A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

CA DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing
A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

HIST FTTS INSP: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing
A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

CA HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

CA WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

CA WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER R5-2017-0061

WASTE DISCHARGE REQUIREMENTS GENERAL ORDER FOR DISCHARGES RELATED TO TIMBERLAND MANAGEMENT ACTIVITIES FOR NON-FEDERAL AND FEDERAL LANDS

The California Regional Water Quality Control Board, Central Valley Region (hereafter, Central Valley Water Board) finds that:

SCOPE OF COVERAGE OF THIS GENERAL ORDER

1. This Order serves as general waste discharge requirements (WDRs) for waste discharges related to timberland management activities on both non-federal and federal lands (managed by the U.S. Forest Service) that could affect waters of the state.

2. Under this Order, "timberland management activities" means commercial activities relating to forest management and timberland conversions, including, but not limited to: cutting or removal of timber and other solid wood forest products; construction, reconstruction and maintenance of roads, fuel breaks, firebreaks, watercourse crossings, landings, skid trails, or beds for the falling of trees; fire hazard abatement and fuel reduction activities; pesticide applications; site preparation that involves disturbance of soil or burning of vegetation following timberland management activities; but excluding preparatory treemarking, surveying or roadflagging.[1]

3. Waste specifically regulated under this Order includes: earthen materials, including soil, silt, sand, clay, rock; organic materials, such as slash, sawdust, or bark; and pesticides that enter or threaten to enter into waters of the state from timberland management activities.

4. Under this Order, the term "Discharger" includes the timberland owner or timber owner, anyone working on behalf of the timberland/timber owner in the conduct of timberland management activities for non-federal lands, the U.S. Forest Service, private timber operators operating on federal lands, and anyone working on behalf of the U.S. Forest Service or a timber operator in the conduct of timberland management activities on federal lands. Although all of the aforementioned persons or entities legally are "Dischargers" for the purposes of this Order, only one Notice of Intent (NOI) shall be submitted for each Project enrollment.

5. Attachment A (Definitions), Attachment B (Monitoring and Reporting Program), Attachment C (Post-Fire Management and Reforestation Plan), and Attachment D (Information Sheet) are hereby incorporated into and made a part of this Order by this reference.

REASONS FOR ISSUING GENERAL ORDER

6. There are approximately 16 million acres of federal and non-federal forested lands located within the Central Valley Region. The water quality impacts from timberland management activities on these forested lands falls within the jurisdiction of the Central Valley Water Board.

7. The adoption of individual WDRs for all timberland management activities in the Central Valley

[1]Definitions for "Pesticide", "Plan", and "Project", as well as other definitions, can be found in Attachment A.

Region is not feasible due to the large number of timber harvesting documents received annually for review, the short mandated timeline for the approval of non-federal timberland management activities, and the time needed to adopt individual WDRs. General WDRs on a watershed-by-watershed basis would also take a significant amount of time given the large number of watersheds and sub-watersheds in the Region, and therefore is not feasible. The Central Valley Water Board currently regulates timberland management activities under the Conditional Waiver of Waste Discharge Requirements for Discharges Related to Timber Harvesting Activities (Waiver), Order No. R5-2014-0144, which expires on March 31, 2018. Without the current Waiver or the adoption of this Order, many timberland management activities would not be subject to any regulation under the California Water Code (Water Code) as required by the Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program (Nonpoint Source Policy) (see Finding 12 below).

8. On October 8, 2013, amendments to Public Resources Code Article 7.7 (commencing with Section 4597) went into effect and established a new type of timber harvesting permit: the Working Forest Management Plan (WFMP). This new permit will allow non-federal, non-industrial landowners of 15,000 acres or less to harvest timber via a non-expiring permit. The amendments also required the California Board of Forestry (BOF) to develop and implement the process for the WFMP by January 2016; process concerns raised by stakeholders have delayed the implementation of the WFMP, which is now anticipated to occur by January 2018.

9. This Order addresses the anticipated implementation of the WFMP by the BOF; the upcoming Waiver expiration; the need for additional information related to post-fire salvage operations; the creation of a low threat category for Plans; the creation of a new category for non-federal watercourse crossing work outside of a Project; the need to revise and clarify the monitoring and reporting program; and the overall need to improve and streamline the existing Waiver. Individual WDRs would not provide identifiable benefits over this Order because this Order contains essentially the same conditions that would be included in individual WDRs, such as the requirements that implement water quality control plans, and this Order is enforceable to the same extent as individual WDRs.

10. As of the effective date of this Order, the Central Valley Water Board will no longer accept new enrollments under the Timber Waiver (Order No. R5-2014-0114). Projects with existing enrollments under the Timber Waiver may continue to operate under the Timber Waiver until its expiration date, March 31, 2018. Projects that will operate past March 31, 2018, must obtain coverage under this Order prior to that date.

REGULATORY CONSIDERATIONS

11. Pursuant to the Porter-Cologne Water Quality Control Act (Division 7 of the Water Code), the Central Valley Water Board has legal authority to regulate waste discharges that could affect the quality of waters of the state.

12. Federal law requires the states to develop and implement plans to address nonpoint source pollution. (33 U.S.C. §1329.) Pursuant to this federal mandate, the State Water Resources Control Board (State Water Board) adopted its Nonpoint Source Policy in 2004. The Nonpoint Source Policy requires the State Water Board and Regional Water Quality Control Boards (Regional Water Boards) to regulate nonpoint source pollution by using either (1) Waste Discharge

Requirements (Water Code section 13260); (2) a Waiver of Waste Discharge Requirements (Water Code section 13269); or (3) a Basin Plan Prohibition (Water Code section 13243).

13. Water Code section 13260, subdivision (a) requires that any person discharging waste or proposing to discharge waste within any region that could affect the quality of waters of the state, other than into a community sewer system, shall file with the appropriate Regional Water Board a Report of Waste Discharge (ROWD) containing such information and data as the Regional Water Board may require.

14. Water Code section 13263 requires the Central Valley Water Board to prescribe WDRs, or waive WDRs, for proposed, existing, or material changes in discharges of waste that could affect water quality. The board may prescribe WDRs even if no ROWD under Water Code section 13260 has been filed. The WDRs must implement applicable water quality control plans and the Water Code. The Central Valley Water Board may prescribe general WDRs for a category of discharges if all the following criteria apply to the discharges in that category:

    a. The discharges are produced by the same or similar operations.
    b. The discharges involve the same or similar types of waste.
    c. The discharges require the same or similar treatment standards.
    d. The discharges are more appropriately regulated under general requirements than individual requirements.

    The rationales for developing general waste discharge requirements for timberland management activities in the Central Valley Region include: (a) discharges are produced by similar operations (timberland management activities); (b) waste discharges under this Order involve similar types of wastes (typically earthen materials such as soil and rock, organic materials such as slash and bark, and pesticides); (c) water quality management practices are similar for timberland management activities; and (d) due to the large number of timberland management activities that take place in the Central Valley region, timberland management activities are more appropriately regulated under general rather than individual WDRs.

15. The Central Valley Water Board's *Water Quality Control Plan for the Sacramento River Basin and the San* Joaquin *River Basin, Fourth Edition, revised April 2016* and the *Water Quality Control Plan for the Tulare Lake Basin, Second Edition, revised January 2015* (hereinafter Basin Plans) designate beneficial uses, establish water quality objectives, contain programs of implementation needed to achieve water quality objectives, and reference plans and policies adopted by the State Water Board.

16. Whether an individual discharge of waste from timberland management activities may affect the quality of the waters of the state depends on a variety of site-specific factors, including, but not limited to:
    a) Distribution and Sensitivity of the Beneficial Uses of Water
        - Presence of domestic water supplies
        - Presence of aquatic species (including listed species)
        - Close proximity of operations to other critical beneficial uses or sensitive receptors
    b) Current Water Quality Conditions
        - Existing Total Maximum Daily Loads or 303(d) listings
        - Documented non-compliance with Basin Plan standards
        - Known or suspected watershed impacts
    c) Physical Setting

- Unstable geologic setting / steep slopes
- Erodible soils
- Existing landslides or active erosion sites
- Roads or watercourse crossings in poor condition
- Harsh climates and/or intense precipitation regimes
- Post-fire landscape

d) Type and Scope of Proposed Activities
- Intensity of silvicultural prescriptions and/or yarding methods
- Intensity of site preparation and/or road construction/reconstruction
- Winter operations and/or "non-standard" or "in-lieu" practices

17. This Order implements the Basin Plans by requiring the implementation of management practices to prevent exceedances of applicable water quality objectives (both numeric and narrative) and requiring the prevention of nuisance. The Order requires implementation of a monitoring and reporting program to determine effects of waste discharges on water quality and the effectiveness of management practices designed to comply with applicable water quality objectives as defined in the Basin Plans.

18. Water Code section 13242 mandates that Regional Water Boards include in their Basin Plans a plan of implementation describing how the board will regulate discharges of waste to waters of the state in a manner that will achieve water quality objectives. Water Code section 13243 provides further that "[a] regional board, in a water quality control plan or in waste discharge requirements, may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted." Water Code section 13263 also requires a Regional Water Board to prescribe requirements in WDRs that will implement the Basin Plan, including achievement of applicable water quality objectives. The conditions of this Order, including but not limited to Eligibility Criteria, Prohibitions, and requirements pertaining to Significant Existing or Potential Erosion Sites (SEPES), implement these and other applicable statutory mandates.

REGULATORY HISTORY AND COORDINATION WITH OTHER AGENCIES

19. **Non-Federal Lands**

The California Department of Forestry and Fire Protection (CAL FIRE) and the Board of Forestry (BOF)

Timberland management activities on non-federal lands in California are regulated in accordance with the Z'berg-Nejedly Forest Practice Act (FPA) (Public Resources Code § 4511 et seq.) and the California Forest Practice Rules (FPR) (California Code of Regulations, title 14, § 895 et seq.). The BOF is responsible for promulgation of the FPR in accordance with the FPA while CAL FIRE is the state agency responsible for overseeing implementation and enforcement of the FPR for timber harvest activities on non-federal lands. Non-federal landowners proposing to harvest timber for commercial purposes are required to have an approved Plan, prepared by a Registered Professional Forester (RPF), prior to starting timberland management activities. Pursuant to the FPR, the applicable Regional Water Board, California Department of Fish and Wildlife, California Geological Survey, and other responsible and local agencies participate in the review of Plans and provide recommendations to the CAL FIRE Director as part of an interdisciplinary "Review Team." As a member of the Review Team, Regional Water Board staff review proposed Plans and is provided the opportunity to participate in pre-harvest inspections (inspections conducted prior to Plan approval). CAL FIRE's Plan approval process is the functional equivalent to the California

Environmental Quality Act Environmental Impact Report process (Public Resources Code § 21080.5; see also California Code of Regulations, title 14, § 896).

Section 208 of the federal Clean Water Act (33 U.S.C. § 1288) requires states to identify areas with "substantial water quality problems" and to designate a Water Quality Management Agency (WQMA) to develop an area-wide plan for addressing water pollution. In 1988, the State Water Board (a) conditionally certified the "Water Quality Management Plan for Timber Operations on Nonfederal Lands" which included those FPR selected as best management practices and the process by which those rules are administered; (b) designated CAL FIRE and the BOF as joint Water Quality Management Agencies; and (c) executed a Management Agency Agreement (MAA) with CAL FIRE and BOF for the purpose of implementing the certified plan and WQMA designations.

The MAA required U.S. Environmental Protection Agency (U.S. EPA) approval of the State Water Board's certification of the FPR and administering processes for regulation of timberland management activities on non-federal lands in California. That approval had not occurred by the time State Board adopted the 2004 Nonpoint Source Policy. Thus, U.S. EPA approval of the State Board's certification of the FPR would not negate the legal requirement for Regional Boards to address nonpoint source pollution using one or more of the three regulatory options provided under the Nonpoint Source Policy (see Finding 12).

AB 1492

Assembly Bill 1492 was enacted in 2012 with the intent to promote and encourage sustainable forest practices; ensure continued sustainable funding for the state's forest practice program to protect the state's forest resources; and replace the piecemeal funding structure with a single funding source. To that end, AB 1492 established the Timber Regulation and Forest Restoration Fund for the purposes of achieving those goals as well as supporting forest, fisheries and wildlife habitat and water quality restoration. Further, the bill extended the potential life span of timber harvest plans filed through the CAL FIRE Review Team process on state or private lands (after 2012) from a maximum of 5 years to a maximum of 7.

The bill language also requires increases in inspections from the Review Team agencies; promotes transparency via creation of performance measures; requires identification and implementation of efficiencies in the regulation of timber harvesting between state agencies; and identifies an intent to modify the current regulatory programs to incorporate and provide incentives for best practices, and develop standards or strategies, where appropriate, to protect natural resources, including the development of plans that address road management and riparian function on an ownershipwide, watershedwide, or districtwide scale.

Finally, the bill requires an annual report to the legislature, prepared by the Secretary of the Natural Resources Agency in conjunction with the Secretary for Natural Resource Protection.

Lead responsibility for implementing the bill has been assigned to the Natural Resource Agency. Members of the Review Team agencies, including Central Valley Water Board staff, participate in AB 1492 Leadership Team meetings as well as the multiple sub-groups developed to implement the legislature's vision. Further information can be found on the Natural Resources Agency website: http://resources.ca.gov/forestry

The California Department of Fish and Wildlife (CDFW)
Pursuant to Fish and Game Code sections 1600-1616, CDFW regulates any activity on non-federal lands that does one or more of the following: 1) substantially diverts or obstructs the natural flow of any river, stream or lake; 2) substantially changes or uses any material from the bed, channel, or bank of, any river, stream, or lake; or 3) deposits or disposes of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake. CDFW may issue a Master Agreement for Timber Operations (MATO) or individual Lake or Streambed Alteration Agreements (LSAAs) to Dischargers that propose watercourse crossing work that meet one or more of these three criteria.

Watercourse crossing work conducted outside of a CAL FIRE-approved Plan or accepted Emergency (EM) Notice, but under the purview of CDFW, was not provided coverage under the Waiver; preventing Dischargers from proactively reconstructing or upgrading existing crossings on their timberlands that were not actively under a Plan. This Order creates a new enrollment category for work on existing watercourse crossings on timber production zoned land outside of a Plan or EM Notice by tiering off CDFW-executed MATOs and LSAAs.

20. **Federal Lands – U.S. Forest Service**
In 1981, pursuant to section 208 of the federal Clean Water Act, the State Water Board (a) certified a plan entitled "Water Quality Management for National Forest System Lands in California" that was developed and submitted by the U.S. Department of Agriculture, U.S. Forest Service; (b) designated the U.S. Forest Service as the WQMA for specified activities on National Forest System lands in California that may result in nonpoint source discharges, including timber management, vegetative manipulation, fuels management, road construction and watershed management; and (c) executed a MAA with the U.S. Forest Service for the purpose of implementing the certified plan and WQMA designation.

The U.S. EPA approved the State Water Board's certification of the U.S. Forest Service water quality management plan, and the management practices therein as "best management practices" (BMPs).

The 1981 MAA between the State Water Board and the U.S. Forest Service contemplates that the Water Boards will waive issuance of waste discharge requirements for U.S. Forest Service timber harvest activities that may result in nonpoint source discharges, provided that the U.S. Forest Service designs and implements its projects to fully comply with state water quality standards. However, the Central Valley Water Board's experience and monitoring have demonstrated that relying solely on the MAA framework to regulate nonpoint source activities on lands managed by the U.S. Forest Service does not result in compliance with water quality standards, and thus does not comport with the State Water Board's Nonpoint Source Policy (see Finding 12).

21. **Chronology of Timber Waiver of Waste Discharge Requirements**
On 30 January 2003, in response to legislative amendments to Water Code section 13269, the Central Valley Water Board adopted Resolution No. R5-2003-0005, which included a conditional "Waiver of Waste Discharge Requirements for Discharges Related to Timber Harvest Activities" (Waiver) as Attachment A.

On 28 April 2005, the Central Valley Water Board adopted Resolution No. R5-2005-0052, which (1) renewed the Waiver for a term of 5 years; (2) revised Attachment A; and (3) added Attachment B, "Monitoring and Reporting Conditions" and Attachment C, "Implementation, Forensic and Effectiveness Monitoring and Reporting Program".

On 18 March 2010, the Central Valley Water Board adopted Order R5-2010-0022, which renewed the Waiver and Attachments A, B, and C for 5 years.

On 4 December 2014, the Central Valley Water Board adopted Order No. R5-2014-0144, which renewed the Waiver and Attachments A, B, and C for an additional 3 years; the Waiver expires on March 31, 2018.

MONITORING AND REPORTING PROGRAM

22. Water Code section 13267(b)(1) provides:

> *In conducting an investigation specified in subdivision (a), the regional board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the regional board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports.* (2) *When requested by the person furnishing a report, the portions of a report that might disclose trade secrets or secret processes may not be made available for inspection by the public but shall be made available to governmental agencies for use in making studies. However, these portions of a report shall be available for use by the state or any state agency in judicial review or enforcement proceedings involving the person furnishing the report.*

23. Technical reports are necessary to evaluate Discharger compliance with the terms and conditions of this Order and to ensure that applicable water quality objectives are in fact being met. Consistent with Water Code section 13267, this Order requires the implementation of a monitoring and reporting program (MRP) that is designed to determine the effects of a Discharger's nonpoint source activity on water quality, to verify the effectiveness of management practices designed to comply with applicable water quality objectives, to verify the adequacy and effectiveness of the Order's conditions, and to evaluate Discharger compliance with the terms and conditions of the Order. Additional information regarding the justification for monitoring and technical reports under this Order is included in the Information Sheet.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

24. The Central Valley Water Board, acting as the lead agency for this project under the California Environmental Quality Act (CEQA)(Public Resources Code, section 21000 et seq.), conducted an Initial Study in 2002 in accordance with California Code of Regulations, title 14, section 15063. The Central Valley water Board adopted a negative declaration pursuant to CEQA on 30 January 2003 when it issued a Waiver of Waste Discharge Requirements Order No. R5-2003-0005.

25. This action to create a General Order does not require preparation of a subsequent or supplemental environmental document pursuant to the California Code of Regulations, title 14, sections 15162 or 15163. There is no evidence to indicate that substantial changes are proposed for the project, that substantial changes have occurred with respect to the circumstances of the project, or that there is new information of substantial importance with respect to the project, as described in section 15162, subdivision (a). Therefore, the environmental impacts from issuance of this Order have already been adequately assessed in accordance with CEQA (title 14, section 15061(b)(3)).

ANTIDEGRADATION

26. State Water Board Resolution 68-16 ("Statement of Policy with Respect to Maintenance of High Quality Waters in California") requires the Central Valley Water Board to regulate discharges of waste to waters of the state to achieve the highest water quality consistent with maximum benefit to the people of the state. It further requires that the Discharger meet waste discharge requirements which will result in the best practicable treatment or control of the discharge necessary to assure that pollution or nuisance will not occur and that the highest water quality consistent with maximum benefit to the people of the state will be maintained. This Order is consistent with Resolution 68-16 because it requires compliance with applicable water quality control plans, prohibits the creation of pollution or nuisance, and sets forth conditions that require Dischargers to implement additional management practices (beyond those required in the FPR and U.S. Forest Service BMP guidance manuals) to assure protection of beneficial uses of waters of the state and maintain the highest water quality consistent with maximum benefit to the people of the state.

27. This Order is in the public interest and is protective of water quality as described below:
    a) Timberland management activities in California are primarily regulated by other agencies, including CAL FIRE and the U.S. Forest Service. The Central Valley Water Board does not approve timberland management activities, but it does have authority to require compliance with the Water Code.
    b) Without this Order, timberland management activities would continue under authority of those other agencies, but such activities may not be subject to appropriate conditions protective of water quality.
    c) Without this Order, the Central Valley Water Board could regulate a smaller percentage of timberland management activities in the Region individually, but once enrolled in this Order, timberland management activities are subject to enforceable conditions.
    d) This Order contains conditions that require compliance with the Basin Plans, including applicable water quality objectives and prohibitions.
    e) This Order contains conditions requiring compliance with a MRP that will assist in the protection of water quality through assessment and verification of the adequacy and effectiveness of Order conditions and management practices.
    f) Compliance with the conditions of this Order will ensure enrolled Projects are protective of water quality.
    g) This Order does not approve of or authorize a condition of pollution or nuisance.
    h) This Order's conditions are subject to enforcement pursuant to Water Code section 13350.
    i) Given available Central Valley Water Board staff resources, this Order is an effective mechanism to regulate a large number of potential discharges and allows staff to maximize field presence.
    j) This Order allows staff to continue to participate in the review of proposed timberland management Projects, providing staff the opportunity to require implementation of

protective measures beyond those required by CAL FIRE and the U.S. Forest Service for the most critical timber operations.

k) This Order allows for inclusion of staff recommendations developed during review of Projects.

l) This Order allows for watercourse crossing reconstruction on existing crossings on timber production zoned land outside of a Plan or EM Notice that might otherwise go uncorrected for years.

m) The inclusion of a MRP allows for timely application of management practices to protect waters of the state once failures resulting in discharges or potential failures that may result in discharges have been identified.

GENERAL FINDINGS

28. Any person seeking coverage under this Order shall file the applicable eligibility document(s) with the Central Valley Water Board as described herein. Where this Order requires the submittal of a NOI, the Discharger shall complete and submit the NOI form available at: http://www.waterboards.ca.gov/centralvalley/water_issues/forest_activities/index.shtml Dischargers shall file any additional eligibility documents required by the Executive Officer.

29. An annual fee for enrollment under this Order is not required pursuant to Assembly Bill 1492, codified as Public Resources Code section 4629.6(c), which states that no currently authorized or required fees shall be charged by the Regional Water Boards for activities or costs associated with the review of Projects or permits necessary to conduct timberland management activities.

30. This Order does not apply to discharges requiring a National Pollutant Discharge Elimination System (NPDES) permit under the Clean Water Act, including silvicultural point sources as defined in 40 CFR 122.27.

31. This Order does not authorize any act that results in the taking of threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code §§ 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). If a "take" will result from any action authorized under this Order, the Discharger shall obtain appropriate take authorization prior to construction or operation of the Project. The Discharger shall be responsible for meeting all requirements of the applicable Endangered Species Acts.

32. Section 106.3 of the Water Code establishes the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This Order promotes that policy by requiring Dischargers to implement best management practices designed to achieve applicable water quality objectives developed to protect municipal and domestic water supplies.

PUBLIC NOTICE & BOARD MEETING

33. The Central Valley Water Board has notified interested agencies and persons of its intent to issue this Order for discharges of waste from timberland management activities on non-federal and federal lands, and has provided them an opportunity to participate in public workshops and to submit written comments.

34. The Central Valley Water Board conducted a public hearing on 9 June 2017, and all comments,

testimony, and evidence pertaining to this Order were heard and considered.

35. This Order is effective upon adoption by the Central Valley Water Board on 9 June 2017 and remains in effect unless rescinded or revised by the Central Valley Water Board.

IT IS HEREBY ORDERED that all Dischargers meeting the criteria and conditions for coverage under this Order shall comply with the following:

I. Prohibitions

1. The Discharger shall not create a condition of pollution, contamination, or nuisance, as defined by Water Code section 13050.

2. The Discharger shall not contribute to an exceedance of any applicable water quality objectives (whether numeric or narrative) or of any applicable state or federal water quality criteria.

3. The discharge of any waste not specifically regulated by this Order is prohibited unless (a) the Discharger complies with Water Code section 13260(a) and the Central Valley Water Board either issues WDRs pursuant to Water Code section 13263 or an individual waiver pursuant to Water Code section 13269; or (b) the discharge does not create or threaten a condition of pollution or nuisance and the timeframes in Water Code section 13264(a) have lapsed.

4. The Discharger shall not cause any point source discharge of waste to a water of the United States unless such discharge is in compliance with a duly-approved NDPES permit.

II. Provisions

1. Dischargers covered under this Order shall comply with the terms and conditions contained in this Order.

2. The Discharger shall conduct timberland management activities in accordance with (a) the CAL FIRE-approved Plan, CAL FIRE-accepted Exemption (EX) or EM Notice, or CDFW-executed MATO or LSAA, in the case of timberland management activities on non-federal timberlands; or (b) in accordance with the final environmental document/decision document prepared pursuant to the National Environmental Policy Act (NEPA) and valid third party contracts, in the case of timberland management activities on federal lands managed by the U.S. Forest Service.

3. The Discharger shall allow Central Valley Water Board staff reasonable access onto property where activities covered by this Order occur whenever requested by Central Valley Water Board staff for the purpose of performing inspections and conducting monitoring, including; sample collection, measuring, and photographing/taping to determine compliance with Order conditions. Such inspections and monitoring shall be conducted consistent with Water Code section 13267(c), Public Resources Code section 4604(b)(1), and other applicable law.

4. The Discharger shall incorporate management practices and/or water quality protective measures resulting from Central Valley Water Board staff participation in CAL FIRE's Review Team process, the Federal review process, the CDFW review process, and/or

during Project enrollment that arise from changed conditions/new information into the Project document(s) and/or NOI addendum. The Discharger may propose alternative management practices if it can demonstrate to the satisfaction of the Executive Officer that the proposed alternatives will meet water quality requirements. Alternative management practices proposed by a Discharger must comply with the Prohibitions in this Order. Until such alternative management practices receive written approval from the Executive Officer, the Discharger shall adhere to those management practices provided by Regional Water Board staff.

5. The Discharger shall maintain a copy of this Order at its primary place of business. The Discharger's designee/agents shall be provided a copy and be familiar with the contents and requirements of this Order.

6. Dischargers shall comply with the attached Monitoring and Reporting Program, Order No. R5-2017-0061, and future revisions thereto or with an individual monitoring and reporting program as specified by the Central Valley Water Board or the Executive Officer.

7. The Discharger shall comply with all applicable requirements and prohibitions of the applicable Basin Plan, including any amendments adopted by the Central Valley Water Board and approved by the State Water Board, and with all applicable policies adopted by the State Water Board.

8. The Executive Officer may require the Discharger to submit additional technical reports pursuant to Water Code section 13267.

9. Pursuant to Water Code section 13263, this Order shall not create a vested right to discharge waste to waters of the state, and all such discharges of waste shall be considered a privilege. Accordingly, the regulatory coverage provided by this Order: (a) may be modified or terminated at any time, either in its entirety or as to any individual Dischargers; (b) does not permit an illegal activity; (c) does not preclude the need for permits which may be required by federal, local, or other governmental agencies; and (d) does not preclude the Central Valley Water Board from administering enforcement remedies (including civil liability) pursuant to the Water Code.

III. Criteria and Condition Specifications by Category

Table 1 summarizes the enrollment categories and corresponding requirements under this Order. The Central Valley Water Board may determine that a Discharger's otherwise eligible Project does not qualify for enrollment under the requested category, requires enrollment in a different category, or that the Project does not quality for enrollment under the Order at all. If the Central Valley Water Board makes such a determination, it will provide prompt notice to the Discharger that enrollment in a different category is required or that enrollment under the Order is denied.

Eligibility under Category 1, 2A, or 2B assumes Discharger compliance with applicable criteria/conditions under California Code of Regulations, title 14, section 1038 (for Notices of Exemption) or title 14, section 1052 et seq. (for Emergency Notices). During a declared State of Emergency, an Executive Order may authorize CAL FIRE to suspend some or all of these criteria. In the event of such a suspension, the Central Valley Water Board hereby retains for itself the discretion to require the Discharger to meet otherwise applicable criteria under title 14, section

1038 and/or section 1052 et seq. – whether suspended by CAL FIRE or not – for eligibility under Category 1, 2A, or 2B. The Central Valley Water Board will provide prompt notice to affected Dischargers that it intends to exercise this discretion, if applicable.

Table 1. Summary of Timberland Management Activity Categories and Requirements[1]

Lead Agency		Cat.	Plans/Projects Covered	NOI, operation notification, and monitoring requirements	Pages
	CAL FIRE (non-federal)	1	• 1038 EX Notices[2,3] • 1052.1-1052.5 EM Notices[2] (*except fire salvage*) • 1104.1 Conversion Exemptions[2]	• Automatically enrolled • Agency Monitoring	15-16
		2A	• 1052.1 EM Notice[2] for fire salvage on: o Industrial timberlands; or o Non-industrial timberlands when no residence is within EM	• Automatically enrolled contingent on submittal of *NOI* and *Erosion Site Table* within 30 days of EM Notice acceptance by CAL FIRE • *Post-Fire Management and Reforestation Plan* (if applicable) • Annual Agency, Implementation, Forensic, and Effectiveness Monitoring and Summary of Operations • Updates to *Erosion Site Table* and if applicable, *Post-Fire Management and Reforestation Plan*	16-18
		2B	• 1052.1 EM Notice[2] for fire salvage when a non-industrial timberland owner's residence is within EM	• *NOI* prior to operations • Agency and Effectiveness Monitoring	19-20
		3A	• THPs, PTHPs, WFMPs, NTMPs, and other Plans[4]	• *NOI* prior to operations • Annual Agency, Implementation, Forensic, and Effectiveness Monitoring and Summary of Operations	21-23
		3B	• 1051-1051.7 modified THPs[2]; or • THPs, PTHPs, WFMPs, NTMPs, and other Plans that meet all the low threat criteria in Part III.D.2.a.ii.	• *NOI* prior to operations • Agency and Effectiveness Monitoring	21-23
	CDFW	4	• Watercourse crossing work conducted under CDFW MATO or LSAA on timber production zoned land for replacement/reconstruction of *existing* watercourse crossings outside of a Plan or EM Notice	• Submit copy of CDFW notification 30 days prior to work commencing • *NOI* 30 days prior to operations • Implementation, Forensic, and Effectiveness Monitoring	24

		Cat.	Plans/Projects Covered	NOI, operation notification, and monitoring requirements	Pages
	U.S. Forest Service	5A	• Post-fire timberland management activities (fire salvage and hazard tree removal)	• Automatically enrolled contingent on submittal of *NOI* and *Erosion Site Table* within 30 days of startup of operations • *Post-Fire Management and Reforestation Plan* (if applicable) • Annual Implementation, Forensic, and Effectiveness Monitoring and Summary of Operations • Updates to *Erosion Site Table* and if applicable, *Post-Fire Management and Reforestation Plan*	25-27
		5B	• Timber harvesting sales, vegetation management and fuels reduction, forest stand improvement and hazard tree removal, and pesticide applications associated with the aforementioned.	• *NOI* 15 days prior to operations • Annual Notice of Operations 15 days prior to startup • Annual National Core BMP monitoring protocols OR Implementation, Forensic, and Effectiveness Monitoring and Summary of Operations	28-29

[1]This table only provides an abbreviated summary of the criteria, conditions, and monitoring for categories; refer to category specific criteria/conditions and Attachments B and C for complete information.
[2]California Code of Regulations, title 14, section (as cited in table)
[3]Excludes the cutting and removal of timber and other solids wood forest products for: Christmas trees, structure protection (150 and 300 feet), and woody debris and slash removal (see Attachment A definition of "timber land management activities").
[4]THP – timber harvesting plan, PTHP – program timber harvesting plan, NTMP – non-industrial timber management plan

A. Certification of Notice of Non-Applicability on Federal and Non-Federal Lands

Enrolment under this Order is not required for Projects that (1) do not contain watercourses or wet meadows and other wet areas within or directly adjacent to the Project area AND (2) do not pose a threat to water quality or the beneficial uses of waters of the state (appurtenant roads to be considered in evaluation). **No later than ten days prior** to the startup of operations, Project proponents must submit a *Certification of Notice of Non-Applicability* signed by a duly authorized agent to the Central Valley Water Board certifying that the Project meets the criteria above.

B. Category 1: Low Threat Exemption and Emergency Notices on Non-Federal Lands

1. Eligibility Criteria: Activities that may proceed under Category 1 are those:

   a) Conducted under a CAL FIRE-accepted Exemption pursuant to California Code of Regulations, title 14, section 1038 (excludes the cutting and removal of timber and other solid wood forest products for Christmas trees, structure protection (150 and 300 feet), and woody debris and slash removal), including but not limited to:

      i. Harvesting dead, dying or diseased trees;
      ii. Substantially damaged timberland unmerchantable as sawlog;
      iii. Forest fire prevention;
      iv. Drought mortality.

   -OR-

   b) Conducted under a CAL FIRE accepted Emergency Notice pursuant to the conditions listed in California Code of Regulations, title 14, sections 1052-1052.5 (**substantially damaged timberlands from fire (fire salvage) excluded – see Categories 2A and 2B**), including, but not limited to:

      i. Harvesting dead or dying (fire salvage excluded);
      ii. Fuel hazard reduction;
      iii. Sudden Oak Death disease.

   -OR-

   c) Conducted under a CAL FIRE-accepted Conversion Exemption pursuant to California Code of Regulations, title 14, section 1104.1, including but not limited to:

      i. Less than 3 acres for the purpose of fuels reduction and/or construction activities;
      ii. Public agency, public and private utility right-of-way.

2. Enrollment: Projects meeting the eligibility criteria listed above for Category 1 are *automatically* enrolled under the Order and must comply with the conditions listed below.

3. Conditions:

   a) The Discharger shall submit a copy of the CAL FIRE-accepted Exemption or Emergency Notice if requested by the Central Valley Water Board.

   b) For Conversion Exemptions that will be for the purpose of residential or commercial development, the Discharger must obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity (Construction General Permit), State Water Board Order No. 2009-0009-DWQ prior to construction activities that disturb one or

more acres or activities that disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres.

c) For Exemption Notices (typically less than 3 acre conversions), for cannabis cultivation, the Discharger may need to obtain coverage under the General Permit for Discharges of Waste Associated with Medicinal Cannabis Cultivation Activities, Order No. R5-2015-0113 or any applicable Order that the State Water Board may adopt in the future to regulate cannabis cultivation.

d) The Discharger shall comply with all conditions specified in Attachment B, Monitoring and Reporting Program, Order No. R5-2017-0061, including notifying the Central Valley Water Board whenever: (1) Agency Monitoring detects a violation of the California Forest Practice Rules that relate to water quality protection measures; or (2) management measures fail and result in a discharge, or the potential to discharge, waste to waters of the state.

C. Categories 2A and 2B: Emergency Notices Related to Fire Salvage on Non-Federal Lands

Category 2A (Industrial Fire Salvage and Non-Industrial Fire Salvage With No Residence)

1. Eligibility Criteria: Activities that may proceed under Category 2A are those conducted under a CAL FIRE-accepted Emergency Notice pursuant to the conditions listed in California Code of Regulations, title 14, section 1052.1 for:

   a) Fire Salvage, for **industrial** timberlands.

   -OR-

   b) Fire salvage, for **non-industrial** timberlands when a **residence is not within the Emergency area**.

2. Enrollment: Projects meeting the eligibility criteria listed above for Category 2A are *automatically* enrolled under the Order when the Discharger submits a copy of the Emergency Notice accepted by CAL FIRE to the Central Valley Water Board.

3. Conditions: Dischargers conducting timberland management activities that meet the eligibility criteria for Category 2A listed above must comply with all of the following conditions, as applicable:

   a) The Central Valley Water Board must receive a **complete *NOI for Category 2A* and *Erosion Site Table*** (see Table 1 in Category 2A *NOI*) **within 30 days of Emergency Notice acceptance by CAL FIRE,** signed by the timberland/timber owner, certifying that the activities meet the criteria and conditions for enrollment in Order Category 2A. The Discharger shall provide timely amendments of the *Erosion Site Table* throughout Emergency Notice enrollment to the Central Valley Water Board when conditions or management objectives have changed.

   b) **IF pesticides will be applied following the fire**, THEN the Discharger shall **EITHER**:

      i. **Submit a Post-Fire Management and Reforestation Plan** (PFP; see Attachment C) **to the Central Valley Water Board for approval prior to application of pesticides** within the post-fire management and reforestation plan area. The PFP shall include measures that will provide equal to or better protection than the conditions under Part III.C.3.b.ii below. **The Executive Officer's written approval of the PFP is required**

before implementation of the PFP can satisfy the requirements of this Part III.C.3.b.; approval or denial of the PFP shall be provided within 30 days of PFP submittal.

-OR-

ii. Meet **ALL** of the following conditions:

1. The Discharger shall **comply with the following pesticide no-spray buffers** (unless more stringent buffers are dictated by application labels/guidance, statute, or regulation):

    a. For Class I and II watercourses, the applicable WLPZ widths specified in the California Code of Regulations, title 14, section 936.5;

    b. For Class III and IV watercourses, a minimum of 25 feet where sideslope steepness is less than 30%, and a minimum of 50 feet where sideslope steepness is 30% or greater.

2. Where management activities are planned on a burned area with **slopes greater than 30%, a minimum of 50% average effective groundcover** (see Attachment C for guidance) **is required to be documented prior to pesticide application**. Documentation shall be provided to the Central Valley Water Board in the pesticide notification **30 days prior to application**.

3. The Discharger shall **notify** the Central Valley Water Board **in writing at least 30 days prior to any proposed application of pesticides**. The notification does *not* need to include information on hack and squirt or individual stump applications. The written notification shall include the pesticide product(s) to be applied, the proposed date(s) of application, the method(s) of application, the area(s) of application (CAL FIRE Notice number and Township/Range/Section), a description of measures that will be employed to assure compliance with the applicable Basin Plan, and documentation of 50% or greater effective groundcover (as applicable). Subsequent changes to the proposal must be submitted in writing no less than 48 hours prior to pesticide application.

c) The Discharger shall meet the following conditions unless Central Valley Water Board staff has been consulted and agrees to alternative protection measures as warranted by site-specific conditions (see Part II.4.) and/or as requested by the Discharger when such protection is inconsistent with land management objectives:

i. A minimum Equipment Limitation Zone for any and all Class III and Class IV watercourses of at minimum 25 feet where sideslope steepness is less than 30%, and at a minimum 50 feet where sideslope steepness is 30% or greater.

ii. Culverts or other permanent in-stream structures at watercourse crossings in which water is flowing at the time of installation shall be installed with their necessary protective structures (i.e. armoring, wing walls, diversion prevention measures) concurrently with fill placement. Additionally, installation shall utilize methods to temporarily isolate or divert stream flows from the installation area while maintaining bypass flows or as specified in an executed MATO or LSAA from CDFW.

iii. Any and all riparian vegetation, other than commercial species, that is found along watercourses and lakes or that is found within or bordering wet meadows and other wet areas shall be retained and protected to the extent feasible during timberland management activities.

d) *IF*:

i. Activities are undertaken pursuant to a CAL FIRE Notice on which Central Valley Water Board staff has not consulted; *AND*

ii. In the CAL FIRE Notice or *NOI* the Discharger proposes *EITHER*

1. Timberland management activities on soils with extreme erosion hazard rating (post-fire), known landslides, and/or unstable areas *that have the potential to impact water quality*, *OR*
2. Any watercourse crossing that involves the placement of more than 500 cubic yards or 25 vertical feet of fill material,

THEN additional field review must be conducted or directed by a licensed civil engineer or licensed geologist prior to the startup of operations to determine if activities conducted under the CAL FIRE Notice could cause or exacerbate the potential for soil erosion or mass soil movement. The CAL FIRE Notice or NOI addendum must incorporate all recommendations made by said licensed engineer or geologist for the specific site conditions listed above.

e) The Discharger shall submit copies of any CDFW **notification(s)** for watercourse crossing work within the burn area associated with a MATO or LSAA **within 30 days of filing the notification with CDFW**.

f) For a CAL FIRE Notice where aquatic or wetland habitat for rare, threatened or endangered species is identified and where timberland management activities may impact such habitat, additional field review shall be conducted prior to the startup of operations by a scientist, with a bachelor's or advanced degree in biological sciences and experience in aquatic systems, and/or a qualified professional trained in biological assessments to determine if the Notice could adversely affect such species or their habitat. The CAL FIRE Notice or NOI addendum must incorporate all project modifications and mitigation measures recommended by the scientist/professional to avoid impacts to rare, threatened, or endangered species.

g) If mine tailings and/or associated waste rock will be disturbed or used as construction materials as part of timberland management activities, the Discharger shall contact Central Valley Water Board staff to discuss proper characterization of the materials to ensure prior to such disturbance or use there will be no adverse impacts to water quality and beneficial uses.

h) The Discharger shall comply with all the conditions specified in Attachment B, Monitoring and Reporting Program, Order No. R5-2017-0061. Category 2A will be subject to agency, implementation, forensic, and effectiveness monitoring; an annual operations summary; and updates to the *Erosion Site Table* and PFP (as applicable).

i) The Discharger shall seek termination of coverage under the Order in accordance with Part V.A., Termination of Coverage.

Category 2B (Non-Industrial Fire Salvage with Residence)

4. Eligibility Criteria: To be eligible for enrollment under Category 2B, activities must be:

    a) Conducted under a CAL FIRE-accepted Emergency Notice pursuant to the conditions listed in California Code of Regulations, title 14, section 1052.1 for **fire salvage**, when a **non-industrial** timberland owner's **residence is within the Emergency area**.

5. Enrollment: Projects that meet the Category 2B eligibility criteria shall enroll under this Order by submitting the following **prior to operations commencing**: (1) a copy of the CAL FIRE-accepted Notice, and (2) a single *NOI for Categories 2B, 3A, and 3B*, signed by the timberland/timber owner, certifying that the activities meet the criteria and conditions for enrollment in Order Category 2B. **Central Valley Water Board staff will review and respond to the *NOI* within 15 days of receipt; activities may commence in compliance with this Order once the Central Valley Water Board has issued a Notice of Applicability (NOA) to the Discharger indicating that the *NOI* is complete**.

6. Conditions: Dischargers conducting timberland management activities under Category 2B must comply with the following conditions, as applicable:

    a) The Discharger must meet the following conditions unless Central Valley Water Board staff has been consulted and agrees to alternative protection measures as warranted by site-specific conditions (see Part II.4.) and/or as requested by the Discharger when such protection is inconsistent with land management objectives:

        i. A minimum Equipment Limitation Zone for any and all Class III and Class IV watercourses of at minimum 25 feet where sideslope steepness is less than 30%, and at a minimum 50 feet where sideslope steepness is 30% or greater.

        ii. Culverts or other permanent in-stream structures at watercourse crossings in which water is flowing at the time of installation shall be installed with their necessary protective structures (i.e. armoring, wing walls, diversion prevention measures) concurrently with fill placement. Additionally, installation shall utilize methods to temporarily isolate or divert stream flows from the installation area while maintaining bypass flows or as specified in an executed MATO or LSAA from CDFW.

        iii. Any and all riparian vegetation, other than commercial species, that is found along watercourses and lakes or that is found within or bordering wet meadows and other wet areas shall be retained and protected to the extent feasible during timberland management activities.

    b) *IF*:

        i. Activities are undertaken pursuant to a CAL FIRE Notice on which Central Valley Water Board staff has not consulted; *AND*

        ii. The CAL FIRE Notice proposes *EITHER*

            1. Timberland management activities on soils with extreme erosion hazard rating (post-fire), known landslides, and/or unstable areas *that have the potential to impact water quality*, *OR*
            2. Any watercourse crossing that involves the placement of more than 500 cubic yards or 25 vertical feet of fill material,

THEN additional field review must be conducted or directed by a licensed civil engineer or registered geologist prior to the startup of operations to determine if the CAL FIRE Notice could cause or exacerbate the potential for soil erosion or mass soil movement. The CAL FIRE Notice or NOI addendum must incorporate all recommendations made by said licensed engineer or geologist for the specific site conditions listed above.

c) The Discharger shall submit copies of any CDFW **notification(s)** for watercourse crossing work within the burn area associated with a MATO or LSAA **within 30 days of filing the notification with CDFW**.

d) For a CAL FIRE Notice where aquatic or wetland habitat for rare, threatened or endangered species is identified and where timberland management activities may impact such habitat, additional field review shall be conducted prior to the startup of operations by a scientist, with a bachelor's or advanced degree in biological sciences and experience in aquatic systems, and/or a qualified professional trained in biological assessments to determine if the Notice could adversely affect such species or their habitat. The CAL FIRE Notice or NOI addendum must incorporate all project modifications and mitigation measures recommended by the scientist/professional to avoid impacts to rare, threatened, or endangered species.

e) The Discharger shall **notify** the Central Valley Water Board in writing at least **15 days prior to any proposed application of pesticides**; the notification does *not* need to include information on hack and squirt or individual stump applications. The written notification shall include the pesticide product(s) to be applied, the proposed date(s) of application, the method(s) of application, the area(s) of application (Notice number and Township/Range/Section), and a description of measures that will be employed to assure compliance with the applicable Basin Plan. Subsequent changes to the proposal must be submitted in writing no less than 48 hours prior to pesticide application.

f) If mine tailings and/or associated waste rock will be disturbed or used as construction materials as part of timberland management activities, the Discharger shall contact Central Valley Water Board staff to discuss proper characterization of the materials to ensure prior to such disturbance or use there will be no adverse impacts to water quality and beneficial uses.

g) The Discharger shall comply with all the conditions specified in Attachment B, Monitoring and Reporting Program, Order No. R5-2017-0061. Category 2B will be subject to agency and effectiveness monitoring.

h) The Discharger shall seek termination of coverage under the Order in accordance with Part V.A., Termination of Coverage.

D. Categories 3A and 3B: Plans that Receive Discretionary Approval from CAL FIRE on Non-Federal Lands

Category 3A (Plans With a Higher Threat to Water Quality)

1. Eligibility Criteria: To be enrolled under Category 3A, activities must meet the following criteria:

   a) The covered activities are timberland management activities on non-federal lands that receive discretionary approval from CAL FIRE, including but not limited to:

      i. Timber harvesting plans;
      ii. Program timber harvesting plans;
      iii. Working forest management plans;
      iv. Non-industrial timber management plans;
      v. Other Plans.

   b) The approved Plan documents or *NOI* addendum include additional management practices and/or water quality protective measures (beyond the requirements of the current Forest Practice Rules) identified during the CAL FIRE Review Team process and/or during Project enrollment (i.e. changed conditions/new information)(see Part II.4.).

Category 3B (Plans With a Lower Threat to Water Quality)

2. Eligibility Criteria: To be enrolled under Category 3B, activities must meet the following criteria:

   a) The covered activities are timberland management activities on non-federal lands that receive discretionary approval from CAL FIRE, including but not limited to:

      i. Modified timber harvesting plans pursuant to California Code of Regulations, title 14, sections 1051-1051.7;

      -OR-

      ii. Timber harvesting plans, program timber harvesting plans, working forest management plans, non-industrial timber management plans, and other Plans that comply with all of the following criteria:

         1) No timberland management activities (i.e. watercourse crossing, road, and/or landing reconstruction/construction/abandonment) within the standard width of a WLPZ or ELZ (as defined in CCR, title 14, section 936.5), wet meadows and other wet areas, ***except*** for: 1) the use and maintenance (not reconstruction) of ***existing*** stable roads and associated watercourse crossings in good working condition that ***will not result in a significant sediment discharge***, and 2) the installation and use of ***dry*** Class III watercourse tractor crossings;
         2) No significant existing or potential erosion sites;
         3) No ground-based equipment on high or extreme Erosion Hazard Rating (EHR) that may result in a significant sediment discharge;
         4) No timberland management activities conducted in-lieu of the standard WLPZ practices contained in the Forest Practice Rules.

   b) The approved Plan documents or *NOI* addendum include additional management practices and/or water quality protective measures (beyond the requirements of the current Forest

Practice Rules) identified during the CAL FIRE Review Team process and/or during Project enrollment (i.e. as a result of changed conditions/new information) (see Part II.4.).

3. Enrollment: Dischargers conducting activities that meet the criteria of Category 3A or 3B shall enroll under this Order as follows:

   a) The Discharger shall submit a copy of the CAL FIRE approved Plan if requested by Central Valley Water Board staff. The Plan must incorporate additional or modified management practices and/or water quality protective measures resulting from the CAL FIRE Review Team process.

   b) The Discharger shall submit a single completed *NOI for Categories 2B, 3A, and 3B* **prior to operations commencing**, signed by the timberland/timber owner, certifying that the activities meet the criteria and conditions contained in either Order Category 3A or 3B. **Central Valley Water Board staff will review and respond to the *NOI* within 15 days of receipt; activities may commence once the Central Valley Water Board has issued a NOA to the Discharger indicating that their NOI is complete**.

4. Conditions: Dischargers conducting timberland management activities under Category 3A or 3B must comply with the following conditions, as applicable:

   a) For CAL FIRE-approved **NTMPs** that do not incorporate the FPR "Road Rules" (Cal. Code Regs., tit. 14, art. 12) which became effective January 2015, the Discharger must submit an inventory of significant existing or potential erosion sites, as detailed in California Code of Regulations, Title 14, section 923.1(e), to the Central Valley Water Board **at least 15 days prior to commencement of timberland management activities**. The erosion inventory shall: (1) be prepared by a RPF; (2) encompass the NTO area and appurtenant roads at a minimum; and (3) include an implementation schedule for treatment of erosion sites.

   b) *IF*:
      i. Activities are undertaken pursuant to a Plan on which Central Valley Water Board staff has not consulted; *AND*

      ii. In the Plan the Discharger proposes *EITHER*
         1. Timberland management activities on soils with extreme erosion hazard rating, known landslides, and/or unstable areas *that have the potential to impact water quality*, *OR*
         2. Any watercourse crossing that involves the placement of more than 500 cubic yards or 25 vertical feet of fill material,

      THEN additional field review must be conducted or directed by a licensed civil engineer or registered geologist prior to the startup of operations to determine if activities conducted under the Plan could cause or exacerbate the potential for soil erosion or mass soil movement. The Plan or NOI addendum must incorporate all recommendations made by said licensed engineer or geologist for the specific site conditions listed above.

   c) Culverts or other permanent in-stream structures at watercourse crossings in which water is flowing at the time of installation shall be installed with their necessary protective structures (e.g. armoring, wing walls, diversion prevention measures) concurrently with fill placement. Additionally, installation shall utilize methods to temporarily isolate or divert stream flows

from the installation area while maintaining bypass flows or as specified in an executed MATO or LSAA from CDFW.

d) For Plans that will be for the purpose of cannabis cultivation, the Discharger may need to obtain coverage under the General Permit for Discharges of Waste Associated with Medicinal Cannabis Cultivation Activities, Order No. R5-2015-0113 or any applicable Order that the State Water Board may adopt in the future to regulate cannabis cultivation.

e) If mine tailings and/or associated waste rock will be disturbed or used as construction materials as part of timberland management activities, the Discharger shall contact Central Valley Water Board staff to discuss proper characterization of the materials to ensure prior to such disturbance or use there will be no adverse impacts to water quality and beneficial uses.

f) The Discharger shall comply with all the conditions specified in Attachment B, Monitoring and Reporting Program, Order No. R5-2017-0061.

g) The Discharger shall **notify** the Central Valley Water Board in writing at least **15 days prior to any proposed application of pesticides**; the notification does *not* need to include information on hack and squirt or individual stump applications. The written notification shall include the pesticide product(s) to be applied, the proposed date(s) of application, the method(s) of application, the area(s) of application (Plan number and Township/Range/Section), and a description of measures that will be employed to assure compliance with the applicable Basin Plan. Subsequent changes to the proposal must be submitted in writing no less than 48 hours prior to pesticide application.

h) The Discharger shall seek termination of coverage under the Order in accordance with Part V.A., Termination of Coverage.

For **non-expiring Plans** (such as NTMPs and WFMPs), the Discharger has the following enrollment/termination options: (1) enroll and terminate with each entry (NTO/Notice), or (2) remain continuously enrolled for the duration of the Plan with an additional requirement to certify in the annual report when discharges associated with timberland management activities for each NTO/Notice area have ceased prior to cessation of monitoring for that entry (see Attachment B, Part V.B.).

