-story horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in beige painted stucco with tan horizontal wood siding on a portion of the main (west) elevation, accented by white trim around the windows and doors. The low-pitched cross-gabled roof is covered with composition shingles and features a moderate eave overhang, boxed eaves, horizontal wood siding below the gable, and decorative scalloped barge board at the gable ends. The fenestration visible from the public right-of-way consists of wood single hung windows, some with decorative shutters, and a wood half-lite diamond patterned door. The main (west) elevation exhibits Northern European or Dutch influences, such as the diamond-patterned half-lite door and windows, scalloped barge board, box bay accented with wood-siding, and a square cupola. The attached three-car garage is connected to the residence by a breezeway on the south elevation. Additional features include a stone planter, a stone chimney on the rear elevation, and concrete steps at the main entryway.

The second milk parlor is located south of the second residence. The building is divided into two sections: the front milk house and a rear milking parlor, separated by an open breezeway. The front section reflects Ranch style characteristics, featuring a hip-and-gable roof with wood shake shingles, beige painted stucco

walls, and metal casement and fixed windows. A breezeway, located between the two sections on the north and south elevations, is partially hidden from the public right-of-way. East of the breezeway, the milking parlor features a gable roof oriented along an east-west axis, topped with corrugated sheet metal. Ventilation is provided by horizontal louvered metal shutters on the east and west elevations, positioned above concrete walls and along the gable ridge. Additional features include a circular driveway, metal doors at the main entryway, and a stone planter. The main (west) elevation of the front section also displays Northern European or Dutch influences, such as diamond-patterned windows, decorative wood spindles below the roofline, and scalloped barge board at the gable end.

The two Minimal Traditional style dwellings feature asymmetrical compact floor plans with minimal decorative details. The first dwelling has a square floor plan with a hipped roof topped with composition shingles. The exterior is stucco painted white. All the windows and doors have since been boarded up with plywood. The second dwelling features a rectilinear floor plan and a white stucco exterior with red trim around the windows and doors. The hipped roof is also topped with composition shingles and includes a moderate eave overhang. Fenestration consists of a combination of aluminum single-hung windows and wood double-hung windows, along with a flush wood entry door. Both dwellings are modest in appearance and do not exhibit distinctive characteristics of the Minimal Traditional style.

The Ranch style structures exemplify Northern European/Dutch stylistic influences and contain low-pitched roofs, stucco cladding, decorative scalloped barge board, diamond-patterned doors and windows, cupolas, and stone planters in-vogue in the postwar period. These structures are located in the northern portion of the property and are outside of the Project area. The two (2) Minimal Traditional residences are the only structures located in the Project area, and are modest, utilitarian examples of the style that lack distinctive detailing or architectural character.

- The Ranch style structures are eligible under CRHR and City of Ontario criteria 3/d for its significant association with the “Ranch Style, 1950-1970s” theme.
- The Minimal Traditional dwellings are not individually eligible nor contributors to any broader eligibility of the property.

*8040 Schaefer Ave and 14050 Grove Ave*

This property includes one (1) parcel that totals 8.62 acres located at the northwest corner of Grove and Edison Avenues. It includes a Minimal Traditional residence, as well as two (2) Ranch style dwellings and milk parlor. The Minimal Traditional residence was constructed prior to 1935, followed by the milk parlor between 1948 and 1946, and the Ranch Style residences between 1966 and 1968. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The Minimal Traditional residence has an asymmetrical façade and a rectilinear floorplan. The exterior is clad in tan-painted stucco. The low-pitched gabled roof is topped with composition shingles and has a moderate eave overhang. The primary (south) elevation includes a recessed entryway beneath the

roofline, a small stoop, and a shed roof over a bay window accented with a brick veneer. The fenestration consists of aluminum windows.

The milk parlor is situated between the two (2) Ranch style residences and consists of a front milk house and the rear milking parlor separated by a breezeway. The milk house has some Ranch-style elements, including a cross-gable roof with wood shake shingles and a stucco façade. It features a gable roof oriented along an east-west axis that is clad in corrugated sheet metal. Ventilation is provided by horizontal louvered metal shutters on the north and south elevations, positioned above concrete walls, along with a vent system along the gable ridge. There is no curved driveway in front of the milk parlor.

The Ranch-style dwelling south of the milk parlor has an asymmetrical façade and an irregular floorplan atop a concrete foundation. Its exterior is clad in tan painted stucco. The moderately pitched hipped roof is topped with composition shingles and features minimal eave overhang and boxed eaves. The recessed main entryway includes a red paneled door, and box bay windows are visible on the primary (east) elevation. The Ranch-style dwelling north of the milk parlor has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The dwelling has a similar appearance to the first residence and features a stucco façade, a bay window, hipped roof topped with composition shingles, and a recessed main entryway.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- Though the property retains integrity of location, setting, feeling, design, materials, and workmanship, it lacks integrity of association.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

*8061 Edison Ave*

This property includes six (6) parcels that total 36.18 acres located south of Edison Avenue between Bon View and Grove Avenues. It includes a Ranch style dwelling, a Ranch Style milk parlor, and ancillary structures. The residence was constructed between 1938 and 1946 along with a milk parlor, though that parlor was demolished and replaced with the current milk parlor between 1966 and 1968. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The Ranch style residence is a one-story residence with an asymmetrical façade and a horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with brown trim on the windows and doors. The moderately pitched hipped roof is topped with composition shingles and has a moderate eave overhang, and boxed eaves. The fenestration consists of vinyl multi-lite sliding sash and single-hung windows and wood paneled doors. The main elevation has a bay window and a stone planter. An attached one-car garage is located on the west elevation and features a white paneled overhead door. The milk parlor just west of the dwelling contains a front milk house and rear milking parlor separated by a breezeway. The milk house is modest in design, incorporating Ranch-style elements such as a hip-and-

gable roof with composition shingles, a moderate eave overhang with boxed eaves, and a stucco façade. The fenestration consists of metal multi-lite fixed windows, metal casement windows, and industrial metal glass door. South of the breezeway, the milking parlor features a gable roof oriented along a north-south axis, topped with corrugated sheet metal. Additional features include a circular driveway in front of the milk parlor.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

*7721-7891 Edison Ave*

This property includes three (3) parcels that total 18.16 acres located south of Edison Avenue between Bon View and Grove Avenues. It includes a Ranch Style residence, a Craftsman Bungalow residence, an Art Deco milk parlor, and ancillary structures. The residence was constructed before 1935 along with three other structures that are no longer present on the property. The milk parlor was added between 1935 and 1946, followed by the Ranch Style residence between 1959 and 1966. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has been modified via additional construction in the 1990s, as well as the destruction of the rear section of the milk parlor in 2017.

The Ranch style residence at 7891 Edison Avenue is a one-story dwelling with an asymmetrical façade and an irregular floorplan atop a concrete foundation. Its exterior is clad in yellow board-and-batten siding, with a partial stone veneer on the main (north) elevation. The low-pitched cross-gabled roof, covered with composition shingles, has a moderate eave overhang, boxed eaves, and a chimney on the rear roof slope. The fenestration consists of vinyl sliding sash windows. The main elevation includes a recessed entryway with a single paneled door, a concrete stoop, a stone planter, and an attached one-car garage with a paneled overhead door. It is smaller example of its type in the area and exhibits modest characteristics of the style.

The Craftsman Bungalow residence is a one-and-a-half story dwelling with a symmetrical façade and a mostly square floor plan. The exterior is clad in tan-painted stucco with blue trim on the windows and doors. The high-pitched, side-gabled roof is topped with composition shingles and has a wide eave overhang with wood brackets beneath the gable. The fenestration visible from the public right-of-way consists of vinyl single-hung windows and fixed wood windows. The main (north) elevation includes a centered gabled dormer with four vinyl single-hung windows, an enclosed full-width porch, a centered main entryway with a wood-paneled door and metal security door, and concrete steps. The milk parlor is located south of the bungalow, though only the front milk house section remains. It retains some Art Deco characteristics, including smooth stucco walls, a flat roof, a symmetrical boxy form, and glass block windows.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

*8185 Edison Ave*

This property includes one (1) parcel that totals 18.56 acres located at the southeast corner of Edison and Grove Avenues. It includes a Ranch style dwelling with Northern European/Dutch influences, a Minimal Traditional residence, and a Streamline Moderne milk parlor constructed between 1952 and 1959. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The Minimal Traditional dwelling has an asymmetrical façade and a rectilinear floorplan atop a concrete foundation. The exterior is clad in tan-painted stucco with green trim on the windows and roof fascia. The low-pitched hipped roof is finished with composition shingles and features a minimal eave overhang with boxed eaves. Fenestration visible from the public right-of-way consists of aluminum sliding sash windows. The main (west) elevation includes a recessed main entryway with a concrete stoop, metal security gate, and a wide stone chimney. The detached garage, located directly north of the dwelling, features two (2) paneled overhead doors, a tan stucco façade, and a hipped roof.

The Ranch style dwelling that exhibits Northern European or Dutch influences has an asymmetrical façade and a one-story horizontal floorplan atop a concrete foundation. The exterior is clad in horizontal wood siding painted yellow, with green trim on the windows and doors. The low-pitched cross-gabled roof is covered with composition shingles and includes a moderate eave overhang with open eaves and exposed rafter ends. A chimney is located on the rear (south) elevation. Fenestration consists of wood-framed diamond-patterned windows, some with green decorative shutters. The main (north) elevation features diamond-patterned windows, box bays with decorative wood support brackets, a stone planter, and an extended roof girder. A garage is attached to the main dwelling by a wide open breezeway on the west elevation.

The Streamline Moderne milk parlor contains a front milk house and rear milking parlor separated by a breezeway. The front section reflects Streamline Moderne characteristics, with smooth stucco walls, a flat roof, curvilinear corners, a central vertical projection, and curved glass block windows. The west elevation contains metal multi-lite casement windows, though the windows on the east elevation are boarded up. The breezeway features a metal barn-style sliding door on both the east and west elevations. South of the breezeway, the milking parlor has a gable roof oriented along a north-south axis clad in corrugated sheet metal. Ventilation is provided by horizontal metal shutters on the east and west elevations, positioned above concrete walls, along with a vent system along the gable ridge. Additional features include a circular driveway in front of the milk parlor and two (2) metal doors.

- The Ranch Style dwelling and Streamline Moderne milk parlor are eligible under CRHR and City of Ontario criteria 3/d within the "Ranch Style, 1950–1970s" and "Streamline Modern style, 1930s-1960s" contexts with a period of significance of 1952-1959.
- The City's Historic Preservation Subcommittee determined the property (identified as 14117 Grove Ave) met local landmark designation and Tier II criterion in November 2014.
- The Minimal Traditional dwelling is not individually eligible nor a contributor to any broader eligibility of the property.

*8311 Edison Ave*

This property includes one (1) parcel that totals 18.77 acres located south of Edison Avenue and Ontario Ranch Road between Grove and Walker Avenues. It includes a Ranch style dwelling and milk parlor constructed between 1968 and 1975. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has been altered via the addition of ancillary structures in the 1990s.

The Ranch style residence has an asymmetrical façade and an irregular horizontal floorplan atop a concrete foundation. The low-pitched cross-gabled roof has a moderate eave overhang with boxed eaves and is topped with terracotta tiles, which likely replaced the original composition or wood shingles at an unidentified date. The exterior is clad in tan-painted stucco. Additional features include a recessed main entryway accessed via concrete steps, two (2) brown paneled doors, metal sliding sash windows, a stone planter, and decorative blue shutters on some of the windows. An attached three-car garage addition was appended to the east elevation and features a roofline that does not match the original structure, resulting in an uneven and visually uneven roofline. To the east of the dwelling is the milk parlor, which contains a front milk house, rear milking parlor separated by a breezeway, and holding area. The milk house shares a similar design with the main dwelling, incorporating Ranch style elements such as a hip and gable roof topped with terracotta tiles, a moderate eave overhang with boxed eaves, and a stucco façade. Its fenestration consists of metal casement windows. South of the milk house, the milking parlor features a gable roof oriented along a north-south axis, topped with corrugated sheet metal. Ventilation elements include metal horizontal louvered shutters set atop concrete walls, along with a vent system along the gable ridge. Further south, the holding area is partially open and enclosed by concrete walls. Additional features include metal doors at the main entryway, bulk tanks, and a circular driveway in front of the milk parlor.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

*8335-8381 Edison Ave*

This property includes four (4) parcels that total 37.42 acres located south of Edison Avenue between Grove and Walker Avenues. It includes a Craftsman Bungalow style residence, a Ranch style milk parlor, and ancillary structures. The Craftsman was constructed prior to 1935, while the milk parlor was added

between 1959 and 1966. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The Craftsman Bungalow style residence has an asymmetrical façade and an irregular floorplan. The exterior is clad in clapboard siding painted brown with dark brown trim on the windows and doors. The moderately pitched hipped roof is topped with composition shingles and has a moderate eave overhang, boxed eaves, and a dormer on the main (north) elevation. The fenestration visible from the public right-of-way consists of wood-framed fixed and double-hung windows, along with some vinyl sliding sash and single-hung windows. The main elevation features a partial-width porch beneath a hipped roof extension, supported by tapered brick columns, concrete steps, and a brick pony wall. Despite the removal of some original windows and roofing, the dwelling maintains a strong representation of the Craftsman Bungalow style through its massing, roof form, and characteristic design features.

The Ranch style milk parlor has a front milk house, rear milking parlor separated by a breezeway, and an open holding area. The milk house incorporates some Ranch style elements such as a hip-and-gable roof, a moderate eave overhang with boxed eaves, and a stucco façade with wood-siding below the gable end. Its fenestration consists of metal multi-lite windows and vinyl windows. South of the milk house, the milking parlor features a flat roof oriented along a north-south axis. Ventilation elements include metal vertical louvered shutters set between concrete walls. Further south, the holding area is open and enclosed behind concrete walls. Additional features include industrial glass doors at the main entryway and a circular driveway in front of the milk parlor.

- The Craftsman Bungalow is eligible under CRHR and City of Ontario criteria 3/d within the "Craftsman Bungalow Style, 1900s–1930s" context with a period of significance of pre-1935.
- The Ranch style milk parlor is not individually eligible nor a contributor to any broader eligibility of the property.

*8485 Edison Ave and 14350 Walker Ave*

This property includes two (2) parcels that total 36.95 acres located on the southwest corner of Ontario Ranch Road and Walker Avenue. It includes two (2) Ranch style dwellings and milk parlor. One (1) Ranch style residence and the milk parlor were constructed between 1959 and 1966, while the second residence was added between 1966 and 1968. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The older Ranch style residence is a one-story structure with an asymmetrical façade and a horizontal, rambling floorplan atop a concrete foundation. Its exterior is clad in tan-painted stucco with a stone veneer along the lower span of the main (north) elevation. The low-pitched hip-and-gable roof is topped with composition shingles and features a moderate eave overhang, boxed eaves, a stone chimney on the rear roof slope, and a cupola. Below the gable end is white horizontal wood siding and a scalloped fascia board. The fenestration consists of vinyl sliding sash units that replaced the original wood-framed windows, some of which featured a diamond pattern. One (1) of the original window openings to the left

of the main entryway was substantially altered and replaced with a smaller window unit. The main elevation includes a stone planter, box bays accented by white horizontal wood siding, a decorative wood spindle column, and a recessed main entryway. On the west elevation, a partially open breezeway connects the dwelling to a two-car garage with white paneled overhead doors. To the west is the Ranch style milk parlor, which has a front milk house and rear milking parlor separated by a breezeway. The milk house incorporates Ranch style elements such as a hip-and-gable roof, a moderate eave overhang with boxed eaves, and a stucco façade. Its fenestration consists of metal multi-lite fixed and casement windows. The breezeway, located between the two (2) sections on the east and west elevations, features two (2) metal barn-style sliding doors. South of the milk house, the milking parlor features a gabled roof oriented along a north-south axis and steel beams. Ventilation elements include metal vertical louvered shutters set on top concrete walls. Additional features include two (2) metal doors at the main entryway and a circular driveway in front of the milk parlor.

The second Ranch style residence has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The exterior is clad in stucco with a stone veneer on the main (east) elevation. The moderately-pitched hipped roof is topped with composition shingles and has a moderate eave overhang, boxed eaves, and a stone chimney on the rear roof slope. The fenestration consists of aluminum windows. An enclosed breezeway is located on the north elevation and connects the dwelling to a two-car garage.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

*14049 Grove Ave*

This property includes two (2) parcels that total 9.04 acres located on the northeast corner of Grove Avenue and Ontario Ranch Road. It includes a Ranch style dwelling with a garage, milk parlor, and ancillary structures constructed between 1959 and 1966. It was historically associated with dairy operations and retains that association today. Historical aerials indicate the built environment has remained the same since that time period.

The Ranch style residence has rectilinear, two-story floorplan with a flat roof and a moderate eave overhang. The exterior is clad in white stucco and includes vinyl sliding sash windows. The main entryway is sheltered by a portico supported by decorative wood spindle columns. Additional features include an attached one-car garage with a paneled overhead door and a deck enclosed by a decorative metal railing above the garage.

A utilitarian milk parlor is located east of the residence and has a front milk house and side milking parlor separated by a breezeway. The milk house features a concrete façade with a bubbled textured section, industrial glass doors, large, fixed windows, and a flat roof. The breezeway, located between the two (2) sections on the east and west elevations, is enclosed by metal barn-style sliding doors. North of the milk house, the milking parlor has a flat roof oriented along a north-south axis. Ventilation elements include

metal vertical louvered shutters set between concrete walls. Additional features include a curved driveway in front of the milk parlor.

- Though associated with several themes and contexts identified within the 2025 historic context, the property as a whole, as well as the individual buildings, do not possess documented significance in relation to the themes and contexts.
- Though the property retains integrity of location, setting, feeling, design, materials, and workmanship, it lacks integrity of association.
- The property is not eligible under any criteria for the CRHR or City of Ontario.

**FINDINGS**

A total of 12 cultural resources were identified in the Project area during the efforts conducted for this study. The resources consist entirely of historic-period dairy farms with associated milk parlors, residential buildings, and/or ancillary structures. As a result of evaluations of potential eligibility for listing in the CRHR and/or designation as City of Ontario Historic Landmark, a total of four (4) resources were identified as eligible for listing or listed:

1. 7587-7697 Edison Ave – eligible for listing, significant historic structures in the Project area
2. 8185 Edison Ave (previously identified as 14117 Grove Ave) – previously determined by the City's Historic Preservation Subcommittee as meeting local landmark designation and Tier II criterion; also meets criteria for listing in the CRHR and is a historical resource under CEQA
3. 8335-8381 Edison Ave – eligible for listing, significant historic structures in the Project area
4. 13715-13751 Grove Avenue, 13817-13819 Grove Avenue, 8270-8292 Edison Avenue – eligible for listing, but no significant historic structures in the Project area

As 13715-13751 Grove Avenue, 13817-13819 Grove Avenue, 8270-8292 Edison Avenue does not contain any buildings or structures within the Project area that are considered eligible/contributors to the eligibility of the site, there is no potential to impact the resource. As such, for the purposes of this study, only three (3) resources (7587-7697 Edison Ave, 8185 Edison Ave, and 8335-8381 Edison Ave) will be considered historical resources identified within the Project area. An overview of the evaluation results is included in **Table 6** and **Figure 11** below, with eligible sites that require further consideration highlighted.

| Table 6: Summary of Resource Evaluations | |
|---|---|
| **Addresses/Name** | **Evaluation Summary** |
| 7587-7697 Edison Ave | The property as a whole is eligible under CRHR criterion 1 and local designation a. Individually, the Craftsman Bungalow and Ranch style residences are each eligible under CRHR criterion 3 and local designation d. The Ranch style milk parlor is not individually eligible but remains a contributor to the eligibility of the whole property. |
| 14213-14297, 14333-14353, 14450, and 14451 Bon View Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |
| 7914 Edison Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |
| 13715-13751 Grove Ave, 13817-13819 Grove Ave, 8270-8292 Edison Ave | Only the Ranch Style properties that are outside of the Project area are eligible under CRHR criterion 3 and local designation d. The Minimal Traditional residences within the Project area are not eligible under any criteria for the CRHR or City of Ontario. |
| 8040 Schaefer Ave and 14050 Grove Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |
| 8061 Edison Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |
| 7721-7891 Edison Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |
| 8185 Edison Ave | The Ranch Style residence and Streamline Moderne milk parlor are each eligible under CRHR criterion 3 and local designation d. The Minimal Traditional dwelling is not eligible. The City's Historic Preservation Subcommittee determined the property (identified as 14117 Grove Ave) met local landmark designation and Tier II criteria in November 2014. |
| 8311 Edison Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |
| 8335-8381 Edison Ave | The Craftsman Bungalow style residence is eligible under CRHR criterion 3 and local designation d. The Ranch style milk parlor is not eligible. |
| 8485 Edison Ave and 14350 Walker Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |
| 14049 Grove Ave | The property is not eligible under any criteria for the CRHR or City of Ontario. |

Figure 11: Cultural Resources Map

**Historic Resources Tiering**

As a result of eligibility evaluations, three (3) of the identified resources (7587-7697 Edison Ave, 8185 Edison Ave, and 8335-8381 Edison Ave) are recommended eligible for listing the CRHR and designation as a City of Ontario Historic Landmark, and are considered historical resources under CEQA with the potential to be impacted by the Project. One (1) of these properties, 8185 Edison Ave (previously identified as 14117 Grove Ave) was determined by the City's Historic Preservation Subcommittee to meet local landmark designation and Tier II criteria in November 2014. However, the remaining two (2) properties (7587-7697 Edison Ave and 8335-8381 Edison Ave) have not yet been subject to this review. As such, while the City's Historic Preservation Committee (or a specified subcommittee) maintains authority to make tiering determinations for resources, this report includes a brief discussion related to potential tiers for each of the two (2) remaining resources to provide preliminary insights into potential mitigation fee requirements for each resource and to later support the City's review:

- 7587-7697 Edison Ave – Under the criteria for Local Historic Landmarks, the property seems to meet tiering criteria 1 and 2 under the Architecture/Form section and criteria 4, 5, and 6 under the History section. It is also recommended eligible for listing in the California Register. As such, it is likely that this resource meets criteria within the tiering system as a Tier II property.
- 8335-8381 Edison Ave – Under the criteria for Local Historic Landmarks, the property seems to meet tiering criterion 1 under the Architecture/Form section. It is also recommended eligible for listing in the California Register. As such, it is likely that this resource meets criteria within the tiering system as a Tier II property.

Upon closer review of the Tiering system, it appears that Tiers II and III share a minimum threshold, in that any eligible historic property could be considered a Tier II or III resource. However, given the resources noted above meet additional criteria beyond just the fact that they are eligible resources, and given a property (8185 Edison Ave, formerly identified as 14117 Grove Ave) within the same area was already provided a Tier II determination, it is likely that each of the above-noted properties will be determined Tier II resources as opposed to Tier III.

**RECOMMENDATIONS**

Mitigation is recommended to reduce impacts to the three (3) eligible resources. Such mitigation often includes educational components, such as the requisite Historic American Building Survey (HABS), a documentary, and comparative studies, as well as physical preservation efforts, such as investigating relocation feasibility. For these resources, a HABS level 3 is recommended. However, both a documentary of the Ontario Ranch area and a comparative study of the area with other dairy farming areas in California were recently prepared as a result of mitigation adopted in the City for a nearby project. As such, those actions are not recommended to be included in mitigation for the current Project. Additionally, while it is common to include the preparation of a relocation feasibility study as a mitigation measure, a study for the properties has already been completed (**Appendix D**). The study concluded the following with respect to the three (3) eligible resources:

1. The milk parlor at 7587-7697 Edison Ave can be feasibly relocated in part. Relocation is limited to the front portion of the building, and it may require repairs. It is not feasible to relocate the back portion of the building without disassembling the structure.
2. The milk parlor at 8185 Edison Ave can be feasibly relocated in part. Relocation is limited to the front portion of the building. It is not feasible to relocate the back portion of the building.
3. The Craftsman Bungalow at 8335-8381 Edison Ave can be feasibly relocated in its entirety, excluding crawl space framings and foundations.

As such, it is recommended to include some level of mitigation related to relocating one or more of the structures/portions of structures that have been identified as feasible for relocation. While a series of mitigation measures will support the reduction of impacts to these resources, it is anticipated that mitigation will not reduce impacts to the resources to a less than significant level due to the unique circumstances related to the significance of each resource and the resource type. Measures for consideration are included below as **MM CUL-1** through **MM CUL-6**.

In addition to the identified historical resources, the Project area has a high sensitivity for historic archaeological resources that could be inadvertently discovered and/or impacted during Project implementation. Conversely, the sensitivity for buried prehistoric archaeological resources within the Project area is relatively low as a result of prior extensive disturbance across the Project area. However, the archaeological sensitivity for prehistoric resources in this area may have once been moderate to high due to the Holocene-age sediments underlying the Project area. As such, it is recommended that mitigation measures that outline the process for inadvertent discoveries be incorporated for the proposed Project. Measures for consideration are included below as **MM CUL-7** through **MM CUL-9**. With these mitigation measures in place, impacts to archaeological resources as a result of the proposed Project would be reduced to less than significant.

**MM CUL-1:** The applicant shall obtain a building permit prior to any demolition, relocation, or construction.

**MM CUL-2:** Prior to issuance of a building permit for demolition of any historical resources, at the same time or separately, a HABS (level 3) documentation, including but not limited to as built drawing, historical narrative, and Historic American Building Survey (HABS) photographs of the three (3) historical resources subject properties, shall be submitted to the Planning Department for review, approval, and subsequent release to the Ovitt Family Community Library, Model Colony History Room. Digital files and 2 printed copies are required (one archival and one non-archival).

**MM CUL-3:** Prior to issuance of a demolition building permit, a relocation plan for at least one (1) property identified as feasible for relocation shall be submitted to the City. The plan shall include location options identified by the City, as well as a relocation schedule and any protective measures to ensure minimal impact to the resource during relocation efforts. Every effort shall be made to facilitate the relocation. The buildings shall be offered at no cost for those who can

relocate off-site. Advertisements notifying the public of the opportunity to relocate the building shall be placed for a minimum of 30 days: on-site with temporary signage, in at least three local publications (newspapers, magazines, local organization newsletters), and on local bulletin boards.

**MM CUL-4:** A mitigation fee pursuant to Section 7.01.030 of the Ontario Development Code shall be paid to the Planning Department prior to issuance of building permit for demolition of any of the identified historical resources for which relocation was determined by the City to be infeasible. Mitigation fee is equal to 30% of the price per square foot construction cost as established in the most current International Code Council Building Valuation Data. The fee amount will be provided by the Planning Department at the time of payment. Funds will be deposited into the City's Historic Preservation Trust Fund.

**MM CUL-5:** Prior to issuance of a building permit for demolition of any of the three (3) historical resources, a determination shall be made by the Planning Department whether items within or on the historic properties should be salvaged. The applicant shall be responsible for the removal, relocation, and donation of such items selected for salvaging. An inventory of salvaged items shall be provided by the applicant to the Planning Department prior to the issuance of building permit.

**MM CUL-6:** Should 8185 Edison Ave be subject to demolition, and prior to issuance of a building permit for demolition of the resource, which is listed in the City's Historic Resources Inventory, the applicant shall apply for a Certificate of Appropriateness and approval of a Demolition approval by the Historic Preservation Subcommittee prior to demolition pursuant to the Ontario Development Code, Section 4.02.050. A Certificate of Appropriateness shall not be issued for the demolition of the resource, either in whole or in part, until such time that a demolition permit application and a replacement structure has been approved by the City, and appropriate permits have been issued for its construction.

**MM CUL-7:** Prior to the issuance of any grading permits for the Project area, a Cultural Awareness Training Program shall be provided to all construction managers and construction personnel prior to commencing any ground disturbance work within the Project area. The training shall be prepared and conducted by a Qualified Archaeologist to the satisfaction of the City Planning Department. The training may be discontinued when ground disturbance is completed. Construction personnel shall not be permitted to operate equipment within the construction area unless they have attended the training. A copy of the training transcript and/or training video, as well as a list of the names of all personnel who attended the training and copies of the signed acknowledgment forms shall be submitted to the City Planning Department for their review and approval.

**MM CUL-8:** Should any cultural resources be discovered during Project implementation, the City Planning Department and a Qualified Archaeologist shall be notified to assess the nature and significance of the find. Should any cultural resources be deemed significant, the Qualified

Archaeologist shall draft a treatment plan for review and approval by the City Planning Department. Tribes listed on the City's contact list for the Project shall be notified of any significance discovery that is Native American in origin and be given the opportunity to comment on the treatment plan prior to implementation. All final site records, reports, etc. associated with the discovery, evaluation, and treatment of cultural resources discovered during Project implementation shall be submitted to the South-Central Coastal Information Center (SCCIC).

**MM CUL-9:** If human remains are encountered during the undertaking, California State Health and Safety Code Section 7050.5 states that excavation shall stop and no further disturbance shall occur within 100 feet of the discovery until the County Coroner has made a determination of origin and disposition of the remains pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), who will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery within 48 hours of notification. If the NAHC is unable to identify an MLD, the MLD fails to make a recommendation, or the landowner or his/her authorized representative rejects the recommendation, the human remains and associated items will be interred on the property with appropriate dignity in a location that will not be subject to future disturbance.

**Re: Ontario Center Park SP Project, San Bernardino County**

To whom it may concern:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information submitted for the above referenced project. The results were positive. Please contact the tribes on the attached list for information. Please note that tribes do not always record their sacred sites in the SLF, nor are they required to do so. A SLF search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with a project's geographic area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites, such as the appropriate regional California Historical Research Information System (CHRIS) archaeological Information Center for the presence of recorded archaeological sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. Please contact all of those listed; if they cannot supply information, they may recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: murphy.donahue@nahc.ca.gov

Sincerely,

Murphy Donahue

***P3a. Description:** The evaluated property consists of four parcels (APN: 105318101, 105318102, 105331101, and 105331102), historically addressed as 13839-13905 Bon View Avenue. The surrounding area is characterized by open space and agricultural land with historical ties to dairy operations. Encompassing 37.38 acres, the property is located northeast corner of Bon View and Edison Avenues. The property includes a one-story Neo-eclectic residence (13839 Bon View Ave), a Ranch style milk parlor (13905 Bon View Avenue), and several ancillary pole structures. Landscaping and hardscaping are minimal consisting of concrete driveways, and some scattered trees and shrubbery. The property continues to function as a dairy farm. **For a more detailed property description, please refer to the Continuation Sheet.**

**B1. Historic Name:** Bon View Farms
**B2. Common Name:** 13839-13905 Bon View Avenue
**B3. Original Use:** Dairy Farm **B4. Present Use:** Dairy Farm
***B5. Architectural Style:** Ranch Style

***B6. Construction History:** This property consists of four parcels under common ownership. No historic-era building permits were found on file for the property at the City of Ontario. Year-built data and property characteristics were obtained from the San Bernardino County Assessor's Property Management Information System and supplemented by aerial imagery from 1935, 1938, 1939, 1946, 1948, 1952, 1959, 1966, and subsequent years. Aerial imagery indicates that the property was initially developed between 1968 and 1975 with the construction of a Ranch style milk parlor and Neo-eclectic single-family residence. Subsequent aerial imagery suggests that the configuration of the remaining buildings has remained unchanged. **See Continuation Sheet for ownership/occupancy information.**

The 13839-13905 Bon View Avenue property was improved between 1968 and 1975. In 1999, the area was annexed into the City of Ontario as part of the New Model Colony, which was formed from a portion of the former Chino Agricultural Preserve. The property is associated with the historical context of Postwar, Large-Capacity Dairies, 1945-1980, but it does not possess documented significance in relation to the theme. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
Constructed between 1966 and 1975, the 13839-13905 Bon View Avenue property is located on parcel 105318101 and consist of a one-and-a-half story residence constructed in the Neo-eclectic style and a Ranch style milk parlor. The dwelling has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The dwelling features a brick and stucco exterior, brick chimney, a high-pitched cross-gabled roof topped with composition shingles, vinyl multi-lite windows, and arched decorative false columns around the windows on the main (west) elevation. The building is mostly obscured from the public right-of-way.

South of the residence is the Ranch style milk parlor, constructed between 1966 and 1975. The structure is divided into two sections: the front milk house and the rear milking parlor, separated by a breezeway. The milk house is modest in design, incorporating Ranch style elements such as a front gable roof, tan stucco façade, a carport on the main elevation supported by brick columns, aluminum sliding sash windows, and a partial brick veneer on the lower span of the building. The breezeway, located between the two sections on the north and south elevations, is obscured from the public right-of-way. East of the breezeway, the milking parlor features a gable roof oriented along an east-west axis. Ventilation features include louvered vertical shutters on the north and west elevations. Additional features include large metal doors with small openings at the bottom of the main north entryway and a circular driveway in front of the milk parlor.

View east of 13839-13905 Bon View Avenue SFR (IMG_8685; October 21, 2024).

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**
In 1983, the property was owned by Bernard Te Velde and known as Bon View Farms.

**B10. Statement of Significance from Page 2:**
For lack of significant association with the theme, the subject property has not been found eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a as the property has not in and of itself been directly associated with significant events or patterns of events in dairy farming in local, regional, state, or national history, nor does it exemplify or reflect special elements of the City's history; not eligible under NRHP / CRHR / City of Ontario Criterion B / 2 / b. as it has not been identified as having an association with an important person, family, or ethnic group significant in the local dairy farming industry; not eligible under NRHP / CRHR / City of Ontario Criterion C / 3 / c-f as none of the buildings at the property, nor the property as a whole, embodies the distinctive characteristics of a type, period, or method of construction and has not been identified as being the work of a master or an important and creative individual; not eligible under City of Ontario Criterion g and h as the property does not in and of itself offer a unique location, a singular physical characteristic, or an established and familiar visual feature within the city of Ontario or the Ontario New Model Colony / Ontario Ranch community, nor is it in and of itself one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen; and not eligible under NRHP / CRHR / City of Ontario Criterion D / 4 / as further study of the 13839-13905 Bon View Avenue would not appear to yield information which could be considered important in local, regional, state, or national history.

Although the 13839-13905 Bon View Avenue property has been found not significant and ineligible and is no longer active, it maintains integrity of location, setting, design, materials, workmanship, feeling, and association as an active and in-use dairy farming property.

***P3a. Description:** The evaluated property consists of three parcels (APN: 105337101, 105337102, and 105353101), historically addressed as 7587-7697 Edison Avenue. Covering 46.58 acres, the property is situated south of Edison Avenue, between Sultana and Bon View Avenues. The surrounding area remains largely open space and agricultural land. The property includes a Craftsman Bungalow style dwelling and detached garage, a Ranch style milk parlor, a Ranch style dwelling, and several ancillary structures/features associated with dairy operations (silos, troughs, feeding gates, sheds, pole structures, etc.). The buildings are located on parcel 105337101. Landscaping and hardscaping are minimal, consisting of some trees and shrubs around the dwellings and milk parlor, as well as a paved driveway. The property is partially enclosed behind a metal fence. The property was historically associated with dairy operations and retains that association today. **For a more detailed property description, please refer to the Continuation Sheet.**

**B2. Common Name:** 7587-7697 Edison Avenue
**B3. Original Use:** Dairy Farm **B4. Present Use:** Dairy Farm
***B5. Architectural Style:** Ranch Style/Craftsman Bungalow Style

***B6. Construction History:** This property consists of three parcels under common ownership. No historic-era building permits were located in the City of Ontario's records for the site. Construction dates and building characteristics were therefore established using data from the San Bernardino County Assessor's Property Management Information System and reviewed in conjunction with aerial imagery from 1935, 1938, 1939, 1946, 1948, 1952, 1959, 1966, and later years. Aerial imagery indicates that the 7587–7697 Edison Avenue property was first developed prior to 1935 with the construction of a Craftsman Bungalow style dwelling. At the time, a large portion of the parcel appears to have been used as farmland, likely for dairy-related purposes. Between 1959 and 1966, a Ranch style dwelling and a Ranch style milk parlor were added to the property. Subsequent aerials suggest that the overall configuration of the built environment has remained largely unchanged since that period. **See Continuation Sheet for ownership/occupancy information.**

***B7. Moved?** ☒ **No** ☐ **Yes** ☐ **Unknown** **Date:** N/A **Original Location:** N/A
***B8. Related Features:** None Identified **B9a.** Architect: Not Identified **b.** Builder: Not Identified
***B10. Significance: Theme:** Postwar, Large-Capacity Dairies, 1945-1980; Craftsman Bungalow Style, 1900s-1930s, Ranch Style, 1950–1970s **Area:** San Bernardino County **Period of Significance:** Pre-1935-1966
**Property Type:** Postwar, Large-Capacity Dairy/Craftsman Bungalow Style/Ranch Style
**Applicable Criteria:** NRHP/CRHR/Local A and C/1 and 3/a and d

The 7587–7697 Edison Avenue property was initially developed prior to 1935 with the existing Craftsman Bungalow. Between 1959 and 1966, the existing Ranch style milk parlor and Ranch style dwelling were constructed reflecting an expansion of operations. The property and its environs was designated as part of the San Bernardino County Agricultural Preserve in 1967 and later annexed into the City of Ontario in 1999 as part of the New Model Colony, which encompassed portions of the former agricultural preserve. The 7587-7697 Edison Avenue property is eligible as a whole for listing under NRHP, CRHR, and City of Ontario criteria A/1/a for its significant association with the theme Postwar, Large-Capacity Dairies, 1945–1980. Additionally, the two dwellings are also individually significant and eligible. The pre-1935 Craftsman Bungalow is individually eligible under criteria C/3/d within the context Craftsman Bungalow Style, 1900s–1930s, with a period of significance of ca. 1920s to the 1930s (pending identification of original construction date). The Ranch style dwelling is individually eligible under the context Ranch Style, 1950–1970s, with a period of significance of ca. 1959 to 1966 representing its original construction campaign. The ca. 1959-1966 Ranch style milk parlor is not individually significant, however, it remains a significant contributing element of the property as a significant Postwar Large Capacity Dairy complex. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**

Improved prior to 1935 with later developments between 1959 and 1966, the property includes a Craftsman Bungalow style dwelling and detached garage, a Ranch style milk parlor, a Ranch style dwelling, and several ancillary structures/features associated with dairy operations (silos, troughs, feeding gates, sheds, pole structures, etc.).

Towards the northeast corner of parcel 105337101 is the Craftsman Bungalow dwelling, listed as 7697 Edison Avenue. Constructed before 1935, the house faces Edison Avenue and features an asymmetrical façade with a one-and-a-half-story irregular floor plan. The exterior is clad in tan stucco with red trim on the windows and doors. The high-pitched, side-gabled roof is covered in composition shingles and includes a wide eave overhang, open eaves, decorative wood brackets below the gable end, and exposed rafter ends. A stucco chimney rises from the front roof slope. The fenestration consists of wood-framed, one-over-one, double-hung and fixed windows with red-painted lintels and sills. The main (north) elevation features a full-width front porch beneath the main roofline, supported by tapered wood/concrete beams, as well as a gabled dormer centered on the roof slope.

At the rear (south) elevation, a two-story addition was appended to the southwest corner between 1975 and 1979. This addition has a gabled roof, aluminum sliding sash windows, and a tan stucco façade. It is largely obscured from the public right-of-way and remains subordinate, secondary, and easily distinguishable from the original structure. The addition is compatible with the dwelling's historic character, in accordance with the Secretary of the Interior's Standards for the Treatment of Historic Properties. It did not result in the removal of original character-defining features. East of the dwelling is a detached one-car garage with a rectangular floorplan, tan stucco facade, and gabled roof.

Centered on the north side of the parcel, fronting Edison Avenue, is the Ranch style milk parlor. Constructed between 1959 and 1966, the building features a horizontal floor plan with two milking parlor wing sections, extending from the front milk house section, separated by a breezeway. The front section exhibits Ranch style characteristics, including a hip-and-gable roof with wood shake shingles, stucco walls, metal fixed and casement windows, and a stone veneer. The breezeway, located between the front and rear wing sections, has metal doors on both the east and west elevations. South of the breezeway, the milking parlor sections have low sloped gable roofs oriented along an east-west axis. Ventilation is provided by horizontal louvered metal shutters on the north and south elevations, positioned between concrete walls. Additional features include a metal door at the main (north) entryway, a circular driveway, and a bulk tank in front. Two silos are located at the rear.

West of the milk parlor is the Ranch style dwelling, listed as 7587 Edison Avenue. Constructed between 1959 and 1966, the dwelling has an asymmetrical façade and a one-story horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with a stone veneer on the main (north) elevation. The moderately pitched hip-and-gable roof is topped with composition shingles and has a moderate eave overhang, boxed eaves, a cupola above the breezeway, and a stone chimney on the rear roof slope. The fenestration consists of a mix of aluminum fixed and sliding sash windows and vinyl units. The primary elevation features a recessed entryway below the main roofline with two double half-lite wood doors, a small concrete stoop, a stone planter, and box bay windows accented by red horizontal wood siding. A wide, open breezeway on the east elevation connects the three-car garage to the dwelling.

Ancillary pole structures, storage sheds, feeding gates and other features are located throughout the property.

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**
Over the years, the residences have undergone minor alterations. A two-story addition was appended to the rear (southwest corner) of the Craftsman Bungalow between 1975 and 1979. The addition features a gabled roof, aluminum sliding sash windows, and a tan stucco exterior. It remains subordinate to the original structure, is largely obscured from public view, and is easily distinguishable from the original section. The addition is compatible with the dwelling's historic character and complies with the Secretary of the Interior's Standards for the Treatment of Historic Properties, as it did not result in the removal of original character-defining features. East of the dwelling is a detached one-car garage with a rectangular floorplan, gabled roof, and tan stucco façade.

Some original windows on the main elevation of the Ranch style dwelling have been replaced with vinyl units set within the original openings. Despite these alterations, the dwelling retains most of the seven aspects of integrity and continues to convey its original Ranch style design. It remains one of the better-preserved and more representative examples of the Ranch architectural style in the area.

**Ownership/Occupancy**

**7587 Edison Ave**
Between the mid-1920s and 1931, the property was owned by Paul Brockmeier. Born in 1894 in Freeport, Illinois, Brockmeier was a salesman, dairyman, and farmer who operated a business known as Brockmeier Brothers. In 1925, the Brockmeier Brothers won the highest yielding dairy cow award in the San Bernardino County Testing Association competition held at Chaffey High School. In January 1929, the Daily Report noted that oat and alfalfa hay were for sale at the property. In 1931, the property was sold to an unidentified buyer.

Between 1955 and 1959, Mr. and Mrs. Albert Alluis Jr. acquired and resided at the property. Born in 1908, Mr. Alluis was the son of a French immigrant who arrived in the United States in the early 1900s and worked as a dairyman in Arcadia, California. On the property, he cultivated potatoes.

In 1976, the property was owned by Ernest De Groot and his son, Chuck De Groot, and operated as Twin Palms Dairy. Born in 1910, Ernest De Groot was a native of Norman County, Minnesota, and the son of Dutch immigrants who arrived in the United States in the late 1800s. In the 1930s, his family relocated to Downey, California, in the Los Angeles Basin, where they worked in the dairy industry. By the mid-to-late 1960s, De Groot moved to the Chino Valley/Ontario region, where he later acquired the property.

In 1986, the property was part of a public dairy open house hosted by the Dairy Committee. According to the Chino Champion, the dairy housed nearly 600 cows and grew approximately one-quarter of its own feed on farmland elsewhere in the Chino Valley. Between 1970 and 1977, the De Groot cows ranked among the top-producing dairy cows in the region.

Ernest De Groot passed away in 2003 at the age of 92, and the property remained under the De Groot family trust. By 2008, it was listed as the Paul Huizenga Dairy, still under the De Groot family's ownership.

**7697 Edison Ave**
Between 1959 and 1962, the Craftsman Bungalow style dwelling was occupied by Mr. and Mrs. Homer Gibson. In 1965, the dwelling was occupied Mr. and Mrs. Pirie Grant. Between 1977 and 1982, Mr. and Mrs. Charles De Groot occupied the dwelling.

# Local dairies show how they do it

By Matthew Erlich, Staff Writer

Hundreds of Chino area residents got a taste of the dairy life, literally drinking down its pleasures when the Twin Palms and Costa View dairies hosted open houses June 7. The event was geared to kick off June as Dairy Month.

Highlight of the event was the milk drinking competition which saw children and adults race to finish small cartons and bottles of milk.

At the Twin Palms Dairy, 7587 Edison Ave, people on hand saw Jim Staal hoof trim cows. Mr Staal was demonstrating something he knows well, trimming between 8,000-10,000 head per year.

Mr Staal uses a custom-built truck that lifts cows and holds them in place for the trimming.

The dairy is owned by Mr and Mrs Ernest De Groot, Mr and Mrs Charles De Groot, and Mr and Mrs Paul Huizenga. The family operation milks 590 cows, and calves are raised on the site.

Ernest De Groot went broke once trying to start a dairy. His second effort in 1944 was more successful. He moved to Chino from Artesia in 1964.

At the Costa View Dairy, 14451 Bon View Ave, participants saw a calf with a fifth leg and glimpsed the computerized feeding process at the dairy.

Mr Costa has operated his dairy at Bon View Ave since 1970.

The milk drinking contest at the Twin Palms Dairy was hosted by Larry Bentley. Winners were:

**3-4 year olds;** Nicole Kleiman, Brian Hooper, Michelle Toledo, all of Chino.

**5-7 year olds;** Jennifer Galinbo of Ontario, Justin White, and Kenny Beattie, both of Chino.

**8-10 year olds;** Vincent Edwards-Ramirez of Ontario, Ernest De Groot and Luke Huizenga, both of Chino.

**11-14 year olds;** Shannon Mason, Nancy Garza and Jason Valencich, all of Chino.

**Adults;** Dennis Parker of Chino Hills, Dorita Valencich of Chino, and Mike Miller of the Chino Hills.

**HASTE MAKES WASTE — This young man is too busy to cry over spilt milk as he tries to get started during the milk drinking competition. Besides the milk they drank, winners received ribbons for their performance.**

Staff photo by Matthew Erlich

**ADULT WINNER — Dennis Parker, 34, of the Chino Hills (center) was the winner of the milk drinking contest for adults who were adorned with a bib and had to drink milk from a nipple. Miss Vitality Kim Stueve (left) and the 1986 Southern California Dairy Princess Sherrie Hoekstra (right) also were on hand for the event and led some dairy tours.**

Staff photo by Matthew Erlich

**THE CONVERSATION — Miss Chino Jane Carroll (right) talks with Mrs Ernest De Groot during the Dairy Open House. The chamber sponsored event was considered a success.**

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
The 7587-7697 Edison Avenue property is recommended significant and eligible as an excellent example of a postwar dairy under the historic context theme for Postwar, Large-Capacity Dairies, 1945–1980. It retains multiple contributing features and clearly conveys its historical association with large scale, industrial dairy production that emerged in the region in the postwar era. Contributing features include a Craftsman Bungalow constructed prior to 1935, a Ranch Style residence built between 1959 and 1966, a Ranch Style Milk Parlor with a circular drive, and a range of ancillary structures including but not limited to silos, stalls, pole barns, a detached garage, feeding gates, water features, and bulk tanks. Under the historic context for Postwar, Large-Capacity Dairies, eligible properties must retain integrity of location, design, setting, materials, workmanship, feeling, and association, and demonstrate a direct and significant association with the dairy industry during the postwar period. This property as a whole meets the eligibility criteria for NRHP Criterion A / CRHR Criterion 1 / City of Ontario Criterion a, as it clearly conveys its historical association with large scale dairy operations that emerged in the region in the postwar.

Individually, the Craftsman Bungalow, built before 1935, is also recommended eligible under NRHP Criterion C / CRHR Criterion 3 / City of Ontario Criterion d. It retains its original shape, scale, and design features such as exposed rafter tails, wood siding, and overhanging eaves. Although a two-story rear addition was built between 1975 and 1979, it is set back, secondary in scale, and does not compromise the building's architectural character. The house continues to convey the key qualities of the Craftsman Bungalow style.

The Ranch style residence, constructed between 1959 and 1966, is also recommended individually eligible under NRHP Criterion C / CRHR Criterion 3 / City of Ontario Criterion d, under the context of Ranch Style, 1950–1970s. The dwelling features a horizontal rambling floorplan, low-pitched roof, wide eaves, cupola, and an integrated attached garage via an open breezeway. Although some windows have been replaced with vinyl units within the original openings, the overall design, materials, and feeling remain intact. The dwelling retains the necessary aspects of integrity and clearly represents a postwar Ranch style residence in Ontario.

While the milk parlor was considered for individual eligibility, the building reflects the standard Ranch style form and layout associated with large-capacity dairy operations. The milk parlor does not exhibit distinctive design features or architectural detailing that would elevate it to individual significance. Its configuration, materials, and construction are typical of postwar dairy facilities and do not reflect a uniquely representative or distinguishing example of the style or type. Accordingly, the building is not recommended for individual eligibility.

***P3a. Description:** The evaluated property consists of six parcels (APN: 105335101, 105335102, 105354101, 105354102, 105357101, and 105357102), historically addressed as 14213-14297, 14333-14353, 14450, and 14451 Bon View Avenue. The surrounding area is characterized by open space and agricultural land with historical ties to dairy operations. Covering 56.47 acres, the property is situated east of Bon View Avenue, between Euclid and Eucalyptus Avenues. The property includes two Ranch style milk parlors, two Minimal Traditional residences, two Craftsman Bungalow residences, two Ranch style dwellings, and multiple geometrically spaced ancillary storage structures located to the rear of the buildings. Water retention ponds are located to the rear portion of the parcels. Landscaping and hardscaping are minimal, consisting of paved driveways and scattered trees and shrubs. Today, the parcels continue to operate as dairy farms. **For a more detailed property description, please refer to the Continuation Sheet.**

**B1. Historic Name:** Rocha Dairy/Dimas Costa Dairy/ Costa View Farms No. 3/ Costa View Dairy/ Costa View Farms No. 1/ H & R Dairy
**B2. Common Name:** 14213-14297, 14333-14353, 14450, 14451 Bon View Avenue
**B3. Original Use:** Dairy Farm **B4. Present Use:** Dairy Farm
***B5. Architectural Style:** Ranch Style/Minimal Traditional Style/Craftsman Bungalow Style

***B6. Construction History:** This property consists of six parcels under common ownership. No historic-era building permits were found on file for the property at the City of Ontario. Year-built data and property characteristics were obtained from the San Bernardino County Assessor's Property Management Information System, supplemented by aerial imagery from 1935, 1938, 1939, 1946, 1948, 1952, 1959, 1966, and subsequent years. Aerial imagery indicates that the parcels at 14213-14297 Bon View Avenue and 14333-14353 Bon View Avenue were first improved with the construction of Craftsman Bungalow-style dwellings. Between 1959 and 1966, a Ranch style milk parlor and two Minimal Traditional-style residences were constructed at 14213-14297 Bon View Avenue. Between 1968 and 1975, a Ranch style dwelling was added at 14333-14353 Bon View Avenue.

During the same period (1968–1975), a Ranch style milk parlor and a Ranch style dwelling were constructed at 14450 and 14451 Bon View Avenue. Over the years, the milk parlor at 14213-14297 Bon View Avenue underwent substantial alterations between 1966 and the 1990s. Additionally, the Craftsman Bungalow dwelling features an early rear addition, appended between 1938 and 1946, and both Craftsman Bungalow dwellings have since lost their original windows. Subsequent aerial imagery suggests that the configuration of the remaining buildings has remained unchanged. **See Continuation Sheet for ownership/occupancy information.**

***B7. Moved?** ☒ **No** ☐ **Yes** ☐ **Unknown** **Date:** N/A **Original Location:** N/A
***B8. Related Features:** None Identified **B9a.** Architect: Not Identified **b.** Builder: Not Identified
***B10. Significance: Theme:** Early Dairy Farms in Ontario, 1900s-1929; Depression-Era and Wartime Dairies, 1930s-1945; Postwar, Large-Capacity Dairies, 1945-1980; Historic Architectural Styles, 1880s-1980s **Area:** San Bernardino County
**Period of Significance:** N/A **Property Type:** N/A
**Applicable Criteria:** NRHP/CRHR/ Local ineligible

The property at 14213-14297, 14333-14353, 14450, 14451 Bon View Avenue was initially developed prior to 1935, with subsequent improvements/alterations made between the 1950s and 1990s. In 1999, the area was annexed into the City of Ontario as part of the New Model Colony, which was formed from a portion of the former Chino Agricultural Preserve. The property is associated with the historical contexts of Early Dairy Farms in Ontario, 1900s-1929; Depression-Era and Wartime Dairies, 1930s-1945; Postwar, Large-Capacity Dairies, 1945-1980; Historic Architectural Styles, 1880s-1980s; however, the property does not possess documented significance in relation to the themes. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
The 14213, 14333, 14450, and 14451 Bon View Avenue property spans multiple parcels fronting Bon View Avenue. Below is a description of each parcel and the buildings/structures located on them.

**14213-14297 Bon View Avenue (APN:105335101 and 105335102), pre-1935, 1959-1966**
Improved prior to 1935 with later developments between 1959 and 1966, the 14213-14297 Bon View Avenue property includes a Craftsman Bungalow style dwelling with a detached garage (14213 Bon View Ave), a Ranch style milk parlor (14239 Bon View Ave), two Minimal Traditional style residences (14283-14297 Bon View Ave), and several geometrically spaced pole structures to the rear.

To the far northwest corner of the parcel is a Craftsman Bungalow-style residence listed as 14213 Bon View Avenue. Constructed prior to 1935, the one-and-a-half-story dwelling has a compact rectilinear floorplan and an asymmetrical façade. The exterior is clad in tan-painted stucco with brown trim on the windows. The high-pitched, cross-gabled roof is topped with composition shingles and features a moderate eave overhang, support brackets below the gable, open eaves with exposed rafter ends, and a shed dormer on the main (west) elevation. The fenestration consists primarily of aluminum sliding sash windows and wood panel doors. The main elevation includes a full-length porch supported by two metal columns, a small stoop, and four concrete square columns approximately four feet in height. The rear (east) elevation features an early addition that was appended between 1938 and 1946. The addition features a stucco façade, gabled roof topped with composition shingles, open eaves with exposed rafter ends, and aluminum windows. The dwelling likely originally featured wood-framed, double-hung windows, as well as columns composed of a different material, which were removed or altered at an unidentified date.

A few feet east of the dwelling is one-car detached garage constructed between 1959 and 1966. The garage has a square floorplan, a gable roof, tan stucco façade, and a white overhead door.

Directly south of the Craftsman Bungalow dwelling is a Ranch style milk parlor listed as 14239 Bon View Avenue. Constructed between 1959 and 1966, the one-story structure has been substantially altered and now consists of three sections: the front milk house with an addition to the south elevation, the original rear milking parlor to the east of the milk house, now modified as a storage shed, and a new milking parlor section extending from the milk house addition. The milk house and milking parlor are separated by a breezeway, which features a metal sliding barn door with a handle on the south elevation. East of the breezeway, the building is divided into a milking area and a wider holding area. The milking area features louvered horizontal shutters on the south elevation, set atop concrete walls, while the north elevation is obscured by the original rear section. The rear section has a gabled roof oriented along an east-west axis. Additional elements include metal doors at the front, a dairy association sign below the gable, and a circular driveway in front of the milk parlor.

South of the milk house are two modest Minimal Traditional residences and a detached garage, historically addressed as 14283-14297 Bon View Avenue. Constructed between 1959 and 1966, the 14283 Bon View Avenue dwelling is situated north of the 14297 Bon View Avenue dwelling, with the detached garage positioned between them. Both residences feature asymmetrical façades and rectilinear floorplans atop concrete foundations. The 14283 Bon View Avenue dwelling has a tan stucco exterior, a hipped roof topped with composition shingles, moderate eave overhang, and boxed eaves. The main entryway is recessed, with a partial porch that includes a small stoop and decorative iron railing and columns. Fenestration consists of aluminum sliding sash windows and paneled doors. The 14297 Bon View Avenue dwelling features a tan stucco façade, a side-gabled roof with composition shingles, and an attached narrow garage with an overhead metal door. The main elevation includes a half-width porch supported by decorative metal columns and railing, a small stoop, aluminum sliding sash windows, and paneled doors.

The detached garage shares a similar appearance with the dwellings, featuring a tan stucco façade, a front-gabled roof, and a metal overhead door. East of the milk parlor and dwellings, several geometrically spaced pole structures are present, along with metal silos and ancillary storage buildings.

P3a. Continued from Page 1:
The 14213, 14333, 14450, and 14451 Bon View Avenue property spans multiple parcels fronting Bon View Avenue. Below is a description of each parcel and the buildings/structures located on them.

14213-14297 Bon View Avenue (APN:105335101 and 105335102), pre-1935, 1959-1966
Improved prior to 1935 with later developments between 1959 and 1966, the 14213-14297 Bon View Avenue property includes a Craftsman Bungalow style dwelling with a detached garage (14213 Bon View Ave), a Ranch style milk parlor (14239 Bon View Ave), two Minimal Traditional style residences (14283-14297 Bon View Ave), and several geometrically spaced pole structures to the rear.

To the far northwest corner of the parcel is a Craftsman Bungalow-style residence listed as 14213 Bon View Avenue. Constructed prior to 1935, the one-and-a-half-story dwelling has a compact rectilinear floorplan and an asymmetrical façade. The exterior is clad in tan-painted stucco with brown trim on the windows. The high-pitched, cross-gabled roof is topped with composition shingles and features a moderate eave overhang, support brackets below the gable, open eaves with exposed rafter ends, and a shed dormer on the main (west) elevation. The fenestration consists primarily of aluminum sliding sash windows and wood panel doors. The main elevation includes a full-length porch supported by two metal columns, a small stoop, and four concrete square columns approximately four feet in height. The rear (east) elevation features an early addition that was appended between 1938 and 1946. The addition features a stucco façade, gabled roof topped with composition shingles, open eaves with exposed rafter ends, and aluminum windows. The dwelling likely originally featured wood-framed, double-hung windows, as well as columns composed of a different material, which were removed or altered at an unidentified date.

A few feet east of the dwelling is one-car detached garage constructed between 1959 and 1966. The garage has a square floorplan, a gable roof, tan stucco façade, and a white overhead door.

Directly south of the Craftsman Bungalow dwelling is a Ranch style milk parlor listed as 14239 Bon View Avenue. Constructed between 1959 and 1966, the one-story structure has been substantially altered and now consists of three sections: the front milk house with an addition to the south elevation, the original rear milking parlor to the east of the milk house, now modified as a storage shed, and a new milking parlor section extending from the milk house addition. The milk house and milking parlor are separated by a breezeway, which features a metal sliding barn door with a handle on the south elevation. East of the breezeway, the building is divided into a milking area and a wider holding area. The milking area features louvered horizontal shutters on the south elevation, set atop concrete walls, while the north elevation is obscured by the original rear section. The rear section has a gabled roof oriented along an east-west axis. Additional elements include metal doors at the front, a dairy association sign below the gable, and a circular driveway in front of the milk parlor.

South of the milk house are two modest Minimal Traditional residences and a detached garage, historically addressed as 14283-14297 Bon View Avenue. Constructed between 1959 and 1966, the 14283 Bon View Avenue dwelling is situated north of the 14297 Bon View Avenue dwelling, with the detached garage positioned between them. Both residences feature asymmetrical façades and rectilinear floorplans atop concrete foundations. The 14283 Bon View Avenue dwelling has a tan stucco exterior, a hipped roof topped with composition shingles, moderate eave overhang, and boxed eaves. The main entryway is recessed, with a partial porch that includes a small stoop and decorative iron railing and columns. Fenestration consists of aluminum sliding sash windows and paneled doors. The 14297 Bon View Avenue dwelling features a tan stucco façade, a side-gabled roof with composition shingles, and an attached narrow garage with an overhead metal door. The main elevation includes a half-width porch supported by decorative metal columns and railing, a small stoop, aluminum sliding sash windows, and paneled doors.

The detached garage shares a similar appearance with the dwellings, featuring a tan stucco façade, a front-gabled roof, and a metal overhead door. East of the milk parlor and dwellings, several geometrically spaced pole structures are present, along with metal silos and ancillary storage buildings.

## Primary Record Information Continued:

**14333-14353 Bon View Avenue (APN:105354102), pre-1935, 1968-1975**
Improved prior to 1935, with later developments between 1968 and 1975, the property includes a Craftsman Bungalow-style dwelling at 14353 Bon View Avenue, a Ranch style dwelling at 14343 Bon View Avenue, a detached garage, and four ancillary pole structures situated to the rear.

To the far southwest corner of the parcel is a Craftsman Bungalow-style dwelling, historically addressed as 14343 Bon View Avenue. Constructed prior to 1935, the dwelling features a rectangular footprint and an asymmetrical façade. The exterior is clad in tan-painted stucco. The high-pitched, side-gabled roof is topped with composition shingles and includes a minimal eave overhang, boxed eaves, and two gabled dormers on the north and south elevations. The fenestration primarily consists of aluminum sliding sash windows. An addition, constructed between 1959 and 1966, extends from the east elevation. The dwelling exhibits minimal decorative detailing throughout.

A few feet north of the dwelling is a one-car garage, which features a front-gabled roof and a metal overhead door.

To the far northwest corner of the parcel is the Ranch style dwelling at 14353 Bon View Avenue. Constructed between 1968 and 1975, the dwelling features an asymmetrical, horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in tan-painted stucco with brown window trim. The low-pitched hipped roof is topped with terracotta tiles and features a minimal eave overhang with boxed eaves. The fenestration is mostly obscured from the public right-of-way but appears to consist of fixed multi-lite or single-pane picture windows. A detached one-car garage is situated south of the dwelling, featuring a tan stucco façade, a hipped roof with terracotta tiles, and a metal overhead door. Additional features include a stone planter and a circular driveway in front of the residence.

East of the dwellings, four pole structures are present.

**14450 Bon View Avenue (APN:105354101),1968-1975**
Improved between 1968 and 1975, the parcel includes a Ranch style milk parlor and several ancillary structures associated with dairy operations. The one-story milk parlor consists of two sections: the front milk house and the rear milking parlor, separated by a breezeway. The milk house features modest Ranch style elements, including a hip-and-gable roof with wood shake shingles, a stucco façade with stone accents along the corners of the main (west) elevation, and metal casement windows on the north elevation. The fenestration throughout has since been boarded up. The breezeway, located between the two sections on the north and south elevations, is obscured from the public right-of-way.
East of the breezeway, the building is divided into a milking area and a wider holding area. The milking area features louvered horizontal shutters on the north and south elevations, set atop concrete walls. The holding area, which extends outward beyond the milking area, is partially open and supported by concrete walls and metal poles. Both sections have gabled roofs oriented along an east-west axis. Additional features include two glass industrial doors at the front, a circular driveway in front of the milk parlor, and a dairy association sign.

Several geometrically spaced pole structures are located around the milk parlor, along with metal silos and ancillary storage buildings.

**14451 Bon View Avenue (APN:105357101 and 105357102),1968-1975**
Improved between 1968 and 1975, the 14451 Bon View Avenue property includes a Ranch style dwelling with an attached garage and several geometrically spaced pole structures to the rear. The dwelling is located on parcel 105357101, while parcel 105357102 to the south remains mostly undeveloped. The dwelling has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with a brick veneer and a planter on the main (west) elevation. The low-pitched hipped roof is topped with composition shingles, featuring a moderate eave overhang, boxed eaves, and a stone chimney on the rear roof slope.
The main elevation showcases a recessed entryway beneath the roofline, with two decorative wood-paneled doors and box bays accented by horizontal wood siding. The fenestration throughout consists primarily of vinyl sliding sash windows. At the far northern end is a one-car attached garage with a white paneled overhead door.

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**

**14213 Bon View Ave**
In 1957, the 14213 Bon View Avenue property was advertised for rent by local newspapers as a 19 acre ranch with water and soil good for sweet potatoes. In 1962, Frank Bernard lived at the property. In 1970, Mr. and Mrs. Dennis M. Coelho lived at the property. In 1973, Mr. and Mrs. Elcidio Rocha lived at the property. In 1982, the dwelling was part of a dairy known as the Jose Rocha Dairy. In 1987, the property appears to have been under the ownership of the Rocha and Coelho family. In 1989, the dwelling was part of the Costa View Farms No. 3 Dairy.

**14297 Bon View Ave**
In 1969, the milk parlor was listed as part of the Rocha family dairy.

**14283 Bon View Ave**
No Results.

**14297 Bon View Ave**
Between the 1960s and 1970s, the dwelling is listed as part of the Rocha Dairy.

## Building, Structure, Object Information Continued:

**14333 Bon View Ave**
Between 1957-1963, the dwelling was occupied by Gene Souza family. In 1966, the property was occupied by Manuel Costa Cordoza Sr., of the Azores. In 1971, Mr. and Mrs. Antonio R. Cota occupied the dwelling.

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
For lack of significant association with the themes, the subject property has not been found eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a as the property has not in and of itself been directly associated with significant events or patterns of events in dairy farming in local, regional, state, or national history, nor does it exemplify or reflect special elements of the City's history; not eligible under NRHP / CRHR / City of Ontario Criterion B / 2 / b. as it has not been identified as having an association with an important person, family, or ethnic group significant in the local dairy farming industry; not eligible under NRHP / CRHR / City of Ontario Criterion C / 3 / c-f as none of the buildings at the property, nor the property as a whole, embodies the distinctive characteristics of a type, period, or method of construction and has not been identified as being the work of a master or an important and creative individual; not eligible under City of Ontario Criterion g and h as the property does not in and of itself offer a unique location, a singular physical characteristic, or an established and familiar visual feature within the city of Ontario or the Ontario New Model Colony / Ontario Ranch community, nor is it in and of itself one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen; and not eligible under NRHP / CRHR / City of Ontario Criterion D / 4 / as further study of the 14213-14297, 14333-14353 , 14450, 14451 Bon View Avenue would not appear to yield information which could be considered important in local, regional, state, or national history.

Although the 14213-14297, 14333-14353 , 14450, 14451 Bon View Avenue property has been found not significant and ineligible, while it maintains integrity of location, setting, feeling, and association as an active and in-use dairy farming property, some of the buildings have lost integrity of design, materials, and workmanship due to modifications.

***P3a. Description:** The evaluated property consists of four parcels (APN: 105317101, 105332102, 105332103, and 105317106), historically addressed as 7914 Edison Avenue. Located in an area characterized by open space and agricultural land with historical ties to dairy operations, the property spans 18.79 acres. It is situated north of Edison Avenue, between Bon View and Grove Avenues. The property includes two Ranch style single-family residences and a Streamline Modern milk parlor. The property is mostly obscured from the public right-of-way and enclosed by a chain-link fence with privacy fabric. The buildings are located on parcel 105332102, while the remaining parcels are undeveloped. Originally the property was owned by Earl Abram Musser, son of Charles Sumner Musser, founder of the Shady Grove Dairy. Dairy operations have ceased at the property. **For a more detailed property description, please refer to the Continuation Sheet.**

**B2. Common Name:** 7914 Edison Avenue
**B3. Original Use:** Dairy Farm **B4. Present Use:** Single-Family Residence
***B5. Architectural Style:** Ranch Style/Streamline Moderne Style

***B6. Construction History:** This property consists of four parcels under common ownership. No historic-era building permits were found in the City of Ontario's records. Year-built data and property characteristics were obtained from the San Bernardino County Assessor's Property Management Information System and supplemented by aerial imagery from 1935, 1938, 1939, 1946, 1948, 1952, 1959, 1966, and subsequent years. Aerial imagery indicates that initial development occurred between 1952 and 1959 with the construction of the existing Ranch style residence and Streamline Moderne milk parlor. Between 1966 and 1980, a second Ranch style residence was added. Aside from the addition of an attached garage to the first dwelling, aerial imagery suggests that the configuration of the existing buildings has remained largely unchanged. **See Continuation Sheet for ownership/occupancy information.**

The property at 7914 Edison Avenue was initially developed between 1952 and 1959. In 1999, the area was annexed into the City of Ontario as part of the New Model Colony, which was formed from a portion of the former San Bernardino County Agricultural Preserve. The property is associated with the historical contexts of Postwar, Large-Capacity Dairies, 1945-1980 and Historic Architectural Styles, 1880s-1980s, but it does not possess documented significance in relation to the themes. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**

Improved between 1952 and 1959 with later developments between 1966 and 1980, the 7914 Edison Avenue property includes two Ranch style residences and a Streamline Moderne milk parlor. The property is obscured behind a fence. Based on Google Street View images and aerial imagery, the dwelling features an asymmetrical façade and an irregular floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with brick and wood shiplap veneer on the main elevation. The low-pitched hipped roof is topped with composition shingles, has a moderate eave overhang, boxed eaves, and a brick chimney along the roof slope at the rear (north) elevation. The fenestration consists of metal casement windows and sliding sash windows. The main elevation features a partial-width porch beneath a shed roof supported by decorative metal beams, a small stoop, and additional decorative metal details. To the west side of the dwelling is a one-car garage addition, installed by the 1980s, with a brown paneled overhead door.

Directly west of the residence is the Streamline Moderne milk parlor. Constructed between 1952 and 1959, the structure retains only the front milk house section, as the rear milking parlor section was demolished by April 2022. The milk house exhibits distinctive Streamline Moderne characteristics, including smooth stucco walls, a flat roof, curvilinear corners, a central vertical projection, and glass block windows, some of which are diamond-shaped. Originally, the milk house featured a white painted stucco exterior, but by 2022, it had been repainted tan. The original metal casement windows on the west and east elevations were replaced with incompatible vinyl single-hung windows. While the milk parlor may have been eligible as a distinctive example of the Streamline Moderne style, it no longer retains sufficient integrity to convey its significance.

To the far southwest corner of the parcel is the second Ranch style residence, constructed between 1966 and 1980. The residence has an asymmetrical façade and a mostly rectilinear floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with a partial brick veneer on the main (south) elevation. The low-pitched hipped roof features a moderate eave overhang and boxed eaves. The fenestration primarily consists of vinyl sliding sash windows, which were installed in 2022, replacing the original aluminum units. The main (south) elevation features a recessed main entryway with decorative double wood-paneled doors, a small stoop, a decorative metal beam beneath the roofline and entryway, and an attached garage on the west side with an overhead door.

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**

During the 1970s, Henry Donkers and his wife lived at the subject property.

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
For lack of significant association with the themes, the subject property has not been found eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a as the property has not in and of itself been directly associated with significant events or patterns of events in dairy farming in local, regional, state, or national history, nor does it exemplify or reflect special elements of the City's history; not eligible under NRHP / CRHR / City of Ontario Criterion B / 2 / b. as it has not been identified as having an association with an important person, family, or ethnic group significant in the local dairy farming industry; not eligible under NRHP / CRHR / City of Ontario Criterion C / 3 / c-f as none of the buildings at the property, nor the property as a whole, embodies the distinctive characteristics of a type, period, or method of construction and has not been identified as being the work of a master or an important and creative individual; not eligible under City of Ontario Criterion g and h as the property does not in and of itself offer a unique location, a singular physical characteristic, or an established and familiar visual feature within the city of Ontario or the Ontario New Model Colony / Ontario Ranch community, nor is it in and of itself one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen; and not eligible under NRHP / CRHR / City of Ontario Criterion D / 4 / as further study of the 7914 Edison Avenue would not appear to yield information which could be considered important in local, regional, state, or national history.

The 7914 Edison Avenue property has been found not significant and ineligible. While the milk parlor may have once been eligible as a distinctive example of the Streamline Moderne style and retains integrity of location and setting, it no longer possesses sufficient integrity of design, materials, workmanship, feeling, or association as an active dairy farming property or a site historically connected to dairy operations.

***P3a. Description:** The evaluated property consists of five parcels (APN: 021631103, 021631104, 021631105, 021631108, and 021631109), historically addressed as 13715-13751 Grove Avenue, 13817-13819 Grove Avenue, and 8270-8292 Edison Avenue. Covering 46.80 acres, the property is located on the east side of Grove Avenue and extends between Schaefer and Edison Avenues. The surrounding area remains largely open space and agricultural land, historically associated with dairy farming. The property includes a Ranch style dwelling and milk parlor with Dutch style characteristics located at 13715–13751 Grove Avenue on parcel 021631105, as well as a second Ranch style dwelling and milk parlor with Dutch style characteristics at 13817–13819 Grove Avenue on parcel 021631104, with some ancillary structures. It also includes two Minimal Traditional style dwellings at 8270–8292 Edison Avenue on parcel 021631109. Water retention ponds are present on parcels 021631103 and 021631109. Although historically associated with dairy operations, the property no longer functions as an active dairy. **For a more detailed property description, please refer to the Continuation Sheet.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**

Improved between 1948 and 1952, with later developments occurring between 1959 and 1966, the property includes two Ranch style milk parlors with associated residences, two Minimal Traditional style dwellings, and several ancillary structures historically associated with dairy operations, including some ancillary structures associated with former dairy operations. The majority of the ancillary structures and features have been demolished. A description of each parcel and its associated buildings is provided below.

**13715-13751 Grove Avenue (APN: 021631105), 1959-1966**

Located on the northeast corner of Grove and Schaefer Avenues, 13715–13751 Grove Avenue includes a Ranch style residence and milk parlor situated on parcel 021631105. The dwelling is located in the northwest corner of the parcel and features an asymmetrical façade with a one-story horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in yellow painted stucco with horizontal wood siding on a portion of the main (west) elevation, accented by white trim around the windows and doors. The low-pitched cross-gabled roof is covered with composition shingles and features a moderate eave overhang, open eaves with exposed rafter tails, and decorative scalloped barge board at the gable ends. The fenestration visible from the public right-of-way consists of wood single-hung windows and a wood half-lite diamond patterned door. The main (west) elevation exhibits Northern European or Dutch influences, such as the diamond-patterned door, scalloped barge board, wood spindle porch supports, and a square cupola. The attached two-car garage is connected to the residence by a breezeway on the south elevation. Additional features include a stone planter and concrete steps at the main entryway.

South of the residence is the Ranch style milk parlor. The building has a horizontal floorplan and is divided into two sections: the front milk house and a rear milking parlor, separated by an open breezeway. The front section reflects Ranch style characteristics, featuring a front-gabled roof with wood shake shingles, yellow painted stucco walls, and metal casement and fixed windows. An open breezeway separates this front section from the rear portion of the building. South of the breezeway, the milking parlor has a gable roof oriented along a north-south axis, topped with corrugated sheet metal. Ventilation is provided by horizontal louvered metal shutters on the east and west elevations, positioned above concrete walls and along the gable ridge. Additional features include a circular driveway, metal doors at the main entryway, and a stone planter. The main (west) elevation of the front section also displays Northern European or Dutch influences, such as diamond-patterned fixed windows and a gabled shed roof above the main entryway supported by curved knee brackets.

The dwelling and milk parlor are strong examples of Ranch style architecture with Northern European or Dutch influences, having undergone minimal alterations. While the property is associated with the postwar, large-capacity dairy theme, several key ancillary structures and features related to former dairy operations are no longer extant. As a result, the property no longer represents a strong example of a postwar, large-capacity dairy. However, the buildings appear individually eligible under the Ranch style theme.

**13817-13819 Grove Avenue (APN: 021631104), 1959-1966**

Located east of Grove Avenue, 13817-13819 Grove Avenue includes a Ranch style residence and milk parlor situated on parcel 021631104. The dwelling is located in the northwest corner of the parcel and features an asymmetrical façade with a one-story horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in beige painted stucco with tan horizontal wood siding on a portion of the main (west) elevation, accented by white trim around the windows and doors. The low-pitched cross-gabled roof is covered with composition shingles and features a moderate eave overhang, boxed eaves, horizontal wood siding below the gable, and decorative scalloped barge board at the gable ends. The fenestration visible from the public right-of-way consists of wood single-hung windows, some with decorative shutters, and a wood half-lite diamond patterned door. The main (west) elevation exhibits Northern European or Dutch influences, such as the diamond-patterned half-lite door and windows, scalloped barge board, box bay accented with wood-siding, and a square cupola. The attached three-car garage is connected to the residence by a breezeway on the south elevation. Additional features include a stone planter, a stone chimney on the rear elevation, and concrete steps at the main entryway.

South of the residence is the Ranch style milk parlor. The building is divided into two sections: the front milk house and a rear milking parlor, separated by an open breezeway. The front section reflects Ranch style characteristics, featuring a hip-and-gable roof with wood shake shingles, beige painted stucco walls, and metal casement and fixed windows. A breezeway, located between the two sections on the north and south elevations, is partially hidden from the public right-of-way. East of the breezeway, the

## Primary Record Information Continued:

milking parlor features a gable roof oriented along an east-west axis, topped with corrugated sheet metal. Ventilation is provided by horizontal louvered metal shutters on the east and west elevations, positioned above concrete walls and along the gable ridge. Additional features include a circular driveway, metal doors at the main entryway, and a stone planter. The main (west) elevation of the front section also displays Northern European or Dutch influences, such as diamond-patterned windows, decorative wood spindles below the roofline, and scalloped barge board at the gable end.

The dwelling and milk parlor are good examples of the Ranch style with Northern European or Dutch influences and minimal alterations. The However, several of the ancillary structures and features associated with former dairy operations are no longer extant. As a result, the property does not represent a strong example of a postwar, scientific, large-capacity dairy.

**8270-8292 Edison Avenue (APN: 021631109), 1948-1952**

Located north of Edison Avenue, 8270-8292 Edison Avenue includes two Minimal Traditional style dwellings situated on parcel 021631109. Both dwellings were constructed between 1948 and 1952 and features an asymmetrical compact floorplan with minimal decorative details. The 8270 Edison Avenue dwelling is located west of 8292 Edison Avenue. The dwelling has a square floorplan with a hipped roof topped with composition shingles. The exterior is stucco painted white. All the windows and doors have since been boarded up with plywood.

The 8292 Edison Avenue dwelling features a rectilinear floorplan and a white stucco exterior with red trim around the windows and doors. The hipped roof is also topped with composition shingles and includes a moderate eave overhang. Fenestration consists of a combination of aluminum single-hung windows and wood double-hung windows, along with a flush wood entry door. Both dwellings are modest in appearance and do not exhibit distinctive characteristics of the Minimal Traditional style.

**8270-8292 Edison Avenue (APN: 021631109), 1948-1952**
Between the 1960s and 2021, the property was under the Dick Hofstra family's ownership.

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
The two Ranch style residences and associated milk parlors, constructed between 1959 and 1966, are individually significant under NRHP, CRHR, and City of Ontario Criterion C/3/d as strong examples of the Ranch style with Northern European or Dutch stylistic influences. Their low-pitched roofs, stucco cladding, decorative scalloped barge board, diamond-patterned doors and windows, cupolas, and stone planters reflect design characteristics in-vogue in the postwar period. The buildings remain largely intact and retain integrity of location, design, materials, workmanship, and feeling. Accordingly, the property is eligible under NRHP, CRHR, and City of Ontario Local Register under C/3/d under the Ranch Style theme.

The property as a whole may have been eligible under NRHP, CRHR, and City of Ontario Criterion A/1/a for its association with the Postwar, Large-Capacity Dairies theme; however, it no longer retains sufficient integrity to convey its significance. As originally developed, the property embodied the postwar dairy type, with two milk parlors, multiple residences, and expansive acreage under single ownership. By 2018, most of the ancillary structures and features historically associated with the dairy, including corrals, barns, silos, pole structures, and feeding areas, had been removed. As a result, the property no longer retains the integrity necessary to convey significance under this theme.

Individually, the two Minimal Traditional style dwellings constructed between 1948 and 1952 are not eligible. They are modest, utilitarian examples of the style that lack distinctive detailing or architectural character and therefore do not rise to the threshold of individual significance.

Under the established context, an eligible property must retain integrity of location, setting, materials, design, feeling, workmanship, and association aspects of integrity to convey significance. The Ranch style milk parlors and residences retains necessary integrity to convey significance including location, setting, feeling, design, materials, workmanship, and association. Accordingly, the property is eligible under NRHP / CRHR / City of Ontario Criterion C/3/d, as it embodies the distinctive characteristics of the Ranch style, qualifying as a historical resource under Section 15064.5 of the CEQA Guidelines.

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
Improved between 1952 and 1959, the property includes two Ranch style dwellings, a Ranch style milk parlor, several ancillary structures, and water retention ponds. Below is a description of the buildings/structures and parcels.

**7595 Schaefer Avenue, 1952-1959 (APN: 105311104)**
Located on the northern end of parcel 105311104, the Ranch style dwelling at 7595 Schaefer Avenue faces Schaefer Avenue. The residence features an asymmetrical façade and a horizontal, irregular floor plan atop a concrete foundation. Its exterior is clad in yellow painted stucco. The low-pitched cross-gabled roof is covered with composition shingles and includes a moderate eave overhang with open eaves and exposed rafter ends. Fenestration consists of vinyl fixed and sliding sash windows. The main elevation features a combination of stucco and horizontal wood siding, along with a recessed main entryway situated beneath an extended roof girder, supported by a carved wood spindle. An attached garage is located on the west elevation and is clad in both stucco and board-and-batten siding.

**13752 Bon View Avenue, 1952-1959 (APN: 105312101, 105312102)**
Situated on the northwest side of parcels 105312101 and 105312102, the Ranch style milk parlor and residence at 13752 Bon View Avenue face Bon View Avenue. Constructed between 1952 and 1959, the milk parlor has a horizontal layout with two wings and consists of three sections: the front milk house, the rear milking parlor, and two holding areas at the wings. The front section incorporates Ranch style elements, including a cross-gable roof topped with wood shake shingles, a moderate eave overhang, wood siding with decorative brackets below the gable end, a stone planter, diamond-patterned casement windows, and a stucco façade. To the rear of the front section, the milking parlor and holding areas feature a gabled roof oriented along a north-south axis, with concrete walls. Additional features include industrial glass doors, silos, and a circular driveway in front of the milk parlor.

North of the milk parlor, a small rectilinear structure features a gabled roof clad in corrugated sheet metal, concrete walls, and horizontal louvered shutters set between the concrete walls.

South of the milk parlor is a Ranch style residence designed with similar architectural elements. The dwelling features an asymmetrical façade and a horizontal, rambling floorplan atop a concrete foundation. Its exterior is clad in yellow painted stucco. The low-pitched cross-gabled roof is topped with tiles and includes a moderate eave overhang, open eaves, a stone chimney on the rear roof slope, and exposed rafter ends. The main elevation showcases horizontal wood siding along the lower span of the building, a partial stone veneer, and aluminum diamond-patterned casement and fixed windows of various sizes. Additional features include a box bay accented with wood siding, a recessed entryway beneath an extended roof girder supported by a decorative wood spindle, and a wood half-lite door with a diamond pattern. An attached garage is located on the north elevation, featuring board-and-batten siding, diamond-patterned casement windows with wood shutters, and a cupola on the roof ridge.

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**
**7595 Schaefer Ave and 13752 Bon View Avenue (APN: 105311104, 105312101, 105312102)**
In the 1950s and 1960s, the dairy was owned by Albert J. Shaw Dairy and listed as the Driftwood Dairy Farm. By 1971, ownership had transferred to Mr. and Mrs. Pete Vander Poel, and the property was renamed the Vander Poel Bros Dairy. By 1980, it became known as the Nederend Dairy under the ownership of Hans Nederend.

The remaining parcels appear to have been acquired under the Nederend family's ownership.

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
For lack of significant association with the themes, the subject property has not been found eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a as the property has not in and of itself been directly associated with significant events or patterns of events in dairy farming in local, regional, state, or national history, nor does it exemplify or reflect special elements of the City's history; not eligible under NRHP / CRHR / City of Ontario Criterion B / 2 / b as it has not been identified as having an association with an important person, family, or ethnic group significant in the local dairy farming industry; not eligible under NRHP / CRHR / City of Ontario Criterion C / 3 / c-f as none of the buildings at the property, nor the property as a whole, embodies the distinctive characteristics of a type, period, or method of construction and has not been identified as being the work of a master or an important and creative individual; not eligible under City of Ontario Criterion g and h as the property does not in and of itself offer a unique location, a singular physical characteristic, or an established and familiar visual feature within the city of Ontario or the Ontario New Model Colony / Ontario Ranch community, nor is it in and of itself one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen; and not eligible under NRHP / CRHR / City of Ontario Criterion D / 4 / as further study of the 7595 Schaefer Avenue, 13752 Bon View Avenue would not appear to yield information which could be considered important in local, regional, state, or national history.

Although the 7595 Schaefer Avenue, 13752 Bon View Avenue property has been found not significant and ineligible, it maintains integrity of location, setting, design, materials, workmanship, feeling, and association as an active and in-use dairy farming property.

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
Improved prior to 1935, with later developments between 1938 and 1946 and 1966 and 1968, the property includes a Minimal Traditional dwelling (8040 Schaefer Avenue), two Ranch style dwelling and a Ranch style milk parlor (14050 Grove Avenue), and several ancillary structures. Below is a description of the buildings/structures and parcels.

**8040 Schaefer Avenue, pre-1935**
Constructed prior to 1935, the dwelling at 8040 Schaefer Avenue is a modest Minimal Traditional residence facing Schaefer Avenue. It features an asymmetrical façade and a rectilinear floorplan. The exterior is clad in tan-painted stucco. The low-pitched gabled roof is topped with composition shingles and has a moderate eave overhang. The primary (south) elevation includes a recessed entryway beneath the roofline, a small stoop, and a shed roof over a bay window accented with a brick veneer. The fenestration visible from the public right-of-way consists of aluminum windows.

A detached garage is situated east of the dwelling toward the rear of the property. Several shed structures are also present nearby, associated with the property's current goat operations.

**14050 Grove Avenue, 1938-1946, 1966-1968**
The Ranch-style milk parlor and two residences at 14050 Grove Avenue front Grove Avenue and are partially obscured by dense tree cover. Constructed between 1938 and 1946, the milk parlor is centered between the two dwellings. The milk parlor consists of two sections: the front milk house and the rear milking parlor, separated by a breezeway. The milk house has a modest design with some Ranch-style elements, including a cross-gable roof with wood shake shingles and a stucco façade. The fenestration and breezeway are not visible from the public right-of-way. West of the front section, the milking parlor features a gable roof oriented along an east-west axis, clad in corrugated sheet metal. Ventilation is provided by horizontal louvered metal shutters on the north and south elevations, positioned above concrete walls, along with a vent system along the gable ridge. There is no curved driveway in front of the milk parlor.

South of the milk parlor is a Ranch-style dwelling, which is largely obscured from view. Constructed between 1966 and 1968, the dwelling has an asymmetrical façade and an irregular floorplan atop a concrete foundation. Its exterior is clad in tan painted stucco. The moderately pitched hipped roof is topped with composition shingles and features minimal eave overhang and boxed eaves. The recessed main entryway includes a red paneled door, and box bay windows are visible on the primary (east) elevation. A detached garage is located north of the dwelling.

North of the milk parlor is the second Ranch style dwelling. Constructed between 1966 and 1968, dwelling has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The dwelling has a similar appearance to the first residence and features a stucco façade, a bay window, hipped roof topped with composition shingles, and a recessed main entryway.

To the rear of the buildings are some pole structures associated with former dairy operations.

View west of 14050 Grove Avenue milk parlor (IMG_8742; October 21, 2024).

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
For lack of significant association with the themes, the subject property has not been found eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a as the property has not in and of itself been directly associated with significant events or patterns of events in dairy farming in local, regional, state, or national history, nor does it exemplify or reflect special elements of the City's history; not eligible under NRHP / CRHR / City of Ontario Criterion B / 2 / b as it has not been identified as having an association with an important person, family, or ethnic group significant in the local dairy farming industry; not eligible under NRHP / CRHR / City of Ontario Criterion C / 3 / c-f as none of the buildings at the property, nor the property as a whole, embodies the distinctive characteristics of a type, period, or method of construction and has not been identified as being the work of a master or an important and creative individual; not eligible under City of Ontario Criterion g and h as the property does not in and of itself offer a unique location, a singular physical characteristic, or an established and familiar visual feature within the city of Ontario or the Ontario New Model Colony / Ontario Ranch community, nor is it in and of itself one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen; and not eligible under NRHP / CRHR / City of Ontario Criterion D / 4 / as further study of the 8040 Schaefer Avenue, 14050 Grove Avenue would not appear to yield information which could be considered important in local, regional, state, or national history.

Although the 8040 Schaefer Avenue, 14050 Grove Avenue has been found not significant and ineligible for historical designation, it generally retains all aspects of integrity in location, setting, design, materials, workmanship, and feeling. However, the property lacks integrity of association, as it no longer functions as a property associated with the dairy industry.

**B2. Common Name:** 8061 Edison Avenue
**B3. Original Use:** Dairy Farm **B4. Present Use:** Dairy Farm
***B5. Architectural Style:** Ranch Style

***B6. Construction History:** This property consists of six parcels under common ownership (APN: 105333101, 105333102, 105333103, 105333104, 105334101, and 105334102). No historic-era building permits were found on file with the City of Ontario. Year-built data and property characteristics were obtained from the San Bernardino County Assessor's Property Management Information System, supplemented by aerial imagery from 1946, 1948, 1952, 1959, 1968, and subsequent years. Available aerial imagery indicates that the 8061 Edison Avenue was initially developed between 1938 and 1946 with the construction of a milk parlor (no longer extant). Between 1966 and 1968, the original milk parlor was demolished and replaced with the existing milk parlor and single-family residence. Subsequent aerial imagery suggests that the overall configuration of the existing buildings has remained unchanged. **See Continuation Sheet for ownership/occupancy information.**

**Applicable Criteria:** NRHP/CRHR/ Local ineligible

The property at 8061 Edison Avenue was developed between 1966 and 1968. In 1999, the area was annexed into the City of Ontario as part of the New Model Colony, which was formed from a portion of the former San Bernardino County Agricultural Preserve. The property is associated with the historical contexts of Postwar, Large-Capacity Dairies, 1945-1980 and Historic Architectural Styles, 1880s-1980s, but it does not possess documented significance in relation to the themes. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
Constructed between 1966 and 1968, the Ranch style milk parlor and residence are located towards the north end of the parcel fronting Edison Avenue. The dwelling is a one-story residence with an asymmetrical façade and a horizontal, rambling floorplan atop a concrete foundation. The exterior is clad in tan painted stucco with brown trim on the windows and doors. The moderately pitched hipped roof is topped with composition shingles and has a moderate eave overhang, and boxed eaves. The fenestration visible from the public right-of-way consists of vinyl multi-lite sliding sash and single-hung windows and wood paneled doors. The main elevation has a bay window and a stone planter. An attached one-car garage is located on the west elevation and features a white paneled overhead door.

West of the dwelling is the Ranch style milk parlor. The structure is divided into two sections: the front milk house and the rear milking parlor, separated by a breezeway. The milk house is modest in design, incorporating Ranch-style elements such as a hip-and-gable roof with composition shingles, a moderate eave overhang with boxed eaves, and a stucco façade. The fenestration consists of metal multi-lite fixed windows and metal casement windows, and industrial metal glass door. The breezeway, situated between the two sections on the east and west elevations, is obscured from the public right-of-way. South of the breezeway, the milking parlor features a gable roof oriented along a north-south axis, topped with corrugated sheet metal. Ventilation is provided by horizontal louvered metal shutters on the east and west elevations, positioned above concrete walls, along with a vent system along the gable ridge. Additional features include a circular driveway in front of the milk parlor.

To the rear of the buildings are several geometrically spaced ancillary pole structures and storage sheds associated with dairy operations.

View south of 8061 Edison Ave Ranch style SFR (IMG_8737; October 21, 2024).

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**
In the 1960s and 1970s, the property was owned by Mr. and Mrs. Jack Tuls and operated as Jack Tuls & Sons Dairy. By 1979, it was acquired by the Jorritsma family and listed as Jorritsma & Company.

**B10. Statement of Significance from Page 2:**
For lack of significant association with the themes, the subject property has not been found eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a as the property has not in and of itself been directly associated with significant events or patterns of events in dairy farming in local, regional, state, or national history, nor does it exemplify or reflect special elements of the City's history; not eligible under NRHP / CRHR / City of Ontario Criterion B / 2 / b as it has not been identified as having an association with an important person, family, or ethnic group significant in the local dairy farming industry; not eligible under NRHP / CRHR / City of Ontario Criterion C / 3 / c-f as none of the buildings at the property, nor the property as a whole, embodies the distinctive characteristics of a type, period, or method of construction and has not been identified as being the work of a master or an important and creative individual; not eligible under City of Ontario Criterion g and h as the property does not in and of itself offer a unique location, a singular physical characteristic, or an established and familiar visual feature within the city of Ontario or the Ontario New Model Colony / Ontario Ranch community, nor is it in and of itself one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen; and not eligible under NRHP / CRHR / City of Ontario Criterion D / 4 / as further study of the 78061 Edison Avenue would not appear to yield information which could be considered important in local, regional, state, or national history.

Although the 8061 Edison Avenue property has been found not significant and ineligible, it maintains integrity of location, setting, design, materials, workmanship, feeling, and association as an active and in-use dairy farming property.

***B10. Significance: Theme:** Early Dairy Farms in Ontario, 1900s-1929; Depression-Era and Wartime Dairies, 1930s-1945; Postwar, Large-Capacity Dairies, 1945-1980; Historic Architectural Styles, 1880s-1980s; Art Deco, 1920-1960s
**Area:** San Bernardino County **Period of Significance:** N/A **Property Type:** N/A
**Applicable Criteria:** NRHP/CRHR/ Local ineligible

The 7721-7891 Edison Avenue property was initially improved prior to 1935, with later developments between 1938 and 1946 and 1959 and 1966. In 1999, the area was annexed into the City as part of the New Model Colony, formed from a portion of the former San Bernardino County Agricultural Preserve. The 7721-7891 Edison Avenue property is significant under NRHP / NRHP / CRHR / City of Ontario C/3/c-f under the context of Early Dairy Farms in Ontario, 1900s-1929; Depression-Era and Wartime Dairies, 1930s-1945; Postwar, Large-Capacity Dairies, 1940-1970s; Art Deco Style, 1920-1960s, with a period of significance of pre-1935 through 1966, representing original construction through completion of the final residential building.

Under the established context, an eligible property must retain most aspects of integrity to convey significance. This property does not retain the necessary integrity to convey significance. It has been altered and the Art Deco style milk parlor is missing key features associated with the property type. Accordingly, the property is not eligible under NRHP / CRHR / City of Ontario Criterion C/3/c-f and does not qualify as an historical resource pursuant to Section 15064.5 of the CEQA Guidelines.

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
The property includes a Craftsman Bungalow style residence, Art Deco style milk parlor, Ranch style residences, manufactured trailer offices, and ancillary structures/features associated with dairy operations. Below is a description of the buildings and parcels.

**7721 Edison Avenue (APN: 105336101), pre-1935, 1935-1946**
Constructed prior to 1935, with later developments between 1935 and 1946, the parcel includes a Craftsman Bungalow style dwelling, an Art Deco style milk parlor, ancillary structures and features associated with former dairy operations, and manufactured trailer offices. The parcel is partially enclosed behind a concrete masonry unit wall.

The Craftsman Bungalow style residence is located at the northwest corner of the parcel, fronting Edison Avenue. This one-and-a-half story dwelling features a symmetrical façade and a mostly square floor plan. The exterior is clad in tan-painted stucco with blue trim on the windows and doors. The high-pitched, side-gabled roof is topped with composition shingles and has a wide eave overhang with wood brackets beneath the gable. The fenestration visible from the public right-of-way consists of vinyl single-hung windows and fixed wood windows. The main (north) elevation includes a centered gabled dormer with four vinyl single-hung windows, an enclosed full-width porch, a centered main entryway with a wood-paneled door and metal security door, and concrete steps.

Directly south of the dwelling stands the Art Deco-style milk parlor, constructed between 1935 and 1946. Only the front milk house section remains, as the rear milking parlor was demolished in 2017. This remaining section retains some Art Deco characteristics, including smooth stucco walls, a flat roof, a symmetrical boxy form, and glass block windows.

East of the dwelling are two storage sheds with gabled roofs. To the rear of the milk parlor are two manufactured office trailers installed after 2017.

Prior to 2017, the parcel contained several pole structures, large metal silos, cattle feeding gates, and corrals located behind the dwelling. While the property may have once exemplified a Depression-era and Wartime dairy operation, it no longer retains sufficient integrity to convey its historical significance.

**7891 Edison Avenue (APN: 105336103), 1959-1966**
Constructed between 1959 and 1966, the Ranch style residence at 7891 Edison Avenue faces Edison Avenue. The one-story dwelling features an asymmetrical façade and an irregular floorplan atop a concrete foundation. Its exterior is clad in yellow board-and-batten siding, with a partial stone veneer on the main (north) elevation. The low-pitched cross-gabled roof, covered with composition shingles, has a moderate eave overhang, boxed eaves, and a chimney on the rear roof slope.

The fenestration visible from the public right-of-way consists of vinyl sliding sash windows. The main elevation includes a recessed entryway with a single paneled door, a concrete stoop, a stone planter, and an attached one-car garage with a paneled overhead door. Compared to other Ranch style residences in the area, the dwelling is smaller in size and exhibits modest characteristics of the style.

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**
**7721 Edison Ave (APN: 105336101)**
In the 1920s, the property was originally owned by Thomas H. Settles, a farmer from Virginia. He retained ownership until 1925, when he relocated to Upland. From the early 1950s to 2017, the property was owned by the Bootsma family, who had moved to the area from Artesia in the Los Angeles Basin during the 1940s.

The family patriarch, Jim Bootsma, immigrated to the United States from Holland and was a member of the California Milk Producers Council. Together with his wife, Tryntje, he had six sons Garret, Symon, Jim Jr., Will, Ike, and John Bootsma and three daughters, Agnes, Nell, and Vicky. In 1979, Jim Bootsma passed away at the age of 76, and the property was passed on to his immediate family.

**7891 Edison Ave (APN: 105336103)**
In 1967, Mr. and Mrs. Symon Bootsma lived at the subject residence.

CHINO CHAMPION
DAIRY FESTIVAL EDITION

Thursday, June 4, 1959
Section 3, page 15

# As the Seed is Planted . .

Both Bootsma boys are vocational agriculture students at Chino high school. Paul Wade, agricultural instructor at the school instructs boys here in the agriculture room, located in the shop building at the high school. —Champion photo

Symon Bootsma works with his milking heifer, part of his Future Farmer project work and a start toward a herd of his own. Boys such as Symon learn not only proper livestock husbandry in vocational agriculture, but are furthered in a science the principles of which they learn by doing on their home ranches. —Champion photo

Milk is one of the world's oldest known foods.

What's a good farm? A good farm boy. And good farm boys are what the Future Farmers are attempting to mould.

Sometimes — in fact most of the time—the FFA leaders have only to direct, for the boy comes to his high school vocational agriculture teachers with a background in farming well moulded by the last remaining industry which is family based in this specialized world of ours.

Such a family is the Bootsma family, 7721 Edison avenue. The 11 member Bootsma family, with Patriarch Jim at their head, run a dairy there, shipping to Arden Creamery.

The family milks some 100 plus head of cows, raise all their own replacements.

This year two of the Bootsma boys, Jim and Symon were in the upper grades at Chino high school. Another, Wilbur, just entered the Chino high school.

The Bootsma boys walked off with their share of the awards at the FFA banquet Thursday night too. The boys raise beef show animals, favoring Angus, and raise milk cows and calves as well.

Symon graduates this year while Jim, Jr., takes over as president of the local FFA chapter next year.

Active in the FFA, the boys rise at 2:30 a.m., to milk before going off to school. Then they leave early again to get home for milking chores.

This year, Jim was vice president and Symon, treasurer of the local chapter. Symon earned 391 points in his work this year, earning his third letter.

Jim not only earned his third letter, but was awarded his state farmer degree and won third in the 20-30 project awards.

The Bootsma's live in a pleasant two-story home on their dairy. Mr. and Mrs. Bootsma, who moved into the valley some 18 years ago from Artesia to found their dairy, were both born in Holland.

Mr. Bootsma presides over a large family, a family which well fills the dinner table even though the two oldest girls have married and moved to homes of their own.

In addition to Mr. and Mrs. Bootsma there are Mrs. Agnes Jacobs, Mrs. Nellie Johnson; Garret Bootsma, 19, a graduate of Chino high school who now works for his father on the dairy; Symon Bootsma, 18, who will graduate and join his father in the dairy; Jim, Jr., 16, and a senior at high school next year; Wilbur, 14; Ike, 12; John, 9; and Vicky, 6.

What do the boys get out of FFA work? They get an eye for beef and dairy cattle. They learn to work with and lead others in the farming community; they learn much about this industry which takes real business sense to operate; and they learn how to use the latest scientific information pouring out of experiment stations and universities to help the farmer make a better living.

Jim Bootsma with his prize Angus bull which he has shown in a number of fairs, and will show at the Junior Fair here this weekend. In the Future Farmers, boys like Jim learn not only scientific farming but leadership as well. Jim is president of the local chapter next year. —Champion photo

***P3a. Description:** The evaluated property consists of a single parcel (APN: 021632103) addressed as 8185 Edison Avenue. Covering 18.56 acres, the property is located at the southeast corner of Edison and Grove Avenues. The property and its environs is historically associated with dairy farming and remains largely open space and agricultural land. The property includes a Ranch style dwelling that exhibits Northern European or Dutch influences, a Minimal Traditional style dwelling, a Streamline Moderne style milk parlor, and several ancillary structures and features associated with dairy operations. A water retention pond is located in the southeast corner of the parcel. Landscaping and hardscaping features include trees and shrubs near the buildings and paved driveways. The property continues to function as an active dairy farm.

