After a minimum equilibration period of 48 hours, soil vapor samples were collected from each sub-slab and soil vapor probe in accordance with regulatory guidance.[1] As part of soil vapor sample collection, a shut-in and leak test was performed and three probe volumes were purged from each sub-slab and soil vapor probe. Samples were collected by Jones Environmental Inc. (“Jones”) in glass syringes for analysis in an onsite mobile laboratory in accordance with the United States Environmental Protection Agency (USEPA) Method 8260B. N-hexane, n-heptane, and n-hexane were used as leak detection compounds to ensure soil vapor probes were properly sealed during sampling, and a material blank was collected to ensure the tubing used during the investigation was free of contaminants. Two replicate samples were also collected in laboratory-provided one-liter Summa canisters, shipped to the analytical laboratory (Eurofins) under chain-of-custody documentation, and analyzed for volatile organic compounds (VOCs) by the USEPA Method TO-15.

Soil Vapor Sampling Results

Soil vapor sampling results are tabulated in Table 1 and shown on Figure 1. Laboratory analytical results are provided in Attachment A. If you have any questions or need further information, please contact us.

Sincerely,

Ramboll Americas Engineering Solutions, Inc.

Phase II Soil and Soil Vapor Investigation Letter Report

June 26, 2025

Tom Gretz
Manager of Corporate Real Estate Services
CC Industries, Inc. – a Henry Crown Company
222 N. LaSalle Street, Suite 1000
Chicago, Illinois 64116

SUBJECT: Phase II Soil and Soil Vapor Investigation Letter Report
3199 Alvarado Street
San Leandro, California

Dear Mr. Gretz:

Roux Associates, Inc. (Roux) has prepared this Phase II Soil and Soil Vapor Investigation Letter Report (Phase II Report) to convey the results of soil and soil vapor sampling conducted at 3199 Alvarado Street in San Leandro, California (Site; Figure 1) on behalf of The Henry Crown Grandchildren Trust (Client).

The results of the Phase II investigation offer the following conclusions:

- Chlorinated solvent contamination in soil vapor at the Site is related to off-site upgradient releases at properties associated with the DWA groundwater plume;
- The Site is not an independent source of soil vapor contamination;
- A passive subslab vapor intrusion mitigation system (VIMS) is recommended for the proposed commercial warehouse to protect against vapor intrusion from off-site upgradient sources; and,
- Based on current use, there is no vapor intrusion concern at the Site building because it is unoccupied.

Roux discussed the Phase II results and conclusions qualitatively with the California Department of Toxic Substances Control (DTSC), which is overseeing remedial activities related to the DWA groundwater plume. DTSC explained that a case would not be opened for the Site unless there was a potentially significant risk to human health or the environment. Based on the results of the Phase II investigation and proposed future use of the Site, Roux does not recommend further investigation at the Site at this time or opening a case with DTSC. As stated above, Roux recommends installing a VIMS when the Site is redeveloped.

SITE FEATURES & SETTING

The Site is approximately 14.9 acres and is located in an area of mixed commercial, industrial, and residential use. It is bound to the north and east by commercial and industrial properties, to the south by a residential neighborhood, and to the west by Highway 880 (Figure 2). The building on the Property was constructed in 1963 and contains an approximately 252,000 square foot warehouse. The Site is presently occupied by a Ford dealership and a Peterson Trucks dealership and is used for new vehicle and truck storage; there are no on-Site personnel occupying the property. Roux understands that Client owns the Site and intends to demolish the existing building and improvements and redevelop the entire Site with a new 241,488 square foot commercial warehouse (Figure 3).

This Phase II Report provides a summary of the results of the sampling events conducted by Roux between May 16 and 20, 2025, and results of a Phase I Environmental Site Assessment[1] and limited subslab and soil vapor sampling[2] (Attachment 1) conducted by Ramboll Americas Engineering Solutions, Inc. (Ramboll) in March and April, 2025. The subsurface investigations were completed in response to requests by the City of San Leandro (City) to perform Phase II Site Assessment and to interact with the California Department of Toxic Substances Control (DTSC), as conditions of approval for permits and entitlements (Attachment 2). The scope of work and results of subsurface investigations presented in this Phase II report were intended to investigate shallow soil and soil vapor conditions across the Site to identify the presence of any on-Site release associated with historical activities or relationship to known regional impacts associated with the Davis-Washington-Alvarado (DWA) Plume, which is comprised of releases of volatile organic compounds (VOCs) from multiple sources to soil and groundwater and is under the regulatory oversight of the DTSC[3].

All work performed at the Site by Roux and Ramboll was in accordance with the California Department of Toxic Substance Control (DTSC) Active Soil Gas Investigation Advisory (Soil Gas Advisory), dated July 2015. The following sections of this Report summarize the field activities, analytical results, and conclusions and recommendations.

SITE BACKGROUND

According to the March 2025 Phase I ESA prepared by Ramboll, the Site was used as farmland from at least 1939 to the early 1960s when a gasoline service station was constructed along the northeast portion of the property (Figure 2). The Site was constructed in its current configuration in 1968 and was historically occupied by multiple tenants, including Levitz Furniture from the late 1960s through 2005 for warehouse and showroom purposes. Most recently, the Site has been used for warehousing and distribution (2008 to 2022), and as of the date of this Phase II Report was being used by a nearby car dealership for storage of vehicles, with no on-Site employees. Client acquired a leasehold interest in the Site in 1971 and acquired ownership in 2003.

The Site is located in the footprint of a regional groundwater plume, referred to as the DWA Plume which has impacted soil, soil vapor, and groundwater over an area of many square miles. Numerous subsurface investigations have been conducted in the vicinity of the Site to evaluate potential sources and define extents of contamination. Grab groundwater sampling data collected by Woodward-Clyde Consultants in 1993[4], identified elevated VOC impacts in a groundwater sample located immediately upgradient from the Site at the intersection of Teagarden and Alvarado Street (sampling location D-48; Figure 4) as follows:

- Tetrachloroethene (PCE) at 526 micrograms per liter (µg/L);
- Trichloroethene (TCE) at 352 µg/L;
- 1,1-Dichloroethane (1,2-DCA) at 4.7 µg/L;
- Cis-1,2-dichloroethene (Cis-1,2-DCE) at 98 µg/L; and,
- Trans-1,2-DCE at 1.4 µg/L.

[4] https://www.envirostor.dtsc.ca.gov/getfile?filename=/public%2Fdeliverable_documents%2F5777784049%2Fdata%20report%20rem%20invest%207-23-93.pdf

Groundwater monitoring data from decades of groundwater monitoring and sampling (most recently published in May 2023[5]) establishes depth to groundwater in the area of the Site at approximately 8 feet below ground surface (bgs), and direction of groundwater flow from the north-northeast to the south-southwest (Figure 4). The leading edge of the DWA Plume is approximately 0.2 miles upgradient from the Site. However, multiple sources exist and DTSC has identified an area northeast of the Site as a Data Gap Area. Historical groundwater investigations have demonstrated PCE and its associated degradation products (TCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride) in groundwater[6] that are present to the north, south, and east of the Site in the Data Gap Area and in a residential area to the immediate south of the Site According to online information, DTSC has recently requisitioned additional soil and soil vapor sampling to further investigate the Data Gap Area and other potential sources in the Site vicinity (February 2025 Work Order Approval Form[7]).

In the 2025 Phase I ESA report, Ramboll identified the following Recognized Environmental Conditions (RECs) and de minimis conditions for the Site:

1. Underground storage tank with known groundwater contamination (de minimis);
2. Groundwater contamination related to off-Site sources (REC);
3. Long-term commercial and light-industrial use of the Site (de minimis);
4. Past use of the Site for agricultural purposes (de minimis); and,
5. Limited pavement and floor staining (de minimis).

To address potential vapor intrusion and investigate potential on- and off-Site sources of VOCs to the subsurface, Ramboll conducted sub-slab and soil vapor sampling in May 2025, which was limited to the footprint of the existing building and proposed building footprint. Ramboll prepared a Soil Vapor Sampling Results letter report[8] presenting the analytical results from the sampling. Benzene, PCE, and vinyl chloride were detected in sub-slab samples and/or soil vapor samples in exceedance of their respective DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Screening Levels (SLs) for Commercial/Industrial Air across a majority of the footprint of the on-Site structures (Figures 4 and 5). PCE concentrations in soil vapor ranged from 22 to 2,320 micrograms per cubic meter (µg/m^3). Concentrations of PCE were greatest across the northern and western portions of the building footprint and decreased to the south and southeast. The sample results indicate the presence of elevated concentrations of PCE in soil vapor in the current and proposed building footprints, but do not identify an on-Site source. The distribution of VOCs in subslab and soil vapor generally aligns with the groundwater flow direction, indicating they may be associated with the regional groundwater contamination REC identified by Ramboll.

INVESTIGATION ACTIVITIES

To supplement Ramboll's findings and assess subsurface conditions across the entire Site with the objective of confirming the absence of on-Site source areas of chlorinated VOCs and determining whether

[8] Ramboll, 2025. Soil Vapors Sampling Results, 3199 Alvarado Street in San Leandro, California. May 28.

observed impacts are attributable to the regional DWA Plume, Roux conducted soil and soil vapor sampling at the locations shown on Figures 2 & 4, between May 16 and 20, 2025.

The following subsections detail the pre-mobilization activities, soil boring advancement and soil sampling, and soil vapor probe installation and soil vapor sampling performed by Roux during this Investigation.

Pre-Mobilization Activities

Prior to commencing ground disturbing activities at the Site, Roux completed the following tasks in preparation for field sampling activities:

- Applied for and received an Alameda County Public Works Agency soil boring permit (Attachment 3);
- Marked the Site and sampling locations with white paint. Contacted Underground Service Alert (USA) at least 48 hours prior to commencing subsurface activities to notify utility operators of the planned work and to request marking of nearby subgrade utility lines (i.e., natural gas, electric, water, sewer, telephone, fiber optic, etc.);
- Contracted with a private utility locating firm to evaluate the proposed boring locations relative to existing underground utilities to minimize the risk of contacting subgrade utility lines; and,
- Prepared a Site-specific Health and Safety Plan (HASP) to establish guidelines for all Site workers and visitors during fieldwork. The HASP was reviewed and signed by all Site workers prior to the commencement of work and was kept on-Site at all times during field activities.

Soil Sampling

On May 16, 2025, 12 borings (RB-1 through RB-7 and RB-9 through RB-13) were advanced via hand auger drilling technology to a total depth of 5.5 feet bgs (Figure 2). RB-8 could not be completed as planned due to tight rebar mesh spacing in the slab preventing coring. During boring advancement, soils were screened for VOCs using a photoionization detector (PID). Soil borings were continuously logged consistent with the United Soil Classification System (USCS) for materials, color, moisture, and other pertinent geologic observations. All sampling equipment was decontaminated between boreholes to minimize potential cross contamination at the Site. Soil boring logs are included in Attachment 4.

At each boring location, a soil sample was collected from 5 feet bgs into laboratory provided sample containers. The samples were sealed, labeled, and placed in an ice-filled chest for transportation to Enthalpy Analytical of Orange, California, a California-certified laboratory, under chain-of-custody procedure for the following analyses:

- VOCs by United States Environmental Protection Agency (USEPA) Method 8260B; and
- Moisture by ASTM Method D2216.

Two 55-gallon drums of surplus soil generated during sampling were staged in a sealed, labelled drum in anticipation of waste profiling for proper off-Site disposal. One four-point composite sample was collected from the investigation derived waste (IDW) drums and submitted for laboratory analysis at Enthalpy. For waste disposal purposes, laboratory analyses were requested for the following on the composite IDW sample:

- VOCs by USEPA Method 8260B;
- Total petroleum hydrocarbons as gasoline, diesel and motor oil (TPH-g, -d, and -mo) by USEPA Method 8015Bm; and,
- CAM 17 metals by USEPA Method 6020/7471.

The waste drums were placed at the northwest corner of the parking lot, adjacent to the RB-3 boring location, and disposal of the drums as non-hazardous waste was completed on June 5, 2025. A non-hazardous soil waste manifest is presented in Attachment 5.

Soil Vapor Probe Installation and Sampling

On May 16, 2025, at 11 of the 12 soil borings (RB-1 through RB-7 and RB-9 through RB-12) permanent soil vapor sampling probes were constructed to assess Site-wide shallow soil vapor conditions (Figure 2). Boring RB-13 was placed immediately adjacent to Ramboll soil vapor sampling location SV-13, so only a soil sample was collected. Soil vapor well construction details are included in the boring logs (Attachment 4).

The soil vapor probes were constructed in general accordance with the Soil Gas Advisory and were installed with the probe tip at a target depth of 5.0 feet bgs. However, due to fine-grained soil conditions observed at 5.0 feet bgs at RB-10, the soil vapor probe at that location was installed in coarser soils at 4.0 feet bgs. Each probe consisted of a new stainless-steel filter probe tip with a ¼-inch push-to-connect fitting attached to ¼-inch diameter Teflon tubing. The probes were installed using a small-diameter PVC pipe to support the borehole while the well tubing and probe were installed, to ensure that the probe tip was emplaced at the proper depth. This down-hole pipe was removed during the placement of annulus materials.

To construct each soil vapor probe, six inches of #3 sand were placed in the boring, and the filter probe tip was installed at 5.0 feet bgs (4.0 feet bgs for RB-10). An additional six inches of sand was then placed above the probe tip, with the sampling tip at the midway point of the 12-inch sand. Above the sand pack, 12 inches of dry granular bentonite were placed, followed by neat cement grout to within 6-inches of ground surface. The 12-inch dry bentonite layer prevented the neat cement grout from infiltrating the sand pack. Traffic rated well boxes were then set in concrete at grade to protect the soil vapor probes.

Following a minimum 48-hour equilibration period, soil vapor samples were collected at all 10 locations, with a duplicate samples (DUP-1 and DUP-2) collected at the RB-12 and RB-4, respectively. Samples were collected using batch-certified clean Summa® Canisters. Prior to collection of the sample, a shut-in test was performed to confirm the integrity of the sampling manifold, and approximately three purge volumes were purged from the sampling tubing using a purge pump. Purge activities were conducted at a flow rate of approximately 200 milliliters per minute (mL/min). During purging and soil vapor sample collection activities, a leak test, with helium as a tracer gas, was performed using a shroud, which enclosed the soil vapor probe well box, probe tubing, and the entire sampling manifold. A minimum helium concentration of 20 percent was maintained within the shroud during the purging and soil vapor sample collection period. Soil vapor sampling forms are included as Attachment 6.

Soil vapor sampling canisters were transported to Enthalpy Analytical, Inc. of Berkeley, California, a California-certified laboratory. Laboratory analyses were requested for VOCs by USEPA Method TO-15 and helium by ASTM D1946.

SOIL RESULTS

Of the 11 soil samples submitted to Enthalpy for VOC analysis, none were reported to have any detections of VOCs above their respective laboratory reporting limits (RLs). Additionally, all RLs were below the DTSC

SL for Commercial/Industrial soil. Analytical laboratory reports for the soil samples are presented in Attachment 7.

SOIL VAPOR RESULTS

The soil vapor results from this Investigation are presented on Tables 1 and 2. Soil vapor results were compared against DTSC SLs for commercial/industrial air, with an attenuation factor of 0.03 applied. For analytes with no established DTSC SL, results were compared to the USEPA Regional Screening Levels (RSLs) for Industrial Air, when available. The following notable analytical results were reported:

- PCE was detected above the DTSC SL of 67 µg/m^3 in nine of 12 samples (including one duplicate sample) ranging in concentration from 230 to 13,000 µg/m^3;
- TCE was detected above the DTSC SL of 100 µg/m^3 in three of 12 samples (including one duplicate) ranging in concentration from 170 and 180 µg/m^3; and,
- Helium was not detected above the laboratory RL in any of the samples.

The two highest soil vapor PCE concentrations were detected in soil vapor probes SV-3 (7,000 µg/m^3) and SV-4 (13,000 µg/m^3), located immediately along the northern property boundary on the upgradient edge of the Site. In all cases, inclusive of the data collected by Ramboll, PCE concentrations were highest in the northern half of the Site and were lowest in probes placed along the eastern and southern property boundaries (RB-6, RB-10, RB-11, RB-12). The distribution of VOCs (primarily PCE with lower concentrations of TCE) in shallow soil vapor are indicative of on-Site migration from an upgradient source and do not point to any on-Site sources or contributions (Figure 4).

Laboratory analytical reports for the soil vapor samples analyzed during this Investigation are provided in Attachment 7.

Quality Assurance/Quality Control

For quality assurance/quality control purposes, Roux collected two duplicate samples and performed all soil vapor sampling utilizing a helium leak tracer gas. Roux compared the results of the duplicate samples (DUP-1 and DUP-2) and their primary samples (RB-12 and RB-4, respectively) by calculating the relative percent difference (RPD) for each detected analyte between the primary and duplicate samples. All detected compounds were within the acceptable RPD of 50% (per Soil Gas Advisory).

Results of the helium analyses indicate that there were no leaks in the sampling manifolds or soil vapor wells for any samples that would compromise the usefulness of the data set.

CONCLUSIONS & RECOMMENDATIONS

Based on the comprehensive investigations conducted at the Site, the following conclusions can be drawn:

- Historical records, as documented in Ramboll's Phase I ESA, confirm that there are no on-Site sources of chlorinated VOCs;
- Data from both recent and historical DWA investigations, along with findings from Ramboll and Roux, confirm that VOC-impacts to on-Site soil vapor are attributable to shallow groundwater contamination originating from off-Site, upgradient sources;
- On-Site soils are not impacted by VOCs, further confirming that there are no on-Site sources of chlorinated VOCs; however, soil vapor contamination is expected to remain. As such, a passive sub-slab VIMS in the future building is recommended;

- Vapor intrusion does not require further consideration at this time because the Site is unoccupied. Vapor intrusion risk within the structure of the proposed redevelopment will be mitigated with the VIMS and additional confirmation testing will be performed following completion of the redevelopment to ensure engineering controls are reducing vapor intrusion impacts to commercial standards.

Roux recommends that Client begin design of a VIMS to be constructed beneath the footprint of any proposed structures. Roux does not have any additional recommendations for on-Site investigations at this time.

Sincerely,

ROUX ASSOCIATES, INC.

Ramboll Americas Engineering Solutions, Inc. (Ramboll) is pleased to present results of a soil vapor sampling investigation performed at the warehouse property located at 3199 Alvarado Street in San Leandro, California (the "site"). The site includes a 14.8-acre portion (two parcels) improved with an approximately 240,000-square-foot warehouse building most recently used as a distribution warehouse and historically used as a furniture showroom/warehouse and a 1.97-acre easement.

This letter presents the results of the soil vapor sampling investigation that was conducted on April 3, 2025.

It is Ramboll's understanding that CCI is contemplating the redevelopment of the site with a new warehouse building of approximately the same size, but slightly different footprint of the existing structure. Ramboll prepared a Phase I ESA for the site in January 2025. To address potential vapor intrusion and determine whether there are on-/off-site sources of volatile organic compounds (VOCs) that could potentially affect future building occupants, Ramboll conducted a soil vapor sampling investigation that included the following:

- Collection and analysis of sub-slab soil vapor samples from 12 locations within the current building's interior perimeter at the approximate locations shown in Figure 1; and
- Because the future warehouse building has a slightly different footprint than the existing warehouse, Ramboll installed and collected samples from three soil vapor probes in the parking area, east of the current warehouse, within the footprint of the future new warehouse. The locations are shown on Figure 1.

Sub-Slab Soil Vapor Probe Installation

Sub-slab soil vapor samples were collected from 12 locations which were selected based on current and historical chemical use, prior sampling data, and accessibility. Prior to vapor pin installation, the building slab was scanned to clear each location of buried utilities and to mark the location of rebar. On March 28, 2025, at each location, a stainless-steel vapor pin was installed through the slab using a roto-hammer and hand tools. The vapor pin consisted of a barbed stainless-steel probe

with silicone sleeves that form an air-tight seal between the vapor pin and the edge of the concrete slab borehole. A 5/8-inch diameter hole was drilled through the slab, the vapor pin was installed in the hole, and a protective stainless-steel cover was installed flush with the surrounding floor surface.

Soil Vapor Monitoring Probe Installation

On March 28, 2025, Ramboll installed three soil vapor probes in the parking area (Figure 1). At each soil vapor probe location, a boring was advanced to a depth of approximately 4.25 feet below ground surface (bgs) to install a soil vapor probe at 4.75 feet bgs. The soil borings were advanced using a hand auger.

The soil vapor monitoring probes were constructed by backfilling the borehole with approximately 6 inches of sand, placing a stainless-steel soil vapor sampling probe connected to Teflon tubing on top of the sand layer at a depth of approximately 4.75 feet bgs and an additional 6 inches of sand was placed on top of the sand layer followed by one foot of dry bentonite. The remaining borehole annulus was backfilled with neat cement grout. An airtight valve was placed on the end of each length of Teflon tubing for sample collection. Each soil vapor monitoring probe was completed with a traffic-rated well box.

Soil Vapor Sample Collection and Analysis

After a minimum equilibration period of 48 hours, soil vapor samples were collected from each sub-slab and soil vapor probe in accordance with regulatory guidance.[1] As part of soil vapor sample collection, a shut-in and leak test was performed and three probe volumes were purged from each sub-slab and soil vapor probe. Samples were collected by Jones Environmental Inc. (“Jones”) in glass syringes for analysis in an onsite mobile laboratory in accordance with the United States Environmental Protection Agency (USEPA) Method 8260B. N-hexane, n-heptane, and n-hexane were used as leak detection compounds to ensure soil vapor probes were properly sealed during sampling, and a material blank was collected to ensure the tubing used during the investigation was free of contaminants. Two replicate samples were also collected in laboratory-provided one-liter Summa canisters, shipped to the analytical laboratory (Eurofins) under chain-of-custody documentation, and analyzed for volatile organic compounds (VOCs) by the USEPA Method TO-15.

Soil Vapor Sampling Results

Soil vapor sampling results are tabulated in Table 1 and shown on Figure 1. Laboratory analytical results are provided in Attachment A. If you have any questions or need further information, please contact us.

Sincerely,

Ramboll Americas Engineering Solutions, Inc.

Notes:
Detected compounds are shown in **bold.**

All data are reported in micrograms per cubic meter ($\mu g/m^3$).

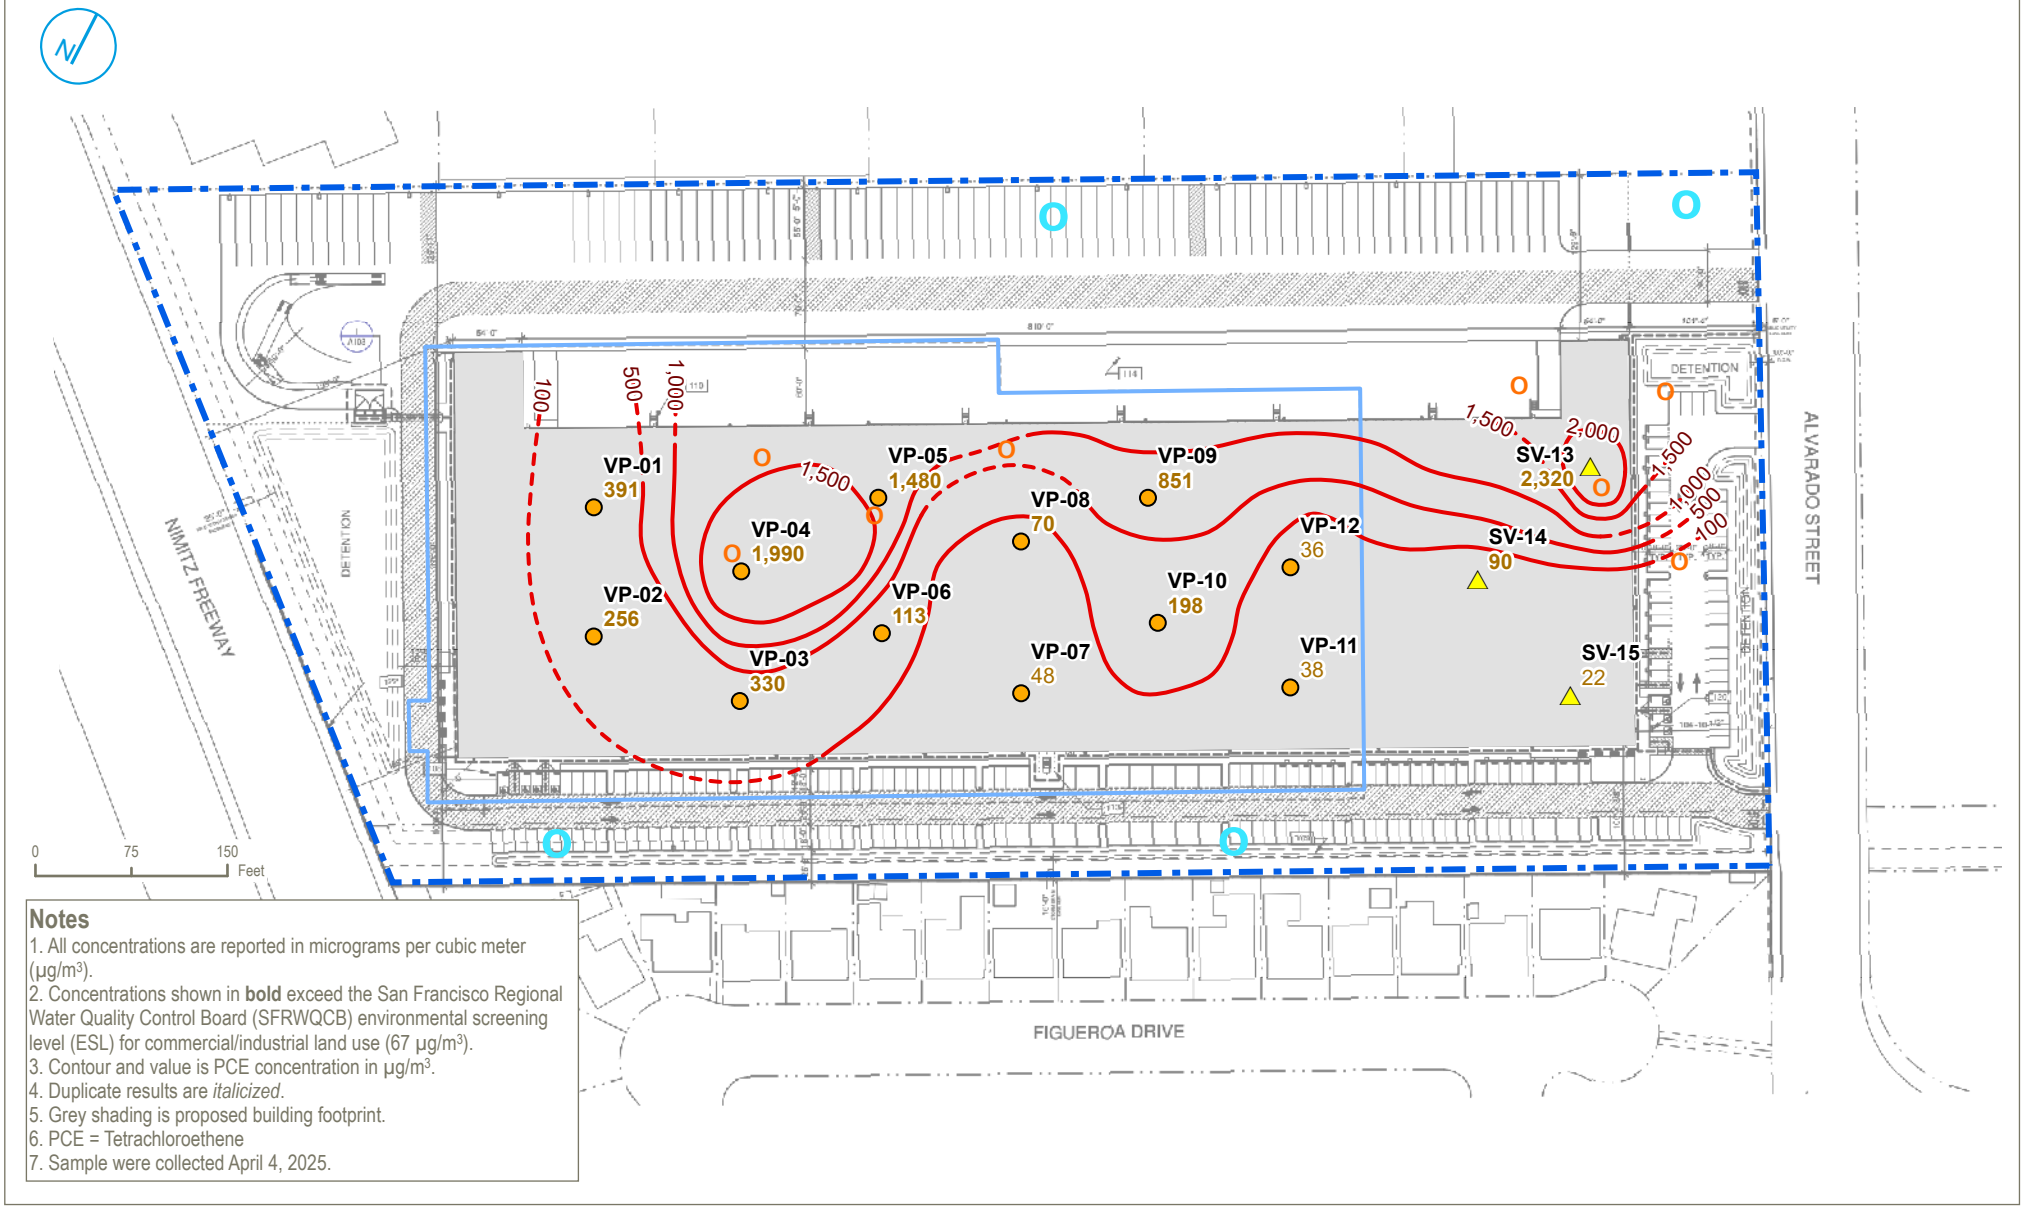
Blue shading denotes detection above screening value.

