CalEEMod® provides a simple platform to calculate both construction emissions and operational emissions from a land use project. It calculates both the maximum daily and annual average emissions for criteria air pollutants as well as total or annual GHG emissions. The model also provides default values for water and energy use.

CalEEMod® contains default values and existing regulation methodologies to use in each specific local air district regions. Appropriate state-wide default values can be utilized if regional default values are not defined. Ramboll used default factors for the Riverside County area that is within the SCAQMD jurisdiction for the emission inventory, unless otherwise noted in the methodology descriptions below. Details regarding the specific methodologies used by CalEEMod® can be found in the CalEEMod® User's Guide and associated appendices.[15] The CalEEMod® output files are provided for reference in **Appendix A** to this report.

3.2 Construction Emissions

This section describes the estimation of emissions from construction activities at the Project Site. The proposed plan for the Project anticipates that warehouse construction will occur across five phases, beginning in 2020. This analysis assumes construction begins in mid-2019. This is conservative, as emission factors improve in future years and; therefore, actual construction emissions will be lower than shown in this report. Construction for the Cactus Channel improvements could occur contemporaneously with the project or separately depending on permitting and timing. For purposes of this analyses we have conservatively assumed that construction associated with Cactus Channel would occur at the same time as the warehouse construction in 2019 and 2020.[16]

The major construction phases for the Project warehouse included in this analysis are:

- Site Preparation: involves clearing vegetation (grubbing and tree/stump removal) and stones prior to grading. It also involves some rough grading and utility installation.
- Grading: involves the cut and fill of land to ensure the proper base and slope for the construction foundation.
- Building Construction: involves the construction of structures and buildings.
- Architectural Coating: involves the application of coatings to both the interior and exterior of buildings or structures.
- Paving: involves the laying of concrete or asphalt such as in parking lots or roads.

There will not be a demolition phase for this development since the construction will occur on previously undeveloped land. Emissions from these construction phases are largely attributable to fuel use from construction equipment and workers commuting to the Project site.

The construction for Cactus Channel improvements is classified as site preparation in CalEEMod® and will include excavation and box culvert installation activities.

[15] CAPCOA. 2017. California Emissions Estimator Model User's Guide. Version 2016.3.2. November. Available at: http://www.caleemod.com/. Accessed: August 2018.

[16] The emissions analysis assumed a construction start year of 2019; therefore, emissions presented in this report conservatively represent emissions for the actual construction in 2019 and 2020.

DRAFT

Construction-related emissions of ROGs, NO_X, CO, SO_X, PM_{10}, and $PM_{2.5}$ were estimated using CalEEMod®. PM emissions are composed of exhaust emissions and fugitive emissions. Exhaust emissions are typically given out by a combustion engine of on-road vehicles and/or off-road equipment. Fugitive emissions are PM dust suspended in the air by wind action and construction related activities. Default on-site equipment lists in CalEEMod® supplemented with Project specific grading equipment were used for the various construction phases.

Ramboll's analysis was based on a mix of project specific estimates including the numbers and types of equipment that will be used in the construction of the Project as well as the duration of the different construction phases. The construction equipment parameters (horsepower, load factor, and hours of operation) and worker/vendor trip amounts were based on CalEEMod® default data. Vendor trips include vehicles such as water trucks and concrete trucks. The hauling trip amounts were estimated using project specific data for volume of soil imported/exported and the CalEEMod® default assumption for haul truck capacity of 16 cubic yards per truck. Worker and vendor trip distances are based on CalEEMod® default assumptions. The haul trip distance for the warehouse construction soil import is 3 miles, based on Project specific data. The haul trip distance for Cactus Channel construction soil export is based on CalEEMod® default assumptions. The Project area was assumed to be developed over a two-year time frame commencing in 2020. This analysis assumes construction begins in mid-2019. This is conservative, as emission factors improve in future years and; therefore, actual construction emissions will be lower than shown in this report. The construction schedule and equipment lists are shown in **Tables 3 and 4**, respectively. The CalEEMod® output files are i`ncluded in **Appendix A**.

3.2.1 Emissions from Construction Equipment

The emission calculations associated with construction equipment are from off-road equipment engine use based on the equipment list and phase length. The fugitive emissions from off-road equipment performing work are also included in this analysis.

Since the majority of the off-road construction equipment used for construction projects are diesel-fueled, CalEEMod® assumes all of the equipment operates on diesel fuel. The calculations associated with construction equipment include the running exhaust emissions from off-road equipment. Since the equipment is assumed to be diesel, there are no starting or evaporative emissions associated with the equipment as these are *de minimis* for diesel-fueled equipment. CalEEMod® calculates the exhaust emissions based on default values for horsepower and load factor from ARB's OFFROAD2011 model.[17]

CalEEMod® was also used to calculate fugitive dust associated with the site preparation and grading phases from three major activities: haul road grading, earth bulldozing, and truck loading. For fugitive dust calculations during grading and site preparation, the maximum number of acres graded in a day is determined by the number of grading equipment, which is assumed to operate for 8 hours. PM_{10} and $PM_{2.5}$ emissions from fugitive dust will be controlled by watering the construction site twice daily in accordance with the construction regulatory measures. CalEEMod® defaults assume watering the construction site twice a day reduces the fugitive dust emissions by 55%.

[17] CAPCOA. 2017. California Emissions Estimator Model User's Guide. Appendix A. Page 32. Version 2016.3.2. November. Available at: http://www.caleemod.com. Accessed: August 2018.

DRAFT

3.2.2 Emissions from On-Road Trips

Construction generates on-road vehicle exhaust (including evaporative emissions) and entrained road dust emissions from personal vehicles for worker/vendor commuting and trucks for soil/material hauling. These emissions are calculated in CalEEMod® based on the number of trips and vehicle miles traveled (VMT) along with emission factors from EMFAC2014. The numbers of worker and vendor trips represent defaults from CalEEMod® based on the construction equipment to be used. The number of haul trips was estimated based on the volume of soil to be imported (220,000 cubic yards) and exported (60,000 cubic yards) the CalEEMod® default assumption for haul truck capacity of 16 cubic yards per truck.

The mobile source emissions were calculated using trip rates and lengths, as well as emission factors from EMFAC2014 as outlined in the CalEEMod® user's guide.[18] Details regarding on-road trips generated during the construction phase are presented in **Table 5**.

3.2.3 Emissions from Architectural Coating

VOC or ROG off-gassing emissions result from evaporation of solvents contained in surface coatings, such as paint. CalEEMod® calculates the VOC evaporative emissions from application of residential and non-residential surface coatings.

Unmitigated emissions for coating categories were calculated based on default VOC content data from CalEEMod®, which was provided by the air districts, including SCAQMD where the Project would be located. The CalEEMod® default VOC content for SCAQMD is based on SCAQMD Rule 1113. Mitigated emissions reflect the use of Super Compliant coatings with a VOC content less than 10 g/L VOC (MM-AQ-2).[19]

3.2.4 Emissions from Paving

CalEEMod® estimates VOC off-gassing emissions associated with asphalt paving of parking lots.

3.2.5 Maximum Daily Emissions from Project Construction

The daily unmitigated and mitigated emissions estimated due to construction of the Project are summarized in **Tables 6a and 6b**, respectively. The estimated emissions show that the regional daily emissions for unmitigated construction are less than the SCAQMD mass daily significance thresholds for CO, SO_X, PM_{10}, and $PM_{2.5}$, and greater than the SCAQMD mass daily significance thresholds for VOC and NO_X. The Project will utilize Super Compliant coatings with a VOC content less than 10 g/L VOC[20] as a mitigation measure (MM-AQ-2) to reduce VOC emissions to below the applicable significance threshold as shown in **Table 6b**. The Project will also use Tier 3 equipment and up to 50% Tier 4 Final equipment as a mitigation measure (MM-AQ-1) to reduce NO_X emissions to below the applicable significance threshold as shown in **Table 6b**. Therefore, under the mitigated scenario, the project's construction impacts are all below SCAQMD mass daily significance thresholds for all pollutants.

[18] CAPCOA. 2017. California Emissions Estimator Model User's Guide. Appendix A. Page 37. Version 2016.3.2. November. Available at: http://www.caleemod.com. Accessed: August 2018.

[20] ibid.

DRAFT

The construction emission estimates are assumed to conservatively represent the maximum emissions for the Project because the calculation accounts for the overlapping construction phases as discussed above. The maximum daily emissions are not expected to be higher than that estimated given the conservative assumptions included in this analysis.

3.3 Maximum Daily Emissions from Project Operation

Operational emissions are emissions that would occur after build-out of the Project. This analysis identifies operational emissions for source categories including area sources, energy use, and mobile sources. The criteria air pollutant operational mass emissions of VOC, NO_X, CO, SO_X, PM_{10}, and $PM_{2.5}$ from area sources and energy use were estimated using CalEEMod®. The CalEEMod® output can be found in **Appendix A**. Mobile source emissions associated with employee commute and truck deliveries were estimated using project-specific traffic data and emission factors from EMFAC2017. There is no operational activity associated with the Cactus Channel, hence operational emissions are zero.

3.3.1 Area Sources

Area sources are those emissions that are generally too small to be uniquely identified as point sources, and are thus generally aggregated as a group. CalEEMod® estimates emissions for the following sources, which are included under the category of "area" sources: landscaping equipment (e.g., lawn mowers), consumer products, and architectural coatings. Criteria air pollutant emissions due to natural gas combustion in buildings, could also be considered area sources, but are reported by CalEEMod® in the emissions associated with building energy use (described below). The criteria air pollutant emissions generated by the Project were calculated using CalEEMod® defaults. Unmitigated and mitigated project area source emissions are presented in **Tables 7a and 7b**. Mitigated emissions reflect the use of Super Compliant coatings with a VOC content less than 10 g/L VOC[21] for architectural coatings (MM-AQ-2).

3.3.1.1 Landscaping Equipment

Landscape maintenance includes fuel combustion emissions from equipment such as lawnmowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers, as well as air compressors, generators, and pumps. The mass emissions of VOC, NO_X, CO, SO_X, PM_{10}, and $PM_{2.5}$ associated with landscaping equipment were calculated using the CalEEMod® default emission factors (i.e., grams per square foot per day for non-residential buildings), which were processed using OFFROAD 2011 and ARB's Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment.[22] Based on CalEEMod® defaults, all operational days (i.e., 250 days per year) were assumed to be summer days, with no snow days. Therefore, the emission factors were multiplied by the total building square footage and the number of summer days. Pieces of equipment that would typically be used in snow conditions, such as snow blowers, were assumed to have no operational days.

DRAFT

3.3.1.2 Consumer Products

Consumer products are chemically formulated products used by institutional consumers, including, but not limited to, detergents; cleaning compounds; polishes; floor finishes; lawn and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products; but does not include other paint products, furniture coatings, or architectural coatings. SCAQMD did an evaluation of consumer product use compared to the total square footage of buildings using data from ARB consumer product Emission Inventory. VOC emissions from consumer product use were estimated based on the Project building area along with the default VOC emission rate in CalEEMod®[23] for Architectural Coatings.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers. The operational emission methodology for architectural coating is the same as the construction emission methodology. All land use buildings are assumed to be repainted at a rate of 10% of area per year, based on CalEEMod® default assumptions. Mitigated emissions reflect the use of Super Compliant coatings with a VOC content less than 10 g/L VOC (MM-AQ-2).[24]

3.3.2 Building Energy Use

Criteria air pollutants are emitted as a result of activities in buildings for which natural gas is typically used as an energy source. Combustion of any type of fuel emits criteria air pollutants directly into the atmosphere; when this occurs in a building, this is a direct emission source associated with that building. Unless otherwise noted, CalEEMod® default parameters were used. Climate zone 10, which best represents the County of Riverside, was selected based on the CalEEMod® forecast climate zone map. In California, Title 24 governs energy consumed by the built environment, mechanical systems, and some types of fixed lighting.[25] The Project's criteria air pollutant emissions calculations reflect that the Project is meeting the 2016 Title 24 Part 6 Building Code[26] for nonresidential construction.

Tables 7a and 7b summarize the energy-related criteria air pollutant emissions for the Project.

3.3.3 Mobile Source Emissions

The criteria air pollutant emissions associated with on-road mobile sources are generated by employees and trucks visiting the proposed Project. The emissions associated with on-road mobile sources includes running and starting exhaust emissions, evaporative emissions, brake and tire wear, and entrained road dust. Starting and evaporative emissions are associated with the number of starts or time between vehicle uses and the assumptions used in determining these values are described below. All of the other emissions are dependent on VMT. Ramboll estimated traffic emissions using the trip rates specified in the Project's Traffic

DRAFT

Impact Analysis[27] and trip length as noted below. Emission factors were obtained from EMFAC2017 for Riverside County. EMFAC2017 model outputs are included in **Appendix B**.

This analysis is based on EMFAC2017, which does not quantify CAP emission reductions from the EPA and NHTSA Phase 1 and Phase 2 Heavy-duty Engines and Vehicles Fuel Efficiency Standards. These standards are expected to reduce the emissions estimated from mobile sources. EMFAC2017 only accounts for reductions in GHG associated with these standards. Criteria air pollutant emissions from mobile sources are presented in **Tables 7a and 7b.**

3.3.3.1 Trip Rates

Trip rates are one factor used to calculate Project mobile source emissions. CalEEMod® relies upon trip generation rates by land use types and associated average trip length by trip type to estimate the criteria air pollutant emissions. Urban Crossroads provided trip rates for the Project, as presented in **Table 8.**[28]

3.3.3.2 Trip Length

Trip lengths are another factor used to calculate Project mobile source emissions. Total VMT by mobile sources is estimated as a product of trip rates and the average trip length. The default CalEEMod® trip length of 16.6 miles for commercial-work trips (i.e., trips made by someone who is employed by the commercial land use sector) for Riverside County located within SCAQMD jurisdiction were used for passenger vehicles that represent vehicles used by employees. The trip length for trucks was assumed to be 60 miles based on likely geographical travel by trucks in the South Coast Air Basin.[29, 30] The default commercial-nonwork trip length for trucks in CalEEMod® is 6.9 miles. Therefore, the use of a 60-mile trip length is conservative assumption. Trip lengths and total VMT are presented in **Table 9**.

3.3.3.3 Vehicle Fleet Mix

Vehicle fleet mix is another parameter used to estimate mobile source emissions from Project operation. Each vehicle type has a different emission factor for each pollutant, so CalEEMod® relies upon vehicle fleet mixes by land use type to estimate the criteria air pollutant emissions for each land use. The fleet mix for passenger vehicles was calculated based on the CalEEMod® default fleet mix for the Unrefrigerated Warehouse – No Rail land use in Riverside County (South Coast). Passenger vehicles represent vehicles used by employees to commute to work. The fleet mix for trucks was estimated based on trip rates from the Urban Crossroads Traffic Impact Analysis, with 2-axle trucks further distributed into LHD1 and LHD2 based on the ratio of their CalEEMod® defaults. The vehicle fleet mix is presented in **Table 10**.

3.3.3.4 Mobile Source Emission Factors

Emission factors were obtained from EMFAC2017 for Riverside County. The emission factors used to estimate mobile emissions from running exhaust, running losses, tire wear, and brake wear are presented in **Table 11.** These emission factors are on a "per mile" basis and thus the emissions were calculated by multiplying these factors by the estimated VMT for each vehicle type listed in **Table 9**. The emission factors for starting exhaust and non-running evaporative processes are presented in **Table 12**. These emission factors are on a "per trip" basis and thus the emissions were calculated by multiplying these factors by the estimated number of trips for each vehicle type listed in **Table 8**. The emission factors used to estimate criteria air pollutant emissions from truck idling are presented in **Table 13.** These emission factors are on a "per minute of idling" basis and thus the emissions were calculated by multiplying these factors by the estimated idle duration of 15 minutes per round trip (5 minutes at entry gate, 5 minutes at dock, and 5 minutes at exit gate) for each truck type.[31] Please note that the trip counts shown in **Table 8** are one-way trips; hence these trip counts were divided by two to estimate the number of round trips. Estimated emissions from entrained road dust are presented in **Table 14.** These emissions were calculated by first estimating entrained road dust emission factors for PM_{10} and $PM_{2.5}$ based on the methodology presented in the Paved Roads chapter of USEPA's AP-42 and then multiplying these emissions factors by the total VMT for passenger vehicles and trucks.[32] A summary of the estimated average daily criteria air pollutant emissions is presented in **Table 15**.

3.3.4 Operational Emissions Results

The mitigated and unmitigated maximum regional daily emissions estimated due to Project operations are summarized in **Tables 7a and 7b**. These emissions were estimated using the methodology described above. The estimated emissions sources include area sources (landscaping equipment, consumer products, and architectural coatings), building energy use, and mobile sources (vehicle trips for employee commute and truck deliveries). The primary source of the operational emissions are mobile sources for all pollutants except VOC, where both mobile sources and area sources are the primary contributors to the total emissions. The emissions from mobile sources are expected to gradually decline in the future, as cars become more fuel-efficient due to existing regulations (i.e., EPA and NHTSA Phase 1 and Phase 2 fuel efficiency standards).[33]

The estimated operational emissions show that regional operational maximum daily emissions for the Project in both the unmitigated and mitigated scenarios are less than the SCAQMD mass daily significance thresholds for all criteria air pollutants except NO_X. The primary source of NO_X emissions are mobile sources which include passenger vehicles and trucks. As stated in Section 1.1, the Project will implement a Commute Trip Reduction

[31] Idle duration at any one location is limited to 5 minutes, based on CARB Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. Available at: https://www.arb.ca.gov/regact/idling/idling.htm. Accessed: February 2019.

[32] United States Environmental Protection Agency. 2011. AP-42: Compilation of Air Emissions Factors. Chapter 13.2.1: Paved Roads. Page 4. January. Available at: https://www3.epa.gov/ttnchie1/ap42/ch13/final/c13s0201.pdf. Accessed: August 2018.

[33] This analysis is based on EMFAC2017, which does not quantify criteria air pollutant emission reductions from the fuel efficiency benefits of Phase 1 and Phase 2 of the Heavy-duty Engines and Vehicles Fuel Efficiency Standards. These standards are expected to reduce the emissions estimated from mobile sources. EMFAC2017 only accounts for reductions in GHG associated with these standards.

DRAFT

Program under MM-AQ-5 which will help reduce NO_X emissions from passenger vehicles; however, these reductions would not reduce NO_X emissions to levels below the SCAQMD mass daily significance threshold. Mobile sources are regulated by California Air Resources Board (CARB) and EPA. As stated earlier emissions from these sources are expected to decline in the future, as mobile sources become more fuel-efficient due to existing regulation.

DRAFT

4. LOCALIZED AMBIENT AIR QUALITY IMPACTS

4.1 Localized Significance Thresholds

As discussed in Section 2, LSTs are used to evaluate the localized ambient air quality impacts of on-site Project construction and operational activities. The on-site construction and operational emissions for NO_X, CO, PM_{10}, and $PM_{2.5}$ are compared to their respective LSTs as provided in Appendix C of SCAQMD's LST Methodology.[34] Based on the Project location, the applicable Source Receptor Area (SRA) was identified as SRA No. 23, Metropolitan Riverside County.[35] The thresholds were chosen assuming a Project site area of 5 acres for the total Project emissions (Cactus Channel and warehouse) and a Project site area of 1 acre for Cactus Channel. This is a conservative assumption since the Project site is approximately 35.4 acres and project activities would be spread out across the site and/or further from nearby receptors. The nearest receptor to the Project site is the March Air Reserve Base, located approximately 30 meters south of the site (**Figure 2**). Therefore, the thresholds for receptor distances of 25 meters for each pollutant were used.

Both the estimated maximum unmitigated and mitigated on-site daily emissions for construction are below the SCAQMD mass-rate LSTs for NO_X, CO, PM_{10}, and $PM_{2.5}$. The unmitigated and mitigated construction emissions are compared against the LSTs in **Tables 16a and 16b**. While the exact construction schedule and equipment mix may vary from the current analysis, the maximum daily emissions are not expected to be higher than that estimated, given the conservative assumptions included in this analysis. The unmitigated and mitigated operational emissions are compared against the LSTs in **Table 17**. As summarized in **Table 17**, the estimated operational emissions are also below the LSTs for NO_X, CO, PM_{10}, and $PM_{2.5}$ including the estimated LST related to the 1-hour federal NO_2 standard (0.100 parts per million [ppm]).[36] Since the screening analysis shows that operational and construction emissions are below the mass-rate LSTs, further air dispersion modeling was not required.

The construction emissions are based on conservative assumptions to represent the maximum level of construction activity that may occur on the Project site on a given day. Both the construction and operational LST analyses are based on the combination of maximum emissions that may occur with the worst-case meteorological conditions. Thus, these are conservatively high estimates and may never occur.

4.2 Localized Carbon Monoxide Impacts

Based on the analysis presented below, a CO "hot spots" analysis is not needed to determine whether the change in the level of service (LOS) of an intersection in the Project would have the potential to result in exceedances of the California Ambient Air Quality Standards (CAAQS) or National Ambient Air Quality Standards (NAAQS).

[34] SCAQMD, 2008. Final Localized Significance Threshold Methodology. Appendix C. July. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/appendix-c-mass-rate-lst-look-up-tables.pdf?sfvrsn=2http://www.aqmd.gov/ceqa/handbook/lst/appC.pdf. Accessed: August 2018.

[35] ibid.

[36] The allowable emissions threshold for comparison to the federal NO_2 standard was calculated by scaling the NO_2 LST by the ratio of the federal to state 1-hour NO_2 standards (i.e., LST x [0.10/0.18]).

DRAFT

It has long been recognized that CO exceedances are caused by vehicular emissions,[37] primarily when idling at intersections.[38, 39] Accordingly, vehicle emissions standards have become increasingly more stringent. Before the first vehicle emission regulations, cars in the 1950's were typically emitting about 87 grams of CO per mile.[40] Since the first regulation of CO emissions from vehicles (model year 1966) in California, vehicle emissions standards for CO applicable to light duty vehicles have decreased by 96% for automobiles,[41, 42] and new cold weather CO standards have been implemented, effective for the 1996 model year.[43] Currently, the CO standard in California is a maximum of 3.4 grams/mile for passenger cars (with provisions for certain cars to emit even less).[44] With the turnover of older vehicles, introduction of cleaner fuels and implementation of control technology on industrial facilities, CO concentrations in the SCAQMD have steadily declined.

The analysis prepared for CO attainment in the South Coast Air Basin (SCAB) by the SCAQMD can be used to assist in evaluating the potential for CO exceedances in the South Coast Air Basin. CO attainment was thoroughly analyzed as part of the SCAQMD's 2003 Air Quality Management Plan (2003 AQMP) and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan).[45] As discussed in the 1992 CO Plan, peak carbon monoxide concentrations in the South Coast Air Basin are due to unusual meteorological and topographical conditions, and not due to the impact of particular intersections. Considering the region's unique meteorological conditions and the increasingly stringent CO emissions standards, CO modeling was performed as part of 1992 CO Plan and subsequent plan updates and air quality management plans.

In the 1992 CO Plan, a CO hot spot analysis was conducted for four busy intersections in Los Angeles at the peak morning and afternoon time periods. The intersections evaluated included: Long Beach Blvd. and Imperial Highway (Lynwood); Wilshire Blvd. and Veteran Ave. (Westwood); Sunset Blvd. and Highland Ave. (Hollywood); and La Cienega Blvd. and Century Blvd. (Inglewood). These analyses did not predict a violation of CO standards. The busiest intersection evaluated was that at Wilshire Blvd. and Veteran Ave., which had a daily

DRAFT

traffic volume of approximately 100,000 vehicles per day. The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm[46]. The most recent three years (2014 through 2016) of background 1-hour CO concentrations in the project vicinity range from 1.7 to 2.5 ppm.[47] This indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 380,000 vehicles per day.[48] The Los Angeles County Metropolitan Transportation Authority evaluated the LOS in the vicinity of the Wilshire Blvd./Veteran Ave. intersection[49] and found it to be Level E at peak morning traffic and Level F at peak afternoon traffic.[50]

At buildout of the Project, the highest average daily trips at an intersection would be approximately 228,500 at the Trautwein Road/Alessandro Boulevard intersection, which is below the daily traffic volumes that would be expected to generate CO exceedances as evaluated in the 2003 AQMP. This daily trip estimate is based on the average daily traffic (ADT) rate conditions of the intersection. There is no reason unique to SCAB meteorology to conclude that the CO concentrations at the Trautwein Road/Alessandro Boulevard intersection would exceed the 1-hour CO standard if modeled in detail, based on the studies undertaken for the 2003 AQMP. The supporting data for this analysis is included in **Appendix C**.

4.3 Odors

The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source, the wind speeds and direction, and the sensitivity of the receiving location each contribute to the intensity of the impact. While offensive odors rarely cause any physical harm, they can be unpleasant and cause distress among the public, and generate citizen complaints. According to the SCAQMD, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project does not include any uses identified by the SCAQMD as being associated with odors, and thus the Project does not anticipate any odor impacts.

DRAFT

[46] It is conservatively assumed that 4.6 ppm does not account for background CO concentration.

5. CUMULATIVE ANALYSIS

The cumulative air quality impacts analysis is based on the guidance provided by SCAQMD.[51] "As Lead Agency, the [SCAQMD] uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for toxic air contaminant (TAC) emissions. Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

5.1 Construction Impacts

As discussed above, if the Project exceeds the SCAQMD's recommended significance thresholds for project-specific construction air emissions, then the Project would have a cumulatively considerable increase in emissions for those pollutants.

Construction of the Project would generate VOC and NO_x emissions that would exceed the SCAQMD's emission-based significance threshold (**Table 6a**). MM-AQ-1 and MM-AQ-2 would reduce NO_x and VOC emissions to less than significant levels (**Table 6b**). Therefore, the Project would not have a considerable contribution to the SCAB's nonattainment designation for O_3 and would not cause a new cumulatively significant impact.

Localized air quality impacts of NO_2, CO, PM_{10}, and $PM_{2.5}$ emissions associated with the construction of the Project are expected to be less than significant (**Table 16a and 16b**). Therefore, according to SCAQMD's guidance, the Project's contribution to cumulative localized air quality concentrations of these pollutants would not be cumulatively considerable and; therefore, less than significant.

5.2 Operational Impacts

As discussed above, if the Project exceeds the SCAQMD's recommended significance thresholds for project-specific operational air emissions, then the Project would have a cumulatively considerable increase in emissions for those pollutants. The Project operational emissions would be less than the SCAQMD's threshold for CO, SO_2, PM_{10}, $PM_{2.5}$, and VOC (**Table 7a** and **Table 7b**). For the Project, operational emissions would exceed the SCAQMD's threshold for NO_X emissions, which is attributed to the vehicular source emissions from trucks traveling to the Project site. MM-AQ-2 would be required to reduce VOC emissions from architectural coatings and MM-AQ-5 and MM-AQ-6 would reduce mobile source emissions during Project operations, but not to a level of less than significant. Thus, the Project would have a cumulatively considerable increase in emissions due to operational-related NO_X emissions and the impacts would be significant and unavoidable.

Localized air quality impacts of NO_2, CO, PM_{10}, and $PM_{2.5}$ emissions associated with Project operation would be less than significant (**Table 17**). Therefore, according to SCAQMD's guidance, the Project's contribution to cumulative localized air quality impacts of these

[51] SCAQMD. White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution. Appendix D. DRAFT

pollutants during operation would not be cumulatively considerable and; therefore, less than significant.

5.3 Odor Impacts

With respect to potential odor impacts, the Project does not have a high potential to generate odor impacts during construction or operations. As discussed above, construction and operations within the Project Site are not expected to be a source of odors. Furthermore, the Project would be required by SCAQMD Rule 402 (Nuisance) to implement BACT requirements to limit potential objectionable odor impacts to a less-than-significant level. Thus, potential odor impacts from the Project are anticipated to be less than significant and, consistent with the SCAQMD approach to assessing cumulative impacts, the Project would not result in a cumulative impact for odors.

5.4 AQMP Consistency

The cumulative analysis can also be evaluated in terms of consistency with SCAQMD's AQMP. SCAQMD and the Southern California Association of Governments (SCAG) are jointly responsible for formulating and implementing the AQMP for the SCAB. SCAG's Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS) form the basis for the land use and transportation control portion of the AQMP. SCAG's 2016-2040 RTP/SCS was adopted in April 2016. Thus, consistency with the RTP/SCS would demonstrate consistency with SCAQMD's 2016 AQMP.[52]

The SCAG RTP is a long-range transportation plan that is developed and updated by SCAG every four years. The RTP provides a vision for transportation investments throughout the region. Using growth forecasts and economic trends that project out over a 20-year period, the RTP considers the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address our mobility needs. The Sustainable Communities Strategy (SCS) is a newly required element of the RTP. The SCS will integrate land use and transportation strategies that will achieve ARB emissions reduction targets.[53]

The Project lies entirely within Traffic Analysis Zone (TAZ) 43268200. The 2016 RTP/SCS projects that within TAZ 43268200, there will be a total of 8,755 jobs by 2020 and 22,196 by 2045[54]. As of 2016, there are 4,531 jobs in the March JPA jurisdiction. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Adding jobs consistent with 2016 RTP/SCS projections supports SCAG's achievement of ARB emissions reductions targets.

The SCS also indicates that this is a jobs poor area so providing more jobs will actually reduce GHG emissions and reduce VMT as it will provide local jobs to achieve a more favorable jobs housing balance.

Additionally, the March JPA Draft General Plan[55] discusses the need to create more jobs, as described below:

[52] SCAQMD. Final 2016 AQMP – CARB/EPA/SIP Submittal. Available at: https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp. Accessed: August 2018.

[53] 2016. The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy. April. Available at: http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS.pdf. Accessed: December 2018.

[54] Jobs data provided by March JPA.

DRAFT

- March JPA has a stated goal of providing 38,000 jobs, through development of its Planning Area, to the western Riverside County area thereby creating a much-needed job center. The creation of a job center is important to reduce the existing jobs/housing imbalance that exists in this region such that it can help reduce traffic congestion, pollution, fossil fuel dependence and improve the overall quality of life for the residents of western Riverside County. (p. 1-11)
- March JPA has a mission to replace regional economic benefit that was lost with the realignment of the active duty March Air Force Base into a Reserve Base in April 1996. The quantified benefits are the creation of at least 38,000 jobs, and more that $500 million annual economic contribution to the Riverside County region. (p. 5-4)

The Project is expected to generate 900 jobs. This is approximately 21% of the projected job growth in TAZ 43268300 in 2020 as compared to 2016, and approximately 5.1% of projected job growth in 2045 as compared to 2016. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Since the jobs created by the Project are within the job growth projections in the 2016 RTP/SCS, the Project would not conflict with the 2016 AQMP and, as such, would not jeopardize attainment of State and national ambient air quality standards in the area under the jurisdiction of the SCAQMD.

DRAFT

6. SUMMARY OF RESULTS

For construction, the maximum daily unmitigated criteria air pollutant emissions for the Project are estimated to be less than the significance thresholds for CO, SO_2, PM_{10}, and $PM_{2.5}$, and greater than the significance thresholds for VOC and NO_X (**Table 6a**). The Project will utilize Super Compliant coatings with a VOC content less than 10 g/L VOC[56] as a mitigation measure (MM-AQ-2) to reduce VOC emissions to below the applicable significance threshold as shown in **Table 6b**. The Project will also utilize Tier 3 off-road equipment and up to 50% Tier 4 Final off-road equipment as a mitigation measure (MM-AQ-1) to reduce NO_X emissions to below the applicable significance threshold as shown in **Table 6b**. The Project will also minimize fugitive PM emissions by complying with the requirements of SCAQMD Rule 403. Fugitive PM emissions reductions from compliance with SCAQMD Rule 403 are quantified in both the unmitigated and mitigated scenarios.

For operational emissions, the maximum daily unmitigated and mitigated criteria air pollutant emissions for the Project are less than the significance thresholds for CO, SO_2, PM_{10}, $PM_{2.5}$, and VOC and greater than the significance thresholds for NO_X (**Tables 7a and 7b**). The primary source of the operational emissions are mobile sources. The emissions from mobile sources are expected to decline in the future as cars become more fuel efficient due to existing regulations (i.e., NHTSA Phase 1 and Phase 2 standards), but this analysis does not incorporate reductions due to these regulatory changes.

The Project would not exceed the CO NAAQS at any intersection affected by Project operation (Section 4.2) and localized air quality impacts of CO, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with Project construction and operation will be less than significant (**Tables 16a, 16b, and 17**).

Notes:

[1] Emissions shown here are based on Project-specific construction schedule, equipment list, and amount of hauling material. CalEEMod® defaults were used for on-site construction equipment horsepower and load factors, and on-road vehicle trips. Emissions were estimated using CalEEMod®. Refer to Appendix A for detailed CalEEMod® outputs. The unmitigated emissions include on-site fugitive dust control [watering two times daily during construction], as required by SCAQMD Rule 403.

[2] For purposes of this analysis VOC emissions are assumed to be equal to ROG.

[3] PM emissions are estimated as a sum of exhaust, tire wear, brake wear, and fugitive emissions.

[4] SCAQMD Air Quality Significance Thresholds. Available at http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2. Accessed: August 2018.

[5] Comparison of mitigated construction emissions against the SCAQMD significance thresholds. Quantified mitigation measures include: (1) half of the off-road construction equipment meets USEPA Tier 3 emission standards and the other half meets USEPA Tier 4 standards; and (2) use of Super Compliant coatings with a VOC content less than 10 g/L VOC for architectural coatings.

Table 5. Construction Trip Assumptions
K4 and Cactus Channel Improvement Project
Riverside County, California

Construction Phase Name	Worker Trips per Day[1]	Vendor Trips per Day[1]	Total Hauling Trips[2]
Warehouse Construction			
Rough Grading and Utility	10	0	27,500
Pad/Site-specific Activities	18	0	0
Building Construction	583	227	0
Paving	15	0	0
Architectural Coating	117	0	0
Cactus Channel Construction			
Cactus Channel Improvements - Phase 1	10	0	7,500
Cactus Channel Improvements - Phase 2	3	0	0

Notes:

[1] Trips are presented as one-way trips and are based on CalEEMod® defaults. The one-way trip lengths for worker and vendor trips are also based on CalEEMod® defaults and are 14.7 and 6.9 miles, respectively.

[2] Trips are presented as one-way trips and represent the total trips for the phase. Project specific estimates of the volume of soil imported (220,000 cubic yards) and exported (60,000 cubic yards) were used to estimate the number of haul trips required. The hauling trip distance for warehouse construction is 3 miles, based on Project specific data. The hauling trip distance for Cactus Channel construction is based on the CalEEMod® default of 20 miles.

Exceeds Threshold for Any Year of Construction?				**YES**	**YES**	NO	NO	NO	NO

Notes:

[1] Emissions shown here are based on Project-specific construction schedule, equipment list, and amount of hauling material. CalEEMod® defaults were used for on-site construction equipment horsepower and load factors, and on-road vehicle trips. Emissions were estimated using CalEEMod®. Refer to Appendix A for detailed CalEEMod® outputs.

[2] For purposes of this analysis VOC emissions are assumed to be equal to ROG.

[3] PM emissions are estimated a sum of exhaust, tire wear, brake wear, and fugitive emissions. On-site fugitive dust is controlled by watering two times daily during construction, as required by SCAQMD Rule 403.

DRAFT

Table 9. Trip Lengths and Vehicle Miles Traveled by Operational Mobile Sources
K4 and Cactus Channel Improvement Project
Riverside County, California

Vehicle Type	Average Trip Length[1,2]	Peak Daily Trips[3]	Peak Daily VMT[4]
Passenger Cars	16.6	5,356	88,910
2-Axle Trucks	60	86	5,160
3-Axle Trucks	60	107	6,420
4-Axle+ Trucks	60	324	19,440

Notes:

[1] Passenger cars represent vehicles used by employee to commute to work. Average trip length for these vehicles is assumed to be equal to the CalEEMod® default trip length for commercial-work trips in Riverside County.

[2] Truck trip length is assumed to be 60 miles based on an anticipated truck usage similar to recent Environmental Impact Reports for warehouse distribution centers in the region. The CalEEMod® default for trucks in CalEEMod® is 6.9 miles. Therefore, the use of a 60-mile trip length is conservative.

[3] Obtained from Table 8.

[4] Estimated as a product of average trip length and peak daily trips.

Abbreviations:

CalEEMod® - CALifornia Emissions Estimator MODel
VMT - vehicle miles traveled

Table 14. Entrained Road Dust Emission Estimates for Operational Mobile Sources
K4 and Cactus Channel Improvement Project
Riverside County, California

Vehicle Type	VMT[1] (miles/day)	Entrained Road Dust Emission Factor[1] (lb/VMT)		Entrained Road Dust Emissions[2] (lb/day)	
		PM_{10}	$PM_{2.5}$	PM_{10}	$PM_{2.5}$
Passenger	88,910	0.00066	0.00016	58.77	14.43
Truck	31,020			20.51	5.03

Notes:

[1] Data obtained from Table 9.

[2] Emission factor calculated following guidance in the CalEEMod User's Guide, Appendix A, which is based on AP-42, Section 13.2.1 for vehicles traveling on paved roads. The equation is:

$EF = k \times (sL)^{0.91} \times (W)^{1.02}$, where:

0.0022 = k_{PM10} (lb/VMT), PM_{10} particle size multiplier

0.00054 = $k_{PM2.5}$ (lb/VMT), $PM_{2.5}$ particle size multiplier

0.1 = sL (g/m^2), silt loading (CalEEMod Default)

2.4 = W (tons), mean vehicle weight (CalEEMod Default)

[3] Assumes 100% of on-road travel occurs on paved roads.

Abbreviations:

CalEEMod - California Emissions Estimator Model

EF - emission factor

lb - pounds

PM_{10} - particulate matter less than 10 microns in aerodynamic diameter

$PM_{2.5}$ - particulate matter less than 2.5 microns in aerodynamic diameter

VMT - vehicle miles traveled

Table 15. Maximum Daily Criteria Air Pollutant Emission Estimates for Operational Mobile Sources
K4 and Cactus Channel Improvement Project
Riverside County, California

Mobile Source Activity	Peak Daily VMT[1] (miles/day)	Peak Daily Trips[1] (one-way trips/day)	Idle Duration (minutes/ round trip)	Maximum Daily Emissions (lb/day)					
				VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Passenger Car Trips (On- and Off-Site)[2]	88,910	5,356	--	16	15	193	0.57	68	18
Truck Trips (On- and Off-Site)[2]	31,020	517	--	10	231	39	0.77	32	12
Truck Idling (On-Site)[3]	--	517	15	0.49	6.23	5.44	0.0083	0.023	0.022
On-Site Emissions[4]				1.2	9.1	13	0.037	2.8	0.8
Total Emissions[5]				**26**	**252**	**237**	**1.3**	**100**	**30**

Notes

[1] Data obtained from Table 9.

[2] Includes emissions from running exhaust, running loss, tire wear, brake wear, starting exhaust, diurnal loss, hot soak, resting loss, and entrained road dust. Emissions were estimated using emission factors from Tables 11, 12, and 14 along with peak daily VMT and peak daily trips.

[3] Includes emissions from on-site truck idling that is estimated using the number of round trips (i.e. half of the one-way trips), idling time per round trip and truck idling emission factors from Tables 13.

[4] Estimated as a sum of the emissions from on-site travel of passenger cars and trucks, and truck idling. Emissions from on-site travel were estimated using a trip length of 0.6 miles per one-way trip; these emissions include running exhaust, running loss, tire and brake wear, starting exhaust, diurnal loss, hot soak, resting loss, and entrained road dust.

[5] Estimated as a sum of emissions from passenger car trips, truck trips, and truck idling.

Abbreviations:

CO - carbon monoxide
lb - pounds
NO - nitrogen monoxide
NO_2 - nitrogen dioxide
NO_x - nitrogen oxide compounds (NO + NO_2)
PM - particulate matter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
PM_{10} - particulate matter less than 10 microns in diameter
ROG - reactive organic gases
SO_x - sulfur oxide compounds
VOC - volatile organic compounds
VMT - vehicle miles traveled

Conversion Factor:

453.592 grams/lb

SCAQMD Localized Significance Thresholds[2]	**270** **150[4]**	**1,577**	**13**	**8**
Exceeds Threshold?	NO	NO	NO	NO
Warehouse On-Site				
2019	67.6	37.4	9.9	5.9
2020	14.1	14.7	0.8	0.7
SCAQMD Localized Significance Thresholds[2]	**270** **150[4]**	**1,577**	**13**	**8**
Exceeds Threshold?	NO	NO	NO	NO
Cactus Channel On-Site				
2019	15.0	9.9	0.6	0.5
2020	5.4	2.1	0.2	0.2
SCAQMD Localized Significance Thresholds[3]	**118** **66[4]**	**602**	**4**	**3**
Exceeds Threshold?	NO	NO	NO	NO

Notes:

[1] Emissions estimated using CalEEMod®. Only on-site emissions are compared with the LSTs. PM emissions include reduction for watering two times daily to reduce fugitive dust.