The property was previously recorded, and the Ranch style dwelling and Streamline Moderne milk parlor were determined eligible in 2014, but not formally designated. **For a more detailed property description, please refer to the Continuation Sheet.**

**Applicable Criteria:** NRHP/CRHR/Local C/3/d

The 8185 Edison Avenue property was improved between 1952 and 1959 with the construction of a Ranch style residence, Minimal Traditional style residence, and Streamline Moderne style milk parlor. In 1967 the area was established as part of the San Bernardino County Agricultural Preserve. In 1999, the area was annexed as part of the New Model Colony, formed from a portion of the former agricultural preserve. The 8185 Edison Avenue property is associated with multiple themes, including Postwar, Large-Capacity Dairies, 1945-1980; Ranch Style, 1950-1970s; Streamline Moderne style, 1930s-1960s; Minimal Traditional style, 1930-1950s; and Consolidation of Dairy Operations, 1980s-1998. However, only the Ranch style dwelling and Streamline Moderne style milk parlor are considered significant under NRHP, CRHR, and City of Ontario criteria C/3/d within the context of Ranch Style, 1950-1970s; Streamline Moderne style, 1930s-1960s, with a period of significance of 1952-1959, representing the dwelling and milk parlor's original construction. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
Constructed between 1952 and 1959, the property includes a Ranch style dwelling, a Minimal Traditional style dwelling, a Streamline Moderne milk parlor, and several ancillary structures and features associated with dairy operations. Located on the northeast corner of the parcel is a Ranch style dwelling that exhibits Northern European or Dutch influences. The dwelling features an asymmetrical façade and a one-story horizontal floorplan atop a concrete foundation. The exterior is clad in horizontal wood siding painted yellow, with green trim on the windows and doors. The low-pitched cross-gabled roof is covered with composition shingles and includes a moderate eave overhang with open eaves and exposed rafter ends. A chimney is located on the rear (south) elevation. Fenestration consists of wood-framed diamond-patterned windows, some with green decorative shutters. The main (north) elevation features diamond-patterned windows, box bays with decorative wood support brackets, a stone planter, and an extended roof girder. A garage is attached to the main dwelling by a wide open breezeway on the west elevation.

West of the Ranch style dwelling is a Streamline Moderne milk parlor. The building is divided into two sections: the front milk house and the rear milking parlor, separated by a breezeway. The front section reflects Streamline Moderne characteristics, with smooth stucco walls, a flat roof, curvilinear corners, a central vertical projection, and curved glass block windows. The west elevation contains metal multi-lite casement windows. The windows on the east elevation are boarded up. The breezeway, located between the two sections, features a metal barn-style sliding door on both the east and west elevations. South of the breezeway, the milking parlor has a gable roof oriented along a north-south axis, clad in corrugated sheet metal. Ventilation is provided by horizontal metal shutters on the east and west elevations, positioned above concrete walls, along with a vent system along the gable ridge. Additional features include a circular driveway in front of the milk parlor and two metal doors.

Located on the northwest corner of the parcel is a Minimal Traditional dwelling with a detached garage. The dwelling has an asymmetrical façade and a rectilinear floorplan atop a concrete foundation. The exterior is clad in tan-painted stucco with green trim on the windows and roof fascia. The low-pitched hipped roof is finished with composition shingles and features a minimal eave overhang with boxed eaves. Fenestration visible from the public right-of-way consists of aluminum sliding sash windows. The main (west) elevation includes a recessed main entryway with a concrete stoop, metal security gate, and a wide stone chimney. The detached garage, located directly north of the dwelling, features two paneled overhead doors, a tan stucco façade, and a hipped roof.

Several ancillary pole structures, sheds, and features are located throughout the property.

The property features a good example of a postwar Streamline Moderne milk parlor and a Ranch style dwelling that incorporates Northern European or Dutch architectural influences. The milk parlor exhibits Streamline Moderne elements that are evident in the smooth stucco surfaces, rounded corners, glass block windows, and horizontal emphasis that give the building a sleek, aerodynamic appearance typical of the style. A circular driveway situated in front of the milk parlor not only enhances the property's functionality but also reflects the era's emphasis on automobile accessibility and streamlined movement through the site. The dwelling's Ranch style influence is seen in the low horizontal massing, asymmetrical layout, and integration of indoor and outdoor spaces. Northern European or Dutch architectural touches include diamond-patterned windows, decorative shutters, and extended roof girders, lending additional character and ornamentation to the design.

View southeast of 8185 Edison Ave Ranch style SFR (IMG_8759; October 21, 2024).

**B10. Statement of Significance from Page 2:**
The 8185 Edison Avenue property was developed between 1952 and 1959 and includes a Ranch style dwelling, a Streamline Moderne milk parlor, a Minimal Traditional dwelling, and several later-added ancillary structures. The Ranch style residence and milk parlor date to the postwar era and reflect two distinct architectural styles tied to Ontario's postwar dairy development.

The property was evaluated under the Postwar, Large-Capacity Dairy, 1945-1980 context, however, is not recommended eligible under that theme as the majority of ancillary structures, such as pole barns, feeding gates, and other operational infrastructure, do not appear in aerial imagery until after 1987, placing them outside the defined period of significance. The absence of these character-defining features needed to demonstrate large-capacity operations indicate that the 8185 Edison Avenue property is not significant or eligible as a Postwar, Large-Capacity Dairy operation.

While several ancillary structures, including pole barns and feeding gates within the property, appear to date to the 1980s-1995 period, placing them within the Consolidation of Dairy Operations, 1980s-1998 thematic timeframe, there is no evidence that the property represents a true consolidation of multiple dairy operations. Accordingly, the 8185 Edison Avenue property is not eligible under the theme of Consolidation of Dairy Operations, 1980s-1998. The property does not contain multiple milk parlors or residences from different operations or periods of operation, nor does it exhibit the spatial layout or landscape features, such as retention ponds or geometrically organized infrastructure, associated with a merged or large-scale consolidated dairy.

The property as a whole is not significant or eligible under NRHP/CRHR/Local criteria. The extant improvements appear to reflect continued use or isolated upgrades rather than a large capacity dairy operation or a broader consolidation effort typical of the late twentieth-century shift in dairy operations across Ontario and the Chino Valley.

**Building, Structure, Object Information Continued:**

Individually, the Ranch style dwelling is recommended eligible under NRHP Criterion C / CRHR Criterion 3 / City of Ontario Criterion d, within the context of Ranch Style, 1950–1970s. The residence exhibits key features of the style, including its one-story, low horizontal massing, an asymmetrical layout, horizontal wood siding, and an attached garage connected by an open breezeway. Additionally, Northern European or Dutch architectural influences are evident in diamond-patterned windows, decorative shutters, and extended roof girders, which lend ornamentation and character to the building. The dwelling retains the necessary aspects of integrity and is a representative example of a Ranch style home in the New Model Colony / Ontario Ranch area. The Ranch style dwelling is not individually eligible under any other NRHP/CRHR/Local criteria.

The Streamline Moderne milk parlor, also constructed between 1952 and 1959, is recommended individually eligible under NRHP Criterion C / CRHR Criterion 3 / City of Ontario Criterion d, as a good example reflecting the Streamline Moderne aesthetic. It features smooth stucco walls, a central bay that projects beyond the front wall plane with rounded corners, and large glass block windows. The structure's front milk house and rear milking parlor are separated by a central breezeway. A character-defining circular driveway in installed in front of the milk parlor representing an key operational feature used for deliveries and for large trucks to load milk from the milk house. The milk parlor building retains the necessary aspects of integrity and is a representative example of a postwar milk parlor designed in the Streamline Moderne style in the New Model Colony / Ontario Ranch area. The milk parlor building is not individually eligible under any other NRHP/CRHR/Local criteria.

The Minimal Traditional residence was also evaluated for individual eligibility and although the dwelling retains integrity, it lacks the distinctive features necessary to be considered a strong or representative example of the style within the survey area. Beyond its architectural appearance, no information was identified to support a positive eligibility finding for the house relative to an individual association with significant events, important persons, or information potential. Accordingly, the Minimal Traditional style home is individually ineligible under all NRHP/CRHR/Local criteria.

Under the established historic context, eligibility requires retention of integrity of location, setting, materials, design, feeling, workmanship, and association. Both the Ranch style dwelling and Streamline Moderne milk parlor meet these integrity requirements and embody the distinctive characteristics of their respective types and periods of construction. As such, both buildings qualify as an historical resource under Section 15064.5 of the CEQA Guidelines.

**B2. Common Name:** 8311 Edison Avenue
**B3. Original Use:** Dairy Farm **B4. Present Use:** Dairy Farm
***B5. Architectural Style:** Ranch Style

***B6. Construction History:** This property consists of a single parcel (APN: 021632108). No historic-era building permits were found on file with the City of Ontario. Year-built data and property characteristics were obtained from the San Bernardino County Assessor's Property Management Information System, supplemented by aerial imagery from 1946, 1948, 1952, 1959, 1968, and subsequent years. Available aerial imagery indicates that the 8311 Edison Avenue was initially developed between 1968 and 1975 with the construction of a Ranch style milk parlor and dwelling. Between 1980 and 1985, a manufactured dwelling was added to the property. Subsequent aerial imagery suggests that the overall configuration of the existing milk parlor has remained unchanged. An early three-car garage addition was appended to the east elevation of the residence. Based on aerial imagery, most of the ancillary structures/features visible on the property today were added in the late 1990s. **See Continuation Sheet for ownership/occupancy information.**

**Area:** San Bernardino County
**Period of Significance:** N/A **Property Type:** N/A
**Applicable Criteria:** NRHP/CRHR/ Local ineligible

The 8311 Edison Avenue property was developed between 1968 and 1975. In 1999, the area was annexed into the City of Ontario as part of the New Model Colony, which was formed from a portion of the former San Bernardino County Agricultural Preserve. The property is associated with the historical contexts of Postwar, Large-Capacity Dairies, 1945–1980; Consolidation of Dairy Operations, 1980s–1998; and Historic Architectural Styles, 1880s–1980s, but it does not possess documented significance in relation to any of these themes. The Ranch style residence and herringbone-style milk parlor are modest examples of their architectural styles and property types, and while ancillary structures are present, they were constructed after the period of significance for the postwar dairy context. Additionally, there is no evidence that the property functioned as part of a consolidated dairy operation during the 1980s–1998 period. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
The dwelling is located west of the milk parlor and has a modest appearance. It features an asymmetrical facade and an irregular horizontal floorplan atop a concrete foundation. The low-pitched cross-gabled roof has a moderate eave overhang with boxed eaves and is topped with terracotta tiles, which likely replaced the original composition or wood shingles at an unidentified date. The exterior is clad in tan-painted stucco. Additional features include a recessed main entryway accessed via concrete steps, two brown paneled doors, metal sliding sash windows, a stone planter, and decorative blue shutters on some of the windows. An attached three-car garage addition was appended to the east elevation and features a roofline that does not match the original structure, resulting in an uneven and visually uneven roofline.

Directly east of the dwelling is the Ranch style milk parlor, which is divided into three sections: the front milk house, the rear milking parlor separated by a breezeway, and a holding area. The milk house shares a similar design with the main dwelling, incorporating Ranch style elements such as a hip and gable roof topped with terracotta tiles, a moderate eave overhang with boxed eaves, and a stucco façade. Its fenestration consists of metal casement windows. The breezeway, located between the two sections on the north and south elevations, is obscured from the public right of way. South of the milk house, the milking parlor features a gable roof oriented along a north-south axis, topped with corrugated sheet metal. Ventilation elements include metal horizontal louvered shutters set atop concrete walls, along with a vent system along the gable ridge. Further south, the holding area is partially open and enclosed by concrete walls. Additional features include metal doors at the main entryway, bulk tanks, and a circular driveway in front of the milk parlor.

East of the milk parlor is the manufactured home. The building features a low-pitched side-gabled roof topped with composition shingles, wood siding painted tan, aluminum sliding sash and single-hung windows, and a shed roof extension.

Within proximity to the buildings are several features and structures associated with dairy operations, including silos, pole structures, feeding gates, corrals, and storage sheds. Water retention ponds are located at the rear of the property. These ancillary features were installed by the late 1990s.

## Primary Record Information Continued:

View south of 8311 Edison Ave Ranch style SFR (IMG_8839; October 21, 2024).

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**
The property was originally owned by Martin De Hoog and was listed as the De Hoog Dairy. By 1977, it was recorded as the Double "D" Dairy. The property remained under the ownership of the De Hoog family until 2022.

**B10. Statement of Significance from Page 2:**
Comparative study of other Postwar Scientific Large-Capacity Dairies in the survey area reveals that the 8311 Edison Avenue property is a more modest example of the property type. The property contains a single Ranch style residence and a Ranch herringbone-style milk parlor. While these components are associated with the Postwar, Large-Capacity Dairy (1945–1980) theme, the property does not appear to be a significant example. Although ancillary structures such as pole barns and feeding infrastructure are present, aerial imagery and field observations indicate that these features were added in the late 1990s, after the defined period of significance for the postwar large capacity theme. Accordingly, the property does not contain the necessary character-defining features needed to demonstrate a postwar scientific large-capacity dairy operation and is therefore ineligible under this theme.

The property also does not meet the thresholds for significance under the Consolidated Dairy Operations (1980s–1998) theme. Although some extant features, such as pole barns and feeding infrastructure, date to this period, there is no evidence that the property functioned as a consolidated operation formed through the merging of multiple dairy facilities. It lacks multiple milk parlors or residences associated with separate earlier operations, key indicators of consolidation. Instead, the improvements appear to reflect continued individual use or isolated upgrades, rather than consolidation efforts.

Additionally, neither the Ranch style residence nor the Ranch style milk parlor is considered a distinctive example of its type. Both buildings are individually ineligible. The residence appears to have been altered early in its history by the addition of a three-car garage, resulting in a modest and irregular layout that lacks defining Ranch style features such as a breezeway or cupola. Similarly, while the milk parlor includes Ranch style elements such as steel casement windows, and a stucco facade, it does not rise to the level of an exemplary or distinctive Ranch style design.

The property as a whole is not significant or eligible under any NRHP/CRHR/Local criteria. It is not eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a due to lack of a significant association with local, regional, state, or national patterns of dairy farming. It is not eligible under Criterion B / 2 / b as it lacks association with any person, family, or group important in Ontario's dairy history. It does not appear to meet Criterion C / 3 / c–f, as the residence and milk parlor do not embody distinctive characteristics of a type, period, or method of construction and are not the work of a master. The property is also not eligible under City of Ontario Criteria g or h, nor under Criterion D / 4, as it is not likely to yield important historical information.

Although the property has been found not significant and ineligible, it retains integrity of location, setting, design, materials, workmanship, feeling, and association as an active dairy property.

***B8. Related Features:** None Identified
**B9a.** Architect: Not Identified **b.** Builder: Not Identified
***B10. Significance: Theme:** Craftsman Bungalow Style, 1900s-1930s **Area:** San Bernardino County
**Period of Significance:** Pre-1935 **Property Type:** Craftsman Bungalow Style
**Applicable Criteria:** NRHP/CRHR/Local C/3/d

The 8335 Edison Avenue property was improved prior to 1935 with the construction of a Craftsman Bungalow residence, with additional developments occurring between 1959 and 1966. In 1967 the area was established as part of the San Bernardino County Agricultural Preserve. In 1999, the area was annexed as part of the New Model Colony, formed from a portion of the former agricultural preserve. The 8335 Edison Avenue property is associated with multiple themes, including Depression-Era and Wartime Dairies, 1930s-1945; Craftsman Bungalow Style, 1900s-1930s; Postwar, Large-Capacity Dairies, 1945-1980; Ranch Style, 1950-1970s. However, only the Craftsman Bungalow style dwelling is considered significant under NRHP, CRHR, and City of Ontario criteria C/3/d within the context of Craftsman Bungalow Style, 1900s-1930s, with a period of significance of pre-1935, representing the dwelling's original construction. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
Improved prior to 1935 with later developments between 1959 and 1966, the property includes a Craftsman Bungalow style dwelling, a Ranch style milk parlor, several ancillary structures and water retention ponds.

The Craftsman Bungalow style residence is located towards the northeast corner of parcel 021632204. The dwelling is two-story and has an asymmetrical façade and an irregular floorplan. The exterior is clad in clapboard siding painted brown with dark brown trim on the windows and doors. The moderately pitched hipped roof is topped with composition shingles and has a moderate eave overhang, boxed eaves, and a dormer on the main (north) elevation. The fenestration visible from the public right-of-way consists of wood-framed fixed and double-hung windows, along with some vinyl sliding sash and single-hung windows. The main elevation features a partial-width porch beneath a hipped roof extension, supported by tapered brick columns, concrete steps, and a brick pony wall.

The dwelling retains key characteristics of the Craftsman Bungalow style, including its use of natural materials such as wood clapboard siding and brick. The dormer, exposed rafter tails, wood-cased windows, and decorative porch elements, such as brick tapered columns and pony wall, further exemplify the style's emphasis on handcrafted architectural details and a connection to nature. Despite the removal of some original windows and roofing, the dwelling maintains a strong representation of the Craftsman Bungalow style through its massing, roof form, and characteristic design features.

South of the dwelling is a detached three-car garage constructed ca. 1959. The garage was designed in a similar fashion to the residence with wood-siding painted brown, hip-and-gable roof with composition shingles, three wood paneled overhead doors, and a small cupola on the top of the roof ridge.

West of the dwelling is the Ranch style milk parlor, which is divided into three sections: the front milk house, the rear milking parlor separated by a breezeway, and an open holding area. Constructed between 1959 and 1966, the milk house incorporates some Ranch style elements such as a hip-and-gable roof, a moderate eave overhang with boxed eaves, and a stucco façade with wood-siding below the gable end. Its fenestration consists of metal multi-lite windows and vinyl windows. The breezeway, located between the two sections on the north and south elevations, is obscured from the public right of way. South of the milk house, the milking parlor features a flat roof oriented along a north-south axis. Ventilation elements include metal vertical louvered shutters set between concrete walls. Further south, the holding area is open and enclosed behind concrete walls. Additional features include industrial glass doors at the main entryway and a circular driveway in front of the milk parlor.

Within proximity to the buildings are several features and structures associated with dairy operations, including silos, pole structures, feeding gates, corrals, and storage sheds. Water retention ponds are located at the rear of the property.

## Primary Record Information Continued:

View south of 8335 Edison Ave Ranch style milk parlor (IMG_8835; October 21, 2024).

## Building, Structure, Object Information Continued:

**B6. Construction History Continued from Page 2:**

**Ownership/Occupancy**
In the 1950s, the property was owned by John T. Veenstra. By 1981, ownership transferred to Martin De Hoog. The property remained under the De Hoog family's ownership until 2022 and was initially known as the De Hoog Dairy before being renamed Three D Dairy.

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
The 8335 Edison Avenue property is an excellent example of a Craftsman Bungalow style residence, retaining key characteristics of the Craftsman Bungalow style, including the use of natural materials such as wood clapboard siding and brick. The dormer, wood-cased windows, and decorative porch elements, such as brick tapered columns and pony wall, further exemplify the style's emphasis on handcrafted architectural details and a connection to nature. Despite the removal of some original windows and roofing, the dwelling maintains a strong representation of the Craftsman Bungalow style through its massing and characteristic design features.

The property also includes a Ranch style milk parlor and a detached garage. Although minimally altered, the milk parlor is not a representative example of the Ranch style within the survey area. The detached garage, constructed circa 1959, well after the original dwelling, does not contribute to the historic character of the property and is not considered a contributing resource.

Under the established context, an eligible property must retain integrity of location, setting, materials, design, feeling, workmanship, and association aspects of integrity to convey significance. Despite minor modifications, the dwelling retains necessary integrity to convey significance including location, setting, feeling, design, materials, workmanship, and association. Accordingly, the property is eligible under NRHP / CRHR / City of Ontario Criterion C/3/d, as it embodies the distinctive characteristics of its type, period, and method of construction, qualifying as a historical resource under Section 15064.5 of the CEQA Guidelines.

***P3a. Description:** The evaluated property consists of two parcels (APN: 021632205 and 021632210), historically addressed as 8485 Edison Avenue and 14350 Walker Avenue. Covering 36.95 acres, it is located on the southwest corner of Ontario Ranch Road and Walker Avenue. The surrounding area remains largely open space and agricultural land, historically associated with dairy farming. The property includes two one-story Ranch style residences, a Ranch style milk parlor, several geometrically spaced ancillary structures, metal storage sheds, and various features associated with dairy operations. Water retention ponds are located to the rear of the property. One of the residences is located towards the rear on the southeast side of the parcel. Landscaping and hardscaping is minimal consisting of paved driveways and some trees. Eucalyptus trees line most of the east side of the parcel. The property continues to function as a dairy farm. **For a more detailed property description, please refer to the Continuation Sheet.**

***B6. Construction History:** This property consists of two parcels under single ownership (APN: 021632205 and 021632210). No historic-era building permits were found on file with the City of Ontario. Year-built data and property characteristics were obtained from the San Bernardino County Assessor's Property Management Information System, supplemented by aerial imagery from 1935, 1938, 1946, 1948, 1952, 1959, 1968, and subsequent years. Available aerial imagery indicates that 8485 Edison and 14350 Walker Avenue property was initially developed between 1959 and 1966, with the construction of a Ranch style milk parlor and residence listed as 8485 Edison Avenue. Between 1966 and 1968, a second Ranch style residence was constructed on the property, listed as 14350 Walker Avenue. Subsequent aerial imagery suggests that the overall configuration of the existing buildings has remained unchanged. **See Continuation Sheet for ownership/occupancy information.**

The property at 8485 Edison and 14350 Walker Avenue was originally developed between 1959 and 1966 with later developments between 1966 and 1968. In 1999, the area was annexed into the City of Ontario as part of the New Model Colony, which was formed from a portion of the former San Bernardino County Agricultural Preserve. The property is associated with the historical contexts of Postwar, Large-Capacity Dairies, 1945-1980 and Historic Architectural Styles, 1880s-1980s, but it does not possess documented significance in relation to the themes. **See Continuation Sheet for significance and integrity conclusions.**

## Primary Record Information Continued:

**P3a. Continued from Page 1:**
Improved between 1959 and 1966, with later developments between 1966 and 1968, the property includes two Ranch style dwellings, a Ranch style milk parlor, several ancillary structures/features and water retention ponds.

Fronting Ontario Ranch Road is one of the Ranch style dwellings and the Ranch style milk parlor, listed as 8485 Edison Avenue. Constructed between 1959 and 1966, the dwelling is a one-story structure with an asymmetrical façade and a horizontal, rambling floorplan atop a concrete foundation. Its exterior is clad in tan-painted stucco with a stone veneer along the lower span of the main (north) elevation. The low-pitched hip-and-gable roof is topped with composition shingles and features a moderate eave overhang, boxed eaves, a stone chimney on the rear roof slope, and a cupola. Below the gable end, is white horizontal wood siding and a scalloped fascia board. The fenestration consists of vinyl sliding sash units, which replaced the original wood-framed windows, some of which featured a diamond pattern. One of the original window openings to the left of the main entryway was substantially altered and replaced with a smaller window unit. The main elevation includes a stone planter, box bays accented by white horizontal wood siding, a decorative wood spindle column, and a recessed main entryway. On the west elevation, a partially open breezeway connects the dwelling to a two-car garage with white paneled overhead doors.

West of the dwelling is the Ranch style milk parlor, which is divided into two sections: the front milk house section and the rear milking parlor separated by a breezeway. The milk house incorporates Ranch style elements such as a hip-and-gable roof, a moderate eave overhang with boxed eaves, and a stucco façade. Its fenestration consists of metal multi-lite fixed and casement windows. The breezeway, located between the two sections on the east and west elevations, features two metal barn-style sliding doors. South of the milk house, the milking parlor features a gabled roof oriented along a north-south axis and steel beams. Ventilation elements include metal vertical louvered shutters set on top concrete walls. Additional features include two metal doors at the main entryway and a circular driveway in front of the milk parlor.

To the rear portion of the parcel fronting Walker Avenue is the second Ranch style residence, listed as 14350 Walker Avenue. Constructed between 1966 and 1968, the dwelling has an asymmetrical façade and an irregular floorplan atop a concrete foundation. The exterior is clad in stucco painted tan and has a stone veneer on the main (east) elevation. The moderately-pitched hipped roof is topped with composition shingles and has a moderate eave overhang, boxed eaves, and a stone chimney on the rear roof slope. The fenestration visible from the public right-of-way consists of aluminum windows. An enclosed breezeway is located on the north elevation and connects the dwelling to a two-car garage.

## Building, Structure, Object Information Continued:

**B10. Statement of Significance from Page 2:**
For lack of significant association with the themes, the subject property has not been found eligible under NRHP / CRHR / City of Ontario Criterion A / 1 / a as the property has not in and of itself been directly associated with significant events or patterns of events in dairy farming in local, regional, state, or national history, nor does it exemplify or reflect special elements of the City's history; not eligible under NRHP / CRHR / City of Ontario Criterion B / 2 / b as it has not been identified as having an association with an important person, family, or ethnic group significant in the local dairy farming industry; not eligible under NRHP / CRHR / City of Ontario Criterion C / 3 / c-f as none of the buildings at the property, nor the property as a whole, embodies the distinctive characteristics of a type, period, or method of construction and has not been identified as being the work of a master or an important and creative individual; not eligible under City of Ontario Criterion g and h as the property does not in and of itself offer a unique location, a singular physical characteristic, or an established and familiar visual feature within the city of Ontario or the Ontario New Model Colony / Ontario Ranch community, nor is it in and of itself one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen; and not eligible under NRHP / CRHR / City of Ontario Criterion D / 4 / as further study of the 8485 Edison and 14350 Walker Avenue would not appear to yield information which could be considered important in local, regional, state, or national history.

Although the 8485 Edison and 14350 Walker Avenue property has been found not significant and ineligible, it maintains integrity of location, setting, design, materials, workmanship, feeling, and association as an active and in-use dairy farming property.

# APPENDIX D

## Relocation Feasibility Study

August 20, 2025

Jason Lee
V.P. RCCD Inc.
jasonl@rccdinc.com

Reference: **RELOCATION OF FIVE STRUCTURES – FEASIBILITY STUDY**
**7587 EDISON AVE, 8311 EDISON AVE, 8381 EDISON AVE, 8485 EDISON AVE, AND 14117 GROVE AVE**
**ONTARIO, CALIFORNIA**
**[S.F. PROJECT #25198]**

Dear Jason:

We have completed our feasibility study for the relocation of four historic milking barns and a historic house located at 7587 Edison Avenue, 8311 Edison Avenue, 8485 Edison Avenue, 14117 Grove Avenue, and 8381 Edison Avenue in Ontario, CA, respectively. Our findings are based on visual observations made while on all five sites on August 8, 2025. Cole Cisakowski of RCCD accompanied Gabriela Pascualy of Structural Focus on the site visit. No existing building drawings or backgrounds were provided for our use, and no exploratory demolition or materials investigation was performed as part of the site visit.

**Building Descriptions**

*7587 Edison Avenue*

The milking barn at 7587 Edison is separated into a smaller wood framed front portion and a larger concrete back portion. The front portion is an enclosed space that is approximately 40 feet wide by 24 feet deep and has a large tank in front of it, along with a tank, washrooms, and storage rooms inside the building. The wood framed stud walls appear to be supported on concrete stem walls which are a few feet tall. There are several window openings and large door openings. The roof is wood framed.

The back portion of the building is much larger at approximately 200 feet wide by approximately 30 feet deep. It consists of concrete roof slabs supported by a central line of built-up steel beams & columns and concrete walls (potentially tilt-up) on the long sides of the building. The roof slabs consist of two spans which overlap & are vertically offset in the center of the building, allowing airflow. The walls contain many window and door openings with five of the window openings infilled with concrete at the northeast corner. The west side of the building is open while the east side has a solid wall. Animal stalls and equipment for milking operations fill this portion of the building.

Foundations for the building were not visible but are presumed to be concrete strip footings below the walls and concrete spread footings below the columns.

*8311 Edison Avenue*

The milking barn at 8311 Edison is separated into a smaller wood framed front portion and a larger metal and wood framed back portion. The front portion is an enclosed space that is approximately 30 feet wide by 15 feet deep with a tank on the exterior of the west side of the building that appears to penetrate the exterior wall. The inside contains washrooms and storage rooms. The wood framed stud walls appear to be supported on concrete stem walls which are a few feet tall. There are several window openings and large door openings. The roof is wood framed with clay tile roofing.

The back portion of the building extends more than three times the depth of the front portion but decreases in width before it expands back to the width of the front portion. The roof consists of corrugated metal sheets

over wood framing, supported by posts only along the exterior in the middle, narrower area and supported by steel posts along the exterior and center in the end, wider area. There are partial height concrete walls along the long sides. Animal stalls and equipment for milking operations fill this portion of the building.

Foundations for the building were not visible but are presumed to be concrete strip footings below the walls and concrete spread footings below the columns.

*8381 Edison Avenue*

The building at 8381 Edison is a craftsman-style single family home. The 2-story house has a covered porch and detached 3-car garage. Interior access to the house was not provided, so our observations are based on what could be seen while walking around the perimeter of the building. The home is likely constructed of wood floor and wall framing, supported by exterior bearing walls and interior posts in the crawl space. Foundations for the bearing walls were not visible but are presumed to be concrete strip footings. In the crawl space, small concrete pad footings were visible below the posts. The garage is also wood framed with what is likely a concrete slab on grade.

*8485 Edison Avenue*

The milking barn at 8485 Edison is separated into a smaller wood framed front portion and a larger metal framed back portion. The front portion is an enclosed space that is approximately 25 feet wide by 15 feet deep and contains storage tanks, washrooms, and storage rooms. Wood framed stud walls are supported on concrete stem walls and there are several window and door openings in the walls. The roof is wood framed.

The back portion of the building is much larger with the same width but extends more than three times the depth of the front portion. The roof consists of corrugated metal sheets supported by metal joists framing into metal frames. There are six total steel beam and column frames with individual concrete pad footings visible below each of the columns. Each frame consists of two exterior columns with a beam spanning between them. There are partial height concrete walls along the long sides of the back portion with metal slats above them spanning vertically to the underside of the roof. Animal stalls and equipment for milking operations fill this portion of the building.

Most foundations are not visible but are presumed to be concrete strip footings below the stem walls (not visible) and concrete spread footings below the columns (visible).

*14117 Grove Avenue*

The building at 14117 Grove is separated into a smaller front portion and a larger back portion. The front portion is an enclosed space that is approximately 35 feet wide by 15 feet deep and contains storage tanks for the milk product, washrooms, and storage rooms. Wood framed stud walls are supported on concrete (or possibly concrete block) stem walls. There are several glass block infill windows in the wood stud walls. The ceiling and roof are wood framed.

The back portion is much larger with the same width but extends more than three times the depth of the front portion. The back portion of the building has a corrugated metal roof supported by wood carpenter trusses spanning to wood beams, supported by steel pipe posts along the exterior of the building. It is an open structure with partial height walls along the sides (likely concrete). Animal stalls and equipment for milking operations fill this portion of the building.

Foundations for the buildings are not visible but are presumed to be concrete spread footings below the stem walls and pipe posts.

**Site Visit Observations**

*7587 Edison Avenue*

The front portion of the milking barn at 7587 Edison appears to have water and weather damage leading to sagging of some of the wood framing. Specifically, the stucco on the underside of the overhang at the southwest corner of the front portion appears to have sagged downward exposing the wood roof joists. The ceiling near the doorway to the back portion has also sagged significantly, presumably from damaged wood framing above.

The back portion is in relatively good condition. During the site visit a crack was observed in the concrete header above the doorway between the front and back portions of the building.

*8311 Edison Avenue*

The front portion of the milking barn at 8311 Edison is in relatively good condition. Some edge members are missing at the north corners of the building, exposing roof members in the area. The visible members show signs of deterioration, but it is presumed that the deterioration is due to exposure to the elements and is limited to the exposed areas.

The back portion also shows some signs of deterioration, likely due to the age of the building and exposure to the elements.

*8381 Edison Avenue*

The house at 8381 Edison was observed from the exterior only. It appears to be in good condition and is currently inhabited.

*8485 Edison Avenue*

The milking barn at 8485 Edison is functioning as a working parlor – both the front and back portions are in relatively good condition.

*14117 Grove Avenue*

The milking barn at 14117 Grove is no longer functioning as a working parlor as of recently and was only observed from the exterior. The front portion appears to be in relatively good condition. The wood trusses in the back portion are deteriorated and in poor condition, with evidence of some previous repairs. In the event that the back portion becomes occupiable again, the roof framing should be shored and repaired.

**Conclusions**

It is our opinion that it is feasible to relocate the front portion of all four milking barns, located at 7587 Edison Ave, 8311 Edison Ave, 8485 Edison Ave, and 14117 Grove Ave; the back portion of the milking barns located at 8311 Edison Ave and 8485 Edison Ave; and the house located at 8381 Edison Ave. The wood framed walls in the front portions of all four milking barns could be detached and lifted off the stem walls. New foundations and stem walls would need to be constructed at the receiver site to support the relocated wood portions. The back portions of the milking barns previously listed could be lifted at the lines of steel/wood posts for relocation of the posts and roofs. The perimeter stem walls and animal stalls would need to be rebuilt at the receiver site. The house could be detached and lifted off the crawl space. New perimeter crawl space walls, interior crawl space posts, and all associated foundations would need to be constructed at the receiver site to support the relocated house.

The back portions of the milking barns located at 7587 Edison Ave and 14117 Grove Ave are not feasible to relocate in their current conditions. The nature of the concrete construction at 7587 Edison Ave makes the structure extremely challenging to relocate without causing damage. However, the structure may be relocated if it is first disassembled and then reassembled at the receiver site.

**Summary**

**7587 Edison Ave** – It **is** feasible to relocate the **front** portion of the building, but it **is not** feasible to relocate the **back** portion of the building without first disassembling the structure. Some repairs to the front portion may be required at the discretion of the relocation specialist.

**8311 Edison Ave** – It **is** feasible to relocate the building in its entirety (with the exception of the stem walls in the front and back portions, the animal stalls in the back, and the foundations).

**8381 Edison Ave** – It **is** feasible to relocate the building in its entirety (with the exception of the crawl space framing and foundations).

**8485 Edison Ave** – It **is** feasible to relocate the building in its entirety (with the exception of the stem walls in the front and back portions, the animal stalls in the back, and the foundations).

**14117 Grove Ave** – It **is** feasible to relocate the **front** portion of the building, but it **is not** feasible to relocate the **back** portion of the building in its current state.

Thank you very much for the opportunity to work with you on this challenging and interesting project. If you have any questions, please feel free to contact us at your convenience.

Sincerely,
STRUCTURAL FOCUS

Russell Kehl, S.E.

# INTRODUCTION

The following biological resources technical report describes a detailed assessment of potential sensitive natural resources located within and/or immediately adjacent to the "Center Park Specific Plan" project (Specific Plan Boundary). The report has been prepared to support compliance with the California Environmental Quality Act (CEQA) documentation including the preparation of an Initial Study (IS), Environmental Impact Report (EIR) and environmental review process conducted by the City of Ontario. As discussed below, the assessment included a thorough literature review, site reconnaissance characterizing existing conditions (including floral, faunal and dominant vegetation communities), impact analysis, and applicable standards and regulations to ensure impacts remain at a level below significance.

## SPECIFIC PLAN LOCATION

The Specific Plan boundary includes a total of 194.05-acres onsite (Project Site), 63.29-acres within a Programmatic Assessment Area (Project Level Assessment Area), and 19.81-acres of offsite right-of-way impact areas (Offsite Areas), as shown in Figure 1, *Regional Location Map*, Figure 2, *Specific Plan Map*, and summarized in Table 1, *Specific Plan Acreages*.

The 194.05-acre Project Site is located within the southern region of the Specific Plan Boundary including Assessor Parcel Numbers (APNs) 0216-311-01,-02, -09, 0216-321-03, -08, 0216-322-03, -04, 1053-301-01, -02, 1053-311-01, -02, 1053-321-01, -02, -03, 1053-331-01 to -04, 1053-341-01, -02, 1053-351-01, -02, 1053-361-01 to -03, 1053-371-01, -02, and portion of 0216-322-10.

The 63.29-acre Project Level Assessment Area is located within the northern region of the Specific Plan Boundary including APN's 0216-311-09, 1053-301-01, -02, 1053-311-01, -02, 1053-321-01, -02, and -03. Authorization to access this region of the project was not provided and therefore was analyzed programmatically based on aerial photographs and assessments from the adjacent parcel boundaries. To ensure that potential adverse effects to sensitive species and resources are reduced to a less than significant level, a focused biological resources assessment and impact analysis shall be conducted in this Project Level Assessment Area portion of the Specific Plan Boundary prior to approval of development within this region. In addition to completing CEQA review, any focused surveys and required mitigation measures shall be implemented prior to project approval and initiation of construction, **CM BIO-7** Programmatic Assessment Area CEQA Analysis.

The 19.81-acre Offsite Areas include existing right-of-ways within the Specific Plan Boundary including but not limited to Comet Avenue, Grove Avenue, Cucamonga Avenue, Bon View Avenue, and Ontario Ranch Road/Edison Avenue.

## SPECIFIC PLAN DESCRIPTION

The proposed action includes the development of medium density residential (22-35 Dwelling Units/Acre), mixed use (retail (379,029 SF), office (289,521 SF)) and open space-recreational (parkland) within the Specific Plan Boundary.

# METHODOLOGY

The following section details the methods implemented prior to and during the reconnaissance survey conducted throughout the Project Site and Offsite Areas.

## LITERATURE REVIEW

Existing biological resource conditions within and adjacent to the Specific Plan Boundary was initially investigated through review of pertinent scientific literature. Federal register listings, protocols, and species data provided by the United States Fish and Wildlife Service (USFWS) were also reviewed in conjunction with anticipated federally listed species potentially occurring within the region of the Specific Plan Boundary. The California Natural Diversity Database (CNDDB) (CDFW 2024a), a California Department of Fish and Wildlife (CDFW) Natural Heritage Division species account database, was also reviewed for all pertinent information regarding the locations of known occurrences of sensitive species in the vicinity of the property. In addition, numerous regional floral and faunal field guides were utilized in the identification of species and suitable habitats. Combined, the reviewed sources provided an excellent baseline from which to inventory the biological resources potentially occurring in the area. Other CDFW reports and publications consulted include the following:

- Special Animals (CDFW 2024b);
- State and Federally Listed Endangered and Threatened Animals of California (CDFW 2024c);
- Endangered, Threatened, and Rare Plants of California (CDFW 2024d); and
- Special Vascular Plants and Bryophytes List (CDFW 2024e).

## FIELD SURVEY

A reconnaissance survey of the Project Site and Offsite Areas was conducted by Ruben Ramirez of Cadre Environmental on June 13th, 2024 in order to characterize and identify potential sensitive plant and wildlife habitats, and to establish the accuracy of the data identified in the literature search. Geologic and soil maps were examined to identify local soil types that may support sensitive taxa. Aerial photograph, topographic maps, vegetation and rare plant maps prepared for previous studies in the region were used to determine community types and other physical features that may support sensitive plants/wildlife, uncommon taxa, or rare communities that occur within or adjacent to the Project Site and Offsite Areas. Habitat assessments were conducted for, but not limited to, the following target species/groups.

- Delhi sands flower loving fly – Federally Endangered (FE)
- Coastal California gnatcatcher – Federally Threatened (FT)/State Species of Special Concern (SSC)
- Burrowing owl - SSC
- San Bernardino kangaroo rat – FE/SSC
- Common and sensitive bat species
- Sensitive plants

As previously stated, authorization to access the Project Level Assessment Area was not provided and therefore was analyzed programmatically based on aerial photographs and assessments from the adjacent parcel boundaries. To ensure that potential adverse effects to sensitive species and resources are reduced to a less than significant level, a focused biological resources assessment and impact analysis shall be conducted in this Project Level Assessment Area portion of the Specific Plan Boundary prior to approval of development within this region. In addition to completing CEQA review, any focused surveys and required mitigation measures shall be implemented prior to project approval and initiation of construction, **CM BIO-7** Programmatic Assessment Area CEQA Analysis.

### Vegetation Communities/Habitat Classification Mapping

Natural community names and hierarchical structure follows the "*Manual of California Vegetation*" (Sayer and Keeler-Wolf 2009) classification system, which has been refined and augmented where appropriate to better characterize the habitat types observed throughout the Specific Plan Boundary.

All plants observed during the survey efforts were either identified in the field or collected and later identified using taxonomic keys. Plant taxonomy follows Hickman (1993). Scientific nomenclature and common names used in this report generally follow Roberts et al. (2004) or Baldwin et al. (2012) for updated taxonomy. Scientific names are included only at the first mention of a species; thereafter, common names alone are used.

### Wildlife Resources Inventory

All animals identified during the reconnaissance survey by sight, call, tracks, scat, or other characteristic sign were documented. In addition to species actually detected, expected use of the site by other wildlife was derived from the analysis of habitats on the site,

combined with known habitat preferences of regionally occurring wildlife species. Vertebrate taxonomy followed in this report is according to the Center for North American Herpetology (2024 for amphibians and reptiles), the American Ornithologists' Union (1988 and supplemental) for birds, and Baker et al. (2003) for mammals. Both common and scientific names are used during the first mention of a species; common names only are used in the remainder of the text.

### Jurisdictional Resources Assessment

The Project Site and Offsite Areas were assessed for the presence/absence of United States Army Corps of Engineers (USACE), California Department of Fish and Wildlife (CDFW), and Regional Water Quality Control Board (RWQCB) jurisdictional resources. Non-wetland waters of the United States were assessed based on the limits of the Ordinary High-Water Mark (OHWM) as determined by erosion, the deposition of vegetation or debris, and changes in vegetation and soil characteristics. The assessment utilized the methodology for routine wetland determination according to the methods outlined in the USACE Wetland Delineation Manual (Environmental Laboratory 1987) and the Arid West Wetland Delineation Supplement and updated regulatory guidance letters (USACE 2008). Wetlands are identified by the presence of three characteristics: hydrophytic vegetation, wetland hydrology, and hydric soils. If any of these criteria were met, one or more transects were run to determine the extent of the wetland. Specifically, the presence of wetland hydrology was evaluated throughout the Project Site and Offsite Areas by recording the extent of observed surface flows, depth of inundation, depth to saturated soils, and depth to free water in the soil pits, where applicable. In addition, indicators of wetland or riverine hydrology were recorded, including water marks, drift lines, rack, debris, and sediment deposits, as warranted. Any indicators of hydric soils, such as redoximorphic features, buried organic matter, organic streaking, reduced soil conditions, gleyed or low-chroma soils, or sulfidic odor were also recorded.

## EXISTING ENVIRONMENTAL SETTING

The following section presents the existing conditions of the Specific Plan Boundary. The Specific Plan Boundary is characterized primarily as heavily disturbed active dairy and agricultural facilities as shown in Figure 3, *Specific Plan Vegetation Communities Map*, Figures 4 to 9, *Current Specific Plan Photographs,* and outlined in Table 2, *Specific Plan Vegetation Community Acreages*. The Specific Plan Boundary is completely bordered by high traffic roads, commercial/residential development and active dairy and agricultural facilities.

The Soil Survey of the San Bernardino County Area has the following soils mapped within the Specific Plan Boundary as shown on Figure 10, *Specific Plan Soils Association Map*:

- Db – Delhi fine sand
- Hr – Hilmar loamy fine sand
- TuB – Tujunga loamy sand 0 to 5 percent slopes.

## VEGETATION COMMUNITIES

### Active Dairy

The majority of the Specific Plan Boundary has and continues to be utilized as active dairy facilities including dry lots, milking parlors/feed storage facilities and housing. These areas are either devoid of vegetation or dominated by ornamental, ruderal non-native and native species commonly detected in disturbed habitats including Palmer's amaranth (*Amaranthus palmeri*), summer cypress (*Bassia scoparia*), horseweed (*Erigeron canadensis*), Russian thistle (*Salsola tragus*), prostate knotweed (*Polygonum aviculare*), cheeseweed (*Malva parviflora*), red-stemmed filaree (*Erodium cicutarium*), castor bean (*Ricinus communis*), prickly lettuce (*Lactuca serriola*), Bermuda grass (*Cynodon dactylon*), truncate finger grass (*Chloris truncata*), barnyard grass (*Echinochloa crus-galli*), goose grass (*Eleusine indica*), wild oat (*Avena fatua*), foxtail barley (*Hordeum murinum*), and ripgut brome (*Bromus diandrus*). Several dairy effluent retention ponds are located onsite and are either devoid of vegetation or inundated with discharge. No riparian scrub, forest or woodland habitat is associated with these ponds.

### Active Agriculture

Several regions of the Specific Plan Boundary have and continue to be actively farmed including the current production of feed and hay products. These areas area also utilized as cattle pastures and fertilizer spreading grounds.

### Disturbed

Disturbed regions of the Specific Plan Boundary are either devoid of vegetation (dirt roads and fallow fields) or dominated by the following species including golden crown beard (*Verbesina encelioides*), tumbling pigweed (*Amaranthus albus*), puncture vine (*Tribulus terrestris*), London rocket (*Sisymbrium irio*), stinknet (*Oncosiphon pilulifer*), giant reed (*Arundo donax*), salt cedar (*Tamarisk ramosissima*), tree tobacco (*Nicotiana glauca*), sacred datura (*Datura wrightii*), milk thistle (*Silybum marianum*), Australian saltbush (*Atriplex semibaccata*), Boccone's sand spurrey (*Spergularia bocconi*), spiny cocklebur (*Xanthium spinosum*), Mediterranean canarygrass (*Phalaris minor*), field bindweed (*Convolvulus arvensis*), common sow thistle (*Sonchus oleraceus*), annual beard-grass (*Polypogon monspeliensis*), and annual sunflower (*Helianthus annus*).

### Developed

Developed regions of the Specific Plan Boundary include the existing roadways within the rights-of-way and ranch house compounds. Species documented within developed areas include Peruvian peppertree (*Schinus molle*), bougainvillea (*Bougainvillea* sp.), pine (*Pinus* sp.), California sycamore (*Platanus racemosa*), Mexican fan palm (*Washingtonia robusta*), white mulberry (*Morus alba*), ash (*Fraxinus* sp.), olive (*Olea europaea*), Chinese elm (*Ulmus parvifolia*), tree of heaven (*Ailanthus altissima*), and jacaranda (*Jacaranda* sp.).

### Ornamental (Eucalyptus)

Several blue gum (*Eucalyptus globulus*) and red gum trees (*Eucalyptus camaldulensis*) are located adjacent to the eastern and southeastern Specific Plan Boundary.

**Table 2.**
**Specific Plan Vegetation Community Acreages**

| Vegetation Community | Project Site Acres | *Project Level Assessment Area Acres | Offsite Areas Acres | Total Acres |
|---|---|---|---|---|
| Active Dairy | 133.55 | 38.56 | 7.55 | 179.66 |
| Active Agriculture | 45.92 | 2.77 | 1.01 | 49.70 |
| Disturbed | 1.11 | 2.31 | 0.19 | 3.61 |
| Developed | 13.19 | 19.65 | 10.60 | 43.44 |
| Ornamental (Eucalyptus) | 0.28 | 0.00 | 0.46 | 0.74 |
| **TOTAL** | **194.05** | **63.29** | **19.81** | **277.15** |

** The 63.29-acre Project Level Assessment Area is located within the northern region of the Specific Plan Boundary including APN's 0216-311-09, 1053-301-01, -02, 1053-311-01, -02, 1053-321-01, -02, and -03. Authorization to access this region of the project was not provided and therefore was analyzed programmatically based on aerial photographs and assessments from the adjacent parcel boundaries. To ensure that potential adverse effects to sensitive species and resources are reduced to a less than significant level, a focused biological resources assessment and impact analysis shall be conducted in this Project Level Assessment Area portion of the Specific Plan Boundary prior to approval of development within this region. In addition to completing CEQA review, any focused surveys and required mitigation measures shall be implemented prior to project approval and initiation of construction,* ***CM BIO-7*** *Programmatic Assessment Area CEQA Analysis.*

## GENERAL PLANT & WILDIFE SPECIES

All plant species documented within the Project Site and Offsite Areas are presented and listed in the previous section. General wildlife species documented on site or within the vicinity of the Project Site and Offsite Areas include white-faced ibis (*Plegadis chihi*), red-winged blackbird (*Agelaius phoeniceus*), red-tailed hawk (*Buteo jamaicensis*), turkey vulture (*Cathartes aura*), rock dove (*Columba livia*), American kestrel (*Falco sparverius*), northern mockingbird (*Mimus polyglottos*), Anna's hummingbird (*Calypte anna*), mourning dove (*Zenaida macroura*), black phoebe (*Sayornis nigricans*), Say's phoebe (*Sayornis saya*), western meadowlark (*Sturnella neglecta*), cliff swallow (*Petrochelidon pyrrhonota*), American crow (*Corvus brachyrhynchos*), hooded oriole (*Icterus cucullatus*), Brewer's blackbird (*Euphagus cyanocephalus*), brown-headed cowbird (*Molothrus ater*), European starling (*Sturnus vulgaris*), yellow rumped warbler (*Setophaga coronata*), lesser gold finch (*Spinus psaltria*), house finch (*Haemorhous mexicanus*), scaly-breasted munia (*Lonchura punctulate*), white-crowned sparrow (*Zonotrichia leucophrys*) house sparrow (*Passer domesticus*), desert cottontail rabbit (*Sylvilagus audubonii*), and California ground squirrel (*Otospermophilus beecheyi*).

## JURISDICTIONAL WETLAND RESOURCES

No wetlands or jurisdictional resources regulated by the USACE, CDFW, or RWQCB were documented within the Project Site and Offsite Areas. The artificially created

unvegetated dairy effluent retention ponds are isolated located in uplands and currently rotated in use resulting in a wet (inundated) and dry phase. All of the active retention ponds are devoid of wetland vegetation including but not limited to riparian scrub, forest or woodland habitat.

Impacts to water quality would be less than significant during both construction and operation following preparation of a Water Quality Management Plan (WQMP), Storm Water Pollution Prevention Plan (SWPPP) and compliance with National Pollutant Discharge Elimination System (NPDES) permit and San Bernardino County Regional Municipal Separate Stormwater Sewer System (MS4) code provisions.

## SENSITIVE BIOLOGICAL RESOURCES

The following discussion describes the plant and wildlife species present, or potentially present within the property boundaries, that have been afforded special recognition by federal, state, or local resource conservation agencies and organizations, principally due to the species' declining or limited population sizes, usually resulting from habitat loss. Also discussed are habitats that are unique, of relatively limited distribution, or of particular value to wildlife. Protected sensitive species are classified by state and/or federal resource management agencies, or both, as threatened or endangered, under provisions of the state and federal endangered species act. Vulnerable or "at-risk" species that are proposed for listing as threatened or endangered (and thereby for protected status) are categorized administratively as "candidates" by the USFWS. CDFW uses various terminology and classifications to describe vulnerable species.

Sensitive biological resources are habitats or individual species that have special recognition by federal, state, or local conservation agencies and organizations as endangered, threatened, or rare. The CDFW, USFWS, and special groups like the California Native Plant Society (CNPS) maintain watch lists of such resources. For the purpose of this assessment sources used to determine the sensitive status of biological resources are:

**Plants**: USFWS (2024), CNDDB (CDFW 2024a), CDFW (2024d, 2024e), CNPS (2024), and Skinner and Pavlik (1994),

**Invertebrate -** Crotch's bumble bee *Bombus crotchii:* Leif Richardson, Paul Williams, Robbin Thorp and Sheila Colla, et al. (2022), CDFW (2019), CDFW (2023), Hatfield, et al. (2019).

**Wildlife:** California Wildlife Habitat Relationships (2008), USFWS (2024), CNDDB (CDFW 2024a), CDFW (2024b, 2024c, 2024f), and Leif Richardson, Paul Williams, Robbin Thorp and Sheila Colla, et al. (2022).

**Habitats**: CNDDB (CDFW 2024a, 2024f).

## FEDERAL PROTECTION AND CLASSIFICATIONS

The Federal Endangered Species Act of 1973 (FESA) defines an endangered species as "any species that is in danger of extinction throughout all or a significant portion of its range..." Threatened species are defined as "any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Under provisions of Section 9(a)(1)(B) of the FESA it is unlawful to "take" any listed species. "Take" is defined as follows in Section 3(18) of the FESA: "...harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." Further, the USFWS, through regulation, has interpreted the terms "harm" and "harass" to include certain types of habitat modification as forms of a "take." These interpretations, however, are generally considered and applied on a case-by-case basis and often vary from species to species. In a case where a property owner seeks permission from a federal agency for an action that could affect a federally listed plant and animal species, the property owner and agency are required to consult with USFWS. Section 9(a)(2)(b) of the FESA addresses the protections afforded to listed plants. Recently, the USFWS instituted changes in the listing status of former candidate species. Former C1 (candidate) species are now referred to simply as candidate species and represent the only candidates for listing. Former C2 species (for which the USFWS had insufficient evidence to warrant listing at this time) and C3 species (either extinct, no longer a valid taxon or more abundant than was formerly believed) are no longer considered as candidate species. Therefore, these species are no longer maintained in list form by the USFWS, nor are they formally protected. However, some USFWS field offices have issued memoranda stating that former C2 species are henceforth to be considered Federal Species of Concern. This term is employed in this document but carries no official protections. All references to federally protected species in this report (whether listed, proposed for listing or candidate) include the most current published status or candidate category to which each species has been assigned by USFWS. For purposes of this assessment, the following acronyms are used for federal status species:

| | |
|---|---|
| FE | Federal Endangered |
| FT | Federal Threatened |
| FPE | Federal Proposed Endangered |
| FPT | Federal Proposed Threatened |
| FC | Federal Candidate for Listing |

The designation of critical habitat can also have a significant impact on the development of land designated as "*critical habitat*." The FESA prohibits federal agencies from taking any action that will "*adversely modify or destroy*" critical habitat (16 U.S.C. § 1536(a)(2)). This provision of the FESA applies to the issuance of permits by federal agencies. Before approving an action affecting critical habitat, the federal agency is required to consult with the USFWS who then issues a biological opinion evaluating whether the action will "*adversely modify"* critical habitat. Thus, the designation of critical habitat effectively gives the USFWS extensive regulatory control over the development of land designated as critical habitat.

The Migratory Bird Treaty Act of 1918 (MBTA) makes it unlawful to "*take*" any migratory bird or part, nest, or egg of such bird listed in wildlife protection treaties between the United States and Great Britain, the Republic of Mexico, Japan, and the Union of Soviet States. For purposes of the MBTA, "*take*" is defined as to pursue, hunt, capture, kill, or possess or attempt to do the same.

The Bald Eagle and Golden Eagle Protection Act explicitly protects the bald eagle and golden eagle and imposes its own prohibition on any taking of these species. As defined in this act, take means to pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, or molest or disturb. Current USFWS policy is not to refer the incidental take of bald eagles for prosecution under the Bald Eagle and Golden Eagle Protection Act (16 U.S.C. 668-668d).

## STATE PROTECTION AND CLASSIFICATIONS

California's Endangered Species Act (CESA) defines an endangered species as "...a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease." The State defines a threatened species as "...a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the commission as rare on or before January 1, 1985 is a threatened species." Candidate species are defined as "...a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the commission has published a notice of proposed regulation to add the species to either list." Candidate species may be afforded temporary protection as though they were already listed as threatened or endangered at the discretion of the Fish and Game Commission. Unlike FESA, CESA does not include listing provisions for invertebrate species.

Article 3, Sections 2080 through 2085, of CESA addresses the taking of threatened or endangered species by stating "No person shall import into this state, export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the commission determines to be an endangered species or a threatened species, or attempt any of those acts, except as otherwise provided..." Under CESA, "take" is defined as "...hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Exceptions authorized by the state to allow "take" require "...permits or memorandums of understanding..." and can be authorized for "...endangered species, threatened species, or candidate species for scientific, educational, or management purposes." Sections 1901 and 1913 of the California Fish and Game Code provide that notification is required prior to disturbance.

Additionally, some sensitive mammals and birds are protected by the State as Fully Protected Mammals or Fully Protected Birds, as described in the California Fish and Game Code, Sections 4700 and 3511, respectively. SSC ("special" animals and plants)

listings include special status species, including all state and federal protected and candidate taxa, Bureau of Land Management (BLM) and US Forest Service (USFS) sensitive species, species considered to be declining or rare by the CNPS or National Audubon Society, and a selection of species which are considered to be under population stress but are not formally proposed for listing. This list is primarily a working document for the CDFW's CNDDB project. Informally listed taxa are not protected per se, but warrant consideration in the preparation of biotic assessments. For some species, the CNDDB is only concerned with specific portions of the life history, such as roosts, rookeries, or nest sites.

For the purposes of this assessment, the following acronyms are used for State status species:

| | |
|---|---|
| SE | State Endangered |
| ST | State Threatened |
| SCE | State Candidate Endangered |
| SCT | State Candidate Threatened |
| SFP | State Fully Protected |
| SP | State Protected |
| SR | State Rare |
| SSC | California Species of Special Concern |
| CWL | California Watch List |

Nesting birds, including raptors, are protected under California Fish and Game Code Section 3503, which reads, “It is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto.” In addition, under California Fish and Game Code Section 3503.5, “it is unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto”. Passerines and non-passerine land birds are further protected under California Fish and Game Code 3513. As such, CDFW typically recommends surveys for nesting birds that could potentially be directly (e.g., actual removal of trees/vegetation) or indirectly (e.g., noise disturbance) impacted by project-related activities. Disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered “take” by CDFW.

The CNPS is a private plant conservation organization dedicated to the monitoring and protection of sensitive species in the State. This organization has compiled an inventory comprised of the information focusing on geographic distribution and qualitative characterization of rare, threatened, or endangered vascular plant species of California (Tibor 2001). The list serves as the candidate list for listing as threatened and endangered by CDFW. The CNPS has developed five categories of rarity (CRPR):

| | |
|---|---|
| CRPR 1A | Presumed extinct in California |
| CRPR 1B | Rare, threatened, or endangered in California and elsewhere |
| CRPR 2A | Plants presumed extirpated in California but common elsewhere |
| CRPR 2B | Plants rare, threatened, or endangered in California but more common elsewhere |
| CRPR 3 | Plants about which we need more information – a review list |
| CRPR 4 | Species of limited distribution in California (i.e., naturally rare in the wild), but whose existence does not appear to be susceptible to threat |

As stated by the CNPS:

> "*Threat Rank is an extension added onto the California Rare Plant Rank and designates the level of endangerment by a 1 to 3 ranking with 1 being the most endangered and 3 being the least endangered. A Threat Rank is present for all California Rare Plant Rank 1B's, 2's, 4's, and the majority of California Rare Plant Rank 3's. California Rare Plant Rank 4 plants are seldom assigned a Threat Rank of 0.1, as they generally have large enough populations to not have significant threats to their continued existence in California; however, certain conditions exist to make the plant a species of concern and hence be assigned a California Rare Plant Rank. In addition, all California Rare Plant Rank 1A (presumed extinct in California), and some California Rare Plant Rank 3 (need more information) plants, which lack threat information, do not have a Threat Rank extension."* (CNPS 2024)

| | |
|---|---|
| 0.1 | Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat) |
| 0.2 | Fairly threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat) |
| 0.3 | Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known) |

## LOCAL PROTECTION AND CLASSIFICATIONS

<u>The following Local Protection and Classifications sections are excerpted from The Ontario Plan 2050 (Placeworks 2022).</u>

The City of Ontario Plan Environmental Resources Element contains goals and policies which pertain to the protection of biological resources in the City of Ontario:

**Goal ER5** Protected high value habitat and farming and mineral resource extraction activities that are compatible with adjacent development.

**Policy ER5-1** Habitat Conservation Areas. We support the protection of biological resources through the establishment restoration, and conservation of high-quality areas.

**Policy ER5-2** Entitlement and Permitting Process. We comply with state and federal regulations regarding protected species.

**Policy ER5-4** Transition of Farms. We protect both existing farms and sensitive uses around them as agricultural areas transition to urban uses.

### City of Ontario Municipal Codes

#### Municipal Code, Volume II, Chapter 2

Title 10, Parks and Recreation, Chapter 2, Parkway Trees, of the City's Municipal Code provides provisions on the preservation, regulation on the maintenance and removal of parkway trees, and establishes types and the locations for planting parkway trees. Parkway is defined as "…that portion of any public street right-of-way between the right-of-way boundary line and the curb line, and also the area enclosed within the curb lines of a medial divider."

The property owner abutting a public right-of-way is responsible for watering any tree in the parkway and for trimming that can be done from the ground to preserve the neat appearance and non-obstructed use of the parkway; the City is responsible for all major pruning. Removal or relocation of any parkway tree requires prior authorization from the City Public Works Agency through a permit process, and planting a replacement tree, whenever feasible, is a condition on any permit issued by the City for the removal of a parkway tree. Alternatively, an in-lieu deposit may be accepted as an alternate to the actual planting of any required parkway tree based on a fair value established by the Public Facilities Manager (The Ontario Plan 2022).

#### Municipal Code, Section 6.05.020

Section 6.05.020, Tree Preservation Policy and Protection Measures, of the Ontario Development Code establishes policies and measures that will further the preservation, protection, and maintenance of established and healthy heritage trees within the City. A Heritage Tree is one that is designated for preservation as a tree of historic or cultural significance, or a tree of importance to the community due to any one of the following factors:

- It is one of the largest or oldest trees of species located within the City and has a trunk diameter of 18 inches or greater when measured at 54 inches above grade;
- It has a historical significance due to association with a historic building, site, street, person, or event;
- It is a defining landmark or significant outstanding feature of a neighborhood or district, typical of early Ontario Landscapes. This includes Camphor Tree (*Cinnamomum camphora*), Deodar Cedar (*Cedrus deodara*), London Planetree (*Platanus acerifolia*), Cork Oak (*Quercus suber*), Holly Oak (*Quercus ilex*), and California Pepper (*Schinus molle*);

- It is a Native Tree. This means that it is one of the following California native tree species with a trunk diameter of more than 8 inches, measured at 54 inches above natural grade: California Sycamore (*Platanus racemose*), Torrey Pine (*Pinus torreyana*), Coast Live Oak (*Quercus agrifolia*), Engelmann Oak (*Quercus engelmannii*), Valley Oak (*Quercus lobata*), or California Bay (*Umbellularia californica*).

Healthy Heritage Trees that are approved for removal shall be replaced with new trees with a total trunk diameter equal to the tree(s) removed, or as deemed appropriate by the Approve Authority based on lot size and available planting space. Replacement trees are to be in addition to the quantity of trees required for landscaping. The Approving Authority is responsible for reviewing the landscape plan and approving appropriate species for tree replacement (The Ontario Plan 2022).

A tree inventory will be required and prepared by a City approved certified arborist or qualified horticulturalist, to determine the presence/absence of Heritage Trees including assessment of health, structure, condition, and expected life span of all affected specimens.

Property proposed for development on which a Heritage Tree exists, shall require the submittal of a Tree Inventory and Preservation Plan prepared by a licensed landscape architect, horticulturalist, certified arborist, or other related professional. Said plan shall be submitted concurrent with a Development Plan or building permit request for alterations of a site, and shall be reviewed and approved by the Approving Authority for the corresponding application request.

The Tree Inventory and Preservation Plan shall show all existing on-site trees, and those existing trees on abutting lots and public rights-of-way with a canopy or root zone that extends onto the site or within 8 feet of a construction, staging or storage area, or graded site. Furthermore, the Tree Inventory and Preservation Plan shall identify Tree Protection Areas and trees requested to be removed, and shall show replacement trees as required by this Division.

**Sphere of Influence General Plan Amendment, Final EIR, and Settlement Agreement**

In January 1998, the Ontario City Council approved a general plan amendment (GPA) and associated Final EIR for the sphere of influence (SOI), which is now known as the Ontario Ranch (previously the New Model Colony (NMC)). The GPA designated Ontario Ranch for a range of urban and suburban uses, including residential, commercial, business park, industrial, and open space. Most of Ontario Ranch was then in agricultural use. The Final EIR for the GPA assessed the impacts on biological resources of the conversion of Ontario Ranch from agricultural uses to developed urban and suburban uses. Before mitigation, significant impacts were identified for waterfowl and waterfowl habitat, raptors and raptor habitat, and the Delhi Sands Flower-Loving Fly (DSFLF) Ontario Recovery Unit. The EIR included three mitigation measures for impacts to biological resources:

- Mitigation Measure BR-1 modified the general plan to require the creation of new waterfowl habitat and specified a mitigation ratio of 2:1 for each acre of such habitat lost. This is off-site mitigation in the Prado Basin.
- Mitigation Measure BR-2 stipulated that the City shall create a Waterfowl and Raptor Conservation Area (WRCA), and included requirements and definitions for it; mitigation is off-site in the Prado Basin.
- Mitigation Measure BR-3 required the City to cooperate with the USFWS in taking specified actions to mitigate impacts to the Delhi Sands Flower-Loving Fly Recovery Unit.

Subsequent to the 1998 adoption of the SOI GPA and EIR, a lawsuit was filed against the City of Ontario by the Endangered Habitats League and the Sierra Club, challenging the City's CEQA compliance and approval of the SOI GPA. A Settlement Agreement was reached and agreed to by all parties that set forth revised mitigation measures for potential impacts in the New Model Colony (referred to as Annexation Area 163 in the agreement) to the burrowing owl, the DSFLF, raptor foraging and wildlife habitat, loss of open space, actual and potential habitat and agricultural land, and sensitive (listed and non-listed) species. These measures will be in effect until all the developable acres in the Ontario Ranch reach full buildout, as determined by the City.

- Prior to issuance of grading permits, Ontario shall impose a $4,320 per net acre mitigation fee on proposed developments in Annexation Area 163 that require discretionary approval or permitting from the City.
- Ontario, in consultation with CDFW, will identify, through CEQA review, lands occupied by burrowing owl and suitable as long-term habitat. The City will require avoidance of those lands to maintain a viable territory and require long-term maintenance through dedication in fee or grant of easement to the Land Trust. If the site is not viable long-term habitat, the developer shall pay the mitigation fee and make provisions for relocation of the owls.
- Since habitat that benefits DSFLF can be expected to benefit burrowing owl, up to 25 percent of the mitigation fee maybe used by the City for DSFLF recovery.
- All mitigation fees collected shall be used for the above-described purposes and may be used to purchase property, conservation easements, or other land with long-term conservation value for the environmental impacts; enhance/restore lands with such values; maintain and operates these lands; and pay for related administrative costs (not to exceed 10 percent of the total fees).
- Land/easements dedicated, conveyed, or purchased to benefit wildlife, waterfowl, raptors, and/or burrowing owl must have long-term conservation value for those species and must be managed by the land trust. The parcels must be in the habitat area designated as part of the settlement agreement. Unacceptable properties are those that would otherwise be purchased by another entity or group as open space mitigation for environmental impacts.

### City of Ontario Biological Resources Habitat Mitigation Fee

Since the Settlement Agreement, the City has established a habitat mitigation fee to cover potential environmental impacts to the Burrowing Owl, DSFLF, raptor foraging, loss of open space, and agricultural lands. Development impact fees for new development in Ontario Ranch were adopted on June 23, 2003, by the City Council. The Ontario Ranch

development impact fees include a habitat mitigation fee of $4,320 per net acre for proposed residential, commercial, hotel and restaurant, office, and industrial development. Mitigation fees have been collected by the City and have been deposited into a trust fund to be used for the acquisition, restoration, rehabilitation, and maintenance of lands deemed to have long-term conservation value. Up to $500 of the fees may be used for DSFLF. In addition, current City procedure is to require a habitat assessment to determine existing habitat and biological resources on proposed development sites. If the assessment determines that there is potential habitat for sensitive species, focused protocol surveys are required. If potential DSFLF habitat is present, two-year (consecutive) protocol surveys per the USFWS Interim General Survey Guidelines for DSFLF are required (The Ontario Plan 2022).

The land use plan for Ontario Ranch originally provided for establishment of the WRCA, a wetlands and habitat area near the confluence of the Cucamonga Creek and the Lower Deer Creek Channels. Creation of the WRCA as part of Ontario Ranch was intended to provide a concentrated area for wetlands that would receive storm drainage from the west. Funding for the environmental restoration of the existing 85-acre Lower Cucamonga flood control basin under the WRCA would have been provided through the USACE with matching funds from the City of Ontario. This conservation area plus acquisition of 145 acres of off-site mitigation land were intended to provide mitigation for impacts resulting from development of Ontario Ranch. However, under the conditions of the settlement agreement, the WRCA is no longer proposed (The Ontario Plan 2022).

In 2010, the Ontario City Council approved the selection of the Riverside Land Conservancy (today known as River and Land Conservancy) as the administrator of the habitat mitigation fees and to create a habitat program pursuant to the requirements of the Settlement Agreement between the City of Ontario, the Endangered Habitats League, and the Sierra Club. However, due to the economic downturn shortly after 2010, the contract between the City and the Riverside Land Conservancy was never ratified. It was anticipated that once development in Ontario Ranch began to commence, the City would ratify the contract (The Ontario Plan 2022).

In 2022, the City will be going out with a Request for Proposals (RFP) to select a non-profit land trust and/or organization specializing in habitat conservation. The selected non-profit and/or organization will be responsible for the administration of the habitat mitigation fees and creation of a habitat program pursuant to the requirements of the Settlement Agreement between the City of Ontario, the Endangered Habitats League, and the Sierra Club. In partnership with the CDFW, the City will work with the selected non-profit and/or organization to maintain an interactive mapping and current inventory of the burrowing owl occurrences and in the selection of adequate lands for passive relocation (The Ontario Plan 2022).

## SENSITIVE HABITATS

As stated by CDFW:

> "*One purpose of the vegetation classification is to assist in determining the level of rarity and imperilment of vegetation types. Ranking of alliances according to their degree of imperilment (as measured by rarity, trends, and*

*threats) follows NatureServe's Heritage Methodology, in which all alliances are listed with a G (global) and S (state) rank. For alliances with State ranks of S1-S3, all associations within them are also considered to be highly imperiled*". (CDFW 2024f)

No sensitive or undisturbed native habitats were documented within the Project Site and Offsite Areas. The Project Site and Offsite Areas are characterized primarily as heavily disturbed active dairy and agricultural facilities

## SENSITIVE PLANTS

Based on a review of the CNDDB, The Ontario Plan 2050 and existing conditions within and adjacent to the Specific Plan Boundary, a total of thirteen (13) sensitive plant species have potential to occur within the vicinity of the Project Site and Offsite Area. as presented in Table 3, *Sensitive Plant Species Assessment*.

**Table 3.**
**Sensitive Plant Species Assessment**

| **Species Name** (*Scientific Name*) Status | **Habitat Description** | **Comments** |
|---|---|---|
| | | |
| **Nevin's barberry** (*Berberis nevinii*)<br><br>FE/SE<br>CRPR 1B.1 | Perennial evergreen shrub which generally blooms from February to June within chaparral, cismontane woodland, coastal scrub, and riparian scrub in sandy, gravelly substrates (CNPS 2024). | Not detected. |
| **Plummer's mariposa-lily** (*Calochortus plummerae*)<br><br>CRPR 4.2 | Perennial bulbiferous herb which generally blooms from May to June within chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and grassland habitats with granite and rocky substrates (CNPS 2024). | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |
| **Lucky morning glory** (*Calystegia felix*)<br><br>CRPR 1B.1 | Annual rhizomatous herb generally blooming from March to September within meadows, seeps and riparian scrub habitat (CNPS 2024). | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |
| **Parry's spineflower** (*Chorizanthe parryi var. parryi*)<br><br>CRPR 1B.1 | Annual herb which generally blooms from April to June within chaparral, cismontane woodland, coastal scrub and grassland habitats with sandy and/or rocky openings. (CNPS 2024) | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| **Slender-horned spineflower**<br>(*Dodecahema leptoceras*)<br><br>CRPR 1B.1<br>FE/SE | Annual herb which generally blooms from April to June within chaparral, cismontane woodland and coastal scrub (alluvial fan) with sandy substrates. (CNPS 2024) | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |
| **Mesa horkelia**<br>(*Horkelia cuneata ssp. puberula*)<br><br>CRPR 1B.1 | Perennial herb which generally blooms from February to September within chaparral (maritime), cismontane woodland and coastal scrub with sandy or gravelly substrates. (CNPS 2024) | Not detected. |
| **Robinson's pepper-grass**<br>(*Lepidium virginicum var. robinsonii*)<br><br>CRPR 4.3 | Annual herb which generally blooms from January to July within chaparral and coastal sage scrub habitats (CNPS 2024). | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |
| **Prostate vernal pool navarretia**<br>(*Navarretia prostrata*)<br><br>CRPR 1B.2 | Annual herb generally blooming from April to July within coastal scrub, meadows and seeps, valley and foothill grasslands and vernal pools (CNPS 2024). | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |
| **Brand's star phacelia**<br>(*Phacelia stellaris*)<br><br>CRPR 1B.1 | Annual herb generally blooming from March to June within coastal sage scrub and dune habitats (CNPS 2024). | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |
| **White rabbit tobacco**<br>(*Pseudognaphalium leucocephalum)*<br><br>CRPR 2B.2 | Perennial herb generally blooming from July to December within chaparral, cismontane woodland, coastal scrub and riparian woodland habitats (CNPS 2024). | Not detected. |
| **Salt spring checkerbloom**<br>(*Sidalcea neomexicana*)<br><br>CRPR 2.2 | Perennial herb which generally blooms from March to June within chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, and playas within alkaline/mesic gravelly substrates (CNPS 2024). | Not detected. |
| **San Bernardino aster**<br>(*Symphyotrichum defoliatum*)<br><br>CRPR 1B.2 | Perennial rhizomatous herb generally blooming from July to December within various vegetation communities in associating with wetland substrates (ditches, streams and springs) (CNPS 2024). | Not detected. |

| **Species Name** (*Scientific Name*) Status | **Habitat Description** | **Comments** |
|---|---|---|
| **Rigid fringepod** (*Thysanocarpus rigidus*)<br><br>CRPR 1B.2 | Annual herb generally blooming from February to May within pinyon and juniper woodland habitats (CNPS 2024). | No Potential. Not expected to occur onsite based on a lack of suitable or undisturbed vegetation or soils. |

**California Native Plant Society (CNPS): California Rare Plant Rank (CRPR)**
CRPR 1A – plants presumed extinct in California
CRPR 1B – plants rare, threatened, or endangered in California, but more common elsewhere
CRPR 2A – plants presumed extirpated in California but common elsewhere
CRPR 2B – plants rare, threatened, or endangered in California but more common elsewhere
CRPR 3 – plants about which we need more information, a review list
CRPR 4 – plants of limited distribution, a watch list
.1 – Seriously endangered in California
.2 – Fairly endangered in California
.3 – Not very endangered in California

**Federal (USFWS) Protection and Classification**
FE – Federally Endangered
FT – Federally Threatened
FC – Federal Candidate for Listing

**State (CDFW) Protection and Classification**
SE – State Endangered
ST – State Threatened

No suitable habitat for sensitive plant species including those listed as federal or state threatened/endangered was documented within the Project Site and Offsite Areas. No sensitive plant species listed in Table 3, *Sensitive Plant Species Assessment* or undisturbed native habitats were documented or expected to occur within the Project Site and Offsite Areas. The Project Site and Offsite Areas are primarily characterized as heavily disturbed active dairy and agricultural facilities.

## SENSITIVE WILDLIFE

Based on a review of the CNDDB, The Ontario Plan 2050 and existing site conditions, a total of fifty (50) sensitive invertebrate and wildlife species have the potential of occurring within the vicinity of the Specific Plan Boundary, as presented in Table 4, *Sensitive Wildlife Species Assessment*.

**Table 4. Sensitive Wildlife Species Assessment**

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| **INVERTEBRATES** | | |
| **Crotch bumble bee**<br>(*Bombus crotchii*)<br><br>SC | Range extends from southern to northern California within a variety of habitats including grassland, scrub, chaparral and desert habitats. Food plants include but are not limited to the following genera: *Antirrhinum, Phacelia, Clarkia, Cordylanthus, Dendromecon, Medicago Eschscholzia, Chaenactis, Eriogonum, Hypericum, Lantana, Lupinus, Salvia, Asclepias, Cirsium, Monardella, Keckiella, Acmispon, Euthamia, Ehrendorferia, Vicia,* and/or *Trichostema*. | No Potential. Not expected to occur onsite based on a lack of suitable food sources and heavily disturbed condition of the Project Site and Offsite Areas. |
| **Delhi Sands flower-loving fly**<br>(*Rhaphiomidas terminatus abdominalis*)<br><br>FE | Restricted to Delhi sand formations in Riverside and San Bernardino Counties. | Low Potential. The Delhi Sands flower-loving fly is not expected to occur onsite based on the historic and ongoing impacts to the Project Site and Offsite Areas respective of active dairy and agricultural use. However, approximately 19-acres of the eastern region of the Project Site and Project Level Assessment Area are mapped as Delhi soils, as shown in Figure 10, *Soils Association Map*. |
| **AMPHIBIANS** | | |
| **Western spadefoot**<br>(*Spea hammondii*)<br><br>SSC | Primary habitat for this species includes suitable breeding habitat below 1500 meters (i.e., vernal pools or other standing water that is free of exotic species) with secondary habitats including adjacent chaparral, sage scrub, grassland, and alluvial scrub habitats. | No Potential. Not expected to occur onsite based on a lack of suitable undisturbed soils and continuous dairy and agricultural activities conducted throughout the Project Site and Offsite Areas. |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| **REPTILES** | | |
| **Southern California legless lizard**<br>(*Anniella stebbinsi*)<br><br>SSC | Broadleaved upland forest, chaparral, coastal dunes, and coastal scrub. Occurs in sandy or loose loamy soils under sparse vegetation, generally in moist, loose soil (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed vegetation or soils. |
| **California glossy snake**<br>(*Arizona elegans occidentalis*)<br><br>SSC | Generalist reported from a range of scrub and grassland habitats, often with loose or sandy soils (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Impact Area based on a lack of suitable undisturbed vegetation or soils. |
| **Coastal western whiptail**<br>(*Aspidoscelis tigris stejnegeri*)<br><br>SSC | The coastal western whiptail occurs in a wide variety of habitats including coastal sage scrub, desert scrub, Riversidean alluvial fan scrub, woodlands, grasslands, playas, and respective ecotones between these habitats. | No Potential. Not expected to occur within Project Site and Offsite Impact Area based on a lack of suitable undisturbed vegetation or soils. |
| **San Bernardino ringneck snake**<br>(*Diadophis punctatus modestus*) | Chaparral, coastal sage scrub, grassland, riparian, and woodlands (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed vegetation or soils. |
| **Western pond turtle**<br>(*Actinemys marmorata*)<br><br>SSC | The western pond turtle inhabits slow moving permanent or intermittent streams, small ponds, small lakes, reservoirs, abandoned gravel pits, permanent and ephemeral shallow wetlands, stock ponds, and sewage treatment lagoons (Rathbun *et al*., 1992; Holland, 1994). Pools are the preferred habitat within streams (Bury, 1972,) | Not Detected. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed basking sites and permanent water. |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| **Coast horned lizard**<br>(*Phrynosoma blainvillii*)<br><br>SSC | Open areas of sandy soil with coastal sage scrub, chaparral, grassland, riparian, and washes and watercourses (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed vegetation or soils. |
| **Coast patch-nosed snake**<br>(*Salvadora hexalepis virgultea*)<br><br>SSC | The coast patch-nosed snake prefers brushy coastal sage scrub/ chaparral habitats. | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed vegetation or soils. |
| **Two-striped gartersnake**<br>(*Thamnophis hammondii*)<br><br>SSC | Marsh and swamp, riparian scrub, riparian woodland, and wetland. Highly aquatic, found in or near permanent fresh water. Often along streams with rocky beds and riparian growth (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed vegetation, soils or permanent water. |
| **BIRDS** | | |
| **Cooper's hawk**<br>(*Accipiter cooperii*)<br><br>SSC | Cooper's hawk is most commonly found within or adjacent to riparian/oak forest and woodland habitats. This uncommon resident of California increases in numbers during winter migration. | Low Potential – May occasionally forage within Project Site and Offsite Areas and breed within the mature Eucalyptus trees. |
| **Sharp-shinned hawk**<br>(*Accipiter striatus*)<br><br>CWL | Potential habitat for the sharp-shinned hawk includes montane coniferous forest for potential breeding areas and riparian scrub, woodland, forest habitat, oak woodland and forest, chaparral, coastal sage scrub, desert scrub, and Riversidean alluvial fan sage scrub for foraging. | Low Potential – May occasionally forage within Project Site and Offsite Areas. |
| **Tri-colored blackbird**<br>(*Agelaius tricolor*)<br><br>ST/SSC | Marshes, grasslands. Breeding colonies require nearby water, nesting substrate, foraging habitat of grassland, woodland, agricultural cropland (Placeworks 2022). | No Potential. Not expected to occur onsite based on a lack of nesting habitat (cattail, rushes, and willows) within or adjacent to the Project Site and Offsite Areas. |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| **Golden eagle**<br>(*Aquila chrysaetos*)<br><br>CWL, SFP | Within southern California, the species prefers grasslands, brushlands (coastal sage scrub and chaparral), deserts, oak savannas, open coniferous forests, and montane valleys (Garrett and Dunn 1981) | Low Potential – May occasionally forage within Project Site and Offsite Areas. |
| **Great egret**<br>(*Ardea alba*)<br><br>Nesting Colony | Wet areas, fields, margins of open water. | Moderate Potential – Expected to occasionally forage within Project Site and Offsite Areas but not breed. |
| **Great blue heron**<br>(*Ardea herodias*)<br><br>Nesting Colony | Wet areas, fields, margins of open water. | Moderate Potential – Expected to occasionally forage within Project Site and Offsite Areas but not breed. |
| **Burrowing owl**<br>(*Athene cunicularia)*<br><br>SSC | The burrowing owl uses predominantly open land, including grassland, agriculture, playa, sparse coastal sage scrub, desert scrub habitats. Some breeding burrowing owls are year-round residents and additional individuals from the north may winter throughout the region. | Moderate Potential – Suitable burrows larger than 4 inches in diameter and foraging habitat documented within the fallow fields within Project Site and Offsite Areas. |
| **Ferruginous hawk**<br>(*Buteo regalis*)<br><br>CWL | Grasslands and other open terrain of the plains and foothills. Wintering species. Primarily open fields with low vegetation (Placeworks 2022). | Low Potential – May occasionally forage within Project Site and Offsite Areas. |
| **Swainson's hawk**<br>(*Buteo swainsoni*)<br><br>ST | Grasslands and other open terrain (Placeworks 2022). | Low Potential – May occasionally forage within Project Site and Offsite Areas. |
| **Mountain plover**<br>(*Charadrius montanus*)<br><br>SSC | Dry upland prairies and plains, semidesert, bare dirt fields (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed vegetation. |
| **Northern harrier**<br>(*Circus cyaneus*)<br><br>SSC | The northern harrier frequents open wetlands, wet/lightly grazed pastures, fields, dry uplands/prairies, mesic | High Potential. Observed adjacent to within Project Site and Offsite Areas during previous surveys of adjacent |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| | grasslands, drained marshlands, croplands, meadows, grasslands, open rangelands, fresh and saltwater emergent wetlands. | properties in 2022 (Cadre Environmental 2023). |
| **Western yellow-billed cuckoo**<br>(*Coccyzus americanus occidentalis*)<br><br>FT/SE | Riparian. Uncommon to rare summer resident of valley foothill and desert riparian habitats (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed riparian scrub, forest or woodland vegetation. |
| **Snowy egret**<br>(*Egretta thula*)<br><br>Nesting Colony | Wet areas, fields, margins of open water (Placeworks 2022). | Moderate Potential – Expected to occasionally forage within Project Site and Offsite Areas but not breed. |
| **White-tailed kite**<br>(*Elanus leucurus*)<br><br>SFP | The white-tailed kite is found in riparian, oak woodlands adjacent to large open spaces including grasslands, wetlands, savannahs and agricultural fields. This non-migratory bird species occurs throughout the lower elevations of California and commonly nests in coast live oaks (Unitt 2004). | Low Potential – May occasionally forage within Project Site and Offsite Areas. |
| **California horned lark**<br>(*Eremophila alpestris actia*)<br><br>CWL | Variety of open habitats, usually where trees and large shrubs are absent (Placeworks 2022). | Moderate Potential – Expected to occasionally forage and breed within Project Site and Offsite Areas. |
| **Merlin**<br>(*Falco columbarius*)<br><br>CWL | Grasslands, coastal sage scrub and estuaries, windrows, open fields (Placeworks 2022). | Low Potential – May occasionally forage within Project Site and Offsite Areas. |
| **Prairie falcon**<br>(*Falco mexicanus*)<br><br>CWL | Habitat use of the prairie falcon includes annual grasslands to alpine meadows. The prairie falcon is associated primarily with perennial grasslands, savannahs, rangeland, some agricultural fields during the winter season, and | Low Potential – May occasionally forage within Project Site and Offsite Areas. |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| | desert scrub areas, all typically dry environments of western North American where there are cliffs or bluffs for nest sites (Brown and Amadon 1968) | |
| **American peregrine falcon**<br>(*Falco peregrinus anatum*)<br><br>SFP | Throughout the species' range, peregrine falcons are found in a large variety of open habitats, including tundra, marshes, seacoasts, savannahs and high mountains (AOU 1998) | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed vegetation. |
| **Loggerhead shrike**<br>(*Lanius ludovicianus*)<br><br>SSC | This species of shrike hunts in open or grassy areas and nests in large chaparral shrubs such as ceanothus and lemonade berry. | Low Potential – May occasionally forage within Project Site and Offsite Areas. |
| **California gull**<br>(*Larus californicus*)<br><br>CWL | Nearly all types of fresh and salt water, cropland, landfills, refuse areas, open lawns (Placeworks 2022). | Moderate Potential – Expected to occasionally forage within Project Site and Offsite Areas. |
| **California black rail**<br>(*Laterallus jamaicensis coturniculus*)<br><br>ST/SFP | Brackish marsh, freshwater marsh, marsh and swamp, salt marsh, wetland. Inhabits freshwater marshes, wet meadows and shallow margins of saltwater marshes bordering large bays (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |
| **Long-billed curlew**<br>(*Numenius americanus*)<br><br>CWL | Coastal estuaries, upland herbaceous areas, croplands, wet areas, open fields, shores of open water. | Moderate Potential – Expected to occasionally forage within Project Site and Offsite Areas. |
| **Double-crested cormorant**<br>(*Nannopterum auritum*)<br><br>CWL | Lakes, fresh, salt, and estuarine waters (Placeworks 2022). | Moderate Potential – Expected to occasionally forage within Project Site and Offsite Areas. |
| **White-faced ibis**<br>(*Plegadis chihi*)<br><br>CWL | Freshwater marshes and brackish areas (Placeworks 2022). | High Potential. Observed adjacent to within Project Site and Offsite Areas during previous surveys of adjacent properties in 2022 (Cadre Environmental 2023). |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| **Coastal California gnatcatcher**<br>(*Polioptila californica californica*)<br><br>FT/SSC | The coastal California gnatcatcher is a non-migratory bird species that primarily occurs within sage scrub habitats in coastal southern California dominated by California sagebrush. | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats including coastal sage scrub and associations. |
| **MAMMALS** | | |
| **Pallid bat**<br>(*Antrozous pallidus*)<br><br>SSC | Chaparral, coastal scrub, desert wash, Great Basin grassland, Great Basin scrub, Mojavean desert scrub, riparian woodland, Sonoran desert scrub, upper montane coniferous forest, and valley and foothill grassland. Oak and grassland ecotones. Prefers foraging in the open. Roosts in attics or rock cracks; in the open, near foliage at night (Placeworks 2022). | Low Potential. Expected to occasionally forage within Project Site and Offsite Areas. |
| **Northwestern San Diego pocket mouse**<br>(*Chaetodipus fallax fallax*)<br><br>SSC | The northwestern San Diego pocket mouse occurs in coastal sage, upland sage scrubs, and alluvial fan sage scrub, sage scrub/grassland ecotones, chaparral, and desert scrubs at all elevations up to 6,000 feet. | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats including coastal sage scrub and associations. |
| **Townsend's big-eared bat**<br>(*Corynorhinus townsendii*)<br><br>SSC | A wide variety of habitats including woodlands and arid grasslands. Roosts in mines and caves (Placeworks 2022). | Low Potential. Expected to occasionally forage within Project Site and Offsite Areas. |
| **San Bernardino kangaroo rat**<br>(*Dipodomys merriami parvus*)<br><br>FE/SSC | Prefers alluvial scrub, coastal sage scrub habitats with sandy and gravelly substrates. | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats including Riversidean alluvial fan sage scrub and associations. |
| **Stephens' kangaroo rat**<br>(*Dipodomys stephensi*) | The Stephens' kangaroo rat is found almost exclusively in open | No Potential. Not expected to occur within Project Site and Offsite Areas based on |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| FE/ST | grasslands or sparse shrublands with cover of less than 50 percent during the summer. | a lack of suitable undisturbed habitats. |
| **Western mastiff bat**<br>(*Eumops perotis californicus*)<br><br>SSC | Roosts in rocky areas and forages in grassland, shrublands, and woodlands. | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |
| **Western yellow bat**<br>(*Lasiurus xanthinus*)<br><br>SSC | Roosts in the skirts of palm trees and forages in adjacent habitats. | Low Potential. Scattered palm trees representing potential roosting habitat documented within the central region of the within Project Site and Offsite Areas. |
| **San Diego black-tailed jackrabbit**<br>(*Lepus californicus bennettii*)<br><br>SSC | The San Diego black-tailed jackrabbit in open habitats, primarily including grasslands, sage scrub, alluvial fan sage scrub, and Great Basin sage scrub. | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |
| **Western small-footed myotis**<br>(*Myotis ciliolabrum*) | Feeds among trees or over brush. Roosts in caves, mines, and in cliff or rock openings (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |
| **Yuma myotis**<br>(*Myotis yumanensis*) | Water and wooded canyon bottoms. Roosts in caves and abandoned buildings (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |
| **San Diego desert woodrat**<br>(*Neotoma lepida intermedia*)<br><br>SSC | Riversidean and coastal sage scrub, chaparral and nonnative grasslands. Shrub and desert habitats, primarily associated with rock outcroppings, boulders, cacti, or areas of dense undergrowth (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |
| **Pocketed free-tailed bat**<br>(*Nyctinomops femorosaccus*)<br><br>SSC | Desert habitats. Roosts in rock crevices in cliffs (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |

| **Species Name**<br>(*Scientific Name*)<br>Status | **Habitat Description** | **Comments** |
|---|---|---|
| **Big free-tailed bat**<br>(*Nyctinomops macrotis*)<br><br>SSC | Desert habitats. Roosts in rock crevices in cliffs (Placeworks 2022). | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |
| **Los Angeles pocket mouse**<br>(*Perognathus longimembris brevinasus*)<br><br>SSC | Low elevation grassland alluvial sage scrub and coastal sage scrub habitats. | No Potential. Not expected to occur within Project Site and Offsite Areas based on a lack of suitable undisturbed habitats. |

**Federal (USFWS) Protection and Classification**
FE – Federally Endangered
FT – Federally Threatened
FC – Federal Candidate for Listing

**State (CDFW) Protection and Classification**
SE – State Endangered
SSC – State Species of Special Concern
CWL – California Watch List
SFP – State Fully Protected
SC – State Candidate for Listing

The federally endangered Delhi Sands flower-loving fly (DSFLF) is not expected to occur within Project Site and Offsite Areas based on the historic and ongoing impacts to the Project Site respective of active dairy and agricultural use. However, approximately 19-acres of the eastern region of the Project Site and Project Level Assessment Area are mapped as Delhi soils, as shown in Figure 10, *Specific Plan Soils Association Map*.

The heavily disturbed active dairy and agricultural facilities documented within the within Project Site and Offsite Areas provide low to high likelihood of occurrence (foraging, breeding and roosting habitat) for the following sensitive or locally monitored species:

- Cooper's hawk (*Accipiter cooperii*), SSC
- Sharp-shinned hawk (*Accipiter striatus*), CWL
- Golden eagle (*Aquila chrysaetos*), CWL, SFP
- Great egret (*Ardea alba*), Nesting Colony
- Great blue heron (*Ardea herodias*), Nesting Colony
- Burrowing owl (*Athene cunicularia),* SSC
- Ferruginous hawk (*Buteo regalis*), CWL
- Swainson's hawk (*Buteo swainsoni*), ST
- Northern harrier (*Circus cyaneus*), SSC
- Snowy egret (*Egretta thula*), Nesting Colony
- White-tailed kite (*Elanus leucurus*), SFP
- California horned lark (*Eremophila alpestris actia*), CWL
- Merlin (*Falco columbarius*), CWL
- Prairie falcon (*Falco mexicanus*), CWL
- Loggerhead shrike (*Lanius ludovicianus*), SSC

- California gull (*Larus californicus*), CWL
- Long-billed curlew (*Numenius americanus*), CWL
- Double-crested cormorant (*Nannopterum auritum*), CWL
- White-faced ibis (*Plegadis chihi*), CWL
- Pallid bat (*Antrozous pallidus*), SSC
- Townsend's big-eared bat (*Corynorhinus townsendii*), SSC
- Western yellow bat (*Lasiurus xanthinus*), SSC

The Project Site and Areas do not occur within or adjacent to a USFWS designated critical habitat for any federally listed threatened or endangered species.

### JURISDICTIONAL WETLAND RESOURCES

No wetlands or jurisdictional resources regulated by the USACE, CDFW, or RWQCB were documented within the Project Site and Offsite Areas. The artificially created unvegetated dairy effluent retention ponds are isolated, located in uplands and currently rotated in use resulting in a wet (inundated) and dry phase. All of the active retention ponds are devoid of wetland vegetation including but not limited to riparian scrub, forest or woodland habitat.

Impacts to water quality would be less than significant during both construction and operation following preparation of a WQMP, SWPPP and compliance with NPDES permit and San Bernardino County Regional MS4 code provisions.

## ENVIRONMENTAL IMPACTS

The following section includes an analysis of the direct and/or indirect impacts of the proposed action on sensitive biological resources. This analysis characterizes the project related activities that are anticipated to adversely impact the species, and when feasible, quantifies such impacts. Direct effects are defined as actions that may cause an immediate effect on the species or its habitat, including the effects of interrelated actions and interdependent actions. Indirect effects are caused by or result from the proposed actions, are later in time, and are reasonably certain to occur. Indirect effects may occur outside of the area directly affected by the proposed action.

### THRESHOLD OF SIGNIFICANCE

The environmental impacts relative to biological resources are assessed using impact significance criteria which mirror the policy statement contained in the CEQA at Section 21001 (c) of the Public Resources Code. This section reflects that the legislature has established it to be the policy of the state to:

> "*Prevent the elimination of fish and wildlife species due to man's activities, ensure that fish and wildlife populations do not drop below self-perpetuating levels, and preserve for future generations representations of all plant and animal communities*…"

The following definitions apply to the significance criteria for biological resources:

- "*Endangered*" means that the species is listed as endangered under state or federal law.

- "*Threatened*" means that the species is listed as threatened under state or federal law.

- "*Rare*" means that the species exists in such small numbers throughout all or a significant portion of its range that it may become endangered if its environment worsens.

- "*Region*" refers to the area within southern California that is within the range of the individual species.

- "*Sensitive habitat*" refers to habitat for plants and animals (1) which plays a special role in perpetuating species utilizing the habitat on the property, and (2) without which there would be substantial danger that the population of that species would drop below self-perpetuating levels.

- "*Substantial effect*" means significance loss or harm of a magnitude which, based on current scientific data and knowledge, (1) would cause a species or a native plant or animal community to drop below self-perpetuating levels on a statewide or regional basis or (2) would cause a species to become threatened or endangered.

Also, the determination of impacts has been made according to the federal definition of "*take*". FESA prohibits the "*taking*" of a member of an endangered or threatened wildlife species or removing, damaging, or destroying a listed plant species by any person (including private individuals and private or government entities). FESA defines "*take*" as "*to harass, harm, pursue, hunt, shoot, would, kill, trap, capture or collect*" an endangered or threatened species, or to attempt to engage in these activities.

## DIRECT IMPACTS

Specifically, the biological resources assessment report addresses the following CEQA Environmental Checklist items.

| **Environmental Issues** | **Potentially Significant Impact** | **Less than Significant with Mitigation** | **Less than Significant Impact** | **No Impact** |
|---|---|---|---|---|
| Would the Project: | | | | |
| **a)** Have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service? | | **X** | | |

| Environmental Issues | Potentially Significant Impact | Less than Significant with Mitigation | Less than Significant Impact | No Impact |
|---|---|---|---|---|
| **b)** Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service? | | **X** | | |
| **c)** Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means? | | | | **X** |
| **d)** Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites? | | **X** | | |
| **e)** Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance? | | X | | |
| **f)** Conflict with the provisions of an adopted Habitat Conservation Plan, Native Community Conservation Plan, or other approved local, regional, or state habitat conservation plan? | | | | **X** |

*a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?*

**Less than Significant with Mitigation**. The 213.86-acre Project Site and Offsite Areas would not have a substantial adverse effect, either directly or through habitat modifications, on any plant species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. No native undisturbed suitable habitat, soils or sensitive plant species observations were documented or expected to occur within the Project Site and Offsite Areas, as outlined in Table 3. *Sensitive Plant Species Assessment*. Therefore, no mitigation is required or proposed.

The 213.86-acre Project Site and Offsite Areas may result in a substantial adverse effect, either directly or through habitat modifications, on wildlife species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS, as outlined in Table 4, *Sensitive Wildlife Species Assessment*.

The federally endangered Delhi Sands flower-loving fly is not expected to occur onsite based on the historic and ongoing impacts to the Project Site and Offsite Areas respective of active dairy and agricultural use. However, approximately 19-acres of the eastern region of the Project Site and Project Level Assessment Area is mapped as Delhi soils, as shown in Figure 10, *Soils Association Map*. Current City procedure is to require a habitat assessment to determine existing habitat and biological resources on proposed development sites. If the assessment determines that there is potential habitat for Delhi Sands flower-loving fly, two-year (consecutive) protocol surveys per the USFWS Interim General Survey Guidelines for DSFLF are required (The Ontario Plan 2022). Potential impacts to DSFLS would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee, and **CM BIO-3**: Delhi Sands Flower-loving Fly Habitat Assessment.

Suitable foraging and nesting habitat for the Cooper's hawk (SSC) was documented within the Project Site and Offsite Areas. Potential impacts to foraging and nesting habitat for this species would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee, and Conservation Measure **CM BIO-4**: Nesting Bird and Raptor Preconstruction Surveys.

Suitable foraging and/or breeding habitat for the *s*harp-shinned hawk *(*CWL), golden eagle (CWL, SFP), great egret, great blue heron, burrowing owl (SSC), ferruginous hawk (CWL), Swainson's hawk (ST), northern harrier (SSC), snowy egret, white-tailed kite (SFP), California horned lark (CWL), merlin (CWL), prairie falcon (CWL), loggerhead shrike (SSC), California gull (CWL), long-billed curlew (CWL), double-crested cormorant (CWL), and white-faced ibis *(*CWL) was documented within the agricultural fields and artificially created unvegetated dairy effluent retention ponds within the Project Site and Offsite Areas. Potential impacts to foraging and/or breeding habitat for these species would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee, and Conservation Measure **CM BIO-4**: Nesting Bird and Raptor Preconstruction Surveys.

Suitable burrows larger than 4-inches in diameter and foraging habitat for the burrowing owl (SSC) were documented within and adjacent to the Project Site and Offsite Areas. Potential impacts to refugia, nesting and foraging habitat for this species would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee, and Conservation Measure **CM-BIO-5:** Focused and Preconstruction Burrowing Owl Surveys.

Suitable foraging and/or roosting habitat for the following bat species including pallid bat (SSC), Townsend's big-eared bat (SSC), and western yellow bat (SSC) was documented onsite. Potential impacts to foraging habitat for these species would be mitigated to a

level of less than significant following implementation of Mitigation Measure **MM BIO-6**: Focused Bat Survey.

b) *Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS?*

**Less than Significant with Mitigation**. A total of 194.05-acres within the Project Site and 19.81-acre Offsite Area (213.86-acres total) of vegetation communities and developed areas will be directly and permanently impacted as a result of project implementation, as summarized in Table 5, *Specific Plan Vegetation Community Impacts,* and illustrated on Figure 11*, Vegetation Communities Impact Map*. No riparian (scrub, forest, woodland), sensitive or undisturbed native/natural habitats were documented within or adjacent to the Project Site and Offsite Areas. The Project Site and Offsite Areas are characterized as heavily disturbed active dairy and agricultural facilities. Several artificially created dairy effluent retention ponds are located onsite and are either devoid of vegetation of inundated with discharge. Permanent impacts to primarily dairy, agricultural lands and artificially created dairy effluent retention ponds would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-1**: City of Ontario Biological Resources Habitat Mitigation Fee.