Volatile Organic Compounds (VOCs) analyzed by EPA Method 8260.

-- = not analyzed
ND = not detected at or above the laboratory reporting limit shown
[a] VP = soil vapor sample collected from directly below the building floor slab via a Vapor Pin
[b] SV = Soil Vapor sample collected from a soil vapor monitoring probe installed at approximately 5 feet below ground surface

SFRWQCB = San Francisco Regional Water Quality Control Board
USEPA = United States Environmental Protection Agency

[1] Data are compared to SFRWQCB Soil Vapor ESLs[2] for commercial/industrial land use; if no ESL is available, USEPA RSLs[3] for industrial air are used assuming an attenuation factor of 0.03.
[2] *ESL - Environmental Screening Level.* San Francisco Bay Regional Water Quality Control Board. 2019. Subslab/Soil Gas Vapor Intrusion: Human Health Risk Levels; Commercial/Industrial. July.
[3] *RSL - Regional Screening Level.* USEPA. 2024. Regional Screening Levels for Chemical Contaminants at Superfund Sites. November.



Notes

1. All concentrations are reported in micrograms per cubic meter (µg/m³).
2. Concentrations shown in **bold** exceed the San Francisco Regional Water Quality Control Board (SFRWQCB) environmental screening level (ESL) for commercial/industrial land use (67 µg/m³).
3. Contour and value is PCE concentration in µg/m³.
4. Duplicate results are *italicized*.
5. Grey shading is proposed building footprint.
6. PCE = Tetrachloroethene
7. Sample were collected April 4, 2025.

Re: CCI San Leandro: 3199 Alvarado

Enclosed are the results of analyses for samples received by the laboratory on 04/03/25. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Colby Wakeman
Lab Director

Ramboll	Project:	CCI San Leandro: 3199 Alvarado	
350 South Grand Avenue	Project Number:	1940111690	Reported
Los Angeles, CA 90071	Project Manager:	Anne Gates	04/08/25 7:36

Notes and Definitions

ND	Analyte NOT DETECTED at or above the reporting limit
RPD	Relative Percent Difference
E	Estimated Concentration; concentration exceeds calibration range.
LCC	Leak Check Compound
MDL	Compound Reported to Method Detection Limit
1	Recovery outside of acceptable limits. LCS/LCSD recoveries and %RSD were within QC limits, therefore data was accepted.
SMSR	Sample matrix prevented adequate surrogate recovery.
J	Value less then PQL but greater than MDL.
HHSR	High hydrocarbon concentration in this sample prevented adequate surrogate recovery.
SMTAR	Sample matrix prevented adequate recovery of target analytes.
OV	Sample was filtered in the lab before extraction.
HHTAR	High hydrocarbon concentration prevented in-range recovery of target analytes.
IHRPD	Target analyte recoveries were outside of range but accepted due to passing RPDs
AROL	Target analyte recovery exceeded recovery range but was accepted due to ND of that analyte in MB and sample(s).
ISO-H	Isomers could not be sufficiently chromatographically resolved according to method requirements due to hydrocarbon interference or other matrix effects. The isomers' reported individual concentrations were each calculated as the average of each of the individual isomers' concentrations.
2	Recovery outside of acceptable limits for either LCS or LCSD. CCV and LCS or LCSD recoveries were within limits; therefore data was accepted.
3	RPD outside of acceptable limits. Target analyte recoveries were within QC limits; therefore, data was accepted.
4	LCS and/or LCSD recoveries exceeded acceptability ranges. Target analyte recoveries were accepted due to passing CCV, in-range LCS/LCSD RPDs, and a clean MB in which all target analytes were < RL.
5	MS and/or MSD recoveries exceeded acceptability ranges. Target analyte recoveries were accepted due to passing CCV, in-range LCS/LCSD RPDs, and a clean MB in which all target analytes were < RL.
SMTAR	Sample matrix prevented adequate recovery of target analytes.
RV	Surrogate recovery outside of control limits due to required dilution.
ASP	Hydrocarbons in this sample most closely resemble asphalt.
@	Surrogate is outside acceptable limits. All other QC parameters in control, therefore data was accepted.
S	Sample was subjected to elemental sulfur cleanup by EPA 3660B.

FIXED BASE LAB REPORT

eurofins | Air Toxics

Analytical Report

4/11/2025
Mr. Tommy Winger
Ramboll
1111 Broadway
Suite 1400
Oakland CA 94607

Project Name: CCI San Leandro: 3199 Alvarado
Project #: 1940111690
Workorder #: 2504081

Dear Mr. Tommy Winger

The following report includes the data for the above referenced project for sample(s) received on 4/4/2025 at Eurofins Air Toxics LLC.

The data and associated QC analyzed by TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics LLC. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Regginette Whitson at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

R. Whitson

Regginette Whitson

Project Manager

LABORATORY NARRATIVE
EPA Method TO-15
Ramboll
Workorder# 2504081

Three 1 Liter Summa Canister (100% Certified) samples were received on April 04, 2025. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

All Quality Control Limit exceedances and affected sample results are noted by flags. Each flag is defined at the bottom of this Case Narrative and on each Sample Result Summary page.

Definition of Data Qualifying Flags

Ten qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

M - Reported value may be biased due to apparent matrix interferences.

CN - See Case Narrative.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

SUBJECT: Review Letter for Sub 2 (INCOMPLETE); PLN24-0030, Conditional Use Permit and Administrative Site Plan Review for a New Warehouse (241,400 sf) at 3199 Alvarado St, San Leandro, CA (APNs: 077B-1201-015-00). Zoning District: IG

Dear Annie Coon,

This letter serves as notification that your application submitted on **April 1, 2025** has been determined by this office to be **incomplete and non-compliant**. A resubmittal is necessary to continue an evaluation of your Conditional Use Permit and Administrative Site Plan Review application.

Resubmittal Required. Each department reviewer has listed their review comments below and they have requested a response letter, revised plans, and required documents. Please resubmit your proposal by providing such items and following each reviewer's instructions. Please remember to respond to each comment by both explaining how you have addressed the comment and where specifically on the plan set we can find the required revisions (using standard sheet and drawing number references). All comments in this letter shall be addressed with your resubmittal, prior to further processing of this application, unless otherwise stated herein. When you are ready to resubmit, please follow the specific ***Next Steps*** instructions at the bottom of this letter.

PLANNING: LOURDES JUAREZ, 510-577-3350, LJUAREZ@SANLEANDRO.ORG

MISSING REQUIRED DOCUMENTS AND AGENCY REVIEWS

The following documents (project studies, reports, and analyses) were not submitted; please submit them with your next submittal. All documents shall be completed by the appropriate licensed professional(s), to standard conventions, and providing required recommendations.

1. **Department of Toxic Substances Control (DTSC) Review**. Contact the DTSC and provide the documents below to initiate their review process. If the DTSC review results in additional design requirements for the project, please incorporate said requirements into the design of the project prior to resubmittal. As previously provided, contact for DTSC continues to be Moises Carvalho,

Juan González III, Mayor
City Council: Victor Aguilar, Jr. Bryan Azevedo Peter Ballew
Xouhoa Bowen Fred Simon Sbeydeh Viveros-Walton

Senior Hazardous Substances Engineer in the Site Mitigation and Restoration Program, reachable at (510) 540-3757 and moises.carvalho@dtsc.ca.gov.

a. **[Sub 1 Comment] Phase II Environmental Site Assessment**. This site is located within the boundaries of a contaminant plume known as the DWA Plume, a commingled groundwater plume of volitive organic compounds (VOCs) with an approximate area of 2 miles by 1 mile, in the center portion of San Leandro.
    i. The DWA Plume is identified as ESTOR / EPA ID No. 01990002, and the Lead Cleanup Oversight Agency (Lead Agency) for the plume is the Department of Toxic Substances Control (DTSC). More information about the EWA Plume can be found online at https://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=01990002.
    ii. Please be informed that there are eight (8) inactive hazardous waste IDs associated with its address, and waste generation ranges back to 1996.
    iii. Provide a Phase II Environmental Site Assessment that identifies the historical uses of the Property, evaluates potential threats to indoor air of the proposed structure, and evaluates both on-site and off-site threats to human health.

b. **[Sub 1 Comment] Property Transaction Environmental Due Diligence Report**. Provide the environmental due diligence report prepared during the property transaction.

[Sub 2 Comment] Per Mr. Carvalho: *Based on a technical discussion held on March 6, 2025, among property owner's representatives, their technical consultants and DTSC staff, it was determined that a Phase II ESA report would be transmitted to DTSC for review and comment if data obtained during the Phase II investigation indicate certain conditions. The requested documents have not been received*.

RESPONSE	

2. **Alameda County Flood Control District (ACFCD) Review**. The subject property contains an ACFCD easement. The project will impact ACFCD's Zone 9, Line C underground flood control facility. ACFCD needs to review the proposed project.

   [Sub 1 Comment] The applicant (developer and/or property owner) shall submit directly to ACFCD the civil plans for the project, which shall include drainage plan drawings, project drainage analysis/report, and the required deposit to initiate the review. For further information about submittal documents and fees, please contact Fernando B. Gonzales, P.E., Senior Civil Engineer in the ACFCD Development Engineering and Permits Department, at (510) 670-5267 and fernando@acpwa.org.

   [Sub 2 Comment] ACFCD Review has not been completed. Per Mr. Gonzales: *For this project to be included in AFCD's current queue of projects for review, please directly send a review deposit check in the initial amount of $5,000, with that check made payable to the "Treasurer of Alameda County." That review deposit will be charged at cost. Any remainder funds at completion of the review will be refunded. However, should the deposit become depleted prior to completion of our review, we will be requesting replenishment funds. Once ACFCD have completed its review and improvement plans have been approved, an appropriate flood encroachment permit will be issued for the project*.

RESPONSE	

NON-COMPLIANT ITEMS

3. **[Sub 1 Comment] Next Generation Workplace Districts Study (NextGen Study)**. Provide 2-3 Site Plan + Floor Plan diagrammatical hybrid drawings that visually demonstrate how the proposed building and proposed exterior improvements could be used by value-added companies.

   [Sub 2 Comment] Diagrammatical site plans received. As there is a possible redesign, staff will revisit at resubmittal. If there is a redesign, please submit updated plans.

RESPONSE	

4. **[Sub 1 Comment] Assembly Bill 98**. This project is subject to state regulations pursuant to California Government Code Section 65098.1(d), 65098.2, 65098.2.5, and 65098.4. Provide a separate site plan that demonstrates compliance with these regulations, including the required buffer, stacking area, and truck route.

   [Sub 2 Comment] Separate site plan received. As there is a possible redesign, staff will revisit at resubmittal. If there is a redesign, please submit updated plans.

RESPONSE	

MINOR PLAN REVISIONS

5. **All Site Plans**. Please add the following to all base site plans in the Architectural plans (Sheet A101) and the Preliminary Landscaping Plan (Sheet L1.2 of the Landscaping Plans).
   a. Depict, label, and dimension all easements.
   b. Depict and dimension all driveway visibility triangles.

RESPONSE	

6. **Errors.** The property line labels ("e.g., "west PL, etc.") on sheet A320 are incorrect. Please fix.

RESPONSE	

REQUIRED ENVIRONMENTAL REVIEW

This project is subject to environmental review pursuant to the California Environmental Quality Act (CEQA) and the analysis will be performed after the project has been deemed complete. An additional separate deposit will be billed for the preparation of the environmental review. Planning staff will provide additional information regarding the process and fees after your resubmittal and once the project has been deemed complete.

ALAMEDA COUNTY FIRE DEPARTMENT

Reviewer: Bonnie Terra, 510-632-3473, bonnie.terra@acgov.org

Fire Staff does not recommend that discretionary approval be given until the following issues are addressed and Fire Conditions are issued.

Re-submittal Required – A re-submittal is required for this project. Submit the revised plan along with a copy of any necessary reference materials, cut sheets, listing sheets and calculations. Include a written itemized response to each comment and where in the re-submittal the specific change or information requested can be found.

1. **[Sub 1 Comment]** On the plans show the location of all fire hydrants. They should be spaced to comply with section 507 of the 2022 CFC. The fire flow should show compliance with requirements in Appendix B of the 2022 CFC. **[Update 4/17/25]** Fire flow could not be determined as the type of construction of the building has not been provided.

RESPONSE	

2. **[Sub 1 Comment]** On the plans note the installation of fire pump shall be deferred submittals. Note the fire sprinkler system shall be designed to comply with requirements for high piled storage.

   [Sub 2 Comment 4/17/25] On the plans state that the fire sprinkler system shall be designed to comply with requirements for high piled storage.

RESPONSE	

3. **[Sub 1 Comment]** Please show on the plans the aerial fire department access roads required under Appendix D Section D105 of the 2022 CFC.

   [Sub 2 Comment 4/17/25] On the plans clearly show which side of the building will be used for aerial fire department access

RESPONSE	

4. **[Sub 1 Comment]** Please show on the plans how you are complying with the fire two apparatus access road requirements under Section D104.2 of the 2022 CFC as adopted by the City of San Leandro.

   [Sub 2 Comment 4/17/25] The plans do not comply with Section D104.2 of the 2022 CFC. In order for the plans to comply with this section you would have to reduce the square footage of the building.

RESPONSE	

5. **[Sub 1 Comment]** Please show on the plans how you are complying with the fire apparatus access road requirements for remoteness under D104.3.]

   [Sub 2 Comment 4/17/25] The remoteness requirement is not met.

RESPONSE	

6. **[Sub 1 Comment]** Show the area of the building that will be used for high piled storage.

   [Sub 2 Comment 4/17/25] Response states the area to be used for high piled storage is not yet known, … It cannot be determined if the requirements of Section 3206.7 of the 2022 CFC are met.

RESPONSE	

WATER POLLUTION CONTROL PLANT

Reviewer: Hayes Morehouse, 510-577-3437, hmorehouse@sanleandro.org

1. Provide drawing showing the location of the existing and proposed private sewer lateral from the structure to the City's sewer main.

RESPONSE	

2. Provide documentation of any sewer easements.

RESPONSE	

DISCLAIMER

The City reserves the right to provide additional comments or revise preliminary conditions of approval after responses to this letter are received and/or if the project is redesigned.

NEXT STEP: RESUBMITTAL

After completing the revisions and responding to the comments above, please submit the following items no later than **March 31, 2025** (per §5.5.120), in order for staff to continue processing your application:

- ❑ **Revised Plan Set**: Provide a revised plan set, formatted to print to scale at min. 24" x 36" paper size. Please do not use any clouds or delta symbols. Please update revision dates on all sheets.
- ❑ **Response Letter**: Provide a response letter using this letter and entering responses directly into the response boxes provided. Please respond to each comment by both explaining how you have addressed the comment and where specifically on the plan set we can find the required revisions (using standard sheet and drawing number references). The written responses will not replace items requested to be on the plan set.
- ❑ **Required Documents**: See above, within the body of this letter.
- ❑ **Printed Documents**: Provide:
  - ❑ **one (1)** collated and stapled plan set printed to scale at min. 24" x 36" paper,
  - ❑ **one (1)** collated and stapled plan set printed on 11" x 17" paper,
  - ❑ **two (2)** response letters printed on 8.5" x 11" paper, and
  - ❑ **one (1)** copy of each required document, collated, stapled, and printed on 8.5" x 11" paper.
- ❑ **Digital Documents**: Provide digital files for all the items above. You may email me the documents or submit them online at: https://www.tinyurl.com/FilesForLourdes. Files shall be in PDF format, with non-visible layers removed, and saved at the smallest possible reduced file size while maintaining legibility.

  Name the files:
  - ❑ Sub 3 Plan Set_PLN24-0030.pdf,
  - ❑ Sub 3 Response Ltr_PLN24-0030.pdf,
  - ❑ Sub 3 Phase II ESA_PLN24-0030.pdf, and so on.

If you have any questions or need more information, I may be reached directly at (510) 577-3350 or ljuarez@sanleandro.org. You may also contact each department directly for specific questions related to their comments.

Sincerely,

Lourdes Juarez

Lourdes Juarez, Associate Planner, Planning Division

Specific Work Permit Conditions

1. Drilling Permit(s) can be voided/ cancelled only in writing. It is the applicant's responsibility to notify Alameda County Public Works Agency, Water Resources Section in writing for an extension or to cancel the drilling permit application. No drilling permit application(s) shall be extended beyond ninety (90) days from the original start date. Applicants may not

cancel a drilling permit application after the completion date of the permit issued has passed.

2. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.

3. Permittee, permittee's contractors, consultants or agents shall be responsible to assure that all material or waters generated during drilling, boring destruction, and/or other activities associated with this Permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statutes regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where work is being completed.

4. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County an Traffic Safety Plan for any lane closures or detours planned.

5. No changes in construction procedures or well type shall change, as described on this permit application. This permit may be voided if it contains incorrect information.

6. Applicant shall submit the copies of the approved encroachment permit to this office within 10 days.

7. Applicant shall contact assigned inspector listed on the top of the permit at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

8. Wells shall have a Christy box or similar structure with a locking cap or cover. Well(s) shall be kept locked at all times. Well(s) that become damaged by traffic or construction shall be repaired in a timely manner or destroyed immediately (through permit process). No well(s) shall be left in a manner to act as a conduit at any time.

9. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of $500.00.

10. Electronic Reporting Regulations (Chapter 30, Division 3 of Title 23 & Division 3 of Title 27, CCR) require electronic submission of any report or data required by a regulatory agency from a cleanup site. Submission dates are set by a Regional Water Board or by a regulatory agency. Once a report/data is successfully uploaded, as required, you have met the reporting requirement (i.e. the compliance measure for electronic submittals is the actual upload itself). The upload date should be on or prior to the regulatory due date.

11. Vapor monitoring wells above water level constructed with tubing maybe be backfilled with pancake-batter consistency bentonite. Minimum surface seal thickness is two inches of cement grout around well box.

Vapor monitoring wells above water level constructed with pvc pipe shall have a minimum seal depth (Neat Cement Seal) of 2 feet below ground surface (BGS). Minimum surface seal thickness is two inches of cement grout around well box. All other conditions for monitoring well construction shall apply.

12. All vapor monitoring well grouting work requires inspection by ACPWA; Except for special circumstances, all work that requires inspection must be performed during the work hours of 9:00 a.m. to 3:30 p.m., Monday through Friday,

except holidays.

ENTHALPY ANALYTICAL

Case Narrative

Roux Associates 555 12th Street Suite 250 Oakland, CA 94607 Bennett Solomon	Lab Job Number: 533344 Project No: 5022.0001L000 Location: CC-3199 Alvarado St. Date Received: 05/16/25

This data package contains sample and QC results for twelve soil samples, requested for the above referenced project on 05/19/25. The samples were received cold and intact.

Volatile Organics by GC/MS (EPA 8260B):

- Low recoveries were observed for toluene and chlorobenzene in the MS/MSD for batch 372077; the parent sample was not a project sample, the BS/BSD were within limits, and the associated RPDs were within limits.
- No other analytical problems were encountered.

Moisture (ASTM D2216):

No analytical problems were encountered.

SAMPLE RECEIPT CHECKLIST

Section 1: General Info

Date Received: 5/16/25 WO# 533344 Client: Rong

Section 2: Shipping / Custody **Are custody seals present?** ☐ Yes ☑ No

Custody seals intact on arrival? ☑ N/A ☐ Yes ☐ No ☐ On cooler / box ☐ On samples

☐ Courier ☑ Walk-In ☐ Field Sampling ☐ Shipping Info: _____

Section 3a: Condition / Packaging ☐ **Outside 0.0 - 6.0°C (0.0 - 10.0°C for microbiology) (PM notified)**

Date Opened 5/16/25 By (initials) MM Type of ice used: ☑ Wet ☐ Blue/Gel ☐ None

☑ Samples received on ice directly from the field; cooling process had begun. (if checked, skip temperatures)

☐ Sample matrix doesn't require cooling (e.g. air, bulk PCB). (if checked, skip temperatures)

If no cooler: Observed/Adjusted Temp (°C): _____ / _____ Thermometer/IR Gun: _____ CF: _____

Cooler Temp (°C) #1: ____/____ #2: ____/____ #3: ____/____ #4: ____/____ #5: ____/____ #6: ____/____

Section 3b: Microbiology Samples ☑ **No microbiology samples submitted (skip 3b)**

☐ Within temp range 0.0 - 10.0°C or received on ice directly from field.

☐ Adequate headspace for microbiology analysis.

Section 3c: Air Samples ☑ **No air samples submitted (skip 3c)**

☐ 1.4L Canisters ☐ 6L Canisters ☐ Tedlar Bags ☐ MCE Cassettes ☐ Sorbent Tubes ☐ Other _____

Section 4: Containers / Labels / Samples	YES	NO	N/A
1) Were custody papers present, filled properly, and legible?	✓		
2) Is the sampler's name present on the CoC?	✓		
3) Were containers received in good condition (unbroken / unopened / uncompromised)?		✓	
4) Were the samples bagged? (required for microbiology samples; recommended for soil samples)		✓	
5) Were all of, and only, the correct samples received?	✓		
6) Are sample labels present, legible, and in agreement with the CoC?	✓		
7) Does the container count match the CoC?	✓*		
8) Was sufficient sample volume / mass received for the analyses requested?	✓		
9) Were samples received in proper containers for the analyses requested?	✓		
10) Were samples received with > 1/2 holding time remaining?	✓		
11) Are samples properly preserved as indicated by CoC / labels?	✓		
12) Unpreserved VOAs received - If necessary, was the hold time changed in LIMS?			✓
13) Are VOA vials free from headspace/bubbles > 6mm?			✓

Section 5: Explanations / Comments

(If no comments are made, then no discrepancies noted.)

4.3: All terracore vials were overfilled. Per PM/client we transferred ~5g from each SoBi vial into unpreserved VOAs (x2) and a 2 oz jar.

4.7: Correct count received, but due to the sample transfer, there are only 3 containers per sample

☐ **No additional discrepancies**

Case Narrative

Roux Associates 555 12th Street Suite 250 Oakland, CA 94607 Bennett Solomon	Lab Job Number: 533499 Project No: 5022.0001L000 Location: CC-3199 Alvarado St. Date Received: 05/20/25

This data package contains sample and QC results for thirteen air samples, requested for the above referenced project on 05/21/25. The samples were received intact.

Volatile Organics in Air by MS (EPA TO-15):
No analytical problems were encountered.

Volatile Organics in Air GC (ASTM D1946):
No analytical problems were encountered.