[2] Total on-site and warehouse on-site construction LSTs are based on Metropolitan Riverside County construction LSTs for a 5-acre site, at a 25-meter receptor distance, and are assumed to be conservative thresholds for larger project sites. Obtained from the 2008 SCAQMD Final Localized Significance Threshold Methodology, Appendix C, Mass Rate LST Look-up Tables. Available at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds. Accessed: November 2018.

[3] Cactus Channel on-site construction LSTs are based on Metropolitan Riverside County construction LSTs for a 1-acre site, at a 25-meter receptor distance, and are assumed to be conservative thresholds for larger project sites. Obtained from the 2008 SCAQMD Final Localized Significance Threshold Methodology, Appendix C, Mass Rate LST Look-up Tables. Available at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds. Accessed: November 2018.

[4] An approximated LST was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD LST has not been updated to reflect this standard. This value was estimated by scaling the SCAQMD LST that represents the state 1-hr NO_2 standard with the ratio of the federal to state 1-hr NO_2 standard (0.10 ppm/0.18 ppm).

Abbreviations:

CalEEMod® - California Emissions Estimator Model

DRAFT

Table 17. Comparison of Project Operational Emissions to SCAQMD Localized Significance Thresholds
K4 and Cactus Channel Improvement Project
Riverside County, California

Operational Year	Maximum Daily On-Site Emissions[1,2]			
	NO_x	CO	PM_{10}	$PM_{2.5}$
	lb/day			
2020	9.5	13	2.8	0.83
SCAQMD Localized Significance Thresholds[3]	**270** **150[4]**	**1,577**	**4**	**2**
Exceeds Threshold?	NO	NO	NO	NO

Notes:

[1] Project emissions include on-site area, energy, and mobile source emissions. Area source and energy emissions were estimated using CalEEMod®. Mobile source emissions were calculated using emission factors from EMFAC2017 and CalEEMod® methodology for entrained road dust. Emissions shown here are for the first year of Project operation (2020), which is conservative because emissions are expected to decrease in later years. There are no quantified mitigation measures for NO_x, CO, and PM operational emissions.

[2] Onsite mobile emissions are estimated in Table 15.

[3] LST based on the operational Metropolitan Riverside County LSTs for a 5-acre site, at a 25-meter receptor distance, and are assumed to be conservative thresholds for larger project sites. Obtained from the 2008 SCAQMD Final Localized Significance Threshold Methodology, Appendix C, Mass Rate LST Look-up Tables. Available at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds. Accessed: August 2018.

[4] An approximated LST of 150 lb/day was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD LST has not been updated to reflect this standard. This value was estimated by scaling the SCAQMD LST of 270 lb/day that represents the state 1-hr NO_2 standard with the ratio of the federal to state 1-hr NO_2 standard (0.10 ppm/0.18 ppm).

Abbreviations:

APPENDIX A.8
K4 PROJECT OPERATION

DRAFT

K4 - Operation

Riverside-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	718.00	1000sqft	20.00	718,000.00	0
Parking Lot	669.75	1000sqft	15.38	669,749.10	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2020
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	475.95	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

DRAFT

Project Characteristics - 2020 RPS (33%)

Land Use - Project data

Energy Use -

Water And Wastewater - Project data

Solid Waste - 75% waste diversion

Land Use Change -

Sequestration -

Area Mitigation - Super-low VOC content

Energy Mitigation - All lighting fixtures will be Energy Star certified

Construction Phase - Construction emissions evaluated separately

Off-road Equipment - Construction emissions evaluated separately.

Trips and VMT - Construction emissions evaluated separately.

Vehicle Trips - Mobile emissions evaluated separately.

EXECUTIVE SUMMARY

Meridian Park K4, LLC proposes a high-cube fulfillment center warehouse for industrial use in Riverside County, California, known as the K4 and Cactus Channel Improvement Project (the Project). The Project is an approximately 718,000 square feet building on an approximately 35.4-acre site that includes surface parking areas for automobiles and truck trailers, and a 7.0-acre drainage channel (Cactus Avenue Channel) bordering the parcel to the north (south side of Cactus Avenue). The warehouse development will be used up to 7 days per week and 24 hours per day. Currently, the site is vacant land. The Project site is located south of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March Joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 0.8 miles west of the Project site.

The health risk assessment (HRA) for the Project was performed as required per South Coast Air Quality Management District (SCAQMD) Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis (2003 SCAQMD Mobile Source Guidance).[1] This document provides guidance for analyzing cancer risks from diesel particulate matter from mobile sources at facilities such as truck stops, truck routes and warehouse distribution centers. The 2003 SCAQMD Mobile Source Guidance provides technical guidance for analyzing cancer risks from potential diesel particulate emissions impacts from truck idling and movement. The primary source of toxic emissions of concern are the heavy-duty vehicles transporting goods to and from the warehouse during Project operation. Consistent with the 2003 SCAQMD Mobile Source Guidance, this analysis evaluates the emissions associated with Project operations of the heavy-duty vehicles while they are onsite and in the near vicinity of the Project Site.

This analysis uses the standard emission estimation, air dispersion modeling, and health risk assessment techniques. These include the California Air Resources Board's EMFAC2017,[2] which is the most recent on-road vehicle emissions estimation model, to estimate the emissions from the heavy-duty vehicles, American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee Model (AERMOD), and current HRA guidance provided by the California Office of Environmental Health Hazard Assessment (OEHHA)[3] and the South Coast Air Quality Management District (SCAQMD).[4]

The Project health impacts are presented in Table ES-1. The results of this HRA show that the maximum estimated excess lifetime cancer risk for an offsite receptor is 1.3 in a million and noncancer chronic hazard index (HI) is 0.004 due to Project operations. These cancer risk and noncancer hazard impacts are below the SCAQMD significance thresholds.[5]

1. INTRODUCTION

This health risk assessment (HRA) evaluates the potential health impacts on residential, sensitive, and worker populations potentially exposed to diesel particulate matter (DPM) emissions from project operations (i.e., heavy-duty trucks transporting goods to and from the warehouse).

The SCAQMD has established significance thresholds[6] to assess the impact of toxic air contaminants (TACs) from project-related emissions sources on nearby sensitive receptors including residents and other human populations, against which air quality impacts of projects and plans proposed in the South Coast Air Basin (SCAB) are to be compared. TACs have been identified as carcinogens by the California Air Resources Board (ARB) in conjunction with the California Office of Environmental and Health Hazard Assessments (OEHHA). TACs may have both chronic (i.e., of long duration) and acute (i.e., severe but of short duration) health impacts. SCAQMD significance thresholds for TACs include cancer risk (maximum incremental cancer risk of 10 in a million) and chronic and acute hazards (project incremental index of 1). The SCAQMD California Environmental Quality Act (CEQA) Air Quality Handbook includes a list of air contaminants that should be analyzed for acute health hazards.[7] This health risk evaluation focused on diesel particulate matter (DPM) emissions consistent with SCAQMD Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions (2003 SCAQMD Mobile Source Guidance).[8] DPM does not have an acute non-cancer toxicity value; therefore, the potential of exposure to acute health impacts was not assessed as part of this analysis. This SCAQMD guidance does not require nor recommend the evaluation of construction emissions in an HRA.

To calculate health impacts for comparison to SCAQMD thresholds, this report assesses risk to residential, sensitive, and worker receptors using the SCAQMD Mobile Source Guidance with the following modifications: (1) current version of the AERMOD (version 18081) was used for dispersion modeling and (2) the health risk methodology followed the current 2015 OEHHA Guidance and SCAQMD Risk Assessment Procedures.[9, 10]

This HRA report includes a discussion of the air dispersion modelling, emission estimation, and health risk calculations.

1.1 Project Description

K4 and Cactus Channel Improvement Project proposes a high-cube fulfillment center industrial use warehouse development in Riverside County, California, known as the K4 and Cactus Channel Improvement Project (the Project). The Project is a building consisting of approximately 718,000 square feet on an approximately 35.4-acre site that includes surface

DRAFT

parking areas for automobiles and truck trailers. The warehouse development will be used up to 7 days per week and 24 hours per day. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. This portion of the Project is being proposed by Riverside County Flood Control and Water Conservation District as part of the District's Master Plan and is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert is being permitted by the Riverside County Flood Control District and Water Conservation District ("District") and it would either be constructed contemporaneously with the project or built separately depending on permitting and timing. The channel would function as part of the District's Master Plan and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan. Currently, the site is vacant land. The Project site is located south of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 0.8 miles west of the Project site. The closest residential land uses are located approximately 0.5 miles to the north and southeast of the Project Site. The proposed Project area is shown in **Figure 1** and the land use summary is presented in **Table 1.**

Regulatory Measures

- Compliance with California Air Resources Board Airborne Toxic Control Measure (ATCM) to Limit Diesel-Fueled Commercial Motor Vehicle Idling (Section 2485).[11] The ATCM limits idling of the vehicle's primary diesel engine to a maximum of 5 minutes at any one location. For the purposes of this regulation, idling is defined as "the vehicle is running at any location while the vehicle is stationary."
- EMFAC2017 incorporates adopted ARB regulations and federal emissions standards to date. [12] These include:
  - The Heavy-duty Engines and Vehicles Fuel Efficiency Standards adopted by the United States Environmental Protection Agency (USEPA) and the National Highway Traffic Safety Administration (NHTSA) for Phase 1 (model year 2014-2018) and Phase 2 (model year 2018-2027).
  - The Advanced Clean Cars program that will apply to light-duty vehicles in model years 2017-2025
  - CARB's Truck and Bus Regulation, which requires heavy-duty trucks to be retrofit with diesel particulate filters or replaced with newer engines

DRAFT

1.2 Existing Conditions

As noted above, the Project site is currently vacant land. The plot of land is located with a United States Air Force base to the south and an industrial area to the north.

DRAFT

2. EMISSIONS ESTIMATION

This technical report evaluates health risk impacts associated with DPM emitted by the heavy-duty trucks transporting goods to and from the proposed Project during operation, in accordance with the 2003 SCAQMD Mobile Source Guidance. Based on California regulatory guidelines,[13, 14] DPM was used as a surrogate to estimate cancer and chronic impacts of diesel-fueled vehicle exhaust.

Ramboll estimated DPM emissions from the project related heavy-duty trucks when idling on-site at the loading docks and entry/exit points, travelling on-site, and travelling to and from the Project site for the 30-year residential exposure period from Project build out year 2020 through the first quarter of 2050. To estimate the annual DPM emissions, emission factors were combined with truck traffic activity data (trip rates) and idling time or travel distance. There is no operational activity associated with the Cactus Channel, hence operational emissions are zero.

2.1 Traffic Data

Urban Crossroads[15] provided peak daily truck trips associated with the Project that would occur during the holiday season (i.e., assumed to be November 15th to January 15th). Daily trips during the non-peak period were estimated to be two-thirds of the peak daily trips based on the Project specific ratio of peak period to non-peak period employment. As shown in **Table 2**, annual average truck trips were estimated using the daily trip estimates for each time period (peak and non-peak) and the number of days in that time period.

Off-site truck routes provided in the Urban Crossroads Traffic Impact Analysis (TIA) were used to represent the modeled road segments shown in **Figure 2**. On-site truck routes and truck idling locations provided in **Figure 3** were placed based on the Project site plan. The truck idling locations were placed at the loading dock area, and the Project site access points near the entry and exit gates.

As shown in **Table 3**, Ramboll calculated vehicle miles traveled (VMT) on each roadway segment as a product of the number of truck trips on that roadway segment and the length of the roadway segment. The number of truck stops per year at each on-site idling location are presented in **Table 4**. For idling at the dock, the number of truck stops was assumed to be equal to the number of round-trips (i.e., half the number of one-way trips), as trucks are assumed to idle only once while docking at the site**.** At the Project site access points (East Gate and West Gate), the number of truck stops per year was assumed to be equal to the number of annual one-way truck trips at these locations, as the trucks are assumed to idle once while entering and once while exiting the site.

2.2 Emission Factor Calculation

Emission factors were estimated using CARB's mobile source emission inventory, EMFAC2017, which is the most recently available on-road vehicle emissions estimation

DRAFT

model.[16] Particulate matter with a diameter less than 10 microns (PM_{10}) exhaust emissions from diesel vehicles was used as a proxy for DPM. Two EMFAC2017 database queries were used to estimate DPM emission factors in grams per mile and grams per idle-minute. Running exhaust emission factors (Query 1) were calculated using EMFAC's "Emissions" model using the web-based tool. This allows for average emissions to be calculated independent of temperature and relative humidity. Idling exhaust emissions factors (Query 2) were calculated using EMFAC's "Emissions Rates" model using the desktop tool. Vehicle categories provided by Urban Crossroads 2-axle, 3-axle, and 4-axle trucks were represented as light-heavy duty trucks (LHDT), medium-heavy duty trucks (MHDT), and Heavy-heavy duty trucks (HHDT) EMFAC vehicle categories, respectively. Input parameters used for these model runs are provided below:

- Inputs for EMFAC2017 Database Query 1 (web-based tool)
  - Data Type: Emissions
  - Region: Sub-Area, Riverside (SC)
  - Calendar Year: 2020, 2025, 2030, 2035, 2040, 2045, and 2050
  - Season: Annual
  - Vehicle Category: LHDT1, LHDT2, MHDT, and HHDT
  - Model Year: Aggregated
  - Speed: Aggregated
  - Fuel: All
- Inputs for EMFAC2017 Database Query 2 (desktop tool)
  - Data Type: Emission Rates
  - Region: Sub-Area, Riverside (SC)
  - Calendar Year: 2020, 2025, 2030, 2035, 2040, 2045, and 2050
  - Season: Annual
  - Vehicle Category: LHDT1, LHDT2, MHDT, HHDT
  - Model Year: Aggregated
  - Fuel: By Fuel
  - Speed:[17] 5 mph
  - Temperature and Humidity:[17] 64, 46
  - Pollutants: PM_{10}

The output data from these queries were used to develop the emission factors for this analysis. **Table A-1** and **A-2** in **Appendix A** present the outputs from these database

[16] CARB. Mobile Source Emissions Inventory – Categories. Available at: https://www.arb.ca.gov/msei/categories.htm#emfac2017. Accessed: August 2018.

[17] Idling exhaust emission factors are independent of Speed, Temperature and Humidity. However, to run the EMFAC desktop tool, the lowest speed and the annual average temperature and humidity were used.

DRAFT

queries. Emission factors for consolidated vehicle categories (LHDT, MHDT, and HHDT) for calendar years 2020, 2025, 2030, 2035, 2040, 2045, and 2050 were estimated using a VMT-weighted approach as shown in **Tables A-3 through A-5 in Appendix A**. A single emission factor for project related heavy-duty trucks in each calendar year (**Table A-6**) was calculated using a fleet weighted average approach based on the project specific fleet mix shown in **Table 2**. Emission factors for intermediate calendar years were interpolated based on this data. **Table 5** presents a summary of the running exhaust and idling exhaust emission factors for calendar years 2020 through 2050.

2.3 Emission Estimates

DPM emissions from truck travel on the nearby roadways and on-site roadways were estimated as a product of the VMT on the road segments and the emission factors in grams per mile. Emissions from on-site truck idling were calculated using the emission factors in grams per idle-minute and an idle duration of 15 minutes per round trip (i.e., 5 minutes at three locations per trip: at entry to project site, exit from the project site, and the docking locations.[18] **Table 6** presents annual DPM emission estimates from project related trucks for each modeled roadway segment and modeled on-site idling location during calendar years 2020 through 2050.

3. AIR DISPERSION MODELING METHODOLOGY

Air dispersion modeling was performed to estimate the concentrations of DPM at receptors in the project vicinity. The following sections describe the methodology used for modeling, including model selection, source characterization, meteorological data, land use, and receptor placement.

3.1 Model Selection

The AMS/EPA Regulatory Model Improvement Committee (AERMIC) Model (AERMOD) (Version 18081) was used to estimate concentrations of ambient air pollutants. AERMOD has been approved for use in various regulatory applications by USEPA, CARB, and SCAQMD. AERMOD uses mathematical equations to simulate the movement and dispersion of air contaminants in the atmosphere. This model, which has been approved for use by USEPA, CARB, and SCAQMD, incorporates multiple variables in its algorithms including:

- Meteorological data representative of surface and upper air conditions;
- Local terrain data to account for elevation changes;
- Multiple receptor locations;
- Physical specification of emission sources including information such as:
  - Location;
  - Release height; and
  - Source dimensions.

For each receptor location, the model generates air concentrations (or air dispersion factors as unit emissions were modeled) that result from emissions from multiple sources.

The regulatory default option, urban dispersion characteristics, and PERIOD averaging time were selected based the SCAQMD modeling recommendations.[19] Dispersion model averaging times are specified based on the averaging times of ambient air quality standards and the air quality significance thresholds established by the appropriate regulatory agencies. For the HRA, the PERIOD averaging time was used to evaluate chronic (long-term) health effects. Emissions from diesel combustion were assumed to occur 24 hours per day, 7 days per week, and 365 days per year based on the operation schedule of the warehouse. Emissions were modeled using the χ/Q ("chi over cue") method, such that each source group had unit emission rates (i.e., a total of 1 gram per second [g/s]) and the model estimated dispersion factors (with units of microgram per cubic meter [$\mu g/m^3$]/[g/s]). The model output was used in a post-processing calculation with actual emission rates to estimate the DPM concentrations at each receptor (see **Section 3.5** for additional information regarding receptors). The air dispersion model files are included electronically in **Appendix B**.

3.2 Source Characterization

This HRA evaluates the on-site truck travel, on-site truck idling, and off-site truck travel associated with the Project operation. Off-site truck travel was evaluated to the nearest highway or intersection based on data provided in the TIA. Line (area) sources were used in

[19] SCAQMD Modeling Guidance for AERMOD. Available at: https://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/modeling-guidance. Accessed: August 2018.

DRAFT

the air dispersion model to represent the on-site and off-site truck travel. Areapoly sources were used to represent truck idling. Off-site truck routes are shown in **Figure 2**. **Figure 3** displays the location of the on-site emission sources for truck routes and idling.

Source parameters (**Table 7**) were developed based on USEPA's Particulate Matter Conformity Guidance for Hotspot Analysis[20] and the USEPA AERMOD user guide.[21] **Table 8** presents a list of sources and emission rates. A source group was created for each roadway segment. As described earlier, modeling was done using the χ/Q method and emission rates were set to 1 gram per second for each source group.

3.3 Meteorology

SCAQMD provides AERMOD model-ready meteorological data sets for use in air quality and risk impact analyses in the SCAB. SCAQMD's Riverside Airport meteorological data set was selected to analyze the Project's impacts, based on that station's close geographic proximity to the Project Site and best representation of the facility's meteorological conditions (such as prevailing winds), terrain, and surrounding land use.[22] The SCAQMD meteorological data set is for January 1, 2012 to December 31, 2016.[23] Miramar was used as upper air meteorological station in this data set. **Figure 4** depicts the location of the meteorological station with respect to the Project site. The wind rose in **Figure 5** shows the distribution of wind speeds and directions, which directly affect the dispersion of the air emissions. The "petals" of the wind rose indicate the direction from which the wind blows from, and the colors represent the wind speed. The air dispersion model uses this data to evaluate how emissions are dispersed through the air.

3.4 Land Use and Terrain Data

The Project Site is currently vacant land, but much of the surrounding area is developed. Residential uses are to the east and north and commercial uses are to the north. The March Air Reserve Base is located just south of the Project site. AERMOD offers the option of using either rural or urban dispersion characteristics. While selection of rural or urban dispersion characteristics can be based on the predominant land use within a three-kilometer radius of the site, per SCAQMD Modeling Guidance, AERMOD was run using the urban modeling option and population of 2,189,641 people for Riverside County.[24]

Data specifying terrain elevations of sources and receptors are imported into the model. Elevations are based on National Elevation Datasets (NEDs) and consist of an array of regularly spaced points on a horizontal plane for which an elevation is specified. NEDs used

DRAFT

in this analysis were obtained from the United States Geologic Survey. [25] The elevation data for the I-215 on- and off-ramps were obtained from Google Earth.

3.5 Receptors

Analyzing impacts of receptors close to sources of TACs is important in determining cancer and non-cancer health risk impacts. Receptor exposure to emission sources is greatest nearest to the emission source. ARB and SCAQMD emissions and modeling analyses showed an 80-percent drop-off in pollutant concentration at approximately 1,000 feet from distribution centers.[26] In order to evaluate health impacts to off-site receptors, including nearby residential and sensitive receptor populations, the geographic scope of this assessment was extended to a one-quarter mile radius or 1,320 feet from the modeled Project sources. Receptors around the project development were covered in two grids of receptors:

- Fine Grid 25 m x 25 m up to 200 m from modeled Project sources; and
- Coarse Grid 100 m x 100 m from 200 m to 1,320 feet from modeled Project sources.

Grid receptors were classified as residential or worker based on the current land use. The receptor grid includes worker receptors in vacant lots, which is conservative.

SCAQMD requires inclusion of sensitive receptors in a health risk analysis and identifies the following as sensitive receptors: long-term health care facilities, rehabilitation centers, convalescent centers, retirement homes, residences, schools, playgrounds, child care centers, and athletic facilities.[27] Sensitive receptor locations were also identified within a one-quarter mile (1,320 feet) radius of the modeled Project sources, based on databases as listed below.

- California Department of Education, California School Directory (http://www.cde.ca.gov/re/sd)
- California Community Care Licensing Division - licensed care facilities including adult residential facilities and daycares (https://secure.dss.ca.gov/CareFacilitySearch/home/selecttype/)
- California Office of Statewide Health Planning and Development, Automated Licensing Information and Report Tracking System - hospitals and long-term care facilities (http://www.oshpd.ca.gov/hid/Products/Listings.html)
- Davis Demographics School Site Locator – K-12 Schools (https://www.davisdemographics.com/videos/schoolsite-locator/)

Databases were searched for all zip codes surrounding the Project Site. Google Earth Pro was also used to identify other schools and day care centers in the Project vicinity.

Based on the database search, four sensitive receptors were identified within a one-quarter mile radius from the modeled Project sources.

4. HEALTH RISK ASSESSMENT

In this HRA as stated in **Section 2**, the chemicals of potential concern is diesel exhaust. Under California regulatory guidelines, DPM is used as a surrogate measure of carcinogen exposure for the mixture of chemicals that make up diesel exhaust as a whole. This health risk assessment was performed to estimate cancer and non-cancer risks associated with the DPM emissions from heavy duty trucks associated with Project operation. The following sections describe the methodology used for estimating health risk impacts particularly the exposure assessment, toxicity criteria, and equations for estimating cancer and non-cancer risk impacts.

4.1 Exposure Assessment

The components of the exposure assessment include the identification of potentially exposed populations, the estimation of exposure point concentrations, identification of exposure pathways, and the selection of exposure assumptions to quantify chemical intakes that may result from potential Project emissions. The exposure assessment step determines the quantity of contaminants people are exposed to during a specific time period. Ramboll used dispersion factors from AERMOD and emission rates to estimate the concentrations of DPM at each receptor. These steps are described in the following sub-sections.

4.1.1 Identification of Potentially Exposed Populations

The potentially exposed populations considered include workers, residents, and sensitive receptors located within the grid of receptors as further described in **Section 3.5**. Locations of potentially exposed residential populations were identified based on review of aerial photographs.[29] The locations of nearby worker, residential, and sensitive receptors are shown in **Figure 6**.

As previously discussed in **Section 3.5**, SCAQMD specifies various non-residential sensitive receptors that must be included in an HRA. The search for existing non-residential sensitive receptors showed that there are four existing non-residential sensitive receptor locations within one-quarter mile of the modeled Project sources including two child care centers, an elementary school, and a high school. In addition to the receptor grid outlined above, non-residential sensitive receptors within one-quarter mile of the modeled Project sources were modeled as discrete receptors. Non-residential sensitive receptors were conservatively modeled using the residential exposure scenario.

4.1.2 Estimation of Exposure Point Concentrations

Exposure point concentrations are the concentrations of each TAC to which an individual may be exposed at a given receptor location. The exposure point concentrations used to estimate cancer risk and chronic non-cancer hazard index (HI) are the annual average ground-level concentrations of each TAC. Ground-level ambient air DPM concentrations at each receptor location were estimated using the methodologies for emissions estimation and air dispersion modeling described in **Sections 2 and 3**, respectively.

4.2 Dose-Response Assessment

The dose-response assessment (also referred to as the toxicity assessment) characterizes the relationship between the magnitude of exposure and the nature and magnitude of

[29] Google Earth Pro. 2018. Imagery date of February 6, 2018. Available for download at: https://www.google.com/earth/.

DRAFT

adverse health effects that may result from such exposure. A brief description of dose-response assessment and key adverse health effects are provided in the following sub-sections.

4.2.1 Toxicity Criteria

Developing toxicity criteria involves using toxicity studies with laboratory animals or epidemiological studies of humans. Toxicological values are published by CARB in the Consolidated Table of Approved Risk Assessment Health Values.[30] OEHHA periodically revises toxicity values for air toxics. This HRA evaluated theoretical exposures to DPM for two categories of potential adverse health effects, cancer and chronic endpoints. The toxicity values used in health risk calculations are summarized in **Table 9.**

4.2.2 Exposure Pathways

The exposure pathways evaluated in this HRA were selected in accordance with the OEHHA Guidance. The inhalation pathway must be evaluated for all chemicals. The OEHHA Guidance also requires the evaluation of non-inhalation exposure pathways, referred to as a multi-pathway analysis, for specific chemicals. However, the exposure pathway for DPM is limited to inhalation and the multi-pathway factor for DPM is 1.0.

4.2.3 Exposure Assumptions

The exposure parameters used to estimate excess lifetime cancer risks (over a lifetime of 70 years) for all potentially exposed populations were obtained using risk assessment guidelines from OEHHA and are presented in **Table 10 and Table 11**.[31] For residential exposure, the total exposure duration analyzed is 30 years, in accordance with OEHHA guidance default assumptions, and begins in the third trimester to accommodate the increased susceptibility of exposures in early life. These exposure assumptions, designed to be protective of children younger than age 16, are assumed to be adequately protective of residents older than 30 years of age, including the elderly. For worker exposure, the total exposure duration analyzed is 25 years. Non-residential sensitive receptors are conservatively analyzed using the residential exposure factors.

Under OEHHA guidance, breathing rates change over time for different age groups for residential exposure. Following the SCAQMD risk assessment procedures, 95th percentile daily breathing rates for age groups less than 2 years old and 80th percentile daily breathing rates for age groups that are greater than or equal to 2 years old were used. Breathing rates were referenced from SCAQMD Risk Assessment Guidance.[32]

The age groups used for the residential exposure analysis are shown in **Table 10.** These age groups are needed in order to use age-sensitivity factors (ASFs). Per SCAQMD Risk Assessment Guidance, ASFs of 10 for ages less than 2 years, 3 for ages 2 years to 16 years, and 1 for ages 16 years or older were used in this analysis. These factors account for increased sensitivity of children to carcinogens. To incorporate ASFs, cancer risk estimates

DRAFT

are weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from two years through 15 years of age. No weighting factor (i.e., an ASF of one, which is equivalent to no adjustment) is applied to ages 16 and older. For the residential exposure, the fraction of time spent at home is 100% for ages up to 16 years and 73% for ages greater than 16 years as referenced from SCAQMD Risk Assessment Guidance. As shown in **Table 11**, there are no ASFs for the worker exposure analysis; hence, there is only one age group for worker exposure, age 16 through 41.

4.3 Risk Characterization Methodology

This section describes the methods used to estimate potential adverse effects associated with off-site exposures to chemicals emitted from operation of the Project Site. The results of this HRA are presented in **Section 5**.

4.3.1 Cancer Risk Calculations

Most regulatory agencies consider carcinogens to pose a risk of cancer at all exposure levels. This "no threshold" assumption means than any increase in dose is assumed to be associated with an increase in the probability of developing cancer.

Cancer risks impacts at receptors on the Project site were estimated as the incremental probability that an individual will develop cancer over a 70-year lifetime as a direct result of exposure to DPM emitted by project related truck traffic.[33, 34] The estimated risk is expressed as a unitless probability. The exposure factor assumptions and toxicity values used in risk calculations are summarized in **Table 9, Table 10, and Table 11**.

The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). For carcinogenic chemicals, both inhalation and non-inhalation pathways must be considered. For simplicity, SCAQMD multi-pathway factors were used for chemicals with multi exposure pathways in this analysis. As stated earlier the exposure pathway for DPM is limited to inhalation and its multi-pathway factor is 1.0

The following equations were used to calculate the maximum individual cancer risk (MICR) from DPM at each modeled receptor (note, all sensitive receptors were modeled with the residential exposure scenario):

$$MICR_R = CP \times Q \times {}^{\chi}/_{Q} \times MWAF \times CEF_R \times MP_R \times 10^{-6}$$

$$MICR_W = CP \times Q \times {}^{\chi}/_{Q} \times MWAF \times CEF_W \times MP_W \times WAF \times 10^{-6}$$

Where:

$MICR_R$	=	Maximum Individual Cancer Risk for Resident (in a million)
$MICR_W$	=	Maximum Individual Cancer Risk for Worker (in a million)

CEF_W	=	Combined Exposure Factor for a Worker
MPR	=	Multi-pathway factor for residential exposure
MPW	=	Multi-pathway factor for worker exposure
WAF	=	Worker adjustment factor of 1.0 was used based on the operation schedule of 24 hours/day, 7 days/week

4.3.2 Non-Cancer Risk Calculations

The potential for exposure to result in adverse chronic non-cancer effect is evaluated by comparing the estimated annual average air concentration of DPM to its non-cancer chronic reference exposure level (cREL). Th following equations are used to estimate the Chronic Hazard Index for residents and workers:

$$HIC_R = \frac{Q \times {}^{\chi}/_{Q} \times MP_R \times MWAF}{cREL}$$

$$HIC_W = \frac{Q \times {}^{\chi}/_{Q} \times MP_W \times MWAF * WAF}{cREL}$$

Where:

HIC_R	=	Chronic Hazard index for Resident
HIC_W	=	Chronic Hazard index for Worker
Q	=	Emissions rate in g/s
χ/Q	=	Annual Average Air concentration for DPM [$(\mu g/m^3)/(g/s)$] output based on AERMOD dispersion factor for each source
MP_R	=	Multi-pathway factor for Resident
MP_R	=	Multi-pathway factor for Worker
WAF	=	Worker Adjustment Factor is 1.0 for Workers
MWAF	=	Molecular Weight Adjustment Factor is 1.0 for DPM
cREL	=	Chronic non-cancer reference exposure level for DPM ($\mu g/m^3$)

DPM does not have an acute non-cancer toxicity value; therefore, the potential of exposure to acute health impacts was not assessed as part of this analysis.

DRAFT

5. RISK CHARACTERIZATION RESULTS

The risk characterization results of this HRA were compared to SCAQMD thresholds of 10 in one million for cancer risk, and 1.0 for chronic HI.[35]

Table C-1 in Appendix C provides the estimated MICR and HIC associated with DPM emissions from Project operation for each modeled receptor. **Table 12** shows a summary of the maximum MICR and HIC for each receptor type (worker, residential, and sensitive). The maximum MICR of 1.3 in a million is less than the SCAQMD significance threshold of 10 in one million. Similarly, the HIC of 0.004 is less than the SCAQMD significance threshold of 1.0. **Figure 7** shows the location of the maximum worker, residential, and sensitive cancer risks. While DPM emissions will also be emitted during Project construction, the short-term duration of the Project construction and the lower level of on-site construction DPM emissions compared to operational emissions suggests that it is unlikely for construction emissions to substantially change the findings and results reported for the operational emissions.

6. UNCERTAINTIES

While Ramboll has used appropriate engineering and scientific methods in the HRA presented in this report, there is a great deal of uncertainty associated with the process of risk assessment. In this context, uncertainty may be defined as what is not known and may be reduced with further scientific studies. Lack of data in many areas necessitates the use of assumptions, thus increasing the uncertainty. This section briefly describes some of the uncertainties that may influence the risk estimates produced in this analysis.

6.1.1 Exposure Assumptions

Consistent with OEHHA Guidance, risks were estimated assuming that hypothetical residents at the receptor points spend a continuous 30 years at one location. However, the United States Environmental Protection Agency (USEPA) has estimated that 50% of the population lives in the same residence for only eight years, while only 10% remain in the same house for 32 years.[36] Accordingly, the actual risks to hypothetical residents at the modeled receptor locations are likely lower than those calculated in this assessment.

In addition, the sensitive receptors identified in this assessment were modeled using the residential scenario. Since these locations provide child care and education, individuals would be there for a shorter period of time than modeled in the residential scenario. Therefore, the actual risks at the modeled sensitive receptor locations are likely lower than those calculated in this assessment.

6.1.2 Dose-Response Assessment

The primary uncertainties associated with the toxicity assessment are related to derivation of toxicity values. Standard RELs and CPFs established by OEHHA were used to estimate potential carcinogenic and non-cancer health effects from exposures to compounds emitted from the Project operation activities. These values are derived by applying conservative assumptions and are intended to protect the most sensitive individuals in the potentially exposed populations.

To derive the toxicity values, OEHHA makes several assumptions that tend to overestimate the actual hazard or risk to human health. Because data from human studies are generally unavailable, RELs are typically derived from animal studies. Uncertainty factors and modifying factors are then applied to these data to ensure that the RELs are adequately protective of human health. For many compounds, it is anticipated that this approach overestimates the potential for non-cancer effects.

CPFs used to estimate carcinogenic risk are also typically derived based on data from animal studies. These data are based on studies in which high doses of a test chemical were administered to laboratory animals, and the reported response is extrapolated to the much lower doses typical of human exposure. Very little experimental data are available on the nature of the dose-response relationship at low doses, such as whether a threshold exists or if the dose-response curve passes through the origin. Because of this uncertainty, a conservative model is used to estimate the low-dose relationship and uses an upper bound

DRAFT

estimate (the 95 percent upper confidence limit of the slope predicted by the extrapolation model) as the CPF. With this factor, an upper-bound estimate of potential cancer risks is obtained.

6.1.3 Risk Calculation

The USEPA notes that the conservative assumptions used in a risk assessment are intended to assure that the estimated risks do not underestimate the actual risks posed by a site and that the estimated risks do not necessarily represent actual risks experienced by populations at or near a site.[37] The estimated risks in this risk assessment are based primarily on a series of conservative assumptions related to predicted environmental concentrations, exposure, and chemical toxicity. The use of conservative assumptions tends to produce upper-bound estimates of risk. Although it is difficult to quantify the uncertainties associated with all the assumptions made in this risk assessment, the use of conservative assumptions is likely to result in substantial overestimates of exposure, and hence, risk.

6.1.4 Estimation of Emissions

There are uncertainties associated with the estimation of emissions from trucks. Emissions depend on emission factors estimated using EMFAC2017. Thus, uncertainties associated with EMFAC2017 apply to this analysis. In particular, this analysis takes into account emissions for future years, which are unknown. Thus, EMFAC2017's assumptions of how regulations will effect emissions in the future are a source of uncertainty.

6.1.5 Estimation of Exposure Concentrations

In addition to uncertainty associated with emission estimates, there is also uncertainty associated with the estimated exposure concentrations. The limitations of the air dispersion model provide a source of uncertainty in the estimation of exposure concentrations. According to USEPA, errors due to the limitation of the algorithms implemented in the air dispersion model in the highest estimated concentrations of +/- 10 percent to 40 percent are typical.[38] Ramboll's methodologies consistently produce conservative results; thus, predicted exposure concentrations are likely to be at or above actual exposure concentrations.

6.1.6 Source Representation

The source parameters used to model emission sources add uncertainty. For all emission sources, Ramboll used source parameters which are either recommended as defaults or expected to produce more conservative (i.e., overestimation of) results.[39] Discrepancies might exist between the actual emissions characteristics of a source and its representation in the model; exposure concentrations used in this assessment represent approximate exposure concentrations.

DRAFT

Table 6. DPM Emission Estimates from Project Related Trucks on the Modeled On-Site and Off-Site Locations During Calendar Years 2020 through 2050
K4 and Cactus Channel Improvement Project
Riverside County, California

Calendar Year	Roadway Segment ID[1]	Roadway Segment Description[1]	Annual DPM Emissions[2] (g/year)
2050	A	I-215S on-ramp	225
	B	I-215S off-ramp	237
	C	I-215N on-ramp	144
	D	I-215N off-ramp	212
	E	Cactus Av. I-215 Overpass	125
	F	Cactus Av. Between I-215N on-ramp and I215N off-ramp	451
	G	Cactus Av. West of Veterans Way	904
	H	Cactus Av. Between Veterans Way and Frederick St.	311
	I	Cactus Av. Between Frederick St. and Graham St.	56
	J	Cactus Av. Between Graham St. and Heacock St.	34
	K	Frederick St.	26
	L	Graham St.	11
	M	Heacock St. North	11
	N	Heacock St. South	6
	O	West Gate	62
	P	Site Docking	644
	Q	East Gate	53
	DOCKIDL	Dock Idling	462
	WGIDL	West Gate Idling	416
	EGIDL	East Gate Idling	509

Notes:

[1] Figure 2 and Figure 3 present locations of modeled roadway segments.

[2] Running exhaust emissions for each segment are estimated as a product of VMT in Table 3 and running exhaust emission factors in Table 5. Idling emissions are estimated as the product of idle duration (5 minutes per truck stop), the number of truck stops in Table 4, and the idling emission factors in Table 5.

Abbreviations:

Av - Avenue
DPM - diesel particulate matter
g - gram
I-215 - Interstate 215
lb - pounds
mi - miles
N - North
S - South
St - Street
VMT - vehicle miles traveled

DRAFT

Table 7. Modeled Source Parameters
K4 and Cactus Channel Improvement Project
Riverside County, California

Source Parameters	Off-site Truck Traffic	On-site Truck Traffic	Onsite Idling
Source Type	Line	Line	Areapoly
Width (m)	Road Width[1]	15.24	N/A
Initial Vertical Dimension[2] (m)	6.8	6.8	6.8
Initial Vertical Dispersion Coefficient[3,4] (m)	3.16	3.16	0.79
Release Height[5] (m)	3.4	3.4	3.4

Notes:

[1] Road width is estimated as a product of the number of lanes and width of a lane. The width of the lane is defined as 12 feet for I-215 on- and off- ramps and 11 feet for arterial roads based on the USEPA Transportation Conformity Guidance..

[2] The initial vertical dimension for truck exhaust is assumed to be equal to 1.7 times the vehicle height. Truck vehicle height is 4 meters based on the USEPA Transportation Conformity Guidance.

[3] The initial vertical dispersion coefficient for off-site and on-site traffic is estimated as the initial vertical dimension divided by 2.15 based on the USEPA Transportation Conformity Guidance.

[4] For on-site idling emission sources, the initial vertical dispersion coefficient is estimated as the initial vertical dimension divided by 4.3, based on the USEPA AERMOD User Guide.

[5] Release height is estimated as half of the initial vertical dimension based on the USEPA Transportation Conformity Guidance.

Abbreviations:

AERMOD - American Meteorological Society/Environmental Protection Agency Regulatory Model

ft - feet

m - meters

N/A - not applicable

PM - particulate matter

USEPA - United States Environmental Protection Agency

I-215 - Interstate 215

	WGIDL	West Gate Idling	WGIDL	1.44E-03
	EGIDL	East Gate Idling	EGIDL	1.45E-03

Notes:

[1] Source groups are assigned based on representation of the roadway segments which are shown in Figures 2 and 3. Source groups are broken down into multiple sources to accurately capture road curvatures.

[2] The emissions rate for each source group is calculated as 1 g/s divided by the total area of all sources within that source group.