**Table 5.**
**Specific Plan Vegetation Community Impacts**

| Vegetation Community | Project Site Acres | *Project Level Assessment Area Acres | Offsite Areas Acres | Project Site Impact Acres | Offsite Areas Impacts Acres | Total Project Site & Offsite Areas Impacts |
|---|---|---|---|---|---|---|
| Active Dairy | 133.55 | 38.56 | 7.55 | 133.55 | 7.55 | 141.1 |
| Active Agriculture | 45.92 | 2.77 | 1.01 | 45.92 | 1.01 | 46.93 |
| Disturbed | 1.11 | 2.31 | 0.19 | 1.11 | 0.19 | 1.3 |
| Developed | 13.19 | 19.65 | 10.60 | 13.19 | 10.60 | 23.79 |
| Ornamental | 0.28 | 0.00 | 0.46 | 0.28 | 0.46 | 0.74 |
| **TOTAL** | **194.05** | **63.29** | **19.81** | **194.05** | **19.81** | **213.86** |

** The 63.29-acre Project Level Assessment Area is located within the northern region of the Specific Plan Boundary including APN's 0216-311-09, 1053-301-01, -02, 1053-311-01, -02, 1053-321-01, -02, and -03. Authorization to access this region of the project was not provided and therefore was analyzed programmatically based on aerial photographs and assessments from the adjacent parcel boundaries. To ensure that potential adverse effects to sensitive species and resources are reduced to a less than significant level, a focused biological resources assessment and impact analysis shall be conducted in this Project Level Assessment Area portion of the Specific Plan Boundary prior to approval of development within this region. In addition to completing CEQA review, any focused surveys and required mitigation measures shall be implemented prior to project approval and initiation of construction,* ***CM BIO-7*** *Programmatic Assessment Area CEQA Analysis.*

c) *Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?*

**No Impact.** No wetlands or jurisdictional resources regulated by the USACE, CDFW, or RWQCB were documented within the Project Site and Offsite Areas. The artificially created unvegetated dairy effluent retention ponds are isolated, located in uplands and currently rotated in use resulting in a wet (inundated) and dry phase. All of the active retention ponds are devoid of wetland, riparian scrub, forest or woodland habitats.

Impacts to water quality would be less than significant during both construction and operation following preparation of a Water Quality Management Plan, Storm Water Pollution Prevention Plan and compliance with National Pollutant Discharge Elimination System permit and San Bernardino County Regional Municipal Separate Stormwater Sewer System (MS4) code provisions. Therefore, no mitigation is required or proposed.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

**Less than Significant with Mitigation.** The Project Site and Offsite Areas are completely bordered by high traffic roads, commercial/residential development, active dairy/agricultural facilities and does not represent a wildlife movement corridor or route between open space habitats. Therefore, no mitigation is required or proposed.

The Project Site and Offsite Areas possess vegetation including trees and shrubs expected to potentially provide nesting habitat for raptors and migratory birds protected under the CDFG Codes. Measures for potential direct/indirect impacts to common and sensitive bird and raptor species will require compliance with the CDFG Code Section 3503. Construction outside the nesting season (between September 1st and January 31st) does not require preconstruction nesting bird surveys. However, if construction is proposed between February 1st and August 31st, a qualified biologist will conduct a preconstruction nesting bird and raptor survey(s) no more than three (3) days prior to initiation of grading to document the presence or absence of nesting birds or raptors within or directly adjacent (200 feet, up to 500 feet for raptors) to the Project Site and Offsite Areas.

Loss of an active nest would be considered a potentially significant impact. Impacts to raptor foraging and potential nesting bird habitat would be reduced to less than significant with the implementation of Conservation Measure **CM BIO-4**: Nesting Bird and Raptor Preconstruction Surveys.

e) *Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?*

**Less than Significant with Mitigation.** Several mature trees including but not limited to pine, California sycamore white mulberry, California ash, olive, Chinese elm, tree of heaven, blue gum and red gum trees are scattered throughout the Project Site and Offsite Areas primarily within right-of-way's and adjacent to existing residences. Therefore, a

tree inventory will be required and prepared by a City approved certified arborist or qualified horticulturalist, to determine the presence/absence of Heritage Trees including assessment of health, structure, condition, and expected life span of all affected specimens.

Property proposed for development on which a Heritage Tree exists, shall require the submittal of a Tree Inventory and Preservation Plan prepared by a licensed landscape architect, horticulturalist, certified arborist, or other related professional. Said plan shall be submitted concurrent with a Development Plan or building permit request for alterations of a site, and shall be reviewed and approved by the Approving Authority for the corresponding application request. Permanent impacts to Heritage Trees would be mitigated to a level of less than significant following implementation of Mitigation Measure **MM BIO-2**: Tree Inventory and Preservation Plan.

*f) Conflict with the provisions of an adopted Habitat Conservation Plan, Native Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?*

**No Impact**. The Project Site and Offsite Areas are not located within or adjacent to a Conservation Program Area. Therefore, implementation of the project would not result in a conflict with the provisions of an adopted habitat conservation plan and no impact would occur. Therefore, no mitigation is required or proposed.

**INDIRECT IMPACTS**

**Water Quality**

Impacts to water quality would be less than significant during both construction and operation following preparation of a Water Quality Management Plan, Storm Water Pollution Prevention Plan and compliance with National Pollutant Discharge Elimination System permit and San Bernardino County Regional Municipal Separate Stormwater Sewer System (MS4) code provisions. Therefore, no mitigation is required or proposed.

**Toxics**

Toxic sources within the Project Site and Offsite Areas would be limited to those commonly associated with residential and mixed-use developments such as pesticides, insecticides, herbicides, fertilizers, and vehicle emissions. In order to mitigate for the potential effects of these toxics, the project will incorporate structural BMPs, as required in association with compliance with the NPDES permit system as warranted, in order to reduce the level of toxins introduced into the drainage system. Water quality measures will be implemented and no significant impacts are anticipated.

**Lighting**

No impacts related to lighting would occur during both construction and operation. The Project Site and Offsite Areas are not located adjacent to any open space habitats or sensitive biological resources. No impact.

**Figure 11 - Specific Plan Vegetation Communities Impact Map**
*Biological Resources Technical Report*
*Center Park Specific Plan, City of Ontario, California*

CADRE Environmental

1 inch = 450 feet

### Noise

Noise and vibration associated with the use of heavy equipment during project construction has the potential to disrupt bird nesting, foraging and breeding behavior within or adjacent to the Project Site and Offsite Areas. Conservation Measure **CM BIO-4:** Nesting Bird and Raptor Preconstruction Survey has been incorporated into the project to collectively contribute to reducing potential indirect noise impacts to nesting bird species located within or adjacent to the Project Site and Offsite Areas. No impact anticipated.

## CUMULATIVE IMPACTS

The direct and/or indirect impacts of the project would not result in significant cumulative impacts (CEQA Section 15310) to environmental resources within the region of the Project Site and Offsite Areas. Cumulative impacts refer to incremental effects of an individual project when assessed with the effects of past, current, and proposed projects. The project represents the development of 194.05-acres within the Project Site and 19.81-acre Offsite Areas (213.86-acres total) of primarily dairy, agricultural habitat and disturbed/developed habitats, surrounded by dairy/agricultural, commercial, residential development and high traffic roads, and therefore will not result in an adverse cumulative impact to sensitive resources. Impacts related to buildout of the City and Sphere of Influence are anticipated to be less than significant if projects comply with Ontario Ranch mitigation measures and The Ontario Plan 2050 policies and standard conditions. Following implementation of the following mitigation and conservation measures, the proposed action would not conflict with the general plan policies and standard conditions for the protection of sensitive resources.

## MITIGATION & CONSERVATION MEASURES

The following biological mitigation and conservation measures (Conditions of Approval) are relevant to the protection of biological resources to the extent practicable as part of ensuring all potential impacts to sensitive or regulated biological resources are in compliance with CEQA.

### MM BIO-1: City of Ontario Biological Resources Habitat Mitigation Fee

The City of Ontario has established a habitat mitigation fee to cover potential environmental impacts to the burrowing owl, DSFLF, raptor foraging, loss of open space, and agricultural lands. Development impact fees for new development in Ontario Ranch were adopted on June 23rd, 2003, by the City Council. The Ontario Ranch development impact fees include a habitat mitigation fee of $4,320 per net acre for proposed residential, commercial, hotel and restaurant, office, and industrial development. Mitigation fees have been collected by the City of Ontario and have been deposited into a trust fund to be used for the acquisition, restoration, rehabilitation, and maintenance of lands deemed to have long-term conservation value.

**MM BIO-2: Tree Inventory and Preservation Plan**

A tree inventory will be required and prepared by a City approved certified arborist or qualified horticulturalist, to determine the presence/absence of Heritage Trees including assessment of health, structure, condition, and expected life span of all affected specimens.

Property proposed for development on which a Heritage Tree exists, shall require the submittal of a Tree Inventory and Preservation Plan prepared by a licensed landscape architect, horticulturalist, certified arborist, or other related professional. Said plan shall be submitted concurrent with a Development Plan or building permit request for alterations of a site, and shall be reviewed and approved by the Approving Authority for the corresponding application request.

The Tree Inventory and Preservation Plan shall show all existing on-site trees, and those existing trees on abutting lots and public rights-of-way with a canopy or root zone that extends onto the site or within 8 feet of a construction, staging or storage area, or graded site. Furthermore, the Tree Inventory and Preservation Plan shall identify Tree Protection Areas and trees requested to be removed, and shall show replacement trees as required by this Division.

**CM BIO-3**: **Delhi Sands Flower-loving Fly Habitat Assessment**

The eastern region of the Project Site is mapped as Delhi fine sand soils and may represent suitable habitat for the Delhi sands flower-loving fly (NRCS 2024). Either 1) a habitat assessment is conducted by a USFWS permitted biologist and concurrence from the USFWS is received that suitable habitat for the Delhi sands flower-loving fly does not occur onsite and focused surveys are not warranted or, 2) a two-year protocol survey for the Delhi sands flower-loving fly shall be conducted to determine presence/absence. If the species is detected onsite, formal consultation with the USFWS will be required.

**CM BIO-4: Nesting Bird & Raptor Preconstruction Survey**

Regulatory requirement for potential direct/indirect impacts to nesting common and sensitive bird and raptor species will require compliance with the CDFG Code Section 3503. Construction outside the nesting season (between September 1$^{st}$ and January 31$^{st}$) do not require pre-removal nesting bird surveys. If construction is proposed between February 1$^{st}$ and August 31$^{st}$, a qualified biologist will conduct a nesting bird survey(s) no more than three (3) days prior to initiation of grading to document the presence or absence of nesting birds within or directly adjacent (200 feet, up to 500 feet for raptors) to the Project Site and Offsite Areas.

The survey(s) will focus on identifying any raptors and/or bird nests that are directly or indirectly affected by construction activities. If active nests are documented, species-specific measures will be prepared by a qualified biologist and implemented to prevent abandonment of the active nest. At a minimum, grading in the vicinity of a nest will be postponed until the young birds have fledged. The perimeter of the nest setback zone will be fenced or adequately demarcated with stakes and flagging at 20-foot intervals, and construction personnel and activities restricted from the area. A survey report by a

qualified biologist verifying that no active nests are present, or that the young have fledged, will be submitted to the City of Ontario for review and approval prior to initiation of grading in the nest-setback zone.

The qualified biologist will serve as a construction monitor during those periods when construction activities occur near active nest areas to ensure that no inadvertent impacts on these nests occur. A final monitoring report of the findings, prepared by a qualified biologist, will be submitted to the City of Ontario documenting compliance with the CDFG Code. Any nest permanently vacated for the season would not warrant protection pursuant to the CDFG Code.

### CM BIO-5 Focused and Preconstruction Burrowing Owl Surveys

Focused surveys for burrowing owl will be conducted in accordance with the March 7, 2022, CDFG staff report on Burrowing Owl Mitigation. Specifically, a total of 4 surveys will be conducted: 1) at least one site visit between February 15th and April 15th, and 2) a minimum of three (3) surveys, at least three weeks apart, between Apr$^{il}$ 15th and July 15th, with at least one visit after June 15th. A report of the findings prepared by a qualified biologist shall be submitted to the City of Ontario prior to any permit or approval for ground disturbing activities.

A 14-day burrowing owl preconstruction survey will be conducted immediately prior to the initiation of ground-disturbing construction to ensure protection for this species. The survey will be conducted in compliance with CDFW guidelines (CDFW 2012). A report of the findings prepared by a qualified biologist shall be submitted to the City of Ontario prior to any permit or approval for ground disturbing activities.

If burrowing owls are detected onsite during the focused surveys or 14-day preconstruction survey efforts, during the breeding season (February 1$^{st}$ to August 31$^{st}$) then construction activities shall be limited to beyond 300 feet of the active burrows until a qualified biologist has confirmed that nesting efforts are compete or not initiated. In addition to monitoring breeding activity, if construction is proposed to be initiated during the breeding season or active relocation is proposed, a burrowing owl relocation plan will be developed and approved by the City of Ontario, CDFW and USFWS.

### CM BIO-6 Preconstruction Focused Bat Survey

Prior to implementation of project activities, a qualified biologist shall be retained to determine whether potential roosting sites for bats may be affected. For large ornamental trees and palms suitable for bat roosting/nursery, exit counts and acoustic surveys shall be performed prior to initial ground disturbance, vegetation or structure removal to determine whether the Project Site, Offsite Areas and a 300-foot buffer supports a nursery or roost, and by which species. This work will occur between late -spring and late summer and/or in the fall (generally mid-March through late October).

If the results of the bat survey find a total of a single roosting individual of a special status bat species or 25 or more individuals of a non-special status bat species with potential to be present in the Project Site and Offsite Areas (i.e., pallid bat, Townsend's big-eared bat, and western yellow bat), a Bat Management Plan shall be developed to ensure

mortality to bats does not occur. For each location confirmed to be occupied by bats, the plan will provide details both in text and graphically where exclusion devises/and or staged tree removal will need to occur, the timing for exclusion work and the timeline and methodology needed to exclude the bats. The plan will need to be reviewed and approved by CDFW prior to disturbance of the roosts.

### CM BIO-7 Programmatic Assessment Area CEQA Analysis

The 63.29-acre Project Level Assessment Area is located within the northern region of the Specific Plan Boundary including APN's 0216-311-09, 1053-301-01, -02, 1053-311-01, -02, 1053-321-01, -02, and -03. Authorization to access this region of the project was not provided and therefore was analyzed programmatically based on aerial photographs and assessments from the adjacent parcel boundaries. To ensure that potential adverse effects to sensitive species and resources are reduced to a less than significant level, a focused biological resources assessment and impact analysis shall be conducted in this Project Level Assessment Area portion of the Specific Plan Boundary prior to approval of development within this region. In addition to completing CEQA review, any focused surveys and required mitigation measures shall be implemented prior to project approval and initiation of construction

# Executive Summary

This report contains the findings of a habitat suitability assessment for the Delhi Sands flower-loving fly (*Rhaphiomidas terminatus abdominalis*) (DSF), a federally endangered species, for the Sares-Regis proposed Brookfield site in the City of Ontario, San Bernardino County, California. The purpose of this assessment is to characterize existing site conditions at the project site and assess the quality of Delhi sand soils on the project to determine if they provide suitable habitat for DSF. DSF requires clean, aeolian deposited Delhi Sand soil that has not been mixed with clay soils. Delhi Sand soils mixed with clay soils will harden or consolidate. Consolidated soils prevent DSF from burrowing into the soils and, thus, are unsuitable for the species. The habitat suitability assessment was conducted by Thomas J. McGill, Ph.D. (ELMT Consulting) on July 30, 2024.

The project site is mapped by the United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Soil Survey as Delhi Sand soils. However, the site has been subject to several decades of use as cattle ranches and dairy farms. Due to this long-standing agricultural use, there is no native habitat on the site. The site supports one (1) land cover type that is classified as heavily disturbed. Due to this regime of constant site disturbance, the site does not support clean Delhi sand soils and is unsuitable for DSF.

# Section 1 Introduction

ELMT Consulting (ELMT) prepared this Delhi Sands Flower-loving Fly (DSF) Habitat Suitability Assessment for the proposed Brookfield Project Site (project site or site) located in the City of Ontario, San Bernardino County, California. Thomas J. McGill, Ph.D., inventoried and evaluated the condition of the habitat on July 30, 2024. This assessment was conducted to determine the project site supports clean Delhi sand soils capable of providing suitable habitat for DSF. DSF requires clean, aeolian (wind) deposited Delhi Sand soil that has not been mixed with clay soils. Delhi Sand soil mixed with clay soil will harden or consolidate. Consolidated soils prevent DSF from burrowing into the soil and, thus, are unsuitable for DSF.

## 1.1 PROJECT LOCATION

The project site is generally located south of State Route 60, west of Interstate 15, north of the State Route 91, and east of State Route 83 in the City of Ontario, San Bernardino County, California. The project site is depicted on the Corona North and Prado Dam quadrangle of the United States Geological Survey's (USGS) 7.5-minute topographic map series in an unsectioned portion of Township 2 South, Range 7 (refer to Exhibit 1, *Site Vicinity*). Specifically, the project site is bordered by Ontario Ranch Road (Edison Avenue) to the north, Walker Avenue to the east, Eucalyptus Avenue to the south, and Grove Avenue to the west (refer to Exhibit 2, *Project Site*). The following Assessor Parcel Numbers (APNs) 0216-321-01, -02, -03, -06, -07, and -08, and 0216-322-01, -02, -03, -04, and -10 occur onsite.

## 1.2 PROJECT DESCRIPTION

The Brookfield project proposes the construction and operation of residential, industrial and commercial uses.

Exhibit 2

# Section 2 Background

It has been generally acknowledged that DSF occurs in Delhi sand soils, particularly clean dune formations composed of Aeolian sands. Conversely, soils and sands deposited by fluvial processes from the surrounding alluvial fans do not support DSF. These alluvial soils are composed of course sands, cobble and gravel (Tujunga soils) or coarse sands, silts and clays (Cieneba soils). In this part of San Bernardino County, the separation of soil types has been lost due to the mixing and cross contamination from years of agricultural activities, development, and other man-made disturbances.

Depending on the extent of mixing and contamination, some areas formally mapped as Delhi sand soils no longer have potential to support DSF populations. Conversely, some areas formally mapped as Cieneba soils may now support wind deposited Delhi sand soils and have potential to support DSF. Six DSF experts (Ken Osborne, Greg Ballmer, Rudy Matoni, Karin Cleary-Rose, Alison Anderson and Tom McGill) used this criterion, the relative abundance of clean Delhi sand soils versus the amount of Cienba or other alluvial soils, to rate the suitability of the habitat to support DSF (Michael Brandman Associates, 2003). Soils high in gravel and alluvial materials, or high in fine materials such as silts and clays, were rated low, while soils that appear to be high in Aeolian deposited sands were rated high. This qualitative assessment of DSF habitat was further refined by considering the relative degree of soil compaction. Alluvial soils have a tendency to solidify to a hard surface pavement, while Aeolian soils are easier to penetrate and provide good substrate for DSF.

Although it has been common to attribute the presence of four common plant species California buckwheat (*Eriogonum fasciculatum*), California croton (*Croton californicus*), deer weed (*Acmispon glaber*), and telegraph weed (*Heterotheca grandiflora*) as indicators of habitat suitability, for the assessment, vegetation composition was not given much weight in making this habitat evaluation. These dominant plant species, and plant species composition of habitats, may not be directly relevant to larval development (due to likely predatory or parasitic habitat of DSF larvae) (Osborne, et al. 2003). The known immature life histories of the nine asiloid fly families, including that to which the DSF is classified, are primarily predatory and/or parasitic on other invertebrate species (mainly insects) and the presence or absence of plant species appears not to be relevant to the life history of these flies. Regardless, none of these plant species were observed within the site boundary.

Land with suitable DSF habitat includes those areas with open, clean and unconsolidated Delhi Series soils that have not been permanently altered by residential, commercial, or industrial development, or other human actions. Areas known to contain Delhi sand soils and/or to be occupied by DSF have been divided by USFWS into three recovery units (Colton, Jurupa, and Ontario Recovery Units (USFWS, 1997)). These recovery units are defined as large geographic areas based on geographic proximity, similarity of habitat, and potential genetic exchange. The project site is located within the Ontario Recovery Unit (refer to Exhibit 3, *DSF Recovery Units*).

Exhibit 3

# Section 3 Methodology

The criteria discussed in detail below were used to rate the relative abundance of clean Delhi sand soils verses the amount of Cieneba Tujunga, or other alluvial soils, to rate the suitability of the habitat to support DSF. Soils high in gravel and alluvial materials, or high in fine materials such as silts and clays, were rated low, while soils that appear to be high in Aeolian deposited sands were rated high. This qualitative assessment of DSF habitat was further refined by considering the relative degree of soil compaction. Alluvial soils have a tendency to solidify to a hard surface pavement, while Aeolian soils are loose sandy soils that are easier to penetrate and provide good substrate for DSF.

## 3.1 SOIL

Onsite soils were researched prior to the field visit using the United States Department of Agricultural (USDA) Natural Resources Conservation Survey (NRCS) Soil Survey for San Bernardino County, California. In particular, the USDA NRCS was reviewed to determine the location of mapped Delhi sand soils on or within the immediate vicinity of the project site.

## 3.2 VEGETATION

Vegetative resources and surrounding land uses were also assessed as part of determining baseline conditions by walking meander transects and recording all species observed and adjacent land uses. Common plant species observed during the field investigation were identified by visual characteristics and morphology in the field and recorded in a field notebook. Unusual and less-familiar plants were photographed in the field and identified in the laboratory using taxonomic guides. Taxonomic nomenclature used in this study follows the 2012 Jepson Manual (Hickman 2012). In this report, scientific names are provided immediately following common names of plant species (first reference only).

## 3.3 HABITAT SUITABILITY ASSESSMENT

The scope of the habitat suitability assessment was to determine the presence or absence of unconsolidated Delhi sand deposits and to determine its quality as it pertains to DSF. DSF permitted biologist, ELMT biologist Tom McGill surveyed the project site on July 30, 2024. The habitat suitability assessment consisted of a visual and tactile inspection of all areas on the project site that contain Delhi sand soils. Soils along the eastern portion of the project site are mapped as Delhi fine sands (refer to Exhibit 4, *Soils*). The site was evaluated for the quality or purity of Delhi Sands and for its potential to support DSF. Areas were assigned one or more ratings ranging between 1 and 5, with 5 being the best quality and most suitable habitat, as detailed below in each paragraph:

Ratings

1 Soils dominated by heavy deposits of alluvial material including coarse sands and gravels with little or no Delhi sand soils and evidence of soil compaction. Developed areas, non-Delhi sands soils with high clay, silt, and/or gravel content. Delhi sands extensively and deeply covered by dumping of exotic soils, rubble, trash or organic debris. *Unsuitable.*

2 Delhi sand soils are present, but the soil characteristics include a predominance of alluvial materials (Tujunga Soils and Hilmar loamy sand), or predominance of other foreign contamination. Sever and frequent disturbance (such as maintenance yard or high use roadbed). *Very Low Quality*.

3 Although not clean, sufficient Delhi sand soil are present to prevent soil compaction. Moderately contaminated Delhi sands. Delhi sands with moderate to high disturbance (such as annual disking). Sufficient Delhi sands are present to prevent soil compaction (related to contamination by foreign soils). Some sandy soils exposed on the surface due to fossorial animal activity. *Low Quality*.

4 Abundant clean Delhi sand soils with little or no foreign soils (such as alluvial material, Tujunga soils or Hilmar loamy sand) present. Moderate abundance of exposed sands on the soil surface. Low vegetative cover. Evidence of moderate degree of fossorial animal activity by vertebrates and invertebrates. May represent high quality habitat with mild or superficial disturbance. *Moderate Quality*.

5 Sand dune habitat with clean Delhi sand soils. High abundance of exposed sands on the soil surface. Low vegetative cover. Evidence (soil surface often gives under foot) of high degree of fossorial animal activity by vertebrates and invertebrates. Sand associated plant and arthropod species may be abundant. *High Quality*.

It should be noted that habitat qualities often vary spatially within a site so that conditions on a site fall within a range of qualities. Further, overall habitat quality is affected by the overall habitat value of a site.

# Section 4 Results

## 4.1 EXISTING CONDITIONS

Due to historic and existing land uses, no native or natural/undisturbed plant communities were observed on the project site. The project site consists of a mixture of land uses, including rural residential structures, cattle stock yards, waste ponds, and other agricultural uses. These disturbances have eliminated the natural plant communities that once occurred on and surrounding the project site (refer to Appendix A, *Site Photographs*, for representative site photographs).

The disturbed from its decadence is a direct result of the long-standing use of the site as a cattle ranch resulting in barren, contaminated soils with little or no vegetation. The dominant land use feature are the numerous stockyards for cows. These areas are completely barren with a thick layer of cow mature on top of the native soil that is periodically removed. Stock ponds created to treat wastewater are the second most dominate feature and are in constant flux as ponds are filled, dried out and refilled.

Developed areas include several rural residences along the northern and western boundaries with landscaped yards. Facilities for hay storage, diary operations and equipment maintenance and repair and stock piling of soils are found in the central portion of the project site.

It should be noted that several small non-native grasslands occur in scattered patches across the site that are dominated by invasive non-native grasses and may contain a variety of native and other non-native species. Areas of non-native grassland are dominated by brome (*Bromus* spp.) and wild oats (*Avena fatua*). In addition, Russian thistle (*Salsola tragus*) and puncture vine (*Tribulus terrestris*), short-podded mustard (*Hirschfeldia incana*), common fiddleneck (*Amsinckia intermedia*), telegraph weed (*Heterotheca grandiflora*), and western ragweed (*Ambrosia psilostachya*) were also identified in these small patches on non-native grasses.

## 4.2 HABITAT SUITABILITY ASSESSMENT

Per USDA NRCS Soil Survey results, Delhi sand soils have been mapped along the eastern boundary of the project site. Since Delhi sand soils are wind deposited (aeolian) as surface soils, they(See Exhibit 1, Regional Location) are affected by surface disturbance. Land with suitable DSF habitat include those areas with open, undisturbed Delhi Series soils that have not been permanently altered by residential, commercial, or industrial development, or other human actions. Areas known to contain Delhi sand soils and/or to be occupied by DSF have been divided by USFWS into three recovery units (Colton, Jurupa, and Ontario Recovery Units (USFWS, 1997)). These recovery units are defined as large geographic areas based on geographic proximity, similarity of habitat, and potential genetic exchange. As noted above, the project site is within the Ontario Recovery Unit.

Areas that have been mapped as supporting Delhi Sand soils have either been converted into pastures/holding pins or large stock ponds used to process wastewater or rural residential housing and infrastructure needed for managing the dairy farms. The stockyards are covered by a thick continuous layer of cow mature that has been mixed over the decades into any underlying Delhi Sand soils by the

constant movement of cow in the stockyards. The underlying soils contaminated with the organic waste found in the cow mature has become compacted and no longer penetrable by DSF.

The stock ponds found throughout the project site are in continuous use and either contain wastewater or are in the process of drying out for the removal of the underlying contaminated soil and deposed of offsite in an appropriate landfill. The repetitive process of contaminating the underlying soils with organic waste products, drying out the ponds and removing and deposing of the soils have eliminated all of the underlying Delhi Sand soils.

All Delhi Sand soils that may have occurred on the project site have either been removed by maintenance of the stock ponds or is so contaminated with cow mature and other waste products that clean Delhi Sand soils needed by DSF no longer exist with the project site. All areas designated as supporting Delhi Sand soils were determined to no longer support clean Delhi Sands needed by the species and were rated as unsuitable with a habitat suitability rating of 1 (see Exhibit 5, *DSF Habitat Suitability*).

DSF SUITABILITY ASSESSMENT
BROOKFIELD PROJECT

# DSF Habitat Suitability

ELMT CONSULTING

0 125 250 500 Feet

Source: ESRI Aerial Imagery, San Bernardino County

Exhibit 5

# Section 5 Conclusion and Recommendations

Based on his twenty-five years of experience with DSF and occupied DSF ecosystems, the information provided in this report, and information based on the referenced DSF habitat suitability scale (Ballmer, Osborne, McGill 2003), Dr. McGill determined that the site no longer supports clean Delhi Sand soils and was rated as unsuitable habitat with a habitat rating of 1. Implementation of the project will have no significant impacts on federally or State listed species known to have historically occurred in the general vicinity of the project site, specifically DSF. Critical Habitat has not been designated for the species. No further surveys are recommended.

**Sares Regis North**
Southwest Corner of Edison Avenue and Walker Avenue
City of Ontario, San Bernardino County, California
Converse Project No. 24-81-184-01

Dear Mr. Lee:

Converse Consultants (Converse) is pleased to submit this Preliminary Geotechnical Investigation and Organic Soil/Manure Evaluation Report to assist with the proposed Sares Regis North medium density residential and mixed-use development located at the southwest corner of Edison Avenue and Walker Avenue, in the City of Ontario, San Bernardino County, California. This report was prepared in accordance with our proposals dated May 21, 2024 and your Professional Services Agreement, dated May 21, 2024.

Based upon our field investigation, laboratory data, and analyses, the project site is considered feasible from a geotechnical standpoint, provided the recommendations presented in this report are incorporated into the design and development of the project.

We appreciate the opportunity to be of service to Ontario Ranch Ventures I & II, LP (ORV I & II). Should you have any questions, please do not hesitate to contact us at 909-474-2847.

# 1.0 INTRODUCTION

This preliminary geotechnical investigation and organic soil/manure evaluation prepared by Converse for the approximately 185-acre rectangular shaped Sares Regis NORTH site is located at the southwest corner of Edison Avenue and Walker Avenue, in the City of Ontario, San Bernardino County, California. The approximate location of the proposed project is shown in Figure No. 1, *Approximate Site Location Map.*

The purpose of this investigation was to evaluate the current nature and engineering properties of the subsurface soils and groundwater conditions and to provide geotechnical recommendations for the proposed residential development.

This report was prepared for the project described herein and is intended for use solely by Ontario Ranch Ventures I & II, LP (ORV I & II), RCCD, Inc. and their authorized agents. This report may be made available to the prospective bidders for bidding purposes. However, the bidders are responsible for their own interpretation of the site conditions between and beyond the boring locations, based on factual data contained in this report. This report may not contain sufficient information for use by others and/or other purposes.

# 2.0 SITE DESCRIPTION AND BACKGROUND

The approximately 185-acre rectangular site, consisting of several active dairies and agricultural fields, is located at the southeast corner of Ontario Ranch Road and Walker Avenue, in the City of Ontario, San Bernardino County, California. The property is bounded to the north by Edison Avenue, to the east by Walker Avenue, to the west by future Campus Avenue, and to the south by dairies and agricultural land.

The site gently slopes from the northeast to southwest. Elevations range from approximately 696 feet above mean sea level (msl) in the northwest corner of the site to approximately 677 feet above msl in the southwest portion of the site. The present site conditions are depicted in Photographs Nos. 1 through 5.

*Photograph No. 5: Current site conditions at stockpile in eastern cow pens, facing southeast.*

# 3.0 PROJECT DESCRIPTION

Based on conversations with Mr. Jason Lee of RCCD, Inc. the property will be developed for medium density residential, mixed use, and open space. No development or grading plans are available at this time. The structures will likely be one to two-story tilt up buildings founded on shallow footings with slab-on-grade with concrete wall, steel and possible block wall construction. Associated with the development will likely be above and below ground utilities, access roads, and interior streets.

# 4.0 PREVIOUS SITE INVESTIGATIONS

The 2 referenced previous geotechnical feasibility studies of the subject site, which were provided, were performed by Southern California Geotechnical (SoCalGeo) in 2022, with the pertinent data incorporated into this report.

# 5.0 SCOPE OF WORK

The scope of Converse's investigation is described in the following sections.

## *5.1 Project Set-up*

The project set-up consisted of the following tasks.

- Reviewed existing plans, geotechnical reports provided, and data relevant to the project.

- Conducted a site reconnaissance to mark the exploration locations and to verify drill rig/backhoe access to the proposed locations were available.
- Notified Underground Service Alert (USA) at least 48 hours prior to conducting field work to clear the exploration locations of any conflict with existing underground utilities.
- Engaged a drill rig company to conduct exploratory borings and a backhoe company to excavate exploratory test pits.

### *5.2 Subsurface Exploration*

Ten exploratory borings (BH-01 through BH-10) were drilled using a truck-mounted GT-16 drill rig equipped with 8-inch diameter hollow-stem augers to investigate the subsurface conditions on May 24, 2024 and May 29, 2024. The borings were drilled to depths ranging from 16.5 feet to 51.5 feet below the existing ground surface (bgs).

Thirteen exploratory test pits (TP-01 through TP-13) were excavated using a backhoe equipped with 24-inch-wide bucket to investigate the subsurface conditions on June 11 and 12, 2024. The test pits were excavated between 4.1 feet and 7.6 feet bgs.

The approximate locations of the current exploratory borings and test pits are shown on Figures No. 2a through 2e, *Approximate Boring, Test Pit, and Overexcavation Location Maps*. A detailed discussion of subsurface exploration is presented in Appendix A, *Field Exploration*.

### *5.3 Laboratory Testing*

Representative samples of the site soils were tested in the laboratory to aid in soil classification, and to evaluate relevant engineering properties. These tests included the following.

- *In-situ* moisture contents and dry densities (ASTM D2216-19 and D2937-17)
- Organic Content (ASTM D2974-20e1, Methods A and C)
- Expansion Index (ASTM D4829-21)
- R-value (California Test 301)
- Soils Corrosivity (CTM 643, 422, 417, 532)
- Collapse (ASTM D4546-21)
- Grain size analysis (ASTM D6913/D6913M-17)
- Maximum dry density and optimum-moisture content (ASTM D1557-12R21)
- Direct shear (ASTM D3080/D3080M-21)
- Consolidation (ASTM D2435/D2435M-11R20)

For *in-situ* moisture and dry density data, see the logs of boring in Appendix A, *Field Exploration*. For a description of the laboratory test methods and test results, see Appendix B, *Laboratory Testing Program*.

### *5.4 Analysis and Report Preparation*

Data obtained from the field exploration and laboratory testing program was assembled and evaluated. Geotechnical analyses of the compiled data were performed, followed by the preparation of this report to present our findings, conclusions, and recommendations for the project.

## 6.0 SITE CONDITIONS

A general description of the subsurface conditions, various materials and groundwater conditions encountered at the site during our field exploration is discussed below.

### *6.1 Subsurface Profile*

Based on our field exploration and laboratory test results, the subsurface soil at the project site consisted primarily of manure, organic artificial fill soil, topsoil and alluvium.

The various subsurface profiles and description of the earth material soils encountered are discussed below.

Manure/Highly Organic Soil: Due to the site being active dairy farms the site is partially covered by generally approximately 0.4 feet to 2.3 foot and locally, within random stockpiles, as much as approximately 3.0 feet to 20.0 feet of manure or highly organic soils. The stockpiles of these materials are located in the eastern portion of the site. This manure and highly organic soils will need to be removed from the site prior to any grading in areas of proposed development. The approximate locations and depth of this material is shown on Figures No. 2a through 2e, *Approximate Boring, Test Pit and Overexcavation Location Maps*.

Artificial Fill Soil: Due to the current dairy and agricultural use the surface of the majority of the project site is generally partially covered by up to approximately 1.0 feet to 9.0 feet of undocumented artificial fill, which is in some areas is partially organic. The partially organic artificial fill is approximately 1.0 feet to 3.6 feet thick. This material was encountered within some of the exploratory excavations and was generally comprised of sandy gravel, silty sand, clayey sand, sandy silt, silt and sandy clay, which was fine to coarse-grained, with trace to few scattered gravel up to 2.0-inches maximum dimension, some localized debris and concrete, some roots and rootlets, locally layered, loose to dense/soft to very stiff, moist and various shades of brown, gray, black, red and orange. The partially organic artificial fill areas were slightly to moderately organic with traces of manure. The approximate locations and depths of the partially organic fill material is shown on Figures No. 2a through 2e, *Approximate Boring, Test Pit and Overexcavation Locations Maps*.

Topsoil: Topsoil was encountered at the surface within some of the exploratory excavations ranging in thickness from approximately 3.0 feet to 4.0 feet bgs. This material was generally comprised of sand and silty sand, which was fine to medium-grained, medium dense to dense, moist and various shades of brown and gray.

Alluvium: Holocene alluvium was encountered below the artificial fill and topsoil in all of the of the exploratory excavations at depths ranging from approximately 1.0 foot to 9.0 feet bgs. Where observed, this material was generally comprised of sand, silty sand, clayey sand, sandy silt, clayey silt and sandy clay, which was fine to coarse-grained, with trace gravel to 1-inch maximum dimension, slightly to very desiccated, some oxidation staining, trace caliche, some pinhole porosity, some scattered carbon, locally micaceous, medium dense to very dense/medium stiff to very stiff, moist and various shades of brown, tan, orange, red, yellow, green and gray. Portions of the upper 0.5 foot to 3.0 feet are weathered and low in density.

For a detailed description of the subsurface materials encountered in the exploratory borings and test pits, see the logs, Drawing Nos. A-2 through A-24, in Appendix A, *Field Exploration.*

### *6.2 Groundwater*

Groundwater was not encountered during our field investigation explored to 51.5 feet.

For comparison, regional groundwater data of available near-by water well information was conducted using the generalized coordinates of 33.9977 N and 117.6193 W were used for the following comparisons.

The GeoTracker database (SWRCB, 2024) was reviewed to evaluate the current and historical groundwater elevation data within a 1.0-mile radius of the project site. A noted active well, named City of Chino Well Number 16/Well #CA3610012_019_019. No groundwater level data was identified in the given well information.

The National Water Information System (USGS, 2024) was reviewed for current and historical groundwater data from sites within an approximately 1.0-mile radius of the project site and no wells with groundwater data were identified.

The California Department of Water Resources database (DWR, 2024) was reviewed for historical groundwater data from sites within a 1.0-mile radius of the project site. One site was identified within a 1.0-mile radius of the project site that contained groundwater elevation data. Details of that record are listed below.

- Well Name CHINO-1208672 (Station 340045N1176407W001), located northwest of the project site, reported groundwater at depths ranging from 137.01 to 145.74 feet bgs between 2011 and 2021.

Based on the available data and the findings of our investigation, the historical high groundwater level and the current groundwater level is estimated to be deeper than approximately 137.0 feet bgs. Groundwater is not expected to be encountered during construction of the proposed project. It should be noted that the groundwater level could vary depending upon the seasonal precipitation and possible groundwater pumping activity in each site vicinity. Perched water layers at depth may be present locally, particularly following high precipitation and irrigation events.

### *6.3 Expansive Soils*

Expansive soils are characterized by their ability to undergo significant volume changes (shrink or swell) due to variations in moisture content. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. Depending on the extent and location below finish subgrade, expansive soils can have a detrimental effect on structures.

Based on the 2 laboratory tests conducted during this investigation and a previous geotechnical feasibility study by SoCalGeo, the expansion index of the upper 4.0 feet to 5.0 feet of the general site soils was 0 to 12, corresponding to a very low potential.

### *6.4 Collapse Potential*

Soil deposits subjected to collapse/hydro-consolidation generally exist in regions of moisture deficiency. Collapsible soils are generally defined as soils that have potential to suddenly decrease in volume upon increase in moisture content even without an increase in external loads. Moreover, some soils may have a different degree of collapse/hydro-consolidation based on the amount of proposed fill or structure loads. Soils susceptible to collapse/ hydro-consolidation include wind-blown silt, weakly cemented sand, and silt where the cementing agent is soluble (e.g., soluble gypsum, halite), alluvial or colluvial deposits within semi-arid to arid climate, and certain weathered bedrock above the groundwater table.

Granular soils may have a potential to collapse upon wetting in arid climate regions. Collapse/hydro-consolidation may occur when the soluble cements (carbonates) in the soil matrix dissolve, causing the soil to densify from its loose/low density configuration from deposition.

The degree of collapse of a soil can be defined by the collapse potential value, which is expressed as a percentage of collapse of the total sample using the Collapse Potential Test (ASTM D4546-21). According to the ASTM guideline, the severity of collapse potential is commonly evaluated by the following Table No. 1, *Collapse Potential Values*.

**Table No. 1, Collapse Potential Values**

| Collapse Potential Value (%) | Severity of Problem |
|---|---|
| 0 | None |
| 0.1 to 2 | Slight |
| 2.1 to 6.0 | Moderate |
| 6.0 to 10.0 | Moderately Severe |
| >10 | Severe |

Two collapse tests were conducted for this project. Based on the laboratory test result a collapse potential value of 1.6 percent at a depth of 2.0 feet bgs in boring BH-02 was measured. A collapse potential value of 0.2 percent at a depth of 3.0 feet bgs in boring BH-06 was measured. Three consolidation tests were also conducted for this project. No collapse potential value at a depth of 3.0 feet bgs in boring BH-03 was measured. A collapse potential value of 0.2 percent at a depth of 6.0 feet bgs in boring BH-06 was measured. A collapse potential value of 0.1 percent at a depth of 4.0 feet bgs in boring BH-07 was measured. These indicate only a none to slight problem at the site. Collapse potential distress is typically considered a concern when a measured collapse potential value is over 2% (LA County, 2013).

### *6.5 Excavatability*

The subsurface materials of the project are expected to be excavatable by conventional heavy-duty earth moving and trenching equipment.

The phrase “conventional heavy-duty excavation equipment” is intended to include commonly used equipment such as excavators, scrapers, and trenching machines. It does not include hydraulic hammers (“breakers”), jackhammers, blasting, or other specialized equipment and techniques used to excavate hard earth materials. Selection of an appropriate excavation equipment models should be done by an experienced earthwork contractor.

### *6.6 Subsurface Variations*

Based on results of the subsurface exploration and our experience, some variations in the continuity and nature of subsurface soil conditions within the project site should be anticipated. Because of the uncertainties involved in the nature and depositional characteristics of the earth material, care should be exercised in interpolating or extrapolating subsurface conditions between or beyond the boring locations.

### *6.7 Caving*

Caving was not encountered in any of the exploratory borings or test pits. Localized caving may occur in excavations that extend into granular soils that are encountered on-site.

## 7.0 ENGINEERING GEOLOGY

The regional and local geology within the proposed project area is discussed below.

### *7.1 Regional Geology*

The project site is located within the northern Peninsular Ranges Geomorphic Province of Southern California. The Peninsular Ranges Geomorphic Province consists of a series of northwest-trending mountain ranges and valleys bounded on the north by the San Bernardino and San Gabriel Mountains, on the west by the Los Angeles Basin, and on the south by the Pacific Ocean.

The province is a seismically active region characterized by a series of northwest-trending strike-slip faults. The most prominent of the nearby fault zones include the San Jacinto, Cucamonga, and San Andreas Fault Zones, all of which have been known to be active during Quaternary time.

Topography within the province is generally characterized by broad alluvial valleys separated by linear mountain ranges. This northwest-trending linear fabric is created by the regional faulting within the granitic basement rock of the Southern California Batholith. Broad, linear, alluvial valleys have been formed by erosion of these principally granitic mountain ranges.

The project site is located within the Chino Basin between the Chino Hills to the southwest and San Gabriel Basin to the north. The Elsinore Fault Zone is located approximately four miles south of the project site. This fault is a north to northwest trending reverse fault that dips steeply towards the southwest. The Chino-Central Avenue Fault acts as a groundwater barrier along the western margin of the Chino Basin.

### *7.2 Local Geology*

The project site is primarily underlain by Young alluvial-fan deposits, (Middle Holocene), consisting of slightly to moderately consolidated silt, sand, and coarse-grained sand with some gravel, cobbles and boulders, having slightly to moderately dissected surfaces.

## 8.0 FAULTING AND SEISMICITY

The location of the site with respect to active faults and associated seismicity is discussed below.

### *8.1 Faulting*

The project site is situated in a seismically active region. As is the case for most areas of Southern California, ground-shaking resulting from earthquakes associated with nearby and more distant faults may occur at the project site. During the life of the project, seismic activity associated with active faults can be expected to generate moderate to strong ground shaking at the site. Review of recent seismological and geophysical publications indicates that the seismic hazard for the project is high.

The project site is not located within a currently mapped State of California or San Bernadino County Earthquake Fault Zone for surface fault rupture.

Table No. 2, *Summary of Regional Faults,* summarizes selected data of known faults capable of seismic activity within 100 kilometers of the project site (coordinate 33.9977 Nand 117.6193 W). The data presented below was calculated using the National Seismic Hazard Maps Database and other published geologic data.

**Table No. 2, Summary of Regional Faults**

| Fault Name and Section | Closest Distance (km) | Slip Sense | Length (km) | Slip Rate (mm/year) | Maximum Magnitude |
|---|---|---|---|---|---|
| Chino, alt 2 | 8.40 | strike slip | 29 | 1 | 6.80 |
| Chino, alt 1 | 8.61 | strike slip | 24 | 1 | 6.70 |
| San Jose | 14.08 | strike slip | 20 | 0.5 | 6.70 |
| Elsinore | 15.95 | strike slip | 241 | n/a | 7.85 |
| Cucamonga | 17.00 | thrust | 28 | 5 | 6.70 |

### *8.2 Seismic Design Parameters*

Seismic parameters based on the 2022 California Building Code (CBSC, 2022) and ASCE 7-16 are provided in the following table. These parameters were determined using the coordinate (33.9977N and 117.6193W) and the Seismic Design Maps ATC online tool.

**Table No. 3, CBC Seismic Design Parameters**

| Seismic Parameters | |
|---|---|
| Site Coordinates | 333.9977N and 117.6193W |
| Site Class | D* |
| Risk Category | II |
| Mapped Short period (0.2-sec) Spectral Response Acceleration, $S_s$ | 1.629g |
| Mapped 1-second Spectral Response Acceleration, $S_1$ | 0.585g |
| Site Coefficient (from Table 11.4-1), $F_a$ | 1.000 |
| Site Coefficient (from Table 11.4-2), $F_v$ | 1.700 |
| MCE 0.2-sec period Spectral Response Acceleration, $S_{MS}$ | 1.629g |
| MCE 1-second period Spectral Response Acceleration, $SM_1$ | 1.000g |
| Design Spectral Response Acceleration for short period $S_{DS}$ | 1.086g |
| Design Spectral Response Acceleration for 1-second period, $S_{D1}$ | 0.700g |
| Site Modified Maximum Peak Ground Acceleration, $PGA_M$ | 0.745g |

** Stiff Soil Classification*

### *8.3 Secondary Effects of Seismic Activity*

In general, secondary effects of seismic activity include surface fault rupture, soil liquefaction, landslides, lateral spreading, and settlement due to seismic shaking, tsunamis, seiches, and earthquake-induced flooding. The site-specific potential for each of these seismic hazards is discussed in the following sections.

***Surface Fault Rupture:*** No portion of the project site is located within a currently designated State of California or San Bernadino County Earthquake Fault Zone (CGS, 2007 and San Bernadino County, 2010). The potential for surface rupture resulting from the movement of nearby or distant faults is not known with certainty but is considered very low.

***Liquefaction:*** Liquefaction is defined as the phenomenon in which a cohesionless soil mass within the upper 50 feet of the ground surface suffers a substantial reduction in its shear strength, due to the improvement of excess pore pressures. During earthquakes,

excess pore pressures in saturated soil deposits may develop as a result of induced cyclic shear stresses, resulting in liquefaction.

Soil liquefaction generally occurs in submerged granular soils and non-plastic silts during or after strong ground shaking. There are several general requirements for liquefaction to occur and they are as follows.

- Soils must be submerged.
- Soils must be loose to medium-dense.
- Ground motion must be intense.
- Duration of shaking must be sufficient for the soils to lose shear resistance.

Based on review of hazard maps, the site is not located within a State of California or San Bernadino County designated zone of liquefaction susceptibility (CGS, 2007; San Bernadino County, 2010). Based on a site-specific settlement analysis presented in Appendix C, *Liquefaction and Settlement Analysis*, and groundwater being deeper than approximately 137 feet bgs we estimate that liquefaction induced settlement of the site is negligible.

***Seismic Settlement***: Dynamic dry settlement may occur in loose, granular, unsaturated soils during a large seismic event. Our analysis of the potential dynamic settlement is presented in Appendix C, Liquefaction and Settlement Analysis. Based on our analysis, we anticipate the site has the potential for up to 1.15 inches of seismically induced settlement. The dynamic differential settlement resulting from dynamic loads is anticipated to be equal to one-half of the total dry seismic settlement over a lateral distance of 40 feet.

***Landslides:*** Seismically induced landslides and slope failures are common occurrences during or soon after large earthquakes. Due to the flat nature of the project site, the potential for seismically induced landslides affecting the pump station is considered to be negligible.

***Lateral Spreading:*** Seismically induced lateral spreading involves primarily lateral movement of earth materials over underlying materials which are liquefied due to ground shaking. It differs from slope failure in that complete ground failure involving large movement does not occur due to the relatively smaller gradient of the initial ground surface. Lateral spreading is demonstrated by near-vertical cracks with predominantly horizontal movement of the soil mass involved. Generally due to the negligible risk for liquefaction and flat nature of project site, the risk of lateral spreading is considered very low.

***Tsunamis:*** Tsunamis are large waves generated in open bodies of water by fault displacement or major ground movement. Due to the inland location of the project site, tsunamis are not considered to be a risk.

***Seiches:*** Seiches are large waves generated in enclosed bodies of water in response to ground shaking. There are no enclosed bodies of water near the project site, therefore, seiching is not considered to be a risk during construction.

***Earthquake-Induced Flooding***: Dams or other water-retaining structures may fail as a result of large earthquakes. The project site is not located within a designated dam inundation area (DSOD, 2024).

# 9.0 LABORATORY TEST RESULTS

Laboratory testing was performed to determine the physical and chemical characteristics and engineering properties of the subsurface soils. Current physical test results are included in Appendix A, *Field Exploration* and Appendix B, *Laboratory Testing Program*. Discussions of the various test results are presented below.

## *9.1 Physical Testing*

- *In-situ* Moisture and Dry Density: *In-situ* dry densities and moisture contents of the site soils were determined in accordance with ASTM Standard D2216-19 and D2937-17. The dry densities of the soils in borings BH-01 to BH-10 ranged from 82 to 139 pounds per cubic foot (pcf) with moisture contents of 3 to 33 percent. The dry density of the manure and highly organic soils in boring BH-01 was 64 pounds per cubic foot (pcf) with a moisture content of 67 percent. Results are presented on the Log of Borings and Test Pits in Appendix A, *Field Exploration.*
- Organic Content: Eight organic content tests were performed during the current geotechnical investigation, in accordance with ASTM Standard D2974-20e1 on representative bulk soil samples. The amount of organic material present in the organic artificial fill soils ranged from 2.1 percent to 12.2 percent and in the undisturbed natural soils ranged from 1.1 percent to 1.9 percent.
- Expansion Index: Two representative bulk soil samples were tested during the current geotechnical investigation of the general site soils to evaluate the expansion potential in accordance with ASTM Standard D4829-21. The test results indicated in both samples returned an expansion index of 0, corresponding to very low expansion potential.
- R-Value: Two representative bulk samples were tested in accordance with Caltrans Test Method 301. The result of the R-value test was 59 and 64.
- Collapse Potential: Two representative samples were tested to determine the collapse potential in accordance with the ASTM Standard D4596. The test results of 0.2 and 1.6 percent correspond to a slight collapse potential.
- Grain Size Analysis: Three representative samples were tested to determine the relative grain size distribution in accordance with the ASTM Standard D6913/D6913M-17. Test results are graphically presented in Drawing No. B-1, *Grain Size Distribution Results.* Based on the test results, soils are typically silty sand.

- Maximum Dry Density and Optimum Moisture Content: Two typical moisture-density relationships of representative soil samples were tested, in accordance with ASTM Standard D1557-12R21, with the results presented in Drawing No. B-2, *Moisture-Density Relationship Results*, in Appendix B, *Laboratory Testing Program.* The laboratory maximum dry densities were 117.5 and 118.6 pounds per cubic feet (pcf), with optimum moisture contents of 11.1 and 12.7 percent, respectively.
- Direct Shear: Three direct shear tests were performed in accordance with ASTM Standard D3080/D3080M-23. The results of the direct shear tests are presented in Drawing Nos. B-3 through B-5, *Direct Shear Test Results* in Appendix B, *Laboratory Testing Program*.
- Consolidation Test: Three consolidation tests were performed on relatively undisturbed samples of the site soil, in accordance with ASTM Standard D2435/D2435-11R20. The test results also indicated a collapse potential of 0.0 and 0.3 percent, which corresponds to a none to slight collapse potential. The test results are shown on Drawing No. B-6 through B-8, *Consolidation Test Results,* in Appendix B, *Laboratory Testing Program.*

### *9.2 Chemical Testing - Corrosivity Evaluation*

One representative soil sample was tested during the current geotechnical investigation within site to determine minimum electrical resistivity, pH, and chemical content, including soluble sulfate and chloride concentrations. The purpose of these tests was to determine the corrosion potential of site soils when placed in contact with common pipe materials. The current test was performed by Keegan Labs, LLC (Pomona, CA) in accordance with California Test Methods 643, 422, and 417. The current and previous test results are presented in Appendix B, *Laboratory Testing Program and* are summarized in below*.*

- The pH measurement of the sample tested ranged was 6.7.
- The sulfate contents of the sample tested was 90 ppm (0.0090 percent by weight).
- The chloride concentration of the sample tested was 25 ppm.
- The minimum electrical resistivity when saturated was 4,620 ohm-cm.

## 10.0 EARTHWORK AND SITE GRADING RECOMMENDATIONS

Earthwork for the project will include grading, trench excavation, pipe subgrade preparation, pipeline bedding placement and trench backfill, as well as roadway pavement construction. Recommendations for earthwork are presented in the following subsections. General Earthwork Specifications are presented in Appendix D*, Earthwork Specifications.*

### *10.1 General*

This section contains our general recommendations regarding earthwork for the proposed medium density residential and mixed use Sares Regis North development in the City of Ontario, San Bernardino County, California.

These recommendations are based on the results of our field exploration and laboratory testing as well as our experience with similar projects, and data evaluation as presented in the preceding sections. These recommendations may require modification by the geotechnical consultant based on observation of the actual field conditions during remedial grading.

Prior to the start of construction, all underground existing utilities and appurtenances should be located at the project site. Such utilities should either be protected in-place or removed and replaced during construction as required by the project specifications. All excavations should be conducted in such a manner as not to cause loss of bearing and/or lateral support of existing structures or utilities.

All existing structures, debris, deleterious material and surficial soils containing roots and perishable materials should be stripped and removed from the project site. Deleterious material, including manure, significant organics, highly organic disturbed fill soils, concrete, and debris generated during excavation, should not be placed as fill.

It should be the responsibility of the contractor to maintain safe working conditions during all phases of construction.

### *10.2 Private Sewage System Abandonment*

From a geotechnical standpoint, any seepage pits, other private sewage systems, and/or other subsurface structures that may be encountered should be located, mapped on the grading plans, removed and/or properly abandoned. Abandonment and/or removal of septic systems that may exist should be in accordance with local codes and recommendations by Converse. Seepage pits, if abandoned in-place, should be pumped clean, backfilled with gravel or clean sand jetted into place, and then capped with a minimum of 2 feet of a 2-sack or greater slurry or concrete for a minimum distance of 2 feet outside the edge of the seepage pit. The top of the slurry or concrete cap should be at a minimum 10 feet below the proposed grade.

### *10.3 Overexcavation*

The site is generally underlain by approximately 1.5 feet to 5.0 feet of potentially compressible soils (artificial fill, topsoil and the upper low-density portions of the alluvium), and locally as much as 7.0 feet to 9.0 feet, which may be prone to future settlement under the surcharge of foundation, improvements and/or fill loads. Therefore, these materials should be over-excavated to competent alluvium, within all areas of proposed structures and other improvements, and replaced with compacted fill soils. Within the entire level

portions of the building pad areas, over-excavations should also extend at least 5.0 feet below proposed pad grade, or at least 3.0 feet below the lowest proposed footings, within the proposed building areas, whichever is deeper. Within any proposed wall footings areas over-excavation should also be a minimum of 5.0 feet below proposed pad grade or 2.0 feet below the proposed wall footings areas, whichever is deeper. All over-excavations should extend at least 5.0 feet or equal to the depth of over-excavation, whichever is greater, outside the entire level portions of the building pad area.

The final bottom surfaces of all excavations should be observed and approved by the project geotechnical consultant prior to placing any fill or structures. However, localized, deeper over-excavation could be encountered, based on findings observations and field testing by the geotechnical consultant during grading of the final bottom surfaces of all excavations, prior to any scarification.

The estimated locations and approximate depths of over-excavation of unsuitable, compressible soil materials are indicated on Figures No. 2a through 2e, *Approximate Boring, Test Pit and Overexcavation Location Maps*.

If isolated pockets of very soft, loose, eroded, or pumping soil are encountered, the unstable soil should be excavated as needed to expose undisturbed, firm, and unyielding soils.

The contractor should determine the best manner to conduct the excavations, such that there are no losses of bearing and/or lateral support to the existing structures or utilities (if any).

Areas to receive fill and/or other surface improvements should be scarified to a minimum depth of 6 inches, brought to a near-optimum moisture condition, and recompacted to at least 90 percent relative compaction (based on ASTM Test Method D1557-12R21).

### *10.4 Cut and Shallow Fill Under Building Pad Areas*

Fill building pads with shallow cut and fill areas should be capped with a minimum of 5.0 feet of engineered structural fill, so that all footings for structures and walls are founded into engineered fill with a minimum of 3.0 feet of fill below footings for proposed structures and 2.0 feet below footings for proposed walls. Over-excavation should extend to the entire level portions of the building pad area with proposed structures or walls, to the depth of fill.

### *10.5 Cut/Fill Transition and Fill Differentials*

To mitigate distress to structures related to the potential adverse effects of excessive differential settlement, cut/fill transitions should be eliminated from all level portions of the building pad areas. This should be accomplished by overexcavating the entire "cut" portion of the building pad area by at least 5.0 feet below proposed grade and replacing the excavated materials as properly compacted fill, so that all footings for structures and walls are founded into engineered fill with a minimum of 3.0 feet of fill below footings for proposed structures and 2.0 feet below footings for proposed walls. Recommended depths of over-excavation are provided in the following table.

**Table No. 4, Overexcavation Depth for Cut/Fill Transitions**

| Depth of Fill ("Fill" Portion) | Depth of Overexcavation ("Cut" Portion) |
|---|---|
| Up to 5.0 feet | 5.0 feet |
| Greater than 5.0 feet | One-third the maximum thickness of fill placed on the "fill" portion (15 feet maximum) |

### *10.6 Engineered Fill*

No fill should be placed until excavations and/or natural ground preparation have been observed by the geotechnical consultant. The native soils encountered within the project sites are generally considered suitable for re-use as compacted fill. Excavated soils should be processed, including removal of roots and debris, removal of oversized particles, mixing, and moisture conditioning, before placing as compacted fill. On-sites soils used as fill should meet the following criteria.

- No particles larger than 8 inches in largest dimension.
- Rocks larger than 4 inches should not be placed within the upper 12 inches of subgrade soils.
- Free of all significant organic matter, debris, or other deleterious material.
- Expansion index of 20 or less.
- Sand Equivalent greater than 15 (greater than 30 for pipe bedding).
- Contain less than 30 percent by weight retained in 3/4-inch sieve.
- Contain less than 45 percent fines (passing #200 sieve).

Based on field investigation and laboratory testing results, on-sites soils may be suitable as fill materials.

Imported materials, if required, should meet the above criteria prior to being used as compacted fill. Any imported fills should be tested and approved by geotechnical representative at least 72 hours prior to delivery to the site.

### *10.7 Organic Content*

Based on the current and previous laboratory test results of the approximately the upper 1.0 foot to 3.7 feet of the partially organic fill soils on portions of the site has about 2.1 percent to 10.3 percent of organic content. This would be an average organic content of about 5.3 percent, for an average depth of approximately 2.0 feet, in the subject areas. Laboratory testing also indicated that generally the undisturbed natural soils below these depths (alluvium) had natural organic contents of about 1.1 percent to 2.4 percent. This would be an average organic content of about 1.9 percent. Therefore, these partially organic should be blended with undisturbed natural soils or removed from the site.

Fill materials should contain no more than 2 percent overall organics. The partially organic soils can be blended with the on-site natural soils at a ratio of at least 3 to 1 (natural soils/clean imported soils to partially organic soils) and placed as compacted fill, provided they are completely mixed during fill placement. The type of equipment and method of placement; blending and mixing of the partially organic materials with onsite natural soils or clean imported soils to be utilized by the grading contractor, should be reviewed and accepted by the geotechnical consultant prior to implementation. A possible method of placement that could be considered would be to place the partially organic materials at an angle to the pattern of the placement of the onsite natural soils or clean imported soils. The testing frequency for verifying the percent organic content should be established by the geotechnical consultant prior to fill placement once the method of blending, placement, and mixing of the partially organic materials with onsite natural soils or clean imported soils. The estimated locations and approximate depths of partially organic to be removed from the site or blended are also indicated on Figures No. 2a through 2e, *Approximate Boring, Test Pit and Overexcavation Location Maps*.

### *10.8 Compacted Fill Placement*

All surfaces to receive structural fills should be scarified to a depth of 12 inches. The soil should be moisture conditioned to within ±3 percent of optimum moisture content for coarse soils and 0 to 2 percent above optimum moisture content for fine soils. The scarified soils should be recompacted to at least 90 percent of the laboratory maximum dry density.

Fill soils should be thoroughly mixed, and moisture conditioned to within ±3 percent of optimum moisture content for coarse soils and 0 to 2 percent above optimum moisture content for fine soils. Fill soils should be evenly spread in horizontal lifts not exceeding 8 inches in uncompacted thickness.

Fill soils should be thoroughly mixed, and moisture conditioned to at least 0 to 2 percent above optimum moisture content. Fill soils should be evenly spread in horizontal lifts not exceeding 8 inches in uncompacted thickness.
All fill placed at the site should be compacted to at least 90 percent of the laboratory maximum dry density as determined by ASTM Standard D1557-12R21 test method unless a higher compaction is specified herein. The upper 12 inches of subgrade soils

underneath pavements intended to support vehicle loads should be scarified, moisture conditioned, and compacted to at least 95 percent of the laboratory maximum dry density.

Fill materials should not be placed, spread or compacted during unfavorable weather conditions. When site grading is interrupted by heavy rain, filling operations should not resume until the geotechnical consultant approves the moisture and density conditions of the previously placed fill.

Observations and field tests should be performed by the project soils consultant to confirm that the required degree of compaction has been obtained. Where compaction is less than specified, additional compactive effort should be made with adjustment of the moisture content as necessary, until the specified compaction is obtained.

Additional expansion index and corrosion testing should be completed after all fill has been placed and compacted at the site in order to confirm the soil properties and revise the foundation design parameters if necessary.

### *10.9 Backfill Recommendations Behind Walls*

Compaction of backfill adjacent to retaining walls, which may be proposed, can produce excessive lateral pressures. Improper types and locations of compaction equipment and/or compaction techniques may damage the walls. The use of heavy compaction equipment should not be permitted within a horizontal distance of 5 feet from the wall. Backfill behind any structural walls within the recommended 5-foot zone should be compacted using lightweight construction equipment such as handheld compactors to avoid overstressing the walls.

### *10.10 Shrinkage and Subsidence*

The volume of excavated and recompacted soils will decrease as a result of grading. The shrinkage would depend on, among other factors, the depth of cut and/or fill, and the grading method and equipment utilized. Based on our exploration as well as previous experience in the other projects in close vicinity of this site, for the preliminary estimation, shrinkage factors for various units of earth material at the site may be taken as presented below.

- The shrinkage factor (defined as a percentage of soil volume reduction when moisture conditioned and compacted to the average of 92 percent relative compaction) for the upper 15 feet of soils is estimated to range from approximately 1 to 24 percent. An average value of 3 percent to 8 percent may be used for preliminary earthwork planning.
- Subsidence (defined as the settlement of native materials from the equipment load applied during grading and proposed fill loads) would depend on the construction methods including type of equipment utilized. Ground subsidence is estimated to be approximately 0.20 foot to 0.25 foot.

Although these values are only approximate, they represent our best estimates of the factors to be used to calculate lost volume that may occur during grading. If more accurate shrinkage and subsidence factors are needed, it is recommended that field-testing using the actual equipment and grading techniques be conducted.

### *10.11 Site Drainage*

Adequate positive drainage should be provided away from the structures and excavation areas to prevent ponding and to reduce percolation of water into the foundation soils. A desirable drainage gradient is 1 percent for paved areas and 2 percent for landscaped areas. Surface drainage should be directed to suitable non-erosive devices.

### *10.12 Utility Trench Backfill*

The following sections present earthwork recommendations for utility trench backfill, including subgrade preparation and trench zone backfill.

Open cuts adjacent to existing roadways or structures are not recommended within a 1:1 (horizontal: vertical) plane extending down and away from the roadway or structure perimeter (if any).

Soils from the trench excavation should not be stockpiled more than 6 feet in height or within a horizontal distance from the trench edge equal to the depth of the trench. Soils should not be stockpiled behind the shoring, if any, within a horizontal distance equal to the depth of the trench, unless the shoring has been designed for such loads.

#### 10.12.1 Pipeline Subgrade Preparation

The final subgrade surface should be level, firm, uniform, and free of loose materials and properly graded to provide uniform bearing and support to the entire section of the pipe placed on bedding material. Protruding oversize particles larger than 2 inches in dimension, if any, should be removed from the trench bottom and replaced with compacted on-site materials.

Any loose, soft and/or unsuitable materials encountered at the pipe subgrade should be removed and replaced with an adequate bedding material. During the digging of depressions for proper sealing of the pipe joints, the pipe should rest on a prepared bottom as near its full length as is practicable.

### 10.12.2 Pipe Bedding

Bedding is defined as the material supporting and surrounding the pipe to 1 foot above the pipe. Recommendations for pipe bedding are provided below.

To provide uniform and firm support for the pipe, compacted granular materials such as clean sand, gravel or ¾-inch crushed aggregate, or crushed rock may be used as pipe bedding material. Typically, soils with sand equivalent value of 30 or more are used as pipe bedding material. The pipe designer should determine if the soils are suitable as pipe bedding material.

The type and thickness of the granular bedding placed underneath and around the pipe, if any, should be selected by the pipe designer. The load on the rigid pipes and deflection of flexible pipes and, hence, the pipe design, depends on the type and the amount of bedding placed underneath and around the pipe.

Bedding materials should be vibrated in-place to achieve compaction. Care should be taken to densify the bedding material below the spring line of the pipe. Prior to placing the pipe bedding material, the pipe subgrade should be uniform and properly graded to provide uniform bearing and support to the entire section of the pipe placed on bedding material. During the digging of depressions for proper sealing of the pipe joints, the pipe should rest on a prepared bottom as near its full length as is practicable.

Based on the design groundwater depth, migration of fines from the surrounding native and/or fill soils may not be considered in selecting the gradation of any imported bedding material.

### 10.12.3 Trench Zone Backfill

The trench zone is defined as the portion of the trench above the pipe bedding extending up to the final grade level of the trench surface. Excavated sites soil free of oversize particles and deleterious matter may be used to backfill the trench zone. Detailed trench backfill recommendations are provided below.

- Trench excavations to receive backfill should be free of trash, debris or other unsatisfactory materials at the time of backfill placement.
- Trench zone backfill should be compacted to at least 90 percent of the laboratory maximum dry density as per ASTM D1557-12R21 test method. At least the upper 1 foot of trench backfill underlying pavement should be compacted to at least 95

percent of the laboratory maximum dry density as per ASTM D1557-12R21 test method.

- Particles larger than 1 inch should not be placed within 12 inches of the pavement subgrade. No more than 30 percent of the backfill volume should be larger than ¾-inch in the largest dimension. Gravel should be well mixed with finer soil. Rocks larger than 3 inches in the largest dimension should not be placed as trench backfill.
- Trench backfill should be compacted by mechanical methods, such as sheepsfoot, vibrating or pneumatic rollers or mechanical tampers to achieve the density specified herein. The backfill materials should be brought to within ± 3 percent of optimum moisture content for coarse-grained soil, and between optimum and 2 percent above optimum for fine-grained soil, then placed in horizontal layers. The thickness of uncompacted layers should not exceed 8 inches. Each layer should be evenly spread, moistened or dried as necessary, and then tamped or rolled until the specified density has been achieved.
- The contractor should select the equipment and processes to be used to achieve the specified density without damage to adjacent ground, structures, utilities and completed work.
- It should be the responsibility of the contractor to maintain safe working conditions during all phases of construction.
- The field density of the compacted soil should be measured by the ASTM D1556 (Sand Cone) or ASTM D6938 (Nuclear Gauge) or equivalent.
- Trench backfill should not be placed, spread or rolled during unfavorable weather conditions. When the work is interrupted by heavy rain, fill operations should not resume until field tests by the project's geotechnical consultant indicate that the moisture content and density of the fill are in compliance with project specifications.

# 11.0 DESIGN RECOMMENDATIONS

Design recommendations for the structures are provided in the following section.

## *11.1 General Evaluation*

The various design recommendations provided in this section are based on the laboratory testing as well as the assumption that in preparing the site, the earthwork recommendations provided in this report will be implemented.

### *11.2 Preliminary Shallow Foundation Design Parameters*

The proposed one- and two-story concrete tilt up buildings and possible retaining walls may be supported on continuous or isolated spread footings founded completely within competent compacted fill. The design of the shallow foundations should be based on the recommended parameters presented in the table below.

**Table No. 5, Recommended Foundation Parameters**

| Parameter | 1-Story Value | 2-Story Value |
|---|---|---|
| Minimum continuous width (interior and exterior) | 12 inches | 15 inches |
| Minimum continuous or isolated footing depth of embedment below lowest adjacent grade (interior and exterior) | 15 inches | 18 inches |
| Allowable net bearing capacity | 3,000 psf | 3,300 psf |

The isolated interior and exterior footings should be at least 24 inches wide. The footing dimensions and reinforcement should be based on structural design. The allowable bearing capacity can be increased by 500 pounds per square foot (psf) with each foot of additional embedment and 100 psf with each foot of additional width up to a maximum of 4,000 psf.

The net allowable bearing values indicated above are for the dead loads and frequently applied live loads and are obtained by applying a factor of safety of 3.0 to the net ultimate bearing capacity. If normal code requirements are applied for design, the above vertical bearing value may be increased by 33 percent for short duration loadings, which will include loadings induced by wind or seismic forces.

### *11.3 Lateral Earth Pressures and Resistance to Lateral Loads*

In the following subsections, the lateral earth pressures and resistance to lateral loads are estimated by using on-site native soils strength parameters obtained from laboratory testing.

#### 11.3.1 Active Earth Pressures

The active earth pressure behind any buried walls or foundation depends primarily on the allowable wall movement, type of backfill materials, backfill slopes, wall or foundation inclination, surcharges, and any hydrostatic pressures. The lateral earth pressures for the project site are presented in the following table.

**Table No. 6, Active and At-Rest Earth Pressures**

| Loading Conditions | Lateral Earth Pressure[1] (psf) | Lateral Earth Pressure[2] (psf) |
|---|---|---|
| | Level backfill | 2:1 backfill |
| Active earth conditions (wall is free to deflect at least 0.001 radian) | 40 | 65 |
| At-rest (wall is restrained) | 60 | 110 |

These pressures assume no surcharge and no hydrostatic pressure. If water pressure is allowed to build up behind the structure, the active pressures should be reduced by 50 percent and added to a full hydrostatic pressure to compute the design pressures against the structure.

### 11.3.2 Passive Earth Pressure

Resistance to lateral loads can be assumed to be provided by a combination of friction acting at the base of foundations and by passive earth pressure. A coefficient of friction of 0.35 between formed concrete and soil may be used with the dead load forces. An allowable passive earth pressure of 240 psf per foot of depth may be used for the sides of footings poured against recompacted soils. A factor of safety of 1.5 was applied in calculating passive earth pressure. The maximum value of the passive earth pressure should be limited to 2,400 psf for compacted fill.

Vertical and lateral bearing values indicated above are for the total dead loads and frequently applied live loads. If normal code requirements are applied for design, the above vertical bearing and lateral resistance values may be increased by 33 percent for short duration loading, which will include the effect of wind or seismic forces.

Due to the low overburden stress of the soil at shallow depth, the upper 1 foot of passive resistance should be neglected unless the soil is confined by pavement or slab.

## *11.4 Retaining Walls Drainage*

The recommended lateral earth pressure values do not include lateral pressures due to hydrostatic forces. Therefore, wall backfill should be free draining and provisions should be made to collect and dispose of excess water that may accumulate behind earth retaining structures. Behind wall drainage may be provided by free-draining gravel surrounded by synthetic filter fabric or by prefabricated, synthetic drain panels or weep holes. In either case, drainage should be collected by perforated pipes and directed to a sump, storm drain, or other suitable location for disposal. We recommend drain rock should consist of durable stone having 100 percent passing the 1-inch sieve and less than 5 percent passing the No. 4 sieve. Synthetic filter fabric should have an equivalent opening size (EOS), U.S. Standard Sieve, of between 40 and 70, a minimum flow rate of

110 gallons per minute per square foot of fabric, and a minimum puncture strength of 110 pounds.

### *11.5 Slabs-on-Grade*

Slabs-on-grade should be supported on properly compacted fill. Compacted fill used to support slabs-on-grade should be placed and compacted in accordance with Section 10.8 *Compacted Fill Placement*.

Slabs should be designed and constructed as promulgated by the American Concrete Institute (ACI) and the Portland Cement Association (PCA). Care should be taken during concrete placement to avoid slab curling. Prior to the slab pour, all utility trenches should be properly backfilled and compacted.

Concrete floors should be underlain with a moisture-vapor retarder consisting of a 10-mil thick vapor barrier. Laps within the membrane should be sealed and overlapped at least 6 inches. Two inches or more of clean sand should be placed above and below the membrane. These recommendations must be confirmed (and/or modified) by the foundation engineer with our concurrence, based upon the performance expectations of the foundation. It is the responsibility of the contractor to ensure that the moisture/vapor barrier systems are placed in accordance with the project plans and specifications, and that the moisture/vapor retarder materials are free of tears and punctures prior to concrete placement. Additional moisture reduction and/or prevention measures may be needed, depending on the performance requirements of future interior floor coverings.

In hot weather, the contractor should take appropriate curing precautions after placement of concrete to minimize cracking or curling of the slabs. The potential for slab cracking may be lessened by the addition of fiber mesh to the concrete and/or control of the water/cement ratio (maximum 0.45).

Concrete should be cured by protecting it against loss of moisture and rapid temperature change for at least 7 days after placement. Moist curing, waterproof paper, white polyethylene sheeting, white liquid membrane compound, or a combination thereof may be used after finishing operations have been completed. The edges of concrete slabs exposed after removal of forms should be immediately protected to provide continuous curing.

### *11.6 Expansion Potential*

Based on the results of the current and previous expansion testing of representative site soils, the general on-site soils have an expansion index of 0 to 12 for an expansion potential of **Very Low.**

The expansion indices of the final finish-grade soils will vary from the results obtained during our current and previous investigations. The expansion potential of the finish-grade soils should be tested at the completion of grading.

### 11.6.1 Very Low Expansion Potential

The following are additional recommendations where foundation soils exhibit **Very Low** expansion potential (E.I. of 0 to 20) as classified in accordance with 2022 CBC.

Slabs-on-grade should have a minimum thickness of 5 inches for support of nominal live loads and reinforced with No. 3 bars spaced 24 inches or less on-centers, both ways. Slab reinforcement should be supported on concrete chairs so that the desired placement is properly placed by the design engineer. Structural design elements of slabs-on-grade, including but not limited to thickness, reinforcement, joint spacing of more heavily loaded slabs will be dependent upon the anticipated loading conditions and the modulus of subgrade reaction (200 kcf) of the supporting materials and should be designed by a structural engineer.

Subgrade for slabs-on-grade should be firm and uniform. All loose or disturbed soils including under-slab utility trench backfill should be recompacted. Prior to placing concrete, the subgrade soils below all floor slabs should be pre-watered to achieve a moisture content that is equal to 100% of the optimum moisture content of the subgrade soils. The moisture content should penetrate to a minimum depth of 12 inches. This should promote uniform curing of the concrete and minimize the development of shrinkage cracks.

## *11.7 Settlement*

The total settlement of shallow footings, designed as recommended above, from static structural loads and short-term settlement of properly compacted fill is anticipated to be 0.35 inch or less. The static differential settlement can be taken as equal to one-half of the static total settlement over a lateral distance of 40 feet.

Our analysis of the potential dynamic settlement is presented in Appendix C, *Liquefaction and Settlement Analysis*. Based on our analysis, we anticipate the reservoir site has the potential for up to 1.15 inches of dry seismic settlement and negligible liquefaction induced settlement. The differential dry seismic settlement resulting from dynamic loads is anticipated to be equal to one-half of the total dry seismic settlement over a lateral distance of 40 feet. The structural engineer should consider this in the design.

## *11.8 Pipe Design for Underground Utilities*

The structural design of pipes requires proper evaluation of all possible loads acting on pipes. The stresses and strains induced on buried pipes depend on many factors, including the type of soil, density, bearing pressure, angle of internal friction, coefficient

of passive earth pressure, and coefficient of friction at the interface between the backfill and native soils. The recommended values of the various soil parameters for the pipe design are provided in Table No. 7, *Soil Parameters for Pipe Design*.

Where pipes are connecting to rigid structures near, or at its lower levels, and then are subjected to significant loads as the backfill is placed to finish grade, we recommend that provisions be incorporated in the design to provide support of these pipes where they exit the structure. Consideration can be given to flexible connections, concrete slurry support beneath the pipes where they exit the structures, overlaying and supporting the pipes with a few inches of compressible material, (i.e., Styrofoam, or other materials), or other techniques. Automatic shutoffs should be installed to limit the potential leakage from seismic event related damage.

**Table No. 7, Soil Parameters for Pipe Design**

| Soil Parameters | Parameters |
|---|---|
| Total unit weight of compacted backfill (assuming 92% average relative compaction), $\gamma$ | 123 pcf |
| Angle of internal friction of soils, $\phi$ | 29º |
| Soil cohesion, c | 136 psf |
| Coefficient of friction between concrete and native soils, fs | 0.35 |
| Coefficient of friction between pipe and native soils, fs | 0.25 for metal or HDPE pipe<br>0.30 for CML&C pipe |
| Bearing pressure against Compacted Fill or Natural Soils | 3,000 psf |
| Coefficient of passive earth pressure, Kp | 1.86 |
| Coefficient of active earth pressure, Ka | 0.54 |
| Modulus of Soil Reaction, E’ | 1,500 psi |

### *11.9 Soil Corrosivity*

The results of current and previous chemical testing of representative site soils with respect to common construction materials such as concrete and steel are presented in Appendix B, *Laboratory Testing Program*, and a general discussion are presented below.

The sulfate contents of the sampled soils correspond to American Concrete Institute (ACI) exposure category S0 for these sulfate concentrations (ACI 318-19, Table 19.3.1.1). No concrete type restrictions are specified for exposure category S0 (ACI 318-19, Table 19.3.2.1). A minimum compressive strength of 2,500 psi is recommended.

We anticipate that concrete will be exposed to moisture from precipitation and irrigation. Based on the project location and the results of chloride testing of the soils, we do not anticipate that concrete structures will be exposed to external sources of chlorides, such

as deicing chemicals, salt, brackish water, or seawater. ACI specifies exposure category C1 where concrete is exposed to moisture, but not to external sources of chlorides (ACI 318-19, Table 19.3.1.1). ACI provides concrete design recommendations in ACI 318-19, Table 19.3.2.1, including a compressive strength of at least 2,500 psi and a maximum chloride content of 0.3 percent.

The measured values of the minimum electrical resistivities of the samples when saturated were between 1,360 and 4,620 Ohm-cm. This indicates that the soils tested are moderately corrosive to corrosive to ferrous metals in contact with the soils (Keegan, 2024). Converse does not practice in the area of corrosion consulting. If needed, a qualified corrosion consultant should provide appropriate corrosion mitigation measures for any ferrous metals in contact with the site and site soils.

According to Keegan Labs LLC, 2024, the following tables provide general guidelines of soil corrosion based on electrical resistivity, sulfates, chlorides and pH.

**Table No. 8a, Correlation Between Resistivity and Corrosion**

| Electrical Resistivity of Soil | |
|---|---|
| **Soil Resistivity (ohm-cm) per Caltrans CT 643** | **Corrosivity Category** |
| Greater than 10,000 | Mildly Corrosive |
| 2,001 to 10,000 | Moderately Corrosive |
| 1,001 to 2,000 | Corrosive |
| 0 to 1,000 | Severe Corrosive |

**Table No. 8b, Correlation Between Sulfates and Corrosion**

| Sulfate in Soil per ACI 318 | |
|---|---|
| **Sulfate Level (mg/kg)** | **Classification** |
| Less than 1,000 (<0.1%) | Negligible |
| 1,000 to 2,000 (0.1 to 0.2%) | Moderate |
| 2,000 to 20,000 (0.2 to 2.0%) | Severe |
| Over 20,000 (>2.0%) | Very Severe |

**Table No. 8c, Correlation Between Chlorides and Corrosion**

| Chloride in Soil per ACI 318 | |
|---|---|
| **Concentration (mg/kg)** | **Classification** |
| ND to 100 | Negligible |
| 100 to 350 | Little Added Concern |
| 350 to 500 | Potential Concern |
| Over 500 | Definite Concern |

**Table No. 8d, Correlation Between pH and Corrosion**

| pH | |
|---|---|
| **pH Range** | **Description** |
| <3.5 | Ultra Acidic |
| 3.5 to 4.4 | Extremely Acidic |
| 4.5 to 5.0 | Very Strongly Acidic |
| 5.1 to 5.5 | Strongly Acidic* |
| 5.6 to 6.0 | Moderately Acidic |
| 6.1 to 6.5 | Slightly Acidic |
| 6.6 to 7.3 | Neutral |
| 7.4 to 7.8 | Slightly Alkaline |
| 7.9 to 8.4 | Moderately Alkaline |
| 8.5 to 9.0 | Strongly Alkaline |
| >9.0 | Very Strongly Alkaline |

*This range and below should have total acidity testing performed to evaluate corrosivity.

### *11.10 Asphalt Concrete Pavement*

Two soil samples were tested by Converse to determine the R-value of the subgrade soils. Based on laboratory testing, the R-values were 59 and 64. For pavement design, we have utilized a maximum design R-value of 50, and City of Ontario designated design Traffic Indices (TIs) ranging from 5.0 to 10.0.

Based on the above information, asphalt concrete and aggregate base thickness results are presented using the Caltrans Highway Design Manual (Caltrans, 2020), Chapter 630 with a safety factor of 0.2 for asphalt concrete/aggregate base section and 0.1 for full depth asphalt concrete section. Preliminary asphalt concrete pavement sections are presented in the following table below. The city of Ontario minimum asphalt pavement and aggregate base thickness requirements were also considered in the pavement designs.

**Table No. 9, Recommended Preliminary Pavement Sections**

| R-value | Traffic Index (TI) | Pavement Section | | |
|---|---|---|---|---|
| | | Option 1 | | Option 2 |
| | | Asphalt Concrete (inches) | Aggregate Base (inches) | Full AC Section (inches) |
| 50 | 5.0 (alleys) | 4.0 | 6.0 | 4.5 |
| | 5.5 (interior street) | 4.0 | 6.0 | 5.0 |
| | 8.0 (exterior street) | 6.0 | 8.0 | 8.0 |
| | 10.0 (exterior street) | 7.0 | 8.0 | 10.0 |

At or near the completion of grading, subsurface samples should be tested to evaluate the actual subgrade R-value for final pavement design.

Prior to placement of aggregate base, at least the upper 12 inches of finish grade should be scarified, moisture-conditioned if necessary, and recompacted to at least 95 percent of the laboratory maximum dry density as defined by ASTM Standard D1557-12R21 test method. Base materials should conform with Section 200-2.2,"*Crushed Aggregate Base*," of the current Standard Specifications for Public Works Construction (SSPWC; Public Works Standards, 2021) and should be placed in accordance with Section 301.2 of the SSPWC.

Asphaltic concrete materials should conform to Section 203 of the SSPWC and should be placed in accordance with Section 302-5 of the SSPWC.

### *11.11 Concrete Flatwork*

Except as modified herein, concrete walks, driveways, access ramps, curb and gutters should be constructed in accordance with Section 303-5, *Concrete Curbs, Walks, Gutters, Cross-Gutters, Alley Intersections, Access Ramps, and Driveways*, of the Standard Specifications for Public Works Construction (Public Works Standards, 2018).

The subgrade soils under the above-mentioned improvements should consist of compacted fill placed as described in section 9.8 of this report. Prior to placement of concrete, the upper 12 inches of finish grade should be moisture conditioned to within 3 percent of optimum moisture content for coarse-grained soils and 0 and 2 percent above optimum for fine-grained soils.

The thickness of driveways for passenger vehicles should be at least 4 inches, or as required by the civil or structural engineer. Transverse control joints for driveways should be spaced not more than 10 feet apart. Driveways wider than 12 feet should be provided with a longitudinal control joint.

Concrete walks subjected to pedestrian and bicycle loading should be at least 4 inches thick, or as required by the civil or structural engineer. Transverse joints should be spaced 15 feet or less and should be cut to a depth of one-fourth the slab thickness.

Positive drainage should be provided away from all driveways and sidewalks to prevent seepage of surface and/or subsurface water into the concrete base and/or subgrade.

# 12.0 CONSTRUCTION RECOMMENDATIONS

Temporary sloped excavation recommendations are presented in the following sections.

## *12.1 General*

Prior to the start of construction, all existing underground utilities (if any) should be located at the project site. Such utilities should either be protected in-place or removed and replaced during construction as required by the project specifications.

Vertical braced excavations can be considered for the foundations. Sloped excavations may not be feasible in locations adjacent to existing utilities, pavement, or structure (if any). Recommendations pertaining to temporary excavations are presented in this section.

Excavations near existing structures may require vertical side wall excavation. Where the side of the excavation is a vertical cut, it should be adequately supported by temporary shoring to protect workers and any adjacent structures.

All applicable requirements of the California Construction and General Industry Safety Orders, the Occupational Safety and Health Act, and the Construction Safety Act should be met. The soils exposed in cuts should be observed during excavation by the geotechnical consultant and the competent person designated by the contractor. If potentially unstable soil conditions are encountered, modifications of slope ratios for temporary cuts may be required.

## *12.2 Temporary Sloped Excavations*

Temporary open-cut trenches may be constructed with side slopes as recommended in the following table. Temporary cuts encountering soft and wet fine-grained soils; dry loose, cohesionless soils or loose fill from trench backfill may have to be constructed at a flatter gradient than presented below.

**Table No. 10, Slope Ratios for Temporary Excavations**

| Soil Type | OSHA Soil Type | Depth of Cut (feet) | Recommended Maximum Slope (Horizontal:Vertical)[1] |
|---|---|---|---|
| Silty Sand (SM) | C | 0-10 | 1.5:1 |

[1] Slope ratio assumed to be uniform from top to toe of slope.

For shallow excavations up to 4 feet bgs can vertical. For steeper temporary construction slopes or deeper excavations, or unstable soil encountered during the excavation, shoring or trench shields should be provided by the contractor to protect the workers in the excavation. Design recommendations for temporary shoring are provided in the following section.

Surfaces exposed in slope excavations should be kept moist but not saturated to retard raveling and sloughing during construction. Adequate provisions should be made to protect the slopes from erosion during periods of rainfall. Surcharge loads, including construction materials, should not be placed within 5 feet of the unsupported slope edge. Stockpiled soils with a height higher than 6 feet will require greater distance from trench edges.

## 13.0 GEOTECHNICAL SERVICES DURING CONSTRUCTION

The project geotechnical consultant should review plans and specifications as the project design progresses. Such review is necessary to identify design elements, assumptions, or new conditions which require revisions or additions to our geotechnical recommendations.

The project geotechnical consultant should be present to observe conditions during construction. Geotechnical observation and testing should be performed as needed to verify compliance with project specifications. Additional geotechnical recommendations may be required based on subsurface conditions encountered during construction.

## 14.0 CLOSURE

This report is prepared for the project described herein and is intended for use solely by Ontario Ranch Ventures I & II, LP (ORV I & II), RCCD, Inc. and their authorized agents, to assist in the development of the proposed project. Our findings and recommendations were obtained in accordance with generally accepted professional principles practiced in geotechnical engineering. We make no other warranty, either expressed or implied.

Converse Consultants is not responsible or liable for any claims or damages associated with interpretation of available information provided to others. Site exploration identifies actual soil conditions only at those points where samples are taken, when they are taken. Data derived through sampling and laboratory testing is extrapolated by Converse employees who render an opinion about the overall soil conditions. Actual conditions in

areas not sampled may differ. In the event that changes to the project occur, or additional, relevant information about the project is brought to our attention, the recommendations contained in this report may not be valid unless these changes and additional relevant information are reviewed, and the recommendations of this report are modified or verified in writing. In addition, the recommendations can only be finalized by observing actual subsurface conditions revealed during construction. Converse cannot be held responsible for misinterpretation or changes to our recommendations made by others during construction.

As the project evolves, a continued consultation and construction monitoring by a qualified geotechnical consultant should be considered an extension of geotechnical investigation services performed to date. The geotechnical consultant should review plans and specifications to verify that the recommendations presented herein have been appropriately interpreted, and that the design assumptions used in this report are valid. Where significant design changes occur, Converse may be required to augment or modify the recommendations presented herein. Subsurface conditions may differ in some locations from those encountered in the explorations, and may require additional analyses and, possibly, modified recommendations.

Design recommendations given in this report are based on the assumption that the recommendations contained in this report are implemented. Additional consultation may be prudent to interpret Converse's findings for contractors, or to possibly refine these recommendations based upon the review of the actual site conditions encountered during construction. If the scope of the project changes, if project completion is to be delayed, or if the report is to be used for another purpose, this office should be consulted.

# Appendix A

## Field Exploration

# APPENDIX A

# FIELD EXPLORATION

Our field investigation included a site reconnaissance and a subsurface exploration program consisting of drilling exploratory borings and excavating test pits. During the site reconnaissance, the surface conditions were noted, and the test pit and boring locations were marked in the field using the referenced topographic maps and from approximate distances from local streets as a guide and should be considered accurate only to the degree implied by the method used to locate them. Description of the field investigation method is presented below.

***Exploratory Borings***

Ten exploratory borings (BH-01 through BH-10) were drilled on May 24, 2024 and May 29, 2024, within the project site to investigate the subsurface conditions. The borings were drilled to depths ranging from 16.5 to 51.5 feet (bgs).

The borings were advanced using a truck-mounted drill rig equipped with 8-inch diameter hollow-stem augers for soils sampling. Encountered materials were continuously logged by a Converse geologist and classified in the field by visual classification in accordance with the Unified Soil Classification System. Where appropriate, the field descriptions and classifications have been modified to reflect laboratory test results.

Relatively undisturbed samples were obtained using California Modified Samplers (2.4 inches inside diameter and 3.0 inches outside diameter) lined with thin sample rings. The steel ring sampler was driven into the bottom of the borehole with successive drops of a 140-pound driving weight falling 30 inches. Blow counts at each sample interval are presented on the boring logs. Samples were retained in brass rings (2.4 inches inside diameter and 1.0 inch in height) and carefully sealed in waterproof plastic containers for shipment to the Converse laboratory. Representative bulk samples were collected from selected depths and placed in large plastic bags for delivery to our laboratory.

Standard Penetration Testing (SPT) were also performed in borings (BH-02, BH-05. BH-06, BH-08 and BH-10) in accordance with the ASTM Standard D1586 using a standard (1.4 inches inside diameter and 2.0 inches outside diameter) split-barrel sampler. The mechanically driven hammer for the SPT sampler was 140 pounds, falling 30 inches for each blow. The recorded blow counts for every 6 inches for a total of 1.5 feet of sampler penetration are shown on the Logs of Borings.

Following completion of logging and sampling, borings BH-01 through BH-10 were backfilled with excavated soil cuttings and compacted by pushing down with the auger using the weight of the drill rig. If construction is delayed the ground surface at the boring locations may settle over time. We recommend the owner monitor the boring locations

and backfill any depressions that occur or provide protection around the boring locations to prevent trip and fall injuries from occurring.

***Test Pits***

Thirteen exploratory test pits (TP-01 through TP-13) were excavated using a backhoe equipped with 24-inch-wide bucket to investigate the subsurface conditions on June 11 and 12, 2024. The test pits were excavated between 4.1 feet and 7.6 feet below the existing ground surface (bgs).

During exploration, encountered materials were continuously logged by a Converse geologist and classified in the field by visual classification in accordance with the Unified Soil Classification System. Where appropriate, the field descriptions and classifications have been modified to reflect laboratory test results.

Relatively undisturbed samples were obtained from the test pits using California Modified Samplers (2.4 inches inside diameter and 3.0 inches outside diameter) lined with thin sample rings. The steel ring sampler was driven at selected level benches in the test pit using manual hand-operated equipment with successive drops of a 35-pound driving weight falling 30 inches. Samples were retained in brass rings (2.4 inches inside diameter and 1.0 inch in height) and carefully sealed in waterproof plastic containers for shipment to the Converse laboratory. In-situ dry densities and moisture contents of the site soils were also determined in the test pits with a nuclear gauge in accordance with ASTM Standard D6938. Representative bulk samples were collected from selected depths and placed in plastic bags for delivery to our laboratory.

Test pits were backfilled in lifts with excavated soil, tamped, and then wheel rolled at the surface using the bucket under the weight of the backhoe. If construction is delayed the ground surface at the test pit locations may settle over time. We recommend the owner monitor the test pit locations and backfill any depressions that occur or provide protection around the test pit locations to prevent trip and fall injuries from occurring.

For a key to soil symbols and terminology used in the test pit and boring logs, refer to Drawing Nos. A-1a and A-1b, *Unified Soil Classification and Key to Boring Log and Test Pit Symbols*. For logs of Borings and Test Pits, see Drawings No. A-2 through A-24, *Logs of Borings and Test Pits*.

## BORING LOG SYMBOLS

SAMPLE TYPE

- STANDARD PENETRATION TEST — Split barrel sampler in accordance with ASTM D-1586-84 Standard Test Method
- DRIVE SAMPLE — 2.42" I.D. sampler (CMS).
- DRIVE SAMPLE — No recovery
- BULK SAMPLE
- GROUNDWATER WHILE DRILLING
- GROUNDWATER AFTER DRILLING

## DRILLING METHOD SYMBOLS

- Auger Drilling
- Mud Rotary Drilling
- Dynamic Cone or Hand Driven
- Diamond Core

## CONSISTENCY OF COHESIVE SOILS

| Descriptor | Unconfined Compressive Strength (tsf) | SPT Blow Counts | Pocket Penetrometer (tsf) | CA Sampler | Torvane (tsf) | Field Approximation |
|---|---|---|---|---|---|---|
| Very Soft | <0.25 | < 2 | <0.25 | <3 | <0.12 | Easily penetrated several inches by fist |
| Soft | 0.25 - 0.50 | 2 - 4 | 0.25 - 0.50 | 3 - 6 | 0.12 - 0.25 | Easily penetrated several inches by thumb |
| Medium Stiff | 0.50 - 1.0 | 5 - 8 | 0.50 - 1.0 | 7 - 12 | 0.25 - 0.50 | Can be penetrated several inches by thumb with moderate effort |
| Stiff | 1.0 - 2.0 | 9 - 15 | 1.0 - 2.0 | 13 - 25 | 0.50 - 1.0 | Readily indented by thumb but penetrated only with great effort |
| Very Stiff | 2.0 - 4.0 | 16 - 30 | 2.0 - 4.0 | 26 - 50 | 1.0 - 2.0 | Readily indented by thumbnail |
| Hard | >4.0 | >30 | >4.0 | >50 | >2.0 | Indented by thumbnail with difficulty |

## APPARENT DENSITY OF COHESIONLESS SOILS

| Descriptor | SPT $N_{60}$- Value (blows / foot) | CA Sampler |
|---|---|---|
| Very Loose | <4 | <5 |
| Loose | 4- 10 | 5 - 12 |
| Medium Dense | 11 - 30 | 13 - 35 |
| Dense | 31 - 50 | 36 - 60 |
| Very Dense | >50 | >60 |

## MOISTURE

| Descriptor | Criteria |
|---|---|
| Dry | Absence of moisture, dusty, dry to the touch |
| Moist | Damp but no visible water |
| Wet | Visible free water, usually soil is below water table |

## PERCENT OF PROPORTION OF SOILS

| Descriptor | Criteria |
|---|---|
| Trace (fine)/ Scattered (coarse) | Particles are present but estimated to be less than 5% |
| Few | 5 to 10% |
| Little | 15 to 25% |
| Some | 30 to 45% |
| Mostly | 50 to 100% |

## SOIL PARTICLE SIZE

| Descriptor | | Size |
|---|---|---|
| Boulder | | > 12 inches |
| Cobble | | 3 to 12 inches |
| Gravel | Coarse | 3/4 inch to 3 inches |
| | Fine | No. 4 Sieve to 3/4 inch |
| Sand | Coarse | No. 10 Sieve to No. 4 Sieve |
| | Medium | No. 40 Sieve to No. 10 Sieve |
| | Fine | No. 200 Sieve to No. No. 40 Sieve |
| Silt and Clay | | Passing No. 200 Sieve |

## PLASTICITY OF FINE-GRAINED SOILS

| Descriptor | Criteria |
|---|---|
| Nonplastic | A 1/8-inch thread cannot be rolled at any water content. |
| Low | The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit. |
| Medium | The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit. |
| High | It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit. |

## CEMENTATION/ Induration

| Descriptor | Criteria |
|---|---|
| Weak | Crumbles or breaks with handling or little finger pressure. |
| Moderate | Crumbles or breaks with considerable finger pressure. |
| Strong | Will not crumble or break with finger pressure. |

**NOTE:** This legend sheet provides descriptions and associated criteria for required soil description components only. Refer to Caltrans Soil and Rock Logging, Classification, and Presentation Manual (2010), Section 2, for tables of additional soil description components and discussion of soil description and identification.

# Log of Boring No. BH-07

Date Drilled: 5/29/2024 Logged by: Elizabeth Hernandez Checked By: Robert L Gregorek II

Equipment: 8" DIAMETER HOLLOW STEM AUGER Driving Weight and Drop: 140 lbs / 30 in

Ground Surface Elevation (ft): 680 Depth to Water (ft, bgs): NOT ENCOUNTERED

| Depth (ft) | Graphic Log | SUMMARY OF SUBSURFACE CONDITIONS<br>This log is part of the report prepared by Converse for this project and should be read together with the report. This summary applies only at the location of the boring and at the time of drilling. Subsurface conditions may differ at other locations and may change at this location with the passage of time. The data presented is a simplification of actual conditions encountered. | SAMPLES DRIVE | SAMPLES BULK | BLOWS | MOISTURE (%) | DRY UNIT WT. (pcf) | OTHER |
|---|---|---|---|---|---|---|---|---|
| | | **MANURE:** 0.3 feet thick. | | | | | | OC |
| | | **ARTIFICIAL FILL**<br>**SANDY SILT (ML):** fine to coarse-grained sand, organics and manure, soft, brown-black. | ■ | | 9/11/12 | 5 | 108 | DS, CP |
| 5 | | **SILTY SAND (SM):** fine to coarse-grained, medium dense, moist, light orange-brown.<br>-@5.0': loose. | ■ | | 4/4/6 | 6 | 103 | C |
| | | **ALLUVIUM**<br>**CLAYEY SAND/ SANDY CLAY (SC-CL):** medium-grained, pinhole porosity, moderately to very desiccated, trace caliche, slight orange oxidation staining, medium dense/stiff, moist, orange-brown. | ■ | | 6/10/14 | 13 | 117 | |
| 10 | | -@10.0': trace silt, caliche stringers. | ■ | | 7/10/14 | 12 | 121 | |
| 15 | | -@15.0': caliche stringers, orange oxidation, medium dense/very stiff. | ■ | | 8/13/17 | 12 | 121 | |

End of boring at 16.5 feet below ground surface
No groundwater encountered
Boring backfilled with cuttings
and compacted with augers using the weight of the drill rig on 5/29/2024.

# Appendix B

## Laboratory Testing Program

# APPENDIX B

## LABORATORY TESTING PROGRAM

Tests were conducted in our laboratory on representative soil samples for the purpose of classification and evaluation of their physical properties and engineering characteristics. The amount and selection of tests were based on the geotechnical parameters required for this project. Test results are presented herein and on the Logs of Borings and Test Pits, in Appendix A, *Field Exploration*. The following is a summary of the various laboratory tests conducted for this project.

### ***In-Situ* Moisture Content and Dry Density**

In-situ dry density and moisture content tests were performed on relatively undisturbed ring samples, in accordance with ASTM Standard D2216-19 and D2937-17 to aid in soils classification and to provide qualitative information on strength and compressibility characteristics of the site soils. For test results, see the Logs of Borings and Test Pits in Appendix A, *Field Exploration*.