SAMPLE RECEIPT CHECKLIST

Section 1: General Info
Date Received: 5/20 WO# 533499 Client: ROUX

Section 2: Shipping / Custody **Are custody seals present?** ☐ Yes ☒ No
Custody seals intact on arrival? ☑ N/A ☐ Yes ☐ No ☐ On cooler / box ☐ On samples
☐ Courier ☒ Walk-In ☐ Field Sampling ☐ Shipping Info: _____

Section 3a: Condition / Packaging ☐ **Outside 0.0 - 6.0°C (0.0 - 10.0°C for microbiology) (PM notified)**
Date Opened 5/20 By (initials) TEAPE Type of ice used: ☐ Wet ☐ Blue/Gel ☒ None
☐ Samples received on ice directly from the field; cooling process had begun. (if checked, skip temperatures)
☒ Sample matrix doesn't require cooling (e.g. air, bulk PCB). (if checked, skip temperatures)
If no cooler: Observed/Adjusted Temp (°C): _____ / _____ Thermometer/IR Gun: _____ CF: _____
Cooler Temp (°C) #1: _____/_____ #2: _____/_____ #3: _____/_____ #4: _____/_____ #5: _____/_____ #6: _____/_____

Section 3b: Microbiology Samples ☒ **No microbiology samples submitted (skip 3b)**
☐ Within temp range 0.0 - 10.0°C or received on ice directly from field.
☐ Adequate headspace for microbiology analysis.

Section 3c: Air Samples ☐ **No air samples submitted (skip 3c)**
☒ 1.4L Canisters ☐ 6L Canisters ☐ Tedlar Bags ☐ MCE Cassettes ☐ Sorbent Tubes ☐ Other _____

Section 4: Containers / Labels / Samples	YES	NO	N/A
1) Were custody papers present, filled properly, and legible?	✓		
2) Is the sampler's name present on the CoC?	✓		
3) Were containers received in good condition (unbroken / unopened / uncompromised)?	✓		
4) Were the samples bagged? (required for microbiology samples; recommended for soil samples)			✓
5) Were all of, and only, the correct samples received?	✓		
6) Are sample labels present, legible, and in agreement with the CoC?	✓		
7) Does the container count match the CoC?	✓		
8) Was sufficient sample volume / mass received for the analyses requested?	✓		
9) Were samples received in proper containers for the analyses requested?	✓		
10) Were samples received with > 1/2 holding time remaining?	✓		
11) Are samples properly preserved as indicated by CoC / labels?	✓		
12) Unpreserved VOAs received - If necessary, was the hold time changed in LIMS?			✓
13) Are VOA vials free from headspace/bubbles > 6mm?			✓

Section 5: Explanations / Comments
(If no comments are made, then no discrepancies noted.)

This data package has been reviewed for technical correctness and completeness. Release of this data has been authorized by the Laboratory Manager or the Manager's designee, as verified by the above signature which applies to this PDF file as well as any associated electronic data deliverable files. The results contained in this report meet all requirements of NELAP and pertain only to those samples which were submitted for analysis. This report may be reproduced only in its entirety.

Case Narrative

Roux Associates 555 12th Street Suite 250 Oakland, CA 94607 Bennett Solomon	Lab Job Number: 533500 Project No: 5022.0001L000 Location: CC-3199 Alvarado St. Date Received: 05/20/25

This data package contains sample and QC results for one two-point soil composite, requested for the above referenced project on 05/21/25. The samples were received cold and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):

- EPA 8260 VOC analyses for select samples were performed at our facility at 2532 E. Cerritos Ave, Anaheim CA 92806. Anaheim cert numbers: ELAP Cert #1338-S1, OR ELAP cert #4197.
- No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015M):

- IDW-COMP (lab # 533500-003) was diluted due to the dark color of the sample extract.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

No analytical problems were encountered.

Metals (EPA 6020 and EPA 7471A):

- Low recoveries were observed for antimony in the MS/MSD of IDW-COMP (lab # 533500-003); the associated RPD was within limits. High recoveries were observed for barium; the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

SAMPLE RECEIPT CHECKLIST

Section 1: General Info
Date Received: 5/20 WO# 533500 Client: ROUX

Section 2: Shipping / Custody **Are custody seals present?** ☐ Yes ☒ No
Custody seals intact on arrival? ☒ N/A ☐ Yes ☐ No ☐ On cooler / box ☐ On samples
☐ Courier ☒ Walk-In ☐ Field Sampling ☐ Shipping Info: _____

Section 3a: Condition / Packaging ☐ **Outside 0.0 - 6.0°C (0.0 - 10.0°C for microbiology) (PM notified)**
Date Opened 5/20 By (initials) TEA Type of ice used: ☒ Wet ☐ Blue/Gel ☐ None
☒ Samples received on ice directly from the field; cooling process had begun. (if checked, skip temperatures)
☐ Sample matrix doesn't require cooling (e.g. air, bulk PCB). (if checked, skip temperatures)
If no cooler: Observed/Adjusted Temp (°C): _____ / _____ Thermometer/IR Gun: _____ CF: _____
Cooler Temp (°C) #1: ____/____ #2: ____/____ #3: ____/____ #4: ____/____ #5: ____/____ #6: ____/____

Section 3b: Microbiology Samples ☒ **No microbiology samples submitted (skip 3b)**
☐ Within temp range 0.0 - 10.0°C or received on ice directly from field.
☐ Adequate headspace for microbiology analysis.

Section 3c: Air Samples ☒ **No air samples submitted (skip 3c)**
☐ 1.4L Canisters ☐ 6L Canisters ☐ Tedlar Bags ☐ MCE Cassettes ☐ Sorbent Tubes ☐ Other _____

Section 4: Containers / Labels / Samples	YES	NO	N/A
1) Were custody papers present, filled properly, and legible?	✓		
2) Is the sampler's name present on the CoC?	✓		
3) Were containers received in good condition (unbroken / unopened / uncompromised)?	✓		
4) Were the samples bagged? (required for microbiology samples; recommended for soil samples)	✓		
5) Were all of, and only, the correct samples received?	✓		
6) Are sample labels present, legible, and in agreement with the CoC?	✓		
7) Does the container count match the CoC?	✓		
8) Was sufficient sample volume / mass received for the analyses requested?	✓		
9) Were samples received in proper containers for the analyses requested?	✓		
10) Were samples received with > 1/2 holding time remaining?	✓		
11) Are samples properly preserved as indicated by CoC / labels?	✓		
12) Unpreserved VOAs received - If necessary, was the hold time changed in LIMS?			✓
13) Are VOA vials free from headspace/bubbles > 6mm?			✓

Section 5: Explanations / Comments
(If no comments are made, then no discrepancies noted.)

PHASE II SOIL AND SOIL VAPOR INVESTIGATION LETTER REPORT; 3199 ALVARADO STREET, SAN LEANDRO, CALIFORNIA (CUP/SPR | PLN24-0030)

Dear Ms. Juarez

This letter presents technical comments from the Department of Toxic Substances Control (DTSC) following a limited review of Phase II Soil and Soil Vapor Investigation Letter Report (Phase II Letter Report; CUP/SPR | PLN24-0030) for a property located at 3199 Alvarado Street, San Leandro, California, as submitted by the City of San Leandro on July 7, 2025.

1. Scope of Review

DTSC review was limited in scope and focused specifically on the Phase II Letter Report and its attachments. DTSC does not have a formal agreement with the 3199 Alvarado Street property (Property) owner to provide comprehensive oversight or to review and approve work plans and their subsequent implementation reports. Consequently, the observations and recommendations contained herein are based solely on the data presented in the documents provided and experience with the DWA Plume site. The Property is within the DWA Plume study area.

2. Key Observations

The Phase II investigation was conducted to evaluate potential vapor intrusion (VI) risks associated with the Recognized Environmental Conditions (REC) identified in the Phase I investigation (Phase I Environmental Site Assessment [ESA]), included as attachment of the Phase II Letter Report. The Phase I ESA identified groundwater contamination from sources outside of the Property as the only REC. The key observations from the Phase II Letter Report are summarized below.

2.1 Soil Gas Sampling Results

- Tetrachloroethene (PCE): PCE concentrations were above the DTSC commercial air screening level (SL) of 67 micrograms per cubic meter (µg/m^3) "in nine of twelve samples (including one duplicate sample) with concentrations ranging from 20 to 13,000 µg/m^3."
- Trichloroethene (TCE): TCE concentrations were above the DTSC commercial air SL of 100 µg/m^3 "in three of twelve samples (including one duplicate), with concentrations ranging from 170 to 180 µg/m^3."

The highest PCE concentrations in soil gas were along the northwest property boundary. PCE concentrations on the Property generally decrease toward the southeast.

2.2 Sub-Slab Soil Gas Sampling Results

Sub-slab soil gas probes were installed in twelve locations within the limits of the Property building (warehouse).

- PCE: PCE was detected above the DTSC commercial air SL of 67 µg/m^3 in nine of twelve samples (including one duplicate sample) with concentrations ranging from 198 to 1,990 µg/m^3.
- TCE: TCE was detected in three sampling locations, with the highest concentration of 8 µg/m^3, which is lower than the DTSC commercial air SL of 100 µg/m^3.

Based on the sub-slab soil gas distribution across the Property's building footprint, it appears that the area with the highest PCE concentration is located in the south-central portion of the building footprint.

3. Limited Site Characterization and Data Gaps

- The Phase II Letter Report does not contain information about historical sewer lines or other preferential pathways beneath the building's foundation, or the presence of sumps, Underground Storage Tank (UST)), or other areas of concern (AOC; e.g., oil-water separator).

- The Phase II Letter Report does not provide a complete record of the eight inactive hazardous waste identification numbers associated with the Property (records indicate that waste generation dates back to 1996).

4. Conclusion and Recommendation

The conclusions and recommendations are restricted to the data provided and experience with the DWA Plume.

The relative PCE concentrations in samples collected from the sub-slab as compared to nearby soil vapor samples collected from 5 feet below ground surface (bgs) varied across the Property:

- The PCE concentration at sub-slab sampling point VP-09 was about one fifth of the PCE concentration at the approximately collocated soil vapor sampling point RB-9.

- The PCE concentration at VP-1 was also lower than at RB-2 and RB-7,

- However, the concentration of PCE at VP-05 (1,460 µg/m^3) was similar to the nearest soil vapor sampling point, RB-2 (1,600 µg/m^3),

- The concentration of PCE at VP-03 was about 10 times higher than the nearest soil vapor sampling point, RB-11.

The highest concentrations of sub-slab soil vapor samples were found in a different area of the Property than the concentrations in the 5-feett below ground surface (bgs) soil vapor samples. This data does not demonstrate a consistent relationship between the sub-slab and the soil vapor concentrations at 5 feet bgs. That being said, there is some general similarity in the distribution of both sub-slab and 5-foot bgs soil vapor samples. In summary, uncertainty remains regarding the potential sources of VOCs at this Property.

The Phase II Letter Report's recommendation for a passive sub-slab vapor intrusion mitigation system (VIMS) does not adequately address the risk posed by the high PCE concentrations, such as 1,990 µg/m^3, reported at vapor point VP-04.

- A passive VIMS' performance is highly variable, as it depends on the type of materials used, the construction, and it is also subject to degradation over time.
- While high-quality passive VIMS can, under ideal conditions, reduce sub-slab vapor concentrations by one to two orders of magnitude (i.e., 90 % to 99% reduction[1,2,3]), this level of performance is not guaranteed.
- Given these factors, an active sub-slab depressurization system is recommended to provide a more reliable, continued and robust protective measure

The Property is in a part of the DWA Plume study area where a data gap has been identified. DTSC is planning to conduct a supplemental site characterization for the DWA Plume in 2025 and 2026 that will include sampling near the Property. As part of this effort, additional groundwater and soil gas samples will be collected in areas around the property. This additional data will improve the DWA Plume conceptual site model (CSM) and the understanding of the potential correlation between the soil gas concentrations observed on this Property and the DWA Plume.

Once additional data from the upcoming supplemental site characterization becomes available, the DWA Plume CSM will be refined, and DTSC will be able to reassess if the observed property-specific data correlates with the observed off-site soil gas data. A

Hi Lourdes,

I'm the Brownfields Coordinator for the DTSC Berkeley office and I handle the intake of new sites and help get the oversight applications in place. I understand that you reached out to DTSC regarding our review status of documents necessary for the redevelopment of 3199 Alvarado Street. DTSC is still working on getting the Standard Voluntary Agreement with the property owner in place; DTSC cannot review any documents until this Agreement has been fully executed. The Agreement is currently with our management for final review before I can release it for signature. DTSC will not be able to finish its review of project documents before September 30, 2025 and I can't provide an estimate of when our review will be completed at this time.

Please reach out if you have any questions.

Existing and Proposed Drainage Conditions

EXISTING CONDITIONS

The existing project site is composed of a ±250,000 SF commercial building and a parking lot with pervious parking islands on the east side of the property. The site drains into two main storm drain lines owned by Alameda County Flood Control District - one 5'x7' RCB main along the south side which eventually flows into the 48" trunk line on the west side. The drainage pattern of the existing site has been separated into 5 Drainage Management Areas (DMA's). The weighted runoff coefficient (c-factor) was calculated by multiplying the impervious area (in acres) by a c-factor of .90 for and adding it to the pervious area (in acres) multiplied by a c-factor of .25 then dividing by the total DMA area (in acres) to get the weighted c-factor. The existing site drainage conditions account for a total of **28.78 cfs** of total flow per the Existing Conditions table below. In the existing stormwater plan, 15.08 cfs is flowing to the trunk line on the west side. 13.70 cfs is flowing to the main line on the south side.

PROPOSED CONDITIONS

The proposed site will compose of ±241,400 SF building with parking areas on the North, East, and South sides of the parcel, along with truck docks on the entire North side of the building. Stormwater treatment areas are separated into 4 DMA areas. The proposed improvements replace approximately 90,000 SF of existing impervious area with new pervious area. The weighted runoff coefficient was calculated the same way as done for the existing conditions in the previous paragraph. The calculated weighted runoff coefficient can be found in the Proposed Conditions table below. This increase in pervious area decreases the total site runoff from 28.78 cfs down to **25.65 cfs**. In the proposed stormwater plan, 16.25 cfs is flowing to the trunk line on the west side. 9.40 cfs is flowing to the main line on the south side.

FINAL RESULT FOR PROPOSED CONDITION:

Flow into the 5x7 RCB mainline on the south side is decreased from 13.70 cfs to 9.40 cfs. Although flow into the 48" trunk line on the west increases along the west side connection points from 13.70 cfs to 16.25 cfs, but the total flow for the 48" trunk line will decrease from 28.78 cfs to 25.65 cfs due to the extra 90,672 sf of pervious area added to the site.

FINAL STATEMENT

Total flow for the site and the mains will decrease from 28.78 cfs in the existing condition to 25.65 cfs in the proposed condition.

Existing Conditions

Storm Event	Catchment Area	Intensity (in/hr)	Runoff Coefficient (Weighted)	Area (Acres)	Existing Flows (cfs)
10-year	DMA 1	2.21	0.90	6.58	**13.08**
10-year	DMA 1A	2.21	0.90	0.06	**0.12**
10-year	DMA 2	2.21	0.87	0.98	**1.88**
Subtotal	48" Trunk Line				**15.08**
10-year	DMA 3	2.21	0.87	1.60	**3.07**
10-year	DMA 4	2.21	0.85	1.73	**3.25**
10-year	DMA 5	2.21	0.87	3.84	**7.38**
Subtotal	5'x7' Main Line				**13.7**
Total					**28.78 cfs**

Proposed Conditions

Storm Event	Catchment Area	Intensity (in/hr	Runoff Coefficient (Weighted)	Area (Acres)	Existing Flows (cfs)
10-year	DMA 1	2.21	0.82	8.97	**16.25**

Product Data

WeatherMaker®
Single Package Heat Pump
Rooftop

15 to 25 Nominal Tons

ecoblue™ technology

50FCQ*17, 24, 28

Single-Packaged Heat Pump with Optional Electric Heat and Puron® Refrigerant (R-410A)

© 2024 Carrier

Features/Benefits

The New Carrier WeatherMaker® packaged heat pump rooftop units (RTU) with EcoBlue™ Technology were designed by customers to provide value added benefits never seen in this type of equipment before.

New features include:

- A patented, industry first, Vane Axial Indoor Fan System, powered by an electronically commutated motor for quiet, efficient, and reliable operation. Compared to traditional belt driven forwards curved fans, this system has:
  - 75% fewer moving parts
  - No fan belts, pulleys, shaft, and shaft bearings
  - Up to 40% better efficiency than traditional belt drive forward curve fans
  - Slow ramp up capability for better sound and comfort control
  - Internal protection from phase reversal and phase loss situations
  - High external static capability
  - Slide out blower assembly design
- Reliable 2 stage cooling with tandem scroll compressors technology, fully active evaporator coil, and mixed air temperature protection on all models
- New unit control board with intuitive indoor fan adjustment that uses simple dial and switch adjustments
- An industry first 25 ton packaged heat pump
- Reliable copper tube/aluminum fin condenser coil with 5/16 in. tubing to help reduce refrigerant charge and reduce weight versus prior designs

WeatherMaker® 50FCQ units up to 25 tons are specifically designed for dedicated factory-supplied vertical air flow or horizontal air flow. No special field kits are required. All footprints were maintained to easily fit on R-410A Carrier and select competitor curbs, making replacements easier than ever.

With “no-strip” screw collars, handled access panels, and more, the unit is easy to install, easy to maintain, and easy to use.

Our 2 speed staged air volume through our Vane Axial fan allows our 15 to 25 ton 50FCQ WeatherMaker units to deliver IEER values up to 14.0 and provide optimum comfort and control.

Value-added features include:

- SystemVu™ intuitive intelligent controls option that provides:
  - Large full text, multi-line display
  - USB Flash Port for data transfer
  - Built in i-Vu®, CCN and BACnet[1]
  - Read refrigerant pressures from display — no gauges
  - Quick LED Status — Run, Alert, Fault
  - Conventional thermostat or sensor capabilities
  - Historical component runtime and starts
  - Supply air tempering
  - Navigator™ and Network Service Tool compatible
- Single point electrical connections
- All 15 to 25 ton models use TXV refrigerant metering devices
- Scroll compressors with internal line-break overload protection
- Units come with an easy access tool-less filter door. Filter track tilts out for filter removal and replacement. All filters are the same size in each unit

Installation ease

Lighter units make for easy replacement and aid in the structural approval process. Units have simple, fast plug-in connections to the standard integrated unit control board (UCB). Clearly labeled connections points to reduce installation time. Also, a large control box provides room to work and room to mount Carrier accessory controls.

Easy to maintain

With the new EcoBlue Vane Axial fan system and direct drive ECM motor, there is no longer a need to adjust or replace belts or pulleys as in past designs. This frees up maintenance, installation and commissioning time.

Features/Benefits (cont)

Easy access handles by Carrier provide quick and easy access to all normally serviced components. Our "no-strip" screw system has superior holding power and guides screws into position while preventing the screw from stripping the unit's metal.

Sloped, corrosion resistant composite drain pan sheds water and won't rust.

Easy to use

The newly re-designed Unit Control Board by Carrier puts all connections and troubleshooting points in one convenient place. Most low voltage connections are made to the same board and make it easy to access it. Setting up the fan is simple by an intuitive switch and rotary dial arrangement.

Carrier rooftops have high and low pressure switches, a new mixed air temperature switch, a filter drier, and 2 in. filters standard.

EcoBlue™ Technology

Direct drive EcoBlue Technology indoor fan system uses Vane Axial fan design and electrically commutated motors.

This new Vane Axial design has 75% fewer moving parts, uses up to 40% less energy and has no fan belts, blower bearings and shaft when compared with past belt drive systems. The full fan and motor assembly also slides out for easier maintenance and service.

Streamlined control and integration

Carrier controllers make connecting WeatherMaker® rooftop heat pump units into existing building automation systems easy. The units are compatible with conventional thermostat controls or SystemVu™ controls for greater comfort, diagnostics and building network integration.

Operating efficiency and flexibility

These 50FCQ packaged rooftops meet the Department of Energy (DOE) 2023 efficiency standard, as well as the latest ASHRAE (American Society of Heating, Refrigerating, and Air-Conditioning Engineers) 90.1 and IECC®[1] (International Energy Conservation Code) minimum IEER efficiency requirements.

Capacity ratings (cont)

Sound Rating Table[a]

UNIT	COOLING STAGES	OUTDOOR SOUND (dB) AT 60 Hz[b]								
		A-WEIGHTED[c]	63	125	250	500	1000	2000	4000	8000
50FCQM17	2	84.1	92.2	83.9	80.4	81.8	78.7	76.5	72.2	65.4
50FCQM17	2	85.9	97.1	88.3	84.4	83.3	80.7	77.4	73.4	67.3
50FCQM28	2	85.9	97.1	88.3	84.4	83.3	80.7	77.4	73.4	67.3

NOTE(S):

a. Outdoor sound data is measured in accordance with AHRI.
b. Measurements are expressed in terms of sound power. Do not compare these values to sound pressure values because sound pressure depends on specific environmental factors which normally do not match individual applications. Sound power values are independent of the environment and therefore more accurate.
c. A-weighted sound ratings filter out very high and very low frequencies, to better approximate the response of “average” human ear. A-weighted measurements for Carrier units are taken in accordance with AHRI.

NOTE(S):

a. Requires a field-supplied 24V transformer for each application. See price pages for details.
b. FDD (Fault Detection and Diagnostic) capability per California Title 24 section 120.2.
c. Models with SystemVu controls comply with California Title 24 Fault Detection and Diagnostic (FDD).
d. Included with economizer.
e. Sensors used to optimize economizer performance.
f. See application data for assistance.
g. Non-fused disconnect switch cannot be used when unit FLA electrical rating exceeds 200 amps (all voltages).
h. High SCCR (Short Circuit Current Rating) is not available on the following: units with Low Ambient controls, Phase loss monitor, Non-fused disconnect, Powered convenience outlet, and 575-v models.

Options and accessories (cont)

Factory-installed options

Economizer (dry-bulb or enthalpy)

Economizers save money. They bring in fresh, outside air for ventilation; and provide cool, outside air to cool your building. This is the preferred method of low-ambient cooling. When coupled to CO_2 sensors, economizers can provide even more savings by coupling the ventilation air to only that amount required.

Economizers are available, installed and tested by the factory, with either enthalpy or dry-bulb temperature inputs. Additional sensors are available as accessories to optimize the economizers. Economizers include a powered exhaust system to help equalize building pressures.

Economizers can be factory-installed or easily field-installed.

Unit mounted CO_2 sensor

The CO_2 sensor works with the economizer to intake only the correct amount of outside air for ventilation. As occupants fill your building, the CO_2 sensor detects their presence through increasing CO_2 levels, and opens the economizer appropriately. When the occupants leave, the CO_2 levels decrease, and the sensor appropriately closes the economizer. This intelligent control of the ventilation air, called demand controlled ventilation (DCV), reduces the overall load on the rooftop, saving money. It is also available as a field-installed accessory.

Phase monitor protection

The Phase Monitor Control will monitor the sequence of 3-phase electrical system to provide a phase reversal protection; and monitor the 3-phase voltage inputs to provide a phase loss protection for the 3-phase device. It will work on either a Delta or Wye power connection.

Smoke detector (supply and/or return air)

Trust the experts. Smoke detectors make your application safer and your job easier. Carrier smoke detectors immediately shut down the rooftop unit when smoke is detected. They are available, installed by the factory, for supply air, return air, or both.

Thru-the-base connections

Thru-the-base connections, included as standard, are necessary to ensure proper connection and seal when routing wire and piping through the rooftop's basepan and curb. These couplings eliminate roof penetration and should be considered for gas lines, main power lines, as well as control power.

Hinged access panels

Allows access to unit's major components with specifically designed hinged access panels. Panels are filter, control box access, and indoor fan motor access.

Cu/Cu (indoor and outdoor) coils

Copper fins and copper tubes are mechanically bonded to copper tubes and copper tube sheets. A polymer strip prevents coil assembly from contacting the sheet metal coil pan to minimize potential for galvanic corrosion between coil and pan.

E-coated (outdoor and indoor) coils

A flexible epoxy polymer coating uniformly applied to all coil surface areas without material bridging between fins. Coating process shall ensure complete coil encapsulation of tubes, fins and headers.

Pre-coated outdoor coils

A durable epoxy-phenolic coating to provide protection in mildly corrosive coastal environments. The coating minimizes galvanic action between dissimilar metals. Coating is applied to the aluminum fin stock prior to the fin stamping process to create an inert barrier between the aluminum fin and copper tube.

Condenser coil hail guard

Sleek, louvered panels protect the condenser coil from hail damage, foreign objects, and incidental contact.

Convenience outlet (powered or un-powered)

Reduce service and/or installation costs by including a convenience outlet in your specification. Carrier will install this service feature at our factory. Provides a convenient, 15 amp, 115-v GFCI receptacle with "Wet in Use" cover. The "powered" option allows the installer to power the outlet from the line side of the disconnect or load side as required by code. The "unpowered" option is to be powered from a separate 115/120-v power source.

The unpowered convenience outlet is available as a 15 amp factory-installed option or a 20 amp field-installed accessory.

Non-fused disconnect

This OSHA-compliant, factory-installed, safety switch allows a service technician to locally secure power to the rooftop. When selecting a factory-installed non-fused disconnect, note they are sized for the unit as ordered from the factory. The sizing of these do not accommodate field-installed items such as power exhaust devices, etc. If field installing electric heat with factory-installed non-fused disconnect switch, a single point kit may or may not be required.

SystemVu™ controller

Carrier's SystemVu controller is an optional factory-installed and tested controller.

This controller takes on a whole new approach to provide an intuitive, intelligent controller that not only monitors and controls the unit, but also provides linkage to multiple building automation systems.

Each SystemVu controller makes it easy to set up, service, troubleshoot, gain historical data, generate reports and provide comfort only Carrier is noted for.

Key features include:

- Easy to read back lit 4 line text screen for superior visibility.
- Quick operational condition LEDs of: Run, Alert, and Fault.
- Simple navigation with large keypad buttons of: Navigation arrows, Test, Back, Enter and Menu.
- Capable of being controlled with a conventional thermostat, space sensor or build automation system.
- Service capabilities include:
  - Auto run test
  - Manual run test
  - Component run hours and starts
  - Commissioning reports
  - Data logging
- Full range of diagnosis:
  - Read refrigerant pressures without the need of gauges

Options and accessories (cont)

- Sensor faults
- Compressor reverse rotation
- Economizer diagnostics that meet California Title 24 requirements

- Quick data transfer via USB port:
  - Unit configuration uploading/downloading
  - Data logging
  - Software upgrades
- Built in capacity for:
  - i-Vu® open systems
  - BACnet systems
  - CCN systems
- Configuration and alarm point capability:
  - Contain over 100 alarm codes
  - Contain over 260 status, troubleshooting, diagnostic and maintenance points
  - Contain over 270 control configuration setpoints

Condensate overflow switch

This sensor and related controller monitors the condensate level in the drain pan and shuts down compression operation when overflow conditions occur. It includes:

- Indicator light — solid red (more than 10 seconds on water contact — compressors disabled), blinking red (sensor disconnected)
- 10-second delay to break — eliminates nuisance trips from splashing or waves in pan (sensor needs 10 seconds of constant water contact before tripping)
- Disables the compressors operation when condensate plug is detected, but still allows fans to run for economizer.