E. Category 4: Watercourse Crossing Work Conducted under a MATO or LSAA Outside of a Plan / Emergency Notice on Non-Federal Lands

1. Eligibility Criteria: To be enrolled under Category 4, activities must meet the following criteria:

    a) The activities are conducted under a CDFW-executed MATO or LSAA on timber production zoned land pursuant to the conditions listed in Fish and Game Code sections 1600-1616 for replacement/reconstruction of *existing* watercourse crossings outside of a CAL FIRE accepted EM Notice or approved Plan.

    b) A *NOI* is submitted on a project-by-project basis (i.e. no long-term enrollment of a MATO).

    c) The CDFW notification/sub-notification or *NOI* incorporates any water quality protective measures identified during review of the project (see Part II.4.).

2. Enrollment: Dischargers conducting timberland management activities under Category 4 shall enroll under this Order by complying with the following:

    a) Submit a copy of the CDFW notification to Central Valley Water Board staff concurrent with submittal to CDFW; at a minimum**, the notification must be submitted at least 30 days prior to work commencing**. The scope of the notification shall encompass all information required by the applicable MATO or CDFW Form FG2023 for an individual LSAA. The Discharger shall notify the Central Valley Water Board if CDFW declares the notification incomplete or requests additional information.

    b) Submit a *NOI for Category 4* **at least 30 days prior to operations commencing** signed by the timberland/timber owner certifying that the activities meet the criteria and conditions required in Category 4. Activities may commence once the Central Valley Water Board has issued a NOA to the Discharger indicating that their NOI is complete

3. Conditions: Dischargers conducting timberland management activities enrolled under Category 4 shall comply with the following conditions:

    a) Comply with all water quality management practices identified in the CDFW-executed MATO or LSAA and shall provide any amendments/project changes to the Central Valley Water Board for review in a timely manner. The Discharger shall submit a copy of the LSAA and appropriate CEQA documentation to the Central Valley Water Board. A MATO shall only be submitted when requested.

    b) Notify Central Valley Water Board staff of any scheduled site visit with CDFW staff; Central Valley Water Board staff retains the discretion to require a site visit in accordance with Part II.3.

    c) The Discharger shall comply with all the requirements specified in Attachment B, Monitoring and Reporting Program, Order No. R5-2017-0061. Category 4 will be subject to Implementation, Forensic, and Effectiveness Monitoring.

    d) The Discharger shall seek termination of coverage under the Order in accordance with Part V.A., Termination of Coverage.

F. Categories 5A and 5B: Timberland Management Activities on Federal Lands Managed by the U.S. Forest Service

Category 5A (Post-Fire Activities)

1. Eligibility Criteria: To be enrolled under Category 5A, activities must meet the following criteria:

   a) Post-fire timberland management activities (e.g. fire salvage and post-fire hazard tree removal for commercial purposes) that have the potential to impact water quality, excluding emergency work conducted during or immediately (within 60 days) after the fire, on federal lands where the U.S. Forest Service has conducted the required or appropriate level of multi-disciplinary review of the timber harvesting proposal and has specified best management practices and additional control measures as needed, in order to assure compliance with the applicable Basin Plan.

   b) The U.S. Forest Service has provided Project description documents to the Central Valley Water Board and allowed time for adequate review and comment. These documents include: 1) the NEPA scoping document; and 2) the NEPA draft environmental analysis, which will include site specific information that identifies Significant Existing or Potential Erosion Sites (SEPES) and priority road improvement locations, as well as, proposed treatments and schedule for those sites to improve or protect water quality. Supplemental project documents may also be provided that contain design specifications, management practices, and/or water quality protection measures. Any additional management practices and/or water quality protective measures identified by Central Valley Water Board staff during the scoping period and/or enrollment under this Order will have been discussed with U.S. Forest Service personnel and incorporated into an addendum to the *NOI* (see Part II.4.), including a timeline and checklist for completion. The project will remain enrolled until all identified management practices and/or water quality protective measures have been completed.

   c) The U.S. Forest Service has conducted a cumulative watershed effects (CWEs) analysis, where required or appropriate, and included specific measures needed to reduce the potential for CWEs in order to assure compliance with the applicable Basin Plan.

2. Enrollment: Projects meeting the Category 5A eligibility criteria are *automatically* enrolled under this Order when the U.S. Forest Service submits copies of final project specific decision/NEPA documents that contain information documenting compliance with the eligibility criteria in Part III.F.1.

   The U.S. Forest Service shall include all specific on-the-ground prescriptions designed to adhere to the BMPs described in *National Best Management Practices for Water Quality Management on National Forest System Lands, Volume 1: National Core BMP Technical Guide*, and all additional management practices and/or water quality protective measures identified by Central Valley Water Board staff (See Part II.4.) within contracts, permits, agreements, and other instruments used to direct the activities of contractors, permittees, U.S. Forest Service personnel, volunteers, and any other third party.

3. Conditions: Dischargers conducting timberland management activities enrolled under Category 5A must comply with the following conditions, as applicable:

   a) The U.S. Forest Service shall submit **a complete *NOI for Category 5A* and *Erosion Site Table*** (see Table 1 in Category 5A NOI) **within 30 days of startup of operations,** signed by

a duly authorized representative, certifying that the activities meet the criteria and conditions for enrollment in Order Category 5A. The U.S. Forest Service shall provide timely amendments of the *Erosion Site Table* to the Central Valley Water Board throughout Project enrollment when conditions or management objectives have changed.

b) For Projects that were included in a Burned Area Emergency Response (BAER) evaluation, the U.S. Forest Service may submit the BAER report in-lieu of the *Erosion Site Table*, if the report includes all the required information (including implementation schedule) and the Discharger intends to implement the BAER recommendations that have a nexus with water quality protection. If the BAER report is incomplete, and does not contain all of the information required in the *Erosion Site Table*, the U.S. Forest Service may submit an addendum to the BAER report with missing or incomplete information.

c) **IF <u>pesticides</u> will be applied following the fire**, THEN the Discharger shall **EITHER**:

i. **Submit a Post-Fire Management and Reforestation Plan** (PFP; see Attachment C) **to the Central Valley Water Board for approval prior to application of pesticides** within the post-fire management and reforestation plan area. The PFP shall include measures that will provide equal to or better protection than the conditions under Part III.F.3.c.ii below. The Executive Officer's written approval of the PFP is required before implementation of the PFP can satisfy the requirements of this Part III.F.3.c.; **approval or denial of the PFP shall be provided within 30 days of PFP submittal**.

-OR-

ii. Meet **ALL** the following conditions:

1. The Discharger must **comply with the following pesticide no-spray buffers** (unless more stringent buffers are dictated by application labels/guidance, statute, or regulation):

a. Perennial or intermittent watercourses which have: (1) surface domestic water use from and/or within 100 feet downstream of operations area and/or (2) fish always or seasonally present onsite, includes habitat to sustain fish migration and spawning, shall utilize the appropriate **Class I WLPZ width(s)** specified in the California Code of Regulations, title 14, section 936.5.

b. Perennial or intermittent watercourses which have: (1) fish always or seasonally present off-site within 1000 feet downstream (excludes intermittent or ephemeral watercourses with no aquatic life that are tributary to watercourses described under (a) above) and/or (2) aquatic habitat for nonfish aquatic species (aquatic insects and/or other physical habitat indicators such as riparian and aquatic vegetation, watercourse debris, and potential for small pool formation), shall utilize the appropriate **Class II WLPZ width(s)** specified in the California Code of Regulations, title 14, section 936.5.

c. Ephemeral or intermittent watercourses with no aquatic life present, watercourse shows evidence of being capable of sediment transport to watercourses described under (a) and (b) above, shall utilize a minimum of **25 feet** where sideslope steepness is **less than 30%,** and a minimum of **50 feet** where sideslope steepness is **30% or greater**.

2. Where management activities are planned on a burned area with **slopes greater than 30%, a minimum of 50% average effective groundcover** (see Attachment C for guidance) **is required to be documented prior to pesticide application**. Documentation shall be provided to the Central Valley Water Board in the pesticide notification **30 days prior to application**.

3. The Discharger shall adhere to the resource protection measures in the Chemical Use Management Activities as designated in the National Best Management Practices for Water Quality Management on National Forest System Lands (USDA April 2012).

4. The Discharger shall **notify** the Central Valley Water Board **in writing at least 30 days prior to any proposed application of pesticides**; the notification does *not* need to include information on hack and squirt or individual stump applications. The written notification shall include the pesticide product(s) to be applied, the proposed date(s) of application, the method(s) of application, the area(s) of application (Township/Range/Section), a description of measures that will be employed to assure compliance with the applicable Basin Plan, and documentation of 50% or greater effective groundcover (as applicable). Subsequent changes to the proposal must be submitted in writing no less than 48 hours prior to pesticide application.

d) For approved Projects that require enrollment under the Order, the Discharger shall **notify the Central Valley Water Board each year at least 15 days prior to start of operations**.

e) The U.S. Forest Service shall comply with all conditions specified in Attachment B, Monitoring and Reporting Program, Order No. R5-2017-0061. Category 5A will be subject to Implementation, Forensic, and Effectiveness Monitoring; an Annual Summary of Operations; and amendments/updates to the *Erosion Site Table* and PFP (as applicable).

f) The U.S. Forest Service shall seek termination of coverage under the Order in accordance with Part V.A., Termination of Coverage.

Category 5B (All timberland management activities except post-fire activities)

4. Eligibility Criteria: To be enrolled under Category 5B, activities must meet the following criteria:

   a) Timberland management activities (see definition of "timberland management activities" as it relates to activities that are commercial in nature) on federal lands where the U.S. Forest Service has conducted a multi-disciplinary review of the timber harvesting proposal and has specified best management practices and additional control measures as needed in order to assure compliance with the applicable Basin Plan. Timberland management activities may include, but are not limited to:

      i. Timber harvesting sales;
      ii. Vegetation management and fuels reduction projects;
      iii. Forest stand improvement and hazard tree removal (excluding hazard tree removal projects that do not pose a threat to water quality (i.e. isolated tree removal in campgrounds, etc.));
      iv. Pesticide applications associated with Part III.F.4.a.i.,ii.,iii. above.

   b) The U.S. Forest Service has provided Project description documents to the Central Valley Water Board and allowed time for adequate review and comment. These documents include: 1) the NEPA scoping document; and 2) the NEPA draft environmental analysis, which will include site specific information that identifies SEPES and priority road improvement locations, as well as, proposed treatments and schedule for those sites to improve or protect water quality. Supplemental project documents may also be provided that contain design specifications, management practices, and/or water quality protection measures. Any additional management practices and/or water quality protective measures identified by Central Valley Water Board staff during the scoping period and/or enrollment under this Order will have been discussed with U.S. Forest Service personnel and incorporated into an addendum to the NOI (see Part II.4.), including a timeline and checklist for completion. The project will remain enrolled until all identified management practices and/or water quality protective measures have been completed.

   c) The U.S. Forest Service has conducted a CWE analysis, where required or appropriate, and included specific measures needed to reduce the potential for CWEs in order to assure compliance with the applicable Basin Plan.

5. Enrollment: To enroll under Category 5B, the U.S. Forest Service shall comply with the following:

   a) Submit to the Central Valley Water Board copies of final decision documents that contain information documenting compliance with the eligibility criteria above. A copy of applicable final NEPA documents shall be submitted upon written request by Central Valley Water Board staff.

   b) Submit a *NOI for Category 5B* **at least 15 days prior to operations commencing**, signed by a duly authorized representative, certifying that the activities meet the criteria and conditions for Order Category 5B. Activities may commence once the Central Valley Water Board has issued a NOA to the Discharger indicating that the NOI is complete.

   c) Submit all specific on-the-ground prescriptions designed to adhere to the U.S. Forest Service BMPs as described in *National Best Management Practices for Water Quality Management on National Forest System Lands, Volume 1: National Core BMP Technical Guide*, and all additional management practices and/or water quality protective measures

identified by Central Valley Water Board staff (See Part II.4.) within contracts, permits, agreements, and other instruments used to direct the activities of contractors, permittees, U.S. Forest Service personnel, volunteers, and any other third party.

6. Conditions: Dischargers conducting timberland management activities enrolled under Category 5B shall comply with the following conditions, as applicable:

   a) For approved Projects that require enrollment under the Order, the Discharger shall **notify the Central Valley Water Board each year at least 15 days prior to start of operations**.

   b) The Discharger shall **notify the Central Valley Water Board, in writing, at least 15 days prior to any proposed application of pesticides**; the notification does *not* need to include information on hack and squirt or individual stump applications. The written notification shall include the pesticide product(s) to be applied, the proposed date(s) of application, the method(s) of application, project name, area(s) of application (include map), and a description of measures that will be employed to assure compliance with the applicable Basin Plan. Subsequent changes to the proposal must be submitted in writing no less than 48 hours prior to pesticide application.

   c) The U.S. Forest Service shall comply with all conditions specified in Attachment B, Monitoring and Reporting Program, Order No. R5-2017-0061.

      Category 5B will be subject to one National Core BMP monitoring protocol as dictated by Project activities. In addition, one additional National Core BMP monitoring protocol will be required when the Discharger's cumulative watershed effects analysis indicates that the project, combined with other U.S. Forest Service projects conducted in the watershed over the past 10 years, may cause any watershed or sub-watershed to exceed a threshold of concern as determined by various models (i.e., Equivalent Roaded Acres (ERA), Surface Erosion (USLE), Mass Wasting (GEO), etc.). Dischargers have the option to conduct the standard Implementation, Forensic, and Effectiveness monitoring at the Project level in lieu of the National Core BMP monitoring protocols.

   d) The U.S. Forest Service shall seek termination of coverage under the Order in accordance with Part V.A., Termination of Coverage.

IV. Notice of Intent

To apply for coverage under this Order, the Discharger must submit a timely and complete category-specific Notice of Intent for approval by the Executive Officer as follows:

Category	*Non-federal*	*Federal*	*Required Forms*
No threat	X	X	*Notice of Non-Applicability (NONA)*
1	X		None[1]
2A	X		*NOI for Category 2A* and *Erosion Site Table*[2]
2B, 3A, or 3B	X		*NOI for Categories 2B, 3A, and 3B*
4	X		*NOI for Category 4*
5A		X	*NOI for Category 5A* and *Erosion Site Table*[3]
5B		X	*NOI for Category 5B*

[1]Automatically enrolled; submission of a NOI is not required.
[2]Automatically enrolled contingent on submittal of a complete NOI and Erosion Site Table within 30 days of CALFIRE acceptance of EM Notice.
[3]Automatically enrolled contingent on submittal of a complete NOI and Erosion Site Table within 30 days of startup of operations.

Timberland management activities may commence for Categories 2B, 3A, 3B, 4, and 5B once Central Valley Water Board staff has reviewed the NOI for completeness/accuracy and has issued a Notice of Applicability (NOA). Categories 2A and 5A are automatically enrolled but require timely submittal of a complete *NOI* and *Erosion Site Table* as a condition of this Order.

V. Termination of Coverage

A. Initiated by Discharger

The following criteria must be satisfied before termination of Order coverage will be considered by the Executive Officer:

- Timberland management activities are completed;
- All Category specific eligibility criteria/conditions were met;
- All elements of required monitoring and reporting have been completed;
- Soil disturbed by timberland management activities has stabilized;
- Pesticide applications have ceased and are not proposed in the foreseeable future;
- All feasible management measures and mitigations identified in the required Erosion Site Table (Category 2A/5A) and/or Post-Fire Management Plan (as applicable) have been completed and discharges have ceased.

In signing the Notice of Termination (NOT), the Discharger or U.S. Forest Service representative shall certify that: (1) the enrolled Project was conducted in conformance with the approved Plan, accepted CAL FIRE Notice, approved MATO/LSAA, or U.S. Forest Service Project requirements, as well as all applicable eligibility criteria/conditions and other applicable Provisions of this Order; and (2) discharges resulting from timberland management activities (including those associated

with pesticide applications) were in compliance and will continue to comply with all requirements of the applicable Basin Plan.

The NOT shall be reviewed for compliance with the above criteria. A field inspection may be conducted to verify compliance with all applicable requirements under this Order. The Central Valley Water Board shall notify the Discharger **within 90 days** following receipt of a NOT of approval or denial.

Non-federal Projects - The Discharger may terminate coverage under this Order by submitting to the Central Valley Water Board a signed Notice of Termination (NOT) and a CAL FIRE-approved final completion RM-71 form (if available and applicable).

Federal Projects - The Discharger may terminate coverage under this Order by submitting to the Central Valley Water Board a NOT signed by the Forest Supervisor or District Ranger.

B. Initiated by Executive Officer

The Executive Officer may terminate the applicability of this Order for a Project if any of the following determinations are made:

1. The proposed timberland management activities do not comply with the eligibility criteria for this Order.
2. The timberland management activities are not in compliance with the applicable conditions of this Order.
3. The proposed timberland management activities are reasonably likely to cause or contribute to a violation of an applicable Basin Plan or policy. In making this determination, the Executive Officer will consider the recommendations of Central Valley Water Board staff that participated in the review of the proposed timberland management activities, if any.
4. A timberland management activity has varied in whole or in any part from the approved Project, unless these changes result in better protection of water quality.

Upon receipt of notice of termination of applicability of the Order initiated by the Executive Officer, the Discharger shall immediately cease all timberland management activities that may result in discharges to waters of the state, other than activities necessary to control erosion. Before a Discharger may recommence timberland management activities that may result in discharges of waste to waters of the state, the Discharger must follow the applicable procedure either for enrolling under this Order or for obtaining individual waste discharge requirements pursuant to Water Code section 13260. Pursuant to Water Code section 13264, such activities may not recommence unless and until the Discharger receives a NOA under this Order or individual waste discharge requirements are adopted by the Central Valley Water Board.

VI. Petitions

Any person aggrieved by this action of the Central Valley Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, section 2050 and following. The State Water Board must receive the petition by 5:00 p.m., 30 days after the date of this Order, except that if the thirtieth day following the date of this Order falls on a Saturday, Sunday, or State holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at:

http://www.waterboards.ca.gov/public_notices/petitions/water_quality

or will be provided upon request.

I, PAMELA C. CREEDON, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Valley Region, on 9 June 2017.

Original signed by

PAMELA C. CREEDON, Executive Officer

ATTACHMENT A

DEFINITIONS
FOR
ORDER NO. R5-2017-0061

1. "Timberland management activities" means commercial activities relating to forest management and timberland conversions, including, but not limited to: cutting or removal of timber and other solid wood forest products; construction, reconstruction and maintenance of roads, fuel breaks, firebreaks, watercourse crossings, landings, skid trails, or beds for the falling of trees; fire hazard abatement and fuel reduction activities; pesticide applications; site preparation that involves disturbance of soil or burning of vegetation following timberland management activities; but excluding preparatory treemarking, surveying or roadflagging. This definition excludes the cutting and removal of timber and other solid wood forest products for Christmas trees, structure protection (150 and 300 feet), and woody debris and slash removal associated with CCR, title 14, section 1038 exemptions.

2. "Discharger" means the timberland owner or timber owner and anyone working on behalf of the timberland/timber owner in the conduct of timberland management activities for non-federal lands, and the U.S. Forest Service, private timber operators operating on federal lands, and anyone working on behalf of the U.S. Forest Service or a timber operator in the conduct of timberland management activities on federal lands.

3. "Effective Groundcover" any combination of slash (lopped and in close contact with the ground), mulch (large wood chips, wood shreds, wood strand blends, straw, bark, or surface rock fragments larger than ¾ inch), plants, and plant litter. Large wood chips should be a minimum of 2 inches in length and at least four (4) times longer than they are wide.

4. "Monitoring" refers to all types of monitoring undertaken in connection with determining water quality conditions and factors that may affect water quality conditions, including but not limited to, implementation, effectiveness, forensic, and Order compliance monitoring undertaken in connection with timberland management activities.

5. "Plan" means any Timber Harvesting Plan (THP), Program Timber Harvesting Plan (PTHP), Nonindustrial Timber Management Plan (NTMP), Working Forest Management Plan (WFMP), Modified Timber Harvesting Plan, Notice of Timber Operations, Working Forest Harvest Notice, or other discretionary permit issued by CAL FIRE to harvest timber, including all substantial deviations thereto that propose a change in timberland management activities that may increase the discharge or otherwise pose the potential for increased impacts to water quality. (For example, substantial deviations that propose to add, expand, or extend winter operations shall be considered a "Plan" for purposes of this Order. Minor deviations that do not propose any material change in how or where timberland management activities will be conducted, such as a change in timber operator, a time extension from CAL FIRE, etc., shall not be considered a "Plan" for purposes of this Order.)

6. "Pesticide" means (1) any substance, or mixture of substances which is intended to be used for defoliating plants, regulating plant growth, or for preventing, destroying, repelling, or mitigating any pest, which may infest or be detrimental to vegetation, man, animals, or households, or be present in any agricultural or nonagricultural environment whatsoever, or (2) any spray adjuvant, or (3) any breakdown products of these material that threaten beneficial uses. This definition excludes aquatic pesticide discharges covered under Order No. 2013-0002-DWQ.

7. "Project" means any CAL FIRE Plan (as defined in #5 above), CAL FIRE Emergency/Exemption Notice, or existing watercourse crossing reconstruction not covered under a Plan or Emergency Notice but conducted pursuant to a CDFW-executed MATO or LSAA on timber production zoned

non-federal lands, and any timberland management activities (i.e. timber sales, fire salvage, fuel hazard reduction, forest stand improvement and hazard tree removal) on federal lands.

8. "Significant Existing or Potential Erosion Site (SEPES)" means a location where soil erosion is currently, or there are visible physical conditions to indicate soil erosion may be in the future, discharged to watercourses or lakes in quantities that violate a water quality objective (narrative or numeric), prohibition, Total Maximum Daily Load implementation plan, policy, or other requirement contained in a water quality control plan adopted by the Regional Board and approved by the State Water Board, or a location where soil erosion may result in significant individual or cumulative adverse impacts to the beneficial uses of water.

9. "Watercourse protection zone" means any Watercourse and Lake Protection Zone, Equipment Limitation Zone, and Equipment Exclusion Zone for the protection of waters of the state as defined in California Code of Regulations, title 14, section 895.1 of the California Forest Practice Rules; it also means any Riparian Reserve or Riparian Conservation Area for federal Projects.

10. All other terms shall have the same definitions as defined in California Code of Regulations, title 14, section 895.1 of the California Forest Practice Rules and the Porter-Cologne Water Quality Control Act, unless specified otherwise. A few definitions from the 2017 FPR that are used throughout the Order are cited below for ease of reference:

    "Equipment Exclusion Zone" (EEZ) means the area, as explained in the THP, where heavy equipment associated with timber operations is totally excluded for the protection of water quality, the beneficial uses of water, and/or other forest resources.

    "Equipment Limitation Zone" (ELZ) means the area, as explained in the THP, where heavy equipment associated with timber operations is limited for the protection of water quality, the beneficial uses of water, and/or other forest resources.

    "Erosion Hazard Rating" (EHR) means the rating derived from the procedure specified in 14 CCR § 912.5 [932.5, 952.5] designed to evaluate the susceptibility of the soil within a given location to erosion.

    "Hydrologic Disconnection" means the removal of direct routes of drainage or overland flow of road runoff to a watercourse or lake.

    "Saturated Soil Conditions" means that soil and/or surface material pore spaces are filled with water to such an extent that runoff is likely to occur. Indicators of saturated soil conditions may include, but are not limited to: (1) areas of ponded water, (2) pumping of fines from the soil or road surfacing material during timber operations, (3) loss of bearing strength resulting in the deflection of soil or road surfaces under a load, such as the creation of wheel ruts, (4) spinning or churning of wheels or tracks that produces a wet slurry, or (5) inadequate traction without blading wet soil or surfacing materials.

    "Significant Sediment Discharge" means soil erosion that is currently, or, as determined based upon visible physical conditions, may be in the future, discharged to watercourses or lakes in quantities that violate Water Quality Requirements or result in significant individual or cumulative adverse impacts to the beneficial uses of water. One indicator of a Significant Sediment Discharge is a visible increase in turbidity to receiving Class I, II, III, or IV waters.

    "Water Quality Requirements" means a water quality objective (narrative or numeric), prohibition, TMDL implementation plan, policy, or other requirement contained in a water quality control plan adopted by the Regional Board and approved by the State Water Board.

"Watercourse and Lake Protection Zone" (WLPZ) means a strip of land, along both sides of a watercourse or around the circumference of a lake or spring, where additional practices may be required for protection of the quality and beneficial uses of water, fish and riparian wildlife habitat, other forest resources and for controlling erosion.

ATTACHMENT B
MONITORING AND REPORTING PROGRAM
FOR
ORDER NO. R5-2017-0061

This Monitoring and Reporting Program (MRP) is issued pursuant to Water Code section 13267 and includes requirements for Projects enrolled under the Waste Discharge Requirements General Order for Discharges Related to Timberland Management Activities on Non-federal and Federal Lands, Order No. R5-2017-0061 (hereinafter referred to as the "Order"). The MRP is required to assure compliance with Order criteria and conditions, to verify the adequacy and effectiveness of the Order, to assist Dischargers with implementation and maintenance of water quality protection measures, and to identify and correct waste discharges that violate or threaten to violate water quality control plan (Basin Plan) requirements.

Dischargers with Projects enrolled under this Order are subject to monitoring requirements; however, the comprehensiveness of the monitoring required depends upon the scope of the timberland management activities and the category of enrollment. The inspection plan, monitoring requirements by category, monitoring types (agency, implementation, forensic, and effectiveness), incident reporting, reporting requirements, and potential additional monitoring requirements are described within this MRP.

I. INSPECTION PLAN

Dischargers shall prepare and implement an Inspection Plan for Projects that exceed 100 acres for all Categories (***except*** Category 1 and Category 5B (unless the U.S. Forest Service conducts implementation, forensic, and effectiveness monitoring in the Project area in lieu of National Core BMP Protocol monitoring)). The Inspection Plan shall be designed to ensure that management measures are installed and functioning prior to a precipitation event that generates overland flow, that the measures were effective in controlling significant sediment discharges (see definition in Attachment A) throughout the winter period, and that no new significant sediment discharge sources developed. The Inspection Plan shall include a site map that includes monitoring points and inspection locations to be visited before, during, and after the winter period once operations have begun. Monitoring points are further described as follows:

- *Visual Monitoring Points* - Visual monitoring points shall be delineated on the monitoring points site map and shall address all bulleted inspection items applicable to the enrolled category detailed in the implementation, forensic, and effectiveness monitoring sections that follow (e.g. watercourse crossings, roads, landings, skid trails, water diversions, unstable areas, accessible watercourse confluences).
- *Photo-point Monitoring* – Photo-point monitoring locations shall be delineated on the site map and shall be identified (monumented) in the field by use of rebar, flagging or other method that will last throughout the period of enrollment for the Project. Photo-point locations shall be determined during Project inspections when Central Valley Water Board staff is present and/or as determined by the Discharger to illustrate compliance. If significant sediment discharges are detected during enrollment or monitoring, these locations shall be added to the Inspection Plan and be photo-point monitored for the remainder of the Project's enrollment.

Inspection Plans shall be maintained and updated as needed by the Discharger and/or agents thereof and shall be submitted to the Central Valley Water Board upon request.

II. MONITORING REQUIREMENTS BY CATEGORY

Projects enrolled under this Order are subject to monitoring requirements based on category of enrollment and threat to water quality. Monitoring requirements for each category are detailed below.

NON-FEDERAL PROJECTS (Categories 1 - 4)

Table 1. Monitoring and Reporting Requirements for Non-Federal Projects

Order Category	1	2B/3B	2A	3A	4
Inspection Plan		Prepare for Projects >100 acres - submit copy when requested			
Agency Monitoring	Yes, submit when a violation of the FPR is identified that relates to water quality protection measures				
Implementation Monitoring			Conduct by November 15[1]		
Forensic Monitoring			Conduct Twice Between November 16 and April 1[1, 2]	Conduct Once Between November 16 and April 1[1]	
Effectiveness Monitoring		Conduct Once Between April 2 and June 15[1]			
Summary of Operations / Annual Report			Submit by July 15		
Erosion Site Table and PFP[3] Update(s)			As Needed[4]		

[1]Photo-point monitoring required as determined by Central Valley Water Board staff on Project inspections and/or as self-determined by the Discharger to illustrate compliance AND for significant sediment discharges (Incident Report required, see Part IV.). Monitoring to be included in annual report due July 15 annually.

[2]*Once between Nov. 16 and Jan. 15 AND once between Jan. 16 and April 1 (see Part III.C.).*

[3]Post-Fire Management and Reforestation Plan (PFP), if applicable (see Attachment C).

[4]Timely amendments to be made throughout Project enrollment when conditions or management objectives have changed.

The monitoring requirements above that are in addition to those required by the FPRs, do not supersede or nullify the monitoring requirements required by the FPR

FEDERAL PROJECTS (Categories 5A and 5B)

Table 2. Monitoring and Reporting Requirements for Federal Projects

<table>
<tr><th>Order Category</th><th>5A (Post-Fire)</th><th>5B</th></tr>
<tr><td>Inspection Plan</td><td colspan="2">Prepare for Projects >100 acres - submit copy when requested[1]</td></tr>
<tr><td>Implementation Monitoring</td><td>Conduct by November 15[2]</td><td rowspan="3">Complete one of the following National Core BMP monitoring protocols in the Project area based on the highest threat to water quality from Project activities[2,4,5]
Road B. Completed Road or Waterbody Crossing Construction or Reconstruction;
Road C. Road Operation and Maintenance;
Veg. A. Ground-based Skidding and Harvesting;
Veg. B. Cable or Aerial Yarding;
Veg. C. Mechanical Site Treatments; or
WatUses C. Completed Reconstruction/Repair or Operation and Maintenance of Water Sources (Drafting)</td></tr>
<tr><td>Forensic Monitoring</td><td>Conduct Twice Between November 16 and April 1[2,3]</td></tr>
<tr><td>Effectiveness Monitoring</td><td>Conduct Once Between April 2 and June 15[2]</td></tr>
<tr><td>Summary of Operations / Annual Report</td><td colspan="2">Submit by August 15</td></tr>
<tr><td>Erosion Site Table and PFP[6] Update(s)</td><td>As Needed[7]</td><td></td></tr>
</table>

[1]For Category 5B, prepare only if electing to do traditional implementation, forensic, and effectiveness monitoring in the Project area in lieu of National Core BMP protocols (see footnote 5 below).

[2]Photo-point monitoring required as determined by Central Valley Water Board staff on Project inspections and/or as self-determined by the Discharger to illustrate compliance AND for significant sediment discharges (Incident Report required, see Part IV.). Monitoring to be included in Annual Report that is submitted August 15 annually.

[3]Once between Nov. 16 and Jan. 15 AND once between Jan. 16 and April 1 (see Part III.C.)

[4]One ***additional*** National Core BMP monitoring protocol is required when USFS cumulative watershed effects analysis indicates that the Project, combined with other USFS activities conducted in the watershed over the past 10 years, may cause any watershed or sub-watershed to exceed a threshold of concern as determined by various models (i.e. Equivalent Roaded Acres, Surface Erosion, Mass Wasting). The *National Best Management Practices for Water Quality Management on National Forest System Lands, Volume 1: National Core BMP Technical Guide* is located at: http://www.fs.fed.us/biology/resources/pubs/watershed/FS_National_Core_BMPs_April2012.pdf

[5]The Discharger may opt to conduct implementation, forensic, and effectiveness monitoring as detailed for Category 3A in lieu of conducting the National Core BMP monitoring protocols; the monitoring must occur in the Project area.

[6]Post-Fire Management and Reforestation Plan (PFP), if applicable (see Attachment C).

[7]Timely amendments to be made throughout Project enrollment when conditions or management objectives have changed.

III. MONITORING TYPES

A. AGENCY MONITORING

Non-federal Projects - Agency monitoring is monitoring (direct field observations) conducted by CAL FIRE to evaluate compliance with the Forest Practice Rules (FPR). The Discharger does not conduct agency monitoring, but should retain copies of all inspection reports from agency monitoring throughout the life of the Project as the reports may be requested by the Central Valley Water Board. The Discharger shall submit a copy of agency monitoring to the Central Valley Water Board when a violation of the FPR is identified that relates to water quality protection measures and the Discharger shall provide notification of such violation within 48 hours of discovery (see Part IV.).

B. IMPLEMENTATION MONITORING

Description	Implementation monitoring consists of detailed visual monitoring within the Project area of hillslope features (i.e. roads, landings, skid trails, watercourse crossings, watercourse protection zones, unstable areas) prior to a precipitation event that generates overland flow; with emphasis placed on determining if management measures (such as erosion control measures, drainage structures, watercourse protection zones) were implemented in accordance with the Project language, FPR, BMP guidance, Central Valley Water Board recommendations, and Order criteria and conditions. For Category 5B, selected National Core BMP monitoring protocols (see Part II, Table 2) will satisfy the Implementation, Forensic, and Effectiveness portions of the monitoring requirements of the Order if the monitoring was conducted *within* the Project area.		
Inspection Timeframe	Prior to a precipitation event that generates overland flow, but no later than November 15		
Inspection Schedule	**Status of Timberland Management Activities**		
	Not Active[1]	Active - No Winter Ops	Active - Winter Ops
Monitoring Required?	No	Yes	Yes
Monitoring Details	N/A	A pre-winter implementation inspection shall be completed **prior to a storm that generates overland flow, but no later than November 15 of each year** to assure that management measures are in place and secure prior to the winter period.	*1st Inspection* - A pre-winter implementation inspection shall be completed **prior to a storm that generates overland flow, but no later than November 15 of each year** to assure that management measures, for areas not subject to winter operations, are in place and secure prior to the winter period. *2nd Inspection* - An Implementation inspection shall be completed **immediately following cessation of winter period operations**, in areas where winter operations occurred, to assure management measures are in place and secure.

[1]Timberland management activities have not commenced on any portion of the Project.

Implementation Inspection – The inspection(s) shall be conducted by the Discharger and is intended to assure that management measures are properly installed; at a minimum, the inspection(s) should focus on the following Project areas:

- Culverts are clear of debris;
- Critical dips are installed and/or diversion potential is addressed at watercourse crossings;
- Fill slopes are adequately armored/stabilized;
- Road runoff is disconnected from watercourse crossings;
- Sufficient drainage facilities installed on roads and skid trails;
- Appropriate watercourse protection zones implemented;
    - Disturbed areas in the watercourse protection zones stabilized;
- Significant existing or potential erosion sites (SEPES) identified in the Project and/or as indicated in an *Erosion Site Table* for Category 2A or 5A;
- Non-standard (in-lieu) practice areas;
    - Landings/skid trails/roads in watercourse protection zones drained/disconnected and/or stabilized;
- Road rocking near watercourses and crossings done to specifications in enrolled Project;
- Temporary and tractor watercourse crossings disconnected and fills excavated to natural grade and orientation;
- Drafting pads and approaches drained and stabilized;
    - Artificial impoundment barriers removed/diversions turned off (if no winter operations);
- Timberland management activities that have the potential to affect unstable areas upslope of watercourses;
- Photo-point monitoring locations (as determined by Central Valley Water Board staff during Project inspections and/or as self-determined by the Discharger to illustrate compliance).

Note: Additional implementation inspections do not need to be conducted for *completed* Project areas where a *full round* of monitoring inspections (implementation, forensic, and effectiveness) have been completed without the occurrence of reportable incidents OR the implementation of new management measures. Project areas that are *newly* active must have an implementation inspection conducted.

C. FORENSIC MONITORING

<table>
<tr><td>Description</td><td colspan="3">Forensic monitoring consists of visual field detection techniques during the winter period within the Project area to determine the condition of installed management measures and to identify threatened or actual significant sediment discharges caused by: failed management measures, failure to implement appropriate management measures, legacy timber activities, non-timber harvesting related land disturbances, and natural sediment sources. The goal of winter forensic monitoring is to locate potential or actual sources of sediment in a timely manner so that rapid corrective action may be taken where feasible and appropriate. If forensic monitoring detects a significant sediment discharge, the Discharger is required to submit photo-point monitoring and an Incident Report (see Part IV.) to the Central Valley Water Board.

For Category 5B, selected National Core BMP monitoring protocols (see Part II, Table 2) will satisfy the Implementation, Forensic, and Effectiveness portion of the monitoring requirements of the Order when the monitoring was conducted *within* the Project area.</td></tr>
<tr><td>Inspection Timeframe</td><td colspan="3">Category 2A and 5A- Once between November 16 and January 15, <u>AND</u>
Once between January 16 and April 1

Category 3A and 4 - Once between November 16 and April 1</td></tr>
<tr><td rowspan="3">Inspection Schedule</td><td colspan="3">Status of Timberland Management Activities</td></tr>
<tr><td>Not Active[1]</td><td>Active - No Winter Ops</td><td>Active - Winter Ops</td></tr>
<tr><td>Monitoring Required?</td><td>No</td><td>Yes</td><td>Yes</td></tr>
<tr><td>Inspection Details and Guidance</td><td colspan="3">The forensic monitoring inspection(s) shall occur after saturated soil conditions have been reached and within 48 hours* after a storm that produces overland flow.

The following bulleted examples may be used as guidance to determine when appropriate conditions (saturated soils and overland flow) may exist for conducting forensic inspections, but are *not* a requirement for inspection(s) as climatic conditions vary widely over the Central Valley Region.

• Within 48 hours* following a 24-hour storm event of at least 2 inches (of rainfall) and after 5 inches (of total precipitation) has accumulated after November 15.

• Within 48 hours* following a 24-hour storm event of at least 2 inches (of rainfall) and after 15 inches (of total precipitation) has accumulated after November 15.

*Inspections that cannot be conducted during or within 48 hours of such a storm event (due to worker safety, access issues or other uncontrollable factors) shall be conducted as soon as possible thereafter.</td></tr>
<tr><td>Photo-Point Monitoring</td><td colspan="3">Forensic photo-point monitoring is required as follows:
• As determined by Central Valley Water Board staff during Project inspections and/or as self-determined by the Discharger to illustrate compliance; and
• When a significant sediment discharge (threatened or actual) is identified resulting from failed management measures, failure to implement management measures, legacy timber activities, non-timber harvesting related land disturbances, and natural sediment sources.</td></tr>
</table>

[1]Timberland management activities have not commenced on any portion of the Project.

Forensic Inspections - Inspections shall be conducted by the Discharger to identify threatened or actual significant sediment discharges such as failed management measures or natural sources (e.g. landslide). The inspection should focus on identifying evidence of erosion (e.g. rilling or gullying of road surfaces and road fills; watercourse crossings with evidence of downcutting, plugging, or overtopping; and increased levels of sediment/turbidity in watercourses). The inspections should focus on the following Project areas, including but not limited to:

- Constructed and reconstructed watercourse crossings;
- Existing undersized watercourse crossings;
- Watercourse protection zones where ground based equipment operations have occurred (e.g. tractor crossings, landing construction/reconstruction, watercourse crossing/road abandonment);
- Project areas of non-standard (in-lieu) practices that have the potential to impact water quality;
- Road segments that were unable to be hydrologically disconnected;
- SEPES identified in the Project and/or as indicated in an *Erosion Site Table* for Category 2A or 5A;
- Road construction or reconstruction within 500 feet of a watercourse;
- Areas rated as high or extreme erosion hazard that have the potential to impact water quality where ground-based equipment operated;
- Areas where ground-based equipment operated on slopes greater than 65% or slopes over 50% rated as high or extreme erosion hazard that have the potential to impact water quality;
- Timberland management activities that have the potential to affect unstable areas near watercourses;
- Photo-point monitoring locations.

D. EFFECTIVENESS MONITORING

<table>
<tr><td>Description</td><td colspan="3">Effectiveness monitoring is a visual evaluation following the winter period of management measures (e.g. erosion control structures) and infrastructure (e.g. roads and watercourse crossings) within the Project area. Effectiveness monitoring is intended to determine the effectiveness of implemented management measures in preventing significant sediment discharges to watercourses and in protecting water quality, and to identify any new sediment sources. If effectiveness monitoring detects a significant sediment discharge resulting from failed management measures or failure to implement management measures, the Discharger is required to submit photo-point monitoring and an Incident Report (see Part IV.) to the Central Valley Water Board.

For Category 5B, selected National Core BMP monitoring protocols (see Part II., Table 2) will satisfy the Implementation, Forensic, and Effectiveness portions of the monitoring requirements of the Order when the monitoring was conducted within the Project area.</td></tr>
<tr><td>Inspection Timeframe</td><td colspan="3">Between April 2 and June 15.</td></tr>
<tr><td rowspan="2">Inspection Schedule</td><td colspan="3">Status of Timberland Management Activities</td></tr>
<tr><td>Not Active[1]</td><td>Active – No Winter Ops</td><td>Active - Winter Ops</td></tr>
<tr><td>Monitoring Required?</td><td>No</td><td>Yes</td><td>Yes</td></tr>
<tr><td>Inspection/ Monitoring Details</td><td colspan="3">The inspection shall be conducted by the Discharger to identify threatened or actual significant sediment discharges from failed management measures and/or failure to implement appropriate management measures. The inspection should evaluate the same Project areas bulleted under the Forensic Inspections Section on the previous page.</td></tr>
<tr><td>Photo-Point Monitoring</td><td colspan="3">Effectiveness photo-point monitoring is required as follows:
As determined by Central Valley Water Board staff during Project inspections and/or as self-determined by the Discharger to illustrate compliance; and
When a significant sediment discharge (threatened or actual) is detected from failed management measures or failure to implement management measures.</td></tr>
</table>

[1]Timberland management activities have not commenced on any portion of the Project.

Effectiveness Inspection – Evaluate the same Project areas bulleted under the *Forensic Inspections* Section on page 7 (see Part III.C.).

IV. INCIDENT REPORT

The Discharger shall notify Central Valley Water Board staff as soon as possible, but **no later than 48 hours after detection** of any of the following, including, but not limited to:

- Violation(s), threatened or actual, of any applicable water quality objective (i.e. for turbidity, sediment, temperature, dissolved oxygen, pesticides, etc.) caused by:
    - Failed management measures (e.g. watercourse crossing fill failure; watercourse diversion; major road, landing, or skid trail failure within or adjacent to a watercourse protection zone);
    - Failure to implement appropriate management measures;
    - Natural sediment sources (landslide/unstable areas);
    - Legacy timber activities (as assessed during Forensic Monitoring);
    - Non-timber harvesting related land disturbances (as assessed during Forensic Monitoring);
- Violation(s) of eligibility criteria or conditions specified in the Order.

Typically, Incident Reporting is a result of forensic or effectiveness monitoring, but can occur at any time during enrollment. After timely notification of an incident, the Discharger should discuss any implemented and planned corrective measures with Central Valley Water Board staff. Central Valley Water Board staff may require additional monitoring (inspections, photo-point, water column sampling, physical stream conditions, etc.) until corrective actions are completed and/or significant sediment discharges/threatened discharges have ceased.

Incident Report - A written report regarding aforementioned incidents(s) shall be submitted to the Central Valley Water Board by the Discharger **within 14 days** following detection and shall include all required information specified in this MRP, including the following:

- The date incident(s) was/were discovered;
- The name and title of person(s) discovering incident(s);
- The name and title of person(s) responsible for follow-up on the incident(s);
- A map indicating location of incident(s);
- Description of recent weather conditions prior to discovering the incident(s);
- Description of the nature and extent of incident(s) (including estimate(s) of sediment/fill volume discharged, if applicable);
- Color photos of site characterizing incident(s) (including impacted watercourse(s));
- Description of corrective management measures implemented to date;
- An implementation schedule for additional corrective actions;
- The signature and title of person preparing the report.

The Executive Officer may modify or rescind this MRP at any time or may issue site-specific and individually developed monitoring and reporting requirements to any Discharger for Projects that could affect the beneficial uses of waters of the state.

V. REPORTING REQUIREMENTS

A. Agency Reporting (Non-Federal Projects)
Dischargers are required to submit a copy of agency monitoring to the Central Valley Water Board when a violation of the FPR is identified that relates to water quality protection measures; the Discharger shall notify the Central Valley Water Board within 48 hours of discovery of such a violation.

B. Annual Reporting (Non-Federal and Federal Projects)
The Discharger shall submit an Annual Monitoring Report to the Executive Officer **by July 15** for Non-Federal Projects and **by August 15** for Federal Projects, for inspections conducted before, during, and after the previous winter period for every year a Project is enrolled in the Order after timberland management activities have commenced; activities that commence after the winter period (April1) shall have monitoring inspections included in the next calendar year annual report.

The Annual Monitoring Report shall include the following (as applicable) as described under Table 1 and Table 2 of this MRP:

Summary of Operations
- The name/number of the Project;
- A table, map, narrative, or combination thereof that includes the following:
    - Watercourse crossings and road segments that have been constructed, reconstructed, and abandoned/deactivated during the past year;
    - SEPES that have been addressed during the past year as identified in the Project and/or *Erosion Site Table*;
    - Units/areas harvested during the past year.

Implementation, Forensic, and Effectiveness Monitoring Inspection Reporting
- Name/number of the Project;
- Name/title of person submitting the report;
- Date of inspection;
- Inspector's name/title;
- Storm event date, precipitation amount, and rainfall station used (forensic only);
- Rainfall accumulation since November 15 (forensic only);
- Color photographs from photo-point monitoring with date/time/location clearly delineated (if applicable);
- Incident Report(s) Update – Include any pertinent updates and/or additional monitoring required by the Central Valley Water Board (if applicable).

- U.S. Forest Service Category 5B (Federal) - Submittal of selected National Core BMP monitoring protocols (see Part II., Table 2) will satisfy the Implementation, Forensic, and Effectiveness portions of the monitoring requirements of the Order when the monitoring was conducted *within* the Project area.

Non-Expiring Plans (NTMPs and WFMPs) (Non-Federal Projects)
- Dischargers that elect to remain continuously enrolled (i.e. not terminate coverage after each entry) under the Order for the duration of the Plan must (1) complete at minimum one full round of monitoring (implementation, forensic, and effectiveness) for each NTO/Harvest Notice area, and (2) be able to certify in a statement (see Part V.C. below) in the annual report that discharges

associated with timberland management activities have ceased for each NTO/Notice area prior to cessation of monitoring for that area.

C. Submission of Reports/Data

The Central Valley Water Board is transitioning to a paperless office; therefore, reports should be submitted in searchable Portable Document Format (PDF), Word, and/or Excel when feasible. Documents that are less than 50 MB should be emailed to the appropriate office:

Rancho Cordova Office: centralvalleysacramento@waterboards.ca.gov;
Redding Office: centralvalleyredding@waterboards.ca.gov;
Fresno Office: centralvalleyfresno@waterboards.ca.gov;

In the subject line of the email, include the program (Forest Activities Program), subject (e.g. annual report, incident report), county, and the name of the staff person that will receive the document (if known). Documents that are 50 MB or larger should be transferred to a disc or flash drive and mailed to the appropriate office. Staff may request that some documents be submitted in hard copy, particularly drawings or maps that require a large size to be readable, or in other electronic formats where evaluation of the data is required.

Monitoring forms (cover letter with certification statement, implementation, forensic, and effectiveness) are provided on the Central Valley Water Board Forest Activities Program website (http://www.waterboards.ca.gov/centralvalley/water_issues/timber_harvest/index.shtml) for Discharger use. If the Discharger elects to create their own monitoring form, it must include all the applicable information detailed under Part V. B. and Tables 1 and 2 or this MRP and include the following certification statement and the signature of the Discharger:

> *I am aware that monitoring and technical reports submitted pursuant to Water Code section 13267 are submitted under penalty of perjury, and I certify that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete.*

In addition, for *non-expiring* Plans that will remain *continuously* enrolled and for which the Discharger intends to cease monitoring in a NTO/Notice Area, the Discharger must include the following statement in the annual report:

> *I certify that all discharges associated with timberland management activities for this NTO/Notice area are and will continue to be in conformance with all applicable Basin Plan requirements and hereby notify the board that no further monitoring is planned for the subject NTO/Notice area.*

The Discharger shall submit all required monitoring reports to the respective Central Valley Water Board office in accordance with the reporting requirements specified in this Order.

The Discharger shall also report monitoring data and results, in a timely manner, for all water quality related monitoring conducted <u>independent</u> of the requirements of this Order.

VI. POTENTIAL ADDITIONAL MONITORING REQUIREMENTS

Pursuant to California Water Code section 13267, the Executive Officer has the authority to issue site-specific and individually developed monitoring and reporting requirements to any Discharger whose activities could affect the beneficial uses of waters of the state.

Additional monitoring requirements may include, but are not limited to:

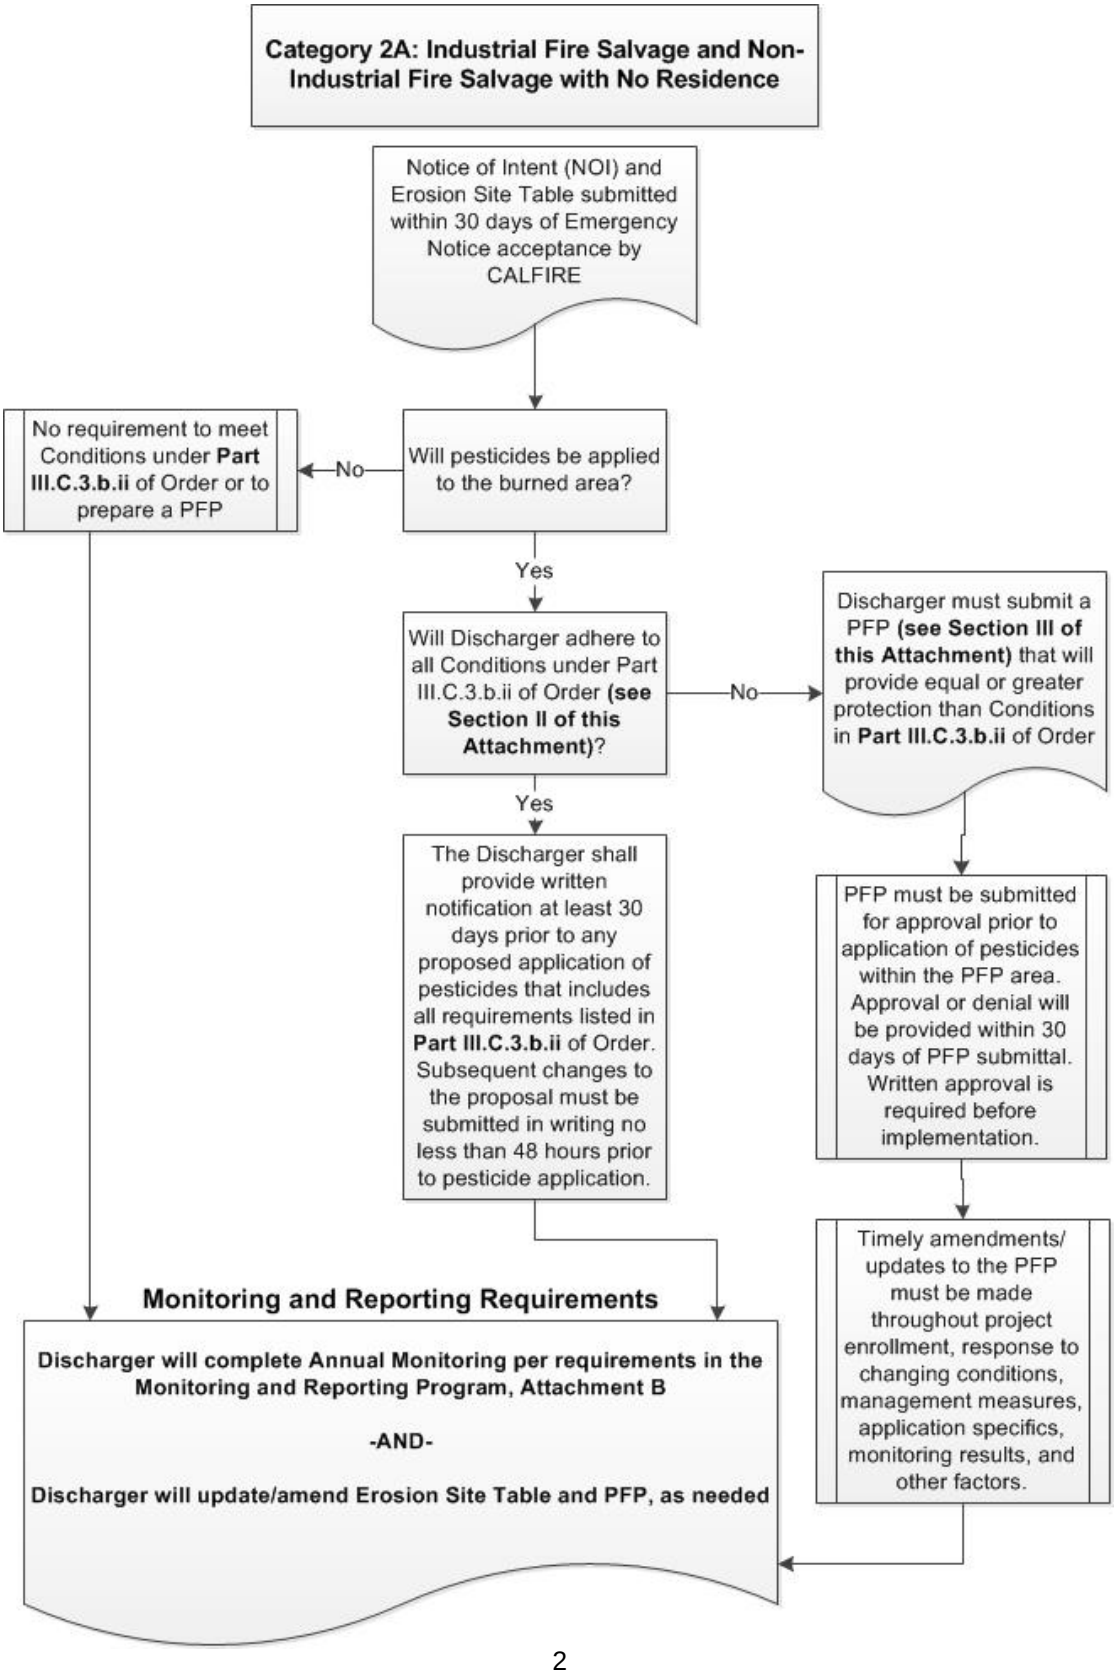
- Water column sampling (typically for sediment);
- Physical stream condition assessment for:
  - Gravel Embeddedness – Degree gravel is embedded with sand or finer sediments;
  - Pool Sedimentation – Degree of sediment depositions in pools;
  - Stream Channel Aggradation – Degree that stream channel has been raised by sedimentation;
  - Streambank Cutting, Mass Wasting and Stream Downcutting;
  - Stream-Side Vegetation;
- Streamflow data (current, historical, peak flows);
- Bioassessment.