### **Organic Content (OC)**

Tests were performed on eight select bulk samples during the current geotechnical investigation and eighteen select samples during the previous geotechnical feasibility study by SoCalGeo of the soil on the site, to determine the organic content, in accordance with the ASTM Standard D2974-20e1 test, Methods A and C. Test results are summarized in the table below.

**Table No. B-1, Summary of Organic Content Test Results**

| Boring/Test Pit No. | Depth (feet) | Soil Description | Total Organic Content (%) |
|---|---|---|---|
| BH-01 | 4.0-10.0 | Silty Sand (SM), Native | 1.1 |
| BH-02 | 0.4-2.0 | Silty Sand (SM), Fill | 2.1 |
| BH-07 | 0.3-1.0 | Sandy Silt (ML), Fill | 7.1 |
| TP-02 | 0.7-1.0 | Silty Sand (SM), Fill | 6.0 |
| TP-05 | 0.0-1.0 | Manure/Clayey Sand (SC), Fill | 12.2 |
| TP-07 | 0.5-2.5 | Clayey Sand/Sandy Clay (SC-CL), Fill | 2.1 |
| TP-08 | 5.0-6.0 | Silty Sand (SM), Native | 1.3 |
| TP-11 | 5.0-6.0 | Silty Sand (SM), Native | 1.9 |

**Table No. B-1a, Summary of Organic Content Test Results (SoCalGeo, 1 & 3/2022)**

| Test Pit No. | Depth (feet) | Soil Description | Total Organic Content (%) |
|---|---|---|---|
| HA-1 (1/22) | 0.0-0.5 | Silty Sand (SM), Fill | 13.0 |
| HA-1 (1/22) | 0.5-1.0 | Silty Sand (SM), Fill | 5.9 |
| HA-1 (1/22) | 1.0-1.5 | Silty Sand (SM), Fill | 7.9 |
| HA-1 (1/22) | 1.5-2.0 | Silty Sand (SM), Fill | 2.5 |
| HA-1 (1/22) | 3.0-3.5 | Sand, trace silt (SP), Native | 1.6 |
| HA-2 (1/22) | 0.0-0.5 | Silty Sand (SM), Fill | 24.3 |
| HA-2 (1/22) | 0.5-1.0 | Silty Sand (SM), Fill | 19.0 |
| HA-2 (1/22) | 1.0-1.5 | Sand, trace silt (SP), Fill | 10.3 |
| HA-2 (1/22) | 1.5-2.0 | Sand, trace silt (SP), Fill | 2.7 |
| HA-2 (1/22) | 3.0-3.5 | Sand, trace silt (SP), Native | 2.0 |
| HA-1 (3/22) | 0.0-0.5 | Silty Sand (SM), Fill | 6.6 |
| HA-1 (3/22) | 0.5-1.0 | Silty Sand (SM), Fill | 5.9 |
| HA-1 (3/22) | 1.0-1.5 | Silty Sand (SM), Fill | 4.0 |
| HA-1 (3/22) | 1.5-2.0 | Sandy Silt (ML), Native | 2.4 |
| HA-2(3/22) | 0.0-0.5 | Silty Sand (SM), Fill | 14.4 |
| HA-2(3/22) | 0.5-1.0 | Silty Sand (SM), Fill | 18.5 |
| HA-2(3/22) | 1.0-1.5 | Silty Sand (SM), Fill | 8.5 |
| HA-2(3/22) | 1.5-2.0 | Silty Sand (SM), Fill | 2.7 |

**Expansion Index (EI)**

Two representative bulk samples were tested during the current geotechnical investigation and one bulk sample weas tested during a previous geotechnical feasibility study by SoCalGeo of the soil on the site, to evaluate the expansion potential of materials encountered at the site in accordance with ASTM D4829-21 Standard. The test results are presented in the following table.

**Table No. B-2, Expansion Index Test Results**

| Boring No. | Depth feet) | Soil Description | Expansion Index | Expansion Potential |
|---|---|---|---|---|
| BH-08 | 0.0-5.0 | Silty Sand (SM) | 0 | Very Low |
| BH-10 | 0.0-4.0 | Silty Sand (SM) | 0 | Very Low |

**Table No. B-2a, Expansion Index Test Results (SoCalGeo, 1/2022)**

| Boring No. | Depth feet) | Soil Description | Expansion Index | Expansion Potential |
|---|---|---|---|---|
| B-7 | 0-5 | Clayey Sand (SC) | 12 | Very Low |

**R-value (R)**

Two representative bulk soil samples were tested for resistance value (R-value) in accordance with California Test Method CT301. This test provides a relative measure of soil strength for use in pavement design. The test result is presented in the table below.

**Table No. B-3, R-Value Test Result**

| Boring No. | Depth (feet) | Soil Classification | Measured R-value |
|---|---|---|---|
| BH-02 | 2.0-5.0 | Silty Sand (SM) | 64 |
| BH-08 | 0-5.0 | Silty Sand (SM) | 59 |

**Soil Corrosivity (CR)**

One representative soil sample was tested during the current geotechnical investigation and three bulk samples were tested during previous geotechnical feasibility studies by SoCalGeo within site, to determine minimum electrical resistivity, pH, and chemical content, including soluble sulfate and chloride concentrations. The purpose of this test was to determine the corrosion potential of site soils when placed in contact with common construction materials. The tests were performed by Keegan Labs. (Pomona, CA) in accordance with Caltrans Test Methods 643, 422 and 417. Test results are presented in the following table.

**Table No. B-4, Summary of Soil Corrosivity Test Results**

| Boring No. | Depth (feet) | pH | Soluble Sulfates (CA 417) (ppm) | Soluble Chlorides (CA 422) (ppm) | Min. Resistivity (CA 643) (Ohm-cm) |
|---|---|---|---|---|---|
| BH-08 | 0.0-5.0 | 6.7 | 90 | 25 | 4,620 |

**Table No. B-4a, Soil Corrosivity Test Result (SoCalGeo, 1 & 3/2022)**

| Boring No. | Depth (feet) | pH | Soluble Sulfates (CA 417) (ppm) | Soluble Chlorides (CA 422) (ppm) | Min. Resistivity (CA 643) (Ohm-cm) |
|---|---|---|---|---|---|
| B-1 (1/22) | 0-5 | 7.5 | 17 | 119.0 | 1,360 |
| B-7 (3/22) | 0-5 | 8.3 | 122 | 94.4 | 2.435 |
| B-9 (3/22) | 0-5 | 9.4 | 72 | 33.1 | 3,216 |

**Collapse (CL)**

To evaluate the moisture sensitivity (collapse/swell potential) of the encountered soils, two collapse tests were performed in accordance with the ASTM Standard D4546-21 laboratory procedure. The samples were loaded to approximately 1 kip per square foot (ksf), allowed to stabilize under load, and then submerged. The test results are presented in the following table.

**Table No. B-5, Collapse Test Results**

| Boring No. | Depth (feet) | Soil Classification | Percent Swell (+) Percent Collapse (-) | Collapse Potential |
|---|---|---|---|---|
| BH-02 | 2.0-3.5 | Silty Sand (SM) | -1.6 | Slight |
| BH-06 | 3.0-4.5 | Silty Sand (SM) | -0.2 | Slight |

**Grain-Size Analysis (PA)**

To assist in soil classification, mechanical grain-size analyses was performed on three select samples in accordance with the ASTM Standard D6913/D6913M-17 test method. Grain-size distribution is summarized in the table below and plotted in Drawing No. B-1, *Grain Size Distribution Results*.

**Table No. B-6, Grain Size Distribution Test Results**

| Boring No. | Depth (ft) | Soil Classification | % Gravel | % Sand | %Silt | %Clay |
|---|---|---|---|---|---|---|
| BH-01 | 4.0-10.0 | Silty Sand (SM) | 0.0 | 82.3 | 17.7 | |
| BH-08 | 0.0-5.0 | Silty Sand (SM) | 0.0 | 72.9 | 27.1 | |
| BH-10 | 0.0-4.0 | Silty Sand (SM) | 0.0 | 59.9 | 40.1 | |

**Maximum Dry Density and Optimum Moisture Content (CP)**

Laboratory maximum dry density-optimum moisture content relationship tests were performed on two representative bulk samples. These tests were conducted in accordance with the ASTM Standard D1557-12R21 test method. The test results are presented in Drawing No. B-2, *Moisture-Density Relationship Results,* and is summarized in the following table.

**Table No B-7, Summary of Moisture-Density Relationship Results**

| Boring No. | Depth (feet) | Soil Description | Optimum Moisture (%) | Maximum Density (lb./cft) |
|---|---|---|---|---|
| BH-01 | 4.0-10.0 | Silty Sand (SM), Brown | 11.1 | 118.6 |
| BH-07 | 1.0-4.0 | Silty Sand (SM), Brown | 12.7 | 117.5 |

**Direct Shear (DS)**

Three direct shear tests were performed; one direct shear test was performed on a relatively undisturbed sample and two direct shear tests were performed on samples remolded to 90% of the maximum dry density under soaked moisture conditions in accordance with ASTM D3080/D3080M-23. on relatively undisturbed samples in accordance with ASTM D3080. For each test, three samples contained in brass sampler rings were placed, one at a time, directly into the test apparatus and subjected to a range of normal loads appropriate for the anticipated conditions. The samples were then sheared at a constant strain rate of 0.02 inch/minute. Shear deformation was recorded until a maximum of about 0.25-inch shear displacement was achieved. Ultimate strength was selected from the shear-stress deformation data and plotted to determine the shear strength parameters. For test data, including sample density and moisture content, see Drawings No. B-3 through B-5*, Direct Shear Test Results,* and the following table.

**Table No. B-8, Summary of Direct Shear Test Results**

| Boring No. | Depth (feet) | Soil Description | Peak Strength Parameters | |
|---|---|---|---|---|
| | | | Friction Angle (degrees) | Cohesion (psf) |
| *BH-01 | 4.0-10.0 | Silty Sand (SM) | 31 | 70 |
| BH-01 | 7.0-8.5 | Silty Sand (SM) | 27 | 150 |
| *BH-07 | 1.0-4.0 | Silty Sand (SM) | 31 | 190 |

*Remolded to 90% of the maximum dry density

**Consolidation (C)**

Three consolidation tests were conducted in accordance with ASTM Standard D2435/D2435M-11R20 method. Data obtained from the test performed on relatively undisturbed ring samples were used to evaluate the settlement characteristics of the on-site soils under load. Preparation for these tests involved trimming the sample, placing it in a 1-inch-high brass ring, and loading it into the test apparatus, which contained porous stones to accommodate drainage during testing. Normal axial loads were applied to one end of the sample through the porous stones, and the resulting deflections were recorded at various time periods. The load was increased after the sample reached a reasonable state of equilibrium. Normal loads were applied at a constant load-increment ratio, successive loads being generally twice the preceding load. For test results, including sample density and initial moisture content, see Drawings No. B-6 through B-8, *Consolidation Test Results*.

**Sample Storage**

Soil samples presently stored in our laboratory will be discarded 30 days after the date of this report, unless this office receives a specific request to retain the samples for a longer period.

# Appendix C

## Liquefaction & Dynamic Settlement Analysis

# APPENDIX C

## LIQUEFACTION AND DYNAMIC SETTLEMENT ANALYSIS

The subsurface data obtained from the boring BH-05 was used to evaluate the liquefaction potential and associated dry seismic settlement when subjected to ground shaking during earthquakes.

A simplified liquefaction hazard analysis was performed using the program SPTLIQ (InfraGEO Software, 2021) using the liquefaction triggering analysis method by Boulanger and Idriss (2014). A modal earthquake magnitude of M 6.66 was selected based on the results of seismic deaggregation analysis using the USGS interactive online tool (https://earthquake.usgs.gov/hazards/interactive/).

A peak ground acceleration ($PGA_M$) of 0.749g for the MCE design event, where g is the acceleration due to gravity, was selected for this analysis. The PGA was based on the CBC seismic design parameters presented in Section 8.2, *CBC Seismic Design Parameters.* The result of our analysis is presented on Plates No. C-1 through C-3 and summarized in the following table.

**Table C-1, Estimated Dynamic Settlements**

| Location | Groundwater Conditions | Groundwater Depth (feet bgs) | Dry Seismic Settlement (inches) | Liquefaction Induced Settlement (inches) |
|---|---|---|---|---|
| BH-05 | Current | >50 | 1.01 | Negligible |
| | Historical | >50 | | |

Based on our analysis, the project site has the potential for up to 1.01 inches of dry seismic settlement with negligible liquefaction induced settlement under the current groundwater conditions. For design purpose, the dynamic differential settlement of the site should be equal to one-half of the total dry seismic settlement over a lateral distance of 40 feet.

# SIMPLIFIED LIQUEFACTION HAZARDS ASSESSMENT USING STANDARD PENETRATION TEST (SPT) DATA

| Cyclic Lateral Displacement: | Tokimatsu and Asaka (1998) | 0.38 inches | 0.79 inches | 0.79 inches | (During Ground Shaking) |
| Lateral Spreading Displacement: | Zhang et al. (2004) | 0.00 inches | 0.00 inches | 0.00 inches | (After Ground Shaking) |

## NOTES AND REFERENCES

\+ This method of analysis is based on observed seismic performance of level ground sites using correlation with normalized and fines-corrected SPT blow count, $(N_1)_{60cs} = f\{(N_1)_{60}, FC\}$ where $(N_1)_{60} = N_{field}\, C_N\, C_E\, C_B\, C_R\, C_S$

++ Liquefaction susceptibility screening is performed to identify soil layers assessed to be non-liquefiable based on laboratory test results using the criteria proposed by Cetin and Seed (2003), Bray and Sancio (2006), or Idriss and Boulanger (2008).

* $FS_{liq}$ = Factor of Safety against liquefaction = (CRR/CSR), where $CRR = CRR_{7.5}\, MSF\, K_\sigma\, K_\alpha$, MSF = Magnitude Scaling Factor, $K_\sigma = f[(N_1)_{60}, \sigma'_{vo}]$, $K_\alpha$ =1.0, (level ground), CSR = Cyclic Stress Ratio = $0.65\, A_{max}\, (\sigma_{vo}/\sigma'_{vo})\, r_d$, and $CRR_{7.5}$ = Cyclic Resistance Ratio is a function of $(N_1)_{60cs}$ and corrected for an earthquake magnitude $M_w$ of 7.5.

** Residual strength values of liquefied soils are based on correlation with post-earthquake, normalized and fines-corrected SPT blow count derived by Idriss and Boulanger (2008).

*** Based on Iwasaki et al. (1978) and Toprak and Holzer (2003)

# Appendix D

## Earthwork Specifications

# APPENDIX D

# EARTHWORK SPECIFICATIONS

## D1.1 Scope of Work

The work includes all labor, supplies and construction equipment required to construct the building pads in a good manner, as shown on the drawings and herein specified. The major items of work covered in this section include the following.

- Site Inspection
- Authority of Geotechnical Engineer
- Site Clearing
- Excavations
- Preparation of Fill Areas
- Placement and Compaction of Fill
- Observation and Testing

## D1.2 Site Inspection

1. The Contractor should carefully examine the site and make all inspections necessary in order to determine the full extent of the work required to make the completed work conform to the drawings and specifications. The Contractor should satisfy himself as to the nature and location of the work, ground surface and the characteristics of equipment and facilities needed prior to and during prosecution of the work. The Contractor should satisfy himself as to the character, quality, and quantity of surface and subsurface materials or obstacles to be encountered. Any inaccuracies or discrepancies between the actual field conditions and the drawings, or between the drawings and specifications must be brought to the Owner's attention in order to clarify the exact nature of the work to be performed.
2. This *Preliminary Geotechnical Investigation and Organic Soil/Manure Evaluation Report, dated September 10, 2024,* by Converse Consultants may be used as a reference to the surface and subsurface conditions on this project. The information presented in this report is intended for use in design and is subject to confirmation of the conditions encountered during construction. The exploration logs and related information depict subsurface conditions only at the particular time and location designated on the boring logs. Subsurface conditions at other locations may differ from conditions encountered at the exploration locations. In addition, the passage of time may result in a change in subsurface conditions at the exploration locations. Any review of this information should not relieve the Contractor from performing such independent investigation and evaluation to satisfy himself as to the nature of the surface and subsurface conditions to be encountered and the procedures to be used in performing his work.

## D1.3 Authority of the Geotechnical Engineer

1. The Geotechnical Engineer will observe the placement of compacted fill and will take sufficient tests to evaluate the uniformity and degree of compaction of filled ground.
2. As the Owner's representative, the Geotechnical Engineer will (a) have the authority to cause the removal and replacement of loose, soft, disturbed and other unsatisfactory soils and uncontrolled fill; (b) have the authority to approve the preparation of native ground to receive fill material; and (c) have the authority to approve or reject soils proposed for use in building areas.
3. The Civil Engineer and/or Owner will decide all questions regarding (a) the interpretation of the drawings and specifications, (b) the acceptable fulfillment of the contract on the part of the Contractor and (c) the matters of compensation.

## D1.4 Site Clearing

1. Clearing and grubbing should consist of the removal from areas to be graded: all existing pavement, utilities, and vegetation.
2. Organic and inorganic materials resulting from the clearing and grubbing operations should be hauled away from the areas to be graded.

## D1.5 Excavations

Based on observations made during our field explorations, the surficial soils can be excavated with conventional earthwork equipment.

## D1.6 Preparation of Fill Areas

1. All highly organic soils, manure and debris should be removed from the proposed foundation, improvements and/or fill areas.
2. After the required removals have been made, the exposed earth materials (undocumented artificial fill, topsoil and the upper low-density portions of the alluvium), should be overexcavated to provide a zone of structural fill for the support of footings, slabs-on-grade, and exterior flatwork or proposed improvements. All loose, soft or disturbed earth materials should be removed from the bottom of excavations before placing structural fill. Any structures will require a minimum of 3.0 feet of compacted fill beneath building footings and 2.0 feet below any proposed wall footings or 5.0 feet below proposed grade, whichever is deeper.
3. The subgrade in all areas to receive fill should be scarified to a minimum depth of 6 inches. Scarification may be terminated on moderately hard to hard, cemented earth materials with the approval of the Geotechnical Engineer. The soil moisture should be adjusted to at least 2 percent above optimum for fine-grained soils and within 3 percent of optimum moisture content for granular soils, and then

compacted to at least 90 percent of the laboratory maximum dry density as determined by ASTM Standard D1557-12R21 test method.

4. Compacted fill may be placed on native soils that have been properly scarified and recompacted as discussed above.
5. All areas to receive compacted fill will be observed and approved by the Geotechnical Engineer before the placement of fill.

## D1.7 Placement and Compaction of Fill

1. Compacted fill placed for the construction of the embankment or for any planned structures will be considered structural fill. Structural fill may consist of approved on-site soils or imported fill that meets the criteria indicated below.
2. Fill consisting of selected on-site earth materials or imported soils approved by the Geotechnical Engineer should be placed in layers on approved earth materials. Soils used as compacted structural fill should have the following characteristics:
   a. All fill soil particles should not exceed 8 inches in nominal size and should not have an organic content greater than 2%, as well as free of matter and miscellaneous inorganic debris and inert rubble.
   b. Imported fill materials should have an Expansion Index (EI) of less than 20. All imported fill should be compacted to at least 90 percent of the laboratory maximum dry density (ASTM Standard D1557-12R21) at about 2 percent above optimum moisture for fine-grained soils, and within 3 percent of optimum for granular soils.
3. Fill exceeding 5 feet in height should not be placed on native slopes that are steeper than 5:1 horizontal:vertical (H:V). Where native slopes are steeper than 5:1 H:V, and the height of the fill is greater than 5 feet, the fill should be benched into competent materials. The height and width of the benches should be at least 2 feet.
4. Representative samples of materials being used, as compacted fill will be analyzed in the laboratory by the Geotechnical Engineer to obtain information on their physical properties. Maximum laboratory density of each soil type used in the compacted fill will be determined by the ASTM Standard D1557-12R21 compaction method.
5. Fill materials should not be placed, spread or compacted during unfavorable weather conditions. When site grading is interrupted by heavy rain, filling operations should not resume until the Geotechnical Engineer approves the moisture and density conditions of the previously placed fill.
6. It should be the Grading Contractor's obligation to take all measures deemed necessary during grading to provide erosion control devices in order to protect slope areas and adjacent properties from storm damage and flood hazard originating on this project. It should be the Contractor's responsibility to maintain slopes in their as-graded form until all slopes are in satisfactory compliance with

job specifications, all berms have been properly constructed, and all associated drainage devices meet the requirements of the Civil Engineer.

## D1.8 Fill Slope Construction

1. Fill slopes placed above existing surfaces or cut slopes should be constructed with keyways.
2. Where fill is placed against existing slopes steeper than 5:1 H:V, the new fill slopes should be keyed and benched to provide increased lateral support after removal of the unsuitable surficial soils, when present.

## D1.9 Observation and Testing

1. During the progress of grading and trench backfill, the Geotechnical Engineer will provide observation of the fill placement operations.
2. Field density tests of all compacted fill will be made during grading and trench backfill to provide an opinion on the degree of compaction being obtained by the Contractor. Where compaction of less than specified herein is indicated, additional compactive effort with adjustment of the moisture content should be made as necessary, until the required degree of compaction is obtained.
3. A sufficient number of field density tests will be performed to provide an opinion to the degree of compaction achieved. In general, density tests will be performed on each one-foot lift of fill, but not less than one for each 500 cubic yards of fill placed.

# 2. Executive Summary

Ontario Ranch Venture, LLC and Ontario Ranch Venture II, LLC (the User) retained Roux Associates, Inc. (Roux) to perform a Phase I Environmental Site Assessment (ESA) of an approximately 180-acre rectangular parcel located south of Edison Avenue and west of Walker Avenue in the City of Ontario, California (Subject Property; Figures 1 and 2). The Subject Property is proposed for residential development and encompasses the northern half of the properties referred to by the User as the Ontario Ranch I and Ontario Ranch II properties (Figure 3). The Subject Property consists of all or portions of seven (7) individual properties referred to herein as the DeGroot Trust (DeGroot), Costa, GH Dairy, Alewyn, DeHoog I, DeHoog II, and Swager Properties (Figures 2 and 3 in Appendix A).Roux performed this Phase I ESA in general accordance with the American Society for Testing and Materials (ASTM) International *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-21) in an effort to identify, to the extent feasible, the presence of Recognized Environmental Conditions (RECs) with respect to the Subject Property as defined in ASTM E1527-21. Exceptions to, or deletions from, this practice are described in Section 3 of this report.

On January 22 and 31, 2025, Roux representative Ms. Tahsin Annoor visually assessed the Subject Property for potential RECs, including, but not limited to, potential underground storage tanks (USTs), aboveground storage tanks (ASTs), polychlorinated biphenyl (PCB)-containing equipment, hazardous materials storage or handling areas, containerized or bulk wastes, and visual indications of impacted soil. At the time of this assessment, the properties were used as dairies and for residential purposes. The User purchased the Alewyn, DeHoog I, DeHoog II, and Swager Properties (associated with Ontario Ranch I) in 2022 and GH Dairy in 2024 and is considering purchasing the remaining portions of the Subject Property for residential development.

From at least 1938 to 1953, the Subject Property was used for agricultural purposes (row crops and orchards) with a few dwellings. By the mid-1950s, the Subject Property became increasingly used for dairy farming purposes. Each of the individual properties at the Subject Property are used for dairy farming purposes and are improved with at least one and up to three residences, a milking barn, wastewater pond(s), and various ancillary dairy farm structures including corral canopies, sheds, and feed silos.

Roux also performed a records review in an effort to identify potential RECs in connection with the Subject Property. This records review addressed the Subject Property and surrounding properties. Roux reviewed commercially available records associated with these nearby properties to assess potential concerns associated with the migration of hazardous substances. The records review also included reasonably ascertainable historical data, which can be helpful in identifying the past uses of the Subject Property and surrounding areas, as it may relate to the environmental condition of the Subject Property.

Roux performed interviews and file reviews with various government agencies and other parties with possible knowledge of the Subject Property and surrounding properties in an effort to identify current and past uses of the Subject Property and surrounding areas, as they may relate to the environmental condition of the Subject Property.

ASTM E 1527-21 defines:

A REC as:

> "The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."

A Controlled Recognized Environmental Condition (CREC) as:

> "A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a No Further Action (NFA) letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)."

And a Historical Recognized Environmental Condition (HREC) as:

> "A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a historical recognized environmental condition, the environmental professional must determine whether the past release is a recognized environmental condition at the time the Phase I ESA is conducted (for example, if there has been a change in the regulatory criteria). If the Environmental Professional considers the past release to be a recognized environmental condition at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a recognized environmental condition."

The term recognized environmental condition is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

This Executive Summary provides a brief overview of the findings of this Phase I ESA. Although the Executive Summary is an integral part of a report, it does not substitute for reading the entire report or the appended or referenced documents in order to fully understand the findings and potential environmental concerns associated with the Subject Property.

Based on the information obtained through the performance of this Phase I ESA, Roux identified the following REC:

**REC 1 – Historical Agricultural Use (Subject Property).** Based on the historical use of the Subject Property for agricultural purposes from at least the 1930s through 1950s, it is likely that pesticides were used. In 2005, soil sampling at the eastern portion of the Subject Property (Swager Property) was conducted to further investigate the potential presence of pesticides. No detectable to low concentrations of organochlorine pesticides were reported in the samples collected and all but one were below regulatory

screening levels. The sample that exceeded residential screening levels was collected from the central portion of the Swager Property and contained slightly elevated dieldrin.

**REC 2 – Vapor Encroachment Concern (Off-Site Hindelang Property).** Historical records for the south adjoining Hindelang Property (immediately south of the DeGroot Property) indicate that manufacturing of fiberglass camper shells from at least 1986 through 1992 included the use and storage of hazardous materials including polyester resin, polyester gel coat, MEK peroxide catalyst, acetone, 1,1,1-trichloroethane (1,1,1-TCA) and hydrocarbon solvents, rubber adhesive, etc. Previous environmental reports noted poor housekeeping practices and automobile repair operations at the Hindelang Property. Based on the documented use of chlorinated solvents (1,1,1-TCA), poor general housekeeping, and noted automobile repair operations, the south adjoining Hindelang Property represents a potential vapor encroachment concern and a REC.

Based upon the information described in this report, this Phase I ESA did not reveal evidence of CRECs, HRECs, or independent Business Environmental Risks (BERs) in connection with the Subject Property.

Other environmental features (OEFs) identified in connection with the current and historical operations at the Subject Property or adjacent properties include:

**OEF 1 – Dairy Farm Operations (Methane).** Due to the historical and current use of the Subject Property for dairy farming purposes, methane gas may be present in shallow soil. Methane gas is naturally produced during the biodegradation of organic matter such as animal manure. Based on the historical dairy farming land use of the Subject Property, methane gas surveys were reportedly completed by others at the Alewyn, DeHoog II, and Swager properties. Results of these surveys indicate sporadic elevated concentrations of methane gas exceeding the Lower Explosive Limit (LEL) of methane (i.e., 50,000 parts per million [ppm]).

Prior to the redevelopment of dairy farms, the City of Ontario Building Department requires that an investigation be performed to evaluate the possible build-up of methane gas in shallow soils and to determine the level of methane gas mitigation required. Proper removal and disposal of manure-laden shallow soil in accordance with local regulatory guidance may also be required prior to redevelopment of the Subject Property.

**OEF 2 – Private Groundwater Wells.** During the site reconnaissance, Roux observed a total of eight groundwater wells throughout the Subject Property that have been used for agricultural, residential, and/or dairy water supply purposes. Groundwater has been identified immediately south of the Subject Property to occur at depths of approximately 120 feet below the ground surface (bgs) and flows in a south to southwesterly direction. These features would not be considered an environmental concern to the Subject Property, but may need to be abandoned prior to redevelopment per State and County guidance.

**OEF 3 – Septic Systems.** Each residential structure on the Subject Property is reportedly equipped with a septic tank. Based on the non-hazardous nature of the domestic waste discharged to the septic systems, these represent an OEF.

**OEF 4 – Hazardous Materials Storage.** A total of eight ASTs containing diesel fuel were observed on the Subject Property including the DeGroot, Costa, GH Dairy, DeHoog II, and Swager Properties; the ASTs ranged from approximately 100 to 500 gallons in size. No significant signs of a release were observed in the vicinity of the ASTs. Additionally, various other chemicals associated with the dairy activities are stored in 55-

gallon drums and used on-site including, but not limited to, iodine, acid wash, and hydrogen peroxide for sanitation purposes. The hazardous material use on-site therefore represents an OEF.

**OEF 5 – Regional Dairy Farm Operations (Groundwater Degradation).** The Subject Property is located within the Chino Groundwater Basin. Concentrated animal feeding lots such as dairy farms can be a source of local groundwater degradation due to nitrates and total dissolved solids (TDS). According to information provided on the EPA website, the Chino Basin once had the highest concentration of dairy animals in the world, with approximately 350 dairies located within a 20-square mile area. Although the number of dairies has declined significantly, historical land application of manure and process water has resulted in significant groundwater degradation due to high levels of TDS and nitrate. The Dairy Farm General Permit was created to minimize continued degradation of groundwater in the Chino Basin as well as other parts of the Santa Ana Region. According to the California Regional Water Quality Control Board, Santa Ana Region (SARWQCB) website, the Subject Property is located within the Chino 2 "antidegradation" management zone which indicates that the SARWQCB has determined that the lowering of water quality is not of maximum benefit to the public. The SARWQCB has reportedly noted that new property owners are not being held liable for this regional issue associated with historical land uses. Based on the known regional groundwater degradation issues in the Chino Basin, the potential presence of elevated TDS and nitrates in groundwater beneath the Subject Property represents an OEF.

**OEF 6 – South Archibald TCE Plume.** The eastern portion of the Subject Property is located within a large regional VOC groundwater plume comprised mostly of trichloroethene (TCE), referred to as the South Archibald TCE Plume. This plume originates from a source approximately 1.7 miles northeast of the Subject Property as a result of historical land use of numerous metal plating and finishing facilities. Low concentrations of TCE were reported from 2017 to 2022 in groundwater from two on-site wells on the DeHoog II and Swager Properties at concentrations of 1.2 and 0.46 micrograms per liter (ug/l), respectively, well below the State Water Resources Control Board (SWRCB), Division of Drinking Water Maximum Contaminant Levels (MCLs) for TCE in drinking water of 5 ug/l. Based on the depth of groundwater and low concentrations of VOCs detected beneath the Subject Property, there is a low likelihood that a vapor intrusion issue is present. Since there are low concentrations of TCE detected beneath the Subject Property and no vapor intrusion issue is present, the regional TCE groundwater plume would be considered an OEF.

**OEF 7 – Former UST, 7587 Edison Avenue (DeGroot Property).** The DeGroot Property reportedly previously operated a 500-gallon diesel UST that was removed in 1987. In 2000, the San Bernardino County Fire Department (SBCFD) was informed of the UST removal following purchase of the property by Paul Huizenga and requested that soil samples be collected. A soil sample was collected from approximately 10 feet bgs in the reported location of the former UST. The laboratory results indicated no detectable concentrations of total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), and methyl tertiary butyl ether (MTBE). No other information was provided (e.g., a closure report or illustration showing where the UST was located). Based on these results, the SBCFD issued a NFA letter dated February 13, 2001. Based on this information, the former UST represents an OEF.

**OEF 8 – Former UST, 8185 Edison Avenue (Alewyn Property).** The Alewyn Property reportedly used a 250-gallon diesel UST that was removed in 1978 without regulatory oversight and no confirmation soil samples were collected. In 2021, soil samples were collected in the reported former location of the UST. Laboratory results indicated no detectable concentrations of total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs) above laboratory reporting limits. Based on these results, the former 250-gallon

diesel UST would not be considered an environmental concern to the Subject Property and represents an OEF.

**OEF 9 – Former UST, 8311 Edison Avenue (DeHoog I Property).** The DeHoog I Property reportedly used a 500-gallon diesel UST that was removed in 1998 with oversight from the SBCFD. A soil sample was collected from beneath the center of the former tank location. The soil sample was analyzed for TPHg, BTEX, and MTBE. Laboratory results indicated no detectable concentrations of these constituents above laboratory reporting limits. Based on these concentrations, the UST was issued a NFA letter, dated January 6, 1999. Based on the regulatory closure and sampling results, the former UST would not be considered an environmental concern to the Subject Property and represents an OEF.

**OEF 10 – Former UST, 8381 Edison Avenue (DeHoog II Property).** A previous Phase I ESA completed by others included an interview with the former property owner, Mr. Joe De Hoog, in which Mr. De Hoog indicated that a 500-gallon gasoline UST was historically present immediately south of the detached three-car garage and was removed in the late-1970s. In 2021, soil samples were collected in the reported former location of the UST. Laboratory results indicated no detectable concentrations of TPH and VOCs above laboratory reporting limits. Based on these results, the former 500-gallon gasoline UST would not be considered an environmental concern to the Subject Property and represents an OEF.

Roux identified the following de minimis condition:

**De Minimis Condition 1 – Surficial Staining.** Roux observed evidence of surficial petroleum stains associated with aboveground storage tanks ASTs and/or equipment storage areas at the GH Dairy, Costa, and DeHoog II properties. The surficial staining noted on these properties appeared to be limited in scale and are not anticipated to present a threat to human health or the environment. A SMP should be implemented to manage any potentially impacted areas encountered during redevelopment of the Subject Property.

During conduct of this ESA, the following data gaps, as defined in ASTM Standard E1527-21, were identified:

- Previous Subject Property owners/operators were not available for an interview. This data gap is not considered significant due to sufficient information regarding Subject Property history available from Environmental Data Resources (EDR) historical documents, previous environmental reports for the Subject Property, GeoTracker and Freedom of Information Act (FOIA)/ Public Records Act (PRA) requests.

- During the site reconnaissance, Roux staff was provided guided access through the Alewyn, DeHoog I, Dehoog II and Swager properties. Roux's reconnaissance of the remaining properties, DeGroot, LMSAME and GH Dairy, was self-guided. Roux staff was not able to access the private residences, areas within the cattle corrals, feeding pastures, or other fenced areas. Due to the types of uses (residential, cattle corrals, etc.), the lack of entry into these areas is not considered a significant data gap in accordance with ASTM Standards.

- Due to time constraints associated with completion of this Phase I ESA, not all regulatory agencies have responded to public records requests. This data gap is not considered significant due to sufficient information regarding Subject Property history available from EDR historical documents, previous environmental reports for the Subject Property, and other regulatory agency responses.

- The DeGroot Property reportedly used a 500-gallon UST and a 1,000-gallon UST, which were removed in 1992. During a property inspection in 1994, a SBCFD inspector was shown the removed

USTs, which were reportedly still stored on-site. The inspection report indicated the UST file had already been removed from the “alpha list” and that the file was to be closed. No confirmation soil sample results were provided in regulatory files reviewed and the location of these features was also not documented. Based on the lack of official regulatory closure following removal of the USTs, these USTs would be considered a data gap.

# 3. Qualifying Conditions

Roux Associates, Inc. (Roux) completed this Phase I Environmental Site Assessment (ESA) an approximately 180-acre rectangular parcel located south of Edison Avenue and west of Walker Avenue in the City of Ontario, California (the Subject Property). Figures 1 and 2 (Appendix A) show the location of the Subject Property. Roux performed this Phase I ESA in compliance with the scope and limitations of ASTM E1527-21 and the terms and conditions of Roux's proposal dated February 6, 2025. Roux conducted this Phase I ESA for the benefit of Ontario Ranch Venture, LLC and Ontario Ranch Venture II, LLC (the User).

The Subject Property is proposed for residential development and encompasses the northern half of the properties referred to by the User as the Ontario Ranch I and Ontario Ranch II properties (Figure 3). The Subject Property consists of all or portions of seven (7) individual properties referred to herein as the DeGroot Trust (DeGroot), Costa, GH Dairy, Alewyn, DeHoog I, DeHoog II, and Swager Properties (Figures 2 and 3 in Appendix A). The User purchased the Alewyn, DeHoog I, DeHoog II, and Swager Properties (associated with Ontario Ranch I) in 2022 and GH Dairy in 2024 and is considering purchasing the remaining portions of the Subject Property for residential development.

The following sections of this report present Phase I ESA findings and conclusions. Appendices presented at the end of the report consist of figures, photographic documentation, historic sources, a third party vendor database report, local and state agency records, records of communication, references, resumes for the individuals who prepared the Phase I ESA, previous investigations, regulatory records, closure reports, and permits.

## 3.1 Purpose

The purpose of this Phase I ESA is to identify and report, to the extent feasible, RECs with respect to the Subject Property. Performing a Phase I ESA in general compliance with ASTM E 1527-21 may enable a User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser defenses pursuant to the federal Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1986, and the Small Business Liability Relief and Brownfields' Revitalization Act of 2002, 42 U.S.C. 9601-9675 (collectively referred to hereinafter as "CERCLA") liability. That is, the practice that constitutes one of the requirements for "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in 42 USC Section 9601(35) (B).

## 3.2 Scope of Services

The scope of services for this Phase I ESA included, but was not limited to, the activities listed below.

- A review of reasonably ascertainable and practicably reviewable topographic maps, historical aerial photographs, and city directories, if available, to investigate past Subject Property conditions;
- A review of specific government lists pursuant to ASTM Standard E 1527-21 regarding environmental activities for the Subject Property and local area properties;
- A review of recorded land title records, building, assessors, and fire department records, for permits, citations, and reports connected to the Subject Property that were reasonably ascertainable, practicably reviewable, and publicly available within reasonable time and cost;

- An inspection by an environmental professional to investigate the current use of the Subject Property and to identify environmental concerns including but not limited to, the presence of hazardous substances or petroleum products, wastes, USTs, ASTs, or other environmental concerns;
- An inspection by an environmental professional to investigate the current use of the adjoining properties from reasonably available public viewpoints to identify the current use of these properties to identify environmental concerns including but not limited to, the presence of hazardous substances or petroleum products, wastes, USTs, ASTs, or other environmental concerns;
- Interviews with available representatives of the owner of the Subject Property, occupants, key Subject Property manager, and local government officials by an environmental professional; and
- Preparation of this Phase I ESA report.

Roux initiated this Phase I ESA pursuant to receipt of written authorization to proceed on January 8, 2025.

## 3.3 Standard of Care

Roux conducted this Phase I ESA using a defined scope of services considered appropriate and agreed upon by all parties on the date the service was authorized, unless the scope of services or the methods used were later modified, in writing, and accepted by all parties prior to performance. Roux conducted this Phase I ESA in accordance with generally accepted practices in a manner consistent with that level of care exercised by other members of our profession in the same locality and under similar conditions of time and accessibility of improvements and information. No other representations expressed or implied, and no warranty or guarantee is included or intended to be part of this Phase I ESA.

Please note that the scope of services performed in execution of this assessment may not be appropriate to satisfy the needs of other parties. We, therefore, are not responsible for independent conclusions, opinions, or recommendations of others based on our assessment. Furthermore, this Phase I ESA relates to the environmental conditions of the Subject Property and does not address issues raised in transactions such as business risk, purchase of business entities, or interests therein, or of their assets, that may well involve environmental liabilities pertaining to properties previously owned or operated or other offsite liabilities.

Additionally, the findings of this Phase I ESA are based on Roux's observations, inquiries, and historical research using reasonably ascertainable and practically reviewable information obtained within reasonable time and cost constraints. Roux does not represent that this Phase I ESA is an exhaustive investigation that reflects the findings of all of the information available for the Subject Property, nor is it representative of future Subject Property conditions. If additional information is generated from the Subject Property, it should be provided to Roux so that we may evaluate its impact on our conclusions. As such, activities or episodes that transpire subsequent to this Phase I ESA are not considered in this assessment. It is not intended that a Phase I ESA in accordance with ASTM E1527-21 be an exhaustive assessment of a property nor can it wholly eliminate uncertainty regarding the potential for RECs in connection with a property.

## 3.4 Assumptions

This Phase I ESA Report, including the exhibits attached hereto, describes the results of Roux's investigation to identify the presence of RECs connected with the Subject Property in accordance with ASTM E1527-21, as allowed by and consistent with the regulatory requirements of the All Appropriate Inquiry Rule, 40 CFR Part 312, Amendment to Standards and Practices for All Appropriate Inquires Under CERCLA, Final Rule, published December 30, 2021 (AAI Rule). Specifically, the preamble to the amended AAI Rule states:

*The Environmental Protection Agency (EPA) today is taking final action to amend the standards and practices for conducting all appropriate inquiries under the CERCLA to reference a standard practice recently made available by ASTM International, a widely recognized standards development organization. Specifically, this final rule amends the "All Appropriate Inquiries Rule" at 40 CFR Part 312 to reference ASTM International's E1527–21 "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process" and make clear that persons conducting all appropriate inquiries may use the procedures included in this standard to comply with the All Appropriate Inquiries Rule*[1].

One of the requirements that a person acquiring real property must meet in order to qualify for either the innocent landowner, contiguous owner, or bona fide prospective purchaser (collectively hereinafter "Prospective Purchaser") defense to liability under CERCLA is that person must conduct all appropriate inquiries into the previous ownership and uses of the property in conformance with the AAI Rule (or the ASTM E1527-21) prior to acquisition of the property. The Client has acknowledged that, under the AAI Rule, Roux's performance of this Phase I ESA in accordance with ASTM E1527-21 will not alone result in the Client satisfying all requirements of the AAI Rule and will not in itself provide a defense to CERCLA liability. The Client has acknowledged that the AAI Rule also requires that the Prospective Purchaser undertake certain additional inquiries and post-acquisition activities to satisfy the CERCLA AAI requirements. Accordingly, Roux makes no guarantees or warranties, expressed or implied, regarding this Phase I ESA, including without limitation, that this Phase I ESA alone will qualify the Client for a defense to CERCLA liability.

Roux has performed this Phase I ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. Professional judgments expressed herein are based on the facts currently available to Roux.

The AAI Rule requires, and the conclusions and recommendations stated herein represent, the application of a variety of engineering and technical disciplines to material facts and conditions associated with the Subject Property. As such, these conclusions and recommendations are based on subjective interpretations and the exercise of discretion based on the facts available to Roux and conditions at the time of the performance of this Phase I ESA. Many of these facts and conditions are subject to change over time. Accordingly, the conclusions and recommendations must be considered within this context.

Client has agreed that Roux shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase I ESA was performed. To the extent practicable, Roux has identified data gaps, and has evaluated the potential significance of such data gaps. Recommendations to address those data gaps are presented herein and are based on the data available at the time of the performance of this Phase I ESA. Implementation of the recommendations may not fully address the data gaps, and the information obtained from execution of those recommendations may alter and/or modify the interpretation of the Subject Property conditions and conclusions, herein. This Phase I ESA does not include consideration of matters specifically excluded by ASTM E1527-21, including but not limited to, asbestos-containing building materials, radon, lead-based paint, lead in drinking water, wetlands,

[1] Federal Register: December 30, 2013 (Volume 78, Number 250) Page 79319

regulatory compliance, and mold unless specifically identified herein. PFAS[2] in drinking water was considered in this Phase I ESA as a REC.

This Phase I ESA Report should not be considered a legal interpretation of existing environmental laws and regulations. This Phase I ESA was conducted with a reasonable degree of inquiry to identify RECs, but uncertainty is not eliminated. No Phase I ESA can wholly eliminate uncertainty regarding the potential for RECs in connection with a property. The Phase I ESA process is intended to reduce, but not eliminate, the uncertainty involved with identifying RECs.

This Phase I ESA Report is not an appraisal or value judgment of the Subject Property. Client has agreed that Roux shall not be liable for any use of this Phase I ESA Report as an appraisal or value judgment of the Subject Property.

This Phase I ESA Report has been prepared for the exclusive use of Client for specific application to the Subject Property covered by this Phase I ESA Report. Client has agreed that, except as set forth in any written agreement by Roux, any third-party use of this Phase I ESA Report, upon disclosure by Client, is the sole responsibility and at the sole liability of Client.

## 3.5 Limitations and Exceptions

There were no limitations or exceptions associated with the performance of this Phase I ESA other than the data gaps identified in Section 3.8.

## 3.6 Special Terms and Conditions

There were no special terms and conditions associated with performing this assessment.

## 3.7 User Reliance

This report is confidential and has been prepared for the exclusive use of the User. No additional parties may use the information contained in this report without obtaining the written permission of Roux or the User. Roux's duties and obligations extend to the User and to no other party. Roux's duties and obligations to the User are not transferable to persons, corporations, or organizations without the express written consent of the User and Roux.

This Phase I ESA report must be read and interpreted as a whole and can only be considered representative of the conditions of the Subject Property as of the date of our site reconnaissance described herein. Roux makes no representation whatsoever concerning the condition of the Subject Property beyond the date of our site reconnaissance described herein. Individual sections and appendices of this report are dependent on the balance of this report, and on the terms, conditions, and stipulations contained in the proposal and written amendments accepted by Roux.

## 3.8 Data Gaps

During conduct of this ESA, the following data gaps, as defined in ASTM Standard E1527-21 were identified:

---

[2] PFAS have been used in a wide variety of industrial and commercial processes and products and have been recently added to the hazardous substances list in the Commonwealth of Pennsylvania.

- During the site reconnaissance, Roux staff was provided guided access through the Alewyn, DeHoog I, Dehoog II and Swager properties. Roux's reconnaissance of the remaining properties, DeGroot, LMSAME and GH Dairy, was self-guided. Roux staff was not able to access the private residences, areas within the cattle corrals, feeding pastures, or other fenced areas. Due to the types of uses (residential, cattle corrals, etc.), the lack of entry into these areas is not considered a significant data gap in accordance with ASTM Standards.

- Previous site owners/operators were not available for an interview. This data gap is not considered significant due to sufficient information regarding Subject Property history available from EDR historical documents, previous environmental reports for the Subject Property, and FOIA/OPRA requests.

- Due to time constraints associated with completion of this Phase I ESA, not all regulatory agencies have responded to public records requests. This data gap is not considered significant due to sufficient information regarding Subject Property history available from EDR historical documents, previous environmental reports for the Subject Property, and other regulatory agency responses.

- The DeGroot Property reportedly used a 500-gallon UST and a 1,000-gallon UST, which were removed in 1992. During a property inspection in 1994, a SBCFD inspector was shown the removed USTs, which were reportedly still stored on-site. The inspection report indicated the UST file had already been removed from the "alpha list" and that the file was to be closed. No confirmation soil sample results were provided in regulatory files reviewed and the location of these features was also not documented. Based on the lack of official regulatory closure following removal of the USTs, these USTs would be considered a data gap.

## 3.9 Deviations

Roux performed this assessment in accordance with the generally accepted practices for environmental assessments at the time of implementation. Roux made a reasonable effort to ensure that the information presented in this report is materially complete and accurate.

# 4. Property Overview

## 4.1 Site and Vicinity General Characteristics

The Subject Property is located southwest of the intersection of Edison Avenue and Walker Avenue in Ontario, California and consists of approximately 180-acres of mostly dairy farms and few residences. The Subject Property consists of seven (7) individual properties referred to herein as the DeGroot, Costa, GH Dairy, Alewyn, DeHoog I, DeHoog II, and Swager Properties (Figures 2 and 3 in Appendix A). Roux photographed the Subject Property to support this written report. Those photographs are included in **Appendix B** – Photographic Documentation. The following table presents the addresses and Assessor's Parcel Numbers (APNs) associated with the Subject Property.

| Property | Address | APN |
|---|---|---|
| DeGroot Trust | 7325, 7371, 7397, 7587, and 7697 Edison Avenue | 1053-371-01-0000<br>1053-371-02-0000 |
| Costa | 14213, 14239, 14279, 14283, and 14297 Bon View Avenue | 1053-351-01-0000<br>1053-351-02-0000 |
| GH Dairy | 7721, 7891, 8061, and 8065 Edison Avenue<br>14203 Bon View Ave | 1053-361-01-0000<br>1053-361-02-0000<br>1053-361-03-0000<br>1053-331-01-0000<br>1053-331-02-0000<br>1053-331-03-0000<br>1053-331-04-0000<br>1053-341-01-0000<br>1053-341-02-0000 |
| Alewyn | 8185 Edison Avenue<br>14117 Grove Ave | 0216-321-03-0000 |
| DeHoog I | 8245, 8295, 8285, and 8311 Edison Avenue | 0216-321-08-0000 |
| DeHoog II | 8335, 8377, and 8381 Edison Avenue | 0216-322-03-0000<br>0216-322-04-0000 |
| Swager | 8405 and 8485 Edison Avenue | 0216-322-10-0000 |

As depicted on the Prado Dam, California (2022) 7.5-minute quadrangle topographic map published by the United States Geological Survey (USGS) and included as **Appendix A** – Subject Property Location Map and the EDR Radius Report Map (EDR Report), the Subject Property has an approximate elevation of 682 feet above mean sea level (msl) and generally slopes to the south.

## 4.2 Current and Past Use of the Site

From at least 1938 to 1953, the Subject Property was used for agricultural purposes (row crops and orchards) with a few dwellings. By the mid-1950s, the Subject Property became increasingly used for dairy farm purposes with some residences.

At the time of this assessment, the Subject Property was used for dairy farming and residential purposes. Additional information regarding on-site features and current operations is discussed below in Section 7.

## 4.3 Current Uses of the Adjoining Properties

The Subject Property is located in a mixed agricultural/dairy farm and residential area. Current uses/occupants of surrounding properties are as follows and are presented on Figure 2:

- North – The Subject Property is bound to the north by Edison Avenue, beyond which are dairy farms, residences, a nursery, truck storage yards, and vacant land;
- East – The Subject Property is bound to the east by Walker Avenue, beyond which is a dairy farm and residences;
- South – The Subject Property is bound to the south by dairy farms and residences including the larger properties associated with the DeGroot, LMSAME, et al, Alewyn, DeHoog II, and Swager Properties, and a storage yard; and
- West – The Subject Property is bound to the west by a potting soil production property.

During the site visits on January 22 and 31, 2025, Roux did not identify RECs on the adjacent properties based on observations from public rights-of-way.

# 5. Property Background/Operating History

## 5.1 Historical Use Information

Pursuant to ASTM, Roux requested the following standard historical sources from EDR:

- Historical Sanborn fire insurance maps;
- Historical aerial photographs;
- Historical USGS 7.5-minute topographic quadrangle maps; and
- Local street directories.

Presented in the following sections is Roux's review of standard historical sources obtained during this Phase I ESA. Copies of the historical records that Roux obtained are included in **Appendix C** – Historic Sources.

### 5.1.1 Historical Sanborn Fire Insurance Maps

Roux requested historical Sanborn fire insurance maps from EDR. Sanborn Fire Insurance Maps were not identified for the Subject Property.

### 5.1.2 Historical Aerial Photographs

Roux requested from EDR a search for historical aerial photographs. Aerial photographs were provided by EDR for the years 1938 through 2020.

**DeGroot**

- **1938, 1946, 1948, and 1953** – The property consisted of agricultural land with approximately two residences present along Edison Avenue. The property vicinity generally consisted of agricultural land with sparce residences.
- **1966, 1975, 1987, 1989, 1990, 1994, 2002, 2006, 2009, 2012, 2016, and 2020** – By 1966, the northern portion of the property was expanding use for dairy farming and by 2002, the western and southwestern portions of the property were as well. The property vicinity transitioned to agricultural and dairy farming operations during this timeframe as well.

**Costa**

- **1938, 1946, 1948, and 1953** – The property consisted of agricultural land with a residence present along Bon View Avenue. The property vicinity generally consisted of agricultural land with sparce residences.
- **1966, 1975, 1987, 1989, 1990, 1994, 2002, 2006, 2009, 2012, 2016, and 2020** – By 1966, the property was expanding use for dairy farming. The property vicinity transitioned to agricultural and dairy farming operations during this timeframe as well.

**GH Dairy**

- **1938, 1946, 1948, and 1953** – The property consisted of mostly agricultural land with approximately two residences noted along the northern boundary of the property and a possible other residence was noted in the central portion of the property. Edison Avenue, Grove Avenue, and Bon View Avenue were present to the north, east, and west of this property. By 1946, an additional dwelling and a farm building associated with a dairy farm were developed in the northeast portion of the property. The property vicinity generally consisted of agricultural land with sparce residences.
- **1966, 1975, 1987, 1989, 1990, 1994, 2002, 2006, 2009, 2012, 2016, and 2020** – By 1966, the northwest portion of the property was expanding dairy farm uses and by 1975, the east portion of the

property was as well. The property vicinity transitioned to agricultural and dairy farming operations during this timeframe as well.

**Alewyn**

- **1938, 1946, 1948, and 1953** – The property was used for agricultural purposes or undeveloped land with a residence noted in the northwest corner of the property. The southern portion of the property appeared to consist of forested land. The property vicinity generally consisted of agricultural land with sparce residences.
- **1966, 1975, 1987, 1989, 1990, 1994, 2002, 2006, 2009, 2012, 2016, and 2020** – By 1966, the property was developed with the existing northeastern residence and hay barn and was partially developed for dairy farm use as noted by the presence of corrals. By 1985, the dairy farm uses expanded and a wastewater pond was noted in the southeast corner of the property. The property vicinity transitioned to agricultural and dairy farming operations during this timeframe as well.

**DeHoog I**

- **1938, 1946, 1948, 1953, and 1966** – The property appeared to consist of forested land. By 1966, the land was cleared and vacant. The property vicinity generally consisted of agricultural land and spare residences.
- **1975, 1987, 1989, 1990, 1994, 2002, 2006, 2009, 2012, 2016, and 2020** – By 1975, the property was used for dairy farming purposes and feature residential buildings along the northern portion of the property along Edison Avenue. The property vicinity transitioned to agricultural and dairy farming operations during this timeframe as well.

**DeHoog II**

- **1938, 1946, 1948, and 1953** – The property consisted of agricultural land with two residences noted in the northeastern corner of the property. By 1946, corrals and a possible barn were noted west of the residences. The Subject Property vicinity generally consisted of agricultural land with sparce residences.
- **1966, 1975, 1987, 1989, 1990, 1994, 2002, 2006, 2009, 2012, 2016, and 2020** – By 1966, the dairy farming operations began expanding into the remainder of the property was as well. The property vicinity transitioned to agricultural and dairy farming operations during this timeframe as well.

**Swager**

- **1938, 1946, 1948, and 1953** – The property consisted of agricultural land. The property vicinity generally consisted of agricultural land with sparce residences.
- **1966, 1975, 1987, 1989, 1990, 1994, 2002, 2006, 2009, 2012, 2016, and 2020** – By 1966, the property began development of a dairy farm with a residence. The property vicinity transitioned to agricultural and dairy farming operations during this timeframe as well.

### 5.1.3 Historical USGS Topographic Maps

Roux requested from EDR a search for historical USGS topographic maps. Coverage was available for select years from 1902 through 2022.

- **1902** – This map had a large scale and did not show site specific details, although the Subject Property and vicinity were generally depicted as vacant land.
- **1933, 1941, 1947, 1949, 1950, and 1967** – These maps depicted the Subject Property and vicinity as vacant land with sporadic residences. Bon View Avenue, Edison Avenue, and Grove Avenue were noted.
- **1973 and 1981** – The Subject Property showed evidence of dairy farm use. The Subject Property vicinity was increasingly depicted with likely dairy farm use.
- **2012, 2018, and 2022** – These maps did not show site specific details.

### 5.1.4 Local City Directories

Roux requested from EDR a search for city directories for select Subject Property addresses and the immediate vicinity. City directories between the years 1922 and 2020 were reviewed using select addresses for each property. Listings for the Subject Property included farming and/or residential occupant listings since at least 1960. Listings for the Subject Property vicinity reflected similar uses.

# 6. Environmental Setting

Roux obtained and reviewed published, reasonably ascertainable information concerning the physical setting of the Subject Property. The following is a summary of our review of those physical setting sources.

## 6.1 Topography

Roux reviewed the Prado Dam, CA (2021) 7.5-minute quadrangle topographic map showing the area in which the Subject Property is located (see **Appendix A** for Subject Property Location Map). The Subject Property slopes slightly to the south with an approximate elevation of 682 feet above msl.

## 6.2 Subsurface Geology and Hydrogeology

The table below, based on information obtained from the EDR Radius Map Report, the United States Department of Agriculture Web Soil Survey (http://websoilsurvey.nrcs.usda.gov/app/HomePage.htm), and the Statewide Geologic Map and Fault Activity Map of California (California Geological Survey, 1977) summarizes mapped geologic conditions in the vicinity of the Subject Property.

| Feature | Description |
|---|---|
| Surficial Geology | Quaternary age alluvium, lake, playa, and terrace deposits; unconsolidated and semi-consolidated |
| Soil | Tujunga loamy sand; Hilmar loamy fine sand; Grangeville fine sandy loam; Chino silt loam |

According to the *Winter and Spring 2024 Semiannual Groundwater Monitoring Report* by Tetra Tech, shallow groundwater at the northern portion of Chino Airport, located approximately 0.5-miles south of the Subject Property, occurs at depths of approximately 56 to 87 feet bgs and flows in a south to southwesterly direction. Based on State Water Resource Control Board (SWRCB) records for the south adjoining property, 14400 South Grove Avenue, groundwater was identified in 2004 at a depth of 120 feet bgs.

The Subject Property is located within the Chino Groundwater Basin. Concentrated animal feeding lots such as dairy farms can be a source of local groundwater degradation due to nitrates and TDS. According to information provided on the EPA website, the Chino Basin once had the highest concentration of dairy animals in the world, with approximately 350 dairies located within a 20-square mile area. Although the number of dairies has declined significantly, historical land application of manure and process water has resulted in significant groundwater degradation due to high levels of TDS and nitrate. The Dairy Farm General Permit was created to minimize continued degradation of groundwater in the Chino Basin as well as other parts of the Santa Ana Region. According to the California Regional Water Quality Control Board, Santa Ana Region (SARWQCB) website, the Subject Property is located within the Chino 2 “antidegradation” management zone which indicates that the SARWQCB has determined that the lowering of water quality is not of maximum benefit to the public. These contaminants do not pose a potential human health risk to occupants of the Subject Property.

Additionally, based on a review of the Chino Basin Watermaster online Map Viewer, the eastern portion of the Subject Property is located within a large regional VOC groundwater plume comprised mostly of TCE, referred to as the South Archibald TCE Plume. This plume originates from a source approximately 1.7 miles northeast of the Subject Property as a result of historical land use of numerous metal plating and finishing

facilities. Based on the 2022 State of the Basin Report, low concentrations of TCE were reported from 2017 to 2022 in groundwater from two on-site wells on the DeHoog II and Swager Properties at concentrations of 1.2 and 0.46 ug/l, respectively, well below the SWRCB, Division of Drinking Water MCLs for TCE in drinking water of 5 ug/l. Based on the depth of groundwater and low concentrations of VOCs detected beneath the Subject Property, there is a low likelihood that a vapor intrusion issue is present. At least three of the Subject Property occupants (Swager, DeHoog I, and DeHoog II Properties) have drinking water supplied by the City of Ontario. Based on the historical and current land use at the Subject Property (i.e., agricultural, diaries, and residential), there is a low likelihood that on-site land use activities have contributed to the regional groundwater issue. Groundwater monitoring within the plume area is on-going and a remediation system to treat the contaminated groundwater is currently in the design and permitting phases.

# 7. Results of On-Site Inspection

Roux representative Ms. Tahsin Annoor conducted a reconnaissance of the Subject Properties and surrounding areas on January 22 and 31, 2025. During the site reconnaissance, the weather was sunny and 75° Fahrenheit.

Roux's site reconnaissance methods included a site visit to physically observe the Subject Properties in an effort to identify RECs in connection with the Subject Properties. Ms. Tahsin Annoor traversed the Subject Properties to observe conditions during the site reconnaissance. Photographs taken to document conditions encountered at the time of the site reconnaissance are included in Appendix B – Photographic Documentation. Ms. Tahsin Annoor also visually and/or physically observed adjoining properties from reasonably accessible locations on the Subject Property and public thoroughfares. The following sections summarize observations during the inspection.

## 7.1 Discussion of Property Operations

At the time of the January 22 and 31, 2025 site visits, the Subject Property consisted of seven properties (referred to as the DeGroot, Costa, GH Dairy, Alewyn, DeHoog I, DeHoog II, and Swager Properties) that were occupied by dairy farms and/or residences. Roux staff was provided guided access through the Alewyn, DeHoog I, Dehoog II and Swager properties. Roux's reconnaissance of the remaining properties, DeGroot, LMSAME and GH Dairy, was self-guided. Roux staff was not able to access the private residences, areas within the cattle corrals, feeding pastures, or other fenced areas. Due to the types of uses (residential, cattle corrals, etc.), the lack of entry into these areas is not considered a significant data gap in accordance with ASTM Standards.

As previously noted, select properties located within the boundaries of the Subject Property are part of a larger property. The following presents a summary description of each property (or portions of properties thereof) as they pertain to the boundaries of the Subject Property:

- **DeGroot Property (portion) –** The DeGroot Property is part of a larger property, comprising of two parcels. The larger, northern parcel associated with APN: 1053-371-01-0000 is located within the Subject Property boundary. Within this select portion of the DeGroot property consists of an active dairy farm and is developed with two residences (7587 and 7697 Edison Avenue), a milking barn, and various ancillary dairy farm structures including corral canopies, sheds, and feed silos. Roux also observed one agricultural water well.

- **Costa Property (portion) –** The LMSAME Property is part of a larger property, comprising of six parcels. Two of these parcels, associated with APNs: 1053-351-01-0000 and 1053-351-02-0000, are located within the Subject Property boundary. Within the select portions of the LMSAME property consists of an active dairy farm and is developed with various private residence (14213 through 14297 Bon View Avenue), a milking barn, wastewater ponds, and various ancillary dairy farm structures including corral canopies, sheds, and feed silos. Roux also observed an agricultural water well and an in-ground truck scale.

- **GH Dairy Property –** The entirety of the GH Dairy Property is located within the Subject Property boundary. The GH Dairy Property consists of an active dairy farm and is developed with three residences (7721, 7891, and 8061 Edison Avenue), a milking barn, wastewater pond, and various ancillary dairy farm structures including corral canopies, sheds, and feed silos. Roux observed one active agricultural water well, one active residential well, and one idle water well.

- **Alewyn Property (portion) –** The Alewyn Property is part of a larger property, comprising of three parcels. Of these, the larger, northern parcel associated with APN: 0216-321-03-0000 is located within the Subject Property boundary. Within this select portion of the Alewyn property is an active dairy farm and is developed with two residences (8185 Edison Avenue and 14117 Grove Avenue), a decommissioned milking barn, wastewater ponds, and various ancillary dairy farm structures including corral canopies, sheds, and feed silos. Roux also observed an agricultural water well.

- **DeHoog I Property –** The entirety of the DeHoog I Property is located within the Subject Property boundary. The DeHoog I Property consisted of an active dairy farm and is developed with two residences (8295 and 8311 Edison Avenue), a milking barn, wastewater ponds, and various ancillary dairy farm structures including corral canopies, sheds, and feed silos.

- **DeHoog II Property (portion) –** The DeHoog II Property is part of a larger property, comprising of four parcels. Of these, the two northern parcels associated with APNs: 0216-322-03-0000 and 0216-322-04-0000 are located within the Subject Property boundary. Within the select portions of the DeHoog II Property is an active dairy farm and is developed with one single-family home (8381 Edison Avenue), a milking barn, an office building, wastewater ponds, and various ancillary dairy farm structures including corral canopies, sheds, and feed silos. Roux also observed agricultural water well and an in-ground truck scale.

- **Swager Property (portion) –** The Swager Property is part of a larger property, comprising of an approximately 36.95-acre parcel. In general, the northern half (approximately 18.48-acres) of the Swager Property is located within the Subject Property boundary. Within this select portion of the Swager Property is an active dairy farm and is developed with one single-family home (8485 Edison Avenue), an active milking barn, wastewater ponds, and various ancillary dairy farm structures including corral canopies, sheds, and feed silos. Roux also observed an agricultural water well.

The following sections summarize other of Roux's Subject Property reconnaissance observations.

## 7.2 Site Inspection Observations

### 7.2.1 Stained Soil, Pavement, or Interior Staining

Roux observed evidence of staining, unusual odors, petroleum sheens, or distressed vegetation at the Subject Property during the site visit on January 22 and 31, 2025. In general, Roux observed surficial staining in the milk barns and feed silos areas associated with the dairy farm operations. According to the staff, the staining observed in the milk barn and feed silos areas are a result of acid wash (a concentrated, non-foaming, tri-blend detergent) and molasses (liquid cattle feed), respectively. Roux also observed small areas of surficial staining along the area surrounding diesel ASTs observed in the LMSAME Property. Moderate to heavy oil staining was noted on and within the vicinity of the diesel ASTs located in the central area of the DeHoog II Property. This area of the DeHoog II Property appeared to concrete/asphalt paved, although the hardscape appeared to be damaged and/or broken.

During the January 2025 site reconnaissance, the surficial staining observed on the different properties located within the Subject Property appeared to be limited in scale and are not anticipated to present a threat to human health or the environment. The staining observed is considered to be de minimis in nature.

### 7.2.2 Wastewater

With the exception of DeGroot Property, wastewater ponds associated with dairy farm operations were observed on all properties located within the boundaries of the Subject Property. These ponds represent permitted features, and no chemical uses were noted to be associated with these features.

### 7.2.3 Oil/Water Separators (OWS)

No evidence of OWS were observed during the site reconnaissance on January 22 and 31, 2025.

### 7.2.4 Utilities

No utilities of environmental concern were noted during the site visit on January 22 and 31, 2025.

### 7.2.5 Flooring and Paved Surfaces

Flooring and paved surfaces were observed to be in good condition throughout the Subject Property. Surface staining was observed on the flooring and paved surfaces of several of the properties within the Subject Property as discussed in Section 7.2.1.

### 7.2.6 Surface Water

Wastewater ponds associated with dairy farm operations were observed on all properties with the exception of the portion of the DeGroot Property located within the Subject Property boundary.

### 7.2.7 Archeological / Endangered Species / Landmarks

No potential for historic landmarks/structures, and/or archaeological features were identified during the January 22 and 31, 2025 site visit.

### 7.2.8 Industrial Processes

Dairy farm operations were noted on the Subject Property during the January 22 and 31, 2025 site visit. Subject Property occupant activities include dairy farm operations, storage, shipping, and receiving of products. Milk manufacturing processes occur on-site.

### 7.2.9 Exterior Industrial Features

Exterior industrial features were observed by Roux during the January 22 and 31, 2025 site visit including milk barns, cattle corral canopies, and feed silos. No railroad spurs, baghouses, air emissions, or barrels were observed. All properties were equipped with milk ASTs and feed silos.

### 7.2.10 Interior Industrial Features

Interior industrial features were observed by Roux during the January 22 and 31, 2025 site visit including milk pump rooms and cattle wash areas.

### 7.2.11 Hydraulic Equipment and PCBs

During the Subject Property reconnaissance on January 22 and 31, 2025, Roux observed several single to triple pole-mounted electrical transformers along Bon View Avenue, and one triple pole-mounted transformer on the DeGroot Property. Based on the available information, all observed transformers are expected to be non-PCB containing and/or dry-type transformers. No staining was observed in the areas of the pole-mounted transformers; therefore, the transformers are not considered a REC and do not warrant additional investigation.

No hydraulic equipment was observed on the Subject Property during the January 22 and 31, 2025 site visit.

### 7.2.12 Surface Features

Roux did not observe landfills or evidence of dumping at the Subject Property during the site visit on January 22 and 31, 2025. Odors associated with dairy farm operations (manure, wastewater ponds) were observed throughout the Subject Property and surrounding area.

### 7.2.13 Aboveground Storage Tanks (ASTs) & Underground Storage Tanks (USTs)

The following features were noted during the January 22 and 31, 2025 site visit:

- **DeGroot Property –** Roux observed a 10,000-gallon water AST, one 10,000-gallon milk AST, two feed silos, and three 500-gallon diesel ASTs.

- **Costa Property –** Roux observed a 4,000-gallon water AST located south of the milk barn; a 500-gallon fuel AST; two 10,000-gallon milk ASTs located north and south of the milking barn; an emergency generator with a 100-gallon diesel fuel AST located immediately south of the milk barn.

- **GH Dairy Property –** Roux observed two 2,000-gallon water ASTs, a 4,000-gallon water AST, two 7,000-gallon milk ASTs, and two 4,000-gallon liquid feed ASTs, and an emergency electrical generator with a 100-gallon diesel fuel AST located immediately west of the milk barn.

- **Alewyn Property –** Roux observed a 2,500-gallon water AST, and 10,000-gallon milk barn wash AST located immediately east of the decommissioned milking barn.

- **DeHoog I Property –** Roux observed one steel AST for storing water west of the milking barn, and two additional ASTs located west of the milking barn, likely used to store water from an associated water well.

- **DeHoog II Property –** Roux observed an AST located southeast of the residence. This AST was viewed from a distance; therefore, the contents are not known. Roux also observed 12,000-gallon milking barn wash tank located in the central north boundary, a water well and associated 4,000-gallon water pressure AST located northwest of the office building, and an emergency generator with a 250-gallon diesel fuel tank located immediately east of the milking barn.

- **Swager Property –** Roux observed an emergency generator with a 200-gallon diesel fuel tank, a water well and associated 2,000-gallon water pressure AST, and a 12,000-gallon water AST located west of the milking barn.

### 7.2.14 On-site Chemical Storage

During the site visit on January 22 and 31, 2025, Roux observed chemical storage, specifically within milk barns, at all properties associated with the dairy farm operations. Chemicals observed in the milk barn areas included numerous 55-gallon drums of iodine, acid wash, and hydrogen peroxide for sanitation purposes.

### 7.2.15 Agricultural

Cattle wash and other sanitation chemicals, farm waste, and feed lot spoils, and wastewater ponds were seen used or stored on-site during the January 22 and 31, 2025 site visit on each of the dairy farm operations located on the Subject Property.

### 7.2.16 Oil / Gas / Mineral Exploration

Roux did not identify any well exploration or refinery activities during the site visit.

### 7.2.17 Asbestos-Containing Materials (ACM)

The manufacture of most ACMs in the United States was phased out in the 1970s. Based on the age of the buildings (1930s to mid-1960s), it is possible that ACM are present. Additionally, underground asbestos-cement pipelines (ACPs) were commonly used to transfer irrigation water. Based on the historical agricultural use of the Subject Property, ACPs may be present.

### 7.2.18 Lead Based Paint (LBP)

The manufacture of LBP was phased out in the United States in approximately 1978. Based on the age of the buildings (1930s to mid-1960s), it is possible that LBP are present.

### 7.2.19 Water Intrusion and Mold

No water intrusion or mold was noted during the site visit on January 22 and 31, 2025.

## 7.3 Interviews

During the site reconnaissance, Roux staff was provided guided access through the Alewyn, DeHoog I, Dehoog II and Swager properties by Mr. Jason Lee, a representative of the residential redevelopment contractor, RCCD, Inc. The information obtained is provided throughout the report.

Roux was unable to conduct interviews with previous site owners or operators. This data gap is not considered significant due to sufficient information regarding Subject Property history available from EDR historical documents, previous environmental reports for the Subject Property, GeoTracker and FOIA/PRA requests. The User was able to provide information and assist in identifying possible RECs in connection with the Subject Property.

## 7.4 User Provided Information

The following sections summarize information provided by the User to assist in identifying possible environmental concerns associated with the Subject Property.

ASTM E1527-21 provides an optional User Questionnaire to present select User-provided information that can assist in identifying possible RECs in connection with the Subject Property. According to ASTM E1527-21, these tasks do not require the technical expertise of an environmental professional and the environmental professional generally does not perform these tasks. Roux administered the optional questionnaire to the User at the beginning of this Phase I ESA to assist them with these tasks. The following sections outline the parts of the questionnaire that the User completed. The questionnaire was completed by Ms. Janine Padia, User representative. The completed questionnaire is provided in Appendix D.

### 7.4.1 Environmental Liens or Activity and Use Limitations

The User indicated that they have no knowledge regarding environmental liens or activity use limitations with respect to the Subject Property.

### 7.4.2 Specialized Knowledge

The User did not report any specialized knowledge related to the Subject Property or nearby properties. The User provided previous environmental reports summarized in Section 7.4.6.

### 7.4.3 Valuation Reduction for Environmental Issues

The User did not report any valuation reduction for environmental issues.

### 7.4.4 Commonly Known or Reasonably Ascertainable Information

The User did not report knowledge of any commonly known or reasonably ascertainable information, other than the historical use of the Subject Property includes dairy farm uses.

### 7.4.5 Specialized Knowledge

The User did not report specialized knowledge of the Subject Property.

### 7.4.6 Other User Provided Information

The User provided Roux with multiple previous environmental reports that included portions of the Subject Property. The Subject Property consists of the northern portions of larger properties referred to cumulatively as Ontario Ranch I and Ontario Ranch II (Figure 3). The Alewyn, DeHoog I, DeHoog II, and Swager properties of the Subject Property are associated with the northern portion of Ontario Ranch I. The DeGroot, LMSAME et al., and GH Dairy properties of the Subject Property are associated with the northern portion of Ontario Ranch II. The following presents a summary of the previous environmental reports provided by the User. Copies of these reports are provided in **Appendix D**.

#### *7.4.6.1 Previous Reports for Ontario Ranch I*

The following presents previous environmental reports associated with Ontario Ranch I. Only information associated with the Subject Property is included in these report summaries.

**Phase I ESA and Limited Site Characterization (LOR, 2005) – Swager Property**

At the time of LOR's report, the property was improved with the existing residence and dairy farm. The following presents the findings and conclusions:

- Three water wells were present on-site. If the wells are destroyed/abandoned during redevelopment, these activities should be completed in accordance with regulatory requirements.
- Due to the extensive dairy farming activities, the potential exists for elevated soil organic levels and the associated presence of subsurface methane gas.
- Portions of the property were utilized for agricultural purposes, therefore pesticides may be present in soils.

To further investigate the potential presence of pesticides, LOR conducted limited soil sampling for pesticides. Seven soil samples were collected in various locations throughout the property at depths of 6 to 12 inches bgs. Trace to low concentrations of organochlorine pesticides were detected in the sampled locations, below residential screening levels, except for one location. One soil sample from the center of the property reported slightly elevated dieldrin. Considering that this was an isolated area, the clearing and grading of the property will reduce the dieldrin level below screening levels, therefore unrestricted use of the property is warranted.

**Phase I ESA (GeoKinetics, 2006a) – DeHoog II Property**

At the time of GeoKinetics's report, the property was improved with the existing residence and dairy farm. The following presents the findings and conclusions:

- Due to the historic dairy farming activities since the 1940s, the potential exists for elevated soil organic levels and the associated presence of subsurface methane gas.
- Portions of the property were utilized for agricultural purposes between the early 1900s and early 1960s, therefore pesticides may be present in soils.
- Surficial staining was noted in various locations throughout the property.
- The on-site septic system will need to be properly removed prior to redevelopment.
- One active water supply well is present east of the milking barn and one sump and associated pump are located at the south end of the feed lanes, which should be abandoned during redevelopment of the property.
- Twelve ASTs are present on the property and should be properly removed and disposed of prior to redevelopment of the property.
- A 500-gallon gasoline UST was reportedly previously operated and removed during the 1970s and soil contamination was not detected.
- Organic rich sediment from wastewater holding ponds should be removed.

**Phase I ESA (GeoKinetics, 2006b) – Alewyn Property**

At the time of GeoKinetics's report, the property was improved with the existing residences and dairy farms. The following presents the findings and conclusions:

- Due to the historic dairy farming activities since the 1950s, the potential exists for elevated soil organic levels and the associated presence of subsurface methane gas.
- Portions of the property were utilized for agricultural purposes between the early 1900s and early 1950s, therefore pesticides may be present in soils.
- Surficial staining was noted in various locations throughout the property.
- The on-site septic system will need to be properly removed prior to redevelopment.
- Two active water supply wells and one sump and associated pump are present, which should be abandoned during redevelopment of the property.
- Nine ASTs are present on the property and should be properly removed and disposed of prior to redevelopment of the property.
- Underground clay drain lines should be removed.
- Organic rich sediment from wastewater holding ponds should be removed.

- A former 250-gallon diesel UST was reportedly removed from the northern dairy. Soil contamination was reportedly not encountered during the tank removal.

**Phase I ESA (GeoKinetics, 2007) – Swager Property**

At the time of GeoKinetics's report, the property was improved with the existing residence and dairy farm. The following presents the findings and conclusions:

- Due to the historic dairy farming activities since the 1960s, the potential exists for elevated soil organic levels and the associated presence of subsurface methane gas.
- Portions of the property were utilized for agricultural purposes between the early 1900s and early 1960s, therefore pesticides may be present in soils.
- Surficial staining was noted in various locations throughout the property.
- The two on-site septic systems will need to be properly removed prior to redevelopment.
- Three active water supply wells are present, which should be abandoned during redevelopment of the property.
- Four ASTs are present on the property and should be properly removed and disposed of prior to redevelopment of the property.
- Underground drain lines should be removed.
- Organic rich sediment from wastewater holding ponds should be removed.

**Phase I ESA (Hillman, 2014) – DeHoog I Property**

At the time of Hillman's report, the property was improved with the existing residence and dairy farm. The following presents the findings and conclusions:

- Chlorinated solvents identified in on-site well water from an upgradient source represents a REC.
- The likely use of pesticides represents a REC.
- Two large evaporation ponds were noted on the south portion of the Property. The evaporation ponds are likely to contain significant accumulations of organically rich sediment. Further, cleaning and sanitizing chemicals are reported to be washed down the barn floor drains to the ponds and spray fields. This was noted as a REC.
- A historic 500-gallon gasoline UST represents a hREC.

**Draft Phase I ESA (Ardent, 2021a)**

Ardent's Phase I ESA was completed for the entirety of Ontario Ranch I. At the time of Ardent's report, the Alewyn, DeHoog I, DeHoog II, and Swager properties were used as dairies. The Subject Property was mainly used for agricultural purposes from at least 1938 through 1953.

- Based on the historical dairy land use, methane gas surveys have been completed by others at the Alewyn, DeHoog II, and Swager properties. Results of these surveys indicate sporadic elevated concentrations of methane gas exceeding the Lower Explosive Limit (LEL) of methane (i.e., 50,000 ppm). Based on our experience, the City of Ontario will require the developer to complete a comprehensive methane gas survey under its jurisdiction following the removal of the source materials (i.e., organic debris) and grading activities to determine the type of methane gas mitigation system that will be required for the proposed buildings. At a minimum, the City requires a passive system. It has been our experience that methane gas surveys completed following the source removal and grading activities result in much lower concentrations (i.e., below guidelines requiring an active methane gas mitigation system). Due to the City requirement, the possible presence of methane gas beneath the site would be considered a de-minimis condition.

- There are 10 groundwater wells located throughout Ontario Ranch I that have been used for agricultural, residential, and/or dairy water supply purposes. These features would not be considered an environmental concern, however, would be identified as a de minimis condition by ASTM Standards. Other unknown wells may be present.

- The Alewyn Property reportedly operated a former 250-gallon diesel UST at JAD #1 was located immediately west of one of the groundwater wells and removed in 1978. This UST was removed prior to UST regulations, and therefore, no regulatory oversight or confirmation soil samples were collected. Based on this information, the former 250-gallon diesel UST at the Alewyn Property would be considered a REC.

- The DeHoog II Property reportedly operated a former 500-gallon gasoline UST was reportedly removed during the late-1970s. This UST was removed prior to UST regulations, and therefore, no regulatory oversight or confirmation soil samples were collected. Based on this information, the former 500-gallon gasoline UST at the DeHoog II Property would be considered an REC.

- Ardent noted that the Subject Property lies within the "South Archibald TCE Plume." Low concentrations of TCE were recently detected at the time of Ardent's report in groundwater from an on-site well, far below the state standards for purveyors of drinking water. Based on the depth of groundwater and low concentrations of VOCs detected beneath the Subject Property, Ardent concluded there is a low likelihood that a vapor intrusion issue is present. Based on the historical and current land use (i.e., agricultural, diaries, and residential), there is a low likelihood that on-site land use activities have contributed to the regional groundwater issue. Groundwater monitoring within the plume area is on-going and a remediation system to treat the contaminated groundwater is currently in the design and permitting phases. Since there are low concentrations of TCE detected beneath the Subject Property and no vapor intrusion issue is present, the regional TCE groundwater plume would be considered a de minimis condition.

- The site is located within the Chino Groundwater Basin. Groundwater in the basin has been reportedly contaminated with elevated salts, namely nitrates, associated with the historical agricultural and dairy activities in this area. According to the SARWQCB, new property owners are not being held liable for this regional issue associated with historical land uses. Groundwater in the basin is undergoing remedial treatment at designed desalination plants. Based on the agency involvement and active remediation, the regional groundwater nitrate issue associated with the Chino Groundwater Basin would be considered a CREC.

- Based on the age of the buildings (1930s to mid-1960s), it is possible that ACM and LBP are present. Based on the historical agricultural use at the site, underground ACPs were commonly used to transfer irrigation water. Based on this information, the possible presence of ACPs would be considered a de minimis condition.

**Draft Subsurface Investigation (Ardent, 2021b)**

Based on the preliminary findings of the Phase I ESA, Ardent completed a subsurface investigation to further evaluate potential impacts associated with the former 250-gallon diesel UST at the Alewyn Property (8185 Edison Avenue) and former 500-gallon gasoline UST at the DeHoog II Property. The location of the 250-gallon diesel UST former UST was generally provided by others in a previous 2006 Phase I ESA and general area was verified by the property owner during a site visit by Ardent personnel during completion of its Phase I ESA. Due to the small size and general location provided, Ardent drilled two soil borings at this location. The location of 500-gallon gasoline UST was verified by the property owner during a site visit by Ardent personnel during completion of its Phase I ESA. Due to the concretely identified location of the former UST, Ardent advanced one soil boring in the reported location of this former feature.

Borings were advanced to 15 feet bgs and soil samples were collected at 5, 10, and 15 feet bgs. Soil samples collected at 10 feet bgs from each boring (the anticipated bottom of the former excavation associated with the tanks) was analyzed for TPH and VOCs in general accordance with EPA Method Nos. 8015 (modified) and 8260B/5035. Laboratory results indicated no detectable concentrations of TPH and VOCs above laboratory reporting limits. Based on these results, the former 250-gallon diesel UST removed from the Alewyn Property and the 500-gallon gasoline UST removed from the DeHoog II property would no longer be considered an REC.

#### *7.4.6.2 Previous Reports for Ontario Ranch II*

The following presents previous environmental reports associated with Ontario Ranch II. Only information associated with the Subject Property is included in these report summaries.

**Draft Phase I ESA (Ardent, 2022)**

Ardent's Phase I ESA was completed for the entirety of Ontario Ranch II. At the time of Ardent's report, the GH Dairy and the DeGroot properties were used as dairies. The Costa Property (referred to by Ardent as the LMSAME et al. Property) was a vacant diary. Ardent identified the following findings and conclusions:

- Based on the historical land use of the site as a dairy, there is a moderate likelihood that methane gas might be present. Methane gas is naturally produced during the biodegradation of organic materials such as animal manure. Based on our experience, the City of Ontario will require the developer to complete a comprehensive methane gas survey under its jurisdiction following the removal of the source materials (i.e., organic debris) and grading activities to determine the type of methane gas mitigation system that will be required for the proposed buildings. Due to the City requirement, the possible presence of methane gas beneath the site would be considered a de-minimis condition.

- There are seven groundwater wells located on Ontario Ranch II that have been used for agricultural, residential, and/or dairy water supply purposes. These features would not be considered an environmental concern, however, would be identified as a de-minimis condition by ASTM Standards. Other unknown wells may be present.

- The DeGroot Property at 7325 Edison Avenue reportedly used a 500-gallon UST and a 1,000-gallon UST, which were removed in 1992. A SBCFD inspector was present at the removal and indicated the file was to be closed. No confirmation soil sample results were provided in regulatory files reviewed. The location of these features was also not documented. Although no confirmation laboratory results were available for review, based on the County inspectors' closure, the small volume of the USTs, and depth to groundwater, there is a low likelihood that a significant release has occurred from these

USTs. Based on this information, these USTs would not be considered an environmental concern to the site.

- The DeGroot Property, 7587 Edison Avenue, reportedly used a 500-gallon diesel UST that was removed in 1987. When later informed of the removal, the SBCFD requested that soil samples be collected. A soil sample was collected from approximately 10 feet bgs. The laboratory results indicated no detectable concentrations of TPHg, BTEX, and MTBE. No other information was provided (e.g., a closure report or illustration showing where the UST was located). Based on these results, the SBCFD issued a no further action (NFA) letter dated February 13, 2001. Ardent agrees with this determination.

- The LMSAME,et al. Property, 14451 Bon View Avenue, reportedly removed a 550-gallon gasoline UST in 1998. A confirmation soil sample was collected. Laboratory results indicated no detectable to low concentrations of metals, TPHg, BTEX, and MTBE. Based on these results, the SBCFD issued a NFA letter dated May 5, 2000. Ardent compared these results to current regulatory guidelines. Based on these results, Ardent concurred with the SBCFD that no further work is needed.

- The Subject Property is located within the Chino Groundwater Basin. Groundwater in the basin has been reportedly contaminated with elevated salts, namely nitrates, associated with the historical agricultural and dairy activities in this area. According to the SARWQCB, new property owners are not being held liable for this regional issue associated with historical land uses. Groundwater in the basin is undergoing remedial treatment at designed desalination plants. Based on the agency involvement and active remediation, the regional groundwater nitrate issue associated with the Chino Groundwater Basin would be considered a CREC.

- Based on the age of the buildings (1930s to mid-1960s), it is possible that ACM and LBP are present. Based on the historical agricultural use at the site, underground ACPs were commonly used to transfer irrigation water. Based on this information, the possible presence of ACPs would be considered a de minimis condition.

**Phase I ESA (Roux, 2024)**

Roux's Phase I ESA was completed for the entirety of Ontario Ranch II. At the time of this assessment, the GH Dairy, Costa, and DeGroot properties were used as dairies and for residential purposes. From at least 1938 to 1953, the Subject Property was used for agricultural purposes (row crops and orchards) with a few dwellings. By 1966, the Subject Property became increasingly used for dairy farm purposes.

Based on the findings of the Phase I ESA, Roux identified the following other environmental features (OEFs) in connection with the current and historical operations at the Subject Property or adjacent properties:

**OEF 1 – Dairy Farm Operations (Methane).** Due to the historical and current use of the Subject Property for dairy farming purposes, methane gas may be present in shallow soil. Methane gas is naturally produced during the biodegradation of organic matter such as animal manure. Prior to the redevelopment of dairy farms, the City of Ontario Building Department requires that an investigation be performed to evaluate the possible build-up of methane gas in shallow soils. Proper removal and disposal of manure-laden shallow soil in accordance with local regulatory guidance may be required prior to redevelopment of the Subject Property.

**OEF 2 – Private Groundwater Wells.** During the site reconnaissance, Roux observed a total of eight groundwater wells throughout the Subject Property that have been used for agricultural, residential, and/or dairy water supply purposes. Groundwater has been identified at the Subject Property to occur at depths of approximately 120 feet bgs and flows in a south to southwesterly

direction. These features would not be considered an environmental concern to the Subject Property, but may need to be abandoned per State and County guidance.

**OEF 3 – Septic Systems.** Each residential structure on the Subject Property is reportedly equipped with a septic tank. Based on the non-hazardous nature of the domestic waste discharged to the septic systems, these represent an OEF.

**OEF 4 – Hazardous Materials Storage.** A total of five ASTs containing diesel fuel were observed on-site; the ASTs ranged from approximately 100 to 500 gallons in size. No secondary containment was observed with the exception of the two emergency generators which are typically constructed with built-in secondary containment. No significant signs of a release were observed in the vicinity of the ASTs. The on-site ASTs containing hazardous materials therefore represent an OEF.

**OEF 5 – Regional Dairy Farm Operations (Groundwater Degradation).** The Subject Property is located within the Chino Groundwater Basin. Concentrated animal feeding lots such as dairy farms can be a source of local groundwater degradation due to nitrates and TDS. According to information provided on the EPA website, the Chino Basin once had the highest concentration of dairy animals in the world, with approximately 350 dairies located within a 20-square mile area. Although the number of dairies has declined significantly, historical land application of manure and process water has resulted in significant groundwater degradation due to high levels of TDS and nitrate. The Dairy Farm General Permit was created to minimize continued degradation of groundwater in the Chino Basin as well as other parts of the Santa Ana Region. According to the SARWQCB website, the Subject Property is located within the Chino 2 “antidegradation” management zone which indicates that the SARWQCB has determined that the lowering of water quality is not of maximum benefit to the public. The SARWQCB has reportedly noted that new property owners are not being held liable for this regional issue associated with historical land uses. Based on the known regional groundwater degradation issues in the Chino Basin, the potential presence of elevated TDS and nitrates in groundwater beneath the Subject Property represents an OEF.

**OEF 6 – Former UST, 14451 Bon View Avenue.** A 550-gallon gasoline UST was removed from the LMSAME,et al. Property on October 28, 1998 with oversight from the SBCFD. One confirmation soil sample was collected from beneath the UST at a reported depth of 8 feet bgs. Laboratory results indicated low concentrations of lead, TPHg, BTEX, and MTBE. Based on these results, the SBCFD issued a NFA letter dated May 5, 2000. Roux compared these results to current regulatory screening levels for the protection of human health at commercial/industrial properties. Based on this review, the results do not exceed current regulatory screening levels. Therefore, Roux agrees with the SBCFD that no further investigation is necessary. Based on the confirmation sample results and regulatory oversight approval of no further investigation, this former UST represents an OEF.

**OEF 7 – Former UST, 7587 Edison Avenue.** The DeGroot Property reportedly previously operated a 500-gallon diesel UST that was removed in 1987. In 2000, the SBCFD was informed of the UST removal following purchase of the property by Paul Huizenga and requested that soil samples be collected. A soil sample was collected from approximately 10 feet bgs in the reported location of the former UST. The laboratory results indicated no detectable concentrations of TPHg, BTEX, and MTBE. No other information was provided (e.g., a closure report or illustration showing where the UST was located). Based on these results, the SBCFD issued a NFA letter dated February 13, 2001. Based on this information, the former UST represents an OEF.

**OEF 8 – Former UST, 7325 Edison Avenue.** The DeGroot Property reportedly used a 500-gallon UST and a 1,000-gallon UST, which were removed in 1992. During a property inspection in 1994, a SBCFD inspector was shown the removed USTs, which were reportedly still stored on-site. The inspection report indicated the UST file had already been removed from the “alpha list” and that the file was to be closed. No confirmation soil sample results were provided in regulatory files reviewed and the location of these features was also not documented. Although no confirmation laboratory

results were available for review, based on the County inspectors' closure, the small volume of the USTs, and depth to groundwater, there is a low likelihood that a significant release has occurred from these USTs. Based on this information, these USTs would not be considered an environmental concern to the Subject Property and represent an OEF.

Roux identified the following de minimis condition:

**De Minimis Condition 1 – Surficial Staining.** Roux observed evidence of surficial petroleum stains associated with aboveground storage tanks ASTs and/or equipment storage and truck repair areas at the GH Dairy and Costa properties. The surficial staining noted on these properties appeared to be limited in scale and are not anticipated to present a threat to human health or the environment.

Roux identified an REC associated with two properties, referred to as the Hindelang and B&G Properties, within Ontario Ranch II that are located off-site immediately south of the eastern portion of the DeGroot Property.

**REC 1 – General Industrial Uses (Hindelang and B&G Properties).** Historical records for the Hindelang Property indicate that the property was used to manufacture fiberglass camper shells from at least 1986 through 1992. This operation reportedly used and stored small quantities of hazardous materials including polyester resin, polyester gel coat, MEK peroxide catalyst, acetone, 1,1,1-trichloroethane (1,1,1-TCA) and hydrocarbon solvents, rubber adhesive, etc. No other regulatory records associated with this facility were provided. During the site reconnaissance of the Hindelang Property, Roux observed general poor housekeeping practices and automobile repair operations. This property is unpaved outside of the storage building and automobile repair canopy areas. Based on the documented use of chlorinated solvents (1,1,1-TCA), lack of regulatory records, poor general housekeeping, and noted automobile repair operations, the general industrial uses of the Hindelang Property represent a REC.

Environmental database records for the B&G property report hazardous wastes including 0.17-tons of halogenated solvents (chloroforms, methyl chloride, perchloroethylene [PCE], etc.) in 1997. During Roux's site reconnaissance, access to this property was not provided, however, storage of large piles of tires was visible from the fence line and the property was noted to be unpaved. From a 2024 Google Earth aerial photograph of the property, possible soil stockpiles are visible along the western and eastern portions of the property. Based on the documented use of chlorinated solvents, lack of records providing clear information regarding the historical use of the property, and possible soil stockpiles, the general industrial uses of the B&G Property represent a REC.

# 8. Regulatory/Government Agency Inquiries

Roux contacted governmental agencies for reasonably ascertainable information concerning environmental conditions at the Subject Property. Roux contacted or reviewed information from the agencies in the following table. Copies of relevant records are provided in **Appendix E**.

| **Federal and State Agencies** | |
|---|---|
| U.S. Environmental Protection Agency (EPA) – FOIAonline | Roux was referred to the USEPA My Property Database. |
| U.S. EPA MyProperty Database | GH Dairy (7721 and 8061 Edison Avenue) and Costa (14213 Bon View Avenue) were listed for Waste Discharge Requirements associated with the dairy farm operations. |
| National Pipeline Mapping System (NPMS) Online Database | Gas Transmission and Hazardous Liquid pipelines were reported within 500 feet of the Subject Property running through Edison Ave. |
| State Water Resources Control Board (SWRCB): GeoTracker Online Database | Roux was provided a Waste Discharge permit associated with the DeGroot Property (7325 Edison Avenue). See below for further information. |
| SWRCB: Storm Water Multiple Application and Report Tracking System (SMARTS) Online Database | Listings were associated with wastewater discharge permits. See below for further information. |
| Department of Toxic Substances Control (DTSC) | No records were associated with the Subject Property. |
| DTSC: EnviroStor Online Database | No listings were associated with the Subject Property. |
| DTSC: Hazardous Waste Tracking System (HWTS) Online Database | Subject Property addresses 8061 Edison Avenue (GH Dairy) was listed with hazardous waste generator ID numbers, but no waste manifests were recorded. Listing on this database is for permitting purposes. |
| California Air Resources Board (CARB) | No records were associated with the Subject Property. |
| California Office of Environmental Health Hazard Assessment (OEHHA) | No response has been received as of this report date. |
| CalEPA CalRecycle | No records were associated with the Subject Property. |
| State of California Department of Conservation: Geological Energy Management (CalGEM) Online Database | No oil wells were associated with the Subject Property or located within 500 feet of the Subject Property. |

| Regional and Local Agencies | |
|---|---|
| Santa Ana Regional Water Quality Control Board (SARWQCB) | The SARWQCB referred Roux to records available on the GeoTracker online database. |
| South Coast Air Quality Management District (SCAQMD) Facility Information Detail (FIND) Online Database | Records were identified for the Facility and Subject Property and are discussed below. |
| San Bernardino County Fire Department | The SBCFD provided records associated with hazardous material permitting and inspections reports for various Subject Property addresses. Records provided also documented the removal of multiple USTs on the Subject Property. See below for further information. |
| City of Ontario Building Department | Various building records associated with the existing residential buildings and AST permits were provided. |

*SWRCB GeoTracker Database/SARWQCB*

Roux requested records from the SARWQCB for the Subject Property addresses. The SARWQCB shared a GeoTracker web-link for the Subject Property address 7325 Edison Avenue (DeGroot Property). These records were associated with Residuals Recovery Group, Inc. and included a Notice of Intent (NOI) for waste discharge requirements for composting operations from June 2021, an associated Technical Report from September 2023, and a Notice of Applicability (NOA) permitting the composting operations from November 2023. This permitted activity does not represent an environmental concern to the Subject Property.

*SWRCB SMARTS Database*

The Subject Property was listed on this database twice for 7325 Edison Avenue (DeGroot Property). One listing included the permit for Residuals Recovery Group, Inc. discussed above. The other listing was for Material Recovery Solutions, Inc. and associated with the management of dairy wastewater collection, retention and disposal system at the SNS Dairy operation. Wastewater/stormwater is stored in on-site retention ponds.

The Subject Property was also listed for 8381 Edison Avenue (DeHoog II Property). Records included a Notice of Intent to discharge stormwater.

*South Coast Air Quality Management District (SCAQMD) FINDS Database*

Records available on the FINDS online database include emissions permits for 7325 and 7587 Edison Avenue (DeGroot Property) associated with the dairy farm and composting operations and permits for an emergency electrical generator. Records for the 8061 Edison Avenue (GH Dairy Property) included emissions permits for the dairy farm operations and for an emergency electrical generator. Records for 8311 Edison Avenue (DeHoog I Property) included a permit to operate a 500-gallon gasoline AST from 1971. Records for 8381 Editon Avenue (DeHoog II Property) included emissions permits for the dairy farm operations and for an emergency electrical generator. Records for 8485 Edison Avenue (Swager Property) included emissions permits for the dairy farm operations. The Alewyn Property (8185 Edison Avenue) was listed with the Facility ID 147414 and was reportedly issued a Notice to Comply in 2006 associated with a diesel powered emergency generator, which was brought to compliance.

*San Bernardino County Fire Department*

Roux requested records from the SBCFD associated with the known current and historical Subject Property addresses. The SBCFD provided records associated with the following Subject Property addresses: 8311 Edison Avenue (DeHoog I Property), 8381 Edison Avenue (DeHoog II Property), 7325, 7371, 7587 Edison Avenue (DeGroot Property), 7721 and 8061 Edison Avenue (GH Dairy), 14213 Bon View Avenue (Costa Property), 8185 Edison Avenue (Alewyn Property), and 8485 Edison Avenue (Swager Property). A majority of the records provided by the SBCFD were associated with permits and inspection reports for hazardous materials associated with the dairy operations, including the storage of chemicals such as soap detergent, acid cleaner, chlorine bleach, iodine, sodium hypochlorite, diesel fuel, etc. No environmentally significant violations were noted.

The following presents a summary of the UST records for the Subject Property. It should be noted that earlier SBCFD documents reportedly indicated the Subject Property addresses as located in the City of Chino, rather than Ontario.

**DeGroot Property**

**7325 Edison Avenue**

The DeGroot Property reportedly used a 500-gallon UST and a 1,000-gallon UST, which were removed in 1992. During a property inspection in 1994, a SBCFD inspector was shown the removed USTs, which were reportedly still stored on-site. The inspection report indicated the UST file had already been removed from the “alpha list” and that the file was to be closed. No confirmation soil sample results were provided in regulatory files reviewed and the location of these features was also not documented. Although no confirmation laboratory results were available for review, based on the County inspectors’ closure, the small volume of the USTs, and depth to groundwater, there is a low likelihood that a significant release has occurred from these USTs. Based on this information, these USTs would not be considered an environmental concern to the Subject Property.

**7587 Edison Avenue**

The DeGroot Property reportedly previously operated a 500-gallon diesel UST that was removed in 1987. In 2000, the SBCFD was informed of the UST removal following purchase of the property by Paul Huizenga and requested that soil samples be collected. A soil sample was collected from approximately 10 feet bgs in the reported location of the former UST. The laboratory results indicated no detectable concentrations of TPHg, BTEX, and MTBE. No other information was provided (e.g., a closure report or illustration showing where the UST was located). Based on these results, the SBCFD issued a NFA letter dated February 13, 2001.

**Alewyn Property**

**8185 Edison Avenue**

An inspection of the property was conducted in 2007 and a Notice of Violation was issued due to the removal of the 250-gallon UST in 1978 without regulatory oversight or confirmation soil samples being collected.

**DeHoog I Property**

**8311 Edison Avenue**

The DeHoog I Property reportedly previously operated a 500-gallon gasoline UST that was removed in 1998. A Site Closure report by A&J Environmental, dated November 30, 1998 indicated that the UST removal activities were overseen by the SBCFD and a soil sample was collected from beneath the center of the former tank location. The soil sample was analyzed for TPHg, BTEX, and MTBE. Laboratory results indicated no detectable concentrations of these constituents above laboratory reporting limits. Based on these concentrations, the UST was issued a NFA letter, dated January 6, 1999. Based on the regulatory closure and sampling results, the former UST would not be considered an environmental concern to the Subject Property.

## 8.1 Vapor Encroachment Condition

In accordance with ASTM E2600 Standard Guide for Vapor Encroachment Screening and in accordance with applicable federal and local guidance Roux conducted a review of potential vapor encroachment concerns at the Subject Property.

Historical records for the south adjoining Hindelang Property indicate that the property was used to manufacture fiberglass camper shells from at least 1986 through 1992. This operation reportedly used and stored small quantities of hazardous materials including polyester resin, polyester gel coat, MEK peroxide catalyst, acetone, 1,1,1-trichloroethane (1,1,1-TCA) and hydrocarbon solvents, rubber adhesive, etc. No other regulatory records associated with this facility were provided. Previous environmental reports that include this property note poor housekeeping practices and automobile repair operations. Based on the documented use of chlorinated solvents (1,1,1-TCA), poor general housekeeping, and noted automobile repair operations, the south adjoining Hindelang Property represents a potential vapor encroachment concern.