MERV-13 4 in. return air filters

This factory option upgrades the return air filters from standard unit filters to high efficiency MERV-13 filters. Non-woven MERV-13 filter media with high strength, moisture-resistant frame. Filter media is securely fasted inside the filter frame on all 4 sides.

High Short Circuit Current Rating (SCCR) protection

This factory-installed option provides high short circuit current protection to each compressor, plus all indoor and outdoor fan motors of 60 kA (for 208/230-3-60 units) and 65 kA (for 460-3-60 units) against high potential fault current situations.

Standard unit comes with 5 kA rating.

This option is not available with factory installed Non-Fused Disconnect, Low Ambient controls, Phase loss monitor/ protection and 575 Volt models.

Filter maintenance indicator

When the optional factory-installed filter maintenance indicator is used, a factory-installed differential pressure switch measures pressure drop across the outside air filter and activates a field-supplied dry contact indicator when the pressure differential exceeds the adjustable switch setpoint.

Options and accessories (cont)

Field-installed accessories

Condenser coil hail guard

Sleek, louvered panels protect the condenser coil from hail damage, foreign objects, and incidental contact. This can be purchased as a factory-installed option or as a field-installed accessory.

Differential enthalpy sensor

The differential enthalpy sensor is comprised of an outdoor and return air enthalpy sensors to provide differential enthalpy control. The sensor allows the unit to determine if outside air is suitable for free cooling.

Wall or duct mounted CO_2 sensor

The IAQ sensor shall be available in duct or wall mount. The sensor provides demand ventilation indoor air quality (IAQ) control.

4 in. filter rack kit

The 4 in. filter rack accessory kit is designed to hold 4 in. MERV-8 or MERV-13 filters. Filters not included in kit.

MERV-13 2 in. return air filters

This kit includes MERV-13 2 in. filters to accommodate unit filter rack size. Kit available through RDC (Replacement Components Division).

MERV-8 2 in. return air filters

This kit includes MERV-8 2 in. filters to accommodate unit filter rack size. Kit available through RDC.

Phase monitor protection

The Phase Monitor Control will monitor the sequence of 3-phase electrical system to provide a phase reversal protection; and monitor the 3-phase voltage inputs to provide a phase loss protection for the 3-phase device. It will work on either a Delta or Wye power connection.

Winter start kit

The winter start kit by Carrier extends the low ambient limit of your rooftop to 25°F (–4°C). The kit bypasses the low pressure switch, preventing nuisance tripping of the low pressure switch. Other low ambient precautions may still be prudent.

Low ambient controller

The low ambient controller is a head pressure controller kit that is designed to maintain the unit's condenser head pressure during periods of low ambient cooling operation. This device should be used as an alternative to economizer free cooling when economizer usage is either not appropriate or desired. The low ambient controller will either cycle the outdoor fan motors or operate them at reduced speed to maintain the unit operation, depending on the model. This controller allows cooling operation down to 0°F (–18°C) ambient conditions.

Roof curb (14 in./356 mm or 24 in./610 mm)

Full perimeter roof curb with exhaust capability provides separate air streams for energy recovery from the exhaust air without supply air contamination.

Filter status indicator accessory

Monitors static pressure across supply and exhaust filters and provides indication when filters become clogged.

Power exhaust

Superior internal building pressure control. This field-installed accessory may eliminate the need for costly, external pressure control fans.

Manual OA damper

Manual outdoor air dampers are an economical way to bring in ventilation air. The dampers are available in 25% and 50% versions.

NOTE: See application tip "ROOFTOP-18-01" prior to use of this damper on 17-28 size models.

Motorized two-position damper

The Carrier two-position, motorized outdoor air damper admits up to 100% outside air. Using reliable, gear-driven technology, the two-position damper opens to allow ventilation air and closes when the rooftop stops, stopping unwanted infiltration.

NOTE: See application tip "ROOFTOP-18-01" prior to use of this damper on 17-28 size models.

Electric heaters

Carrier offers a full-line of field-installed accessory heaters. The heaters are very easy to use, install and are all pre-engineered and certified.

Time Guard II control circuit

This accessory protects your compressor by preventing short-cycling in the event of some other failure, prevents the compressor from restarting for 30 seconds after stopping. Not required with SystemVu™ controller or authorized commercial thermostats.

Wi-Fi stick for EconomizerONE (optional)

The accessory Wi-Fi/WLAN stick can be connected to the EconomizerONE POL224 economizer controller via the USB host interface. The Wi-Fi stick enables a wireless connection to be made between a smartphone and the economizer controller via the Climatix™[1] mobile application for commissioning, troubleshooting, and maintenance operations. The Wi-Fi stick is required to utilize the mobile application.

Climatix™ mobile application

The Climatix™ mobile application offers a best-in-class user interface and a simple step-by-step commissioning workflow using a mobile device. The user interface walks users through the setup of the controller and allows users to view the operating mode and parameters. Users can adjust setpoints, initiate damper tests, and save the final configuration as a favorite to expedite setup in the future.

The application is available on Android™[1] and Apple iOS®[1] platforms. The Wi-Fi stick for the EconomizerONE is required to join the Siemens-WiFi-Stick network and setup the controller on a smartphone.

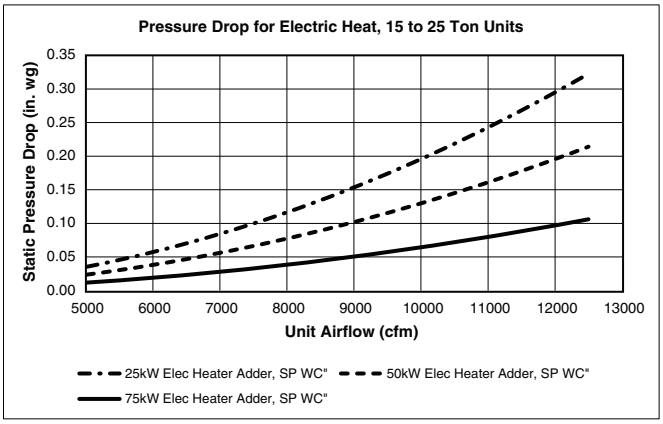
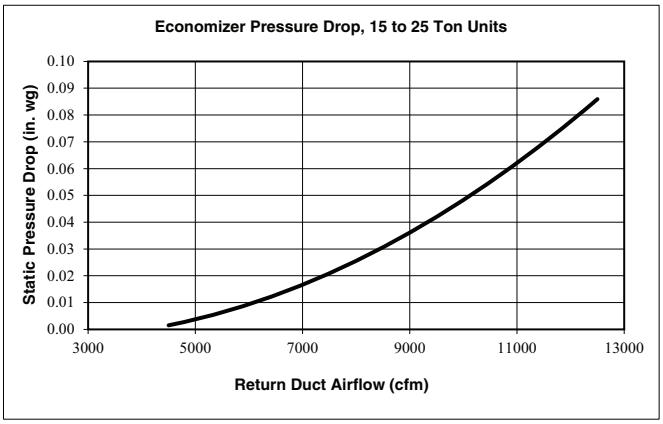
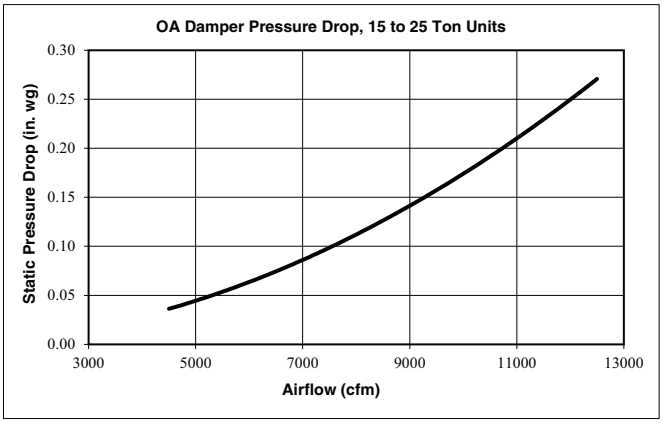
Pressure Drop for Electric Heating Units
15 to 25 Ton Units



Static Pressure Drop — Accessory Economizer
15 to 25 Ton Units



Outside Air Damper Leakage
15 to 25 Ton Units



General Fan Performance Notes

1. Interpolation is permissible. Do not extrapolate.
2. External static pressure is the static pressure difference between the return duct and the supply duct plus the static pressure caused by any FIOPs or accessories.
3. Tabular data accounts for pressure loss due to clean filters, unit casing, and wet coils.
4. Factory options and accessories may effect static pressure losses. Selection software is available, through your salesperson, to help you select the best motor/drive combination for your application.
5. The fan performance tables offer motor/drive recommendations. In cases when 2 motor/drive combinations would work, the lower horsepower option is recommended.
6. For information on the electrical properties of the fan motors, please see the Electrical information section of this book.
7. For more information on the performance limits of the fan motors, see the application data section of this book.
8. The EPACT (Energy Policy Act of 1992) regulates energy requirements for specific types of indoor fan motors. Motors regulated by EPACT include any general purpose, T-frame (3-digit, 143 and larger), single-speed, foot mounted, polyphase, squirrel cage induction motors of NEMA (National Electrical Manufacturers Association) design A and B, manufactured for use in the United States. Ranging from 1 to 200 Hp, these continuous-duty motors operate on 230 and 460 volt, 60 Hz power. If a motor does not fit into these specifications, the motor does not have to be replaced by an EPACT compliant energy-efficient motor. Variable-speed motors are exempt from EPACT compliance requirements.

LEGEND

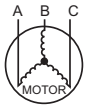
BRKR	—	Circuit Breaker
C.O.	—	Convenience Outlet
FLA	—	Full Load Amps
IFM	—	Indoor Fan Motor
LRA	—	Locked Rotor Amps
MCA	—	Minimum Circuit Amps
P.E.	—	Power Exhaust
PWRD C.O.	—	Powered Convenience Outlet
RLA	—	Rated Load Amps
SCCR	—	Short Circuit Current Rating
UNPWR C.O.	—	Unpowered Convenience Outlet

NOTES:

1. In compliance with NEC requirements for multi-motor and combination load equipment (refer to NEC Articles 430 and 440), the overcurrent protective device for the unit shall be fuse or HACR breaker. Canadian units may be fuse or circuit breaker.
2. For 208/230 v units, where one value is show it is the same for either 208 or 230 volts.
3. **Unbalanced 3-Phase Supply Voltage**: Never operate a motor where a phase imbalance in supply voltage is greater than 2%. Use the following formula to determine the percentage of voltage imbalance.

$$\text{\% Voltage Imbalance} = 100 \times \frac{\text{max voltage deviation from average voltage}}{\text{average voltage}}$$

Example: Supply voltage is 230-3-60



AB = 224-v
BC = 231-v
AC = 226-v

$$\text{Average Voltage} = \frac{(224 + 231 + 226)}{3} = \frac{681}{3} = 227$$

Determine maximum deviation from average voltage.
(AB) 227-224 = 3-v
(BC) 231-227 = 4-v
(AC) 227-226 = 1-v
Maximum deviation is 4-v.
Determine percent of voltage imbalance.

$$\text{\% Voltage Imbalance} = 100x \frac{4}{227} = 1.76\%$$

This amount of phase imbalance is satisfactory as it is below the maximum allowable 2%.

IMPORTANT: If the supply voltage phase imbalance is more than 2%, contact your local electric utility company immediately.

Sequence of operation

General

The sequence below describes the sequence of operation for an electromechanical unit with and without a factory-installed EconomizerONE (POL224 controller). For information regarding a direct digital controller, see the start-up, operations, and troubleshooting manual for the applicable controller.

Electromechanical units without economizer

Cooling

When the thermostat calls for cooling, terminals G and Y1 are energized. The indoor fan will run at the low fan speed and the C1 compressor contactor (CC) is energized causing the compressor and outdoor fan to run. The low indoor fan speed is 60% or 66% of the user set fan speed depending on unit size.

If additional cooling is needed, the thermostat will add the call for Y2. This will increase the indoor fan speed to the user set fan speed and energize the C2 contactor and second compressor for full compressor capacity. The outdoor fan is the same speed for Y1 and Y2.

When the thermostat removes the call for Y2 but leaves the Y1, the indoor fan will slow to the reduced percentage of the user set fan speed, the C2 contactor will de-energize, the second compressor will turn off, and the outdoor fan will remain on. When the thermostat removes the call for Y1 the compressor contactor will de-energize shutting down the compressor and the outdoor fan. When the thermostat removes the call for G, the indoor fan will turn off after the specific unit fan off delay.

NOTE: Per ASHRAE 90.1-2019 and IECC-2018 standards, during the first stage cooling operation the Unit Control Board (UCB) will adjust the fan motor speed to provide 60% or 66% of the total cfm established for the unit.

Defrost

When the temperature of the outdoor coil drops below 28°F (–2°C) as sensed by the defrost thermostat (DFT2) and the defrost timer is at the end of a timed period (adjustable at 30, 60, 90 or 120 minutes), the reversing valve solenoid (RVS) is energized and the OFC is de-energized. This switches the position of the reversing valve and shuts off the outdoor fan. The electric heaters (if installed) will be energized.

Heating, unit with economizer

Upon a request for heating from the space thermostat terminal, W1 will be energized with 24V. The indoor fan will run at high speed, and outdoor fan contactor (OFC), C1 and C2 will be energized in heating. The indoor fan, outdoor fans, and both stages of the compressor are energized. The reversing valve is de-energized and switch positions. The economizer is set to minimum position (ventilation position). If the space temperature continues to fall with W1 energized, W2 will bring on all electric heat (HC).

As the space temperature rises the W2 will de-energize and the compressors will continue to operate, until the thermostat set point is achieved de-energizing W1. If the thermostat is set to Auto, the indoor fan will de-energize and the economizer will close. If the indoor fan is set to On, the indoor fan will continue to operate and the economizer will remain at minimum position (vent position).

On units equipped for 2 stages of heat, when additional heat is needed, heater contactor no. 2 is energized through W2. The economizer damper moves to the minimum position. When the thermostat is satisfied, the damper moves to the fully closed position.

Heating, unit without economizer

Upon a request for heating from the space thermostat, terminal W1 will be energized with 24V. The IFC, outdoor fan contactor (OFC), C1, and C2 will be energized. The indoor fan, outdoor fans, and compressor no. 1, and compressor no. 2 are energized and reversing valves are de-energized and switch position.

If the space temperature continues to fall while W1 is energized, W2 will be energized with 24V, and the heater contactor(s) (HC) will be energized, which will energize the electric heater(s).

When the space thermostat is satisfied, W2 will be de-energized first, and the electric heater(s) will be de-energized. Upon a further rise in space temperature, W1 will be de-energized.

IMPORTANT: The thermostat must be configured for Electric Heat so it will energize G with the W1 call.

Electromechanical units with factory-installed EconomizerONE

When free cooling is not available, the compressors will be controlled by the zone thermostat. When free cooling is available, the outdoor-air damper is modulated by the EconomizerONE control to provide a 50°F (10°C) to 55°F (13°C) mixed-air temperature into the zone. As the mixed air temperature fluctuates above 55°F (13°C) or below 50°F (10°C) dampers will be modulated (open or close) to bring the mixed-air temperature back within control. If mechanical cooling is utilized with free cooling, the outdoor-air damper will maintain its current position at the time the compressor is started. If the increase in cooling capacity causes the mixed-air temperature to drop below 45°F (7°C), then the outdoor-air damper position will be decreased to the minimum position. If the mixed-air temperature continues to fall, the outdoor-air damper will close. Control returns to normal once the mixed-air temperature rises above 48°F (9°C). The power exhaust fans will be energized and de-energized, if installed, as the outdoor-air damper opens and closes.

If field-installed accessory CO_2 sensors are connected to the EconomizerONE control, a demand controlled ventilation strategy will begin to operate. As the CO_2 level in the zone increases above the CO_2 set-point (on the EconomizerONE controller), the minimum position of the damper will be increased proportionally until the Maximum Ventilation setting is reached. As the CO_2 level decreases because of the increase in fresh air, the outdoor-air damper will follow the higher demand condition from either the DCV mode or from the free cooling mode. For EconomizerONE operation, there must be a thermostat call for the fan (G). If the unit is occupied and the fan is on, the damper will operate at minimum position. Otherwise, the damper will be closed.

When the EconomizerONE control is in the occupied mode and a call for cooling exists (Y1 on the thermostat), the control will first check for indoor fan operation. If the fan is not on, then cooling will not be activated. If the fan is

on, then the control will open the EconomizerONE damper to the minimum position.

On the initial power to the EconomizerONE control, it will take the damper up to 2-1/2 minutes before it begins to position itself. After the initial power-up, further changes in damper position can take up to 90 seconds to initiate. Damper movement from full closed to full open (or vice versa) will take between 1-1/2 and 2-1/2 minutes. If free cooling can be used as determined from the appropriate changeover command (dry bulb, outdoor enthalpy, differential dry bulb, or differential enthalpy), then the control will modulate the dampers open and closed to maintain the mixed-air temperature set-point at 50°F (10°C) to 55°F (13°C). If there is a further demand for cooling (cooling second stage — Y2 is energized), then the control will bring on compressor stage 1 to maintain the mixed-air temperature setpoint. The EconomizerONE damper will be open at maximum position.

NOTE: On 2-speed units, the EconomizerONE controller will adjust the damper position as the Indoor Fan Speed changes, per its configured values.

Heating

The sequence of operation for the heating is the same as an electromechanical unit without economizer. The only difference is how the economizer acts. The economizer will stay at the Economizer Minimum Position while the evaporator fan is operating. The outdoor-air damper is closed when the indoor fan is not operating. Refer to Service and Maintenance manual for further details.

SystemVu™ controller (factory option)

For details on operating 50FCQ units equipped with the factory-installed SystemVu controller option, refer to FCQ/GCQ Series Single Package Rooftop Units with SystemVu Controller Controls, Start-Up, Operation and Troubleshooting manual.

Application data

Minimum operating ambient temperature (cooling)

In mechanical cooling mode, your Carrier rooftop unit can safely operate down to an outdoor ambient temperature of 40°F (4°C). It is possible to provide cooling at lower outdoor ambient temperatures by using less outside air, economizers, and/or accessory low ambient kits.

Maximum operating ambient temperature (cooling)

The maximum operating ambient temperature for cooling mode is 125°F (52°C). While cooling operation above 125°F (52°C) may be possible, it could cause either a reduction in performance, reliability, or a protective action by the unit's internal safety devices.

Multiple motor and drive packages

Some applications need larger horsepower motors, some need more airflow, and some need both. Regardless of the case, your Carrier expert has a factory installed combination to meet your application. A wide selection of motors are available, factory installed, to handle nearly any application.

Minimum and maximum airflow (heating and cooling)

To maintain safe and reliable operation of your rooftop, operate within the heating airflow limits during heating mode and cooling airflow limits during cooling mode. Operating above the maximum may cause blow-off, undesired airflow noise, or airflow related problems with the rooftop unit. Operating below the minimum may cause problems with coil freeze-up and unsafe heating operation. Heating and cooling limitations differ when evaluating operating CFM, minimum value is the HIGHER of the cooling and heating minimum CFM values published on page 6 and the maximum value is the LOWER of the cooling and heating minimum values published on page 6.

Heating-to-cooling changeover

Your unit will automatically change from heating to cooling mode when using a thermostat with an auto-changeover feature.

Airflow

All units are draw-though in cooling mode and blow-through in heating mode.

Outdoor air application strategies

Economizers reduce operating expenses and compressor run time by providing a free source of cooling and a means of ventilation to match application changing needs. In fact, they should be considered for most applications. Also, consider the various economizer control methods and their benefits, as well as sensors required to accomplish your application goals. Please contact your local Carrier representative for assistance.

Motor limits, brake horsepower (bhp)

Due to internal design of Carrier units, the air path, and specially designed motors, the full horsepower (maximum continuous bhp) band, as listed in the Fan Performance tables, can be used with the utmost confidence. There is no need for extra safety factors, as Carrier motors are designed and rigorously tested to use the entire, listed bhp range without either nuisance tripping or premature motor failure.

Sizing a rooftop

Bigger is not necessarily better. While an air conditioner needs to have enough capacity to meet the design loads, it does not need excess capacity. In fact, excess capacity typically results in very poor part load performance and humidity control.

Using higher design temperatures than ASHRAE recommends for your location, adding "safety factors" to the calculated load, are all signs of oversizing air conditioners. Oversizing the air conditioner leads to poor humidity control, reduced efficiency, higher utility bills, larger indoor temperature swings, excessive noise, and increased wear and tear on the air conditioner.

Rather than oversizing an air conditioner, engineers should "right-size" or even slightly "under-size" air conditioners. Correctly sizing an air conditioner controls humidity better; promotes efficiency; reduces utility bills; extends equipment life, and maintains even, comfortable temperatures. Please contact your local Carrier representative for assistance.

Low ambient applications

The optional Carrier economizer can adequately cool your space by bringing in fresh, cool outside air. In fact, when so equipped, accessory low-ambient kit may not be necessary. In low ambient conditions, unless the outdoor air is excessively humid or contaminated, economizer-based "free cooling" is the preferred less costly and energy conscious method. In low ambient applications where outside air might not be desired (such as contaminated or excessively humid outdoor environments), your Carrier rooftop can operate to ambient temperatures down to –0°F (–18°C) using the recommended accessory low ambient controller.

Guide specifications

Note about this specification:

This specification is in the "Masterformat" as published by the Construction Specification Institute. Please feel free to copy this specification directly into your building spec.

Cooling Only/Electric Heat Packaged Rooftop Heat Pump

HVAC Guide Specifications

Size Range: **15 to 25 Nominal Tons**

Carrier Model Number: **50FCQ*17-28**

Part 1 — (23 06 80) Schedules for Decentralized HVAC Equipment

1.01 (23 06 80.13) Decentralized Unitary HVAC Equipment Schedule:

A. (23 06 80.13.A.) Rooftop Unit (RTU) Schedule:

1. Schedule is per the project specification requirements.

Part 2 — (23 07 16) HVAC Equipment Insulation

2.01 (23 07 16.13) Decentralized, Rooftop Units:

A. (23 07 16.13.A.) Evaporator Fan Compartment:

1. Interior cabinet surfaces shall be insulated with a minimum 1/2 in. thick, minimum 1-1/2 lb density, flexible fiberglass insulation bonded with a phenolic binder, neoprene coated on the air side.
2. Insulation and adhesive shall meet NFPA 90A requirements for flame spread and smoke generation.

B. (23 07 16.13.B.) Electric Heat Compartment:

1. Aluminum foil-faced fiberglass insulation shall be used.
2. Insulation and adhesive shall meet NFPA 90A requirements for flame spread and smoke generation.

Part 3 — (23 09 13) Instrumentation and Control Devices for HVAC

3.01 (23 09 13.23) Sensors and Transmitters:

A. (23 09 13.23.A.) Thermostats:

Thermostat must:

a. energize both "W" and "G" when calling for heat.

b. have capability to energize 1 or 2 different stages of cooling, and 2 different stages of heating.

c. include capability for occupancy scheduling.

Part 4 — (23 09 23) Direct Digital Control system for HVAC

4.01 (23 09 23.13) Decentralized, Rooftop Units:

A. (23 09 23.13.A.) SystemVu™ intelligent integrated Direct Digital Control (DDC) shall provide:

1. Integrated unit operation for comfort cooling, heating ventilation as well as all monitoring, recording and reporting capabilities. Controller shall also provide diagnostics and alarms of abnormal unit operation through the controller. Controller shall have an intuitive user display and be able to be used in a standalone operation or via building automation system (BAS).
2. Quick Unit Status LEDs of: RUN — meaning all systems are go, ALERT — that indicates there is currently a non-critical issue with the unit, like filters need to be replaced and FAULT — that indicates the unit has a critical issue and will possibly shut down.
3. Six large navigation keys for easy access. Navigation keys shall consist of: TEST, BACK, ENTER, and MENU along with UP and DOWN arrows.
4. Full back lit user display with 4 line by 30 character text capabilities. Display menu shall be designed to provide guided major menus and sub menus main menus provided below:
   a. Shutdown Unit
   b. Run Status
   c. Settings
   d. Alerts/Faults
   e. Service
   f. Inputs
   g. Outputs
   h. USB
5. The capability for standalone operation with conventional thermostat/sensor or use with building automation systems (BAS) of Carrier i-Vu®, BACnet[1] MS/TP and Carrier Comfort Network® (CCN) systems. No special modules or boards are required for these capabilities. Has the capability to work with Equipment Touch™ and System Touch™ devices and ZS Sensors.
6. The ability to read refrigerant pressures at display or via BAS network of; Discharge Pressure and Suction Pressure. The need for traditional refrigerant gauges is not required.
7. USB Data Port for flash drive interaction. This will allow the transfer of data for uploads, downloads, perform software upgrades, back-up and restore data and file transfer data such as component number of starts and run hours.
8. Reverse Rotation Protection of compressors if field 3-phase wiring is misapplied.

1. Third-party trademarks and logos are the property of their respective owners.

9. Provide Service Capabilities of:
   a. Auto run test
   b. Manual run test
   c. Component run hours and starts
   d. Commissioning reports
   e. Data logging
   f. Alarm history
10. Economizer control and diagnostics. Set up economizer operation, receive feedback from actuator. Also meets the most recent California Title 24, ASHRAE 90.1 and IECC®[1] Fault Detection and Diagnostic (FDD) requirements.
11. Unit cooling operation down to 40°F (4°C).
12. Controller shall have easy access connections around the controller perimeter area and consist of Mate-N-Lok®[1], terminal block and RJ style modular jack connections.
13. 365 day real time clock, 20 holiday schedules along with occupied and unoccupied scheduling.
14. Auto-Recognition for easy installation and commissioning of devices like economizers, space sensors, etc.
15. A 5°F (2.8°C) temperature difference between cooling and heating set points to meet the latest ASHRAE 90.1 Energy Standard.
16. Contains return air sensor, supply air sensor and outdoor air sensor to help monitor and provide data for the unit comfort operation, diagnostic and alarms.
17. Use of Carrier's field accessory hand-held Navigator™ display, Equipment Touch and System Touch devices.
18. Supply Air Tempering control operates the electric heat to maintain a minimum supply air temperature during conditions where very cold outdoor air causes the supply air temperature to fall below the configured Supply Air Tempering Setpoint. This occurs during periods where DCV is active and increasing the amount of outdoor air or in cases where the system is operating at very low airflow and the calculated economizer position has increased to maintain a constant ventilation rate.
19. Demand limiting in units with SystemVu™ controller is achieved through set point expansion. The systems heating and cooling set points are expanded in steps or levels. The degree to which the set points may be expanded is defined by the 6 demand level offsets and the 2 commanded demand limit levels.
20. 3-year limited part warranty.