ATTACHMENT C

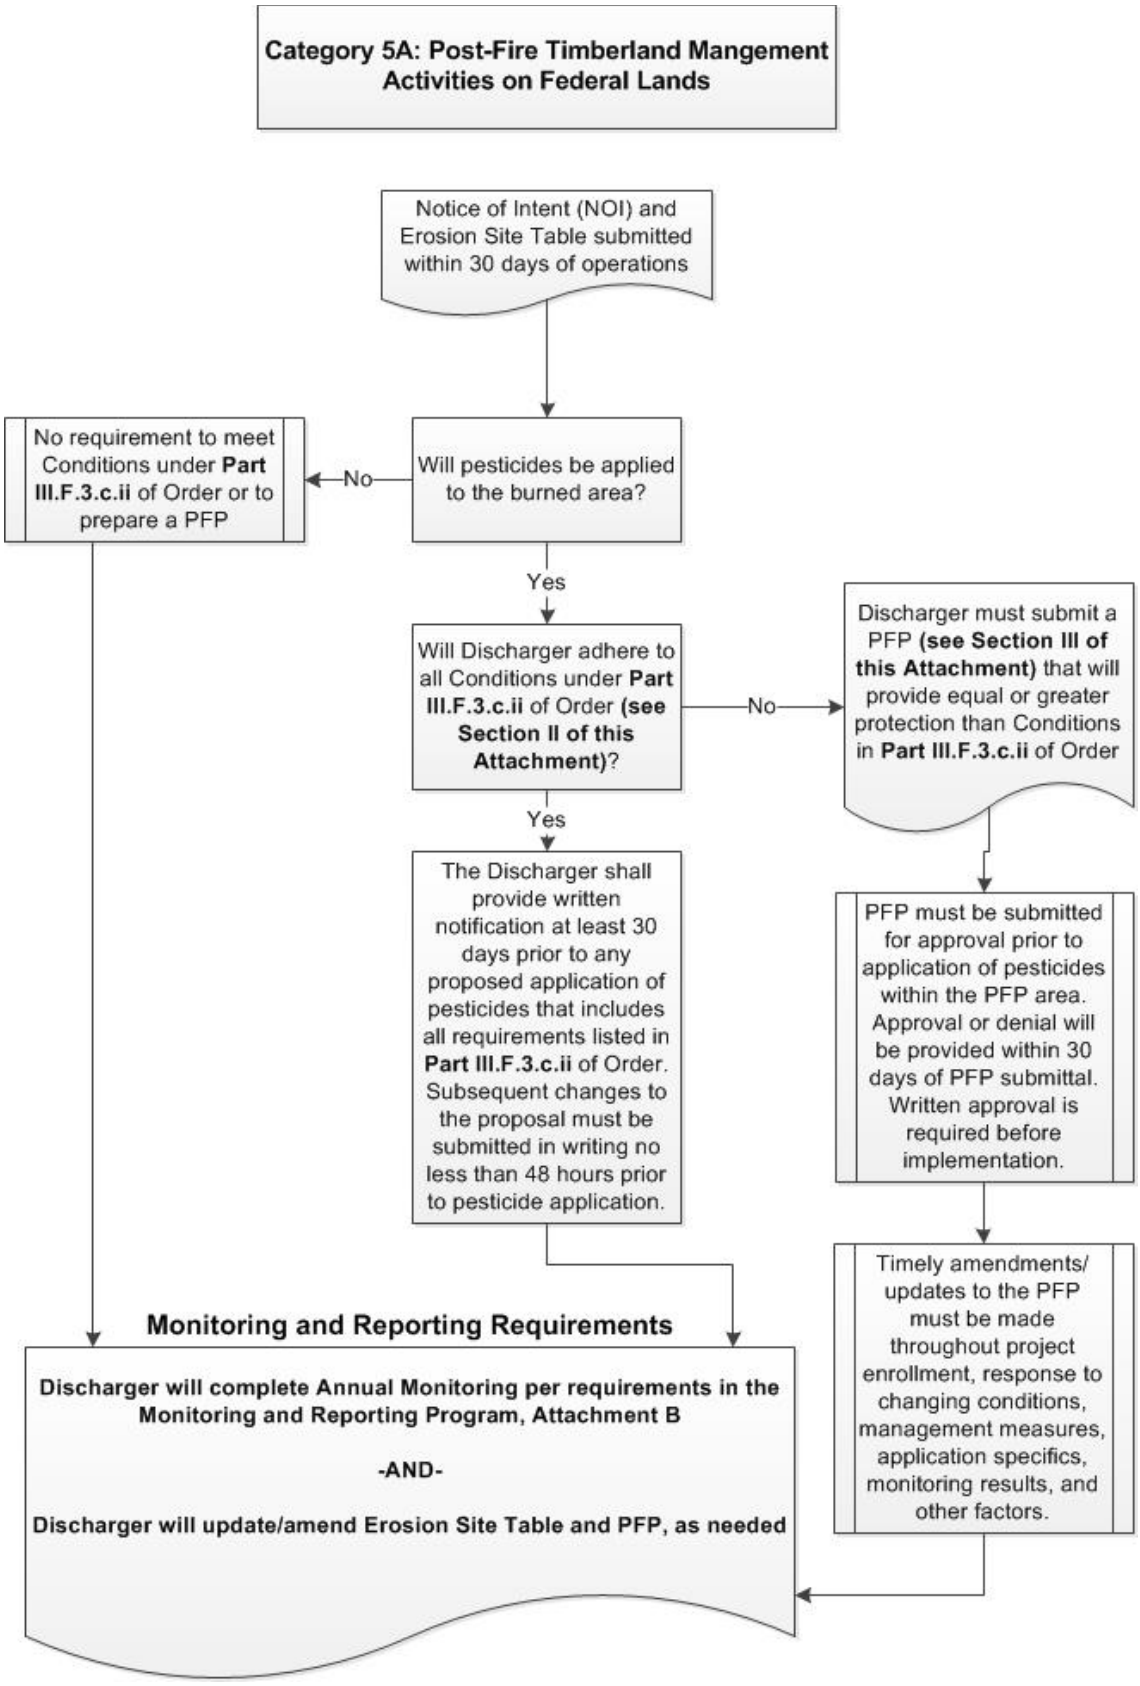
POST-FIRE MANAGEMENT AND REFORESTATION PLAN GUIDANCE AND TECHNICAL STANDARDS FOR CATEGORIES 2A AND 5A

ORDER NO. R5-2017-0061

Waste Discharge Requirements General Order R5-2017-0061 (hereinafter referred to as Order) requires Dischargers who intend to apply pesticides associated with timberland management and reforestation activities related to fire salvage to develop comply with management measures as described in Part III.C.3.b.ii (Category 2A) and Part III. F.3.c.ii (Category 5A) of the Order OR to prepare a Post-Fire Management and Reforestation Plan (PFP) to help mitigate erosion, sediment delivery, and discharges of waste that could affect waters of the state.



The purpose of Attachment C is to serve as a guidance document to help Dischargers understand the requirements of Categories 2A and 5A and to give a detailed explanation of the technical standard requirements. Attachment C is organized into three Sections as follows: 1) Flow Charts for Category 2A and 5A that guide the Discharger through a series of questions about pesticide application and the subsequent required steps for document submittal and reporting; 2) Pesticide Buffer and Effective Ground Cover Requirements, which provides detailed information on pesticide buffers and photographic examples of 50% ground cover; and 3) Contents of a PFP.



A PFP is required for all pesticide applications for: 1) for Emergency Notices enrolled in Category 2A where the Discharger elects to not meet the specific watercourse buffers or ground cover requirements as stated in Part III.C.3.b.ii of the Order; and 2) for Projects enrolled in Category 5A where the Discharger elects to not meet the specific watercourse buffers or ground cover requirements as stated in Part III.F.3.c.ii of the Order. The purpose of the PFP is to allow the Discharger flexibility in applying specific management practices across the fire salvage area that consider all aspects of the timing of the fire salvage, site-preparation, and other management objectives associated with reforestation; provide for site specificity in terms of topography, soils, climate, hydrology, and burn severity; and consider all sources of potential negative water quality impacts from those activities (i.e. sediment and pesticides).

A PFP must contain, at a minimum, all of the elements listed under “Contents of a PFP” (Section III of this Attachment); the portions of the PFP that are related directly to pesticide applications must be prepared by, or under the reasonable charge of, a Registered Professional Forester, Pest Control Advisor, and/or other qualified professional. **The Discharger shall submit the PFP to the Central Valley Regional Water Quality Control Board for approval prior to application of pesticides within the post-fire management and reforestation plan area; approval or denial of the PFP shall be provided to the Discharger within 30 days of PFP submittal**. Additionally, **the PFP must be updated/amended** in response to changing conditions, management measures, and application specifics; addition of fire salvage areas (i.e. Emergency Notices or Projects) or application areas; monitoring results; and other factors throughout Project enrollment.

For Category 5A pesticide applications on fire salvaged federal lands, if a Project has been prepared under the National Environmental Policy Act (NEPA) for reforestation activities, the NEPA document(s) may be submitted in-lieu of the PFP if it includes all required information detailed under “Contents of a PFP. If the NEPA document(s) does not cover all elements of the “Contents of a PFP”, then the U.S. Forest Service may submit supplemental information along with the NEPA document(s).

I. Flow Charts for Category 2A and 5A

Category 5A: Post-Fire Timberland Mangement Activities on Federal Lands
Notice of Intent (NOI) and Erosion Site Table submitted within 30 days of operations
Will pesticides be applied to the burned area?
No
No requirement to meet Conditions under Part III.F.3.c.ii of Order or to prepare a PFP
Yes
Will Discharger adhere to all Conditions under Part III.F.3.c.ii of Order (see Section II of this Attachment)?
No
Discharger must submit a PFP (see Section III of this Attachment) that will provide equal or greater protection than Conditions in Part III.F.3.c.ii of Order
Yes
The Discharger shall provide written notification at least 30 days prior to any proposed application of pesticides that includes all requirements listed in Part III.F.3.c.ii of Order. Subsequent changes to the proposal must be submitted in writing no less than 48 hours prior to pesticide application.
PFP must be submitted for approval prior to application of pesticides within the PFP area. Approval or denial will be provided within 30 days of PFP submittal. Written approval is required before implementation.
Timely amendments/ updates to the PFP must be made throughout project enrollment, response to changing conditions, management measures, application specifics, monitoring results, and other factors.
Monitoring and Reporting Requirements
Discharger will complete Annual Monitoring per requirements in the Monitoring and Reporting Program, Attachment B
-AND-
Discharger will update/amend Erosion Site Table and PFP, as needed

II. Pesticide Buffer and Effective Ground Cover Requirements

For Category 2A Fire Salvage Projects, all industrial and non-industrial with no residence (see Part III.C.1. criteria in the Order), where pesticides will be applied, the Discharger shall submit a PFP or meet the conditions in Part III.C.3.b.ii of the Order, which are *abbreviated* below:

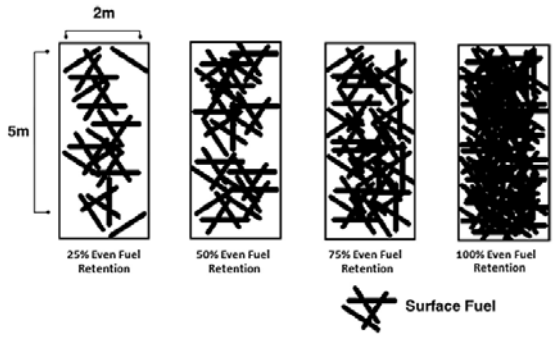
- The Discharger must **comply with the following pesticide no-spray buffers** (unless more stringent buffers are dictated by application labels/guidance, statute, or regulation):
    - For Class I and II watercourses, the applicable WLPZ widths specified in the California Code of Regulations, title 14, section 936.5; http://calfire.ca.gov/resource_mgt/resource_mgt_forestpractice
    - For Class III and IV watercourses, a minimum of 25 feet where sideslope steepness is less than 30%, and a minimum of 50 feet where sideslope steepness is 30% or greater.
- Where management activities are planned on a burned area with **slopes greater than 30%, a minimum of 50% average effective groundcover is required to be documented prior to pesticide application**. Documentation shall be provided to the Central Valley Water Board in the pesticide notification **30 days prior to application**.
- The Discharger shall **notify** the Central Valley Water Board **in writing at least 30 days prior to any proposed application of pesticides**.

For Category 5A Post-Fire Projects (see Part III.F.1. criteria in the Order), where pesticides will be applied, the Discharger shall submit a PFP or meet the conditions in Part III.F.3.c.ii of the Order, which are *abbreviated* below:

- The Discharger must **comply with the following pesticide no-spray buffers** (unless more stringent buffers are dictated by application labels/guidance, statute, or regulation):
    a) Perennial or intermittent watercourses which have: (1) surface domestic water use from and/or within 100 feet downstream of operations area and/or (2) fish always or seasonally present onsite, includes habitat to sustain fish migration and spawning, shall utilize the appropriate **Class I WLPZ width(s)** specified in the California Code of Regulations, title 14, section 936.5. http://calfire.ca.gov/resource_mgt/resource_mgt_forestpractice

    b) Perennial or intermittent watercourses which have: (1) fish always or seasonally present off-site within 1000 feet downstream (excludes intermittent or ephemeral watercourses with no aquatic life that are tributary to watercourses described under (a) above) and/or (2) aquatic habitat for nonfish aquatic species (aquatic insects and/or other physical habitat indicators such as riparian and aquatic vegetation, watercourse debris, and potential for small pool formation), shall utilize the appropriate **Class II WLPZ width(s)** specified in the California Code of Regulations, title 14, section 936.5. http://calfire.ca.gov/resource_mgt/resource_mgt_forestpractice

    c) Ephemeral or intermittent watercourses with no aquatic life present, watercourse shows evidence of being capable of sediment transport to watercourses described under (a) and



(b) above, shall utilize a minimum of **25 feet** where sideslope steepness is **less than 30%,** and a minimum of **50 feet** where sideslope steepness is **30% or greater**.

- Where management activities are planned on a burned area with **slopes greater than 30%, a minimum of 50% average effective groundcover is required to be documented prior to pesticide application**. Documentation shall be provided to the Central Valley Water Board in the pesticide notification **30 days prior to application**.

- The Discharger shall **notify** the Central Valley Water Board **in writing at least 30 days prior to any proposed application of pesticides**.

- The Discharger shall adhere to the resource protection measures in the Chemical Use Management Activities as designated in the National Best Management Practices for Water Quality Management on National Forest System Lands (USDA April 2012).

"Effective Ground Cover", as defined in Attachment A, means any combination of slash (lopped and in close contact with the ground), mulch (large wood chips, wood shreds, wood strand blends, straw, bark, surface rock fragments larger than ¾ inch), plants, and plant litter. Large wood chips are a minimum of 2 inches in length and at least four (4) times longer than they are wide.

Fifty-percent ground cover documentation shall use standard methods including aerial photography analysis, point intercept, plot, or transect methods, or any combination thereof.

The Discharger shall provide documentation of ground cover sampling methodology, locations of any ground-based sampling points, and any ground-based verification points or plots for aerial photo estimates. The figure to the left, borrowed from Harrison et. al 2016, is a schematic that illustrates even distribution of 25, 50, 75, and 100% ground cover. Additionally, the photo in the bottom left corner, borrowed from the Natural Resource Conservation Service at https://www.nrcs.usda.gov/wps/portal/nrcs/detail/ny/technical/ecoscience/agronomy/, provides a useful image of 50% ground cover.

For post-fire salvage activities, ground cover shall be estimated down to 20 acres if such a scale will change the estimated effective ground cover percentage of individual areas, and down to 10 acres for areas that either have been determined to have high or extreme EHR, or have experienced high to severe burn severity as a result of wildfire. Burn severity determination will be made based on available soil burn severity maps or through field determinations made by the RPF or qualified professional.

III. Contents of a Post-Fire Management and Reforestation Plan

The PFP shall include the following to demonstrate that the Discharger can mitigate, to the maximum extent feasible, any controllable and management related sources of sediment and pesticides that may impact waters of the state, and that proposed management measures and operations will provide equal to or better protection than the conditions under Part III.C.3.b.ii. or Part III.F.3.c.ii of the Order, Category 2A and Category 5A, respectively.

A. A list of Emergency Notices/Projects enrolled under the Order that will adhere to the PFP.

B. A list of any "other areas" in the burn area that will adhere to the PFP (if they are not included in an Emergency Notice or Project area), such as old plantations that burned over and will receive pesticide applications but did not have timber salvaged. For these "other areas", include a map that shows the location(s) by Township, Section, Range and the associated acreage.

C. Evaluation of Receiving Waters and Beneficial Uses

   a. Within and downstream of the Emergency Notice/Project area(s) and "other areas":

      i. List the beneficial uses for surface water bodies and downstream receiving waters as identified in the appropriate Basin Plan;
      ii. List any 303(d) listing(s);
      iii. Identify and describe other critical habitat and aquatic resources (e.g. salmonids, domestic water supply intakes, aquatic species (including listed species));

   b. Describe how the PFP will adequately protect/address the resources identified above.

D. Pesticide Application

   a. Describe the following:

      i. Pesticide Product(s) to be applied;
      ii. Application method(s);
      iii. Schedule for application (dates);
      iv. Location(s) of application (Emergency Notice number and/or Township/Section/Range);

      **Changes to any of the above (D.a.i-iv.) must be submitted in writing no less than 48 hours prior to pesticide application.

   b. An evaluation of how pesticide applications could impact: identified significant and existing potential erosion sites and/or unstable areas/swales/erosional features that could contribute sediment to downstream crossings and watercourses.

   c. Explain why site conditions are favorable for the proposed land management activities (e.g. EHR, burn severity, slopes, annual rainfall).

   d. Describe pesticide mitigation measures recommended by the PCA, RPF, or other qualified professional that will be employed.

E. Land Management Practices

a. Describe any management practices/ mitigation measures that will be utilized to mitigate soil erosion (e.g. slash packing, mulching, contour ripping, waterbar spacing, percent groundcover, falling logs on contour, watercourse buffers, vegetative buffer strips, leave trees, etc.). The description/maps shall indicate the location(s) where specified management practices will be applied.

F. Monitoring

a. If additional monitoring is proposed or required to evaluate management measures related to the PFP, include the following;

i. Type of monitoring proposed (i.e., visual, photo point, water column sampling, etc.);
ii. Location of monitoring;
iii. Frequency and schedule;
iv. Evaluation of monitoring results;
v. Report submittal.

ATTACHMENT D
INFORMATION SHEET IN SUPPORT OF

GENERAL ORDER OF WASTE DISCHARGE REQUIREMENTS FOR TIMBERLAND MANAGEMENT ACTIVITIES ON NON-FEDERAL AND FEDERAL LANDS IN THE CENTRAL VALLEY REGION
FOR
ORDER NO. R5-2017-0061

This Information Sheet sets forth the background, rationale and references used in the development of certain requirements for Waste Discharge Requirements related to Timberland Management Activities on Non-Federal and Federal Lands, Order No. R5-2017-0061 (hereinafter "Order") within the Central Valley Region. Specifically, the information included herein elaborates on findings in the General Order related to water quality impacts and timberland management activities in the post-fire environment, an evaluation of Significant Existing or Potential Erosion Sites (SEPES), and monitoring and reporting costs associated with Order compliance. The content of this Information Sheet includes: the best available scientific research and information in the area of fire ecology, erosion, forest hydrology and water quality impacts from pesticide[1] use in the post-fire environment; field observations by Central Valley Regional Water Quality Control Board (Central Valley Water Board) staff; clarification on the evaluation of SEPES; and a summary of the existing rules and policies that are currently in place in California that regulate post-fire salvage logging and subsequent post-fire management activities.

WATER QUALITY IMPACTS AND TIMBER HARVEST OPERATIONS IN THE POST-FIRE ENVIRONMENT

In the western United States historic forest management and fire suppression, in conjunction with a changing climate, have led to uncharacteristically large, severe wildfires (Flannigan et al. 2000, Littell et al. 2009, Westerling et al. 2006, Westerling and Bryant 2008). As a result of this general decline in active fuels management on both federal and non-federal lands, exacerbated by nearly a century of intense fire suppression, increased frequency and intensity of stand-replacing fire is occurring throughout the western United States. The remaining forests of central and northern California that have not recently burned at high severity have high fuel loads and are experiencing extended periods of above average seasonal temperatures. These factors are leading to both extended fire seasons as a result of drier fuel conditions, and increased incident of extreme fire behavior with stand-replacing wildfires. Climatology models and information gathered by leading fire ecologists predict that the future wildfire regime in California will result in increased spatial size, distribution, and occurrence of severe wildfires (Fried et al. 2004, Miller et al. 2009, Westerling and Bryant 2008, Westerling et al. 2011).

Fire is a natural disturbance that directly influences California ecosystems and ecological processes, plant species, animals, and entire watershed ecosystems in California that have evolved to be both tolerant and dependent on fire as a landscape scale physical disturbance. However, as fire regimes in California shift, so has the intensity of the physical disturbance caused by wildfire. Increases in wildfire frequency, magnitude, and severity due to climate change within the western United States may lead to detrimental sediment-related water quality issues within

[1] For the purposes of this Information Sheet and Order (Attachment A) "pesticide" means (1) any substance, or mixture of substances which is intended to be used for defoliating plants, regulating plant growth, or for preventing, destroying, repelling, or mitigating any pest, which may infest or be detrimental to vegetation, man, animals, or households, or be present in any agricultural or nonagricultural environment whatsoever, or (2) any spray adjuvant, or (3) any breakdown products of these material that threaten beneficial uses. This definition excludes aquatic pesticide discharges covered under Order No. 2013-0002-DWQ.

burned mountainous watersheds (Gould et al. 2016). There must be recognition that post-fire land use activities have the potential to exacerbate fire effects, and land owners, land managers, and resource agencies have a responsibility to understand what those potential impacts are and where there is opportunity to minimize those impacts through both adaptive management and strategic regulatory measures.

Water Quality Impacts Following Fire

Following severe wildfire in forested landscapes, increased soil water repellency and other changes to soil properties can reduce infiltration rates and increase the rate and frequency of runoff (Martin and Moody 2001, Robichaud 2000, Robichaud et al. 2016). Additionally, the loss of ground cover following severe wildfires is a dominant factor for increased soil erosion rates (Benavides-Solorio and MacDonald 2001, Delwiche 2009, Larsen et al. 2009, Robichaud et al. 2016). Increased soil erosion rates and sediment delivery to downstream channel networks can pose a significant threat to aquatic resources and beneficial uses, particularly after extensive high severity wildfires (Helvey 1980, Moody et al. 2013, Bladon et al. 2014, Chappel 2014).

Soil erosion at its most basic form involves the detachment, breakdown, transport, and deposition of sediment, which in the context of post-wildfire effects, is dependent on multiple factors, including: fire severity, watershed area, topography, geology, vegetation, and precipitation intensity. The greatest erosion events typically occur before vegetation regrowth and recovery and often coincide with episodic, short-duration, high intensity rain storms immediately after severe wildfire (Moody and Martin 2001). Accelerated erosion, potential hydrophobic soils, reduced water infiltration rates, overland runoff, and mass soil hillslope failures can also produce catastrophic debris flows in some environments (Doerr et al. 2009) which pose a direct threat to water quality, beneficial uses, and human health and safety (Cannon et al. 2010). Accelerated soil loss also affects site class and future tree growth.

On uncompacted, unburned hillslopes and areas with intact overstory canopy and ground cover, overland flow usually occurs only during very intense and short duration storm events. In high severity post-fire environments, where soil properties have been altered and effective ground cover is not present, significantly higher rates of runoff can be expected (e.g., Wagenbrenner et al. 2017). Compared to lower severity fires, high severity fires consume a higher proportion of the vegetation, forest litter, and other organic matter that provide effective ground cover. Reduced ground cover exposes more of the soil to precipitation and often increases erosion by several orders of magnitude. In studies conducted in the Sierra Nevada, rates of post-fire surface erosion have been reported to be 2-239 times greater than pre-burn rates (Ahlgren and Ahlgren 1960). The amount of erosion and sedimentation depends on severity of the fire and post fire storm events (number and intensity), especially the first two winters. The progressive decline in post-fire sediment yields over time is largely controlled by the regeneration of surface cover, primarily vegetation (MacDonald and Larsen 2009, Benavides-Solorio et al. 2001, Larsen et al. 2009). With the return of vegetative growth and stabilization of easily mobilized soil material, hillslope erosion rates generally attenuate with time after the wildfire and return to background rates within 2-3 years (Heede et al. 1988, Wohlgemuth et al. 1998) under natural conditions.

Only limited post-fire sediment monitoring has been undertaken in the Sierra Nevada and Cascade Ranges. Usually erosion and sediment data are not collected following a wildfire. Data collected to date show widely varying impacts, with very high hillslope erosion rates usually requiring one or more major hydrologic event the first two winters. In general, post-wildfire erosion is highly variable

and difficult to predict. The risk of elevated sediment yields generally is greatest the first few years after the fire until vegetation is reestablished (Wagenbrenner 2017).

As an extreme example of post fire erosion, the 2012 Bagley Fire (46,011 acres) in Shasta County produced an estimated total hillslope erosion of 5.23 million tons (114 tons per acre) during the first year post-fire. Two intense storms occurred a few months after the fire, with estimated return intervals of 25-50 years. Soil loss was estimated at 0.2 to 2.2 inches on virtually all hillslopes (USFS 2014). Measured sediment delivered to Squaw Creek during the first year post-fire resulted in sustained turbidity and significantly higher water temperatures, exceeding 70 degrees Fahrenheit; a temperature that can be lethal to cold water fish. Sediment produced during the first year post-fire and during subsequent years continue to be transported downstream to Lake Shasta, leading to reduced storage capacity and increased nutrient loads.

Other post-fire monitoring efforts in interior California have documented lower sediment yields at the plot or small catchment scales. These include the 2012 Ponderosa Fire - 15.5 t/ac (James 2014); 1999 Pendola Fire - 5 t/ac (MacDonald et al. 2004); 2007 Angora Fire - 0.01 t/ac (Wade and Kocker 2012), 1987 Stanislaus Complex - 20-50 t/ac (J. Frazier and A. Janicki, Stanislaus National Forest, pers. communication, cited in the California Fire Plan, BOF 1995); 1987 Hayfork District - Shasta Trinity National Forest Complex Fires - 10-40 cubic yds/ac (Miles et al. 1989); and the 2001 Star Fire - 1.2 t/ac, second winter (Chase 2004).

Following wildfire, sediment discharge can lead to changes in turbidity, temperature and stream chemistry. These changes may degrade water quality (i.e., taste, odor, color) and impair drinking-water treatment processes, along with negatively impacting aquatic life. Increases in sediment and turbidity can affect aquatic ecosystems by clogging streambed interstitial voids with fine sediments, reducing stream depth, increasing channel instability, altering stream temperatures, impairing fish feeding, and destabilizing stream channels (Goode et al. 2012). The growth and survival of aquatic plants, invertebrates, and fish are negatively affected by increases in sediment and turbidity (Wagner et al. 2014).

Wildfires such as the 2012 Bagley Fire can liberate accumulated metals, such as arsenic, aluminum, cadmium, iron, lead, and mercury. These metals have a strong affinity for ash and fine sediment, which are subsequently discharged to stream systems via elevated runoff and erosion (Bladon et al. 2014). Mercury's potential to bioaccumulate and biomagnify can result in health problems for consumers of fish. There are several streams, lakes, and reservoirs—including Lake Shasta—in the Central Valley Water Board region that are currently listed as 303(d) impaired by various metals, including mercury. Many of these waterbodies are located in watersheds subject to increased risk of large, severe wildfires.

Nutrients such as nitrogen and phosphorous are often mobilized by fire, which results in increased loading to streams (Bixby et al. 2015). In addition, significant increases in specific conductance and turbidity, along with corresponding decreases in dissolved oxygen are documented (Sherson et al. 2015). Nutrients can contribute to and exacerbate Cyanobacteria (blue-green algae) blooms, such as those experienced during the summer of 2015 throughout much of the Central Valley Water Board region, including Lake Shasta.

Timber Harvesting Policies and Regulations in California

Non-Federal Lands

Timber harvesting on non-federal lands in California is regulated by the Board of Forestry and Fire Protection (BOF) in accordance with the Forest Practice Act (FPA) through implementation of the California Forest Practice Rules (FPRs); a set of regulations that lay out administrative procedures and prescriptive best management practices to protect natural resources. Pursuant to the FPA and through the FPRs, the California Department for Forestry and Fire Protection (CAL FIRE), acting as the lead agency, the applicable Regional Water Board, California Department of Fish and Wildlife (CDFW), and California Geological Survey are responsible agencies for the review of timber harvesting plans (THPs) (Cal. Code of Regs., tit. 14, § 896). As a member of this interdisciplinary Review Team for green tree THPs, the Central Valley Water Board staff reviews proposed THPs, and has the opportunity to participate in pre-harvest inspections, and may provide input and recommendations on water quality-specific components to ensure water quality protection prior to CAL FIRE approval.

This multi-disciplinary review process for green tree THPs is considered to be functionally equivalent to the Environmental Impact Report (EIR) process under California Environmental Quality Act (CEQA) (*see* Cal. Code of Regs., tit. 14, § 896). The average THP consists of more than 120 pages of information related to the site, current conditions, proposed operations, cumulative impacts assessment, operational considerations, and proposed mitigations to address potential impacts to a variety of natural resources supported by forestlands.

Following wildfire, many large industrial forest landowners engage in salvage logging, whereby burned, damaged, and commercially valuable timber is removed through conventional timber harvesting techniques. Generally, the value of the commercial timber burned in a fire degrades within 1-2 years post-fire, resulting in harvesting operations that focus on removing burned timber quickly to recover as much economic value as possible. The FPA and FPRs allow for the rapid removal of trees from areas damaged by fires where such removal meets the definition of an emergency:

> *…those conditions that will cause appreciable financial loss to the timber owner that may be minimized by immediate harvesting of timber"* (Pub. Res. Code § 4592; *see also* Cal. Code of Regs., tit.14, § 895.1).

The Emergency Notice process requires minimal documentation (generally approximately 3 pages including a map) and does not provide opportunity for the interdisciplinary Review Team to address potential impacts to resources from post-fire salvage operations. As a non-discretionary action taken by CAL FIRE, timber operations associated with Emergency Notices can commence five working days after submittal without first preparing a THP, and are not subject to the interdisciplinary Review Team process or public review/comment. In fact, due to the accelerated timeline for Emergency Notices, it is generally only after a timber/timberland owner has submitted the Emergency Notice to CAL FIRE and then submitted an application for coverage under the Central Valley Water Board's current Waiver of Waste Discharge Requirements (Order No. R5-2014-0144) that staff becomes aware post-fire salvage operations have commenced and receive limited information about the location and timing of those operations.

Non-federal timber/timberland owners are required to retain a Registered Professional Forester (RPF) to prepare and submit an Emergency Notice. Timber operations conducted pursuant to a CAL FIRE-accepted Emergency Notice must comply with the rules and regulations of the BOF and

specifically with all operational provisions of the FPRs applicable to plans. The timber/timberland owner has one year to complete timber harvesting under the Emergency Notice from the date of CAL FIRE receipt, unless a discretionary THP is subsequently approved allowing for continued operations in the area.

There are also other differences between an Emergency Notice for post-fire salvage and a typical "green tree" THP. While there are no upper (or lower) limits for the total acreage allowed under a THP, individual even aged harvest unit size in a "green tree" THP is limited to 20 acres for tractor logging and 30 acres for cable/aerial logging with additional controls on the filing of contiguous harvesting plans. Post-fire salvage operations have no upper or lower limits for the total acreage harvested, as long as all operations can be concluded within the one-year time period. Therefore, harvest units under an Emergency Notice can be as large as the timber/timberland owner can operationally accommodate, effectively resulting in the potential for clear-cutting of multiple contiguous square miles (thousands of acres). In burned landscapes, large salvage logged units that exceed hundreds of acres in size can exacerbate runoff and erosion rates through removal of standing dead timber and timber that is damaged by the fire. Increased erosion and runoff can occur due to road and skid trail construction and use, and possible reduction in overstory canopy and removal of biomass that if left unharvested would provide ground cover (i.e., needle cast, tree limbs, and eventually snags and whole trees) to dissipate rainfall energy and concentrated flow along the hillslopes. Often, however, salvage logging increases short-term ground cover due to the logging slash and tree tops left on site (Poff 1989).

Another fundamental difference between an Emergency Notice for post-fire salvage and a typical "green tree" THP applies to the Watercourse and Lake Protection Zone (WLPZ)—also known as riparian buffer zones. WLPZ requirements apply to both standard green tree THPs as well as Emergency Notice operations; however, trees within the WLPZ that have fallen, or are damaged, dead, or dying can be removed under an Emergency Notice, regardless of the standard tree retention or restocking requirements of the FPRs for green tree THPs. This can result in the complete removal of all large timber from within these streamside zones during salvage logging operations, unless the watershed requires additional protection measures for anadromous salmonids.

In 2009, after the 2008 June lightning fire siege that occurred across the state, a proposal to extend Emergency Notices from 120 to 365 days was proposed by the timber industry to the BOF. The proposal included modification of California Code of Regulations, title14, section 1052(e) language that:

> *…intended to lengthen the effective period of an Emergency Notice such that preparation and approval of a succeeding THP may be assured prior to expiration of an Emergency Notice.*

At the time, Central Valley Regional Water Board staff argued that if the BOF's intent was to ensure harvesting operations in the post-fire environment would be started under an Emergency Notice and then analyzed with the THP Review Team process, then the rule language would need to clearly require a THP be submitted prior to the expiration of the applicable Emergency Notice.

In response to questions about possible significant adverse environmental effects, the BOF found that:

> *…[this] proposed regulation would not result in significant adverse environmental effects. The existing Forest Practice Rules for Emergency Notices and Timber Harvesting Plans already provide for comprehensive assessment and mitigation of potential adverse effects. This proposed regulation does not alter these existing provisions.*

Additional response was provided by Central Valley Water Board staff:

> *While Regional Water Board staff agrees that the FPRs provide for assessment and mitigation of potential adverse effects through the THP process, the information required in a THP is significantly more complex than that required by the Emergency Notice. It is inaccurate to state that the FPRs provide for a comprehensive assessment and mitigation of potential adverse effects through the Emergency Notice process. While there is a list of operational limitations that must be complied with for Emergency Notices in the FPRs, there are numerous concerns that are not addressed. And in fact, an argument could be made that allowing operations on lands that have been burned (and thus been made more sensitive than those normally reviewed under the THP process) through a non-discretionary process is not an environmentally responsible or defensible position.*
>
> *If a burned area has unmaintained legacy roads and [watercourse] crossings that are undersized, the Emergency Notice allows for those roads to be used and does not require assessment and mitigation of any erosion problems from those roads and crossings.* [Central Valley] *Water Board staff acknowledges that there may not be a simple answer for the problem this rule is trying to address, but a simple extension of the time limits is only addressing a small portion of the problem.*
>
> *The FPRs provide minimum operational standards, and those requirements are frequently supplemented with additional mitigations to address potential impacts to the resources through the interdisciplinary review team process* [for THPs]. *Due to the nature of the Emergency Notice process those same minimum operational standards* [additional mitigations] *provided in the FPRs are not applied. If Emergency Notices are allowed to proceed for 365 days, the likelihood of a succeeding THP ever being submitted and those additional environmental mitigation measures being developed declines dramatically.*
>
> *There must be acknowledgement that fire is a natural process by which waters of the state (as well as other resources) are impacted, but it is critical to accept that it is our responsibility to ensure that the impacts from the fire are not further aggravated by anthropogenic activities.*

Since the lightning fire siege that occurred throughout the state in 2008, Central Valley Water Board Forest Activities Program staff has focused more effort on these post-fire salvage operations and have not observed THPs being prepared to continue salvage operations subsequent to the first year of harvesting conducted under Emergency Notices (on non-federal lands). Instead, staff has observed multiple Emergency Notices being submitted for 1-3 years after the fire.

Over the last several years CAL FIRE has processed, on average, approximately 175 Emergency Notices covering roughly 45,000 acres annually. This number is heavily dependent on annual fire season activity, but it provides a general idea of the recent scope of the issue.

During this time, Central Valley Water Board staff has observed extensive soil erosion and sediment discharge to receiving waters extending for several years following many large wildfire

events. These large fires include: the Bagley, Bully, Ponderosa, King, Chips, Moonlight, Valley, and Rim Fires. Post-fire salvage operations following these fires has resulted in direct impacts to water quality through accelerated erosion and sediment delivery from skid trails, roads, landings, and episodic events such as landslides and debris flows. Many of these sources of sediment discharge are largely attributed to and associated with post-fire salvage operations. Direct in-stream measurements of turbidity that exceeded Basin Plan objectives have been documented downstream of several fires (e.g., Ponderosa, Bagley, and Bully Fires). There are data to suggest that changes in turbidity in streams draining the 2012 Ponderosa Fire were caused by the fire, salvage harvesting, and associated road use (Lewis 2014). In addition, dozens of herbicide (pesticide) detections have been recorded in the post-fire environment that will be discussed in later sections of this document.

There is recognition among Central Valley Water Board staff that identifying cause and effect between post-fire salvage operations and water quality impacts is challenging. Non-point source water quality pollution can be complex and evaluating sediment discharge from post-fire salvage operations against natural or background delivery rates to watercourses is no different. However, the Central Valley Water Board has a responsibility and mandate under the Clean Water Act, California Water Code, Basin Plan, and Non-Point Source policy to identify potential non-point source discharges to waters of the state and address those discharges through prohibitions; or Waste Discharge Requirements (WDRs); conditional waivers of WDRs; or until a determination has been made that the threat of discharge and impact to water quality no longer exists.

Federal Lands

As the largest public land management agency in the Central Valley Region's forested zones, the U.S. Forest Service (USFS) experiences large catastrophic wildland fires, predominantly along the west slope of the Sierra Nevada and southern Cascade Ranges on National Forest System lands (NFS).

Immediately following a fire on federal lands, there is a rapid assessment by a Burned Area Emergency Resource (BAER) team staffed by specially trained professionals for fires greater than 300 acres, generally including hydrologists, soil scientists, engineers, biologists, vegetation specialists, archeologists, GIS specialists, and others, who rapidly evaluate the burned area and prescribe emergency stabilization treatments for Forest Service lands. The BAER program is designed to address these emergency situations through its key goals of protecting values at risk (VARs), including life, property, and critical natural and cultural resources. Water quality and aquatic habitat are not specifically included in the list of VARs evaluated through the BAER process. In most cases, only a small portion of the burned area is treated based on the outcome of the BAER process, due to the high cost of effective treatments (e.g., mulching; hydro-mulching). Some of the information that is gathered during these assessments, however, can be utilized for development of future project proposals and in support of environmental documents for those projects.

The percent of federal lands salvage logged is much lower than that which occurs on private industrial timberland in California. Post-fire salvage logging on federal lands seldom occurs in the first year of the fire due to the time involved in preparing environmental documents in conformance with the National Environmental Policy Act (NEPA). Depending on the scope of proposed actions and the level of impact on the environment, the USFS may choose to prepare a Categorical Exclusion (CE), Environmental Assessment (EA), or Environmental Impact Statement (EIS). In general, the USFS will only utilize a CE for very small proposed post-fire salvage operations or roadside hazard tree removal through areas that have experienced wildfire. The preparation of this

document and final decision can be relatively fast and a final decision can be made within a few months. The scope of an EA is generally broader and incorporates multiple resource objectives (e.g., reduce public safety hazard along NFS roads, recover economic value of fire-killed trees, reduce fuel loading, implement reforestation, and manage road infrastructure). These documents take longer to develop utilizing a multi-disciplinary team of specialists, and there is a much more involved public scoping process which can often lead to delays and litigation. The most robust NEPA document is the EIS. These documents can be very broad in scope and include evaluation of a multitude of resource objectives and goals. Preparation of these documents can be lengthy and if post-fire salvage operations are a component of the proposed actions, it is often unlikely that the decision approving the NEPA document will be prepared before the fire-killed commercial species of trees have lost all economic value.

There is a growing trend within the federal agency to prepare larger environmental documents (i.e., EA and EIS) in an effort to conduct multi-phased and longer term watershed-scale projects with multiple resource goals and objectives. There are many reasons why the USFS pursues this type of approach to their land management; however, a consequence of this approach is that post-fire salvage projects can take much longer to receive approval, and as a result, the trees quickly lose economic value before they can be harvested. This can lead to the timber sale/salvage component of these projects being removed from the project or Timber Sales are not purchased by private contractors and the trees are left unharvested. Either way, standing dead and dying trees are often left behind on the landscape. Reforestation efforts are greatly compromised, leading to reduced long term carbon storage in California forestlands (CARB 2017). Despite broad agreement on reforesting lands burned, lack of funding and staff have made reforestation very difficult.

The Central Valley Water Board's review process for post-fire salvage projects on federal lands is significantly different compared to non-federal projects. Following a wildfire on NFS lands, Central Valley Water Board staff review the Schedule of Proposed Actions (SOPA) list for each National Forest to see what projects and associated environmental documents will be proposed. Staff review and respond to the proposed action during the regular public scoping period. Once a USFS decision has been made on the NEPA document, the USFS submits a NOI for the proposed project, and Central Valley Water Board staff review the submitted project documents, enrolling the project under the appropriate permit category. Staff often conducts inspections of the post-fire salvage operations and provides recommendations for additional erosion mitigations where necessary to protect water quality. However, unlike the THP process for non-federal lands, it is sometimes difficult to incorporate substantial recommendations (e.g., new or reconstructed watercourse crossings or significant modification to road shape and drainage) without modifying the original environmental documents (i.e., CE, EA, or EIS). These documents are often written in very general, non-prescriptive terms that make evaluations for potential water quality impacts prior to commencement of project activities challenging. The lack of site specificity in the project documents provided by the USFS has been an on-going issue for Central Valley Water Board staff, not only for post-fire salvage projects, but for all non-point source projects enrolled under Water Board permits.

Post-Fire Timber Harvest

Numerous studies have been conducted on post-fire erosion response to logging (Ice and Beschta 1999). Some studies indicate that there are potential benefits to logging after wildfire—increasing ground cover through logging slash, removing sources of high intensity water droplets from standing dead trees, reduction of fuel loading and risk of high intensity fires, and by breaking up

hydrophobic soil layers (Poff 1989, James 2014). The application of these ground-based treatments, however, are often limited to slopes that are less than 35 percent where erosion rates are generally lower due to lower erosive energy and runoff velocity. Conversely, there is documentation from other studies reporting that salvage logging increases the risk of sedimentation and that specific best management practices are needed to mitigate the hydrologic impacts of post-fire logging (Beschta et al. 1995, Peterson et al. 2009, Wagenbrenner et al. 2015, Wagenbrenner et al. 2016b, Lewis 2014).

At the small catchment scale, impacts of salvage logging on sediment yields are variable. One recent study has shown a net decrease in sediment yields after salvage logging and subsequent herbicide (pesticide) applications (James 2014), two studies have shown no detectable change in sediment yields because of salvage logging (Wagenbrenner et al. 2015)—Hayman and Kraft Springs Fires; Olsen, 2016), and one study has documented an increase in sediment yields because of salvage logging (Wagenbrenner et al. 2015—Red Eagle Fire) (Wagenbrenner 2017).

Non-Federal Lands

Large non-federal industrial landowners generally remove all the trees within an Emergency Notice harvest unit, including those only partially burned or scorched. This can result in post-fire harvest units which have no size limitations and are almost completely devoid of trees. Based on the fact that burned areas produce additional stormwater runoff and sediment, both the existing road network and any new logging road construction should be designed, utilized for heavy equipment and log hauling, and maintained to minimize delivery of sediment to streams. Post-fire logging generally requires the installation and use of numerous skid trails, used when heavy equipment transports the cut logs within the logging unit to a landing, where the tree is then processed and loaded onto log trucks for transport to the mill. As with new logging road construction, post-fire skid trails present a heightened potential for erosion and sediment transport. With the urgency to remove burned trees and maximize the economic value of the rapidly degrading wood product, there are usually compressed timelines within which to evaluate, design, and implement logging operations, including road construction, before the first winter period following the fire. Central Valley Water Board staff has observed that standard coefficients and input values (e.g., runoff coefficients, time of concentration calculations, headwater/depth ratios for culverts, etc.) used in technical guidance documents for design of stream crossing structures (as noted in Cafferata et al. 2004) may be inadequate in the post-fire environment.

Federal Lands

Unlike non-federal landowners, USFS salvage operations remove only a fraction of the burned trees and generally leave most partially burned and scorched trees for wildlife values and possible recovery. This limited and selective harvesting, by its very nature, may provide immediate ground cover in the form of needle cast, as well as dead trees, green trees (foliage), and some logging slash.

Riparian buffers mandated by various USFS BMPs, regulations and policies, are wider than those required of non-federal landowners in the FPRs, providing extra protection for aquatic resources and water quality.

Post-Fire Pesticide Use

Non-Federal Lands

While post-fire salvage operations conducted under an Emergency Notice are not required to restock (i.e., replant conifers), most non-federal industrial timberland owners in California choose to

reforest their lands. Replanting conifers is frequently accompanied by pesticide applications to ensure seedling survival and establish conifer plantations as quickly as possible (DiTornaso et al. 1997, Webster and Fredrickson 2005, Zhang et al. 2008). In some cases, pre-emergent pesticides are applied in the late fall or early spring immediately after the fire to prevent competing vegetation from germinating. In other cases, post-emergent pesticides are used to kill newly sprouting vegetation before and/or after planting new conifers. There are two common methods in which pesticides are applied within the forested landscape to facilitate regeneration of conifer seedlings: spot applications, where an applicator uses a hand-sprayer to apply pesticides in a small circle around an individual conifer seedling; and aerial applications, where pesticides are sprayed from an aircraft over larger areas. In many cases, especially with the size and extent of recent spatially extensive wildfires, applications of pesticides by non-federal landowners are accomplished via aerial spraying (e.g., helicopters).

Pre-emergents [pesticides] are very effective at preventing new ground cover establishment for several years in the post-fire landscape, which reduces competition for nutrients, light, and water, increasing the success rate of conifer seedling survival (Webster and Fredrickson 2005). From a reforestation perspective, the use of pre-emergents [pesticides] achieves the objective of reducing competition between recently established commercial tree species seedlings and non-desirable species such as hardwoods, brush, and grasses. This practice, however, can come at a cost by delaying natural recovery of the burned landscape and the establishment of effective ground cover to reduce surface erosion (DiTornaso et al. 1997).

Very little information is available regarding the impacts of post-fire management on runoff and erosion (Wagenbrenner 2017). Most post fire research has focused attention on the physical effects of ground-based salvage logging on runoff and erosion, while little attention has focused on post-logging vegetation management. It is currently unknown whether post-fire vegetation management using pesticide treatments has a larger effect on post-fire hydrogeomorphic processes than salvage logging due to alterations in post-fire recovery processes (i.e., revegetation and associated ground cover increases). Clearly there are trade-offs associated with limited pesticide application (e.g., poorer seedling survival, slower establishment of tree cover).

Numerous studies have shown that the percent of ground cover is the primary and dominant control of erosion and sediment yield in the post-fire environment (Benavides-Solorio and Macdonald 2001, Benavides-Solorio et al. 2005, Goldman et al. 1986, Larsen et al. 2009, Lavee et al. 1995, Robichaud et al. 2010, Wagenbrenner et al. 2015, Slesak et al. 2015, Delwiche 2009).

Federal Lands

The USFS typically utilizes pesticides on a very limited basis in post-fire environments. In most cases where pesticides are used on NFS lands, spot spraying is used to control invasive weeds and to help re-establish conifers. Unlike non-federal industrial landowners, these limited applications generally occur a year or more after the fire when vegetative recovery and ground cover has been significantly re-established, thereby, providing the cover necessary to reduce erosion and limit offsite movement of sediment.

For the pesticides commonly used by the USFS in its management activities, Human Health and Ecological Risk Assessments (HERAs) are prepared. In these documents, the process of risk assessment is used to quantitatively evaluate the probability that pesticide use might pose harm to humans or other species in the environment. When evaluating risks from the use of pesticides proposed in a NEPA planning document, the USFS has determined that reliance on the U.S. Environmental Protection Agency's (U.S. EPA) pesticide registration process as the sole

demonstration of safety is insufficient. The USFS and Bureau of Land Management (BLM) were involved in court cases in the early 1980's that specifically addressed this question (principally Save Our Ecosystems v. Clark, 747 F.2d 1240, 1248 (9th Circuit, 1984) and Southern Oregon Citizens v. Clark, 720 F. 2d 1475, 1480 (9th Cir. 1983)). These court decisions and others affirmed that although the USFS can use U.S. EPA toxicology data, it is still required to do an independent assessment of the safety of pesticides rather than relying on the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) registration alone. The Courts have also found that FIFRA does not require the same examination of impacts that the USFS is required to undertake under NEPA. Further, USFS assessments consider data collected from both published scientific literature and data submitted to U.S. EPA to support FIFRA product registration, whereas U.S. EPA utilizes the latter data only. The U.S. EPA also considers many forestry pesticides uses to be minor. Thus, the project-specific application rates, spectrum of target and non-target organisms, and specialized exposure scenarios evaluated by the USFS are frequently not evaluated by U.S. EPA in its generalized registration assessments.