## 8.2 Standard Environmental Record Sources

According to ASTM Standard E1527-21, the purpose of reviewing regulatory records is to obtain and review records that will help identify RECs in connection with the Subject Property. In addition, some records to be reviewed pertain not only to the Subject Property, but also to properties within an additional “approximate minimum search distance” in order to help assess the likelihood of problems from migrating hazardous substances or petroleum products. The basis of the “approximate minimum search distance” is the Subject Property boundary.

Roux retained EDR of Shelton, Connecticut to provide an EDR Report for this Subject Property. This report is a computerized search of select state and federal environmental databases that identify various properties with a record of environmental activity. Roux reviewed the report and summarized the relevant findings in the following sections. A copy of the compiled EDR Report has been included in **Appendix F** – Third Party Vendor Database Report.

The following sections describe the findings of the database search. Properties that meet the criteria presented below are discussed in this report.

- Properties with listings indicative of a release (e.g., State Hazardous Waste Sites [SHWS], LUST, VCP, RELEASE). Nonadjacent sites with hazardous waste generator, FINDS, ECHO, NPDES, AIRS, or UST listings only will not be discussed in this report.

- Properties adjoining the Subject Site are examined due to their proximity to the Subject Site and the potential for surface water discharges (e.g., storm water runoff, surface water effluent discharges) to enter the Subject Site or through the migration of groundwater.
- Properties located within 1/8-mile topographically upgradient of the Subject Property. Based on local topography and drainage, groundwater flow in the Subject Property vicinity is interpreted to be to the south/southeast. Therefore, properties considered upgradient are located north/northwest of the Subject Property. Sites that are located downgradient or cross gradient to the Subject Property but do not adjoin the Subject Property are not discussed in this report.

### 8.2.1 Subject Property

An EDR Report was generated on February 27, 2025, and is provided in **Appendix F**. The Subject Property was identified on the following databases searched by EDR.

**DeGroot**

- **7325 Edison Avenue:** SWF/LF, LDS, NPDES, CERS

  The SWF/LF listings Residuals Recovery Group and Recycled Wood Products indicate the facility is actively used as an agricultural material composting operation.

- **7371 Edison Avenue:** San Bernardino County Permit

  This listing for SNS Dairy reports an inactive permit from 1997 with no additional relevant details.

- **7397 Edison Avenue:** FINDS, CIWQS
- **7587 Edison Avenue:** AST, EMI, ENF, CIWQS, CERS, EMI, San Bernardino County Permit, UST

  These listings indicate the Subject Property has been used and permitted for dairy farming purposes since at least the 1990s with animal wastewater discharge. The AST and UST databases did not provide any detailed information.

**Costa**

- **14213 Bon View Avenue:** FINDS, ECHO, WDS, ENF, San Bernardino County Permit, CIWQS, CERS

These listings indicate the Subject Property has been used and permitted for dairy farming purposes since at least the 1980s with animal wastewater discharge.

**GH Dairy**

- **7721 Edison Avenue:** ENF, San Bernardino County Permit, CIWQS
- **8061 Edison Avenue:** ECHO, FINDS, EMI, ENF, HWTS, San Bernardino County Permit, CIWQS, CERS, WDS

These listings indicate the Subject Property has been used and permitted for dairy farming purposes since at least the 1990s with animal wastewater discharge.

**Alewyn**

- **8185 Edison Avenue:** ENF, San Bernardino County Permit, UST, SWEEPS UST, CA FID UST, HIST UST, CIWQS, FINDS, WDS, ECHO, CERS

These listings indicate the Subject Property has been used and permitted for dairy farming purposes since at least the 1980s with animal wastewater discharge. The UST databases are associated with the former 250-gallon UST discussed above in Section 8.

**DeHoog I**

- **8311 Edison Avenue:** ENF, San Bernardino County Permit, CIWQS, ECHO, CERS, FINDS

These listings indicate the Subject Property has been used and permitted for dairy farming purposes since at least 2001 with animal wastewater discharge.

**DeHoog II**

- **8381 Edison Avenue:** ENF, San Bernardino County Permit, CIWQS, ECHO, CERS, FINDS, AST

These listings indicate the Subject Property has been used and permitted for dairy farming purposes since at least the 1980s with animal wastewater discharge. The AST database did not provide any detailed information.

**Swager**

- **8485 Edison Avenue:** HIST UST, WDS

These listings indicate the Subject Property has been used and permitted for dairy farming purposes since at least 1994 with animal wastewater discharge. The HIST UST database is associated with the former 250-gallon UST at the Alewyn Property (8185 Edison Avenue).

### 8.2.2 Site Vicinity

Roux reviewed a Database Report prepared by EDR for the Subject Property. A copy of the Database Report is provided in **Appendix F**. Based on Roux's review, facilities near the Subject Property were generally reported as dairy farms and listed on similar databases to the Subject Property. One notable upgradient facility was identified and is summarized below:

- Redwood Products of Chino Inc., located at 13814 South Grove Avenue, approximately 0.32-miles north to northeast of the Subject Property, was listed on the SWF/LF, CERS HAZ WASTE, CERS TANKS, LDS, HWTS, San Bernardino County Permit, and CERS databases. These databases indicate this facility is an active green materials transfer and processing operation. No hazardous material/waste releases have been reported at this facility.

Based on the information listed in the databases, this facility is not considered a REC.

### 8.2.3 Orphan Sites

The EDR Report includes a section addressing "Orphan Sites." Orphan sites are sites, which, due to incomplete geographic location data, incomplete address information or incorrect address information, cannot be plotted correctly. The database report identified thirteen unmapped facilities. Based on the noted locations or listed databases, these listings are not considered to represent RECs in the context of this Phase I ESA.

# 9. Small Business Administration

Reliance to the US Small Business Administration and the participating Community Development Corporation is not applicable. Therefore, a reliance letter will not be provided at this time.

# 10. Conflict Certification

Roux has no present or contemplated future ownership interest or financial interest in the real estate that is the subject of this Report; and Roux has no personal interest with respect to the subject matter of the Report of the parties involved and consultant has no relationship with the property or the owners thereof which would prevent an independent analysis of the environmental or other conditions of the property.

# 11. Environmental Professional Statement

Roux performed this assessment in accordance with the generally accepted practices for environmental assessments at the time of implementation. Roux made a reasonable effort to ensure that the information presented in this report is materially complete and accurate.

Roux completed a Phase I ESA in general compliance with the scope and limitations of ASTM Practice E1527-21 of the 180-acre proposed residential development property south of Edison Avenue and west of Walker Avenue in the City of Ontario, California.

"We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental professional as defined in §312.10 of 40 CFR 312" and,

"We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312."

Roux performed this Phase I ESA by, or under direct supervision of, the undersigned environmental professionals. Resumes are included in **Appendix G**. Resumes for the individuals who prepared the Phase I ESA**.**

Respectfully Submitted,

**ROUX ASSOCIATES, INC.**

Kasia Anderson
Project Geologist

Mauricio H. Escobar, P.G.
Vice President / Principal Geologist

# 12. Conclusions, Opinions and Recommendations

Roux has performed this Phase I ESA in general compliance with the scope and limitations of ASTM Standard Practice E1527-21. Roux separated the findings of this assessment into the following four categories: RECs, controlled RECs, historical RECs and de minimis conditions. Exceptions to or deletions from this practice are described in Section 3.5 and Section 3.8 of this report.

## 12.1 Recognized Environmental Conditions

Based on the information obtained through the performance of this Phase I ESA, Roux identified the following REC:

**REC 1 – Historical Agricultural Use (Subject Property).** Based on the historical use of the Subject Property for agricultural purposes from at least the 1930s through 1950s, it is likely that pesticides were used. In 2005, soil sampling at the eastern portion of the Subject Property (Swager Property) was conducted to further investigate the potential presence of pesticides. No detectable to low concentrations of organochlorine pesticides were reported in the samples collected and all but one were below regulatory screening levels. The sample that exceeded residential screening levels was collected from the central portion of the Swager Property and contained slightly elevated dieldrin.

**REC 2 – Vapor Encroachment Concern (Off-Site Hindelang Property).** Historical records for the south adjoining Hindelang Property (immediately south of the DeGroot Property) indicate that manufacturing of fiberglass camper shells from at least 1986 through 1992 included the use and storage of hazardous materials including polyester resin, polyester gel coat, MEK peroxide catalyst, acetone, 1,1,1-TCA and hydrocarbon solvents, rubber adhesive, etc. Previous environmental reports noted poor housekeeping practices and automobile repair operations at the Hindelang Property. Based on the documented use of chlorinated solvents (1,1,1-TCA), poor general housekeeping, and noted automobile repair operations, the south adjoining Hindelang Property represents a potential vapor encroachment concern and a REC.

## 12.2 Controlled Recognized Environmental Conditions

Based upon the information described in this report, this Phase I ESA did not reveal evidence of CRECs.

## 12.3 Historical Recognized Environmental Conditions

Based upon the information described in this report, this Phase I ESA did not reveal evidence of HRECs.

## 12.4 De Minimis Conditions

Roux identified the following de minimis condition:

**De Minimis Condition 1 – Surficial Staining.** Roux observed evidence of surficial petroleum stains associated with aboveground storage tanks ASTs and/or equipment storage areas at the GH Dairy, Costa, and DeHoog II properties. The surficial staining noted on these properties appeared to be limited in scale and are not anticipated to present a threat to human health or the environment. A SMP should be implemented to manage any potentially impacted areas encountered during redevelopment of the Subject Property.

## 12.5 Business Environmental Risks

Based upon the information described in this report, this Phase I ESA did not reveal evidence of independent Business Environmental Risks (BERs) in connection with the Subject Property.

## 12.6 Other Environmental Features

Other environmental features (OEFs) identified in connection with the current and historical operations at the Subject Property or adjacent properties include:

**OEF 1 – Dairy Farm Operations (Methane).** Due to the historical and current use of the Subject Property for dairy farming purposes, methane gas may be present in shallow soil. Methane gas is naturally produced during the biodegradation of organic matter such as animal manure. Based on the historical dairy farming land use of the Subject Property, methane gas surveys were reportedly completed by others at the Alewyn, DeHoog II, and Swager properties. Results of these surveys indicate sporadic elevated concentrations of methane gas exceeding the Lower Explosive Limit (LEL) of methane (i.e., 50,000 parts per million [ppm]).

Prior to the redevelopment of dairy farms, the City of Ontario Building Department requires that an investigation be performed to evaluate the possible build-up of methane gas in shallow soils and to determine the level of methane gas mitigation required. Proper removal and disposal of manure-laden shallow soil in accordance with local regulatory guidance may also be required prior to redevelopment of the Subject Property.

**OEF 2 – Private Groundwater Wells.** During the site reconnaissance, Roux observed a total of eight groundwater wells throughout the Subject Property that have been used for agricultural, residential, and/or dairy water supply purposes. Groundwater has been identified immediately south of the Subject Property to occur at depths of approximately 120 feet below the ground surface (bgs) and flows in a south to southwesterly direction. These features would not be considered an environmental concern to the Subject Property, but may need to be abandoned prior to redevelopment per State and County guidance.

**OEF 3 – Septic Systems.** Each residential structure on the Subject Property is reportedly equipped with a septic tank. Based on the non-hazardous nature of the domestic waste discharged to the septic systems, these represent an OEF.

**OEF 4 – Hazardous Materials Storage.** A total of eight ASTs containing diesel fuel were observed on the Subject Property including the DeGroot, Costa, GH Dairy, DeHoog II, and Swager Properties; the ASTs ranged from approximately 100 to 500 gallons in size. No significant signs of a release were observed in the vicinity of the ASTs. Additionally, various other chemicals associated with the dairy activities are stored in 55-gallon drums and used on-site including, but not limited to, iodine, acid wash, and hydrogen peroxide for sanitation purposes. The hazardous material use on-site therefore represents an OEF.

**OEF 5 – Regional Dairy Farm Operations (Groundwater Degradation).** The Subject Property is located within the Chino Groundwater Basin. Concentrated animal feeding lots such as dairy farms can be a source of local groundwater degradation due to nitrates and TDS. According to information provided on the EPA website, the Chino Basin once had the highest concentration of dairy animals in the world, with approximately 350 dairies located within a 20-square mile area. Although the number of dairies has declined significantly, historical land application of manure and process water has resulted in significant groundwater degradation due to high levels of TDS and nitrate. The Dairy Farm General Permit was created to minimize continued degradation of groundwater in the Chino Basin as well as other parts of the Santa Ana Region. According to the SARWQCB website, the Subject Property is located within the Chino 2 “antidegradation” management zone which indicates that the SARWQCB has determined that the lowering of water quality is not of maximum

benefit to the public. The SARWQCB has reportedly noted that new property owners are not being held liable for this regional issue associated with historical land uses. Based on the known regional groundwater degradation issues in the Chino Basin, the potential presence of elevated TDS and nitrates in groundwater beneath the Subject Property represents an OEF.

**OEF 6 – South Archibald TCE Plume.** The eastern portion of the Subject Property is located within a large regional VOC groundwater plume comprised mostly of TCE, referred to as the South Archibald TCE Plume. This plume originates from a source approximately 1.7 miles northeast of the Subject Property as a result of historical land use of numerous metal plating and finishing facilities. Low concentrations of TCE were reported from 2017 to 2022 in groundwater from two on-site wells on the DeHoog II and Swager Properties at concentrations of 1.2 and 0.46 ug/l, respectively, well below the SWRCB, Division of Drinking Water MCLs for TCE in drinking water of 5 ug/l. Based on the depth of groundwater and low concentrations of VOCs detected beneath the Subject Property, there is a low likelihood that a vapor intrusion issue is present. Since there are low concentrations of TCE detected beneath the Subject Property and no vapor intrusion issue is present, the regional TCE groundwater plume would be considered an OEF.

**OEF 7 – Former UST, 7587 Edison Avenue (DeGroot Property).** The DeGroot Property reportedly previously operated a 500-gallon diesel UST that was removed in 1987. In 2000, the SBCFD was informed of the UST removal following purchase of the property by Paul Huizenga and requested that soil samples be collected. A soil sample was collected from approximately 10 feet bgs in the reported location of the former UST. The laboratory results indicated no detectable concentrations of TPHg, BTEX, and MTBE. No other information was provided (e.g., a closure report or illustration showing where the UST was located). Based on these results, the SBCFD issued a NFA letter dated February 13, 2001. Based on this information, the former UST represents an OEF.

**OEF 8 – Former UST, 8185 Edison Avenue (Alewyn Property).** The Alewyn Property reportedly used a 250-gallon diesel UST that was removed in 1978 without regulatory oversight and no confirmation soil samples were collected. In 2021, soil samples were collected in the reported former location of the UST. Laboratory results indicated no detectable concentrations of TPH and VOCs above laboratory reporting limits. Based on these results, the former 250-gallon diesel UST would not be considered an environmental concern to the Subject Property and represents an OEF.

**OEF 9 – Former UST, 8311 Edison Avenue (DeHoog I Property).** The DeHoog I Property reportedly used a 500-gallon diesel UST that was removed in 1998 with oversight from the SBCFD. A soil sample was collected from beneath the center of the former tank location. The soil sample was analyzed for TPHg, BTEX, and MTBE. Laboratory results indicated no detectable concentrations of these constituents above laboratory reporting limits. Based on these concentrations, the UST was issued a NFA letter, dated January 6, 1999. Based on the regulatory closure and sampling results, the former UST would not be considered an environmental concern to the Subject Property and represents an OEF.

**OEF 10 – Former UST, 8381 Edison Avenue (DeHoog II Property).** A previous Phase I ESA completed by others included an interview with the former property owner, Mr. Joe De Hoog, in which Mr. De Hoog indicated that a 500-gallon gasoline UST was historically present immediately south of the detached three-car garage and was removed in the late-1970s. In 2021, soil samples were collected in the reported former location of the UST. Laboratory results indicated no detectable concentrations of TPH and VOCs above laboratory reporting limits. Based on these results, the former 500-gallon gasoline UST would not be considered an environmental concern to the Subject Property and represents an OEF.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

# EXECUTIVE SUMMARY

## DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at approximately five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through current. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 1320 feet of the target property.

Summary information obtained is provided in the text of this report.

## RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

# EXECUTIVE SUMMARY

## DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at approximately five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through current. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 1320 feet of the target property.

Summary information obtained is provided in the text of this report.

## RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Roux Associates were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

## *Certified Sanborn Results:*

**Certification #** 953A-4D1D-AA64

**PO #** 3669.0004L

**Project** Ontario Ranch I

**UNMAPPED PROPERTY**

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 953A-4D1D-AA64

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ✔ Library of Congress
- ✔ University Publications of America
- ✔ EDR Private Collection

*The Sanborn Library LLC Since 1866™*

### Limited Permission To Make Copies

Roux Associates (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

**Disclaimer - Copyright and Trademark Notice**

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, LLC. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. This Report is provided on an "AS IS", "AS AVAILABLE" basis. NO WARRANTY EXPRESS OR IMPLIED IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, LLC AND ITS SUBSIDIARIES, AFFILIATES AND THIRD PARTY SUPPLIERS DISCLAIM ALL WARRANTIES, OF ANY KIND OR NATURE, EXPRESS OR IMPLIED, ARISING OUT OF OR RELATED TO THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT, INCLUDING WITHOUT LIMITATION, ANY WARRANTIES REGARDING ACCURACY, QUALITY, CORRECTNESS, COMPLETENESS, COMPREHENSIVENESS, SUITABILITY, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, MISAPPROPRIATION, OR OTHERWISE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, LLC OR ITS SUBSIDIARIES, AFFILIATES OR THIRD PARTY SUPPLIERS BE LIABLE TO ANYONE FOR ANY DIRECT, INCIDENTAL, INDIRECT, SPECIAL, CONSEQUENTIAL OR OTHER DAMAGES OF ANY TYPE OR KIND (INCLUDING BUT NOT LIMITED TO LOSS OF PROFITS, LOSS OF USE, OR LOSS OF DATA), ARISING OUT OF OR IN ANY WAY CONNECTED WITH THIS REPORT OR ANY OF THE DATA AND INFORMATION PROVIDED IN THIS REPORT. Any analyses, estimates, ratings, environmental risk levels, or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only an assessment performed by a qualified environmental professional can provide findings, opinions or conclusions regarding the environmental risk or conditions in, on or at any property.

## I. INTRODUCTION

This plan describes the operational setting of SNS Dairy and recommended procedures of the operation and management of the dairy wastewater collection, retention, and disposal system at the:

SNS Dairy

| | |
|---|---|
| Owner/Operator: | Sam Souza |
| Location: | 7325 Edison Avenue, Chino,California |
| Mailing Address: | same |

| | | | |
|---|---|---|---|
| EWMP Responsible Party: | Primary: | Sam Souza | (909) 732-8165 |
| | Secondary: | Sam Souza Jr. | (909) 203-5905 |

The dairy is situated on the south side of Edison Avenue. The west boundary of the dairy is adjacent to the Sultana Avenue right-of-way. The east boundary is adjacent to the Campus Avenue right-of-way.

The gross area of the dairy is approximately 36.55 acres. The dairy operations occupy approximately 33.41 acres of the total acres and include the following uses:

- Corrals,
- Hay barns,
- Commodity barn,
- Milk barn, and
- Wastewater lagoons

The current typical animal population is:

- 850 milk cows, and
- 150 dry cows

This onsite stock count equates to 1400 animal units. SNS Dairy has not plans for expansion at this time. However, the operator does intend to abandon milking operations in the near future and use the facility for raising his heifers. The EWMP is designed for a milking herd to provide the option of leasing out the facility to a dairy operator if he chooses.

At the time this report was prepared, this dairy could not comply with the RWQCB's 2001 Guidelines for the Development of EWMPs. The quantities reported are the result of the proposed improvements described herein under Section II, Recommendations.

Portions of SNS Dairy that require containment of runoff include approximately 12.73 acres of corrals, 1.49 acres of concrete feed alleys, 3.15 acres of dirt areas, and 6.97 acres of fields and pastures. The wastewater lagoon and evaporation basins occupy 8.74 acres and have a combined storage capacity of 10,301,007 gallons (31.61 acre-ft). SNS Dairy generates approximately 24,861 gallons of wash water per day (See Appendix A, page 1).

SNS Dairy has a very efficient and effective way of managing its wash water and storm water. Wash water from the milk barn gravity flows to a sump located just east of the milk barn. From the sump the wash water continues by gravity flow through a 4 inch PVC line to a series of check valves located along the northerly portion of Field #2. Water can be dispersed via the check valves to various portions of Field #2 to evaporate and percolate. Any wash water or storm runoff from Field #2 is collected in a series of evaporation basins located to the south.

Storm runoff from Corral #1 flows south, then east to commingle with runoff from Corrals #2 through #5 and continue south via a swale located along the west boundary of the corrals. Just south of Corral #5, a berm directs the runoff to the east and ultimately into Basin #1. Storm runoff from Corrals #6 through #9 flows east to the west boundary of Field #1, then south to Basin #1. Storm runoff from Corral #10 flows south to Field #1 and ultimately to Basin #1. Corrals #11 through #13 drain south to Field #2 and ultimately into Evaporation Basins #1 through #5.

Corral #14 receives some runoff from the dirt area located to the north of the corral. There is a potential for runoff exiting the corral along the south fence line to flow southeast and offsite. Any runoff that exits the facility along the east fence line will be contained within a small swale located between the east fence line for SNS Dairy and the Feed Alley for the adjacent facility to the east. The runoff will then be channeled, within the swale, to the south along the Campus Avenue right-of-way. This report includes a recommendation that Corral #14 be abandoned, the manure removed and a two foot berm constructed along the west fence line between Corral #13 and #14. By implementing this recommendation, runoff from the dirt area and Corral #14 will remain uncontaminated with manure and, therefore, can flow offsite along the natural drainage course within the Campus Avenue right-of-way.

SNS Dairy has adequate protection against on-site storm water leaving the property. In general, storm runoff drains from north to south to either Basin #1 or Evaporation Basins #1 through #5. The west boundary is protected by a berm along the west part of the Sultana Avenue right-of-way. Potential runoff along the south boundary is contained by the west to east extension of the west berm. Runoff is directed in an easterly direction into Basin #1. Runoff along the east boundary, south of the dirt area and Corral #14, is contained within Evaporation Basin #5.

SNS Dairy also has excellent protection against offsite entering the property. The northern property line is protected from run-on by a series of dirt and asphalt berms depicted on the Plot Plan. The storm runoff from Edison Avenue is directed west and away from the dairy. The remaining boundaries of the dairy are protected by the berms and Basin #1, as discussed above and depicted on the Plot Plan.

SNS Dairy was built prior to November 27, 1984. Therefore, they are not required to protect their manured areas from the 100-year peak stream flow. However, they are required to protect all manured areas from the 20-year peak stream flow. Studies have not been done to calculate the flood elevations of a 20-year peak stream flow. In order to protect the dairy from, and prepare for, a 20-year peak flow, it must maintain regular maintenance programs as described herein. All onsite flows and the required volumes for the 25-year, 24-hour storm must be contained (See Appendix H, 100 Year Flood Plain Data).

## II. DESIGN

SNS Dairy was originally contracted to comply with Order No. 99-11. Since that time, guidelines for achieving compliance with Order No. 99-11 have been issued (Guidelines for the Development of Engineered Waste Management Plans for Concentrated Animal Feeding Operations, February 5, 2001). This Engineered Waste Management Plan (EWMP) was prepared under the recommendations of the new guidelines.

Order No. 99-11 required the containment of the daily production of wastewater and storm water runoff from a 24-hour, 25-year storm. The new guidelines to Order No. 99-11 require the containment of:

- 150 days of the daily production of wastewater,
- A 24-hour, 25-year storm,
- 150 days of winter precipitation, and
- The 150-day accumulation of 10% of manure solids that could end up in the lagoons.

Although evaporation and percolation can be accounted for, the new guidelines require a large change in containment from Order No. 99-11.

In order to accommodate the new guidelines, this report contains two sets of calculations. The first set of calculations determines the amount of capacity required for 150 days storage. The second set of calculations performs a month-by-month water balance analysis of the amount of wastewater generated and eliminated. This second set of calculations was developed for those dairies that do not meet the requirements of the new guidelines. This second set of calculations optimizes the amount of storage required by including percolation and evaporation on a month by month basis.

The Engineered Wastewater Management Plan (EWMP) developed for SNS Dairy in December 2003 determined that the dairy has appreciable wastewater storage. SNS Dairy meets all of the requirements of the new guidelines. In Table 1, wastewater volumes and the capacity of the settling basin & lagoon are summarized.

| Table 1<br>Capacity Summary | | |
|---|---|---|
| Total Days Required | 150 | days |
| Total Milkhouse and Parlor Water Rate | 3,045 | gal per day |
| Total Wash Pen Rate | 21,816 | gal per day |
| Total Milkhouse and Wash Pen Rate | 24,861 | gal per day |
| Total Required Storm Water Volume | 15.44 | acre-ft |
| Total Manure Volume | 0.66 | acre-ft |
| Total Required Containment Facility Volume | 27.54 | acre-ft |
| Total Available Volume | 31.61 | acre-ft |
| ADDITIONAL VOLUME REQUIRED | 0 | acre-ft |
| | | |
| Total Annual Washwater and Storm Water Accumulation | 59.07 | acre-ft |
| Total Annual Evaporation and Percolation Capability | 134.57 | acre-ft |
| | | |
| Total Winter (Nov.-Dec.-Jan.-Feb.-Mar.) Washwater and Storm Water Accumulation (Inflow) | 35.46 | acre-ft |
| Total Winter (Nov.-Dec.-Jan.-Feb.-Mar.) Evaporation and Percolation Capability (Outflow) | 9.72 | acre-ft |

The data presented in this report was generated in the spreadsheets labeled "Worksheet for Determining Containment Facility Volume" (Appendix A). The first page[1] details the current animal population and the daily wash water generated on the dairy. All numbers for milk house and wash pen water rates were generated from Rain Bird and Weather Tech Sprinkler Volume Ratings for single and double nozzles. An average of 5.05 Gallons per minute was used for single nozzles and 7.1 gallons per minute was used for double nozzles. These numbers were confirmed by watching the total run time of the wash pen sprinklers per cow pen and matched with research from the University of California Cooperative Extension Program for Dairies (see Appendix C).

The second page[1] shows the equivalent gallons per cow per day. This calculation was generated in response to the EWMP guidelines adopted by the Regional Board. The guidelines recommend that as much as 100 gal/cow/day should be used to generate

[1] Appendix A, "Worksheet for Determining Containment Facility Volume".

wastewater during winter months. The calculation on the second page[1] shows a more accurate estimate of the volume of water used per cow per day on SNS Dairy.

Page two[1] also shows the total storm water accumulation generated on the dairy. Evaporation was considered, based on data from the California Department of Water Resources. Manure was also considered in the total volume calculations. The Total Required Containment Facility Volume is shown on the bottom of the second page[1].

The Total Available Volume is shown on page three[1] for SNS Dairy. The Additional Volume Required was found by subtracting the Total Required Volume from the Current Capacity. In the case of SNS Dairy, no additional volume is required.

Also included on page three[1] is a calculation showing the total depth needed in the basins to contain the 24-hr, 25-yr storm. This calculation was developed to show how much depth should be retained at the top of the basins to ensure that the 24-hr, 25-yr storm can be fully contained. This calculation also shows the maximum fill depth of the basins before pumping must be initiated. The calculation assumes that all storm water flows by gravity to the basins and is contained before it is pumped to application fields. In the case of SNS Dairy, 3.00 feet must be maintained at the top of the Basins #1 and 0.60 feet maintained at the top of Evaporation Basins #1-5 to ensure capacity of the 24-hr, 25-yr storm.

Shown below are two examples of wastewater lagoons. Figure 1 shows an optimum dairy lagoon that is able to contain all of the required wastewater and runoff volumes. Figure 2 shows a more common situation where two lagoons are used to split the total wastewater and runoff volumes. There should always be enough room in one lagoon to hold the 24-hr, 25-yr storm. By leaving enough room for the 24-hr, 25-yr storm, it eliminates dependency on the pump and eliminates potential spills due to pump failure. The calculation on the bottom of page three[1] shows exactly how much depth is needed at the top of the lagoon to ensure containment of the 24-hr, 25-yr storm.

---

[1] Appendix A, "Worksheet for Determining Containment Facility Volume"

**Figure 1.** Cross section of optimum dairy lagoon.

**Figure 2.** Cross sections of typical dairy lagoons with split volumes.

Appendix B contains the Inflow-Outflow computations designed to optimize the amount of storage required. This spreadsheet models the month-by-month totals of operations water, precipitation, 24-hour, 25-year storm data, evaporation and percolation. Although the 24-hour - 25-year storm could occur at any time, it was assumed to occur during the month of

January. Percolation is not included for November through March. All data is referenced in Appendices D-G. As can be seen in the spreadsheets, SNS Dairy has 19,245,907 million gallons of total inflow (Column [15]), and 43,846,695 gallons of total outflow (Column [27]).

Column [28] compares the total inflow with the total outflow on a month-by-month basis. The calculation subtracts the total outflow from the total inflow to give a clear estimate of which months have more inflow than outflow. If there is more inflow than outflow, additional storage is required. Since all factors including evaporation and percolation are included, this calculation gives an accurate estimate of how much storage is needed per month. The total capacity needed on the dairy based on all the months that have more inflow than outflow is then shown at the bottom of the calculation sheet. In the case of SNS Dairy, there are 5 months (November through March) where there is more inflow than outflow. There is a total of 8,386,434 gallons that need to be contained over the year. This number when compared with the total available capacity on the dairy shows if the lagoons need to be expanded or not. Since the SNS Dairy has 10,301,007 gallons of capacity, there is no need to expand the lagoons.

Following the spreadsheets are two charts showing the results of the Inflow-Outflow Computation, titled "Inflow-Outflow Comparison Chart" and "3D Inflow-Outflow Comparison Chart." The 3D Inflow-Outflow Comparison Chart is simply a 3D version of the Inflow-Outflow Comparison Chart. The dark blue line on the chart depicts the total operation water generated in gallons per month. The light blue line shows the total precipitation over the site in gallons per month. The yellow line shows the combination of operation water and precipitation water. The light red line shows the Total Inflow for the dairy including the operations water, precipitation, and the 24-hour, 25-year storm. The large jump in the light blue line denotes the 24-hour, 25-year storm. The purple line shows the evaporation from the fields and lagoons per month. The orange line shows the percolation from the fields per month. The large drop in the line denotes the lack of percolation in the winter months. The green line shows the Total Outflow from the dairy, including evaporation and percolation, per month.

This chart is an excellent reference because it shows the total amount of storage time that would be needed to properly manage the wastewater and storm water. In the case of SNS Dairy, there is more total inflow than total outflow in the months of November through March. This shows that the dairy technically needs 150 days of storage to properly manage the wastewater and storm runoff. In every other month there is more potential evaporation and percolation than there is inflow.

The SNS Dairy meets the requirements of the guidelines to Order No. 99-11 for 150 days storage. The following recommendations should be performed to meet the other requirements of the guidelines to Order No. 99-11.

**Recommendations**

1. Remove all animals from Corral #14. Clean the manure from the corral and construct a berm along the west fence line per Section I-I on the Plot Plan. Continue the berm south of the Corral to divert runoff from Corral #14 and run-on from the adjacent dairy away from Field #2. This portion of the berm should be constructed per Section L-L on the Plot Plan.

2. Construct a spillway near the southeast corner of Basin #1 per Detail 1 of the Plat Plan. The spillway shall be constructed of a material such as concrete, asphalt, or rip rap and shall include aprons designed to control slope erosion.

## III. PLOT (SITE) PLAN

Please see Plot Plan at the end of this report. (Plate 1)

## IV. COMPACTION

For construction and/or replacement of berms, the following procedures should be followed:

A. Over excavate the soil to 1'-2' below original ground before building berms.

B. Place backfill and fill materials in layers not more than 8 inches in loose depth for material compacted by heavy compaction equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers. Backfill and fill materials should be completely free from manure.

C. Uniformly moisten sub-grade and each subsequent fill or backfill layer before compaction to within 2 percent of optimum moisture content.

    1. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
    2. Remove and replace, or scarify and air-dry, otherwise satisfactory soil material that exceeds optimum moisture content by 2 percent and is too wet to compact to specified dry unit weight.

D. The excavation shall be backfilled and compacted to a relative compaction of no less than 90 percent. A Soils Engineer will need to be hired to ensure 90 percent compaction.

## V. OPERATION AND MAINTENANCE

The basic maintenance objectives are to ensure the reliable storage and disposal of accumulated wastewater and waste solids. To achieve this, there are several tasks that must be accomplished on a routine basis:

- Disposal of accumulated wastewater
- Measurement of accumulated waste solids
- Removal and disposal of accumulated waste solids
- Repair and maintenance of dikes and berms
- Maintenance of site grading
- Weed Abatement
- Record keeping

### Accumulated Wastewater Disposal

It is important that the water level in the wastewater holding ponds be properly maintained so that the ponds can provide the required storage capacity during wet weather periods. The California Regional Water Quality Control Board - Santa Ana Region (CRWQCB) has developed specific standards for the handling and storage of wastewater and storm water collected from the dairy operations. This portion of the Engineered Waste Management Plan describes the recommended maintenance procedures for the wastewater holding ponds to ensure compliance with CRWQCB standards.

In order to meet the requirements of the CRWQCB, the following general guidelines should be followed in disposing of wastewater in the ponds:

- Empty ponds just prior to the start of the wet weather season (November 1st) to ensure maximum capacity for the winter months. If stagnant water remains at the bottom of the ponds below the reach of the pumps, portable pumps should be used to remove all wastewater before the start of the wet season.
- Take advantage of dry weather periods during the annual wet weather period to dispose of accumulated wastewater. Fields must be bermed to prevent overflow from disposal areas onto adjacent properties.
- Start to empty ponds at end of wet weather season (March 31st) to maximize percolation and to create additional capacity in the lagoons.

General Equipment Maintenance. Pumps, pipelines and all pertinent equipment used in the handling of wastewater must be routinely checked and serviced to ensure proper operation:

- Check all wastewater distribution and application equipment weekly to ensure proper operation condition.
- Check and service motors and pumps three times a year. Portable replacement pumps should be available in case of a pump failure. If portable pumps are not available on-site, a rental company phone number should be posted with high visibility for all

employees. Rental company phone numbers are also listed on the last page of this report.

- Check transmission pipes for proper condition.
- Take inventory of spare parts and check sources of emergency repair.
- Disc percolation areas (fields) to about 18 inches to assure maximum percolation during wet seasons. Disking of the disposal area should occur as early in the year as possible, as soon as the fields are dry enough for the procedure to be effective. All of the disposal area should be disked at least once each year.

Dry Weather Disposal. Following the annual wet weather months, wastewater accumulated in the ponds should be disposed of in a timely manner in preparation of the coming wet weather months. The following guidelines should be followed for wastewater disposal during dry weather conditions:

- Apply wastewater to each of the evaporation/percolation disposal areas (fields) on a rotational basis.
- Wastewater should be applied to fields in a manner so that all wastewater will percolate and evaporate. Wastewater should be applied to all parts of the field to improve percolation and evaporation and to prevent stagnant wastewater.
- Observe the wastewater levels in the disposal areas on a daily basis and apply additional wastewater as the drying and percolation rates permit.
- Avoid having the fields completely flooded for extended periods of time. The best disposal rates will occur if the fields are flooded 4 to 6 inches and then allowed to evaporate and percolate. Fields can only be flooded to 4 to 6 inches if proper berms exist around the boundaries of the field. If stagnant wastewater develops, a portable pump or other measures should be used to help spread the water and prevent insect breeding conditions.

Wet Weather Disposal. During the wet weather months, there may be weeks of dry weather available to dispose of accumulated wastewater. Take advantage of every opportunity to reduce the wastewater levels in the holding basins/lagoons so that in the event of a large storm the chances of overflow and inadvertent runoff are reduced. The following guidelines should be followed for wastewater disposal during wet weather months:

- Apply wastewater to each of the disposal areas on a rotational basis.
- Apply wastewater in a manner so that all wastewater will percolate and evaporate. Fields should be watered so that all parts of the field receive wastewater. This will help percolation and evaporation and will help prevent stagnant wastewater.
- Observe the wastewater levels in the disposal areas on a daily basis. Apply additional wastewater only if the previously applied wastewater has evaporated or percolated and if a large storm is not eminent.
- Do not flood the fields and leave standing water for a long period of time unless it has so been designated.

## Accumulated Solids Removal and Disposal

Solids contained in the dairy-generated wastewater and in the storm water will naturally settle and accumulate in the bottom of the holding basins/lagoons. The settled solids will reduce the holding capacity of the ponds. To maintain holding pond storage capacity, solids must be routinely checked and periodically removed. The frequency of solids removal will depend on how quickly solids accumulate in the ponds.

Solids Removal. Remove accumulated solids 1st by agitation and pumping, 2nd by dredging, and 3rd by draining and scraping. If dredging is used, ensure that dredging runoff and excess wastewater taken from the ponds is contained and returned to the ponds. Lagoon solids should be removed *every summer* to ensure full capacity in the lagoons before the start of the next winter season.

Solids Disposal. Solids removed from the ponds can be applied to application areas on-site or must be hauled off-site to farm ground for land application. Solids from lagoon applied to application areas should be tilled and mixed into the native soils shortly after application.

## Levee, Berm and Dike Maintenance

The integrity of pond berms, levees, and dikes must be maintained. Follow these guidelines to ensure proper maintenance of the levees and berms:

- Check pond dikes, levees, and berms a minimum of two times per year for erosion and settlement, and repair as necessary (one inspection to occur just prior to the rainy season).
- Check pond dikes, levees, and berms a minimum of two times per year for rodent damage, and repair as necessary (one inspection to occur just prior to the rainy season).
- If immediate repairs must be made, compacted soil should be used to fill all cracks and holes until further repair can be performed.
- Apply suitable rodent control measures for widespread or frequent rodent damage. These may include Anti-Coagulant Bait, Trapping or Fumigation. Pest Control Specialists should be contacted before using any of these methods.

## Site Grading Maintenance

Site grading must be maintained to ensure proper drainage patterns across the dairy. The goal is to minimize the amount of water contaminated with manure and flowing into the holding ponds and to prevent contaminated wastewater from running off-site. The following guidelines should be followed to maintain site grading:

- Ensure that all wastewater generated by the daily dairy operations flows to the wastewater holding ponds. Re-grade as needed.
- Clean and repair buried drain lines as needed.

- Ensure that rainfall collected from cow holding pens, feed storage areas, and other manured areas flows to the holding ponds or containment areas. Re-grade as needed.
- Check the condition of containment walls and berms surrounding the cow confined areas, and repair as necessary.
- Ensure that storm water from off-site areas is diverted away from holding pens and other manured areas.
- Ensure that storm water from other off-site areas does not drain into the holding ponds.

**Weed Abatement**

Weed abatement measures such as pesticides and clearing and grubbing should be used to control weeds in fields, lagoons, wastewater transport channels, and wastewater access paths. Clearing manure out of lagoons once a year and discing fields at a minimum of once a year will help ensure weed abatement.

**Maintenance and Operations Records**

Keep records of all maintenance activities for future reference.

| Maintenance Activity | | Frequency |
|---|---|---|
| Holding Basin/Lagoon Levels | Pond Depth in Feet | Weekly |
| Holding Basin/Lagoon General Inspection | Berm and Lagoon Wall Stability | Weekly |
| Wastewater distribution/ Application Equipment | Pump/Pipe/Ditch Inspection | Weekly |
| Rainfall Totals | Days of Rain & Inches of Rainfall | Daily/Monthly |
| Solids Level | Solids Depth in Feet | Annually |
| Wastewater Application | Wastewater Depth in Inches | Daily |
| Wastewater Application | Days Applied & Approximate Volume | Weekly |
| Lagoon Solids Removal/Disposal | Days Removed & Volume Removed | Annually |
| Corral Solids Removal/Disposal | Days Removed & Volume Removed | Semi-Annually |
| Dikes and Berms Maintenance | Damage Found & Date Repairs Made | Semi-Annually |
| Site Grading Maintenance | Improvements Made & Date | Annually |
| Equipment Maintenance | Service and Repair Records & Dates | Semi-Annually |

- Daily inspections should be made upon all ponds, berms and wastewater distribution and application equipment following the first significant rain event of each Winter season. These daily inspections should continue until large rain events cease in the Spring.

- Should an unauthorized discharge be made from the facility, the dairy operator should follow the guidelines described in Monitoring and Reporting Program No. 99-11. (See back pages of Order No. 99-11.) Emergency phone numbers are located on the next page of this report.

**Emergency Spill Plan**

In the case of an emergency spill on the dairy, these directions should be followed.

First, the Regional Water Quality Control Board should be contacted if a spill occurs. This requirement is based on Order 99-11.
At least one of these people should be contacted in the case of a spill.

Regional Water Quality Control Board
Steve Mayville (909) 782-4130
Chief of the Dairy Units

Should a pump or piece of equipment break down, these numbers should be used to pursue emergency temporary equipment.

Vandenberg Manufacturing Company, Inc.
(909)-597-3412

Below is a list of spare parts that could be used in the case of an emergency spill.

There are no spare parts on-site.

## VII. GLOSSARY

| | | | | | | | | | | | | *Winter Months Total* | *9.72 [F] Acre-Ft.* |

[A] Calculation includes actual number of days in each month
[B] Annual totals are calculated January through December
[C] Assumes no percolation during winter months (Nov.-Mar.)
[D] Assumes field is barred for winter disposal. Null values are inserted if field cannot be used for winter disposal.
[E] Evaporation inches reduced 50% during winter months (Nov.-Mar.)
[F] Winter months totals are calculated November through March

## PLANING AND DESIGNING DAIRY WASTE STORAGE FACILITIES

**Alison Van Eenennaam[1]**

A dairy waste management system must be planned, designed and managed to:

- Prevent water pollution
- Control odors
- Eliminate breeding places for insects
- Provide a convenient and efficient operation for the dairy owner/operator
- Require minimal investment, maintenance and operational costs
- Meet legal requirements.

Proper management of manure and waste water ensures further benefits in providing a healthy atmosphere for the animals. A facility that is clean, dry and free of manure provides a less desirable environment for disease organisms to thrive.

The purposes of this document are to:

- detail the factors to consider in designing a waste management storage facility;
- outline the major factors to be considered when designing dairy waste holding ponds; and
- provide an example of how to size a dairy manure holding pond.

[1]University of California Cooperative Extension Postdoctoral Associate.

## TABLES

**Table 1.** Waste produced daily by a 1,000 pound dairy cow and where it is deposited (2).

| Area | Percent | Cubic Feet |
|---|---|---|
| Housing area | 40 | .548 |
| Feeding area | 45 | .617 |
| Holding pen | 10 | .137 |
| Milk parlor | 5 | .068 |
| Total cubic feet/1,000 lb cow | | 1.370 |

**Table 2.** Volume of milkhouse and parlor water (2, and D. Johnson, NRCS, pers. comm.).

| Washing operation | Water Volume |
|---|---|
| Bulk Tank | |
| Automatic, 3 cycle wash | 60 to 110 gal/wash |
| Manual wash | 30 to 50 gal/wash |
| Pipeline | |
| In parlor (volume is higher for long flat barns) | 75 to 150 gal/wash |
| Milkhouse and parlor floors | 300 to 700 gal/wash |
| Pail milkers | 30 to 40 gal/wash |
| Miscellaneous equipment | 30 gal/day |
| Cow preparation wash | |
| Automatic | 1 to 4.5 gal/wash/cow |
| Manual | .25 to .5 gal/wash/cow |
| Holding pen (sprinklers) | 5 gal/min/head (dependent upon nozzle size & pressure) |

Unofficial values based on averages/sums of smoothed daily data. Information is computed from available daily data during the 1961-1990 period. Smoothing, missing data and observation-time changes may cause these 1961-1990 values to differ from official NCDC values. This table is presented for use at locations that don't have official NCDC data. No adjustments are made for missing data or time of observation. Check **NCDC normals** table for official data.

## 1961 - 1990 Temperature and Precipitation

Data is smoothed using a 29 day running average.

■ - Max. Temp. is the average of all daily maximum temperatures recorded for the day of the year between the years 1961 and 1990.
■ - Ave. Temp. is the average of all daily average temperatures recorded for the day of the year the years 1961 and 1990.
■ - Min. Temp. is the average of all daily minimum temperatures recorded for the day of the year between the years 1961 and 1990.
■ - Precipitation is the average of all daily total precipitation recorded for the day of the year between the years 1961 and 1990.

| Recommended rates of wastewater application for Trench and Bed Bottom Areas [a] | | |
|---|---|---|
| Soil Texture | Percolation rate, min/in | *Application rate, gal / ft² x d* [b,c] |
| Gravel, coarse sand | <1 | Not Suitable [d] |
| Coarse to medium sand | 1-5 | 1.20 |
| Fine sand, loamy sand | 5-15 | 0.80 |
| Sand loam, loam | 16-30 | 0.60 |
| Loam, porous silt loam | 31-60 | 0.45 |
| Silty clay loam, clay loam [a,f] | 61-120 | 0.20 |
| Clays, colloidal clays | >120 | Not Suitable [g] |

Use Application Rate of 0.7 to Fit B/Re( Classification"

[a] From U.S. EPA (1980).

[b] Rates based on septic tank effluent from a domestic waste source. A factor of safety may be desirable for wastewater's of significantly different strength or character.

[c] May be suitable for sidewall infiltration rates.

[d] Soils with percolation rates less than 1 min/in may be suitable for septic tank effluent if a 2ft layer of loamy sand or other soil is placed above or in place of the native topsoil.

[e] These soils are suitable if they are without significant amounts of expandable clays.

[f] Soil easily damaged during construction.

[g] Alternative pretreatment may be needed and alternative disposal (wetlands or evaporation systems) may be required.

## Hilmar Series

The Hilmar series consists of somewhat poorly drained, nearly level soils on alluvial valley floors and fans. These soils formed in wind-laid coarse-textured material underlain by medium-textured granitic alluvium. Slopes are 0 to 2 percent. Elevation is 600 to 900 feet. Vegetation is annual grasses and forbs. The average annual precipitation is 12 to 16 inches, the mean annual air temperature is 62° to 65° F, and the frost-free season is 230 to 280 days.

In a representative profile, the surface layer is grayish-brown loamy fine sand about 13 inches thick. The underlying material, to a depth of 23 inches, is light yellowish-brown and grayish-brown loamy sand. Below this, to a depth of 60 inches, it is light brownish-gray mottled loam stratified with thin lenses of sandy loam and loamy sand. Hilmar soils are moderately alkaline throughout the profile and are slightly calcareous in the upper 23 inches and strongly calcareous below.

In these soils the surface layer and the upper part of the underlying material that formed in coarse-textured material are rapidly permeable. The lower part of the underlying material that formed in medium-textured material is slowly permeable. Available water capacity is about 7 to 9 inches. Roots penetrate to a depth of 60 inches or more. Originally the soils were somewhat poorly drained, but the drainage has been altered by lowering the ground water table through pumping.

These soils are used mainly for such irrigated crops as grapes, alfalfa, pasture plants, and small grains.

Representative profile of Hilmar loamy fine sand, about 100 feet south of Edison Road and about 200 feet west of Cucamonga Creek, SE¼NW¼NW¼ sec. 22, T. 2 S., R. 7 W; San Bernardino base line and meridian:

Ap—0 to 13 inches, grayish-brown (2.5Y 5/2) loamy fine sand, very dark grayish brown (2.5Y 3/2) when moist; single grained; loose when dry and moist, nonsticky and nonplastic; many very fine and fine roots; slightly effervescent; moderately alkaline; gradual, smooth boundary.

C1—13 to 16 inches, light yellowish-brown (2.5Y 6/4) loamy sand, light olive brown (2.5Y 5/4) when moist; few, fine, distinct, brownish-yellow (10YR 6/6) mottles, yellowish brown (10YR 5/6) when moist; single grained; loose when dry and moist, nonsticky and nonplastic; common very fine and fine roots; slightly effervescent; moderately alkaline; gradual, smooth boundary.

C2—16 to 23 inches, grayish-brown (2.5Y 5/2) loamy sand, light brownish gray (2.5Y 6/2) when moist; single grained; loose when dry and moist, nonsticky and nonplastic; common very fine and fine roots; slightly effervescent; moderately alkaline; abrupt, smooth boundary.

IIC3—23 to 60 inches, light brownish-gray (2.5Y 6/2) loam stratified with thin lenses of sandy loam and loamy sand, grayish brown (2.5Y 5/2) when moist; common, medium, distinct, brownish-yellow (10YR 6/6) mottles, yellowish brown (10YR 5/6) when moist; massive; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; strongly effervescent; moderately alkaline.

The A horizon is grayish brown, dark grayish brown, or brown loamy fine sand or loamy sand. The soil material is dominantly single grained but has weak, very fine to fine, subangular blocky structure in small areas, and in some places it is massive. The soil material is slightly effervescent but is strongly effervescent in a few spots. The A horizon ranges from 8 to 14 inches in thickness but is 13 inches thick in most places.

The C horizon is generally light yellowish brown to grayish brown, but in a few places it is light brownish gray. Yellowish-brown, brownish-yellow, or dark yellowish-brown mottles are common. They range from few to common in abundance, fine to medium in size, and faint to distinct in contrast. The C horizon is loamy sand or loamy fine sand. The soil material is typically single grained, but in some places it is massive. Lime content varies from slight to strong. Thickness is about 10 inches but ranges from 8 to 12 inches.

The IIC horizon is light brownish gray, grayish brown, or light gray. Brownish-yellow or yellowish-brown mottles range from common to many in abundance, fine to medium in size, and distinct to prominent in contrast. The IIC horizon is generally loam that has thin lenses of sandy loam, coarse sandy loam, or loamy sand, but in a few places, it is clay loam or silt loam stratified with thin lenses of coarse-textured material. The IIC horizon is typically massive, but in some places it has weak, moderate, subangular blocky structure. Reaction ranges from mildly alkaline to strongly alkaline.

**Hilmar loamy fine sand (Hr).**—This nearly level soil is on valley floors and alluvial fans. Included with it in mapping are areas of Delhi fine sand that make up about 10 percent of each area. Also included are patches of Tujunga loamy sand, 0 to 5 percent slopes, and small areas where slopes are 2 or 3 percent.

Runoff is slow, and the hazard of water erosion is slight. If the soils are left without a protective cover of vegetation, the hazard of soil blowing is high.

The Hilmar soil is used chiefly for irrigated alfalfa, grapes, small grains, and pasture plants. Capability unit IIe-4 irrigated.

## Merrill Series

The Merrill series consists of somewhat poorly drained, nearly level soils that formed on alluvial fans in medium-textured granitic alluvium. Slopes are 0 to 2 percent, elevation is 500 to 700 feet. Vegetation is mainly annual grasses and forbs, but perennial grasses grow in some areas. The average annual precipitation is 12 to 16 inches, the mean annual air temperature is 62° to 65° F, and the frost-free season is 230 to 280 days.

In a representative profile, the surface layer is gray silt loam about 25 inches thick. The underlying material, to a depth of 43 inches, is light-gray loam that is weakly cemented and contains many extremely hard silica-lime cemented nodules. Below this the underlying material is light brownish-gray loam that extends to a depth of 60 inches or more. Merrill soils are strongly calcareous and moderately alkaline throughout their profile.

These soils are slowly permeable. Their available water capacity is 4 to 7 inches. Roots can penetrate to a depth of 25 to 40 inches. Drainage has been altered on these soils by pumping ground water for irrigation.

These soils are used for such irrigated crops as pasture plants, alfalfa, small grains, and some truck crops.

Representative profile of Merrill silt loam, about 300 feet northwest of Eucalyptus and Central Avenue;

GUIDELINES FOR ORDER NO. 99-11

# Guidelines for the Development of Engineered Waste Management Plans For Concentrated Animal Feeding Operations

(Dairies and Related Facilities)

California Regional Water Quality Control Board
Santa Ana Region

February 2001

## Introduction

On August 20, 1999, the California Regional Water Quality control Board, Santa Ana Region (Board), adopted Order No. 99-11 (NPDES No. CAG018001), General Waste Discharge Requirements for Concentrated Animal Feeding Operations (Dairies and Related Facilities) in the Santa Ana Region. This order required all operators of dairies and related facilities (i.e., heifer ranches and calf nurseries) authorized to discharge wastes under Order No. 99-11 to develop and implement an engineered waste management plan (EWMP). The primary purpose of an EWMP is to provide a wastewater management system that is designed, constructed, operated and maintained to comply with the wastewater containment requirements in Order No. 99-11. Order No. 99-11 included applicable state and federal regulations that address waste discharges from animal feeding operations.

## Background

The Board began issuing waste discharge requirements to all animal feeding operations in the Region in 1972. These waste discharge requirements stated that each facility had to contain, on the property, all wastewater (i.e., dairy wash water, storm water runoff from manured areas, etc.), including the storm water runoff from a 24-hour, 25-year storm. In an attempt to comply with this requirement, many facilities constructed new ponds, enlarged existing ponds, constructed berms, and implemented other measures. However, these measures were generally implemented in a piecemeal fashion, usually on an as-needed basis, and often did not integrate well with other wastewater containment measures at the facility. It became more and more apparent that many of the wastewater containment improvements that were being made were not very effective. For example, ponds were not sized properly, and therefore, did not have sufficient capacity to contain the entire volume of wastewater generated at the site; berms were sized and constructed improperly, resulting in failures; wastewater pumps, pipelines, etc., were often inoperable and were not replaced when needed; and most wastewater containment structures and equipment were often in a state of disrepair. All of these situations resulted in frequent discharges of wastewater to surface waters, primarily during the winter.

To minimize discharges to surface waters, it became apparent that an overall plan for containing wastewater was necessary. In the late 1980's, Board staff prepared a two-page document that provided guidelines for preparing an EWMP. An EWMP was then generally requested from animal feeding operations that had a history of recurring wastewater discharges. In 1994, the Board adopted Order No. 94-7 (NPDES No. CAG018001), General Waste Discharge Requirements for Concentrated Animal Feeding Operations (CAFOs). Order No. 94-7 required that, in addition to an EWMP being required from CAFOs that had a history of recurring wastewater discharges, EWMPs were to be prepared by anyone initiating a new CAFO at either a new or existing facility. The guidelines for preparing an EWMP were then included as an attachment to Order No.

94-7. Order No. 94-7 expired in March 1999, and the Board adopted Order No. 99-11 in August 1999. To assure that every CAFO had a wastewater management system capable of complying with wastewater containment requirements, Order No. 99-11 required that all CAFO operators develop and fully implement an EWMP. The existing guidelines for preparing an EWMP were included as an attachment to Order No. 99-11. However, the existing EWMP guidelines were outdated, general in nature, and did not contain sufficient criteria to comply with the wastewater containment requirements in Order No. 99-11. Therefore, Order No. 99-11 authorized the Executive Officer to make necessary revisions to the guidelines.

These revised guidelines are longer than the previous guidelines. This is primarily the result of adding explanations and clarification to make EWMPs prepared in accordance with the guidelines as consistent as possible. There are two significant differences between these guidelines and the previous guidelines. First, the new guidelines outline criteria for determining the storage capacity necessary to comply with waste discharge requirements. These criteria will result in the need for significantly more storage capacity than the criteria included in the previous guidelines. However, this does not reflect a change in state or federal regulations. Instead, previous guidelines did not accurately specify criteria for determining the storage capacity necessary to comply with state and federal regulations. Regardless of what was included in previous guidelines, CAFOs have always been, and still are, required to comply with all applicable state and federal regulations. Second, the new guidelines identify several items (such as best management practices) that should be considered in the development and implementation of EWMPs. Many of these items have been included in EWMPs approved by the Executive Officer in the past.

## Purpose

The purpose of an EWMP is to provide a wastewater management system that is designed, constructed, operated and maintained to comply with the wastewater containment requirements in Order No. 99-11. These guidelines do not address the management, application or disposal of manure removed from the corrals. Compliance with waste discharge requirements associated with the discharge of manure removed from corrals is addressed separately. The development and implementation of an EWMP is required by Order No. 99-11. Discharges of wastewater from a CAFO are allowed only if the CAFO operator has constructed and maintained containment structures as required, and if a chronic or catastrophic rainfall event occurs. A chronic rainfall event is a series of wet weather conditions that would total the volume of the 24-hour, 25-year storm event, and would not provide reasonable opportunity for dewatering containment structures prior to the next storm events. A catastrophic storm event includes events such as tornadoes and hurricanes, and any single event that totals the runoff volume of the 24-hour, 25-year storm event. Order No. 99-11 requires that an EWMP be developed in accordance with guidelines established by the Executive Officer. However, these are guidelines, not regulations, and any EWMP that will result in compliance with waste discharge requirements will be acceptable by the Executive Officer. Adhering to these

guidelines, though, will provide consistency for preparing EWMPs, and will increase the likelihood that the EWMP will be acceptable.

## Elements of an EWMP

The EWMP must be prepared by a registered engineer (civil, or other appropriate discipline) or other qualified person (required by Order No. 99-11). The qualified person preparing the EWMP must have the knowledge, technical expertise and experience appropriate to develop an EWMP. This guidance document describes five basic elements that should be addressed in an EWMP. These elements include an introduction, a design, a plot (site) plan, construction specifications, and an operation and management plan. These elements should include a detailed description, as follows:

## I. Introduction

The introduction should describe the existing animal population, the design population for the EWMP, existing wastewater containment facilities, and the operation of those facilities. At a minimum, the Introduction should consist of a brief narrative that addresses the following:

- The facility address, operator name, land owner, and location of the facility with respect to cross streets or other landmarks.
- The name, telephone number and address of the person responsible for implementing the EWMP on an on-going basis (CAFO operator or other designated person)
- The number, telephone number and address of the person(s) to be contacted, if necessary, in the event that the CAFO operator or designated person is not available.
- Current and design animal population (for the expected life of the CAFO)
- The estimated volume of wash water generated at the facility each day (based on gallons per cow per day)
- Total size of the facility (acres)
- The size (acres) of existing ponds, corrals, wastewater disposal areas and wastewater containment areas
- General location and height of berms
- How dairy wastewater is managed and where it is discharged
- Storm water run-on problems (storm water that occurs off-site, but enters the CAFO), including run-on from neighboring facilities, etc.

## II. Design

To comply with Order No. 99-11, containment facilities must be designated to contain all wastewater generated at the facility (i.e., dairy wash water, storm water runoff from manured areas, etc.) and all storm water runoff that comes into contact with manure generated by a 24-hour, 25-year storm. A 24-hour, 25-year storm is a 24-hour storm with

a return frequency of once every 25 years. The design must take into consideration that this storm can and should be expected to occur each year. CAFOs are required to contain the storm water runoff from all lesser storms, if that runoff has come into contact with manure.

If a CAFO does not have existing structures capable of containing the required volume of wastewater, then additional structures must be provided. This may include significantly deepening existing ponds, adding additional ponds, connecting to a sewer system, raising berms to increase the volume of wastewater that can be stored in containment areas, etc. An EWMP may be acceptable if the design has maximized the amount of wastewater that can be contained and the operation and management plan optimizes utilization of the containment capacity provided by the containment structures. **However, acceptance of such a plan will not relieve the CAFO operator of responsibility for any discharges that are not allowed by Order No. 99-11. Wastewater that is discharged off the CAFO property, even after implementing an acceptable EWMP, is still a violation of Order No. 99-11. unless the discharge occurred as a result of a chronic or catastrophic storm event.**

- Historically, containment of wash water and storm water runoff at CAFOs in the Region between the drier months of April through October has not been a problem. However, containing storm water runoff from corrals, wastewater disposal fields, etc., and daily wash water, has been problematic during the five generally wet months of November through March. During these months, evaporation is minimal, and since disposal fields are usually saturated by rainfall, percolation is minimal. Since it is difficult to dispose of daily wash water and accumulated storm water runoff during these months, wastewater facilities should be designed to contain all wastewater generated during this 150-day period, as noted below.

- Containment structures should be designed to contain 150 days of annual storm water runoff <u>and</u> the runoff from a 24-hour, 25-year storm. For the Chino Basin area, average rainfall for the 150 days from November through March is approximately 13 inches, and a 24-hour, 25-year storm generates approximately 4.5 inches of precipitation (based on information from the National Weather Service). For the San Jacinto area, average annual rainfall for the 150 days from November through March is approximately 11 inches, and a 24-hour, 25-year storm is approximately 3.5 inches. These are average values for these areas, and other values can be used for a particular CAFO, if justification is provided.

- Containment structures should be designed to contain 150 days of wash water. This should be based on the maximum number of milking cows for the life of the facility. Otherwise, the EWMP may have to be revised in the future, at such time that the number of milking cows exceeds the number of cows stated in the EWMP. Recent studies have shown that the average daily wash water generated at dairies in the Region is about 70 gal/cow/day (based on two milkings/cow/day). The average daily wash water produced during winter months, however, can exceed 100 gal/cow/day. The average gal/cow/day used during the winter should be used in determining the

volume of storage required for wash water. This volume can vary, depending on specific site practices, but should be about 100 gal/cow/day unless adequate justification is provided for using a smaller number. The installation of a water meter can verify the amount of water used and assist in efforts to conserve water usage, and thereby reduce the amount of water discharged to containment structures. A wash water meter will be required to justify a volume significantly less than 100 gal/cow/day.

- During the winter, evaporation is minimal. Also, ponds tend to seal up over time, and disposal fields are generally saturated during the winter, thereby minimizing percolation. In addition, the amount of wastewater percolated during the winter at a CAFO can vary, depending on the particular wastewater disposal practices implemented at that CAFO. Allowances for loss of wastewater due to percolation and evaporation can be made in determining the amount of storage required for wastewater, as long as reasonable assumptions are made that consider winter conditions and practical CAFO specific wastewater disposal practices.

- The accumulation of solids in ponds and other containment structures decreases the storage capacity available for wastewater. It is estimated that dairy wash water in the Region contains about 10% of the manure generated by a milking cow. Also, solids are present in storm water runoff from corrals, disposal land and other areas. The estimated annual decrease in available storage capacity resulting from the accumulation of these solids should be determined (the volume of manure in wash water can be considered to be 10% of what a milking cow expels).

- Calculations should be provided showing the design capacity of all wastewater containment structures (existing and proposed).

- The total capacity of the containment structures should be at least equal to the volume determined by the following equation: 150 days dairy wash water + 150 days annual storm water runoff + 24-hour, 25-year storm runoff + accumulation of solids + wastewater in containment structures on November 1 – percolation – evaporation.

- A description of all wastewater conveyance equipment and structures (pipelines, surface channels, pumps, etc.), including their design capacities, should be provided.

- CAFOs in operation prior to November 27, 1984 must be designed to protect all manured areas from inundation or washout by overflow from any stream channel during a 20-year peak stream flow (required by Order No. 99-11).

- CAFOs built after November 27, 1984 must be designed to process all manured areas from inundation or washout by overflow from any stream channel during a 100-year peak stream flow (required by Order No. 99-11).

- The use of pumps must be considered for ponds and other containment structures so that wastewater can be pumped from ponds or containment areas to disposal areas, in

order to restore needed capacity in the containments structures. If pumps are not utilized, exceptional justification for not utilizing pumps must be included.

- Storm water containment structures must be protected against inundation from off-site storm water sources, unless such run-on is fully contained (required by Order No. 99-11). If it is not practical to divert all storm water run-on away from a CAFO, a justification should be included that explains why it is not practical to do so. If all storm water run-on from up to a 24-hour, 25-year storm cannot be diverted from containment structures, a description of how the design takes the run-on into consideration should be included.

- The addition of roof structures in areas where manure is present, and diverting the roof runoff off site, should be considered in order to minimize the amount of precipitation that comes into contact with manure.

- Structures should be designed to prevent storm water runoff from non-manured areas (roofs, residence area, paved surfaces, etc.) from entering wastewater containment structures. The use of rain gutters and diversion trenches should be considered. If the CAFO cannot be designed to prevent or minimize the flow of this water onto containment areas, an explanation should be provided that describes how the design accounts for such flows.

- The design for ponds and other wastewater containment areas should allow vehicle access for mosquito abatement personnel to inspect and treat these areas to reduce the risk of mosquito-borne disease and to prevent insect nuisance conditions.

- An emergency spillway must be designed to provide for a controlled release of wastewater, and to maintain the integrity of existing containment structures, in the event that storm events cause the capacity of the containment structures to be exceeded. The use of gateways, valves, or other similar devices for the purpose of manually releasing wastewater, is not acceptable.

- If visual observations, hand-level measurements and information provided by the CAFO operator and others are not sufficient to determine rise and fall dimensions and flow directions for adequately calculating runoff volumes for placing and sizing appropriate containment structures, then current contours must be determined, based on acceptable engineering and surveying practices (it is expected that current contours will be necessary for most CAFOs).

- Structures should be designed to accommodate future increases in animal population.

## III. Plot (Site) Plan

The plot plan should be a standard blue line print, using an appropriate scale, that shows sufficient detail of all containment structures, drainage patterns, and equipment. The plot plan should include:

- The legal description of the property (i.e., parcel numbers), the primary address and any other addresses that may exist at the property, and the location of significant structures on the property (residences, milk barn, hay alleys, etc.).
- The property boundaries, the gross acreage of the property, vicinity map (insert), north arrow, legend and date the plan was prepared.
- The location, elevation contours and dimensions of all areas associated with the generation, storage or management of wastewater and manure (corrals, ponds, access roads around wastewater containment areas, wastewater disposal areas, temporary manure storage areas, cropland, etc.).
- The location of all facilities necessary for containment and management of wastewater (berms, upstream diversion structures, pumps, spillway, distribution lines, etc.) and the dimensions, elevation and cross-sections of all containment structures.
- The drainage patterns (indicated by arrows) for on-site surface drainage courses (swales, ditches, etc.) and any off-site surface drainage that can flow onto, or immediately adjacent to, the facility.

## IV. Construction

The construction plan should describe all construction materials, construction methods (i.e., compaction), criteria and specifications, etc., necessary for proper construction of all containment and conveyance structures (berms, ponds, levees, pipelines, channels, etc.).

- Existing berms that are not sized properly, not adequately compacted, or contain materials (i.e., manure) that are deleterious to the berm's long term stability and effectiveness, must be replaced or improved to a standard that is equivalent to that which would be expected from a new berm constructed in accordance with best engineering practices.
- Actions necessary to restore existing structures to proper conditions and capacities should be clearly described (i.e., clean out existing ponds or containment areas, regarding, repair or replacement of existing berms, etc.).

- Manure shall not be used to construct new containment structures (i.e., berms0, and manure shall not be used to improve or raise existing containment structures (prohibited by Order No. 99-11).

- In accordance with acceptable engineering practices, specifications developed to assure that construction material is applied in lifts of appropriate depth, and rolled and watered to achieve a minimum compaction of 90%, must be included.

## V. Operation and Maintenance

An operation and maintenance plan should be provided to implement effective operation of all containment structures and equipment. During the wet season, wastewater should be managed on a daily basis to maximize the volume of containment capacity available.

- Specific procedures should be included to assure that containment structures have the maximum capacity available just prior to the wet season (November – March).

- Management practices to reduce, to the maximum extent practicable, the volume of dairy wash water generated should be addressed, particularly if the proposed structures are incapable of containing the required volume of wastewater.

- Replacement pumps should be available on-site, or advanced arrangements made for the immediate and reliable delivery of portable pumps.

- Specific procedures for operating standpipes or other conveyance systems used for applying wastewater to land should be provided to efficiently utilize the entire area available for wastewater disposal (i.e., avoid localized over-application that can occur with furrow application, and utilize methods to maximize the spreading of wastewater).

- If all storm water run-on cannot be diverted, the EWMP should contain a description of how storm water run-on will be managed or handled to minimize the impact on wastewater containment structures and to minimize the amount of wastewater that could be discharged from the CAFO.

- Specific measures to minimize the effects of gophers, squirrels or other rodents on the integrity of the containment structures should be identified.

- Removal of solids from containment structures on a scheduled basis should be specified so that the design capacity of the containment structures will be restored prior to each rain season.

- Measures for minimizing the accumulation of stagnant wastewater in low lying areas (corrals, disposal areas, etc.) and preventing potential insect nuisance conditions should be addressed.

- Weekly inspections of ponds, berms, wastewater distribution and application equipment, etc., should be specified to provide assurance that all containment structures are intact and all equipment is in proper operating condition. Daily inspections should be conducted following the first significant rain events at the beginning of the wet season (generally in early Fall), continuing through the cessation of significant rain events (generally in early Spring). Provisions for the immediate repair of any damaged containment structures (i.e., rodent holes, cracks, erosion, etc.) should be provided.

- A description of methods and schedules for maintaining disposal areas in a condition that maximizes the efficient disposal of wastewater in the winter should be provided (i.e., grading, disking, etc.).

- An equipment maintenance schedule should be provided to assure the efficient, consistent and reliable operation of all pumps, sumps, pipelines, etc.

- Weed abatement measures to maintain access to containment structures, maintain capacity of containment structures and to maintain the efficient distribution of wastewater through channels, etc., should be addressed.

- A brief emergency spill plan must be included. The plan must include a list of spare parts (pumps, piping, valves, etc.) that are to be kept on site to maintain adequate wastewater containment facilities, a list of names and phone numbers for contacts for obtaining immediate emergency equipment (pump, piping, valves, heavy equipment, etc.), and a list of names and phone numbers for reporting problems (Board staff, County staff, etc.).

# APPENDIX K

ORDER NO. 99-11

California Regional Water Quality Control Board
Santa Ana Region

Order No. 99-11
NPDES No. CAG018001

# GENERAL WASTE DISCHARGE REQUIREMENTS FOR CONCENTRATED ANIMAL FEEDING OPERATIONS (DAIRIES AND RELATED FACILITIES) WITHIN THE SANTA ANA REGION

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter, Regional Board), finds that:

1. On February 17, 1994, the Board adopted Order No. 94-7, General Waste Discharge Requirements For Concentrated Animal Feeding Operations, Including Dairies, Within The Santa Ana Region (NPDES NO. CAG018001).

2. Order No. 94-7 satisfied the criteria cited in 40 CFR 122.28 and, as such, served as a General NPDES Permit. 40 CFR 122.28 pertains to the issuance of general permits to regulate discharges of waste that meet the following criteria:

   a. Waste discharges involving the same or substantially similar types of operations;
   b. Discharge the same types of wastes;
   c. Require the same or similar operating conditions;
   d. Require the same or similar monitoring ; and
   e. Are more appropriately regulated under a general permit rather than individual permits.

3. 40 CFR Part 122.23 defines a concentrated animal feeding operation (CAFO) as any animal feeding operation that has more than 1,000 animal units (dairy cattle are considered 1.4 animal units). Pursuant to the Clean Water Act (CWA), all CAFOs are point sources and are subject to NPDES permitting requirements. Smaller animal feeding operations can also be designated as CAFOs by the permitting agencies after considering certain criteria cited under 40 CFR 122.23 (b)(1). The Regional Board has determined that all dairies, heifer ranches, and calf nurseries in the Region shall be designated as CAFOs.

4. Order No. 94-7 has expedited the preparation of waste discharge requirements and has allowed the Regional Board to better utilize staff resources. To date, approximately 215 CAFOs have been enrolled under Order No. 94-7. Another 72 CAFOs are in the process of obtaining authorization to discharge wastes under that order. Order No. 94-7 expired on March 1, 1999. The dairies currently enrolled under Order No. 94-7, or in the process of enrolling under Order No. 94-7, will want to continue to discharge waste. Therefore, it is necessary to renew the waste discharge requirements contained in Order No. 94-7 to continue this expedited permitting process.

5. Persons discharging, or proposing to discharge, dairy wastes or other similar kinds of wastes in any manner that may affect water quality are hereinafter referred to as "discharger" and are subject to the terms and conditions of this order. Persons discharging, or proposing to discharge, wastes from other types of animal feeding operations must obtain coverage under a separate general permit or individual waste discharge requirements.

6. The Regional Board adopted a revised Water Quality Control Plan (Basin Plan) on March 11, 1994. The Basin Plan became effective on January 24, 1995. The Basin Plan specifies beneficial uses and water quality objectives for surface and ground waters in the Santa Ana Region (Chapters 3 and 4). This order specifies requirements necessary to meet the water quality objectives and to protect the beneficial uses.

7. Revised regulations governing discharges from CAFOs, including dairies, are contained in Division 2, Title 27 of the Combined State Water Resources Control Board/California Integrated Waste Management Board AB 1220 Regulations, which became effective on July 18, 1997. Chapter 7, Subchapter 2 (Article 1) contains requirements for Confined Animal Facilities. Previously, these regulations were specified in Chapter 15, Division 3, Article 6, Title 23 of the California Code of Regulations.

8. Section 402(p) of the CWA as amended by the Water Quality Act of 1987 and the related regulations published by the U.S. EPA on November 16, 1990 (40 CFR Parts 122, 123 and 124), requires an NPDES permit for pollutant discharges from CAFOs. The EPA's Effluent Guidelines and Standards for Feedlots are contained in 40 CFR Part 412 (revised July 1, 1993).

9. On April 17, 1997, the State Water Resources Control Board adopted the General Industrial Storm Water Permit, Order No. 97-03-DWQ, NPDES No. CAS000001. Order No. 97-03-DWQ implements the final regulations (40 CFR 122, 123, and 124) for storm water runoff published on November 16, 1990 by the U.S. EPA in compliance with Section 402(p) of the CWA. This order includes those provisions of the General Industrial Storm Water Permit that pertains to dairies. Once a discharger is authorized under Order No. 99-11, coverage under the State Water Resources Control Board's General Industrial Storm Water Permit (Order No. 97-03-DWQ) will be terminated.

10. Wastes from CAFOs contain high concentrations of salts (total dissolved solids and nitrates). Previous studies conducted by the Board have shown that cow manure produced in the Region contains about 160 pounds of salt per (dry) ton of manure (110 pounds of salt per ton of manure @ 33% moisture). The application of manure or the discharge of process wastewater[1] to land results in the discharge of salts that has adversely impacted, and continues to adversely impact, the quality of groundwater and surface water in the Region.

[1] Process wastewater shall mean any process generated wastewater and any precipitation (rain or snow) which comes into contact with any manure, litter or bedding, or any other raw material or intermediate or final material or product used in or resulting from the production of animals or poultry or direct products (e.g. milk, eggs).

11. Most of the CAFOs in the Region overlie the Chino Groundwater Basin. The Chino II and III Groundwater Subbasins lack assimilative capacity for additional salt inputs (total dissolved solids and nitrogen). For groundwater subbasins without assimilative capacity, salt inputs that exceed the water quality objectives for these subbasins cannot be allowed (State Water Resources Control Board Order No. 73-4, the Rancho Caballero decision). To meet the Chino Basin groundwater objectives, as well as the groundwater objectives for any other subbasin lacking assimilative capacity, the discharge of manure and other animal wastes, such as process waste water, and their application as fertilizer and irrigation water, must be controlled to prevent further exceedance of water quality objectives. Salt discharges in excess of water quality objectives can only be allowed if the additional salt inputs are offset.

12. The Basin Plan assumed that two desalters would be built in the Chino Basin. The amount of salt to be extracted from the Basin from these desalters was assumed to be adequate to provide sufficient salt removal to offset the present and projected salt loads from ongoing discharges from CAFOs. However, only one desalter is currently being built. This desalter will extract enough salt to offset the amount of salt being added to the basin from process wastewater water discharges. No mitigation measures are currently in place to offset the salt loading from manure application within the Basin. Therefore, the discharge of manure, and its application as fertilizer, must be prohibited.

13. The Board has considered antidegradation pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16 and finds that these discharges are consistent with the State and Federal regulations, as long as appropriate salt offset programs are implemented.

14. In accordance with Water Code Section 13389, the issuance of waste discharge requirements for these discharges is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (Commencing with Section 21100), Division 13 of the Public Resources Code.

15. The Regional Board has notified interested agencies and persons of its intent to issue general waste discharge requirements for discharges of wastes CAFOs, and has provided them with an opportunity to submit their views and recommendations.

16. The Regional Board, in a public meeting, heard and considered all comments pertaining to discharges of wastes from CAFOs proposed to be regulated under the general waste discharge requirements.

IT IS HEREBY ORDERED that, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder and the provisions of the Clean Water Act as amended, and regulations and guidelines adopted thereunder, dischargers, their agents, successors, and assigns, discharging wastes from CAFOs shall comply with the following:

## A. DISCHARGE SPECIFICATIONS:

1. The discharger shall design, construct and maintain containment structures to retain all wastewater within its facility, including all process generated wastewater[2] and all precipitation on, and drainage through, manured areas resulting from storms up to and including a 24-hour, 25-year storm.

2. The discharger shall develop and fully implement an Engineered Waste Management Plan (EMWP) acceptable to the Executive Officer. The EMWP shall be developed by a registered professional engineer, or other qualified individual, in accordance with the guidelines specified in Attachment "B" of this order. The Executive Officer is hereby authorized to make necessary revisions to the guidelines for the preparation of an EWMP outlined in Attachment "B".

3. The discharge to any surface water bodies, or tributary thereof, is prohibited unless a chronic[3] or catastrophic[4] rainfall causes overflow from a storage facility designed, constructed, maintained and operated to contain all process generated wastewater plus the runoff from a 24-hour, 25-year storm.

4. Retention ponds and manured areas at CAFOs in operation on November 27, 1984, shall be protected from inundation or washout by overflow from any stream channel during 20-year peak stream flows. Facilities existing before November 27, 1984 that are protected against 100-year peak stream flows must continue to provide such protection. New facilities (built after November 27, 1984) shall be protected from 100-year peak stream flows.

5. Disposal of manure to land is prohibited, unless allowed by separate waste discharge requirements issued by the Board.

6. The use of manure as a fertilizer in any area that may affect a groundwater subbasin lacking assimilative capacity, including the Chino Groundwater Basin, is prohibited unless a plan, acceptable to the Executive Officer, is implemented which mitigates the effects of that use on the underlying groundwater subbasin.

---

[2] Process generated wastewater shall mean water directly or indirectly used in the operation of a feedlot for any or all of the following: Spillage or overflow from animal or poultry watering systems; washing, cleaning of flushing pens, barns, manure pits or other feedlot facilities; direct contact swimming, washing or spray cooling of animals; and dust control.

[3] Chronic rainfall means a series of wet weather conditions which would not provide opportunity for dewatering and which total the volume of the 25 year, 24 hour storm event.

[4] Catastrophic rainfall means any single event which would total the volume of the 25 year, 24 hour storm event; this could include tornadoes, hurricanes or other catastrophic conditions which could cause overflow due to winds or mechanical damage.

7. Manure applied to cultivated cropland outside of any area that may affect a groundwater subbasin lacking assimilative capacity, including the Chino Groundwater Basin, shall not exceed agronomic rates and shall be incorporated into soil soon after application or appropriate containment (based upon the specific crop grown) controls must be provided. For any application of manure to cropland above 12 dry tons per acre per year (17.5 tons/year @ 33% moisture), an explanation of the type of crop and the number of times it is harvested per year shall also be included in the annual report.

8. Manure removed from the corrals shall be removed from the facility within 180 days. Any manure remaining at the facility after 180 days of being removed from the corrals is considered to be disposal of manure and is prohibited in accordance with Discharge Specification A.5. A manifest of the manure hauled away shall be prepared and submitted with the annual report in accordance with Monitoring and Reporting Program No. 99-11. (The discharger shall be responsible for active management of legal disposal of manure from the property over the six month period following removal of the manure from corrals. This means that legal disposal must be coordinated with periods of rainfall such that manure can be removed from the facility within 180 days of being scraped from corrals.)

9. On two designated "clean days" per calendar year, facilities subject to this order shall be free of all stockpiled manure that has been removed from corrals. These "clean days" shall be selected by each discharger, beginning in 2000. The two "clean days" shall be at least four months apart. Each "clean day" shall be identified and reported to the Board office at least five working days in advance of the selected date.

10. All surface drainage from outside of the facility shall be diverted away from any manured areas unless such drainage is fully contained.

## B. PROVISIONS:

1. Neither the treatment nor the discharge of wastes shall create, or threaten to create, a nuisance or pollution as defined by Section 13050 of the California Water Code.

2. This order shall serve as a general National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Clean Water Act or amendments thereto. The general permit shall become effective 10 days after the date of its adoption provided the Regional Administrator of the Environmental Protection Agency has no objection. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

3. This order expires on August 1, 2004. However, it shall continue in force and effect until a new general permit is issued. All dischargers authorized to discharge under the expired permit may continue to discharge waste in accordance with that permit until a new permit is issued.

4. Upon receipt of an application to discharge wastes under this order, the Executive Officer shall authorize the proposed discharge by transmitting a "Discharge Authorization Letter" to the discharger. The discharge authorization letter may be terminated or revised by the Executive Officer at any time.

5. Upon issuance of a discharge authorization letter from the Executive Officer to discharge wastes under this order, the discharger's authorization to discharge waste under the State Water Resources Control Board's General Industrial Storm Water Permit (Order No. 97-03-DWQ) is hereby terminated.

6. All discharges from the facility must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies regarding discharges of storm water to storm drain systems or other courses under their jurisdiction.

7. Storm flows in excess of a 24-hour, 25-year storm event may be discharged to surface water bodies in accordance with the requirements specified in U.S. Environmental Protection Agency's "Effluent Guidelines and Standards for Feedlot's, 40 CFR Part 412". Additionally, storm flows resulting from chronic or catastrophic events may also be discharged to surface water bodies in accordance with the U.S. Environmental Protection Agency's effluent guidelines referenced above.

8. The discharger shall comply with Monitoring and Reporting Program No. 99-11.

9. The discharge of wastes to property not owned or controlled by the discharger, except as authorized by this order, is prohibited.

10. The discharger shall comply with all Federal, State, County and local laws and regulations pertaining to the discharge of wastes from the facility.

11. Following a storm event, the discharger shall restore the wastewater holding capacity of retention ponds in a timely manner.

12. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the discharger from liabilities under Federal, State, or local laws, nor guarantee the discharger a capacity right in the receiving waters.

13. This order does not convey any property rights of any sort, or any exclusive privilege.

14. An authorization to discharge wastes under this order is not transferable to any person without written authorization from the Executive Officer.

15. The discharger shall comply with all requirements of this order and all terms, conditions, and limitations specified in the discharge authorization letter issued by the Executive Officer.

16. The discharger shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

17. Any instance of noncompliance with this order constitutes a violation of the Clean Water Act (CWA), its regulations, and the California Water Code, and is grounds for enforcement action, and/or termination of the authorization to discharge.

18. The provisions of this order are severable, and if any provision of this order, or the application of any provisions of this order to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this order shall not be affected thereby.

19. It shall not be a defense for a discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this order.

20. Compliance determination with the terms of this order shall be based on the following:

    a. Periodic inspections by Regional Board staff;
    b. Evaluation of the annual report of animal waste and storm water discharge submitted according to the attached monitoring and reporting program; and
    c. Any other information deemed necessary by the Executive Officer.

21. The Regional Board, USEPA, and other authorized representatives shall be allowed:

    a. Entry upon premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this general permit;
    b. Access to copy any records that are kept under the conditions of this general permit;
    c. To inspect any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this general permit; and
    d. To photograph, sample, and monitor for the purpose of assuring compliance with this general permit, or as otherwise authorized by the CWA.

## C. PERMIT REOPENING, REVISION, REVOCATION, AND RE-ISSUANCE:

1. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal CWA, or amendments thereto, the Board will revise and modify this order in accordance with such standards.

2. This order may be reopened to address any changes in State or Federal plans, policies or regulations that would affect the quality requirements for the discharges.

## D. PENALTIES:

1. The CWA provides that any person who violates a provision implementing sections 301, 302, 306, 307, or 308 of the CWA is subject to a civil penalty not to exceed $11,000 per day of such violation. Any person who willfully or negligently violates provisions implementing these sections of the CWA is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

2. The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $11,000 per violation, or by imprisonment for not more than 6 months per violation, or by both.

3. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $11,000 per violation, or by imprisonment for not more than six months per violation, or by both.

4. The California Water Code provides that any person who violates a waste discharge requirement or a provision of the California Water Code is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation, or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day, or $20 per gallon per day of violation; or some combination thereof, depending on the violation, or upon the combination of violations.

## E. REQUIRED REPORTS AND NOTICES:

1. Reporting Provisions:

   a. All applications, annual reports, or information submitted to the Regional Board shall be signed and certified in accordance with 40 CFR 122.22.

   b. Any discharger authorized to discharge waste under this order shall furnish, within a reasonable time, any information the Regional Board or EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating their authorization or this general permit. The discharger shall also furnish to the Regional Board, upon request, copies of records required to be kept by this order.

c. Except for data determined to be confidential under Section 308 of the CWA, all reports prepared in accordance with the terms of this general permit shall be available for public inspection at the offices of the Regional Water Quality Control Board and the Regional Administrator of USEPA. As required by the CWA, effluent data shall not be considered confidential. Knowingly making any false statements on any such report may result in the imposition of criminal penalties as provided for in Section 309 of the Act and Section 13387 of the California Water Code.

2. The discharger shall notify the Regional Board by telephone within 24 hours of any unauthorized discharge of waste from the facility. This notification shall be followed by a written report including the following:

   a. The approximate date and time of the discharge;
   b. The volume and duration of the discharge;
   c. The cause of the discharge; and
   d. A time schedule and a plan to implement necessary corrective actions to prevent the recurrence of such discharges.

3. The discharger shall report promptly in writing to the Regional Board of any changes or proposed changes in:

   a. The control, ownership, operation or location of the facility;
   b. The character, location, volume or disposal methods of waste discharges; and
   c. The size of the animal population, if it increases beyond the design capacity of the facility specified in the EWMP.

4. The discharger shall give advance notice to the Regional Board of any planned changes in the permitted facility or activity that may result in noncompliance with this general permit.

## F. APPLICATION REQUIREMENTS:

1. Dischargers previously authorized to discharge wastes under Order No. 94-7, dischargers currently discharging wastes under individual waste discharge requirements, and dischargers who have submitted a notice of intent to discharge wastes under Order No. 94-7 are automatically enrolled under this Order, unless they file an application to be covered under an individual permit. Once the Executive Officer issues a discharge authorization letter, the individual waste discharge requirements are hereby rescinded.

2. Dischargers not previously authorized to discharge waste under Order No. 94-7 are required to submit the following within 60 days of the effective date of this Order for existing discharges and at least 60 days before the start of any new discharge:

a. A completed Notice of Intent Form (see attachment "A") with the appropriate filing fee;
b. An Engineered Waste Management Plan for the facility, acceptable to the Executive Officer (see Attachment "B");
c. If an acceptable EWMP has not been developed, the discharger must submit the name of the engineer, or other qualified individual, who will develop the EWMP and a proposed time schedule for its development; and
d. Any other information deemed necessary by the Executive Officer.

If the proposed discharge meets the requirements of this order, the Executive Officer will provide the discharger with a written authorization to discharge waste in accordance with these waste discharge requirements.

3. The following types of facilities are generally not required to obtain authorization under this order. Such facilities must not discharge waste which may affect water quality, or cause a nuisance or pollution as defined in Section 13050 of the California Water Code.

a. Dairies where the animal population is less than 20 (dry or milking cows).
b. Heifer or calf ranches where the herd size is less than 50.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on August 20, 1999.

G J Thibeault

Gerard J. Thibeault
Executive Officer

Attachment "A" NOI

# REQUIREMENTS FOR AN ENGINEERED WASTE MANAGEMENT PLAN

**The Engineered Waste Management Plan must be prepared by a registered professional engineer in the State of California or another qualified individual.**

## A. SITE PLAN:

Site plan shall include:

1. Address and/or legal description of the property.

2. Name, address, and telephone number of the owner and operator of the property.

3. Total gross acreage of the property, showing property boundaries and all existing and proposed facilities including buildings, storage areas, berms/levees, holding ponds, pumping facilities, culverts, drainage easements, disposal areas, croplands (whether farmed by the owner/operator or another party), etc. The site plan must include the overall dimensions, contours, a vicinity map, north arrow, and the date the plan was prepared. The plan shall be drawn on a standard blue print format using an appropriate scale that shows sufficient details of all facilities.

4. Containment facilities shall be designed to retain, on the property, all process generated wastewater and storm water runoff due to precipitation and drainage through manured areas which results from a 24-hour, 25-year storm event. Facilities in operation on November 27, 1984 shall be designed for protection of all manured areas from inundation or washout by overflow from any stream channel during 20-year peak stream flows. All manured areas for new facilities (built after November 27, 1984) shall be protected from inundation resulting from a 100-year peak stream flow. The site plan shall show all facilities necessary for containment and management of on-site storm water runoff as well as the interception and conveyance of any off-site storm water runoff through the property.

5. The site plan shall show the size, elevation, and location of all facilities proposed for containment of process generated wastewater and storm water runoff on the property (berms/levees, holding ponds, upstream diversion structures, etc.). Cross section details of these facilities shall be presented.

6. A description of existing and proposed disposal areas or cropland, designated to receive operational water.

## B. DESIGN CALCULATIONS:

Design calculations shall include:

1. Present and proposed animal population (numbers of each: milk cows, dry cows, calves, heifers, etc.) and the volume of wash water generated.

2. Amount of storm water runoff resulting from a 24-hour, 25-year storm event.

3. Total amount of wastewater (wash water and storm water) to be contained on the property.

4. Dimensions and capacity of the holding ponds.

5. Percolation rates, if used.

## C. CONSTRUCTION SPECIFICATIONS:

Construction specifications shall include the construction materials and method of compaction utilized to build berms/levees and other containment facilities.

## D. OPERATION AND MANAGEMENT PLAN:

Operations and maintenance plan shall include:

1. A proposed holding pond management plan (to provide maximum pond capacity prior to winter storms; periodic dredging, etc.).

2. A proposed wastewater distribution plan (periodic rotation of wastewater to disposal areas or croplands).

3. A proposed maintenance plan for berms/levees and other containment facilities, including a proposed rodent control plan (periodic inspections to monitor for holes/cracks or breaks, etc.)

California Regional Water Quality Control Board
Santa Ana Region

Monitoring and Reporting Program No. 99-11
for
Concentrated Animal Feeding Operations (Dairies and Related Facilities)
Santa Ana Region

## A. Monitoring

1. The discharger(s) shall inspect the waste holding and disposal areas and note any discharges off the property that is under the control of the discharger. Inspections will be made daily when wastewater is being applied to cropland and weekly during other periods. The results of all inspections will be recorded and submitted with the required reports.

2. During each significant storm event[5], the discharger(s) shall make visual inspections of all storm water containment structures.

3. The discharger(s) shall record the approximate time of each storm-related discharge that results in off-property discharges of storm water commingled with wastewater or manure, and its approximate duration.

4. The discharger(s) shall record each manure-hauling event on a manure tracking manifest form.

## B. Reporting

1. By January 15 of each year, an annual report of animal waste discharge and storm water discharge shall be submitted.

2. The annual report shall be submitted on forms provided by Regional Board staff and shall also include copies of all manure tracking manifests for the reporting period and copies of the inspection logs required to be maintained under A.1. and A.4. above.

3. The discharger shall notify the Regional Board by telephone within 24 hours of any unauthorized discharge of wastes. This notification shall be followed by a written report which shall be submitted to the Regional Board within two weeks of the discharge . The written report shall contain:

---

[5] A significant storm event is defined as a storm event which results in continuous discharge of storm water for a minimum of one hour, or intermittent discharge of storm water for a minimum of three hours in a 12-hour period.

a. The approximate date and time of the discharge;

b. The flow rate and duration of the discharge;

c. The specific type and source of the waste discharges (e.g., overflow from holding pond, rainfall runoff from manure storage areas, etc.); and

d. A time schedule and a plan to implement necessary corrective actions to prevent the recurrence of the discharge.

All reports shall be signed by a responsible officer or duly authorized representative of the discharger(s) and shall be submitted under penalty of perjury.

FACT SHEET

# GENERAL WASTE DISCHARGE REQUIREMENTS FOR CONCENTRATED ANIMAL FEEDING OPERATIONS (DAIRIES AND RELATED FACILITIES) WITHIN THE SANTA ANA REGION, ORDER NO. 99-11, NPDES NO. CAG018001

## I. Need for General Waste Discharge Requirements

There are approximately 302 animal feeding operations (AFOs), including dairies, heifer ranches and calf nurseries in the Santa Ana Region. These AFOs contain about 370,000 animals [213,000 lactating (milking) cows, 37,000 dry (pregnant) cows, 56,000 heifers (12-18 month old cows), and 60,000 calves (less than 12 month old cows)]. Two hundred and seventy nine of these facilities (320,000 animals) are located in the Chino Basin, while 23 of the facilities (50,000 animals) are located in the San Jacinto Basin. The wastes generated at these facilities include manure, wash water[1] and storm water runoff from manured areas. About 950,000 tons of manure (at 33% moisture) were produced in the corrals by these facilities in 1998. This is equivalent to about 4,000,000 cubic yards of manure (at 33% moisture). About 15 million gallons of washwater, which contains about 10% of the manure produced by milking cows, is discharged to the ground each day. Wastes produced at AFOs contain high levels of bacteria, biochemical oxygen demand, ammonia, nitrate, phosphorus, and other salts.

Wastes in rainfall runoff from AFOs in the Chino Basin affect Chino Creek, Mill Creek and Reach 3 of the Santa Ana River, which are 303(d) listed impacted water bodies. Wastes from AFOs that are discharged to the Santa Ana River also affect the quality of groundwater in Orange County, since the Orange County Water District captures and percolates a significant amount of the flow of the Santa Ana River to recharge the Santa Ana Forebay Groundwater Subbasin. The Chino Basin is considered to have the highest concentration of dairy animals in the world, with its 279 facilities and 320,000 animals located within an area of less than 50 square miles (30,000 acres). The application of manure to the ground in the Chino Basin has resulted in significant groundwater pollution, specifically total dissolved solids (TDS) and nitrate. Affected groundwater in the Chino Basin also impacts the quality of the Santa Ana River because the Santa Ana River becomes a gaining steam in the Prado Basin where groundwater from the Chino Basin contributes to the surface flow of the Santa Ana River.

Wastes in surface runoff from AFOs in the San Jacinto Basin affect the San Jacinto River, Canyon Lake and Lake Elsinore. Phosphorus from AFOs is considered to be the primary cause of algae blooms in Lake Elsinore, the largest natural freshwater lake in Southern California. These algae blooms deplete oxygen in the lake, creating fish kills and other conditions which affect the economic development and aesthetics of the area. Proper management of wastes from AFOs is essential to protect the surface and groundwater resources of the Region.

---

[1] Water used to wash cows prior to milking, milking equipment and the milk barn.

Beginning in 1972, and continuing through 1994, the Board's regulatory approach was to issue individual waste discharge requirements to each AFO. Changes in the location, size, number of animals, or operator of these facilities were frequent and necessitated rescinding existing waste discharge requirements and issuing new requirements. The time demands to draft and rescind individual waste discharge requirements far exceeded the staff resources available to do so.

Criteria cited in 40 CFR 122.28 state that general permits may be issued for facilities 1) involving the same or substantially similar types of operations; 2) discharging the same types of wastes; 3) having the same or similar operating conditions; 4) requiring the same or similar monitoring; and 5) that are more appropriately regulated under a general permit rather than individual permits. The types of wastes and appropriate waste discharge requirements for dairies and related facilities are similar. Given this, the AFOs in the Region can be adequately and appropriately regulated by coverage under the terms of a general waste discharge permit.

On February 17, 1994, the Board adopted Order No. 94-7, General Waste Discharge Requirements For Concentrated Animal Feeding Operations, Including Dairies, Within The Santa Ana Region (NPDES NO. CAG018001). Order No. 94-7 has allowed the Board to better utilize staff resources. Currently, approximately 215 AFOs have been enrolled under Order No. 94-7. The remaining AFOs are either covered under individual waste discharge requirements issued prior to 1994, have submitted a Notice of Intent (NOI) to be covered under Order No. 94-7, or have not yet submitted a NOI. AFOs that have submitted a NOI and have not yet been granted coverage under Order No. 94-7 and AFOs that are still covered under individual waste discharge requirements, have not been granted coverage under Order No. 94-7 because they have not yet completed Engineered Waste Management Plans (EWMPs). Order No. 94-7 expired on March 1, 1999. Therefore, it is necessary to renew the waste discharge requirements contained in Order No. 94-7.

Although Order No. 94-7 regulated the discharge of waste from all AFOs (including non-dairy related facilities), the proposed order only addresses the discharge of wastes from dairies and related facilities, such as calf nurseries and heifer ranches. Over 95% of the dischargers enrolled, or waiting to be enrolled, under Order 94-7 are dairies and related facilities. Many of the requirements contained in Order No. 94-7, and this proposed order, are not appropriate for most other types of AFOs. Therefore, persons discharging, or proposing to discharge, wastes from other types of AFOs must obtain coverage under individual waste discharge requirements or another general permit, if one is adopted.

Currently, the larger AFOs are required to get coverage under the State Water Resources Control Board (State Board) General Industrial Storm Water Permit (Order No. 91-13-DWQ) for storm water runoff from their facilities. However, the proposed order consolidates all requirements for AFOs, including those for storm water runoff, into a single permit. Once coverage is granted under this order, other waste discharge requirements issued by this Regional Board and coverage under the State's General Permit will be terminated.

The Federal Clean Water Act (CWA) states that all concentrated animal feeding operations (CAFOs) are point sources and are subject to NPDES permitting requirements. The CWA defines a CAFO as any AFO that has more than 1,000 animal units (i.e., dairy cattle are considered 1.4 animal units). About 70% of the AFOs in the Region have over 1,000 animal units, and are, therefore, considered CAFOs under the CWA. However, the CWA states that smaller facilities can be designated as CAFOs by the permitting authority (i.e., Regional Board) after considering certain criteria. These criteria include, in part, the location of the AFO relative to surface waters, the slope, rainfall and other factors that increase the likelihood or frequency of discharges, and the impact of the aggregate amount of waste from many small operations in a watershed that exceed that of lager operations. Board staff has determined that all dairies, heifer ranches and calf nurseries in the Region meet one or more of these criteria, and, therefore, should be designated as CAFOs under the CWA. Tentative Order No. 99-11 designates all dairies, heifer ranches and calf nurseries in the Region as CAFOs, and makes them subject to NPDES requirements. Therefore, the acronym "CAFO" will be used to describe all facilities addressed by Tentative Order No. 99-11.

## II. Basis for Discharge Limitations

### Development and Implementation of Engineered Waste Management Plans

In compliance with the CWA and the California Code of Regulations, Tentative Order No. 99-11 prohibits discharges to any surface water bodies, or tributary thereof, unless rainfall events, either chronic or catastrophic, cause an overflow of process waste water from a facility designed, constructed and operated to contain all process generated waste waters plus the runoff from a 25-year, 24-hour rainfall event. (Title 27, Chapter 7, Subchapter 2, Article 1, Section 22562(a), California Code of Regulations and 40 CFR Part 412). Therefore, process waste water in overflows resulting from rainfall events that are chronic or catastrophic, or are in excess of a 24-hour, 25-year rainfall event, may be discharged to surface water bodies in accordance with requirements specified in this order. To insure that compliance with these requirements is achieved, all CAFOs are required to develop and implement an Engineered Waste Management Plan (EWMP). The guidelines for the preparation of an EWMP are included in Attachment "B" of the proposed order. Attachment "B" is intended to be revised by the Executive Officer in the near future. As with expired Order No. 94-7, Tentative Order No. 99-11 authorizes the Executive Officer to make necessary revisions to "Attachment B".

### Prohibition on the Application of Manure to Land in the Chino Basin

The Regional Board has conducted extensive studies on TDS and nitrate using computer models to determine acceptable salt loading rates to groundwater from various land uses, including dairies and other animal confinement facilities. These studies are the basis of the TDS and nitrogen management plan specified in the Water Quality Control Plan (Basin Plan) for the Region. In accordance with the TDS/nitrogen management plan, since 1972, waste discharge requirements adopted by the Board for CAFOs limited the amount of manure disposal on disposal acreage at

CAFOs to 3 (dry) tons (4.38 tons @ 33% moisture) per acre per year to address potential groundwater impacts. The resultant salt load is roughly equivalent to that permitted by the plan for other types of land use when the affected receiving waters have salt assimilative capacity. Dairy manure contains much more salt per unit of nitrogen than other types of fertilizers. The Board's 1990 Dairy Report, "Dairies and Their Relationship to Water Quality Impacts in the Chino Basin", showed that the use of manure as a fertilizer results in two to four times more salt reaching groundwater (up to 10 times more non-nitrate salts) than the use of non-manure commercial fertilizers. For this reason, the use of manure to meet the nutrient needs of crops results in excessive application of salts that are not utilized by plants and which can, therefore, migrate to groundwater. Order No. 94-7 limited manure application to cropland to agronomic rates [up to 12 (dry) tons (17.5 tons @ 33% moisture) per acre per year]. Limiting the amount of manure applied to cropland to agronomic rates was an attempt to minimize the amount of salt that would reach groundwater from the use of manure on cropland, without hindering the effective use of manure as a fertilizer.