Abbreviations:

I-215 - Interstate 215
St - Street
Av - Avenue
g - grams
N - North
S - South
s - seconds
g/s/m^2 - gram per second per square meter

Table 12. Project Health Impacts
K4 and Cactus Channel Improvement Project
Riverside County, California

Receptor Type	Maximum Incremental Cancer Risk[1] (in a million)	Maximum Incremental HIC[2]
Worker	0.6	0.004
Residential	0.5	0.0002
Sensitive	1.3	0.0006
SCAQMD Significance Threshold[3]	**10**	**1**
Exceeds Threshold?	**NO**	**NO**

Notes:

[1] Maximum incremental cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens.

[2] The potential for exposure to result in adverse chronic non-cancer effects is evaluated by comparing the estimated annual average air concentration to the non-cancer chronic reference exposure level for each chemical.

[3] SCAQMD Air Quality Significance Thresholds. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. Accessed: August 2018.

Abbreviations:

HIC - chronic hazard index

SCAQMD - South Coast Air Quality Management District

2050 LHDT Weighted Average Emission Factor[3]			**0.0037**	**0.0074**

Notes:

[1] Data obtained from Table A-1.

[2] For purposes of this analysis, diesel particulate matter emissions are assumed to be equal to PM_{10} exhaust emissions from diesel vehicles. Therefore, emission factors for the gasoline vehicles are set to zero. For diesel vehicles, emission factors for each combination of vehicle class and calendar year are obtained from Table A-1 (running exhaust) and Table A-2 (idling exhaust).

[3] LHDT emission factors for each calendar year are estimated as VMT weighted average across all EMFAC vehicle category-fuel combinations that represent light-heavy duty trucks.

Abbreviations:

CARB - California Air Resources Board
DSL - diesel
EMFAC - CARB's mobile source emission inventory model
GAS - gasoline
g - grams
LHDT1 - light-heavy duty trucks (8501-10000 pounds)
LHDT2 - light-heavy duty trucks (10001-14000 pounds)
PM_{10} - particulate matter less than 10 microns in diameter
VMT - vehicle miles travelled

1 INTRODUCTION

Meridian Park K4, LLC proposes to construct a warehouse and associated improvements, the K4 Warehouse project, in Riverside County, California. In addition, improvements to the Cactus Drainage Channel, a drainage bordering the parcel to the north and continuing both east and west of the warehouse site, are proposed. The channel improvement portion of the project is being conducted on behalf of the Riverside County Flood Control and Water Conservation District as part of the District's Master Plan.

The project area is located north of March Air Reserve Base (MARB), south of Cactus Avenue, and extends east-to-west from the Veterans Way / Cactus Avenue intersection to Chanute Avenue. Interstate 215 (I-215) is located approximately 0.75 mile west of the project site. The K4 Warehouse site is located within the March Joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California (Figure 1). The project site is comprised of five parcels designated as Assessor's Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The project site is located within the Riverside East and Sunnymead 7.5-minute quadrangles, as mapped by the U.S. Geological Survey (USGS 2015).

The K4 Warehouse site is on a 35.4-acre parcel, the Cactus Channel Improvements occur over a 7.0-acre area immediately south of Cactus Avenue (Figure 1). The K4 Warehouse site is a relatively flat parcel that supports several upland vegetation communities, primarily goldenbush scrub/non-native grassland and developed/disturbed. Surrounding land uses include industrial and commercial development, residential development, and military development. The project site is adjacent to the Meridian Specific Plan area but is outside of it and requires separate land use approvals. The site is within the jurisdiction of the March JPA.

This Biological Technical Report (BTR) describes the existing biological resources within and adjacent to the proposed project footprint; details the methods used to assess existing conditions and potential impacts to sensitive habitats and species; and presents potential avoidance, minimization, and mitigation measures to reduce potential project impacts.

1.1 SITE BACKGROUND AND PLANNING CONTEXT

The project was part of the larger 'Disposal and Reuse of March Air Force Base' and occurs within the 'northeast planning subarea' area identified for future development under that process. Reuse of the entire base was planned under the *March AFB Master Reuse Plan*, and that document served as the basis for the *March Joint Powers Authority (JPA) General Plan*. Environmental review of the general plan was performed in 1999 under the *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA, 1999; SCH No. 97071095).

As part of that process, a section 7 consultation with the U.S. Fish and Wildlife Service (USFWS) was pursued for Stephens' kangaroo rat (*Dipodomys stephensi*; SKR), least Bell's vireo (*Vireo bellii pusillus*; LBVI), mountain plover (*Charadrius montanus*), coastal California gnatcatcher (*Polioptila californica californica*; CAGN), Quino checkerspot butterfly (*Euphydryas editha quino*; QCB), southwestern willow flycatcher (*Empidonax traillii extimus*; SWFL), and Riverside fairy shrimp (*Streptocephalus woottoni*).

The project also occurs within the Western Riverside Multiple Species Habitat Conservation Plan (MSHCP) plan area. The MSHCP is a regional effort to preserve sensitive habitats and species, and all development in the region that is permitted through the County of Riverside must comply with the MSHCP. The goal of such regional biological planning efforts is to preserve sufficient native habitats such that special-status species are also conserved. Though the JPA is an independent agency and therefore not covered under the MSHCP, project mitigation will be pursued in a manner consistent with the MSHCP, further off-setting potential minor impacts on special-status species that could occur with project implementation.

1.2 PROJECT DESCRIPTION

The proposed project development includes a 718,000-square-foot building equipped with 105 loading docks, 289 automobile parking stalls, 242 truck trailer parking stalls, and new driveways on the approximately 35.4-acre K4 warehouse site parcel. The project also includes converting an existing open-air drainage channel on the south side of Cactus Avenue into a box culvert. Additionally, the project would include implementing regional improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the project frontage, and further to the east ending at the Heacock Channel. This portion of the project is being conducted on behalf of the Riverside County Flood Control and Water Conservation District as part of the District's Master Plan and is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County MSHCP.

The project site is bordered to the north by Cactus Avenue and industrial commercial warehouses and to the east, west, and south by MARB buildings. The site is located outside of the existing March Business Center and Meridian Specific Plan areas but within the jurisdiction of the March JPA.

Specific details regarding future operation of the facility are not currently available; however, for the purposes of the California Environmental Quality Act (CEQA) and to ensure full disclosure on all potential allowable uses within the proposed Industrial (IND) lots, the assessment herein assumes a variety of industrial functions within the buildings, consistent with the opportunities and limitations associated with the project site as outlined herein.

The following are requirements in order to achieve project approval:

General Plan Amendment: The project site has a land use designation of Business Park within the existing March JPA General Plan. The project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.

Zoning Designation: As the project site is not yet zoned, to be consistent with the requested General Plan land use designations of Industrial, the proposed project is pursuing a zoning designation of Industrial (IND) on the 35.4-acre site (excluding Cactus Avenue Channel).

Plot Plan: A plot plan approval is required to construct the 718,000-square-foot building, 598 automobile parking stalls, and 242 truck trailer parking stalls.

Lot Merger: A lot merger is required to merge the five separate parcels on the project site into one 35.4-acre parcel (excluding Cactus Avenue Channel).

1.3 REGULATORY FRAMEWORK

Several regulations have been established by federal, state, and local agencies to protect and conserve biological resources. The descriptions below provide a brief overview of agency regulations that may be applicable to the project. The final determination as to what types of permits are required is made by the regulating agencies.

FEDERAL REGULATIONS

Federal Endangered Species Act

The federal Endangered Species Act (ESA) of 1973, as amended, provides for listing of endangered and threatened species of plants and animals and designation of critical habitat for listed species. ESA regulates the "taking" of any endangered fish or wildlife species, per Section 9 of the Act. As development is proposed, the responsible agency or individual landowner is required to consult with the USFWS to assess potential impacts to listed species (including plants) or its critical habitat, pursuant to Sections 7 and 10 of the act. USFWS is required to make a determination as to the extent of impact to a particular species a project would have. If it is determined that potential impacts to a species would likely occur, measures to avoid or reduce such impacts must be identified. USFWS may issue an incidental take statement, following consultation and the issuance of a Biological Opinion. This allows for take of the species that is incidental to another authorized activity, provided that the action will not adversely affect the existence of the species. Section 10 of the federal ESA provides for issuance of incidental take permits to non-federal parties with the development of a habitat conservation plan (HCP); Section 7 of the act provides for permitting of federal projects on projects requiring federal permits.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA; 16 U.S. Code [U.S.C.] 703 et seq.) is a federal statute that implements treaties with several countries on the conservation and protection of migratory birds. The number of bird species covered by the MBTA is extensive and is listed at 50 CFR 10.13. The MBTA is enforced by USFWS and prohibits "by any means or in any manner, to pursue, hunt, take, capture, [or] kill" any migratory bird, or attempt such actions, except as permitted by regulation.

Rivers and Harbors Act of 1899

The Rivers and Harbors Act of 1899 prohibits discharge of any material into navigable waters, or tributaries thereof, of the United States without a permit. The act also makes it a misdemeanor to excavate, fill, or alter the course, condition, or capacity of any port, harbor, or channel; or to dam navigable streams without a permit.

Many activities originally covered by the Rivers and Harbors Act are now regulated under the Clean Water Act of 1972, discussed below. However, the 1899 Act retains relevance and created the structure under which the U.S. Army Corps of Engineers oversees Clean Water Act 404 permitting.

Clean Water Act

Pursuant to Section 404 of the Clean Water Act (CWA), the U.S. Army Corps of Engineers (Corps) is authorized to regulate any activity that would result in the discharge of dredged or fill material into waters of the U.S. (including wetlands), which include those waters listed in 33 CFR 328.3 (as amended at 80 Federal Register 37104, June 29, 2015. The Corps, with oversight from the U.S. Environmental Protection Agency (USEPA), has the principal authority to issue CWA Section 404 permits.

A water quality certification or waiver pursuant to Section 401 of the CWA is required for all Section 404 permitted actions. The Regional Water Quality Control Board (RWQCB), a division of the State Water Resources Control Board, provides oversight of the 401 permit process in California. The RWQCB is required to provide “certification that there is reasonable assurance that an activity that may result in the discharge to waters of the United States will not violate water quality standards.” Water Quality Certification must be based on the finding that proposed discharge will comply with applicable water quality standards.

The National Pollutant Discharge Elimination System (NPDES) is the permitting program for discharge of pollutants into surface waters of the U.S. under Section 402 of the CWA. Substantial impacts to wetlands may require an Individual Permit. Projects that only minimally affect wetlands may meet the conditions of one of the existing Nationwide Permits.

STATE REGULATIONS

California Environmental Quality Act

The California Environmental Quality Act (CEQA) was established in 1970 as California’s counterpart to the National Environmental Policy Act (NEPA). It is a statute that requires state and local agencies to identify significant environmental impacts of their actions and to avoid or mitigate those impacts, where feasible.

CEQA applies to certain activities of state and local public agencies. A public agency must comply with CEQA when it undertakes an activity defined by CEQA as a "project." A project is an activity undertaken by a public agency or a private activity, which must receive some discretionary approval (meaning that the agency has the authority to deny the requested permit or approval) from a government agency that may cause either a direct physical change in the environment or a reasonably foreseeable indirect change in the environment.

California Endangered Species Act and Natural Community Conservation Planning Act

The California Endangered Species Act (CESA) of 1984, in combination with the California Native Plant Protection Act of 1977, regulates the listing and take of plant and animal species designated as endangered, threatened, or rare within the state. California also lists species of special concern based on limited distribution, declining populations, diminishing habitat, or unusual scientific, recreational, or educational value. The California Department of Fish and Wildlife (CDFW) is responsible for assessing development projects for their potential to impact listed species and their habitats. State-listed special-status species are addressed through the issuance of a 2081 permit (Memorandum of Understanding).

In 1991, the California NCCP Act was approved and the NCCP Coastal Sage Scrub program was initiated in Southern California. California law (Section 2800 et seq. of the California Fish and Game Code [CFGC]) established the NCCP program "to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development and growth." The NCCP Act encourages preparation of plans that address habitat conservation and management on an ecosystem basis rather than one species or habitat at a time.

California Fish and Game Code Sections 1600-1602

Pursuant to Division 2, Chapter 6, Section 1602 of the California Fish and Game Code (CFGC), CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream or lake that supports fish or wildlife. A Lake or Streambed Alteration Agreement Application must be submitted to CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." CDFW has jurisdiction over riparian habitats associated with watercourses. Jurisdictional waters are delineated by the outer edge of riparian vegetation or at the top of the bank of streams or lakes, whichever is wider. CDFW jurisdiction does not include tidal areas or isolated resources. CDFW reviews the proposed actions and, if necessary, submits (to the applicant) a proposal that includes measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and applicant is the Lake or Streambed Alteration Agreement.

California Fish and Game Code Sections 3503, 3511, 3513, 3801, 4700, 5050, and 5515

Within California, fish, wildlife, and native plant resources are protected and managed by CDFW. The California Fish and Game Commission and/or CDFW are responsible for issuing permits for the take or possession of protected species. The following sections of the CFGC address protected species: Section 3511 (birds), Section 4700 (mammals), Section 5050 (reptiles and amphibians), and Section 5515 (fish). In addition, the protection of birds of prey is provided for in Sections 3503, 3513, and 3800 of the CFGC.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Water Code Section 13000 et seq.) provides for statewide coordination of water quality regulations. The state Water Resources Control Board was established as the statewide authority and nine separate RWQCBs were developed to oversee water quality on a day-to-day basis.

The RWQCB is the primary agency responsible for protecting water quality in California. As discussed above, the RWQCB regulates discharges to surface waters under the federal CWA. In addition, the RWQCB is responsible for administering the California Porter-Cologne Water Quality Control Act.

Pursuant to the Porter-Cologne Water Quality Control Act, the state is given authority to regulate waters of the state, which are defined as any surface water or groundwater, including saline waters. As such, any person proposing to discharge waste into a water body that could affect its water quality must first file a Report of Waste Discharge if Section 404 is not required for the activity. "Waste" is partially defined as any waste substance associated with human habitation, including fill material discharged into water bodies.

REGIONAL AND LOCAL PLANS

Western Riverside Multiple Species Habitat Conservation Plan (MSHCP)

The project occurs within an area covered by the Western Riverside Multiple Species Habitat Conservation Plan (MSHCP). Projects where the lead agency is signatory to the MSHCP are covered under the MSHCP. However, the March Joint Powers Authority is the lead agency for the project and is not a signatory to the MSHCP. As such, the project is not subject to MSHCP regulations nor does it receive take authority granted under the MSHCP.

Riverside County Ordinance Nos. 499 and 559- Tree Removal

Chapter 12.08 of the Riverside County Code of Ordinances sets for regulations regarding roadside tree removal and trimming activities (County of Riverside 2016). In accordance with Unincorporated Riverside County Ordinance No. 499 (as amended through 499.11), a permit must be obtained from the County Transportation Director prior to removing trees or trimming any tree planted in the right of way of a County highway. If such removals are proposed, conditions may be imposed by the County Transportation Director such as requirements for use of a qualified tree surgeon or trimmer, and for bond, insurance or security to protect from damage, as well as relocation and/or replacement by one or more other trees.

Chapter 12.24 of the Riverside County Code of Ordinances also includes regulations related to tree removal (County of Riverside 2016). According to the Unincorporated Riverside County Ordinance No. 559 (as amended through 559.7), the removal of living native trees on parcels or property greater than 0.5 acre in size, located in the unincorporated Riverside County, and above 5,000 feet in elevation requires a permit. The project site elevation is below 5,000 acres; as such, this ordinance is not applicable.

Riverside County Oak Tree Management Guidelines

Riverside County Oak Tree Management Guidelines address oak woodlands in areas where zoning and/or general plan density restrictions will allow the effective use of clustering (County of Riverside 1999). A biological study is required for properties that support oak trees on a lot size of 2.5 acres or greater. Protected oaks include any individual tree larger than 2 inches in diameter at breast height (DBH) or the sum of the diameters of multiple trunks at DBH. Protected species include *Quercus agrifolia*, *Q. chrysolepis*, *Q. engelmann*, *Q. kelloggii*, *Q. morehus*, and *Q. wislezenii* (County of Riverside 1999).

Stephens' Kangaroo Rat Habitat Conservation Plan

The Stephens' Kangaroo Rat Habitat Conservation Plan (HCP) was completed in 1996 by the Riverside County Habitat Conservation Agency, the CDFW, and the USFWS. The HCP was created as a region-wide plan for species permitting and conservation so that individual projects could receive ESA take authority for the species through the County, rather than individually. The HCP established 7 "core reserves," totaling more than 41,000 acres, within a planning area of 533,000 acres. The Riverside County Habitat Conservation Agency is responsible for "completing" the reserves through the addition of land in fee simple or through the acquisition of easements. The HCP also calls for the addition of 2,500 acres of occupied Stephens' kangaroo habitat into the reserves, for total acreage of occupied SKR habitat within core reserves to 15,000 acres

(Chamberlin, 1998). A portion of the reserves occur within the former March Air Base; however, the project site is not among the reserve lands.

General Plan of the March Joint Powers Authority.

As part of the base re-alignment, the General Plan of the March Joint Powers Authority was created as a guiding tool for development within the former Air Base. The general plan is designed to implement the March Air Force Base Master Reuse Plan, which included disposal and redevelopment of approximately 4,400 acres of the approximately 6,500 acres of the former Air Base. The General Plan established serves as a blueprint for future growth and development (March JPA, 1999).

2 METHODS

RBC conducted vegetation mapping; a habitat assessment; general biological surveys; a preliminary jurisdictional wetland/waters delineation; and summer special-status plant surveys at the project site on July 17 and 25, 2018 (Appendices B). RBC also conducted protocol presence/absence surveys for Stephens' kangaroo rat on October 21-26, 2018 (Appendix G). The general biological survey, vegetation mapping and wildlife surveys were conducted within the project area plus a 50-foot buffer, collectively referred to as the Biological Survey Area (BSA) herein. Note that figures in this report depict the full BSA for informational purposes and edge effects analysis; however, only project site information is included in report calculations and tables.

Prior to conducting field surveys, existing information regarding biological resources present or potentially present within the BSA was obtained through a review of pertinent literature and databases, including, but not limited to:

- CDFW California Natural Diversity Database (CNDDB)
- California Native Plant Society (CNPS) Electronic Inventory
- United States Fish and Wildlife Service Database
- National Wetlands Inventory Database

A CNDDB (CDFW 2018) query was conducted for the project site plus a 3-mile radius. The CNPS Electronic Inventory (CNPS 2018) search was conducted for the nine United States Geological Survey (USGS) 7.5' quadrangles surrounding the BSA for an elevation range of 1,500 to 1,600 feet above median sea level (AMSL). The potential for special-status species to occur within the BSA was refined by considering the habitat affinities of each species, the results of field habitat assessments, vegetation mapping, and knowledge of local biological resources.

Additionally, large branchiopod (fairy shrimp) surveys are currently underway; survey results will be shared with the USFWS pursuant to survey protocol.

2.1 VEGETATION COMMUNITIES AND LAND USES

RBC conducted vegetation mapping in the field to provide a baseline of the biological resources that occur or have the potential to occur within the BSA. RBC conducted vegetation mapping by walking throughout the BSA and mapping vegetation communities on aerial photographs at a 1:2400 scale (1 inch = 200 feet). The extent of each habitat type (delineated as a habitat polygon on the vegetation maps) was calculated using the ArcGIS Geographic Information System (GIS). Habitats were classified based on the dominant and characteristic plant species in accordance with vegetation community classifications outlined in Holland's *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986) and consistent with MSCHP vegetation mapping classification. Note that information regarding how each community is classified under the Manual of California Vegetation, 2nd Edition is also provided herein for reference.

2.2 BIOLOGICAL SURVEYS

A general biological survey for plants and animals was conducted concurrently with project vegetation mapping on July 17 and 25, 2018. Plant species encountered during the field survey were identified and recorded in field notebooks. Plant species that could not be identified were brought into the laboratory for identification using the dichotomous keys in the *Jepson Manual* (Baldwin et al. 2012) and following the taxonomic treatment of the Jepson Manual with input from the *Western Riverside County Annotated Checklist* (Roberts et al. 2004). A compiled list of the vascular plant species observed in the BSA is presented in Appendix C.

Wildlife species were documented during the field survey by sight, calls, tracks, scat, or other signs, and were recorded in field notebooks. Binoculars (8X42 magnification) were used to aid in the identification of wildlife. In addition to species observed during the surveys, expected wildlife use of the BSA was assessed based on known habitat preferences of local species and knowledge of their biogeographic distribution in the region. Scientific and common names of animals follow CDFW (2018). A list of wildlife species observed in the study area is presented in Appendix D.

The location of observed biological resources designated as special-status by the USFWS, CDFW, and/or CNPS, were recorded in field notebooks, aerial maps, and/or through the use of Global Positioning System (GPS) handheld units. The BSA was also surveyed for habitat with the potential to support special-status plant and animal species.

2.3 PRELIMINARY JURISDICTIONAL DELINEATION

Prior to conducting the preliminary wetland delineation on July 17, 2018, field maps were created using GIS to incorporate topographic maps, color aerial photograph at a 1:100 scale, and the USFWS National Wetlands Inventory data. Potential jurisdictional features within the project area were evaluated for the presence of defined channels and/or wetland vegetation, soils, and hydrology. Potential jurisdictional areas on-site were examined using the methods set forth in the U.S. Army Corps of Engineers 1987 *Wetland Delineation Manual* (Wetland Manual) (Environmental Laboratory 1987) and the 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region Version 2.0* (Arid West Supplement) (Corps 2008).

Lateral limits of non-wetland waters of the U.S. were identified using field indicators of an ordinary high water mark (Corps 2008). All areas with depressions, drainage channels, or wetland vegetation were evaluated for the presence of an ordinary high water mark. For each feature exhibiting the potential presence of an OHMW, RBC completed a 2010 Arid West Ephemeral and Intermittent Streams OHWM Datasheet (OHWM Datasheet) following the guidance provided in the Updated Datasheet for the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States (Corps 2010).

CDFW jurisdictional boundaries were determined based on the presence of riparian vegetation and/or regular surface flow (hydrology indicators). Streambeds within CDFW jurisdiction were delineated based on the definition of streambed as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supporting fish or other aquatic life.

This includes watercourses having a surface or subsurface flow that supports riparian vegetation" (Title 14, Section 1.72). Riparian habitat refers to vegetation and habitat associated with a stream. The CDFW jurisdictional habitat includes all riparian shrub or tree canopy that may extend beyond the banks of a stream.

Potential jurisdictional features were recorded using a hand-held GPS unit. Plants were identified according to *The Jepson Manual* (Baldwin et al. 2012). Wetland affiliations of plant species follow the U.S. Department of Agriculture (USDA) *Wetland Indicator Plant List* (USDA 2014). Soil chromas were identified according to *Munsell's Soil Color Charts* (Kollmorgen 2000).

2.4 SPECIAL-STATUS SPECIES SURVEYS

SUMMER PLANT SURVEYS

RBC conducted focused surveys for summer-blooming floral species within the project site in July 2018. The K4 project site was surveyed for special-status plants with a moderate or high potential to occur on site (Table 4). Surveys were conducted for paniculate tarplant (*Deinandra paniculata*), smooth tarplant (*Centromadia pungens* ssp. *laevis*), and other summer blooming species on July 17 and July 25, 2018. All suitable habitat within the project impact area was walked and assessed for special-status floral species presence.

STEPHENS' KANGAROO RAT SURVEYS

RBC conducted focused surveys for Stephens' kangaroo rat within the BSA between October 21 and October 26, 2018. RBC set 140 extra-large Sherman live traps within the BSA for five nights, for a total of 700 trap/nights (traps set per night per survey). Traps were baited with a seed mix of millet and sunflower around 1630, approximately an hour and a half before sunset. Traps were checked once during the night and again just after sunrise (0700). The traps remained closed during the day to avoid unnecessary animal capture. RBC mapped all trap locations in ArcGIS Collector.

3 RESULTS

3.1 PHYSICAL SETTING

The project site is located on relatively flat ground and supports primarily upland vegetation communities with one drainage channel bordering the site to the north at Cactus Avenue, containing sparse riparian vegetation. On-site elevations range from approximately 1548 to 1553 feet AMSL. The site supports primarily disturbed goldenbush scrub/non-native grassland and developed/disturbed upland habitats, with smaller areas of non-native grassland. Soils on-site are primarily Greenfield sandy loams, ranging from moderately coarse to coarse sandy loam to coarse textured alluvium (Appendix E).

3.2 VEGETATION COMMUNITIES AND LAND USES

The project site supports seven vegetation communities and other land covers as shown on Figure 2 and identified in Table 1. The site is periodically disked so conditions are atypical; mapping was performed based on conditions observed during the July 2018 field visit. The upland vegetation communities within the BSA include goldenbush scrub/non-native grassland, developed/disturbed land, and non-native grassland habitats. Areas that are developed including roads and industrial areas were mapped as developed. No large stands of riparian vegetation communities are present on site, although small numbers of individual riparian plants were observed within the Cactus Avenue channel.

Habitats were classified based on the dominant and characteristic plant species in accordance with vegetation community classifications outlined in Holland's *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986) and consistent with MSCHP vegetation mapping classification. Note that information regarding how each community is classified under the Manual of California Vegetation, 2nd Edition is also provided herein for reference.

Table 1. Vegetation Communities within K4 Warehouse and Cactus Channel Improvement Project Areas

Vegetation Community (Holland Code)	Vegetation Community (MCV 2)	Global/ State Rank	K4 Warehouse Site (acres)	Cactus Channel (acres)	Total
Goldenbush Scrub/Non-Native Grassland	Disturbed Palmer's Goldenbush Scrub*	G3 S3	22.16	-	22.16
Developed/Disturbed	Developed/ Disturbed	-	10.16	0.85	11.01
Non-Native Grassland	Mediterranean California Nauralized Annual and Perennial Grassland	None	0.26	8.40	8.66

Freshwater Marsh	Cattail Marshes	G5 S5	0.04	0.37	0.41
Ornamental	Ornamental	-	-	0.05	0.05
Southern Willow Scrub	Sandbar Willow Thickets	G5 S4.2	0.02	0.02	0.04
Fremont's Cottonwood *(Populus fremontii)*	Fremont Cottonwood Forest	G4 S3.2	-	0.02	0.02
Total			32.64	9.71	42.35

**Goldenbush occurring on the project site is the more common thick-bracted goldenbush rather than the CNPS List 1B.1 Palmer's goldenbush, but this community type is the closest crosswalk.*

VEGETATION COMMUNITIES

Goldenbush Scrub/Non-Native Grassland

Goldenbush scrub/non-native grassland areas within the project area (22.16 acres) support scattered stands of goldenbush (*Ericameria palmeri* var. *pachylepis*) amongst primarily non-native grasses (*Bromus madritensis* ssp. *rubens*, *Bromus sterilis*, *Cynodon dactylon*, etc.). The project site is frequently disked, keeping non-native grasses fairly low to the ground and goldenbush specimens small. Typically, these communities would be split into discrete categories; however, due to atypical site conditions and disturbance, the site is a mosaic of the two communities. Goldenbush scrub/non-native grassland occurs on the western two-thirds of the site.

Developed/Disturbed

Developed/disturbed areas within the project area (11.01 acres) support little to no native vegetation and are comprised of human-made disturbances (agriculture, construction, or other land-clearing activities) or structures such as buildings and roads. The high level of soil disturbance allows only sparse ruderal (weedy) plant species to occur. Major developed areas within the project boundary are concentrated on the eastern third of the site and include a soil stockpile area and areas disturbed by grading and former concrete pads on the site. Areas mapped as developed/disturbed on the project site are overwhelming disturbed areas within only a few small developed areas in the form of concrete bridges and roads.

Non-Native Grassland

Non-native grassland (8.66 acres) predominantly occurs within the Cactus Avenue Channel on the project site. Non-native grassland generally occurs on fine-textured loam or clay soils that are moist during the winter rainy season and very dry during the summer and fall (Holland 1986). Non-native grassland within the biological survey area is largely dominated by common brome (*Bromus madritensis* ssp. *rubens*). Areas mapped as non-native grassland within the Cactus Avenue Channel also support Dallis grass (*Paspalum dilatatum*) and Bermuda grass (*Cynodon dactylon*). Jurisdictional resources were delineated and mapped as part of the project; details regarding aquatic resources is provided in the project jurisdictional delineation report (Appendix F).

Freshwater Marsh

Freshwater marsh within the project area (0.41 acre) supports hydrophytic species including broadleaf cattail, pondweed, and tall flat sedge. Freshwater marsh vegetation occurs within inundated portions of the Cactus Avenue Channel.

Ornamental

Ornamental vegetation within the project area (0.05 acres) supports non-native tree and grass species including tree of heaven (*Ailanthus altissima*) and Bermuda grass. Ornamental vegetation within the project area is located along the Cactus Avenue Channel and at the far west end of the Cactus Avenue Channel.

Southern Willow Scrub

Southern willow scrub (0.04 acre) occurrs within the Cactus Avenue Channel on site. Southern willow scrub is characteristically dominated by dense stands of willows (*Salix* spp.). The on-site southern willow scrub contains limited stands of Goodding's black willow (*Salix gooddingii*; four individuals) and sandbar willow (*Salix exigua* var. *exigua*; 60 small individuals).

Fremont's Cottonwood

A small population of young Fremont cottonwood (*Populus fremontii*; 0.02 acre) occurs within the Cactus Avenue Channel. Fremont cottonwood is a riparian tree species which grows near streams, rivers, and wetlands in the southwestern United States. Fremont cottonwood are typically associated with riparian forests, however the on-site population of this species is limited to 11 individuals.

3.3 PRELIMINARY JURISDICTIONAL AREAS

A west-east, earthen-lined and vegetated drainage ditch, hearby referred to as the Cactus Avenue Channel, runs parallel to Cactus Avenue from just east of Elsworth Street to Heacock Street and was the only observed aquatic resource within the project area. A wetland delineation was performed to determine state and federal jurisdictional status of these areas (Figure 3; Appendix F). The channel supports a large wetland area that met all three parameters per the Arid West Supplement and is therefore jurisdictional wetlands per the Corps, RWQCB, and CDFW. Note that all drainages that are Other Waters of the U.S. will also require permitting though the RWQCB under the Clean Water Act Section 401. Details regarding state and federal jurisdictional status are provided below.

No vernal pools were observed during 2018 project biological surveys; however, depressions with cracked soils were observed on site during July 2018 general biological surveys. These areas may pond during the rainy season; protocol fairy shrimp surveys are currently being undertaken to determine species presence/absence on-site.

A total of 3.01 acres of potential CDFW jurisdictional resources, and 1.82 acres of potential Corps and RWQCB resources occur within the Cactus Avenue Channel, including both wetlands and non-wetlands waters of the US (inclusive of areas on the K4 Warehouse site and the remainder of the channel area). Resources that will potentially be subject to jurisdiction by CDFW, and Corps and RWQCB are shown in Figure 3 and identified in Tables 2 and Table 3.

Table 2. Potential Jurisdictional Resources On-Site: Corps and RWQCB

Corps and RWQCB Jurisdictional Designation	Acreage	Linear Feet	Presence of OHWM	Wetland Presence	Dominant Vegetation
K4 Warehouse Area					
Wetland	0.68	2389	No	Yes	Freshwater marsh
Non-Wetland Waters of the US/State	0	0	Yes	No	Unvegetated; Non-native grassland
Cactus Channel Improvements Area					
Wetland	0.71	2401	No	Yes	Freshwater marsh
Non-Wetland Waters of the US/State	0.42	2876	Yes	No	Unvegetated; Non-native grassland
Total	**1.81**	**7666**			

Table 3 . Potential Jurisdictional Resources On-Site: CDFW

CDFW Jurisdictional Designation	Acreage	Linear Feet	Presence of OHWM	Wetland Presence	Dominant Vegetation
K4 Warehouse Area					
Wetland	0.68	2386	No	Yes	Freshwater marsh
Cactus Avenue Channel Non-Wetland Waters of the US/State	0.47	0	Yes	No	Unvegetated; Non-native grassland
Cactus Channel Improvements Area					
Wetland	0.71	2404	No	Yes	Freshwater marsh
Non-Wetland Waters of the US/State	1.13	2876	Yes	No	Unvegetated; Non-native grassland
Total	**2.99**	**7666**			

3.4 PLANTS AND ANIMALS

The project area supports a low diversity of vegetation communities and plant species diversity. A total of 36 plant species (56 percent native, 44 percent non-native) were observed during project biological surveys. A comprehensive list of plant species that were observed during biological surveys within the BSA is included as Appendix C.

A total of 14 species of birds, two reptiles, three mammals, and one invertebrate species were observed or presumed present based on track and/or scat (Appendix D). Because twilight/nighttime surveys were not conducted, crepuscular and nocturnal animals are likely under-represented in this assessment.

Special-status biological resources are those defined as follows: 1) Species that have been given special recognition by federal, state, or local conservation agencies and organizations due to limited, declining, or threatened/endangered population sizes; 2) Species and habitat types recognized by local and regional resource agencies as sensitive; 3) Habitat areas or vegetation communities that are unique, are of relatively limited distribution, or are of particular value to wildlife; 4) Wildlife corridors and habitat linkages; and/or 5) Biological resources that may or may not be considered sensitive, but are regulated under local, state, and/or federal laws.

For the purposes of this report, species are considered to have special-status if they meet one or more of the following criteria:

- Listed under the federal or state Endangered Species Act (CDFW 2018; USFWS 2018).
- USFWS Birds of Conservation Concern (USFWS 2018)
- CDFW Special Animals List (CDFW 2018)
- CDFW Species of Special Concern (CDFW 2018)
- CDFW Fully Protected Species (CDFW 2018)
- Listed as having a California Rare Plant Rank (CRPR; formerly CNPS List, CNPS 2018)

3.4.1 SPECIAL-STATUS PLANT SPECIES

Special-status plant species include those that are: 1) Listed or proposed for listing by federal or state agencies as threatened or endangered; 2) CRPR List 1 through 4 (CNPS 2018); or 3) Considered rare, endangered, or threatened by the CDFW (CDFW 2018) or other local conservation organizations or specialists.

CNPS is a statewide resource conservation organization that has developed an inventory of California's sensitive plant species. The CRPR system is recognized by the CDFW and essentially serves as an early warning list of potential candidate species for threatened or endangered status. The CRPR system is categorized as outlined in Table 5.

The potential for the project area to support special-status plant species was assessed during the site visits and vegetation mapping; analysis of CNDDB (Figure 4) and CNPS data; and knowledge of the habitat affinities and biogeography of special-status plants in southern California. Based on site suitability and local databases, two special-status plant species had moderate or high potential to occur on-site: 1) Smooth tarplant; and 2) Paniculate tarplant. Both are summer blooming species;

as such, a summer rare plant survery was performed in July 2018. Surveys for smooth tarplant were positive (Appendix C); surveys for paniculate tarplant were negative. A complete list of special-status plants with potential to occur on-site can be found in Table 4.

Some trees are protected under local tree protection ordinances. There are a some willows and very young, small cottonwoods within the Cactus Avenue Channel; however, no oak trees or other protected specimens occur on-site.

Table 4. Special-Status Plant Species with Potential to Occur Within the Project Study Area

Species	Status	Habitat Description	Potential to Occur
California satintail (*Imperata brevifolia*)	CRPR 2B.1	Perennial rhizomatous herb. Blooms Sep-May. Chaparral, coastal scrub, Mojavean desert scrub, alkali meadows and seeps, and riparian scrub. Elev. 0-3,986 ft.	Very low potential to occur. No suitable habitat present; not observed during summer plant surveys.
Chaparral ragwort (*Senecio aphanactis*)	CRPR 2B.2	Annual herb. Blooms Jan-Apr. Chaparral, cismontane woodland, and coastal scrub. Elev. 50-2,625 ft.	Very low potential to occur. No chaparral, cismontane woodland or coastal scrub habitat present on site.
Chaparral sand-verbena (*Abronia villosa* var. *aurita*)	CRPR 1B.1	Annual herb. Blooms Jan-Sep. Sandy chaparral, coastal scrub and desert dunes. Elev. 245-5,250 ft.	Very low potential to occur. Suitable sandy habitat not present.
Coulter's goldfields (*Lasthenia glabrata ssp. coulteri*)	CRPR 1B.1	Annual herb. Blooms Feb-Jun. Coastal salt marshes and swamps, playas, vernal pools. Elev. 3-4,002 ft.	Very low potential to occur. No suitable coastal salt marsh, swamp, or playa habitat present on site.
Coulter's matilija poppy (*Romneya coulteri*)	CRPR 4.2	Perennial rhizomatous herb. Blooms Mar-Jul. Chaparral and coastal scrubs. Elev. 65-3,937 ft.	Low potential to occur. Not observed during summer plant surveys.
Little mousetail (*Myosurus minimus* ssp. *apus*)	CRPR 3.1	Annual herb. Blooms Mar-Jun. Valley/foothill grasslands and alkaline vernal pools. Elev. 65-2,100 ft.	Low potential to occur. Areas that may pond are highly disturbed and unlikely to support native vernal pool species.
Long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*)	CRPR 1B.2	Annual herb. Blooms Apr-Jul. Chaparral, coastal scrub, meadows and seeps, valley/foothill grassland, and vernal pools. Elev. 98-5,020 ft.	Low potential to occur. Limited suitable habitat present and not detected during summer plant survey.
Many-stemmed dudleya (*Dudleya multicaulis*)	CRPR 1B.2	Perennial herb. Blooms Apr-Jul. Chaparral, coastal scrub, and valley/foothill grasslands. Elev. 50-2,590 ft.	Very low potential to occur. No suitable habitat present.
Mesa horkelia (*Horkelia cuneata* var. *puberula*)	CRPR 1B.1	Perennial herb. Blooms Feb-Sep. Maritime chaparral, cismontane woodland, and coastal scrub. Elev. 230-2,657 ft.	Very low potential to occur. No suitable habitat present.
Munz's onion (*Allium munzii*)	FE; ST; CRPR 1B.1	Perennial bulbiferous herb. Blooms Mar-May. Chaparral, Cismontane woodland, Coastal scrub, Pinyon and juniper woodland, Valley and foothill grassland. Elev. 970-3,510 ft.	Very low potential to occur. No undisturbed native vegetation communities on site. No clay soils mapped prior to site disturbance (mapped soil is a sandy loam) and no clay soil observed during site visit.

Species	Status	Habitat Description	Potential to Occur
Nevin's barberry (*Berberis nevinii*)	FE; SE; CRPR 1B.1	Perennial evergreen shrub. Blooms Feb-Jun. Chaparral, cismontane woodland, coastal scrub, and riparian scrub. Elev. 230-2,705 ft.	No potential to occur. Species is visible year-round and was not detected during summer plant surveys.
Palmer's grapplinghook (*Harpagonella palmeri*)	CRPR 4.2	Annual herb. Blooms Mar-May. Chaparral, coastal scrub, and valley/foothill grasslands. Elev. 65-3,133 ft.	Very low potential to occur. No clay soils or suitable habitats present on site.
Paniculate tarplant (*Deinandra paniculata*)	CRPR 4.2	Annual herb. Blooms Apr-Nov. Coastal scrub, valley/foothill grassland, vernal pools. Elev. 82-3,084 ft.	Low potential to occur. Known from area so considered moderate potential but not observed during summer rare plant survey.
Parish's brittlescale (*Atriplex parishii*)	CRPR 1B.1	Annual herb. Blooms Jun-Oct. Chenopod scrub, playas, and vernal pools within alkaline habitat. Elev. 82-6,233 ft.	Very low potential to occur. No suitable alkaline habitat present.
Parry's spineflower (*Chorizanthe parryi* var. *parryi*)	CRPR 1B.1	Annual herb. Blooms Apr-Jun. Chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland. Elev. 900-4,000 ft.	Low potential to occur. Limited suitable habitat present and not detected during plant survey.
Payson's jewelflower (*Caulanthus simulans*)	CRPR 4.2	Annual herb. Blooms Feb-Jun. Chaparral and coastal scrub. Elev. 295-7,218 ft.	Very low potential to occur. No suitable habitat on-site.
Peninsular spineflower (*Chorizanthe leptotheca*)	CRPR 4.2	Annual herb. Blooms May-Aug. Chaparral, coastal scrub, lower montane coniferous forest. Elev. 984-6,233 ft.	Low potential to occur. Limited suitable habitat present and not detected during summer plant survey.
Plummer's mariposa lily (*Calochortus plummerae*)	CRPR 4.2	Perennial bulbiferous herb. Blooms May-Jul. Chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, valley and foothill grassland. Elev. 330-5,580 ft.	Very low potential to occur. No suitable habitats present on site. Species not observed during summer plant surveys, and no dried *Calochortus* fruit observed on site.
Prairie wedge grass (*Sphenopholis obtusata*)	CRPR 2B.2	Perennial herb. Blooms Apr-Jul. Cismontane woodland, meadows and seeps. Elev. 984-6,561 ft.	Very low potential to occur. No woodlands, meadows, or seeps present.
Robinson's pepper-grass (*Lepidium virginicum* var. *robinsonii*)	CRPR 4.3	Annual herb. Blooms Jan-Jul. Chaparral and coastal sage scrub. Elev. 3-2,905 ft.	Very low potential to occur. No suitable habitat on-site.
Salt spring checkerbloom (*Sidalcea neomexicana*)	CRPR 2B.2	Perennial herb. Blooms Mar-Jun. Chaparral, coastal scrub, lower montane coniferous forests, Mojavean desert scrub, and playas. Elev. 50-5,020 ft.	Very low potential to occur. No suitable alkaline habitat present.
San Bernardino aster (*Symphyotrichum defoliatum*)	CRPR 1B.2	Perennial rhizomatous herb. Blooms Jul-Nov. Cismontane woodlands, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, and vernally mesic valley/foothill grasslands. Elev. 7-6,690 ft.	Very low potential to occur. No associated habitats present on site. No suitable mesic habitat present on site.