1. Third-party trademarks and logos are the property of their respective owners.

Part 5 — (23 09 33) Electric and Electronic Control System for HVAC

5.01 (23 09 33.13) Decentralized, Rooftop Units:

A. (23 09 33.13.A.) General:
   1. Shall be complete with self-contained low-voltage control circuit protected by a resettable circuit breaker on the 24-v transformer side. Transformer shall have 75 VA capability.
   2. Shall utilize color-coded wiring.
   3. Shall include a Unit Control Board to conveniently and safely provide connection points for vital control functions such as: smoke detectors, phase monitor, economizer, thermostat, DDC control options, and low and high pressure switches. Controller shall also provide an intuitive means to adjust the indoor fan speed through a simple switch and pot adjustment design.
   4. Unit shall include a minimum of one 8-pin screw terminal connection board for connection of control wiring.
   5. Shall include integrated defrost system to prevent excessive frost accumulation during heating duty, and shall be controlled as follows:
      a. Defrost shall be initiated on the basis of time and coil temperature.
      b. A 30, 60, 90, 120 minute timer shall activate the defrost cycle only if the coil temperature is low enough to indicate a heavy frost condition.
      c. Defrost cycle shall terminate when defrost thermostat is satisfied and shall have a positive termination time of 10 minutes.
   6. Defrost system shall also include:
      a. Defrost Cycle Indicator LED.
      b. DIP switch selectable defrost time between 30, 60, 90 and 120 minutes. Factory set at 30 minutes.
      c. Molded plug connection to ensure proper connection.

B. (23 09 33.13.B.) Safeties:
   1. Compressor over-temperature, over-current. High internal pressure differential.
   2. Low Pressure Switch.
      a. Low pressure switch shall use different color wire than the high pressure switch. The purpose is to assist the installer and service technician to correctly wire and or troubleshoot the rooftop unit.
   3. High Pressure Switch.
      a. High pressure switch shall use different color wire than the low pressure switch. The purpose is to assist the installer and service technician to correctly wire and or troubleshoot the rooftop unit.
   4. Automatic reset, motor thermal overload protector.

Part 6 — (23 09 93) Sequence of Operation for HVAC Controls

6.01 (23 09 93.13) Decentralized, Rooftop Units:

A. (23 09 93.13.A.) INSERT SEQUENCE OF OPERATION

Part 7 — (23 40 13) Panel Air Filters

7.01 (23 40 13.13) Decentralized, Rooftop Units:

A. (23 40 13.13.A.) Standard Filter Section:

1. Shall consist of factory installed, low velocity, disposable 2 in. thick fiberglass filters of commercially available sizes.
2. Filters shall be accessible through a dedicated, weather tight access pane.
3. Four-inch filter capabilities shall be capable with pre-engineered and approved Carrier filter track field installed accessory. This kit requires field furnished filters.

Part 8 — (23 81 19) Self-Contained Air Conditioners

8.01 (23 81 19.13) Small-Capacity Self-Contained Air Conditioners:

A. (23 81 19.13.A.) General:

1. Outdoor, rooftop mounted, electrically controlled, heating and cooling unit utilizing fully hermetic scroll compressors for cooling duty and optional electric heat for heating duty.
2. Factory assembled, single-piece heating and cooling rooftop unit. Contained within the unit enclosure shall be all factory wiring, piping, controls, and special features required prior to field start-up.
3. Unit shall use Puron® (R-410A) refrigerant.
4. Unit shall be installed in accordance with the manufacturer's instructions.
5. Unit must be selected and installed in compliance with local, state, and federal codes.

B. (23 81 19.13.B.) Quality Assurance:

1. Unit meets ASHRAE 90.1 minimum efficiency requirements.
2. Unit shall be rated in accordance with AHRI Standards 340/360.
3. Unit shall be designed to conform to ASHRAE 15.
4. Unit shall be UL-tested and certified in accordance with ANSI Z21.47 Standards and UL-listed and certified under Canadian standards as a total package for safety requirements.
5. Insulation and adhesive shall meet NFPA 90A requirements for flame spread and smoke generation.
6. Unit casing shall be capable of withstanding 500 hour salt spray exposure per ASTM B117 (scribed specimen).
7. Unit shall be designed in accordance with ISO 9001, and shall be manufactured in a facility registered by ISO 9001:2015.
8. Roof curb shall be designed to conform to NRCA Standards.
9. Unit shall be subjected to a completely automated run test on the assembly line. The data for each unit will be stored at the factory, and must be available upon request.
10. Unit shall be designed in accordance with UL Standard 60335-2-40, including tested to withstand rain.
11. Unit shall be constructed to prevent intrusion of snow and tested to prevent snow intrusion into the control box up to 40 mph.
12. Unit shake tested to assurance level 1, ASTM D4169 to ensure shipping reliability.

C. (23 81 19.13.C.) Delivery, Storage, and Handling:

1. Unit shall be stored and handled per manufacturer's recommendations.
2. Lifted by crane requires either shipping top panel or spreader bars.
3. Unit shall only be stored or positioned in the upright position.

D. (23 81 19.13.D.) Project Conditions:

1. As specified in the contract.

E. (23 81 19.13.E.) Operating Characteristics:

1. Unit shall be capable of starting and running at 125°F (52°C) ambient outdoor temperature meeting maximum load criteria of AHRI Standard 340/360 at ±10% voltage.
2. Compressor with standard controls shall be capable of operation down to 40°F (4°C) ambient outdoor temperatures. Accessory winter start kit is necessary if mechanically cooling at ambient temperatures down to 25°F (–4°C) or 0°F (–18°C).
3. Unit shall discharge supply air vertically or horizontally as shown on contract drawings.
4. Unit shall be factory configured for vertical supply and return configurations or horizontal supply and return configurations. Dedicated models provided with no special air conversion kits required.

F. (23 81 19.13.F.) Electrical Requirements:

1. Main power supply voltage, phase, and frequency must match those required by the manufacturer.

G. (23 81 19.13.G.) Unit Cabinet:

1. Unit cabinet shall be constructed of galvanized steel, and shall be bonderized and coated with a prepainted baked enamel finish on all externally exposed surfaces.
2. Unit cabinet exterior paint shall be: film thickness, (dry) 0.003 in. minimum, gloss (per ASTM D523, 60°F/16°C): 60, Hardness: H-2H Pencil hardness.
3. Evaporator fan compartment interior cabinet insulation shall conform to AHRI Standards 340/360 minimum exterior sweat criteria.

Interior surfaces shall be insulated with a minimum 1/2 in. thick, 1 lb density, flexible fiberglass insulation, neoprene coated on the air side. Aluminum foil-faced fiberglass insulation shall be used in the heat compartment.

4. Base of unit shall have a minimum of 4 locations for thru-the-base gas and electrical connections (factory-installed or field-installed), standard.
5. Base Rail:
   a. Unit shall have base rails on a minimum of 2 sides.
   b. Holes shall be provided in the base rails for rigging shackles to facilitate maneuvering and overhead rigging.
   c. Holes shall be provided in the base rail for moving the rooftop by fork truck.
   d. Base rail shall be a minimum of 16 gauge thickness.
6. Condensate Pan and Connections:
   a. Shall be a sloped condensate drain pan made of a corrosion resistant material.
   b. Shall comply with ASHRAE Standard 62.
   c. Shall use a 3/4 in. 14 NPT drain connection, possible either through the bottom or side of the drain pan. Connection shall be made per manufacturer's recommendations.
7. Top Panel:
   a. Shall be a multi-top panel with watertight flanges and locking systems.
8. Electrical Connections:
   a. All unit power wiring shall enter unit cabinet at a single, factory prepared, knockout location.
   b. Thru-the-Base Capability.
      1) Thru-the-base provisions/connections are available as standard with every unit. When bottom connections are required, field furnished couplings are required.
      2) No basepan penetration, other than those authorized by the manufacturer, is permitted.
9. Component Access Panels (standard):
   a. Cabinet panels shall be easily removable for servicing.
   b. Unit shall have large removable, filter access panel.
   c. Panels covering control box, indoor fan, indoor fan motor, gas components (where applicable), and compressors shall have molded composite handles.
   d. Handles shall be UV modified, composite. They shall be permanently attached, and recessed into the panel.
   e. Screws on the vertical portion of all removable access panel shall engage into heat resistant, molded composite collars.
   f. Collars shall be removable and easily replaceable using manufacturer recommended parts.

H. (23 81 19.13.H.) Coils:
   1. Standard Aluminum Fin-Copper Tube Coils:
      a. Standard evaporator and condenser coils shall have aluminum lanced plate fins mechanically bonded to seamless internally grooved copper tubes with all joints brazed.
      b. Evaporator coils shall be leak tested to 150 psig, pressure tested to 450 psig, and qualified to UL 1995 burst test at 1775 psig.
      c. Condenser coils shall be leak tested to 150 psig, pressure tested to 650 psig, and qualified to UL 1995 burst test at 1980 psig.
   2. Optional Pre-Coated Aluminum-Fin Condenser Coils:
      a. Shall have a durable epoxy-phenolic coating to provide protection in mildly corrosive coastal environments.
      b. Coating shall be applied to the aluminum fin stock prior to the fin stamping process to create an inert barrier between the aluminum fin and copper tube.
      c. Epoxy-phenolic barrier shall minimize galvanic action between dissimilar metals.
      d. Corrosion durability of fin stock shall be confirmed through testing to be no less than 1000 hours salt spray per ASTM B117-90.
      e. Corrosion durability of fin stock shall be confirmed through testing to have no visible corrosion after 48 hour immersion in a room temperature solution of 5% salt, 1% acetic acid.
      f. Fin stock coating shall pass 2000 hours of the following: one week exposure in the prohesion chamber followed by one week of accelerated ultraviolet light testing. Prohesion chamber: the solution shall contain 3.5% sodium chloride and 0.35% ammonium sulfate. The exposure cycle is one hour of salt fog application at ambient followed by one hour drying at 95°F (35°C).
   3. Optional Copper-Fin Evaporator and Condenser Coils:
      a. Shall be constructed of copper fins mechanically bonded to copper tubes and copper tube sheets.
      b. Galvanized steel tube sheets shall not be acceptable.
      c. A polymer strip shall prevent coil assembly from contacting the sheet metal coil pan to minimize potential for galvanic corrosion between coil and pan.

4. Optional E-Coated Aluminum-Fin Evaporator and Condenser Coils:
   a. Shall have a flexible epoxy polymer coating uniformly applied to all coil surface areas without material bridging between fins.
   b. Coating process shall ensure complete coil encapsulation of tubes, fins and headers.
   c. Color shall be high gloss black with gloss per ASTM D523-89.
   d. Uniform dry film thickness from 0.8 to 1.2 mil on all surface areas including fin edges.
   e. Superior hardness characteristics of 2H per ASTM D3363-92A and cross-hatch adhesion of 4B-5B per ASTM D3359-93.
   f. Impact resistance shall be up to 160 in.-lb (ASTM D2794-93).
   g. Humidity and water immersion resistance shall be up to minimum 1000 and 250 hours respectively (ASTM D2247-92 and ASTM D870-92).
   h. Corrosion durability shall be confirmed through testing to be no less than 1000 hours salt spray per ASTM B117-90.

I. (23 81 19.13.I.) Refrigerant Components:
   1. Refrigerant circuit shall include the following control, safety, and maintenance features:
      a. Thermostatic Expansion Valve (TXV) shall help provide optimum performance across the entire operating range. Shall contain removable power element to allow change out of power element and bulb without removing the valve body.
      b. Refrigerant filter drier — Solid core design.
      c. Service gauge connections on suction and discharge lines.
      d. Suction line accumulator to provide protection in all operating modes from cooling, heating and reverse cycle switching.
   2. Compressors:
      a. Unit shall use 2 tandem scroll compressors on single independent refrigeration circuit.
      b. Units shall have single circuit and 2 stage cooling with 2 compressors.
      c. Evaporator coils shall be a full active design to help better control comfort latent removal.
      d. Compressor motors shall be cooled by refrigerant gas passing through motor windings.
      e. Compressors shall be internally protected from high discharge temperature conditions.
      f. Compressors shall be protected from an over-temperature and over-amperage conditions by an internal, motor overload device.
      g. Compressor shall be factory mounted on rubber grommets.
      h. Compressor motors shall have internal line break thermal, current overload and high pressure differential protection.
      i. Crankcase heaters shall not be required for normal operating range, unless required by compressor manufacturer due to refrigerant charge limits.
      j. Compressors shall be a 2 stage cooling capacity design.

J. (23 81 19.13.J.) Return Air Filter Section:
   1. Filters access is specified in the unit cabinet section of this specification.
   2. Filters shall be held in place by a pivoting filter tray, facilitating easy removal and installation.
   3. Shall consist of factory installed, low velocity, throw-away 2 in. thick fiberglass filters.
   4. Filters shall be standard, commercially available sizes.
   5. Only one size filter per unit is allowed.

K. (23 81 19.13.K.) Evaporator Fan and Motor with EcoBlue™ Technology:
   1. Direct Drive Evaporator Fan Motor:
      a. Shall be a ECM motor design.
      b. Shall have permanently lubricated bearings.
      c. Shall have inherent automatic-reset thermal overload protection.
      d. Shall have slow ramp up to speed capabilities.
      e. Shall require no fan/motor belts for operation, adjustments and or initial fan speed set up.
      f. Fan DC voltage set up on Unit Control Board can eliminate the need of removal of blower access door, required on conventional belt drive systems.
      g. Shall be internally protected from electrical phase reversal and loss.
   2. Evaporator Fan:
      a. Shall be easily set with dedicated selection switch and adjustment pot on unit control board or through SystemVu™ controller.
      b. Shall provide 2 stage cooling capacity control, the indoor fan speed is automatically controlled to meet the code-compliant <66% low fan speed and 100% at full fan speed operation.
      c. Blower fan shall be a Vane Axial fan design with 75% less moving parts than a conventional belt drive system.
      d. Shall be constructed of a cast aluminum stator and high impact composite material on stator, rotor and air inlet casing.
      e. Shall be a patented design with a corrosion resistant material and dynamically balanced.
      f. Shall have slow ramp up to speed capabilities to help reduce sound and comfort issues

typically associated with single speed belt drive systems.

g. Units shall contain 2 separate vane axial fan assemblies.

h. Shall be a slide out design with removal of a few support brackets.

3. Shall include an easily accessible Unit Control Board to conveniently and safely provide connection points for vital control functions such as: smoke detectors, phase monitor, economizer, thermostat, DDC control options, and low, high and mixed air temperature switches. Controller shall also provide an intuitive means to adjust the indoor fan speed through a simple switch and pot adjustment design.

L. (23 81 19.13.L.) Condenser Fans and Motors:

1. Condenser Fan Motors:

a. Shall be a totally enclosed motor.

b. Shall use permanently lubricated bearings.

c. Shall have inherent thermal overload protection with an automatic reset feature.

d. Shall use a shaft-down design on all sizes.

2. Condenser Fans:

a. Shall be a direct-driven propeller type fan.

b. Shall have galvalum blades riveted to steel spider that have corrosion-resistant properties and shall be dynamically balanced.

M. (23 81 19.13.M.) Special Features Options and Accessories:

1. Integrated EconomizerONE and EconoMi$er® 2 Low Leak Rate Models.

a. Integrated, gear driven opposing modulating blade design type capable of simultaneous economizer and compressor operation.

b. Independent modules for vertical or horizontal return configuration shall be available. Vertical return modules shall be available as a factory installed option.

c. Damper blades shall be galvanized steel with composite gears. Plastic or composite blades on intake or return shall not be acceptable.

d. Shall include all hardware and controls to provide free cooling with outdoor air when temperature and/or humidity are below setpoints.

e. Shall be equipped with gear driven dampers for both the outdoor ventilation air and the return air for positive air stream control.

f. Standard leak rate shall be equipped with dampers not to exceed 2% leakage at 1 in. wg pressure differential.

g. Economizer controller on EconomizerONE models shall be Siemens POL224 that provides:

1) Combined minimum and DCV maximum damper position potentiometers with compressor staging relay.

2) Functions with solid-state analog enthalpy or dry bulb changeover control sensing.

3) LED indicators for free cooling, sensor, and damper operation.

4) One-line LCD interface screen for setup, configuration and troubleshooting.

5) Optional configuration via WLAN stick and Siemens Climatix™[1] smartphone app for easy setup.

6) On-board Fault Detection and Diagnostics (FDD) that senses and alerts when the economizer is not operating properly, per California Title 24, ASHRAE 90.1 and IECC.

7) Sensor failure loss of communication identification.

8) Capabilities for use with multiple-speed or single speed indoor fan systems.

9) Utilize digital sensors: Dry bulb and Enthalpy.

h. Economizer controller on EconoMi$er 2 models with SystemVu™ controls shall be a 4 to 20 mA design controlled directly by the controller. SystemVu controller meets California Title 24, ASHRAE 90.1 and IECC Fault Detection and Diagnostic (FDD) requirements.

i. Shall be capable of introducing up to 100% outdoor air.

j. Shall be equipped with a barometric relief damper capable of relieving up to 100% return air and contain seals that meet ASHRAE 90.1 requirements.

k. Shall be designed to close damper(s) during loss-of-power situations with spring return built into motor.

l. Dry bulb outdoor air temperature sensor shall be provided as standard. Enthalpy sensor is also available on factory installed only. Outdoor air sensor setpoint shall be adjustable and shall range from 40°F to 100°F (4°C to 38°C). Additional sensor options shall be available as accessories.

m. The economizer controller shall also provide control of an accessory power exhaust unit function. Factory set at 100%, with a range of 0% to 100%.

1. Third-party trademarks and logos are the property of their respective owners.

n. The economizer shall maintain minimum airflow into the building during occupied period and provide design ventilation rate for full occupancy.

o. Dampers shall be completely closed when the unit is in the unoccupied mode.

p. Economizer controller shall accept a 0 to 10 vdc CO_2 sensor input for IAQ/DCV control. In this mode, dampers shall modulate the outdoor air damper to provide ventilation based on the sensor input.

q. Compressor lockout temperature on POL224 control is adjustable from –45°F to 80°F (–43°C to 27°C), set at a factory default of 32°F (0°C).

r. Actuator shall be direct coupled to economizer gear. No linkage arms or control rods shall be acceptable.

s. Shall contain LED indication for free cooling, sensor, and damper operation.

2. Integrated EconomizerONE and EconoMi$er® 2 Ultra Low Leak Rate Models.

a. Integrated, gear driven opposing modulating blade design type capable of simultaneous economizer and compressor operation.

b. Independent modules for vertical or horizontal return configuration shall be available. Vertical return modules shall be available as a factory-installed option.

c. Damper blades shall be galvanized steel with composite gears. Plastic or composite blades on intake or return shall not be acceptable.

d. Shall include all hardware and controls to provide free cooling with outdoor air when temperature and/or humidity are below setpoints.

e. Shall be equipped with gear driven dampers for both the outdoor ventilation air and the return air for positive air stream control.

f. Ultra Low Leak design meets California Title 24 section 140.4 and ASHRAE 90.1 requirements for 4 cfm per sq ft on the outside air dampers and 10 cfm per sq ft on the return dampers.

g. Economizer controller on EconomizerONE models shall be the Siemens POL224 that provides:

1) One-line LCD interface screen for setup, configuration and troubleshooting.

2) Optional configuration via WLAN stick and Siemens Climatix™ smartphone app for easy setup.

3) On-board Fault Detection and Diagnostics (FDD) that senses and alerts when the economizer is not operating properly, per California Title 24, ASHRAE 90.1 and IECC.

4) Sensor failure loss of communication identification.

5) Capabilities for use with multiple-speed indoor fan systems.

6) Utilize digital sensors: Dry bulb and Enthalpy.

h. Economizer controller on EconoMi$er 2 models with SystemVu™ controls shall be a 4-20mA design controlled directly by the controller. SystemVu controller meets California Title 24, ASHRAE 90.1 and IECC Fault Detection and Diagnostic (FDD) requirements.

i. Shall be capable of introducing up to 100% outdoor air.

j. Shall be equipped with a barometric relief damper capable of relieving up to 100% return air and contain seals that meet ASHRAE 90.1 requirements.

k. Shall be designed to close damper(s) during loss-of-power situations with spring return built into motor.

l. Dry bulb outdoor air temperature sensor shall be provided as standard. Enthalpy sensor is also available on factory installed only. Outdoor air sensor setpoint shall be adjustable and shall range from 40°F to 100°F (4°C to 38°C). Additional sensor options shall be available as accessories.

m. The economizer controller shall also provide control of an accessory power exhaust unit function. Factory set at 100%, with a range of 0% to 100%.

n. The economizer shall maintain minimum airflow into the building during occupied period and provide design ventilation rate for full occupancy.

o. Dampers shall be completely closed when the unit is in the unoccupied mode.

p. Economizer controller shall accept a 0 to 10 vdc CO_2 sensor input for IAQ/DCV control. In this mode, dampers shall modulate the outdoor air damper to provide ventilation based on the sensor input.

q. Compressor lockout temperature on POL224 control is adjustable from –45°F to 80°F (–43°C to 27°C), set at a factory default of 32°F (0°C).

r. Actuator shall be direct coupled to economizer gear. No linkage arms or control rods shall be acceptable.

s. Shall contain LED indication for free cooling, sensor, and damper operation.

3. Wi-Fi/WLAN stick for EconomizerONE POL224 (field-installed):

This item allows use of the Siemens Climatix™ mobile application.

4. Two-Position Damper (field-installed only):
   a. Damper shall be a Two-Position Damper. Damper travel shall be from the full closed position to the field adjustable %-open setpoint.
   b. Damper shall include adjustable damper travel from 25% to 100% (full open).
   c. Damper shall include single or dual blade, gear driven dampers and actuator motor.
   d. Actuator shall be direct coupled to damper gear. No linkage arms or control rods shall be acceptable.
   e. Damper will admit up to 100% outdoor air for applicable rooftop units.
   f. Damper shall close upon indoor (evaporator) fan shutoff and/or loss of power.
   g. The damper actuator shall plug into the rooftop unit's wiring harness plug. No hard wiring shall be required.
   h. Outside air hood shall include aluminum water entrainment filter.
5. Manual Damper (field-installed only):
   a. Manual damper package shall consist of damper, air inlet screen, and rain hood which can be preset to admit up to 25% or 50% outdoor air for year round ventilation.
6. Low Ambient Control Package:
   a. Controller shall control coil head pressure by condenser fan speed modulation or condenser fan cycling and wind baffles.
   b. Shall consist of solid-state control and condenser coil temperature sensor to maintain condensing temperature between 90°F (32°C) and 110°F (43°C) at outdoor ambient temperatures down to 0°F (–18°C).
7. Condenser Coil Hail Guard Assembly:
   a. Shall protect against damage from hail.
   b. Shall be either hood style or louvered.
8. Unit-Mounted, Non-Fused Disconnect Switch:
   a. Switch shall be factory installed, internally mounted.
   b. National Electric Code (NEC) and UL approved non-fused switch shall provide unit power shutoff.
   c. Shall be accessible from outside the unit.
   d. Shall provide local shutdown and lockout capability.
   e. Sized only for the unit as ordered from the factory. Does not accommodate field-installed devices.
9. Convenience Outlet:
   a. Powered Convenience Outlet.
      1) Outlet shall be powered from main line power to the rooftop unit.
      2) Outlet shall be powered from line side or load side of disconnect by installing contractor, as required by code. If outlet is powered from load side of disconnect, unit electrical ratings shall be UL certified and rated for additional outlet amperage.
      3) Outlet shall be factory-installed and internally mounted with easily accessible 115-v female receptacle.
      4) Outlet shall include 15 amp GFI receptacles with independent fuse protection.
      5) Voltage required to operate convenience outlet shall be provided by a factory installed step-down transformer.
      6) Outlet shall be accessible from outside the unit.
      7) Outlet shall include a field installed "Wet in Use" cover.
   b. Factory-Installed Non-Powered Convenience Outlet.
      1) Outlet shall be powered from a separate 115/120-v power source.
      2) A transformer shall not be included.
      3) Outlet shall be factory-installed and internally mounted with easily accessible 115-v female receptacle.
      4) Outlet shall include 15 amp GFI receptacles with independent fuse protection.
      5) Outlet shall be accessible from outside the unit.
      6) Outlet shall include a field installed "Wet in Use" cover.
   c. Field-Installed Non-Powered Convenience Outlet.
      1) Outlet shall be powered from a separate 115/120-v power source.
      2) A transformer shall not be included.
      3) Outlet shall be field-installed and internally mounted with easily accessible 115-v female receptacle.
      4) Outlet shall include 20 amp GFI receptacles. This kit provides a flexible installation method which allows code compliance for height requirements of the GFCI outlet from the finished roof surface as well as the capability to relocate the outlet to a more convenient location.
      5) Outlet shall be accessible from outside the unit.
      6) Outlet shall include a field installed "Wet in Use" cover.
10. Centrifugal Fan Power Exhaust:
    a. Power exhaust shall be used in conjunction with an integrated economizer.

b. Independent modules for vertical or horizontal return configurations shall be available.
c. Horizontal power exhaust shall be mounted in return ductwork.
d. Power exhaust shall be controlled by economizer controller operation. Exhaust fans shall be energized when dampers open past the 0 to 100% adjustable setpoint on the economizer control.