Ninety percent of the CAFOs in the Region are located in the Chino Basin, which has severe TDS and nitrate groundwater quality problems. As noted in the Board's Basin Plan, the Chino II and III Groundwater Subbasins lack assimilative capacity for these constituents. For groundwater subbasins without assimilative capacity, additional salt inputs at rates above Basin Plan objectives cannot be allowed (State Water Resources Control Board Order No. 73-4, the Rancho Caballero decision). To meet the Chino Basin groundwater objectives, the discharge of manure and other animal wastes, such as dairy wash water, and their application as fertilizer, cannot be legally permitted unless this salt load is offset. The Basin Plan contains a dairy regulatory strategy that was developed in the Board's 1990 Dairy Report. One element of that strategy addresses waste discharge requirements for manure and wash water disposal and application of wastes to cropland. That element specifies that ongoing manure and wash water disposal or application to cropland in the Chino Basin must be prohibited unless suitable salt offset programs are implemented.

In 1994, the Board was informed that two desalters would be built in the Chino Basin. The Board was also informed that a significant amount of manure would be exported from the Chino Basin by the proposed Chino Basin Co-Composting Facility. It was assumed that after the Chino Basin Co-Composting Facility began operation and began exporting a significant amount of manure, the amount of salt to be extracted from the Chino Basin by the two desalters would be adequate to provide sufficient salt removal to offset the present and projected salt loads from ongoing dairy discharges. Therefore, the Board adopted Order No. 94-7, allowing manure and wash water discharges to continue, on the assumption that adequate salt offsets would be implemented. However, the desalters were never built (although one is now under construction) and the Co-Composting Facility, built in 1995, has never exported the significant amount of manure that had been projected. Therefore, sufficient offsets were not implemented, and manure and wash water discharges, and the use of manure on cropland, have been continuing without adequate salt offsets, in violation of State law.

Board staff estimates that over 13 million tons of manure have been applied in the Chino Basin since the mid-1950's, resulting in over 1.4 million tons of salt that have reached, or will reach,

groundwater. The application of about 400,000 tons of manure (@ 33% moisture) per year to disposal land, cropland and ongoing stockpiles in the Chino Basin is continuing. Board staff estimates that the current rate of application of manure and wash water to land in the Chino Basin is resulting in about 34,000 tons of salt that will reach groundwater each year. About 30,000 tons per year is from the application of manure, and about 4,200 tons per year is from the discharge of wash water. A desalter is currently being built in the Chino Basin. The extraction wells that will supply water for the desalter are expected to remove about 11,500 tons of salt per year from the Chino Basin. Kaiser Steel will be credited with an offset of 4,000 tons of this salt each year for a period of 25 years, in accordance with a previous settlement agreement with the Board. The Board has previously indicated that it would accept the remainder of the salt that will be removed from the extraction wells as an offset for continuing discharges from CAFOs in the Chino Basin. However, that amounts to an offset of only 7,500 tons of salt per year, compared to a current CAFO salt loading to groundwater of about 34,000 tons per year. In addition to the 4,200 tons of salt that reaches groundwater each year from wash water discharges, salt also is discharged to groundwater as a result of the percolation of rainfall runoff from corrals and drainage from manure stockpiles. The amount of salt that reaches groundwater each year from the percolation of rainfall runoff from corrals and percolation of drainage from manure stockpiles has not yet been adequately determined. However, staff believes that it may account for the remaining 3,800 tons of salt offset provided by the desalter, leaving no, or very little, salt offset available for continued manure application in the Chino Basin. No other mitigation measures are currently in place, and none are expected to be in place immediately, to offset the salt loading from ongoing manure application in the Chino Basin. Therefore, the discharge of manure and its application as fertilizer in the Chino II and Chino III Subbasins must be prohibited. The remainder of the subbasins in the Chino Basin are of excellent quality and are tributary to the Chino II and Chino III Subbasins. Also, the addition of salt to those subbasins by the application of manure was not considered when the assimilative capacity for those subbasins was determined. Therefore, Tentative Order No. 99-11 prohibits the discharge of manure and its application as fertilizer throughout the entire Chino Basin (The accompanying cease and desist order allows manure to continue to be applied to cultivated croplands within the Chino Basin at agronomic rates as long as significant progress is being made towards the construction and operation of a second desalter within the Chino Basin). Tentative Order No. 99-11 does not prohibit the on-site discharge of wash water, rainfall runoff from corrals, or drainage from manure stockpiles, since the salt loadings from these discharges appear to be offset by the salt that will be removed by the desalter facility.

Removal of Manure from the Facility

Tentative Order No. 99-11 requires that manure be hauled from each facility within 180 days after being removed from the corrals. Any manure remaining at the facility after 180 days of being removed from the corrals is considered to be disposal of manure and is prohibited by Tentative Order No. 99-11. Draft Order No. 99-11, which was distributed for comments in March and April 1999, proposed requiring the removal of manure from the facility within 90 days after removal of the manure from the corrals. Several comments were received in writing and orally at Board Workshops, stating reasons why this time frame was unreasonable. Board staff also solicited

comments from farm advisors with the University of California Cooperative Extension. It was determined that it is beneficial to "cure" manure for 90 to 180 days prior to composting or for application to cropland, and that the nutrient value of the manure is not significantly affected when manure is stored for less than 180 days. During the winter, 90 days would not allow sufficient time for the manure to dry adequately prior to hauling. Providing 180 days of storage will allow the moisture content of the manure to be sufficiently reduced, making it lighter per unit of volume, and easier and less expensive to haul. Some commercial fertilizer facilities in the Chino Basin prefer receiving manure that has been aged for at least 150 days. Also, CAFOs generally remove manure from their corrals twice a year. Allowing up to 180 days (6 months) storage will result in manure being removed from the facility prior to the next corral cleaning, and will still achieve the goal of preventing the long term accumulation of manure at CAFOs. Board staff believes that allowing for 180 days storage is reasonable, and that there would be no significant difference in water quality impacts from storing manure at the facility for 180 days instead of 90 days.

Change in Language Pertaining to Containment of Storm Water Runoff

Order No. 94-7 and Draft Order No. 99-11 included the following Discharge Specification: "The discharge to any surface water bodies, or tributary thereof, is prohibited unless a chronic, catastrophic or cumulative rainfall causes overflow from a storage facility designed, constructed, maintained and operated to contain all process generated wastewater plus the runoff from a 24-hour, 25-year storm." These Orders defined a chronic, catastrophic or cumulative rainfall as rainfall occurring over a 7-day period or less which is equivalent to that from a 24-hour, 25-year storm event. This language is slightly different than similar language included in the CWA that does not refer to "cumulative" rainfall, and does not contain a definition that refers to rainfall "occurring over a 7-day period." The specification included in Order No. 94-7 and Draft Order No. 99-11 is, overall, more stringent than the language in the CWA, and was developed to provide a more objective basis for determining compliance with the rainfall containment requirement and to be consistent with the Board's EWMP Guidelines. However, the USEPA, and others, have noted that there could be instances during certain storm events of less than 7 days when the specification included in Order No. 94-7 and Draft Order No. 99-11 can be less restrictive than the language included in the CWA. They have requested that the language proposed in Draft Order No. 99-11 be changed to be consistent with the language in the CWA, since NPDES permits cannot contain requirements that can be less restrictive than the CWA. Therefore, the term "cumulative" and the reference to rainfall "occurring over a 7-day period" has been removed from Tentative Order No. 99-11 to make the rainfall containment requirement consistent with the CWA.

Consistency with USDA/USEPA "Unified National Strategy for Animal Feeding Operations"

In March 1999, the United States Department of Agriculture (USDA) and the USEPA finalized their unified national strategy for AFOs. Among other items, the national strategy recommended that general permits require the development and implementation of Comprehensive Nutrient Management Plans (CNMPs). In general, development and implementation of CNMPs is intended to bring each CAFO into compliance with the requirements of the CWA and to minimize the

impacts to groundwater and surface water by the implementation of best management practices. The national strategy describes many best management practices that could be included in CNMPs for individual CAFOs. The best management practices included in each CNMP for each CAFO would include specific best management practices for that CAFO, depending on the specific situations that exist at that particular CAFO. In general, the CNMP would assure that appropriate wastewater facilities were developed, constructed and maintained to comply with the requirements of the CWA, and that the use and application of waste water and manure (i.e., nutrient management) was managed to minimize impacts to groundwater and surface water. Tentative Order No. 99-11 does not require the development and implementation of CNMPs, as described and recommended in the national strategy. This is because the requirements included in Tentative Order No. 99-11 are equivalent to, or more stringent than, what would be required in CNMPs. Also, many of the BMPs recommended to be included in CNMPs are not relevant to the specific, isolated conditions that exist in the Chino Basin. The requirements in Tentative Order No. 99-11 for wastewater and rainfall are equivalent to what the national strategy requires. General BMPs that can be implemented to comply with the wastewater and rainfall containment requirements will be further addressed in the Board's EWMP Guidelines when they are revised in the near future. Specific BMPs that will be implemented at each CAFO to comply with the wastewater and rainfall containment requirements will be addressed in each CAFO's specific EWMP. The prohibition on the application of manure in the Chino Basin is obviously a more stringent requirement than the BMPs for manure application and management that the national strategy recommends to be included in CNMPs, since application of manure is not permitted. The limitation on the application of manure to agronomic rates, not to exceed 12 (dry) tons (17.5 tons @ 33% moisture) per acre per year, in groundwater basins outside the Chino Basin where assimilative capacity exists and application of manure is permitted, is equivalent to the nutrient management guidelines included in the national strategy. Specific BMPs addressing application of manure will be included in each CAFOs specific EWMP.

Prohibition on Covering New Discharges in the Chino Basin Under this Order

The 1998 California 303(d) List and TMDL Priority Schedule includes several surface water bodies as impaired due to CAFOs, including Chino Creek, Mill Creek (Prado Area), and Reach 3 of the Santa Ana River for nutrients, pathogens, salinity/TDS/chlorides, and suspended solids. The CWA states that NPDES permits cannot be issued to a new source (discharger) if the discharge will cause or contribute to the violation of water quality standards, unless certain specified criteria are met, including the development of TMDLs. In the absence of a current TMDL, USEPA has recommended that this general permit be limited to current facilities, and that any new sources (i.e., construction of any new facilities) be processed through an application for an individual NPDES permit. Therefore, Tentative Order No. 99-11 prohibits new sources (i.e., new facilities) from being covered under this general permit. Since the most recent new construction of a CAFO facility in the Chino Basin was approximately 20 years ago, this prohibition is not expected to be a significant issue.

Inability of Many CAFOs to Immediately Comply with Several Requirements Included in this Order

Many CAFOs will not be able to immediately comply with several of the requirements contained in Tentative Order No. 99-11. These requirements include the prohibition on the application of manure in the Chino Basin, implementation of EWMPs and containment of rainfall from a 24-hour, 25-year storm. The Board will consider adoption of a Cease and Desist Order No. 99-65 with a time schedule for compliance with these requirements.

## III. Coverage Under the General NPDES Permit

### A. Dischargers Currently Regulated Under Order No. 94-7 or Under Individual Waste Discharge Requirements, and Dischargers that have Submitted NOIs

These dischargers will be automatically enrolled under the proposed order, once it is adopted. Dischargers who have not yet submitted an acceptable EWMP (see Attachment "B" of the order) are required to do so.

### B. Dischargers Not Currently Regulated Under Order No. 94-7 or Under Individual Waste Discharge Requirements, and Dischargers that have not Submitted NOIs:

At least 60 days prior to initiating a discharge at an existing facility, the discharger shall submit a Notice of Intent (NOI) (see Attachment "A") with the appropriate filing fee (currently, the filing fee is $2,000.00 for each facility) and an acceptable EWMP[2].

## IV. Discharge Authorization Letter

Upon adoption of this order, the Executive Officer shall issue discharge authorization letters to dischargers currently enrolled under Order No. 94-7, discharging waste under individual waste discharge requirements or who have submitted an NOI to be covered under a general permit.

Upon receipt of a complete application for initiation of a discharge at an existing facility, the Executive Officer will review the application to determine eligibility for discharge under this order. If the Executive Officer determines that the discharger is eligible to discharge wastes under this general order, the Executive Officer may authorize the proposed discharge. Otherwise, the Executive Officer may require the discharger to obtain individual waste discharge requirements.

---

[2] New operators/owners of existing facilities for which an EWMP has been approved are not required to submit an additional EWMP.

## V. Antidegradation Analysis

The Regional Board conducted extensive TDS and nitrate studies using computer models to determine acceptable salt loading rates to groundwater from various land uses, including dairies and other concentrated animal feeding operations. These studies indicate that if the requirements specified in the proposed general permit are met, water quality of the Region is not expected to degrade as a result of discharges authorized under this general permit. The Regional Board, in establishing the requirements in the tentative order, has taken into consideration the requirements of the State and Federal "antidegradation policies" and has determined that the discharges are in conformance with the antidegradation policies.

## VI. Written Comments

All written comments regarding the proposed general order should be submitted to: Robert Holub, Regional Water Quality Control Board, 3737 Main Street, Suite 500, Riverside, CA 92501.

## VII. Information and Copying

Persons wishing further information may write to the address given below (see IX, below) or call the Regional Board at (909) 782-4130. Copies of the proposed waste discharge requirements, and other documents (other than those which the Executive Officer maintains as confidential) are available at the Regional Board office for inspection and copying by appointment scheduled between the hours of 10:00 a.m. and 4:00 p.m., Monday through Thursday (excluding holidays).

## VIII. Register of Interested Persons

Any person interested in a general permit, or in a particular application or group of applications, may leave his name, address, and phone number as part of the file for an application. Copies of tentative waste discharge requirements will be mailed to all interested parties.

## IX. Workshops and Public Hearing

The Regional Board conducted public workshops on April 9, 1999, May 21, 1999, and June 25, 1999, to solicit comments on the draft general waste discharge requirements that were distributed in March and April 1999. Oral comments were received during these workshops, and written comments were submitted by several parties. These comments were considered by staff and incorporated into Tentative Order No. 99-11, as appropriate.

The Regional Board will hold a public hearing and consider adopting Tentative Order No. 99-11 during a public meeting on August 20, 1999, beginning at 9:00 a.m. The meeting will be held at the City Council Chambers of Loma Linda, 25541 Barton Road, Loma Linda.

Further information regarding the conduct and nature of workshops and pubic hearings concerning waste discharge requirements may be obtained by writing or visiting the Santa Ana Regional Board office, 3737 Main Street, Suite 500, Riverside, 92501 or by calling Robert Holub of Regional Board Staff at (909) 782-3298.

California Regional Water Quality Control Board
Santa Ana Region

August 20, 1999

ITEM:

SUBJECT: General Waste Discharge Requirements For Concentrated Animal Feeding Operations (Dairies And Related Facilities) Within The Santa Ana Region, Order No. 99-11, NPDES No. CAG018001

DISCUSSION:

See attached Fact Sheet

RECOMMENDATION:

Adopt Order No. 99-11, as presented.

Comments were solicited from the following agencies and/or persons:

U.S. EPA, Washington, Office of Wastewater Enforcement and Compliance - Michael B. Cook
U.S. EPA, San Francisco – Alexis Straus
U.S. EPA, Permit Issuance Section - Terry Oda (W-5-1)
U.S. EPA, San Francisco – Dan Meer
State Water Resources Control Board, Office of the Chief Counsel - Ted Cobb
State Water Resources Control Board, DWQ – Jim Kessel, Jack Hodges, Cheryl Closson

## I. INTRODUCTION

This plan describes the operational setting of SNS Dairy and recommended procedures of the operation and management of the dairy wastewater collection, retention, and disposal system at the:

SNS Dairy

| | |
|---|---|
| Owner/Operator: | Sam Souza |
| Location: | 7325 Edison Avenue, Chino,California |
| Mailing Address: | same |

| | | | |
|---|---|---|---|
| EWMP Responsible Party: | Primary: | Sam Souza | (909) 732-8165 |
| | Secondary: | Sam Souza Jr. | (909) 203-5905 |

The dairy is situated on the south side of Edison Avenue. The west boundary of the dairy is adjacent to the Sultana Avenue right-of-way. The east boundary is adjacent to the Campus Avenue right-of-way.

The gross area of the dairy is approximately 36.55 acres. The dairy operations occupy approximately 33.41 acres of the total acres and include the following uses:

- Corrals,
- Hay barns,
- Commodity barn,
- Milk barn, and
- Wastewater lagoons

The current typical animal population is:

- 850 milk cows, and
- 150 dry cows

This onsite stock count equates to 1400 animal units. SNS Dairy has not plans for expansion at this time. However, the operator does intend to abandon milking operations in the near future and use the facility for raising his heifers. The EWMP is designed for a milking herd to provide the option of leasing out the facility to a dairy operator if he chooses.

At the time this report was prepared, this dairy could not comply with the RWQCB's 2001 Guidelines for the Development of EWMPs. The quantities reported are the result of the proposed improvements described herein under Section II, Recommendations.

Portions of SNS Dairy that require containment of runoff include approximately 12.73 acres of corrals, 1.49 acres of concrete feed alleys, 3.15 acres of dirt areas, and 6.97 acres of fields and pastures. The wastewater lagoon and evaporation basins occupy 8.74 acres and have a combined storage capacity of 10,301,007 gallons (31.61 acre-ft). SNS Dairy generates approximately 24,861 gallons of wash water per day (See Appendix A, page 1).

SNS Dairy has a very efficient and effective way of managing its wash water and storm water. Wash water from the milk barn gravity flows to a sump located just east of the milk barn. From the sump the wash water continues by gravity flow through a 4 inch PVC line to a series of check valves located along the northerly portion of Field #2. Water can be dispersed via the check valves to various portions of Field #2 to evaporate and percolate. Any wash water or storm runoff from Field #2 is collected in a series of evaporation basins located to the south.

Storm runoff from Corral #1 flows south, then east to commingle with runoff from Corrals #2 through #5 and continue south via a swale located along the west boundary of the corrals. Just south of Corral #5, a berm directs the runoff to the east and ultimately into Basin #1. Storm runoff from Corrals #6 through #9 flows east to the west boundary of Field #1, then south to Basin #1. Storm runoff from Corral #10 flows south to Field #1 and ultimately to Basin #1. Corrals #11 through #13 drain south to Field #2 and ultimately into Evaporation Basins #1 through #5.

Corral #14 receives some runoff from the dirt area located to the north of the corral. There is a potential for runoff exiting the corral along the south fence line to flow southeast and offsite. Any runoff that exits the facility along the east fence line will be contained within a small swale located between the east fence line for SNS Dairy and the Feed Alley for the adjacent facility to the east. The runoff will then be channeled, within the swale, to the south along the Campus Avenue right-of-way. This report includes a recommendation that Corral #14 be abandoned, the manure removed and a two foot berm constructed along the west fence line between Corral #13 and #14. By implementing this recommendation, runoff from the dirt area and Corral #14 will remain uncontaminated with manure and, therefore, can flow offsite along the natural drainage course within the Campus Avenue right-of-way.

SNS Dairy has adequate protection against on-site storm water leaving the property. In general, storm runoff drains from north to south to either Basin #1 or Evaporation Basins #1 through #5. The west boundary is protected by a berm along the west part of the Sultana Avenue right-of-way. Potential runoff along the south boundary is contained by the west to east extension of the west berm. Runoff is directed in an easterly direction into Basin #1. Runoff along the east boundary, south of the dirt area and Corral #14, is contained within Evaporation Basin #5.

SNS Dairy also has excellent protection against offsite entering the property. The northern property line is protected from run-on by a series of dirt and asphalt berms depicted on the Plot Plan. The storm runoff from Edison Avenue is directed west and away from the dairy. The remaining boundaries of the dairy are protected by the berms and Basin #1, as discussed above and depicted on the Plot Plan.

SNS Dairy was built prior to November 27, 1984. Therefore, they are not required to protect their manured areas from the 100-year peak stream flow. However, they are required to protect all manured areas from the 20-year peak stream flow. Studies have not been done to calculate the flood elevations of a 20-year peak stream flow. In order to protect the dairy from, and prepare for, a 20-year peak flow, it must maintain regular maintenance programs as described herein. All onsite flows and the required volumes for the 25-year, 24-hour storm must be contained (See Appendix H, 100 Year Flood Plain Data).

## II. DESIGN

SNS Dairy was originally contracted to comply with Order No. 99-11. Since that time, guidelines for achieving compliance with Order No. 99-11 have been issued (Guidelines for the Development of Engineered Waste Management Plans for Concentrated Animal Feeding Operations, February 5, 2001). This Engineered Waste Management Plan (EWMP) was prepared under the recommendations of the new guidelines.

Order No. 99-11 required the containment of the daily production of wastewater and storm water runoff from a 24-hour, 25-year storm. The new guidelines to Order No. 99-11 require the containment of:

- 150 days of the daily production of wastewater,
- A 24-hour, 25-year storm,
- 150 days of winter precipitation, and
- The 150-day accumulation of 10% of manure solids that could end up in the lagoons.

Although evaporation and percolation can be accounted for, the new guidelines require a large change in containment from Order No. 99-11.

In order to accommodate the new guidelines, this report contains two sets of calculations. The first set of calculations determines the amount of capacity required for 150 days storage. The second set of calculations performs a month-by-month water balance analysis of the amount of wastewater generated and eliminated. This second set of calculations was developed for those dairies that do not meet the requirements of the new guidelines. This second set of calculations optimizes the amount of storage required by including percolation and evaporation on a month by month basis.

The Engineered Wastewater Management Plan (EWMP) developed for SNS Dairy in December 2003 determined that the dairy has appreciable wastewater storage. SNS Dairy meets all of the requirements of the new guidelines. In Table 1, wastewater volumes and the capacity of the settling basin & lagoon are summarized.

| Table 1<br>Capacity Summary | | |
|---|---|---|
| Total Days Required | 150 | days |
| Total Milkhouse and Parlor Water Rate | 3,045 | gal per day |
| Total Wash Pen Rate | 21,816 | gal per day |
| Total Milkhouse and Wash Pen Rate | 24,861 | gal per day |
| Total Required Storm Water Volume | 15.44 | acre-ft |
| Total Manure Volume | 0.66 | acre-ft |
| Total Required Containment Facility Volume | 27.54 | acre-ft |
| Total Available Volume | 31.61 | acre-ft |
| ADDITIONAL VOLUME REQUIRED | 0 | acre-ft |
| | | |
| Total Annual Washwater and Storm Water Accumulation | 59.07 | acre-ft |
| Total Annual Evaporation and Percolation Capability | 134.57 | acre-ft |
| | | |
| Total Winter (Nov.-Dec.-Jan.-Feb.-Mar.) Washwater and Storm Water Accumulation (Inflow) | 35.46 | acre-ft |
| Total Winter (Nov.-Dec.-Jan.-Feb.-Mar.) Evaporation and Percolation Capability (Outflow) | 9.72 | acre-ft |

The data presented in this report was generated in the spreadsheets labeled "Worksheet for Determining Containment Facility Volume" (Appendix A). The first page[1] details the current animal population and the daily wash water generated on the dairy. All numbers for milk house and wash pen water rates were generated from Rain Bird and Weather Tech Sprinkler Volume Ratings for single and double nozzles. An average of 5.05 Gallons per minute was used for single nozzles and 7.1 gallons per minute was used for double nozzles. These numbers were confirmed by watching the total run time of the wash pen sprinklers per cow pen and matched with research from the University of California Cooperative Extension Program for Dairies (see Appendix C).

The second page[1] shows the equivalent gallons per cow per day. This calculation was generated in response to the EWMP guidelines adopted by the Regional Board. The guidelines recommend that as much as 100 gal/cow/day should be used to generate

[1] Appendix A, "Worksheet for Determining Containment Facility Volume".

wastewater during winter months. The calculation on the second page[1] shows a more accurate estimate of the volume of water used per cow per day on SNS Dairy.

Page two[1] also shows the total storm water accumulation generated on the dairy. Evaporation was considered, based on data from the California Department of Water Resources. Manure was also considered in the total volume calculations. The Total Required Containment Facility Volume is shown on the bottom of the second page[1].

The Total Available Volume is shown on page three[1] for SNS Dairy. The Additional Volume Required was found by subtracting the Total Required Volume from the Current Capacity. In the case of SNS Dairy, no additional volume is required.

Also included on page three[1] is a calculation showing the total depth needed in the basins to contain the 24-hr, 25-yr storm. This calculation was developed to show how much depth should be retained at the top of the basins to ensure that the 24-hr, 25-yr storm can be fully contained. This calculation also shows the maximum fill depth of the basins before pumping must be initiated. The calculation assumes that all storm water flows by gravity to the basins and is contained before it is pumped to application fields. In the case of SNS Dairy, 3.00 feet must be maintained at the top of the Basins #1 and 0.60 feet maintained at the top of Evaporation Basins #1-5 to ensure capacity of the 24-hr, 25-yr storm.

Shown below are two examples of wastewater lagoons. Figure 1 shows an optimum dairy lagoon that is able to contain all of the required wastewater and runoff volumes. Figure 2 shows a more common situation where two lagoons are used to split the total wastewater and runoff volumes. There should always be enough room in one lagoon to hold the 24-hr, 25-yr storm. By leaving enough room for the 24-hr, 25-yr storm, it eliminates dependency on the pump and eliminates potential spills due to pump failure. The calculation on the bottom of page three[1] shows exactly how much depth is needed at the top of the lagoon to ensure containment of the 24-hr, 25-yr storm.

---

[1] Appendix A, "Worksheet for Determining Containment Facility Volume"

**Figure 1.** Cross section of optimum dairy lagoon.

**Figure 2.** Cross sections of typical dairy lagoons with split volumes.

Appendix B contains the Inflow-Outflow computations designed to optimize the amount of storage required. This spreadsheet models the month-by-month totals of operations water, precipitation, 24-hour, 25-year storm data, evaporation and percolation. Although the 24-hour - 25-year storm could occur at any time, it was assumed to occur during the month of

January. Percolation is not included for November through March. All data is referenced in Appendices D-G. As can be seen in the spreadsheets, SNS Dairy has 19,245,907 million gallons of total inflow (Column [15]), and 43,846,695 gallons of total outflow (Column [27]).

Column [28] compares the total inflow with the total outflow on a month-by-month basis. The calculation subtracts the total outflow from the total inflow to give a clear estimate of which months have more inflow than outflow. If there is more inflow than outflow, additional storage is required. Since all factors including evaporation and percolation are included, this calculation gives an accurate estimate of how much storage is needed per month. The total capacity needed on the dairy based on all the months that have more inflow than outflow is then shown at the bottom of the calculation sheet. In the case of SNS Dairy, there are 5 months (November through March) where there is more inflow than outflow. There is a total of 8,386,434 gallons that need to be contained over the year. This number when compared with the total available capacity on the dairy shows if the lagoons need to be expanded or not. Since the SNS Dairy has 10,301,007 gallons of capacity, there is no need to expand the lagoons.

Following the spreadsheets are two charts showing the results of the Inflow-Outflow Computation, titled "Inflow-Outflow Comparison Chart" and "3D Inflow-Outflow Comparison Chart." The 3D Inflow-Outflow Comparison Chart is simply a 3D version of the Inflow-Outflow Comparison Chart. The dark blue line on the chart depicts the total operation water generated in gallons per month. The light blue line shows the total precipitation over the site in gallons per month. The yellow line shows the combination of operation water and precipitation water. The light red line shows the Total Inflow for the dairy including the operations water, precipitation, and the 24-hour, 25-year storm. The large jump in the light blue line denotes the 24-hour, 25-year storm. The purple line shows the evaporation from the fields and lagoons per month. The orange line shows the percolation from the fields per month. The large drop in the line denotes the lack of percolation in the winter months. The green line shows the Total Outflow from the dairy, including evaporation and percolation, per month.

This chart is an excellent reference because it shows the total amount of storage time that would be needed to properly manage the wastewater and storm water. In the case of SNS Dairy, there is more total inflow than total outflow in the months of November through March. This shows that the dairy technically needs 150 days of storage to properly manage the wastewater and storm runoff. In every other month there is more potential evaporation and percolation than there is inflow.

The SNS Dairy meets the requirements of the guidelines to Order No. 99-11 for 150 days storage. The following recommendations should be performed to meet the other requirements of the guidelines to Order No. 99-11.

**Recommendations**

1. Remove all animals from Corral #14. Clean the manure from the corral and construct a berm along the west fence line per Section I-I on the Plot Plan. Continue the berm south of the Corral to divert runoff from Corral #14 and run-on from the adjacent dairy away from Field #2. This portion of the berm should be constructed per Section L-L on the Plot Plan.

2. Construct a spillway near the southeast corner of Basin #1 per Detail 1 of the Plat Plan. The spillway shall be constructed of a material such as concrete, asphalt, or rip rap and shall include aprons designed to control slope erosion.

## III. PLOT (SITE) PLAN

Please see Plot Plan at the end of this report. (Plate 1)

## IV. COMPACTION

For construction and/or replacement of berms, the following procedures should be followed:

A. Over excavate the soil to 1'-2' below original ground before building berms.

B. Place backfill and fill materials in layers not more than 8 inches in loose depth for material compacted by heavy compaction equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers. Backfill and fill materials should be completely free from manure.

C. Uniformly moisten sub-grade and each subsequent fill or backfill layer before compaction to within 2 percent of optimum moisture content.

    1. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
    2. Remove and replace, or scarify and air-dry, otherwise satisfactory soil material that exceeds optimum moisture content by 2 percent and is too wet to compact to specified dry unit weight.

D. The excavation shall be backfilled and compacted to a relative compaction of no less than 90 percent. A Soils Engineer will need to be hired to ensure 90 percent compaction.

## V. OPERATION AND MAINTENANCE

The basic maintenance objectives are to ensure the reliable storage and disposal of accumulated wastewater and waste solids. To achieve this, there are several tasks that must be accomplished on a routine basis:

- Disposal of accumulated wastewater
- Measurement of accumulated waste solids
- Removal and disposal of accumulated waste solids
- Repair and maintenance of dikes and berms
- Maintenance of site grading
- Weed Abatement
- Record keeping

### Accumulated Wastewater Disposal

It is important that the water level in the wastewater holding ponds be properly maintained so that the ponds can provide the required storage capacity during wet weather periods. The California Regional Water Quality Control Board - Santa Ana Region (CRWQCB) has developed specific standards for the handling and storage of wastewater and storm water collected from the dairy operations. This portion of the Engineered Waste Management Plan describes the recommended maintenance procedures for the wastewater holding ponds to ensure compliance with CRWQCB standards.

In order to meet the requirements of the CRWQCB, the following general guidelines should be followed in disposing of wastewater in the ponds:

- Empty ponds just prior to the start of the wet weather season (November 1st) to ensure maximum capacity for the winter months. If stagnant water remains at the bottom of the ponds below the reach of the pumps, portable pumps should be used to remove all wastewater before the start of the wet season.
- Take advantage of dry weather periods during the annual wet weather period to dispose of accumulated wastewater. Fields must be bermed to prevent overflow from disposal areas onto adjacent properties.
- Start to empty ponds at end of wet weather season (March 31st) to maximize percolation and to create additional capacity in the lagoons.

General Equipment Maintenance. Pumps, pipelines and all pertinent equipment used in the handling of wastewater must be routinely checked and serviced to ensure proper operation:

- Check all wastewater distribution and application equipment weekly to ensure proper operation condition.
- Check and service motors and pumps three times a year. Portable replacement pumps should be available in case of a pump failure. If portable pumps are not available on-site, a rental company phone number should be posted with high visibility for all

employees. Rental company phone numbers are also listed on the last page of this report.

- Check transmission pipes for proper condition.
- Take inventory of spare parts and check sources of emergency repair.
- Disc percolation areas (fields) to about 18 inches to assure maximum percolation during wet seasons. Disking of the disposal area should occur as early in the year as possible, as soon as the fields are dry enough for the procedure to be effective. All of the disposal area should be disked at least once each year.

Dry Weather Disposal. Following the annual wet weather months, wastewater accumulated in the ponds should be disposed of in a timely manner in preparation of the coming wet weather months. The following guidelines should be followed for wastewater disposal during dry weather conditions:

- Apply wastewater to each of the evaporation/percolation disposal areas (fields) on a rotational basis.
- Wastewater should be applied to fields in a manner so that all wastewater will percolate and evaporate. Wastewater should be applied to all parts of the field to improve percolation and evaporation and to prevent stagnant wastewater.
- Observe the wastewater levels in the disposal areas on a daily basis and apply additional wastewater as the drying and percolation rates permit.
- Avoid having the fields completely flooded for extended periods of time. The best disposal rates will occur if the fields are flooded 4 to 6 inches and then allowed to evaporate and percolate. Fields can only be flooded to 4 to 6 inches if proper berms exist around the boundaries of the field. If stagnant wastewater develops, a portable pump or other measures should be used to help spread the water and prevent insect breeding conditions.

Wet Weather Disposal. During the wet weather months, there may be weeks of dry weather available to dispose of accumulated wastewater. Take advantage of every opportunity to reduce the wastewater levels in the holding basins/lagoons so that in the event of a large storm the chances of overflow and inadvertent runoff are reduced. The following guidelines should be followed for wastewater disposal during wet weather months:

- Apply wastewater to each of the disposal areas on a rotational basis.
- Apply wastewater in a manner so that all wastewater will percolate and evaporate. Fields should be watered so that all parts of the field receive wastewater. This will help percolation and evaporation and will help prevent stagnant wastewater.
- Observe the wastewater levels in the disposal areas on a daily basis. Apply additional wastewater only if the previously applied wastewater has evaporated or percolated and if a large storm is not eminent.
- Do not flood the fields and leave standing water for a long period of time unless it has so been designated.

## Accumulated Solids Removal and Disposal

Solids contained in the dairy-generated wastewater and in the storm water will naturally settle and accumulate in the bottom of the holding basins/lagoons. The settled solids will reduce the holding capacity of the ponds. To maintain holding pond storage capacity, solids must be routinely checked and periodically removed. The frequency of solids removal will depend on how quickly solids accumulate in the ponds.

Solids Removal. Remove accumulated solids 1st by agitation and pumping, 2nd by dredging, and 3rd by draining and scraping. If dredging is used, ensure that dredging runoff and excess wastewater taken from the ponds is contained and returned to the ponds. Lagoon solids should be removed *every summer* to ensure full capacity in the lagoons before the start of the next winter season.

Solids Disposal. Solids removed from the ponds can be applied to application areas on-site or must be hauled off-site to farm ground for land application. Solids from lagoon applied to application areas should be tilled and mixed into the native soils shortly after application.

## Levee, Berm and Dike Maintenance

The integrity of pond berms, levees, and dikes must be maintained. Follow these guidelines to ensure proper maintenance of the levees and berms:

- Check pond dikes, levees, and berms a minimum of two times per year for erosion and settlement, and repair as necessary (one inspection to occur just prior to the rainy season).
- Check pond dikes, levees, and berms a minimum of two times per year for rodent damage, and repair as necessary (one inspection to occur just prior to the rainy season).
- If immediate repairs must be made, compacted soil should be used to fill all cracks and holes until further repair can be performed.
- Apply suitable rodent control measures for widespread or frequent rodent damage. These may include Anti-Coagulant Bait, Trapping or Fumigation. Pest Control Specialists should be contacted before using any of these methods.

## Site Grading Maintenance

Site grading must be maintained to ensure proper drainage patterns across the dairy. The goal is to minimize the amount of water contaminated with manure and flowing into the holding ponds and to prevent contaminated wastewater from running off-site. The following guidelines should be followed to maintain site grading:

- Ensure that all wastewater generated by the daily dairy operations flows to the wastewater holding ponds. Re-grade as needed.
- Clean and repair buried drain lines as needed.

- Ensure that rainfall collected from cow holding pens, feed storage areas, and other manured areas flows to the holding ponds or containment areas. Re-grade as needed.
- Check the condition of containment walls and berms surrounding the cow confined areas, and repair as necessary.
- Ensure that storm water from off-site areas is diverted away from holding pens and other manured areas.
- Ensure that storm water from other off-site areas does not drain into the holding ponds.

**Weed Abatement**

Weed abatement measures such as pesticides and clearing and grubbing should be used to control weeds in fields, lagoons, wastewater transport channels, and wastewater access paths. Clearing manure out of lagoons once a year and discing fields at a minimum of once a year will help ensure weed abatement.

**Maintenance and Operations Records**

Keep records of all maintenance activities for future reference.

| Maintenance Activity | | Frequency |
|---|---|---|
| Holding Basin/Lagoon Levels | Pond Depth in Feet | Weekly |
| Holding Basin/Lagoon General Inspection | Berm and Lagoon Wall Stability | Weekly |
| Wastewater distribution/ Application Equipment | Pump/Pipe/Ditch Inspection | Weekly |
| Rainfall Totals | Days of Rain & Inches of Rainfall | Daily/Monthly |
| Solids Level | Solids Depth in Feet | Annually |
| Wastewater Application | Wastewater Depth in Inches | Daily |
| Wastewater Application | Days Applied & Approximate Volume | Weekly |
| Lagoon Solids Removal/Disposal | Days Removed & Volume Removed | Annually |
| Corral Solids Removal/Disposal | Days Removed & Volume Removed | Semi-Annually |
| Dikes and Berms Maintenance | Damage Found & Date Repairs Made | Semi-Annually |
| Site Grading Maintenance | Improvements Made & Date | Annually |
| Equipment Maintenance | Service and Repair Records & Dates | Semi-Annually |

- Daily inspections should be made upon all ponds, berms and wastewater distribution and application equipment following the first significant rain event of each Winter season. These daily inspections should continue until large rain events cease in the Spring.

- Should an unauthorized discharge be made from the facility, the dairy operator should follow the guidelines described in Monitoring and Reporting Program No. 99-11. (See back pages of Order No. 99-11.) Emergency phone numbers are located on the next page of this report.

**Emergency Spill Plan**

In the case of an emergency spill on the dairy, these directions should be followed.

First, the Regional Water Quality Control Board should be contacted if a spill occurs. This requirement is based on Order 99-11.
At least one of these people should be contacted in the case of a spill.

Regional Water Quality Control Board
Steve Mayville (909) 782-4130
Chief of the Dairy Units

Should a pump or piece of equipment break down, these numbers should be used to pursue emergency temporary equipment.

Vandenberg Manufacturing Company, Inc.
(909)-597-3412

Below is a list of spare parts that could be used in the case of an emergency spill.

There are no spare parts on-site.

## WORKSHEET FOR DETERMINING CONTAINMENT FACILITY VOLUME

NOLTE
BEYOND ENGINEERING

WORKSHEET FOR DETERMINING
CONTAINMENT FACILITY VOLUME

NAME OF FACILITY: SNS Dairy

NAME OF OPERATOR: Sam Souza
7325 Edison Avenue
Chino, CA 91710

DATE: 12/03/03
PHONE: (909) 627-9432

**TOTAL ACRES OF PROPERTY** 36.55
**DAIRY SITE (Manured Areas)** 33.41 Acres

**TOTAL DAYS STORAGE:** 150

## ANIMAL UNITS

| | Milk Cows | Dry Cows | Bred Heifers | Heifers 1 yr/breed | Calves 3 m to 1yr | Baby Calves |
|---|---|---|---|---|---|---|
| Number (N) | 850 | 150 | 0 | 0 | 0 | 0 |
| Weights (lbs) | 1,400 | 1,400 | 1,100 | 775 | 450 | 150 |
| Pounds (lbs.x N) | 1,190,000 | 210,000 | 0 | 0 | 0 | 0 |
| Units ((N x lbs.)/1000) | 1,190.0 | 210.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| | | | | | TOTAL ANIMAL UNIT | 1400.0 |

## MILKHOUSE AND PARLOR WATER RATE

| | Gal Per Milking | # Milkings Per Day | # Cows | Totals (Gal Per Day) |
|---|---|---|---|---|
| Bulk Tank Wash Volume [1] | 35 | 2 | | 70 |
| Pipeline Wash Volume [1] | 250 | 2 | | 500 |
| Milkhouse Parlor Floor Wash [1] | 250 | 2 | | 500 |
| Cow Prep (hose wash per cow) [1] | 0.25 | 2 | 850 | 425 |
| Miscellaneous Equipment (buckets etc.) [1] | 250 | 2 | | 500 |
| Miscellaneous Wash (wash/drip pen hose etc.) [1] | 525 | 2 | | 1050 |
| TOTAL DAILY MILK HOUSE AND PARLOR WATER USE | | | | 3,045 |

## WASH PEN/HOLDING PEN WATER RATE

| | | # Strings | Totals (Gal Per Day) |
|---|---|---|---|
| Number of Holding Pen Sprinklers | 54 | | |
| Duration of Sprinkler Wash Cycle (minutes) | 5 | | |
| Number of Wash Cycles (cow pens) | 8 | | |
| Sprinkler Flow Rate (gallons per minute) [1] | 5.05 | | |
| TOTAL WASH PEN WATER USE | 10,908 | 2 | 21,816 |

## WASHWATER VOLUME

| | | |
|---|---|---|
| Milkhouse and Wash Pen (gal per day) | | 24,861 |
| Required days for Containment Facility to hold | | 150 |
| TOTAL WASHWATER VOLUME | Gallons | 3,729,150 |
| | Cu. Ft. | 498,549 |

| EQUIVALENT GALLONS PER COW PER DAY | Gal Per Day | # Cows | # Cows |
|---|---|---|---|
| | 24,861 | 850 | 29.25 Gal/Cow/Day |

[A] Calculation includes actual number of days in each month
[B] Annual totals are calculated January through December
[C] Assumes no percolation during winter months (Nov.-Mar.)
[D] Assumes field is barred for winter disposal. Null values are inserted if field cannot be used for winter disposal.
[E] Evaporation inches reduced 50% during winter months (Nov.-Mar.)
[F] Winter months totals are calculated November through March

## PLANING AND DESIGNING DAIRY WASTE STORAGE FACILITIES

**Alison Van Eenennaam[1]**

A dairy waste management system must be planned, designed and managed to:

- Prevent water pollution
- Control odors
- Eliminate breeding places for insects
- Provide a convenient and efficient operation for the dairy owner/operator
- Require minimal investment, maintenance and operational costs
- Meet legal requirements.

Proper management of manure and waste water ensures further benefits in providing a healthy atmosphere for the animals. A facility that is clean, dry and free of manure provides a less desirable environment for disease organisms to thrive.

The purposes of this document are to:

- detail the factors to consider in designing a waste management storage facility;
- outline the major factors to be considered when designing dairy waste holding ponds; and
- provide an example of how to size a dairy manure holding pond.

[1]University of California Cooperative Extension Postdoctoral Associate.

## TABLES

**Table 1.** Waste produced daily by a 1,000 pound dairy cow and where it is deposited (2).

| Area | Percent | Cubic Feet |
|---|---|---|
| Housing area | 40 | .548 |
| Feeding area | 45 | .617 |
| Holding pen | 10 | .137 |
| Milk parlor | 5 | .068 |
| Total cubic feet/1,000 lb cow | | 1.370 |

**Table 2.** Volume of milkhouse and parlor water (2, and D. Johnson, NRCS, pers. comm.).

| Washing operation | Water Volume |
|---|---|
| Bulk Tank | |
| Automatic, 3 cycle wash | 60 to 110 gal/wash |
| Manual wash | 30 to 50 gal/wash |
| Pipeline | |
| In parlor (volume is higher for long flat barns) | 75 to 150 gal/wash |
| Milkhouse and parlor floors | 300 to 700 gal/wash |
| Pail milkers | 30 to 40 gal/wash |
| Miscellaneous equipment | 30 gal/day |
| Cow preparation wash | |
| Automatic | 1 to 4.5 gal/wash/cow |
| Manual | .25 to .5 gal/wash/cow |
| Holding pen (sprinklers) | 5 gal/min/head (dependent upon nozzle size & pressure) |

Unofficial values based on averages/sums of smoothed daily data. Information is computed from available daily data during the 1961-1990 period. Smoothing, missing data and observation-time changes may cause these 1961-1990 values to differ from official NCDC values. This table is presented for use at locations that don't have official NCDC data. No adjustments are made for missing data or time of observation. Check **NCDC normals** table for official data.

## 1961 - 1990 Temperature and Precipitation

Data is smoothed using a 29 day running average.

■ - Max. Temp. is the average of all daily maximum temperatures recorded for the day of the year between the years 1961 and 1990.
■ - Ave. Temp. is the average of all daily average temperatures recorded for the day of the year the years 1961 and 1990.
■ - Min. Temp. is the average of all daily minimum temperatures recorded for the day of the year between the years 1961 and 1990.
■ - Precipitation is the average of all daily total precipitation recorded for the day of the year between the years 1961 and 1990.

**Table 13-9** [2]

| Recommended rates of wastewater application for Trench and Bed Bottom Areas [a] | | |
|---|---|---|
| Soil Texture | Percolation rate, min/in | *Application rate, gal / ft² x d* [b,c] |
| Gravel, coarse sand | <1 | Not Suitable [d] |
| Coarse to medium sand | 1-5 | 1.20 |
| Fine sand, loamy sand | 5-15 | 0.80 |
| Sand loam, loam | 16-30 | 0.60 |
| Loam, porous silt loam | 31-60 | 0.45 |
| Silty clay loam, clay loam [a,f] | 61-120 | 0.20 |
| Clays, colloidal clays | >120 | Not Suitable [g] |

Use Application Rate of 0.7 to Fit B/Re( Classification"

[a] From U.S. EPA (1980).

[b] Rates based on septic tank effluent from a domestic waste source. A factor of safety may be desirable for wastewater's of significantly different strength or character.

[c] May be suitable for sidewall infiltration rates.

[d] Soils with percolation rates less than 1 min/in may be suitable for septic tank effluent if a 2ft layer of loamy sand or other soil is placed above or in place of the native topsoil.

[e] These soils are suitable if they are without significant amounts of expandable clays.

[f] Soil easily damaged during construction.

[g] Alternative pretreatment may be needed and alternative disposal (wetlands or evaporation systems) may be required.

## Hilmar Series

The Hilmar series consists of somewhat poorly drained, nearly level soils on alluvial valley floors and fans. These soils formed in wind-laid coarse-textured material underlain by medium-textured granitic alluvium. Slopes are 0 to 2 percent. Elevation is 600 to 900 feet. Vegetation is annual grasses and forbs. The average annual precipitation is 12 to 16 inches, the mean annual air temperature is 62° to 65° F, and the frost-free season is 230 to 280 days.

In a representative profile, the surface layer is grayish-brown loamy fine sand about 13 inches thick. The underlying material, to a depth of 23 inches, is light yellowish-brown and grayish-brown loamy sand. Below this, to a depth of 60 inches, it is light brownish-gray mottled loam stratified with thin lenses of sandy loam and loamy sand. Hilmar soils are moderately alkaline throughout the profile and are slightly calcareous in the upper 23 inches and strongly calcareous below.

In these soils the surface layer and the upper part of the underlying material that formed in coarse-textured material are rapidly permeable. The lower part of the underlying material that formed in medium-textured material is slowly permeable. Available water capacity is about 7 to 9 inches. Roots penetrate to a depth of 60 inches or more. Originally the soils were somewhat poorly drained, but the drainage has been altered by lowering the ground water table through pumping.

These soils are used mainly for such irrigated crops as grapes, alfalfa, pasture plants, and small grains.

Representative profile of Hilmar loamy fine sand, about 100 feet south of Edison Road and about 200 feet west of Cucamonga Creek, SE¼NW¼NW¼ sec. 22, T. 2 S., R. 7 W; San Bernardino base line and meridian:

Ap—0 to 13 inches, grayish-brown (2.5Y 5/2) loamy fine sand, very dark grayish brown (2.5Y 3/2) when moist; single grained; loose when dry and moist, nonsticky and nonplastic; many very fine and fine roots; slightly effervescent; moderately alkaline; gradual, smooth boundary.

C1—13 to 16 inches, light yellowish-brown (2.5Y 6/4) loamy sand, light olive brown (2.5Y 5/4) when moist; few, fine, distinct, brownish-yellow (10YR 6/6) mottles, yellowish brown (10YR 5/6) when moist; single grained; loose when dry and moist, nonsticky and nonplastic; common very fine and fine roots; slightly effervescent; moderately alkaline; gradual, smooth boundary.

C2—16 to 23 inches, grayish-brown (2.5Y 5/2) loamy sand, light brownish gray (2.5Y 6/2) when moist; single grained; loose when dry and moist, nonsticky and nonplastic; common very fine and fine roots; slightly effervescent; moderately alkaline; abrupt, smooth boundary.

IIC3—23 to 60 inches, light brownish-gray (2.5Y 6/2) loam stratified with thin lenses of sandy loam and loamy sand, grayish brown (2.5Y 5/2) when moist; common, medium, distinct, brownish-yellow (10YR 6/6) mottles, yellowish brown (10YR 5/6) when moist; massive; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; strongly effervescent; moderately alkaline.

The A horizon is grayish brown, dark grayish brown, or brown loamy fine sand or loamy sand. The soil material is dominantly single grained but has weak, very fine to fine, subangular blocky structure in small areas, and in some places it is massive. The soil material is slightly effervescent but is strongly effervescent in a few spots. The A horizon ranges from 8 to 14 inches in thickness but is 13 inches thick in most places.

The C horizon is generally light yellowish brown to grayish brown, but in a few places it is light brownish gray. Yellowish-brown, brownish-yellow, or dark yellowish-brown mottles are common. They range from few to common in abundance, fine to medium in size, and faint to distinct in contrast. The C horizon is loamy sand or loamy fine sand. The soil material is typically single grained, but in some places it is massive. Lime content varies from slight to strong. Thickness is about 10 inches but ranges from 8 to 12 inches.

The IIC horizon is light brownish gray, grayish brown, or light gray. Brownish-yellow or yellowish-brown mottles range from common to many in abundance, fine to medium in size, and distinct to prominent in contrast. The IIC horizon is generally loam that has thin lenses of sandy loam, coarse sandy loam, or loamy sand, but in a few places, it is clay loam or silt loam stratified with thin lenses of coarse-textured material. The IIC horizon is typically massive, but in some places it has weak, moderate, subangular blocky structure. Reaction ranges from mildly alkaline to strongly alkaline.

**Hilmar loamy fine sand (Hr).**—This nearly level soil is on valley floors and alluvial fans. Included with it in mapping are areas of Delhi fine sand that make up about 10 percent of each area. Also included are patches of Tujunga loamy sand, 0 to 5 percent slopes, and small areas where slopes are 2 or 3 percent.

Runoff is slow, and the hazard of water erosion is slight. If the soils are left without a protective cover of vegetation, the hazard of soil blowing is high.

The Hilmar soil is used chiefly for irrigated alfalfa, grapes, small grains, and pasture plants. Capability unit IIe-4 irrigated.

## Merrill Series

The Merrill series consists of somewhat poorly drained, nearly level soils that formed on alluvial fans in medium-textured granitic alluvium. Slopes are 0 to 2 percent, elevation is 500 to 700 feet. Vegetation is mainly annual grasses and forbs, but perennial grasses grow in some areas. The average annual precipitation is 12 to 16 inches, the mean annual air temperature is 62° to 65° F, and the frost-free season is 230 to 280 days.

In a representative profile, the surface layer is gray silt loam about 25 inches thick. The underlying material, to a depth of 43 inches, is light-gray loam that is weakly cemented and contains many extremely hard silica-lime cemented nodules. Below this the underlying material is light brownish-gray loam that extends to a depth of 60 inches or more. Merrill soils are strongly calcareous and moderately alkaline throughout their profile.

These soils are slowly permeable. Their available water capacity is 4 to 7 inches. Roots can penetrate to a depth of 25 to 40 inches. Drainage has been altered on these soils by pumping ground water for irrigation.

These soils are used for such irrigated crops as pasture plants, alfalfa, small grains, and some truck crops.

Representative profile of Merrill silt loam, about 300 feet northwest of Eucalyptus and Central Avenue;

GUIDELINES FOR ORDER NO. 99-11

# Guidelines for the Development of Engineered Waste Management Plans For Concentrated Animal Feeding Operations

(Dairies and Related Facilities)

California Regional Water Quality Control Board
Santa Ana Region

February 2001

## Introduction

On August 20, 1999, the California Regional Water Quality control Board, Santa Ana Region (Board), adopted Order No. 99-11 (NPDES No. CAG018001), General Waste Discharge Requirements for Concentrated Animal Feeding Operations (Dairies and Related Facilities) in the Santa Ana Region. This order required all operators of dairies and related facilities (i.e., heifer ranches and calf nurseries) authorized to discharge wastes under Order No. 99-11 to develop and implement an engineered waste management plan (EWMP). The primary purpose of an EWMP is to provide a wastewater management system that is designed, constructed, operated and maintained to comply with the wastewater containment requirements in Order No. 99-11. Order No. 99-11 included applicable state and federal regulations that address waste discharges from animal feeding operations.

## Background

The Board began issuing waste discharge requirements to all animal feeding operations in the Region in 1972. These waste discharge requirements stated that each facility had to contain, on the property, all wastewater (i.e., dairy wash water, storm water runoff from manured areas, etc.), including the storm water runoff from a 24-hour, 25-year storm. In an attempt to comply with this requirement, many facilities constructed new ponds, enlarged existing ponds, constructed berms, and implemented other measures. However, these measures were generally implemented in a piecemeal fashion, usually on an as-needed basis, and often did not integrate well with other wastewater containment measures at the facility. It became more and more apparent that many of the wastewater containment improvements that were being made were not very effective. For example, ponds were not sized properly, and therefore, did not have sufficient capacity to contain the entire volume of wastewater generated at the site; berms were sized and constructed improperly, resulting in failures; wastewater pumps, pipelines, etc., were often inoperable and were not replaced when needed; and most wastewater containment structures and equipment were often in a state of disrepair. All of these situations resulted in frequent discharges of wastewater to surface waters, primarily during the winter.

To minimize discharges to surface waters, it became apparent that an overall plan for containing wastewater was necessary. In the late 1980's, Board staff prepared a two-page document that provided guidelines for preparing an EWMP. An EWMP was then generally requested from animal feeding operations that had a history of recurring wastewater discharges. In 1994, the Board adopted Order No. 94-7 (NPDES No. CAG018001), General Waste Discharge Requirements for Concentrated Animal Feeding Operations (CAFOs). Order No. 94-7 required that, in addition to an EWMP being required from CAFOs that had a history of recurring wastewater discharges, EWMPs were to be prepared by anyone initiating a new CAFO at either a new or existing facility. The guidelines for preparing an EWMP were then included as an attachment to Order No.

94-7. Order No. 94-7 expired in March 1999, and the Board adopted Order No. 99-11 in August 1999. To assure that every CAFO had a wastewater management system capable of complying with wastewater containment requirements, Order No. 99-11 required that all CAFO operators develop and fully implement an EWMP. The existing guidelines for preparing an EWMP were included as an attachment to Order No. 99-11. However, the existing EWMP guidelines were outdated, general in nature, and did not contain sufficient criteria to comply with the wastewater containment requirements in Order No. 99-11. Therefore, Order No. 99-11 authorized the Executive Officer to make necessary revisions to the guidelines.

These revised guidelines are longer than the previous guidelines. This is primarily the result of adding explanations and clarification to make EWMPs prepared in accordance with the guidelines as consistent as possible. There are two significant differences between these guidelines and the previous guidelines. First, the new guidelines outline criteria for determining the storage capacity necessary to comply with waste discharge requirements. These criteria will result in the need for significantly more storage capacity than the criteria included in the previous guidelines. However, this does not reflect a change in state or federal regulations. Instead, previous guidelines did not accurately specify criteria for determining the storage capacity necessary to comply with state and federal regulations. Regardless of what was included in previous guidelines, CAFOs have always been, and still are, required to comply with all applicable state and federal regulations. Second, the new guidelines identify several items (such as best management practices) that should be considered in the development and implementation of EWMPs. Many of these items have been included in EWMPs approved by the Executive Officer in the past.

## Purpose

The purpose of an EWMP is to provide a wastewater management system that is designed, constructed, operated and maintained to comply with the wastewater containment requirements in Order No. 99-11. These guidelines do not address the management, application or disposal of manure removed from the corrals. Compliance with waste discharge requirements associated with the discharge of manure removed from corrals is addressed separately. The development and implementation of an EWMP is required by Order No. 99-11. Discharges of wastewater from a CAFO are allowed only if the CAFO operator has constructed and maintained containment structures as required, and if a chronic or catastrophic rainfall event occurs. A chronic rainfall event is a series of wet weather conditions that would total the volume of the 24-hour, 25-year storm event, and would not provide reasonable opportunity for dewatering containment structures prior to the next storm events. A catastrophic storm event includes events such as tornadoes and hurricanes, and any single event that totals the runoff volume of the 24-hour, 25-year storm event. Order No. 99-11 requires that an EWMP be developed in accordance with guidelines established by the Executive Officer. However, these are guidelines, not regulations, and any EWMP that will result in compliance with waste discharge requirements will be acceptable by the Executive Officer. Adhering to these

guidelines, though, will provide consistency for preparing EWMPs, and will increase the likelihood that the EWMP will be acceptable.

## Elements of an EWMP

The EWMP must be prepared by a registered engineer (civil, or other appropriate discipline) or other qualified person (required by Order No. 99-11). The qualified person preparing the EWMP must have the knowledge, technical expertise and experience appropriate to develop an EWMP. This guidance document describes five basic elements that should be addressed in an EWMP. These elements include an introduction, a design, a plot (site) plan, construction specifications, and an operation and management plan. These elements should include a detailed description, as follows:

## I. Introduction

The introduction should describe the existing animal population, the design population for the EWMP, existing wastewater containment facilities, and the operation of those facilities. At a minimum, the Introduction should consist of a brief narrative that addresses the following:

- The facility address, operator name, land owner, and location of the facility with respect to cross streets or other landmarks.
- The name, telephone number and address of the person responsible for implementing the EWMP on an on-going basis (CAFO operator or other designated person)
- The number, telephone number and address of the person(s) to be contacted, if necessary, in the event that the CAFO operator or designated person is not available.
- Current and design animal population (for the expected life of the CAFO)
- The estimated volume of wash water generated at the facility each day (based on gallons per cow per day)
- Total size of the facility (acres)
- The size (acres) of existing ponds, corrals, wastewater disposal areas and wastewater containment areas
- General location and height of berms
- How dairy wastewater is managed and where it is discharged
- Storm water run-on problems (storm water that occurs off-site, but enters the CAFO), including run-on from neighboring facilities, etc.

## II. Design

To comply with Order No. 99-11, containment facilities must be designated to contain all wastewater generated at the facility (i.e., dairy wash water, storm water runoff from manured areas, etc.) and all storm water runoff that comes into contact with manure generated by a 24-hour, 25-year storm. A 24-hour, 25-year storm is a 24-hour storm with

a return frequency of once every 25 years. The design must take into consideration that this storm can and should be expected to occur each year. CAFOs are required to contain the storm water runoff from all lesser storms, if that runoff has come into contact with manure.

If a CAFO does not have existing structures capable of containing the required volume of wastewater, then additional structures must be provided. This may include significantly deepening existing ponds, adding additional ponds, connecting to a sewer system, raising berms to increase the volume of wastewater that can be stored in containment areas, etc. An EWMP may be acceptable if the design has maximized the amount of wastewater that can be contained and the operation and management plan optimizes utilization of the containment capacity provided by the containment structures. **However, acceptance of such a plan will not relieve the CAFO operator of responsibility for any discharges that are not allowed by Order No. 99-11. Wastewater that is discharged off the CAFO property, even after implementing an acceptable EWMP, is still a violation of Order No. 99-11. unless the discharge occurred as a result of a chronic or catastrophic storm event.**

- Historically, containment of wash water and storm water runoff at CAFOs in the Region between the drier months of April through October has not been a problem. However, containing storm water runoff from corrals, wastewater disposal fields, etc., and daily wash water, has been problematic during the five generally wet months of November through March. During these months, evaporation is minimal, and since disposal fields are usually saturated by rainfall, percolation is minimal. Since it is difficult to dispose of daily wash water and accumulated storm water runoff during these months, wastewater facilities should be designed to contain all wastewater generated during this 150-day period, as noted below.

- Containment structures should be designed to contain 150 days of annual storm water runoff <u>and</u> the runoff from a 24-hour, 25-year storm. For the Chino Basin area, average rainfall for the 150 days from November through March is approximately 13 inches, and a 24-hour, 25-year storm generates approximately 4.5 inches of precipitation (based on information from the National Weather Service). For the San Jacinto area, average annual rainfall for the 150 days from November through March is approximately 11 inches, and a 24-hour, 25-year storm is approximately 3.5 inches. These are average values for these areas, and other values can be used for a particular CAFO, if justification is provided.

- Containment structures should be designed to contain 150 days of wash water. This should be based on the maximum number of milking cows for the life of the facility. Otherwise, the EWMP may have to be revised in the future, at such time that the number of milking cows exceeds the number of cows stated in the EWMP. Recent studies have shown that the average daily wash water generated at dairies in the Region is about 70 gal/cow/day (based on two milkings/cow/day). The average daily wash water produced during winter months, however, can exceed 100 gal/cow/day. The average gal/cow/day used during the winter should be used in determining the

volume of storage required for wash water. This volume can vary, depending on specific site practices, but should be about 100 gal/cow/day unless adequate justification is provided for using a smaller number. The installation of a water meter can verify the amount of water used and assist in efforts to conserve water usage, and thereby reduce the amount of water discharged to containment structures. A wash water meter will be required to justify a volume significantly less than 100 gal/cow/day.

- During the winter, evaporation is minimal. Also, ponds tend to seal up over time, and disposal fields are generally saturated during the winter, thereby minimizing percolation. In addition, the amount of wastewater percolated during the winter at a CAFO can vary, depending on the particular wastewater disposal practices implemented at that CAFO. Allowances for loss of wastewater due to percolation and evaporation can be made in determining the amount of storage required for wastewater, as long as reasonable assumptions are made that consider winter conditions and practical CAFO specific wastewater disposal practices.

- The accumulation of solids in ponds and other containment structures decreases the storage capacity available for wastewater. It is estimated that dairy wash water in the Region contains about 10% of the manure generated by a milking cow. Also, solids are present in storm water runoff from corrals, disposal land and other areas. The estimated annual decrease in available storage capacity resulting from the accumulation of these solids should be determined (the volume of manure in wash water can be considered to be 10% of what a milking cow expels).

- Calculations should be provided showing the design capacity of all wastewater containment structures (existing and proposed).

- The total capacity of the containment structures should be at least equal to the volume determined by the following equation: 150 days dairy wash water + 150 days annual storm water runoff + 24-hour, 25-year storm runoff + accumulation of solids + wastewater in containment structures on November 1 – percolation – evaporation.

- A description of all wastewater conveyance equipment and structures (pipelines, surface channels, pumps, etc.), including their design capacities, should be provided.

- CAFOs in operation prior to November 27, 1984 must be designed to protect all manured areas from inundation or washout by overflow from any stream channel during a 20-year peak stream flow (required by Order No. 99-11).

- CAFOs built after November 27, 1984 must be designed to process all manured areas from inundation or washout by overflow from any stream channel during a 100-year peak stream flow (required by Order No. 99-11).

- The use of pumps must be considered for ponds and other containment structures so that wastewater can be pumped from ponds or containment areas to disposal areas, in

order to restore needed capacity in the containments structures. If pumps are not utilized, exceptional justification for not utilizing pumps must be included.

- Storm water containment structures must be protected against inundation from off-site storm water sources, unless such run-on is fully contained (required by Order No. 99-11). If it is not practical to divert all storm water run-on away from a CAFO, a justification should be included that explains why it is not practical to do so. If all storm water run-on from up to a 24-hour, 25-year storm cannot be diverted from containment structures, a description of how the design takes the run-on into consideration should be included.

- The addition of roof structures in areas where manure is present, and diverting the roof runoff off site, should be considered in order to minimize the amount of precipitation that comes into contact with manure.

- Structures should be designed to prevent storm water runoff from non-manured areas (roofs, residence area, paved surfaces, etc.) from entering wastewater containment structures. The use of rain gutters and diversion trenches should be considered. If the CAFO cannot be designed to prevent or minimize the flow of this water onto containment areas, an explanation should be provided that describes how the design accounts for such flows.

- The design for ponds and other wastewater containment areas should allow vehicle access for mosquito abatement personnel to inspect and treat these areas to reduce the risk of mosquito-borne disease and to prevent insect nuisance conditions.

- An emergency spillway must be designed to provide for a controlled release of wastewater, and to maintain the integrity of existing containment structures, in the event that storm events cause the capacity of the containment structures to be exceeded. The use of gateways, valves, or other similar devices for the purpose of manually releasing wastewater, is not acceptable.

- If visual observations, hand-level measurements and information provided by the CAFO operator and others are not sufficient to determine rise and fall dimensions and flow directions for adequately calculating runoff volumes for placing and sizing appropriate containment structures, then current contours must be determined, based on acceptable engineering and surveying practices (it is expected that current contours will be necessary for most CAFOs).

- Structures should be designed to accommodate future increases in animal population.

## III. Plot (Site) Plan

The plot plan should be a standard blue line print, using an appropriate scale, that shows sufficient detail of all containment structures, drainage patterns, and equipment. The plot plan should include:

- The legal description of the property (i.e., parcel numbers), the primary address and any other addresses that may exist at the property, and the location of significant structures on the property (residences, milk barn, hay alleys, etc.).
- The property boundaries, the gross acreage of the property, vicinity map (insert), north arrow, legend and date the plan was prepared.
- The location, elevation contours and dimensions of all areas associated with the generation, storage or management of wastewater and manure (corrals, ponds, access roads around wastewater containment areas, wastewater disposal areas, temporary manure storage areas, cropland, etc.).
- The location of all facilities necessary for containment and management of wastewater (berms, upstream diversion structures, pumps, spillway, distribution lines, etc.) and the dimensions, elevation and cross-sections of all containment structures.
- The drainage patterns (indicated by arrows) for on-site surface drainage courses (swales, ditches, etc.) and any off-site surface drainage that can flow onto, or immediately adjacent to, the facility.

## IV. Construction

The construction plan should describe all construction materials, construction methods (i.e., compaction), criteria and specifications, etc., necessary for proper construction of all containment and conveyance structures (berms, ponds, levees, pipelines, channels, etc.).

- Existing berms that are not sized properly, not adequately compacted, or contain materials (i.e., manure) that are deleterious to the berm's long term stability and effectiveness, must be replaced or improved to a standard that is equivalent to that which would be expected from a new berm constructed in accordance with best engineering practices.
- Actions necessary to restore existing structures to proper conditions and capacities should be clearly described (i.e., clean out existing ponds or containment areas, regarding, repair or replacement of existing berms, etc.).

- Manure shall not be used to construct new containment structures (i.e., berms0, and manure shall not be used to improve or raise existing containment structures (prohibited by Order No. 99-11).

- In accordance with acceptable engineering practices, specifications developed to assure that construction material is applied in lifts of appropriate depth, and rolled and watered to achieve a minimum compaction of 90%, must be included.

## V. Operation and Maintenance

An operation and maintenance plan should be provided to implement effective operation of all containment structures and equipment. During the wet season, wastewater should be managed on a daily basis to maximize the volume of containment capacity available.

- Specific procedures should be included to assure that containment structures have the maximum capacity available just prior to the wet season (November – March).

- Management practices to reduce, to the maximum extent practicable, the volume of dairy wash water generated should be addressed, particularly if the proposed structures are incapable of containing the required volume of wastewater.

- Replacement pumps should be available on-site, or advanced arrangements made for the immediate and reliable delivery of portable pumps.

- Specific procedures for operating standpipes or other conveyance systems used for applying wastewater to land should be provided to efficiently utilize the entire area available for wastewater disposal (i.e., avoid localized over-application that can occur with furrow application, and utilize methods to maximize the spreading of wastewater).

- If all storm water run-on cannot be diverted, the EWMP should contain a description of how storm water run-on will be managed or handled to minimize the impact on wastewater containment structures and to minimize the amount of wastewater that could be discharged from the CAFO.

- Specific measures to minimize the effects of gophers, squirrels or other rodents on the integrity of the containment structures should be identified.

- Removal of solids from containment structures on a scheduled basis should be specified so that the design capacity of the containment structures will be restored prior to each rain season.

- Measures for minimizing the accumulation of stagnant wastewater in low lying areas (corrals, disposal areas, etc.) and preventing potential insect nuisance conditions should be addressed.

- Weekly inspections of ponds, berms, wastewater distribution and application equipment, etc., should be specified to provide assurance that all containment structures are intact and all equipment is in proper operating condition. Daily inspections should be conducted following the first significant rain events at the beginning of the wet season (generally in early Fall), continuing through the cessation of significant rain events (generally in early Spring). Provisions for the immediate repair of any damaged containment structures (i.e., rodent holes, cracks, erosion, etc.) should be provided.

- A description of methods and schedules for maintaining disposal areas in a condition that maximizes the efficient disposal of wastewater in the winter should be provided (i.e., grading, disking, etc.).

- An equipment maintenance schedule should be provided to assure the efficient, consistent and reliable operation of all pumps, sumps, pipelines, etc.

- Weed abatement measures to maintain access to containment structures, maintain capacity of containment structures and to maintain the efficient distribution of wastewater through channels, etc., should be addressed.

- A brief emergency spill plan must be included. The plan must include a list of spare parts (pumps, piping, valves, etc.) that are to be kept on site to maintain adequate wastewater containment facilities, a list of names and phone numbers for contacts for obtaining immediate emergency equipment (pump, piping, valves, heavy equipment, etc.), and a list of names and phone numbers for reporting problems (Board staff, County staff, etc.).

# APPENDIX K

ORDER NO. 99-11

California Regional Water Quality Control Board
Santa Ana Region

Order No. 99-11
NPDES No. CAG018001

# GENERAL WASTE DISCHARGE REQUIREMENTS FOR CONCENTRATED ANIMAL FEEDING OPERATIONS (DAIRIES AND RELATED FACILITIES) WITHIN THE SANTA ANA REGION

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter, Regional Board), finds that:

1. On February 17, 1994, the Board adopted Order No. 94-7, General Waste Discharge Requirements For Concentrated Animal Feeding Operations, Including Dairies, Within The Santa Ana Region (NPDES NO. CAG018001).

2. Order No. 94-7 satisfied the criteria cited in 40 CFR 122.28 and, as such, served as a General NPDES Permit. 40 CFR 122.28 pertains to the issuance of general permits to regulate discharges of waste that meet the following criteria:

   a. Waste discharges involving the same or substantially similar types of operations;
   b. Discharge the same types of wastes;
   c. Require the same or similar operating conditions;
   d. Require the same or similar monitoring ; and
   e. Are more appropriately regulated under a general permit rather than individual permits.

3. 40 CFR Part 122.23 defines a concentrated animal feeding operation (CAFO) as any animal feeding operation that has more than 1,000 animal units (dairy cattle are considered 1.4 animal units). Pursuant to the Clean Water Act (CWA), all CAFOs are point sources and are subject to NPDES permitting requirements. Smaller animal feeding operations can also be designated as CAFOs by the permitting agencies after considering certain criteria cited under 40 CFR 122.23 (b)(1). The Regional Board has determined that all dairies, heifer ranches, and calf nurseries in the Region shall be designated as CAFOs.

4. Order No. 94-7 has expedited the preparation of waste discharge requirements and has allowed the Regional Board to better utilize staff resources. To date, approximately 215 CAFOs have been enrolled under Order No. 94-7. Another 72 CAFOs are in the process of obtaining authorization to discharge wastes under that order. Order No. 94-7 expired on March 1, 1999. The dairies currently enrolled under Order No. 94-7, or in the process of enrolling under Order No. 94-7, will want to continue to discharge waste. Therefore, it is necessary to renew the waste discharge requirements contained in Order No. 94-7 to continue this expedited permitting process.

5. Persons discharging, or proposing to discharge, dairy wastes or other similar kinds of wastes in any manner that may affect water quality are hereinafter referred to as "discharger" and are subject to the terms and conditions of this order. Persons discharging, or proposing to discharge, wastes from other types of animal feeding operations must obtain coverage under a separate general permit or individual waste discharge requirements.

6. The Regional Board adopted a revised Water Quality Control Plan (Basin Plan) on March 11, 1994. The Basin Plan became effective on January 24, 1995. The Basin Plan specifies beneficial uses and water quality objectives for surface and ground waters in the Santa Ana Region (Chapters 3 and 4). This order specifies requirements necessary to meet the water quality objectives and to protect the beneficial uses.

7. Revised regulations governing discharges from CAFOs, including dairies, are contained in Division 2, Title 27 of the Combined State Water Resources Control Board/California Integrated Waste Management Board AB 1220 Regulations, which became effective on July 18, 1997. Chapter 7, Subchapter 2 (Article 1) contains requirements for Confined Animal Facilities. Previously, these regulations were specified in Chapter 15, Division 3, Article 6, Title 23 of the California Code of Regulations.

8. Section 402(p) of the CWA as amended by the Water Quality Act of 1987 and the related regulations published by the U.S. EPA on November 16, 1990 (40 CFR Parts 122, 123 and 124), requires an NPDES permit for pollutant discharges from CAFOs. The EPA's Effluent Guidelines and Standards for Feedlots are contained in 40 CFR Part 412 (revised July 1, 1993).

9. On April 17, 1997, the State Water Resources Control Board adopted the General Industrial Storm Water Permit, Order No. 97-03-DWQ, NPDES No. CAS000001. Order No. 97-03-DWQ implements the final regulations (40 CFR 122, 123, and 124) for storm water runoff published on November 16, 1990 by the U.S. EPA in compliance with Section 402(p) of the CWA. This order includes those provisions of the General Industrial Storm Water Permit that pertains to dairies. Once a discharger is authorized under Order No. 99-11, coverage under the State Water Resources Control Board's General Industrial Storm Water Permit (Order No. 97-03-DWQ) will be terminated.

10. Wastes from CAFOs contain high concentrations of salts (total dissolved solids and nitrates). Previous studies conducted by the Board have shown that cow manure produced in the Region contains about 160 pounds of salt per (dry) ton of manure (110 pounds of salt per ton of manure @ 33% moisture). The application of manure or the discharge of process wastewater[1] to land results in the discharge of salts that has adversely impacted, and continues to adversely impact, the quality of groundwater and surface water in the Region.

[1] Process wastewater shall mean any process generated wastewater and any precipitation (rain or snow) which comes into contact with any manure, litter or bedding, or any other raw material or intermediate or final material or product used in or resulting from the production of animals or poultry or direct products (e.g. milk, eggs).

11. Most of the CAFOs in the Region overlie the Chino Groundwater Basin. The Chino II and III Groundwater Subbasins lack assimilative capacity for additional salt inputs (total dissolved solids and nitrogen). For groundwater subbasins without assimilative capacity, salt inputs that exceed the water quality objectives for these subbasins cannot be allowed (State Water Resources Control Board Order No. 73-4, the Rancho Caballero decision). To meet the Chino Basin groundwater objectives, as well as the groundwater objectives for any other subbasin lacking assimilative capacity, the discharge of manure and other animal wastes, such as process waste water, and their application as fertilizer and irrigation water, must be controlled to prevent further exceedance of water quality objectives. Salt discharges in excess of water quality objectives can only be allowed if the additional salt inputs are offset.

12. The Basin Plan assumed that two desalters would be built in the Chino Basin. The amount of salt to be extracted from the Basin from these desalters was assumed to be adequate to provide sufficient salt removal to offset the present and projected salt loads from ongoing discharges from CAFOs. However, only one desalter is currently being built. This desalter will extract enough salt to offset the amount of salt being added to the basin from process wastewater water discharges. No mitigation measures are currently in place to offset the salt loading from manure application within the Basin. Therefore, the discharge of manure, and its application as fertilizer, must be prohibited.

13. The Board has considered antidegradation pursuant to 40 CFR 131.12 and State Board Resolution No. 68-16 and finds that these discharges are consistent with the State and Federal regulations, as long as appropriate salt offset programs are implemented.

14. In accordance with Water Code Section 13389, the issuance of waste discharge requirements for these discharges is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (Commencing with Section 21100), Division 13 of the Public Resources Code.

15. The Regional Board has notified interested agencies and persons of its intent to issue general waste discharge requirements for discharges of wastes CAFOs, and has provided them with an opportunity to submit their views and recommendations.

16. The Regional Board, in a public meeting, heard and considered all comments pertaining to discharges of wastes from CAFOs proposed to be regulated under the general waste discharge requirements.

IT IS HEREBY ORDERED that, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder and the provisions of the Clean Water Act as amended, and regulations and guidelines adopted thereunder, dischargers, their agents, successors, and assigns, discharging wastes from CAFOs shall comply with the following:

## A. DISCHARGE SPECIFICATIONS:

1. The discharger shall design, construct and maintain containment structures to retain all wastewater within its facility, including all process generated wastewater[2] and all precipitation on, and drainage through, manured areas resulting from storms up to and including a 24-hour, 25-year storm.

2. The discharger shall develop and fully implement an Engineered Waste Management Plan (EMWP) acceptable to the Executive Officer. The EMWP shall be developed by a registered professional engineer, or other qualified individual, in accordance with the guidelines specified in Attachment "B" of this order. The Executive Officer is hereby authorized to make necessary revisions to the guidelines for the preparation of an EWMP outlined in Attachment "B".

3. The discharge to any surface water bodies, or tributary thereof, is prohibited unless a chronic[3] or catastrophic[4] rainfall causes overflow from a storage facility designed, constructed, maintained and operated to contain all process generated wastewater plus the runoff from a 24-hour, 25-year storm.

4. Retention ponds and manured areas at CAFOs in operation on November 27, 1984, shall be protected from inundation or washout by overflow from any stream channel during 20-year peak stream flows. Facilities existing before November 27, 1984 that are protected against 100-year peak stream flows must continue to provide such protection. New facilities (built after November 27, 1984) shall be protected from 100-year peak stream flows.

5. Disposal of manure to land is prohibited, unless allowed by separate waste discharge requirements issued by the Board.

6. The use of manure as a fertilizer in any area that may affect a groundwater subbasin lacking assimilative capacity, including the Chino Groundwater Basin, is prohibited unless a plan, acceptable to the Executive Officer, is implemented which mitigates the effects of that use on the underlying groundwater subbasin.

---

[2] Process generated wastewater shall mean water directly or indirectly used in the operation of a feedlot for any or all of the following: Spillage or overflow from animal or poultry watering systems; washing, cleaning of flushing pens, barns, manure pits or other feedlot facilities; direct contact swimming, washing or spray cooling of animals; and dust control.

[3] Chronic rainfall means a series of wet weather conditions which would not provide opportunity for dewatering and which total the volume of the 25 year, 24 hour storm event.

[4] Catastrophic rainfall means any single event which would total the volume of the 25 year, 24 hour storm event; this could include tornadoes, hurricanes or other catastrophic conditions which could cause overflow due to winds or mechanical damage.

7. Manure applied to cultivated cropland outside of any area that may affect a groundwater subbasin lacking assimilative capacity, including the Chino Groundwater Basin, shall not exceed agronomic rates and shall be incorporated into soil soon after application or appropriate containment (based upon the specific crop grown) controls must be provided. For any application of manure to cropland above 12 dry tons per acre per year (17.5 tons/year @ 33% moisture), an explanation of the type of crop and the number of times it is harvested per year shall also be included in the annual report.

8. Manure removed from the corrals shall be removed from the facility within 180 days. Any manure remaining at the facility after 180 days of being removed from the corrals is considered to be disposal of manure and is prohibited in accordance with Discharge Specification A.5. A manifest of the manure hauled away shall be prepared and submitted with the annual report in accordance with Monitoring and Reporting Program No. 99-11. (The discharger shall be responsible for active management of legal disposal of manure from the property over the six month period following removal of the manure from corrals. This means that legal disposal must be coordinated with periods of rainfall such that manure can be removed from the facility within 180 days of being scraped from corrals.)

9. On two designated "clean days" per calendar year, facilities subject to this order shall be free of all stockpiled manure that has been removed from corrals. These "clean days" shall be selected by each discharger, beginning in 2000. The two "clean days" shall be at least four months apart. Each "clean day" shall be identified and reported to the Board office at least five working days in advance of the selected date.

10. All surface drainage from outside of the facility shall be diverted away from any manured areas unless such drainage is fully contained.

## B. PROVISIONS:

1. Neither the treatment nor the discharge of wastes shall create, or threaten to create, a nuisance or pollution as defined by Section 13050 of the California Water Code.

2. This order shall serve as a general National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Clean Water Act or amendments thereto. The general permit shall become effective 10 days after the date of its adoption provided the Regional Administrator of the Environmental Protection Agency has no objection. If the Regional Administrator objects to its issuance, the permit shall not become effective until such objection is withdrawn.

3. This order expires on August 1, 2004. However, it shall continue in force and effect until a new general permit is issued. All dischargers authorized to discharge under the expired permit may continue to discharge waste in accordance with that permit until a new permit is issued.

4. Upon receipt of an application to discharge wastes under this order, the Executive Officer shall authorize the proposed discharge by transmitting a "Discharge Authorization Letter" to the discharger. The discharge authorization letter may be terminated or revised by the Executive Officer at any time.

5. Upon issuance of a discharge authorization letter from the Executive Officer to discharge wastes under this order, the discharger's authorization to discharge waste under the State Water Resources Control Board's General Industrial Storm Water Permit (Order No. 97-03-DWQ) is hereby terminated.

6. All discharges from the facility must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies regarding discharges of storm water to storm drain systems or other courses under their jurisdiction.

7. Storm flows in excess of a 24-hour, 25-year storm event may be discharged to surface water bodies in accordance with the requirements specified in U.S. Environmental Protection Agency's "Effluent Guidelines and Standards for Feedlot's, 40 CFR Part 412". Additionally, storm flows resulting from chronic or catastrophic events may also be discharged to surface water bodies in accordance with the U.S. Environmental Protection Agency's effluent guidelines referenced above.

8. The discharger shall comply with Monitoring and Reporting Program No. 99-11.

9. The discharge of wastes to property not owned or controlled by the discharger, except as authorized by this order, is prohibited.

10. The discharger shall comply with all Federal, State, County and local laws and regulations pertaining to the discharge of wastes from the facility.

11. Following a storm event, the discharger shall restore the wastewater holding capacity of retention ponds in a timely manner.

12. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the discharger from liabilities under Federal, State, or local laws, nor guarantee the discharger a capacity right in the receiving waters.

13. This order does not convey any property rights of any sort, or any exclusive privilege.

14. An authorization to discharge wastes under this order is not transferable to any person without written authorization from the Executive Officer.

15. The discharger shall comply with all requirements of this order and all terms, conditions, and limitations specified in the discharge authorization letter issued by the Executive Officer.

16. The discharger shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

17. Any instance of noncompliance with this order constitutes a violation of the Clean Water Act (CWA), its regulations, and the California Water Code, and is grounds for enforcement action, and/or termination of the authorization to discharge.

18. The provisions of this order are severable, and if any provision of this order, or the application of any provisions of this order to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this order shall not be affected thereby.

19. It shall not be a defense for a discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this order.

20. Compliance determination with the terms of this order shall be based on the following:

    a. Periodic inspections by Regional Board staff;
    b. Evaluation of the annual report of animal waste and storm water discharge submitted according to the attached monitoring and reporting program; and
    c. Any other information deemed necessary by the Executive Officer.

21. The Regional Board, USEPA, and other authorized representatives shall be allowed:

    a. Entry upon premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this general permit;
    b. Access to copy any records that are kept under the conditions of this general permit;
    c. To inspect any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this general permit; and
    d. To photograph, sample, and monitor for the purpose of assuring compliance with this general permit, or as otherwise authorized by the CWA.

## C. PERMIT REOPENING, REVISION, REVOCATION, AND RE-ISSUANCE:

1. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal CWA, or amendments thereto, the Board will revise and modify this order in accordance with such standards.

2. This order may be reopened to address any changes in State or Federal plans, policies or regulations that would affect the quality requirements for the discharges.

## D. PENALTIES:

1. The CWA provides that any person who violates a provision implementing sections 301, 302, 306, 307, or 308 of the CWA is subject to a civil penalty not to exceed $11,000 per day of such violation. Any person who willfully or negligently violates provisions implementing these sections of the CWA is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

2. The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $11,000 per violation, or by imprisonment for not more than 6 months per violation, or by both.

3. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $11,000 per violation, or by imprisonment for not more than six months per violation, or by both.

4. The California Water Code provides that any person who violates a waste discharge requirement or a provision of the California Water Code is subject to civil penalties of up to $5,000 per day, $10,000 per day, or $25,000 per day of violation, or when the violation involves the discharge of pollutants, is subject to civil penalties of up to $10 per gallon per day, or $20 per gallon per day of violation; or some combination thereof, depending on the violation, or upon the combination of violations.

## E. REQUIRED REPORTS AND NOTICES:

1. Reporting Provisions:

   a. All applications, annual reports, or information submitted to the Regional Board shall be signed and certified in accordance with 40 CFR 122.22.

   b. Any discharger authorized to discharge waste under this order shall furnish, within a reasonable time, any information the Regional Board or EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating their authorization or this general permit. The discharger shall also furnish to the Regional Board, upon request, copies of records required to be kept by this order.

c. Except for data determined to be confidential under Section 308 of the CWA, all reports prepared in accordance with the terms of this general permit shall be available for public inspection at the offices of the Regional Water Quality Control Board and the Regional Administrator of USEPA. As required by the CWA, effluent data shall not be considered confidential. Knowingly making any false statements on any such report may result in the imposition of criminal penalties as provided for in Section 309 of the Act and Section 13387 of the California Water Code.

2. The discharger shall notify the Regional Board by telephone within 24 hours of any unauthorized discharge of waste from the facility. This notification shall be followed by a written report including the following:

   a. The approximate date and time of the discharge;
   b. The volume and duration of the discharge;
   c. The cause of the discharge; and
   d. A time schedule and a plan to implement necessary corrective actions to prevent the recurrence of such discharges.

3. The discharger shall report promptly in writing to the Regional Board of any changes or proposed changes in:

   a. The control, ownership, operation or location of the facility;
   b. The character, location, volume or disposal methods of waste discharges; and
   c. The size of the animal population, if it increases beyond the design capacity of the facility specified in the EWMP.

4. The discharger shall give advance notice to the Regional Board of any planned changes in the permitted facility or activity that may result in noncompliance with this general permit.

## F. APPLICATION REQUIREMENTS:

1. Dischargers previously authorized to discharge wastes under Order No. 94-7, dischargers currently discharging wastes under individual waste discharge requirements, and dischargers who have submitted a notice of intent to discharge wastes under Order No. 94-7 are automatically enrolled under this Order, unless they file an application to be covered under an individual permit. Once the Executive Officer issues a discharge authorization letter, the individual waste discharge requirements are hereby rescinded.

2. Dischargers not previously authorized to discharge waste under Order No. 94-7 are required to submit the following within 60 days of the effective date of this Order for existing discharges and at least 60 days before the start of any new discharge:

a. A completed Notice of Intent Form (see attachment "A") with the appropriate filing fee;
b. An Engineered Waste Management Plan for the facility, acceptable to the Executive Officer (see Attachment "B");
c. If an acceptable EWMP has not been developed, the discharger must submit the name of the engineer, or other qualified individual, who will develop the EWMP and a proposed time schedule for its development; and
d. Any other information deemed necessary by the Executive Officer.

If the proposed discharge meets the requirements of this order, the Executive Officer will provide the discharger with a written authorization to discharge waste in accordance with these waste discharge requirements.

3. The following types of facilities are generally not required to obtain authorization under this order. Such facilities must not discharge waste which may affect water quality, or cause a nuisance or pollution as defined in Section 13050 of the California Water Code.

a. Dairies where the animal population is less than 20 (dry or milking cows).
b. Heifer or calf ranches where the herd size is less than 50.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on August 20, 1999.

G J Thibeault

Gerard J. Thibeault
Executive Officer

Attachment "A" NOI

# REQUIREMENTS FOR AN ENGINEERED WASTE MANAGEMENT PLAN

**The Engineered Waste Management Plan must be prepared by a registered professional engineer in the State of California or another qualified individual.**

## A. SITE PLAN:

Site plan shall include:

1. Address and/or legal description of the property.

2. Name, address, and telephone number of the owner and operator of the property.

3. Total gross acreage of the property, showing property boundaries and all existing and proposed facilities including buildings, storage areas, berms/levees, holding ponds, pumping facilities, culverts, drainage easements, disposal areas, croplands (whether farmed by the owner/operator or another party), etc. The site plan must include the overall dimensions, contours, a vicinity map, north arrow, and the date the plan was prepared. The plan shall be drawn on a standard blue print format using an appropriate scale that shows sufficient details of all facilities.

4. Containment facilities shall be designed to retain, on the property, all process generated wastewater and storm water runoff due to precipitation and drainage through manured areas which results from a 24-hour, 25-year storm event. Facilities in operation on November 27, 1984 shall be designed for protection of all manured areas from inundation or washout by overflow from any stream channel during 20-year peak stream flows. All manured areas for new facilities (built after November 27, 1984) shall be protected from inundation resulting from a 100-year peak stream flow. The site plan shall show all facilities necessary for containment and management of on-site storm water runoff as well as the interception and conveyance of any off-site storm water runoff through the property.

5. The site plan shall show the size, elevation, and location of all facilities proposed for containment of process generated wastewater and storm water runoff on the property (berms/levees, holding ponds, upstream diversion structures, etc.). Cross section details of these facilities shall be presented.

6. A description of existing and proposed disposal areas or cropland, designated to receive operational water.

## B. DESIGN CALCULATIONS:

Design calculations shall include:

1. Present and proposed animal population (numbers of each: milk cows, dry cows, calves, heifers, etc.) and the volume of wash water generated.

2. Amount of storm water runoff resulting from a 24-hour, 25-year storm event.

3. Total amount of wastewater (wash water and storm water) to be contained on the property.

4. Dimensions and capacity of the holding ponds.

5. Percolation rates, if used.

## C. CONSTRUCTION SPECIFICATIONS:

Construction specifications shall include the construction materials and method of compaction utilized to build berms/levees and other containment facilities.

## D. OPERATION AND MANAGEMENT PLAN:

Operations and maintenance plan shall include:

1. A proposed holding pond management plan (to provide maximum pond capacity prior to winter storms; periodic dredging, etc.).

2. A proposed wastewater distribution plan (periodic rotation of wastewater to disposal areas or croplands).

3. A proposed maintenance plan for berms/levees and other containment facilities, including a proposed rodent control plan (periodic inspections to monitor for holes/cracks or breaks, etc.)

California Regional Water Quality Control Board
Santa Ana Region

Monitoring and Reporting Program No. 99-11
for
Concentrated Animal Feeding Operations (Dairies and Related Facilities)
Santa Ana Region

## A. Monitoring

1. The discharger(s) shall inspect the waste holding and disposal areas and note any discharges off the property that is under the control of the discharger. Inspections will be made daily when wastewater is being applied to cropland and weekly during other periods. The results of all inspections will be recorded and submitted with the required reports.

2. During each significant storm event[5], the discharger(s) shall make visual inspections of all storm water containment structures.

3. The discharger(s) shall record the approximate time of each storm-related discharge that results in off-property discharges of storm water commingled with wastewater or manure, and its approximate duration.

4. The discharger(s) shall record each manure-hauling event on a manure tracking manifest form.

## B. Reporting

1. By January 15 of each year, an annual report of animal waste discharge and storm water discharge shall be submitted.

2. The annual report shall be submitted on forms provided by Regional Board staff and shall also include copies of all manure tracking manifests for the reporting period and copies of the inspection logs required to be maintained under A.1. and A.4. above.

3. The discharger shall notify the Regional Board by telephone within 24 hours of any unauthorized discharge of wastes. This notification shall be followed by a written report which shall be submitted to the Regional Board within two weeks of the discharge . The written report shall contain:

---

[5] A significant storm event is defined as a storm event which results in continuous discharge of storm water for a minimum of one hour, or intermittent discharge of storm water for a minimum of three hours in a 12-hour period.

a. The approximate date and time of the discharge;

b. The flow rate and duration of the discharge;

c. The specific type and source of the waste discharges (e.g., overflow from holding pond, rainfall runoff from manure storage areas, etc.); and

d. A time schedule and a plan to implement necessary corrective actions to prevent the recurrence of the discharge.

All reports shall be signed by a responsible officer or duly authorized representative of the discharger(s) and shall be submitted under penalty of perjury.

Santa Ana Region

FACT SHEET

# GENERAL WASTE DISCHARGE REQUIREMENTS FOR CONCENTRATED ANIMAL FEEDING OPERATIONS (DAIRIES AND RELATED FACILITIES) WITHIN THE SANTA ANA REGION, ORDER NO. 99-11, NPDES NO. CAG018001

## I. Need for General Waste Discharge Requirements

There are approximately 302 animal feeding operations (AFOs), including dairies, heifer ranches and calf nurseries in the Santa Ana Region. These AFOs contain about 370,000 animals [213,000 lactating (milking) cows, 37,000 dry (pregnant) cows, 56,000 heifers (12-18 month old cows), and 60,000 calves (less than 12 month old cows)]. Two hundred and seventy nine of these facilities (320,000 animals) are located in the Chino Basin, while 23 of the facilities (50,000 animals) are located in the San Jacinto Basin. The wastes generated at these facilities include manure, wash water[1] and storm water runoff from manured areas. About 950,000 tons of manure (at 33% moisture) were produced in the corrals by these facilities in 1998. This is equivalent to about 4,000,000 cubic yards of manure (at 33% moisture). About 15 million gallons of washwater, which contains about 10% of the manure produced by milking cows, is discharged to the ground each day. Wastes produced at AFOs contain high levels of bacteria, biochemical oxygen demand, ammonia, nitrate, phosphorus, and other salts.

Wastes in rainfall runoff from AFOs in the Chino Basin affect Chino Creek, Mill Creek and Reach 3 of the Santa Ana River, which are 303(d) listed impacted water bodies. Wastes from AFOs that are discharged to the Santa Ana River also affect the quality of groundwater in Orange County, since the Orange County Water District captures and percolates a significant amount of the flow of the Santa Ana River to recharge the Santa Ana Forebay Groundwater Subbasin. The Chino Basin is considered to have the highest concentration of dairy animals in the world, with its 279 facilities and 320,000 animals located within an area of less than 50 square miles (30,000 acres). The application of manure to the ground in the Chino Basin has resulted in significant groundwater pollution, specifically total dissolved solids (TDS) and nitrate. Affected groundwater in the Chino Basin also impacts the quality of the Santa Ana River because the Santa Ana River becomes a gaining steam in the Prado Basin where groundwater from the Chino Basin contributes to the surface flow of the Santa Ana River.

Wastes in surface runoff from AFOs in the San Jacinto Basin affect the San Jacinto River, Canyon Lake and Lake Elsinore. Phosphorus from AFOs is considered to be the primary cause of algae blooms in Lake Elsinore, the largest natural freshwater lake in Southern California. These algae blooms deplete oxygen in the lake, creating fish kills and other conditions which affect the economic development and aesthetics of the area. Proper management of wastes from AFOs is essential to protect the surface and groundwater resources of the Region.

---

[1] Water used to wash cows prior to milking, milking equipment and the milk barn.

Beginning in 1972, and continuing through 1994, the Board's regulatory approach was to issue individual waste discharge requirements to each AFO. Changes in the location, size, number of animals, or operator of these facilities were frequent and necessitated rescinding existing waste discharge requirements and issuing new requirements. The time demands to draft and rescind individual waste discharge requirements far exceeded the staff resources available to do so.

Criteria cited in 40 CFR 122.28 state that general permits may be issued for facilities 1) involving the same or substantially similar types of operations; 2) discharging the same types of wastes; 3) having the same or similar operating conditions; 4) requiring the same or similar monitoring; and 5) that are more appropriately regulated under a general permit rather than individual permits. The types of wastes and appropriate waste discharge requirements for dairies and related facilities are similar. Given this, the AFOs in the Region can be adequately and appropriately regulated by coverage under the terms of a general waste discharge permit.

On February 17, 1994, the Board adopted Order No. 94-7, General Waste Discharge Requirements For Concentrated Animal Feeding Operations, Including Dairies, Within The Santa Ana Region (NPDES NO. CAG018001). Order No. 94-7 has allowed the Board to better utilize staff resources. Currently, approximately 215 AFOs have been enrolled under Order No. 94-7. The remaining AFOs are either covered under individual waste discharge requirements issued prior to 1994, have submitted a Notice of Intent (NOI) to be covered under Order No. 94-7, or have not yet submitted a NOI. AFOs that have submitted a NOI and have not yet been granted coverage under Order No. 94-7 and AFOs that are still covered under individual waste discharge requirements, have not been granted coverage under Order No. 94-7 because they have not yet completed Engineered Waste Management Plans (EWMPs). Order No. 94-7 expired on March 1, 1999. Therefore, it is necessary to renew the waste discharge requirements contained in Order No. 94-7.

Although Order No. 94-7 regulated the discharge of waste from all AFOs (including non-dairy related facilities), the proposed order only addresses the discharge of wastes from dairies and related facilities, such as calf nurseries and heifer ranches. Over 95% of the dischargers enrolled, or waiting to be enrolled, under Order 94-7 are dairies and related facilities. Many of the requirements contained in Order No. 94-7, and this proposed order, are not appropriate for most other types of AFOs. Therefore, persons discharging, or proposing to discharge, wastes from other types of AFOs must obtain coverage under individual waste discharge requirements or another general permit, if one is adopted.

Currently, the larger AFOs are required to get coverage under the State Water Resources Control Board (State Board) General Industrial Storm Water Permit (Order No. 91-13-DWQ) for storm water runoff from their facilities. However, the proposed order consolidates all requirements for AFOs, including those for storm water runoff, into a single permit. Once coverage is granted under this order, other waste discharge requirements issued by this Regional Board and coverage under the State's General Permit will be terminated.

The Federal Clean Water Act (CWA) states that all concentrated animal feeding operations (CAFOs) are point sources and are subject to NPDES permitting requirements. The CWA defines a CAFO as any AFO that has more than 1,000 animal units (i.e., dairy cattle are considered 1.4 animal units). About 70% of the AFOs in the Region have over 1,000 animal units, and are, therefore, considered CAFOs under the CWA. However, the CWA states that smaller facilities can be designated as CAFOs by the permitting authority (i.e., Regional Board) after considering certain criteria. These criteria include, in part, the location of the AFO relative to surface waters, the slope, rainfall and other factors that increase the likelihood or frequency of discharges, and the impact of the aggregate amount of waste from many small operations in a watershed that exceed that of lager operations. Board staff has determined that all dairies, heifer ranches and calf nurseries in the Region meet one or more of these criteria, and, therefore, should be designated as CAFOs under the CWA. Tentative Order No. 99-11 designates all dairies, heifer ranches and calf nurseries in the Region as CAFOs, and makes them subject to NPDES requirements. Therefore, the acronym "CAFO" will be used to describe all facilities addressed by Tentative Order No. 99-11.

## II. Basis for Discharge Limitations

### Development and Implementation of Engineered Waste Management Plans

In compliance with the CWA and the California Code of Regulations, Tentative Order No. 99-11 prohibits discharges to any surface water bodies, or tributary thereof, unless rainfall events, either chronic or catastrophic, cause an overflow of process waste water from a facility designed, constructed and operated to contain all process generated waste waters plus the runoff from a 25-year, 24-hour rainfall event. (Title 27, Chapter 7, Subchapter 2, Article 1, Section 22562(a), California Code of Regulations and 40 CFR Part 412). Therefore, process waste water in overflows resulting from rainfall events that are chronic or catastrophic, or are in excess of a 24-hour, 25-year rainfall event, may be discharged to surface water bodies in accordance with requirements specified in this order. To insure that compliance with these requirements is achieved, all CAFOs are required to develop and implement an Engineered Waste Management Plan (EWMP). The guidelines for the preparation of an EWMP are included in Attachment "B" of the proposed order. Attachment "B" is intended to be revised by the Executive Officer in the near future. As with expired Order No. 94-7, Tentative Order No. 99-11 authorizes the Executive Officer to make necessary revisions to "Attachment B".

### Prohibition on the Application of Manure to Land in the Chino Basin

The Regional Board has conducted extensive studies on TDS and nitrate using computer models to determine acceptable salt loading rates to groundwater from various land uses, including dairies and other animal confinement facilities. These studies are the basis of the TDS and nitrogen management plan specified in the Water Quality Control Plan (Basin Plan) for the Region. In accordance with the TDS/nitrogen management plan, since 1972, waste discharge requirements adopted by the Board for CAFOs limited the amount of manure disposal on disposal acreage at

CAFOs to 3 (dry) tons (4.38 tons @ 33% moisture) per acre per year to address potential groundwater impacts. The resultant salt load is roughly equivalent to that permitted by the plan for other types of land use when the affected receiving waters have salt assimilative capacity. Dairy manure contains much more salt per unit of nitrogen than other types of fertilizers. The Board's 1990 Dairy Report, "Dairies and Their Relationship to Water Quality Impacts in the Chino Basin", showed that the use of manure as a fertilizer results in two to four times more salt reaching groundwater (up to 10 times more non-nitrate salts) than the use of non-manure commercial fertilizers. For this reason, the use of manure to meet the nutrient needs of crops results in excessive application of salts that are not utilized by plants and which can, therefore, migrate to groundwater. Order No. 94-7 limited manure application to cropland to agronomic rates [up to 12 (dry) tons (17.5 tons @ 33% moisture) per acre per year]. Limiting the amount of manure applied to cropland to agronomic rates was an attempt to minimize the amount of salt that would reach groundwater from the use of manure on cropland, without hindering the effective use of manure as a fertilizer.