Post-Fire Pesticide Application and Regulations

Post-fire applications of pesticides follow the same pesticide labeling rules as used in 'green tree' forestry pesticide applications (as shown on the individual pesticide label), regardless of the severity of the fire and the amount of vegetation cover removed by the fire or the risk of erosion.

All pesticide label requirements, including those related to aquatic buffers are initially approved by the U.S. EPA based on evaluation of pesticide registrant submitted data used to support proposed label uses. In order for pesticide products to be used in California, the Department of Pesticide Regulation (DPR) reviews all U.S. EPA pesticide label components. State specific modifications to address necessary additional restrictions may be incorporated in coordination with registrant and EPA. Each pesticide label has general use instructions with specific state requirements. A Pest Control Advisor (PCA) is a trained, licensed individual that provides site specific pesticide recommendations. Most commonly used forestry pesticides have no aquatic buffers listed on the label, as indicated in Table 1 below.

Table 1 – Pesticide aquatic buffer widths as provided in current labels*

Active Ingredient	Formulation Name	Aquatic Buffer (feet)	Label Toxicity Warnings	Additional Labeling
Aminopyralid	Milestone	0		
Clopyralid	Transline	0		
Glyphosate	Accord XRT II	0		
Hexazinone	Velpar L	0		
Imazapyr	Polaris	0		
	Arsenal	0		
	Chopper	0		
	Stalker	0		
	Rotary 2 SL	0		
Oxfluorfen	Pindar GT	25 ***Vegetated* buffer strip	*This product is toxic to aquatic invertebrates and wildlife*	*Runoff from treated areas may be hazardous to aquatic organisms in neighboring areas*
	Cleantraxx	25 ***Vegetated* buffer strip	*This product is toxic to aquatic invertebrates and wildlife*	*Runoff from treated areas may be hazardous to aquatic organisms in*

Active Ingredient	Formulation Name	Aquatic Buffer (feet)	Label Toxicity Warnings	Additional Labeling
				neighboring areas.
Sulfometuron methyl	Oust XP	0		
Triclopyr	Garlon 4	0	*This pesticide is toxic to fish.*	*The use of this chemical in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.*
	Element 4	0	*This pesticide is toxic to fish.*	*The use of this chemical in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.*
	Forestry Garlon XRT	0	*This pesticide is toxic to fish.*	*The use of this chemical in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.*
***** 2,4-D**	Weedone LV6 EC	0	*This pesticide is toxic to fish.*	*The use of this chemical in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.*
	Weedone LV4	0	*This pesticide is toxic to fish.*	*The use of this chemical in areas where soils are permeable, particularly where the water table is shallow, may result in groundwater contamination.*

** This table provides a summary of current label requirements and is subject to change. The most up to date requirements for individual pesticides are listed on the label and should take precedent.*

*** Vegetated buffer: Note that in many wildfires with high burn severity there is no vegetation remaining to provide an aquatic buffer.*

**** 2,4-D is a Restricted Material: Restricted Materials are designated by DPR, based on hazards to public health, applicators, farm workers, domestic animals, honeybees, the environment, wildlife, or crops other than those being treated.*

Pesticide Application Monitoring (DPR/County Ag)

For non-restricted materials, licensed pesticide applicators are required to report pesticide use to the respective county agricultural commissioner (CAC) within seven days of the completion of the application. Restricted material pesticides (e.g., 2,4-D and strychnine) have to report to the CAC 24 hours in advance of application. Restricted Materials are designated by DPR, based on hazards to public health, applicators, farm workers, domestic animals, honeybees, the environment, wildlife, or crops other than those being treated. There is no evidence that any monitoring of forestry pesticide applications is conducted by CAC staff (Central Valley Water Board staff personal communication with CAC staff and RPFs, May 2016).

Post-Fire Pesticide Detections

Following the 2012 Ponderosa Fire in the Battle Creek watershed located in Shasta and Tehama counties, salvage operations were conducted throughout the watershed on non-federal lands. During 2013 and early 2014, approximately 12,000 pounds of Hexazinone (Active Ingredient – A.I.) 1395 pounds of Imazapyr, 115 pounds of Triclopyr, and 30 pounds of 2,4-D were applied in the Battle Creek watershed, most of it associated with post-fire conifer plantation establishment. . Through a contract agreement with the Central Valley Water Board, a water sampling and analysis pilot study was conducted by the California Department of Fish and Wildlife (CDFW) between November 2013 and March 2014. Hexazinone, 2, 4-D, Triclopyr, and Imazapyr were detected. Hexazinone was detected in all 26 samples. The primary purpose of the pilot study was to test the utility of the Continuous Low Level Aquatic Monitoring (CLAM) collection devices for detecting pesticides downstream of forestry operations. This study did not quantify concentrations of specific chemicals; however, pesticide chemicals were present and detectable. While detections were indicated, significant issues with regard to the equipment reliability of the CLAM sampling devices, testing protocols, and verification standards indicate that further study is needed. Until further study can be conducted, the General Order establishes specific requirements in Parts III.C.3.b.ii. and III.F.3.c.ii. to provide reasonable protection measures to address potential threat to water quality from pesticides in forestry application.

Post-Fire Mitigations for Protecting Water Quality

The previous sections have summarized the naturally occurring and anthropogenic sources of accelerated erosion and sediment delivery that can occur following a major wildfire, including: the mechanics of increased runoff rates, hydrophobicity, surface soil erosion, and the inability of burned landscapes to buffer increased erosion. In unmanaged landscapes where no salvage logging operations will occur, these processes will occur naturally and play a vital role in ecosystem dynamics and landscape scale erosional processes. In managed landscapes where salvage logging will occur, BMPs and mitigations are needed to reduce management-related sediment sources to watercourses within the burned area. The most widely used and most cost-effective management measures and BMPs used to mitigate erosion and sediment delivery are erosion barrier treatments, mulch treatments, chemical soil surface treatments, and natural reestablishment of vegetative cover.

Erosion barrier treatments are designed to slow runoff, and trap and store eroded sediment. Common post-fire hillslope erosion barriers include contour-felled logs, straw wattles, contour trenches or ‘contour ripping’ (hand or machine dug), and straw bales (Napper 2006). Erosion barriers, and contour-felled logs in particular, may reduce runoff and sediment yields for low intensity rain events, but they are unlikely to have a significant effect for high intensity rain events and can concentrate flow, creating erosion if implemented incorrectly (Robichaud et al. 2010). Contour ripping has been used by some landowners and land managers as cost-effective erosion mitigation in post-fire environments (James 2014). Contour ripping can be implemented generally on slopes 35% or less, where erosion is lower than on steeper slopes, and is not restricted by natural barriers, such as rocky terrain. The contours created by this practice must be deep enough to penetrate the hydrophobic layer created by high intensity fire and be constructed “on-contour”, perpendicular to slope, to reduce flow pathways and concentration of runoff that could result in rilling and gullying. A study conducted by a large industrial landowner in the Ponderosa Fire footprint indicates that contour ripping reduces post-fire surface erosion (James 2014).

Mulch treatments can be an effective post-fire mitigation for reducing surface erosion and involves the spread of material over the exposed soil surface to protect it from rain drop impact, overland flow, and erosion. Mulching is a quick way to immediately increase ground cover in areas that are at high risk of erosion and can be an effective post-fire mitigation. Mulches include wet mulches, such as hydromulches, which are mixed with water and sprayed over the soil surface. Dry mulches include straw, wood chips, wood shreds, and wood strands. Large wood chippers and masticators have proven to be very effective at generating wood chips and wood sheds using on-site fuels and logging slash. A limiting factor with dry mulches is that they are generally applied only on slopes from 20 to 60 percent, or where chippers can broadcast chipped materials on to the hillslope. "Straw bombing" or heli-mulching is another technique that has been utilized most frequently on federal post-fire landscapes by dropping cut hay bales from helicopters. This method can be effective, however, the operational cost of helicopters to "bomb" the hillside is often cost prohibitive (usually over $1500 per acre), and can result in less than two percent of the landscape being successfully treated.

Tackifiers—also known as soil binding agents—are another form of erosion treatment that is applied directly to the soil surface, forming a thin web of polymer designed to hold soil particles together. The soil binder polyacrylamide (PAM), a soil particle flocculant, is designed to connect small particles, thus increasing their size and mass. PAM is the only soil binder that has been used as a post-fire hillslope stabilization treatment. Post-fire treatment effectiveness studies that include PAM have generally been inconclusive or have shown no treatment effect.

For landscape-scale fires, many of the mitigations mentioned above are costly, with varying degrees of effectiveness (Robichaud et al. 2010, Wagenbrenner et al. 2006). The natural re-establishment of ground cover has shown to be the most feasible and cost-effective method to reduce erosion and sediment production (MacDonald and Larsen 2009, Benavides-Solorio et al. 2001). For many non-federal industrial timberland owners, however, allowing burned forestlands to regenerate naturally is not a viable economic option for maximizing commercial tree species production. For these landowners, herbicide (pesticide) use has been proven to be an effective measure for delaying the re-establishment of natural vegetative cover and increasing the rate of survival for replanted conifer seedlings. As discussed in previous sections of this document, the application of pesticides in the post-fire environment can have both a direct and indirect effect on rates of soil erosion, and the potential discharge of residual chemicals directly into surface waters.

Ground cover and riparian buffers can reduce pesticide discharge into streams by providing dissipation, filtration, chemical sequestration, and chemical degradation/biodegradation (Wenger 1999, Larson et al. 1997). Ground cover has been shown through numerous studies to be effective at reducing erosion and sediment transport. Research consistently indicates that 50% ground cover functions as the threshold where erosion and sediment production is significantly reduced (Benavides-Solorio et al. 2005, Foltz and Wagenbrenner 2010, Golman et al. 1986, Harrison et al. 2016, MacDonald and Robichaud 2008, Prats et al. 2012, Robichaud et al. 2012, Wagenbrenner et al. 2006, Yanosek et al. 2006).

Riparian buffers are shown to protect water quality, habitat, and biota in *non-burned* landscapes (Sweeney and Newbold 2014, Wenger 1999, U. S. Army Corps of Engineers 1991). Unburned or stream buffers burned with low severity are critical to protect water quality and other beneficial uses in post-fire environments because of the increased sediment production due to runoff after wildfires. Appropriate sized stream buffers (generally ≥30 meters or 100 feet) have been shown to mitigate stream impacts from *green tree* logging activities, while small buffers (≤10 meters) do not significantly protect a stream from logging impacts (Davies and Nelson 1994). Areas with high

resource value—such as wetlands and fish bearings streams—benefit from buffers that are a minimum of 15 meters, or approximately 50 feet (Castelle et al. 1994).
Studies on herbicide fate and transport show that average buffer widths of 38 m and 50 m, in restored and managed riparian forests respectively, reduced herbicide concentrations to at or below detection limits (Lowrance et al. 1997, Vellidis et al. 2002). A review of pesticide buffers found that cases of high pesticide concentrations only occurred when no buffer was used and that generally, bufferstrips of 15 m or larger are effective in minimizing pesticide contamination in streams (Neary et al. 1993).

This General Order requires the implementation of buffers based upon the information provided above. While slightly larger than research indicates necessary, required buffers are the same as those required in the FPRs to address large variations in soil, topography, resource sensitivity, etc. This General Order also allows the discharger to propose an optional plan (Attachment C) should they wish to test out emerging or alternate methods, technology, or pesticide use within the buffer(s) or on the slopes above.

Development of effective post-fire mitigations and BMPs to reduce impacts from erosion and sediment delivery to streams is an area of research and development that is being explored by many leading fire scientists, soil scientists, watershed scientists, foresters, and many state and federal resource agencies throughout the western U.S., including California. In an effort to provide more site-specific research into the effects of post-fire salvage logging in California, and to support an adaptive management framework where new science and research is used to support or promulgate existing and new rules and regulations, the Central Valley Water Board is funding a study through the AB 1492 Timber Regulation and Forest Restoration Fund (TRFRF) on Boggs Mountain Demonstration Forest (BMDSF), managed by CAL FIRE. BMDSF burned in 2015 during the Valley Fire and has provided a valuable opportunity to explore the effects of post-fire management on water quality by assessing the responses of runoff and sediment to logging and reforestation activities, and to demonstrate effective logging BMPs to landowners and land managers that are well suited for post-fire landscapes to mitigate potential water quality impacts. The project has three primary purposes: (1) to quantify the effects of post-fire salvage logging and common post-salvage site preparation techniques including mechanical and herbicide (pesticide)-assisted reforestation on soil properties controlling runoff, hillslope erosion rates, and vegetative recovery; (2) to understand processes occurring at small-catchment scales so that small-plot results can be extrapolated to sizes of specific interest to land managers and watershed stakeholders; and (3) to develop and demonstrate alternative BMPs used to reduce runoff and erosion from post-fire salvage logging. This study is currently underway and is expected to be completed by 2019. Initial study results are presented in Wagenbrenner et al. (2016a) and Olsen (2016).

Evaluation of Significant Existing or Potential Erosion Sites (SEPES)

The BOF, through a lengthy stakeholder process, developed and adopted a section in the FPRs referred to as the Road Rules, 2013, Rule Package. This rule package was intended to clarify, streamline and organize all of the FPRs where roads were included. The development process resulted in some additions as well, including the new definition of “Significant Existing or Potential Erosion Site (SEPES)” (Cal. Code of Regs., title 14, § 895.1) based upon a need to address such sites for water quality protection. The FPRs now include the following definition:

> “*Significant Existing or Potential Erosion Site means a location where soil is currently, or there are visible physical conditions to indicate soil erosion may be in the future, discharged*

> *to watercourses or lakes in quantities that violate Water Quality Requirements or result in significant individual or cumulative adverse impacts to the beneficial uses of water."*

The Road Rules, 2013, Rule Package became effective on January 1, 2015. Central Valley Water Board staff has been reviewing and commenting on the application of this definition for the past two years through the THP process and noting inconsistent interpretations. In Attachment A of the Order, an expanded definition has been provided that embeds the definition of Water Quality Requirements (also provided California Code of Regulations, title 14, section 895.1):

> *"Significant Existing or Potential Erosion Sites (SEPES)" means a location where soil erosion is currently, or there are visible physical conditions to indicate soil erosion may be in the future, discharged to watercourses or lakes in quantities that violate a water quality objective (narrative or numeric), prohibition, Total Maximum Daily Load (TMDL) implementation plan, policy, or other requirement contained in a water quality control plan adopted by the Central Valley Water Board and approved by the State Water Central Valley Water Board, or a location where soil erosion may result in significant individual or cumulative adverse impacts to the beneficial uses of water"* (emphasis added).

The intent in combining the two definitions in Attachment A of the Order is to emphasize that level of significance relative to existing and potential erosion sites is ultimately determined by, and is the responsibility of the Central Valley Water Board, who have a legal mandate and the authority to determine the significance of any discharge to waters of the state, and to ensure permitted discharges are in conformance with the appropriate Basin Plan, permit, policy, or other requirement (see Finding 18 of the Order).

Indicators of SEPES on the Existing Road Network

As noted in California Code of Regulations, title 14, Technical Rule Addendum No. 5: Guidance on Hydrologic Disconnection, Road Drainage, Minimization of Diversion Potential, and High Risk Crossings (1st Edition), section B, indicators of SEPES with the existing road drainage systems include:

- *Evidence of direct sediment entry into a watercourse or a flood prone area from road surfaces or drainage structures and facilities (e.g., ponded sediment, sediment deposits, delivery of turbid runoff from drainage structures during rainfall events).*
- *Ditch scour or downcutting resulting from excessively long undrained ditches with infrequent ditch drain (relief) culverts or other outlet structures or facilities. This condition can also result from design inadequacies (e.g., spacing not altered for steep ditch gradient), inadequate erosion prevention practices (e.g., lack of armoring), or ditches located in areas of erodible soils.*
- *Gullies or other evidence of erosion on road surfaces or below the outlets of road drainage facilities or structures, including ditch drain (relief) culverts, with transport or a high likelihood of transport to a watercourse.*

Additionally, if a road and/or ditch runoff is hydrologically connected to a watercourse, the following factors elevate the risk of sediment delivery to a watercourse:

- *Existing or high potential for cutbank sloughing or erosion into inside ditches.*
- *Native-surfaced road exhibiting erosion.*
- *Native-surfaced road composed of erodible soil types (e.g., granitic soils).*

- *Rilled, gullied, or rutted road approaches to crossings.*
- *Existing ditch drain (relief) culverts or other road drainage structures with significant plugging from sediment and/or small woody debris.*
- *Existing ditch drain (relief) culverts or other road drainage structures with decreased capacity due to damage or impairment (e.g., crushed or bent inlets, flattened dips due to road grading).*
- *Decreased structural integrity of ditch drain (relief) culverts, waterbreaks, or other road drainage structures (e.g., excessive culvert corrosion, breached waterbreaks, or rutted road segments).*

Under the FPRs, a standard 'green tree' THP must include an analysis of all SEPES and a schedule for addressing such sites within the project area as a part of the CEQA EIR equivalent process. However, post-fire salvage operations conducted under an Emergency Notice are exempt from the requirement to disclose and address SEPES. Previous sections of this Information Sheet have described the concerns that Central Valley Water Board staff have with salvage logging operations conducted under an Emergency Notice, and to address these concerns, the Order contains requirements for SEPES disclosure as a condition for enrollment of post-fire salvage operations.

SEPES in the Post-Fire Environment

For post-fire salvage areas (Category 2A and 5A), and areas not salvage logged but proposed for reforestation with pesticide applications, the Discharger shall evaluate SEPES considering the factors listed below that elevate the risk of sediment delivery to watercourses. The intent of this expanded SEPES evaluation is to identify existing or the potential for upslope erosional features (e.g., landslides, debris flows, significant gully networks, channel initiation and other mass wasting features) within the burned/logged area that have the potential to significantly influence the downslope road network. Documentation of hillslope level SEPES is only required where there is, or there is the potential for, an interaction of that feature with the below road network that will result in significant erosion and sediment delivery to a watercourse.

- Increased runoff and associated sediment/debris in high/moderate burn severity areas originating at mid to upper, convergent slope within the fire salvage area; or in areas outside the salvage area that contribute increased runoff to watercourse crossings and drainage structures within the fire salvage area or to appurtenant roads.
- Rilling and gullying along existing or proposed skid trails and water bars within the fire salvage area that have potential for sediment delivery to a watercourse;
- Existing watercourse crossings, particularly those with a structure (i.e. culvert, bridge), that are now undersized and at an elevated risk of failure due to any of the bulleted items listed above.

How Information is Used in the General Order

This Information Sheet sets forth the background and rationale used in the development of certain requirements in Order No. R5-2017-0061. Many of these requirements are new and represent significant changes between Order No. R5-2014-0144 (Timber "Waiver") and Order R5-2017-0061, specifically creation of Category 2A and Category 5A for post-fire salvage operations on non-federal and federal lands, respectively. The following requirements and the rationale for these requirements will be summarized in this section: 50% Effective Ground Cover and Minimum

Watercourse Pesticide Buffers (Parts III.C.3.b.ii. and III.F.3.c.ii. of the General Order); Table 1. Erosion Site Table for Significant Existing or Potential Erosion Sites (SEPES) and New Watercourse Crossings (Category 2A and 5A NOI); and the Post-Fire Management and Reforestation Plan (Attachment C).

50% Effective Ground Cover

Based on thorough research and review of dozens of peer reviewed studies, technical guidance documents, and handbooks on post-fire effects, and the mechanisms that are driving both increased rates of erosion and sediment delivery on managed and un-managed post-fire landscapes, the rationale for selecting 50% effective ground cover as a requirement for Category 2A and 5A in the Order (see Parts III.C.3.b.ii. and III.F.3.c.ii.) is based four primary factors:

- The dominant factor for controlling soil erosion rates post-fire is ground cover;
- Fifty-percent effective ground cover is the value most often referred to the reviewed literature (e.g., U.S. Forest Service 2012, Benavides-Solorio et al. 2001, 2005, Berg and Azuma 2010, Doerr et al. 2009, Goldman et al. 1986, Harrison et al. 2016, Hyde et al. 2007, 2014, and 2015, Johansen et al. 2001, Stubblefield et al. 2016);
- Fifty-percent effective ground cover is a value that is most easily assessed and verified from visual estimations; and
- Ground cover is shown to be the most feasible and cost-effective method to reduce erosion and sediment production.

Watercourse Pesticide Buffers

The rationale behind the requirement for standard watercourse riparian buffers (see Parts III.C.3.b.ii. and III.F.3.c.ii. of the Order) in Category 2A and 5A in the Order is based on four primary factors:

- Extensive literature review indicates that ground cover and aquatic buffers can reduce pesticide discharge into streams by providing dissipation, filtration, chemical sequestration, chemical degradation/biodegradation (Brosofske et al. 1997, Reeves et al. 2006, Davies and Nelson 1994, Sweeney and Newbold 2014, Richardson et al. 2012, Wenger 1999, ACOE 1991, MacDonald 2011, Lindenmayer and Noss 2006, Minshall 2003);
- Studies on herbicide fate and transport show that average buffer widths of 38 m and 50 m, in restored and managed riparian forests respectiviely, reduced herbicide concentrations to at or below detection limits (Lowrance et al. 1997, Vellidis et al. 2002).
- A review of pesticide buffers found that cases of high pesticide concentrations only occurred when no buffer was used and that generally, bufferstrips of 15 m or larger are effective in minimizing pesticide contamination in streams (Neary et al. 1993).
- Buffers widths for pesticide applied in the post-fire landscape are limited or non-existent (see Table 1);
- Post-fire pesticide sampling by CDFW in 2014 indicates that label instructions and applications were ineffective at preventing discharge of specific chemicals (Hexazinone, 2, 4-D, Triclopyr, and Imazapyr) to surface waters; and
- The buffer requirements that are in the Order (see Parts III.C.3.b.ii. and III.F.3.c.ii.) are existing buffer widths for WLPZs as specified in California Code of Regulations, title 14, section 936.5 for ‘green tree’ timber harvesting activities, have been proven to be effective at reducing transport of waste to surface waters, and are widths that are familiar to RPFs. For federal projects, these same buffer widths are specified around perennial, intermittent, and ephemeral streams.

Erosion Site Table for Significant Existing or Potential Erosion Sites (SEPES) and New Watercourse Crossings

The rationale behind the requirement to disclose road and crossing-related SEPES within project areas enrolling in Category 2A and 5A NOI is based on five primary factors:

- Decades of research in post-fire hydrologic response and erosional processes indicate that roads and associated watercourse crossings are particularly susceptible to accelerated rates of erosion due to increased runoff rates and transport of associated sediment and debris;
- SEPES and new/reconstructed watercourse crossings in the post-fire environmental necessitate additional evaluation and review, as normal input values for calculating stream flow to determine the appropriate size and capacity of stream crossing structures (e.g., culverts) may need modification (Cafferata et al. 2017);
- Emergency Notices pursuant to California Code of Regulations, title 14, §§ 1052.1 et seq., for fire salvage do not provide adequate information to properly assess whether a project has SEPES and whether those sites will be mitigated to a level that is less than significant (for enrollment in Category 2A);
- Following wildfires on federal lands, values at risk assessed through BAER teams do not directly consider or prioritize water quality and aquatic habitat for immediate resource protection; and
- Requirement of an Erosion Site Table for Category 2A and 5A allows for better treatment prioritization and implementation tracking.

Post-fire Management and Reforestation Plan (PFP)

The rationale behind the Order requirement for Category 2A and 5A to provide a PFP (Attachment C) in-lieu of complying with the watercourse buffers and ground cover standards, is based on four primary factors:

- A PFP provides the Discharger flexibility in applying specific management practices across the fire salvage area that consider all aspects of the timing of the fire salvage, site-preparation, and other activities associated with reforestation; provides for site specificity in terms of topography, soils, climate, hydrology, and soil burn severity; and consider all sources of potential negative water quality impacts from those activities (i.e., sediment and pesticide applications);
- Allows the Discharger the option to address multiple Emergency Notice areas (non-federal), and fire salvage areas (federal projects), under one comprehensive post-fire plan;
- Provides the Discharger the option and flexibility in applying post-fire management practices and mitigations other than those identified in Parts III.C.3.b.ii. and III.F.3.c.ii. of the Order, including experimental practices; and
- Ensures an appropriate monitoring plan will be developed for a PFP.

COST OF MONITORING FOR NON-FEDERAL PROJECTS

Water Code section 13267(b)(1) states that "the burden, including costs, of these [required monitoring and] reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports." Based upon information provided by timber industry representatives, staff estimates an annual cost of required visual monitoring and reporting, depending on project type and enrollment category, to range from $100 to $2,800 per enrolled project once operations have been initiated. Table 2 provides an estimate for a 'green-tree' THP on non-federal lands with a maximum operational lifespan of 7 years enrolled under Category 3A and for a post-fire salvage Emergency Notice project with a maximum operational lifespan of 1 year enrolled in Category 2A. Projects can remain enrolled in the General Order beyond the maximum operational lifespan if risks to water quality are identified and additional management measures, monitoring and reporting are necessary to protect the beneficial uses.

Table 2. Example Monitoring Cost Estimate for 7 Year THP and 1 Year Post-Fire Salvage Emergency Notice (EM).

MRP Activity	THP (3A) Cost Range	EM (2A) Cost Range
Inspection Plan Development (1 time cost per project)	$200-$500	$200-$500
Erosion Site Inventory Table	NA	$500-$700
Implementation Monitoring**	$500-$700	$500-$700
Forensic Monitoring**	$500-$700	$500-$700
Effectiveness Monitoring	$500-$700	$500-$700
Reporting (annual and NOV)	$100-$200	$100-$200
1st Year Cost Estimate*	$1,800-$2,800	$2,300-$3,500
Total Cost Estimate for 7 years of enrollment	$11,200-$16,100	NA
Total Cost Estimate for 2 years of enrollment	NA	$4,200-$6,000

** Mileage not included, extreme variability in distance to monitored sites exists.*
*** Implementation and forensic monitoring required by the FPRs for THPs.*

The visual monitoring required for 'green tree' projects (THPs) on non-federal lands has, since 2005 under the Timber Waiver, included two rounds of forensic monitoring during the winter period once operations have commenced. Eleven years of enrolled project monitoring has resulted in staff proposing to reduce this type of monitoring from twice per winter to once per winter under the General Order, comprising a modest annual cost savings to the timber/timberland owner of these projects.

It must also be noted that implementation monitoring is a requirement of the FPRs, as is forensic monitoring. The FPRs specify that the Regional Water Board's monitoring and reporting requirements may be used in the evaluation of the road rule requirements. California Code of Regulations, title 14, section 943.7(k)(2) under Maintenance and Monitoring of Logging Roads and Landings specifies: "*Inspections conducted pursuant to California Regional Water Quality Control Board requirements may be used to satisfy the inspection requirement of this section."* While the FPRs require visual implementation inspections prior to the winter period, and inspections during the winter period (essentially "forensic" monitoring), no formal reporting is required. So, even should the Central Valley Water Board determine that no additional monitoring or reporting will be required of projects enrolled in the Order, implementation and forensic inspections are still required by the FPRs (even for projects eligible to file an Notice of Non-Applicability under the General Order), though no reporting occurs. Thus, requiring development of an inspection plan,

effectiveness monitoring, Notice of Violation (NOV) reporting and annual reporting are additional costs to non-federal Dischargers not required by the Forest Practice Rules.

The Central Valley Water Board concludes that the cost of monitoring and reporting required by the General Order represent a reasonable cost of conducting permitted operations that pose a threat to water quality. Benefits inherent in the proposed monitoring and reporting are many and include: increased awareness on the part of the landowner/land manager of sensitive water quality resources; potential impacts and effectiveness of management measures; increased potential for identifying threats before they impact water quality and the beneficial uses; increased data available to aid in future risk analyses; lessons learned regarding specific threats and effective mitigations that can be presented to the BOF for consideration in developing rule revisions or used in the furtherance of best management practice development.

memorandum

To:	Henry Woltag ConnectGen LLC	**EDR Project No:**	19255
From:	Jacob Runner		
Date:	May 6, 2020		
Reference:	Fountain Wind Farm Shadow Flicker Analysis		

Comments:

Introduction

This memorandum report presents the findings of a shadow flicker analysis for the proposed Fountain Wind Farm (the Project) proposed by ConnectGen LLC (Client) in Shasta County, California (Figure 1). The layout evaluated in this analysis includes 72 Vestas V162 wind turbines on a 125-meter tower. The shadow flicker impact was evaluated at 69 receptors within 10 rotor diameters (1,620 meters) of the proposed wind turbines.

Shadow flicker refers to the shadows that a wind turbine casts over structures and observers at times of the day when the sun is directly behind the turbine rotor from an observer's position. During intervals of sunshine, operating wind turbine generators will cast a shadow on surrounding areas as the rotor blades pass in front of the sun, causing a flickering effect while the rotor is in motion. Shadow flicker is most pronounced in northern latitudes during winter months because of the lower angle of the sun in the winter sky. However, it is possible to encounter shadow flicker anywhere for brief periods after sunrise and before sunset (U.S. Department of the Interior, 2005). Shadow flicker does not occur when fog or clouds obscure the sun, or when turbines are not operating.

The distance between a wind turbine and a potential shadow-flicker receptor affects the intensity of the shadows cast by the blades, and therefore the intensity of flickering. Shadows cast close to a turbine will be more intense, distinct, and focused. This is because a greater proportion of the sun's disc is intermittently blocked by the turbine (BERR, 2009). Obstacles such as terrain, vegetation, and/or buildings occurring between residences and wind turbines can significantly reduce or eliminate shadow flicker effects. At distances beyond roughly 10 rotor diameters (approximately 1,620 meters based on the largest turbine model proposed for the Project [V162]) shadow flicker effects are generally considered negligible (BERR, 2009; DECC, 2011; DOER, 2011). For this reason, the shadow flicker analysis was run with a study area of 10 rotor diameters (1,620 meters).

The location and duration of shadow flicker can be predicted quite accurately using computer modeling programs and input data regarding turbine locations, turbine dimensions, receptor locations, local topography, and sunshine frequency. A conservative assumption that the turbines are in continuous operation is also applied. Shadow flicker effects predicted by the modeling exercise are expressed in terms of frequency (hours per year) at each receptor location.

Methods

This shadow flicker analysis evaluated the potential impact of 72 Vestas V162 turbines, each with a rotor diameter of 162 meters and a hub height of 125 meters (Figure 2).

WindPRO 3.3 software and the associated Shadow module was used to conduct the shadow flicker analysis. This software is a widely accepted modeling software package developed specifically for the design and evaluation of wind power projects. Input variables and assumptions used for shadow flicker modeling calculations for the proposed Project include:

- The latitude and longitude coordinates of 72 proposed wind turbine sites (provided by the Applicant).
- The latitude and longitude coordinates for 69 potential receptors located within the 10-rotor diameter Study Area (provided by the Applicant).
- USGS 1:24,000 topographic mapping and USGS digital elevation model (DEM) data.
- The rotor diameter (162 meters) and hub height (125 meters) for the V162 turbine.
- Annual wind rose data (provided by the Applicant) to determine the approximate directional frequency of rotor orientation throughout the year (Table A1 of Attachment A).
- To account for the occurrence of cloudy conditions, the average monthly percent of available sunshine for the nearest National Oceanic and Atmospheric Administration (NOAA) weather station in Sacramento, California was used (Table A2 of Attachment A). Data were obtained from NOAA's "Comparative Climatic Data for the United States through 2015" (http://www.ncdc.noaa.gov).
- No allowance was made for wind being below or above generation speeds. Blades are assumed to be moving during all daylight hours when the sun's elevation is more than 3 degrees above the horizon. Shadow flicker is generally considered imperceptible when the sun is less than 3 degrees above the horizon due to the scattering effect of the atmosphere on low angle sunlight (DECC, 2011).
- In the preliminary analysis, the possible screening effect of trees and buildings adjacent to the receptors was not taken into consideration. In addition, the number and/or orientation of windows in residential receptors were not considered in the analysis.

Based on these variables and assumptions, *WindPRO* was used to calculate the theoretical number of hours per year that shadow flicker would occur at any given location in the vicinity of the Project. These predicted values represent a worst-case scenario. To more accurately calculate the amount of shadow flicker modeled to occur at non-participating receptors predicted to receive over 30-hours in the preliminary analysis, a desktop analysis was conducted to identify obstacles that could fully or partially block shadows at receptor sites. These data were then incorporated into the WindPro model and the analysis of predicted shadow flicker impacts at this receptor was evaluated. The following steps were undertaken as part of this desktop analysis:

1. Orthographic images were imported into the WindPro model (all images are geo-referenced).
2. Using digitizing tools in WindPro, geometric objects were drawn to represent different types of obstacles. Each object was assigned a width, length, and height to reflect the dimensions of the obstacle, as documented through client correspondence and orthographic images.
3. Porosity is then assigned to each obstacle. Low porosity factors (0, 0.2, etc.) were assigned to dense obstacles (such as buildings or stands of conifers) while higher porosity factors (0.5, 0.6, etc.) were assigned to obstacles with less density (such as widely spaced deciduous trees), see Table 1.

Table 1. Summary of Identified Obstacles at Non-Participating Receptors Predicted to Exceed 30 Hours[1]

Receptor ID	Obstacle Types	Obstacle Location Relative to Receptor	Approximate Obstacle Dimensions (meters)	Assigned Porosity Factor
46	Stand of Mixed Trees	NW	12 x 19 x 7	0.3
51	Large Stand of Mixed Trees	W	12 x 44 x 50	0.3
12	Large Stand of Mixed Trees	W	12 x 67 x 45	0.3
15	Large Stand of Mixed Trees	W	12 x 43 x 71	0.3
11	Large Stand of Mixed Trees	NNW	12 x 67 x 45	0.3
	Large Stand of Mixed Trees	WSW	12 x 35 x 22	0.3
47	Large Stand of Mixed Trees	W	12 x 36 x 51	0.3
48	Large Stand of Mixed Trees	WNW	12 x 21 x 21	0.3
52	Large Stand of Mixed Trees	W	12 x 67 x 45	0.3
3	Large Stand of Mixed Trees	W	12 x 30 x 41	0.3
	Large Stand of Mixed Trees	WSW	12 x 20 x 74	0.3
50	Large Stand of Mixed Trees	W	12 x 30 x 41	0.3
	Large Stand of Mixed Trees	WSW	12 x 20 x 74	0.3
5	Large Stand of Mixed Trees	NNE	12 x 35 x 22	0.3
	Large Stand of Mixed Trees	W	12 x 20 x 14	0.3
	Stand of Evergreen Trees	WNW	12 x 36 x 71	0.2
1	Large Stand of Mixed Trees	NW	12 x 60 x 146	0.3
	Large Stand of Mixed Trees	NNE	12 x 128 x 247	0.3
49	Large Stand of Mixed Trees	NW	12 x 19 x 7	0.3
7	Stand of Evergreen Trees	W	12 x 36 x 71	0.2
	Large Stand of Mixed Trees	SE	12 x 20 x 14	0.3
6	Large Stand of Mixed Trees	NW	12 x 36 x 71	0.2
	Large Stand of Mixed Trees	W	12 x 41 x 18	0.3
2	Deciduous Tree	W	12 x 8 x 7	0.4
	Open Hedge	N	8 x 30 x 5	0.7
57	Large Stand of Mixed Trees	NW	12 x 24 x 11	0.3

No consistent national, state, county, or local standards exist for allowable frequency or duration of shadow flicker from wind turbines at the proposed Project site. The National Association of Regulatory Utility Commissioners (NARUC)

[1] The non-participating receptors identified in this table were identified based on the results of the conservative worst-case analysis modeling. See the Results section of this document for an identification of receptors predicted to receive over 30 hours of shadow flicker per year after the effects of screening were taken into consideration.

recommends a threshold of 30 hours of shadow flicker per year at occupied buildings (NARUC, 2012). Accordingly, a threshold of 30 hours of shadow flicker per year was applied to this Project.

Although shadow flicker has been alleged to cause or contribute to health effects, including seizures, modern wind turbines typically operate at a frequency lower than the typical threshold for photosensitive epilepsy sensitivity, and there is no evidence that wind turbines can trigger seizures (British Epilepsy Association, 2007; Ellenbogen et al., 2012; NHMRC, 2010; DECC, 2011). Based on a detailed review of scientific literature and other reports, an expert panel found that, "there is limited scientific evidence of an association from prolonged shadow flicker and potential transitory cognitive and physical health effects" (Ellenbogen et al., 2012).

The model calculations include the cumulative sum of shadow hours for all turbines. This omni-directional approach reports total shadow flicker results at a receptor regardless of the presence or orientation of windows at the receptor (i.e., it assumes shadows from all directions can be perceived at a receptor, which may or may not be true). A receptor in the model is defined as a one square meter area, one meter above ground level; the actual dimensions of the receptor or window locations are not taken into consideration.

Results

Output from the model includes the following information:

- Calculated shadow flicker time (specific days, maximum hours per day, and total hours per year when shadow flicker is expected) at each of the receptors located in the Study Area.
- Tabulated and plotted time of day that receptors are predicted to receive shadow flicker (Attachment B).
- Shadow isolines, which are used to create maps showing turbine locations, receptors, and projected shadow flicker duration (hours per year; Figure 3).

A summary of the projected shadow flicker at each of the 69 receptors in the Study Area is presented below:

- 13 (19%) of the receptors may be affected 0-1 hour/year,
- 19 (28%) of the receptors may be affected 1-10 hours/year,
- 19 (28%) of the receptors may be affected 10-20 hours/year,
- 16 (23%) of the receptors may be affected 20-30 hours/year,
- 2 (3%) of the receptors may be affected for more than 30 hours/year.

As these results indicate, 97% of the receptors are predicted to receive less than 30 hours of shadow flicker per year, with 47% of the receptors predicted to receive less than 10 hours of shadow flicker per year. At most receptor locations, shadow flicker will occur primarily in the early morning or late afternoon and will generally last less than 1 hour per day. The maximum daily duration of shadow flicker is 1 hour and 14 minutes (at receptor 2, see Attachment B).

Table 2 provides the results of the predicted shadow flicker at the two receptors calculated to experience more than 30 hours of shadow flicker per year. Figure 4 shows the results of the predicted shadow flicker with obstacles in place at non-participating receptors originally predicted over 30-hours of shadow flicker per year. The times of day and duration of shadow flicker experienced by each receptor will vary throughout the calendar year based on the position of the sun in the sky and the direction of prevailing winds. See Attachment B for detailed calendars that illustrate the specific times of year and day that shadow flicker may occur at all receptors.

Table 2. Summary of Shadow Flicker Results at Receptors Predicted to Exceed 30 Hours

Receptor ID	Project Status	Predicted Annual Shadow Flicker (hh:mm)	Predicted Max Daily Shadow Flicker (hh:mm)	Predicted Shadow Flicker (days/year)
2	Non-Participating	50:20	1:14	119
58	Participating	51:41	0:57	230

Details regarding shadow flicker effects predicted at the two receptors predicted to receive over 30 hours of shadow flicker are presented in Table 3 below and in Attachment B.

Table 3. Daily Effect to Receptors Predicted to Exceed 30 Hours of Shadow Flicker

Receptor ID	Project Status	Predicted Annual Shadow Flicker (hh:mm)	Turbines Contributing to Shadow Flicker	Approximate Times of Day Receptor Potentially Affected by Flicker[1]
2	Non-Participating	50:20	D04, D05	6:45 PM – 8:15 PM
58	Participating	51:41	N02, M08, M10	6:45 AM – 7:30 AM 8:00 AM – 8:45 AM 4:15 PM – 5:45 PM 7:15 PM – 8:30 PM

[1] The times of day represent the range of times during which each receptor could potentially experience shadow flicker throughout the year; however, no receptors will experience shadow flicker every day during all of these hours. See Attachment B for detailed calendars that illustrate the specific time of year and day that each receptor may experience shadow flicker.

Conclusion

In summary, as a result of modeling the proposed Vestas V162 turbine model, *WindPRO* predicted that two receptors will receive more than 30 hours of shadow flicker per year. The primary concern with shadow flicker is the annoyance that it can cause for adjacent homeowners. A common finding is that annoyance is lower among residents who benefited economically from the wind turbines (i.e., project participants; Michaud et al., 2016). One of the receptors predicted to receive over 30 hours of shadow flicker per year is a Project participant.

Depending on the final turbine layout and model selected, there may be no non-participating receptors that are predicted to receive more than 30 hours/year of shadow flicker, the proposed threshold for which mitigation will be performed as discussed below. Therefore, following final turbine model selection the Applicant will prepare an updated receptor-specific shadow flicker analysis for non-participating residences. This analysis will take into account any screening by existing yard trees, buildings, or proximity to stands of trees and the number and/or orientation of windows in residential receptors. Additionally, this analysis will also use project specific met data to account for wind being below or above generation speeds.

Many of the modeled shadow flicker hours are expected to be of low intensity, as they will occur during the early morning or late afternoon hours when the sun is low in the sky. When the sun sinks low on the horizon, more of its light is scattered by the atmosphere, which has the effect of dampening its brightness and therefore reducing its ability to cast dark shadows. Following the final shadow flicker analysis for non-participating residences, if shadow flicker is modeled to exceed 30 hours per year at a non-participating residence, the following mitigation options are available: work with the landowner to become a Project participant or planting of trees or installation of window blinds to block the shadow flicker. These mitigation options can be easily implemented even after the Facility has been constructed.

Shadow-flicker areas and isolines were created using WindPRO 3.3 software and associated Shadow module. The model is based on a "expected case" scenario where the model assumes the wind conditions allow for continuous turbine operation, there may be a percentage of clouds, the turbine may not always be directly between the receptor and the sun, and the turbine may not always be perpendicular to the sun. These calculations do not take into account the actual location and orientation of windows, or the screening effects associated with existing, site-specific conditions and obstacles such as trees and/or buildings.

A ZVI (Zones of Visual Influence) calculation is performed before flicker calculation so non visible WTG do not contribute to calculated flicker values. A WTG will be visible if it is visible from any part of the receiver window. The ZVI calculation is based on the following assumptions:
Height contours used: Height Contours: 5m_contour.wpo (2)
Obstacles used in calculation
Eye height for map: 1.5 m
Grid resolution: 1.0 m

All coordinates are in
UTM (north)-NAD83 (US+CA) Zone: 10

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Total, real				264	398		200	537				

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Wind dir. red.			0.72	0.61				0.58	0.72			
Total reduction			0.53	0.50				0.56	0.67			
Total, real			269	256				211	438			

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Potential sun hours	458	428	375	346		298		288		
Total, worst case					312		315		894	
Sun reduction					0.84		0.61		0.47	
Oper. time red.					1.00		1.00		1.00	
Wind dir. red.					0.81		0.89		0.89	
Total reduction					0.69		0.55		0.42	
Total, real					215		172		377	

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Total reduction		0.40												0.54			0.42	
Total, real		277												220			306	

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Total, real		282												246			238	

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Total reduction		0.40			0.50			0.59				
Total, real		315			90			70				

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Potential sun hours	298			297	369	398	448	452	458	428	375	346	298	288		
Total, worst case		46													367	
Sun reduction		0.45													0.47	
Oper. time red.		1.00													1.00	
Wind dir. red.		0.89													0.89	
Total reduction		0.40													0.42	
Total, real		18													154	

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Wind dir. red.			0.69	0.62				0.56	0.69			
Total reduction			0.50	0.51				0.54	0.64			
Total, real			129	291				174	331			

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Total reduction					0.74		0.75			0.78						
Total, real					237		584			490						

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Total reduction						0.74		0.76		0.78						
Total, real						211		585		461						

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Wind dir. red.		0.38		0.39										0.39		0.38	
Total reduction		0.17		0.24										0.33		0.23	
Total, real		61		178										164		142	

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Total, real			172	236				174	324			

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm) Sun set (hh:mm)	Minutes with flicker	First time (hh:mm) with flicker Last time (hh:mm) with flicker	(WTG causing flicker first time) (WTG causing flicker last time)

Total reduction			0.53	0.50					0.57	0.66				
Total, real			254	165					147	379				

Table layout: For each day in each month the following matrix apply

Day in month	Sun rise (hh:mm)		First time (hh:mm) with flicker	(WTG causing flicker first time)
	Sun set (hh:mm)	Minutes with flicker	Last time (hh:mm) with flicker	(WTG causing flicker last time)

Project: 18-069

EXECUTIVE SUMMARY

This report provides a noise assessment of the Fountain Wind Energy Project (Project) proposed in an unincorporated area in the southern end of the Cascade Range in Shasta County, California. The Project proposes the construction, operation, maintenance, and decommissioning of up to 72 turbines, each having a generating capacity of 3 to 5.7 megawatts (MW), for a total nameplate generating capacity of up to approximately 216 MW. The lands underlying the Project are designated as Timber Production and Unclassified.

The closest residences are located about 2,200 feet from proposed turbines. The existing noise environment in the vicinity of nearby residences is defined primarily by natural sounds, such as wind rustling the leaves of foliage, insects, and birds. In locations adjacent to SR-299, traffic is the dominant noise source. Based on noise monitoring results, existing ambient noise levels range from 42 dBA L_{dn} at more remote locations to 54 dBA L_{dn} in locations adjacent to SR-299.

Noise associated with Project operations is not expected to exceed Shasta County noise standards or the supplementary criteria for low frequency and infrasonic noise at any residential property in the site vicinity. However, use of helicopters during construction and any nighttime construction located within 2,500 feet of residences would have the potential to cause sleep and/or speech interference. Noise reduction measures, including limiting helicopter and heavy construction near residential areas to daytime hours and minimizing helicopter use, are provided to minimize disruption and annoyance during construction.

TABLE OF CONTENTS

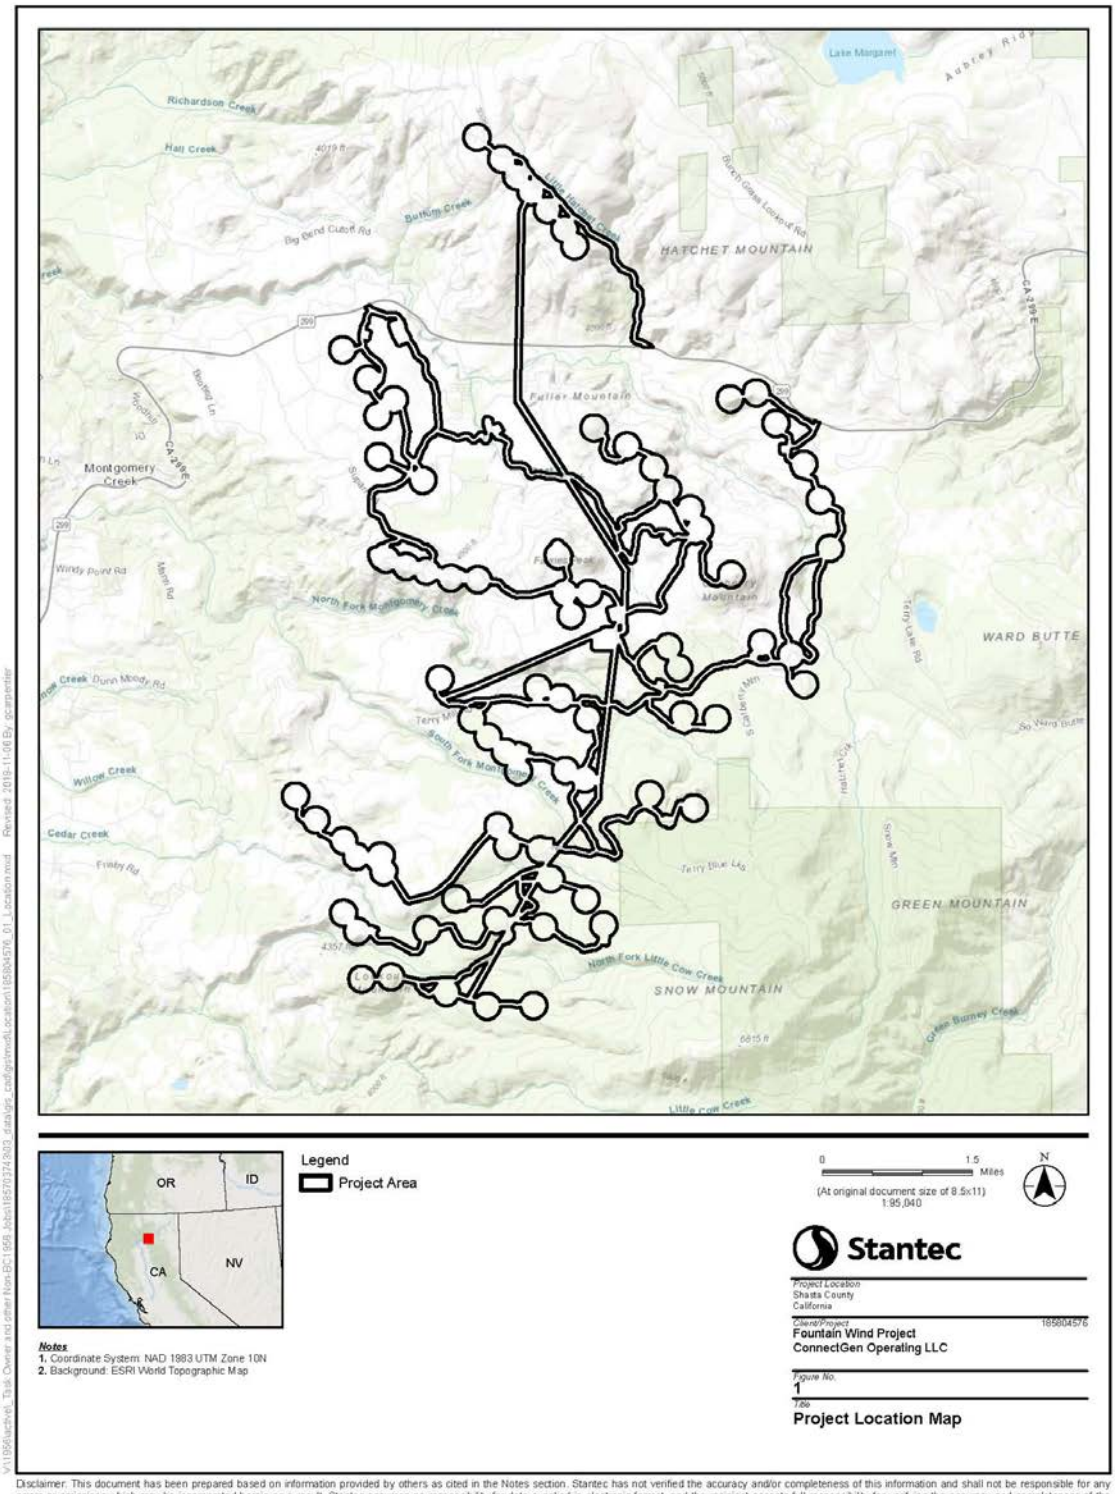
RECOMMENDED NOISE REDUCTION MEASURES 34
SUMMARY 34
REFERENCES 35

INTRODUCTION



The Fountain Wind Energy Project (Project) proposes the construction, operation, maintenance, and decommissioning of up to 72 wind turbines and related infrastructure in the southern end of the Cascade Range in Shasta County, California (Figure 1). This Project proposes a reduction in turbines from the originally proposed project, for which an environmental noise study was prepared in March 2019.[1]

Each turbine would be no more than 679 feet above ground level at the top of the blade and would have a generating capacity of 3 to 5.7 megawatts (MW). The Project would have a total nameplate generating capacity of up to 216 MW. Associated infrastructure and ancillary facilities would include: a 34.5-kilovolt (kV) overhead and underground electrical collector system to connect turbines together and to an onsite collector substation; overhead and underground fiber-optic communication lines, an onsite switching station to connect the Project to the regional grid operated by the Pacific Gas and Electric Company (PG&E), a temporary construction and equipment laydown area, 14 temporary laydown areas distributed throughout the Project Site to store and stage building materials and equipment, an operation and maintenance (O&M) facility, up to four permanent meteorological (MET) towers and temporary, episodic deployment of mobile Sonic Detection and Ranging (SoDAR) or Light Detection and Ranging (LiDAR) systems, two storage sheds, and three temporary cement batch plants. New access roads would be constructed within the Project Site, and existing roads would be improved. The lands underlying the Project are designated as Timber Production and Unclassified.