11. Roof Curbs (Vertical):
    a. Full perimeter roof curb with exhaust capability providing separate air streams for energy recovery from the exhaust air without supply air contamination.
    b. Formed galvanized steel with wood nailer strip and shall be capable of supporting entire unit weight.
    c. Permits installation and securing of ductwork to curb prior to mounting unit on the curb.
12. Outdoor Air Enthalpy Sensor:
    a. The outdoor air enthalpy sensor shall be used to provide single enthalpy control. When used in conjunction with a return air enthalpy sensor, the unit will provide differential enthalpy control. The sensor allows the unit to determine if outside air is suitable for free cooling.
13. Return Air Enthalpy Sensor:
    a. The return air enthalpy sensor shall be used in conjunction with an outdoor air enthalpy sensor to provide differential enthalpy control.
14. Indoor Air Quality (CO_2) Sensor:
    a. Shall be able to provide demand ventilation indoor air quality (IAQ) control.
    b. The IAQ sensor shall be available in duct mount, wall mount, or wall mount with LED display. The setpoint shall have adjustment capability.
15. Smoke Detectors:
    a. Shall be a 4-wire controller and detector.
    b. Shall be environmental compensated with differential sensing for reliable, stable, and drift-free sensitivity.
    c. Shall use magnet-activated test/reset sensor switches.
    d. Shall have tool-less connection terminal access.
    e. Shall have a recessed momentary switch for testing and resetting the detector.
    f. Controller shall include:
        1) One set of normally open alarm initiation contacts for connection to an initiating device circuit on a fire alarm control panel.
        2) Two Form-C auxiliary alarm relays for interface with rooftop unit or other equipment.
        3) One Form-C supervision (trouble) relay to control the operation of the Trouble LED on a remote test/reset station.
        4) Capable of direct connection to 2 individual detector modules.
        5) Can be wired to up to 14 other duct smoke detectors for multiple fan shutdown applications.
16. Winter Start Kit:
    a. Shall contain a bypass device around the low pressure switch.
    b. Shall be required when mechanical cooling is required down to 25°F (–4°C).
    c. Shall not be required to operate on an economizer when below an outdoor ambient of 40°F (4°C).
17. Time Guard:
    a. Shall prevent compressor short-cycling by providing a 5 minute delay (±2 minutes) before restarting a compressor after shutdown for any reason.
    b. One device shall be required per compressor.
18. Hinged Access Panels:
    a. Shall provide easy access through integrated quarter turn latches.
    b. Shall be on major panels of: filter, control box, fan motor, and compressor.
19. 4 in. MERV-13 Return Air Filters:
    a. Factory option to upgrade standard unit filters to 4 in. MERV-13 filters. Filter media is securely fasted inside the filter frame on all 4 sides.
20. 4 in. Filter Rack Kit:
    a. The 4 in. filter rack accessory kit is designed to hold 4 in. MERV-8 or MERV-13 filters. Filters not included in kit.
21. 2 in. MERV-13 Return Air Filters:
    a. Accessory kit to field upgrade standard unit filters to 2 in. MERV-13 filters.
22. 2 in. MERV-8 Return Air Filters:
    a. Accessory kit to field upgrade standard unit filters to 2 in. MERV-8 filters.
23. Phase Monitor Control:
    a. Shall monitor the sequence of 3-phase electrical system to provide a phase reversal protection.
    b. Shall monitor the 3-phase voltage inputs to provide a phase loss protection for the 3-phase device.
    c. Will work on either a Delta or Wye power connection.

Guide specifications (cont)

24. Horn/Strobe Annunciator:
    a. Provides an audible/visual signaling device for use with factory-installed option or field installed accessory smoke detectors.
        1) Requires installation of a field-supplied 24-v transformer suitable for 4.2 VA (AC) or 3.0 VA (DC) per horn/strobe accessory.
        2) Requires field-supplied electrical box, North American 1-gang box, 2 in. (51 mm) x 4 in. (102 mm).
        3) Shall have a clear colored lens.
25. Electric Heat:
    a. Heating Section:
        1) Heater element open coil resistance wire, nickel-chrome alloy, 0.29 inches inside diameter, strung through ceramic insulators mounted on metal frame. Coil ends are staked and welded to terminal screw slots.
        2) Heater assemblies are provided with integral fusing for protection of internal heater circuits not exceeding 48 amps each. Auto reset thermo limit controls, magnetic heater contactors (24 v coil) and terminal block all mounted in electric heater control box (minimum 18 ga galvanized steel) attached to end of heater assembly.
26. High Short Circuit Current Rating (SCCR) Protection:
    a. Factory-installed option provides high short circuit current protection to each compressor, plus all indoor and outdoor fan motors of 60 kA for 208/230-3-60 units and 65 kA for 460-3-60 units against high potential fault current situations. (Standard unit comes with 5 kA rating.)
    b. This option is not available with factory installed Non-Fused Disconnect, Low Ambient controls, Phase loss monitor/protection, or 575 Volt models.

Manufacturer reserves the right to discontinue, or change at any time, specifications or designs without notice and without incurring obligations.

INTRODUCTION

This traffic impact analysis (TIA) addresses transportation and circulation conditions associated with a proposed development project (3199 Alvarado Street Warehouse) in the City of San Leandro, California. The proposed project involves the demolition and removal of an existing 252,220± square foot industrial building, and the construction of a new approximately 241,000 square foot industrial building and all associated site and parking improvements.

The TIA focuses on the project's relationship to the City street system, including nearby intersections, the proposed access points, on-site circulation, and parking adequacy. The TIA includes consideration of motorized vehicle traffic impacts on roadway capacity, and potential impacts to transit service, bicyclists, and pedestrians. Quantitative transportation analyses have been conducted for the following scenarios:

- Existing Conditions (2025)
- Existing Plus Approved and Pending Projects
- Existing Plus Approved / Pending Plus Project
- Year 2035 Forecasted Traffic

This report also documents the evaluation of project VMT, in accordance with CEQA guidelines for transportation impacts.

PROJECT DESCRIPTION

As illustrated in **Figure 1**, the proposed project site is located on the west side of Alvarado Street, in the block between Teagarden Street (to the north) and Fremont Avenue (to the south). The lot size is 649,159 square feet (14.9 acres). Existing Zoning is IG (Industrial General), with a General Plan Designation of IL (Industrial Light). Land use to the north and east is industrial. Immediately south of the site is a residential neighborhood. The Nimitz Freeway (I-880) is immediately west of the site.

As illustrated in **Figure 2**, the project consists of an industrial building of approximately 241,000 square feet with a ceiling height of 36 feet. The north side of the building provides 52 truck docks and additional trailer parking stalls. Truck access is provided via the north driveway, which is separated from passenger vehicle access. Parking is provided on the east (front) side of the building, and along the south side. Passenger vehicle access and parking are provided via two driveways to Alvarado Street.

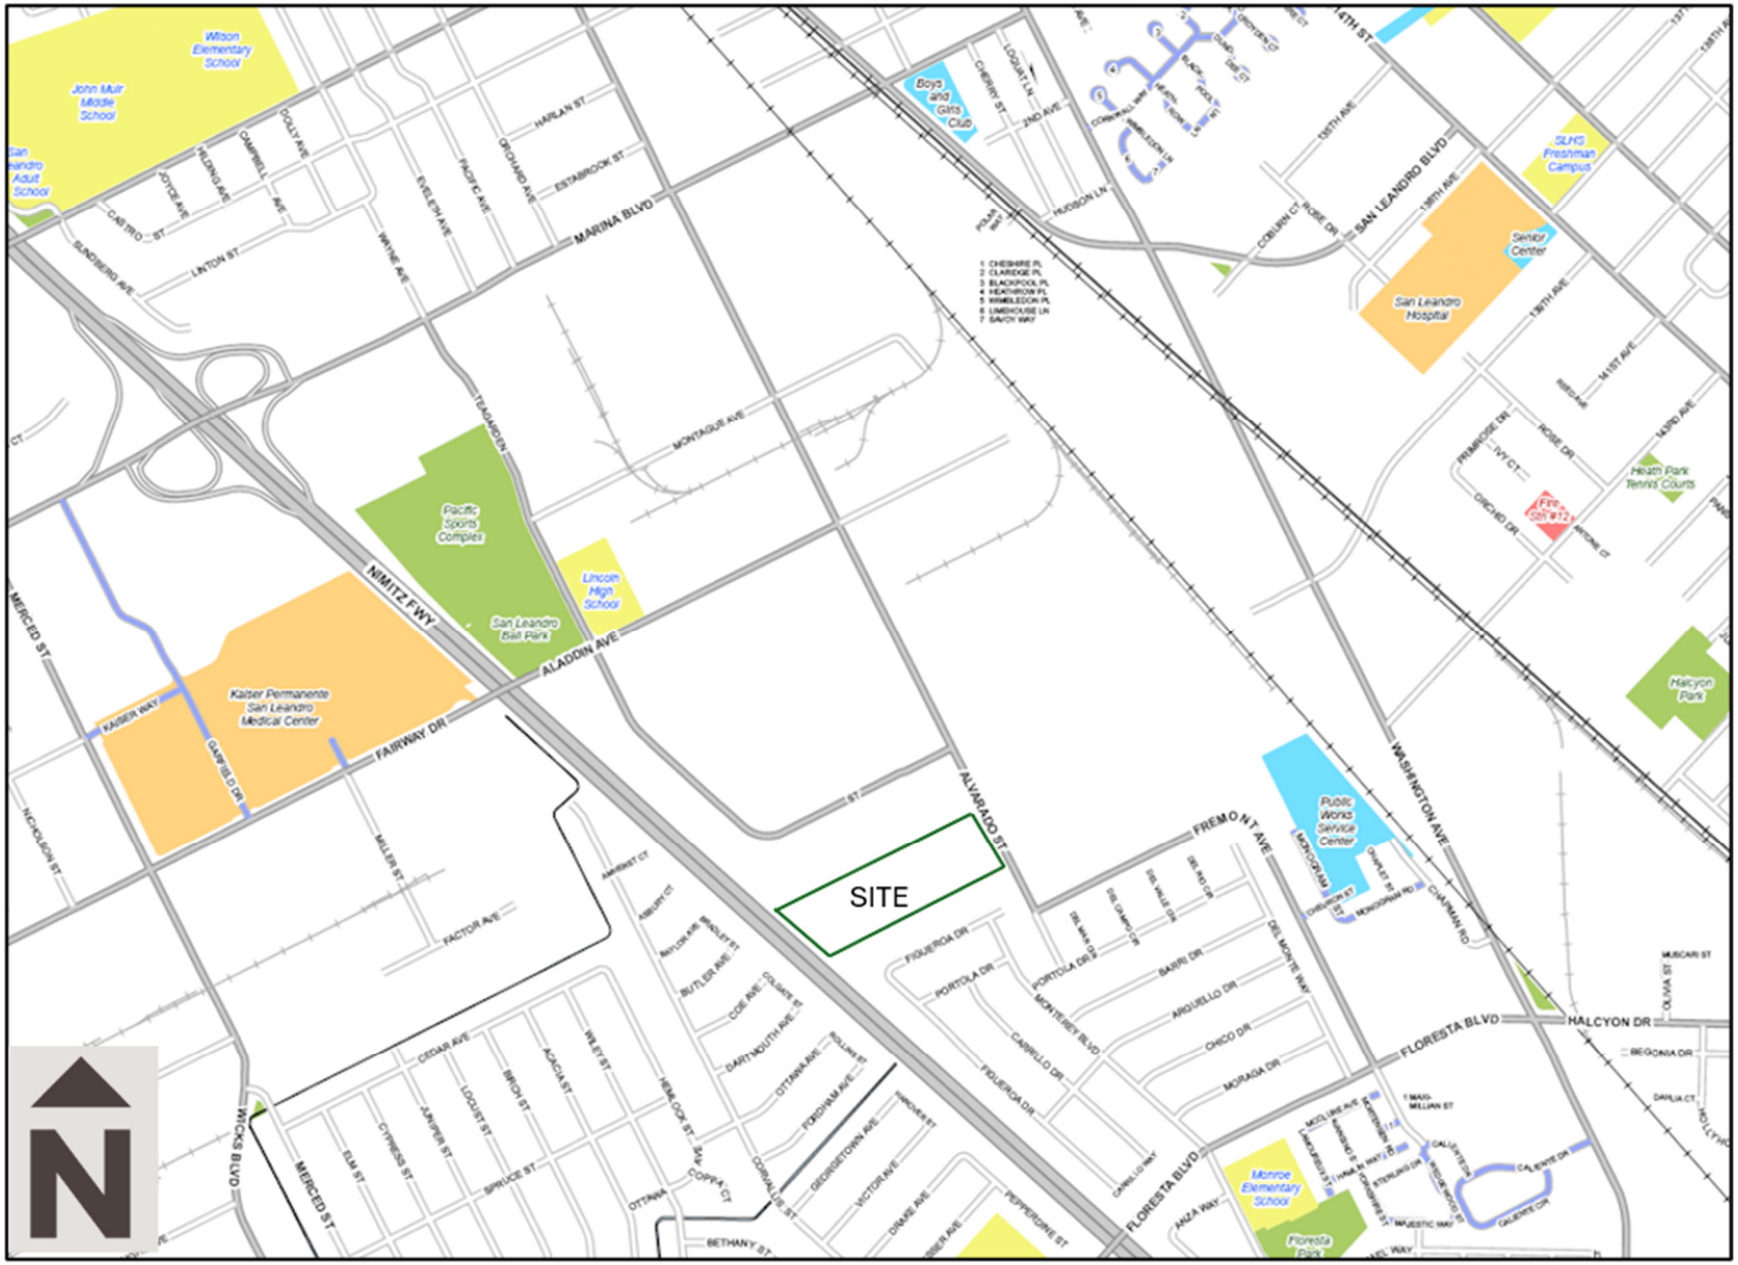

FIGURE 1: SITE LOCATION

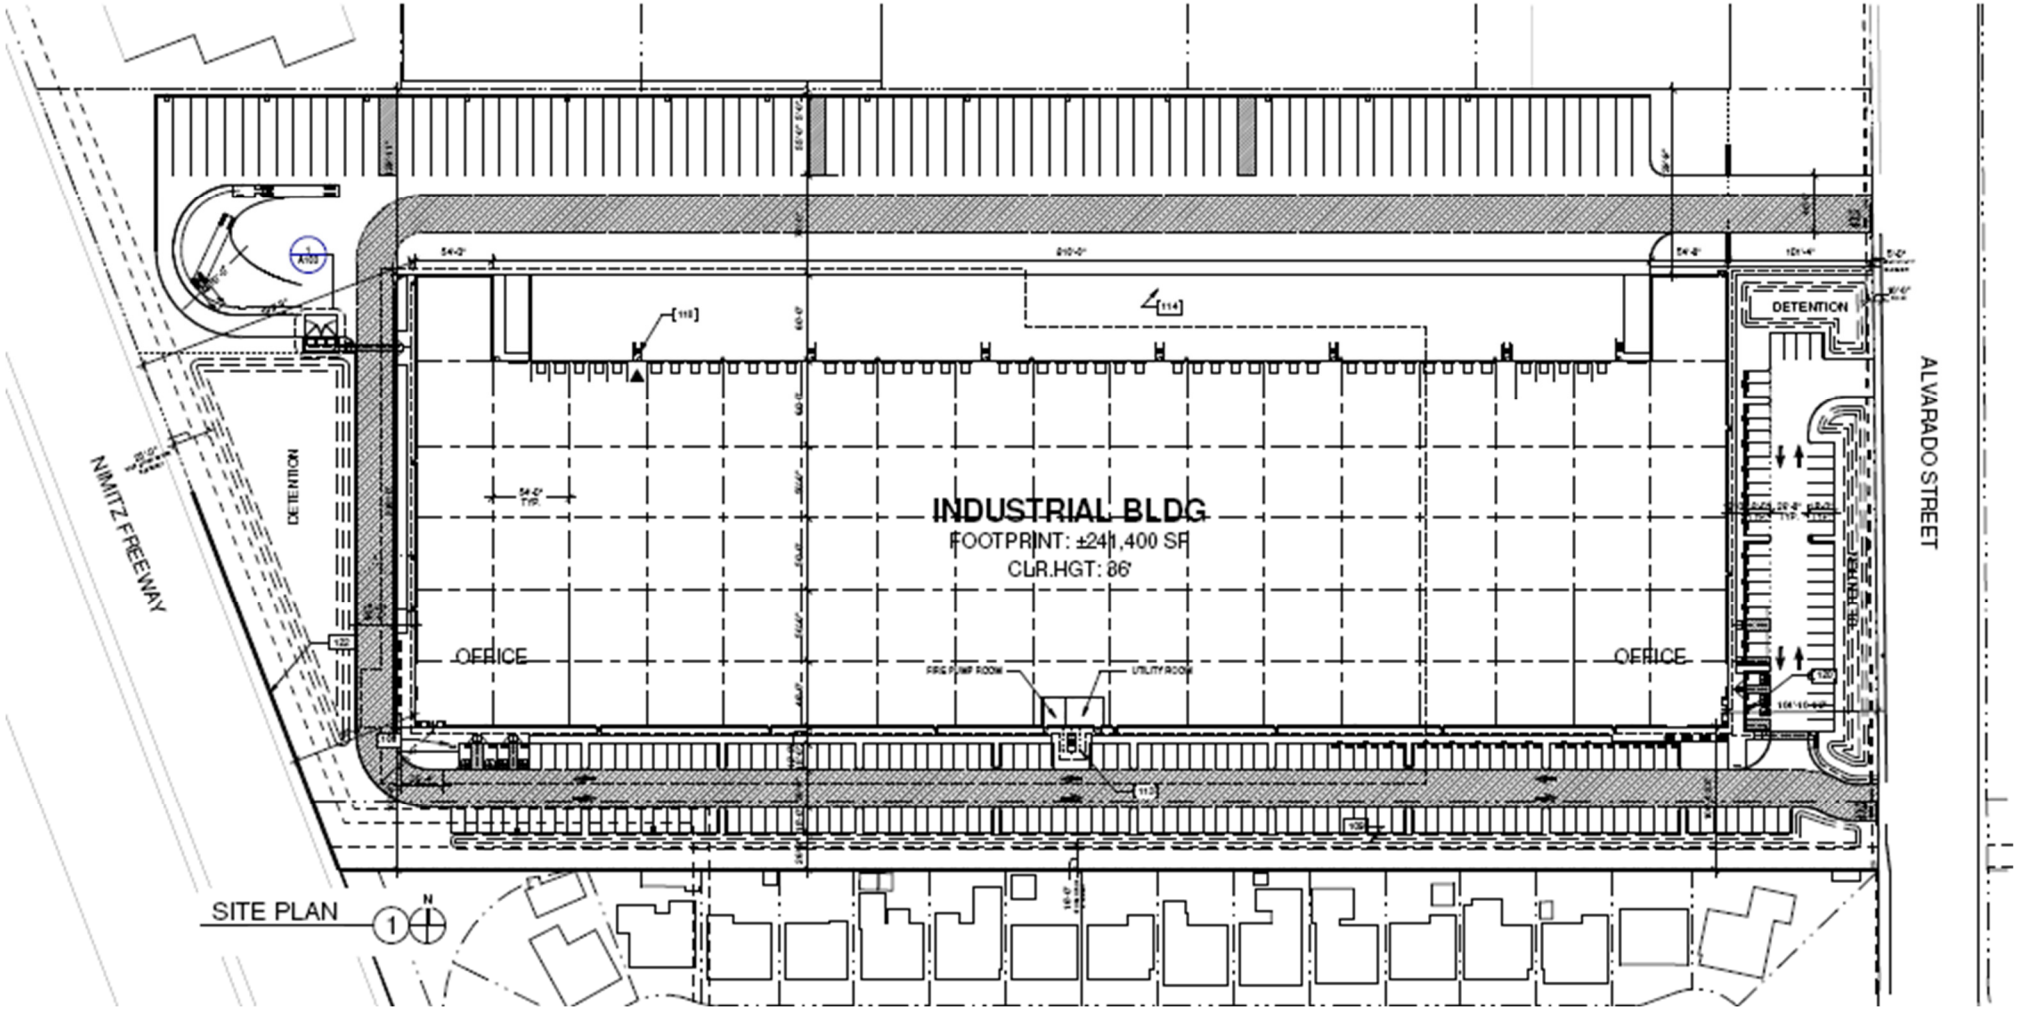

FIGURE 2: SITE PLAN

EXISTING CONDITIONS

STUDY AREA

The study area intersections, illustrated in **Figure 3**, were chosen by the City, and represent major nearby intersections anticipated to accommodate project traffic:

1. Alvarado Street & Teagarden Street
2. Alvarado Street & Marina Boulevard
3. Marina Boulevard & Teagarden Street / Wayne Avenue
4. Aladdin Avenue / Fairway Drive & Teagarden Street
5. Floresta Boulevard / Halcyon Drive & Washington Avene
6. Marina Boulevard & I-880 Northbound Ramps
7. Marina Boulevard & I-880 Southbound Ramps

ROADWAY SYSTEM

Aladdin Avenue is an east-west roadway that extends from Teagarden Street to east of Alvarado Street. It is an arterial from Teagarden Street to Alvarado Street, with a speed limit of 30 mph. It has one travel lane in each direction.

Alvarado Street is a north-south roadway that provides direct access to the project site. It is an arterial from Fremont Avenue to Marina Boulevard, and a collector south of Fremont Avenue and north of Marina Boulevard to Davis Street. It has one travel lane in each direction and a two-way-left-turn-lane (TWLTL) from Fremont Avenue to Marina Boulevard. South of Fremont Avenue and north of Marina Boulevard to Thornton Street, it has one lane in each direction. The speed limit is 35 mph south of Marina Boulevard, and 30 mph north of Marina Boulevard to Davis Street.

Fairway Drive is an east-west collector roadway with one travel lane in each direction in the site vicinity. It extends westerly from Aladdin Avenue at Teagarden Street. The speed limit is 30 mph.

Floresta Boulevard is an east-west arterial roadway. It has a 35 mph speed limit. It has one to three travel lanes per direction.

Halcyon Drive is an east-west arterial roadway that continues easterly from Floresta Boulevard at Washington Street. It has two travel lanes per direction with a 40 mph speed limit.

I-880 (Nimitz Freeway) is a north-south freeway through the City. To the south, it provides access to I-238 and extends through Fremont to San Jose. To the north, it extends into Oakland, and provides access to I-80 and the San Francisco – Oakland Bay Bridge.

Marina Boulevard is an east-west arterial roadway that provides access to I-880. It has two to three lanes per direction in the site vicinity. The speed limit is 35 mph in the site vicinity.

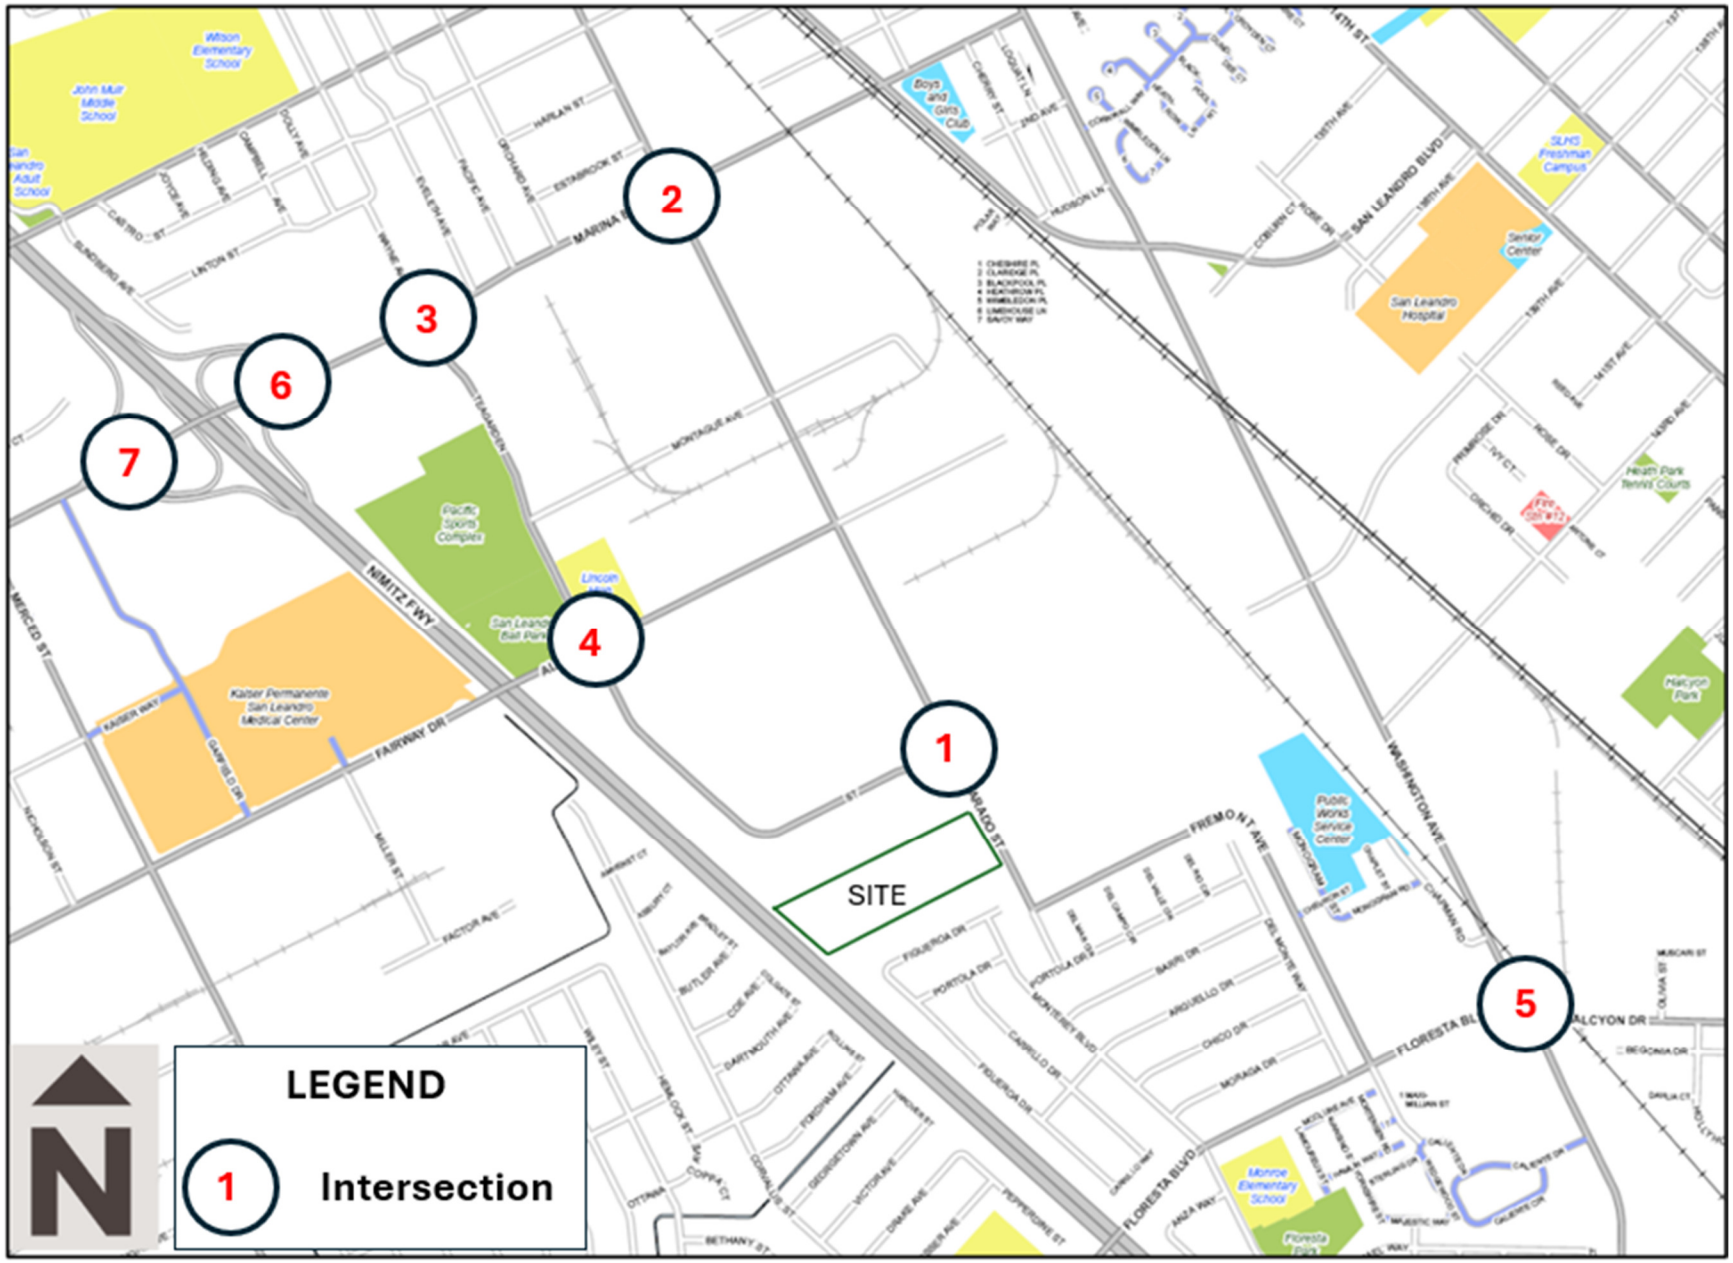

FIGURE 3: STUDY AREA

Teagarden Street is a collector roadway that extends from Alvarado Street to Marina Boulevard. It has one lane in each direction with a speed limit of 30 mph.