Species	Status	Habitat Description	Potential to Occur
San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*)	FE; CRPR 1B.1	Annual herb. Blooms Apr-Aug. Playas, mesic valley/foothill grasslands, and vernal pools within alkaline habitat. Elev. 456-1,640 ft.	Very low potential to occur. No suitable alkaline habitat present.
Santa Ana River woollystar (*Eriastrum densifolium* ssp. *sanctorum*)	FE; SE; CRPR 1B.1	Perennial herb. Blooms Apr-Sep. Chaparral and coastal alluvial fan scrub. Elev. 298-2,000 ft.	Very low potential to occur. No chaparral or coastal alluvial fan scrub present.
Slender-horned spineflower (*Dodecahema leptoceras*)	FE; SE; CRPR 1B.1	Annual herb. Blooms Apr-Jun. Chaparral, cismontane woodland, alluvial fan coastal scrub. Elev. 655-2,490 ft.	Very low potential to occur. No suitable habitat present.
Small-flowered microseris (*Microseris douglasii* ssp. *platycarpha*)	CRPR 4.2	Annual herb. Blooms Mar-May. Cismontane woodlands, coastal scrub, valley/foothill grasslands, and vernal pools. Elev. 50-3,510 ft.	Low potential to occur. No undisturbed native vegetation communities on site. This species can be found in non-native grassland but high site disturbance likely precludes it.
Small-flowered morning-glory (*Convolvulus simulans*)	CRPR 42	Annual herb. Blooms Mar-Jul. Chaparral, coastal scrub, valley and foothill grasslands. Elev. 98-2,296 ft.	Low potential to occur. Limited suitable habitat present.
Smooth tarplant (*Centromadia pungens* ssp. *laevis*)	CRPR 1B.1	Annual herb. Blooms Apr-Sep. Chenopod scrub, meadows and seeps, playa, riparian woodland, valley and foothill grassland. Elev. 0-2,100 ft.	Present. This species is common on the K4 warehouse site with a population of 525-550 individuals occupying 0.15 acre.
Spreading navarretia (*Navarretia fossalis*)	FT; CRPR 1B.1	Annual herb. Blooms Apr-Jun. Chenopod scrub, shallow freshwater marshes and swamps, playas, and vernal pools. Elev. 98-2,150 ft.	Low potential to occur. Not reported from area and not observed during surveys; potentially ponded areas on-site are highly disturbed and unlikely to support native species.
Thread-leaved brodiaea (*Brodiaea filifolia*)	FT; SE; CRPR 1B.1	Perennial bulbiferous herb. Blooms Mar-Jun. Chaparral, cismontane woodlands, coastal scrub, playas, valley/foothill grasslands, vernal pools. Elev. 82-3,675 ft.	Low potential to occur. Not known from region and no suitable habitat present.
Vernal barley (*Hordeum intercedens*)	CRPR 3.2	Annual herb. Blooms Mar-Jun. Coastal dunes, coastal scrub, valley/foothill grassland saline flats and depressions, and vernal pools. Elev. 16-3,280 ft.	Very low potential to occur. Not known from the vicinity; not observed during summer plant survey. On-site disturbance and lack of saline habitat would likely preclude species.
Western spleenwort (*Asplenium vespertinum*)	CRPR 4.2	Perennial rhizomatous herb. Blooms Feb-Jun. Chaparral, Cismontane woodland, Coastal scrub. Elev. 590-3,280 ft.	No potential to occur. No undisturbed native vegetation communities on site. Additionally, visible year-round and not observed during site visit.
White rabbit-tobacco (*Pseudognaphalium leucocephalum*)	CRPR 2B.2	Perennial herb. Blooms (Jul)Aug-Nov(Dec). Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland. Elev. 0-6,890 ft.	Very low potential to occur. No suitable habitat on site; not observed during summer rare plant survey.

Species	Status	Habitat Description	Potential to Occur
Woven-spored lichen (*Texosporium sancti-jacobi*)	CRPR 3	Crustose lichen. Appears on soil, small mammal pellets, dead twigs, and on *Selaginella* spp., as well as chaparral openings. Elev. 950-2,165	Very low potential to occur. Continuous site disturbance would disrupt the establishment of this species.

FE: USFWS Federally Threatened (FE) Species under the Endangered Species Act
FT: USFWS Federally Threatened (FT) Species under the Endangered Species Act
SE: CDFW State Endangered (SE) under the California Endangered Species Act
ST: CDFW State Threatened (ST) under the California Endangered Species Act
CRPR: California Rare Plant Rank

Table 5. California Rare Plant Rank (CRPR) Definitions

California Rare Plant Rank (CRPR)	1A	presumed extirpated in California and rare or extinct elsewhere
	1B	rare, threatened, or endangered in California and elsewhere
	2A	presumed extirpated in California but more common elsewhere
	2B	rare, threatened, or endangered in California but more common elsewhere
	3	plants for which more information needed
	4	plants of limited distribution
CRPR Threat Ranks	0.1	Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
	0.2	Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
	0.3	Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

3.4.1.1 Threatened and Endangered Plant Species

No federally or state threatened, or endangered plants were observed during the general field survey or summer rare plant survey and none have a moderate or high potential to occur on the site based on the disturbed nature of the site and lack of suitable habitats (Table 4).

3.4.1.2 Plant Species of Special Concern

One CRPR 1B.1 list plant, smooth tarplant, was observed on the K4 Warehouse site. Paniculate tarplant would typically be considered to have a moderate probability to occur on-site; however, summer season surveys for this species were negative.

Paniculate Tarplant (Deinandra paniculata)

Paniculate tarplant is an annual herb in the sunflower family (Asteraceae) and has small yellow flowers that bloom from March to November. Paniculate tarplant is native to California and Baja California. In the U.S. it occurs from San Diego County to Santa Barbara County at elevations less than 3,000 feet. It is commonly found in coastal scrub, valley and foothill grassland, and vernal pool habitats (CNPS, 2018). Paniculate tarplant is a CRPR rank 4.2 species and State Rank S4. Its CPRP 4.2 listing means that it is a plant of limited distribution that is moderately threatened in

California (20-80% of occurrences threatened); its state rank S4 means that it is "apparently secure within California." Prior to 2018 surveys, paniculate tarplant was anticipated to have a moderate potential to occur on site. However, following negative 2018 surveys, potential to occur has been reduced from moderate to low.

Smooth Tarplant (Centromadia pungens spp. laevis)

Smooth tarplant was observed on the K4 Warehouse site during 2018 summer surveys (Appendix C). Smooth tarplant has a CRPR rank of 1B.1, meaning it is rare, threatened, or endangered in California and elsewhere, and seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat). Smooth tarplant holds the State Rank S2, meaning the plant is imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province (CNPS 2018). Smooth tarplant was observed in the eastern third of the K4 Warehouse site in disturbed/developed, and in the central portion of the Cactus Avenue Channel within non-native grassland vegetation communities. The total on-site population is approximately 525-550 individuals covering an area of 0.15 acre (Figure 2).

3.4.2 SPECIAL-STATUS WILDLIFE SPECIES AND CRITICAL HABITATS

Prior to conducting field surveys, the potential for the project site to support special-status wildlife species was assessed based on the vegetation mapping, analysis of CNDDB query from July 2018 (Figure 4), review of USFWS data, and knowledge of the habitat affinities and biogeography of special-status wildlife in southern California. Additionally, the base re-alignment Biological Opinion (1999) and supporting information was reviewed as part of this assessment.

No USFWS federally listed endangered species were observed within or immediately adjacent to the BSA during project surveys. One CDFW Species of Special Concern (SSC), San Diego black-tailed jackrabbit, was observed in the BSA during project surveys.

Two listed species, least bell's vireo and Stephens' kangaroo rat have been documented approximately 1.25 miles west and southwest of the project area (Figure 4). A list of the potential of sensitive wildlife to occur on the site is provided in Table 6.

Table 6. Special-Status Wildlife Species with Potential to Occur Within the Project Study Area

Species	Status	Habitat Description	Potential to Occur
INVERTEBRATES			
Riverside fairy shrimp (*Streptocephalus woottoni*)	FE	Vernal pools or other seasonal pools with a depth greater than 30 cm.	Moderate potential to occur. Limited ponding features observed during project surveys that appear to be deep enough for this species, which typically occurs in pools >30 cm depth; moderate potential to occur in the Cactus Avenue channel as it supports temporarily ponded areas that may be deep enough for this species.

Species	Status	Habitat Description	Potential to Occur
Vernal pool fairy shrimp (*Branchinecta lynchi*)	FT	Natural vernal pools or other seasonal pools.	Low to moderate potential to occur. Potential ponding features observed on-site may be suitable for this species, which is typically found in deep, naturally occurring vernal pools. This species also has a minor potential to occur in the Cactus Avenue channel as it supports temporarily ponded areas.
AMPHIBIANS			
Western spadefoot (*Spea hammondii*)	SSC	Temporary ponds, vernal pools, and backwaters of flowing creeks. Also adjacent upland habitats such as grasslands and coastal sage scrub for burrowing.	Moderate potential to occur. Though the site is fairly disturbed, low areas occur on the site that would be suitable for this species if they hold water. Additionally, the Cactus Avenue channel has suitable habitat to support this species.
REPTILES			
Coastal whiptail (*Aspidoscelis tigris stejnegeri*)	SSC	A variety of rocky, sandy, dry habitats including sage scrub, chaparral, woodlands on friable loose soil.	Low potential to occur. Suitable habitat is present; this species is more common near the coast.
Coast horned lizard (*Phrynosoma blainvillii*)	SSC	A variety of habitats including sage scrub, chaparral, and coniferous and broadleaf woodlands. Found on sandy or friable soils with open scrub. Requires open areas, bushes, and fine loose soil.	Low potential to occur. Suitable habitat is present; however, species is more common near the coast.
Orange-throated whiptail (*Aspidoscelis hyperythra*)	WL	A variety of habitats including sage scrub, chaparral, and coniferous and broadleaf woodlands. Found on sandy or friable soils with open scrub.	Moderate potential to occur. Suitable habitat is present, but this species not observed during field surveys.
Red-diamond rattlesnake (*Crotalus ruber*)	SSC	Chaparral, coastal sage scrub, along creek banks, and in rock outcrops or piles of debris. Often associated with dense vegetation in rocky areas.	Low potential to occur. Suitable rocky habitat is not present.
BIRDS			
Burrowing owl (*Athene cunicularia*)	SSC (at burrowing sites & some wintering sites)	Found in grasslands and open scrub from the coast to foothills. Strongly associated with California ground squirrel (*Otospermophilus beecheyi*) and other fossorial mammal burrows.	Moderate to high potential to occur. Suitable but unoccupied burrows observed on site. Burrowing owls known to occur within 1.25 mile of site.

Species	Status	Habitat Description	Potential to Occur
California horned lark (*Eremophila alpestris actia*)	WL	Found from coastal deserts and grasslands to alpine dwarf-shrub habitat above treeline. Also seen in coniferous or chaparral habitats.	Low to moderate potential to occur. Suitable habitat not present; however, species known to occasionally occupy disturbed grasslands. Nearest documented occurrence approximately 3.5 miles southwest.
Cooper's hawk (*Accipiter cooperii*)	WL (when nesting)	Usually in oak woodlands but occasionally in willow or eucalyptus woodlands.	Low potential to occur. Although not observed during project surveys, this species is known to occur in the area. Limited nesting habitat present on site. No large willows, oaks, or eucalyptus trees present on site.
Least Bell's vireo (*Vireo bellii pusillus*)	FE (when nesting); SE (when nesting)	Riparian woodland with understory of dense young willows or mulefat and willow canopy. Nests often placed along internal or external edges of riparian thickets.	Low potential to occur. Suitable riparian habitat is not present.
Loggerhead shrike (*Lanius ludovicianus*)	SSC (when nesting)	Found within grassland, chaparral, desert, and desert edge scrub, particularly near dense vegetation used for nesting.	Low potential to occur. Suitable foraging habitat is present, but dense nesting habitat is not present.
Mountain plover (*Charadrius montanus*)	SSC (wintering)	Inhabits annual grasslands and agricultural fields	Low potential to occur. Suitable foraging habitat not present.
MAMMALS			
Los Angeles pocket mouse (*Perognathus longimembris brevinasus*)	SSC	Found in low elevation grassland, alluvial sage scrub, and coastal sage scrub.	Low to moderate potential to occur. Alluvial sage scrub and coastal sage scrub not present, however grassland present. Repeated disturbance of the site would likely preclude this species.
Northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*)	SSC	Inhabits coastal sage scrub, sage scrub/grassland ecotones, and chaparral communities.	Low to moderate potential to occur. Suitable habitat on-site and burrows observed that are consistent with pocket mouse size; however, repeated disturbance of the site would likely preclude this species.
Pocketed free-tailed bat (*Nyctinomops femorosaccus*)	SSC	Rugged cliffs, rocky outcrops, and slopes in desert shrub and pine oak forests.	Low potential to occur. Rocky outcrops not present.
San Diego black-tailed jackrabbit (*Lepus californicus bennettii*)	SSC	Habitats include early stages of chaparral, open coastal sage scrub, and grasslands near the edges of brush. Uses open land but requires some shrubs for cover.	Present. Although the site is fairly disturbed, suitable foraging habitat is present for this species.

Species	Status	Habitat Description	Potential to Occur
Southern grasshopper mouse (*Onychomys torridus ramona*)	SSC	Low open and semi-open scrubs habitats including coastal sage scrub, mixed chaparral, low sagebrush, riparian scrub, and annual grassland with scattered shrubs.	Low potential to occur. Suitable desert habitat with friable soils lacking on site. Repeated disturbance of the site would likely preclude this species.
Stephens' kangaroo rat (*Dipodomys stephensi*)	FE; ST	Habitats include annual grassland and coastal sage scrub with sparse shrub cover. Commonly in association with *Eriogonum fasciculatum*, *Artemisia californica*, and *Erodium cicutarium*, in areas with loose, friable, well-drained soil, and flat or gently rolling terrain.	None. No individuals or sign observed during focused SKR surveys.
Western mastiff bat (*Eumops perotis californicus*)	SSC	Chaparral, live oaks, and arid, rocky regions. Requires downward opening crevices.	Low potential to occur. Suitable roosting crevices not present.
Western yellow bat (*Lasiurus xanthinus*)	SSC	Occupies a range of habitats in arid and dry areas. Inhabits secluded woodlands, agricultural lands, and sometimes even residential areas.	Low potential to occur. Suitable roosting habitat not present.

FE: Federally Endangered (FE) Species under the Endangered Species Act
FT: Federally Threatened (FT) Species under the Endangered Species Act
SE: State Endangered (SE) under the California Endangered Species Act
ST: State Threatened (ST) under the California Endangered Species Act
SSC: California Department of Fish and Wildlife Species of Special Concern (SSC)
WL: California Department of Fish and Wildlife Watch List (WL) Species

3.4.2.1 Threatened and Endangered Wildlife Species

Riverside Fairy Shrimp (Streptocephalus woottoni)

The Riverside fairy shrimp is federally listed as endangered (USFWS, 2013). This species is the biotic foundation of the food web for a diverse range of aquatic and terrestrial predators. Riverside fairy shrimp have adapted and evolved to endure dry seasons, when vernal pools are not ponded, by lying dormant in cysts (dormant eggs) until environmental conditions are optimal for the Riverside fairy shrimp life cycle. Hatching and observation periods are variable based on annual and seasonal precipitation levels. Riverside fairy shrimp hatch and mature within 48 to 56 days, dependent on environmental variables such as water temperature. Since the Riverside fairy shrimp matures slowly (as compared to seven to 14 days for San Diego fairy shrimp), it is generally restricted to the cooler water temperatures of deep (greater than 12 inches or 30 centimeters) vernal pools (USFWS 2011).

The Riverside fairy shrimp is considered to have one of the most limited distributions among west coast-endemic fairy shrimps. The species is found in California in Ventura, Orange, Riverside, and San Diego Counties (and is also known to occur in Baja California). The extent of the Riverside fairy shrimp range in California spans 163 miles north-south and all populations, with the exception of the Riverside population, are found within 15 miles of the coast (USFWS 2011).

The Riverside fairy shrimps restricted distribution and requirement for deep vernal pools that pond for a minimum of six weeks is attributed to the species substantial development period. The Riverside fairy shrimp takes approximately 48 to 56 days to carry out its lifecycle. The species is

typically observed from mid-March to April. However, the species may hatch outside of its characteristic season due to early or late precipitation. Riverside fairy shrimp are relatively sedentary and do not possess a strong ability to disperse (USFWS 2011).

Based on the 2008 5-year review for Riverside fairy shrimp, there are 45 known extant or presumed extant occurrences in approximately 200 vernal pools and vernal pool complexes. A CNDDB query (2018) shows two historical occurrence of Riverside fairy shrimp. One population approximately 0.25 mile south of the project site, has been extirpated. The additional population is located approximately 1.70 miles south of the project site and is listed as possibly extirpated (CNDDB; Figure 4).

The flat parcel supports potential ponding features. The Cactus Avenue channel supports features that likely remain inundated for periods greater than 120 days, and therefore may be suitable for Riverside fairy shrimp. As such, Riverside fairy shrimp has a moderate potential to occur on site. Protocol large branchiopod (fairy shrimp) surveys are currently being undertaken to determine species presence/absence on-site; results will be forwarded to the USFWS in conformance with protocol.

Stephens' Kangaroo Rat (Dipodomys stephensi)

Stephens' kangaroo rat is a federal-listed endangered and state-listed threatened species. This species occupies portions of Riverside and San Diego counties. There are three distinct regions with Stephens' kangaroo rat populations: western Riverside County, western San Diego County, and central San Diego County. Stephens' kangaroo rat historically occurred in southwestern San Bernardino County, but this species is believed to be extirpated from that area (USFWS 1997). Habitat for the Stephens' kangaroo rat includes open grasslands, fallow agricultural fields, and sparse coastal sage scrub vegetation communities in areas with penetrable soils and flat to fairly steep sloping topography (USFWS 1997). Stephens' kangaroo rat is found at elevations of 180 to 4,100 feet, with most populations located at elevations below 2,000 feet (USFWS 1997). Habitat for the Stephens' kangaroo rat varies in composition and density from place to place and season to season. Filaree (*Erodium* spp.) frequently dominates the best Stephens' kangaroo rat habitat areas, especially during and shortly after the rainy season (RECON 1989). Areas with dense grass cover are typically not suitable for Stephens' kangaroo rat (USFWS 1997). A nocturnal species, Stephens' kangaroo rat consumes a diet primarily of seeds. The decline of this species is attributed in large part to habitat loss and fragmentation due to urban development and agriculture. Other factors contributing to the loss of the species include off-road vehicles, rodent control, and predation by feral and domestic cats (USFWS 1997).

Stephens' kangaroo rat has been reported within close proximity to the site (CDFW; Figure 4). Suitable habitat for Stephens' kangaroo rat is present on the project site and a burrow consistent with this species was observed during the 2018 general biological surveys. Due to the disturbed nature (disked soil) of the site, the probability of an extant, on-site Stephens' kangaroo rat population is not as high as it might have been historically; however, this species maintains a moderate to high potential for occurrence.

RBC conducted a focused Stephens' kangaroo rat survey within the BSA between October 21 and 26, 2018. No Stephens' kangaroo rats were trapped during the survey and no SKR sign

(tracks, scat, tail-drags, seed caches) were observed within the BSA. The complete SKR survey results are attached as Appendix G.

Vernal Pool Fairy Shrimp (Branchinecta lynchi)

The vernal pool fairy shrimp is federal-listed as threatened. This species occurs from Jackson County near Medford, Oregon, throughout the Central Valley, and west to the central Coast Ranges. Isolated southern populations occur on the Santa Rosa Plateau and near Rancho California in Riverside County (Eng et al.1990). This species is more typical of natural vernal pools, not riverine or other systems. In its southernmost range, e.g., Riverside County, this species tends to occur in pools that pond for long periods of time (USFWS, 2007).

This species has not been reported in the immediate project area (CNDDB; Figure 4). However, on-site ponding features support potentially suitable habitat for vernal pool fairy shrimp. The vernal pool fairy shrimp requires a long ponding period that deeper pools, such as Santa Rosa Plateau with pools up to 16 inches, provide (Chester, 2007). The Cactus Avenue channel supports features that likely remain inundated for long periods, and therefore may be suitable for vernal pool fairy shrimp. As such, the vernal pool fairy shrimp has a low to moderate potential to occur on site. Protocol large branchiopod (fairy shrimp) surveys are currently being undertaken to determine species presence/absence on-site; results will be forwarded to the USFWS in conformance with protocol.

3.4.2.2 Wildlife Species of Special Concern & Watch List Species

Western Spadefoot Toad (Spea hammondii)

The western spadefoot is a California Species of Special Concern. This species was reported in the CNDDB query (Figure 4), with the nearest historical occurrence located approximately 1.5 miles northwest of the project site. A 2011 Stephens' kangaroo rat management report notes the observation of western spadefoot in a ponded area at the north end of the Meridian West Campus project Site (approximately 1.55 miles west-northwest of the proposed K4 Warehouse site).

RBC documented potentially suitable habitat for western spadefoot during 2018 surveys. Potential ponding areas on-site and the drainage channel on the south side of Cactus Avenue have the potential to support this species. As such, western spadefoot has a moderate potential to occur at the site.

Orange-Throated Whiptail (Aspidoscelis hyperythra)

The orange-throated whiptail is a CDFW watch list species that inhabits chaparral, non-native grassland, coastal sage scrub, juniper woodland, and oak woodland in southwestern California and Baja California from sea level to 3,400 feet. Its diet consists primarily of the termite (*Reticulitermes hesperus*) so it is tied to perennial vegetation (Bostic 1966) including California buckwheat (McGurty 1981). Orange-throated whiptails are diurnal but spend the hottest part of the day in the shade (Pianka 1986). The orange-throated whiptail does not reproduce parthenogenetically and mates from April to July with a clutch size of around 2 eggs. Hibernation for adults takes place in late July to September with juveniles hibernating all the way to December (Bostic 1966).

The orange throated-whiptail is threatened by habitat loss and conversion of shrub-dominated habitats to non-native grassland. Additionally, non-native Argentine ants (*Irdomyrmex humilis*) are an invasive species known to displace many native insects and may influence the food base the orange-throated whiptail (Jennings and Hayes 1994). The orange-throated whiptail was not observed within the survey area during biological surveys, however has a moderate potential to occur based on habitat suitability and regional occurrences.

Burrowing Owl (Athene cunicularia)

Burrowing owl is a California Species of Special Concern at nesting sites and is federally protected by the Migratory Bird Treaty Act (MBTA). The western subspecies of burrowing owl (*A. c.* hypugaea) breeds from southern Canada to the western half of the United States and into Baja California and central Mexico. In California, suitable habitat for BUOW is generally characterized by short, sparse vegetation with few shrubs, level to gentle topography, and well-drained soils, such as naturally occurring grassland, shrub steppe, and desert habitats (Haug et al. 1993). BUOW may also occur in agricultural areas, ruderal grassy fields, vacant lots, and pastures containing suitable vegetation structure and useable burrows with foraging habitat in proximity (Gervais et al. 2008). BUOW usually use burrows dug by California ground squirrel (*Otospermophilus beecheyi*) and round-tailed ground squirrel (*Citellus tereticaudus*) and dens or holes dug by other fossorial species including badger (*Taxidea taxus*), coyote (*Canis latrans*), and fox (e.g., San Joaquin kit fox (*Vulpes macrotis mutica*)) (Ronan 2002). BUOW also frequently use natural rock cavities, debris piles, culverts, and pipes for nesting and roosting (Rosenberg et al. 2004) and have been documented using artificial burrows for nesting and cover (Smith and Belthoff 2001).

Burrowing owls have declined throughout much of their range because of habitat loss due to urbanization, agricultural conversion, and destruction of ground squirrel colonies (Remsen 1978). The incidental poisoning of burrowing owls and the destruction of their burrows during eradication programs aimed at rodent colonies have also caused their decline (Collins 1979; Remsen 1978). Although burrowing owls are relatively tolerant of lower levels of human activity, human related impacts such as shooting and introduction of non-native predators, have negative population impacts. Burrowing owls often nest and perch near roads where they are vulnerable to roadside shooting, fatal car strikes, and general harassment (Remsen 1978).

Focused burrowing owl surveys have not been conducted for the project. A wintering burrowing owl was documented by RBC approximately 1.5 miles west of the project site near the Meridian West Campus site on December 23, 2015. Burrowing owl was not observed on the project site during 2018 biological surveys. However, based on the presence of on-site suitable burrows and the ability of burrowing owls to occupy fairly disturbed and urban environments, this species has a moderate to high potential to occur on both the K4 Warehouse and the Cactus Channel Improvement sites.

California Horned Lark (Eremophila alpestris actia)

California horned lark is a Species of Special Concern found from coastal deserts and grasslands to alpine dwarf-shrub habitat above treeline and in coniferous or chaparral habitats. It is a common to abundant resident in a variety of open habitats, usually found in habitats where trees and large shrubs are absent. Within southern California, California horned larks' nest on the ground in open fields, grasslands, and rangelands. Horned larks forage in areas with low-growing vegetation and

feed primarily on grains and other seeds and shift to mostly insects in the summer months. California horned lark breeds from March through July, with a peak in activity in May. Outside of the breeding season pairs do not maintain territories and instead form large gregarious, somewhat nomadic flocks.

Threats to the California horned lark include habitat destruction and fragmentation. The habitats preferred by California horned larks are easily converted to other landscapes and human uses such as farmland and development. Pesticides have been shown to poison and kill horned larks (Beason 1995). As a ground nester, California horned lark is vulnerable to mowing in a variety of habitats and pesticide use in agricultural fields.

California horned lark were not observed in the BSA during biological surveys, however the species has been reported approximately 3.5 miles southwest of the project site (Figure 2; CNDDB 2018). However, California horned lark has a low to moderate potential to occur on both the both the K4 Warehouse and the Cactus Channel Improvement sites based on the ability of the species ability to utilize disturbed grassland habitats.

San Diego Black-Tailed Jackrabbit (Lepus californicus)

San Diego black-tailed jackrabbit is a California Species of Special Concern. San Diego black-tailed jackrabbit is found from the coast to the western slope of the coastal mountains, up to 6,000 feet. It inhabits open land but requires some shrubs for cover. Typical habitats include early stages of chaparral; open coastal sage scrub, and grasslands near the edges of brush. Grasses and forbs are their preferred foods. Chew and Chew (1970) reported a diet of 65% shrub browse and 35% herbage. Breeding occurs throughout the year, and young are born under shrubs with no special nest structure. Home ranges averaging 45 acres have been recorded in California (Lechleitner 1958).

San Diego black-tailed jackrabbit is considered a Species of Special Concern in California because the population declines threaten this subspecies with extinction in the state. It is currently considered vulnerable due to a restricted range and small number of populations. Major threats to black-tailed jackrabbits include habitat loss and fragmentation due to agriculture and urban development.

One individual was observed within the K4 Warehouse project site (Figure 2), and although the site is fairly disturbed, foraging habitat for San Diego black-tailed jackrabbit is present.

Los Angeles Pocket Mouse (Perognathus longimembris brevinasus)

Los Angeles pocket mouse is a California Species of Special Concern. This species occurs in coastal basins of southern California, from Los Angeles east to Cabazon, south to Temecula (Bolster 1998). This species is uncommon to rare throughout its range. Los Angeles pocket mouse inhabits low elevation (550-2,650 feet) grasslands, alluvial sage scrub, and coastal sage scrub. This species hibernates (October-February) and primarily feeds on seeds and forbs, and infrequently arthropods and larva (Bolster 1998).

Suitable Los Angeles pocket mouse foraging habitat is present on site; however the disturbed nature of the site reduces potential for occurrence. In addition, this species was not observed during project surveys. As such, this species has a low to moderate potential to occur at the site.

Northwestern San Diego Pocket Mouse (Chaetodipus fallax fallax)

The northwestern San Diego pocket mouse is a CDFW Species of Special Concern found in coastal sage scrub, sage scrub/grassland ecotones, and chaparral communities and is associated with rocky and gravelly substrates. In San Diego County the San Diego pocket mouse was associated with shrub cover greater than 50 percent (Bolger 1997). The northwestern San Diego pocket mouse is one of six subspecies of San Diego pocket mouse (Williams et al. 1993) and is primarily a granivore (seed-eater). Beyond specialization on seeds, little is known of the foraging behavior of the San Diego pocket mouse. However, other pocket mice (*Chaetodipus*, *Perognathus* spp.) tend to forage under shrub and tree canopies, or around rock crevices. San Diego pocket mice are nocturnal and spend their days in burrows.

The San Diego pocket mouse is threatened by development, habitat fragmentation, and degradation. A study by Bolger et al. (1997) suggests that isolated habitat patches must be at least 62 to 198 acres to sustain native rodent populations.

Suitable San Diego pocket mouse habitat occurs on both the both the K4 Warehouse and the Cactus Channel Improvement sites, and burrows that are consistent with pocket mouse size were observed during general biological surveys. Due to the small size and disturbed nature of the site, the potential for this species in not high but there remains a low to moderate potential for occurrence.

3.4.2.3 Critical Habitat

The Endangered Species Act defines critical habitat as a specific geographic area, or areas, that contain features essential for the survival and recovery of endangered and threatened species. Critical habitat is designated by USFWS for endangered and threatened species and may include sites for breeding and rearing, movement or migration, feeding, roosting, cover, and shelter. Critical habitat may also include areas that are not currently occupied by the species, but that will be needed for its recovery. Special management of critical habitat, including measures for water quality and quantity, host animals and plants, food availability, pollinators, sunlight, and specific soil types is required to ensure the long-term survival and recovery of the identified species.

No USFWS-designated critical habitat or proposed critical habitat occurs within five miles of the proposed project site (USFWS, 2018). Therefore, no impacts to critical habitat are expected with implementation of the proposed project.

3.5 WILDLIFE CORRIDORS

A wildlife corridor can be defined as a physical feature that links wildlife habitat, often consisting of native vegetation that joins two or more larger areas of similar wildlife habitat. Corridors enable migration, colonization, and genetic diversity through interbreeding and are therefore critical for the movement of animals and the continuation of viable populations. Corridors can consist of large, linear stretches of connected habitat (such as riparian vegetation) or as a sequence of stepping-stones across the landscape (discontinuous areas of habitat such as wetlands and ornamental vegetation), or corridors can be larger habitat areas with known or likely importance to local fauna.

Regional corridors are defined as those linking two or more large patches of habitat, and local corridors are defined as those allowing resident animals to access critical resources (food, cover, and water) in a smaller area that might otherwise be isolated by urban development. A viable wildlife migration corridor consists of more than an unobstructed path between habitat areas. Appropriate vegetation communities must be present to provide food and cover for both transient species and resident populations of less mobile animals. There must also be a sufficient lack of stressors and threats within and adjacent to the corridor for species to use it successfully.

The project area does not serve as a wildlife corridor, as the areas surrounding the site are substantially developed.

4 IMPACT ANALYSIS

Direct impacts are caused by the project and occur at the same time and place as the project. Any alteration, disturbance, or destruction of biological resources that would result from project-related activities is considered a direct impact. Direct impacts would include direct losses to native habitats, potential jurisdictional waters, wetlands, and special-status species; and diverting natural surface water flows. Direct impacts could include injury, death, and/or harassment of listed and/or special-status species. Direct impacts could also include the destruction of habitats necessary for species breeding, feeding, or sheltering. Direct impacts to plants can include crushing of adult plants, bulbs, or seeds.

Indirect impacts can result from project-related activities where biological resources are affected in a manner that is not direct. Indirect impacts may occur later in time or at a place that is farther removed in distance from the project than direct impacts, but indirect impacts are still reasonably foreseeable and attributable to project-related activities. Examples include habitat fragmentation; elevated noise, dust, and lighting levels; changes in hydrology, runoff, and sedimentation; decreased water quality; soil compaction; increased human activity; and the introduction of invasive wildlife (domestic cats and dogs) and plants.

Cumulative impacts refer to incremental individual environmental effects of two or more projects when considered together. Such impacts taken individually may be minor, but are collectively significant in light of regional impacts.

March JPA's 2015 Local California Environmental Quality Act (CEQA) Guidelines Form J thresholds of significance have been used to determine whether project implementation would result in a significant direct, indirect, and/or cumulative impact. These thresholds are based on Appendix G of the state CEQA Guidelines (CCR Title 14, Division 6, Chapter 3, Sections 15000–15387). A significant biological resources impact would occur if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by CDFW or USFWS;
- Have a substantial adverse effect on federal protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marshes, vernal pools, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy, or ordinance;
- Conflict with the provisions of an adopted Habitat Conservation Plan; Natural Community Conservation Plan; or other approved local, regional, or state habitat conservation plan.

4.1 K4 WAREHOUSE IMPACT ANALYSIS

4.1.1 K4 WAREHOUSE UPLAND VEGETATION IMPACTS

The proposed project would result in permanent impacts on upland vegetation communities and land uses, including goldenbush scrub/non-native grassland and non-native grassland, will result from the proposed K4 Warehouse project. Additionally, the project will result in impacts to developed and disturbed land uses (Figure 5, Table 7).

The only upland habitat present on-site that may be considered sensitive by the resource agencies (CDFW, USFWS) is goldenbush scrub; however, this habitat is sparse and heavily intermixed with non-native grassland. It is not comprised of the rare goldenbush species for which this community is likely considered sensitive; the goldenbush on-site is thick-bracted goldenbush (*Ericamerica palmeri* var. *pachylepis*; no CRPR or other listing) whereas it is Palmer's goldenbush (*Ericamerica palmeri* var. *palmeri*) that is rare and is a CRPR 1B.1 species. The loss of non-native grassland is adverse due to its value for raptor foraging habitat, however would not be a significant loss.

Additionally, as part of the base realignment and subsequent negotiations, 664 acres of native habitat were set aside for conservation in consideration of development within the base re-use area. These conservation areas include upland habitats similar to those that occur on-site. As such, impacts on upland habitats are considered adequately mitigated under previous agency consultation and are less than significant.

Table 7. K4 Warehouse Upland Vegetation Communities/Land Use Project Impacts

Vegetation Community	Project Site (acres)
Goldenbush Scrub/Non-Native Grassland	22.16
Developed/Disturbed	10.16
Non-native Grassland	0.26
Total	**32.58**

4.1.2 K4 WAREHOUSE POTENTIAL JURISDICTIONAL AREA IMPACTS

The proposed K4 warehouse access driveways would permanentally impact approximately 0.06 acre (131 linear feet) of potential Corps and RWQCB wetland waters of the U.S./State. Such crossings are necessary in order to provide ingress/egress to the site from Cactus Avenue. No non-wetland, ephemeral Corps/RWQCB waters of the U.S./State would be impacted with development of the K4 Warehouse (Table 8).

The CDFW has a slightly more expansive jurisdiction than Corps/RWQCB. All Corps/RWQCB potentially jurisdictional areas would also be CDFW jurisdictional, and an additional 0.02 acre would also be potentially CDFW jurisdictional. In total, approximately 0.08 acre (131 linear feet) of potentially jurisdictional CDFW streambed (wetland and non-wetland) areas would be impacted with implementation of the K4 Warehouse development (Table 8). Impacts on these areas would potentially require permitting from the Corps, RWQCB, and CDFW. The K4 Warehouse project as planned is within permit limits for a Corps Nationwide Permit No. 39 and is below the 200 linear foot limitation.

Table 8. K4 Warehouse Project Potential Corps and RWQCB Jurisdictional Resource Impacts and CDFW Jurisdictional Resource Impacts

Agency Jurisdiction	Acreage	Linear Feet
Potentially Jurisdictional Corps and RWQCB Disturbed Wetland Waters	0.06	131
Potentially Jurisdictional CDFW Streambed (Wetland and Non-Wetland)	0.08	131

4.1.3 K4 WAREHOUSE SPECIAL-STATUS PLANTS AND ANIMAL IMPACTS

Federally and State Listed Threatened/Endangered Species

One federally and/or state listed species has been documented on-site and two have a moderate potential to occur on the project site (Section 3.4.2).

Riverside Fairy Shrimp (Streptocephalus woottoni) and Vernal Pool Fairy Shrimp (Branchinecta lynchi)

Riverside fairy shrimp has a moderate potential to occur on site and the vernal pool fairy shrimp has a low to moderate potential to occur on site. The K4 Warehouse parcel supports low areas that may pond during rain events, and the Cactus Avenue channel supports features that likely remain inundated for periods greater than 120 days, and therefore may be suitable for fairy shrimp.

Focused fairy shrimp surveys have not been conducted for the project. As such, any ground-disturbing activities have the potential to significantly impact this species. If present, any impacts on Riverside fairy shrimp or vernal pool fairy shrimp would be significant and require consultation and approval through the USFWS. Protocol shrimp surveys are underway in order to determine the presence or absence of these species on site; results will be submitted to the USFWS in accordance with species protocols.

Stephens' Kangaroo Rat

Protocol Stephens' kangaroo rat surveys were conducted within the BSA and the results were negative. No SKR or SKR sign including tracks, scat, tail drags, or seed caches, were documented during the survey conducted between October 21 and 26, 2018. Therefore, no direct impacts to this species are expected to occur with project implementation.

Species of Special Concern

CRPR Listed Plant Species

One plant species, smooth tarplant, has been documented on the K4 Warehouse site. Smooth tarplant is a CRPR rank 1B.1 species and State Rank S2. Its CRPR 1B.1 listing means that it is rare throughout its range (endemic to California) and has likely declined substantially over the last century. Smooth tarplant State Rank S2 signifies the plant is imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province (CNPS 2018).

CRPR 1B plants "meet the definitions of the California Endangered Species Act of the California Fish and Game Code and are eligible for state listing." Impacts to these species or their habitat must be analyzed during preparation of environmental documents relating to CEQA, or those considered to be functionally equivalent to CEQA, as they meet the definition of Rare or Endangered under CEQA Guidelines §15125; (c) and/or §15380" (CNPS 2018). Its State Rank of S2 means that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province."

A smooth tarplant population of approximately 525-550 individuals (approximately 0.15 acre) would be permanently impacted with construction of the K4 Warehouse project (Figure 2). Direct impacts to smooth tarplant would be potentially significant. As part of the March Air Force Base closure process, 664 acres of lands were placed into conservation easement to offset species and habitat losses associated with base redevelopment, including development of the project site. Conserved areas occur west of I-15 and approximately 1.5 miles west of the K4 project site and provide similar habitats to those that will be impacted by the project (Appendix A). The conservation area is comprised of similar habitats as those occurring on the project site, and at least one population of 50 smooth tarplant individuals was observed during a brief 2018 survey of the conservation area. It is also likely, given the habitats present within the conserved areas, that there are additional populations of smooth tarplant within the conserved areas. As such, many habitat and species losses have already been addressed through conservation of this site, including smooth tarplant and other CRPR species. With implementation of mitigation outlined in Section XX, impacts on smooth tarplant would be less than significant conditional upon satisfaction of previous mitigation requirements.