This report includes basic information on noise measurement and assessment, applicable noise regulations and guidelines, an evaluation of the existing noise environment, an assessment of noise levels generated by Project construction and operations, and a discussion of potential noise reduction options, as needed.

FUNDAMENTALS OF ENVIRONMENTAL NOISE

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound could be caused by its *pitch* or its *loudness*. *Pitch* is the height or depth of a tone or sound, depending on the relative rapidity (*frequency*) of the vibrations by which it is produced. Higher pitched signals sound louder to humans than sounds with a lower pitch. *Loudness* is intensity of sound waves combined with the reception characteristics of the ear. Intensity is a measure of the amplitude (height) of the sound wave.

There are several noise measurement scales which are used to describe noise. A *decibel (dB)* is a unit of measurement which indicates the relative amplitude of a sound. The zero on the decibel scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a ten-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and its intensity. Each 10-decibel increase in sound level is perceived as approximately a doubling of loudness over a fairly wide range of intensities. Technical terms are defined in Table 1.

Environmental noise is typically described in terms of the *sound pressure level*, the quantity that is directly measured by a sound level meter at a specified location. The strength of a wind turbine source, however, is often characterized by its *sound power level*. Sound power level is independent of the distance a receiver is from the source and is a property of the source alone. Knowing the sound power level of an idealized source and its distance from a receiver, the sound pressure level at the receiver point can be calculated based on geometrical spreading. Both sound pressure level and sound power level utilize the decibel scale, although the relative reference used is different between the two concepts. This approach is applied to wind turbine generators in the standard measurement techniques for determining the sound power or source level[1].

There are several methods of characterizing sound. The most common in California is the *A-weighted sound level (dBA).* This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Representative outdoor and indoor noise levels in units of dBA are shown in Table 2. The *C-weighed sound level (dBC)* also follows the frequency sensitivity of the human ear, but at much higher noise levels. This results in a flatter curve giving more emphasis to low frequency sounds.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as wind turbines, roadways, and airports. The accuracy of the predicted models depends upon the receptor's distance from the noise source. Close to the noise source, the models are accurate to within about plus or minus 1 to 2 dBA.

For sound propagation outdoors, the sound level decreases with distance due to the spreading out of sound waves originating from the source. For an ideal "point" source, this geometrical or spherical spreading results in a reduction of sound pressure level of 6 dB per doubling of distance from the source. In addition, other phenomena can create excess

attenuation. These include atmospheric absorption, ground absorption, and shielding. For sound propagation outdoors, there is almost always excess attenuation producing lower levels than what would be predicted by spherical spreading alone. At large distances attenuation by air absorption can be significant: approximately 4 dB per mile in the 500 Hz band at standard atmospheric conditions (68°F and 50% humidity). Ground absorption is lower for a reflective surface such as pavement or water and higher for an absorptive surface such as lawn or soft forest floor. For sound propagating over soft ground at near grazing angles of incidence, excess attenuations of 20 to 30 dB can be measured due to interference effect of the direct and reflected sound. Shielding from intervening terrain, structures, or barriers can provide 5 to 20 dB of sound reduction if the line-of-sight between the source and receiver is broken. Under certain meteorological conditions, some of these excess attenuation mechanisms are reduced or eliminated, leaving spherical spreading as the primary determinate of sound level at a receiver location.

When more than one noise source contributes to the sound pressure level at a receiver point, the overall sound level is determined by combining the contribution of the sources. This is done by logarithmically adding the individual sound pressures together. The logarithmic addition of two sound sources that are independent and equal would result in a 3 dB increase over the level of each alone. In assessing environmental noise, a 3 dB increase in level is typically considered as just perceivable, while an increase of 1 dB is difficult to detect and within the accuracy limitations of the sound level meter and predicted models.

Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This *energy-equivalent sound/noise descriptor* is called L_{eq}. The most common averaging period is hourly, but L_{eq} can describe any series of noise events of arbitrary duration. Since the sensitivity to noise increases during the evening and at night -- because excessive noise interferes with the ability to sleep -- 24-hour descriptors have been developed that incorporate artificial noise penalties added to quiet-time noise events. The *Community Noise Equivalent Level* (*CNEL*) is a measure of the cumulative noise exposure in a community, with a 5 dB penalty added to evening (7:00 pm - 10:00 pm) and a 10 dB addition to nocturnal (10:00 pm - 7:00 am) noise levels. The *Day/Night Average Sound Level* (*DNL* or L_{dn}) is essentially the same as CNEL, with the exception that the evening time period is dropped and all occurrences during this three-hour period are grouped into the daytime period.

TABLE 1 Definition of Acoustical Terms Used in this Report

Term	Definition
Decibel, dB	A unit describing, the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure. The reference pressure for air is 20 micro Pascals.
Sound Pressure Level	Sound pressure is the sound force per unit area, usually expressed in micro Pascals (or 20 micro Newtons per square meter), where 1 Pascal is the pressure resulting from a force of 1 Newton exerted over an area of 1 square meter. The sound pressure level is expressed in decibels as 20 times the logarithm to the base 10 of the ratio between the pressures exerted by the sound to a reference sound pressure (e. g., 20 micro Pascals). Sound pressure level is the quantity that is directly measured by a sound level meter.
Sound Power	Sound power is the rate at which sound energy is emitted, reflected, transmitted or received, per unit time. Sound power is a property of a sound source, equal to the total power emitted by that source in all directions and is neither room-dependent nor distance-dependent.
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz. Infrasonic sound are below 20 Hz and Ultrasonic sounds are above 20,000 Hz.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.
C-Weighted Sound Level, dBC	The sound pressure level in decibels as measured using the C-weighting filter network. The C-weighting is very close to an unweighted or "flat" response. C-weighting is only used in special cases when low frequency noise is of particular importance.
Equivalent Noise Level, L_{eq}	The average A-weighted noise level during the measurement period.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Day/Night Noise Level, L_{dn} or DNL	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 5 decibels in the evening from 7:00 pm to 10:00 pm and after addition of 10 decibels to sound levels measured in the night between 10:00 pm and 7:00 am.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.

FUNDAMENTALS OF NOISE AND VIBRATION FROM BLASTING

When explosive charges are detonated in rock, the blast has been designed so that most of the energy is used in breaking and displacing the rock mass. However, some of the energy can also be released in the form of transient stress waves, which in turn cause temporary ground vibration. Detonating charges also create rock movement and the release of high-pressure gas, which in turn, induces air-overpressure (blast noise).

The average person is quite sensitive to ground motion, and vibration levels as low as 0.01 in/sec can be detected by the human body. Frequency of motion or cycles per second is a measure of how many times a particle of ground moves back and forth (or up and down) in one second of time. Frequency is expressed in units of Hertz (Hz).

Noise from blasting or "blast noise" is primarily composed of sound pressures at frequencies below the threshold-of-hearing for humans (16 to 20 Hz). Hence, the common industry term for blast-induced noise is "air-overpressure". As its name implies, air-overpressure is a measure of the transient pressure changes above and below ambient atmospheric pressure. When calculating maximum overpressure values, the absolute value of the greatest pressure change is used — regardless of whether it is a positive or negative change.

When measurements include low frequency noise (2 Hz and higher) with a flat response, they are called "linear scale" measurements. Air-overpressure measurements are typically expressed in dB units, and when the scale is linear, the unit designation is "dB(L)." Regular acoustical noise measurements taken for the purpose of monitoring compliance with local noise ordinances almost always use weighted scales that discriminate against low frequency noise. Thus, for a similar noise source, A-weighted and C-weighted scales will usually record significantly lower levels of noise.

The regulatory limit defined by the former United States Department of the Interior, Bureau of Mines (US Bureau of Mines) for air-overpressure measured with 2-Hz response seismographs is 133 dB(L) (USBM 1971). Damage to old or poorly glazed windows does not occur until air-overpressure reaches about 150 dB(L). More importantly, since the decibel scale is a logarithmic ratio, the actual overpressure at 150 dB(L) is 0.092 pounds per square inch (psi), versus 0.013 psi at 133 dB(L). Therefore, the actual pressure at the 133 dB(L) limit, is over seven times (0.0915/0.0129) lower than the threshold damage level at 150 dB(L).

When blasting occurs at large distances from sensitive structures, the primary concern is damage to structures. Structural damage can be classified as cosmetic, such as paint flaking or minimal extension of cracks in building surfaces; minor, including limited surface cracking; or major, that may threaten the structural integrity of the building. Safe vibration limits that can be applied to assess the potential for damaging a structure vary by researcher. The damage criteria presented in Table 3 include several categories for ancient, fragile, and historic structures, the types of structures most at risk to damage. Most buildings are included within the categories ranging from "Historic and some old buildings" to "Modern industrial/commercial buildings". Construction-induced vibration that can be detrimental to the building is very rare and has only been observed in instances where the structure is

at a high state of disrepair and the construction activity occurs immediately adjacent to the structure.

The annoyance levels shown in Table 3 should be interpreted with care since vibration may be found to be annoying at lower levels than those shown, depending on the level of activity or the sensitivity of the individual. To sensitive individuals, vibrations approaching the threshold of perception can be annoying. Low-level vibrations frequently cause irritating secondary vibration, such as a slight rattling of windows, doors, or stacked dishes. The rattling sound can give rise to an elevated human reaction, even though there is very little risk of actual structural damage.

TABLE 3 Reaction of People and Damage to Buildings from Continuous or Frequent Intermittent Vibration Levels

Velocity Level, PPV (in/sec)	Human Reaction	Effect on Buildings
0.01	Barely perceptible	No effect
0.04	Distinctly perceptible	Vibration unlikely to cause damage of any type to any structure
0.08	Distinctly perceptible to strongly perceptible	Recommended upper level of the vibration to which ruins and ancient monuments should be subjected
0.1	Strongly perceptible	Threshold at which there is a risk of damage to fragile buildings with no risk of damage to most buildings
0.25	Strongly perceptible to severe	Threshold at which there is a risk of damage to historic and some old buildings.
0.3	Strongly perceptible to severe	Threshold at which there is a risk of damage to older residential structures
0.5	Severe - Vibrations considered unpleasant	Threshold at which there is a risk of damage to new residential and modern commercial/industrial structures

REGULATORY BACKGROUND

Noise from wind turbine generator operations is typically regulated at the County level. Applicable guidance from the Noise Element of the Shasta County General Plan and supplemental criteria for low frequency and infrasonic noise are described below.

Shasta County Noise Element. An objective of the Noise Element of the Shasta County General Plan is to protect County residents from the harmful and annoying effects of exposure to excessive noise. The General Plan considers residential land uses "generally acceptable" in noise environments of 60 dBA L_{dn} or less and "conditionally acceptable" in noise environments between 60 to 70 dBA L_{dn}. See Figure N-1.

In addition, the following Policies would be applicable to the Project:

N-b: Noise likely to be created by a proposed non-transportation land use shall be mitigated so as not to exceed the noise level standards of Table N–IV (shown below) as measured immediately within the property line of adjacent lands designated as noise-sensitive. (From Table N-IV: In rural areas where large lots exist, the exterior noise level standard shall be applied at a point 100' away from the residence.) Noise generated from existing or proposed agricultural operations conducted in accordance with generally accepted agricultural industry standards and practices is not required to be mitigated.

N-c: Where proposed non-residential land uses are likely to produce noise levels exceeding the performance standards of Table N–IV upon existing or planned noise-sensitive uses, an acoustical analysis shall be required as part of the environmental review process so that appropriate noise mitigation may be included in the project design. The requirements for the content of an acoustical analysis are given by Table N-V (not shown).

N-g: Existing noise-sensitive uses may be exposed to increased noise levels due to future roadway improvement projects as a result of increased traffic capacity and volumes and increases in travel speeds. In these instances, it may not be practical to reduce increased traffic noise levels consistent with those contained in Table N-VI (shown below). Therefore, as an alternative, the following criteria may be used as a test of significance for increases in the ambient outdoor activity areas of the noise level of noise-sensitive uses created as a result of a new roadway improvement project:

- Where existing traffic noise levels are less than 60 dB L_{dn}, a +5 dB L_{dn} increase will be considered significant; and
- Where existing traffic noise levels range between 60 and 65 dB L_{dn}, a +3 dB L_{dn} increase will be considered significant; and
- Where existing traffic noise levels are greater than 65 dB L_{dn}, a + 1.5 dB L_{dn} increase will be considered significant.

N-i: Where noise mitigation measures are required to achieve the standards of Tables N-IV and N-VI, the emphasis of such measures shall be placed upon site planning and project design. The use of noise barriers shall be considered a means of achieving compliance with the noise standards only after all other practical design-related noise mitigation measures have been integrated into the project.

Shasta County regulations do not address the operational characteristics of wind turbines. Wind turbines only operate when the wind exceeds a "cut-in" speed which is typically about 4 m/sec (8.9 mph). As a result, they do not produce noise continuously. For Shasta County, the noise limits are interpreted to be not-to-exceed levels, or essentially steady-state levels. Since wind turbines may operate day or night, the nighttime limits (50 dBA as measured immediately within the property line of adjacent lands designated as noise-sensitive) will be considered as the appropriate levels with which to compare the estimated noise levels produced by the proposed Project.

FIGURE N-1: TRANSPORTATION NOISE RELATED LAND USE COMPATIBILITY GUIDELINES FOR DEVELOPMENT

LAND USE CATEGORY		50	55	60	65	70	75	80
		COMMUNITY NOISE EXPOSURE L_{dn} OR CNEL, dB

	C.A.					▒	▒	
	G.U.							■

INTERPRETATION:

G.A. = **GENERALLY ACCEPTABLE**

Specified land use is satisfactory. No noise mitigation measures are required.

C.A. = **CONDITIONALLY ACCEPTABLE**

Use should be permitted only after careful study and inclusion of protective measures as needed to satisfy the policies of the Noise Element.

G.U. = **GENERALLY UNACCEPTABLE**

Development is usually not feasible in accordance with the goals of the Noise Element.

Source: Brown-Buntin Associates Inc, 1998

TABLE N-IV:
NOISE LEVEL PERFORMANCE STANDARDS FOR NEW PROJECTS AFFECTED BY OR INCLUDING NON-TRANSPORTATION SOURCES

Noise Level Descriptor	Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
Hourly L_{eq}, dB	55	50

The noise levels specified above shall be lowered by 5 dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises. These noise level standards do not apply to residential units established in conjunction with industrial or commercial uses (e.g., caretaker dwellings). The County can impose noise level standards, which are more restrictive than those specified above based upon determination of existing low ambient noise levels. In rural areas where large lots exist, the exterior noise level standard shall be applied at a point 100' away from the residence. Industrial, light industrial, commercial, and public service facilities which have the potential for producing objectionable noise levels at nearby noise-sensitive uses are dispersed throughout the County. Fixed-noise sources which are typically of concern include, but are not limited to, the following:

HVAC Systems	Cooling Towers/Evaporative Condensers
Pump Stations	Lift Stations
Emergency Generators	Boilers
Steam Valves	Steam Turbines
Generators	Fans
Air Compressors	Heavy Equipment
Conveyor Systems	Transformers
Pile Drivers	Grinders
Drill Rigs	Gas or Diesel Motors
Welders	Cutting Equipment
Outdoor Speakers	Blowers

The types of uses which may typically produce the noise sources described above include, but are not limited to: industrial facilities including lumber mills, trucking operations, tire shops, auto maintenance shops, metal fabricating shops, shopping centers, drive-up windows, car washes, loading docks, public works projects, batch plants, bottling and canning plants, recycling centers, electric generating stations, race tracks, landfills, sand and gravel operations, and athletic fields. Note: For the purposes of the Noise Element, transportation noise sources are defined as traffic on public roadways, railroad line operations, and aircraft in flight. Control of noise from these sources is preempted by Federal and State regulations. Other noise sources are presumed to be subject to local regulations, such as a noise control ordinance. Non-transportation noise sources may include industrial operations, outdoor recreation facilities, HVAC units, loading docks, etc.

Source: Shasta County Noise Element

Supplemental Criteria for Low Frequency and Infrasonic Noise. Neither the State of California nor Shasta County specifically address low frequency noise and infrasonic noise from wind energy or other projects. However, low frequency noise and infrasonic noise from wind energy projects should be explored as part of a complete noise assessment[2]. Other criteria can be considered to determine if the project would exhibit high infrasonic noise generation potential. In general, low frequency noise has been associated with older generation, downwind turbines. For these turbines, the wake of the tower interacts with the passing blades to generate pulses at the rate the blades pass the tower. Low frequency noise is typically minimized with upwind turbines. Objective sound pressure level guidelines can be inferred from several different sources.

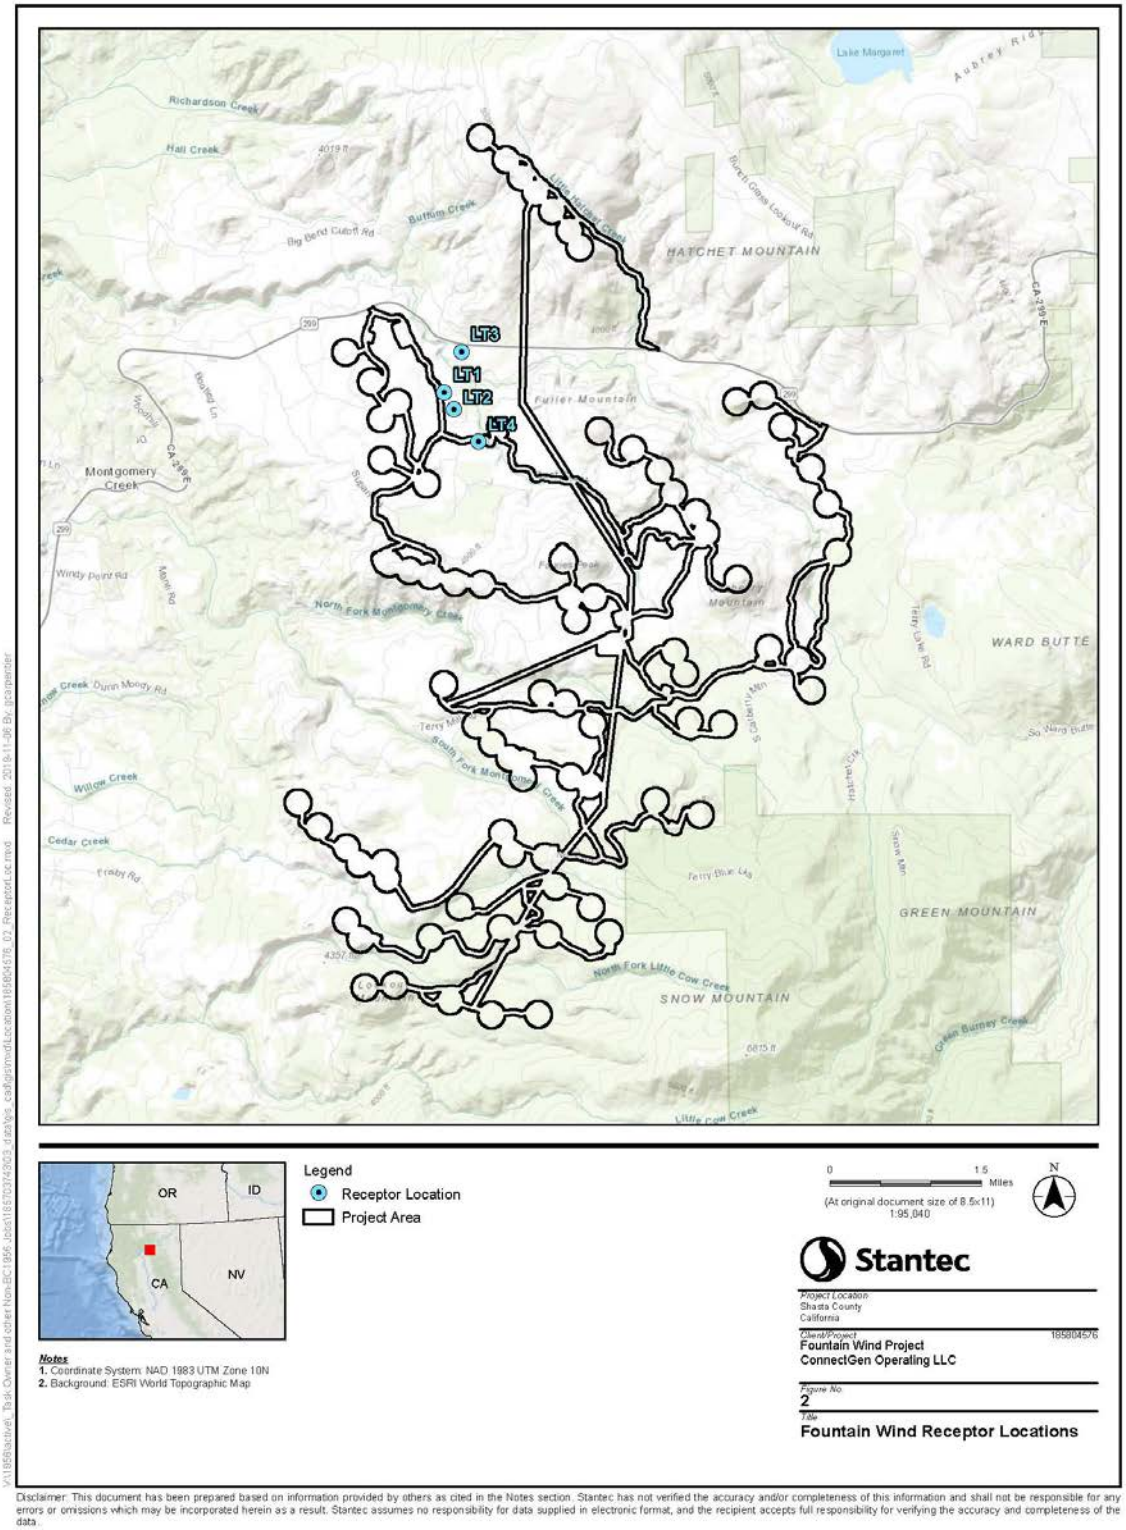
One source of low frequency criteria is the Alameda County Standard Conditions of Permit Approval for Windfarms[3]. This document uses 70 dBC L_{dn} as the threshold for considering "reasonable complaints". Another source of low frequency criteria within the State of California is the Kern County Code[4]. Under this criteria, the low frequency noise levels at 50 feet from a residence are given below for 1/3 octave bands centered at 2 to 125 Hz as shown in Table 4. In the infrasonic range (below 20 Hz), the Table 4 criteria are actually lower than the established threshold of hearing by 18 to 37 dB[7]. As a result, achieving the values shown for the Kern County criteria should assure that any infrasonic noise generated by the Project will be sufficiently low in level to avoid any noise impact.

TABLE 4 Low frequency noise criteria used by Kern County

1/3 Octave Band Center Frequency, Hz	Noise Level Limit, dB
2 to 16	70
20	68
25	67
31.5	65
40	62
50	60
63	57
80	55
100	52
125	50

Finally, a simpler criterion based on the difference of overall levels has also been proposed as a predictor of annoyance. This occurs when the C-weighted level exceeds the A-weighted level by 20 dB or more[5].

EXISTING NOISE ENVIRONMENT



The Project Site is located in an unincorporated area of eastern Shasta County, approximately 1 mile west of the existing Hatchet Ridge Wind Project, 6 miles west of Burney, 35 miles northeast of Redding, immediately north and south of California State Route 299 (SR 299), and near the private recreational facility of Moose Camp. Other communities near the Project Area include Montgomery Creek, Round Mountain, and Wengler (each approximately 3 miles from the Project Site) and Big Bend (approximately 7 miles from the Project Site). The Project Site is located within the southern end of the Cascade Range with topography characterized by buttes and peaks separated by small valleys. The Lassen National Forest lies adjacent to the Project Site to the southeast and the Shasta-Trinity National Forest borders the Project Site to the north. Other surrounding lands are privately owned; many are used for timber harvesting purposes.

There are no residences within the bounds of the project. The closest residences are located about 2,200 feet from proposed turbines. The noise environment in the vicinity of nearby residences is defined primarily by natural sounds, such as wind rustling the leaves of foliage, insects, and birds. In locations adjacent to SR-299, traffic is the dominant noise source. The Project Site is under active timber management and noise associated with related vehicle trips along the roadway network are included in the ambient noise environment.

Noise Measurement Methods

To objectively characterize the noise environment, sound pressure levels were measured in and surrounding the Project Site. Long-term, unattended noise measurements were made at four locations in the vicinity of the Project Site at locations indicated as LT-1, LT-2, LT-3, and LT-4 in Figure 2. Measurements were conducted over an 8-day period from Sunday, August 19th, 2018 to Monday, August 27th, 2018. The sites were selected to represent the closest residences to the Project. Sites LT-1, LT-2, and LT-3 were selected at distances of about 100 feet from the closest residences, in the worst-case location relative to the proposed turbines. Due to the inaccessibility of the residence to the south (represented by LT-4), measurements were not attempted on this property, but rather were taken to be representative of the Project Site. The long-term noise levels were measured with Larson-Davis 820 precision Type 1 sound level meters (SLMs) fitted with a ½-inch pre-polarized condenser microphone and a windscreen. The meters were calibrated before and after the surveys with a 94 dB, 1000 Hz Larson-Davis acoustical calibrator.

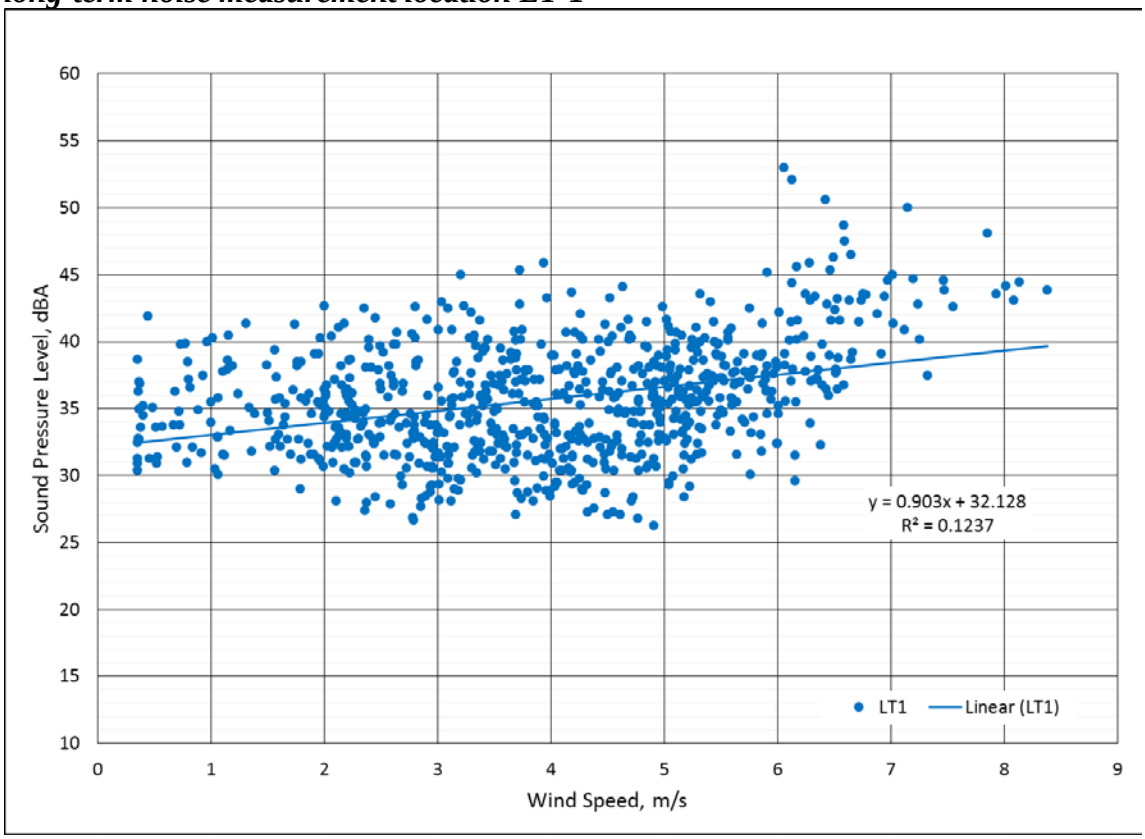
Figure 2: Ambient Noise Measurement Locations

The long-term data were monitored in 10-minute intervals that were later combined to give hourly levels. The measured levels included the L_{eq}, L_{max}, L_{min}, L_1, L_2, L_{10}, L_{25}, L_{50}, and L_{90} for each 10-minute interval. The daily trends in noise levels for the long-term measurement site are presented in Appendix A.

Noise Measurement Results

Ambient Noise Levels. For purposes of comparison of ambient noise levels to those predicted for the Project, the primary metric of concern based on the Shasta County criteria is the hourly L_{eq}. These data are shown in Appendix A for each of the test days for each LT measurement. As indicated in the data, there is considerable variation in level between test days and times of day at each site. The average hourly L_{eq} values for the daytime hours (7:00 a.m. to 10:00 p.m.) and the nighttime hours (10:00 p.m. to 7:00 a.m.) are shown in Table 5 along with the day-night average levels for each LT measurement. At all sites, elevated noise levels occurring between approximately 7:00 pm and 11:00 pm are thought to be attributable to insect and other natural sounds. At all sites and on all measurement days, noise levels during these hours increased substantially (15 to 20 dB) around 8:00 pm and then dropped off slowly between 8:00 pm and 11:00 pm.

Table 5: Summary of Ambient Levels at Long-Term Measurement Locations



Location	Time Period	Hourly L_{eq}		Standard Dev., dB	L_{dn}, dBA
		Average, dBA	Range, dBA		
LT-1	Daytime	40	28-49	4.4	43-45
	Nighttime	36	32-45	3.5	
LT-2	Daytime	38	28-50	5.2	42-44
	Nighttime	34	28-42	3.5	
LT-3	Daytime	47	39-53	3.5	53-54
	Nighttime	46	40-53	3.6	
LT-4	Daytime	42	38-49	2.8	47-50
	Nighttime	42	38-48	2.9	

Daytime vs. Nighttime Noise Levels. As indicated in Table 5, daytime noise levels were about 4 dBA greater than nighttime noise levels at locations LT-1 and LT-2, but were similar between daytime and nighttime periods at LT-3 and LT-4. The noise environment at LT-1, LT-2, and LT-4 is primarily comprised of natural sounds, such as wind rustling the leaves of foliage, insects, and birds, and vehicular traffic on local logging roads. At LT-3, noise from occasional traffic on SR-299 is the primary noise source, along with evening insect noise; however, insect noise is similar in level to the traffic noise at this site and does not appear to significantly affect the L_{50} and L_{eq} levels. The L_{dn} values calculated for each LT locations are also provided in Table 5 and range from 42 dBA L_{dn} at more remote locations (LT-2) to 54 dBA L_{dn} in locations adjacent to SR-299 (LT-3). The noise floor identified in the data at LT-4 is due to the noise floor of the sound level meter. These trends can be observed in greater detail on the figures given in Appendix A.

Effects of Wind Speed on Noise Levels. To document the effect of wind speed on the ambient noise levels, wind speed data were reviewed from meteorological towers located near the Project site. The 10-minute L_{eq} levels measured at the four long-term noise monitoring locations from August 19th, 2018 to August 27th, 2018 were plotted against average 10-minute wind speed. As an example, the sound pressure level (L_{eq}) versus wind speed at location LT-1 is shown in Figure 4. Similar trends were seen at of the LT sites. Based on review of Figure 3 (and similar charts for the other LT locations), higher noise levels were observed under wind speeds exceeding 6 m/s. However, considerable scatter is apparent in the data; R^2 values of 0.12 or less at all locations indicate very low correlation

between wind speed and noise level. Higher wind speed may result in a stronger correlation; however, based on the data reviewed, the noise environment at these sites is not directly correlated with wind speed.

Figure 3: 10-Minute L_{eq} level versus wind speed from nearby meteorological tower for long-term noise measurement location LT-1

NOISE ASSESSMENT

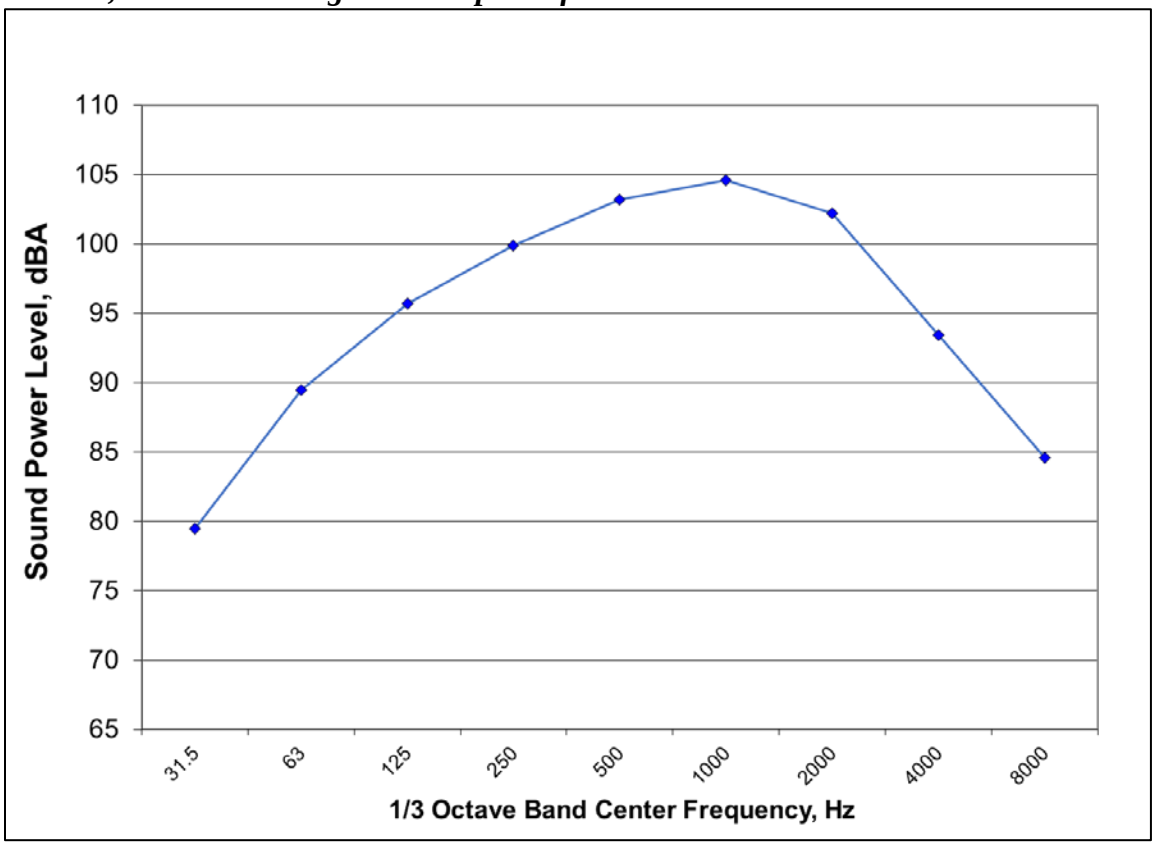
The noise assessment consisted of a review of the construction and operational details of the Project, calculation of noise levels at nearby noise sensitive areas based on the proposed turbine layout, the assessment of the predicted levels relative to the appropriate regulations and guidelines, and the discussion of noise reduction strategies, as necessary. The following criteria, which generally follow the California Environmental Quality Act (CEQA) Guidelines, Appendix G, were used to evaluate the significance of environmental noise resulting from the Project:

- **Noise Levels in Excess of Standards:** A noise impact would be identified if the Project would exceed 55 dBA during daytime hours (7:00 am to 10:00 pm), 50 dBA during nighttime hours (10:00 pm to 7:00 am), and/or 60 dBA L_{dn} at noise sensitive uses (residences). *Shasta County General Plan Policy N-b and Figure N-1.*

- **Permanent Noise Increases:** A noise impact would be identified if operational noise generated by the Project would substantially increase noise levels at sensitive receivers in the vicinity. Shasta County defines noise level increases of 3 dBA L_{dn} or greater to be considered significant where exterior noise levels would exceed the generally acceptable noise level standard (60 dBA L_{dn} for residential land uses). Where noise levels would remain at or below the normally acceptable noise level standard with the Project, noise level increases of 5 dBA L_{dn} or greater would be considered significant. *Shasta County General Plan Policy N-g*

- **Supplemental Criteria for Low Frequency and Infrasonic Noise:** The threshold for concern for low frequency noise occurs when the C-weighted level exceeds the A-weighted level by 20 dB or more or if the 1/3rd octave band thresholds shown in Table 4 are exceeded.

- **Temporary Noise Increase from Construction:** A temporary noise impact would be identified if construction-related noise would temporarily increase ambient noise levels at sensitive receptors. Hourly average noise levels exceeding 60 dBA L_{eq} at residential land uses, and the ambient by at least 5 dBA L_{eq}, for a period of more than one year would constitute a significant temporary noise increase at adjacent residential land uses. For temporary noise increases due to construction traffic, Shasta County's 3 and 5 dBA L_{dn} increase criteria would apply, as described above.



- **Groundborne Vibration from Blasting:** A vibration impact would be identified if the Project blasting for construction would generate groundborne vibration levels exceeding 0.3 in/sec PPV or groundborne noise exceeding 133 dB(L). *See Table 3 and discussion.*

NOISE GENERATED DURING OPERATIONS

Wind Turbine Operation

The Project is located on approximately 4,400 acres of land in the southern end of the Cascade Range in Shasta County, California. The proposed, 72-turbine layout is shown in Figure 1. Based on preliminary design, the Nordex N163/5.X turbine was selected as the worst-case, loudest turbine that is anticipated to be used at the site. This turbine has a maximum sound power level of 109.2 dBA and a hub height of 118 m (387 feet). One-third octave band data for this turbine is shown in Figure 4.

Figure 4: One-third octave band sound power levels for the Nordex N163/5.X Wind Turbine, with a Hub Height Wind Speed of 15 m/s

As sound spreads out from a noise source, physics dictates an attenuation of 6 dB for each doubling of distance from the source. The closest residences are located about 2,200 feet from adjacent turbines. Given the long propagation distances and mountainous terrain between the turbines and the closest receptors, turbine sound would be subject to additional attenuation by shielding from intervening terrain, atmospheric absorption, and ground absorption. Some variation in noise exposure at residences will occur with variations in temperature gradients and/or wind speed gradients, which vary over time.

Noise Levels in Excess of Standards

SoundPLAN Version 8.1 was used to calculate noise levels at adjacent noise sensitive locations, assuming a worst-case condition with operation of all wind turbines

simultaneously. SoundPLAN is a three-dimensional ray-tracing program, which takes into account the topography of the area and the spectral characteristics of the noise sources. These results include the effect of atmospheric attenuation, ground reflection/absorption, and topography. Neutral environmental conditions are assessed for CEQA purposes, i.e., no wind or temperature gradients.

Figure 5 shows the calculated future A-Weighted noise contours generated during a worst-case scenario with all wind turbines operating simultaneously. Contours are shown for the area surrounding the Project, much of which is currently undeveloped. Receptor locations are representative of the worst-case existing residential locations, located 100 feet from the residences themselves in the direction of the closest turbine. For LT-1, LT-2, and LT-3, these locations are the same as the ambient measurement locations. For LT-4, a location representative of the receptor further to the south was selected (R-4).

The calculated levels at each of the nearest existing noise sensitive receptors under this same worst-case scenario are shown in tabular form in Table 6, which gives A-Weighted L_{eq} and L_{dn} results at each location. Measurement and receptor locations are indicated in Figures 2 and 5.

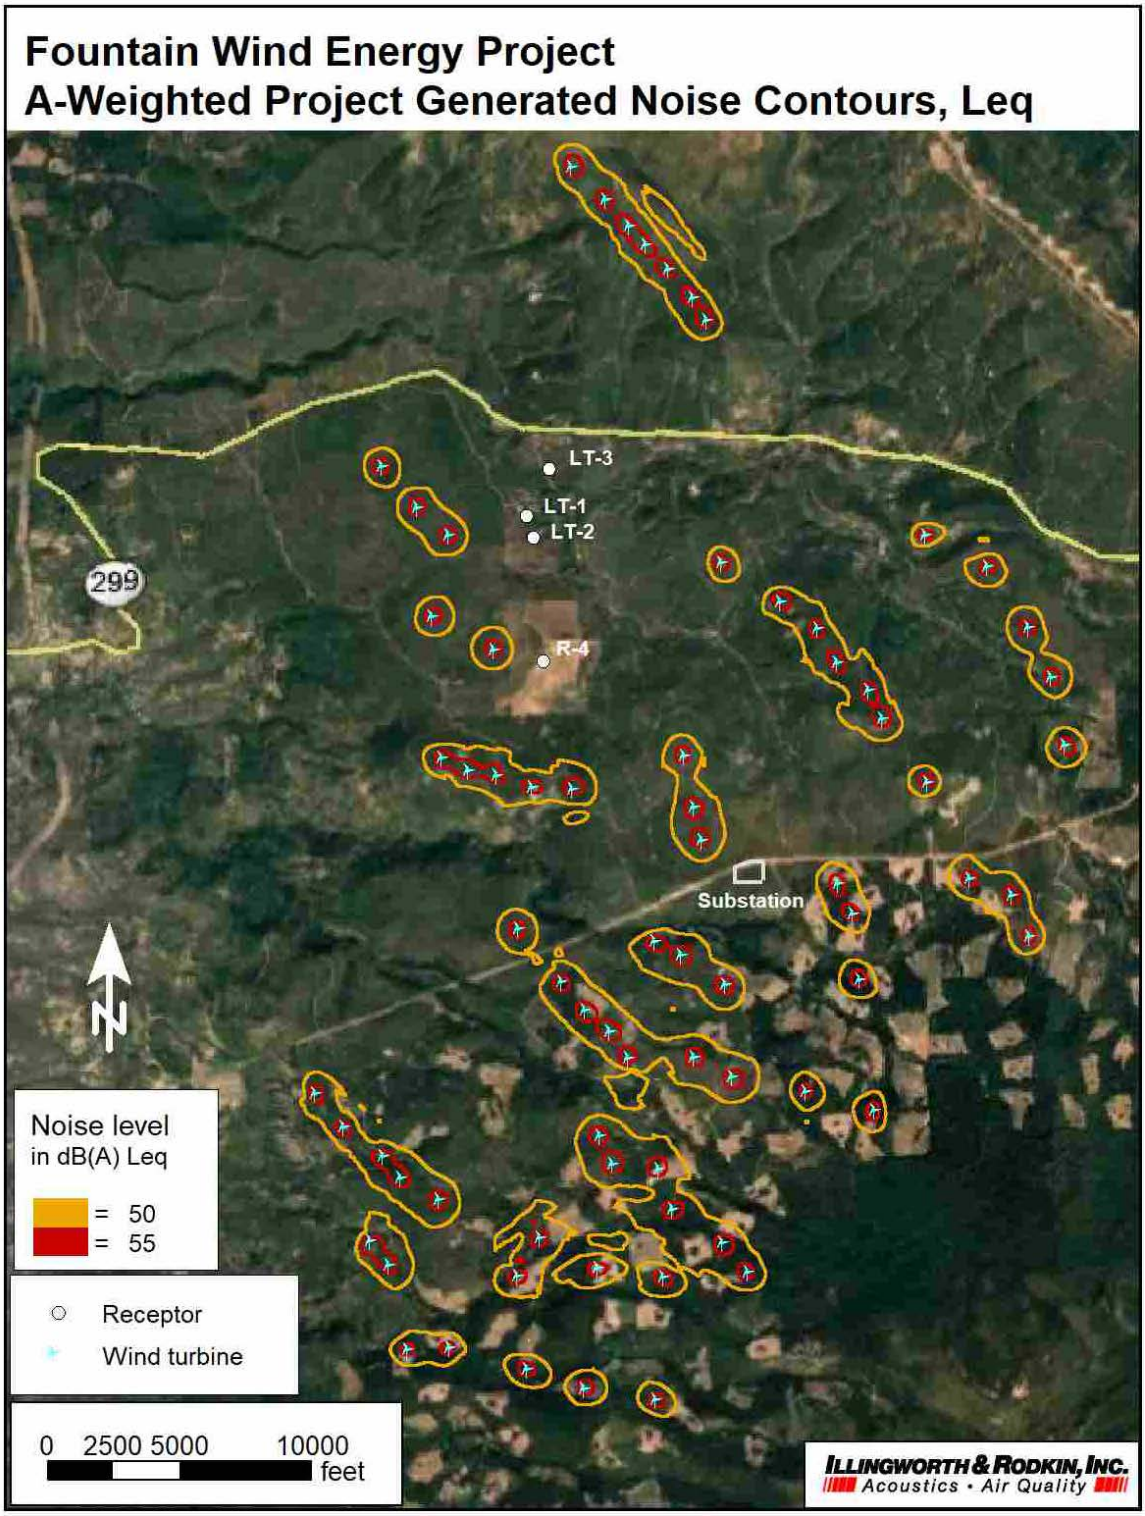
TABLE 6: Project Generated Sound Pressure Levels at Nearby Residences

Receiver	A-Weighted L_{eq}, dBA	L_{dn}[1], dBA
LT-1	40	46
LT-2	40	46
LT-3	38	45
R-4	43	50

[1] Assumes continuous simultaneous operation of all turbines, 24-hr/day.

As shown in Table 6, A-Weighted L_{eq} levels would range from 38 to 43 dBA at the nearest existing residences and L_{dn} levels, assuming a worst-case scenario with turbine operating continuously for 24-hr/day, would range from 45 to 50 dBA. Therefore, wind turbine noise levels would not be anticipated to exceed the County's daytime (55 dBA L_{eq}), nighttime (50 dBA L_{eq}), or L_{dn} (60 dBA L_{dn}) thresholds.

Figure 5a: Fountain Wind Energy Project A-Weighted Contours



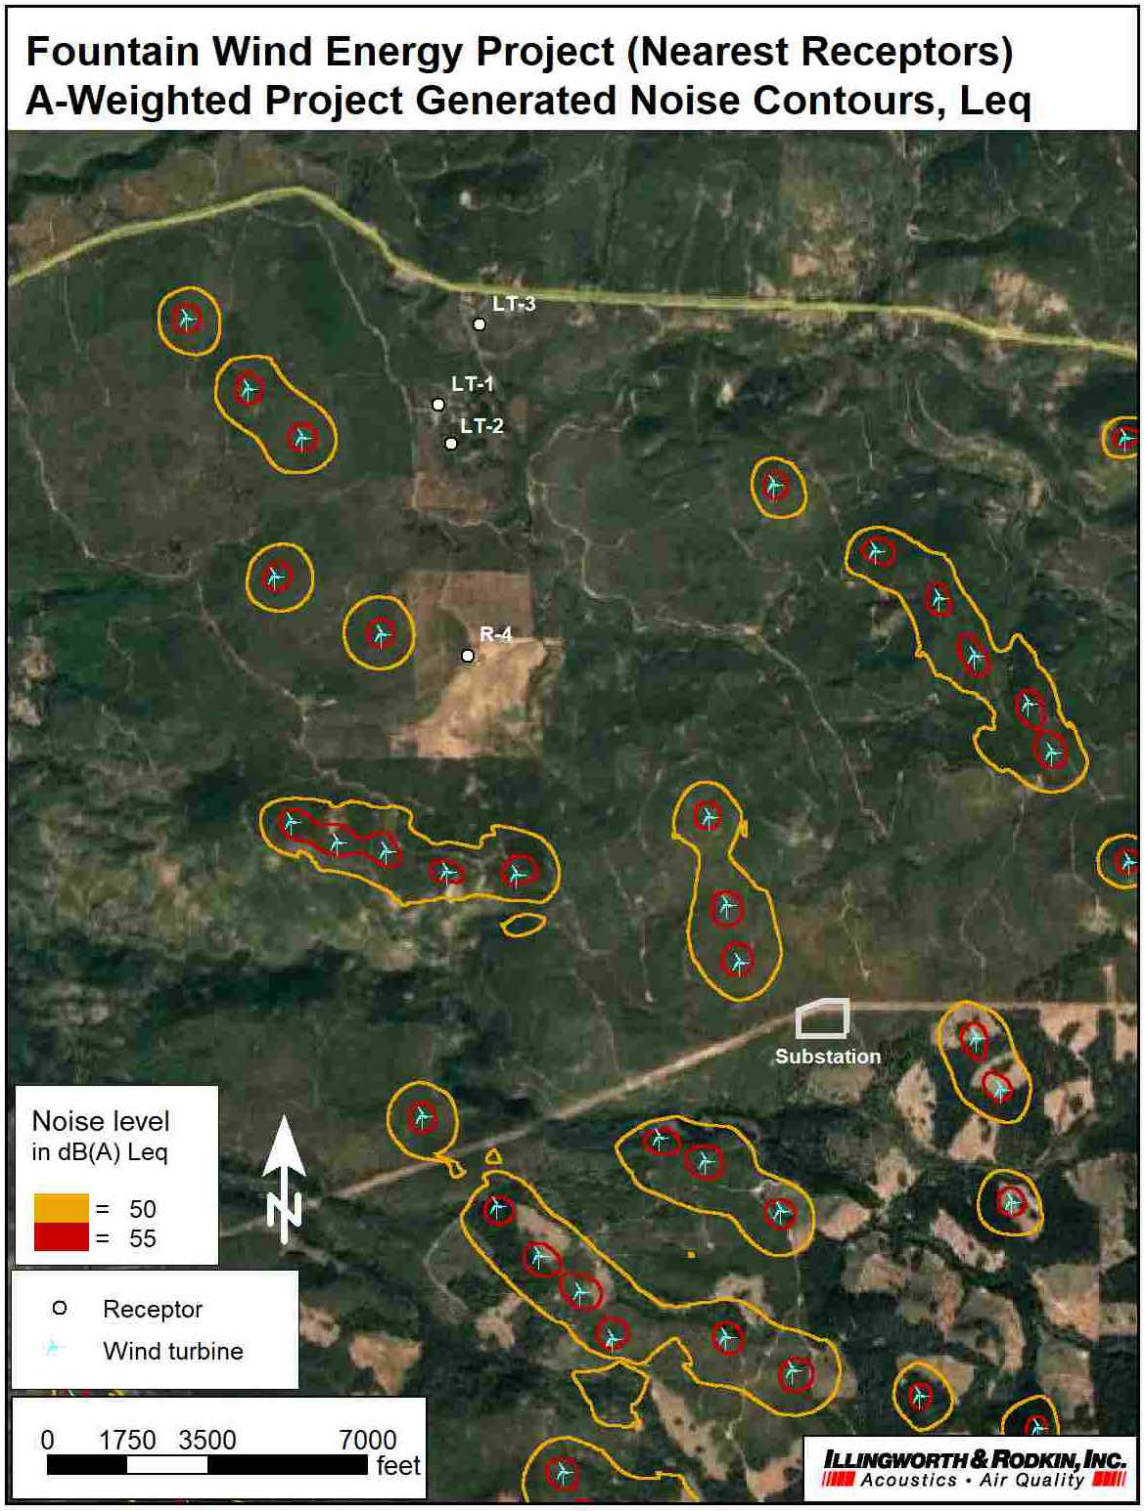


Figure 5b: Fountain Wind Energy Project A-Weighted Contours, Nearest Receptors

Permanent Noise Increases

Table 7 shows existing ambient and calculated L_{dn} noise levels resulting from the worst-case wind turbine scenario discussed above, with all turbines operating simultaneously 24-hr/day. Ambient L_{dn} levels are based on noise measurements and observations made during the noise monitoring survey.