Washington Avenue is a north-south arterial with two travel lanes in each direction in the site vicinity. It has a 35 mph speed limit.

Wayne Avenue is a north-side collector roadway which extends northerly from Teagarden Street at Marina Boulevard. It has one travel lane in each direction.

TRANSIT SYSTEM

Transit service in the site vicinity includes Bay Area Rapid Transit (BART), the Alameda-Contra Costa Transit District (AC Transit), and San Leandro LINKS shuttles. **Figure 4** illustrates transit routes in the site vicinity.

BART is the rapid transit rail system serving the San Francisco Bay Area. The Green, Orange, and Blue lines operate through San Leandro, with connections to the Red and Yellow lines. The San Leandro Station is located about 1.3 miles north of the project site, and the Bay Fair Station is located about 1.6 miles east of the site.

Service on all BART lines begins at 5:00 AM on weekdays, 6:00 AM on Saturdays, and 8:00 AM on Sundays. All lines operate until 9:00 PM, while the Blue, Orange, and Yellow lines operate until Midnight.

AC Transit operates Route 28 along Alvardo Street past the project site. Route 28 extends from the San Leandro BART station to the Hayward BART station, with access to the Bay Fair and Castro Valley BART stations. Route 28 has stops on each side of Alvardo Street just north of Teagarden Street, about 350 feet north of the project site. Route 28 operates in each direction at hourly frequencies from approximately 6:00 AM to 10:00 PM on weekdays, Saturdays, Sundays, and Holidays.

LINKS provides a free and convenient shuttle to and from the San Leandro BART station. Shuttles run every 30 minutes, Monday through Friday, during peak commute hours (5:45 AM to 10:30 AM, and 3:00 PM to 7:20 PM). The South Loop stops at the same location as the southbound AC Transit Route 28 on Alvarado Street just north of Teagarden Street.

BIKEWAY SYSTEM

The San Leandro bikeways in the vicinity of the project site are illustrated in **Figure 5**.

Source: https://511.org/media/456/show, accessed March 21, 2025.

FIGURE 4: TRANSIT SYSTEM

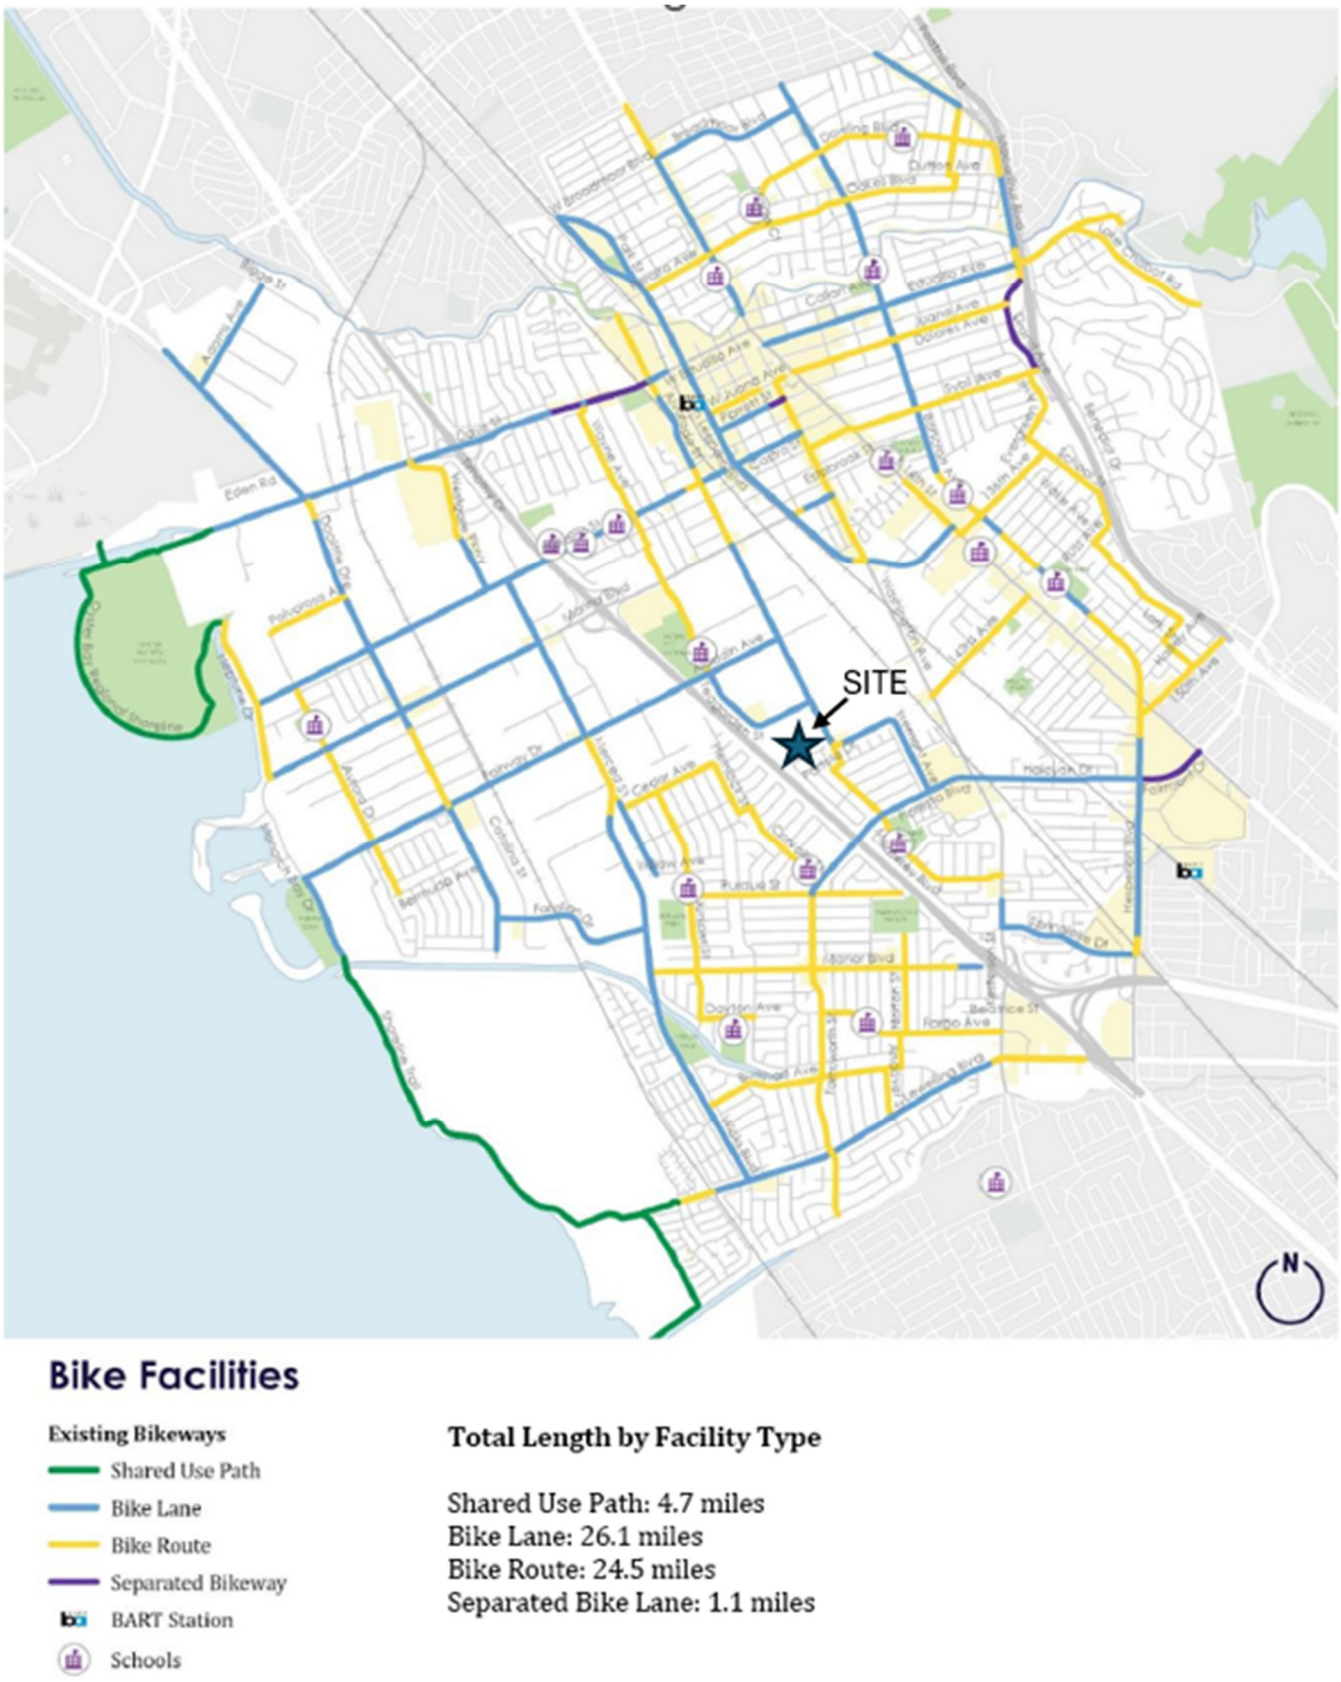

FIGURE 5: BIKEWAY SYSTEM

On the study area roadways, the following bikeways exist:

- Aladdin Avenue
  - Bike Lane (Class II) – Alvarado Street to Teagarden Street
- Alvarado Street
  - Buffered Bike Lane (Class II) – Fremont Avenue to Aladdin Avene
  - Bike Lane (Class II) – Aladdin Avenue to Marina Boulevard
  - Bike Route (Class III) – Marina Boulevard to Williams Street
- Fairway Drive
  - Bike Lane (Class II) – Teagarden Street to Aurora Drive
- Floresta Boulevard
  - Bike Lane (Class II) – Monterey Boulevard to Washington Avenue
- Fremont Avenue
  - Bike Lane (Class II) – Alvarado Street to Floresta Boulevard
- Halcyon Drive
  - Bike Lane (Class II) – Washington Avenue to BART line
- Teagarden Street
  - Bike Lane (Class II) – Alvarado Street to Aladdin Avenue
  - Bike Route (Class III) – Aladdin Avenue to Marina Boulevard
- Wayne Avenue
  - Bike Route (Class III) – Marina Boulevard to Davis Street

PEDESTRIAN SYSTEM

Most, but not all, streets in the site vicinity have sidewalks along both sides. There are continuous sidewalks on both sides of Alvarado Street near the site. At the signalized intersection with Teagarden Street, there are marked crosswalks with pedestrian signals. There is also a marked crosswalk with pedestrian signals on the east leg of the Alvarado Street intersection with Fremont Avenue. Fremont Avenue only has a sidewalk along the north and east side between Alvarado Street and Floresta Boulevard.

EXISTING INTERSECTION GEOMETRY

Existing intersection geometry (number of approach lanes and traffic control) is illustrated in **Figure 6.** All of the study area intersections are signalized.

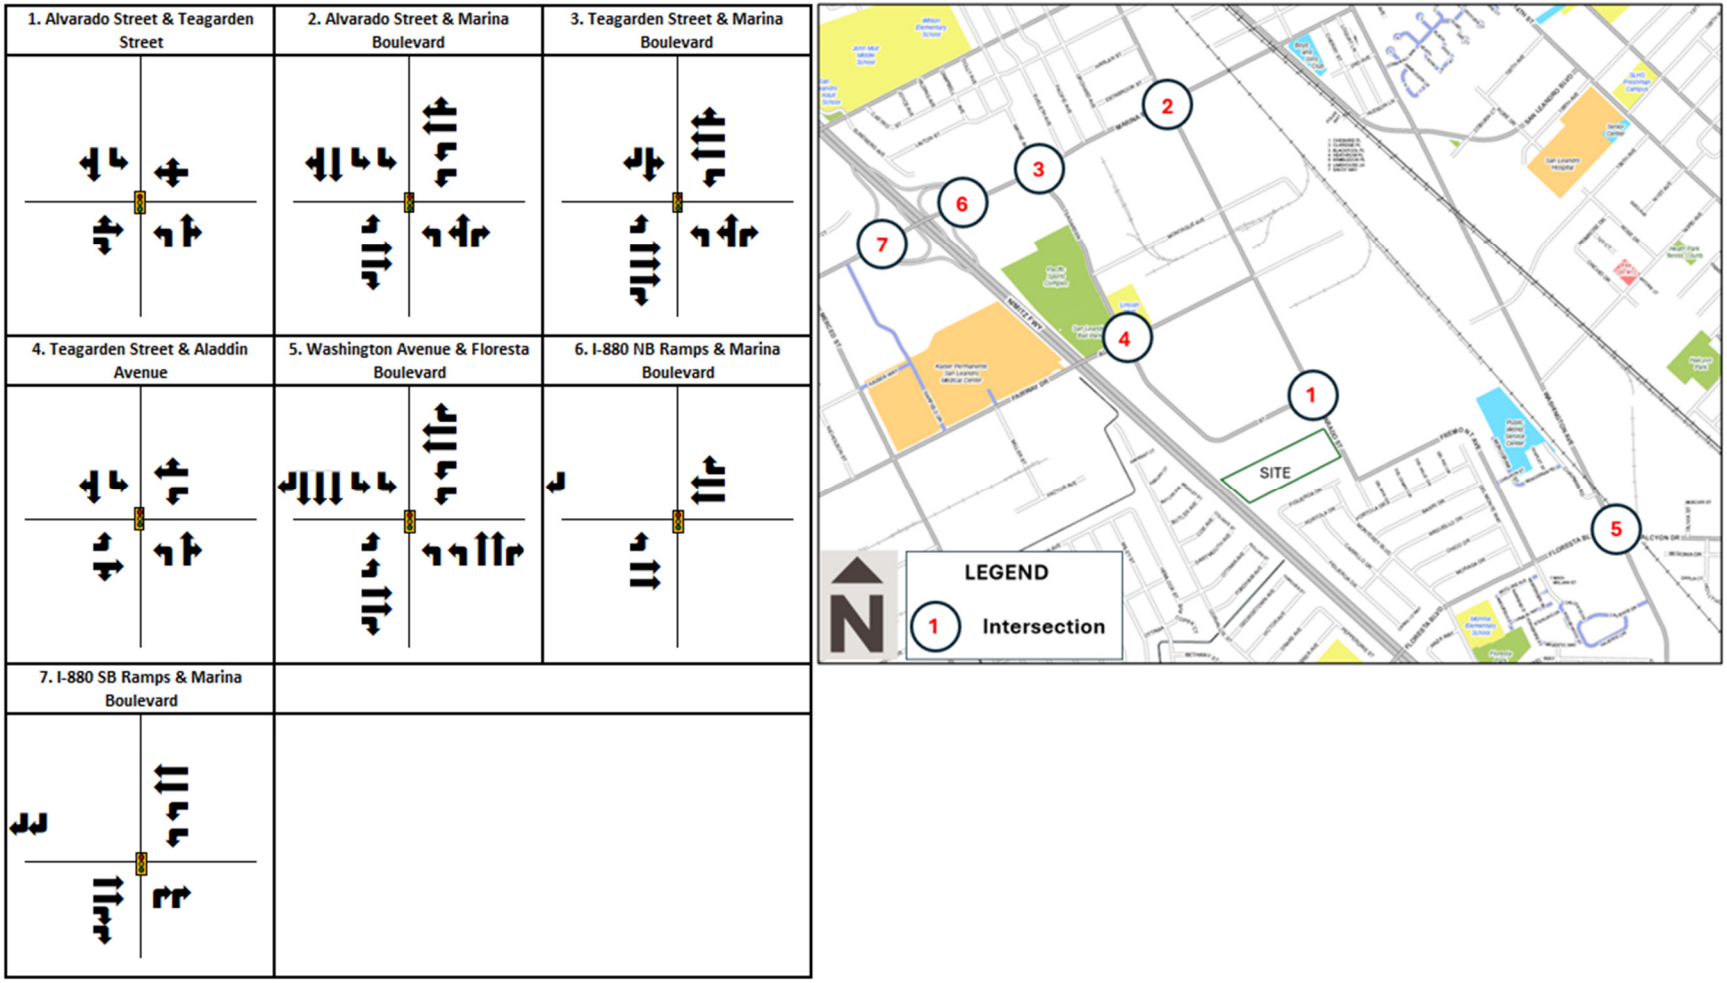

FIGURE 6: EXISTING INTERSECTION GEOMETRY

DATA COLLECTION

Peak period intersection turning movement counts at the study area intersections were conducted for the AM weekday peak period (7:00 to 9:00 AM) and the PM weekday peak period (4:00 to 6:00 PM) on Tuesday, February 25, 2025. Schools were in session, and there were no extreme weather events. **Figure 7** illustrates the peak hour traffic volumes. Detailed traffic count information is included in the Appendix.

INTERSECTION OPERATIONS

INTERSECTION ANALYSIS AND METHODOLOGY

Synchro 12 software was used to analyze intersection delay and queue lengths at the study area intersections. **Table 1** presents the level of service criteria for intersections in accordance with HCM methodology. Level of Service (LOS) D is the minimum acceptable level of service for intersections in the City of San Leandro outside of Priority Development Areas. All of the study area intersections are located outside Priority Development Areas

HCM 7 methodology was utilized to estimate average intersection delay and LOS for intersections 1 through 5. For intersections 6 and 7, HCM 2000 methodology was utilized, due to non-NEMA compliant signal phasing at the ramp intersections. For all intersections, HCM 2000 methodology was utilized to estimate the volume-to-capacity (V/C) ratio.

For turning lanes at each intersection, the 95th percentile queue was estimated, and compared to the available storage.

TABLE 1: INTERSECTION LEVEL OF SERVICE

INTERSECTION LEVEL OF SERVICE CRITERIA		
LEVEL OF SERVICE (LOS)	TOTAL DELAY PER VEHICLE (SECONDS)	
	SIGNALIZED	UNSIGNALIZED
A	$\leq$ 10	$\leq$ 10
B	> 10 and $\leq$ 20	> 10 and $\leq$ 15
C	> 20 and $\leq$ 35	> 15 and $\leq$ 25
D	> 35 and $\leq$ 55	> 25 and $\leq$ 35
E	> 55 and $\leq$ 80	> 35 and $\leq$ 50
F	> 80	> 50

Source: Highway Capacity Manual 6th Edition, Transportation Research Board.

LOS and queuing were calculated for the weekday AM and PM peak hours.

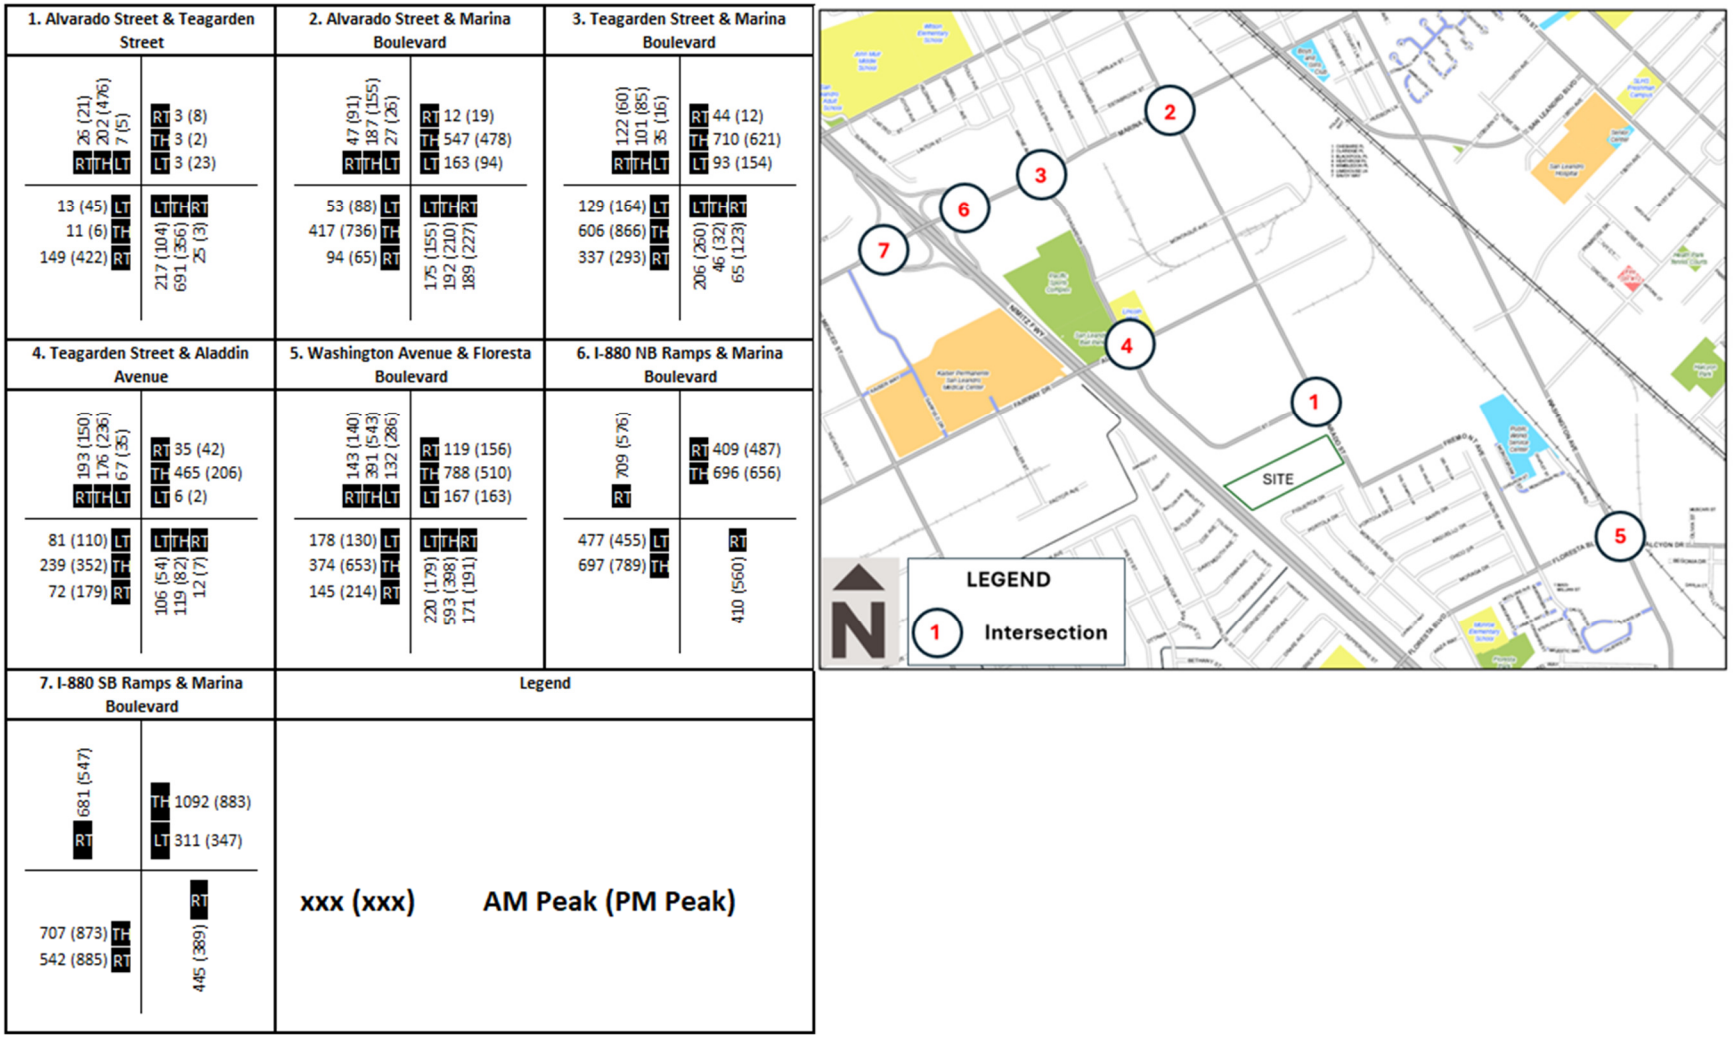

FIGURE 7: EXISTING PEAK HOUR TRAFFIC VOLUMES

EXISTING INTERSECTION LEVEL OF SERVICE

Table 2 summarizes the existing peak hour intersection operations. All of the intersections meet the City's LOS D criteria.