Wildlife Species of Special Concern & Watch List Species

Burrowing Owl

Burrowing owl or sign (active burrow, white-wash, pellets, etc.) was not observed during 2018 biological surveys. Suitable foraging and nesting habitat (burrows) occur on site, however, and there is potential for this species to colonize the site prior to project construction. If the site becomes occupied by breeding burrowing owl, direct impacts in the form of habitat destruction, and potentially death, injury, or harassment of nesting birds, their eggs, and their young could occur. Injury or mortality occurs most frequently during the vegetation clearing stage of construction and involves eggs, nestlings, and recently fledged young that cannot safely avoid equipment. Potential impacts on burrowing owl were identified in the *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA, 1999), and project impacts on burrowing owls are potentially significant.

Other Special-status Wildlife Species

One other Species of Special Concern wildlife species, San Diego black-tailed jackrabbit, was observed within the K4 Warehouse project area during 2018 surveys (Appendix D). Other Species of Special Concern and 'Watch List' species with a moderate or high potential to occur at the site include western spadefoot, orange-throated whiptail, California horned lark, northwestern San Diego pocket mouse, and Los Angeles pocket mouse.

The project will be construction of an industrial warehouse building, and access to the site from Cactus Avenue. Adult avian species would likely flush during initial project activities, and with implementation of nesting bird protections (MM-6), potential impact on nests would be avoided.

As part of the March Air Force Base closure process, 664 acres of lands were placed into conservation easement to offset species and habitat losses associated with base redevelopment, including development of the project site. As such, many habitat and species losses have already been addressed through conservation of this site. The conservation area occurs west of the site, and provides similar habitats to those that will be impacted by the project (Appendix A). According to the CNLM Stephens' kangaroo monitoring report (2012), the preserve lands are dominated by non-native grasslands, with patches of Riversidean sage scrub and riparian areas. Additionally, direct impacts on avian species will be avoided through nesting bird mitigation (see Section 5.3). Thus, direct avian impacts would be avoided.

Loss of habitat for species of concern and watch list species have been offset through conservation of 664 acres as part of the larger base closure efforts. Impacts on these species would be less than significant, conditional upon satisfaction of previous mitigation requirements.

4.1.4 K4 WAREHOUSE NESTING BIRD IMPACTS

The K4 Warehouse project area has a minor potential to support avian nests, which would be protected under the Migratory Bird Treaty Act and/or the California Fish and Game Code (§3503) under which it is unlawful to "take, possess, or needlessly destroy" avian nests or eggs. Thus, potential impacts could occur if vegetation clearing is undertaken during the breeding season. Removal of habitat would occur outside of the breeding season (February 1 to September 15), or would be surveyed by a qualified biologist prior to construction initiation. If active nests are found, the project clearing in that area plus an appropriate buffer (determined by the qualified biologist in consultation with CDFW) would be delayed until nestlings have fledged. Please refer to section 5.3 for full nest protection requirements.

4.1.5 K4 WAREHOUSE WILDLIFE CORRIDOR IMPACTS

The project is surrounded in all directions by developed land. Thus, the project area does not serve as a wildlife corridor, and therefore the project would not impact wildlife corridors.

4.1.6 K4 WAREHOUSE LOCAL POLICIES & ORDINANCES IMPACTS

No native oaks occur within the K4 Warehouse project site; therefore, no impacts to oaks that are protected under the Riverside County Oak Tree Management Guidelines would occur with project implementation.

The only trees that occur near roadways are willows associated with on-site drainages; there are no street tree plantings. Pursuant to Unincorporated Riverside County Ordinance No. 499.11 (as amended though 499.11), "No person, firm, corporation, public district, public agency or political subdivision shall remove or severely trim any tree planted in the right of way of any County highway without first obtaining a permit from the County Transportation Director to do so." [emphasis added]. As there have been no street trees planted on the project site, no impacts to trees protected under Ordinance No. 499.11 would occur with project implementation.

Chapter 12.24 of the Riverside County Code of Ordinances also includes regulations related to tree removal (County of Riverside 2016). According to the Unincorporated Riverside County Ordinance No. 559 (as amended through 559.7), the removal of living native trees on parcels or property greater than 0.5 acre in size, located in the unincorporated Riverside County, and above 5,000 feet in elevation requires a permit. The project site elevation is below 5,000 acres; as such, this ordinance is not applicable and no impacts to trees protected under Riverside County Ordinance No. 559 would occur with project implementation.

4.1.7 K4 WAREHOUSE CUMULATIVE IMPACTS

The project would result in minor impacts to potentially jurisdictional features, disturbed goldenbush scrub/non-native grassland, as well as special-status species. All impacts will be fully mitigated in accordance with previous agreements and in consultation with state and federal wildlife agencies. Project impacts were considered in connection with the larger March Air Base re-use, and this area is included in the regional MSHCP plan. The MSHCP is a regional effort to offset significant cumulative biological impacts, and all development in the region that is permitted through the County of Riverside must comply with the MSHCP. Because of this regional biological planning, cumulative biological impacts are avoided for development in the western Riverside region when developments are pursued in compliance with the plan. Though the JPA is an independent agency and therefore not a participant under the MSHCP, project mitigation will be pursued in a manner consistent with the MSHCP and all special-status species impacts will be permitted through state and federal agencies. As such, cumulative impacts are considered less than significant.

4.2 CACTUS CHANNEL IMPROVEMENTS IMPACT ANALYSIS

4.2.1 CACTUS CHANNEL IMPROVEMENTS UPLAND VEGETATION IMPACTS

The proposed project would result in permanent impacts on upland vegetation communities and land uses, including non-native grassland and ornamental lands. Additionally, the project will result in impacts to developed and disturbed land uses (Figures 6a-b, Table 9).

Upland habitats on-site are all non-native and are not considered sensitive by the resource agencies. The loss of non-native grassland is adverse due to its value for raptor foraging habitat, however would not be a significant loss. Additionally, as part of the base realignment and subsequent negotiations, 664 acres of native habitat were set aside for conservation in consideration of base re-use development.

Table 9. Cactus Channel Upland Vegetation Communities/Land Use Project Impacts

Vegetation Community	Project Site (acres)
Developed/Disturbed	0.85
Non-native Grassland	8.40
Ornamental	0.05
Total	**9.30**

4.2.2 CACTUS CHANNEL IMPROVEMENTS POTENTIAL JURISDICTIONAL AREA IMPACTS

The proposed Cactus Channel Improvements would permanentally impact approximately 1.34 acre (4659 linear feet) of potential Corps and RWQCB wetland waters of the U.S./State and approximately 0.42 acre (2876 linear feet) of non-wetland, ephemeral Corps/RWQCB waters of the U.S./State (Table 10).

Approximately 2.90 acres (7535 linear feet) of potentially jurisdictional CDFW streambed (wetland and non-wetland) and/or associated riparian habitat within the Cactus Avenue Channel would be impacted with the proposed Cactus Channel Improvements (Table 10). The 2.9 acres of CDFW impacts include 2.5 acres of non-native grassland, 0.37 acre of freshwater marsh, 0.02 acre of Fremont's cottonwood, and 0.02 acre of southern willow scrub. Impacts on jurisdictional areas would be significant and would require consultation with the Corps, RWQCB, and CDFW (Table 10). The Corps may evaluate the Cactus Avenue Channel culvert project under a Standard Individual Permit (SIP) which would require an analysis of alternatives pursuant to the Section 404(b)(1) Guidelines. Additionally, the Corps, RWQCB, and/or CDFW may require a functional assessment (e.g., California Rapid Assessment Method [CRAM]) to quantitatively estimate the stream/wetland condition for the evaluation of the proposed project.

Table 10. Cactus Channel Project Potential Corps and RWQCB Jurisdictional Resource Impacts and CDFW Jurisdictional Resource Impacts

Agency Jurisdiction	Acreage	Linear Feet
Potentially Jurisdictional Corps and RWQCB Disturbed Wetland Waters	1.34	4659
Potentially Jurisdictional Corps and RWQCB Non-Wetland, Ephemeral Waters of the US/State	0.42	2876
Total Potential Corps/RWQCB Impacts:	*1.76*	*7535*
Potentially Jurisdictional CDFW Streambed (Wetland and Non-Wetland)	2.9	7535

Note: Corps/RWQCB jurisdictional areas are the same as/within CDFW jurisdictional areas; acreages do not represent separate lands.

4.2.3 CACTUS CHANNEL IMPROVEMENTS SPECIAL-STATUS PLANTS AND ANIMAL IMPACTS

Federally and State Listed Threatened/Endangered Species

Three federally and/or state listed species have a moderate potential to occur on the project site (Section 3.4.2).

Riverside Fairy Shrimp (Streptocephalus woottoni) and Vernal Pool Fairy Shrimp (Branchinecta lynchi)

Riverside fairy shrimp has a moderate potential to occur on site and the vernal pool fairy shrimp has a low to moderate potential to occur on site. The Cactus Avenue channel supports features that likely remain inundated for periods greater than 120 days, and therefore may be suitable for fairy shrimp.

As such, any ground-disturbing activities have the potential to significantly impact this species. If present, any impacts on Riverside fairy shrimp or vernal pool fairy shrimp would be significant and require consultation and approval through the USFWS. Protocol shrimp surveys are underway in

order to determine the presence or absence of these species on site; results will be submitted to the USFWS in accordance with species protocols.

Stephens' Kangaroo Rat

Protocol Stephens' kangaroo rat surveys were conducted within the BSA and the results were negative. No SKR or SKR sign including tracks, scat, tail drags, or seed caches, were documented during the survey conducted between October 21 and 26, 2018. Therefore, no direct impacts to this species are expected to occur with project implementation.

Species of Special Concern

Several Species of Special Concern have potential to occur within the Cactus Channel Improvements project area.

Burrowing Owl

Burrowing owl or sign (active burrow, white-wash, pellets, etc.) was not observed during 2018 biological surveys. Suitable foraging and nesting habitat (burrows) occur on site, however, and there is potential for this species to colonize the site prior to project construction. If the site becomes occupied by breeding burrowing owl, direct impacts in the form of habitat destruction, and potentially death, injury, or harassment of nesting birds, their eggs, and their young could occur. Injury or mortality occurs most frequently during the vegetation clearing stage of construction and involves eggs, nestlings, and recently fledged young that cannot safely avoid equipment. Potential impacts on burrowing owl were identified in the *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA, 1999), and project impacts on burrowing owls are potentially significant.

Other Special-status Wildlife Species

One other Species of Special Concern, the San Diego black-tailed jackrabbit, was observed on the K4 Warehouse site immediately adjacent the proposed Cactus Channel Improvements work area during 2018 surveys (Appendix D). Other Species of Special Concern and 'Watch List' species

with a moderate or high potential to occur at the site include western spadefoot, orange-throated whiptail, California horned lark, northwestern San Diego pocket mouse, and Los Angeles pocket mouse.

The project will be undergrounding of the Cactus Avenue Channel. Adult avian species would likely flush during initial project activities, and with implementation of nesting bird protections (MM-6), potential impact on nests would be avoided.

As part of the March Air Force Base closure process, 664 acres of lands were placed into conservation easement to offset species and habitat losses associated with base redevelopment, including development of the project site. As such, many habitat and species losses have already been addressed through conservation of this site. The conservation area occurs west of the site and provides similar habitats to those that will be impacted by the project (Appendix A). According

to the CNLM Stephens' kangaroo monitoring report (2012), the preserve lands are dominated by non-native grasslands, with patches of Riversidean sage scrub and riparian areas. Additionally, direct impacts on avian species will be avoided through nesting bird mitigation (see Section 5.3). Thus, direct avian impacts would be avoided.

Loss of habitat for species of concern and watch list species have been offset through conservation of 664 acres as part of the larger base closure efforts. Impacts on these species would be less than significant, conditional upon satisfaction of previous mitigation requirements.

4.2.4 CACTUS CHANNEL IMPROVEMENTS NESTING BIRD IMPACTS

The project area has a minor potential to support avian nests, which would be protected under the Migratory Bird Treaty Act and/or the California Fish and Game Code (§3503) under which it is unlawful to "take, possess, or needlessly destroy" avian nests or eggs. Thus potential impacts could occur if vegetation clearing is undertaken during the breeding season. Removal of habitat would occur outside of the breeding season (February 1 to September 15), or would be surveyed by a qualified biologist prior to construction initiation. If active nests are found, the project clearing in that area plus an appropriate buffer (determined by the qualified biologist in consultation with CDFW) would be delayed until nestlings have fledged. Please refer to section 5.3 for full nest protection requirements.

4.2.5 CACTUS CHANNEL IMPROVEMENTS WILDLIFE CORRIDOR IMPACTS

The project is surrounded in all directions by developed land. Thus, the project area does not serve as a wildlife corridor, and therefore the project would not impact wildlife corridors.

4.2.6 CACTUS CHANNEL IMPROVEMENTS LOCAL POLICIES & ORDINANCES IMPACTS

No native oaks occur within the project site; therefore, no impacts to oaks that are protected under the Riverside County Oak Tree Management Guidelines would occur with project implementation.

The only trees that occur near roadways are occasional willows within the channel; there are no street tree plantings. Pursuant to Unincorporated Riverside County Ordinance No. 499.11 (as amended though 499.11), "No person, firm, corporation, public district, public agency or political subdivision shall remove or severely trim any tree planted in the right of way of any County highway

without first obtaining a permit from the County Transportation Director to do so." [emphasis added]. As there have been no street trees planted on the project site, no impacts to trees protected under Ordinance No. 499.11 would occur with project implementation.

Chapter 12.24 of the Riverside County Code of Ordinances also includes regulations related to tree removal (County of Riverside 2016). According to the Unincorporated Riverside County Ordinance No. 559 (as amended through 559.7), the removal of living native trees on parcels or property greater than 0.5 acre in size, located in the unincorporated Riverside County, and above 5,000 feet in elevation requires a permit. The project site elevation is below 5,000 acres; as such, this ordinance is not applicable and no impacts to trees protected under Riverside County Ordinance No. 559 would occur with project implementation.

4.2.7 CACTUS CHANNEL IMPROVEMENTS CUMULATIVE IMPACTS

The Cactus Channel Improvements would result in impacts to potentially jurisdictional features, non-native grassland, and potential impacts on special-status species. All impacts will be fully mitigated in accordance with previous agreements and in consultation with state and federal wildlife agencies. Project impacts were considered in connection with the larger March Air Base re-use, and this area is included in the regional MSHCP plan. The MSHCP is a regional effort to offset significant cumulative biological impacts, and all development in the region that is permitted through the County of Riverside must comply with the MSHCP. Because of this regional biological planning, cumulative biological impacts are avoided for development in the western Riverside region when developments are pursued in compliance with the plan. Though the JPA is an independent agency and therefore not a participant under the MSHCP, project mitigation will be pursued in a manner consistent with the MSHCP and all special-status species impacts, and jurisdictional resource impacts will be permitted through state and federal agencies. The channel is constructed and any impacts would not contribute to a significant regional loss of such habitats. Cumulative impacts are considered less than significant.

5 MITIGATION

The following discussion provides project-specific mitigation/avoidance measures for potential impacts on special-status resources.

5.1 K4 WAREHOUSE MITIGATION

5.1.1 K4 WAREHOUSE SITE MONITORING AND ADJACENCY IMPACT AVOIDANCE

To prevent inadvertent disturbance to areas outside the limits of the proposed project activities, following monitoring requirements and BMPs shall be implemented. A biologist shall be contracted to perform regular random checks (at minimum twice a month) to ensure implementation within the following monitoring requirements and BMPs. Monitoring reports and a post-construction monitoring report will be prepared to document compliance with these requirements.

MM- K4-1: To prevent inadvertent disturbance to areas outside the limits of the proposed project construction limits, the following monitoring requirements and BMPs shall be implemented. A biologist shall be contracted to perform regular random checks (at minimum once a month) to ensure implementation with the following monitoring requirements and BMPs. Monitoring reports and a post-construction monitoring report will be prepared to document compliance with these requirements.

1) To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground disturbance activities and all construction activities, including equipment staging and maintenance shall be conducted within the marked disturbance limits. The work limit delineation will be maintained throughout project construction.
2) Biologist will flush special-status species (i.e., avian or other mobile species) from suitable habitat areas to the maximum extent practicable immediately prior to initial vegetation removal activities.
3) Construction vehicles shall not exceed 15 miles per hour on unpaved roads adjacent to project site or the right-of-way accessing the site.
4) If trash and debris need to be stored overnight during the maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof will be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash receptacles may be used during the day, but must be removed each night.
5) Cut vegetation must be hauled out of the channel and stored, if necessary, where it cannot be washed by rainfall or runoff into the channel. When maintenance activities are completed, any excess materials or debris will be removed from the project site.
6) Temporary structures and storage of construction materials will not be located in jurisdictional waters, including wetlands and riparian areas.
7) Staging/storage areas for construction equipment and materials will not be located in jurisdictional waters, including wetland and riparian areas.
8) Pets on or adjacent to construction-sites will not be permitted by the operator.

9) As per the Landscaping Guidelines of the Resource Management Element of the March JPA General Plan (1999), drought tolerant vegetation and native vegetation will be used to the extent feasible, consistent with March JPA Landscape Water Efficiency Ordinance #JPA 16-03, with the purpose of preserving existing mature trees and native vegetation. Landscape plans shall be reviewed by a qualified botanist to recommend appropriate provisions to minimize the spread of invasive plant species as defined by the County of Riverside and listed by the California Invasive Plant Council (www.cal-ipc.org) and California Native Plant Society (www.cnps.org) within the project area. Provisions may include: a) installation of container plants and/or hydro-seeding areas adjacent to existing, undisturbed native vegetation areas with native plant species common within temporary impact areas; and (b) review and screening of proposed plants to identify and avoid potential invasive species and weed removal during the initial planting of landscaped areas.

5.1.2 K4 WAREHOUSE JURISDICTIONAL AREAS MITIGATION

The project area supports 0.08 acres of CDFW jurisdictional wetlands (streambed and non-streambed), and 0.06 acre of this area is also Corps jurisdictional non-wetland waters of the U.S. project impacts on wetland communities are significant and will be permitted and mitigated in consultation with the state and federal agencies.

Final mitigation ratios will be determined in consultation with the CDFW, Corps, and/or RWQCB based on agency evaluation of current resource functions and values. A minimum 1:1 ratio (0.08 acres) is typically required, though ratios may be higher. If mitigation is not achieved on-site, it must be performed in an in an agency-approved location that will be conserved and managed in perpetuity.

MM-K4-2: Applicable 404, 401, and 1600 permits and/or clearances shall be obtained prior to any disturbance of the jurisdictional features on-site. All mitigation measures and conditions contained within the permits shall be implemented. Additionally, the following precautions shall be taken during project construction activities. Mitigation options include on-site, offsite, in lieu fee mitigation, or a combination, to replace the disturbed jurisdictional features. Mitigation shall be determined in consultation with the agencies. Best Management Practices (BMPs) shall be implemented to avoid indirect impacts to jurisdictional waters, including the following:

1) Vehicles and equipment will not be operated in ponded or flowing water except as described in the permits.
2) Water containing mud, silt, or other pollutants from grading or other activities will not be allowed to enter jurisdictional waters or be placed in locations that may be subjected to high storm flows.
3) Spoil sites will not be located within 30 feet from the boundaries of jurisdictional waters or in locations that may be subject to high storm flows, where spoils might be washed back into drainages.
4) Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil, or other petroleum products, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from project-related activities, will be prevented from contaminating the soil and/or entering avoided jurisdictional waters.

5) No equipment maintenance will occur within 100 feet of jurisdictional waters and no petroleum products or other pollutants from the equipment will be allowed to enter these areas or enter any off-site state-jurisdictional waters under any flow

5.1.3 K4 WAREHOUSE SPECIAL-STATUS SPECIES MITIGATION

5.1.3.1 K4 Warehouse Threatened and Endangered Species Mitigation

Riverside Fairy Shrimp (Streptocephalus woottoni) and Vernal Pool Fairy Shrimp (Branchinecta lynchi)

Ponding surveys and protocol shrimp surveys should be conducted in order to determine the presence or absence of these species on site.

As described previously, listed fairy shrimp have potential for occurrence in the project area. As such, focused surveys for these species should be conducted as part of project CEQA process.

MM-K4-3: A qualified biologist with a USFWS permit for Riverside fairy shrimp and vernal pool fairy shrimp shall conduct protocol surveys within the project area. If detected, consultation with the USFWS shall be pursued and either a finding of no jeopardy or a take permit shall be obtained for the project. All mitigation measures and conditions contained within any project permits shall be implemented.

5.1.3.2 K4 Warehouse Species of Special Concern Mitigation

Burrowing Owl

Burrowing owl, a federal bird of conservation concern and state Species of Special Concern, was not observed during 2018 general biological surveys, but has the potential to inhabit the site. As such, pre-construction surveys will be required.

MM-K4-4: In accordance with the *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA, 1999), the following mitigation for burrowing owl is required:

> *Thirty days prior to the onset of construction activities, a qualified biologist with appropriate resource agency permits shall survey the construction limits of the Project for the presence of burrowing owls and occupied nest burrows. Any occupied burrows found during the survey efforts shall be mapped on the construction plans. (Draft MEIR, p. 3-96)*
>
> *If nesting and/or activity is present at any burrow site, then the active burrow shall be protected until nesting activity has ended to ensure compliance with Section 3503.5 of the California Fish and Game Code. Nesting activity for burrowing owls in the region of the Planning Area normally occurs from February 1 to August 31. To protect any burrow site, the following restrictions on construction are required between February 1 to August 31:*
>
> *1) Clearing limits will be established a minimum of 100 feet in any direction from any occupied burrow; and*

2) *Access and surveying will not be allowed within 50 feet of any occupied burrow. (Ibid.)*

Construction during the non-nesting season can occur only at the sites if a qualified biologist has determined that the burrows are no longer active. If an active burrow is observed during the non-nesting period, the burrow site will be monitored by a qualified biologist, and when the owl is outside the burrow entrance, the biologist will flush any owl to open space areas. The biologist will then excavate the burrow site with tools or fill the burrow with soil so owls cannot return to the burrow site. (Ibid.)

Note that clearing limit and access distances may be revised during project consultation with CDFW; distances are typically 300-feet for current permits/mitigation.

Smooth Tarplant

A smooth tarplant population of approximately 525-550 individuals (approximately 0.15 acre) would be permanently impacted with construction of the K4 Warehouse project.

MM-K4-5: Smooth Tarplant Mitigation and Monitoring Plan. Surveys shall be conducted for smooth tarplant the season prior to each phase of construction. Surveys shall occur within the Project site and include suitable habitat within a 100-foot buffer (access permitting), at the appropriate time to capture the characteristics necessary to identify the taxon. Surveys shall be conducted consistent with CDFW protocols and by a qualified botanist knowledgeable of the local flora. Since annual variation in weather may result in fewer specimens being observed, the locations of plants considered will be cumulative (i.e., all known plant locations over the course of the various surveys, will be noted). The full extent of the occurrence within the survey area shall be recorded using GPS.
The location of smooth tarplant shall be mapped and number of individuals for each occurrence documented. The outer extent of each occurrence shall be flagged at the time of the survey and the following avoidance measures implemented:

1) Establish Environmentally Sensitive Areas (ESAs). Prior to the start of any ground- or vegetation-disturbing activities, a qualified biologist shall establish ESAs to protect and avoid special-status plants that occur outside of the Project disturbance areas and within 100 feet of Project disturbance areas. The locations of ESAs shall be clearly depicted on construction drawings, which shall also include all avoidance and minimization measures on the margins of the construction plans. ESAs shall be clearly delineated in the field (e.g., with temporary construction fencing) to ensure that avoided plants are not inadvertently harmed during construction.
2) Monitoring. A qualified biologist shall conduct weekly monitoring of the ESAs that protect special-status plant occurrences. The monitor shall have the authority to stop construction activities in the vicinity (within 100 feet) of an ESA if it is determined as a result of monitoring that corrective actions are necessary to avoid and protect the ESA.
3) Smooth Tarplant Mitigation Plan. If impacts to smooth tarplant cannot be avoided a Smooth Tarplant Mitigation Plan shall be submitted to CDFW for review and approval prior to ground disturbance to occupied habitat. Upon approval, the plan will be implemented by the applicant or its designee. The plan will demonstrate the feasibility of enhancing or restoring smooth tarplant habitat in areas to be managed as natural

open space (i.e., within the designated conservation areas west of I-215) without conflicting with other resource management objectives. Habitat enhancement replacement will be at a 1:1 ratio (acres enhanced or restored:acres impacted).

4) The plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals.

5.1.4 K4 WAREHOUSE NESTING BIRD MITIGATION

MM-K4-6: To avoid direct impacts to raptors and/or native/migratory birds, removal of habitat that supports active nests in the proposed area of disturbance should occur outside of the breeding season for these species (February 1 to September 15). If removal of habitat in the proposed area of disturbance must occur during the breeding season, a qualified biologist shall conduct a pre-construction survey to determine the presence or absence of nesting birds in the proposed area of disturbance. The pre-construction (precon) survey shall be conducted within ten (10) calendar days prior to the start of construction activities (including removal of vegetation). If nesting birds are observed, a letter report or mitigation plan in conformance with applicable State and Federal Law (i.e. appropriate follow up surveys, monitoring schedules, construction and noise barriers/buffers, etc.) shall be prepared and include proposed measures to be implemented to ensure that take of birds or eggs or disturbance of breeding activities is avoided. The report or mitigation plan shall be submitted to the CDFW and/or USFWS as applicable for review and approval and implemented to the satisfaction of those agencies. The project biologist shall verify and approve that all measures identified in the report or mitigation plan are in place prior to and/or during construction. If nesting birds are not detected during the precon survey, no further mitigation is required.

5.2 CACTUS CHANNEL IMPROVEMENTS MITIGATION

5.2.1 CACTUS CHANNEL IMPROVEMENTS SITE MONITORING AND ADJACENCY IMPACT AVOIDANCE

To prevent inadvertent disturbance to areas outside the limits of the proposed project activities, following monitoring requirements and BMPs shall be implemented. A biologist shall be contracted to perform regular random checks (at minimum twice a month) to ensure implementation within the following monitoring requirements and BMPs. Monitoring reports and a post-construction monitoring report will be prepared to document compliance with these requirements.

MM-CC-1: To prevent inadvertent disturbance to areas outside the limits of the proposed project construction limits, the following monitoring requirements and BMPs shall be implemented. A biologist shall be contracted to perform regular random checks (at minimum once a month) to ensure implementation with the following monitoring requirements and BMPs. Monitoring reports and a post-construction monitoring report will be prepared to document compliance with these requirements.

1) To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground disturbance activities and all construction activities, including equipment staging and maintenance shall be conducted within the marked disturbance limits. The work limit delineation will be maintained throughout project construction.
2) Biologist will flush special-status species (i.e., avian or other mobile species) from suitable habitat areas to the maximum extent practicable immediately prior to initial vegetation removal activities.
3) Construction vehicles shall not exceed 15 miles per hour on unpaved roads adjacent to project site or the right-of-way accessing the site.
4) If trash and debris need to be stored overnight during the maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof will be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash receptacles may be used during the day, but must be removed each night.
5) Cut vegetation must be hauled out of the channel and stored, if necessary, where it cannot be washed by rainfall or runoff into the channel. When maintenance activities are completed, any excess materials or debris will be removed from the project site.
6) Temporary structures and storage of construction materials will not be located in jurisdictional waters, including wetlands and riparian areas.
7) Staging/storage areas for construction equipment and materials will not be located in jurisdictional waters, including wetland and riparian areas.
8) Pets on or adjacent to construction-sites will not be permitted by the operator.
9) As per the Landscaping Guidelines of the Resource Management Element of the March JPA General Plan (1999), drought tolerant vegetation and native vegetation will be used to the extent feasible, consistent with March JPA Landscape Water Efficiency Ordinance #JPA 16-03, with the purpose of preserving existing mature trees and native vegetation. Landscape plans shall be reviewed by a qualified botanist to recommend appropriate provisions to minimize the spread of invasive plant species as defined by the County of Riverside and listed by the California Invasive Plant Council (www.cal-ipc.org) and California Native Plant Society (www.cnps.org) within the project area. Provisions may include: a) installation of container plants and/or hydro-seeding areas adjacent to existing, undisturbed native vegetation areas with native plant species common within temporary impact areas; and (b) review and screening of proposed plants to identify and avoid potential invasive species and weed removal during the initial planting of landscaped areas.

5.2.2 CACTUS CHANNEL IMPROVEMENTS JURISDICTIONAL AREAS MITIGATION

The Cactus Channel Improvement project area supports 2.90 acres of CDFW jurisdictional wetlands (streambed and non-streambed), and 1.76 acre of this area is also Corps jurisdictional non-wetland waters of the U.S. or waters of the U.S./State. Project impacts on wetland communities are significant and will be permitted and mitigated in consultation with the state and federal agencies.

Final mitigation ratios will be determined in consultation with the CDFW, Corps, and/or RWQCB based on agency evaluation of current resource functions and values. A minimum 1:1 ratio (2.90 acres) is typically required, though ratios may be higher. If mitigation is not achieved on-site, it must be performed in an in an agency-approved location that will be conserved and managed in perpetuity.

MM-CC-2: Applicable 404, 401, and 1600 permits and/or clearances shall be obtained prior to any disturbance of the jurisdictional features on-site. All mitigation measures and conditions contained within the permits shall be implemented. Additionally, the following precautions shall be taken during project construction activities. Mitigation options include on-site, offsite, in lieu fee mitigation, or a combination, to replace the disturbed jurisdictional features. Mitigation shall be determined in consultation with the agencies. Best Management Practices (BMPs) shall be implemented to avoid indirect impacts to jurisdictional waters, including the following:

1) Vehicles and equipment will not be operated in ponded or flowing water except as described in the permits.
2) Water containing mud, slit, or other pollutants from grading or other activities will not be allowed to enter jurisdictional waters or be placed in locations that may be subjected to high storm flows.
3) Spoil sites will not be located within 30 feet from the boundaries of jurisdictional waters or in locations that may be subject to high storm flows, where spoils might be washed back into drainages.
4) Raw cement/concrete or washing thereof, asphalt, paint or other coating material, oil, or other petroleum products, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from project-related activities, will be prevented from contaminating the solid and/or entering avoided jurisdictional waters.
5) No equipment maintenance will occur within 100 feet of jurisdictional waters and no petroleum products or other pollutants from the equipment will be allowed to enter these areas or enter any off-site state-jurisdictional waters under any flow

5.2.3 CACTUS CHANNEL IMPROVEMENTS SPECIAL-STATUS SPECIES MITIGATION

5.2.3.1 Cactus Channel Improvements Threatened and Endangered Species Mitigation

Riverside Fairy Shrimp (Streptocephalus woottoni) and Vernal Pool Fairy Shrimp (Branchinecta lynchi)

Ponding surveys and protocol shrimp surveys should be conducted in order to determine the presence or absence of these species on site.

As described previously, listed fairy shrimp have potential for occurrence in the project area. As such, focused surveys for these species should be conducted as part of project CEQA process.

MM-CC-3: A qualified biologist with a USFWS permit for Riverside fairy shimp and vernal pool fairy shrimp shall conduct protocol surveys within the project area. If detected, consultation with the USFWS shall be pursued and either a finding of no jeopardy or a take permit shall be obtained for the project. All mitigation measures and conditions contained within any project permits shall be implemented.

5.2.3.2 Cactus Channel IMprovements Species of Special Concern Mitigation

Burrowing Owl

Burrowing owl, a federal bird of conservation concern and state Species of Special Concern, was not observed during 2018 general biological surveys, but has the potential to inhabit the site. As such, pre-construction surveys will be required.

MM-CC-4: In accordance with the *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA, 1999), the following mitigation for burrowing owl is required:

> *Thirty days prior to the onset of construction activities, a qualified biologist with appropriate resource agency permits shall survey the construction limits of the Project for the presence of burrowing owls and occupied nest burrows. Any occupied burrows found during the survey efforts shall be mapped on the construction plans. (Draft MEIR, p. 3-96)*
>
> *If nesting and/or activity is present at any burrow site, then the active burrow shall be protected until nesting activity has ended to ensure compliance with Section 3503.5 of the California Fish and Game Code. Nesting activity for burrowing owls in the region of the Planning Area normally occurs from February 1 to August 31. To protect any burrow site, the following restrictions on construction are required between February 1 to August 31:*

1) *Clearing limits will be established a minimum of 100 feet in any direction from any occupied burrow; and*
2) *Access and surveying will not be allowed within 50 feet of any occupied burrow. (Ibid.)*

Construction during the non-nesting season can occur only at the sites if a qualified biologist has determined that the burrows are no longer active. If an active burrow is observed during the non-nesting period, the burrow site will be monitored by a qualified biologist, and when the owl is outside the burrow entrance, the biologist will flush any owl to open space areas. The biologist will then excavate the burrow site with tools or fill the burrow with soil so owls cannot return to the burrow site. (Ibid.)

Note that clearing limit and access distances may be revised during project consultation with CDFW; distances are typically 300-feet for current permits/mitigation.

5.2.4 CACTUS CHANNEL IMPROVEMENTS NESTING BIRD MITIGATION

MM-CC-5: To avoid direct impacts to raptors and/or native/migratory birds, removal of habitat that supports active nests in the proposed area of disturbance should occur outside of the breeding season for these species (February 1 to September 15). If removal of habitat in the proposed area of disturbance must occur during the breeding season, a qualified biologist shall conduct a pre-construction survey to determine the presence or absence of nesting birds in the proposed area of disturbance. The pre-construction (precon) survey shall be conducted within ten (10) calendar days prior to the start of construction activities (including removal of vegetation). If

nesting birds are observed, a letter report or mitigation plan in conformance with applicable State and Federal Law (i.e. appropriate follow up surveys, monitoring schedules, construction and noise barriers/buffers, etc.) shall be prepared and include proposed measures to be implemented to ensure that take of birds or eggs or disturbance of breeding activities is avoided. The report or mitigation plan shall be submitted to the CDFW and/or USFWS as applicable for review and approval and implemented to the satisfaction of those agencies. The project biologist shall verify and approve that all measures identified in the report or mitigation plan are in place prior to and/or during construction. If nesting birds are not detected during the precon survey, no further mitigation is required.

APPENDIX A

SITE PHOTOGRAPHS

Appendix A

Site Photographs

Photo 1. Overview of project site, facing west. Photograph shows goldenbush scrub/non-native grassland vegetation community on the project site. July 17, 2018.

Photo 2. Overview of project site, facing south. Photograph shows goldenbush scrub/non-native grassland vegetation on the project site. July 17, 2018.

Photo 3. View of southern end of site, facing north toward developed/disturbed vegetation and the area next to old concrete/asphalt where water may shallowly pond. July 17, 2018.

Photo 4. View of southern end of site, facing west. Photograph shows developed/disturbed vegetation on the southern end of site south of the stockpile area. July 17, 2018.

Photo 5. View of smooth tarplant on southeast side of project site, just south of stockpile area. July 17, 2018.

Photo 6. View of Cactus Avenue Channel at intersection of Cactus Avenue and Veterans Way, facing northwest. Cattails dominate this inundated portion of the channel. July 17, 2018.

Photo 7. View of Cactus Avenue Channel, facing east. Non-native grassland vegetation community shown on sides of and within channel. July 17, 2018.

Photo 8. Non-native grassland vegetation at western end of Cactus Avenue Channel, facing east. Dominant plant species at this portion of the channel include common brome and Bermuda grass. July 25, 2018.

Photo 9. Middle portion of Cactus Ave Channel, facing west. Cattails and dense non-native grassland thrive due to the influx of water from storm drains. 25, 2018.

Photo 10. View of eastern end of Cactus Avenue Channel, facing east. Most of channel supports non-native vegetation community but a small patch of Fremont cottonwood has recently established. July 25, 2018.

Photo 11. Middle portion of Cactus Avenue Channel, facing southeast. Photograph shows dense non-native grassland within channel and small patch of the non-native tree of heaven. July 25, 2018.

Photo 12. View of culvert at intersection of Cactus Avenue and Elsworth Street. Photograph shows cattails within inundated portion of culvert. July 25, 2018.