TABLE 7: Increase in L_{dn} Resulting from Project Operations, 100% Operations

Receiver	Average Ambient L_{dn}, dBA	Project Generated L_{dn}[1], dBA	Existing + Project L_{dn}[1], dBA	L_{dn} Increase[2], dBA
LT-1	44	46	48	4.1
LT-2	43	46	48	5.0
LT-3	54	45	54	0.5
R-4	49	50	52	3.3

[1] Assumes continuous simultaneous operation of all turbines, 24-hr/day.
[2] Results were rounded to the nearest decibel. In some cases, this can result in relative changes that may not appear intuitive. For example, the difference between 64.4 (64) and 64.5 (65) is 0.1 (0), not 1.

As indicated in Table 7, worst-case wind turbine operation would result in L_{dn} noise levels increases of 0.5 to 5.0 dBA at the nearest surrounding residences, assuming 100% operations. Ambient noise levels at all receptors are below 60 dBA L_{dn}; therefore, the 5 dBA increase threshold would apply. Noise increases at all receptors would be 5.0 dBA L_{dn} or less. More likely assumptions, assuming 30, 40, 50, and 85% operations, would result in lower Project generated L_{dn} levels and thus lower noise level increases at residences. Likewise, selection of a lower noise turbine would result in lower Project generated L_{dn} levels and thus lower noise level increases at residences.

Low Frequency and Infrasonic Noise

Spectral data for the worst-case wind turbine scenario are shown in Figure 4. Table 8 shows the differences between the A-Weighted and C-Weighted levels, as calculated at each receptor location.

TABLE 8: Difference Between A-Weighted and C-Weighted Results

Receiver	A-Weighted L_{eq}, dBA	C-Weighted L_{eq}, dBC	L_{dn}[1], dBA	L_{dn}[1], dBC	dBC – dBA, dB
LT-1	39.5	58.4	46	65	18.9
LT-2	39.5	58.5	46	65	19.0
LT-3	38.2	57.7	45	64	19.5
R-4	43.3	61.0	50	67	17.7

[1] Assumes continuous simultaneous operation of all turbines, 24-hr/day.

As shown in Table 8, the difference between the A-Weighted and C-Weighted levels are anticipated to be 17.7 to 19.5 dB. These differences are below the 20-dB threshold of concern for low frequency noise relative to A-weighted levels. Levels are also 5 dB or more below the Kern County thresholds shown in Table 4 and the standard condition of approval used in Alameda County (70 dBA dBC). As a result, low frequency noise from the turbines is anticipated to be below any of the typical regulations or guidelines if the A-weighted sound level limits are achieved.

Onsite Collector Substation and Switching Station

An onsite collector substation and switching station (Substation) would increase the voltage of the electricity from the collection system's 34.5 kV to 230 kV to match the voltage of the existing PG&E 230 kV line. The closest existing residential areas are 1.5 miles to the northwest and southwest from the Substation location (see Figure 5). The basic elements of the substation facilities include a control house, a bank of one or two main transformers, outdoor breakers, capacitor banks, relaying equipment, high-voltage bus work, steel support structures, an underground grounding grid, and overhead lightning-suppression conductors.

The primary operational noise sources proposed at the Substation are anticipated to be transformers. A typical transformer would be estimated to generate a noise level of 72 dB at a distance of 6 feet during full load with fans and pumps running. With two transformers running simultaneously, the noise level would be 3 dB higher. Based on noise measurements made at the Bridgeville Substation in Humboldt County, California, steady state noise levels in the range of 47 to 54 dBA L_{eq} would be anticipated at the fence line of the Substation. Equipment-generated noise levels drop off at a rate of about 6 dBA per doubling of the distance between the source and receptor. Shielding by buildings or terrain can provide an additional 5 to 10 dBA or more noise reduction at distant receptors. At a distance of 1.5 miles, Substation noise would be inaudible.

Corona Noise

The project proposes overhead transmission lines ranging from 34.5 kV to 230 kV to match the voltage of the existing PG&E 230 kV line. A short 230kv line interconnection to the existing system will be installed at the sub/switching. The remainder of the line that runs north to south within the Project Site would be a 34.5 KV.

The localized electric field near an energized conductor can be sufficiently concentrated to produce a small electric discharge, which can ionize air close to the conductors. This effect is called corona, and it is associated with all energized electric power lines. Corona can result in the production of small amounts of sound. Corona noise is typically characterized as a hissing or crackling sound, which may be accompanied by a 120-hertz hum. Slight irregularities or water droplets on the conductor and/or insulator surface accentuate the electric field strength near the conductor surface, making corona discharge and the associated audible noise more likely. Therefore, audible noise levels from transmission lines are generally higher during wet weather.

Using computer modeling software developed by the Bonneville Power Administration (BPA)[6], audible noise values can be calculated for transmission lines experiencing corona activity. This modeling indicates that, during wet weather conditions, audible noise levels of up to 46 dBA would occur within the ROW for a transmission line operating at 230 kV. The 34.5 kV lines would likely be inaudible outside the ROW. Noise from lower voltage lines and/or during dry conditions would be lower.

At the closest residence, located more than 2,000 feet from the proposed lines, noise levels from the 230 kV lines would be 25 to 35 dBA lower than the levels within the ROW, resulting in levels that are well below ambient noise levels and most likely inaudible.

Shielding by buildings or terrain can provide an additional 5 to 10 dBA or more noise reduction at distant receptors.

Other Operations and Maintenance Activities

The Project anticipates employing up to 12 full-time employees. Operation and maintenance activities would generally occur during normal workday hours from Monday to Friday. Turbines would be monitored and controlled 24 hours a day, seven days a week, using a remote off-site monitoring system. This system would allow a remote operator to perform self-diagnostic tests and system checks, establish operating parameters, and ensure that the turbines are operating at peak performance. In the event of winds or gusts above the maximum operating parameters, the turbines would automatically shut down.

Routine maintenance activities are expected to include, but not be limited to: checking torque on tower bolts and anchors; checking for cracks and other signs of stress on the turbine tower and other turbine components; inspecting for leakage of lubricants, hydraulic fluids and other hazardous materials, and replacing them as necessary; inspecting the grounding cables, wire ropes and clips, and surge arrestors; cleaning; and repainting. Most routine maintenance activities would occur within and around the tower and the nacelle. Cleanup from routine maintenance activities would be performed at the time maintenance was performed. While performing most routine maintenance activities, staff would travel via pickup or other light-duty trucks.

Each turbine would also be serviced twice a year, or as needed. Turbine servicing would require maintenance staff to climb towers and service turbine parts by performing activities such as removing the turbine rotor and replacing generators and bearings. Scheduled maintenance may require the use of a crane within the 65- to 95-foot diameter areas around the turbines.

Although unlikely, non-routine maintenance such as repair or replacement of rotors or other major components could become necessary. Such maintenance would involve use of one or more cranes and equipment transport vehicles, though the cranes would not be as large as the track-mounted cranes needed to erect the turbine towers. Permanent access roads would be periodically graded and compacted in order to minimize erosion. Catch basins, roadway ditches, and culverts would be cleaned and maintained regularly

The addition of 12 vehicles daily spread throughout the existing logging roadway network in the vicinity of the Project would not be anticipated to measurably change the noise environment (increase would be less than 1 dBA L_{dn}). Maintenance operations would be located as close as about 2,000 feet from existing residences. Maintenance noise levels were calculated using the Federal Highway Administration (FHWA) software - Roadway Construction Noise Model (RCNM). A crane is calculated to generate a maximum instantaneous noise level of 49 dBA L_{max} and 41 dBA L_{eq} at a distance of 2,000 feet, not taking into account any noise reduction from intervening shielding by structures or terrain. Maintenance operations would be occasional at each individual turbine, with servicing occurring only twice a year. Although maintenance operations may occasionally be audible during quiet ambient conditions when located nearest noise sensitive locations, ambient noise levels would not be affected on an hourly or daily average basis.

NOISE GENERATED DURING CONSTRUCTION

Neither Shasta County nor the State of California specify quantitative thresholds for the impact of temporary increases in noise due to construction. The threshold for speech interference indoors is 45 dBA. Assuming a 15 dB exterior-to-interior reduction for standard residential construction with windows open and a 25 dB exterior-to-interior reduction for standard commercial construction, assuming windows closed, this would correlate to an exterior threshold of 60 dBA L_{eq} at residential land uses. Therefore, the Project would be considered to generate a significant temporary construction noise impact if Project construction activities exceeded 60 dBA L_{eq} at nearby residences and exceeded the ambient noise environment by 5 dBA L_{eq} or more for a period longer than one year.

The Project construction period is expected to last 18 to 24 months. Construction would be completed during daylight hours, typically from 7:00 am to 5:00 pm but may be earlier or later during the summer months. There may be circumstances where these hours need to be extended earlier or later, such as during the delivery of superloads, and nighttime construction may occur to avoid traffic, adjust for high winds during daylight hours, and to facilitate schedule. The construction workforce is estimated to include up to 400 construction workers at any given time.

Noise impacts resulting from construction depend upon the noise generated by various pieces of construction equipment, the timing and duration of noise-generating activities, and the distance between construction noise sources and noise-sensitive areas. Construction noise impacts primarily result when construction activities occur during noise-sensitive times of the day (e.g., early morning, evening, or nighttime hours), the construction occurs in areas immediately adjoining noise-sensitive land uses, or when construction lasts over extended periods of time.

Project construction activities would include grading, widening of existing and construction of new access roads, transportation of turbine components, clearing of laydown areas, construction of turbine foundations, assembly and erection of turbines, construction of substation and O&M Building, and installation of the underground and overhead collection system. Blasting and helicopters may be necessary in some areas. Pile driving is not anticipated as a method of construction.

Heavy Equipment Use

During each stage of construction, there would be a different mix of equipment operating, and noise levels would vary by stage and vary within stages, based on the amount of equipment in operation and the location at which the equipment is operating. Typical construction noise levels at 50 feet for equipment likely to be used in the construction of a wind facility are shown in Table 9. Most demolition and construction activities at a wind turbine facility generate noise levels in the range of 80 to 85 dBA L_{max} at 50 feet from the source. Hourly average noise levels would also be in the range of 80 to 85 dBA L_{eq} during periods of heavy construction.[7] Construction-generated noise levels drop off at a rate of about 6 dBA per doubling of the distance between the source and receptor. Shielding by buildings or terrain can provide an additional 5 to 20 dBA noise reduction at distant receptors.

TABLE 9 Construction Equipment 50-foot Noise Emission Limits

Equipment Category	L_{max} Level (dBA)[1,2]	Impact/Continuous
Backhoe	80	Continuous
Concrete Mixer	85	Continuous
Concrete Pump	82	Continuous
Crane	85	Continuous
Dozer	85	Continuous
Excavator	85	Continuous

[1] Measured at 50 feet from the construction equipment, with a "slow" (1 sec.) time constant.

[2] Noise limits apply to total noise emitted from equipment and associated components operating at full power while engaged in its intended operation.

[3] Portable Air Compressor rated at 75 cfm or greater and that operates at greater than 50 psi.

Source: Mitigation of Nighttime Construction Noise, Vibrations and Other Nuisances, National Cooperative Highway Research Program, 1999.

The closest residences are located approximately 2,000 feet from turbine construction areas. At this distance, hourly average noise levels from heavy construction activities would be in the range of 48 to 53 dBA L_{eq}, not taking into account any shielding from intervening terrain or structures. These noise levels could, at times, be audible at receptors, particularly during nighttime construction activities, but would not be anticipated to cause sleep or speech interference or affect the overall ambient noise levels in these locations. Construction activities at any individual turbine location would be limited to a relatively short period of time as construction proceeds to other turbines throughout the Project Site.

The closest existing residences to Substation and O&M Building construction are 1.5 miles to the northwest and southwest from the Substation location. At this distance, construction noise levels would be less than 40 dBA L_{eq} and would not be anticipated to be distinguishable from ambient noise levels.

Roadway construction activities could occur as close as 580 (LT-2) to 1,170 (R-4) feet from the nearest residences. At a distance of 580 feet, noise from heavy construction activities would be in the range of 59 to 64 dBA L_{eq}, not taking into account any shielding from intervening terrain or structures. At 1,170 feet, noise from heavy construction activities would be in the range of 53 to 58 dBA L_{eq}. Roadway construction would typically occur for relatively short periods of time in any specific location as construction proceeds along the roadway. Although construction located nearest residences would not be expected to cause sleep or speech interferences, noise levels could exceed ambient levels by as much as 20 dBA at LT-2 when construction is located adjacent to noise sensitive locations.

Construction Truck Trips

Construction traffic entering the Project Site will comprise of trips by construction workers, material delivery, and equipment delivery. All traffic will reach the site using SR 299. Three access roads are proposed to coincide with existing logging roads at the intersections with SR 299. Based on the available traffic volumes from Caltrans,[8] SR 299 carries an existing peak hour traffic volume of about 320 vehicles per hour with a truck percentage of 13.79%.

During construction, the project will employ an estimated 400 construction workers, project management staff, equipment operators, survey staff, and delivery vehicle drivers during the peak period, with the average number of workers on-site in the range of 325 workers. The material delivery vehicle trips will be spread out throughout the day. The maximum number of aggregate deliveries per day is approximately 90 deliveries (180 trips), constrained by the loading and unloading times. The maximum number of concrete deliveries per day is approximately 50 deliveries (100 trips), constrained by the rate that ready mix plants can batch concrete, and the rate the contractor can unload trucks. The maximum rate of deliveries is approximately 6 to 8 per hour, equivalent to placing a wind turbine foundation during a single work shift. The estimated total number of construction trips occurring over the 18 to 24 month construction period is projected to be 93,088 trips.

Construction and post-construction traffic volumes were provided in the project's traffic study.[9] The post-construction scenario would be equivalent to existing conditions, as it includes only a minimal number (6) of employees accessing the site for maintenance and operations. Based on a comparison between provided construction peak hour volumes and post construction peak hour volumes, project construction is calculated to result in a traffic noise increase of about 2 dBA on SR 299 in the vicinity of the site. This increase would be below the County's 3 dBA L_{dn} and 5 dBA L_{dn} thresholds for noise increases due to permanent project operations.

Construction traffic peak hour volumes on the existing logging roads are anticipated to increase from 24 to 40 trips on the west access road, 12 to 128 trips on the north access road, and 12 to 273 trips on the east access road. Assuming a worst-case analysis with 50% of these vehicles (both existing and project construction vehicles) being heavy trucks, the calculated noise levels at a distance of 50 feet from the center of the road would be 58 dBA L_{eq} on the west access road, 63 dBA L_{eq} on the north access road, and 66 dBA L_{eq} on the east access road.

Ambient noise levels at receptors along local access roads are below 60 dBA L_{dn}; therefore, the 5 dBA increase threshold would apply. The closest residence to the west access road (represented by LT-1) is located about 300 feet from the center of the road. At this distance, the peak hour noise level generated by the 28 project construction related trips (14 light vehicles and 14 heavy trucks) would be 44 dBA L_{eq}. The existing daytime peak hour noise level at this residence ranges from 43 to 49 dBA L_{eq} (see Table 5 and Appendix A). The resulting peak hour noise levels with combined ambient and project construction traffic noise levels would be 47 to 50 dBA L_{eq}. This would equate to a 1 to 4 dBA noise increase above existing ambient levels, which would be below the 5 dBA threshold. Considering construction is proposed to occur during daytime hours, noise increases on a day-night average (L_{dn}) basis would be lower. If construction activities were required during nighttime hours, construction traffic could be redirected to use alternative access routes such as the north and east access roads to avoid construction-related noise near residential uses. There are no noise sensitive

receptors adjacent to the north and east access roads, therefore use of these roads, even during night time hours would not exceed ambient noise standards for residential uses.

Helicopter Use

Helicopters may be used to string overhead collector lines. Helicopter overflights could generate noise levels of up to 100 dBA at a distance of 100 feet.[10] Helicopter overflights and activities would be intermittent and would not be located at a single location for any extended period. Noise levels, attenuating at approximately 6 dBA per doubling of distance, would be approximately 74 dBA at 2,000 feet. This noise level would be anticipated to cause speech interference outdoors and sleep disturbance indoors, assuming a 15 dBA exterior-to-interior noise reduction with windows partially open.

Blasting

In rocky areas, blasting may be necessary to loosen rock before excavation. If blasting is necessary, a Blasting Plan would be prepared to identify the locations that are anticipated to require blasting. All applicable federal, state, and local regulations for blasting procedures would be identified in the Blasting Plan and would be followed. The Blasting Plan also would specify the times and distances where explosives would be permitted to avoid impacts to environmental sensitivities and the human environment. The County and emergency responders would be notified in accordance to the blasting plan, but at the very least no later than at least 24-hours in advance of blasting.

When blasting occurs at large distances from sensitive structures, the primary concern is cosmetic damage to structures. Cosmetic damage (e.g., minor cracking in plastered walls) can occur as a result of ground-borne vibration or acoustic overpressures. The US Bureau of Mines has analyzed the effects of blast-induced vibration on buildings in USBM RI 8507[11], and these findings have been applied to vibrations emanating from construction equipment on buildings[12]. Figure 6 presents the damage probability as reported in USBM RI 8507 and reproduced by Dowding. California Department of Transportation recommends a vibration limit of 0.5 in/sec PPV for structurally sound buildings designed to modern engineering standards, and 0.3 in/sec PPV for buildings that are found to be structurally sound but where structural damage is a major concern. The more conservative limit (0.3 in/sec PPV) is used in this analysis. As indicated in Figure 6, the US Bureau of Mines studies indicate no observations of “threshold damage” (referred to as cosmetic damage elsewhere in this report), “minor damage” or “major damage” at vibration levels of 0.4 in/sec PPV or less.

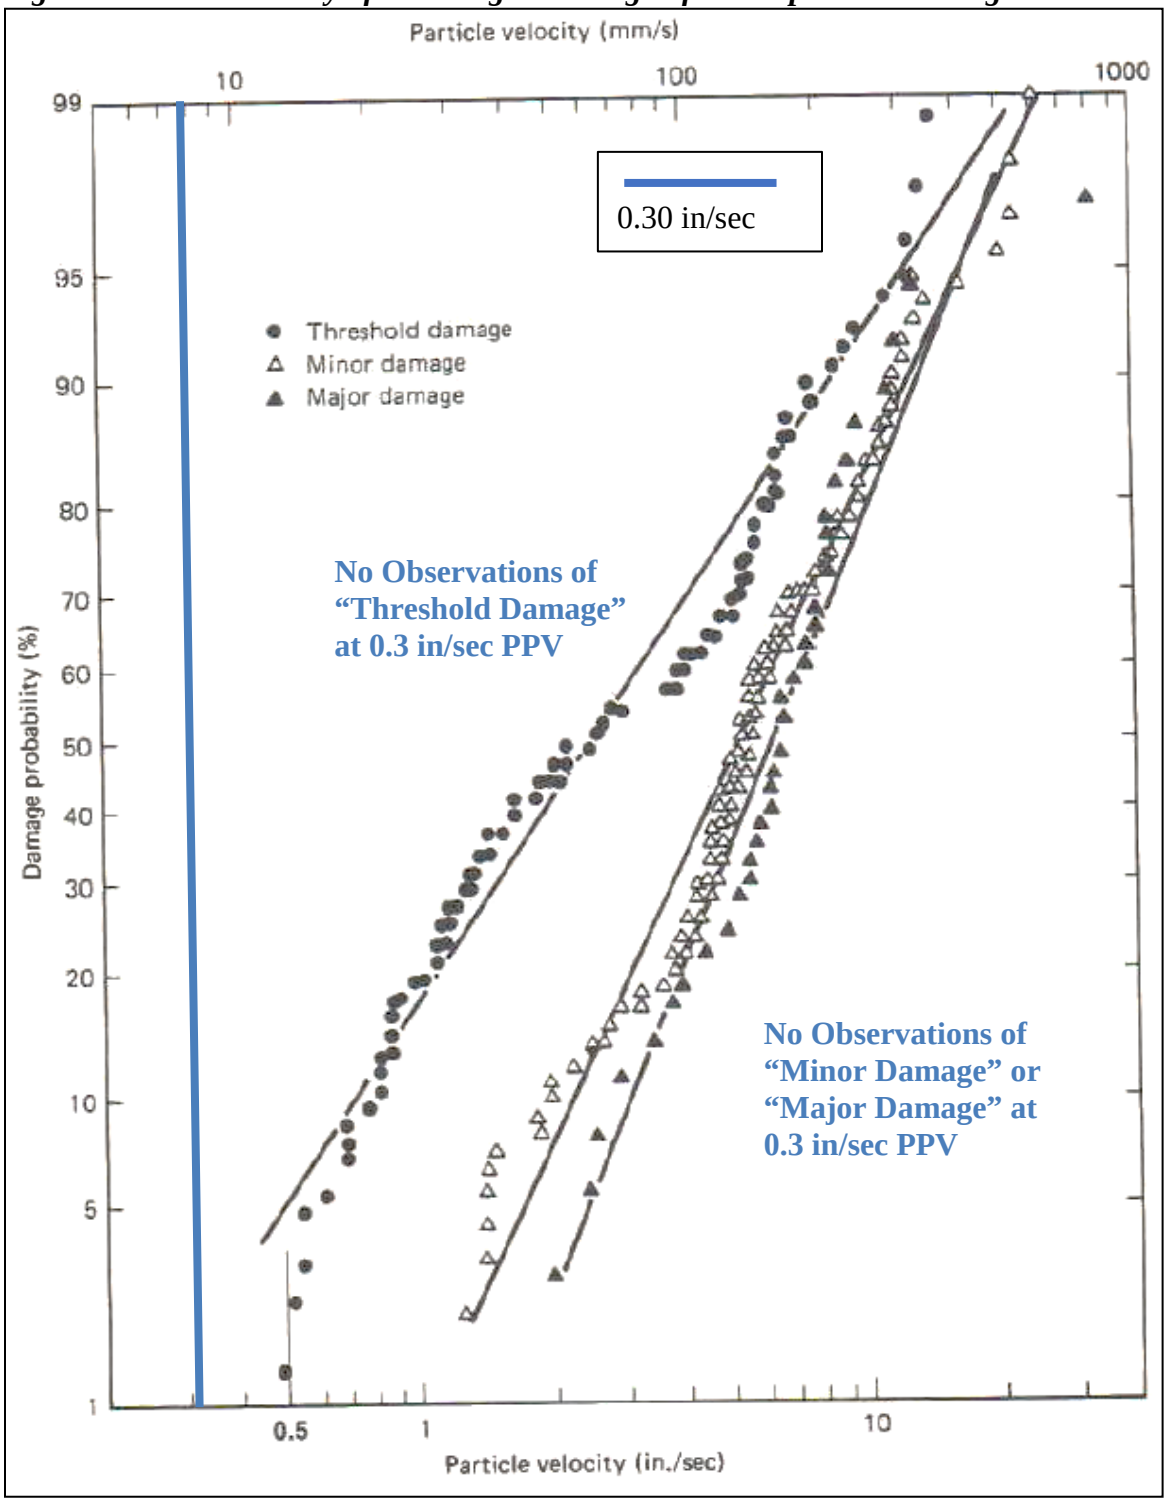
<u>Blasting Vibration Levels</u>
Vibration from blasting events on the Project Site were calculated using methods established by the former US Bureau of Mines. Ground vibration levels were calculated using the following equation, representing the upper range of levels established by the US Bureau of Mines for various soil conditions:

$$PPV = 300 \times (D/W^{1/2})^{-1.6}$$

Where: PPV = Peak Particle Velocity (in/sec)
D = Distance from explosive charge to receptor (ft)
W = Weight of explosive charge per delay (lbs)

Blasting could be located as close as 2,000 feet from existing residential areas. Calculated ground vibration levels are summarized in Table 10 for a variety of charge weights and distances. Receptors located further from blasting activities would experience lower vibration levels.

TABLE 10 Worst-Case Blasting Ground Vibration Levels, in/sec PPV



Distance, ft	Blasting Level (in/sec PPV) for Various Explosive Charge Weights per Delay (lbs)		
	175 lbs	**350 lbs**	**700 lbs**
2,000 feet	0.098	0.170	0.296
3,000 feet	0.051	0.089	0.155
4,000 feet	0.032	0.056	0.098

As shown in Table 10, worst-case blasting, using a charge weight of 700 lbs/delay within 2,000 feet of sensitive structures, could generate groundborne vibration levels as high as 0.296 in/sec PPV. These vibration levels would be below the 0.3 in/sec PPV threshold. As indicated in Figure 6, structures adjacent to potential blast areas would be unlikely to experience any level of cosmetic or structural damage, assuming a maximum vibration level of 0.3 in/sec PPV. Vibration levels would be lower at locations further from blasting or when lower charge weights are used.

Blasting Noise Levels

For blasts previously monitored by Illingworth & Rodkin, Inc. in Northern California, the highest peak overpressure was 116 dB(L) at 2,240 feet. Noise from blasting events would be anticipated to drop off at a rate of about 6 dB per doubling of distance. At the closest residences to potential blasting, located 2,000 feet from the nearest wind turbine construction area, peak overpressures of about 117 dB(L) would be anticipated, which are well below the 133 dB(L) criteria to avoid damage. Peak overpressure is controlled by charge confinement. The standard procedure for confining the charge is to place the explosives deep in the drilled blast hole and then to backfill the remainder of the hole with crushed rock. Assuming standard blast confinement techniques are used, Project-related damage from acoustic overpressures is not expected for any residence. Although these low frequency overpressures could potentially be audible, the Shasta County noise criteria do not apply to this type of impulsive noise. While residents may occasionally hear sounds from blasting events, these sounds would occur on an infrequent basis during construction. These brief intermittent events would not be expected to substantially increase hourly average or daily average noise levels.

Figure 6 Probability of Cracking and Fatigue from Repetitive Loading

RECOMMENDED NOISE REDUCTION MEASURES

Implementation of the following best management practices for construction would reduce construction noise levels emanating from the site and minimize disruption of nearby residents.

- Limit construction operations located within 2,500 feet of residences to daytime hours only.

- Minimize helicopter use, as feasible.

- Prohibit nighttime helicopter use.

SUMMARY

Based on the above findings, noise associated with Project operations is not expected to exceed Shasta County noise standards or the supplementary criteria for low frequency and infrasonic noise at any residential property in the site vicinity. However, use of helicopters during construction and any nighttime construction located within 2,500 feet of residences would have the potential to cause sleep and/or speech interference. Noise reduction measures, including limiting helicopter and heavy construction near residential areas to daytime hours and minimizing helicopter use, are provided to minimize disruption and annoyance during construction.

APPENDIX

APPENDIX A – Potential Transportation Environmental Protection Measures for the Fountain Wind Project
APPENDIX B – Guidance Calculations for Left Turn Lanes on Two Lane Highways (Critical Peak Hour Only)

1.0 INTRODUCTION

The Fountain Wind project is proposed as a 216 MW wind project consisting of up to 72 wind turbines with associated access roads, collection system, meteorological (MET) towers, operations and maintenance facility (O&M), staging yards, substation, and interconnection. The construction of the Fountain Wind project will generally require conventional construction worker personal vehicles, logging trucks, aggregate dump trucks, concrete ready-mix trucks, and single unit and semi-tractor trailer trucks, crawler cranes and a few specialized transportation vehicles for the oversize/overweight vehicles associated with the delivery of wind turbine components. The other anticipated oversized deliveries will be the substation main power transformers (MPTs).

The scope of this report is to determine the total number of vehicles entering the project site from public roads and to calculate the approximate peak hourly traffic entering the site from public roads. Trips are summarized as trips each way. Trips for both the delivery and removal of equipment, field offices, and temporary aggregate surfaces are shown.

2.0 TRAFFIC PROJECTION

Traffic entering the project site will comprise trips by construction workers, materials delivery, and equipment delivery. Materials deliveries include aggregate, concrete, and water, as well as turbines, electrical equipment and cables, and items such as reinforcing steel and forms for concrete foundations.

All traffic will reach the site using State Route (SR) 299 (See Exhibit 1). Manufactured components will likely originate from Interstate 5 (I-5) to the west or from US 395 and SR 139 to the east. The direction of turbine component deliveries is assumed to be from the Port of Stockton, CA. Locally sourced materials such as aggregate and water will likely come from Burney, approximately 6 miles to the east of the project site, or from pits and quarries east of Burney. If the concrete is not batched on-site, there are several concrete plants in Redding about 35 miles to the west of the project site that will likely be the source. Project workers will most likely commute from both east and west of the project. Redding is the largest town in the region. Other towns west of the project are very small and not likely to be able to accommodate many project workers. Several small towns including Burney, Fall River Mills, and McArthur are located east of the project and may also accommodate some project workers. For this study the split for commuting traffic is assumed to be 60 percent from the west and 40 percent from the east on SR-299. (See Exhibit 1.)

Three access roads are proposed to coincide with existing logging roads at the intersections with SR-299. The West Access is proposed along a road called G Line, which intersects with SR-299 approximately 37 miles east of the interchange with I-5 in Redding. There is a widened shoulder at this intersection, but no turn lanes.

The North Access is approximately three miles east of the West Access. This access is proposed along an existing and unnamed logging road that intersects SR-299 just to the east of Little Hatchet Creek. As with the West Access, there is a widened shoulder at this access, but no turn lanes.

The East Access is approximately two miles east of the North Access and approximately eight miles west of Burney. This access is proposed along an existing and unnamed logging road that provides access to the area south of SR-299. As with the other access points, there is a widened shoulder at this access, but no turn lanes.

The West and East Access roads will serve the majority of the turbines of the Fountain Wind project. The North Access will serve only a few wind turbines. As a result, the heaviest direction for peak hour traffic (eastbound) will make right turns from SR-299 onto the access roads, and the lighter direction of traffic (westbound) will make left turns from SR-299 into the project site.

As points of reference, the Shasta Green plant lies along SR-299 approximately 4.4 miles east of the East Access, and the Sierra Pacific Industries plant lies another 1.2 miles to the east of that. The Shasta Green plant has both eastbound and westbound turn lanes along SR-299. The Sierra Pacific Industries plant has no turn lanes.

The nearby Hatchet Ridge Wind Farm accesses SR-299 at Bunch Grass Lookout Road. This access is approximately one mile east of the East Access road for the Fountain Wind project. Both eastbound and westbound turn lanes serve the Hatchet Ridge access. It is noted that this is a four-way intersection on SR-299, with Terry Mill Road accessing to the south.

3.0 EXISTING TRAFFIC CONDITIONS

According to the Caltrans 2017 listing of traffic volumes (see Exhibit 2), urban centers on each end of SR 229 record the highest traffic volumes, then diminish significantly in the rural and mountainous areas in between. Between I-5, in Redding and Plumas Street, in Burney, California, there are 9 daily and peak hour count locations listed.[1]

The highest existing annual average daily traffic (AADT) on SR-299 is 21,000 vehicles per day at I-5 in Redding where the highway has a four-lane freeway alignment.[2] The peak hour volume is 2,150 vehicles per hour. The base capacity of a freeway segment is

[1] CalTrans Traffic Census Program.
[2] CalTrans Traffic Census Program, https://dot.ca.gov/programs/traffic-operations/census/traffic-volumes/2017/route-280-405, 2017.

2,300 passenger cars/hour/lane; which, for a four-lane section, would equal 9,200 vehicles per hour.[3]

The base capacity of a two-lane rural roadway segment is 2,000 passenger cars/hour/lane; which, for a two-lane section, would equal 4,000 vehicles per hour. In the two-lane rural section of SR-299 between Deschutes Road (on the east edge of Redding) and Elm Street (on the west edge of Burney), the peak hour volume never exceeds 490 vehicles per hour (See Exhibit 2).

The three access roads for the Fountain Wind project are all located within the segment of SR-299 between Big Bend Road and Tamarack Road. CalTrans has listed AADT and peak hour volumes for this segment as 3,000 vehicles per day and 320 vehicles per hour, respectively. (See Tamarack Road volumes in Exhibit 2.)

Heavy vehicle traffic does constitute a notable percentage of the background traffic on this segment of SR-299. At Mile Post 72.64 west of Burney, the heavy vehicle percentage on SR-299 was recorded in 2014 as 13.79%.[4]

4.0 CONSTRCUTION TRAFFIC OVERVIEW

Westwood estimated the full construction period traffic volume based on the types of delivery, construction, operations, maintenance and worker vehicles required during the various phases of the project. Westwood estimated trips into and out of the development area based on the projected number of deliveries, the required types of equipment and material, and the projected number of employees necessary to complete the project over the estimated construction period. Typically, the selected construction contractor will determine the project timeline. These volumes of trips were calculated using a spreadsheet that lists every known phase of construction with corresponding equipment, material and numbers of employees, which are then averaged over the course of the project period.

During construction, the project will employ an estimated 400 construction workers, project management staff, equipment operators, survey staff, and delivery vehicle drivers during the peak period, with the average number of workers on-site in the range of 325 based on preliminary schedule development. The calculation of workers and delivery vehicles was developed using a construction estimation based on time and materials and using crew productivity data from RS Means. The total number of trips was determined by using the number of employees in each of the categories listed above, dividing that number by an estimated vehicle occupancy (2.0 for survey crews;

[3] Highway Capacity Manual, 6th Edition (2018), c(basic freeway segment) = 2,200 + 10 * (Free-Flow Speed$_{adj}$ – 50) = 2,300 passenger cars/hour/lane
[4] CalTrans Planning Profile, ArcGIS.

1.5 for all other categories, except for delivery vehicles with an occupancy of 1.0) and multiplying by the number of work days for each employee category.

As a result, the estimated number of work days and total number of trips for each category are:

- 100 days for survey (400 total trips);
- 250 days for construction trades (24,000 total trips);
- 250 days for project management staff (2,500 total trips);
- 200 days for equipment operators (6,267 total trips);
- 250 days for small equipment on flatbed trailers (1,250 total trips); and
- 230 days for deliveries (56,079 total trips).

Thus, over the estimated two-year construction period, the total number of all trips could be approximately 93,088 trips.

After construction of the wind farm, operations and maintenance traffic will be limited to a few passenger vehicle trips per day.

General summaries of the construction work tasks and related delivery and construction vehicles are listed below.

4.1 WORK TASKS

Work Tasks are generally listed in chronological order, but extensive overlap can be expected depending on the contractor scheduling.

- Survey project site and set construction stakes
- Install and maintain erosion and sediment control
- Timber removal/clear and grub laydown, substations, O&M, access roads, and turbine pads areas
- Grade field office and O&M locations
- Deliver and Install Field Office trailers
- Grade temporary laydown areas
- Improve logging roads/construct access roads – grade and place aggregate
- Erect security fencing – enclosing laydown yards and facilities
- Excavate turbine foundations
- Place foundation mud mat
- Place foundation reinforcing
- Place foundation forms
- Place foundation concrete
- Strip forms
- Backfill foundations
- Unload turbine components
- Erect turbine tower sections using base crane

- Erect top turbine tower section, nacelle, hub, and blades using topping crane
- Grade transformer pad areas
- Install turbine transformers
- Connect turbine to transformer wiring
- Grade substation and switching substation areas
- Construct substation and O&M foundations
- Trench underground collector system (34.5kV)
- Install overhead collection system lines (34.5kV)
- Construct O&M Facility
- Construct substation and switching substation equipment and main power transformer foundations
- Install step-up substation and switching substation equipment and Supervisory Control and Data Acquisition (SCADA)
- Place step-up substation and switching substation aggregate
- Install security fence around step-up substation and switching substation
- Connect step-up substation to switching substation
- Connect switching substation to transmission line
- Test and commission equipment
- Remove field offices, security fencing, and replace topsoil
- Remove staging area security fences and replace topsoil
- Restore, revegetate, and remove temporary erosion and sediment control

4.2 CONSTRUCTION EQUIPMENT

Examples of the types of equipment generally used in wind farm construction are listed below. Exhibit 3 in the Appendix lists the number and type of equipment assumed for construction:

- Survey – one pick-up truck for each 2 person crew
- Erosion and sediment control – silt fence trenchers
- Timber harvest/removal – typical forestry equipment such as feller-bunchers, shears, skidders, hydro-axe, and logging trucks
- Grading (field office location, staging areas, O&M facility, step-up substation, and switching substation) – medium bulldozers, scrapers, road grader, compaction rollers, and water trucks
- Logging road/access road improvements – medium bulldozers, road grader, scrapers, compaction rollers, and water trucks
- Materials handling equipment (unloading wind turbine components) – hydraulic (helper) cranes, small flat-bed trailers pulled by pick-up trucks, heavy crawler cranes
- Security fencing – skid-steer with auger attachment, and hydraulic post driver attachment, and hand tools for each crew
- Turbine foundations – medium bulldozer, excavator, hydraulic crane, and concrete pump truck

- Tower base erection – hydraulic (helper) cranes and base crane
- Tower top/nacelle/hub/blades erection – hydraulic cranes and topper crane
- Pad mounted transformers at each turbine – truck mounted or mobile hydraulic crane
- Turbine wiring – hand tools
- 34.5 kV underground collector trenching – specialized trenching equipment, cable plows, and back hoes, cable reel trailers
- 34.5 kV overhead collection line – backhoe with auger attachment, specialized pole setting equipment (boom trucks), bucket trucks, cable reel trailers
- O&M and substation equipment foundations – back hoe
- Substation construction – bulldozer, backhoe, compaction roller, water trucks, mobile hydraulic crane, large crane (MPT)
- Switching substation construction – bulldozers, backhoes, compaction rollers, water trucks, mobile hydraulic crane
- Substation to interconnect transmission line – foundation auger mounted on back hoe, mobile hydraulic crane
- O&M Building – mobile hydraulic crane
- Removal of temporary aggregate (field office location and staging areas) – Front end loader
- Revegetation and removal of erosion and sediment control – chisel plow (decompaction), small tractor and tilling equipment, skid steer loader, hydro seeding/hydro-mulching equipment

4.3 MATERIALS

Examples of materials used in the construction of wind farms is listed below. Exhibit 3 in the Appendix lists the materials assumed for construction:

- Silt fence, bio log, and other erosion and sediment control materials
- Aggregate (access roads, staging areas, O&M facility, substations)
- Security fencing (field office location, staging areas, substations)
- Field Offices and storage trailers
- Formwork for foundations (equipment pads, O&M, substation transformers and equipment, and switching substation equipment)
- Rebar for above concrete foundations
- Concrete for wind turbine foundations and transformer pads
- Concrete for O&M facility foundation
- Concrete for substation foundations (Main Power Transformer (MPT), electrical equipment, and control building)
- O&M Building materials
- Collection system wiring (underground and overhead)
- Electrical equipment (transformers, switch gear, circuit breakers, junction boxes, conduit, SCADA, etc.)
- Structural steel for substation racking

- Structural steel poles for overhead collection line
- Main power transformers
- Transmission line cables (from switching substation to transmission line)
- Water for aggregate/backfill compaction, vegetation establishment, and dust control
- Miscellaneous consumables
- Plant stock, seed, and mulch

4.4 MATERIAL DELIVERY VEHICLES

The types of vehicles used for material deliveries is listed below. Exhibit 3 in the Appendix lists the material delivery vehicles assumed for construction:

- Semi-Trailer Flatbed Trucks for hauling logs off of site
- Single Unit Flatbed Trucks - Erosion and sediment control materials, plant stock, seed, and mulch, miscellaneous consumables
- Gravel Semi-Trailer Dump Trucks with a 16 cubic yard load capacity (loose volume) with an approximate gross vehicle weight of 80,000 pounds and a load weight of approximately 40,000 pounds.
- Field office trailers (one 40’ x 12’ for PM use; 12’ x 36’ triple wide for subs use)
- Concrete Trucks- with a 10 CY capacity, weighing approximately 69,000 pounds
- Semi-Trailer Flat Bed – security fence, concrete forms, rebar, O&M building components, transformers, miscellaneous turbine materials, structural steel for substations, electrical equipment for substation, - Non-permit load size 8’-6” x 8’-6” x 48’-0”, gross vehicle weight 80,000 pounds, up to 45,000 pound loads
- Cable trailers – 34.5 kV underground, 34.5 kV overhead, and overhead transmission from switching substation to transmission line
- Overhead collection system pole trailers
- Water trucks – 4000 gallon capacity, single unit tank trucks, weighing approximately 59,000 pounds
- Lowboy Multi-Axel Trailer –Main power transformer, substation control building
- Workers’ trucks (Pick-up trucks –average 1.5 occupants)

4.5 EQUIPMENT DELIVERY VEHICLES

Types of vehicles used for the delivery of construction equipment:

- Lowboy semi-trailer – Logging equipment, bulldozers, scrapers, compaction rollers, road grader, excavator, trenching equipment, backhoes, hydraulic (helper) cranes, crawler cranes, skid steer loaders, trenchers, cable plows, agricultural plows
- Single unit flatbed truck – Hydro much/hydro-seed equipment
- Small flatbed trailers towed behind pick-up trucks for small equipment and tools

5.0 CONSTRUCTION SCHEDULE

Construction of wind farms requires that a few tasks be repeated across the project site. Some sequencing of tasks is required, but many tasks may overlap across the site for efficient scheduling. The construction of the operations and maintenance facility, substation, switching substation, and underground and overhead collection systems can overlap with other tasks, or can be exceptions, depending on scheduling of and priority of precedent activities.

For the purpose of determining the daily volume of traffic, construction time is estimated to take approximately two years, with construction occurring only during the spring, summer and fall. Wind farm sites are large and allow many crews to work simultaneously without interfering with one another. Nevertheless, the size of the project (number of wind turbines) impacts the construction time significantly because the cost of mobilizing the large cranes required for turbine erection is high, and because the cranes are in such high demand that mobilizing a small number of cranes is typical on wind projects.

6.0 OVERSIZED LOADS AND PERMITTING

The logistics of delivering the oversized loads for the wind turbines, with the use of specialized transportation vehicles, also creates schedule constraints. A Transportation Management Plan would be prepared to minimize impacts from transportation of oversized loads and to direct deliveries to off-peak hours.

Trucks carrying turbine components such as blades and nacelles will be oversized and will be required to be accompanied by pilot cars. Oversized load transportation permits will be required from CalTrans.

These oversized trucks would likely be required to travel over bridges and overpasses. Weight and size limits may require detours in accordance with CalTrans direction. A logistical route analysis that focuses more on geometrics and bridge capacity will be performed following final selection of the turbine model to be used for the project. Because there is direct project access to the state highway, and the fact that the adjacent Hatchet Ridge project delivered oversized components along this same infrastructure indicates that the existing highway and bridge geometrics will likely be able to accommodate the planned deliveries. This will be verified by a logistical route survey when a turbine manufacturer, turbine model and contractor have been selected.

Westwood has contacted Caltrans' Office of Transportation Permits. This office reviews and approves oversize/overweight permits along state highways. They have responded that any specific weight and height limitations would only be determined once a contractor has been selected and a Route Request Permit defining the origin and

destination of the equipment/components is requested. The Caltrans variance coordinator will then review the request and issue the permit.

Variance permits are required for anything over 53 feet in length with a maximum kingpin of 43 feet. A variance permit would be required for each blade or component delivery.

Once the requested route permit has been received by Caltrans, it will take up to thirty days to review and issue the permit. Bridge ratings will be tested depending on the loads forecast for each component and delivery vehicle.

Also, the Transportation Permit office states that even though SR-299 is identified as a "Blue Route" and pilot cars will be assumed for each blade delivery vehicle, the contractor will likely be required to contract with the California Highway Patrol (CHP) for escorts.

As far as roadway connections to SR-299, Caltrans Transportation Permits Office noted that coordination with the District 2 Encroachments Office will be required to determine what additional planning or roadway improvements would be needed to accommodate the oversized loads. A "Swept Path Analysis" must be completed that shows turn-by-turn impacts that might be experienced by the oversized loads along SR-299 or at side road intersections.

In summary, the sizes and weights of the selected components, the dimensions of the vehicles delivering them, the delivery routes and the route surveys will be completed as part of the Caltrans application process.

Nevertheless, all deliveries of components and materials for the Fountain Wind project will be similar to those of the Hatchet Ridge project, with the exception of turbine blade deliveries. Fountain is proposing WTG ranging from 3-5.7MW. WTG models in the lower size range of those proposed will have similar blade lengths as the 2.3 MW Siemens WTGs constructed on Hatchet Ridge. The largest blade length proposed for Fountain would be approximately 261' in length, which would be approximately 90' longer than those delivered to Hatchet Ridge. Although Fountain may utilize longer blade lengths, the haul trucks will include rear-axle steering capabilities, thereby mitigating potential turning constraints.

CalTrans roads are designed to comply with the state Highway Design Manual. Vehicular design speeds are listed for various highway types. For conventional rural highways, the following design speeds are listed:

- Flat terrain 55-70 mph
- Rolling terrain 50-60 mph
- Mountainous terrain 40-50 mph

It is uncertain as to which design speed SR-299 is designed. It is likely that the design speed varies throughout its length – flat to rolling near Redding, rolling to mountainous near Montgomery Creek and Hillcrest.

According to the Caltrans Highway Design Manual, the k-value is the distance in feet required to achieve a 1% change in grade. Thus, the following k-values are listed under each condition:

- For stopping sight distances on crest vertical curves, the k-value = 68 feet when design speed is 40 mph
- For stopping sight distances on crest vertical curves, the k-value = 139 feet when design speed is 50 mph
- For stopping sight distances on sag vertical curves, the k-value = 62 feet when design speed is 40 mph
- For stopping sight distances on sag vertical curves, the k-value = 97 feet when design speed is 50 mph

According to a "desktop review", there appear to be no underpasses along SR-299 east of I-5. There are two overpasses, however – one at Churn Creek Road and one at Old Oregon Trail on the east side of Redding. Further to the east, there appear to be two creek crossings (Salt Creek Bridge 6-49 and Cedar Creek Bridge 6-20) along SR-299 between I-5 and the proposed access roadways for Fountain Wind. There is one creek crossing along SR-299 between the proposed access roads for Fountain Wind and Burney (Burney Creek Bridge 6-12). As of this writing, weight limits for these bridges have not been determined.

Regarding horizontal curves, a "desktop review" of SR-299 show two curves with radii less than 1,000 feet. SR-299 has a curve with a radius of approximately 600-foot near Montgomery Creek. SR-299 has a curve with a radius of approximately 700-foot near Hillcrest. Near Burney, there appears to be a curve with a radius of approximately 650 feet.

The speed limit along SR-299 is 55 mph for trucks with three or more axles, but there are places along SR-299 where the advisory speed drops to 40 and 45 mph approaching the sharper curves. Also, there are passing lanes at some of the steeper inclines.

The geometry resulting from the basic highway design criteria appears to exceed the requirements for turbine component delivery, which requires a minimum k-value in the range of 20 (and which comfortably falls within the k-values of the highway design above). Further, turbine component delivery specifications require a minimum horizontal curve of 200'. Therefore, while it appears there is little risk that the turbine delivery vehicles will not be able to navigate the existing geometry of the highway, a

route survey by a permit service and a "swept path" analysis will be able to verify this statement and support Caltrans permit authorizations.

Upon approach to the site, turbine deliveries will be directed to proceed directly to the appropriate turbine pad sites for offloading. Construction access points off SR-299 will provide adequate turning radii to ingress/egress the site with minimal time required for turning maneuvers. Because the turbine pad sites are distributed throughout the site and not directly adjacent to state SR-299, if queuing were to occur, it is expected that the queues would take place on access roads near the turbine pad sites – wholly within the project site.

7.0 CONSTRUCTION TRAFFIC MANAGEMENT PLAN

A Construction Traffic Management Plan (CTMP) will be developed and presented once the construction contractor has been selected. Upon selection, the contractor will review the site and available aggregate and water sources. The contractor will provide input on project staging and equipment delivery that will be incorporated and used to define the CTMP. Therefore, the CTMP will be specific to the construction approach and phasing, as well as specific to the location and environment, of the project area.

Specifically, the CTMP will be implemented for the Fountain Wind Project site during construction to address the safety requirements of the project. This plan will reflect the assessment conducted to define the plan, as well as the details of the plan itself. The CTMP will include:

- A consideration of the existing traffic, pedestrian, and cycling activity along SR-299 as well as the related road/intersection operations;
- A determination of the route from a safety perspective and emergency access perspective between staging/loading sites and proposed wind turbine sites;
- An articulation plan to manage construction traffic in a manner that minimizes the potential impact on local wildlife;
- The specific measures to be implemented during the construction phase of the project, which incorporate the principles and guidelines of the Caltrans Transportation Permits Manual; and
- Any additional environmental protection measures that the project proposed to further avoid or minimize potential impacts to traffic and safety. Appendix A of this report includes a list of potential Environmental Protection Measures (EPMs) that may be applicable for inclusion in the CTMP prepared for the Fountain Wind project.

The ConnectGen/Westwood Team will work with the contractor to ensure that key transportation considerations related to residents and businesses along SR-299 and within Shasta County and the planned construction of wind turbines are sensitive to the following:

- Potential conflicts between construction-related traffic and the day-to-day activities associated with the local area, including local travel by car, school bus, bicycle, or on foot as well as the movement of logging equipment;
- The need to ensure that local residents and emergency response agencies are aware of the temporary conditions during construction that could affect traffic mobility and safety on various parts of the county depending on the location of the work sites; and,
- The need to ensure that local wildlife and its habitat are not adversely impacted by the construction traffic associated with the project.

The ConnectGen/Westwood Team will work with the contractor to develop a public information strategy to ensure that communication of the traffic plan will be shared with the residents and businesses in the area. This includes installing Road Restriction Notice Signs near all work sites a minimum of one week prior to any lane closures or detours. This will allow residents to effectively plan their routes, and mitigate the overall impact caused by the work and deliveries to the site. An activity forecast report shall be provided to Shasta County outlining construction activity a minimum of two weeks prior to any work commencing.

8.0 ANALYSIS

Two forms of traffic analysis were conducted. Both **Level of Service** (LOS) and **Vehicle Miles Traveled** (VMT) were calculated for the three Project intersections during construction and post-construction. Westwood also tested each access for left turn warrants along SR-299.

A **Level of Service** (LOS) analysis measured delay per vehicle and operational performance. The LOS analysis was performed using the traffic engineering industry-standard software package *Synchro/SimTraffic* for AM and PM peak hour conditions for periods during and after construction. It is noted that LOS-A generally represents free-flow conditions, while LOS-F generally represents gridlock conditions.

To estimate peak hour conditions, Westwood reviewed historical traffic volumes for the segment, and found that peak hour volumes have not changed appreciably over the years.[5] Therefore, it is assumed background volumes will stay constant during and after construction of the wind farm. It was assumed that 60% of the peak hour background traffic would be coming to and from the west, while 40% would be coming to and from the east. Therefore, 192 background peak hour trips would approach from the west while 128 background peak hour trips would approach from the east.

Directional distribution of the construction, equipment and material delivery trips was made based on the number of projected wind turbines along each access road.

[5] Comparison of 2014 and 2017 CalTrans Traffic Volume Books.

Therefore, it was assumed that 62% of the construction trips would use the East Access road, 29% would use the West Access road and 9% would use the North Access road. Construction trips were assigned based on these percentages.

Figure 1 shows the resulting turning movements projected during the construction phase of the project. The red numbers indicate the a.m. peak hour directional flow (either left turn, through traffic or right turn). Likewise, blue numbers represent the p.m. peak hour turning volumes. Table 1 lists the resulting levels of service by both intersection and movement in the construction phase of the project.