Ninety percent of the CAFOs in the Region are located in the Chino Basin, which has severe TDS and nitrate groundwater quality problems. As noted in the Board's Basin Plan, the Chino II and III Groundwater Subbasins lack assimilative capacity for these constituents. For groundwater subbasins without assimilative capacity, additional salt inputs at rates above Basin Plan objectives cannot be allowed (State Water Resources Control Board Order No. 73-4, the Rancho Caballero decision). To meet the Chino Basin groundwater objectives, the discharge of manure and other animal wastes, such as dairy wash water, and their application as fertilizer, cannot be legally permitted unless this salt load is offset. The Basin Plan contains a dairy regulatory strategy that was developed in the Board's 1990 Dairy Report. One element of that strategy addresses waste discharge requirements for manure and wash water disposal and application of wastes to cropland. That element specifies that ongoing manure and wash water disposal or application to cropland in the Chino Basin must be prohibited unless suitable salt offset programs are implemented.

In 1994, the Board was informed that two desalters would be built in the Chino Basin. The Board was also informed that a significant amount of manure would be exported from the Chino Basin by the proposed Chino Basin Co-Composting Facility. It was assumed that after the Chino Basin Co-Composting Facility began operation and began exporting a significant amount of manure, the amount of salt to be extracted from the Chino Basin by the two desalters would be adequate to provide sufficient salt removal to offset the present and projected salt loads from ongoing dairy discharges. Therefore, the Board adopted Order No. 94-7, allowing manure and wash water discharges to continue, on the assumption that adequate salt offsets would be implemented. However, the desalters were never built (although one is now under construction) and the Co-Composting Facility, built in 1995, has never exported the significant amount of manure that had been projected. Therefore, sufficient offsets were not implemented, and manure and wash water discharges, and the use of manure on cropland, have been continuing without adequate salt offsets, in violation of State law.

Board staff estimates that over 13 million tons of manure have been applied in the Chino Basin since the mid-1950's, resulting in over 1.4 million tons of salt that have reached, or will reach,

groundwater. The application of about 400,000 tons of manure (@ 33% moisture) per year to disposal land, cropland and ongoing stockpiles in the Chino Basin is continuing. Board staff estimates that the current rate of application of manure and wash water to land in the Chino Basin is resulting in about 34,000 tons of salt that will reach groundwater each year. About 30,000 tons per year is from the application of manure, and about 4,200 tons per year is from the discharge of wash water. A desalter is currently being built in the Chino Basin. The extraction wells that will supply water for the desalter are expected to remove about 11,500 tons of salt per year from the Chino Basin. Kaiser Steel will be credited with an offset of 4,000 tons of this salt each year for a period of 25 years, in accordance with a previous settlement agreement with the Board. The Board has previously indicated that it would accept the remainder of the salt that will be removed from the extraction wells as an offset for continuing discharges from CAFOs in the Chino Basin. However, that amounts to an offset of only 7,500 tons of salt per year, compared to a current CAFO salt loading to groundwater of about 34,000 tons per year. In addition to the 4,200 tons of salt that reaches groundwater each year from wash water discharges, salt also is discharged to groundwater as a result of the percolation of rainfall runoff from corrals and drainage from manure stockpiles. The amount of salt that reaches groundwater each year from the percolation of rainfall runoff from corrals and percolation of drainage from manure stockpiles has not yet been adequately determined. However, staff believes that it may account for the remaining 3,800 tons of salt offset provided by the desalter, leaving no, or very little, salt offset available for continued manure application in the Chino Basin. No other mitigation measures are currently in place, and none are expected to be in place immediately, to offset the salt loading from ongoing manure application in the Chino Basin. Therefore, the discharge of manure and its application as fertilizer in the Chino II and Chino III Subbasins must be prohibited. The remainder of the subbasins in the Chino Basin are of excellent quality and are tributary to the Chino II and Chino III Subbasins. Also, the addition of salt to those subbasins by the application of manure was not considered when the assimilative capacity for those subbasins was determined. Therefore, Tentative Order No. 99-11 prohibits the discharge of manure and its application as fertilizer throughout the entire Chino Basin (The accompanying cease and desist order allows manure to continue to be applied to cultivated croplands within the Chino Basin at agronomic rates as long as significant progress is being made towards the construction and operation of a second desalter within the Chino Basin). Tentative Order No. 99-11 does not prohibit the on-site discharge of wash water, rainfall runoff from corrals, or drainage from manure stockpiles, since the salt loadings from these discharges appear to be offset by the salt that will be removed by the desalter facility.

Removal of Manure from the Facility

Tentative Order No. 99-11 requires that manure be hauled from each facility within 180 days after being removed from the corrals. Any manure remaining at the facility after 180 days of being removed from the corrals is considered to be disposal of manure and is prohibited by Tentative Order No. 99-11. Draft Order No. 99-11, which was distributed for comments in March and April 1999, proposed requiring the removal of manure from the facility within 90 days after removal of the manure from the corrals. Several comments were received in writing and orally at Board Workshops, stating reasons why this time frame was unreasonable. Board staff also solicited

comments from farm advisors with the University of California Cooperative Extension. It was determined that it is beneficial to "cure" manure for 90 to 180 days prior to composting or for application to cropland, and that the nutrient value of the manure is not significantly affected when manure is stored for less than 180 days. During the winter, 90 days would not allow sufficient time for the manure to dry adequately prior to hauling. Providing 180 days of storage will allow the moisture content of the manure to be sufficiently reduced, making it lighter per unit of volume, and easier and less expensive to haul. Some commercial fertilizer facilities in the Chino Basin prefer receiving manure that has been aged for at least 150 days. Also, CAFOs generally remove manure from their corrals twice a year. Allowing up to 180 days (6 months) storage will result in manure being removed from the facility prior to the next corral cleaning, and will still achieve the goal of preventing the long term accumulation of manure at CAFOs. Board staff believes that allowing for 180 days storage is reasonable, and that there would be no significant difference in water quality impacts from storing manure at the facility for 180 days instead of 90 days.

Change in Language Pertaining to Containment of Storm Water Runoff

Order No. 94-7 and Draft Order No. 99-11 included the following Discharge Specification: "The discharge to any surface water bodies, or tributary thereof, is prohibited unless a chronic, catastrophic or cumulative rainfall causes overflow from a storage facility designed, constructed, maintained and operated to contain all process generated wastewater plus the runoff from a 24-hour, 25-year storm." These Orders defined a chronic, catastrophic or cumulative rainfall as rainfall occurring over a 7-day period or less which is equivalent to that from a 24-hour, 25-year storm event. This language is slightly different than similar language included in the CWA that does not refer to "cumulative" rainfall, and does not contain a definition that refers to rainfall "occurring over a 7-day period." The specification included in Order No. 94-7 and Draft Order No. 99-11 is, overall, more stringent than the language in the CWA, and was developed to provide a more objective basis for determining compliance with the rainfall containment requirement and to be consistent with the Board's EWMP Guidelines. However, the USEPA, and others, have noted that there could be instances during certain storm events of less than 7 days when the specification included in Order No. 94-7 and Draft Order No. 99-11 can be less restrictive than the language included in the CWA. They have requested that the language proposed in Draft Order No. 99-11 be changed to be consistent with the language in the CWA, since NPDES permits cannot contain requirements that can be less restrictive than the CWA. Therefore, the term "cumulative" and the reference to rainfall "occurring over a 7-day period" has been removed from Tentative Order No. 99-11 to make the rainfall containment requirement consistent with the CWA.

Consistency with USDA/USEPA "Unified National Strategy for Animal Feeding Operations"

In March 1999, the United States Department of Agriculture (USDA) and the USEPA finalized their unified national strategy for AFOs. Among other items, the national strategy recommended that general permits require the development and implementation of Comprehensive Nutrient Management Plans (CNMPs). In general, development and implementation of CNMPs is intended to bring each CAFO into compliance with the requirements of the CWA and to minimize the

impacts to groundwater and surface water by the implementation of best management practices. The national strategy describes many best management practices that could be included in CNMPs for individual CAFOs. The best management practices included in each CNMP for each CAFO would include specific best management practices for that CAFO, depending on the specific situations that exist at that particular CAFO. In general, the CNMP would assure that appropriate wastewater facilities were developed, constructed and maintained to comply with the requirements of the CWA, and that the use and application of waste water and manure (i.e., nutrient management) was managed to minimize impacts to groundwater and surface water. Tentative Order No. 99-11 does not require the development and implementation of CNMPs, as described and recommended in the national strategy. This is because the requirements included in Tentative Order No. 99-11 are equivalent to, or more stringent than, what would be required in CNMPs. Also, many of the BMPs recommended to be included in CNMPs are not relevant to the specific, isolated conditions that exist in the Chino Basin. The requirements in Tentative Order No. 99-11 for wastewater and rainfall are equivalent to what the national strategy requires. General BMPs that can be implemented to comply with the wastewater and rainfall containment requirements will be further addressed in the Board's EWMP Guidelines when they are revised in the near future. Specific BMPs that will be implemented at each CAFO to comply with the wastewater and rainfall containment requirements will be addressed in each CAFO's specific EWMP. The prohibition on the application of manure in the Chino Basin is obviously a more stringent requirement than the BMPs for manure application and management that the national strategy recommends to be included in CNMPs, since application of manure is not permitted. The limitation on the application of manure to agronomic rates, not to exceed 12 (dry) tons (17.5 tons @ 33% moisture) per acre per year, in groundwater basins outside the Chino Basin where assimilative capacity exists and application of manure is permitted, is equivalent to the nutrient management guidelines included in the national strategy. Specific BMPs addressing application of manure will be included in each CAFOs specific EWMP.

Prohibition on Covering New Discharges in the Chino Basin Under this Order

The 1998 California 303(d) List and TMDL Priority Schedule includes several surface water bodies as impaired due to CAFOs, including Chino Creek, Mill Creek (Prado Area), and Reach 3 of the Santa Ana River for nutrients, pathogens, salinity/TDS/chlorides, and suspended solids. The CWA states that NPDES permits cannot be issued to a new source (discharger) if the discharge will cause or contribute to the violation of water quality standards, unless certain specified criteria are met, including the development of TMDLs. In the absence of a current TMDL, USEPA has recommended that this general permit be limited to current facilities, and that any new sources (i.e., construction of any new facilities) be processed through an application for an individual NPDES permit. Therefore, Tentative Order No. 99-11 prohibits new sources (i.e., new facilities) from being covered under this general permit. Since the most recent new construction of a CAFO facility in the Chino Basin was approximately 20 years ago, this prohibition is not expected to be a significant issue.

Inability of Many CAFOs to Immediately Comply with Several Requirements Included in this Order

Many CAFOs will not be able to immediately comply with several of the requirements contained in Tentative Order No. 99-11. These requirements include the prohibition on the application of manure in the Chino Basin, implementation of EWMPs and containment of rainfall from a 24-hour, 25-year storm. The Board will consider adoption of a Cease and Desist Order No. 99-65 with a time schedule for compliance with these requirements.

## III. Coverage Under the General NPDES Permit

### A. Dischargers Currently Regulated Under Order No. 94-7 or Under Individual Waste Discharge Requirements, and Dischargers that have Submitted NOIs

These dischargers will be automatically enrolled under the proposed order, once it is adopted. Dischargers who have not yet submitted an acceptable EWMP (see Attachment "B" of the order) are required to do so.

### B. Dischargers Not Currently Regulated Under Order No. 94-7 or Under Individual Waste Discharge Requirements, and Dischargers that have not Submitted NOIs:

At least 60 days prior to initiating a discharge at an existing facility, the discharger shall submit a Notice of Intent (NOI) (see Attachment "A") with the appropriate filing fee (currently, the filing fee is $2,000.00 for each facility) and an acceptable EWMP[2].

## IV. Discharge Authorization Letter

Upon adoption of this order, the Executive Officer shall issue discharge authorization letters to dischargers currently enrolled under Order No. 94-7, discharging waste under individual waste discharge requirements or who have submitted an NOI to be covered under a general permit.

Upon receipt of a complete application for initiation of a discharge at an existing facility, the Executive Officer will review the application to determine eligibility for discharge under this order. If the Executive Officer determines that the discharger is eligible to discharge wastes under this general order, the Executive Officer may authorize the proposed discharge. Otherwise, the Executive Officer may require the discharger to obtain individual waste discharge requirements.

---

[2] New operators/owners of existing facilities for which an EWMP has been approved are not required to submit an additional EWMP.

## V. Antidegradation Analysis

The Regional Board conducted extensive TDS and nitrate studies using computer models to determine acceptable salt loading rates to groundwater from various land uses, including dairies and other concentrated animal feeding operations. These studies indicate that if the requirements specified in the proposed general permit are met, water quality of the Region is not expected to degrade as a result of discharges authorized under this general permit. The Regional Board, in establishing the requirements in the tentative order, has taken into consideration the requirements of the State and Federal "antidegradation policies" and has determined that the discharges are in conformance with the antidegradation policies.

## VI. Written Comments

All written comments regarding the proposed general order should be submitted to: Robert Holub, Regional Water Quality Control Board, 3737 Main Street, Suite 500, Riverside, CA 92501.

## VII. Information and Copying

Persons wishing further information may write to the address given below (see IX, below) or call the Regional Board at (909) 782-4130. Copies of the proposed waste discharge requirements, and other documents (other than those which the Executive Officer maintains as confidential) are available at the Regional Board office for inspection and copying by appointment scheduled between the hours of 10:00 a.m. and 4:00 p.m., Monday through Thursday (excluding holidays).

## VIII. Register of Interested Persons

Any person interested in a general permit, or in a particular application or group of applications, may leave his name, address, and phone number as part of the file for an application. Copies of tentative waste discharge requirements will be mailed to all interested parties.

## IX. Workshops and Public Hearing

The Regional Board conducted public workshops on April 9, 1999, May 21, 1999, and June 25, 1999, to solicit comments on the draft general waste discharge requirements that were distributed in March and April 1999. Oral comments were received during these workshops, and written comments were submitted by several parties. These comments were considered by staff and incorporated into Tentative Order No. 99-11, as appropriate.

The Regional Board will hold a public hearing and consider adopting Tentative Order No. 99-11 during a public meeting on August 20, 1999, beginning at 9:00 a.m. The meeting will be held at the City Council Chambers of Loma Linda, 25541 Barton Road, Loma Linda.

Further information regarding the conduct and nature of workshops and pubic hearings concerning waste discharge requirements may be obtained by writing or visiting the Santa Ana Regional Board office, 3737 Main Street, Suite 500, Riverside, 92501 or by calling Robert Holub of Regional Board Staff at (909) 782-3298.

California Regional Water Quality Control Board
Santa Ana Region

August 20, 1999

ITEM:

SUBJECT: General Waste Discharge Requirements For Concentrated Animal Feeding Operations (Dairies And Related Facilities) Within The Santa Ana Region, Order No. 99-11, NPDES No. CAG018001

DISCUSSION:

See attached Fact Sheet

RECOMMENDATION:

Adopt Order No. 99-11, as presented.

Comments were solicited from the following agencies and/or persons:

U.S. EPA, Washington, Office of Wastewater Enforcement and Compliance - Michael B. Cook
U.S. EPA, San Francisco – Alexis Straus
U.S. EPA, Permit Issuance Section - Terry Oda (W-5-1)
U.S. EPA, San Francisco – Dan Meer
State Water Resources Control Board, Office of the Chief Counsel - Ted Cobb
State Water Resources Control Board, DWQ – Jim Kessel, Jack Hodges, Cheryl Closson
State Department of Water Resources - Glendale
State Department of Health Services - San Bernardino/Santa Ana/San Diego
State Department of Fish and Game - Fred Worthley

# RECYCLED WOOD PRODUCTS -IV GREEN WASTE COMPOSTING NONA REPORT

## 1.0 INTRODUCTION

The Recycled Wood Products IV (RWP) is a green waste (Tier I) composting facility in the city of Ontario, operated by Mr. Chris Kiralla. This property is leased from Golden Ontario Holdings by Mr. Bob Feenstra. The property is located at 7325 Edison Avenue in Ontario. The total size of the property is 36.5 acres, A total of 10.5 acres of the site is used for the active green waste composting operation. Two other small side businesses consisting of fruit waste recycling, and wood chips & manure bagging are also in operating at this site. The APN numbers for the entire site is 1053-391-01. Prior to the composting operation, the facility was a dairy site. The corrals, and the pond were cleaned of any manure residue prior to start of the composting operation.

**Facility Data**

The following data has been obtained from the client by Sierra's Engineering staff.

| | |
|---|---|
| Property Owner: | Mr. Gary Dou, Golden Ontario Holdings |
| Address | 14240 Sapphire Hill Lane<br>Chino Hills, CA 91709 |
| Contact No. | (562)921-9974 |
| Property Lease Holder: | Mr. Bob Feenstra<br>Residual Recovery Group<br>P.O. Box 17482<br>Anaheim Hills, CA 92817 |

| Email Address | chris@rwpmulch.com |
| Contact No. | (909)868-6882 |
| Facility Location: | RWP Ontario IV<br>7325 Edison Avenue<br>Ontario, CA 91762 |

| | | | |
|---|---|---|---|
| Acreage: | Composting Area ( green waste receiving, 2 acres, active curing 6 Acres, finished products & storage, 2.5 Acres) | 10.50 | acres |
| | SMC Fruit Waste Processing Area | 3.0 | acres |
| | Gro Well Wood Chips & Manure Bagging | 10.0 | acres |
| | Buildings, Road ways, lawns, Display Area | 10.05 | acres |
| | Containment Pond, Drainage path & Berms. | 3.0 | acres |
| Total | | 36.55 | acres |

About 5 acres of the property consist of buildings, barns, offices and landscaped area facing Edison Avenue. The stormwater runoff from this area drains toward Edison Avenue on the north side of the property.

The property is listed in the Assessor Map Book No. 682 , Section 17, Township 2S, Range 7W, the property and the surrounding area land use is agricultural. The total size of the green waste composting area is about 10.5 acres. The land use within 1 mile radius of the facility is primarily agricultural, with some mixed residential. The facility receives city water, but, the onsite irrigation well is the main source of water for the composting operation ( see the site plan for the ground water well location). The nearest surface water body to the site is Cucamonga Creek at about 1.5 miles distance from the composting operation.

The new operations at the site consist of discarded fruits & vegetable recovery for animal feed, wood chips & manure bagging & the green waste composting operations.

## 2. FRUITS & VEGETABLES RECOVERY OPERATION

The fruits and vegetables are received in packaged and un packaged containers. Approximately 60% of the material (fruits, vegetables and a little bit of breads) received is clean (no packaging). The other 40% has some sort of packaging that is de-packaged at the site.

The material (discarded fruits and vegetables) arrive in cardboard totes and is unloaded from the trucks. The total number of trucks unloaded is four (4) per day. The maximum amount of fruits and vegetable received and processed per day is 75 tons, or about 62 cubic yards. Once unloaded, the totes are tipped into one of the two cement pits depending if the material is clean or not. The tipped clean material is scraped from a pit with a front loader and loaded directly into a trailer. The tipped material that has packaging is scrapped from a pit and loaded into a de-packager. Once de-packaged, the clean material is conveyed into a cement lined bunker; then scraped and loaded into a trailer. Once the trailer is full with clean material, it is hauled down the street to feed cattle that are either owned by the Ontario Agricultural Commodities (OAC) or by one of the partnering cattle producers. This whole process from unloading the material to delivering clean feed to the cattle takes only a couple of hours.

Recently, part of the operation has become mechanized by utilizing a press on a small portion of the clean material. The pressed juice from the material is pumped into a tanker and once full,

delivered by the tanker to Vivotien ( a local business) as feed for them to mix in and feed to their larvae. The solids left over from the press are used as cattle feed.

The packaging left over from the de-packager is conveyed to a separate cement lined bunker where it is scraped and loaded into an on-site roll-off container that is owned by the City of Ontario and picked up every day, 6 days a week.

## 2.1 Wood Chips & Manure Bagging Operation

The Gro Well wood chips & bagging operation consist of receiving by trucks dry manure and wood chips. The materials are piled on the south west side of the facility, and then delivered by fork lift into the stationary hopper, where it is dropped on a reclining conveyor belt and moved to the automated bagging units. The wood chips or dry manure is transferred from the inclined conveyor belt into 30 lbs bags attached on the automated bagging chain line. The bags are filled and sealed by the automated system and dropped on the pallets on the ground. Each bag filling duration is about 15 seconds. The processing rate is about 200 bags per hour, and the facility operates one shift per day. The pallets containing about 20 bags are then picked up by the forklift and delivered to a temporary station for loading into the trucks and delivery to the customer. The entire bagging system is in a covered area, and the bagging unit is equipped by dust control unit for collection of any dust generated during the bags filling operation.

The facility has a stock pile of dry manure on the south west side of the property. The stock piled manure is being continually used for the manure bagging operation, During the spring season there is a greater demand for dry manure for landscaping and gardening purposes. The manure stock pile has been reduced in size by more than 50% since last year. The measured size of the manure stock pile last year was 200'W. X 240'L. X 12' H. which equals to 576,000 CF, or 21,333 CY. The recently measured stock pile dimensions is 140' W. X 150' L. X 12 H. which is equivalent to 252,000 CF or 9,333 CY of manure. This indicates that the size and amount of the manure stockpile has been reduced by 56% in one year. Based on the current rate of production the manure stock pile will be used up & finished in less than one year from now. The bagging operation for dry manure and wood chips peaks during late winter, & spring seasons.

The facility operators conduct routine daily maintenance at the site, remove any dirt piles, or bagged materials that may block the drainage pathway.

## 2.2 Green Waste Composting Operation

The materials used in the green waste composting operation consist of untreated wood pallets, salvaged wood from warehouses, plus cut out section of trees and branches from landscaping operations. The operator has no use for blending of manure as feed. Green materials is the primary materials used in the composting process, however, a small amount of agricultural, paper ( maximum of 500 cu yard/day agricultural, and 20 cubic

yard/day vegetative food material may be used in feedstock or final products as variation when requested. The total amount of vegetative food material added to the compost will be less than 5000 cubic yards per year. There will not be also any use of the additive non-vegetative food material in the feed or final product The received green waste material is mixed and shredded into a pile. The piles are kept in long rows separated at a minimum of 25 feet intervals. The windrow piles are wetted by water spray from the water trucks moving in between the rows. Backhoes turn the piles on a going basis to distribute the moisture evenly within the mixed materials. The moistened piles are kept onsite for a period of 60 days in the curing area. The total duration for receipt, mixing, curing, storage, and delivery of the compost material is less than 90 days. The pile's moisture content and temperature is checked in the curing area on daily basis to prevent overheating, and excess moisture content building up. Once the cured material temperature is stabilized between 125 to 130 F, it is transferred to the final staging area for final screening, pick up, and delivery. The facility may keep onsite a maximum of 1,000 cubic yards of manure to amend the final product. The final product is placed in the trucks for delivery to landscaping, and gardening material suppliers and distributors in Southern California. Based on the operational history, there is no wastewater generation or runoff from the green waste curing process. The estimated size of the active composting area is 6 acres, the curing area is about 3 acres. The final material staging area is around 1.5 acres. The residual material is screened out of the compost blends with a trammel screener. A very small percentage of the material is collected as residuals. The collected residuals in placed into trash bins, stored at a designated secure area, and hauled out within a few days to the landfill. The composting operation area is not in the flood zone, and there is no creek or waterway within the 1-1/2 miles radius of this operation.

## MATERIAL PROCESS FLOW CHART

**Green Waste Receiving Area > Initial Screening & Separation>Grinding & Screening>Mixing & Curing> Final Staging Area & Residual Removal> Final Material Storage >Loading & Delivery By Trucks to Farms**

## 3. WASTEWATER MANAGEMENT SYSTEM

There is one groundwater well on-site at a **greater distance than 100 feet** from the composting area, that is used for pumping and transfer of water to the water spray tanker trucks. Each tanker truck can hold up to 2,000 gallons of water. During the dry weather condition, the tanker truck turnover rate is about 20 times per day. In the mild weather, the turnover rate could fluctuate between 10 to 12 trucks per day. The tank truck sprays water into the windrow piles at a consistent rate. An attendant is onsite during the entire moistening process to assure that there is no over spraying or runoff from the spraying,

and the water content within the piles is distributed evenly. As observed during the site inspection, no water is collected in the detention pond on non-rainy days or on rainy days with low precipitation. This indicates that there is no wastewater runoff from the composting process. The water collected in the pond is associated with occasional stormwater runoff during the wet season. No water is stored in the pond primarily throughout the year, except on rainy occasions, which generally lasts for a few days. Also, the perimeter area around the composting operation is bermed and protected from run-on. Since no composting wastewater is collected and stored in the pond, no water sampling will be conducted.

### 3.1 Stormwater Run-off/Run on

The site is bordered on the north by Edison Avenue, and on the south, east, and west by adjacent dairy, and pasture land areas. There is no potential of stormwater runoff or run-on from the property boundary areas. According to the Riverside County Flood Control, the average annual precipitation in the Chino/Ontario area is about 13 inches. The maximum historical rainfall recorded at Ontario Air Port for 24 Hr storm event in December 2010 is 2.8 inches. The maximum recorded monthly and annual rainfall are respectively 3.2 and 15 inches.

As shown in the site plan, the property is sloped to the south, and the stormwater runoff from the green waste compost production & side operations drains to the big pond situated on the south side of the composting facility via the compacted and sloped drainage pathways in between the piles. The stormwater run-off from the composting area drainage pathway is led to several surface inlets of 4 to 5 feet in width along the bermed-up length of the detention pond ( see the site plan). Stormwater runoff from the nonproduction area flows toward the southwest side of the pond. To allow a greater a greater stormwater runoff containment capacity the depth of the pond will increased from 8 feet to 12 feet. A data search of the Ontario International Weather Air Port Station indicates that highest amount of 24 rainfall occurred on December 21 to December 22 (see the attachment). The rainfall started at 11:53 AM on December 21, 2010 and stopped at 5:53 AM on December 22, 2010. The total rainfall during this period was 2.8 inches.

### 3.2 Stormwater Containment Volume

The retention pond containment volume exceeds the total volume required for the maximum 24-hr historic rainfall. The pond's average depth has been increased from 8 feet to 12 feet (see the attached site plan). The total containment volume for the pond at the site is as follows:

**Pond's Containment Capacity**

| Pond No. 1 | Area (Sq. Ft.) | Average Depth (Ft.) | Volume (Cuft.) |
|---|---|---|---|
| **780' x 86'x12' (Avg)** | **64,740** (sloped sides) | **12** | **776,880** |

**Total Area = 64,740 Sq. ft** **Total Containment Volume = 776,880 Cu. ft**

Total area of stormwater runoff leading into the containment pond = 31.5 Acres
1 acre-ft = 325,829 Gallons, = 43,560 cu. ft
Runoff from maximum-24hour storm = 2.8 inch /12 inch x 31.5 acre-ft = 7.35 acre-ft
= 320,166 cu. ft
Suspended Solids Volume = 50 cu. ft
= 320,216 cu. ft
Total Containment Volume Required = 320,216 Cu. Ft, 7.36 acre-ft
Total Containment Volume Available = 776,880 Cu. Ft. 17.83 acre-ft

As shown by the above data, the containment pond capacity well exceeds the stormwater runoff volume generated from maximum historic rainfall in the Ontario/Chino area, without taking into account the additional losses in evaporation.

## 4.0 REFERENCES

**1.0** Composting facility site inspection, February 28, 2020.

**2.0** California Water Quality Control Boards Technical Guidelines, August 4, 2015.

**3.0** Riverside County Flood Control Hydrology Manual, April 1978.

**4.0** DWR, Groundwater Wells Profile.

**5.0** Updated information on materials storage, and operation status at the site, furnished by Nathan De Boom, April 14, 2021.

**6.0** Historic rainfall data, Ontario International Air Port, Ontario, CA, December 2010.

The data confirms that the containment volume exceeds the Stormwater runoff.

Scale : 1"=30'

## GRADING NOTES

1 ALL DIKES AND BERMS SHALL BE CONSTRUCTED OF MINERAL EARTH FREE OF VEGETATION AND DELETERIOUS MATERIAL.

2 NO ROCKS OR COBBLES GREATER THAN 6 INCHES IN DIAMETER SHALL BE PLACED IN ANY FILL.

3 ALL AREAS TO RECIEVE FILL SHALL BE SCARIFIED OR RIPPED TO A DEPTH OF 6 INCHES PRIOR TO THE PLACEMENT OF ANY MATERIAL.

4 ALL MATERIAL SHALL BE PLACED IN LIFTS NO GREATER THAN 8 INCHES, WHEELED ROLLED AND WATERED TO ACHIEVE ADEQUATE COMPACTION.

| ☒ Tier I | ☐ Tier II | ☐ Tier II (monitoring) |
| If the box for Tier II (monitoring) has been marked, provide the proposed Groundwater Protection Monitoring Plan with Technical Report. | | |

## 9. TECHNICAL REPORT

Provide a complete technical report with all the information required in Attachment D of this General Order.

## 10. FILING FEE

Pursuant to California Water Code section 13260 et seq., Dischargers enrolled under this General Order are required to pay an annual fee, as determined by the State Water Resources Control Board. The filing fee accompanying this NOI is the first year's annual fee. The annual fee is based on the threat to water quality and complexity of the discharge in accordance with California Code of Regulations, title 23, section 2200. Dischargers enrolled under this General Order will be assigned a threat to water quality and complexity rating as described in the General Order and will be assessed the corresponding fee, plus any applicable surcharges. The NOI is to be accompanied by a check, made out to the State Water Resources Control Board for the payment of the filing fee.

## 11. CERTIFICATION

"I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

## INSPECTION SUMMARY (REQUIRED) (500 character limit)

An pre-requirement inspection performed at Recycled Wood Products (RWP), Ontario IV and others at this location to verify information submitted in the permit application by RWP for coverage under the Composting General Order and to gather site information for application approval. Santa Ana Water Board staff (Joanne Lee and Cindy Li) met with San Bernardino County Dept. of Environmental Health, Local Enforcement Agency (LEA) staff (Griselda Reisinger) for this inspection.

## GENERAL NOTES (OPTIONAL) (2000 character limit)

In 2016, Residual Recovery Group leased and operated a manure composting facility at this location. In 2020, RRG ceased operations and the property was sub-leased to multiple operators with multiple operations at the site.

Santa Ana Water Board staff joined LEA staff for a joint facility inspection. There are four different operations observed during inspection: Recycled Wood Products greenwaste composting operations, Gro-Well dairy manure stockpiling/bagging operations, Salvadore Coco fruit and vegetable waste processing operations, and Residual Recovery Group (RRG) one-time chicken manure composting operations. Bob Feenstra of RRG/AG Concepts, Inc. is the master lease holder and representative of the landowner. RRG sub-leases the property to RWP, Gro-Well , and Salvadore Coco for their operations.

All surface runoff from the site drains to the detention pond, installed by the former dairy at this location. A rusty steel drum was found on the east (west-facing) slope of the pond. RRG planned to remove the former empty cattle feed drum from the pond and reuse it offsite.

Santa Ana Water Board staff recommended that RWP composting operations be covered under the Composting General Order and begin water quality monitoring of the pond water and for the need to implement any further groundwater protection measures.

Recycled Wood Products, Ontario IV Composting Facility, 7325 Edison Avenue, Ontario,  August 2, 2022 Pre-requirement Facility Inspection, 9:30-11:15am (sunny and hot)

Looking southwest at the detention pond located south at the site (see attached site plan). Some water was observed in the pond. Surface runoff from all operations at the site discharges to the pond.

Looking south at the pond.

Looking southeast at the pond.

Looking southeast at an empty steel drum sitting on the west-facing slope of the pond. Residual Recovery Group (RRG), the master lease holder of the site property and landowner's representative, was later contacted to remove the drum from the pond. RRG stated that the empty drum was an old dairy feed (molasses) tank that was moved out back when the site was converted from a dairy to composting operations. RRG planned to remove the empty drum for offsite use.

Earthen berm located north of the pond for drainage control and runoff diversion to pond.

Looking northwest at Gro-Well manure stockpiling, bagging and storage operations (by Elvia Medina) at the site.

Looking northeast at RWP greenwaste composting operations.

RWP composting operations at the site.

Looking north at the site entrance.

RWP composting operations.

Looking west at an area north of the pond, south of Gro-Well operations at the site.

RWP windrow compost piles.

RWP windrow compost piles.

A pile of residual waste generated from screening incoming greenwaste at RWP.

Salvadore CoCo's fruit and vegetable waste processing facility, located at the northwest portion of the site, is one of the operations currently onsite. Fruit and vegetable scraps are pressed to produce juice for processing at the City's digester and solid scrap is used as cattle feed.

Looking southwest at the chicken manure composting operations by Residual Recovery Group (RRG) in an area north of Gro-Well's operations. Sheridan Griepsma and Bob Feenstra of RRG explained that this was a one-time composting event to take and compost

about 400 cubic yards of manure from a local chicken producer that is going out of business.

Looking southeast at the manure windrow compost piles. There were several windrow piles.

Looking south at the manure windrow piles. Gro-Well's manure stockpile is in the background.

Looking southwest at the manure windrow piles.

One of the manure piles measured a temperature of 126.4ºF, below 131ºF (the active composting temperature).

# RECYCLED WOOD PRODUCTS -IV GREEN WASTE COMPOSTING TECHNICAL REPORT

## 1.0 INTRODUCTION

This Technical Report has been submitted for review and approval by the Santa Ana Region Water Quality Control Board. The Recycled Wood Products IV (RWP) is a green waste (Tier I) composting facility in the city of Ontario, operated by Mr. Chris Kiralla. This property is leased from Golden Ontario Holdings by Mr. Bob Feenstra. Under the adopted order No. WQ2020-0012DWQ, the California Regional Water Quality Control Board, the composting facilities are to submit and implement a Technical Report. The property is located at 7325 Edison Avenue in Ontario. The total size of the property is 36.5 acres, A total of 10.5 acres of the site is used for the active green waste composting operation. Two other small side businesses consisting of fruit waste recycling, and wood chips & manure bagging are also operating at this site. The APN numbers for the entire site is 1053-391-01. The property was used as a Tier II manure composting facility prior to starting of the green waste composting operation. The manure composting operation ceased on October 17, 2019. Prior to the composting operation, the facility was a dairy site. The corrals and the pond were cleaned of any manure residue prior to the start of the composting operation.

**Facility Data**

| | | | |
|---|---|---|---|
| Acreage: | Composting Area ( green waste receiving, 2 acres, active curing 6 Acres, finished products & storage, 2.5 Acres) | 10.50 | acres |
| | SMC Fruit Waste Processing Area | 3.0 | acres |
| | Gro Well Wood Chips & Manure Bagging | 10.0 | acres |
| | Buildings, Road ways, lawns, Display Area | 10.05 | acres |
| | Containment Pond, Drainage path & Berms. | 3.0 | acres |
| Total | | 36.55 | acres |

The area of the buildings, houses, roadways, and lawn areas draining toward Edison Avenue is 4.4 acres.

The property is listed in the Assessor Map Book No. 682, Section 17, Township 2S, Range 7W, the property, and the surrounding area land use is agricultural. The total size of the green waste composting area is about 10.5 acres. The land use within a one mile radius of the facility is primarily agricultural, with some mixed residential. The facility receives city water, but, the onsite irrigation well is the main source of water for the composting operation (see the site plan for the groundwater well location). The nearest surface water body to the site is Cucamonga Creek about 1.5 miles distance from the composting operation.

The new non-composting operations at the site consist of discarded fruits and vegetable recovery for animalfeed, wood chips and manure bagging, and green waste composting operations.

## 2. SITE OPERATIONS

### 2.1 Wood Chips & Manure Bagging Operation

The Gro Well wood chips and bagging operation consists of receiving trucks of dry manure and wood chips. The materials are piled on the southwest side of the facility and then delivered by forklift into the stationary hopper, where it is dropped on a reclining conveyor belt and moved to the automated bagging units. The wood chips or dry manure are transferred from the inclined conveyor belt into the bags attached to the automated bagging chain line. The bags are filled and sealed by the automated system and dropped

on the pallets on the ground. **Each bag filling duration is about 15 seconds. The maximum processing rate is about 200 bags per hour, and the facility operates one shift per day. Each bag of wood chips weighs 30 lbs, and each bag of manure weighs 50 lbs. The average number of wood chip & dry manure bags processed on daily basis is 150. The estimated annual amount of wood chips and dry manure processed are respectively 2700 & 4500 tons/yr. The estimated amount of wood chips that is stored onsite will be limited to about four weeks' supply, around 250 tons.** The pallets containing about 20 bags are then picked up by the forklift and delivered to a temporary station for loading into the trucks and delivery to the customer. The entire bagging system is in a covered area, and the bagging unit is equipped with a dust control unit for the collection of any dust generated during the bag-filling operation.

The facility has a stockpile of dry manure on the southwest side of the property. The stockpiled manure is being continually used for the manure bagging operation, During the spring season, there is a greater demand for dry manure for landscaping and gardening purposes. The manure stockpile has been reduced in size by more than 50% since the start of the operation. The measured size of the manure stockpile at the start of operation was about 200' W. X 240'L. X 12' H. which equals to 576,000 CF, or 21,333 CY. The recently measured stockpile dimensions is 140' W. X 150' L. X 12 H. which is equivalent to 252,000 CF or 9,333 CY of manure. This indicates that the size and amount of the manure stockpile were reduced by 56% in about two years. The recent events caused a slow down in manure bagging operation, but the stockpile continues to be reduced & possibly finished in less than two years. The bagging operation for dry manure and wood chips peaks during late winter, & spring seasons. **Currently The Gro well facility has two more years of the lease remaining, with an option to extend the lease for an additional two years. Once the current manure stockpile is depleted, Gro well will import dry manure for their bagging operation, but no more than 5,000 CY of dry manure will be stored at the site at any one time.**

The facility operators conduct routine daily maintenance at the site and remove any dirt piles or bagged materials that may block the drainage pathway.

## 2.2 Green Waste Composting Operation

The materials used in the green waste composting operation consist of untreated wood pallets, salvaged wood from warehouses, and cut-out sections of trees and branches from landscaping operations. The operator has no use for blending manure as feedstock but a very small amount of manure may be added as an additive on occasion per customer demand. The maximum amount of manure that may be added on an annual basis will be less than 980 Cubic yards.

Green materials is the primary materials used in the composting process, however, a small amount of agricultural/green materials ( maximum of 500 cu yard/day) and 20 cubic yard /day vegetative food material may be used in feed stock or final products as variation when requested. The total amount of vegetative food material added to the compost will be less than 5,000 cubic yards per year. There will not be any use of the additive non-vegetative food material in the feed or final product The received green waste material is mixed and shredded into a pile. The piles are kept in long rows separated at a minimum of 25 feet intervals. The windrow piles are wetted by water spray from the water trucks moving in between the rows. Backhoes turn the piles on an ongoing basis to distribute the moisture evenly within the mixed materials. The moistened piles are kept onsite for a period of **60 days in the active composting and curing area**. The total duration for receipt, mixing, curing, storage, and delivery of the compost material is less than 90 days. The pile's moisture content and temperature are checked in the curing area on a daily basis to prevent overheating and excess moisture content build-up. Once the cured material temperature is stabilized between 125 to 130 F, it is transferred to the final staging area for final screening, pickup, and delivery. The facility may keep onsite a maximum of 1,000 cubic yards of manure to amend the final product. The final product is placed in the trucks for delivery to landscaping, and gardening material suppliers and distributors in Southern California. Based on the operational history, there is no waste water generationor runoff from the green waste curing process. The estimated size of the active composting area is 6 acres, the curing area is about 3 acres. The final material staging area is around 1.5 acres. The residual material is screened out of the compost blends with a trammel screener. A very small percentage of the material is collected as residuals . The collected residuals in placed into trash bins, stored at a designated secure area, and hauled out within a few days to landfill. The composting operation area is not in the floodzone, and there is no creek or water way within the 1-1/2 miles radius of this operation.

## 2.3 Fruits & Vegetables Recovery Operation

Fruits and vegetables are received in packaged and unpackaged containers. Approximately 60% of the materials ( fruits, vegetables, and few pieces of bread) that are received, are unpackaged clean materials picked from local supermarkets and grocery stores. The other 40% has some sort of packaging that is removed at the site. The materials (discarded fruits and vegetables) arrive in totes and are unloaded from the trucks. A total of four (4) trucks of materials are received per day. The maximum amount of fruits and vegetables received and processed per day is 75 tons, or 62 cubic yards. Once unloaded, the totes are tipped into one of the two cement pits depending if the material is clean or not. The tipped clean material is scraped from a pit with a front loader, and loaded directly into the trailer. The tipped material that has packaging is scrapped from a pit and loaded into a de-packager. Once de-packaged, the clean material is conveyed into a cement-lined bunker; then scraped and loaded into a trailer. Once the trailer is full of clean material, it is hauled down the street to feed cattle that are either owned by the Ontario Agricultural Commodities (OAC) or by one of the partnering cattle producers. This whole process from unloading the material to delivering from clean feed to the cattle takes only couple of hours.

Recently, part of the operation has become mechanized by utilizing a press on a small portion of the

clean material. The pressed juice from the material is pumped into a tanker and once full, it is delivered by the tanker to Vivotien ( a local business) as feed for them to mix in and fed to their larvae. The solids left over from the press are used as cattle feed. The packaging left over from the de-packer is conveyed to a separate cement lined bunker, where it is scraped and loaded into an onsite roll off container that is owned by the City of Ontario, and picked up 6 days a week.

**MATERIAL PROCESS FLOW CHART**

## 3. SITE GEOLOGY

The geology and hydrogeology of the site and adjacent areas (unless otherwise specified) are taken from:

*"2013 Chino Basin Groundwater Model Update and Recalculation of Safe Yield Pursuant to the Peace Agreement"*, Prepared for Chino Basin Watermaster by Wildermuth Environmental, Inc. October 2015

The subject site is located within the Chino Basin. The Chino Basin consists of about 235 square miles of the Upper Santa Ana river watershed . The basin is bounded by the Cucamonga Basin and the San Gabriel Mountains to the north; the Rialto-Colton Basin to the northeast; the chain of Jurupa, Pedley, and La Sierra Hills to the southeast; the Temescal Basin to the south; the Chino and Puente Hills to the southwest; and the San Jose Hills and the Pomona and Claremont Basins to the northwest (Figure 1-1). The location of the subject site is shown on **Figure 1-1.**

## 3.1 Geologic Setting

The general geology of the Chino Basin is shown on **Figure 2-1.** Although the entire Basin is immediately underlain by Quaternary Alluvium, **Figure 2.1** shows (within shaded borders) the nature of the rock units that underlie the water-bearing sediments of the Quaternary Alluvium. The Chino Basin was formed as a result of tectonic activity along major fault zones during the Quaternary Period. It is part of a large, broad, alluvial-filled plain located between the San Gabriel Mountains to the north (Transverse Ranges) and the elevated Perris block to the south (Peninsular Ranges), which is sometimes referred to as the Chino Plain. The Santa Ana River is the main tributary draining the area.

A number of major faults are at least partly responsible for the uplift of the surrounding mountains and the depression of the Chino Basin. These faults are the Cucamonga Fault Zone, the Rialto-Colton Fault, the Red Hill Fault, the San Jose Fault, and the Chino Fault **(Figure 1-1).** The bottom of the basin, the effective base of the freshwater aquifer, consists of impermeable sedimentary and igneous bedrock formations. These formations are exposed at the surface in the surrounding mountains and hills. Sediments were eroded and washed out from the surrounding mountains and filled the Chino Basin to form its groundwater reservoirs. These sediments are greater than 1,000 feet thick in the deepest portions of the Basin.

The major faults form groundwater barriers and form some of the external boundaries of the Basin by influencing the magnitude and direction of groundwater flow.

## 3.2 Stratigraphy

### 3.2.1 Consolidated Bedrock

The consolidated bedrock formations of the Chino Basin area include the basement complex; consolidated marine sedimentary and volcanic strata; and more recent semi-

consolidated continental sedimentary deposits. Reference **to Figure 2-1** shows the surface outcrops of the consolidated bedrock formations that surround the Chino Basin.

#### 3.2.1.1 Basement Complex

The basement complex consists of deformed and re-crystallized metamorphic rocks that have been intruded by masses of granitic and related igneous rocks. These rocks were subsequently uplifted and exposed by erosion. They have been the major source of detritus to the younger sedimentary formations, particularly the younger water-bearing sediments of the Chino Basin.

#### 3.2.1.2 Undifferentiated Pre-Pliocene Formations

Well-stratified marine sandstones, conglomerates, shales, and interlayered lava flows (late Cretaceous to Miocene) overlie the basement complex and crop out along the western margin of the Chino Basin. This sequence reaches a total stratigraphic thickness of 24,000 feet in the Puente Hills, and is down-warped more than 8,000 feet below sea-level in the Prado Dam area.

#### 3.2.1.3 Plio-Pleistocene Formations

A thick series of semi-consolidated clays, sands, and gravels of marine and non-marine origin overly the older consolidated bedrock formations. These sediments have been named the Fernando Group. The upper portion of the Fernando Group is more permeable than the lower portion and thus represents a gradual transition from non-water-bearing consolidated rocks to water-bearing sediments.

## 4. WATER-BEARINGING SEDIMENTS

An intense episode of faulting, occurring in the Pleistocene, depressed the Chino Basin area and uplifted the surrounding mountains and hills. Detritus eroded from the mountains were transported and deposited in the Chino Basin on top of the bedrock formations. they were deposited as interbedded, discontinuous layers of gravel, sand, silt, and clay to form water-bearing sediments. These water-bearing sediments are differentiated into Older Alluvium of Pleistocene Age and Younger Alluvium of Holocene Age.

### 4.1 Older Alluvium

The Older Alluvium varies in thickness from about 200 feet near the southwestern end of the Chino Basin to over 1,000 feet southwest of Fontana. The pumping capacities of wells completed in the Older Alluvium generally range between 500 and 1,500 gallons per minute (gpm). Capacities exceeding 1,000 gpm are common, and some modern production wells test-pumped at over 4,000 gpm. In the southern part of the Basin where the water-bearing sediments tend to be more clay-rich, the wells generally yield less than 1,000 gpm.

### 4.2 Younger Alluvium

The streambeds, washes, and other areas of recent sedimentation are occupied by the Younger Alluvium. The You8nger Alluvium varies in thickness from over 100 feet near the mountains to just a few feet south of Interstate 10 and generally covers most of the north half of the Basin. The Younger Alluvium is not saturated and, thus , does not yield water directly to wells.

### 4.3 Effective Base of the Freshwater Aquifer

**Figure 2-2** shows the Water master's interpretation of the effective base of the freshwater aquifer in the Chino Basin.

#### 4.3.1 Eastern Chino Basin

The subject site does not lie within the Eastern Chino Basin, so that portion of the Chino Basin (east of Archibald Avenue) will not be discussed here.

#### 4.3.2 Western Chino Basin

On the west side of the Chino Basin (west of Archibald Avenue) and in the Temescal Basin, the determination of the bottom of the aquifer is not straightforward. Some boreholes to 1,400 feet bgs did not penetrate the basement complex, but terminated in highly-weathered and consolidated sediments that may be formations of the sedimentary bedrock formations. There is evidence to suggest that that the upper portions of the sedimentary bedrock formations have a useful porosity and permeability, and that these formations contribute water to deep production wells.

**Figure 2-2** shows deep wells in the western portion of the Chino Basin with screens deeper than 1,000 feet bgs. All of the well boreholes penetrated a similar sequence of sediments that include sands, gravels, silts, and clays.

## 5. SITE HYDROGEOLOGY

### 5.1 Groundwater Flow

The physical nature of the Chino Basin as a groundwater reservoir is described with regard to Basin boundaries, recharge, groundwater flow, internal barriers to groundwater flow, and discharge. **Figure 2-1** shows the physical boundaries of the Basin, primarily composed of faults and surrounding mountains and hills.

The predominant source of recharge to the Basin groundwater reservoirs is the percolation of direct precipitation and returns of applied water.

In general, groundwater flow mimics surface drainage patterns: from the forebay areas of high elevation in the north and east flanking San Gabriel and Jurupa Mountains, towards areas of discharge near the Santa Ana River within Prado Basin. The directions of groundwater flow within the Basin are shown by the groundwater contours depicted on **Exhibit 18,** taken from Chino Basin Watermaster Engineering Report-State of the Basin 2012. The direction of groundwater flow at any location is perpendicular to the groundwater contour line. In the area of the subject site, the direction of groundwater flow is directly south.

There is only one documented barrier to groundwater flow within the aquifer systems of the Chino Basin. This barrier exists only within the deep aquifer system of the western Chino Basin. The location of this barrier is shown in **Figure 2-2** just to the west of the subject site) and is named the Riley Barrier.

Groundwater moves generally in alluvium south of the mountains and west from adjacent basins through the Chino Basin; it rises to the surface along the Santa Ana River between Riverside narrows and the Prado Dam. Subsurface flow past Prado Dam has been stopped by means of a sheet-steel wall driven to the base of the water-bearing sediments (Geological Survey Water-Supply Paper 1999-G, 1972)

### 5.2 Aquifer Systems

The saturated sediments within the Chino Basin comprise one groundwater reservoir, but the reservoir can be subdivided into distinct aquifer systems based on the physical and hydraulic characteristics of the aquifer-system sediments and the contained groundwater. These aquifer systems include Layer 1 (shallow), Layer 2 (intermediate), and Layer 3 (deep). The sediments that comprise the shallow aquifer system (Layer 1) are almost fully saturated in the southern portion of the Chino Basin. Depth to groundwater increases to the north to provide a thick vadose zone for percolating groundwater in the forebay regions of the Chino Basin. The sediments within the deep aquifer system are always fully saturated. The shallow aquifer system is generally characterized by unconfined to semi-confined groundwater conditions, high permeability within its sand and gravel units and high concentrations of dissolved solids and nitrate (especially in the southern portions of the Basin). The deep aquifer system is generally characterized by confined groundwater conditions, lower permeability within its sand and gravel units, and lower concentrations of dissolved solids and nitrate. There is generally a downward hydraulic gradient.

The distinction between the aquifer systems is most pronounced within the west-southwest portions of the Chino Basin. This is likely because of the relative abundance of fine-grained sediments in the southwest (multiple layers of clays and silts). Groundwater flowing from high-elevation forebay areas to the north and east become confined beneath these fine-grained sediments in the west-southwest, and these sediments effectively isolate the shallow aquifer system from the deep aquifer system(s). The three-dimensional extent of these fine-grained sedimentary units and their effectiveness as confining layers is shown by the fact that the subject site is located in an area of historical

flowing artesian conditions, which indicates the existence of confining layers in this area. The presence of these fine-grained sedimentary units is verified by the driller's log of a water well located at 7330 Edison Avenue, directly across Edison Avenue, to the north of the site. The driller's log is contained in the DWR Water Well Drillers Report No. 105755, for State Well Number 2S/7W-17E 1. This well is 357 feet deep, with clay strata at the following intervals:

31-54 feet
115-131 feet
150-168 feet
212-225 feet
227-278 feet
280-285 feet
323-357 feet

Standing water was in the well casing at a depth of 135 feet following 35 hours of well testing. The yield was 750 gallons per minute with 23 feet of drawdown. The date of the Well Drillers Report was May 31, 1976. Reference to Exhibit 18 indicates that, in the Spring of 2012, the depth to groundwater at the site was approximately 133 feet, very similar.

The presence of confining layers beneath the site is an indication that any contaminants produced at the subject site will not likely penetrate below layer 1 and will remain in the Shallow Aquifer.

Layer 1 consists of the upper 150-950 feet of sediments and is generally representative of the shallow aquifer system. Layer 1 sediments are typically coarse (sand and gravel layers) and, where saturated, transmit large quantities of groundwater to wells due to high hydraulic conductivities. On the west side of the Chino Basin, Layer 1 sediments are composed of a greater fraction of finer-grained sediments (silt and clay layers), especially in the uppermost 100 feet. Layer 1 water quality is generally poor in the southern portion of the Basin with relatively high concentrations of TDS and nitrate. **Figure 2-6c** displays the profile view of cross-section J-J' (**Figure 2-5** shows the map view of the hydro Stratigraphic cross sections), which is aligned southwest-northeast and illustrates the thickening of layer 1 in the northeastern direction at the expense of layer 2. The thickening of Layer 1 is supported by the observation that the silt and clay layers, which are typical of Layer 2 sediments in the southwestern Chino Basin, become thinner and less abundant in the eastern and northeastern portion of the Basin. Layers 2 and 3 will not be discussed in detail due to the fact that the site is underlain by extensive clay strata and any contaminants that may leak from the site will not likely penetrate below Layer 1.

### 5.3 Hydraulic Conductivity

The vertical hydraulic conductivity of Layer 1 in the area of the subject site ranges from 5.4 x $10^{-7}$ to 2.5 x $10^{-3}$ cm/sec **(Figure 2-13a).** The hydraulic conductivity of the soil layer immediately beneath the site was determined by conducting soil percolation

tests following the procedure specified by County and local agencies. As shown on the site plan four locations within the composting working pads, and drainage pads area were designated for soil and hydraulic conductivity tests in accordance with the Technical guidelines. Two additional soil testing locations were designated along the perimeter of the detention pond.

**The soil percolation tests were conducted at a greater depth of 2 feet below the working pads, and below the bottom of the detention pond, at the designated locations shown on the site map on December 9th and 10th 2021. A copy of the soil percolation test results is attached in the Appendices.**

## 6. WASTEWATER MANAGEMENT SYSTEM

There is one groundwater well on site at a **greater distance than 100 feet** from the composting area, that is used for pumping and transfer of water to the water spray tanker trucks. Each tanker truck can hold up to 2,000 gallons of water. During the dry weather condition, the tanker truck turnover rate is about 20 times per day. In the mild weather, the turnover rate could fluctuate between 10 to 12 trucks per day. The tank truck sprays water into the wind row piles at a consistent rate. An attendant is onsite during the entire moistening process to assure that there is no over spraying or runoff from the spraying, and the water content within the piles is distributed evenly. As observed during the site inspection, no water is collected in the detention pond in non-rainy days or on rainy days with low precipitation. No water is stored in the pond primarily through-out the year, except on rainy occasions and during the wet season, which generally lasts for few days or few weeks depending on the duration or intensity of the rainy event. **Quarterly wastewater samples will be collected, when adequate amount of water is in the pond for collection of representative samples. A wastewater sample was collected during the last wet season and analyzed for the parameters listed in the Tech Report Guidelines for the Tier I composting facility. Copy of the test results is attached in the appendices.** It needs to be noted that the perimeter area around the composting operation is bermed and protected from run-on.

### 6.1 Storm water Run-off/Run on

The site is bordered on the north by Edison Avenue, and on the south, east and west by adjacent dairy, and pasture land area. There are no potential of stormwater runoff or run on from the property boundary areas. According to the Riverside County Flood Control, the average annual precipitation in the Chino/Ontario area is about 13 inches. The rain fall during the 25 yr, 24 hr storm event is around 4.2 inches. The nearest weather station at the Chino Airport indicate a maximum annual rainfall is about 15 inches. A review of the published data shows a mean annual evaporation rate in the Chino area of 75 inches. As shown in the site plan, the property is sloped to the south, and the stormwater runoff from the green waste compost production & side operations drains to the big pond situated on the south side of the composting facility via the compacted and sloped drainage pathways in between the piles. The stormwater runoff from the composting area drainage pathway is led to several surface inlets of 4 to 5 feet in width along the bermed-up length of the detention pond (see the site plan). Stormwater runoff from the non

production area flows toward the southwest side of the pond.

### 6.2 Stormwater Containment Volume

The proposed retention pond containment volume exceeds the total volume required for the annual rainfall and 25 yr, 24 hr storm. The containment volumes for the proposed ponds at the site are as follows:

**Pond's Containment Capacity**

| **Pond No.1** | **Area (Sq. Ft.)** | **Average Depth (Ft.)** | **Volume (Cuft.)** |
|---|---|---|---|
| **780' x 86'x12' (Avg)** | **64740** (sloped sides) | **12** | **776,880** |

**Total Area= 64740 Sq. ft** **Total Existing Volume= 776,880 Cu. ft**

Runoff from 25-year-24-hour storm 399,700 cu. ft., 9.17 acre-ft
Runoff from 150-day annual rainfall 382,602 cu. ft., 8.78 *acre-ft.*
Suspended Solids Volume = 50 cu. ft.
Total Containment Volume Required 743,526 Cu. Ft, 17.95 acre-ft

Runoff from the 25-year, 24-hour storm was calculated as shown in Appendix I. The 25-year, 24-hour rainfall was calculated according to plate E-5.7 in the *Riverside County Hydrology Manual.* (Riverside County was used because it provides an expanded chart). Rainfall was converted to runoff using Figure C-5, with roofed areas assigned a watershed curve number (CN) of 100, paved areas a CN of 97, and unpaved areas a CN of 90.

The containment pond capacity exceeds the 24 hr-25year storm and 150 days annual rainfall without taking into account the additional losses in evaporation.

The RWP-IV green waste composting operation is a Tier I facility. There is no process wastewater discharge or stormwater runoff from this operation off-site at the facility. The facility has obtained a NONA permit from the Regional Water Board for containing the entire stormwater runoff during a 25-year, 24-hour storm.

## 7. SITE DESIGN INFORMATION

The composting facility is designed and built to minimize soil erosion and dust formation, by having paved, and gravel roadways for materials delivery and movement. The roadways are built around the composting area, to make easy access to the windrow piles. All working surfaces are properly graded and compacted to prevent ponding and ease the surface water flow from storm events. Areas used for receiving, processing, and delivery of composting materials are designed, constructed, and maintained to control and manage stormwater run-on, and runoff.

The current size of the containment pond is 780' L. X 86' W. X 8' H. However, the containment pond will be enlarged within the next few weeks ( by November 30, 2022) by increasing the average depth of the pond from 8 feet to 12 feet. The overall dimensions of the pond will be 780' L. X 86' W. X 12' H. The composting area working pads, and drainage pathways are graded and compacted at greater than 90 %. compaction. The compacted area meets the design criteria set for the hydraulic, and soil percolation rate limits set by the State's Water Board. Hydraulic tests were conducted at the working pads, and the pond area to demonstrate compliance ( see the test results in the appendices section). The proposed pond has extra holding capacity to capture 24 hr, 25 yr storm, and annual rainfall from the composting and non-composting operations at the site.

## 8. EROSION CONTROL PLAN

The prevalent slope per onsite observation ( **no survey data is available**) is toward the southeast, where, the large containment pond is situated. The site is graded properly to prevent the settling of stormwater and soil erosion associated with loose soil and water accumulation. The composting facility and the side operations are inspected by the operators on a regular basis and prior to the start of the wet season. The production area is scraped on an annual basis and cleared from any residue that may have been accumulated during the composting process. Working surfaces are monitored after each storm event, and areas with an uneven grade, or loosened soil are compacted and re-graded. To prevent ponding and ease the stormwater flow to the containment area, all weeds, dead vegetation, and debris that may be encountered in the water flow path is cleared. Mosquito and Vector control measures are strictly enforced, and operators are trained to conduct a weekly inspection, to ensure the integrity of the structure, that there are no holes in the bermed-up areas, and soil erosion does not occur due to the presence of gophers, rabbits, rats, etc.. Additional compaction and reshaping of the bermed areas will be done if any breakdown or soil erosion is encountered.

## 9. OPERATIONS & MONITORING

To comply with the **Water Quality Board Order WQ-2015-0121-DWQ, as amended by order WQ-2020-0012-DWQ,** the facility operators are trained to conduct maintenance

and monitoring of the composting operations periodically. The operators conduct quarterly inspections of the working surfaces, berms, drainage path,

and facility perimeter. The composting facility operator also follows a strict procedure in odor control, and the site is cleaned and the residuals are placed in trash bins and hauled out onweekly basis. The composting facility has an in-house odor control program and a trained staff that conduct routine inspection and maintenance to prevent the growth of vegetation and the formation of algae in the drainage pathways and the pond area.

The facility operators are also trained in utilizing erosion control Best Management Practices (BMP). A thorough inspection of the facility is conducted on annual basis, prior to the start of the wet season to assure that no residues remain on the ground, through scraping and cleaning of the material production area, and working surfaces. Any area with loose or eroded soil will be resurfaced, compacted, and re-graded. The containment pond structure, embankments, berms, and surface drainage areas will be inspected for signs of surface failure, such as cracking or spilling. Any visible sign of surface deterioration will be logged, and taken care of within 24 hrs. Additional measures are taken during the dry season, by preventing soil erosion and dust formation, by slightly wetting and compacting the working surfaces if needed. Receiving and delivery trucks' tires are also inspected and cleaned from dust and debris.

During the rainy event, the piled material will be checked and turned over on an as-needed basis, to prevent wastewater or leachate formation. The operators will inspect the entire facility one day after each major storm event, and log in their observations. Stormwater runoff resulting in the formation of ponding will be collected and cleared within 24 hrs. If any damages are encountered, it will be repaired, and the surface will be graded, and compacted within 10 days of the storm event. The encountered damages and repairs conducted along with visible pictures will be included in the annual report submitted to the Regional Water Board The detention pond will be monitored after each storm event to determine the depth and level of the water collected. The pond will be equipped with a scaled stick for measuring the collected water in the deepest area. During the last few years of composting at the site, the operators have observed that the water collected duringthe rainy days is due to stormwater runoff. Generally few days after the rainfall the pond is dried, and no water is collected until the next rainfall. **A quarterly sampling of stormwater runoff and wastewater that is stored in the detention pond will be conducted, provided that adequate volume is collected for representative sampling.** On January 10, 2022, representative samples of the water in the pond were collected and analyzed for the parameters listed in the Technical Guideline for Tier I composting operations. The test report (see Appendix VI) showed a low concentration of the tested parameters. E Coliform will be added to the list of parameters that are to be analyzed.

Additional measures will be taken to maintain the containment pond integrity and holding capacity. The pond will be cleaned of any vegetation, dead algae, and debris. A mosquito, and vector control plan in accordance with the San Bernardino County Department of Public Health has been implemented onsite. The working surface area is cleaned from any trash, and residues on a regular basis, and maintained free of odor. All trash are collected in covered trash bins and hauled out of the facility on a weekly. Surface drainage and the pathway to the containment pond are also inspected on a weekly basis to ensure it is free of debris and sediments to ease the conveyance of water runoff. During heavy rainfall, if any of the piles can no longer absorb the precipitation, will be coveredwith a tarp to prevent material runoff, soil erosion, or the formation of a slurry.

## 10. CLOSURE PLAN

Due to the type of composting operation, and size of the production and location, as well a routine maintenance monitoring program, the chances of soil or groundwater contamination has been minimized. However, the operator, 90 days prior to vacating the site, or ceasing the operation, will submit a detailed closure plan to the Santa Ana Regional Water Quality Control Board (RWQCB) specifying the site condition, and methods used for inspection, cleaning and disposal of residues, or any potentially contaminated area. Per obtaining the plan approval, the closure activities will be conducted. The RWQCB, and local enforcement agency will be notified in writing at the conclusion of the closure activities.

## 11. COMPLIANCE SHEDULE

To show compliance with the State's Water Board requirement, **RWP-IV** conducted soil percolation tests in accordance with the Technical Guidelines per the site map designated locations of the composting area working pads and the detention pond on December 9th & 10th 2021 ( Appendix VII). The test result showed the water percolation rate well below allowable limits in Table I of the Technical Guidelines. One of the locations chosen for testing failed due to the build-up of silt and sediments. The containment pond enlargement shall be completed by November 30th 2022.

## GENERAL Geology & Hydrology Maps

This map displays contours of equal groundwater elevation across the Chino Basin during the spring of 2012. The groundwater elevation contours for spring 2012 are generally consistent with the groundwater elevation contours for spring 2010 shown in Exhibit 17. Groundwater flows from higher to lower elevations, with localized flow direction perpendicular to the contours. The contours indicate that groundwater was generally flowing in a south-southwest direction from the primary areas of recharge in the northern parts of the Basin toward the Prado Basin in the south. There is a discernible depression in groundwater levels around the eastern portion of the Chino Desalter well field, which has achieved Hydraulic Control in this area. This depression has merged with the pumping depression around the JCSD well field to the east and has increased the hydraulic gradient from the Santa Ana River toward the desalter well field. As seen in Exhibit 16, and 17, there is a notable pumping depression in the groundwater-level surface in the northern portion of MZ1 (Montclair and Pomona areas).

Groundwater Elevation Contours (feet above mean sea-level)

# FEMA Flood Zone Map

SITE

## NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

**Coastal Base Flood Elevations** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11 North. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

**Base map** information shown on this FIRM was derived from digital orthophotography collected by the U.S. Department of Agriculture Farm Service Agency. This imagery was flown in 2005 and was produced with a 1-meter ground sample distance.

This map may reflect more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to confirm to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.

**WARNING:** This map contains levees, dikes, or other structures that have been provisionally accredited and mapped as providing protection from the 1-percent-annual-chance flood. To maintain accreditation, the levee owner or community is required to submit documentation necessary to comply with 44 CFR Section 65.10 by August 8, 2009. Because of the risk of overtopping or failure of the structure, communities should take proper precautions to protect lives and minimize damages in these areas, such as issuing an evacuation plan and encouraging property owners to purchase flood insurance.

## LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

| | |
|---|---|
| ZONE A | No Base Flood Elevations determined. |
| ZONE AE | Base Flood Elevations determined. |
| ZONE AH | Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined. |
| ZONE AO | Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined. |
| ZONE AR | Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood. |
| ZONE A99 | Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined. |
| ZONE V | Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined. |
| ZONE VE | Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined. |

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X — Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X — Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D — Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

1% annual chance floodplain boundary

0.2% annual chance floodplain boundary

Floodway boundary

Zone D boundary

CBRS and OPA boundary

Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

STATE OF CALIFORNIA

AM/PAC AND ASSOCIATES, INC.
2900 Adams St., Suite C-35 • Riverside, CA 92504

**PROJECT NUMBER:** 17-13272 **DATE:** NOVEMBER 10, 2017

**1.1 CLIENT REQUESTING REPORT:**

AG CONCEPTS, INC.
ATT: MR. NATHAN DE BOOM (951) 452-1148
7325 EDISON AVENUE ONTARIO, CA. 91762
VIA E-MAIL: n8deboom@gmail.com

**1.2 JOB SITE LOCATION:**

RECYCLED WOOD PRODUCTS, COMPOST FACILITY, TIER 1, AT:
7325 EDISON AVENUE ONTARIO, CA. 91762
APN: 1053-391-01-0000 & 1053-521-01 & 02-0000

ASSESSORS, VICINITY MAPS AND THE SITE PLAN ARE FOUND IN THE APPENDIX OF THIS REPORT

**1.3 PROPOSED DEVELOPMENT:**

THIS IS AN EXISTING RECYCLED WOOD COMPOSTING PLANT. THE DESIGN CIVIL ENGINEER AND THE FACILITY MANAGER HAVE REQUESTED A PERCOLATION/INFILTRATION INVESTIGATION TO COMPLY WITH THE "STATE WATER RESOURCES CONTROL BOARD, ORDER WQ 2015-0121-DWQ".

**PURPOSE AND SCOPE OF THIS REPORT:**

THIS TEST AND INVESTIGATION WAS PERFORMED TO DETERMINE THE PERCOLATION RATE AT 6 PREDETERMINED LOCATIONS ON THE PROPERTY. THE DATA IS TO BE UTILIZED BY THE DESIGN CIVIL.

**1.4 PROPERTY DESCRIPTION:**

THIS PARCEL IS A TOTAL OF 55.28 ACRES, 3 SEPARATELY DEEDED PARCELS, RECTANGULAR IN SHAPE, FRONTING EDISON AVENUE ALONG THE NORTHERLY LOT LINE AND SULTANA AVENUE ALONG THE WESTERLY LOT LINE OF THE PROPERTY. NO ROCK OUTCROPPINGS, TREES, SEASONAL DRAINAGE COURSES OR DETRIMENTAL FEATURES WERE NOTED ON THE PROPERTY.

GROUNDCOVER OF THE PROPERTY CONSISTS OF COMPOSTED WOOD AND BARE SOIL. TOPOGRAPHY IS NOTED AS FALLING FROM THE NORTHERLY PROPERTY LINE DOWN TO THE SOUTHERLY PROPERTY LINE APPROXIMATELY 13 FEET OVERALL. NO NEIGHBOR WELLS WERE NOTED WITHIN 100' OF THIS PARCEL. THIS PARCEL IS EASILY FOUND. PLEASE SEE THE VICINITY MAP, ASSESSORS PARCEL MAP AND GOOGLE EARTH AERIAL ATTACHED.

**2. EQUIPMENT USED:**

PER THE COUNTY OF SAN BERNARDINO, DEPARTMENT OF ENVIRONMENTAL HEALTH'S REQUIREMENTS: ALL EXCAVATIONS WERE MADE USING AM/PAC'S TRUCK MOUNTED MOBILE DRILL B-34, CONTINUOUS FLIGHT AUGER, DRILL RIG. AN 8" DIAMETER AUGER WAS USED TO EXCAVATE THE PERCOLATION TEST HOLES AND THE EXPLORATORY BORING.
ALSO UTILIZED DURING TESTING WAS A SOLINST WATER LEVEL METER, PERFORATED PIPE SLEEVES TO DEPTH AND A 300 GALLON WATER TANK.

**3.1 LOCATION OF EXPLORATORY BORINGS AND TRENCHES:**

THE CLIENT HAS PROVIDED THIS OFFICE WITH A SITE PLAN IN AN ENGINEERS SCALE. THIS OFFICE HAS UTILIZED THE PLAN FOR USE AS A TEST LOCATION PLOT PLAN.

**3.2 SOIL CHARACTERISTICS:**

THE SOILS IN THIS GEOGRAPHICAL AREA OF THE COUNTY AS WELL AS THE SOILS EXCAVATED ON THIS PROJECT, ARE BEST DESCRIBED, AS FAVORABLE. THE SOIL IS SANDY WITH NO CLAYS OR SILTS. THERE IS NO VISUAL EVIDENCE OF SHALLOW GROUNDWATER, BEDROCK, IMPERVIOUS MATERIALS, ETC. TESTS AND BORINGS PERFORMED AGREE WITH THE VISUAL EVIDENCE. THE NATURAL/FINISHED SLOPE OF THE AREA IS LESS THAN 5%.

**3.3.1 BORING/TRENCHING LOG:**

| | | |
|---|---|---|
| 0-5' | S/M | TANNISH BROWN SANDS, SILTY-FINE GRAINED SANDS, SLIGHT AMOUNTS OF SUB-ANGULAR GRAVELS AND COBBLES 1" TO THE LARGEST DIMENSION, LOOSE AND MOIST. |
| 5-10' | S/M | MEDIUM BROWN, SILTY-FINE TO MEDIUM GRAINED SANDS, FIRM AND DRY. |
| 10-15' | S/W | MEDIUM BROWN, FINE GRAINED SANDS, DENSE AND DRY. |

## GROUNDWATER INFORMATION

GROUNDWATER AT THE TIME OF BORING: NONE
GROUNDWATER AT THE 24 HR. RECHECK: NONE
MONITORING WELL INSTALLED? YES

**3.3.4 MINIMUM NUMBER OF TESTS:**

TESTING WAS PERFORMED PER THE STATE OF CALIFORNIA, WATER RESOURCES CONTROL BOARD, ORDER WQ 2015-0121-DWQ, GENERAL WASTE DISCHARGE REQUIREMENTS FOR COMPOSTING OPERATIONS, DATED AUGUST 4, 2015. NOTED WAS ATTACHMENT A (PAGE A-6) "PERCOLATION TEST". THE REQUIREMENT IS NOTED AS FOUR PERCOLATION TEST HOLES A MINIMUM OF 24 INCHES DEEP THROUGHOUT THE OPERATIONS PAD AREA
(SEE TESTS 1-6)

ALSO, TWO PERCOLATION TEST HOLES OUTSIDE OF THE PERIMETER OF THE DETENTION POND NEAREST THE DEEPEST CORNER (SEE TEST 1 AND 2) THESE HOLES MUST BE DRILLED 24" DEEPER THAN THE BOTTOM OF THE DETENTION POND.

PERCOLATION TESTING HAS BEEN CONDUCTED IN THE MANNER SET FORTH BY THE COUNTY OF SAN BERNARDINO DEPARTMENT OF ENVIRONMENTAL HEALTH, LAND USE DIVISION AS SET FORTH IS THE PUBLICATION, "PERCOLATION TESTING AND REPORT WRITING FOR ON-SITE WASTE-WATER TREATMENT SYSTEMS, "SEPTEMBER 2019. AS NOTED ON THE COVER PAGE OF THIS REPORT, THIS TESTING AND REPORT HAS BEEN PERFORMED UNDER THE DIRECTION OF GEORGE HAWES P.E, CALIFORNIA REGISTRATION NUMBER C034779, LIC. EXP. 9-30-23.

### 3.4.1 PERCOLATION TEST PROCEDURE FOR LEACH LINES:

ALL PERCOLATION TEST SITE HOLES WERE EXCAVATED USING THE DRILL RIG. ALL LOOSE MATERIAL WAS REMOVED FROM THE HOLE USING THE POST HOLE DIGGER. ALL TESTS WERE PERFORMED AT LEVELS REQUESTED BY THE DESIGN CIVIL. SIERRA ENGINEERING SERVICES. AN 6 INCH DIAMETER PERFORATED PIPE SLEEVE, WITH A SOLID CAP BOTTOM, ¼" DIAMETER HOLES DRILLED IN THE CAP BOTTOM TO ALLOW WATER TO ESCAPE TO THE SIDEWALL OF THE TEST HOLE, WAS INSERTED INTO EACH OF THE TEST HOLES. THE CAP AT THE BOTTOM ELIMINATES THE NEED FOR PEA GRAVEL AND PREVENTS SCOURING OF THE BOTTOM OF THE TEST HOLE DURING FILLINGS. THE DEPTH OF EACH TEST HOLE IS NOTED ON THE "FIELD DATA SHEET" ATTACHED.

THE TEST HOLES WERE FILLED WITH 10 INCHES OF CLEAR WATER AS MEASURED ABOVE THE PIPE CAP BOTTOM. AS NOTED ON THE "FIELD TEST DATA" SHEET, 10 INCHES OF CLEAR WATER DID NOT SEEP OR PERCOLATE AWAY IN LESS THAN 10 MINUTES TIME, TWICE IN CONSECUTIVE READINGS. THE NATURAL SOIL IS NOTED TO BE OF SILTY-FINE GRAINED AND CLAYEY MATERIAL. THEREFORE, PRESOAKING WAS THEN CONDUCTED. TESTING WAS PERFORMED AFTER AN OVERNIGHT PRESOAK.

EACH TEST HOLE WAS THEN FILLED WITH 8 INCHES OF CLEAR WATER AS MEASURED FROM THE BOTTOM OF THE HOLE. AS NOTED ON THE "FIELD DATA SHEET" ATTACHED, THE TESTS WERE RUN AT INTERVALS OF 30 MINUTES OVER A 6 HOUR CYCLE. REFILLING EACH TEST HOLE AFTER EACH READING. ALL MEASUREMENTS WERE TAKEN TO THE NEAREST 1/10$^{TH}$ OF AN INCH.

EXPLORATORY BORING AND PERCOLATION TESTING WERE PERFORMED ON DECEMBER 9 THROUGH DECEMBER 10, 2021. ALL TEST SITES ARE MARKED WITH LATH AND FLAGGING.

### 4. DISCUSSION OF RESULTS:

AS SHOWN IN THE TEST RESULTS, THE SOILS TESTED ARE NOTED TO BE UNIFORM IN CLASSIFICATION, GRADATION AND THE DEMONSTRATED ABILITY TO ABSORB WATER DURING TESTING. NO RESTRICTIVE SOIL LAYERS WERE ENCOUNTERED TO THE DEPTHS TESTED. NO TESTS WERE NOTED AS FAILING. THERE IS NO INDICATION OF ANY POSSIBLE SOURCE OF ERROR OR VARIABILITY OF THE RESULTS AS SHOWN. ALTHOUGH BIOTURBATION WAS OBSERVED AND NOTED, NO EVIDENCE OF ANY GOPHER HOLES WAS PRESENT AT ANY EXCAVATED TEST SITE.

### 5 HISTORIC HIGH GROUNDWATER DATA:

THE CALIFORNIA DEPT. OF WATER RESOURCES SOUTHERN DISTRICT DATA SHOWS WELL LEVELS AT 250 TO 300 FEET BELOW GRADE FOR THIS AREA. NO GROUNDWATER WAS ENCOUNTERED IN AM/PAC'S EXPLORATORY BORE TO A DEPTH OF 15'.

### 6. PERCOLATION TEST RESULTS: (SEE DATA SHEETS ATTACHED)

## GRADING NOTES

1 ALL DIKES AND BERMS SHALL BE CONSTRUCTED OF MINERAL EARTH FREE OF VEGETATION AND DELETERIOUS MATERIAL.

2 NO ROCKS OR COBBLES GREATER THAN 6 INCHES IN DIAMETER SHALL BE PLACED IN ANY FILL.

3 ALL AREAS TO RECIEVE FILL SHALL BE SCARIFIED OR RIPPED TO A DEPTH OF 6 INCHES PRIOR TO THE PLACEMENT OF ANY MATERIAL.

4 ALL MATERIAL SHALL BE PLACED IN LIFTS NO GREATER THAN 8 INCHES, WHEELED ROLLED AND WATERED TO ACHIEVE ADEQUATE COMPACTION.

Pomona, CA 91766

**NOTICE OF APPLICABILITY FOR COVERAGE UNDER WATER QUALITY ORDER WQ 2020-0012-DWQ, STATEWIDE GENERAL WASTE DISCHARGE REQUIREMENTS – RECYCLED WOOD PRODUCTS ONTARIO IV, 7325 EDISON AVENUE, ONTARIO, SAN BERNARDINO COUNTY**
**GEOTRACKER ID: T10000020070**

Dear Mr. Kiralla:

You have submitted a Report of Waste Discharge application to obtain coverage under Water Quality (WQ) Order WQ 2015-0121-DWQ, as amended by Order WQ 2020-0012-DWQ, General Waste Discharge Requirements for Commercial Composting Operations (Composting General Order) for Recycled Wood Products Ontario IV (the Facility), located at the above-referenced address.

A copy of the Composting General Order is accessible at:
https://www.waterboards.ca.gov/water_issues/programs/compost/

The application, formally received on June 16, 2020, consists of a Notice of Intent (NOI) and a Technical Report. A filing fee of $2,848 was received on June 11, 2021, with the corrected fee of $3,326 received in full on July 2, 2022. The NOI and Technical Report were subsequently updated and submitted in April 2021, October 2021, June 2022, August 2022, September 2022, October 2022, December 2022, September 2023, and October 2023 to address comments from Santa Ana Regional Water Quality Control Board (Santa Ana Water Board) staff. Based on our review of the updated NOI and Technical Report, we considered the application complete on October 9, 2023. A summary of the Facility description, composting operations and system design, run-on and runoff drainage control system, and monitoring and reporting plan is provided in Table 1. The Facility site plan that you provided in your application is enclosed with this letter as Figure 1.

Based on the information provided, Santa Ana Water Board staff has determined that the Facility meets the conditions for coverage under the Composting General Order,

and it is hereby authorized for coverage as a Tier 1 facility (Site-specific Composting General Order WQ 2020-0012-DWQ-R8018). You will be assessed an annual fee with the discharge rating of 3C until your facility coverage under the Composting General Order is officially terminated.

This letter constitutes the Notice of Applicability (NOA), authorizing the coverage of the Facility under the Composting General Order, which incorporates the NOI and Technical Report. The NOA is contingent upon continual compliance with the Composting General Order.

To ensure compliance with the Composting General Order, it is essential that you and your operators are familiar with the contents of the Composting General Order and the Technical Report. Any non-compliance with the Composting General Order constitutes a violation of the California Water Code and is grounds for enforcement action and/or termination of enrollment under the Composting General Order.

In accordance with Notification Requirements of the Composting General Order, please notify Santa Ana Water Board staff in writing or by email for:

- Any proposed change in materials (feedstock materials, additives, amendments), facility design, and composting operations identified in the NOI and Technical Report;
- Any change in facility ownership or transfer; and
- Any proposed termination of facility operations or termination of coverage under the General Order. A Site Closure Plan must be submitted at least 90 days prior to terminating composting operations for approval by the Executive Officer of the Santa Ana Water Board.

All monitoring and technical reports must be submitted by uploading them to the State Water Resources Control Board's GeoTracker database in searchable Portable Document Format (PDF) under a site-specific global identification number (Global ID). In addition, analytical data must be uploaded to the GeoTracker database in Electronic Deliverable Format (EDF). Guidance for the Electronic Submittal of Information (ESI) to GeoTracker database for composting operations is provided at:
ESI Beginner's Guide - Responsible Party (ca.gov)

**Your first Annual Monitoring and Maintenance Report, for the January 1-December 31, 2023 monitoring period, is due April 1, 2024.** Please use the following site reference information for uploading documents to GeoTracker or for submitting a written notification:

## Table 1

| Composting Facility Information | Description |
|---|---|
| Facility Name | Recycled Wood Products Ontario IV |
| Facility Address | 7325 Edison Avenue, Ontario, CA 91762 |
| Facility Operator | Chris Kiralla |
| Facility Landowner | Mr. Gary Dou, Golden Ontario Holdings |
| Facility Size (acreage) | 10.5 acres of the 36.6-acre site |
| Facility Accessor Parcel No. | APN 1053-391-01 |
| Facility Capacity | Up to 12,500 cubic yards |
| Feedstock Materials | Vegetative agricultural materials, green materials, and vegetative food materials |
| Additives/Amendments | Manure |
| Facility Type | Tier 1 Facility |
| GPS Coordinates | 33.9966 latitude and 117.6434 longitude |
| Water Supply (domestic/Industrial) | Onsite irrigation well |
| **Affected Water Bodies** | |
| Groundwater Management Zone | Chino-North |
| Depth to Groundwater | Approximately 133 feet below ground surface |
| Groundwater Flow Direction | South |
| Distance to Nearest Water Supply Well | The nearest water supply well is over 100 feet from the site |
| Distance to Nearest Surface Water Bodies | Cucamonga Creek (over 5,500 feet east of the site) |
| **Facility Operations/Design Information** | |
| Composting Method | Turned Windrow Pile Method |
| Composting Pad/Working Surfaces Design | Compacted pad |
| Runoff Drainage Control System Design | Earthen drainage ditches and berms; all working surfaces are graded and compacted to drain to a 17.8-acre-foot detention basin. |
| Run-on Drainage Control System Design | The facility is bordered by Edison Ave to the north, and dairy and pastureland to the south, east and west. Run-on drainage to the facility is not anticipated. |
| Compliance Schedule | Onsite soil percolation tests were conducted in December 2021. The detention pond was enlarged to adequately contain surface runoff from the site in November 2022. |
| **Monitoring** | |
| Facility Inspection & Maintenance | Comply with Section A.1, Attachment B (Monitoring and Reporting Program), Order WQ 2020-0012-DWQ |
| Detention Pond Monitoring | Comply with Sections A.2 and A.5, Attachment B, Order WQ 2020-0012-DWQ |
| Groundwater Monitoring (if applicable) | Not applicable |
| **Reporting/Notifications** | |
| Annual Monitoring and Maintenance Report | Comply with Section B.1, Attachment B, Order WQ 2020-0012-DWQ |
| Notification of Violations/Non-compliances | Comply with Sections B.2 and B.3, Attachment B, Order WQ 2020-0012-DWQ |
| Record-keeping | Comply with Section C, Attachment B, Order WQ 2020-0012-DWQ |
| Revised NOI | To be submitted at least 90 days prior to any proposed changes to the approved NOI [Page 37 of Order WQ 2020-0012-DWQ] |
| Change in Ownership | To submit a written notice, at least 30 days in advance of any transfer of the General Order's responsibility and coverage from the current owner to a new owner [Page 37 of Order WQ 2020-0012-DWQ] |
| Site Closure Plan | To be submitted at least 90 days prior to discontinuing composting operations [Page 34 of Order WQ 2020-0012-DWQ] |
| Notice of Termination | Comply with Attachment E, Order WQ 2020-0012-DWQ |

ADDRESS — TELEPHONE NO.

**********
DISCUSSION:

Site inspection made at above address. Sam Sousa owner and operator said tanks (2) were removed in 1992. 500 gallon and 1000 gallon.

He showed me the tanks that were removed.

File has already been removed off alpha list. Stays closed and send to closed file room.

**LABORATORY BUSINESS PLAN FORM**

Labs which handle hazardous materials **must** complete this form.

I. Joe Mello Dairy
Name
13832 MOUNTAIN APN
Address
CHINO CAL 91710 Parcel No.

II. _____
Telephone number of laboratory

III. _____
Type of Laboratory (activity/description)
Analytical_____ University/College_____
Clinical_____ Dental_____
Research_____ Other Dairy

IV. Two (2) Emergency Contacts for Laboratory:

Name_____ phone_____
Title
Name_____ phone_____
Title

V. _____
Emergency Notification (* Mandatory in case of release of hazardous material)
911 or list other local emergency agency if 911 is not available

* (800) 852-7550 Office of Emergency Services
* (800) 33-TOXIC San Bernardino Co. Department of Environmental Health Services
(800) 424-8802 National Response Center
_____Other (ie. Main office, insurance company, etc.)
_____

VI. Briefly explain lab employee emergency notification and evacuation procedures.

**LABORATORY BUSINESS PLAN FORM (Continued)**

VII. Briefly explain the lab employee Hazard Communication Program (OSHA) or training program (Ed. Code) currently implemented or proposed.

VIII. Briefly explain emergency procedures developed for laboratory personnel in case of emergency (list emergency coordinator and other emergency personnel.

IX. Briefly explain preventive measures currently implemented or proposed for the laboratory (to prevent or minimize the potential for accidents).

X. List emergency equipment in laboratory (include fire extinguishers, eyewash stations, breathing apparatus, emergency kits, etc.).

XI. Provide Maps - See page 9 of this document.

Check all chemicals located at the laboratory and give the maximum amount on hand of that substance. Substances that are not listed on this inventory page must be included on the laboratories Business Plan form and submitted with a Material Safety Data Sheet.

## LABORATORY INVENTORY

| PLEASE CHECK | CHEMICAL NAME | MAXIMUM AMOUNT ON HAND (INCLUDING UNITS) |
|---|---|---|
| | Acetic Acid | |
| | Acetone | |
| | Acetonitrile | |
| ✓ | Acetylene (compressed gas) | 500 lbs |
| | Acrylamide | |
| | Aluminum Ammonium Sulfate | |
| | Aluminum Chloride | |
| | Aluminum Granular | |
| | Aluminum Oxide | |
| | Aluminum Potassium Sulfate | |
| | Aluminum Sodium Sulfate | |
| | Aluminum Sulfate | |
| | * Ammonia | |
| | Ammonium Carbonate | |
| | Ammonium Chloride | |
| | Ammonium Hydroxide | |
| | Ammonium Nibrate | |
| | Ammonium Persulfate | |
| | Ammonium Phosphate | |
| | Ammonium Sulfate | |
| | Ammonium Sulfide | |
| | Ammonium Tartrate | |
| | Ammonium Thiocyanate | |
| | Amyl Acetate | |
| | Amyl Alcohol | |
| | Antimony | |
| | Antimony Trichloride | |
| | Barium Hydroxide | |
| | Barium Chloride | |
| | Barium Nitrate | |
| | Barium Oxide | |
| | Barium Sulfate | |
| | * Benzene | |
| | Benzoic Acid | |
| | Boric Acid | |
| | Bromine Water | |
| | Bromophenol Blue | |
| | Bromothymol Blue | |

**LABORATORY BUSINESS PLAN FORM (Continued)**

Hazardous Material Inventory- See attached inventory. Any hazardous materials that are handled by your business which does not appear on the specific inventory page, LIST those substances here. Indicate the quantity (maximum at any one time), the CAS number and submit a Material Safety Data Sheet for those substances.

**INSPECTION NARRATIVE**

An inspection was conducted to verify operating status of this dairy.

Facility raises cattle only, no milk production occurs. No hazardous materials or hazardous wastes were observed at time of inspection.

Correct the following violation:

(117) Contaminated containers not managed properly - CCR 66261.7

Empty containers larger than 5 gallons are required to be labeled as empty along with the date on which the container became empty.

☐ **NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN ____ DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.**

## Submittal Status

Certified on 2/15/2024 by *Betsy Hunter-Binns* of TIVA DAIRY (ONTARIO, CA)

## Hazardous Materials

| | |
|---|---|
| Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70? | Yes |

## Underground Storage Tank(s) (UST)

| | |
|---|---|
| Does your facility own or operate underground storage tanks? | No |

## Hazardous Waste

| | |
|---|---|
| Is your facility a Hazardous Waste Generator? | No |
| Does your facility treat hazardous waste on-site? | No |
| Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)? | No |
| Does your facility consolidate hazardous waste generated at a remote site? | No |
| Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site? | No |
| Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste. | No |
| Is your facility a Household Hazardous Waste (HHW) Collection site? | No |

## Excluded and/or Exempted Materials

| | |
|---|---|
| Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)? | No |

## Aboveground Petroleum Storage

| | |
|---|---|
| Does your facility own or operate aboveground petroleum storage tanks or containers AND:<br>* have a total aboveground petroleum storage capacity of 1,320 gallons or more, OR<br>* have one or more petroleum tanks in an underground area? | No |

## Regulated Substances

| | |
|---|---|
| Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)? | No |

## Additional Information

No additional comments provided.

# CONSOLIDATED EMERGENCY RESPONSE / CONTINGENCY PLAN

*Prior to completing this Plan, please refer to the INSTRUCTIONS FOR COMPLETING A CONSOLIDATED CONTINGENCY PLAN*

## A. FACILITY IDENTIFICATION AND OPERATIONS OVERVIEW

| | | | |
|---|---|---|---|
| FACILITY ID # FA0000672 | A1. | CERS ID # 10034845 A2. | DATE OF PLAN PREPARATION/REVISION (MM/DD/YYYY) 04/29/2019 A3. |

BUSINESS NAME *(Same as Facility Name or DBA - Doing Business As)*
TiVa Dairy A4.

BUSINESS SITE ADDRESS
7587 Edison Avenue A5.

| | | |
|---|---|---|
| BUSINESS SITE CITY Ontario A6. | CA | ZIP CODE 91710-0000 A7. |

| | |
|---|---|
| TYPE OF BUSINESS (e.g., Painting Contractor) dairy farm A8. | INCIDENTAL OPERATIONS (e.g., Fleet Maintenance) none A9. |

THIS PLAN COVERS CHEMICAL SPILLS, FIRES, AND EARTHQUAKES INVOLVING (Check all that apply): A10.

- [x] 1. HAZARDOUS MATERIALS; [ ] 2. HAZARDOUS WASTES

## B. INTERNAL RESPONSE

INTERNAL FACILITY EMERGENCY RESPONSE WILL OCCUR BY (Check all that apply): B1.

- [x] 1. CALLING PUBLIC EMERGENCY RESPONDERS (e.g., 9-1-1)
- [ ] 2. CALLING HAZARDOUS WASTE CONTRACTOR
- [ ] 3. ACTIVATING IN-HOUSE EMERGENCY RESPONSE TEAM

## C. EMERGENCY COMMUNICATIONS, PHONE NUMBERS AND NOTIFICATIONS

In the event of an emergency involving hazardous materials and/or hazardous waste, all facilities must IMMEDIATELY:

1. Notify facility personnel and evacuate if necessary in accordance with the Emergency Action Plan (Title 8 California Code of Regulations §3220);
2. Notify local emergency responders by calling 9-1-1;
3. Notify the local Unified Program Agency (UPA) at the phone number below; and
4. Notify the State Warning Center at (800) 852-7550.

Facilities that generate, treat, store or dispose of hazardous waste have additional responsibilities to notify and coordinate with other response agencies. Whenever there is an imminent or actual emergency situation such as an explosion, fire, or release, the Emergency Coordinator must follow the appropriate requirements for the category of facility and type of release involved:

1. Title 22 California Code of Regulations §66265.56. Emergency Procedures for generators of 1,000 kilograms or more of hazardous waste in any calendar month.
2. Title 22 California Code of Regulations §66265.196. Response to Leaks or Spills and Disposition of Leaking or Unfit-for-Use Tank Systems.
3. Title 40 Code of Federal Regulations §302.6. Notification requirements for a release of a hazardous substance equal to or greater than the reportable quantity.
4. Title 22 California Code of Regulations §66262.34(d)(2) and Title 40 Code of Federal Regulations §262.34(d)(5)(ii) for generators of less than 1000 kilograms of hazardous waste in any calendar month.

Following notification and before facility operations are resumed in areas of the facility affected by the incident, the Emergency Coordinator shall notify the local UPA and the local fire department's hazardous materials program, if necessary, that the facility is in compliance with requirements to:

1. Provide for proper storage and disposal of recovered waste, contaminated soil or surface water, or any other material that results from an explosion, fire, or release at the facility; and
2. Ensure that no material that is incompatible with the released material is transferred, stored, or disposed of in areas of the facility affected by the incident until cleanup procedures are completed.

PRIMARY EMERGENCY COORDINATOR NAME: Dickie Vander Meulen PHONE NO.: (951) 202-8787 PHONE NO.: (951) 202-8787

ALTERNATE EMERGENCY COORDINATOR NAME: Harold Tillema PHONE NO.: (909) 226-1160 PHONE NO.: (909) 226-1160

[ ] Check if additional Emergency Coordinator contact and address information is available onsite or by calling PHONE NO.:

Note: If more than one alternate emergency coordinator is designated, attach a list in order of responsibility.

## D. EMERGENCY CONTAINMENT AND CLEANUP PROCEDURES

Check the applicable boxes to indicate your facility's procedures for containing spills and preventing and mitigating releases, fires and/or explosions.

D1.

- [x] 1. MONITOR FOR LEAKS, RUPTURES, PRESSURE BUILD-UP, ETC.;
- [x] 2. PROVIDE STRUCTURAL PHYSICAL BARRIERS (e.g., Portable spill containment walls, built-in berms);
- [x] 3. PROVIDE ABSORBENT PHYSICAL BARRIERS (e.g., Pads, spill pigs, spill pillows);
- [x] 4. COVER OR BLOCK FLOOR AND/OR STORM DRAINS;
- [ ] 5. LINED TRENCH DRAINS AND/OR SUMPS;
- [ ] 6. AUTOMATIC FIRE SUPPRESSION SYSTEM;
- [x] 7. ELIMINATE SOURCES OF IGNITION FOR FLAMMABLE HAZARDS;
- [x] 8. STOP PROCESSES AND/OR OPERATIONS;
- [ ] 9. AUTOMATIC / ELECTRONIC EQUIPMENT SHUT-OFF SYSTEM;
- [x] 10. SHUT OFF WATER, GAS, ELECTRICAL UTILITIES;
- [x] 11. CALL 9-1-1 FOR PUBLIC EMERGENCY RESPONDER ASSISTANCE AND/OR MEDICAL AID;
- [x] 12. NOTIFY AND EVACUATE PERSONS IN ALL THREATENED AND/OR IMPACTED AREAS;
- [x] 13. ACCOUNT FOR EVACUATED PERSONS IMMEDIATELY AFTER EVACUATION;
- [ ] 14. PROVIDE PROTECTIVE EQUIPMENT FOR ON-SITE EMERGENCY RESPONSE TEAM;
- [x] 15. REMOVE CONTAINERS AND/OR ISOLATE AREAS;
- [ ] 16. HIRE LICENSED HAZARDOUS WASTE CONTRACTOR;
- [x] 17. USE ABSORBENT MATERIAL FOR SPILL CONTAINMENT;
- [ ] 18. VACUUM SUCTION USING APPROPRIATE VACUUM (e.g., Intrinsically safe) FOR SPILL CONTROL AND/OR CLEANUP;
- [ ] 19. DECONTAMINATE PERSONNEL AND EQUIPMENT WITHIN DESIGNATED AREA AND DISPOSE OF WASTEWATER AS HAZARDOUS WASTE;
- [ ] 20. PROVIDE SAFE TEMPORARY STORAGE OF HAZARDOUS WASTE GENERATED DURING EMERGENCY ACTIONS;
- [ ] 21. OTHER (Specify):

D2.

## E. FACILITY EVACUATION

THE FOLLOWING ALARM SIGNAL(S) WILL BE USED TO BEGIN EVACUATION OF THE FACILITY (Check all that apply): E1.

- [ ] 1. BELLS;
- [ ] 2. HORNS/SIRENS;
- [x] 3. VERBAL (i.e., Shouting);
- [x] 4. OTHER (Specify): personal cellular telephones

E2.

THE FOLLOWING LOCATION(S) WILL BE USED FOR AN EMERGENCY ASSEMBLY AREA(S) (e.g., Parking lot, street corner): E3.

grass area adjacent to Edison Avenue, north side of milk barn

Note: The Emergency Coordinator must account for all onsite employees and visitors after evacuation.

EVACUATION ROUTE S AND ALTERNATE EVACUATION ROUTES ARE DESCRIBED AS FOLLOWS: E4.

- [ ] 1. WRITTEN PROCEDURES DESCRIBING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [x] 2. EVACUATION MAP(S) DEPICTING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [ ] 3. OTHER (Specify):

E5.

Note: Evacuation procedures and/or maps should be posted in visible facility locations and must be included in the Contingency Plan.

## F. ARRANGEMENTS FOR EMERGENCY SERVICES

ADVANCE ARRANGEMENTS FOR LOCAL EMERGENCY SERVICES (Check one of the following): F1.

- [x] 1. HAVE BEEN DETERMINED NOT NECESSARY;
- [ ] 2. THE FOLLOWING ARRANGEMENTS HAVE BEEN MADE (Specify):

F2.

Note: Advance arrangements with local fire and police departments, hospitals, state and local emergency response teams, and/or emergency services contractors should be made for your facility, if necessary. Large Quantity Generators must describe arrangements in the Contingency Plan.

## G. EMERGENCY EQUIPMENT

**Check the applicable boxes to list emergency response equipment available at the facility, identify the location(s) where the equipment is kept, and indicate the equipment's capability, if applicable.**

| TYPE | EQUIPMENT AVAILABLE G1. | LOCATION G2. | CAPABILITY G3. |
|---|---|---|---|
| *EXAMPLE* | ☒ *CHEMICAL PROTECTIVE GLOVES* | *SPILL RESPONSE KIT* | *SINGLE USE, OIL RESISTANT ONLY* |
| **Safety and First Aid** | 1. ☒ CHEMICAL PROTECTIVE SUITS, APRONS, AND/OR VESTS | Chemical room | apron |
| | 2. ☐ CHEMICAL PROTECTIVE GLOVES | | |
| | 3. ☒ CHEMICAL PROTECTIVE BOOTS | employees all wear rubber boots | |

## H. EARTHQUAKE VULNERABILITY

Identify areas of the facility that are vulnerable to hazardous materials releases due to seismic motion. These areas require immediate isolation and inspection.

| VULNERABLE AREAS (Check all that apply): H1. | LOCATIONS (e.g., Shop, outdoor shed, lab): H2. |
|---|---|
| ☒ 1. HAZARDOUS MATERIALS AND/OR WASTE STORAGE AREAS | chemical room |
| ☐ 2. PROCESS LINES AND PIPING | |
| ☐ 3. LABORATORY | |
| ☐ 4. WASTE TREATMENT AREA | |

Identify mechanical systems vulnerable to releases / spills due to earthquake-related motion. These systems require immediate isolation and inspection.

| VULNERABLE SYSTEMS AND/OR EQUIPMENT (Check all that apply): H3. | LOCATIONS: H4. |
|---|---|
| ☒ 1. SHELVES, CABINETS AND/OR RACKS | chemical room |
| ☒ 2. TANKS AND SHUT-OFF VALVES | |
| ☐ 3. PORTABLE GAS CYLINDERS | |
| ☒ 4. EMERGENCY SHUT-OFF AND/OR UTILITY VALVES | machine room |
| ☐ 5. SPRINKLER SYSTEMS | |
| ☐ 6. STATIONARY PRESSURIZED CONTAINERS (e.g., Propane tank) | |

## I. EMPLOYEE TRAINING

Employee training is required for all employees and/or contractors handling hazardous materials and/or hazardous wastes during normal and/or emergency operations. Most facilities will need to submit a separate Training Plan. However, your CUPA may accept this section as the Training Plan for some small facilities. Employee training plans may include the following content:

- Applicable laws and regulations;
- Emergency response plans and procedures;
- Safety Data Sheets;
- Hazard communication related to health and safety;
- Methods for safe handling of hazardous substances;
- Hazards of materials and processes (e.g., fire, explosion, asphyxiation);
- Hazard mitigation, prevention and abatement procedures;
- Coordination of emergency response actions;
- Notification procedures for local emergency responders, CUPA, Cal OES, and onsite personnel;
- Communication and alarm systems;
- Personal protective equipment;
- Use and maintenance of emergency response equipment and supplies (e.g. Fire extinguishers, respirators, spill control materials);
- Decontamination procedures;
- Evacuation procedures and evacuation staging locations;
- Identification of facility areas, equipment, and systems vulnerable to earthquakes and other natural disasters.
- OTHER (Specify):

Check the applicable boxes below to indicate how the employee training program is administered.

☐ 1. FORMAL CLASSROOM ☐ 2. VIDEOS ☐ 3. SAFETY MEETINGS ☐ 4. STUDY GUIDES / MANUALS I1.

☒ 5. OTHER (Specify): tailgate meetings as needed I2.