APPENDIX B

BIOLOGICAL SURVEY DATES

Appendix B

Biological Survey Dates

Date/s	Task	Personnel
July 17, 2018	Jurisdictional delineation, vegetation mapping, plant and wildlife survey	Emily Trevino, Lee Ripma, Shanti Santulli
July 25, 2018	Vegetation mapping, plant and wildlife survey	Lee Ripma
October 22, 2018 October 23, 2018 October 24, 2018 October 25, 2018 October 26, 2018	Stephens' Kangaroo Rat surveys	Phil Brylski, Ian Hirschler

APPENDIX C

LIST OF VASCULAR PLANT SPECIES OBSERVED WITHIN THE PROJECT STUDY AREA

Appendix C

List of Vascular Plant Species Observed within the Project Study Area

Scientific Name	Common Name
Amaranthaceae (amaranth family)	
Amaranthus blitoides	prostrate amaranth
Asteraceae (sunflower family)	
*Anthemis cotula**	dog fennel, mayweed
Centromadia pungens ssp. *laevis* (CRPR 1B.1)	smooth tarplant (CRPR 1B.1)
Corethrogyne filaginifolia	common sandaster
Encelia sp.	brittlebush species
Ericameria palmeri var. *pachylepis*	broad scaled palmer's goldenbush
Helianthus sp.	sunflower species
Stephanomeria sp.	Stephanomeria species
	thistle species
Brassicaceae (mustard family)	
*Hirschfeldia incana***	short-pod mustard
Chenopodiaceae (goosefoot family)	
*Atriplex semibaccata***	Australian saltbush
*Salsola tragus***	prickly Russian-thistle, tumbleweed
Cyperaceae (sedge family)	
Cyperus eragrostis	tall cyperus
Euphorbiaceae (spurge family)	
*Euphorbia maculata**	spotted spurge
Fabaceae (legume family)	
Acmispon americanus var. *americanus*	Spanish-clover
Juglandaceae (walnut family)	
*Carya illinoinensis**	pecan
Onagraceae (evening-primrose family)	
Epilobium sp.	willowherb species
Ludwigia palustris	pacific marsh-purslane
Oenothera sp.**	evening primrose species
Poaceae (grass family)	
Bromus madritensis ssp. *rubens***	foxtail brome
*Bromus sterilis**	poverty brome
*Cynodon dactylon***	Bermuda grass
*Paspalum dilatatum**	dallis grass
Paspalum distichum	common knotgrass
*Polypogon monspeliensis***	annual beard grass
Polygonaceae (buckwheat family)	
Polygonum aviculare	prostrate knotweed
*Rumex crispus***	curly dock

Scientific Name	Common Name
Portulacaceae (purslane family)	
*Portulaca oleracea**	common purslane
Potamogetonaceae (pondweed family)	
Potamogeton sp.	pondweed species
Salicaceae (willow family)	
Salix gooddingii	Goodding's black willow
Salix exigua var. *exigua*	sandbar willow
Populus fremontii	Fremont cottonwood
Simaroubaceae (quassia or simarouba family)	
*Ailanthus altissima**	tree of heaven
Solanaceae (nightshade family)	
Datura wrightii	western jimson weed
Typhaceae (cattail family)	
Typha latifolia	broadleaf cattail
Zygophyllaceae (calotrop family)	
*Tribulus terrestris***	puncture vine

CRPR: *California Rare Plant Rank (California Native Plant Society)*

* *Non-Native Species (CalFlora)*

** *Invasive and Non-Native Species (CalFlora)*

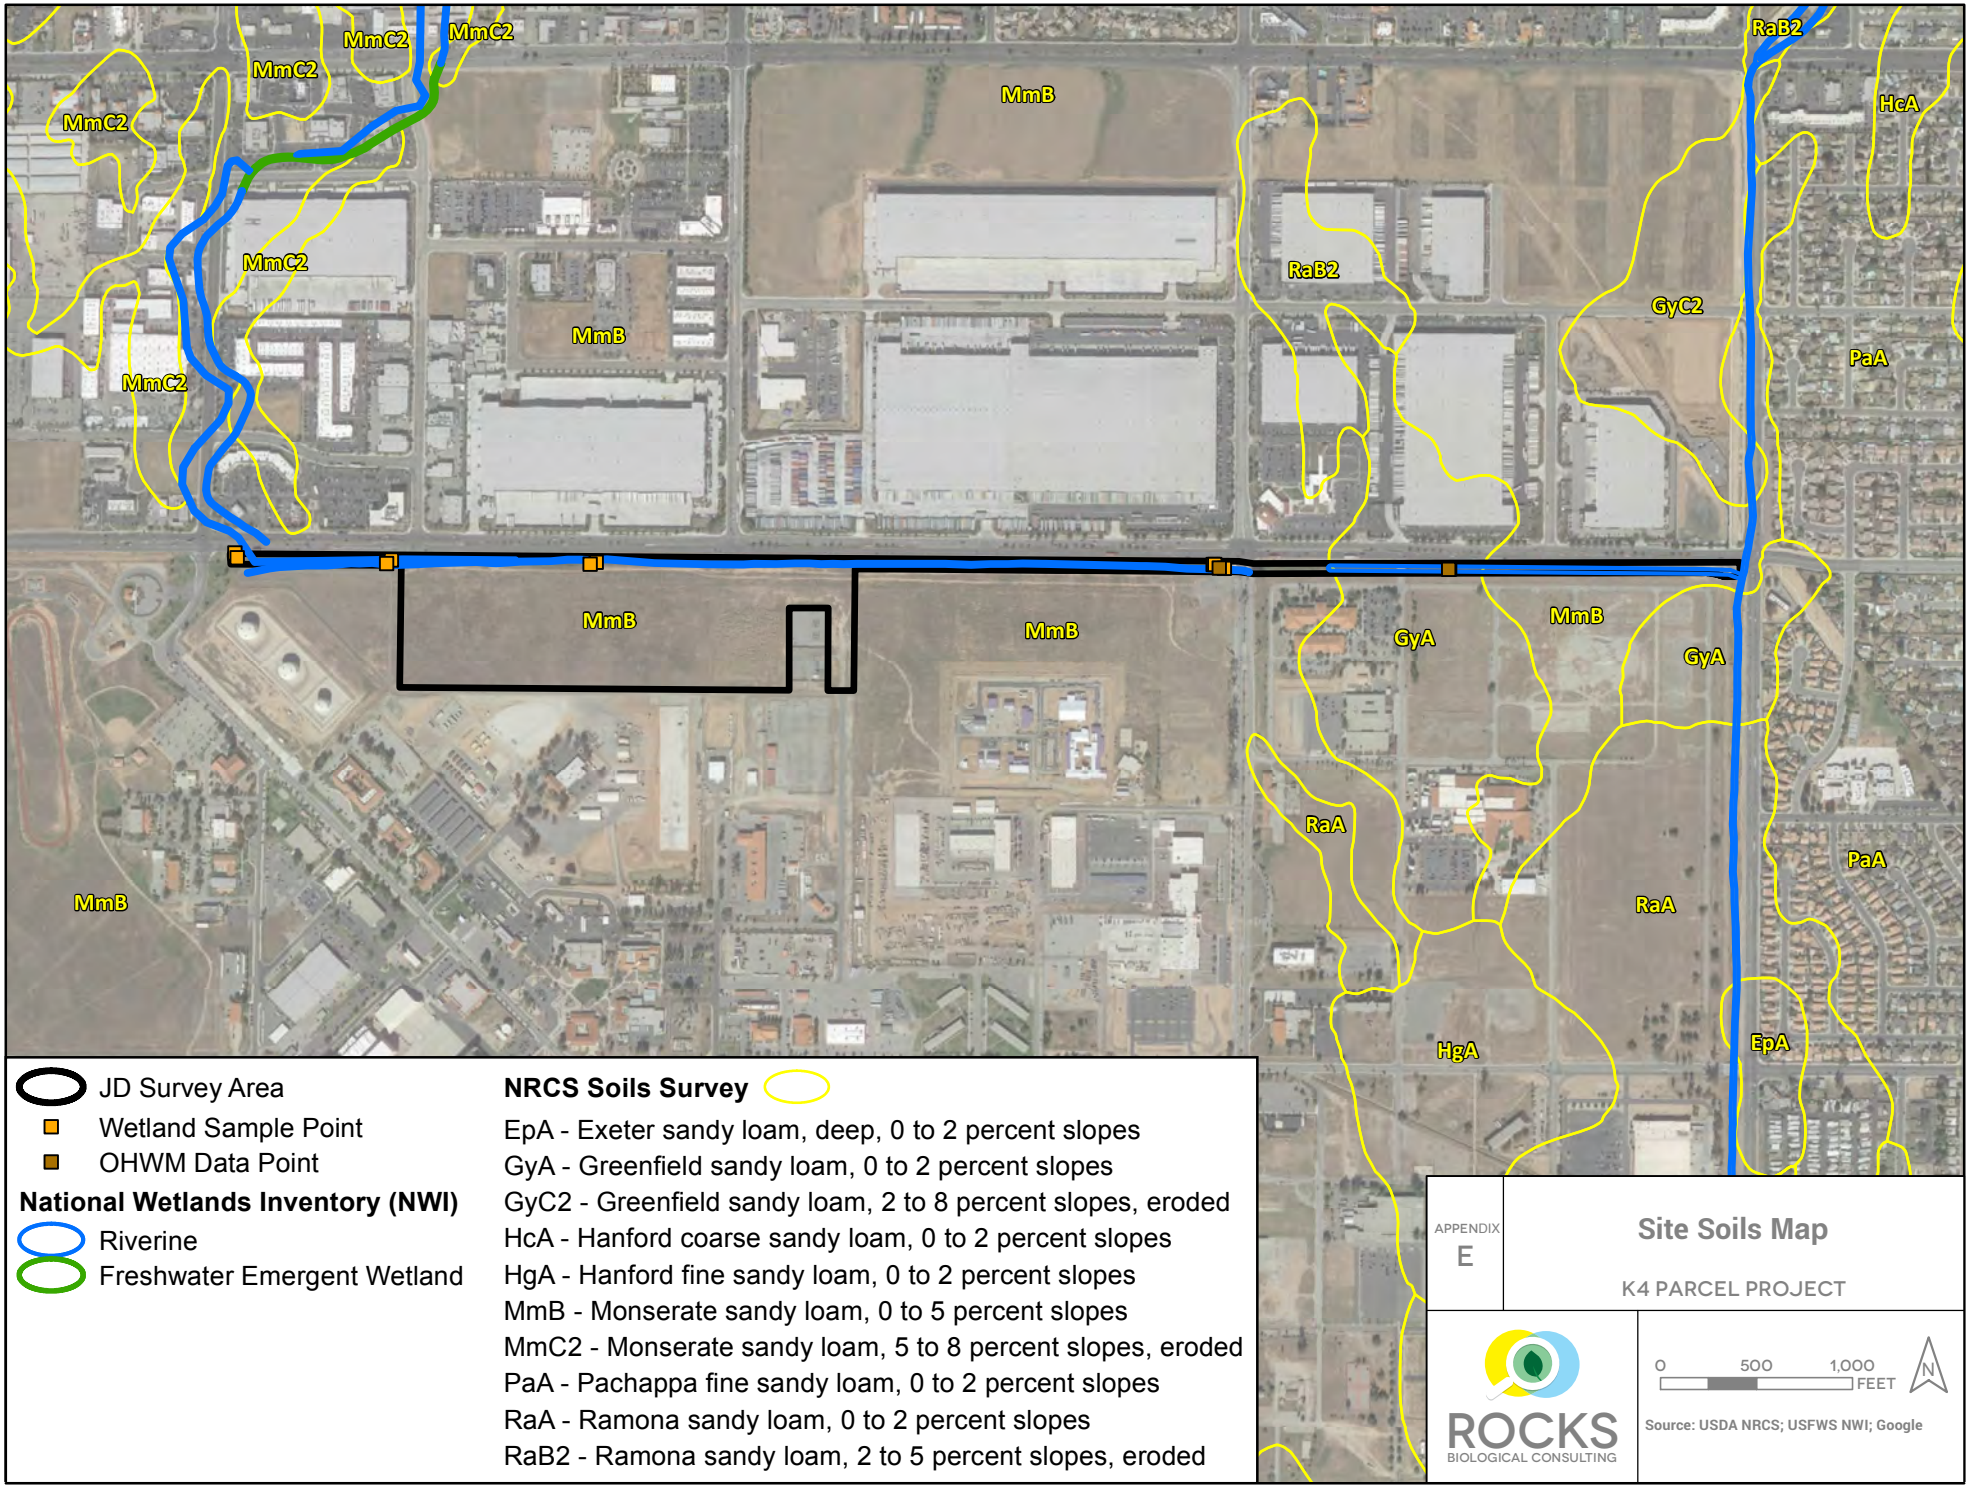
List of Wildlife Species Observed within the Project Study Area

Common Name	Scientific Name
REPTILES	
Colubridae (colubrid snakes)	
San Diego gopher snake	*Pituophis catenifer annectens*
Phrynosomatidae (spiny lizards)	
common side-blotched lizard	*Uta stansburiana*
INVERTEBRATES	
Nymphalidae (brush-footed butterflies)	
common buckeye	*Junonia coenia*
BIRDS	
Accipitridae (eagles, hawks, and kites)	
red-tailed hawk	*Buteo jamaicensis*
Aegithalidae (bushtits)	
bushtit	*Psaltriparus minimus*
Charadriidae (plovers and lapwings)	
killdeer	*Charadrius vociferus*
Columbidae (pigeons and doves)	
mourning dove	*Zenaida macroura*
Corvidae (crows, jays, and magpies)	
American crow	*Corvus brachyrhynchos*
common raven	*Corvus corax*
Falconidae (falcons and caracaras)	
American kestrel	*Falco sparverius*
Fringillidae (finches)	
house finch	*Haemorhous mexicanus*
lesser goldfinch	*Spinus psaltria*
Passerellidae (sparrows and towhees)	
savannah sparrow	*Passerculus sandwichensis*
white-crowned sparrow	*Zonotrichia leucophrys*
Tyrannidae (tyrant flycatchers)	
black phoebe	*Sayornis nigricans*
Say's phoebe	*Sayornis saya*
western kingbird	*Tyrannus verticalis*



Appendix D

List of Wildlife Species Observed within the Project Study Area

MAMMALS	
Cricetidae (deer mice and relatives)	
deer mouse	*Peromyscus maniculatus*
Leporidae (rabbits and hares)	
Audubon's cottontail	*Sylvilagus audubonii*
San Diego black-tailed jackrabbit (SSC)	*Lepus californicus bennettii*
SSC: *California Department of Fish and Wildlife (CDFW) Species of Special Concern*

1 INTRODUCTION

Rocks Biological Consulting (RBC) conducted a formal jurisdictional delineation for the K4 Warehouse and Cactus Channel Improvements Project (project) to identify areas potentially jurisdictional under the U.S. Army Corps of Engineers (Corps) pursuant to Section 404 of the Clean Water Act; the Regional Water Quality Control Board (RWQCB) pursuant to Section 401 of the Clean Water Act and the Porter-Cologne Act; and streambed and riparian habitats under California Department of Fish and Wildlife (CDFW) pursuant to California Fish and Game Code (§1602). This information is necessary to evaluate potential jurisdictional impacts and permit requirements associated with the project, can be used by the agencies to assess project conformance with state and federal regulations, and serves as a request for the Corps to complete a Preliminary Jurisdictional Determination (PJD) based on the information provided in this report. Furthermore, Appendix A provides a checklist of the information contained in this report in compliance with the Corps Los Angeles District's *Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (Corps 2017).

1.1 PROJECT LOCATION

The approximately 35.4-acre project site is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March Joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California (Figure 1). Interstate 215 (I-215) is located approximately 0.8 mile east of the Project site. The Project site is comprised of five parcels designated as Assessor's Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0.

The latitude and longitude of the approximate center of the site is 33.909420, -117.263420. The Project site sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey (USGS; Figure 2).

1.2 PROJECT DESCRIPTION

The proposed K4 Warehouse project includes the construction of a 718,000-square-foot warehouse building on the 34.5-acre parcel. Access to the Project is across the Cactus Avenue Channel (discussed further in this report) that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the project frontage, and further to the east ending at the Heacock Channel at Heacock Street. Additionally, the Riverside County Flood Control District and Water Conservation District are proposing to underground the current drainage ditch in a box culvert, e.g., the Cactus Channel improvements. The culvert would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width total). The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District, and it would function as part of the District's Master Plan. If the channel improvements are not complete prior to warehouse development, the K4 Warehouse development will be constructed with two access driveways that cross the Cactus Avenue Channel.

1.3 REGULATORY BACKGROUND

Several regulations have been established by federal, state, and local agencies to protect and conserve aquatic resources. The descriptions below provide a brief overview of agency regulations that may be applicable to the project. Regulatory agencies make the final determination of whether a project requires authorization pursuant to these regulations.

1.3.1 APPLICABLE AQUATIC RESOURCE PROTECTION REGULATIONS

Clean Water Act

Pursuant to Section 404 of the Clean Water Act (33 USC § 1251 et seq.; CWA), the Corps is authorized to regulate any activity that would result in the discharge of dredged or fill material into waters of the U.S. (including wetlands), which include those waters listed in 33 Code of Federal Regulations (CFR) 328.3 (as amended at 80 Federal Register (FR) 37104, June 29, 2015). The Corps, with oversight from the U.S. Environmental Protection Agency (USEPA), has the principal authority to issue CWA Section 404 permits. The Corps would require a Standard Individual Permit (SIP) for more than minimal impacts to waters of the U.S. as determined by the Corps. Projects with minimal individual and cumulative adverse effects on the environment may meet the conditions of an existing Nationwide Permit (NWP).

A water quality certification or waiver pursuant to Section 401 of the CWA is required for all Section 404 permitted actions. The RWQCB, a division of the State Water Resources Control Board, provides oversight of the 401-certification process in California. The RWQCB is required to provide "certification that there is reasonable assurance that an activity that may result in the discharge to waters of the United States will not violate water quality standards." Water Quality Certification must be based on the finding that proposed discharge will comply with applicable water quality standards.

The National Pollutant Discharge Elimination System (NPDES) is the permitting program for discharge of pollutants into surface waters of the U.S. under Section 402 of the CWA.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Water Code § 13000 et seq.) provides for statewide coordination of water quality regulations. The State Water Resources Control Board was established as the statewide authority and nine separate RWQCBs were developed to oversee water quality on a day-to-day basis. The RWQCB is the primary agency responsible for protecting water quality in California. As discussed above, the RWQCB regulates discharges to surface waters under the federal CWA. In addition, the RWQCB is responsible for administering the California Porter-Cologne Water Quality Control Act.

Pursuant to the Porter-Cologne Water Quality Control Act, the state is given authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. As such, any person proposing to discharge waste into a water body that could affect its water quality must first file a Report of Waste Discharge if Section 404 is not required for the activity. "Waste" is partially defined as any waste substance associated with human habitation, including fill material discharged into water bodies.

California Fish and Game Code Section 1600-1602

Pursuant to Division 2, Chapter 6, Section 1602 of the California Fish and Game Code (CFGC), CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream or lake that supports fish or wildlife. A Notification of Lake or Streambed Alteration must be submitted to CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." CDFW has jurisdiction over riparian habitats associated with watercourses. Jurisdictional waters are delineated by the outer edge of riparian vegetation (i.e., drip line) or at the top of the bank of streams or lakes, whichever is wider. CDFW jurisdiction does not include tidal areas or isolated resources. CDFW reviews the proposed actions and, if necessary, submits (to the applicant) a proposal that includes measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and applicant is the Lake or Streambed Alteration Agreement.

Agency access to the project site can be coordinated with the applicant and/or agent upon request.

2 METHODS

Prior to the on-site delineation, field maps were created using a Geographic Information System (GIS) and a color aerial photograph at a 1:100 scale. RBC staff also reviewed U.S. Geological Survey (USGS) National Hydrography Dataset (NHD) and topography data (Figure 2) and U.S.

Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soils map data and U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) data (Figure 4) to further determine the potential locations of jurisdictional aquatic resources. Google Earth, NetrOnline Historic Aerials, and University of California-Santa Barbara database was also utilized to assess historic presence or absence of flow in the project area.

Shanti Santulli, Lee Ripma, and Emily Trevino of Rocks Biological Consulting (RBC) conducted the jurisdictional delineation field visit on July 17, 2018. Areas with depressions, drainage patterns, and/or wetland vegetation within the project impact area were evaluated for potential jurisdictional status, with focus on the presence of defined channels and/or wetland vegetation, soils and hydrology. Field staff examined potential jurisdictional wetland areas using the methods set forth in the Corps 1987 *Wetland Delineation Manual* (Wetland Manual) (Environmental Laboratory 1987) and the 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region Version 2.0* (Arid West Supplement) (Corps 2008a). Wetland plant indicator status was determined using the *National Wetland Plant List* (NWPL; Corps 2016) and hydric soils indicators on *Field Indicators of Hydric Soils in the United States, Version 8.1* (NRCS 2017). Soil chromas were identified in the field according to *Munsell's Soil Color Charts* (Kollmorgen 2000).

Lateral limits of potential non-wetland waters of the U.S./State for the Corps and RWQCB were identified using field indicators of an ordinary high-water mark (OHWM) as described in *A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States* (Corps 2008b). For each feature exhibiting the potential presence of an OHMW, RBC completed a 2010 Arid West Ephemeral and Intermittent Streams OHWM Datasheet (OHWM Datasheet) following the guidance provided in the Updated Datasheet for the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States (Corps 2010).

CDFW potential jurisdictional boundaries were determined based on the presence of riparian habitat and/or streambed. Streambeds considered within CDFW jurisdiction were delineated based on the definition of streambed as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supporting fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports riparian vegetation" (Title 14, Section 1.72). Riparian habitat refers to vegetation and habitat associated with a stream. The CDFW jurisdictional habitat includes all riparian shrub or tree canopy that may extend beyond the banks of a stream.

While in the field, potentially jurisdictional features were recorded using a hand-held Global Positioning System (GPS) unit with a level of accuracy ranging from four to 12 feet. RBC staff refined the data using aerial photographs and topo maps with two-foot contours to ensure accuracy. Off-site portions of drainages were visited to confirm the presence of the indicators above, if appropriate, and general flow path. Plants were identified according to The Jepson Manual 2nd edition (Baldwin et al. 2012). Vegetation community classifications follow Holland (1986) and nomenclature follows Jepson eFlora (2018).

All figures generated for this jurisdictional delineation report follow the Corps' Updated Map and Drawing Standards for the South Pacific Division Regulatory Program (Corps, 2016).

3 RESULTS

3.1 TOPOGRAPHY

The site is primarily flat with elevations around 1,550 feet. The only shift in topography observed on site occurred within a west-east trending drainage that runs parallel to Cactus Avenue from just east of Elsworth Street to Heacock Steet (Cactus Avenue Channel, discussed further below; Figure 5).

3.2 WATERSHED

The proposed project area is within the San Jacinto Hydrologic Unit Code [HUC] 8 (18070202), Lower San Jacinto River Hydrologic Unit Code [HUC] 10 (1807020203), Perris Reservoir Hydrologic Unit Code [HUC] 12 (180702020305) (Figure 2).

3.3 HYDROLOGY

USGS NHD maps a "blue-line stream" along the northern boundary of the project area, which flows south along Heacock Street into the Perris Valley storm drain system (Figure 2). USFWS NWI also map Riverine designations within the projects northern boundary, draining east until diverting south along Heacock Street (Figure 4).

Known hydrologic sources for the observed on-site drainages, discussed further below, are several culverted storm-drain outlets (which collect and convey runoff from the commercial area north of the channel), sheet flows from the adjacent March Air Force Base, and direct precipitation. Flows generally drain from west to east until the intersection of Cactus Avenue and Heacock Street, where flows are diverted south into a drainage ditch along Heacock Street which drains into the Perris Valley storm drain system. Flows continue into the San Jacinto River and ultimately into Lake Elsinore.

Table 1 describes the estimated monthly total and average precipitation for the project area between 2007 and 2018 to provide the pertinent pre-site visit precipitation data. RBC staff accessed precipitation data through the NRCS Agricultural Applied Climate Information System (AgACIS) database from the March AFB station in Riverside County on July 17, 2018.

Table 1. Precipitation Data

Monthly Total Precipitation (inches) for March AFB, CA (NOAA)													
Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
2007	M	M	M	M	M	M	M	M	M	M	M	M	M

2014	T	1.19	0.68	0.49	0	0	T	0.57	0.05	T	0.18	2.91	6.07
2015	0.6	0.33	0.13	0.14	0.61	T	1.39	T	0.45	0.31	0.05	0.3	4.31
2016	2.24	0.12	0.56	0.96	0.28	T	T	0	0.06	0.32	0.7	3.11	8.35
2017	3.78	1.91	0.01	T	0.02	T	0.01	0.59	T	T	T	T	6.32
2018	1.44	0.23	M	T	0.08	0	T	M	M	M	M	M	M
Mean	**1.67**	**1.06**	**0.59**	**0.35**	**0.17**	**T**	**0.19**	**0.43**	**0.13**	**0.21**	**0.39**	**2.02**	**7.58**

*Per AgACIS database: "Monthly summarized data - means, sums, daily extremes or frequencies for the selected variable for each month of the year for the selected range of years. HDD, CDD and GDD are heating, cooling and growing degree days, respectively. Note: trace precipitation/snowfall/snow depth amounts are treated as zero in sums, means, and frequency counts. Annual average temperatures are the average of the twelve-monthly values. Values of 'M' indicate missing data and 'T' indicates a trace."

Table 1 indicates that the field survey date of July 17, 2018 occurred during below-average historic precipitation (trace precipitation treated as 0.0 inches) for the month of July, which averaged 0.19 inches between 2010-2018. The 2017 average precipitation of 6.32 inches was 1.26 inches below the average annual precipitation of 7.58 inches from 2010-2017.

3.4 SOILS

Based on the NRCS map of the project area (Figure 4), the following soil occurs within the project site boundary and is described below per the USDA's Official Soil Series Description and Series Classification database:

Monserate sandy loam, 0 to 5 percent slopes

The Monserate series consist of well to well drained and moderately slow permeable soils. These soils are found primarily on nearly level to moderately steep terraces and fans in southern California and are primarily used for growing grain or pasture. The NRCS does not list this soil as hydric.

Greenfield sandy loam, 0 to 2 percent slopes

The Greenfield series consist of well drained soils moderately permeable soils. These soils form in moderately coarse and coarse textured alluvium, found on alluvial fans and terraces, and are primarily used for the production of irrigated field, forage and fruit crops. The NRCS does not list this soil as hydric.

3.5 FEATURES OBSERVED

A west-east, earthen-lined and vegetated drainage ditch, hearby referred to as the Cactus Avenue Channel, runs parallel to Cactus Avenue from just east of Elsworth Street to Heacock Street and was the only observed aquatic resource within the project area.

RBC investigated ten wetland delineation sampling points within the Cactus Avenue Channel in the survey area boundaries to determine the presence or absence of federally jurisdictional wetlands within the channel (Figure 5; Appendix B). RBC also completed two Arid West Ephemeral and Intermittent Streams OHWM Datasheets (OHWM Datasheets) in the project survey boundary (Figure 5; Appendix B). The descriptions provided below detail the existing characteristics of each feature determined in the field. Appendix C provides site photographs of the features, and Figure 7 displays representative photo points also discussed below.

Cactus Avenue Channel

The Cactus Avenue Channel receives flows from several culverts along Cactus Avenue, as noted on Figure 5. The feature originates on the project survey area from a culvert along Cactus Avenue, east of the intersection of Elsworth Street and flows east approximately 1.5-miles until being diverted south into a drainage ditch along Heacock Street. RBC staff observed both wetland and non-wetland features within the Cactus Avenue Channel, as further described below.

Wetland Sample Point (WSP) 1 was taken adjacent to the initial, westernmost culvert outlet along the channel. WSP 1 was dominated by *Potamogeton sp.* (OBL) and contained standing water at the time of the jurisdictional delineation; as such, WSP 1 met the parameters for hydrophytic vegetation and wetland hydrology based on field observation of the applicable indicators for both (Appendix B, WSP 1). Additionally, RBC assumed the presence of hydric soils at WSP 1 per the 1987 Wetland Manual, which states that hydric soils can be assumed present if the sample point is located “within a plant community type where all dominant species have an indicator status of OBL” (Environmental Laboratory 1987). WSP 1 showed standing water/ponding within a well-defined, depressional area by a culvert outlet as well as the presence of a dominant OBL plant species (*Potamogeton sp.*). As such, WSP 1 met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters. WSP 2, taken approximately 25 feet downstream of WSP 1, did not meet parameters for wetland hydrology, hydric soils, or hydrophytic vegetation (Appendix B, WSP 2). Vegetation observed at WSP 2 included common brome (*Bromus madritensis ssp. rubens*; UPL) and bermuda grass (*Cynodon dactylon*; FACU). A small disturbed (i.e., mowed), 4-foot wide drainage/streambed was observed between WSP 1 and WSP 3 (Appendix C, Photo 4).

WSP 3, taken within a large section of the channel that had been recently mowed, met the parameters for hydrophytic vegetation, wetland hydrology, and hydric soils (Appendix B, WSP 3). Hydrophytic vegetation at WSP 3 included common knotgrass (*Paspalum distichum*; FACW) and mayweed (*Anthemis cotula*; FACU). The wetland boundary observed was approximately 20 feet wide with a bed and bank (including the delineated wetland area) of approximatedly 25 feet wide at this portion of the channel. WSP 4, taken in the adjacent uplands of WSP 3 to help determine the wetland boundary, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils indicators (Appendix B, WSP 4). Downstream of WSP 3/4, RBC staff observed an approximate 800-foot long stretch of the channel containing cattail (*Typha latifolia*; OBL), tall flat sedge (*Cyperus* eragrostis; FACW), and visible standing water. A large, 35-foot wide culvert at the intersection of Cactus Avenue and Veterans Way appeared to be the primary hydrologic input into this area, causing standing water/saturation both upstream and downstream of the culvert (Appendix C, Photo 12).

WSP 5 was taken approximately 230 feet downstream from the end of the standing water observed downstream of the Cactus Avenue and Veterans Way culvert, where the bed of the channel narrows to approximately 10 feet wide with 20-foot wide banks; WSP 5 met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters (Appendix B, WSP 5). The hydrophytic vegetation observed within the sample point included tall flat sedge (FACW); prominent redox features were also observed (Appendix C, Photo 16). WSP 6, taken in the adjacent uplands, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soil indicators (Appendix B, WSP 6). The feature continues downstream towards the intersection of Cactus Avenue and Riverside Drive. WSP 7, taken near a culvert outlet at the Riverside Drive intersection, met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters (Appendix B, WSP 7). Hydrophytic vegetation observed at WSP 7 included tall flat sedge (FACW), prostrate amaranth (*Amaranthus blitoides*; FACU), dallis grass (*Paspalum dilatatum*; FAC), and curly dock (*Rumex crispus*; FAC). WSP 8, taken in the adjacent uplands of WSP 7, and WSP 9, taken downstream from the tall flat sedge-dominated area, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils indicators (Appendix B, WSP 8 and WSP 9).

Although wetland parameters were not present at WSP 9, RBC staff observed a 15-foot wide OHWM within 20-foot wide banks just west of the Riverside Drive and Cactus Avenue intersection within the channel based on the presence of a break in slope, change in sediment texture, and change in vegetation species (Figure 5; Appendix B, OHWM 1). The ephemeral feature flows east and narrows from a ten- to five-foot wide OHWM within 15- to ten-foot wide banks before reaching the intersection of Cactus Avenue and Heacock Street (Figure 5; Appendix B, OHWM 2). WSP 10, taken within the channel, adjacent to a small cluster of young Fremont's cottonwood (*Populus fremontii*; NL), met the wetland hydrology parameter; however, the sample point did not show evidence of hydrophytic vegetation or hydric soils (Appendix B, WSP 10).

Ponding Area

RBC field staff observed a small area of potential ponding with some minor soil cracking along the eastern boundary of the K4 Warehouse portion of the project site, approximately 400 feet south of the Cactus Avenue Channel, at the end of a driveway. The area appeared to be a road rut/puddle in a disturbed asphalt and otherwise bare ground area. During the time of the jurisdictional delineation site visit, the area was dry, unvegetated, and lacked any indicators of an OHWM. An RBC biologist conducted an additional field survey on October 4, 2018 and noted ponding in the area. As such, protocol fairy shrimp surveys are underway to determine the presence/absence of the federally endangered Riverside fairy shrimp (*Streptocephalus wootton)* given the moderate potential for this species to occur on site. RBC staff did not dig a soil pit to check for hydric soil indicators in case the area may be inhabited by Riverside fairy shrimp.

3.6 JURISDICTIONAL RESOURCES AND ANALYSES

A majority of the Cactus Avenue Channel within the survey area met all three parameters per the Arid West Supplement and would therefore be considered potentially jurisdictional wetlands per the Corps and RWQCB. These wetland areas were disturbed by regular mowing of the channel. As such, the presence or absence of wetland boundaries was largely defined by observation of hydric soil indicators (i.e., presence and prominence/abundance of redox features. These wetland areas occur within the bed and banks of potentially jurisdictional CDFW streambed, as shown on Figure 5.

RBC determined the presence of an OHWM and bed and bank, without wetland, throughout the channel from just west of Riverside Drive to Heacock Street and considers this area potential non-wetland, ephemeral waters of the U.S./State jurisdictional by the Corps and RWQCB and ephemeral streambed jurisdictional by the CDFW. Furthermore, there were some areas with small patches of riparian vegetation (i.e., sandbar willow [*Salix exigua*], Fremont's cottonwood, and Goodding's Black Willow [*Salix gooddingii*]) that occur along the streambed and would be considered potentially jurisdictional CDFW riparian habitat; these riparian areas did not meet the federal wetland parameters. The trapezoidal nature of the channel and associated wide banks account for the increase in CDFW estimated jurisdiction, which extends beyond the delineated Corps/RWQCB/CDFW wetland and non-wetland areas in most areas within the channel.

The small ponding area noted in Section 3.5 was not considered potentially jurisdictional as it lacked indicators of an OHWM and would not meet the three required parameters of federally jurisdictional wetland absent vegetation (Picture 36) even if hydric soils were assumed for the area.

Tables 2 and 3 provide approximate acreages of potential jurisdictional resources, per applicable regulatory agency, delineated within the project survey area and related information. Table 4 provides vegetation community acreages within the project area (Figure 6). Please note, some areas that met federal wetland parameters are mapped as non-native grassland on Figure

6 given the presence of non-native grassland species (many of which had a FAC or higher indicator status).

Table 2. Potential Jurisdictional Resources within the Project Area: Corps and RWQCB

Feature Name	Acreage	Linear Feet	Cowardin Code	Presence of OHWM	Wetland Presence	Dominant Vegetation	Location (lat/long)
Cactus Avenue Channel Wetland	1.39	4790	PEM	No	Yes	Freshwater marsh	33.909944442, -117.2615647
Cactus Avenue Channel Non-Wetland	0.42	2876	R6	Yes	No	Unvegetated; Non-native grassland	33.909960615, -117.2509659
Total	1.81	7666					

Table 3. Potential Jurisdictional Resources within the Project Area: CDFW

Feature Name	Acreage	Linear Feet	Cowardin Code	Presence of OHWM	Wetland Presence	Dominant Vegetation	Location (lat/long)
Cactus Avenue Channel Wetland	1.39	4790	PEM	No	Yes	Freshwater marsh	33.909944442, -117.2615647
Cactus Avenue Channel Non-Wetland	1.60	2876	R6	Yes	No	Unvegetated; Non-native grassland	33.909960615, -117.2509659
Total	2.99	7666					

Table 4. Vegetation Communities within Project Survey Area

Vegetation Community	Project Site (acres)
Golden Bush Scrub/Non-native Grassland Disturbed	22.16
Developed/Disturbed	11.01
Non-native Grassland	8.66
Freshwater Marsh	0.41
Ornamental	0.05
Southern Willow Scrub	0.04

Fremont's Cottonwood	0.02
Total	42.35

3.7 PROPOSED JURISDICTIONAL IMPACTS

The project consists of both the construction of the K4 Warehouse and construction of a box culvert along the Cactus Avenue Channel. The proposed project with both project components would permanently impact approximately 1.81 acres (7666 linear feet) of potential Corps and RWQCB disturbed waters of the U.S./State (wetland and non-wetland), of which, 0.06 acre (131 linear feet) of impacts are associated with the K4 Warehouse site and 1.76 acres (7535 linear feet) are associated with the Cactus Avenue Channel culvert project.

The proposed project with both project components would impact approximately 2.99 acres (7666 linear feet) of potentially jurisdictional CDFW streambed (wetland and non-wetland) and/or associated riparian habitat, of which, 0.08 acre (131 linear feet) are associated with the K4 Warehouse and 2.9 acre (7535 linear feet) are associated with the culvert along the Cactus Avenue Channel.

4 CONCLUSION

The K4 Warehouse and Cactus Channel Improvements Project area supports a drainage ditch, Cactus Avenue Channel, containing disturbed wetland and non-wetland aquatic resources potentially jurisdictional by the Corps, RWQCB, and CDFW as shown in Tables 2 and 3.

Assuming concurrence with the provided jurisdictional delineation and estimated impact calculations, both portions of the proposed project, the K4 Warehouse and Cactus Avenue Channel culvert, would each require Section 404 authorization from the Corps, a Section 401 water quality certification from the RWQCB, and a Streambed Alteration Agreement from CDFW. The K4 Warehouse project alone could meet the required acreage threshold for authorization under the Corps' streamlined Nationwide Permit (NWP) process, while RBC expects the Corps to evaluate the Cactus Avenue Channel culvert project under a Standard Individual Permit (SIP) which will require an analysis of alternatives pursuant to the Section 404(b)(1) Guidelines. Additionally, the Corps, RWQCB, and/or CDFW may require a functional assessment (e.g., California Rapid Assessment Method [CRAM]) to quantitatively estimate the stream/wetland condition for the evaluation of the proposed project.

Please note that the applicable agencies will make final jurisdictional determinations. RBC recommends early coordination with the resource agencies to determine the final jurisdictional boundaries, applicable permitting processes, compensatory mitigation requirements, and other potential permitting issues specific to the proposed project. Agency representatives may request access to the site to field-verify the results of this jurisdictional delineation report with the project applicant, or a designated representative.

The information provided in this report should remain valid for up to five years from the date of the field effort for the jurisdictional delineation unless site conditions change substantially, or a regulatory agency requires an updated report.

APPENDIX A

CHECKLIST: MINIMUM STANDARDS FOR ACCEPTANCE OF AQUATIC RESOURCES DELINEATION REPORTS, LOS ANGELES DISTRICT REGULATORY DIVISION, CORPS

CHECKLIST: MINIMUM STANDARDS FOR ACCEPTANCE OF AQUATIC RESOURCES DELINEATION REPORTS, LOS ANGELES DISTRICT REGULATORY DIVISION, CORPS, MARCH 16, 2017

REPORT SECTION/ PAGE NUMBER	MINIMUM STANDARDS FOR ACCEPTANCE OF AQUATIC RESOURCES DELINEATION REPORTS	ADDITIONAL NOTES
Cover Letter	JD REQUEST AND FORMS: A cover letter indicating whether you are requesting a jurisdictional determination (JD). If you are requesting a JD, you must complete, sign, and return the Request for Corps Jurisdictional Determination (JD) sheet. For preliminary jurisdictional determinations the Preliminary Jurisdictional Determination Form must be signed and submitted.	
Section 1.4	CONTACT INFORMATION: Contact information for the applicant(s), property owner(s), and agent(s).	
N/A	SITE ACCESS: If the property owner or their representatives will not accompany the Corps to the site, a signed statement from the property owner(s) allowing Corps personnel to enter the property and to collect samples during normal business hours. If the property lacks direct access by public roads (in other words, access requires passage through private property not owned by the applicant), the owner or proponent must obtain permission from the adjacent property owner(s) to provide access for Corps personnel.	Property owner and/or representatives will accompany the Corps for a site visit upon request.
Section 1.1	LOCATION: Directions to the survey area, an address (if available) and one or more set of geographic coordinates expressed in decimal degrees.	
Section 2, Paragraphs 2 and 3	DELINEATION MANUAL CONFIRMATION: A statement confirming the delineation has been conducted in accordance with the 1987 Corps of Engineers Wetlands Delineation Manual and applicable regional supplement(s). The regional supplement(s) used must be identified. For OHWM delineations, a statement must be included confirming the use of the OHWM field guide or that it is not applicable.	
Section 3.5	AQUATIC RESOURCE(S) DESCRIPTION: A narrative describing all aquatic resources on-site and an explanation of the mapped boundaries and any complex transition zones. If the site contains resources that only meet one or two of the three wetland criteria or do not exhibit a clear OHWM, describe the rationale for their inclusion or exclusion from the delineation. Also explain if any erosional features, upland swales, ditches and other potential aquatic features were considered but not included in the delineation.	
Figure 5, Tables 2 and 3	AQUATIC RESOURCE MAPPING AND ACREAGE: Map the outside survey boundary, total extent of aquatic and proposed non-aquatic features, type of feature(s) (waters of the United States or wetland), and include the total acreage for each polygon.	
Section 2, Paragraph 2	FIELD WORK DATES: Date(s) field work was completed.	
Tables 2 and 3	AQUATIC RESOURCE TABLE: A table listing all aquatic resources. The table must include the name of each aquatic resource (actual or arbitrary), its Cowardin type, acreage, summary of OHWM/wetland presence, dominant vegetation for each, and location (latitude/longitude in decimal degrees). For linear features, the table must show both acreage and linear feet as well as channel measurements (active channel width).	
Section 1.1 and 2	FIELD CONDITIONS: A description of existing field conditions, including current land use, normal conditions, flood/drought conditions, irrigation practices, past or recent manipulation to the site, and	

ROCKS
BIOLOGICAL CONSULTING

	characteristics considered atypical (for criteria see OHWM and wetland supplement guides). Include WETS tables or pre-site visit precipitation data as appropriate: https://www.wcc.nrcs.usda.gov/climate/wets_doc.html.	
Section 3.3	HYDROLOGY: A discussion of the hydrology at the site, including all known surface or subsurface sources, drainage gradients, downstream connections to the nearest traditional navigable waterway or interstate water, and any influence from manmade water sources such as irrigation.	
N/A	REMOTE SENSING: If remote sensing was used in the delineation, provide an explanation of how it was used and include the name, date and source of the tools and data used and copies of the maps/photographs.	
Section 3.4; Figure 4; Appendix C	SOILS: Soil descriptions, soil map(s), soil photos, and a discussion of hydric soils (for wetland delineations only).	
Figure 2	USGS QUADRANGLE: A site location map on a 7.5-minute USGS quadrangle. The map must provide the name of the USGS quadrangle, Section, Township, Range, and the latitude and longitude in decimal degree format.	
N/A	BULK UPLOAD FORM: For sites with 3 or more separate aquatic features a completed copy of the ORM Bulk Upload Aquatic Resources or Consolidated Excel spreadsheet must be submitted.	
Figure 5	FIGURES: Map(s) of all delineated aquatic resources in accordance with the Final Map and Drawing Standards for the South Pacific Division Regulatory Program, available at: http://www.spd.usace.army.mil/Missions/Regulatory/Public-Notices-and-References/Article/651327/updated-map-and-drawing-standards/	
Figure 7 and Appendix C	SITE PHOTOGRAPHS: Ground photographs showing representative aquatic resource sites (or lack of), as well as an accompanying map of photo-points and table of photographic information (see Final Map and Drawing Standards for the South Pacific Division Regulatory Program item no. 8 a-c).	
Appendix B	DATA FORMS: Completed data forms including all essential information to make a jurisdictional determination [e.g. 2006 Wetland Determination Data Form -- Arid West Supplement; 2010 Arid West Ephemeral and Intermittent Streams OHWM Datasheet].	
Section 2	METHODS: A description of the methods used to survey the aquatic resource boundaries. If GPS data is used, the level of accuracy must be included. Ideally, the GPS equipment should have the capability of sub-meter (<=1 meter) level horizontal accuracy.	
Appendix E	GIS DATA: Digital data for the site, aquatic resource boundaries, and data point locations must be provided in a geographic information system (GIS) format, preferably either ESRI shapefiles or Geodatabase format, but GoogleEarth KMZ or KML files may be acceptable non-complex projects. Each GIS data file must be accompanied by a metadata file containing the appropriate geographic coordinate system, projection, datum, and labeling description. If GIS data is unavailable or otherwise cannot be produced and the Corps determines a site visit is necessary, the aquatic resource boundaries should be physically marked with numbered flags or stakes to facilitate verification by the Corps.