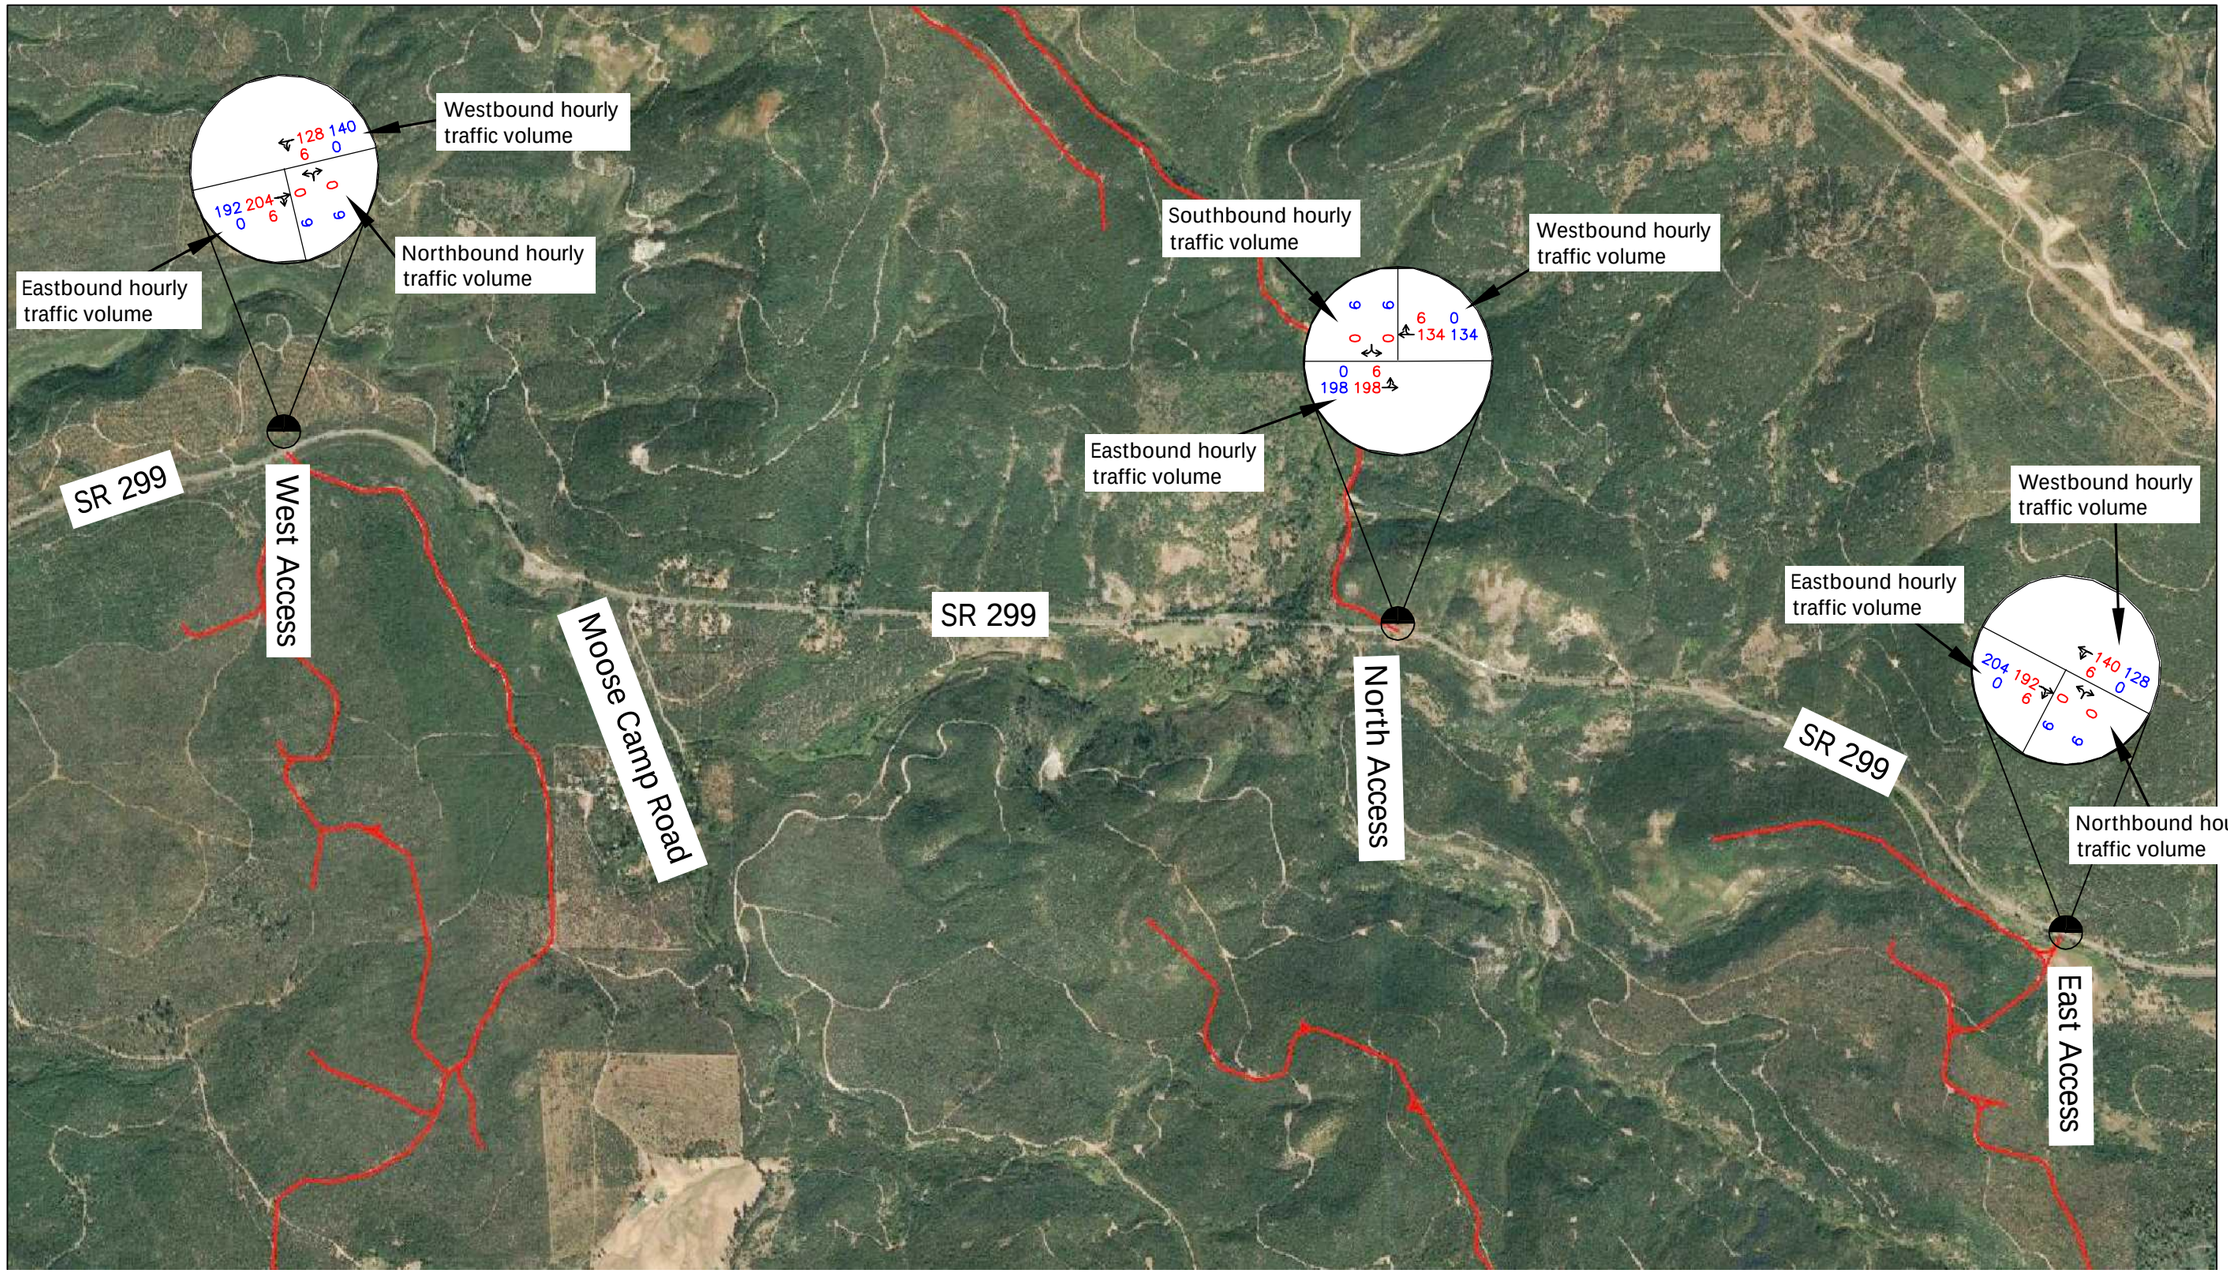

Table 1 – Level of Service – During Construction

Intersection	Lane Assignment	Intersection Traffic Control	Construction Conditions

(Source: Westwood Professional Services, 2019)

In the post-construction scenario, there are a minimal number of employees accessing the site for operations and maintenance activities. Therefore, it was assumed a total of six (6) operations and maintenance workers daily would be entering any of the access points during the AM peak hour from the east and west, and six would be exiting east/westbound during the PM peak hour.

Westwood also estimated **Vehicle Miles Traveled** (VMT). California Senate Bill 743 was signed into law in 2013 in order to utilize VMT to review the potential impact of land use projects on the State Highway System.

VMT is calculated by multiplying the amount of daily traffic on a roadway segment by the length of the segment, then summing all the segments (See Exhibit 3). Westwood estimated the number of trips taken by trucks and other vehicles to haul equipment, material, aggregate, turbines, concrete, water and employees. Westwood then estimated the mileage that would be logged to perform these trips during the two-year construction period.

For this analysis, it was assumed that turbine equipment and material would be delivered from the Port of Stockton, CA. The turbine equipment pick-up location will be finalized prior to construction, upon the selection of the turbine type to be used for the Project; however, the Port of Stockton provides a feasible and realistic turbine delivery location for the purpose of assessing transportation impacts. Similarly, the Project will identify the locations from where other equipment or material would be delivered prior

to construction, therefore, the VMT estimations were limited to the city of Redding on the west and the town of Burney on the east. From these calculations, it is estimated that the total VMT during the construction period will be **2,168,492 vehicle miles traveled**.

The material delivery vehicle trips will be spread out throughout the day. The maximum number of aggregate deliveries per day is approximately 90 deliveries, constrained by the loading and unloading times. The maximum number of concrete deliveries per day is approximately 50 deliveries (100 trips), constrained by the rate that ready mix plants can batch concrete, and the rate the contractor can unload trucks. The maximum rate of deliveries is approximately 6 to 8 per hour, equivalent to placing a wind turbine foundation during a single work shift.

The post-construction VMT will be much less. Westwood assumed there would be six (6) trucks per day utilized for operations and maintenance of the wind farm. It is assumed that each truck would be traveling 50 miles per day from their place of origin, to the wind farm for inspection, maintenance and operation, and then return. Therefore, the total VMT per day post-construction is assumed to be **300 vehicle miles traveled**. Per capita daily VMT for the permanent employees at the facility is estimated to be approximately **50 vehicle miles per day**.

It is unknown what VMT significance thresholds the County of Shasta will adopt for the construction and operational phases of the project, pursuant to the California Environmental Quality Act (CEQA). Naturally, travel to and from wind farms is increased during construction. However, travel to the wind farms is negligible post-construction. Any potential reduction in VMT would likely occur in the construction phase, through the implementation of carpooling and ridesharing, as applicable.

No significant environmental impacts are anticipated from the use of oversized vehicles to transport large turbine components.

To test whether any access required left turn lanes, Westwood utilized AASHTO Green Book, 2018 Edition Table 9-25, "Suggested Left-Turn Treatment Guidelines Based on Results from Benefit-Cost Evaluations for Intersections on Two-Lane Highways in Rural Areas".[6] Westwood calculated whether any project intersection met the guidance for left turns on the two-lane highway. Appendix B of this document shows that during the a.m. peak hour of the construction phase, each of the three intersections will meet the warranted volumes for left turn lanes on the two-lane highway. None of the intersections meets the warrants for left turn lanes during the p.m. peak hour.

[6] Table 9-25, Suggested Left-Turn Treatment Guidelines Based on Results from Benefit-Cost Evaluations for Intersections on Two-Lane Highways in Rural Areas, A Policy on Geometric Design of Highways and Streets, 7th Edition, American Association of State Highway and Transportation Officials, Washington, DC, 2018.

During the a.m. peak hour of the post construction phase, only the West Access and the East Access roads warrant left turn lanes on SR-299. Warrants for a left turn lane on SR-299 at the North Access road are only marginally met during the post construction phase. Again, none of the intersections meets the warrants for left turn lanes during the p.m. peak hour. The number of trips generated by the wind farm reduces significantly after construction, since this phase comprises operations and maintenance activities.

9.0 SIGNAGE

The number of trucks turning from SR-299 onto the access roads may require advance warning signs based on sight distance. CalTrans may require any of the following to signs to be installed along SR-299 in advance of the access roads during construction.

C44 W2-2 W2-3

(These signs may be black on orange for construction)

10.0 SUMMARY

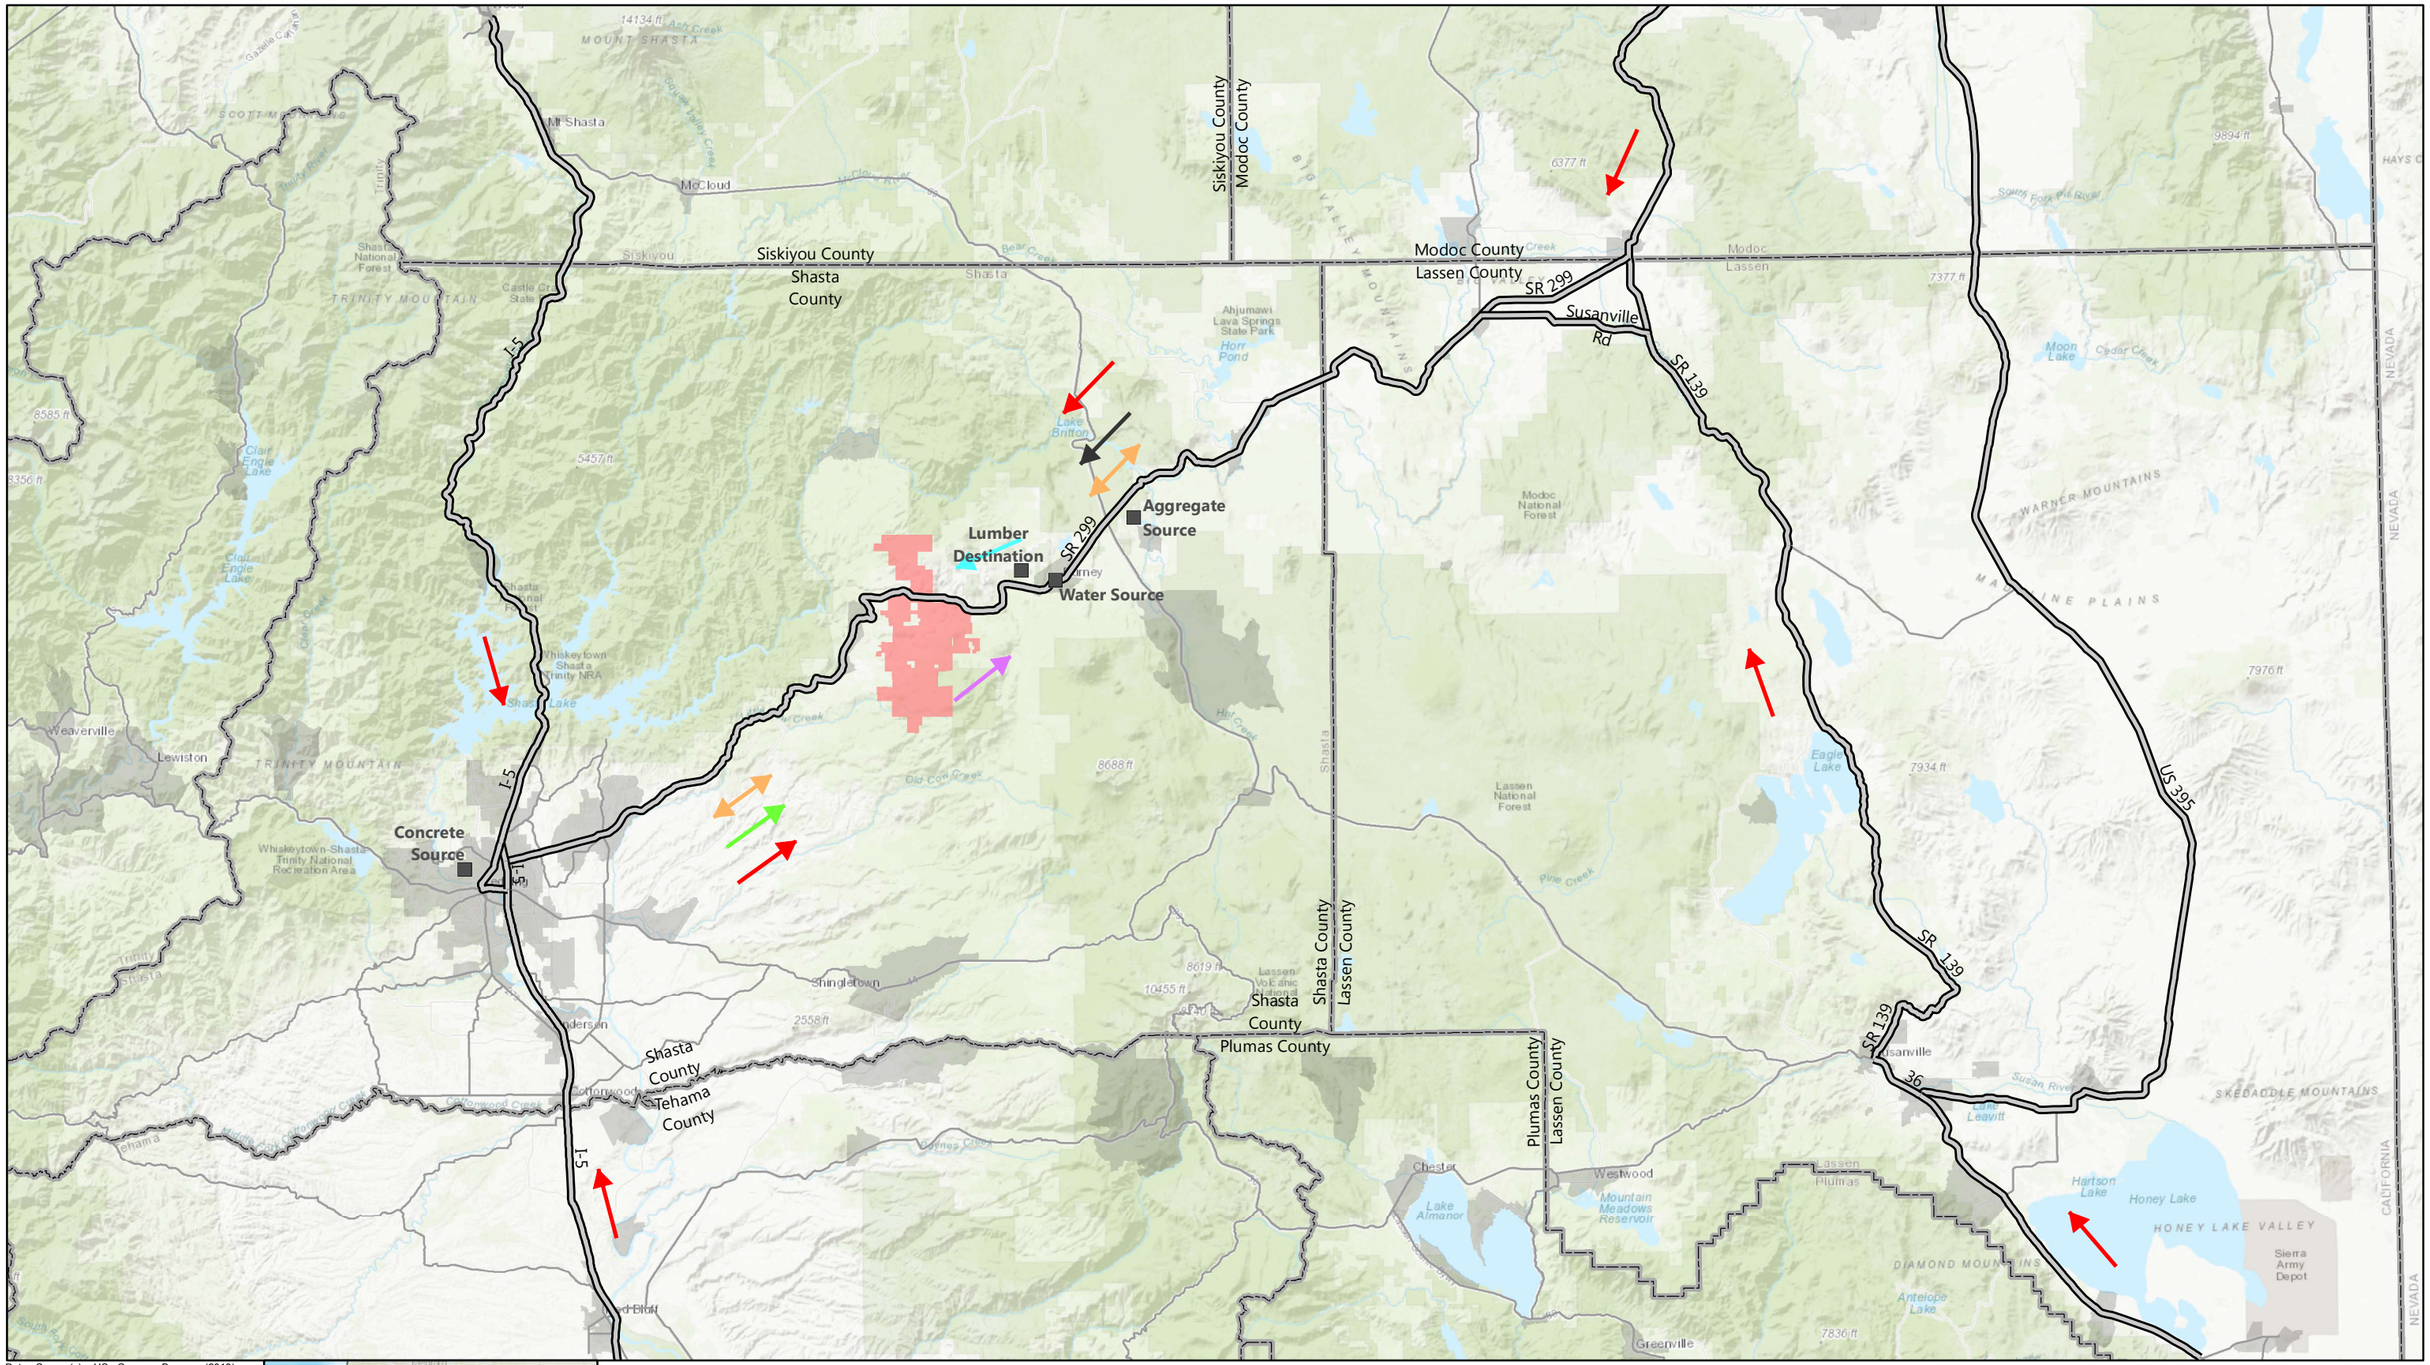
The Appendix shows the types and numbers of vehicles projected for the construction of the Fountain Wind Project. The design of the project is preliminary, so material quantities are based on information contained in the permitting documents and preliminary CADD design files used to determine the feasibility of grading access roads and turbine pads. The specific assumptions for each line item are shown in the Notes/Assumptions column.

The project could generate approximately 93,100 trips during the duration of the 250 construction day period. Approximately 68,800 of these trips are commuting trips by the construction workers and project management staff. Aggregate is responsible for the largest portion of the material trips. Construction equipment deliveries account for a small amount of the trips, and turbine component deliveries account for only about 2,744 trips in the two-year period (excluding pilot cars). The maximum number of turbine component delivery trips is approximately 10 deliveries per day. These deliveries can be scheduled to avoid the peak hours.

For this analysis, it was assumed that turbine equipment and material would be delivered from the Port of Stockton, CA. Use of oversized trucks is anticipated to be

required to carry turbine components such as nacelle and turbine blades. It is assumed I-5 will be the primary delivery route to State Route 299 in Redding. Appropriate permits will be required from CalTrans.

SR-299 west of the project site will likely be the source for concrete, and other components, and a majority of the commuting trips. State Route 299 east of the project site will see a lesser percentage of trips than SR-299 west of the project site. Delivery of aggregate, water, and a share of the worker commuting trips may originate within, and to the east of Burney. Nevertheless, based on the relative sizes of, and distances to Redding and the small towns east of the project site, this traffic study estimated 60 percent of the construction worker traffic using SR-299 from the west, and 40 percent using SR-299 from the east of the project.



Based on a project duration of approximately 250 work days, peak hour vehicle counts would be approximately 453 trips each way per day, with the highest hourly volume of approximately 260 vehicles per hour during the morning and afternoon peaks on SR-299 from the west, and 181 vehicles per hour from the east. The majority of the peak hour project related trips are commuting trips. A portion of the commuting trips are likely to occur before the peak hour since it is customary on construction projects to begin work earlier than other types of work.

Left turn lanes are projected to be warranted on SR-299 at each of the access roads during the construction period. During the operations and maintenance phase post construction, only the East and West Access roads will warrant left turn lanes along SR-299. The North Access road only marginally warrants a left turn lane along SR-299 post construction.

Westwood looked at both levels of service (LOS) and vehicle miles traveled (VMT) in this analysis. In estimating LOS, Westwood assigned peak hour trips at each access road intersections with SR-299. In each case, the intersection level of service was acceptable in the construction and post-construction phase at each access.

Westwood also estimated vehicle miles traveled (VMT). Westwood projected the number of trips taken by trucks and other vehicles to haul equipment, material, aggregate, turbines, concrete, water and employees. Westwood then estimated the mileage that would be logged to perform these trips during the two-year construction period. It is estimated that the total VMT during the construction period could be **2,168,492 vehicle miles traveled**. The total VMT per day post-construction is assumed to be **300 vehicle miles traveled**. Per capita daily VMT during operations is estimated to be **32.49 miles per day**.

Concrete Aggregate	9	80,000	40,200	20	185	Based on Aggregate equal to 76% of weight
Total Aggregate Deliveries	1,058	21,497	Tons		21,165	Assume all trips on SR 299 East
Wind Turbine Tower Base	72		153,400	270	19,440	Based on GE 3.4 137, HH 110m
Wind Turbine Tower Lower Mid-Section	72		120,100	270	19,440	Based on GE 3.4 137, HH 110m
Wind Turbine Tower Upper Mid-Section	72		112,850	270	19,440	Based on GE 3.4 137, HH 110m
Wind Turbine Tower Top Section	72		86,900	270	19,440	Based on GE 3.4 137, HH 110m
Wind Turbine Nacelle	72		150,700	270	19,440	Based on GE 3.4 137
Wind Turbine Hub	72		88,050	270	19,440	Based on GE 3.4 137
Wind Turbine Blades (3)	216		37,750	270	58,320	Based on GE 3.4 137
Wire and Cable - Underground Colletion System	38	80,000	45,000	270	10,260	Based on 3 conductors, 1.9 pounds/foot
Wire and Cable - Overhead Collection System	12	80,000	45,000	270	3,240	Based on 3 conductors, 2.1 pounds/foot
Overhead Collection Line Poles	85	30,000	15,000	270	22,883	Assume 250' wire span, 4 - 2000 pound Poles per trailer
Transmission Line Poles	77	27,000	12,000	270	20,790	Assume 750' wire span, 1 - 8000 pound Pole per trailer
Met Poles	5			270	1,350	Assume 1 Met Pole can be carried on a single truck
Transformers	72	80,000	45,000	270	19,440	Based on 3.5 MW transformer
Miscellaneous Turbine Components	288	80,000	45,000	270	77,760	Based on 4 miscellaneous deliveries per turbine
Formwork	3	80,000	45,000	50	144	Based on 25 reuses of forms
Reinforcing Steel (Rebar)	144	80,000	45,000	50	7,200	Based on 45 tons per turbine
Pilot Cars (Front and Back)	1,296			270	349,920	Pilot Cars for Wind Turbines
Total Turbine Related Deliveries	2,668				687,947	Assume all trips on SR 299 west and I-5 from Stockton - Schedule to avoid pe
Concrete for Turbine Foundations	3,600	69,000	40,000	50	180,000	
Concrete Pump Trucks	2			50	100	
Concrete for Substation Foundations	41	69,000	40,000	50	2,050	Based on 2 MPT - Foundation 8'-6" x 24'-0" x 1'-4"
Concrete for Switching Station Foundations	41	69,000	40,000	50	2,050	Based on 40' container each with 6 foundation pies
Concrete for Overhead Collection System Pole Foundations	36	40,332	11,332	50	1,800	Assume 1 concrete foundations (terminations & angles)
Concrete for Transformer Pads	72	41,180	12,180	50	3,600	Assume Pad 9' x 9' x 1'
Concrete for O&M Building	13	69,000	40,000	50	650	Based on foundation wall 78' x 70' x 1' thick x 5' deep + 4" floor slab
Total Concrete Deliveries	3,805	36,946	CuYds		190,250	Assume all trips on SR 299 west

Cement for Concrete Batch Plant	2	80,000	40,000	50	99	Based on Aggregate equal to 16% of weight
Building Materials	20	80,000	45,000	50	1,000	Based on 5460 square foot prefabricated metal building
Structural Steel - Substation	4	80,000	45,000	50	222	Based on 200,000 Pounds of Structural Steel
Structural Steel - Switching Substation	4	80,000	45,000	50	200	Based on 200,000 Pounds of Structural Steel
Elecrical Equipment - Substation	10	80,000	45,000	50	500	Includes Control Building, switch gear, capacitors, etc.
Elecrical Equipment - Switchingsubstation	10	80,000	45,000	50	500	Includes Control Building, switch gear, capacitors, etc.
CMP Culverts	4	80,000	45,000	50	200	Culvert Extensions and new culverts
Chain Link Fence	7	80,000	45,000	50	362	Based on 30,600 linear feet of fence at 10.65 pounds/ ft
Micellaneous Consumables	26	60,000	20,000	50	1,300	
Fuel Deliveries	25	26,000	7,000	50	1,250	Based on 2000 Gallons/week ea. of diesel on-road & off road
Sanitation	52	50,000	10,000	50	2,600	Based on weekly maintenance visits
Plant Stock, Seed and Mulch	17	52,600	12,800	50	859	Based on 2.5 tons/acre
Total Miscellaneous Deliveries	182				9,093	Assume all trips on SR 299 West
Water (Compaction)	307	33,400	0	20	6,140	Based on 20 gallons/ton of aggregate (Roads, Laydown, etc.)
Water (Dust Control)	919	33,400	0	20	18,380	Based on 300 gallons/acre/day of Road, staging, and field office area areas
Water (Vegetation establishment)	110	33,400	0	20	2,200	Based on 10,000 gallons/acre of Laydown areas

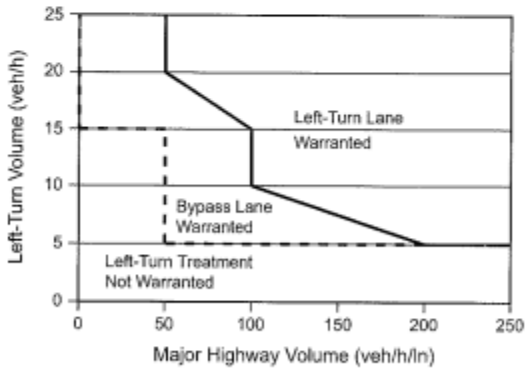
APPENDIX A – Potential Transportation Environmental Protection Measures for the Fountain Wind Project

Resource Category	Measure	Implementation			
		Preconstruction	Construction	Operations	Decommissioning
Transportation					
TRANS-1	[Project] will coordinate with CalTrans and Shasta County to implement a Transportation and Traffic Management Plan that minimizes risks and inconvenience to the public, while ensuring safe and efficient construction of the Project. The plan will focus on turbine component deliveries, traffic and circulation primarily within and in the vicinity of the Project area. It will be designed to minimize potential hazards from increased truck traffic and worker traffic and to minimize impacts to traffic flow in the vicinity of the Project.	X	X		
TRANS-2	To minimize conflicts between Project traffic and background traffic, deliveries of project components will be scheduled around local volume peaks to the extent feasible.		X		
TRANS-3	Road clearances may include temporarily blocking road intersections via construction cones and/or staffing blocked intersections with a traffic-control flagger to allow haul trucks sole access to the road while delivering Project components. If required, public road closures are not expected to exceed 15 minutes during each/any road closure event.		X		X
TRANS-4	The Project will coordinate with CalTrans to determine whether temporary speed limit reductions during construction are applicable where Project access points intersect with State Highway 299.	X	X		
TRANS-5	Construction deliveries would be coordinated to avoid major traffic-generating events in Redding, to the extent practicable.		X		
TRANS-6	The Project would coordinate with local law enforcement, to manage traffic flows and monitor traffic speed during deliveries.		X		X
TRANS-7	All staging activities and parking of equipment and vehicles would occur within the Project Area and would not occur on maintained State Highways or County roads.		X		



Resource Category	Measure	Implementation			
		Preconstruction	Construction	Operations	Decommissioning
TRANS-8	Equipment and material deliveries to the site would be performed by professional transportation companies familiar with the type of equipment, loads involved, and U.S. DOT, CalTrans, and Shasta County regulations.		X		X
TRANS-9	Road signs would be erected to notify travelers and local residents that construction is occurring in the area and provide information regarding the timing and route for oversized vehicle movements and deliveries. The erection/placement of road signs and the Project construction activities would be performed in accordance with the Shasta County and CalTrans requirements.		X		
TRANS-10	Escort vehicles would assist delivery of oversized turbine components to give drivers additional warning of oversized loads.		X		

APPENDIX B – AASHTO Guidance for Left Turn Lanes on Two Lane Highways (AASHTO Green Book, Seventh Edition)

Table 9-25. Suggested Left-Turn Treatment Guidelines Based on Results from Benefit–Cost Evaluations for Intersections on Two-Lane Highways in Rural Areas (*16*)

Left-Turn Lane Peak-Hour Volume (veh/h)	Three-Leg Intersection, Major-Road Two-Lane Highway Peak-Hour Volume (veh/h/ln) that Warrants a Bypass Lane	Three-Leg Intersection, Major-Road Two-Lane Highway Peak-Hour Volume (veh/h/ln) that Warrants a Left-Turn Lane	Four-Leg Intersection, Major-Road Two-Lane Highway Peak-Hour Volume (veh/h/ln) that Warrants a Left-Turn Lane
5	50	200	150
10	50	100	50
15	< 50	100	50
20	< 50	50	< 50
25	< 50	50	< 50
30	< 50	50	< 50
35	< 50	50	< 50
40	< 50	50	< 50
45	< 50	50	< 50
50 or More	< 50	50	< 50

Note: These guidelines apply where the major road is uncontrolled and the minor-road approaches are stop- or yield-controlled. Both the left-turn peak-hour volume and the major-rad volume warrants should be met as shown in Figure 9-36.

(a) Three-Leg Intersections

NOTE: The analysis on the following page shows that SR 299 either meets warrants or is marginally warranted for left turn lanes at the access roads. The RED shading above indicates the warrant guidelines that were met, while the PURPLE shading above indicates that warrants were marginally met for one access.

Figure 9-36. Suggested Left-Turn Treatment Warrants Based on Results from Benefit–Cost Evaluations for Intersections on Two-Lane Highways in Rural Areas (*16*)

The construction and post construction volumes have been applied using the AASHTO warrants above, and have yielded the following results:

1.0 SUMMARY

Stantec Consulting Services Inc. (Stantec) has completed a Water Supply Assessment (WSA) for Report Title (Project) on behalf of Shasta County, the CEQA Lead Agency for the Project. The Project would span approximately 4,600 acres of forested land in unincorporated Shasta County, California. Project construction and long-term operation includes the use of potable water from one or more new onsite water supply wells or the importation of water by truck from the Burney Water District (BWD). This WSA was conducted in conformance with the requirements of the California Water Code.

The Project is located in eastern Shasta County approximately six miles west of the unincorporated town of Burney and about 35 miles northeast of Redding. The Project is accessed by State Route (SR) 299, which bisects the Project. The Project area and boundaries are presented on Figure 1-1.

Stantec analyzed water supplies available to serve the project, as well as the water demand anticipated during construction and through operation of the facility. According to the requirements of Water Code Section 10910(c)(4):

> "*If the city or county is required to comply with this part pursuant to subdivision (b), the water assessment shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.*"

WATER SUPPLY ASSESSMENT

Summary

The following are primary conclusions of the WSA:

- The project meets the definition of a "project" under Water Code Section 10912(a)(5).
- The project is located in a rural setting and will not be served by a public water system. Therefore, under Water Code section 10910(b), Shasta County is preparing this water supply assessment in accordance with the guidance in Water Code section 10910(c)(4).
- There is no current Urban Water Management Plan (UWMP) that accounts for the project or other demand.
- The groundwater supply would be extracted from fractured volcanic bedrock terrain not affiliated with any California Department of Water Resources (DWR) Bulletin 118 groundwater basin. As a result, no groundwater sustainability agency (GSA) has been formed to serve this Basin, and management of this Basin is assumed by Shasta County.
- Owing to the absence of a DWR Bulletin 118 designated groundwater basin in the Project Site, a Groundwater Sustainability Plan (GSP) is not required under the Sustainable Groundwater Management Act (SGMA).
- Groundwater production in the Project Site is not adjudicated and there are no know groundwater rights holders.
- Groundwater storage on the Project Site cannot be estimated due to the lack of a definable groundwater basin and because the Project Site is underlain by thick accumulations of volcanic rock. Groundwater is assumed to occur in fractures and possible thin semi-permeable layers in some volcanic rocks beneath the Project Site. However, well yields in these rocks are relatively low and range between 1.5 and 63 gallons per minute (gpm) based on available well completion report data (DWR, 2018) for wells located within 1 mile of State Route (SR) 299 and within 2 miles of the proposed O&M facility.
- It is understood and believed that water demand from other uses overlaying this fractured volcanic bedrock terrain is very low and is limited to scattered residences. The County is not aware of any historic or current concerns about groundwater shortages for any existing users and is not aware of any future development that is planned for this area that would create a new large source of demand for groundwater.
- Water to be used for the construction of project facilities, dust control, soils compaction, and concrete manufacture will consist of groundwater pumped from one or more new, onsite water supply wells located at the project Operations and Maintenance (O&M) facility or from an offsite public water system such as BWD located six miles east-northeast of the Project. Potable water supplies may also be met by pumping from one or more new onsite wells at the proposed O&M facility.
- Estimated total water demand for construction of the Project, dust control, soils compaction, and concrete manufacture is 49 acre-feet (af).
- Estimated annual water demand for operations and maintenance at the Project is up to 5.6 acre-feet per year (afy) for vehicle and equipment washing and maintenance, potable water supplies for 12 full-time employees, and water storage to meet Shasta County fire flow requirements.
- According to State Water Resources Control Board Division of Water Rights (SWRCBDWR) there is one surface water rights adjudication in the southern portion of the Project for Cedar Creek and North

Fork Cow Creek, and one surface water adjudication in the eastern portion of the Project for Burney Creek. However, operation of a proposed onsite water supply well at the proposed O&M facility is not expected to impact these surface water rights holders because the proposed well(s) will be more than five, six, and seven miles from Cedar Creek, North Fork Cow Creek and Burney Creek, respectively.

- It is our conclusion that there is sufficient water supply available to serve the Fountain Wind Energy Project as proposed as well as existing and planned future uses, including agricultural and manufacturing uses during a 20-year projection and no further analysis is required.

2.0 WATER SUPPLY PLANNING

2.1 PROJECT WATER SUPPLY AND DEMAND

Most of the water to be used by the Project will be during wind turbine, collector line, and related facilities construction for dust suppression, soil backfill compaction, and concrete manufacture. An estimated 49-acre feet (af) of water will be required for construction-related activities. Construction water will consist of groundwater pumped from the underlying fractured volcanic bedrock using one or more proposed new, onsite water supply wells located at the proposed Operations and Maintenance (O&M facility) facility, or delivered by a water supply contractor from an offsite, existing public water system, such as the nearby Burney Water District (BWD) located approximately 6 miles east-northeast of the project.

Estimated O&M annual water demand for the Project is up to 5.6 afy (approximately 5,000 gallons per day [gpd]) for the proposed O&M facility including potable water demands for 12 full-time employees, equipment maintenance and washing, and emergency fire suppression. The estimated potable water demand is relatively low at 30 gallons per capita per day (gpcd) (equivalent to 0.4 afy) because the O&M employees will be working throughout the Project site and only occasionally visit the O&M facility. In addition, the restroom and other potable water facilities at the O&M building will be designed to conserve water (e.g. low flush toilets, low flow sinks, etc.).

O&M water demand also includes onsite fire flow water storage to meet fire flow requirements in accordance with Shasta County Code of Ordinances Title 16 Buildings and Construction, Chapter 16.04.130 Fire Standards and Equipment (Ordinance No. 2019-06 (2019) and 2019 California Fire Code (California Code of Regulations Title 24 Part 9). The estimated minimum fire flow water supply required for the proposed O&M facility per National Fire Protection Association (NFPA) 1142 (NFPA, 2017) Equation 4.3.1 for structures with exposure hazards is 28,665 gallons (0.09 af) but may range up to 2,000 gpm for two hours or 240,000 gallons (0.74 af) depending on final Shasta County fire flow water storage requirements. Together, the resulting first year O&M potable and fire flow water demand is estimated to range between approximately 0.5 af and 1.14 af, depending on final Shasta County fire flow water storage requirements. The potable and fire flow requirements may decline in subsequent years to 0.4 afy.

Construction and operation of one or more water supply wells for construction and long-term O&M activities will also comply with all federal, state, and local laws and ordinances and will be in conformance with applicable mitigation measures for this Project. If delivery of off-site water from BWD is pursued, all deliveries of water to the site will also comply with all federal, state, and local laws and ordinances and will be in conformance with applicable mitigation measures for this Project.

2.2 WATER SUPPLY ASSESSMENT

SB 610 was passed into law on January 1, 2002. This legislation identified the need to incorporate water supply and demand analysis at the earliest possible stage in the planning process. SB 610 amended

portions of the California Water Code (Water Code), including Section 10631, which contains the Urban Water Management Planning Act, as well as adding Sections 10910, 10911, 10912, 10913, and 10915, which describe the required elements of a WSA.

2.2.1 "Is it a Project Under SB 610?"

The first step in the WSA process is determining whether the project is subject to CEQA. SB 610 amended Public Resources Code Section 21151.9 to read: *Whenever a city or county determines that a project, as defined in Section 10912 of the [California] Water Code, is subject to this division [i.e., CEQA] it shall comply with part 2.10 (commencing with Section 10910 of Division 6 of the Water Code).* The proposed project is currently under environmental review pursuant to the requirements of CEQA; therefore, the information contained in this assessment may be used to support the analysis contained in the CEQA document.

The second step in the SB 610 process is to determine if a project meets the definition of a "Project" under Water Code Section 10912(a) and (b). Under this section,

(a) *"Project" means any of the following:*

1) *A proposed residential development of more than 500 dwelling units.*

2) *A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.*

3) *A proposed commercial building employing more than 1,000 persons or having more than 250,000 square feet of floor area.*

4) *A hotel or motel with more than 500 rooms.*

5) *A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.*

6) *A mixed-use project that includes one or more specified in this subdivision.*

7) *A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500-dwelling unit project.*

(b) *If a public water system has fewer than 5,000 service connections, then "project" means any proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of the public water system's existing service connections, or a mixed use project that would demand an amount of water equivalent to, or greater than, the amount of water required by residential development that would represent an increase in 10 percent or more in the number of the public water system's existing service connections.*

The Project will occupy approximately 4,463 acres and will include a proposed permanent O&M facility that will be less than 6,000 square feet (5,460 square feet) within a 5-acre parcel. The proposed Fountain Wind Energy Project is considered to be a project pursuant to Section 10912(a)(5) of the Water Code because it is an industrial plant occupying more than 40 acres of land. Parcels crossed for turbine installation and conveyance are zoned as Timber (T) and Timber Production (TP).

2.2.2 "Is There a Public Water System?"

The second step in the WSA process is determining if there is a "public water system" to serve the project. Section 10912(c) of the California Water Code (Water Code) states: *"[A] public water system means a system for the provision of piped water to the public for human consumption that has 3,000 or more service connections."*

The proposed project is not within the service area of a public water system but the project may purchase water from the BWD and truck it on site. The closest public water system to the proposed Project is the BWD located approximately 6 miles east-northeast of the Project. BWD operates a public water system (CA4510003) and sewer system in the unincorporated town of Burney. BWD is an independent special district formed as a county water district under California Water Code Section 30000 et seq. In 2019, BWD served a population of 3,154 persons from 1,267 service connections (BWD, 2020).

Municipal water demands are met by the extraction of local groundwater through the operation of three water supply wells, Wells 6, 7 and 8, according to the State Water Resources Control Board Division of Drinking Water (SWRCBDDW) State Drinking Water Information System (SDWIS) website (accessed on May 26, 2020), and the Burney Water District Water Master Plan (PACE, 2014). Total groundwater pumped from the three wells and metered groundwater deliveries in 2019 were 1,353 af and 1,145 af, respectively (BWD, 2020). The current production capacity of the three BWD wells is 4,600 gpm or 7,420 afy, if operated continuously. Therefore, if water is obtained from the BWD, there is sufficient water supply capacity to meet the estimated additional temporary water supply demand of 49 af for the construction of project facilities.

2.2.3 "Is There a Current UWMP That Accounts for the Project Demand?"

Step four in the WSA process involves determining if there is a current UWMP that considers the projected water demand for the Project Site. The Project is not within the service area of a public water system and there is no applicable UWMP. Construction water demands are estimated to be approximately 49 af.

Estimated O&M annual water demand for the Project is up to 5.6 afy for the proposed O&M facility including potable water demands for 12 full-time employees, equipment maintenance and washing, and emergency fire suppression. The estimated potable water demand is 30 gpcd (0.4 afy). The estimated O&M water demand also includes onsite fire flow water storage to meet Shasta County Code of Ordinances Title 16 Buildings and Construction, Chapter 16.04.130 Fire Standards and Equipment (Ordinance No. 2019-06 (2019) and 2019 California Fire Code (California Code of Regulations Title 24 Part 9) fire flow requirements. The estimated minimum fire flow water supply required for the proposed

O&M facility per NFPA 1142 (NFPA, 2017) Equation 4.3.1 for structures with exposure hazards is 28,665 gallons (0.09 af), but could also be conservatively assumed to be 2,000 gpm for 2 hours or 240,000 gallon. Annual O&M water of approximately 0.4 af will be supplied by an onsite water supply well with an estimated minimum production capacity of approximately 11 gpm. However, water demand during the first year of operation may be considerably higher to account for the filling of a fire flow water storage tank which may range between 30,000 and 240,000 gallons depending on Shasta County final fire flow water storage requirements.

2.2.4 "Is Groundwater a Component of the Supplies for the Project?"

This section addresses the requirements of Water Code Section 10910(f), paragraphs 1 through 5, which apply if groundwater is a source of supply for a proposed project. Pursuant to Water Code Section 10910(f); the groundwater analysis presented in this WSA focuses on the volcanic terrain underlying the Project Site and the wells operated by the BWD.

2.2.4.1 Geologic and Hydrogeologic Conditions

The Project is in rural, mountainous terrain that is not within a defined DWR Bulletin 118 (2016) groundwater basin. The Project Site is also located in the Sacramento River Hydrologic Region (DWR, 2013, 2019). The closest DWR 118-designated groundwater basins to the Project include the Burney Creek Valley Basin (Basin No. 5-047), Goose Valley Basin (Basin No. 5-047), and Dry Burney Creek Valley Basin (5-049). These groundwater basins are listed as Very Low Priority on the SGMA Basin Prioritization Dashboard.

The Project occurs within the Cascade Range Geomorphic province of California (California Geological Survey, 2002). The Cascade Range consists of a northerly trending chain of volcanoes and related deposits extending from northern California to southern British Columbia. In northern California, the Cascade Range extends from south of Mount Lassen (Lassen Peak) to the Oregon border. The subsurface geology within the Project Site is predominantly ash, lava flows of various chemical composition (predominantly basalt and andesite), and debris flows (lahars), the latter, containing chaotic mixtures of sand, silt, clay, ash and rock. The Project Site is underlain by a thick accumulation of individual layers of these varying types of volcanic deposits.

Groundwater in the underlying volcanic deposits is primarily contained within fractures and in discontinuous layers of weathered volcanic rocks or debris flows and is largely derived from the infiltration of direct precipitation and snowmelt, and infiltration along creeks and downstream of spring discharges. The thickness of the volcanic deposits underlying the Project has not been determined but is considered to be relatively thick based on the relatively long period of volcanism in the area. Owing to the highly fractured nature of the underlying volcanic rocks, numerous springs have developed throughout the Project Site and contribute to streamflow.

Lithologic logs of 33 domestic wells drilled within 1 mile of SR 299 and within 2 miles of the proposed O&M facility are of inconsistent quality, but indicate the underlying geology to a maximum depth of 364 feet below ground surface (ft bgs) consists of highly variable thicknesses and sequences of layers and

mixtures of lava, cinders, ash, gravel, sand, silt, and clay (DWR 2020a). Descriptions of some of the mixed layers of gravel, silt and clay may constitute volcanic mudflow deposits or lahars. In addition, some deposits are reported to contain clay from the chemical weathering of certain minerals in lava flows and ash layers or lava and ash fragments in lahars.

All 33 wells were drilled for domestic use. Well completion depths generally matched the drilled depth or contained well casing to a lesser depth and the remainder of the borehole was open to the natural rock formations. Initial well yield (by airlifting or pumping) reported in wells located within 1 mile of SR 299 is relatively low and varies between 1.5 and 66 gpm. Initial estimated well yield in the nine wells (one destroyed) located within 2 miles of the proposed O&M facility and water supply well(s), ranges between 6 and 60 gpm and averages 20.2 gpm.

Depth to groundwater in 29 of the 33 wells located within 1 mile of SR 299 is highly variable and ranges between 5 and 238.5 ft bgs. Groundwater levels in the nine wells (one destroyed) located within 2 miles of the proposed O&M facility range between 10 and 238.5 ft bgs. The highly variable nature of the water level data precludes the development of a groundwater contour map or an understanding of the direction(s) of groundwater flow. There are no California Statewide Groundwater Elevation Monitoring (CASGEM) wells monitored under Senate Bill x7-6 (2009) for groundwater levels due to the lack of groundwater basin designation.

2.2.4.2 Water Demands

There are two sources of demand drawing groundwater from existing wells in the area where the new wells would be drilled to serve the Project. According to the SWRCBDDW SDWIS (SWRCBDDW v. 3.2.1), two small, public water systems are located adjacent to or near the Project Site, including California Department of Transportation (Caltrans) Hillcrest Safety Roadside Rest Area (SRRA)(Water System No. CA4500283), and Moose Camp (Water System No.CA4500017). Caltrans Hillcrest SRRA owns and operates one public (domestic) water supply well, Well 1 (listed as Well WW-2 on the Well Completion Report). This well is located less than 2 miles west of the proposed O&M facility. The initial estimated well yield was reported to be 29 gpm. The estimated annual population served at the Hillcrest SRRA per the SWRCBDDW SDWIS is 2,500 through one service connection.