TABLE 2: EXISTING INTERSECTION LEVEL OF SERVICE

EXISTING INTERSECTION OPERATING CONDITIONS						
INTERSECTION	AM PEAK HOUR			PM PEAK HOUR		
	DELAY (SECONDS)	LOS	V/C	DELAY (SECONDS)	LOS	V/C
1. Alvarado Street & Teagarden Street / Driveway	15.8	B	0.62	24.9	C	0.61
2. Alvarado Street & Marina Boulevard	40.0	D	0.66	36.7	D	0.58

7. Marina Boulevard & I-880 SB Ramps	15.2	B	0.67	13.1	B	0.56

EXISTING INTERSECTION QUEUING

Table 3 summarizes the existing peak hour intersection queuing in turning lanes. The following locations have 95th percentile queues that exceed the available storage:

- Intersection 1: Alvarado Street & Teagarden Street
  - Northbound left turn lane in the AM peak hour. (Queue extends into TWLTL.)
- Intersection 2: Alvarado Street & Marina Boulevard
  - Westbound left turn lane in the AM peak hour. (Queue extends into TWLTL.)
  - Northbound left turn lane in the AM and PM peak hours. (Queue extends into TWLTL.)
- Intersection 3: Marina Boulevard & Teagarden Street / Wayne Avenue
  - Eastbound left turn lane in the AM and PM peak hours.
  - Westbound left turn lane in the PM peak hour.
- Intersection 4: Aladdin Avenue / Fairway Drive & Teagarden Street
  - Eastbound left turn lane in the AM and PM peak hours.

- Intersection 5: Floresta Boulevard / Halcyon Drive & Washington Avenue
  - Westbound right turn lane in the AM and PM peak hours.

EXISTING PLUS APPROVED AND PENDING PROJECTS

The City maintains a City Development Activity Map. Based on the map, amended through December 23, 2024, there are 30 active projects in the City. These projects were reviewed to determine their applicability for inclusion in the traffic analysis.

1. Some projects are "Entitlement Application Under Review". These were screened out. The remaining project types are Entitlement Application Approved, Building Permit Review, and Under Construction.
2. Small residential projects (under 10 DU) were screened out.
3. The remaining projects were screened for location. Projects more than ½ mile from the project site and / or study area intersections were screened out.

The following projects were included in the set of Approved and Pending Projects:

- 2436 Washington Avenue – 66 multi-family dwelling units
- 14143 – 14273 Washington Avenue – 52,269 square foot warehouse
- 1800 Williams Street – 9,306 square foot Industrial
- 1919 Williams Street – 221,000 square foot industrial (warehouse)

The City Development Activity Map and associated information is included in the Appendix.

METHODOLOGY

The Alameda County Transportation Commission (Alameda CTC) maintains and updates a countywide travel demand model in compliance with Congestion Management Program (CMP) legislation. The base year model (2020) dataset was modified to include the four approved and pending projects. The difference (delta) between the base year and modified model volume estimates was applied to the 2025 intersection count data for the AM and PM peak hours.

INTERSECTION OPERATIONS

INTERSECTION GEOMETRY

No changes were assumed in number of lanes, lane designations, or traffic signal timing / phasing from existing conditions.

EXISTING PLUS APPROVED AND PENDING PROJECTS PEAK HOUR TRAFFIC VOLUMES

Figure 8 illustrates the peak hour traffic volumes.

EXISTING PLUS APPROVED AND PENDING PROJECTS INTERSECTION LEVEL OF SERVICE

Table 4 summarizes the peak hour intersection operations. All of the intersections meet the City's LOS D criteria.

EXISTING PLUS APPROVED AND PENDING PROJECTS INTERSECTION QUEUING

Table 5 summarizes the peak hour intersection queuing in turning lanes. Compared to existing conditions, no new locations have queues that exceed available storage. In locations where storage was previously exceeded, none of the queues have increased by 25 feet or more (1 vehicle length).

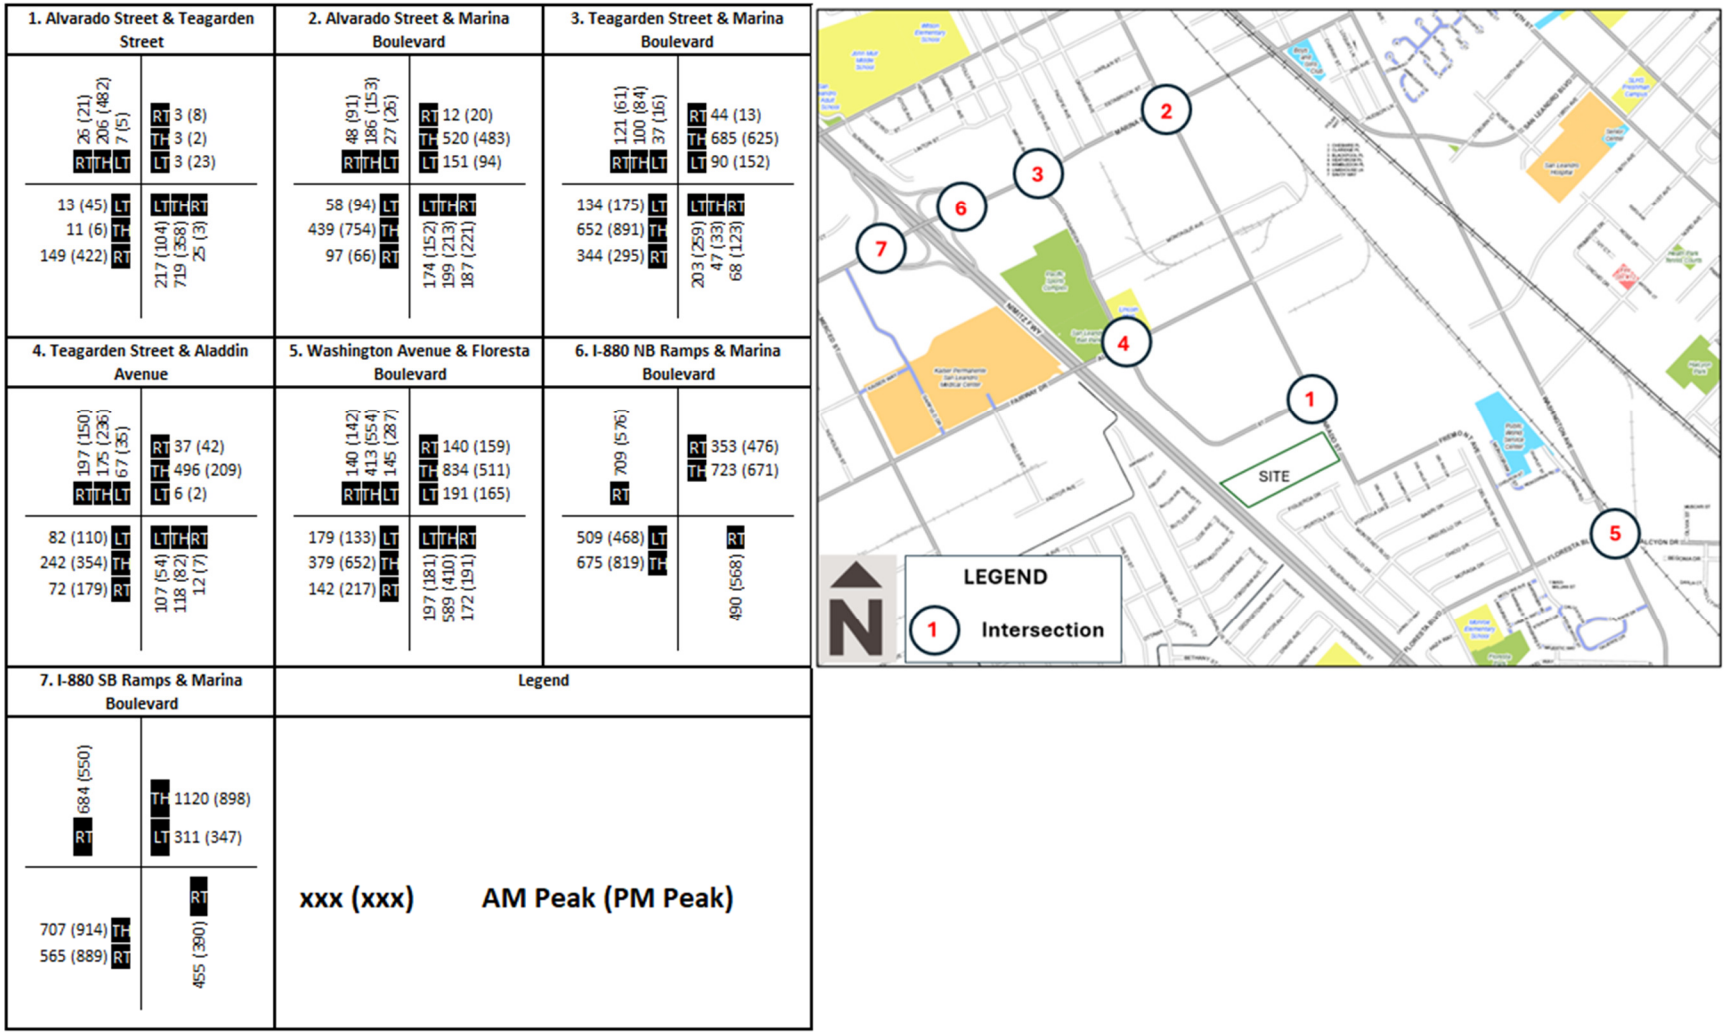

FIGURE 8: EXISTING PLUS APPROVED AND PENDING PROJECTS PEAK HOUR TRAFFIC VOLUMES

EXISTING PLUS APPROVED / PENDING PLUS PROJECT

This scenario adds the project traffic to the prior existing plus approved and pending projects scenario.

PROJECT TRAVEL CHARACTERISTICS

TRIP GENERATION

Vehicular trip generation estimates of the project are based upon information published by the Institute of Transportation Engineers (ITE). Specifically, the following source has been utilized:

- ITE Trip Generation Manual 11th Edition, Version: 4.0.0.421

Based upon the project description, ITE land use category "Warehousing" (Code 150) was utilized for trip generation estimates. **Table 6** summarizes the trip generation estimates.

TABLE 6: PROJECT TRIP GENERATION

USE (ITE CODE)	VEHICLE TYPE	SIZE (1,000 SQUARE FEET)	VEHICLE TRIPS GENERATED (PCE)						
			WEEKDAY	AM PEAK HOUR			PM PEAK HOUR		
				ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
WAREHOUSING (150)	LIGHT	241	281	37	11	48	12	36	48
	TRUCK		138	3	2	5	4	3	7
	TOTAL		419	40	13	53	16	39	55

Source: DKS Associates, 2025; ITE Trip Generation Manual 11th Edition, Version 4.0.0.421.

In the calculation of trip generation of the project:

- No credit was given for traffic generated by the existing building on the site.
- No adjustments for mode choice were made, although employee traffic may be lower due to transit, bicycle, and pedestrian access to the site.

Trip generation is based upon ITE fitted curves, where available. Fitted curves were not available for truck trip peak hour trip generation, so average rates were utilized.

Detailed trip generation information is included in the Appendix.

TRIP DISTRIBUTION

The distribution of project traffic on the study area roadways was estimated with the assistance of the Alameda CTC travel model. Separate distribution patterns were developed for AM peak hour

entering, AM peak hour exiting, PM peak hour entering, and PM peak hour exiting traffic. Travel model data is included in the Appendix.

Figure 9 illustrates the entering project trip distribution for the AM and PM peak hours.

Figure 10 illustrates the exiting project trip distribution for the AM and PM peak hours.

FORECAST METHODOLOGY

Utilizing the trip generation estimates from Table 6 and trip distribution patterns from Figure 9 and Figure 10, project traffic was manually added to the estimates from the existing plus approved and pending projects scenario traffic volumes illustrated in Figure 8.

INTERSECTION OPERATIONS

DEFICIENCY CRITERIA

A project would cause deficiencies where the project traffic:

- Results in an intersection operating at an acceptable LOS (D or better) to deteriorate to an unacceptable LOS.
- Results in an intersection operating at an unacceptable LOS to increase the V/C ratio by 0.05 or more.
- Causes queues to exceed available storage by more than 1 vehicle length (25 feet).
- Increase the queue length by more than 1 vehicle length (25 feet) where the available storage is already exceeded.

INTERSECTION GEOMETRY

No changes were assumed in number of lanes, lane designations, or traffic signal timing / phasing from existing conditions.

EXISTING PLUS APPROVED / PENDING PLUS PROJECT PEAK HOUR TRAFFIC VOLUMES

Figure 11 illustrates the peak hour traffic volumes.

EXISTING PLUS APPROVED / PENDING PLUS PROJECT INTERSECTION LEVEL OF SERVICE

Table 7 summarizes the peak hour intersection operations. All of the intersections meet the City's LOS D criteria.

EXISTING PLUS APPROVED / PENDING PLUS PROJECT INTERSECTION QUEUING

Table 8 summarizes the peak hour intersection queuing in turning lanes. Compared to existing conditions, no new locations have queues that exceed available storage. In locations where storage was previously exceeded, none of the queues have increased by 25 feet or more (1 vehicle length).

SUMMARY

The addition of project traffic does not result in any deficiencies based upon LOS or queuing.

The project would not interfere with existing or planned bicycle facilities.

The project would not interfere with existing or planned pedestrian facilities.

The project would not negatively affect transit services.

YEAR 2035 FORECASTED TRAFFIC

METHODOLOGY

The Alameda CTC travel model includes year 2020 and 2040 datasets. The difference in volume forecasts was calculated, and adjusted to reflect a 10 year change in traffic from 2025 to 2035. This difference was applied to the 2025 intersection count data for the AM and PM peak hours.

INTERSECTION OPERATIONS

INTERSECTION GEOMETRY

No changes were assumed in number of lanes, lane designations, or traffic signal timing / phasing from existing conditions.

YEAR 2035 FORECASTED TRAFFIC PEAK HOUR TRAFFIC VOLUMES

Figure 12 illustrates the peak hour traffic volumes.

YEAR 2035 FORECASTED TRAFFIC INTERSECTION LEVEL OF SERVICE

Table 9 summarizes the peak hour intersection operations. All of the intersections meet the City's LOS D criteria.

YEAR 2035 FORECASTED TRAFFIC INTERSECTION QUEUING

Table 10 summarizes the peak hour intersection queuing in turning lanes.

Compared to existing conditions, in locations where storage was previously exceeded, none of the queues have increased by 25 feet or more (1 vehicle length).

Compared to existing conditions, one new location has a queue that exceeds available storage by more than 1 vehicle length (25 feet).

- Intersection 2: Alvarado Street & Marina Boulevard
  - Westbound left turn lane in the PM peak hour. (Queue extends into TWLTL. Queue previously exceeded available storage in the AM peak hour only.)

VMT ANALYSIS

VMT analysis of the project is based upon the City's proposed guidelines, as described in the memorandum "City of San Leandro Proposed Guidelines for Analyzing VMT", Fehr & Peers, December 8, 2023.

The California Environmental Quality Act (CEQA) requires land use development and transportation projects to identify, disclose, and mitigate environmental impacts. In accordance with SB 743, jurisdictions in California are now required to use VMT based metrics to evaluate environmental impacts related to transportation. VMT measures the amount of driving produced by a project and provides a measure of travel efficiency of a land use project.

The first step in VMT analysis is the screening process. The screening process provides a simplified methodology to determine if a project is unlikely to result in significant VMT impacts, thereby avoiding detailed VMT analysis. In the case of an industrial project, the project meets the screening criteria if it is located in a "Low VMT Area". Low VMT areas are traffic analysis zones (TAZs) that have existing VMT that is 15% below the existing home-based VMT per resident for the Central Planning Area for residential uses, 15% below the existing home-work VMT per worker for the Central Planning Area for employment uses that are office or similar uses, and below the existing average home-work VMT per worker for the Central Planning Area for employment uses that are industrial, warehouse or similar uses.

Figure 13 illustrates the VMT screening map for industrial uses, and the location of the project. The project is located in an area that is "Between 15% below and Planning Area 2 average (threshold of significance for industrial uses)". It is therefore concluded that the project's CEQA VMT transportation impact is less than significant, and that additional VMT analysis is unnecessary.

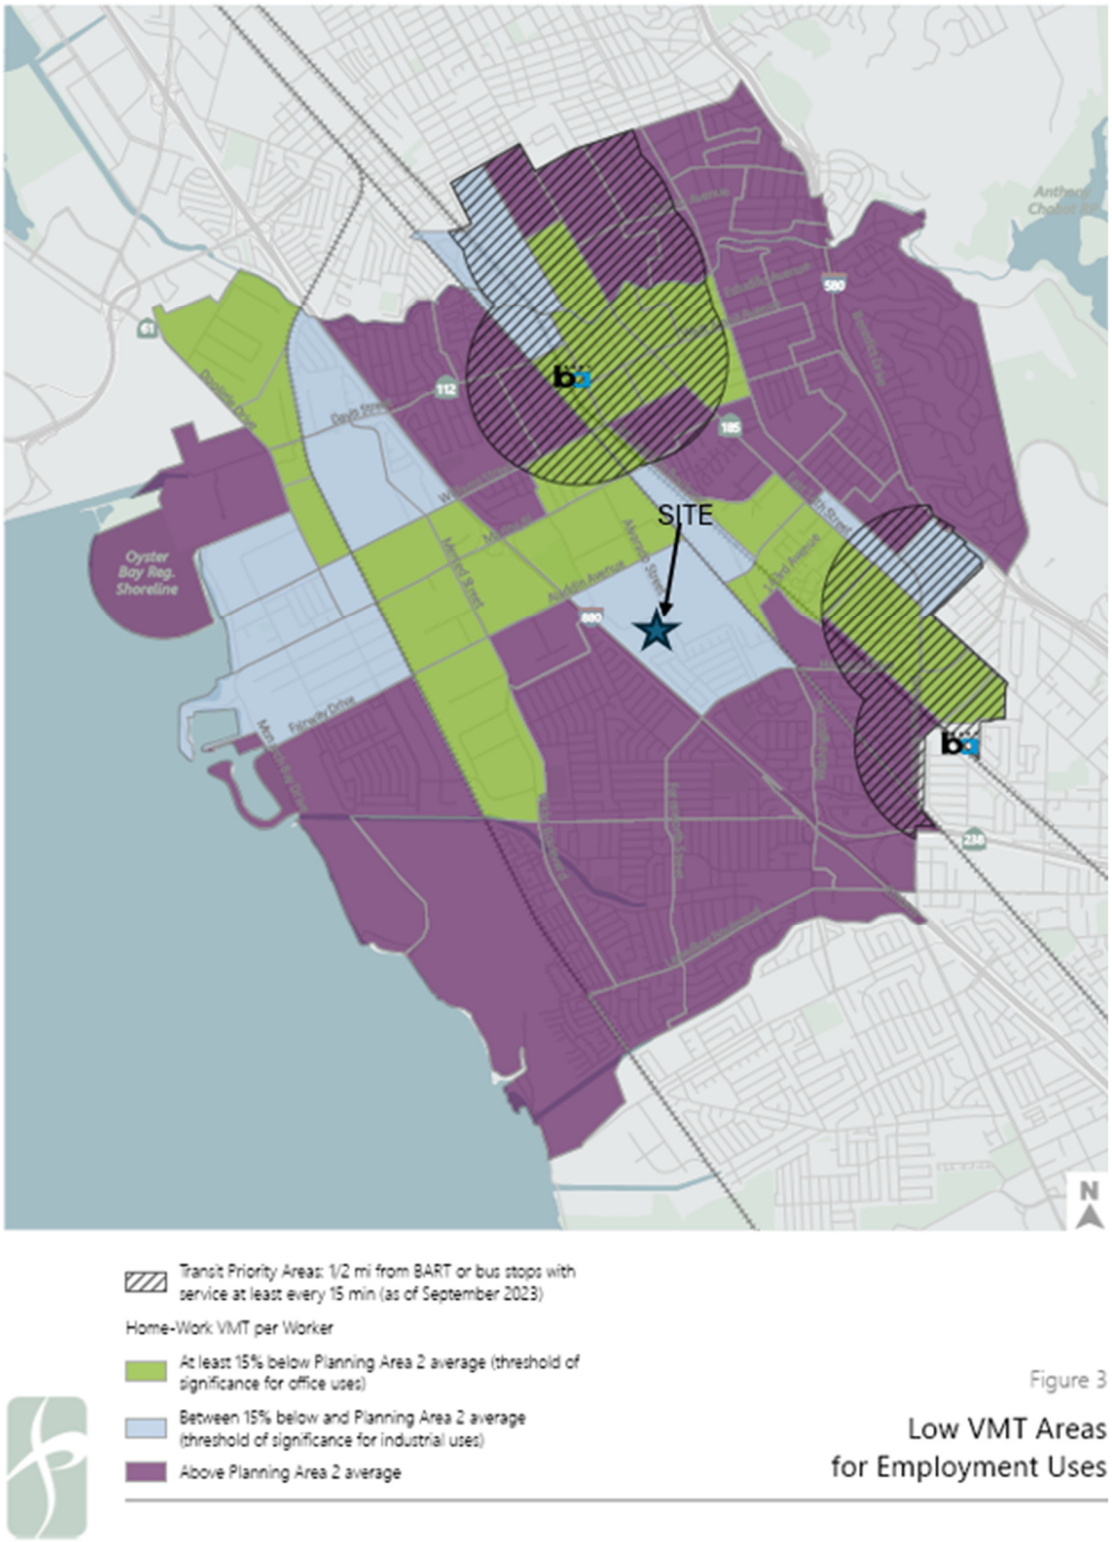

FIGURE 13: VMT SCREENING MAP

SITE OPERATIONS REVIEW

The project circulation was reviewed with regard to safety, circulation, adequacy of driveway throat depths, and turn pocket storage. Figure 2 illustrates the site plan and proposed circulation elements.

The circulation plan separates passenger vehicle traffic from truck traffic. Truck traffic will be accommodated via the north driveway. Passenger vehicle traffic will be accommodated via the center and south driveways. Alvarado Street has one travel lane in each direction, a center TWLTL, buffered Class II bikeways in each direction, and sidewalks for pedestrians on each side.

The north (truck) driveway is forty-feet wide, to accommodate heavy truck turning movements. It has a throat depth of about 155 feet, capable of storing two semi-trailer trucks.

The center driveway is about 26 feet wide, and has a throat depth of about 35 feet. The south driveway is about 26 feet wide, and has a throat depth of about 60 feet.

Synchro 12 software was utilized to evaluate the delay and queuing entering and exiting the site at each driveway during the AM and PM peak hours, based upon the traffic volumes of the Existing Plus Approved / Pending Plus Project scenario. The driveway throat lengths are acceptable, as the 95th percentile queues at each driveway were one vehicle or less. Similarly, queuing in the TWLTL was limited to a 95th percentile queue of one vehicle or less. Because of driveway access to and from properties on the east side of Alvarado Street, no modifications to the TWLTL are recommended.

The onsite circulation plan appears to meet generally accepted practices, with adequately sized aisles and parking areas. The applicant's circulation plan shows the ability for a design semi-trailer truck to turn around at the west end of the truck dock / trailer storage area.

PARKING REVIEW

The parking requirements for the project have been calculated based upon the City's Chapter 4.08, Off-Street Parking and Loading Regulations.

For "Warehousing, Distributions and Storage Facilities", 1 off-street parking space per 1,500 square feet is required. Based upon the building size of approximately 241,000 square feet, this results in 161 parking spaces. The "Project Data" information on the site plans calculated parking based on 10 percent of the building as office, and the remaining 90 percent as warehouse, which yields 225 parking spaces. Typically, if the office space is associated with the warehouse use, the office space is not segregated for the parking calculation. However, if it is possible that the office space could be utilized by a user / tenant not associated with the warehouse operations, then this conservative calculation could be warranted. The reviewed site plan provides 231 parking spaces.

The City also requires off-street loading spaces. For a warehouse of this size, two 12' x 35' x 14' VC spaces and one 12' x 65' x 14' VC space are required. In the City comments on the site plan,

they have requested "a Type A and a Type B loading area for each tenant." The reviewed site plan does not include any off-street loading spaces.

For a parking lot with 201 to 300 spaces, ADA requires a minimum of 7 accessible parking spaces. The project provides 7 accessible parking spaces, 3 near the office entrance at the southeast corner of the building, and 4 near the office entrance at the southwest corner of the building.

The California Green Building Standards Code requires that, for a parking lot with 201 and over spaces, a minimum of 20 percent of spaces must be EV capable (EVC), and that 25 percent of the EVC spaces are provided with electric vehicle supply equipment (EVSE), also known as chargers. The project meets this requirement with 46 EVC spaces, 14 of which have EVSE. Three of the spaces with EVSE are accessible.

SECTION 3: TRIP GENERATION

Land Use: 150
Warehousing

Description

A warehouse is primarily devoted to the storage of materials, but it may also include office and maintenance areas. High-cube transload and short-term storage warehouse (Land Use 154), high-cube fulfillment center warehouse (Land Use 155), high-cube parcel hub warehouse (Land Use 156), and high-cube cold storage warehouse (Land Use 157) are related uses.

Additional Data

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (https://www.ite.org/technical-resources/topics/trip-and-parking-generation/).

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in California, Connecticut, Minnesota, New Jersey, New York, Ohio, Oregon, Pennsylvania, and Texas.

Source Numbers

Intersection Summary	
HCM 7th Control Delay, s/veh	32.6
HCM 7th LOS	C

Notes

*HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Notes

User approved volume balancing among the lanes for turning movement.

*HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 7th Control Delay, s/veh	35.2
HCM 7th LOS	D

Notes

*HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

HCM 7th Control Delay, s/veh	34.2
HCM 7th LOS	C

Notes

*HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Notes

User approved volume balancing among the lanes for turning movement.

*HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.

HCM 7th LOS	D

Notes

*HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.
Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Notes

*HCM 7th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.