- ✔ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ✔ No ___

Remarks:

Hydric soils assumed within standing water and with dominance of OBL vegetation (per methodology in 1987 Corps Wetland Delineation Manual, p. 58).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ✔ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ✔ Drift Deposits (B3) (**Riverine**)
- ✔ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✔ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ✔ No ___ Depth (inches): At surface

Water Table Present? Yes ___ No ___ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ___ No ___ Depth (inches): _____

Wetland Hydrology Present? Yes ✔ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Ponded area by culvert which contained standing water. Presence of water table or saturation from water table unknown given presence of standing water (i.e., no soil pit dug).

WETLAND DETERMINATION DATA FORM – Arid West Region

% Bare Ground in Herb Stratum 40 % Cover of Biotic Crust _____

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100% (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:	
OBL species	x 1 =	
FACW species	x 2 =	
FAC species	x 3 =	
FACU species	x 4 =	
UPL species	x 5 =	
Column Totals: (A)		(B)

Prevalence Index = B/A = _____

Hydrophytic Vegetation Indicators:

___ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes _____ No ✔

Remarks:

Area dictates significant change in veg. from wetland area upstream that is dominated by Cyperus eragrostis; channel regularly mowed although no evidence of recent mowing observed in this section of the channel.

SOIL

Sampling Point: WSP 9

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Type[1]	Loc[2]	Texture	Remarks
0-10	10 YR 3/3	100					SC	Sandy clay

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: Shovel refusal

Depth (inches): 10 inches

Hydric Soil Present? Yes ____ No ✔

Remarks:

Hard impenetrable soils past 10 inches; uniform color and texture. The area is more sloped than the downstream wetland area.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ✔ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ____ No ✔ Depth (inches): ____

Water Table Present? Yes ____ No ✔ Depth (inches): ____

Saturation Present? (includes capillary fringe) Yes ____ No ✔ Depth (inches): ____

Wetland Hydrology Present? Yes ____ No ✔

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Drainage patterns faintly visible. FAC-Neutral text not met.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: K4 Warehouse & Cactus Channel Improv. Pr City/County: Moreno Valley, Riverside Sampling Date: 7/17/18

Applicant/Owner: March Joint Powers Authority State: CA Sampling Point: WSP 10

Investigator(s): Lee Ripma Section, Township, Range: S13, T03S, R04W

Landform (hillslope, terrace, etc.): In drainage Local relief (concave, convex, none): None Slope (%): 0

Subregion (LRR): LLRC - Mediterranean California Lat: 33.909941025 Long: -117.248824397 Datum: WGS84

Soil Map Unit Name: Monserate sandy loam, 0 to 5 percent slopes NWI classification: Riverine

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✔ No _____ (If no, explain in Remarks.)

Are Vegetation ✔, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✔ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✔	**Is the Sampled Area within a Wetland?** Yes _____ No ✔
Hydric Soil Present?	Yes _____	No ✔	
Wetland Hydrology Present?	Yes _____	No ✔	

Remarks:

Sample point within Cactus Channel, appears to have been recently cleared/mowed; fed by culvert at intersection of Graham St. and Cactus Ave. and drains east to Heacock St. then is diverted south.

VEGETATION – Use scientific names of plants.

Remarks:

Drainage patterns visible within 2 to 3-foot channel.

Arid West Ephemeral and Intermittent Streams OHWM Datasheet

Project: K4 Warehouse & Cactus Channel Improv. Project
Project Number: --
Stream: OHWM 1
Investigator(s): Shanti Santulli and Emily Trevino

Date: 07/17/2018
Town: Moreno Valley
Photo begin file#:

Time: 0930
State: California
Photo end file#:

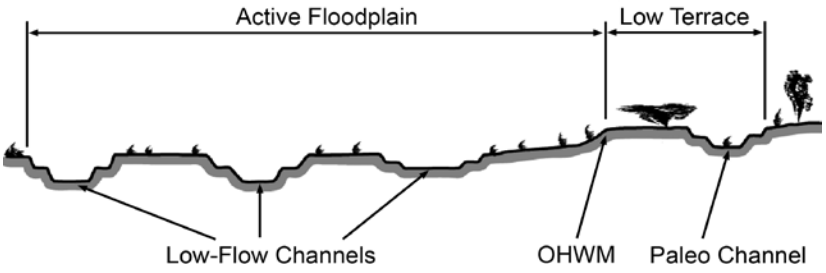
Y ☑ / N ☐ Do normal circumstances exist on the site?

Y ☐ / N ☑ Is the site significantly disturbed?

Location Details:
See Figure 5 and Appendix C (photo log)

Projection:
Datum: WGS 1894
Coordinates: See below

Potential anthropogenic influences on the channel system:
Channel runs along Cactus Avenue and is a artificially/manipulated channel, culverted at each intersection, contains trash/debris, and large portions of the channel appear to have been recently mowed



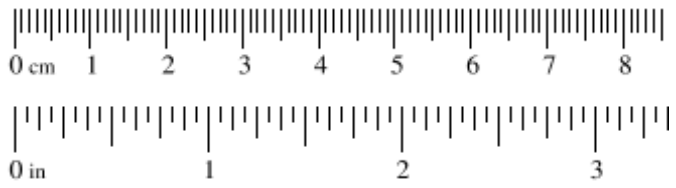
Brief site description:
Channel running along Cactus Avenue that is fed by multiple culverts, contains large wetland areas and flows through culverted intersections

Checklist of resources (if available):

- ☑ Aerial photography
  Dates:
- ☑ Topographic maps
- ☐ Geologic maps
- ☑ Vegetation maps
- ☑ Soils maps
- ☐ Rainfall/precipitation maps
- ☑ Existing delineation(s) for site
- ☑ Global positioning system (GPS)
- ☐ Other studies

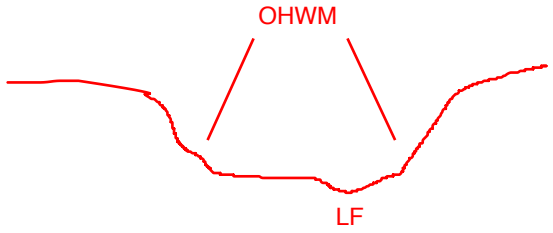
- ☐ Stream gage data
  Gage number:
  Period of record:
- ☐ History of recent effective discharges
- ☐ Results of flood frequency analysis
- ☐ Most recent shift-adjusted rating
- ☐ Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

Hydrogeomorphic Floodplain Units



Procedure for identifying and characterizing the floodplain units to assist in identifying the OHWM:

1. Walk the channel and floodplain within the study area to get an impression of the geomorphology and vegetation present at the site.
2. Select a representative cross section across the channel. Draw the cross section and label the floodplain units.
3. Determine a point on the cross section that is characteristic of one of the hydrogeomorphic floodplain units.
   a) Record the floodplain unit and GPS position.
   b) Describe the sediment texture (using the Wentworth class size) and the vegetation characteristics of the floodplain unit.
   c) Identify any indicators present at the location.
4. Repeat for other points in different hydrogeomorphic floodplain units across the cross section.
5. Identify the OHWM and record the indicators. Record the OHWM position via:
   - ☑ Mapping on aerial photograph
   - ☐ Digitized on computer
   - ☑ GPS
   - ☐ Other:



Wentworth Size Classes

Inches (in)	Millimeters (mm)	Wentworth size class	
10.08	256	Boulder	Gravel
2.56	64	Cobble	Gravel

APPENDIX C

SITE PHOTOGRAPHS

Appendix C – Site Photographs*

K4 Warehouse & Cactus Channel Imprveoments Project Jurisdictional Delineation

July 18, 2018

Photo 1. View of Wetland Sample Point (WSP) 1, area contains standing water and appears to have been recently mowed. Photo taken facing northwest.

Photo 2. Upstream view of WSP 2, near WSP 1. WSP 2 did not show any indicators of wetland hydrology, hydrophytic vegetation or hydric soils. Photo taken facing north.

*See Corresponding Figure 7 for Photo Point Locations

Photo 3. Downstream view of area where WSP 1 and WSP 2 data was collected; WSP 2 in foreground. Area appears to have been recently mowed; Drainage patterns observed. Photo taken facing southeast.

Photo 4. Downstream view of area between the WSP 1 and 2 near Elsworth Street toward area dominated by *Typha latifolia-dominated* area at Veterans Way. Photo taken facing east.

Photo 5. WSP 3, taken within the mowed area adjacent to the *Typha latifolia*-dominated area by Veterans Way. The sample point met the hydrophytic vegetation, wetland hydrology, and hydric soil indicators.

Photo 6. Downstream view at WSP 3 showing extent of mowed area and taller hydrophytic vegetation (*Typha latifolia*) further downstream. Photo taken facing east.

Photo 7. View of WSP 3 soils showing presence of distinct and prominent redox features.

Photo 8. View of WSP 4, taken in the uplands, the sample point did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils indicators.

Photo 9. Upstream view of area where WSP 3 and WSP 4 was taken; WSP 4 visible in foreground and determined extent/width of the wetland area. Photo taken facing west.

Photo 10. Upstream view of wetland area. The area appears to have been recently mowed and the abrupt end of *Typha latifolia* dictates where mowing stopped. Photo taken facing west.

Photo 11. Downstream view of wetland area where standing water was visible. Photo taken facing east towards the Cactus Avenue and Veterans Way culvert outlet.

Photo 12. Upstream view of large *Typha latifolia* dominated area. Photo taken near the crossing of Cactus Avenue and Veterans Way, where a large culvert feeds the area. Photo taken facing west.

Photo 13. Downstream view of large *Typha latifolia* dominated area.
Photo taken near the crossing of Cactus Avenue and Veterans Way, facing east.

Photo 14. Upstream view of wetland area where standing water was observed. These conditions continue upstream, eventually growing into a large *Typha latifolia* area. Photo taken facing west.

Photo 15. Upstream view of WSP 5, the same point met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters. Photo taken facing west.

Photo 16. View of WSP 5 soils, abundant redox features present.

Photo 17. View of WSP 6, taken in the uplands; the sample point did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils parameters.

Photo 18. Downstream view of area where WSP 5 and WSP 6 was taken; WSP 6 in foreground and determined the extent of the wetland area. Photo taken facing east.

Photo 19. Downstream view from a culvert outlet at Cactus Avenue and Frederick Street. Photo taken facing east.

Photo 20. View of culvert outlet at Cactus Avenue and Frederick Street. Vegetation within the area include *Rumex crispus* and *Salix exigua*. Photo taken facing north.

Photo 21. Upstream view of wetland area at the culvert outlet at Cactus Avenue and Frederick Street. Photo taken facing west.

Photo 22. Upstream view of continued wetland area. While vegetation was disturbed in this section of the channel, wetland hydrology and hydric soils remained present. Photo taken facing east.

Photo 23. View of area with visible soil cracks that displayed similar vegetation (albeit disturbed) and soil redox features as WSP 7, downstream. Photo taken facing east, downstream.

Photo 24. View of culvert that feeds into wetland area where WSP 7 and WSP 8 was taken. Photo taken facing north.

Photo 25. View of WSP 7. The sample point met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters.

Photo 26. WSP 8, taken in the uplands adjacent to WSP 7, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soil parameters. Photo taken facing north.

Photo 32. Overview of ephemeral drainage, feature is visible and consistent along Cactus Avenue from Riverside Drive to Heacock Street. Photo taken facing east.

Photo 33. WSP 10. The sample point displayed wetland hydrology; however, hydrophytic vegetation and hydric soils were not observed.

Photo 34. Upstream view of WSP 10 and OHWM Data Point 2. Photo taken facing west.

Photo 35. OHWM Data Point 2 downstream. OHWM Data Point 2 is defined by a break in slope, change in sediment texture, vegetation species, and vegetation cover. Photo taken facing east.

Photo 36. View of potential ponding area observed by RBC field staff. Protocol fairy shrimp surveys are currently being undertaken to determine species presence/absence although the area appears to be a puddle in a disturbed asphalt/unvegetated area. Photo taken on October 4, 2018.

APPENDIX D

JD REQUEST FORMS

PRELIMINARY JURISDICTIONAL DETERMINATION FORM

This preliminary JD finds that there *"may be"* waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

District Office: Los Angeles District | File/ORM #: | PJD Date:

State: CA | City/County: Moreno Valley/Riverside

Nearest Waterbody: San Jacinto River

Location: TRS, LatLong or UTM: 33.909420, -117.263420

Name/ Address of Person Requesting PJD:
Jeff Gordon
Meridian Park K4, LLC
567 San Nicholas Drive, Suite 270
Newport Beach, CA 92660
San Diego, CA 92110
JGordon@waypointpg.com
949-200-6733

Identify (Estimate) Amount of Waters in the Review Area:

Non-Wetland Waters: 2876 linear ft | 5-15 width | 0.42 acres | Stream Flow: Ephemeral

Wetlands: 1.40 acre(s) | Cowardin Class: Palustrine, emergent

Name of Any Water Bodies on the Site Identified as Section 10 Waters: Tidal: N/A | Non-Tidal: N/A

- ☑ Other information (please specify): 2018 JD Report, prepared by Rocks Biological Consult

IMPORTANT NOTE: The information recorded on this form has not necessarily been verified by the Corps and should not be relied upon for later jurisdictional determinations.

Signature and Date of Regulatory Project Manager (REQUIRED)

Signature and Date of Person Requesting Preliminary JD (REQUIRED, unless obtaining the signature is impracticable)

EXPLANATION OF PRELIMINARY AND APPROVED JURISDICTIONAL DETERMINATIONS:

1. The Corps of Engineers believes that there may be jurisdictional waters of the United States on the subject site, and the permit applicant or other affected party who requested this preliminary JD is hereby advised of his or her option to request and obtain an approved jurisdictional determination (JD) for that site. Nevertheless, the permit applicant or other person who requested this preliminary JD has declined to exercise the option to obtain an approved JD in this instance and at this time.

2. In any circumstance where a permit applicant obtains an individual permit, or a Nationwide General Permit (NWP) or other general permit verification requiring "preconstruction notification" (PCN), or requests verification for a non-reporting NWP or other general permit, and the permit applicant has not requested an approved JD for the activity, the permit applicant is hereby made aware of the following: (1) the permit applicant has elected to seek a permit authorization based on a preliminary JD, which does not make an official determination of jurisdictional waters; (2) that the applicant has the option to request an approved JD before accepting the terms and conditions of the permit authorization, and that basing a permit authorization on an approved JD could possibly result in less compensatory mitigation being required or different special conditions; (3) that the applicant has the right to request an individual permit rather than accepting the terms and conditions of the NWP or other general permit authorization; (4) that the applicant can accept a permit authorization and thereby agree to comply with all the terms and conditions of that permit, including whatever mitigation requirements the Corps has determined to be necessary; (5) that undertaking any activity in reliance upon the subject permit authorization without requesting an approved JD constitutes the applicant's acceptance of the use of the preliminary JD, but that either form of JD will be processed as soon as is practicable; (6) accepting a permit authorization (e.g., signing a proffered individual permit) or undertaking any activity in reliance on any form of Corps permit authorization based on a preliminary JD constitutes agreement that all wetlands and other water bodies on the site affected in any way by that activity are jurisdictional waters of the United States, and precludes any challenge to such jurisdiction in any administrative or judicial compliance or enforcement action, or in any administrative appeal or in any Federal court; and (7) whether the applicant elects to use either an approved JD or a preliminary JD, that JD will be processed as soon as is practicable. Further, an approved JD, a proffered individual permit (and all terms and conditions contained therein), or individual permit denial can be administratively appealed pursuant to 33 C.F.R. Part 331, and that in any administrative appeal, jurisdictional issues can be raised (see 33 C.F.R. 331.5(a)(2)). If, during that administrative appeal, it becomes necessary to make an official determination whether CWA jurisdiction exists over a site, or to provide an official delineation of jurisdictional waters on the site, the Corps will provide an approved JD to accomplish that result, as soon as is practicable.

PRELIMINARY JURISDICTIONAL DETERMINATION FORM

This preliminary JD finds that there *"may be"* waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

Appendix A - Sites

District Office: Los Angeles District | File/ORM #: | PJD Date:

State: CA | City/County: Moreno Valley/Riverside | Person Requestinq PJD: Jeff Gordon

Site Number	Latitude	Longitude	Cowardin Class	Est. Amount of Aquatic Resource in Review Area	Class of Aquatic Resource
CACW	33.909944442	-117.26156467	Palustrine, emergent	1.40	Non-Section 10 wetland
CACNW	33.909960615	-117.25096585	Riverine	0.42	Non-Section 10 non-wetla

Notes:

The review area for this requested PJD includes the project survey area shown on the provided figures with the K4 Warehouse & Cactus Channel Improvements Project Jurisdictional Delineation Report (Rocks Biological Consulting 2018), incorporated here by reference. A majority of the Cactus Avenue Channel (CAC) displayed evidence of federally jurisdictional wetland waters of the U.S.; while the remaining portions displayed evidence of an OHWM as discussed in the provided Jurisdictional Delineation Report.

The delineated feature on site drains from west to east along Cactus Avenue until the intersection of Cactus Avenue and Heacock Street, where flows are diverted south to drain into the Perris Valley storm drain system. Flows continue into the San Jacinto River and ultimately into Lake Elsinore.

Appendix 1 - REQUEST FOR CORPS JURISDICTIONAL DETERMINATION (JD)

To: District Name Here

- I am requesting a JD on property located at: Cactus Ave. b/w Elsworth St. to Heacock St. (Street Address)
  City/Township/Parish: Moreno Valley County: Riverside State: CA
  Acreage of Parcel/Review Area for JD: 42.36 acres
  Section: S15, S22 Township: T03S Range: R04W
  Latitude (decimal degrees): 33.909420 Longitude (decimal degrees): -117.263420
  (For linear projects, please include the center point of the proposed alignment.)
- Please attach a survey/plat map and vicinity map identifying location and review area for the JD.
- ✔ I currently own this property. ___ I plan to purchase this property.
  ___ I am an agent/consultant acting on behalf of the requestor.
  ___ Other (please explain): _____.
- Reason for request: (check as many as applicable)
  ___ I intend to construct/develop a project or perform activities on this parcel which would be designed to avoid all aquatic resources.
  ___ I intend to construct/develop a project or perform activities on this parcel which would be designed to avoid all jurisdictional aquatic resources under Corps authority.
  ___ I intend to construct/develop a project or perform activities on this parcel which may require authorization from the Corps, and the JD would be used to avoid and minimize impacts to jurisdictional aquatic resources and as an initial step in a future permitting process.
  ✔ I intend to construct/develop a project or perform activities on this parcel which may require authorization from the Corps; this request is accompanied by my permit application and the JD is to be used in the permitting process.
  ___ I intend to construct/develop a project or perform activities in a navigable water of the U.S. which is included on the district Section 10 list and/or is subject to the ebb and flow of the tide.
  ___ A Corps JD is required in order to obtain my local/state authorization.
  ___ I intend to contest jurisdiction over a particular aquatic resource and request the Corps confirm that jurisdiction does/does not exist over the aquatic resource on the parcel.
  ___ I believe that the site may be comprised entirely of dry land.
  ___ Other: _____
- Type of determination being requested:
  ___ I am requesting an approved JD.
  ✔ I am requesting a preliminary JD.
  ___ I am requesting a "no permit required" letter as I believe my proposed activity is not regulated.
  ___ I am unclear as to which JD I would like to request and require additional information to inform my decision.

By signing below, you are indicating that you have the authority, or are acting as the duly authorized agent of a person or entity with such authority, to and do hereby grant Corps personnel right of entry to legally access the site if needed to perform the JD. Your signature shall be an affirmation that you possess the requisite property rights to request a JD on the subject property.

*Signature: _____ Date: _____

- Typed or printed name: Jeff Gordon
  Company name: Meridian Park K4, LLC
  Address: 567 San Nicholas Drive, Suite 270
  Newport Beach, CA 92660
  Daytime phone no.: 949-200-6733
  Email address: JGordon@waypointpg.com

***Authorities:** Rivers and Harbors Act, Section 10, 33 USC 403; Clean Water Act, Section 404, 33 USC 1344; Marine Protection, Research, and Sanctuaries Act, Section 103, 33 USC 1413; Regulatory Program of the U.S. Army Corps of Engineers; Final Rule for 33 CFR Parts 320-332.
Principal Purpose: The information that you provide will be used in evaluating your request to determine whether there are any aquatic resources within the project area subject to federal jurisdiction under the regulatory authorities referenced above.
Routine Uses: This information may be shared with the Department of Justice and other federal, state, and local government agencies, and the public, and may be made available as part of a public notice as required by federal law. Your name and property location where federal jurisdiction is to be determined will be included in the approved jurisdictional determination (AJD), which will be made available to the public on the District's website and on the Headquarters USACE website.
Disclosure: Submission of requested information is voluntary; however, if information is not provided, the request for an AJD cannot be evaluated nor can an AJD be issued.

STEPHENS' KANGAROO RAT PROTOCOL SURVEY RESULTS

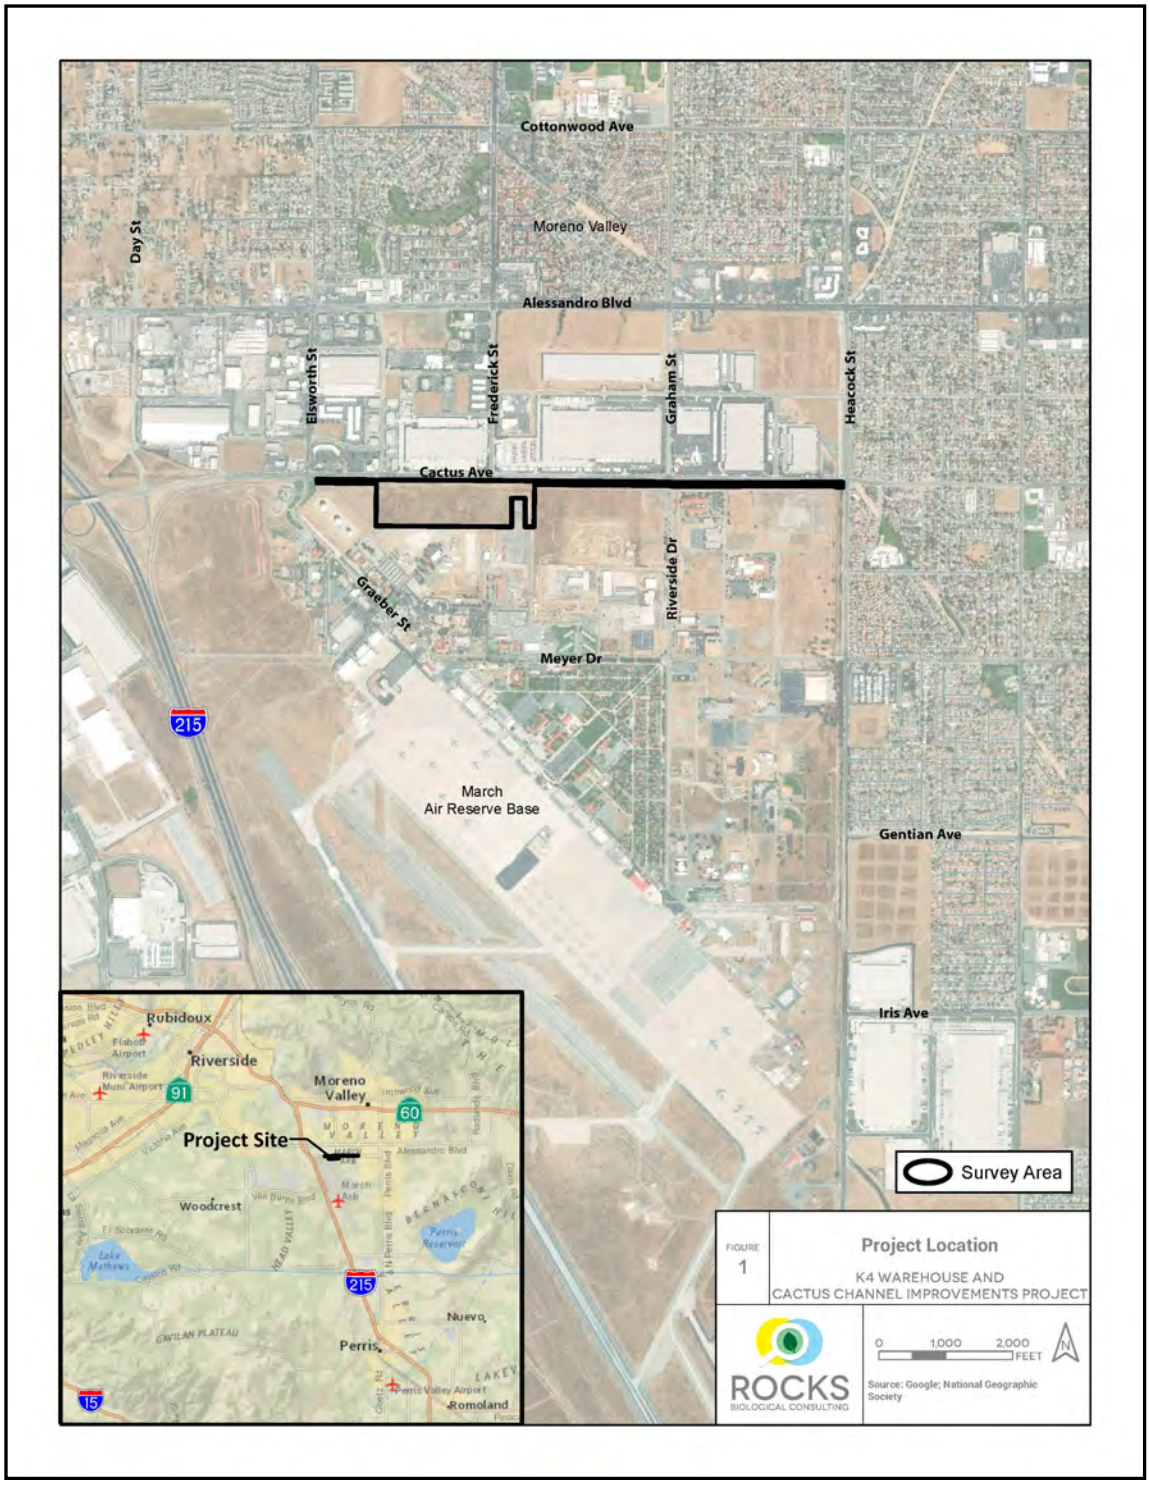
January 10, 2019

Ms. Stacey Love
Recovery Permit Coordinator
Carlsbad Fish and Wildlife Office
2177 Salk Avenue, Suite 250
Carlsbad, CA 92008

Subject: Results of a trapping survey for the federally endangered Stephen's kangaroo rat (Dipodomys stephensi) on an approximately 42.4-acre site in March Joint Powers Authority, Riverside County, California.

Dear Ms. Love,

This report presents the results of a trapping survey for the federally threatened Stephen's kangaroo rat (SKR; Dipodomys stephensi) on the site of the proposed K4 warehouse project and proposed improvements to the existing Cactus drainage channel along the southern side of Cactus Ave. The survey area is located on the U.S. Geological Survey (USGS) Riverside East and Sunnymead 7.5-minute quadrangles (Township 3S, Range 4W, Sections 13 and 14). The UTM coordinates of the approximate center of the survey area are 11S 476230E/ 3752224N (NAD 83). The site is approximately 1,550 feet in elevation. Figure 1 shows the project site on a vicinity map. Appendix A contains site photos.



INTRODUCTION

The proposed project is for construction of a K4 warehouse and channelization of the existing Cactus Ave earthen drainage ditch along the southern side of Cactus Ave. The K4 warehouse project site is immediately south of Cactus Ave within the March Joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County. The drainage improvement project extends from the vicinity of the entrance to March Air Reserve Base (MARB) east to Heacock St. The K4 Warehouse site is on a 35.4-acre parcel; the Cactus Channel Improvements would occur over a 7.0-acre area immediately south of Cactus Avenue (Figure 1). Interstate 215 (I-215) is located approximately 0.75 mile west of the project site. The project site is comprised of five Assessor's Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0.

The natural history and habitat requirements of SKR are fairly well known. Habitats occupied by SKR typically occur on level to gently sloping terrain, although the species has occasionally been found on relatively steep slopes. SKR typically occupy lands described as disturbed annual grassland and characterized by a relatively sparse cover of both shrubs and herbaceous vegetation. Occupied SKR habitat commonly exhibits an abundance of bare (unvegetated) ground during much of the year. When grasslands develop extremely high densities of herb cover following periods of rainfall, SKR usually occur only along dirt roads that traverse such dense habitats. Similarly, SKR often will be found along truck or cow trails that traverse dense grasslands. Soils in habitats harboring SKR are typically loamy in nature, while soils dominated by clay or sand very rarely support this species (O'Farrell and Uptain 1989, O'Farrell 1990, Price and Endo 1989, USFWS 1997).

Stephens' kangaroo rat is known to occur widely in Riverside County, and in a few localities in southwestern San Bernardino County (O'Farrell and Uptain 1989; RCHCA 1995; USFWS 1997, 1993). The species has long been known to occur in the March Air Base area along Interstate 215 (Montgomery 2000, 2002, 2010).

Figure 1. Vicinity map of project site.

METHODS

A live-trapping survey was carried out over five consecutive nights from October 22-26, 2018. The live-trapping effort used large (3 x 3.75 x 12") Sherman live-traps with doors shortened to avoid tail damage. Traps were set in areas that showed potential for SKR occurrence. The disced field that comprises much of the K4 warehouse site showed no potential for SKR occurrence. Traps were opened and baited with bird seed within one hour of sunset and checked at night and in the morning. Animals were identified and released immediately at the point of capture. A total of 725 trap-nights were accrued during the field survey. Trapping was conducted by Dr. Phil Brylski (USFWS permit TE148555-2 and CDFG MOU).

Figures 2A and 2B show the survey area on an aerial photo and the locations of the four survey transects: A, B, C, and D.

RESULTS

Site Description

The project site lies on flat land bordered by Cactus Ave to the north and by vacant land to the south. To the south are developed land uses within March Air Reserve Base. To the north across Cactus Ave are light industrial and commercial land uses.

The plant communities in the survey area site include disturbed golden bush scrub/non-native grassland and developed/disturbed. The vacant parcels that occur along Transects B, C, and D were recently disced, and have been regularly mowed or disced in recent years. The disturbed golden bush scrub/non-native grassland occurs along the fence lines and in several areas that have not been disced. The soils on the site are predominantly Monserate sandy loams (NRCS 2018), which are suitable for SKR.

Project Site in Relation to SKR Historical Range and Habitat

The project site is within the historical range for SKR. The disturbed golden bush scrub/non-native grassland are potentially suitable habitat for SKR, however, no kangaroo rat sign (burrows, tail drag, scat) was observed in the survey area.

The California Natural Diversity Database (CNDDB; CDFWG 2018) contains a number of SKR records for the project vicinity – mainly in the sparse grasslands located west of I-215. The nearest records are located from 1 to 1.3 miles to the west and southwest of the survey area. Many of these SKR occurrences are from the years before residential and light industrial development of the area. One SKR locality on the eastern side of I-215 is within March Air Based, approximately 2.2 miles south of the project site (south of in the vicinity of the MARB museum facility). SKR were observed there during a live-trapping survey in 2000 (Montgomery 2000), but it is not known whether the species still occurs there (S. Montgomery, pers. comm.).

Figure 2A. SKR transect locations, western part of survey area.

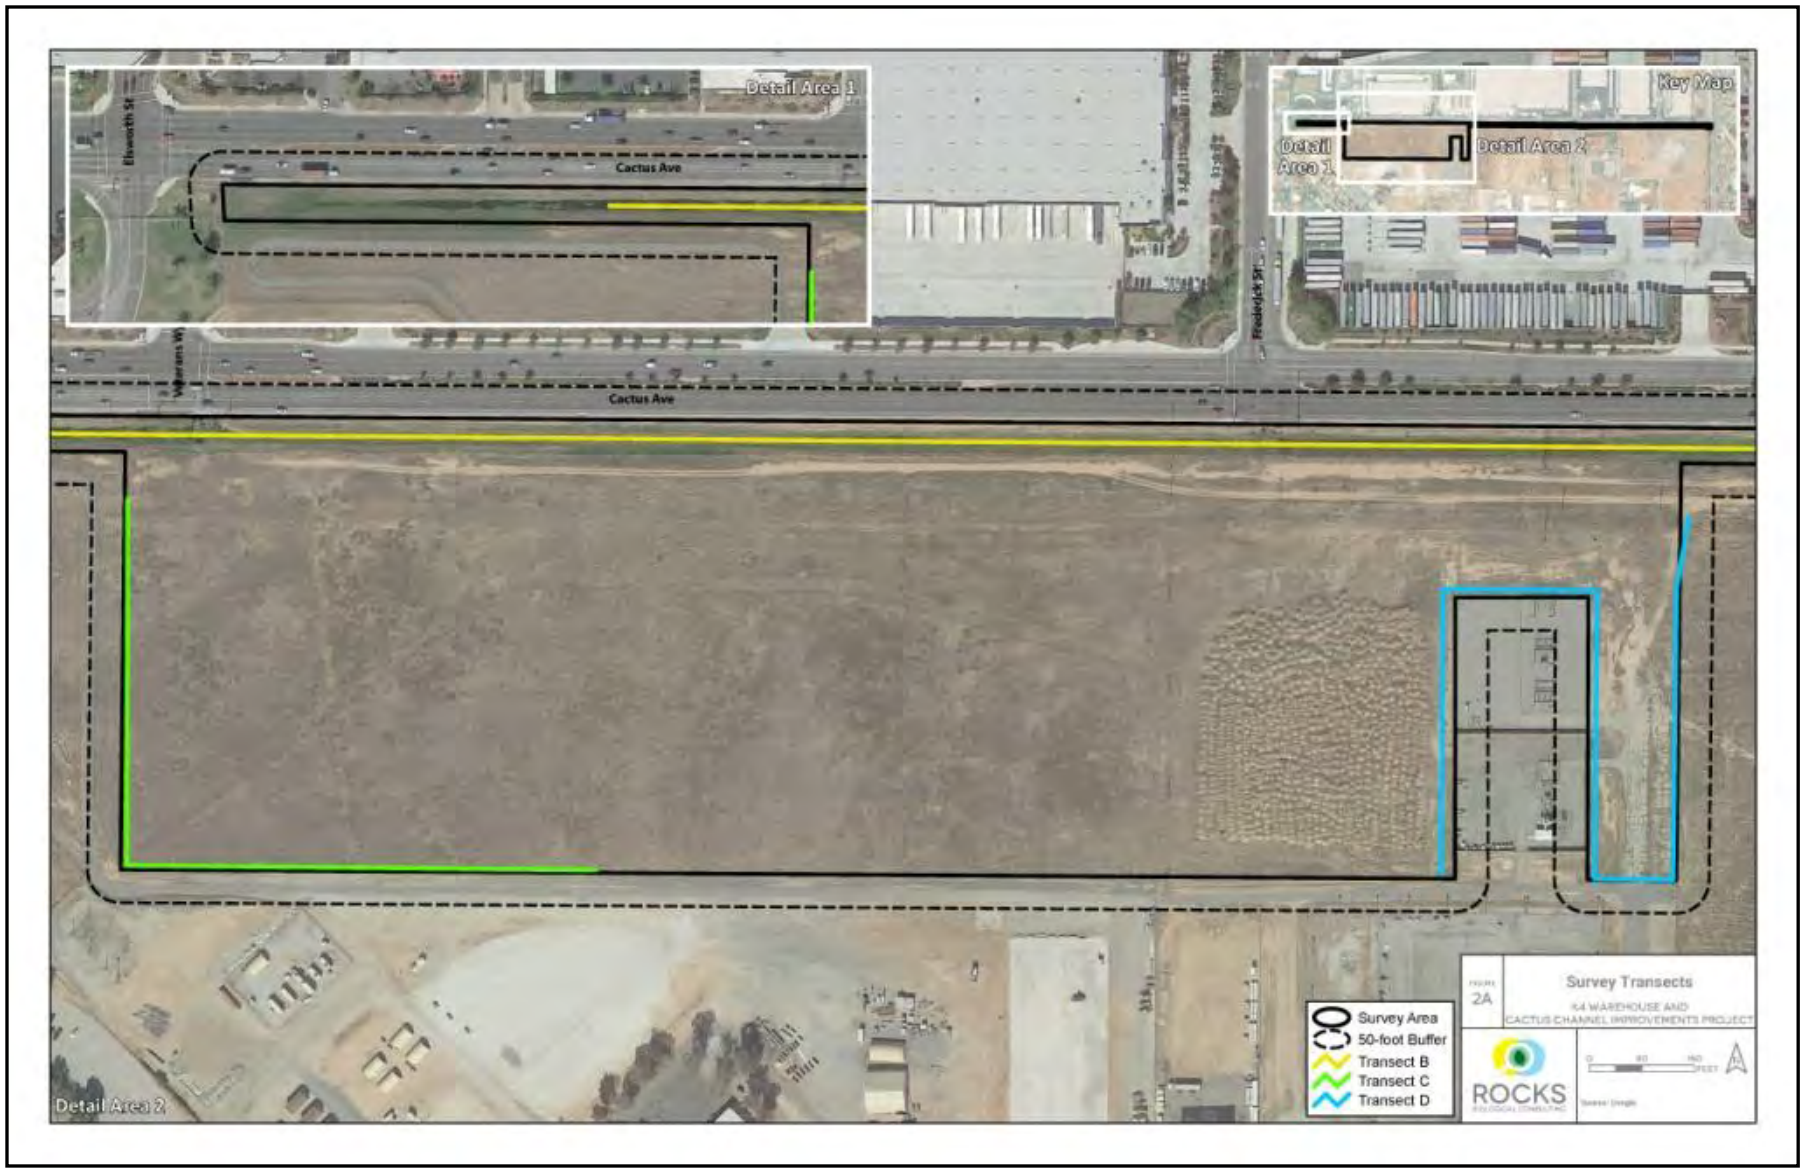


Figure 2B. SKR transect locations, eastern part of survey area.

SKR Survey Results

Weather conditions during the survey were mild, with mostly clear skies, low wind, and temperatures of 55-63°F. Weather conditions during the survey are summarized in Table 1.

Table 1. Weather Conditions			
Date	Temperature (F)	Cloud Cover (%)	Wind (mph)
10-22	55/62	0-3	0-2
10-23	57/62	5-15	0-1
10-24	59/63	0	0
10-25	57/56	0	0
10-26	57/61	0	0-3

The survey yielded captures of one small mammal species: the deer mouse (Peromyscus maniculatus). Table 2 summarizes the captures.

Table 2. Summary of Small Mammal Captures		
Date	Transect	Species
		PMAN
10-22	A	
	B	
	C	
	D	
10-23	A

	C	1
	D	
10-26	A	
	B	
	C	
	D	
	Total	3
PMAN: deer mouse, Peromyscus maniculatus		

CONCLUSION

No SKR were captured on the project site. The site contains potentially suitable habitat for SKR, but no sign (potential burrows, tail drag marks, scat) was observed there. The absence of SKR in the current trapping survey indicates that there would be no impacts to SKR as a result of the proposed project.

Please contact me if you have any questions regarding this survey report.

Sincerely,

Phil Brylski

1 INTRODUCTION

Rocks Biological Consulting (RBC) conducted a formal jurisdictional delineation for the K4 Warehouse and Cactus Channel Improvements Project (project) to identify areas potentially jurisdictional under the U.S. Army Corps of Engineers (Corps) pursuant to Section 404 of the Clean Water Act; the Regional Water Quality Control Board (RWQCB) pursuant to Section 401 of the Clean Water Act and the Porter-Cologne Act; and streambed and riparian habitats under California Department of Fish and Wildlife (CDFW) pursuant to California Fish and Game Code (§1602). This information is necessary to evaluate potential jurisdictional impacts and permit requirements associated with the project, can be used by the agencies to assess project conformance with state and federal regulations, and serves as a request for the Corps to complete a Preliminary Jurisdictional Determination (PJD) based on the information provided in this report. Furthermore, Appendix A provides a checklist of the information contained in this report in compliance with the Corps Los Angeles District's *Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (Corps 2017).

1.1 PROJECT LOCATION

The approximately 35.4-acre project site is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March Joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California (Figure 1). Interstate 215 (I-215) is located approximately 0.8 mile east of the Project site. The Project site is comprised of five parcels designated as Assessor's Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0.

The latitude and longitude of the approximate center of the site is 33.909420, -117.263420. The Project site sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey (USGS; Figure 2).