Moose Camp owns and operates two domestic water supply wells, Wells 2 and 3. According to a water system map on the Moose Camp website, Wells 2 and 3 are located about 1 mile southeast of the proposed O&M facility (Moose Camp 2007). The Well Completion Report for Well 2 was not included in the online DWR Well Completion Report Application or was not properly identified by the drilling contractor. As a result, the initial estimated yield at Well 2 was not determined. The initial estimated yield at Well 3 was reported to be 12 gpm. According to SWRCBDDW SDWIS, the estimated population served at Moose Camp is 77 persons through 51 service connections.

Although not listed on SWRCBDDW SDWIS public water system link, a domestic well was installed at California Department of Forestry and Fire Protection (CAL FIRE) Hillcrest Forest Fire Station No. 75 in May 1974. This facility is located on SR 299 about 1.5 miles west of the proposed O&M facility. The initial estimated yield at this well was reported to be 30 gpm; it is uncertain if the well is still operating.

BWD's municipal water demands are met by the extraction of local groundwater through the operation of three water supply wells, Wells 6, 7 and 8, according to the State Water Resources Control Board Division of Drinking Water (SWRCBDDW) State Drinking Water Information System (SDWIS) website (accessed on May 26, 2020), and the Burney Water District Water Master Plan (PACE, 2014). Total groundwater pumped from the three wells and metered groundwater deliveries in 2019 were 1,353 af and 1,145 af, respectively (BWD, 2020). The current production capacity of the three BWD wells is 4,600 gpm or 7,420 afy, if operated continuously. Therefore, if water is obtained from the BWD, there is sufficient water supply capacity to meet the estimated additional temporary water supply demand of 49 af for the construction of project facilities.

Groundwater purchased from BWD or withdrawn from a new well at the O&M facility, is anticipated to provide the estimated 49 af of water supply for site development and construction of Project facilities. Either option would be considered a *de minimis* water use (see Section 2.2.5.2 for further analysis). Groundwater is also anticipated to provide the estimated O&M, potable, and fire flow water demands for the Project. This estimated long-term water demand is up to 5.6 afy. Based on the existing groundwater levels within and near the Project Site and the projected future annual population served by existing wells, the estimated quantity of groundwater to be extracted for the proposed Project for O&M, potable and fire flow purposes is considered to be a *de minimis* water use.

2.2.4.3 Groundwater Sustainability Plans

As noted, the Project is not located within a DWR Bulletin 118-designated groundwater basin and is not subject to SGMA. Therefore, no GSP is required.

2.2.5 "Are There Sufficient Supplies to Serve the Project Over the Next Twenty Years?"

The next step in the WSA process is to prepare the actual assessment of the available water supplies, including the availability of these supplies in all water-year conditions over a 20-year planning horizon, and an assessment of how these supplies relate to project-specific and cumulative demands over that same 20-year period. To be consistent, the analysis horizon of this WSA extends to 2040. Water Code Section 10910(c)(4) states:

> *"If the city or county is required to comply with this part pursuant to subdivision (b), the water assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses."*

The amount of groundwater in storage in the fractured volcanic deposits underlying the Project Site is unknown owing to the lack of defined basin boundaries and saturated layers for the storage of groundwater.

Development of a water budget to account for surface water and groundwater inflow and outflow is not

feasible owing to the general lack of data on inflow (e.g., precipitation and streamflow recharge) and outflow components (e.g., groundwater production and consumptive use [population served]). In addition, none of the springs or streams in the Project Site possess flow gauges to measure outflow. However, a preliminary estimate of current annual local non-Project groundwater production is presented below in Table 2-1 based on the population served estimates and water use assumptions indicated in the table.

Table 2-1: Estimated Annual Current Local Non-Project Groundwater Production From Existing Nearby Wells

Site	Use Type	Population Served (persons)	GPCD[1]	Estimated Total Water Use Per Day (gpd)	Estimated Total Annual Water Use (afy)
Moose Camp	Continuous occupancy	129	224	28,896	32.4
CAL FIRE Forest Fire Station No. 75		4	224	896	1.0
Site	**Use Type**	**Visitors Per Year (persons)**	**Estimated Annual Water Use Per Person (gal)**		**Estimated Total Annual Water Use (afy)**
Caltrans Hillcrest SRRA	Intermittent	2,500	15		0.1
Site	**Use Type**	**Area (acres)**	**Estimated Unit Consumptive Use Per Acre (af/acre)**		**Estimated Total Annual Water Use (afy)[2]**
Irrigated land (T35N/R1E-34R)	Irrigation	3	3.5		10.5
Grand Total					**44**

Notes:
1. Based on City of Redding 2015 Urban Water Management Plan 2020 per capita water use target (City of Redding, 2016)
2. Calculation assumes one crop growth per year
af = acre-foot
afy = acre-feet per year
gal = gallons
GPCD = gallons per capita per day
gpy = gallons per year
gpd = gallons per day
SRRA = Safety Roadside Rest Area

As shown in Table 2-1, the total estimated current annual local non-Project groundwater production near the Project Site is approximately 44 afy.

2.2.5.1 Project-Site Demands

Historically, there has been localized consumptive demand in the vicinity of the Project Site. Operation and maintenance of the Project will require an annual demand of up to 5.6 afy for potable use and to meet fire flow requirements, with an actual expected demand of 0.5 afy. This demand is anticipated to remain constant throughout the life of the Project.

2.2.5.2 Comparison of Available Water Supplies Versus Demand

Section 10910 (c)(4) of the Water Code states:

> *"If the city or county is required to comply with this part pursuant to subdivision (b), the water assessment shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses."*

Onsite Well Option

The Project does not overlie a defined groundwater basin or subbasin, and, as a result, there is no GSA or GSP, and limited quantifiable data exist to support groundwater storage or budget estimates. However, the Project will require 49 af of water for up to 24 months of construction (24.5 afy), which is approximately half the combined annual groundwater production of the four closest non-Project groundwater users to the proposed O&M facility (Table 2-1). In addition, the long-term, O&M water use is projected to be as much as 5.6 afy, which is approximately one-eighth the combined annual groundwater production of the four closest non-Project groundwater users to the proposed O&M facility (Table 2-1). Though existing water supplies have not been quantified, the estimated annual O&M water demand of the Project represents a de minimis use compared with existing groundwater withdrawals, and will have a negligible contribution to existing groundwater supplies under all water year conditions.

Burney Water District Option

The current production capacity of the three BWD wells located approximately seven miles east-northeast of the project, is 4,600 gpm, or 7,420 afy, if operated continuously, with only one foot of drawdown (PACE, 2014). This indicates that the impact to groundwater supplies is negligible even with all three wells operating at capacity. In addition, the BWD's current effective system source capacity is 4.3 million gallons per day, or 4,816 afy. Because the project will only temporarily require 49 af of water for construction and up to 5.6 afy for O&M, the estimated annual demand for the Project represents a de minimis use compared with existing production capacity. Therefore, there are adequate supplies available to serve the proposed Fountain Wind Energy Project under all water year conditions.

FOUNTAIN WIND PROJECT
Scoping Report

1. Introduction

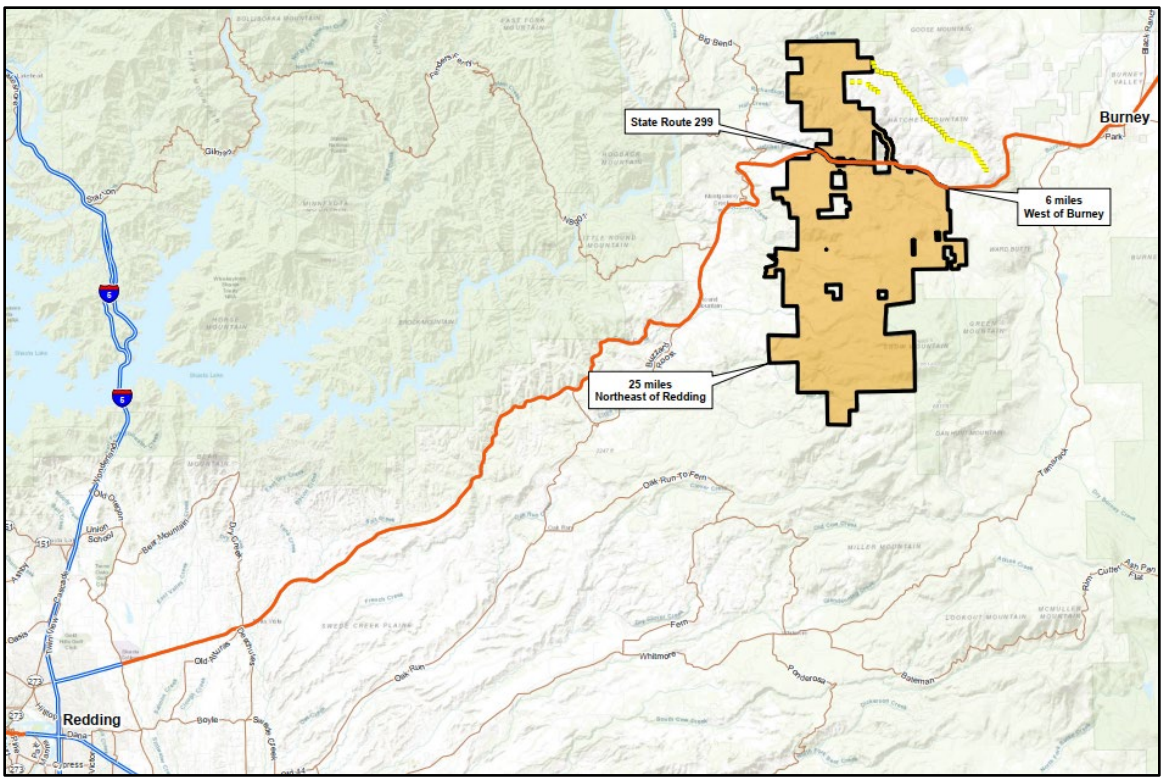
The Shasta County Department of Resource Management Planning Division (County) is preparing an Environmental Impact Report (EIR) for the Fountain Wind Project as part of the County's consideration of the application for Use Permit No. 16-007 filed by Pacific Wind Development, LLC (Applicant), a subsidiary of Avangrid Renewables, LLC (Project).[1] This scoping report documents input contributed by agencies, Tribes, and members of the public during the EIR scoping period (January 15, 2019 to February 22, 2019). As the public agency with principal responsibility for carrying out or approving the Project, the County is the Lead Agency for purposes of complying with the California Environmental Quality Act (CEQA).

CEQA Guidelines Section 15083 provides that a "Lead Agency may…consult directly with any person…it believes will be concerned with the environmental effects of the project." Scoping is the process of early consultation with affected agencies and the public prior to completion of a Draft EIR. Section 15083(a) states that scoping can be "helpful to agencies in identifying the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in an EIR and in eliminating from detailed study issues found not to be important." Scoping is an effective way to bring together and consider the concerns of affected State, regional, and local agencies, the Project proponent, and other interested persons (CEQA Guidelines §15083(b)). Scoping is not conducted to resolve differences concerning the merits of a project or to anticipate the ultimate decision on a proposal. Rather, the purpose of scoping is to determine the scope of information and analysis to be included in an EIR and, thereby, to ensure that an appropriately comprehensive and focused EIR will be prepared that provides a firm basis for informed decision-making. Comments not within the scope of CEQA will not be addressed through the CEQA process but will be included as part of record of information for consideration by the County as part of its decision-making process for the Project.

This report is intended for use by the County in preparing the EIR as formal documentation of initial input received from governmental agencies, Tribes, and members of the public regarding the range of actions, alternatives, mitigation measures, and potential significant effects to be analyzed in depth in the EIR. It also provides access for other agencies and members of the public to see the comments received during the scoping period.

[1] The County is conducting the EIR process, including the preparation of this Scoping Report, pursuant to the requirements of CEQA (Pub. Res. Code §21000 et seq.) and its implementing regulations, the CEQA Guidelines (14Cal. Code Regs. §15000 et seq.).

2. Description of the Project



2.1 Project Summary

The Fountain Wind Project is a renewable wind energy generation development proposed by Pacific Wind Development, LLC, within an approximately 30,532-acre, privately-owned area in unincorporated Shasta County. The Applicant has applied for a Use Permit (UP 16-007) to construct, operate, maintain, and ultimately decommission up to 100 wind turbines and associated transformers together with associated infrastructure and ancillary facilities. Each turbine would be no more than 591 feet tall, as measured from ground level to vertical blade tip (total tip height), and would have a generating capacity of 2 to 4 megawatts (MW). The Project would have a maximum total nameplate generating capacity of up to 347 MW. Associated infrastructure and ancillary facilities would include: a 34.5-kilovolt (kV) overhead and underground electrical collector system to connect turbines together and to an onsite collector substation; overhead and underground fiber-optic communication lines, an onsite switching station to connect the Project to the regional grid operated by the Pacific Gas and Electric Company (PG&E), a temporary construction and equipment laydown area, 17 temporary laydown areas distributed throughout the Project site, an operation and maintenance (O&M) facility, permanent meteorological (MET) towers and either Sonic Detection and Ranging (SoDAR) or Light Detection and Ranging (LiDAR) capability, storage sheds, and temporary batch plants. New access roads would be constructed within the project boundary, and existing roads would be improved.

2.2 Project Location

The Project would be located approximately 1 mile west of the existing Hatchet Ridge Wind Project, approximately 6 miles west of Burney, 35 miles northeast of Redding, immediately north and south of California State Route 299 (SR 299), and near the community of Moose Camp and other private inholdings. See **Figure 1**, *Project Location*. Other communities near the Project area include Montgomery Creek, Round Mountain, and Wengler (each approximately 3 miles from the Project area) and Big Bend (approximately 7 miles from the Project area). The Lassen National Forest lies adjacent to the Project area southeast and the Shasta-Trinity National Forest borders the Project site to the north; other surrounding lands are privately owned.

The Project would be constructed on an up-to 2,167-acre Project site (outlined in Figure 1) located within the approximately 30,532-acres that comprise 76 Shasta County Assessor's parcels (APNs). The 76 APNs consist exclusively of private property operated as managed forest timberlands.

Project Location

3. Opportunities for Agency and Public Input

3.1 Pre-scoping Activities

The County initiated pre-scoping activities following receipt of the application for Use Permit No. 16-007. Pre-scoping activities included initial agency and community outreach, the results of which efforts were documented in an Initial Study, and consultation with Tribes pursuant to Assembly Bill (AB) 52 (Gatto, 2014). The Initial Study, initial outreach efforts, and the AB 52 consultation process are summarized below.

Initial Study

Pre-scoping activities included the preparation of an Initial Study. On the basis of the Initial Study, the County determined that preparation of an EIR would be required.

Initial Agency and Community Outreach

Initial agency outreach included communications with: The Burney Fire Protection District, California Department of Fish and Wildlife, California Department of Transportation, Central Valley Regional Water Quality Control Board, Shasta County Assessor/Recorder, Shasta County

Air Quality Management District, Shasta County Fire Department, Shasta County Office of the Sheriff, and the Shasta Mosquito and Vector Control District. Initial community outreach included communications with: The Pit Rive Tribe, Frontier Communications, and the Wintu Audubon Society. Correspondence with these agencies and members of the community is documented in the Initial Study.

Tribal Consultation Pursuant to AB 52

Pursuant to the AB 52 Tribal consultation process, CEQA lead agencies consult with tribes that are traditionally and culturally affiliated with the project area and that have requested consultation pursuant to Public Resources Code section 21080.3.1. The purpose of the consultation is to determine whether a proposed project may result in a significant impact to tribal cultural resources that may be undocumented or known only to the tribe and its members. As set forth in Public Resources Code Section 21080.3.1(b), the law requires:

> *Prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report for a project, the lead agency shall begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project if: (1) the California Native American tribe requested to the lead agency, in writing, to be informed by the lead agency through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated with the tribe, and (2) the California Native American tribe responds, in writing, within 30 days of receipt of the formal notification, and requests the consultation.*

The County's AB52 contact list consists of Native American tribes that had submitted written requests for notification of CEQA projects within their geographic area of traditional and cultural affiliation as of December 8, 2017, when the County initiated consultation. The County sent letters by certified mail on December 8, 2017 to two representatives of the Pit River Tribe: Mickey Gemmill[2] and Morning Star Gali.[3] Each letter identified the area within which the Project is proposed as within the Tribe's geographic area of traditional and cultural affiliation. Return receipts for the certified letters indicate the letters were delivered on December 8, 2017. The County received no response to either letter.

3.2 Scoping Activities

Notifications

On January 15, 2019 the County published and distributed a Notice of Preparation (NOP) accompanied by the Initial Study described above, to advise interested local, regional, state, and federal agencies, as well as the public, that an EIR would be prepared for the Project. The County sent the NOP package to trustee, responsible, and potentially affected federal agencies; to the Governor's Office of Planning and Research/ State Clearinghouse; and to three libraries in the Project area. The NOP and NOP mailing list are provided in **Appendix A**.

The County sent separate notice to a mailing list of 603 recipients that included Tribes, property owners within 2 miles of the Project site, and other interested parties. The direct-mail notification and its mailing list are provided in **Appendix B**.

The County also posted an electronic copy of the NOP and the direct-mail notice on its website: https://www.co.shasta.ca.us/index/drm_index/planning_index/eirs/fountain-wind-project. A screen shot of the website as of January 16, 2019 is included in **Appendix C**. In addition to the NOP, direct mail notifications, and web posting, the County notified the public about the public scoping meeting through newspaper advertisements published in the Record Searchlight on January 15 2019, in the Mountain Echo on January 15, 2019, and in the Intermountain News on January 16, 2019. The newspaper notices are provided in **Appendix D**.

Agency Scoping Meeting

The County held an agency-specific scoping meeting on Thursday, January 24, 2019 at 2 p.m. at the Shasta County Administration Building, located at 1450 Court Street in Redding. Notes of the agency-specific scoping meeting are provided in **Appendix E**.

Public Scoping Meeting

The County held a scoping meeting for members of the public on Thursday, January 24, 2019, at the Montgomery Creek Elementary School, located at 30365 State Route (SR) 299 East in Montgomery Creek. Doors opened to view project information at 6:30 p.m.; the public scoping meeting began at 7 p.m. The presentation slides and "story boards" that were displayed at the meeting were posted on the County's website after the meeting and are provided in **Appendix F**. A transcript of comments made by speakers at the meeting is provided in **Appendix G**.

4. Summary of Scoping Input Received

The NOP and other notifications solicited comments on the scope, content, and format of the EIR. Agencies and members of the public were encouraged to submit their comments to the County by U.S. mail, e-mail, via an on-line tool, or in person at the public scoping meeting. In addition to the oral comments made at the public scoping meeting (Appendix G), written input was received from approximately 150 entities. **Table 1** identifies the agencies, Tribes, and members of the public who submitted input on or before the close of the scoping period. Copies of all written input received is provided in **Appendix H**. All input received on or before end of the scoping period is documented in this Scoping Report.

TABLE 1A
AGENCIES WHO SUBMITTED SCOPING INPUT
FOR THE FOUNTAIN WIND PROJECT

Name	Affiliation	Letter ID	Date
Curt Babcock	California Department of Fish and wildlife	A1	2/19/19
William Solinsky	California Department of Forestry and Fire	A2	1/25/29
Marcelino Gonzalez	California Department of Transportation	A3	2/12/19
Patricia Nelson	California Governor's Office of Emergency Services	A4	2/7/19
Gayle Totton	Native American Heritage Commission	A5	2/12/19
John Waldrop	Shasta County Air Quality Management District	A6	1/16/19

TABLE 1B
TRIBES AND TRIBAL MEMBERS WHO SUBMITTED SCOPING INPUT
FOR THE FOUNTAIN WIND PROJECT

Name	Affiliation	Letter ID	Date
Anguiano, James	Atsuge Band-Pit River Tribe	T1	2/14/19
Davis, Radley	Illmawi Band-Pit River Tribe	T2	2/22/19

NOTE: Within the Column "Letter ID," the letter "P" refers to the designation of the letter or other communication included in Appendix H, whereas the letter "H" indicates that scoping input also was received at the public scoping meeting as documented in the transcript included in Appendix G.

4.1 Approach to the Consideration of Scoping Input

The County has reviewed the full text of all scoping input received and will consider it in preparing the EIR. Summaries of the issues raised are provided below for ease in review by other agencies and members of the public.

Input Received on Issues Outside the Scope of CEQA

CEQA requires lead agencies in preparing an EIR to analyze significant effects on the environment. For purposes of CEQA, the term "environment" means the physical conditions that exist in the area that will be affected by a proposed project including "land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance…. The 'environment'

includes both natural and man-made conditions" (Pub. Res. Code §21060.5; CEQA Guidelines §15360). Input on topics that are beyond the scope of CEQA was received during the scoping period. Examples of such input include comments about:

a. Economic changes, such as financial benefits to the community (such as a desire to receive donations from the applicant to support scholarships or community programs, or lower energy costs) or others (such as potential workers or suppliers of Project materials) if the Project is approved (including the owner of the Project site and whether the applicant is a foreign or domestic entity), or declines in tourism-related income. CEQA is clear that potential impacts to property values are beyond the scope of CEQA, no matter how potentially severe they may be [*Porterville Citizens for Responsible Hillside Development v. City of Porterville* (2007) 157 Cal.App. 4th 885, 903].

b. Perceptions of unfair distribution of benefits and burdens of the local community relative to more distant, urban areas in terms of renewable energy production and energy demands;

c. Psychological and social impacts on community character also are beyond the scope of CEQA. *Preserve Poway v. City of Poway* (2016) 245 Cal.App.4th 560. The character of the communities that would be affected by the Project have been described generally in scoping input as reflective of "country living, quiet, pure and clean", "undisturbed by civilization," and as "a refuge from city life." Community character input also was received in connection with changes being experienced in people's expectations regarding the ability to use their neighbors' land (such as increasingly strict anti-trespassing policies);

d. Expressions of favor or disfavor for renewable energy, the Project, an aspect of the Project, or a potential alternative without reference to a change in the environment that would be attributable to the Project; and

e. Non-project-specific comments, including quotations from legal requirements without providing a stated connection to the project, and general feelings about renewable energy, the wind industry, or comments about other energy projects where questions about the reliability of data or other issues may remain.

The County acknowledges its receipt of input that is beyond the scope of CEQA and has included it in the record of materials for consideration by decision-makers even though it will not be addressed in the EIR. The environmental consequences of a project are but one of multiple factors that may be taken into consideration when a Lead Agency is deciding whether or not to approve a proposal.

Input Received on Issues Within the Scope of CEQA

The purpose of scoping is to solicit input as to the scope and content of the EIR, including potential impacts of concern and mitigation measures or alternatives to be considered. This type of input was received during the scoping period and is summarized below. These summaries include "raw" input that has not been vetted for accuracy; they represent to the greatest extent possible commenters' actual input.

a) Aesthetics

Scoping input was received regarding the existing environmental setting, which includes: Daytime and nighttime views of the Hatchet Ridge Wind Project, which are described as visible

from Interstate (I)-5 and locations in Modoc and Siskiyou counties; two major transmission lines that are described as "crisscrossing" the Montgomery Creek/ Round Mountain community before connecting to the regional grid PG&E's Round Mountain substation; the Fountain Fire burn scar; and SR 299. Scoping input regarding regulatory setting suggests that the County consider the General Plan section that addresses the visual effects of all new development.

Scoping input expressed general concerns about impacts to existing daytime and nighttime views, the potential to limit the possibility of SR 299 being designated a scenic highway at some point in the future; and requests to analyze potential changes to views from nearby homes (including private properties in Moose Camp) and to views from geographic locations (including SR 299, Round Mountain, Oak Run, Burney, Mount Shasta, Castle Crags State Park, Redding, Bella Vista, Palo Cedro, Anderson, Cottonwood and I-5, Fall River Mills, Lassen Volcanic National Park, and Big Valley Point).

Commenters suggested that project elements that could trigger changes in aesthetic resources include site preparation activities (e.g., timber removal, road construction), and construction, operation, maintenance, and decommissioning of the proposed turbines, meteorological towers, and overhead power lines. Commenters identified the density and proximity of the proposed turbines to viewers as causing potential impacts, as well as the introduction the motion of turbine blades in the landscape and as perceived as "shadow flicker." Commenters identified the potential for FAA-required safety lighting to affect existing night-sky conditions as a concern for affected residents and other observers. Commenters suggested that temporary disturbances would change views during the time needed for the temporarily disturbed areas to be reclaimed and that permanently-cleared or minimally-revegetated areas (e.g., for the underground and above ground transmission lines) are to be considered. Commenters also suggested that the addition of truck traffic where now there is very little traffic at all would affect the scenic character of the area.

To assess potential cumulative effects, commenters identified the following for inclusion as part of the cumulative scenario specifically with respect to aesthetics: The Hatchet Ridge Wind Project and its impacts, including shadow flicker across SR 299.

To mitigate anticipated impacts to aesthetics, commenters suggested consideration of the following measures: eliminating turbines, relocating them north of SR 299, relocating them further south of SR 299, increasing setbacks, and painting turbine towers and blades a color other than white or with a pattern would have less visual impact.

b) Agriculture and Forestry Resources

No scoping comments were received regarding agriculture resources. Scoping input received regarding forestry resources noted that the site is subject to herbicide use and thinning under existing (baseline) conditions and included expressions of concern that the development of a wind project on the proposed site would: 1) remove trees that have taken years to recover from prior wildfire events, 2) result in tree removal on a much greater scale than if commercial timber harvesting were approved, and 3) result conversion to non-timber-producing use, where the forest conversion could lead to loss of nutrient-rich topsoils, disrupted nutrient cycling, and increased erosion.

To assess potential cumulative effects, commenters identified the following for consideration as part of the cumulative scenario specifically with respect to forestry: the growing scarcity of productive forest lands through timberland conversion, harvesting associated with timber harvesting plans (THPs), and the devastating impacts of recent forest fires, drought, and tree mortality in Shasta County and nearby areas.

c) Air Quality

Scoping input from the Shasta County Air Quality Management District advises the County that the AQMD typically refers to California Health and Safety Code Section 41700 as the guideline when dealing with prohibited discharges, and nuisance complaints, but has not specifically defined "substantial." Regarding the regulatory setting, the AQMD also recommends the following for the County's consideration: Protocol for Review- Land Use Permitting Activities (Nov. 2003), Environmental Review Guidelines- Procedures for Implementing CEQA (Nov. 2003); and Rule 3:2 (Specific Air Contaminants), Rule 3:16- (Fugitive Emissions), Rule 3:31 (Architectural Coatings) and Rule 3:32 (Adhesives and Sealants). Further, all heavy equipment operating on site must be registered under the State of California Portable Equipment Registration Program; on site fuel dispensing and storage must meet California Phase 1 vapor recovery requirements; and, in the event that operations are being conducted in an area containing naturally occurring asbestos, a plan shall be submitted that meets the requirements of the Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations.

Other air quality-related scoping comments related to the proximity of residential receptors to project emissions from construction materials delivery vehicles (including wide or "super" loads for turbine components) originating outside the county, secondary impacts resulting from increased emissions from other vehicle delays resulting from traffic controls and lane closures required for materials delivery, emissions from construction worker commute trips and construction vehicles, on-site vehicle and equipment emissions for site preparation-related timber harvesting, and dust. Comments noted that dust would be caused by construction work, travel on Project roads in and near Moose Camp (resulting in declining attendance of functions at the social hall and events that include cooking and eating outdoors). One comment noted that the prevailing south-west winds of summer would exacerbate the Project's anticipated dust-related impacts. Another expressed concern that water truck-based applications would not be sufficiently effective in reducing dust impacts during construction or during the life of the Project thereafter.

d) Biological Resources

Scoping input received regarding the environmental setting for the analysis of biological resources identified the fact that the Project site that was replanted after the Fountain Fire, and is maintained with herbicide use and thinning. Existing invasive species in the area include: Scotch Broom, Pampas Grass, Star Thistle and Johnsongrass. Further, the Project area abuts both the Lassen National Forest and the Shasta-Trinity National Forest.

Regarding data inputs to be considered in the analysis, one scoping commenter questioned whether the Applicant's bird point count surveys adequately estimate all avian species that use the project area due to an inconsistency with recommendations in guidance published by the California Energy

Commission. Another commenter suggested that bird count surveys should (but so far do not) account for sand hill cranes' seasonal migration in early spring and late fall. More information was requested about why avian surveys were not conducted of nighttime migration for the Sandhill crane, in light of anecdotal evidence that the migration of this species descends into the proposed turbines' rotor range during storm events in winter. Nighttime migration survey methods (including radar, acoustical and near-infrared) were recommended. Further, scoping comments mention wolverine sitings on Hatchet Ridge, crossings of SR 299, and presence in the Tahoe National Forest, scoping comments suggest that these sitings could indicate recolonization of this species' California habitat may be in progress and, on this basis, request furbearer studies. Other input notes that site terrain and landforms are distinguishable from the Hatchet Ridge Wind Project site, and so information from that project site should be considered with caution in the context of this site. Finally, recognizing that the Project site has the potential to support aquatic, riparian, or wetland habitat, one commenter requested that a preliminary jurisdictional delineation be provided of lakes, streams, and associated riparian habitats potentially affected by the Project including wetlands identification pursuant to the U.S. Fish and Wildlife Service's definition of "wetland" as adopted by the California Department of Fish and Wildlife.

Regarding the regulatory setting, scoping input identifies the following laws as relevant to the analysis: The Endangered Species Act (ESA), Migratory Bird Treaty Act (MBTA), and the Bald and Golden Eagle Protection Act (BGEPA).

Potential impacts of concern identified relate to all manner of flora and fauna, including:

- Vegetation, wetlands, and whether the analysis would consider streams, creeks, peats, bogs and meadows and aquatic habitat for brook trout and other fish;
- Rare, threatened, and endangered plants, and California rare plants that were identified as existing near the northern part of the Project area on U.S. Forest Service lands;
- Elderberry longhorn beetle identified in scoping comments as present along SR 299;
- Fully-protected animals (e.g., ring-tailed cat);
- The pack of gray wolf near Lassen National Park (federally/State endangered);
- Species of Special Concern;
- Invertebrates/insects, fish, amphibian (frogs, salamanders), reptiles, and other wildlife species (birds, mammals);
- common wildlife species (game, non-game, specially-protected species, etc.) also were identified in comments as present in the Project area, including rabbits, fox, raccoon, California Brown bear, wolverine, American marten, badger, mountain lion, bobcat, Rocky Mountain elk, and deer; and
- Wildlife corridor/movement areas and other key seasonal use areas.

Scoping input identifies several avian species in the Project area, including nesting and other raptors (i.e., bald eagles, golden eagles, red-tailed hawks, red kite, osprey, Northern goshawk, Northern spotted owl, great grey owl); Species of Special Concern (e.g., olive-sided flycatcher

and yellow-headed blackbird); yellow warbler, migrating and other waterbirds and fowl (i.e., Sandhill crane, which migrates in early spring and late fall, white pelican, heron, hooded merganser, swan, Canadian geese, and mallards) and other birds, including hummingbirds, woodpeckers, mountain jays and crows.

Scoping comments request that the analysis consider the potential for the proposed turbines to result in mortality, injury, or displacement or other adverse impacts to the avian species that inhabit, nest in, pass or migrate through, or forage within the Project area. Scoping comments request that the analysis estimate the number of birds that would be killed by collisions with different sizes of towers and at different tower densities and layouts and the potential for disturbance to nest sites and foraging habitat from increased human intrusion from traffic, noise, road widening, and the construction of ancillary facilities and structures. Regarding the hoary bat and other bats, scoping input recommends consideration of the work of Curt Babcock. Other input refers to studies suggesting that changes in electric field and air pressure effects in the vicinity of turbine blade tips can burst the capillaries in the lungs of bats that fly near them, and request that the analysis evaluate this potential impact.

Other temporary and permanent impacts of concern were identified as relating to forest habitat, habitat fragmentation, edge effects associated with new or wider roads and other cleared areas, and the potential for the proposed vegetation clearing to increase the amount of light that penetrates the forest floor, which may result in displacement and changes in species composition. Scoping input also suggests that the proposed diversion of water to construct the project would negatively impact biodiversity and that the Project could contribute to cyanobacteria/toxic algae that would harm members of the community. Other impacts identified as being of potential concern relate to Project activities' potential to spread invasive species; introduce noise that, at even moderate levels (40-60 dB) is associated with physiological and behavioral changes in birds, terrestrial mammals, amphibians, and bats; introduce "infrasound," which is sound waves with frequencies below the lower limit of 20Hz that may affect the behavior and well-being of animals including geese, worms, chickens and cows; introduce hazardous features that could trap, displace, or lead to death of wildlife; and introduce artificial lighting that could have adverse impacts to birds and nocturnal species. Scoping comments asked whether the proposed red blinking light technology would disrupt the normal, natural balance of the ecosystem based on comparability to products as "Nite Guard Solar-Powered Night Animal Predator Light," which is claimed to successfully deter and frighten nocturnal species such as owls, coyotes, opossum, raccoons, fox, bobcats, muskrats, bears, cougar, wild boar, mink and weasels. Fisheries dependent on the water quality afforded by the existing ecosystem, scoping input suggests, would be disrupted by the proposed construction activities.

For inclusion in and consideration as part of the cumulative scenario specifically for biological resources, scoping input identifies the permanent and temporary reduction of several thousand acres of habitat as a result of timberland conversion, fires, drought and tree mortality; other sources of avian mortality including buildings, windows, and domestic cats; other sources of bat mortality including mosquito abatement projects dating back to the 1960s; and trend data indicating declines in populations for species such as spotted owl, goshawk, and English peak greenbriar.

Scoping input identifies potential mitigation measures to avoid or reduce potential impacts to biological resources, including whether painting turbine towers and blades a color other than white or with a pattern could reduce bird strike impacts, whether the color of the FAA security lighting could be changed to reduce the attractiveness to birds; and whether a greater carcass search distance could be imposed than previously required to more accurately quantify avian mortality.

e) Communication Interference

Scoping input requests that the EIR analyze whether Project components such as wind turbines or meteorological towers could cause communications interference that adversely affects residents' and others' ability to coordinate with emergency service providers via cell phone, 2-way radio, landlines, or the internet. One comment also asked about potential interference with television reception. Concerns were raised specifically regarding potential interference with the communications infrastructure and communications needs of SHASCOM (the Shasta Area Safety Communications Agency), California Highway Patrol, air ambulance service providers such as PHI and REACH, aviation companies that use the flight path over the proposed site, and Valley Industrial Communications, which repairs and handles repeaters and radio problems for public safety entities such as the Sherriff's Office and SHASCOM.

f) Cultural

Scoping input received regarding Tribal Cultural Resources is summarized in subsection s), below. Scoping input about cultural resources more generally suggests that analysts inquire with the California Historical Research Information System (CHRIS) regarding archeological records, and with the Native American Heritage Commission regarding sacred lands file research and tribal consultation. Potentially affected historic resources were identified as including Moose Camp, official historical sites on the Buffum Homestead that were certified after the 1992 Fountain Fire, and a cabin within the Project site that was built in the 1800s that would have to be demolished. The potential to disturb human remains including Indian burials and burial sites also was identified. Mitigation measures were recommended relating to the potential for inadvertent discoveries and regarding the disposition of non-burial recovered cultural items. Caltrans asked whether a historic resource recordation area report would be required and, if so, requested inclusion in conversations regarding any proposal to include SR 299.

g) Economic and Social Impacts

Expressly in the context of CEQA Guidelines Section 15131(a)'s "chain of cause and effect" provision, the County received scoping input suggesting that the project's impacts to existing scenic vistas would have a detrimental effect on property values that would cause a reassessment of property values and corresponding loss in tax revenues relative to current conditions. Input from a forensic appraiser in Wisconsin was received, and requests for a guarantee of compensation against property loss relating to the Project were made. Additional input was received suggesting that a pattern of behavior exists of targeting socio-economically suppressed areas, and exploiting them for personal gain.

h) Energy

Scoping input received regarding the environmental setting for the analysis of energy, including energy efficiency, includes seven hydropower plants in the Project area (Pit #1 through Pit #7) with additional hydropower plants including the ones located at Shasta Dam, Spring Creek Power plant, Judge Francis Carr Powerhouse, Trinity Dam and Keswick Dam; as well as five privately owned hydropower plants in Shasta County, including Balta on Battle Creek, Kilarc on Cow Creek, Hat Creek, Roaring Creek and Haynes Burney Creek. The existing energy setting also includes Wheelabrator and cogeneration power plant facilities in Shasta County.

Scoping commenters request that the analysis consider fuel use for construction equipment, backup power generation, construction vehicles, and worker transportation to/from the Project site as well as for vehicles idling on SR 299 during materials delivery and as required to start/re-start a turbine. Other comments request disclosure of the difference between estimated and actual power generation from the turbines, including an explanation of the existing sources of energy that would be replaced by this Project; and consideration not only of whether water diverted for Project use would reduce the water going through existing hydropower plants, but also that the transmission of power over long distances is not efficient.

i) Geology and Soils

Scoping input received regarding the environmental setting for geology and soils suggest that landslides and road collapses are not uncommon in the project area and identify the presence of Montgomery Creek formations, which are described as “extremely permeable” primarily alluvial fan deposits of sand and mixed rocks. Comments question whether such deposits are suited for the proposed foundations, suggest that the compaction that would be needed to provide road access throughout the site could alter the current underground water flows to Class 1 streams, and note that applications of pesticides could degrade water quality. A “full geological investigation” is requested to address movement of water throughout the geology.

j) Greenhouse Gas Emissions and Climate Change

The County received scoping comments regarding the existing environmental setting for the evaluation of impacts relating to greenhouse gas (GHG) emissions and climate change, including about annual rainfall assumptions and annual average wind speed.

Input also expressed concern that operation of the wind turbines could result in “localized atmospheric warming” (also referred to as a “heat island effect”) that would affect the snow pack and temperatures required to grow apples. The possibility also was raised that the wind turbulence of turbines located along ridge lines could impact local weather by disrupting normal air flow over ridge tops, that spinning turbine rotors increase the vertical mixing of heat and water vapor, thereby affecting downwind meteorological conditions, including rainfall.

Multiple scoping comments requested disclosure of the Project’s net effect on GHGs, including any reduction of other green sources of energy production (such as local hydroelectric capacity that would have to be throttled back during the operation of the proposed turbines) and any reduction in the site’s GHG sequestration capacity caused by the temporary and permanent

removal of thousands of acres of forest. Comments also requested that the analysis provide a "cradle-to-grave" carbon lifecycle analysis that factors in emissions associated with the mining, manufacture, transportation, and construction of turbines, concrete, rebar, and other materials for the Project.

k) Hazards and Hazardous Materials

Scoping input relating to Hazards and Hazardous Materials suggest consideration of Shasta County's local hazard mitigation plan, which addresses wildfires and other hazards. Potential causes or contributors to hazards were identified as increased truck traffic on Moose Camp roads, activities that would disturb natural deposits of arsenic (which could be released to surface waters), and equipment that could leak of toxic chemicals or flammable oils (such as transformers, turbines, or batteries).

l) Hydrology and Water Quality

Scoping input regarding the existing environmental setting for Hydrology and Water Quality identify a host of headwaters, surface waters, and other sources of drinking water in the Snow Mountain area, including: Hatchet Creek, Montgomery Creek, the South Fork of Montgomery Creek, Goat Creek, Indian Springs, Willow Creek, Cedar Creek, Blue Lake, Little Cow Creek, the North Fork of Little Cow Creek, Mill Creek, Cheddar Creek, Sawdust Creek, and Buffum Creek. Drinking and agricultural water for the 20-family community of Wengler is pulled from Roaring Creek through the Vaughn Ditch. Area waters also are used for recreational activities (swimming and fishing) as well as for aquatic habitat.

There are three existing wells in Moose Camp that provide water for domestic use; an additional well is located at the Caltrans Hillcrest Rest Area. Existing groundwater quality is described as full of iron and minerals that make the water from some wells unsuitable for gardening or domestic use. There is one fire hydrant in the area; it is located at the Halcumb Cemetery in Montgomery Creek.

Regarding the regulatory setting, scoping input requests the use of current reports or other information from the water board regarding the present status of the water table and the Pit River watershed.

Many comments expressed concern about potential impacts to existing water rights and water supplies (including creeks, rivers, ditches, springs, and wells) resulting from hydrologic disturbance caused by construction and other stresses on the aquifer from temporary and permanent clearance of timber, road widening, application of gravel to ground surfaces, compaction of earth, cable trenching and related clearance, transmission line infrastructure and related clearance, excavation for foundations including the burying of concrete, blasting, and Project-caused vibration. Because soils in the area are broken "volcanic rock, fragile and extremely fast draining," there is widespread concern that the use of heavy equipment could change the direction of underground water flows. Concerns about potential impacts caused by Project-related water use (e.g., for dust suppression) were raised, as were concerns about the potential for Project activities to contaminate area waters due to erosion and runoff from

construction-related soil disturbance in the watershed, hazardous materials that could leak or drip onto the ground and then migrate to area waterways or wells, or the proposed use of Round Up, similar defoliants, soil sterilants, or herbicides to clear or maintain land within the Project site.

Regarding cumulative effects specifically to hydrology and water quality, scoping input recommends consideration of onsite and offsite water courses and springs, sediment yields, and water quality in light of existing stresses on area waters, including from illegal marijuana grow operations' water demand and pesticide use (e.g., carbofuran, and neurotoxic insecticide) which contaminate the water.

m) Land Use and Planning

Scoping input asked whether the Project would be consistent, or would conflict, with Shasta County Code Section 17.92.025 regarding use permits for high voltage electrical transmission and distribution projects.

n) Noise and Vibration

Scoping input identified existing potential receptors in Moose Camp that could be affected by increased noise and vibration during the Project's construction, operation, and maintenance. Comments suggested that noise could result from additional vehicles traveling along the main road proposed between the two substations (which would abut residential property) and along the three roads that surround Moose Camp's fence line, from heavy equipment and from the proposed concrete plant; from operation of the turbines (including low frequency sonic and infrasonic noise caused by the blades combined with the creaking and groaning of the structures) and from operation of the power lines (described in scoping comments as the "hissing sound," "constant buzz" and "sizzle and pop" audible in winter or when it is cold or moist). Vibration could be caused by operation of the turbines.

o) Public Health

Scoping input described the existing environmental setting for the EIR's consideration of potential impacts to human health as including the identification of Shasta County and the Round Mountain area as having the highest rates of cancer, neurological disorders, suicide, osteoporosis, and dementia in the state; and the fact that the intermountain community is made up primarily of older citizens, who may be more susceptible to health impacts.

Scoping comments specifically identified questions or concerns relating to blade throw, ice throw, the potential exacerbation of dust-related allergies, and for light pollution to compromise health. Other scoping comments identified concerns relating to electromagnetic radiation (EMF) from high voltage power lines and turbines and their potential to cause neurological problems, cancer, Alzheimer's disease, dementia, Parkinson's disease, and depression. Other comments identified shadow flicker and its potential to trigger epileptic seizures, migraines or affect mental health. Some comments focused on infrasound (i.e., sound waves with frequencies below the lower limit of 20Hz) and the potential it may have to cause neurological and physiological disorders resulting in feelings of sea sickness, annoyance, fatigue, pressure or tinnitus (ear ringing), sleep disturbance or sleeplessness, headaches, or vibroacoustic disease. Other scoping

input identified the use of glyphosate weed killers such as Roundup as having potential to cause cancer and/or deoxyribonucleic acid (DNA) disruption, resulting in sterility and deformities. Concerns about an unspecified condition called "wind turbine syndrome" also were raised as having the potential to cause sleep disturbance, headaches, tinnitus, a sense of quivering or vibration, dizziness, nausea, nervousness, high blood pressure or rapid heartbeat, difficulty with concentration, memory loss, irritability and anger, and seizures.

Potential mitigation measures proposed in scoping comments to address potential health impacts include not build high-powered lines within 1,000 feet of any existing residence and increasing setbacks to 1,500 feet, filtering inverters, and burying collector lines.

p) Public Services

Scoping input regarding Public Services in the Project area note that Cal OES provides community support, including disaster response and recovery, that the local community is served by a volunteer fire department (the Montgomery Creek Fire Company). Concerns expressed relating to Public Services include potential inhibition of the use of the emergency flight care helipad in Moose Camp for transport of sick or injured from Alturas to Redding, preclusion of the use for emergency egress to SR 299 of the road outside the yellow gate to the west of Moose Camp, and whether water diverted for Project use would reduce the water source serving the only fire hydrant in the Project area (located at the Halcumb Cemetery in Montgomery Creek).

q) Recreation

Although there are no parks in the project area, scoping input suggests that the Project would affect areas that provide recreation based on swimming, hunting and fishing, hiking, biking, cross-country skiing, snowmobiling, and bird watching.

r) Transportation

Scoping input received regarding the existing environmental setting for the EIR's analysis of transportation suggest that SR 299 is narrow, of steep grade in the Project area, and subject to commercial accidents on a regular basis. Further, there is a road located within 100 feet of Moose Camp that provides the owner of the Lammer Ranch access to SR 299, and has provided emergency ingress/egress for residents of Moose Camp since the 1930s; this road is "seldom used."

Concerns were expressed about the potential for the Project to result in impacts to transportation during construction, operation, and maintenance. During construction, potential impacts could result from the number and size of loads needed to transport and deliver of turbine components (SR 299) and gravel. Delays could adversely affect emergency vehicles trying to get through town; local users of SR 299 and adjoining roads; and commuters heading to Redding for work, entertainment or shopping. The analysis also should consider delays during the time to repair SR 299 post-materials delivery. Potential impacts during operation and maintenance could be caused by members of the general public wanting to get up close to the turbines (as they do for the Hatchet Ridge Wind Project), regular traffic to/from the O&M Facility (which is proposed on a road located within 100 feet of Moose Camp that provides the owner of the Lammer Ranch

access SR 299 and emergency ingress/egress to SR 299 for residents of Moose Camp) and use of the main road proposed between the two substations (which abuts residential property).

s) Tribal Cultural Resources

Scoping input regarding Tribal Cultural Resources note that natural and cultural resources are indistinguishable from the Pit River Peoples and are a central element of the spirituality, traditional ceremonial practices, religious expressions, history, and identity of the Tribe and Tribal members. Tribal members explain that the Tribe and its nation have deep ties to the area, which they describe as a place of refuge, ceremony, healing, prayer, fasting, hunting, gathering, and other sacred traditional uses. Burial grounds are believed to present in the Project area. Tribal members express concern that the construction, operation, and maintenance of the Project could infringe on the freedom of religion and the cultural practices of the Pit River Tribe and other Indian Tribal Nations in the region and that the Project could adversely affect sacred sites, traditional plants, and the viewshed of mountains held sacred by the Tribe including Yet-Tey-Cha-Na (Lassen Peak) and Kohm Yamani (Snow Mountain). Comments mention an old ridgetop trail connects the Pit River to Goose Valley to the Lassen area and has traditionally been, and continues to be, used to reach remote areas during vision quests. The ridge also is identified as a boundary between the Itsatawi, Madesi and Atsugewi Bands. Birds traditionally important to the Pit River culture (such as eagles and eagle nests, osprey, ducks, and geese) cross the ridge and could be injured or killed by the turbine blades. Deer also migrate across the ridge. Commenters suggest that sounds generated by the Project could disrupt bird and animal patterns, as well as human experiences in the area. Existing conditions identified in comments as contributing to ongoing impacts to tribal cultural resources include burdens from power generating activities associated with the Hatchet Ridge Wind Project, power lines, dams, and PG&E hydroelectric activities.

Scoping input identifies sources of information and relevant regulation of impacts to Tribal Cultural Resources as including federal and state statutes, declarations, executive orders, resolutions, decrees, and conventions; guidance documents provided by the Native American Heritage Commission; and, regarding the ridgetop trail, old General Land Office Maps. The Tribal Historic Preservation Officer (THPO) from the Susanville Indian Rancheria asked whether it is too late to request consultation under AB 52.

t) Utilities and Service Systems

Regarding Utilities and Service Systems, scoping comments ask whether existing electrical infrastructure is adequate to transmit electricity to be generated by the Project reliably and safely once it hits the Round Mountain station operated by PG&E. It is suggested that these lines are at or over electrical capacity during peak times 7 months or more of the year.

u) Wildfire

Scoping input received regarding the existing environmental setting for the EIR's analysis of potential impacts related to wildfire note that the Project is proposed in an area designated by the California Department of Forestry and Fire Protection as a "State Responsibility Area (SRA)," as

a "Very High Fire Hazard Severity Zone (VHFHSZ)," and as within approximately 1.5 miles of the 1992 Fountain Fire at Round Mountain. Existing conditions are windy; the terrain is (up to 25 percent grade). There is a history of lightning strikes and fires, both natural and human-caused, in the area. Options for ingress and egress are limited. Furthermore, the existing forest, which was planted after the Fountain Fire, is mostly pine. Trees are approximately 20-30 feet tall and grow 3-4 feet apart, deer brush and manzanita grow in the understory, and years of pine needles cover the forest floor. It is suggested that the current owners will not allow controlled burns to occur because of the timber value. Regarding the regulatory setting, scoping comments note that Shasta County recently prepared a local hazard mitigation plan that addresses wildfires and other hazards.

Potential Project-related ignition sources identified in scoping comments include: road-building activities (e.g., scraping, grinding, blasting), installation and operation of new electrical infrastructure, the use of existing transmission lines that may sag and reduce vegetative clearance, and addition of turbines in the landscape that might act as lightning rods or malfunction, igniting a fire at such a height that it cannot easily be extinguished. Commenters note that the largest wildfires in the State began under transmission lines, including the Fountain Fire for which this Project is named. Other potential impacts identified include the exacerbation of existing challenges to aerial firefighting by the Forest Service and others, including restrictions on flying near turbines or dropping fire retardant; wildfire impacts on equipment, roads, culverts, fencing, runoff (water quality), and wildfire visual impacts to adjacent landowners.

Suggested mitigation measures include tending the forest before any major construction starts and planting trees appropriate distances apart rather than brush (even if the brush is native to the area). Scoping input suggests that the cumulative scenario for wildfire-related impacts should include ongoing impacts of the Fountain Fire of 1992 and the Camp and Carr fires of 2018.

v) Alternatives

Scoping comments regarding potential alternatives suggested that the EIR evaluate:

i. No Project alternative

ii. Reduced-project alternative (i.e., with fewer turbines and/or a more concentrated placement of turbines);

iii. Modified project alternative that restricts turbines to at least 1 mile from the Moose Camp fence, or moves them to the south relative to the existing proposal or north of SR 299;

iv. Alternative sites, such as off-shore in Central California or on-shore in Modoc County, Tehama County, Contra Costa County's Altamont Pass, Kern County's Tehachapi Pass, Riverside County's San Gregorio Pass, or someplace with less carbon sequestration potential than the proposed conifer and deciduous forest location or repowering the Applicant's existing wind facilities (including Dillon, Tule Wind, Phoenix Wind, Manzana Wind, Mountain View III, and Shiloh);

v. Alternative technologies, such as solar, cogeneration, or increasing hydroelectric generating capacity at existing Shasta County facilities); and

vi. Alternative approaches, including conservation and demand side management and improving the efficiency of existing infrastructure for the delivery and storage of excess power already generated in California.

w) Cumulative Scenario

The EIR will analyze the potential for the Project's impacts to combine with the incremental impacts of other projects to cause or contribute to significant cumulative effects. The cumulative scenario will include ongoing impacts of past projects, as well as the impacts of other present and reasonably-foreseeable, probable future projects. Scoping input suggests that the cumulative scenario should include:

- Timber Harvesting Plans (THPs), including the Terry Cloth 144-acre 99 percent clear-cut THP approved in 2015 along Hatchet Ridge;
- Other wind energy projects, including the Hatchet Ridge Wind Project as well as wind projects in Solano County, the Altamont Pass, and Tehachapi Pass;
- Other power lines, including PG&E's lines into and out of the substation where the Project would connect;
- The area's fire history, including the Carr, Hirtz, and Delta fires as well as the Montgomery Creek fire that occurred in August 2018;
- Other natural events, including volcanic eruptions