☐ 6. NOT APPLICABLE SINCE FACILITY HAS NO EMPLOYEES

☐ 7. CHECK IF A SEPARATE EMPLOYEE TRAINING PLAN IS USED AND UPLOADED TO CERS AS A PDF DOCUMENT I3.

☐ 8. CHECK IF EMPLOYEE TRAINING IS COVERED BY THE ABOVE REFERENCED CONTENT AND OTHER DOCUMENTS ONSITE I4.

**EMPLOYEE TRAINING FREQUENCY AND RECORDKEEPING TRAINING MUST BE:**

- Provided initially for new employees as soon as possible following the date of hire. New employees should not work in an unsupervised position that involves hazardous materials handling and/or hazardous waste management without proper training;
- Provided within six months from the date of hire for new employees at a large quantity generator;
- Ongoing and provided at least annually;
- Amended prior to a change in process or work assignment;
- Given upon modification to the Emergency Response/Contingency Plan.

**Large Quantity Generator Training:** Large quantity generators (1,000 kg or more) must retain written plan and documentation of employee training which includes:

- A written description of the type and amount of both initial and ongoing training that will be given to persons filling each job position having responsibility for hazardous waste management and/or emergency response.
- The name, job title and job description for each position at the facility related to hazardous waste management.
- Current employee training records must be retained until closure of the facility and former employee training records must be retained for at least three years after termination of employment.

**Small Quantity Generator Training:** Small quantity generators (less than 1,000 kg) must include basic hazardous waste management and emergency response procedures but a written employee training plan and training records are not required. In order to show that the facility has met the small quantity generator employee training requirement, an employee training plan and training records may be made available.

**Hazardous Materials Business Plan Training**: Businesses must provide initial and annual employee training that includes the content referenced above. The training may be based on the job position and training records must be made available for a period of at least three years.

THIS PLAN COVERS CHEMICAL SPILLS, FIRES, AND EARTHQUAKES INVOLVING (Check all that apply): A10.

- [x] 1. HAZARDOUS MATERIALS;
- [ ] 2. HAZARDOUS WASTES

## B. INTERNAL RESPONSE

INTERNAL FACILITY EMERGENCY RESPONSE WILL OCCUR BY (Check all that apply): B1.

- [x] 1. CALLING PUBLIC EMERGENCY RESPONDERS (e.g., 9-1-1)
- [ ] 2. CALLING HAZARDOUS WASTE CONTRACTOR
- [ ] 3. ACTIVATING IN-HOUSE EMERGENCY RESPONSE TEAM

## C. EMERGENCY COMMUNICATIONS, PHONE NUMBERS AND NOTIFICATIONS

In the event of an emergency involving hazardous materials and/or hazardous waste, all facilities must IMMEDIATELY:
1. Notify facility personnel and evacuate if necessary in accordance with the Emergency Action Plan (Title 8 California Code of Regulations §3220);
2. Notify local emergency responders by calling 9-1-1;
3. Notify the local Unified Program Agency (UPA) at the phone number below; and
4. Notify the State Warning Center at (800) 852-7550.

Facilities that generate, treat, store or dispose of hazardous waste have additional responsibilities to notify and coordinate with other response agencies. Whenever there is an imminent or actual emergency situation such as an explosion, fire, or release, the Emergency Coordinator must follow the appropriate requirements for the category of facility and type of release involved:
1. Title 22 California Code of Regulations §66265.56. Emergency Procedures for generators of 1,000 kilograms or more of hazardous waste in any calendar month.
2. Title 22 California Code of Regulations §66265.196. Response to Leaks or Spills and Disposition of Leaking or Unfit-for-Use Tank Systems.
3. Title 40 Code of Federal Regulations §302.6. Notification requirements for a release of a hazardous substance equal to or greater than the reportable quantity.
4. Title 22 California Code of Regulations §66262.34(d)(2) and Title 40 Code of Federal Regulations §262.34(d)(5)(ii) for generators of less than 1000 kilograms of hazardous waste in any calendar month.

Following notification and before facility operations are resumed in areas of the facility affected by the incident, the Emergency Coordinator shall notify the local UPA and the local fire department's hazardous materials program, if necessary, that the facility is in compliance with requirements to:
1. Provide for proper storage and disposal of recovered waste, contaminated soil or surface water, or any other material that results from an explosion, fire, or release at the facility; and
2. Ensure that no material that is incompatible with the released material is transferred, stored, or disposed of in areas of the facility affected by the incident until cleanup procedures are completed.

Note: If more than one alternate emergency coordinator is designated, attach a list in order of responsibility.

## D. EMERGENCY CONTAINMENT AND CLEANUP PROCEDURES

Check the applicable boxes to indicate your facility's procedures for containing spills and preventing and mitigating releases, fires and/or explosions.

D1.

- [x] 1. MONITOR FOR LEAKS, RUPTURES, PRESSURE BUILD-UP, ETC.;
- [x] 2. PROVIDE STRUCTURAL PHYSICAL BARRIERS (e.g., Portable spill containment walls, built-in berms);
- [x] 3. PROVIDE ABSORBENT PHYSICAL BARRIERS (e.g., Pads, spill pigs, spill pillows);
- [x] 4. COVER OR BLOCK FLOOR AND/OR STORM DRAINS;
- [ ] 5. LINED TRENCH DRAINS AND/OR SUMPS;
- [ ] 6. AUTOMATIC FIRE SUPPRESSION SYSTEM;
- [x] 7. ELIMINATE SOURCES OF IGNITION FOR FLAMMABLE HAZARDS;
- [x] 8. STOP PROCESSES AND/OR OPERATIONS;
- [ ] 9. AUTOMATIC / ELECTRONIC EQUIPMENT SHUT-OFF SYSTEM;
- [x] 10. SHUT OFF WATER, GAS, ELECTRICAL UTILITIES;
- [x] 11. CALL 9-1-1 FOR PUBLIC EMERGENCY RESPONDER ASSISTANCE AND/OR MEDICAL AID;
- [x] 12. NOTIFY AND EVACUATE PERSONS IN ALL THREATENED AND/OR IMPACTED AREAS;
- [x] 13. ACCOUNT FOR EVACUATED PERSONS IMMEDIATELY AFTER EVACUATION;
- [ ] 14. PROVIDE PROTECTIVE EQUIPMENT FOR ON-SITE EMERGENCY RESPONSE TEAM;
- [x] 15. REMOVE CONTAINERS AND/OR ISOLATE AREAS;
- [ ] 16. HIRE LICENSED HAZARDOUS WASTE CONTRACTOR;
- [x] 17. USE ABSORBENT MATERIAL FOR SPILL CONTAINMENT;
- [ ] 18. VACUUM SUCTION USING APPROPRIATE VACUUM (e.g., Intrinsically safe) FOR SPILL CONTROL AND/OR CLEANUP;
- [ ] 19. DECONTAMINATE PERSONNEL AND EQUIPMENT WITHIN DESIGNATED AREA AND DISPOSE OF WASTEWATER AS HAZARDOUS WASTE;
- [ ] 20. PROVIDE SAFE TEMPORARY STORAGE OF HAZARDOUS WASTE GENERATED DURING EMERGENCY ACTIONS;
- [ ] 21. OTHER (Specify): D2.

## E. FACILITY EVACUATION

THE FOLLOWING ALARM SIGNAL(S) WILL BE USED TO BEGIN EVACUATION OF THE FACILITY (Check all that apply): E1.

E2.

- [ ] 1. BELLS;
- [ ] 2. HORNS/SIRENS;
- [x] 3. VERBAL (i.e., Shouting);
- [x] 4. OTHER (Specify): personal cellular telephones

THE FOLLOWING LOCATION(S) WILL BE USED FOR AN EMERGENCY ASSEMBLY AREA(S) (e.g., Parking lot, street corner): E3.

grass area adjacent to Edison Avenue, north side of milk barn

Note: The Emergency Coordinator must account for all onsite employees and visitors after evacuation.

EVACUATION ROUTE S AND ALTERNATE EVACUATION ROUTES ARE DESCRIBED AS FOLLOWS: E4.

- [ ] 1. WRITTEN PROCEDURES DESCRIBING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [x] 2. EVACUATION MAP(S) DEPICTING ROUTES, EXITS, AND ASSEMBLY AREAS;
- [ ] 3. OTHER (Specify): E5.

Note: Evacuation procedures and/or maps should be posted in visible facility locations and must be included in the Contingency Plan.

## F. ARRANGEMENTS FOR EMERGENCY SERVICES

ADVANCE ARRANGEMENTS FOR LOCAL EMERGENCY SERVICES (Check one of the following): F1.

- [x] 1. HAVE BEEN DETERMINED NOT NECESSARY;
- [ ] 2. THE FOLLOWING ARRANGEMENTS HAVE BEEN MADE (Specify): F2.

Note: Advance arrangements with local fire and police departments, hospitals, state and local emergency response teams, and/or emergency services contractors should be made for your facility, if necessary. Large Quantity Generators must describe arrangements in the Contingency Plan.

## G. EMERGENCY EQUIPMENT

**Check the applicable boxes to list emergency response equipment available at the facility, identify the location(s) where the equipment is kept, and indicate the equipment's capability, if applicable.**

| TYPE | EQUIPMENT AVAILABLE G1. | LOCATION G2. | CAPABILITY G3. |
|---|---|---|---|
| *EXAMPLE* | ☒ *CHEMICAL PROTECTIVE GLOVES* | *SPILL RESPONSE KIT* | *SINGLE USE, OIL RESISTANT ONLY* |
| **Safety and First Aid** | 1. ☒ CHEMICAL PROTECTIVE SUITS, APRONS, AND/OR VESTS | Chemical room | apron |
| | 2. ☐ CHEMICAL PROTECTIVE GLOVES | | |
| | 3. ☒ CHEMICAL PROTECTIVE BOOTS | employees all wear rubber boots | |
| | 4. ☐ SAFETY GLASSES, GOGGLES, AND FACE SHIELDS | | |
| | 5. ☐ HARD HATS | | |
| | 6. ☐ AIR-PURIFYING RESPIRATORS | | |
| | 7. ☐ SELF-CONTAINED BREATHING APPARATUS (SCBA) | | |
| | 8. ☒ FIRST AID KITS | office | |
| | 9. ☐ PLUMBED EYEWASH FOUNTAIN AND/OR SHOWER | | |
| | 10. ☐ PORTABLE EYEWASH KITS AND/OR STATION | | |
| | 11. ☒ OTHER | drop hoses in milking area fresh water | |
| **Fire Fighting** | 12. ☒ PORTABLE FIRE EXTINGUISHERS | office | |
| | 13. ☐ FIXED FIRE SUPPRESSION SYSTEMS AND/ OR SPRINKLERS | | |
| | 14. ☐ FIRE ALARM BOXES | | |
| | 15. ☐ OTHER | | |
| **Spill Control and Clean-Up** | 16. ☐ ALL-IN-ONE SPILL KIT | | |
| | 17. ☒ ABSORBENT MATERIAL | feed storage area- soil | |
| | 18. ☐ CONTAINER FOR USED ABSORBENT | | |
| | 19. ☒ BERM AND/OR DIKING EQUIPMENT | front end loader- feed storage area | |
| | 20. ☐ BROOM | | |
| | 21. ☒ SHOVEL | feed storage area | |
| | 22. ☐ VACUUM | | |
| | 23. ☐ EXHAUST HOOD | | |
| | 24. ☐ SUMP AND/OR HOLDING TANK | | |
| | 25. ☐ CHEMICAL NEUTRALIZERS | | |
| | 26. ☐ GAS CYLINDER LEAK REPAIR KIT | | |
| | 27. ☐ SPILL OVERPACK DRUMS | | |
| | 28. ☐ OTHER | | |
| **Communi-cations and Alarm Systems** | 29. ☒ TELEPHONES (e.g., Cellular) | all employees have personal cell phone | |
| | 30. ☐ INTERCOM AND/OR PA SYSTEM | | |
| | 31. ☐ PORTABLE RADIOS | | |
| | 32. ☐ AUTOMATIC ALARM CHEMICAL MONITORING EQUIPMENT | | |
| **Other** | 33. ☐ OTHER | | |
| | 34. ☐ OTHER | | |

## H. EARTHQUAKE VULNERABILITY

Identify areas of the facility that are vulnerable to hazardous materials releases due to seismic motion. These areas require immediate isolation and inspection.

| VULNERABLE AREAS (Check all that apply): H1. | LOCATIONS (e.g., Shop, outdoor shed, lab): H2. |
|---|---|
| ☒ 1. HAZARDOUS MATERIALS AND/OR WASTE STORAGE AREAS | chemical room |
| ☐ 2. PROCESS LINES AND PIPING | |
| ☐ 3. LABORATORY | |
| ☐ 4. WASTE TREATMENT AREA | |

Identify mechanical systems vulnerable to releases / spills due to earthquake-related motion. These systems require immediate isolation and inspection.

| VULNERABLE SYSTEMS AND/OR EQUIPMENT (Check all that apply): H3. | LOCATIONS: H4. |
|---|---|
| ☒ 1. SHELVES, CABINETS AND/OR RACKS | chemical room |
| ☒ 2. TANKS AND SHUT-OFF VALVES | |
| ☐ 3. PORTABLE GAS CYLINDERS | |
| ☒ 4. EMERGENCY SHUT-OFF AND/OR UTILITY VALVES | machine room |
| ☐ 5. SPRINKLER SYSTEMS | |
| ☐ 6. STATIONARY PRESSURIZED CONTAINERS (e.g., Propane tank) | |

## I. EMPLOYEE TRAINING

Employee training is required for all employees and/or contractors handling hazardous materials and/or hazardous wastes during normal and/or emergency operations. Most facilities will need to submit a separate Training Plan. However, your CUPA may accept this section as the Training Plan for some small facilities.
Employee training plans may include the following content:

- Applicable laws and regulations;
- Emergency response plans and procedures;
- Safety Data Sheets;
- Hazard communication related to health and safety;
- Methods for safe handling of hazardous substances;
- Hazards of materials and processes (e.g., fire, explosion, asphyxiation);
- Hazard mitigation, prevention and abatement procedures;
- Coordination of emergency response actions;
- Notification procedures for local emergency responders, CUPA, Cal OES, and onsite personnel;
- Communication and alarm systems;
- Personal protective equipment;
- Use and maintenance of emergency response equipment and supplies (e.g. Fire extinguishers, respirators, spill control materials);
- Decontamination procedures;
- Evacuation procedures and evacuation staging locations;
- Identification of facility areas, equipment, and systems vulnerable to earthquakes and other natural disasters.
- OTHER (Specify):

Check the applicable boxes below to indicate how the employee training program is administered.

☐ 1. FORMAL CLASSROOM ☐ 2. VIDEOS ☐ 3. SAFETY MEETINGS ☐ 4. STUDY GUIDES / MANUALS I1.
☒ 5. OTHER (Specify): tailgate meetings as needed I2.
☐ 6. NOT APPLICABLE SINCE FACILITY HAS NO EMPLOYEES
☐ 7. CHECK IF A SEPARATE EMPLOYEE TRAINING PLAN IS USED AND UPLOADED TO CERS AS A PDF DOCUMENT I3.
☐ 8. CHECK IF EMPLOYEE TRAINING IS COVERED BY THE ABOVE REFERENCED CONTENT AND OTHER DOCUMENTS ONSITE I4.

**EMPLOYEE TRAINING FREQUENCY AND RECORDKEEPING TRAINING MUST BE:**

- Provided initially for new employees as soon as possible following the date of hire. New employees should not work in an unsupervised position that involves hazardous materials handling and/or hazardous waste management without proper training;
- Provided within six months from the date of hire for new employees at a large quantity generator;
- Ongoing and provided at least annually;
- Amended prior to a change in process or work assignment;
- Given upon modification to the Emergency Response/Contingency Plan.

**Large Quantity Generator Training:** Large quantity generators (1,000 kg or more) must retain written plan and documentation of employee training which includes:

- A written description of the type and amount of both initial and ongoing training that will be given to persons filling each job position having responsibility for hazardous waste management and/or emergency response.
- The name, job title and job description for each position at the facility related to hazardous waste management.
- Current employee training records must be retained until closure of the facility and former employee training records must be retained for at least three years after termination of employment.

**Small Quantity Generator Training:** Small quantity generators (less than 1,000 kg) must include basic hazardous waste management and emergency response procedures but a written employee training plan and training records are not required. In order to show that the facility has met the small quantity generator employee training requirement, an employee training plan and training records may be made available.

**Hazardous Materials Business Plan Training**: Businesses must provide initial and annual employee training that includes the content referenced above. The training may be based on the job position and training records must be made available for a period of at least three years.

PLEASE REPLY TO ADDRESS CHECKED

COUNTY OF SAN BERNARDINO
ENVIRONMENTAL
PUBLIC WORKS AGENCY

PAUL F. RYAN, R.S., MPPA
Director

**TO ALL AGRICULTURAL BUSINESSES**

As you may recall, last year you returned to the San Bernardino County Agricultural Commissioner, an inventory form requesting information about your hazardous materials at your facility. Many of you have recently received another request for similar information (Business Plan) from the Department of Environmental Health Services.

A complete Business Plan does not need to be submitted. If your inventory of hazardous materials has not changed since you reported last year, please fill in the form below and send to:

**Ag. Commissioner**
**777 East Rialto Avenue**
**San Bernardino, CA 92415-0720**
**Attention: John Gardner**

If your inventory of hazardous materials has changed, please send in duplicate a statement to the above address explaining the changes (added or deleted substances) and include the name of the hazardous material, maximum quantity on hand and how it is stored (i.e., underground tank, bags, drum, etc.).

This will satisfy the state mandated disclosure requirement for agricultural businesses pursuant to Chp. 6.95 of the Health & Safety Code. Please refer questions to (714) 387-2120.

Thank you for your cooperation.

---

**BUSINESS NAME** Ernest Twin Palms Dairy

**BUSINESS ADDRESS** 7587 Edison Ave.
Chino, Calif. 91710

**PHONE NUMBER** 714. 5972176

The inventory of hazardous materials at the above address has not changed since reported on the 1987-88 Inventory Form requested by the County Ag. Commissioner and the Department of Environmental Health Services.

Authorized Signature: Ernest De Groot

Title: Dairy Farmer

CHINO, CA 91710

**SUBJECT: SOIL SAMPLING IN AREA OF FORMER UNDERGROUND STORAGE TANK AT 7587 EDISON, CHINO**

The Department has received the sample results and/or closure report submitted by George Bryant Construction, dated January 30, 2001. After review of the reports prepared by you or your agent, it has been determined that the extent of contamination or lack thereof would indicate that no further investigation is warranted at this time.

**It is important to note** that this can not be construed as a release of liability for the site or declaration that the site is free from contamination. Should further projects or environmental investigations reveal additional contaminants on site you will be responsible and held liable for the investigation and remedial actions.

If you have any questions, please call (909) 387-3082.

SAMPLES TAKEN BY George Bryant LABORATORY Del Mar Analytical

CONTAINER _____ LABELS _____ SPLITS _____ HEADSPACE _____ SEALS _____

REFRIGERATED _____ CHAIN OF CUSTODY _____ OTHER _____

REQUIRED EPA TESTS:
Gasoline: 8020 (BTEX) or 8021B , 8015 (TRPH - modified for gas) & MTBE
Diesel: 8020 (BTEX) or 8021B , 8015 (TRPH - modified for diesel) & MTBE
Solvents/HVO's: 8010 or 8021B
Waste Oil: 418.1 (with 8010 or 8021B if solvents are suspect) & CAM 17 for metals
Metals: 7030 (Cd), 7190 (Cr), 7950 (Zn), 7420 or 6010 (Pb), 7080 (As), 8080 (PCB), 9010 (CN's) OR CAM 17
Pesticides: 8080 (organo-Cl's), 8140 (N & P containing)

USTs ≥1000 gal. require a minimum of 2 samples. One from the fill end and one from the turbine end. Also, a sample from the dispenser should be taken. Samples should be taken from at least 2' below native soil (not fill). If discoloration is noted in sidewalls, take samples there. And sample stockpiles if contamination is suspect. For piping, samples should be taken ± every 20' & at major connections.

**Note: Methods 8020 and 8010 were deleted in SW846 -III and combined as 8021B. Also, 8260B may be used in place of 8021B for more accurate analyses when sampling for potential legal actions.**

Re: Site Closure Letter
7587 Edison
Chino, CA 91710

Dear Ms. Parsons:

Enclosed please find the analytical results from the samples taken in your presence, on January 11, 2001, at the above referenced project. As you can see from the test results, all samples were non-detect or below acceptable levels. No further action is required at this site.

Please forward you Site Closure Letter for this project at your earliest convenience.

Sincerely,

M. S. Bryant

CHINO, CA 91710

**SUBJECT: EXPIRATION OF UNDERGROUND STORAGE TANK REMOVAL SAMPLING PERMIT FOR 7697 EDISON AVE, CHINO**

On April 20, 2000 a permit to conduct underground storage tank sampling was issued. This letter is a reminder to inform you that your permit for underground storage tank sampling located at 7697 Edison Avenue, Chino will expire on January 20, 2001.

If the underground storage tank sampling has not been conducted on or before the expiration date, you will be required to pay an additional permit fee.

Please feel free to contact me at (909) 387-3082, to schedule any necessary appointments needed to finalize this underground storage tank sampling permit application.

Thank you for your cooperation in this matter.

| 347. Unlawful deposit of fuel into a non-compliant UST | CHSC 25292.3 | | | |

**NARRATIVE / CORRECTIONS**

A recent review of your file indicates that this facility has 1 underground storage tank onsite. The size of the UST was indicated to be 500 gallons. Please contact this office immediately regarding changes to UST status. This may include removal, no longer in use, and/or upgrading of the underground storage tank system to meet December 22, 1998 UST standards.

4/7/00 10am Spoke to Paul Huizenga re: this dairy. The property owner is his father-in-law, he (Paul) is leasing property. I sent an appl. packet for removal. Tank was removed 5-10 years ago.

χ NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN 30 DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.

Inspector: CHRISTINE PARSONS

**Consent granted by:**

☒ **Photograph** ☒ **Inspect** **Name:** Dickie Vandermeulen **Title:** Owner

An inspection was conducted on 01/18/2023 to determine compliance with applicable hazardous materials and hazardous waste laws and regulations. Dickie Vandermeulen, Owner was the escort during the inspection.

Tiva Diary is a farm that raises cattle for milk production. The facility handles hazardous materials in the form of teat dip, multi chlor bleach solution, and diesel fuel. No hazardous waste is generated or stored on site. Per Mr. Vandermeulen the farm equipment is serviced by Ross Avery and all hazardous waste is managed by the servicer. Aramark provides the facility with a rag service.

The inventory observed during the inspection was consistent with that reported to the California Environmental Reporting System on 03/16/2022.

Document Review:

- CUPA program permits are current, expiration date 05/31/2023.
- This facility is a handler only and does not have EPA ID#.
- The Hazardous Materials Business Plan was previously submitted to the California Environmental Reporting System, or CERS, on 03/16/2022.

No violations were observed on this date.

Please contact Erick Tilus at (909) 386-8401 or by e-mail at etilus@sbcfire.org with any questions regarding this report.

If you have any questions regarding CERS, please call the CERS Help Desk at (909) 386-8432.

PS Form 3800, April 2015 PSN 7530-02-000-9047 See Reverse for Instructions

- A receipt (this portion of the Certified Mail label).
- A unique identifier for your mailpiece.
- Electronic verification of delivery or attempted delivery.
- A record of delivery (including the recipient's signature) that is retained by the Postal Service™ for a specified period.

*Important Reminders:*

- You may purchase Certified Mail service with First-Class Mail®, First-Class Package Service®, or Priority Mail® service.
- Certified Mail service is *not* available for international mail.
- Insurance coverage is *not* available for purchase with Certified Mail service. However, the purchase of Certified Mail service does not change the insurance coverage automatically included with certain Priority Mail items.
- For an additional fee, and with a proper endorsement on the mailpiece, you may request the following services:
  - Return receipt service, which provides a record of delivery (including the recipient's signature). You can request a hardcopy return receipt or an electronic version. For a hardcopy return receipt, complete PS Form 3811, *Domestic Return Receipt;* attach PS Form 3811 to your mailpiece; for an electronic return receipt, see a retail associate for as[illegible]nce. To receive a duplicate return receipt [illegible] dditional fee, present this USPS®-postm[illegible] ertified Mail receipt to the retail associate.
  - Restricted delivery service, which provides delivery to the addressee specified by name, or to the addressee's authorized agent.
  - Adult signature service, which requires the signee to be at least 21 years of age (not available at retail).
  - Adult signature restricted delivery service, which requires the signee to be at least 21 years of age and provides delivery to the addressee specified by name, or to the addressee's authorized agent (not available at retail).
- To ensure that your Certified Mail receipt is accepted as legal proof of mailing, it should bear a USPS postmark. If you would like a postmark on this Certified Mail receipt, please present your Certified Mail item at a Post Office™ for postmarking. If you don't need a postmark on this Certified Mail receipt, detach the barcoded portion of this label, affix it to the mailpiece, apply appropriate postage, and deposit the mailpiece.

**IMPORTANT: Save this receipt for your records.**

**SENDER: *COMPLETE THIS SECTION***

- Complete items 1, 2, and 3.
- Print your name and address on the reverse so that we can return the card to you.
- Attach this card to the back of the mailpiece, or on the front if space permits.

Mr. Huizenga,

A recent review of our records indicates that the following violation(s) remain outstanding from the inspection conducted on April 22, 2016:

- Owner/Operator shall electronically update the information submitted to the statewide information management system if operations require modification to any portion of the plan or there is a substantial change in the handler's operations.
- At least once every 12 months, the owner/owner shall review and certify that the information in the statewide information management system has been verified and is complete, accurate and up to date.
- Owner/Operator shall submit the hazardous materials inventory, emergency contacts, site plan and certification that the existing plan is current and up to date.

**Failure to submit the signed and completed certificate of compliance with the previously requested documentation immediately may result in legal action.**

If you have any questions, please call me at (909) 386-8401 or email me at BWADE@SBCFIRE.ORG.

**Inspection Narrative (v020000)**

An inspection was conducted to determine compliance with hazardous waste generator and hazardous material handler laws and regulations. Consent to conduct the inspection and take photographs was given by Paul Huizenga, the Owner.

This facility is a dairy milking operation. Hazardous materials are stored on site for vehicle fueling and the milking operation. No hazardous waste is generated by the facility.

HAZARDOUS MATERIALS INVENTORY:
(3) 500-gallon tanks of diesel fuel.
(2) 275-gallon and (1) 55-gallon containers of teat dip.
(1) 55-gallon drum of formaldehyde 37%.
(1) 400-pound container of alkaline pipe cleaner.

DOCUMENTATION REVIEW:
-Heavy equipment is serviced by Kent Avery.
-Indoor equipment is serviced by Southern California Dairy Equipment. SoCal Dairy also provides chemicals used in the milking process and removes the empty drums.
-Diesel fuel is delivered by Western Refining.
-The Business Plan elements were last submitted into CERS on 3/19/2013. CERS ID 10052128.
-The permits are current; expiration date of 11/30/2016.

Submit a signed Certificate of Compliance with required documentation to this office within 30 days.

If you have any questions, feel free to contact me at 909-658-5912 or bwade@sbcfire.org. If you have any questions regarding CERS, please call the CERS helpline at 909-386-8432.

# ACCESS REQUEST to FACILITY RECORD IN CERS - SINGLE FACILITY*

For more information, see: http://www.sbcfire.org/hazmat/efile.aspx or call CERS help line (909) 386-8432

The purpose of the ACCESS REQUST is to ensure that only individuals designated by the facility owner/operator are authorized by the CUPA to access facility records and to create, edit, and submit electronic data on the owner's behalf to the statewide system, known as the California Environmental Reporting System (CERS). The initial business user authorized by the CUPA to have access to a facility on CERS is designated as a lead business user. Lead business users have the ability to add additional lead or standard business users, approve or reject other access requests, or delete other users for any facility for which they are listed as a lead user.

*Each facility record that is entered into CERS is assigned to a business/organization. Multiple facilities that have the same owner/operator and that will have the same users managing the facility record in CERS can be grouped together into a single "umbrella" business/organization. If you own or operate multiple facilities and if the same users will be managing all of the facilities in CERS, you may want them to be grouped into a single business/organization. For more information please contact the San Bernardino CERS help line at (909) 386-8432.

| 205. Facility access for inspection granted – HM | CHSC 25508 | | X | |
| 206. Regulated Substances registration filed | CHSC 25533(a) | | | X |
| 207. SPCC Plan prepared | CHSC 25270.5(c) | | | X |

**INSPECTION NARRATIVE**

An inspection was conducted to determine compliance with hazardous materials laws and regulations. I met with Paul Huizenga for the inspection.

This dairy uses chemicals for cleaning and disinfecting cows in the milking process.

They have three 500 gallon diesel fuel tanks, two 200-300lb drums of Pride chlorinated caustic detergent, and one 55 gallon drum of formaldehyde.

See next page

**SPECIAL INSTRUCTIONS:** Information in this location will not be entered into Envision.

C Mz data exchanged on 05/16/2019-yr

**COMMENTS/REMARKS:** Only text in this area will be entered as a blue book comment. Please attach and label additional sheets needed for comments.

Per inspection conducted on 05/01/2019, Huizenga Dairy ceased operations in late 2018, and Tiva Dairy took over operations. Hazardous Materials pertaining to the previous owner are no longer at this location with the exception of (3) 500-gallon Diesel Tanks. Tiva Dairy will now be responsible for permit payment.

- -Keep same FA and assign new owner ID
- -Change anniversary date
- -No changes in permits or operations

**FOR FISCAL USE ONLY:** Fiscal comments / remarks / instruction area (for use between OFM Fiscal and Admin Fiscal)

# CUPA PERMIT CONDITIONS

As a condition of the Certified Unified Program Agency (CUPA) permit to operate, the owner, operator, and permit holder shall comply with the following:

a. **Hazardous Materials Release Response Plans and Inventories Program (HMRRP):** California Health and Safety Code (CHSC) Division 20, Chapter 6.95, Article 1 and Title 19 California Code of Regulations (CCR).

b. **California Accidental Release Prevention Program (CalARP):** CHSC Division 20, Chapter 6.95, Article 2 and Title 19 CCR.

c. **Underground Storage Tanks (USTs):** CHSC Division 20, Chapters 6.5, 6.7 and Title 23 CCR, Chapter 16.

   (1) Monitoring, Response and Plot Plans shall be approved by the San Bernardino County CUPA.

   (2) The owner and operator are subject to all applicable requirements of Chapter 6.7 of the CHSC and the applicable regulations.

   (3) This permit and permit conditions including the Monitoring, Response and Plot Plans shall be maintained on site.

   (4) Monitoring or programming for monitoring shall be conducted at the locations of the following UST equipment, if installed: monitoring system control panels; sensors monitoring tank annular spaces, sumps, dispenser pans, spill containers, or other secondary containment areas (e.g. double-walled piping); mechanical or electronic line leak detectors; and in-tank liquid level probes used for leak detection.
   Note: The UST ID Number is listed on the front of the permit for each UST

d. **Aboveground Petroleum Storage Act SPCC Plans:** CHSC Division 20, Chapter 6.67 and 40 CFR 112.

e. **Hazardous Waste Generator and Hazardous Waste Onsite Treatment:** CHSC Division 20, Chapter 6.5 and Title 22 CCR, Division 4.5, Chapters 10, 11, 12, 20 and 31.

f. **San Bernardino County Fire Protection District Fire Code (SBCFPD FC), Hazardous Materials Management Plans and Inventories:** CHSC Division 12, Part2, Chapter 1,Article 2, Section 13143.9, CHSC Division 20, Chapter 6.95, Article 1, Section 25504, **SBCFPD FC** Chapter 4 Section 407.5, Section 407.6, Chapter 50, Section 5001.5.1 and Section 5001.5.2.

g. **Unified Program Forms and Electronic Reporting:** CHSC Division 20, Chapter 6.11, Section 25404(e)(4) and Title 27 CCR.

**Permitted by:**
San Bernardino County Fire Protection District
Hazardous Materials Division
620 South "E" Street
San Bernardino, CA 92415-0153
(909) 386-8401

Mark A. Hartwig, Fire Chief

**THIS PERMIT IS NOT TRANSFERABLE AND IS ISSUED CONDITIONALLY UPON ADHERENCE TO THE REQUIREMENTS LISTED ON THE BACK OF THIS PERMIT. THIS FORM MUST BE DISPLAYED CONSPICUOUSLY ON THE PREMISES.**

# PERMIT CONDITIONS

As a condition of the permit to operate, the owner, operator, and permit holder shall comply with the following:

a. **Hazardous Materials Release Response Plans and Inventories Program (HMRRP):** California Health and Safety Code (CHSC) Division 20, Chapter 6.95, Article 1 and Title 19 California Code of Regulations (CCR).

b. **California Accidental Release Prevention Program (CalARP):** CHSC Division 20, Chapter 6.95, Article 2 and Title 19 CCR.

c. **Underground Storage Tanks (USTs):** CHSC Division 20, Chapters 6.5, 6.7, 6.75, and Title 23 CCR, Chapters 16 & 18.

   (1) Monitoring, Response and Plot Plans shall be approved by the San Bernardino County CUPA.

   (2) The owner and operator are subject to all applicable requirements of Chapter 6.7 and 6.75 of the CHSC and the applicable regulations.

   (3) This permit and permit conditions including the Monitoring, Response and Plot Plans shall be maintained on site.

   (4) Monitoring or programming for monitoring shall be conducted at the locations of the following UST equipment, if installed: monitoring system control panels; sensors monitoring tank annular spaces, sumps, dispenser pans, spill containers, or other secondary containment areas (e.g. double-walled piping); mechanical or electronic line leak detectors; and in-tank liquid level probes used for leak detection.
   *Note: The UST ID Number is listed on the front of the permit for each UST.*

d. **Aboveground Petroleum Storage Act SPCC Plans:** CHSC Division 20, Chapter 6.67 and 40 CFR 112.

e. **Hazardous Waste Generator and Hazardous Waste Onsite Treatment:** CHSC Division 20, Chapter 6.5 and Title 22 CCR, Division 4.5, Chapters 10, 11, 12, 20 and 31.

f. **Uniform Fire Code, Hazardous Materials Management Plans and Inventories:** CHSC Division 12, Part 2, Chapter 1, Article 2, Section 13143.9, CHSC Division 20, Chapter 6.95, Article 1, Section 25509.2, California Fire Code Chapter 27, Section 2701.5.1 and Section 2701.5.2, formerly referred to as UFC Section 80.103.

g. **Unified Program Forms and Electronic Reporting:** CHSC Division 20, Chapter 6.11, Section 25404(e)(4) and Title 27 CCR.

**INSPECTION NARRATIVE**

An inspection was conducted to verify permit applicability as facility contacted Fiscal Division stating that hazardous materials are no longer present. Jim Bootsma escorted me along the inspection.

Hazardous Materials observed:
(1) 30-gallon drum containing Sodium Hypochlorite
(1) 30-gallon drum containing acid cleaner
(1) 30-gallon drum containing CIP cleaner
Diesel AST previously onsite has been removed (now purchased offsite as needed)
Kent Avery services equipment & removes waste. *Permits will be inactivated *

☐ **NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN ____ DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.**

No hazardous waste was observed at the time of inspection. Ken Avery provides repair service on equipment.

Correct the following violations:

(201) Hazardous material handler permit not current - CC 23.0602(b)(3)
Facilities that handle hazardous materials in quantities of 55 gallons or greater require a permit with this department.

To correct this violation: Submit payment upon receipt of invoice.

(202) Business Plan not established - CHSC 25503.5
Facilities that handle permittable quantities of hazardous materials must establish a Business Plan.

To correct this violation: Complete and submit the Business Emergency/Contingency Plan, original and 1 copy. Additionally, keep a copy onsite. Forms provided at time of inspection.

☒ **NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN 30 DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.**

8061 Edison Ave
Ontario, CA 91762
County
San Bernardino

CERS ID
**10741726**
EPA ID Number

## Submittal Status

Submitted on 5/8/2024 by *Patricia Mohr* of GH DAIRY (ONTARIO, CA)
Submittal was ***Accepted***; Processed on 5/9/2024 by *Erick Tilus* for San Bernardino County Fire Department
Comments by regulator: Accepted pending field verification. If you have any questions, please contact Erick Tilus at etilus@sbcfire.org or (909) 386-8401.

## Hazardous Materials

| | |
|---|---|
| Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70? | **Yes** |

## Underground Storage Tank(s) (UST)

| | |
|---|---|
| Does your facility own or operate underground storage tanks? | **No** |

## Hazardous Waste

| | |
|---|---|
| Is your facility a Hazardous Waste Generator? | **No** |
| Does your facility treat hazardous waste on-site? | **No** |
| Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)? | **No** |
| Does your facility consolidate hazardous waste generated at a remote site? | **No** |
| Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site? | **No** |
| Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month greater than 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste. | **No** |
| Is your facility a Household Hazardous Waste (HHW) Collection site? | **No** |

## Excluded and/or Exempted Materials

| | |
|---|---|
| Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)? | **No** |

## Aboveground Petroleum Storage

| | |
|---|---|
| Does your facility own or operate aboveground petroleum storage tanks or containers AND:<br>* have a total aboveground petroleum storage capacity of 1,320 gallons or more, OR<br>* have one or more petroleum tanks in an underground area? | **No** |

## Regulated Substances

| | |
|---|---|
| Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)? | **No** |

## Additional Information

7 Employees

## CERS Readiness Survey

Please return this survey to us by one of the following methods by October 31, 2012

Mail: Office of the Fire Marshal
620 South E Street
San Bernardino CA 92415-0153

Fax: (909) 386-8460

Scan & email: Efile@sbcfire.org

*Facility ID# (if known): FA0010956, FA0000522
Facility Name: 14389 Sultana, 8061 Edison Ave
Facility Address: Ontario CA 91761, Ontario, CA 91761

Please read the following descriptions and mark the answer(s) in the section that most closely describes your situation:

☐ I will put off electronic filing as long as possible. Since any Business Plan received on or after November 1st fulfills the requirement for the following March 1st deadline, I will submit a paper copy between November 1 and December 31, 2012, and not worry about tackling electronic filing until it is time to either meet the March 1, 2014, deadline or my Business Plan requires an update, whichever comes first.

☐ I have the situation covered. I don't anticipate needing any help beyond a possible call or two to the San Bernardino CUPA CERS Help Line at (909) 386-8432. (Be aware that there are almost 7,000 facilities in San Bernardino County with the same March 1st deadline, so those who wait until the last minute to file may find it really hard to get through to a live person by phone. The earlier the better!)

☐ A little assistance would be appreciated. I would feel more comfortable entering my facility information into CERS in a workshop setting, where there is someone there to explain the process and who would be immediately available to offer assistance as needed.
Best time for me to attend a workshop: (check more than one if applicable)
- ☐ Workdays (Mon-Fri) between 8 am & 5 pm
- ☐ Workdays in the evening (after 5 pm)
- ☐ Weekends (Saturday or Sunday)
- ☐ I would appreciate assistance in Spanish

☐ Help! I don't have a computer and/or don't know how to use one. I will definitely need help entering my facility's information.
- ☐ I would be able to make an appointment and travel to the San Bernardino Office of the Fire Marshal in order to receive one-on-one help
- ☐ I am unable to travel to San Bernardino and would need someone to travel to my location
- ☐ I would appreciate assistance in Spanish

☒ None of the above describes my situation. Below is a brief description:

We are closeing Down our Businesses on or around Nov. 1st 2012

Name: Greg Arema Assigned to Greg.

The best way to contact me:
☐ U.S Mail ☐ Email: _____ ☐ Phone: 951-741-6184

*If you report for more than one facility, fill out just one survey and note the total number of facilities that you report for.

Mark A. Hartwig, Fire Chief

**THIS PERMIT IS NOT TRANSFERABLE AND IS ISSUED CONDITIONALLY UPON ADHERENCE TO THE REQUIREMENTS LISTED ON THE BACK OF THIS PERMIT. THIS FORM MUST BE DISPLAYED CONSPICUOUSLY ON THE PREMISES.**

# PERMIT CONDITIONS

As a condition of the permit to operate, the owner, operator, and permit holder shall comply with the following:

a. **Hazardous Materials Release Response Plans and Inventories Program (HMRRP):** California Health and Safety Code (CHSC) Division 20, Chapter 6.95, Article 1 and Title 19 California Code of Regulations (CCR).

b. **California Accidental Release Prevention Program (CalARP):** CHSC Division 20, Chapter 6.95, Article 2 and Title 19 CCR.

c. **Underground Storage Tanks (USTs):** CHSC Division 20, Chapters 6.5, 6.7, 6.75, and Title 23 CCR, Chapters 16 & 18.

   (1) Monitoring, Response and Plot Plans shall be approved by the San Bernardino County CUPA.

   (2) The owner and operator are subject to all applicable requirements of Chapter 6.7 and 6.75 of the CHSC and the applicable regulations.

   (3) This permit and permit conditions including the Monitoring, Response and Plot Plans shall be maintained on site.

   (4) Monitoring or programming for monitoring shall be conducted at the locations of the following UST equipment, if installed: monitoring system control panels; sensors monitoring tank annular spaces, sumps, dispenser pans, spill containers, or other secondary containment areas (e.g. double-walled piping); mechanical or electronic line leak detectors; and in-tank liquid level probes used for leak detection.
   *Note: The UST ID Number is listed on the front of the permit for each UST.*

d. **Aboveground Petroleum Storage Act SPCC Plans:** CHSC Division 20, Chapter 6.67 and 40 CFR 112.

## HAZARDOUS WASTE GENERATOR AND HAZARDOUS MATERIALS HANDLER INSPECTION REPORT

FA #: FA0000522 Facility Name: Joostsma Dairy Inspection Date: April 19, 2007
Site Address: 8061 Edison Ave Phone #: (951) 741-6184
City: Ontario Zip Code: 91762 EPA ID #: not established
Consent Granted by:
☒ Inspect ☒ Photograph Name: Greg Arema ~~Joostsma~~ Title: Partner # Emp: 6

Refer to Title 19 and Title 22 of the California Code of Regulations (CCR), Chapter 6.5 of the Health and Safety Code (CHSC) and Division 3 of Title 2 of the San Bernardino County Code (CC). The following code sections are either in Violation (V) of, in Compliance (C) with, the applicable laws and regulations, or compliance is not applicable, not addressed or unknown (N).

| GENERAL REQUIREMENTS FOR GENERATORS | | V | C | N |
|---|---|---|---|---|
| 101. Hazardous Waste Generator Permit current | CC 23.0602(b)(1) | X | | |
| 102. Facility access for inspection granted - HW only | CHSC 25185 | | X | |
| 103. Hazardous Waste determination made | CCR 66262.11 | | | X |
| 104. EPA ID Number obtained | CCR 66262.12(a) | X | | |
| 105. Hazardous Waste storage/treatment authorization | CHSC 25189.5(d) | | | X |
| 106. Facility operated/maintained to prevent release/fire | CCR 66265.31 | X | | |
| 107. Contingency Plan established | CCR 66265.51(a) | X | | |
| 108. Recyclable materials managed lawfully | CHSC 25143.2 | | | X |
| 905. Universal Waste managed lawfully | CCR 66273.1 | | | X |
| **STORAGE AND LABELING REQUIREMENTS** | | | | |
| 110. Tank/container labeled/marked "Hazardous Waste" | CCR | X | | |
| 111. Hazardous Waste label complete | CCR 66262.34(f)(3) | | | X |
| 112. Accumulation start date on tank/container | CCR 66262.34(f)(2) | | | X |
| 113. Hazardous Waste accumulation time not exceeded | CCR 66262.34 | | | X |
| 114. Hazardous Waste containers sound | CCR 66265.171 | | X | |
| 115. Hazardous Waste containers not leaking | CCR 66265.173(b) | | X | |
| 116. Hazardous Waste containers closed | CCR 66265.173(a) | X | | |
| 117. Contaminated containers managed properly | CCR 66261.7 | X | | |
| 118. Container storage area inspected weekly | CCR 66265.174 | | | X |
| 119. Hazardous Waste managed lawfully | CHSC 25154 | X | | |
| 120. Hazardous Waste aboveground tank system inspected | CCR 66262.34 | | | X |
| **HAZARDOUS WASTE RECORDS AND MANIFESTS** | | | | |
| 125. Hazardous Waste transported with a manifest | CCR 66262.20(a) | | | X |
| 126. Hazardous Waste manifest complete | CCR 66262.23 | | | X |
| 127. Hazardous Waste manifests sent to DTSC | CCR 66262.23(a)(4) | | | X |
| 128. Manifests retained for at least 3 years | CCR 66262.40(a) | | | X |
| 129. Biennial Report prepared | CCR 66262.41 | | | X |
| 130. Hazardous Waste analyses retained for 3 years | CCR 66262.40(c) | | | X |
| 131. Training documentation complete & available | CCR 66265.16 | | | X |
| 132. Copy of completed SB 14 available | CCR 67100.3 | | | X |
| 135. Used oil managed properly | CHSC 25250.4 | | | X |
| 136. Used oil not contaminated with Hazardous Waste | CHSC 25250.7 | | | X |
| 137. Consolidated manifesting records available | CHSC 25160.2(b)(3) | X | | |
| 138. Used oil filters managed lawfully | CCR 66266.130 | | | X |
| 139. Spent lead acid batteries managed lawfully | CCR 66266.81 | | | X |
| **DISPOSAL AND TRANSPORTATION** | | | | |
| 145. Illegal disposal/abandonment of Hazardous Waste | CHSC 25189.5(a) | | | X |
| 146. Illegal disposal of used oil | CHSC 25250.5(a) | | | X |
| 147. Transporting Hazardous Waste w/o valid registration | CHSC 25163 | | | X |
| 148. Hazardous Waste hauled by transporter w/o valid registration | CHSC 25163 | | | X |
| 149. Hazardous Waste transported to an unauthorized facility | CHSC 25189.5(c) | | | X |

| GENERAL REQUIREMENTS FOR HANDLERS | | V | C | N |
|---|---|---|---|---|
| 201. Hazardous Material Handler permit current | CC 23.0602(b)(3) | X | | |
| 202. Business Plan established | CHSC 25503.5 | X | | |
| 203. Business Plan submitted/updated | CHSC 25505 | | | X |
| 204. Hazardous Materials release reported | CHSC 25507 | | | X |
| 205. Facility access for inspection granted – HM | CHSC 25508 | | X | |
| 206. Regulated Substances registration filed | CHSC 25533(a) | | | X |
| 207. SPCC Plan prepared | CHSC 25270.5(c) | | | X |
| 230. Business Plan implemented | CHSC 25503.5 | | | X |

**INSPECTION NARRATIVE**

An ispection was conducted to determine compliance with all applicable hazardous materials and hazardous waste laws and regulations. Facility is a dairy (milk production).

Hazardous Materials Inventory
(1) 55 gal drum teat dip
(2) 55 gal powder Chlorinated Soap
(2) 30 gal Acid
(1) 30 gal Sodium Hypochlorite
(1) 250 gal ~~tote~~ teat dip
(6) 50 lbs bags Zinc Sulfate
(1) 55 gal Hydrochloric Acid
(1) 55 gal Oxene

**NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN 30 DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.**

# SUPPLEMENTAL INSPECTION REPORT

INSPECTION DATE: April 19, 2007

| FACILITY ID | FACILITY NAME: | FACILITY LOCATION: |
|---|---|---|
| FA0000522 | Joritsma Dairy | 8061 Edison Ave, Ontario |
| Consent Granted by: ☒ Inspect ☒ Photograph | NAME Greg Arema | TITLE Partner |

Note: The above items (HCl and Oxene) are mixed together to make Chlorine Dioxide. These are automatically ~~pumped~~ injected into the water tank to kill bacteria in water troughs for cattle.
(2) AST's Diesel (1-500 gal; 1-100 gal).

Hazardous waste inventory
(2) 30 gal used oil & (3) 5-gal used oil (open)
Mr. Joritsma indicated that the waste from this waste is consolidated at other location (FA 694). To date used oil has not been removed.

Note: Evaporation ponds onsite provide water for irrigation of fields.

Correct the following violations:
(10) Hazardous waste generator permit not current - CC 23.0602(b)(1)
(201) Hazardous material handler permit not current - CC 23.0602(b)(3)
Facilities that generate any amounts of hazardous waste and handle hazardous materials in quantities of 55 gallons or greater are required to have permits with this department.

To correct this violation: Submit payment upon receipt of invoice.

(104) EPA ID number not obtained - CCR 66262.12(a)
Facilities that generate hazardous waste must obtain an EPA ID number to track removal of hazardous waste.

☒ NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN 30 DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.

# SUPPLEMENTAL INSPECTION REPORT

INSPECTION DATE: April 19, 2007

| FACILITY ID | FACILITY NAME: | FACILITY LOCATION: |
|---|---|---|
| FA0000522 | Joritsma Dairy | 8061 Edison Ave, Ontario |
| Consent Granted by: ☒ Inspect ☒ Photograph | NAME Greg Arema | TITLE Partner |

To correct this violation: Submit a statement indicating that an EPA ID number has been obtained.

(106) Facility not operated/maintained to prevent release - CCR 66265.31
(116) Hazardous waste containers not closed - CCR 66265.173 (a)
Having open containers of hazardous waste is not operating facility to prevent a release. Containers should be closed unless adding to or removing waste. (3) open 5-gallon containers of used oil observed.

To correct these violations: Submit a statement indicating all containers are closed.

(110) Tank/container not labeled/marked "Hazardous Waste" - CCR 66262.34 (a)(3)
(119) Hazardous waste not managed lawfully - CHSC 25154
Containers of hazardous waste must be labeled properly (see Compliance Made Easy handbook for guidance). Not labeling containers properly is unlawful management of hazardous waste. (2) drums of used oil not labeled.

To correct these violations: Submit a statement indicating all containers are labeled properly.

(107) Contingency Plan not established - CCR 66265.51(a)
(202) Business Plan not established - CHSC 25503.5
A Business Emergency/Contingency Plan has not been established.

**NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN 30 DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.**

To correct these violations: Complete and submit a Business Emergency/Contingency Plan, original and 1 copy. Additionally, keep a copy onsite.

(117) Contaminated containers not managed properly - CCR 66261.7
Empty containers must be labeled as "empty" with date they become empty and removed within 1 year. Observed several empty containers that were not labeled properly.

To correct this violation: Submit a statement indicating the containers are labeled properly or copy of receipt documenting removal.

(137) Consolidated manifesting records not available - CHSC 25160.2(b)(3)
Receipts documenting removal of used oil shall be maintained for at least 3 years. To date waste has not been removed.

To correct this violation: Submit a copy of the receipt documenting removal of used oil.

If you have any questions, call (909) 386-8401.

☒ NOTICE OF VIOLATION: THE VIOLATIONS NOTED ABOVE MUST BE CORRECTED WITHIN 30 DAYS. FAILURE TO COMPLY MAY RESULT IN LEGAL ACTION. THE CERTIFICATE OF COMPLIANCE SHALL BE SUBMITTED WITHIN THE TIME PERIOD NOTED ABOVE.

| | | | | |
| | | | | |
| | | | | |
| | | | | |

Summarize the Business Plan inventory on this page. Place this summary in front of the inventory section of the Business Plan. Make copies of this sheet as necessary. Reminder: You need not report hazardous materials with a maximum quantity of less than 55 gallons, 500 pounds, 200 cubic feet, or the threshold planning quantity of an extremely hazardous substance. However, hazardous wastes, Category 1 and 2 pesticides, and explosives are reportable at any quantity.

### III. SIGNATURE- EPCRA Facilities MUST sign the bottom of each individual attached Inventory form.

| SIGNATURE OF OWNER/OPERATOR | NAME OF SIGNER (*print*) | DATE |

## HAZARDOUS MATERIALS INVENTORY – CHEMICAL DESCRIPTION

☒ MATERIAL ☐ WASTE | Page ___ of ___

### I. FACILITY INFORMATION

BUSINESS NAME (Same as FACILITY NAME or DBA – Doing Business As): Jorritsma & Anema Dairy (3)

FACILITY ID #: F A 0 0 0 0 5 2 2 (1) | MAP#: 1 (203) | GRID#: D5 (204)

### II. CHEMICAL INFORMATION

CHEMICAL NAME (205): Sodium Hypochlorite

TRADE SECRET (206): ☐ Yes ☒ No — If Subject to EPCRA, refer to Instructions

COMMON NAME (207): Chlorine Bleach

EHS* (208): ☐ Yes ☒ No

CAS# (209): 7681-52-9

*If EHS is "Yes", all amounts below must be in lbs.

HAZARDOUS MATERIAL TYPE (Check one item only) (211): ☐ a. PURE ☒ b. MIXTURE ☐ c. WASTE

RADIOACTIVE (212): ☐ Yes ☒ No | CURIES (213):

PHYSICAL STATE (Check one item only) (214): ☐ a. SOLID ☒ b. LIQUID ☐ c. GAS

LARGEST CONTAINER (215): 30 gal

FED HAZARD CATEGORIES (Check all that apply) (216): ☐ a. FIRE ☐ b. REACTIVE ☐ c. PRESSURE RELEASE ☒ d. ACUTE HEALTH ☐ e. CHRONIC HEALTH

| AVERAGE DAILY AMOUNT (217) | MAXIMUM DAILY AMOUNT (218) | ANNUAL WASTE AMOUNT (219) | STATE WASTE CODE (220) |
|---|---|---|---|
| 30 gal | 50 gal | | |

UNITS* (Check one item only) (221): ☒ a. GALLONS ☐ b. CUBIC FEET ☐ c. POUNDS ☐ d. TONS
* If EHS, amount must be in pounds.

DAYS ON SITE: 365 (222)

STORAGE CONTAINER (223):
☐ a. ABOVE GROUND TANK ☒ e. PLASTIC/NONMETALLIC DRUM ☐ i. FIBER DRUM ☐ m. GLASS BOTTLE ☐ q. RAIL CAR
☐ b. UNDERGROUND TANK ☐ f. CAN ☐ j. BAG ☐ n. PLASTIC BOTTLE ☐ r. OTHER
☐ c. TANK INSIDE BUILDING ☐ g. CARBOY ☐ k. BOX ☐ o. TOTE BIN
☐ d. STEEL DRUM ☐ h. SILO ☐ l. CYLINDER ☐ p. TANK WAGON

STORAGE PRESSURE (224): ☒ a. AMBIENT ☐ b. ABOVE AMBIENT ☐ c. BELOW AMBIENT

STORAGE TEMPERATURE (225): ☒ a. AMBIENT ☐ b. ABOVE AMBIENT ☐ c. BELOW AMBIENT ☐ d. CRYOGENIC

| | %WT | HAZARDOUS COMPONENT (For mixture or waste only) | EHS | CAS # |
|---|---|---|---|---|
| 1 | 12.5 (226) | Sodium Hypochlorite (227) | ☐ Yes ☒ No (228) | 7681-52-9 (229) |
| 2 | 1.0 (230) | Sodium Hydroxide (231) | ☐ Yes ☒ No (232) | 1310-73-2 (233) |
| 3 | 10 (234) | Sodium Chloride (235) | ☐ Yes ☒ No (236) | 7647-14-5 (237) |
| 4 | Balance (238) | Water (239) | ☐ Yes ☒ No (240) | 7732-18-5 (241) |
| 5 | (242) | (243) | ☐ Yes ☐ No (244) | (245) |

If more hazardous components are present at greater than 1% by weight if non-carcinogenic, or > 0.1% by weight if carcinogenic, attach additional sheets of paper capturing the required information.

# EMERGENCY RESPONSE PLANS & PROCEDURES – AGENCY NOTIFICATION

3 BUSINESS NAME (Same as FACILITY NAME or DBA) Jorritsma + Anema Dairy

## POST BY TELEPHONE

**Agency Notification**: **If a situation is an emergency, call 911 first.** Additionally, a handler of hazardous materials is required to immediately report any release or threatened release of a hazardous material to San Bernardino County Fire Department, Hazardous Materials Division and the Governor's Office of Emergency Services. Spills exceeding Federal reportable quantities require additional notification to the National Response Center. However, California statute does not limit the requirement to report to any specific quantity. **Also note that calling 911 does not meet the requirement for the handler to report a release and that the local fire department cannot make required notifications on behalf of the handler.** This CUPA requires a written report within 15 days after any reportable release or threatened release. Contact the CUPA for further guidance.

| Agency (* Indicates mandatory notification) | Phone Number |
|---|---|
| 1. *Local Emergency Response Agency (if an emergency) | **911** |
| 2. *San Bernardino County Fire Department Hazardous Materials Division | **(800) 33-TOXIC** or **(909) 386-8425** |
| *Note: (800) 33-TOXIC does not work nationwide; non-local callers must use (909) 386-8425 to report **any** release or threatened release.* | |
| 3. *Cal E·M·A (Formerly known as OES) | **(800) 852-7550** or **(916) 845-8911** |
| 4. National Response Center | **(800) 424-8802** |
| 5. Other Agencies *(Cal OSHA, Regional Board, Air Quality, as applicable)* | |

| *Agency Name* | *Phone Number* |
|---|---|
| *Agency Name* | *Phone Number* |
| *Agency Name* | *Phone Number* |

**EMERGENCY INFORMATION REQUIRED: BE PREPARED TO PROVIDE THE FOLLOWING INFORMATION**

- Name & phone number of person reporting
- Name and street address of the business
- Location of the incident or threatened release
- Type of incident or threatened release
- Hazardous materials involved & physical state
- Hazards to human health and/or environment
- Actions taken or planned
- Contractor or cleanup company name
- Estimate of the quantity released
- Media (soil, water, air) into which release occurred
- Precautions to take (if known)
- Time and duration of the release
- Is the chemical an extremely hazardous substance?
- Extent of injuries, if any
- Is any assistance required?

Release reporting citations (California Health and Safety Code):

§ 25501. Definitions:
(r) "Release" means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment, unless permitted or authorized by a regulatory agency.
(u) "Threatened release," means a condition creating a substantial probability of harm, when the probability and potential extent of harm make it reasonably necessary to take immediate action to prevent, reduce, or mitigate damages to persons, property, or the environment.

§ 25507(a) ... the handler or any employee, authorized representative, agent, or designee of a handler shall, upon discovery, immediately report any release or threatened release of a hazardous material to the administering agency, and to the office, in accordance with the regulations adopted pursuant to Section 25503. Each handler and any employee, authorized representative, agent, or designee of a handler shall provide all state, city, or county fire or public health or safety personnel and emergency rescue personnel with access to the handler's facilities.

See Appendix G for further citations and explanation.

Date:

# EMERGENCY RESPONSE PLANS AND PROCEDURES

BUSINESS NAME (Same as FACILITY NAME or DBA)
Jorritsma + Arena Dairy

**FACILITY TRAINING PLAN:** Describe employee and operator training including local emergency response coordination, use of facility emergency equipment, and provisions for initial and refresher training. In addition, describe training for hazardous materials/waste handling as required by OSHA. (√ Check those items that apply and write additional information in the space provided)

- ☒ New employee training
- ☒ Annual training & periodic refresher courses
- ☒ Familiarization with the Emergency Response Plans and Procedures of this Business Plan
- ☒ Spill control equipment
- ☐ Monitoring system
- ☒ Personal Protective Equipment
- ☒ On the job training (Described below)
- ☐ Other:

**EMERGENCY PROCEDURES:** Describe duties of the Emergency Coordinator and how implementation of Facility Emergency Response will be accomplished. (e.g. Notification, evacuation, emergency coordination) (√ Check those items that apply and write additional information in the space provided)

Emergency Coordinator will:

- ☒ Identify potential hazards and determine whether a release has occurred
- ☒ Activate local emergency systems (e.g. manual shutoff devices) and take appropriate immediate actions based on level of training and the ability to act safely
- ☒ Coordinate the notification and evacuation of employees, customers, and other visitors from the facility
- ☒ Make required agency notifications and request needed assistance
- ☒ Assist responding agencies by providing access to the facility and information about the facility
- ☐ Other:

9: 7-30-11

# MATERIAL SAFETY DATA SHEET

## L A CHEMCHLOR

## SECTION 1 – CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Los Angeles Chemical Company
4545 Ardine Street
South Gate, CA 90280
1-323-562-9500

**Product Name:** Sodium Hypochlorite Solution (10-16%)
**Synonyms:** Sodium Hypochlorite Solution -Trade % (11 – 19), Bleach, Javel Water, Clorox, Bacticide
**Major, Update:** 05/01/00 **Product Use:** Bleach, disinfectant **CAS#:** 7681-52-9

### Emergency Contacts (24 hr.)

FOR EMERGENCIES INVOLVING CHEMICAL SPILL OR RELEASE, CALL
**1-800-424-9300.**

## SECTION 2 – COMPOSITION / INFORMATION ON INGREDIENTS

| Hazardous Ingredient(s) | % (w/w) | ACGIH AIHA | CAS NO. |
|---|---|---|---|
| Sodium Hypochlorite | 10 - 16 | 0.5 ppm (STEL) 2 mg/m$^3$ (as chlorine) | 7681-52-9 |

## SECTION 3 – HAZARD IDENTIFICATION

**********

**Emergency Overview:** CORROSIVE! Contact with acid liberates toxic chlorine gas. Causes burns to skin, eyes, respiratory tract and mucous membranes. Harmful or fatal if swallowed. May cause sensitization by skin contact. Toxic to aquatic organisms. Read the entire MSDS for a more thorough evaluation of the hazards.

**********

**Potential Health Effects:**

**Inhalation:** Mist can irritate the nose and throat. If mixed with acids, hypochlorite solutions release large amounts of chlorine gas. This gas can cause severe irritation of the nose and throat. Exposure to high levels of chlorine gas may result in severe lung damage.
**Skin Contact:** Sodium hypochlorite mist and solutions can cause skin irritation. In severe cases, chemical burns may result.

**Eye Contact:** Can cause severe burns and corneal damage, which may result in permanent blindness.

**Ingestion:** Hypochlorite solutions release hypochlorous acid on contact with gastric juices, and ingestion causes irritation and corrosion of mucous membranes, pain, vomiting, and oedema of the pharynx and larynx; reduced blood pressure, delirium and coma may occur.

**Subchronic Effects:** SKIN: Prolonged or repeated skin contact with solutions containing as little as 4-6% sodium hypochlorite can cause allergic contact dermatitis. Symptoms include chronic, itchy eczema. Sensitized people can react to very dilute (0.04-0.06% NaOCl) solutions that touch their skin

**Existing Medical Conditions Possibly Aggravated By Exposure :** Skin irritation may be aggravated in individuals with existing skin lesions. Breathing of vapors or mists may aggravate acute or chronic asthma and chronic pulmonary disease such as emphysema and bronchitis.

**Carcinogenicity:** Sodium hypochlorite is not classified as carcinogenic by ACGIH (American Conference of Governmental Industrial Hygienists) or IARC (International Agency for Research on Cancer), not regulated as carcinogens by OSHA (Occupational Safety and Health Administration), and not listed as carcinogens by NTP (National Toxicology Program).

## SECTION 4 – FIRST AID MEASURES

**General:** If you feel unwell seek medical advice (show the label where possible).

**Inhalation:** Move victim to fresh air. Give artificial respiration ONLY if breathing has stopped. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Give Cardiopulmonary Resuscitation (CPR) only if there is no pulse AND no breathing. Obtain medical attention IMMEDIATELY.

**Skin Contact:** Immediately flush skin with running water for at least 15 - 20 minutes. Under running water remove contaminated clothing, jewelry, and shoes. If irritation persists, repeat flushing. For burns, obtain medical attention. Discard heavily contaminated clothing and shoes in a manner, which limits further exposure. Otherwise, wash clothing separately before reuse.

**Eye Contact:** Immediately flush eyes with running water for a minimum of 15 minutes. Hold eyelids open during flushing. If irritation persists, repeat flushing. Obtain medical attention IMMEDIATELY. Do not transport victim until the recommended flushing period is completed unless flushing can be continued during transport.

**Ingestion:** DO NOT INDUCE VOMITING. If victim is alert and not convulsing, rinse mouth and give as much water as possible to dilute material. If spontaneous vomiting occurs, have victim lean forward with head down to avoid breathing in of vomitus, rinse mouth and administer more water. IMMEDIATELY transport victim to an emergency facility.

**Note to Physicians:** Symptomatic. Treatment and supportive therapy as indicated. Do NOT give acidic antidotes such as juice, soft drink, vinegar, etc. This product contains materials that may cause severe pneumonitis if aspirated. If ingestion has occurred less than 2 hours earlier, carry out careful gastric lavage; use endotracheal cuff if available, to prevent aspiration. Observe patient for respiratory difficulty from aspiration pneumonitis. Give artificial resuscitation and appropriate chemotherapy if respiration is depressed. Following exposure the patient should be kept under medical review for at least 48 hours as delayed pneumonitis may occur. Pulmonary edema is likely and may be delayed. Steroid therapy, if given early, may be effective in preventing or alleviating edema.

## SECTION 5 – FIRE FIGHTING MEASURES

| | |
|---|---|
| **Flash Point** | Not applicable. Not combustible |
| **Flammable Limits (Lower)** | Not applicable |
| **Flammable Limits (Upper)** | Not applicable |
| **Auto Ignition Temperature** | Not applicable |
| **Combustion and Thermal Decomposition Products** | Chlorine, sodium oxide, oxygen |
| **Rate of Burning** | Not applicable |
| **Explosive Power** | Not applicable |
| **Sensitivity to Mechanical Impact** | Not applicable |

**Fire and Explosion Hazards:** Sodium hypochlorite is a strong chemical oxidant, but solutions do not support combustion. Reaction with nitrogen compounds, chloroorganic compounds, or easily oxidizable compounds (reducing agents) may be explosive. This material is non-flammable but is decomposed by heat and light, causing a pressure build-up, which could result in an explosion. When heated, it may

release chlorine gas. Vigorous reaction with oxidizable or organic materials may result in fire. See Section 10.

**Extinguishing Media :** For large fires use an all purpose type AFFF alcohol foam resistant medium expansion according to foam manufacturer's recommended techniques. The foam supplier should be consulted for recommendations regarding foam types and delivery rates for specific applications. Use carbon dioxide or dry chemical media for small fires. If only water is available, use it in the form of a fog.

**Special Information:** Water may be used to cool containers of Hypochlorite solution exposed to heat from a fire. This should be done from a safe distance since containers may rupture.
Firefighters should wear protective equipment and self-contained breathing apparatus with full facepiece operated in positive pressure mode. Move containers from fire area if you can do it without risk. Dike fire control water for later disposal; do not scatter the material. Fire involving tanks or trailer loads: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. ALWAYS stay away from the ends of tanks.

**Evacuation:** If tank or tank truck involved in a fire, ISOLATE and consider evacuation of one-half (1/2) mile radius.

**Fire Fighting Protective Equipment:** Full protective clothing, including a self-contained breathing apparatus, must be worn in a fire involving this material. Toxic gas and vapors are produced upon decomposition.

**NOTE:** Also see "Section 10 - Stability and Reactivity"

## SECTION 6 – ACCIDENTAL RELEASE MEASURES

**Spills, Leaks, or Releases:**
- Restrict access to area until completion of clean up. Ensure trained personnel conduct clean up.
- Remove all ignition sources (no smoking, flares, sparks or flames). All equipment should be grounded and non-sparking. Ventilate area.
- Wear adequate personal protective equipment. Do not touch spilled material.
- Stop leak if possible without personal risk.

Small spills: Cover with DRY earth, sand or other non-combustible material. Use clean non-sparking tools to collect material and place it into loosely covered plastic containers for later disposal. Rinse area with water.
Large spills: Prevent entry into sewers and confined areas. Dike with inert material (sand, earth, etc.). Contact fire and emergency services and supplier for advice. Collect product for recovery or disposal by pumping it into polyethylene containers. Consider in-situ neutralization and disposal. Ensure adequate decontamination of tools and equipment following clean up. Collect contaminated soil and water, and absorbent for proper disposal. Comply with Federal, Provincial/State and local regulations on reporting releases.

**Deactivation For Small Spills:** Hypochlorite can be broken down by covering it with a reducing agent such as sodium sulfite or sodium thiosulfate.

**Deactivating Chemicals:** Use sodium sulfite or diluted hydrogen peroxide to reduce the material. Ensure there is no chlorine residue before neutralizing with a weak solution of hydrochloric or sulfuric acid.

**Waste Disposal Methods:** Dispose of waste material at an approved waste treatment/disposal facility, in accordance with applicable regulations. Do not dispose of waste with normal garbage or to sewer systems.

Note - Clean-up material may be a RCRA Hazardous Waste on disposal.
- Spills are subject to CERCLA reporting requirements: RQ = 100 lbs.
-

## SECTION 7 – HANDLING AND STORAGE

**Precautions:** Have emergency equipment (for fires, spills, leaks, etc.) readily available. Ensure all containers are labeled. Wear appropriate Personal Protection Equipment. People working with this chemical should be properly trained regarding its hazards and its safe use.

**Handling Procedures and Equipment:** Avoid generating mist. Use smallest possible amounts in designated areas with adequate ventilation. Keep containers closed when not in use. Empty containers may contain hazardous residues. Use corrosion-resistant transfer equipment when dispensing.

**Storage Requirements:** Store in a cool, dry, well-ventilated area, out of direct sunlight. Store containers at 15 – 29 °C (59-84 °F). Do not store above 30 °C (86°F) or below freezing point. Keep containers tightly closed when not in use and when empty. Protect from damage. Vent caps should be checked with full personal protection. Store away from incompatible materials such as reducing materials, strong acids, nitrogen compounds, copper, nickel and cobalt. Use corrosion-resistant structural materials and lighting and ventilation systems in the storage area. This product has a shelf life of up to six months at 60°F or lower.

Outdoor storage tanks should be suitably diked or otherwise provided with an adequate means of secondary containment. Appropriate secondary containment measures should be taken to prevent spills or leaks from indoor storage tanks and tank-truck unloading stations from entering sewers or other channels that discharge directly to a water body or a municipal sewage system.

## SECTION 8 – EXPOSURE CONTROLS / PERSONAL PROTECTION

### PREVENTIVE MEASURES

**Recommendations listed in this section indicate the type of equipment, which will provide protection against over exposure to this product. Conditions of use, adequacy of engineering or other control measures, and actual exposures will dictate the need for specific protective devices at your workplace.**

**Engineering Controls:** Local exhaust ventilation should be applied wherever there is an incidence of point source emissions or dispersion of regulated contaminants in the work area. Ventilation control of the contaminant as close to its point of generation is both the most economical and safest method to minimize personnel exposure to airborne contaminants. The most effective measures are the total enclosure of processes and the mechanization of handling procedures to prevent all personal contact. Smoking should be prohibited in areas in which sodium hypochlorite solution is stored or handled.

### PERSONAL PROTECTIVE EQUIPMENT

**Eye Protection:** Wear splash resistant chemical goggles and full-face shield. Maintain eye wash fountain and quick-drench facilities in work area.
**Skin Protection:** Wear impervious protective clothing, including boots, gloves, lab coat, apron, rain jacket, pants or coveralls, as appropriate, to prevent skin contact.
RECOMMENDED (resistance to breakthrough longer than 8 hours): butyl rubber, natural rubber, neoprene, nitrile rubber, polyethylene, Viton(TM), Saranex(TM), Responder(TM).

Recommendations are valid for permeation rates reaching 0.1 ug/cm2/min or 1 mg/m2/min and over. Resistance of specific materials can vary from product to product. Breakthrough times are obtained under conditions of continuous contact, generally at room temperature. Evaluate resistance under conditions of use and maintain clothing carefully.

**Respiratory Protection:** A NIOSH/MSHA approved air-purifying respirator equipped with acid mist cartridges for concentrations up to 10 times the TLV. Use a supplied air respirator if concentrations are higher or unknown.

### EXPOSURE GUIDELINES

**PRODUCT:**
**Sodium hypochlorite:** Workplace environmental exposure level guides (WEELS) /American Industrial Hygiene Association (AIHA) / 1996 short-term time weighted average ; 2 mg/m$^3$: 15 minute

**Chlorine:**

| | | | |
|---|---|---|---|
| ACGIH TWA | 0.5 ppm as $Cl_2$ | ACGIH STEL | 1 ppm as $Cl_2$ |
| OSHA PEL | 0.5 ppm as $Cl_2$ | OSHA STEL | 1 ppm as $Cl_2$ |
| NIOSH IDLH | 10 ppm as $Cl_2$ | NIOSH (15 min. ceiling) 0.5 ppm | |

## SECTION 9 – PHYSICAL AND CHEMICAL PROPERTIES

| | |
|---|---|
| **Alternate Name(s)** | Hypochlorous acid , Clorox, Javelle water |
| **Chemical Name** | Sodium hypochlorite |
| **Chemical Family** | Hypochlorous acid salt |
| **Molecular Formula** | Na-O-Cl |
| **Molecular Weight** | 74.4 |
| **Appearance** | Green to yellow, watery liquid |
| **Odor** | Pungent chlorine-like odor |
| **pH** | 11-13 |
| **Vapor Pressure (mm Hg at 21 °C(69.8°F)** | 12 mmHg |
| **Vapor Density (Air = 1)** | No data |
| **Boiling Point** | Decomposes above 40 °C (104 ° F) |
| **Freezing Point** | 7.5°F (-13.6°C) |
| **Solubility (Water)** | Completely |
| **Specific Gravity** | About 1.198 (12.5%w/w solution) @ 20°C (68 ° F) |
| **Evaporation Rate** | Not available |
| **% Volatile by Volume** | Not available |

## SECTION 10 – STABILITY AND REACTIVITY

**Chemical Stability:** Stable at room temperature.

**Hazardous Decomposition Products:** Thermal decomposition: Chlorine, sodium oxide, oxygen, oxides of chlorine, sodium chlorate, and hydrogen.

**Conditions to Avoid:** Keep away from high heat, and sunlight or ultra-violet light. Do not store above 30°C (86°F). Do not allow solutions to evaporate dry. Keep away from incompatibles.

**Incompatibility with other Substances:** May react violently with strong acids producing chlorine gas, which is toxic. Other incompatibles include organic material, cellulose, oxidizable materials, ammonia, urea, ammonium salts, ethyleneimine, cyanides, nitrogen compounds, alcohols, metals, and metal oxides. Reacts with metals to produce flammable hydrogen gas. Metal and metal oxide catalysts decompose hypochlorites, evolving oxygen and often causing explosions. May react explosively with nitrogen containing compounds or form chloroamines, which are explosive. Alkaline hypochlorite solutions may react explosively with some chloroorganic compounds.

**Corrosivity to Metals:** Solutions can be corrosive to many metals.

**Hazardous Polymerization:** Will not occur.

## SECTION 11 – TOXICOLOGICAL INFORMATION

### TOXICOLOGICAL DATA:

**Toxicological Data:** Sodium Hypochlorite: Irritation Data: 10 mg eyes-rabbit moderate

Toxicity Data: 1 gm/kg oral-woman TDLo (Lowest published toxic dose);
45 mg/kg intravenous-man TDLo; LD50 oral rat- 8910 mg/kg

Sodium hydroxide: Irritation data: 500 mg/24 hour(s) skin-rabbit severe; 400 µg eyes-rabbit mild; 1 percent eyes-rabbit severe;
Toxicity data: 1350 mg/kg skin-rabbit $LD_{50}$; 104-340 mg/kg oral-rat $LD_{50}$

**Mutagenicity:** Sodium hypochlorite caused mutations in several short-term studies using bacteria and cultured mammalian cells. The significance of these tests is unclear. It was not mutagenic in tests (chromosome aberration and micronucleus) on live animals.

**Reproductive Effects:** No data available

**Teratogenicity and Fetotoxicity:** No data available

**Synergistic Materials:** None known

## SECTION 12 – ECOLOGICAL INFORMATION

**Ecotoxicological Information:** Fish Toxicity: LC50 (48 hr) rainbow trout 0.07 mg/ l.
LC50 (96 hr) fathead minnow 5.9 mg/l.
Invertebrate and Microbial Toxicity: LOEC Oncorhynchus kisutch 0.02 mg/ l.

**Persistence and Degradation:** No data available.

## SECTION 13 – DISPOSAL CONSIDERATIONS

Review federal, state and local government requirements prior to disposal.

Do not dispose of waste with normal garbage, or to sewer systems.

Whatever cannot be saved for recovery or recycling, including containers should be managed in an appropriate and approved waste disposal facility. Processing, use or contamination of this product may change the waste management options.

**RCRA:** Test waste material for corrosivity, D002, prior to disposal.

## SECTION 14 – TRANSPORT INFORMATION

| | TDG | DOT |
|---|---|---|
| **Shipping Name** | Hypochlorite solutions- *with more than 5 percent but less than 16 percent available chlorine* | Hypochlorite solutions- *with more than 5 percent but less than 16 percent available chlorine* |
| **Hazard Class/Division** | 8: Corrosive<br>9.2 | 8: Corrosive |
| **Identification No.**<br>**Packing Group:** | UN1791<br>III | UN1791<br>III |

**IATA/ICAO Class:** 8

**Transportation Emergency Telephone Number:** 1-800-424-9300

## SECTION 15 – REGULATORY INFORMATION

**OSHA Classification:** Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200)

**SARA Regulations sections 313 and 40 CFR 372:** N

**SARA Hazard Categories, SARA SECTIONS 311/312 (40CFR370.21):**
ACUTE: Y
CHRONIC: N
FIRE: N
REACTIVE: N
SUDDEN RELEASE: N
OSHA PROCESS SAFETY (29CFR1910.119): N

**CERCLA SECTION 103 (40CFR302.4):** Y
**Reportable Quantity (RQ) under CERCLA:** 100 lb. (45.4 kg)

**TSCA Inventory Status:** Y

**Other Regulations/Legislation which apply to this product:**

**Right-to-Know/Disclosure Lists: Illinois, Massachusetts, New Jersey, Pennsylvania,**

California Proposition 65: N

This product does not contain nor is it manufactured with ozone depleting substances.

## Canadian Classification

**This product has been classified in accordance with the hazard criteria of the CPR (Controlled Products Regulations) and this MSDS (Material Safety Data Sheet) contains all the information required by the CPR.**

**Controlled Products Regulations (WHMIS) Classification:** D2B: Toxic E: Corrosive

**CEPA / Canadian Domestic Substances List (DSL): Y**

**WHMIS Ingredient Disclosure List: Meets criteria for disclosure at 1% or greater.**

**EINECS Number: 231-668-3**

## SECTION 16 – OTHER INFORMATION

All information appearing herein is based upon data obtained from the manufacturer and/or recognized technical sources. While the information is believed to be accurate Los Angeles Chemical Company makes no representation as to its accuracy or sufficiency. Conditions of use are beyond Los Angeles Chemical Company's control and therefore users are responsible to verify this data under their own operating conditions to determine whether this product is suitable for their particular purposes and they assume all risks of their use, handling, and disposal of the product, or from the publication or use of, or reliance upon, information contained herein. This information relates only to the product designated herein, and does not relate to its use in combination with any other material or in any other process.

# Material Safety Data Sheet

## Section 1 - General Information

**Product Name:** VORTEX

**DOT Hazard Class:** Corrosive, 8

**Chemical Name:** Mixture

**Chemical Family:** Powdered Caustic Cleaner, Chlorinated

(NE = None Established; NA = Not Available; NDF = No Data Found)

## Section 2 - Hazardous Ingredients

| Ingredients/CAS Number | Wt/Wt Percent | ACGIH TLV PPM | ACGIH TLV mg/M$^3$ | STEL | Vapor Pressure mm HG. 20°C |
|---|---|---|---|---|---|
| Sodium dichloro-s-triazinetrione, dihydrate/51580-86-0 | 4-5 | NE | NE | NE | NE |
| Sodium Hydroxide/1310-73-2 | 15-16 | NDF | 2 ceiling | NDF | 42 @ 1000°C |

## Section 3 - Physical Data

**Boiling Point:** Not applicable

**Specific Gravity ($H_2O$ = 1):** Not applicable

**Vapor Pressure (mm Hg.):** Not applicable

**Percent Volatile by Weight (%):** NDF

**pH:** > 12 (1% solution) typical

**Evaporation Rate (____ = 1):** Not applicable

**Solubility in Water:** Complete at use dilutions

**Viscosity @ 25°C:** Not applicable

**Appearance and Odor:** Free flowing white powder with a mild surfactant/chlorine odor.

## Section 4 - Health Hazard Data

**Threshold Limit Value:** None established.

**Note:** **This product does not contain any known carcinogens.**

**Effects of Overexposure:** Causes severe burns to eyes and skin. Harmful if swallowed.

**FOR ASSISTANCE WITH MEDICAL EMERGENCY,**
**CALL: 1-800-228-5635, Ext. 149 (24 HRS./DAY; 7 DAYS/WEEK)**

**Emergency First Aid:**

EXTERNAL: Flush with large volumes of water for at least 15 minutes. If irritation persists, seek medical attention.

EYES: Flush with large volumes of water for at least 15 minutes. Seek medical attention immediately.

INTERNAL: If swallowed, DO NOT INDUCE VOMITING. Rinse mouth, then give small amount/glass of water. Seek medical attention immediately. Never give anything by mouth to an unconscious person.

SEE OTHER SIDE

## Section 5 - Fire and Explosion Hazard Data

**Flash Point (test method):** Not applicable

**Flammable Limits:** Not applicable

**Extinguishing Media:** Use media appropriate for surrounding material.

**Special Fire Fighting Procedures:** Where there is potential for exposure, wear impervious clothing and Self-Contained Breathing Apparatus (SCBA).

**Unusual Fire & Explosion Hazards:** Excessive heat may liberate chlorine gas.

## Section 6 - Reactivity Data

**Stability:** ☒ Stable ☐ Unstable

**Hazardous Polymerization:** ☐ may occur ☒ will not occur

**Incompatibility:** Strong mineral acids and organic materials. Aluminum, zinc, tin, galvanized iron, or other soft metals.

**Hazardous Decomposition Products:** Chlorine gas.

## Section 7 - Spill or Leak Procedures

**Spill Response:** Shovel and sweep up spilled material. Place in labeled containers to await disposal. Flush spill area with water.

**Waste Disposal Method:** Observe all local, state, & federal regulations.

**We make no guarantee or warranty of any kind that the use or disposal of this product is in compliance with all federal, state or local laws. It is the obligation of each user of the product mentioned herein to determine and comply with the requirements of all applicable statutes.**

## Section 8 - Special Protection Information

**Eye Protection:** Safety glasses, goggles or face shield if exposure is anticipated.

**Respiratory Protection:** NIOSH/MSHA approved respirator for dust if exposure is anticipated.

**Skin Protection:** As appropriate to avoid skin contact with powder.

**Other Protection:** N/A

**Ventilation Recommended:** General or local exhaust where dust may be generated.

## Section 9 - Special Precautions

**Hygienic Practices in Handling & Storage:** Avoid contact with eyes and skin. Avoid breathing dust (See Section 8.)

**Other Precautions:** KEEP OUT OF REACH OF CHILDREN.

**Date prepared:** APR. 17, 1995 **Prepared by:** Richard I. Engstrom R. I. Engstrom

The information contained herein is based on data available to us and is believed to be correct. Since this information may have been obtained in part from independent laboratories or other sources not under our direct supervision, no representation is made that the information is accurate, reliable, complete or representative and Buyer may rely thereon only at Buyer's risk. We make no guarantee that the health and safety precautions we have suggested will be adequate for all individuals and/or situations involving its handling and use. No warranty is expressed or implied regarding the accuracy of these data or the results to be obtained from the use thereof.

Vendor assumes no responsibility for injury to vendee or third person proximately caused by the material if reasonable safety procedures are not adhered to as stipulated in this data sheet.

# MATERIAL SAFETY DATA SHEET
## Starbar QuikStrike Fly Scatter Bait

**Manufacturer:** Wellmark International

**Address:** 1501 East Woodfield Road, Suite 200-West Schaumburg, IL 60173

**Emergency Phone:** 800-347-8272

**Transportation Emergency Phone:** CHEMTREC: 1-800-424-9300

## 1. CHEMICAL PRODUCT INFORMATION

**Product Name:** Starbar QuikStrike Fly Scatter Bait

**Chemical Name/Synonym:** Dinotefuran; Guanidine, N-methyl-N'-nitro-N''-[(tetrahydro-3-furanyl)methyl]

**Chemical Family:** Neonicotinoid

**Formula:** C7 $H_{14}$ N4 O3

**EPA Registration No.:** 73049-450-2724

**RF Number:** 2061

## 2. COMPOSITION / INFORMATION ON INGREDIENTS

| Component (chemical, common name) | CAS Number | Weight | Tolerance |
|---|---|---|---|
| Dinotefuran; Guanidine, N-methyl-N'-nitro-N''-[(tetrahydro-3-furanyl)methyl] | 165252-70-0 | 0.50% | |
| (Z)-9-Tricosene | 27519-02-4 | 0.04% | |
| Other ingredients (non-hazardous) | | 99.46% | |

## 3. HAZARD INFORMATION

**PRECAUTIONARY STATEMENT**
**CAUTION**
**KEEP OUT OF REACH OF CHILDREN**
**HAZARDS TO HUMANS AND DOMESTIC ANIMALS CAUTION**
**AVOID CONTACT WITH SKIN, EYES OR CLOTHING**

**PRIMARY ROUTE OF ENTRY** Dermal/Eye: Yes Oral: Yes Inhalation: No

**ACUTE TOXICITY**

**Oral:** No specific hazard identified.

**Dermal:** No specific hazard identified.

**Inhalation:** No specific hazard identified.

### OTHER TOXICOLOGICAL INFORMATION

**Skin Irritation:** May cause brief and/or minor irritation.

**Eye Irritation:** May cause minimal irritation.

**Sensitizer:** Not a skin sensitizer.

## 4. FIRST AID MEASURES

**Eye:** Hold eye open and rinse slowly and gently with water for 15-20 minutes. Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye. Call a poison control center or doctor for treatment advice.

**Skin:** Take off contaminated clothing. Rinse skin immediately with plenty of water for 15-20 minutes. Call a poison control center or doctor for treatment advice.

**Ingestion:** Call a poison control center or doctor for treatment advice. Do not induce vomiting unless told to do so by the poison control center or doctor. Have person sip a glass of water if able to swallow. Do not give anything by mouth to an unconscious person.

**Note to Physician:** There is no specific antidote. Treatment of overexposure should be directed at the control of symptoms and the clinical condition.

## 5. FIRE FIGHTING MEASURES

**NFPA Rating:** **Health:** 1 **Fire:** 1 **Reactivity:** 0

**Flammability Class:** Solid.

**Flash Point:** N/A.

**Explosive Limits (% of Volume):** N/A.

**Extinguishing Media:** Water fog, carbon dioxide, foam, dry chemical.

**Special Protective Equipment:** Fire fighters should wear full protective clothing including self-contained breathing apparatus.

**Fire Fighting Procedures:** Products of combustion from fires involving this material may be toxic. Avoid breathing smoke and mists. Minimize the amount of water used for fire fighting. Do not allow fire fighting water to escape into waterways or sewers.

**Combustion Products:** Incomplete combustion can produce carbon monoxide. Normal combustion forms carbon dioxide, water vapor and may produce oxides of nitrogen.

**Unusual Fire/Explosion Hazards:** None known.

## 6. ACCIDENTAL RELEASE MEASURES

**Steps to be taken:** Do not allow spilled material to enter waterways or sewers.

**Absorbents:** None needed due to product form. Scoop up material and dispose of all wastes according to applicable regulations.

**Incompatibles:** None known.

## 7. HANDLING AND STORAGE

**Handling:** Avoid contact with skin, eyes or clothing. Wash thoroughly with soap and water after handling and before eating, drinking, chewing gum, using tobacco or using the toilet. Remove clothing immediately if bait gets inside. Wash thoroughly and put on clean clothing. Do not use, pour, spill or store near heat or open flame.

**Storage:** Store in a cool, well-ventilated place away from sources of heat and direct sunlight. Keep container tightly closed. Keep only in original container. Do not contaminate water, food or feed by storage or disposal.

## 8. EXPOSURE CONTROL / PERSONAL MEASURES

**Exposure Limits:** None.

**Ventilation:** Use in a well ventilated area.

**Personal Protective Equipment:** Avoid contact with skin, eyes or clothing. Handlers and applicators should wear appropriate protective equipment including, at a minimum, long pants, long-sleeved shirt and shoes plus socks and chemical resistant gloves.

## 9. PHYSICAL AND CHEMICAL PROPERTIES

**Appearance and Odor:** Solid blue granules.

**Boiling Point:** Not applicable.

**Melting Point:** Not available.

**Vapor Pressure (mm Hg):** Not available.

**Vapor Density (Air = 1):** Not available.

**Specific Gravity:** 0.94.

**Bulk Density:** 59 lbs / cubic foot.

**Solubility:** Soluble in water.

**Evaporation Rate:** Not available.

**pH:** 6.15.

## 10. STABILITY AND REACTIVITY

**Stability:** Stable.

**Reactivity:** Not reactive.

**Incompatibility w/ Other Materials:** Reactive metals and strong oxidizers.

**Decomposition Products:** Oxides of nitrogen, carbon monoxide, carbon dioxide.

**Hazardous Polymerization:** Will not occur.

## 11. TOXICOLOGICAL INFORMATION

**ACUTE TOXICITY**

| | |
|---|---|
| Acute oral toxicity (rat): | LD50 >5000 mg/kg |
| Acute dermal toxicity: | LD50 >5050 mg/kg |
| Acute inhalation toxicity: | LC50 >4090 mg/m$^3$ |
| Skin irritation: | Slightly irritating |
| Eye irritation: | Mildly irritating |
| Dermal Sensitization: | Not a sensitizer |

**SUBCHRONIC/CHRONIC TOXICITY [Specific to Active Ingredient(s)]**

**Dinotefuran technical** was tested in 13-week dietary toxicity studies in rats, mice and dogs. In the rat study, a NOEL of 500 ppm was established, based on reduced body weight gain in females and adrenal cortical vacuolation in males and a NOAEL of 5,000 ppm based on marked growth retardation at 25,000 ppm (adrenal cortical vacuolation not adverse). A NOEL of 25,000 ppm was established in the mouse study based on reduced body weight gain at 50,000 ppm. In the dog 13-week dietary study, a NOEL of 8,000 ppm was established based on reduced body weight gain. No target organs were identified in subchronic inhalation or dermal toxicity studies in rats.

**Dinotefuran technical** was tested in lifetime studies with rats and mice and a one-year study with dogs. In common with the subchronic studies in these species, no specific target organs could be identified. In the 78-week mouse study a NOAEL of 2500 ppm was established, based on decreased weight gain and a decrease in circulating platelet counts. In the 104-week rat study a NOAEL of 2000 ppm was established, based on a decrease in weight gain in females. There were no treatment-related effects in rats or mice on survival or the nature and incidence of neoplastic and adverse non-neoplastic histomorphological findings in either species at any dose level. In the 52-week dog study, a NOAEL of 16000 ppm was established based on decreased weight gain in both sexes and decreased food consumption in females.

This product is not listed as a carcinogen by the National Toxicology Program (NTP), the International Agency for Research on Cancer (IARC), the Occupational Safety and Health Administration (OSHA) or ACGIH.

**DEVELOPMENTAL/REPRODUCTIVE TOXICITY** **[Specific to Active Ingredient(s)]**
**Dinotefuran technical** was tested in a two-generation rat reproduction study at doses of 0, 300, 1000, 3000 and 10000 ppm. The NOAEL for systemic toxicity in parental animals was 3000 ppm based on decreased body weight gain and food consumption and decreased spleen and thyroid weights at the highest dose level evaluated (10000 ppm). The NOAEL for reproductive effects was 10000 ppm. The NOAEL for effects on the offspring was 3000 ppm based on reduced preweaning weight gain at 10000 ppm.

In a developmental toxicity study of Dinotefuran technical in rats, the maternal NOAEL was 300 mg/kg/day based on reduced weight gain, food consumption and water intake at 1000 mg/kg/day. Dinotefuran technical did not produce developmental effects in rats at doses up to 1000 mg/kg/day (the highest does tested). In a study with rabbits, the maternal NOAEL was 52 mg/kg/day based on reduced weight gain, food consumption and water intake and clinical signs noted at 300 mg/kg/day and pathology findings in the liver and stomach at 125 mg/kg/day and higher. The developmental NOEL was 300 mg/kg/day.

**NEUROTOXICITY** **[Specific to Active Ingredient(s)]**
**Dinotefuran** did not produce any functional or histomorphological evidence of neurotoxicity in acute (gavage) and 13-week (dietary) neurotoxicity studies in rats. The NOEL for neurotoxicity in the acute study was 1,500 mg/kg, the highest dose level administered. The NOEL for neurotoxicity in the 13-week dietary study was 50,000 ppm. The NOEL for all effects in this study was 5,000 ppm based on reduced body weight gain and food consumption.

**MUTAGENICITY** **[Specific to Active Ingredient(s)]**
**Dinotefuran technical** was negative in the following *in vitro* assays: Ames Assay, mouse lymphoma (L5178Y), mammalian cytogenetics (CHL/IU) or DNA Repair. Dinotefuran technical was negative in the following *in vivo* assays: mouse micronucleus. Overall, Dinotefuran technical does not present a genetic hazard.

## 12 ECOLOGICAL INFORMATION

**ACUTE AND LONG-TERM TOXICITY TO FISH AND INVERTEBRATES:**
Do not discharge effluent containing this product into lakes, streams, ponds, estuaries, oceans or public waters unless in accordance with the requirements of a National Pollutant Discharge Elimination System (NPDES) permit and permitting authority has been notified in writing prior to discharge. Do not discharge effluent containing this product to sewer systems without previously notifying the local sewage treatment plant authority. For guidance contact your State Water Board or Regional Office of the EPA.

ECOLOGICAL TOXICITY [Specific to Active Ingredient(s)]
**Dinotefuran Technical** is practically non-toxic to moderately toxic to avian species. Test results include:

Oral $LD_{50}$ quail: greater than 2000 mg/kg;
Dietary $LC_{50}$ Mallard duck: greater than 997.9 ppm;
Dietary $LC_{50}$ quail: greater than 1301 ppm;
Reproduction quail: NOEL = 5000 ppm;
Reproduction Mallard duck: NOEL = 2000 ppm.

**Dinotefuran Technical** is practically nontoxic to fish and practically nontoxic to highly toxic to aquatic invertebrate species. Test results include:

$LC_{50}$ (96 hr) Bluegill Sunfish: greater than 100 mg/l;
$LC_{50}$ (96 hr) Rainbow Trout: greater than 100 mg/l;
$LC_{50}$ (96 hr) Common Carp: greater than 100 mg/l;
$LC_{50}$ (96 hr) Sheepshead Minnow: greater than 109 mg/l;
NOEC (early life stage) Rainbow Trout: greater than 10 mg/l;
$EC_{50}$ (48 hr) Daphnia magna: greater than 1000 mg/l;
NOEC (lifecycle) Daphnia magna: greater than 10 mg/l;
$LC_{50}$ (96 hr) Mysid Shrimp: 0.79 mg/l;
$EC_{50}$ (96 hr) Oyster Shell Deposition: greater than 141 mg/l.

**OTHER ENVIRONMENTAL INFORMATION:**
**Dinotefuran Technical** is highly toxic to bees. The acute oral and contact $LD_{50}$ in bees were 0.056 µg/bee and 0.022 ug/bee, respectively.

## 13. DISPOSAL CONSIDERATIONS

Dispose of product and used containers in accordance with applicable Federal, State and local regulations. Do not contaminate water, food or feed by disposal. End users must dispose of any unused product as per the label recommendations.

## 14. TRANSPORT INFORMATION

**DOT49CFR Description:** Not Regulated.

**Freight Classification:** Insecticides NOI NMFC 102120 CL. 60.

## 15. REGULATORY INFORMATION

**CERCLA (Superfund):** Not regulated.

**RCRA:** Not regulated.

**SARA 311/312 HAZARD CATEGORIES**

**Immediate Health:** Yes.

**Delayed Health:** Yes.

**Fire:** No.

**Sudden Pressure:** No.

**Reactivity:** No.

*The information presented herein, while not guaranteed, was prepared by technically knowledgeable personnel and to the best of our knowledge is true and accurate. It is not intended to be all inclusive and the manner and conditions of use and handling may involve other or additional considerations.*

## HAZARDOUS MATERIALS INVENTORY – CHEMICAL DESCRIPTION

☒ MATERIAL ☐ WASTE | Page ___ of ___

### I. FACILITY INFORMATION

BUSINESS NAME (Same as FACILITY NAME or DBA – Doing Business As): Jorritsma + Ameno Dairy (3)

FACILITY ID #: F A 0 0 0 0 5 2 2 (1) | MAP#: 1 (203) | GRID#: D5 (204)

### II. CHEMICAL INFORMATION

CHEMICAL NAME: Iodozyme (205) | TRADE SECRET ☐ Yes ☒ No (206) — If Subject to EPCRA, refer to instructions

COMMON NAME (207) | EHS* ☐ Yes ☐ No (208)

CAS# (209) | *If EHS is "Yes", all amounts below must be in lbs.

HAZARDOUS MATERIAL TYPE (Check one item only): ☐ a. PURE ☐ b. MIXTURE ☐ c. WASTE (211) | RADIOACTIVE ☐ Yes ☒ No (212) | CURIES (213)

PHYSICAL STATE (Check one item only): ☐ a. SOLID ☒ b. LIQUID ☐ c. GAS (214) | LARGEST CONTAINER: 250 gallons (215)

FED HAZARD CATEGORIES (Check all that apply): ☐ a. FIRE ☐ b. REACTIVE ☐ c. PRESSURE RELEASE ☐ d. ACUTE HEALTH ☐ e. CHRONIC HEALTH (216)

| AVERAGE DAILY AMOUNT (217) | MAXIMUM DAILY AMOUNT (218) | ANNUAL WASTE AMOUNT (219) | STATE WASTE CODE (220) |
|---|---|---|---|
| | | | |

UNITS* (Check one item only): ☐ a. GALLONS ☐ b. CUBIC FEET ☐ c. POUNDS ☐ d. TONS (221) — * If EHS, amount must be in pounds. | DAYS ON SITE: 365 (222)

STORAGE CONTAINER:
☐ a. ABOVE GROUND TANK ☒ a. PLASTIC/NONMETALLIC DRUM ☐ i. FIBER DRUM ☐ m. GLASS BOTTLE ☐ q. RAIL CAR
☐ b. UNDERGROUND TANK ☐ f. CAN ☐ j. BAG ☐ n. PLASTIC BOTTLE ☐ r. OTHER
☐ c. TANK INSIDE BUILDING ☐ g. CARBOY ☐ k. BOX ☐ o. TOTE BIN
☐ d. STEEL DRUM ☐ h. SILO ☐ l. CYLINDER ☐ p. TANK WAGON (223)

STORAGE PRESSURE: ☒ a. AMBIENT ☐ b. ABOVE AMBIENT ☐ c. BELOW AMBIENT (224)

STORAGE TEMPERATURE: ☒ a. AMBIENT ☐ b. ABOVE AMBIENT ☐ c. BELOW AMBIENT ☐ d. CRYOGENIC (225)

| | %WT | HAZARDOUS COMPONENT (For mixture or waste only) | EHS | CAS # |
|---|---|---|---|---|
| 1 | 1-5 (226) | Iodine (227) | ☐ Yes ☐ No (228) | 7553-56-2 (229) |
| 2 | (230) | (231) | ☐ Yes ☐ No (232) | (233) |
| 3 | (234) | (235) | ☐ Yes ☐ No (236) | (237) |
| 4 | (238) | (239) | ☐ Yes ☐ No (240) | (241) |
| 5 | (242) | (243) | ☐ Yes ☐ No (244) | (245) |

If more hazardous components are present at greater than 1% by weight if non-carcinogenic, or > 0.1% by weight if carcinogenic, attach additional sheets of paper capturing the required information.

WESTAGRO®

# Iodozyme Liquid — Material Safety Data Sheet

**Preparation Date** 26-Nov-2007
**Revision Number:** 0
**Revision Date**

## 1. IDENTIFICATION OF THE SUBSTANCE/PREPARATION AND OF THE COMPANY/UNDERTAKING

**Product Description:** Iodozyme Liquid
**Item#:** 0145

**Supplier**
DeLaval Manufacturing
11100 N. Congress Ave.
Kansas City, MO 64153

Tel: 816-891-7700, 8am – 5pm M-F

**Emergency Telephone Number** Chemtrec 1-800-424-9300

## 2. HAZARDS IDENTIFICATION

**Emergency Overview**
May cause eye irritation

**Potential Health Effects**

**Principle Routes of Exposure** Eye contact
Ingestion

**Major effects of exposure**
**Eyes** Contact with eyes may cause irritation.
**Ingestion** Ingestion may cause gastrointestinal irritation, nausea, vomiting and diarrhea .

## 3. COMPOSITION/INFORMATION ON INGREDIENTS

| Component | CAS-No | Weight % | OSHA PEL |
|---|---|---|---|
| Iodine | 7553-56-2 | 1 - 5 | Ceiling: 0.1 ppm<br>Ceiling: 1 mg/m$^3$ |

## 4. FIRST AID MEASURES

**Eye contact**
- Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes
- If eye irritation persists, get medical advice/attention

**Ingestion** • Call a physician or Poison Control Centre immediately

## 5. FIRE-FIGHTING MEASURES

**Fire Hazard** The product is not flammable.