1.2 PROJECT DESCRIPTION

The proposed K4 Warehouse project includes the construction of a 718,000-square-foot warehouse building on the 34.5-acre parcel. Access to the Project is across the Cactus Avenue Channel (discussed further in this report) that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the project frontage, and further to the east ending at the Heacock Channel at Heacock Street. Additionally, the Riverside County Flood Control District and Water Conservation District are proposing to underground the current drainage ditch in a box culvert, e.g., the Cactus Channel improvements. The culvert would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width total). The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District, and it would function as part of the District's Master Plan. If the channel improvements are not complete prior to warehouse development, the K4 Warehouse development will be constructed with two access driveways that cross the Cactus Avenue Channel.

1.3 REGULATORY BACKGROUND

Several regulations have been established by federal, state, and local agencies to protect and conserve aquatic resources. The descriptions below provide a brief overview of agency regulations that may be applicable to the project. Regulatory agencies make the final determination of whether a project requires authorization pursuant to these regulations.

1.3.1 APPLICABLE AQUATIC RESOURCE PROTECTION REGULATIONS

Clean Water Act

Pursuant to Section 404 of the Clean Water Act (33 USC § 1251 et seq.; CWA), the Corps is authorized to regulate any activity that would result in the discharge of dredged or fill material into waters of the U.S. (including wetlands), which include those waters listed in 33 Code of Federal Regulations (CFR) 328.3 (as amended at 80 Federal Register (FR) 37104, June 29, 2015). The Corps, with oversight from the U.S. Environmental Protection Agency (USEPA), has the principal authority to issue CWA Section 404 permits. The Corps would require a Standard Individual Permit (SIP) for more than minimal impacts to waters of the U.S. as determined by the Corps. Projects with minimal individual and cumulative adverse effects on the environment may meet the conditions of an existing Nationwide Permit (NWP).

A water quality certification or waiver pursuant to Section 401 of the CWA is required for all Section 404 permitted actions. The RWQCB, a division of the State Water Resources Control Board, provides oversight of the 401-certification process in California. The RWQCB is required to provide "certification that there is reasonable assurance that an activity that may result in the discharge to waters of the United States will not violate water quality standards." Water Quality Certification must be based on the finding that proposed discharge will comply with applicable water quality standards.

The National Pollutant Discharge Elimination System (NPDES) is the permitting program for discharge of pollutants into surface waters of the U.S. under Section 402 of the CWA.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Water Code § 13000 et seq.) provides for statewide coordination of water quality regulations. The State Water Resources Control Board was established as the statewide authority and nine separate RWQCBs were developed to oversee water quality on a day-to-day basis. The RWQCB is the primary agency responsible for protecting water quality in California. As discussed above, the RWQCB regulates discharges to surface waters under the federal CWA. In addition, the RWQCB is responsible for administering the California Porter-Cologne Water Quality Control Act.

Pursuant to the Porter-Cologne Water Quality Control Act, the state is given authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. As such, any person proposing to discharge waste into a water body that could affect its water quality must first file a Report of Waste Discharge if Section 404 is not required for the activity. "Waste" is partially defined as any waste substance associated with human habitation, including fill material discharged into water bodies.

California Fish and Game Code Section 1600-1602

Pursuant to Division 2, Chapter 6, Section 1602 of the California Fish and Game Code (CFGC), CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream or lake that supports fish or wildlife. A Notification of Lake or Streambed Alteration must be submitted to CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." CDFW has jurisdiction over riparian habitats associated with watercourses. Jurisdictional waters are delineated by the outer edge of riparian vegetation (i.e., drip line) or at the top of the bank of streams or lakes, whichever is wider. CDFW jurisdiction does not include tidal areas or isolated resources. CDFW reviews the proposed actions and, if necessary, submits (to the applicant) a proposal that includes measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and applicant is the Lake or Streambed Alteration Agreement.

Agency access to the project site can be coordinated with the applicant and/or agent upon request.

2 METHODS

Prior to the on-site delineation, field maps were created using a Geographic Information System (GIS) and a color aerial photograph at a 1:100 scale. RBC staff also reviewed U.S. Geological Survey (USGS) National Hydrography Dataset (NHD) and topography data (Figure 2) and U.S.

Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soils map data and U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) data (Figure 4) to further determine the potential locations of jurisdictional aquatic resources. Google Earth, NetrOnline Historic Aerials, and University of California-Santa Barbara database was also utilized to assess historic presence or absence of flow in the project area.

Shanti Santulli, Lee Ripma, and Emily Trevino of Rocks Biological Consulting (RBC) conducted the jurisdictional delineation field visit on July 17, 2018. Areas with depressions, drainage patterns, and/or wetland vegetation within the project impact area were evaluated for potential jurisdictional status, with focus on the presence of defined channels and/or wetland vegetation, soils and hydrology. Field staff examined potential jurisdictional wetland areas using the methods set forth in the Corps 1987 *Wetland Delineation Manual* (Wetland Manual) (Environmental Laboratory 1987) and the 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region Version 2.0* (Arid West Supplement) (Corps 2008a). Wetland plant indicator status was determined using the *National Wetland Plant List* (NWPL; Corps 2016) and hydric soils indicators on *Field Indicators of Hydric Soils in the United States, Version 8.1* (NRCS 2017). Soil chromas were identified in the field according to *Munsell's Soil Color Charts* (Kollmorgen 2000).

Lateral limits of potential non-wetland waters of the U.S./State for the Corps and RWQCB were identified using field indicators of an ordinary high-water mark (OHWM) as described in *A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States* (Corps 2008b). For each feature exhibiting the potential presence of an OHMW, RBC completed a 2010 Arid West Ephemeral and Intermittent Streams OHWM Datasheet (OHWM Datasheet) following the guidance provided in the Updated Datasheet for the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States (Corps 2010).

CDFW potential jurisdictional boundaries were determined based on the presence of riparian habitat and/or streambed. Streambeds considered within CDFW jurisdiction were delineated based on the definition of streambed as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supporting fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports riparian vegetation" (Title 14, Section 1.72). Riparian habitat refers to vegetation and habitat associated with a stream. The CDFW jurisdictional habitat includes all riparian shrub or tree canopy that may extend beyond the banks of a stream.

While in the field, potentially jurisdictional features were recorded using a hand-held Global Positioning System (GPS) unit with a level of accuracy ranging from four to 12 feet. RBC staff refined the data using aerial photographs and topo maps with two-foot contours to ensure accuracy. Off-site portions of drainages were visited to confirm the presence of the indicators above, if appropriate, and general flow path. Plants were identified according to The Jepson Manual 2nd edition (Baldwin et al. 2012). Vegetation community classifications follow Holland (1986) and nomenclature follows Jepson eFlora (2018).

All figures generated for this jurisdictional delineation report follow the Corps' Updated Map and Drawing Standards for the South Pacific Division Regulatory Program (Corps, 2016).

3 RESULTS

3.1 TOPOGRAPHY

The site is primarily flat with elevations around 1,550 feet. The only shift in topography observed on site occurred within a west-east trending drainage that runs parallel to Cactus Avenue from just east of Elsworth Street to Heacock Steet (Cactus Avenue Channel, discussed further below; Figure 5).

3.2 WATERSHED

The proposed project area is within the San Jacinto Hydrologic Unit Code [HUC] 8 (18070202), Lower San Jacinto River Hydrologic Unit Code [HUC] 10 (1807020203), Perris Reservoir Hydrologic Unit Code [HUC] 12 (180702020305) (Figure 2).

3.3 HYDROLOGY

USGS NHD maps a "blue-line stream" along the northern boundary of the project area, which flows south along Heacock Street into the Perris Valley storm drain system (Figure 2). USFWS NWI also map Riverine designations within the projects northern boundary, draining east until diverting south along Heacock Street (Figure 4).

Known hydrologic sources for the observed on-site drainages, discussed further below, are several culverted storm-drain outlets (which collect and convey runoff from the commercial area north of the channel), sheet flows from the adjacent March Air Force Base, and direct precipitation. Flows generally drain from west to east until the intersection of Cactus Avenue and Heacock Street, where flows are diverted south into a drainage ditch along Heacock Street which drains into the Perris Valley storm drain system. Flows continue into the San Jacinto River and ultimately into Lake Elsinore.

Table 1 describes the estimated monthly total and average precipitation for the project area between 2007 and 2018 to provide the pertinent pre-site visit precipitation data. RBC staff accessed precipitation data through the NRCS Agricultural Applied Climate Information System (AgACIS) database from the March AFB station in Riverside County on July 17, 2018.

Table 1. Precipitation Data

Monthly Total Precipitation (inches) for March AFB, CA (NOAA)													
Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual

2017	3.78	1.91	0.01	T	0.02	T	0.01	0.59	T	T	T	T	6.32
2018	1.44	0.23	M	T	0.08	0	T	M	M	M	M	M	M
Mean	**1.67**	**1.06**	**0.59**	**0.35**	**0.17**	**T**	**0.19**	**0.43**	**0.13**	**0.21**	**0.39**	**2.02**	**7.58**

*Per AgACIS database: "Monthly summarized data - means, sums, daily extremes or frequencies for the selected variable for each month of the year for the selected range of years. HDD, CDD and GDD are heating, cooling and growing degree days, respectively. Note: trace precipitation/snowfall/snow depth amounts are treated as zero in sums, means, and frequency counts. Annual average temperatures are the average of the twelve-monthly values. Values of 'M' indicate missing data and 'T' indicates a trace."

Table 1 indicates that the field survey date of July 17, 2018 occurred during below-average historic precipitation (trace precipitation treated as 0.0 inches) for the month of July, which averaged 0.19 inches between 2010-2018. The 2017 average precipitation of 6.32 inches was 1.26 inches below the average annual precipitation of 7.58 inches from 2010-2017.

3.4 SOILS

Based on the NRCS map of the project area (Figure 4), the following soil occurs within the project site boundary and is described below per the USDA's Official Soil Series Description and Series Classification database:

Monserate sandy loam, 0 to 5 percent slopes

The Monserate series consist of well to well drained and moderately slow permeable soils. These soils are found primarily on nearly level to moderately steep terraces and fans in southern California and are primarily used for growing grain or pasture. The NRCS does not list this soil as hydric.

Greenfield sandy loam, 0 to 2 percent slopes

The Greenfield series consist of well drained soils moderately permeable soils. These soils form in moderately coarse and coarse textured alluvium, found on alluvial fans and terraces, and are primarily used for the production of irrigated field, forage and fruit crops. The NRCS does not list this soil as hydric.

3.5 FEATURES OBSERVED

A west-east, earthen-lined and vegetated drainage ditch, hearby referred to as the Cactus Avenue Channel, runs parallel to Cactus Avenue from just east of Elsworth Street to Heacock Street and was the only observed aquatic resource within the project area.

RBC investigated ten wetland delineation sampling points within the Cactus Avenue Channel in the survey area boundaries to determine the presence or absence of federally jurisdictional wetlands within the channel (Figure 5; Appendix B). RBC also completed two Arid West Ephemeral and Intermittent Streams OHWM Datasheets (OHWM Datasheets) in the project survey boundary (Figure 5; Appendix B). The descriptions provided below detail the existing characteristics of each feature determined in the field. Appendix C provides site photographs of the features, and Figure 7 displays representative photo points also discussed below.

Cactus Avenue Channel

The Cactus Avenue Channel receives flows from several culverts along Cactus Avenue, as noted on Figure 5. The feature originates on the project survey area from a culvert along Cactus Avenue, east of the intersection of Elsworth Street and flows east approximately 1.5-miles until being diverted south into a drainage ditch along Heacock Street. RBC staff observed both wetland and non-wetland features within the Cactus Avenue Channel, as further described below.

Wetland Sample Point (WSP) 1 was taken adjacent to the initial, westernmost culvert outlet along the channel. WSP 1 was dominated by *Potamogeton sp.* (OBL) and contained standing water at the time of the jurisdictional delineation; as such, WSP 1 met the parameters for hydrophytic vegetation and wetland hydrology based on field observation of the applicable indicators for both (Appendix B, WSP 1). Additionally, RBC assumed the presence of hydric soils at WSP 1 per the 1987 Wetland Manual, which states that hydric soils can be assumed present if the sample point is located “within a plant community type where all dominant species have an indicator status of OBL” (Environmental Laboratory 1987). WSP 1 showed standing water/ponding within a well-defined, depressional area by a culvert outlet as well as the presence of a dominant OBL plant species (*Potamogeton sp.*). As such, WSP 1 met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters. WSP 2, taken approximately 25 feet downstream of WSP 1, did not meet parameters for wetland hydrology, hydric soils, or hydrophytic vegetation (Appendix B, WSP 2). Vegetation observed at WSP 2 included common brome (*Bromus madritensis ssp. rubens*; UPL) and bermuda grass (*Cynodon dactylon*; FACU). A small disturbed (i.e., mowed), 4-foot wide drainage/streambed was observed between WSP 1 and WSP 3 (Appendix C, Photo 4).

WSP 3, taken within a large section of the channel that had been recently mowed, met the parameters for hydrophytic vegetation, wetland hydrology, and hydric soils (Appendix B, WSP 3). Hydrophytic vegetation at WSP 3 included common knotgrass (*Paspalum distichum*; FACW) and mayweed (*Anthemis cotula*; FACU). The wetland boundary observed was approximately 20 feet wide with a bed and bank (including the delineated wetland area) of approximatedly 25 feet wide at this portion of the channel. WSP 4, taken in the adjacent uplands of WSP 3 to help determine the wetland boundary, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils indicators (Appendix B, WSP 4). Downstream of WSP 3/4, RBC staff observed an approximate 800-foot long stretch of the channel containing cattail (*Typha latifolia*; OBL), tall flat sedge (*Cyperus* eragrostis; FACW), and visible standing water. A large, 35-foot wide culvert at the intersection of Cactus Avenue and Veterans Way appeared to be the primary hydrologic input into this area, causing standing water/saturation both upstream and downstream of the culvert (Appendix C, Photo 12).

WSP 5 was taken approximately 230 feet downstream from the end of the standing water observed downstream of the Cactus Avenue and Veterans Way culvert, where the bed of the channel narrows to approximately 10 feet wide with 20-foot wide banks; WSP 5 met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters (Appendix B, WSP 5). The hydrophytic vegetation observed within the sample point included tall flat sedge (FACW); prominent redox features were also observed (Appendix C, Photo 16). WSP 6, taken in the adjacent uplands, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soil indicators (Appendix B, WSP 6). The feature continues downstream towards the intersection of Cactus Avenue and Riverside Drive. WSP 7, taken near a culvert outlet at the Riverside Drive intersection, met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters (Appendix B, WSP 7). Hydrophytic vegetation observed at WSP 7 included tall flat sedge (FACW), prostrate amaranth (*Amaranthus blitoides*; FACU), dallis grass (*Paspalum dilatatum*; FAC), and curly dock (*Rumex crispus*; FAC). WSP 8, taken in the adjacent uplands of WSP 7, and WSP 9, taken downstream from the tall flat sedge-dominated area, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils indicators (Appendix B, WSP 8 and WSP 9).

Although wetland parameters were not present at WSP 9, RBC staff observed a 15-foot wide OHWM within 20-foot wide banks just west of the Riverside Drive and Cactus Avenue intersection within the channel based on the presence of a break in slope, change in sediment texture, and change in vegetation species (Figure 5; Appendix B, OHWM 1). The ephemeral feature flows east and narrows from a ten- to five-foot wide OHWM within 15- to ten-foot wide banks before reaching the intersection of Cactus Avenue and Heacock Street (Figure 5; Appendix B, OHWM 2). WSP 10, taken within the channel, adjacent to a small cluster of young Fremont's cottonwood (*Populus fremontii*; NL), met the wetland hydrology parameter; however, the sample point did not show evidence of hydrophytic vegetation or hydric soils (Appendix B, WSP 10).

Ponding Area

RBC field staff observed a small area of potential ponding with some minor soil cracking along the eastern boundary of the K4 Warehouse portion of the project site, approximately 400 feet south of the Cactus Avenue Channel, at the end of a driveway. The area appeared to be a road rut/puddle in a disturbed asphalt and otherwise bare ground area. During the time of the jurisdictional delineation site visit, the area was dry, unvegetated, and lacked any indicators of an OHWM. An RBC biologist conducted an additional field survey on October 4, 2018 and noted ponding in the area. As such, protocol fairy shrimp surveys are underway to determine the presence/absence of the federally endangered Riverside fairy shrimp (*Streptocephalus wootton)* given the moderate potential for this species to occur on site. RBC staff did not dig a soil pit to check for hydric soil indicators in case the area may be inhabited by Riverside fairy shrimp.

3.6 JURISDICTIONAL RESOURCES AND ANALYSES

A majority of the Cactus Avenue Channel within the survey area met all three parameters per the Arid West Supplement and would therefore be considered potentially jurisdictional wetlands per the Corps and RWQCB. These wetland areas were disturbed by regular mowing of the channel. As such, the presence or absence of wetland boundaries was largely defined by observation of hydric soil indicators (i.e., presence and prominence/abundance of redox features. These wetland areas occur within the bed and banks of potentially jurisdictional CDFW streambed, as shown on Figure 5.

RBC determined the presence of an OHWM and bed and bank, without wetland, throughout the channel from just west of Riverside Drive to Heacock Street and considers this area potential non-wetland, ephemeral waters of the U.S./State jurisdictional by the Corps and RWQCB and ephemeral streambed jurisdictional by the CDFW. Furthermore, there were some areas with small patches of riparian vegetation (i.e., sandbar willow [*Salix exigua*], Fremont's cottonwood, and Goodding's Black Willow [*Salix gooddingii*]) that occur along the streambed and would be considered potentially jurisdictional CDFW riparian habitat; these riparian areas did not meet the federal wetland parameters. The trapezoidal nature of the channel and associated wide banks account for the increase in CDFW estimated jurisdiction, which extends beyond the delineated Corps/RWQCB/CDFW wetland and non-wetland areas in most areas within the channel.

The small ponding area noted in Section 3.5 was not considered potentially jurisdictional as it lacked indicators of an OHWM and would not meet the three required parameters of federally jurisdictional wetland absent vegetation (Picture 36) even if hydric soils were assumed for the area.

Tables 2 and 3 provide approximate acreages of potential jurisdictional resources, per applicable regulatory agency, delineated within the project survey area and related information. Table 4 provides vegetation community acreages within the project area (Figure 6). Please note, some areas that met federal wetland parameters are mapped as non-native grassland on Figure

6 given the presence of non-native grassland species (many of which had a FAC or higher indicator status).

Table 2. Potential Jurisdictional Resources within the Project Area: Corps and RWQCB

Feature Name	Acreage	Linear Feet	Cowardin Code	Presence of OHWM	Wetland Presence	Dominant Vegetation	Location (lat/long)
Cactus Avenue Channel Wetland	1.39	4790	PEM	No	Yes	Freshwater marsh	33.909944442, -117.2615647
Cactus Avenue Channel Non-Wetland	0.42	2876	R6	Yes	No	Unvegetated; Non-native grassland	33.909960615, -117.2509659
Total	1.81	7666					

Table 3. Potential Jurisdictional Resources within the Project Area: CDFW

Feature Name	Acreage	Linear Feet	Cowardin Code	Presence of OHWM	Wetland Presence	Dominant Vegetation	Location (lat/long)
Cactus Avenue Channel Wetland	1.39	4790	PEM	No	Yes	Freshwater marsh	33.909944442, -117.2615647
Cactus Avenue Channel Non-Wetland	1.60	2876	R6	Yes	No	Unvegetated; Non-native grassland	33.909960615, -117.2509659
Total	2.99	7666					

Table 4. Vegetation Communities within Project Survey Area

Vegetation Community	Project Site (acres)
Golden Bush Scrub/Non-native Grassland Disturbed	22.16
Developed/Disturbed	11.01
Non-native Grassland	8.66
Freshwater Marsh	0.41
Ornamental	0.05
Southern Willow Scrub	0.04

Fremont's Cottonwood	0.02
Total	42.35

3.7 PROPOSED JURISDICTIONAL IMPACTS

The project consists of both the construction of the K4 Warehouse and construction of a box culvert along the Cactus Avenue Channel. The proposed project with both project components would permanently impact approximately 1.81 acres (7666 linear feet) of potential Corps and RWQCB disturbed waters of the U.S./State (wetland and non-wetland), of which, 0.06 acre (131 linear feet) of impacts are associated with the K4 Warehouse site and 1.76 acres (7535 linear feet) are associated with the Cactus Avenue Channel culvert project.

The proposed project with both project components would impact approximately 2.99 acres (7666 linear feet) of potentially jurisdictional CDFW streambed (wetland and non-wetland) and/or associated riparian habitat, of which, 0.08 acre (131 linear feet) are associated with the K4 Warehouse and 2.9 acre (7535 linear feet) are associated with the culvert along the Cactus Avenue Channel.

4 CONCLUSION

The K4 Warehouse and Cactus Channel Improvements Project area supports a drainage ditch, Cactus Avenue Channel, containing disturbed wetland and non-wetland aquatic resources potentially jurisdictional by the Corps, RWQCB, and CDFW as shown in Tables 2 and 3.

Assuming concurrence with the provided jurisdictional delineation and estimated impact calculations, both portions of the proposed project, the K4 Warehouse and Cactus Avenue Channel culvert, would each require Section 404 authorization from the Corps, a Section 401 water quality certification from the RWQCB, and a Streambed Alteration Agreement from CDFW. The K4 Warehouse project alone could meet the required acreage threshold for authorization under the Corps' streamlined Nationwide Permit (NWP) process, while RBC expects the Corps to evaluate the Cactus Avenue Channel culvert project under a Standard Individual Permit (SIP) which will require an analysis of alternatives pursuant to the Section 404(b)(1) Guidelines. Additionally, the Corps, RWQCB, and/or CDFW may require a functional assessment (e.g., California Rapid Assessment Method [CRAM]) to quantitatively estimate the stream/wetland condition for the evaluation of the proposed project.

Please note that the applicable agencies will make final jurisdictional determinations. RBC recommends early coordination with the resource agencies to determine the final jurisdictional boundaries, applicable permitting processes, compensatory mitigation requirements, and other potential permitting issues specific to the proposed project. Agency representatives may request access to the site to field-verify the results of this jurisdictional delineation report with the project applicant, or a designated representative.

The information provided in this report should remain valid for up to five years from the date of the field effort for the jurisdictional delineation unless site conditions change substantially, or a regulatory agency requires an updated report.

APPENDIX A

CHECKLIST: MINIMUM STANDARDS FOR ACCEPTANCE OF AQUATIC RESOURCES DELINEATION REPORTS, LOS ANGELES DISTRICT REGULATORY DIVISION, CORPS

CHECKLIST: MINIMUM STANDARDS FOR ACCEPTANCE OF AQUATIC RESOURCES DELINEATION REPORTS, LOS ANGELES DISTRICT REGULATORY DIVISION, CORPS, MARCH 16, 2017

REPORT SECTION/ PAGE NUMBER	MINIMUM STANDARDS FOR ACCEPTANCE OF AQUATIC RESOURCES DELINEATION REPORTS	ADDITIONAL NOTES
Cover Letter	JD REQUEST AND FORMS: A cover letter indicating whether you are requesting a jurisdictional determination (JD). If you are requesting a JD, you must complete, sign, and return the Request for Corps Jurisdictional Determination (JD) sheet. For preliminary jurisdictional determinations the Preliminary Jurisdictional Determination Form must be signed and submitted.	
Section 1.4	CONTACT INFORMATION: Contact information for the applicant(s), property owner(s), and agent(s).	
N/A	SITE ACCESS: If the property owner or their representatives will not accompany the Corps to the site, a signed statement from the property owner(s) allowing Corps personnel to enter the property and to collect samples during normal business hours. If the property lacks direct access by public roads (in other words, access requires passage through private property not owned by the applicant), the owner or proponent must obtain permission from the adjacent property owner(s) to provide access for Corps personnel.	Property owner and/or representatives will accompany the Corps for a site visit upon request.
Section 1.1	LOCATION: Directions to the survey area, an address (if available) and one or more set of geographic coordinates expressed in decimal degrees.	
Section 2, Paragraphs 2 and 3	DELINEATION MANUAL CONFIRMATION: A statement confirming the delineation has been conducted in accordance with the 1987 Corps of Engineers Wetlands Delineation Manual and applicable regional supplement(s). The regional supplement(s) used must be identified. For OHWM delineations, a statement must be included confirming the use of the OHWM field guide or that it is not applicable.	
Section 3.5	AQUATIC RESOURCE(S) DESCRIPTION: A narrative describing all aquatic resources on-site and an explanation of the mapped boundaries and any complex transition zones. If the site contains resources that only meet one or two of the three wetland criteria or do not exhibit a clear OHWM, describe the rationale for their inclusion or exclusion from the delineation. Also explain if any erosional features, upland swales, ditches and other potential aquatic features were considered but not included in the delineation.	
Figure 5, Tables 2 and 3	AQUATIC RESOURCE MAPPING AND ACREAGE: Map the outside survey boundary, total extent of aquatic and proposed non-aquatic features, type of feature(s) (waters of the United States or wetland), and include the total acreage for each polygon.	
Section 2, Paragraph 2	FIELD WORK DATES: Date(s) field work was completed.	
Tables 2 and 3	AQUATIC RESOURCE TABLE: A table listing all aquatic resources. The table must include the name of each aquatic resource (actual or arbitrary), its Cowardin type, acreage, summary of OHWM/wetland presence, dominant vegetation for each, and location (latitude/longitude in decimal degrees). For linear features, the table must show both acreage and linear feet as well as channel measurements (active channel width).	
Section 1.1 and 2	FIELD CONDITIONS: A description of existing field conditions, including current land use, normal conditions, flood/drought conditions, irrigation practices, past or recent manipulation to the site, and	

	characteristics considered atypical (for criteria see OHWM and wetland supplement guides). Include WETS tables or pre-site visit precipitation data as appropriate: https://www.wcc.nrcs.usda.gov/climate/wets_doc.html.	
Section 3.3	HYDROLOGY: A discussion of the hydrology at the site, including all known surface or subsurface sources, drainage gradients, downstream connections to the nearest traditional navigable waterway or interstate water, and any influence from manmade water sources such as irrigation.	
N/A	REMOTE SENSING: If remote sensing was used in the delineation, provide an explanation of how it was used and include the name, date and source of the tools and data used and copies of the maps/photographs.	
Section 3.4; Figure 4; Appendix C	SOILS: Soil descriptions, soil map(s), soil photos, and a discussion of hydric soils (for wetland delineations only).	
Figure 2	USGS QUADRANGLE: A site location map on a 7.5-minute USGS quadrangle. The map must provide the name of the USGS quadrangle, Section, Township, Range, and the latitude and longitude in decimal degree format.	
N/A	BULK UPLOAD FORM: For sites with 3 or more separate aquatic features a completed copy of the ORM Bulk Upload Aquatic Resources or Consolidated Excel spreadsheet must be submitted.	
Figure 5	FIGURES: Map(s) of all delineated aquatic resources in accordance with the Final Map and Drawing Standards for the South Pacific Division Regulatory Program, available at: http://www.spd.usace.army.mil/Missions/Regulatory/Public-Notices-and-References/Article/651327/updated-map-and-drawing-standards/	
Figure 7 and Appendix C	SITE PHOTOGRAPHS: Ground photographs showing representative aquatic resource sites (or lack of), as well as an accompanying map of photo-points and table of photographic information (see Final Map and Drawing Standards for the South Pacific Division Regulatory Program item no. 8 a-c).	
Appendix B	DATA FORMS: Completed data forms including all essential information to make a jurisdictional determination [e.g. 2006 Wetland Determination Data Form -- Arid West Supplement; 2010 Arid West Ephemeral and Intermittent Streams OHWM Datasheet].	
Section 2	METHODS: A description of the methods used to survey the aquatic resource boundaries. If GPS data is used, the level of accuracy must be included. Ideally, the GPS equipment should have the capability of sub-meter (<=1 meter) level horizontal accuracy.	
Appendix E	GIS DATA: Digital data for the site, aquatic resource boundaries, and data point locations must be provided in a geographic information system (GIS) format, preferably either ESRI shapefiles or Geodatabase format, but GoogleEarth KMZ or KML files may be acceptable non-complex projects. Each GIS data file must be accompanied by a metadata file containing the appropriate geographic coordinate system, projection, datum, and labeling description. If GIS data is unavailable or otherwise cannot be produced and the Corps determines a site visit is necessary, the aquatic resource boundaries should be physically marked with numbered flags or stakes to facilitate verification by the Corps.	

APPENDIX B

ARID WEST WETLAND DELINEATION AND EPHEMERAL AND INTERMITTENT ORDINARY HIGH WATER MARK (OHWM) DATASHEETS

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: K4 Warehouse & Cactus Channel Improv. Pro City/County: Moreno Valley/Riverside Sampling Date: 07/17/18

Applicant/Owner: March Joint Powers Authority State: CA Sampling Point: WSP 1

Investigator(s): Shanti Santulli, Lee Ripma, Emily Trevino Section, Township, Range: S14, T03S, R04W

Landform (hillslope, terrace, etc.): In channel Local relief (concave, convex, none): Concave Slope (%): 0%

Subregion (LRR): LLRC - Mediterranean California Lat: 33.910000236 Long: -117.269678652 Datum: WGS84

Soil Map Unit Name: Monserate sandy loam, 0 to 5 percent slopes NWI classification: Riverine

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✔ No _____ (If no, explain in Remarks.)

Are Vegetation ✔, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✔ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✔ No _____	**Is the Sampled Area within a Wetland?** Yes ✔ No _____
Hydric Soil Present?	Yes ✔ No _____	
Wetland Hydrology Present?	Yes ✔ No _____	

Remarks:

Taken with Cactus Avenue Channel. Area is adjacent to culvert outlet at Cactus Avenue; contains standing water; vegetation is considered significantly disturbed as area was recently mowed.

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: _____)	Absolute % Cover	Dominant Species?	Indicator Status

Hydrophytic Vegetation Indicators:

✔ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ✔ No _____

Remarks:

Vegetation recently mowed, identified vegetation where possible; Species of Potamogeton unidentifiable, all Potamogeton sp. within AW Indicator Plant List listed as OBL

SOIL

Sampling Point: WSP 1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
n/a								

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ✔ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ✔ No ___

Remarks:

Hydric soils assumed within standing water and with dominance of OBL vegetation (per methodology in 1987 Corps Wetland Delineation Manual, p. 58).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ✔ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ✔ Drift Deposits (B3) (**Riverine**)
- ✔ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✔ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ✔ No ___ Depth (inches): At surface

Water Table Present? Yes ___ No ___ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ___ No ___ Depth (inches): _____

Wetland Hydrology Present? Yes ✔ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Ponded area by culvert which contained standing water. Presence of water table or saturation from water table unknown given presence of standing water (i.e., no soil pit dug).

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: K4 Warehouse & Cactus Channel Improv. Pr City/County: Moreno Valley/Riverside Sampling Date: 07/17/18

Applicant/Owner: March Joint Powers Authority State: CA Sampling Point: WSP 2

Investigator(s): Shanti Santulli, Lee Ripma, Emily Trevino Section, Township, Range: S14, T03S, R04W

Landform (hillslope, terrace, etc.): Depression in channel Local relief (concave, convex, none): Concave Slope (%): 0-1%

Subregion (LRR): LLRC - Mediterranean California Lat: 33.909934544 Long: -117.269641985 Datum: WGS84

Soil Map Unit Name: Monserate sandy loam, 0 to 5 percent slopes NWI classification: Riverine

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✔ No _____ (If no, explain in Remarks.)

Are Vegetation ✔, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✔ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✔	**Is the Sampled Area within a Wetland?** Yes _____ No ✔
Hydric Soil Present?	Yes _____	No ✔	
Wetland Hydrology Present?	Yes _____	No ✔	

Remarks:

Upland pit next to WSP 1. Vegetation within the area is considered significantly disturbed as it appears to have be recently mowed.

VEGETATION – Use scientific names of plants.

- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✔ Depth (inches): _____

Water Table Present? Yes _____ No ✔ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✔ Depth (inches): _____

Wetland Hydrology Present? Yes _____ No ✔

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

No hydrology indicators present. Upland. FAC-neutral test not met.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: K4 Warehouse & Cactus Channel Improv. Pr City/County: Moreno Valley/Riverside Sampling Date: 07/17/18

Applicant/Owner: March Joint Powers Authority State: CA Sampling Point: WSP 3

Investigator(s): Shanti Santulli, Lee Ripma, Emily Trevino Section, Township, Range: S15, S22, T03S, R04W

Landform (hillslope, terrace, etc.): Depression in channel Local relief (concave, convex, none): Concave Slope (%): 0-1%

Subregion (LRR): LLRC - Mediterranean California Lat: 33.909923962 Long: -117.266991980 Datum: WGS84

Soil Map Unit Name: Monserate sandy loam, 0 to 5 percent slopes NWI classification: Riverine

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✔ No _____ (If no, explain in Remarks.)

Are Vegetation ✔, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✔ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✔	No _____	**Is the Sampled Area within a Wetland?** Yes ✔ No _____
Hydric Soil Present?	Yes ✔	No _____	
Wetland Hydrology Present?	Yes ✔	No _____	

Remarks:

Taken with Cactus Avenue Channel. Vegetation is considered significantly disturbed as the area appears to be recently mowed; downstream is a large Typha latifolia area with standing water.

VEGETATION – Use scientific names of plants.

Project: K4 Warehouse & Cactus Channel Improv. Project
Project Number: --
Stream: OHWM 1
Investigator(s): Shanti Santulli and Emily Trevino

Date: 07/17/2018
Town: Moreno Valley
Photo begin file#:

Time: 0930
State: California
Photo end file#:

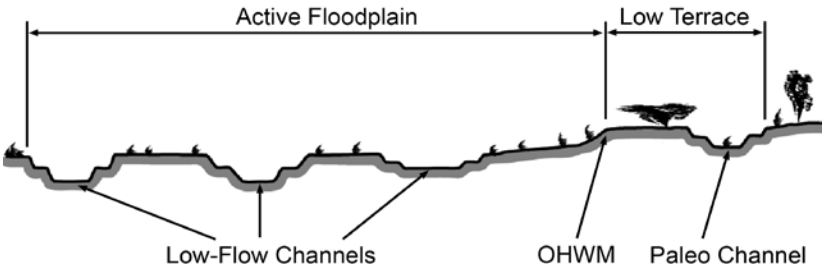
Y ☑ / N ☐ Do normal circumstances exist on the site?

Y ☐ / N ☑ Is the site significantly disturbed?

Location Details:
See Figure 5 and Appendix C (photo log)

Projection:
Datum: WGS 1894
Coordinates: See below

Potential anthropogenic influences on the channel system:
Channel runs along Cactus Avenue and is a artificially/manipulated channel, culverted at each intersection, contains trash/debris, and large portions of the channel appear to have been recently mowed



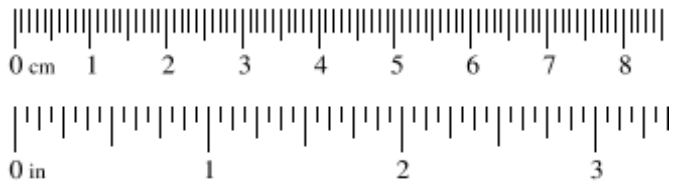
Brief site description:
Channel running along Cactus Avenue that is fed by multiple culverts, contains large wetland areas and flows through culverted intersections

Checklist of resources (if available):

- ☑ Aerial photography
  Dates:
- ☑ Topographic maps
- ☐ Geologic maps
- ☑ Vegetation maps
- ☑ Soils maps
- ☐ Rainfall/precipitation maps
- ☑ Existing delineation(s) for site
- ☑ Global positioning system (GPS)
- ☐ Other studies

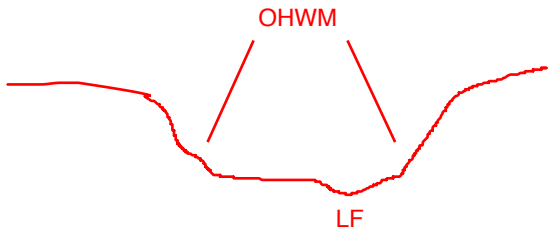
- ☐ Stream gage data
  Gage number:
  Period of record:
- ☐ History of recent effective discharges
- ☐ Results of flood frequency analysis
- ☐ Most recent shift-adjusted rating
- ☐ Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

Hydrogeomorphic Floodplain Units



Procedure for identifying and characterizing the floodplain units to assist in identifying the OHWM:

1. Walk the channel and floodplain within the study area to get an impression of the geomorphology and vegetation present at the site.
2. Select a representative cross section across the channel. Draw the cross section and label the floodplain units.
3. Determine a point on the cross section that is characteristic of one of the hydrogeomorphic floodplain units.
   a) Record the floodplain unit and GPS position.
   b) Describe the sediment texture (using the Wentworth class size) and the vegetation characteristics of the floodplain unit.
   c) Identify any indicators present at the location.
4. Repeat for other points in different hydrogeomorphic floodplain units across the cross section.
5. Identify the OHWM and record the indicators. Record the OHWM position via:
   - ☑ Mapping on aerial photograph
   - ☐ Digitized on computer
   - ☑ GPS
   - ☐ Other:



Wentworth Size Classes

Inches (in)	Millimeters (mm)	Wentworth size class	
10.08	256	Boulder

Cross section drawing:

OHWM

GPS point: 33.909923908, -117.25278283

Indicators:

- ☑ Change in average sediment texture
- ☑ Change in vegetation species
- ☑ Change in vegetation cover
- ☑ Break in bank slope
- ☐ Other: _____
- ☐ Other: _____

Comments:
Non-wetland segment within earthen channel; vegetation composed primarily of Anthemis cotula

Floodplain unit:

☑ Low-Flow Channel ☐ Active Floodplain ☐ Low Terrace

GPS point: Within OHWM

Characteristics of the floodplain unit:

Average sediment texture: Coarse silt

Total veg cover: 20 % Tree: _____% Shrub: _____% Herb: 20 %

Community successional stage:

- ☐ NA
- ☐ Early (herbaceous & seedlings)
- ☑ Mid (herbaceous, shrubs, saplings)
- ☐ Late (herbaceous, shrubs, mature trees)

Indicators:

- ☐ Mudcracks
- ☐ Ripples
- ☑ Drift and/or debris
- ☐ Presence of bed and bank
- ☐ Benches
- ☐ Soil development
- ☐ Surface relief
- ☐ Other: _____
- ☐ Other: _____
- ☐ Other: _____

Comments:
2 ft wide LF channel with some Cyperus eragrostis individuals and sediment size slightly larger than active channel; area is very dry (typical July conditions)

Project ID: K4 Warehouse & **Cross section ID:** OHWM 1 **Date:** 07/17/2018 **Time:** 0930

Floodplain unit: ☐ Low-Flow Channel ☑ Active Floodplain ☐ Low Terrace

GPS point: 3 ft. Above south bank

Characteristics of the floodplain unit:

Average sediment texture: fine silt

Total veg cover: 40 % Tree: _____% Shrub: _____% Herb: 40 %

Community successional stage:

- ☐ NA
- ☐ Early (herbaceous & seedlings)
- ☑ Mid (herbaceous, shrubs, saplings)
- ☐ Late (herbaceous, shrubs, mature trees)

Indicators:

- ☐ Mudcracks
- ☐ Ripples
- ☑ Drift and/or debris
- ☑ Presence of bed and bank
- ☐ Benches
- ☐ Soil development
- ☐ Surface relief
- ☐ Other: _____
- ☐ Other: _____
- ☐ Other: _____

Comments:

Cyperus eragrostis sprinkled throughout LF and Anthemis cotula throughout the active floodplain

Floodplain unit: ☐ Low-Flow Channel ☐ Active Floodplain ☑ Low Terrace

GPS point: Just above AF/OHWM

Characteristics of the floodplain unit:

Average sediment texture: very fine silt

Total veg cover: 80 % Tree: _____% Shrub: _____% Herb: 80 %

Community successional stage:

- ☐ NA
- ☐ Early (herbaceous & seedlings)
- ☑ Mid (herbaceous, shrubs, saplings)
- ☐ Late (herbaceous, shrubs, mature trees)

Indicators:

- ☐ Mudcracks
- ☐ Ripples
- ☐ Drift and/or debris
- ☐ Presence of bed and bank
- ☐ Benches
- ☑ Soil development
- ☑ Surface relief
- ☐ Other: _____
- ☐ Other: _____
- ☐ Other: _____

Comments:

No low terrace, goes straight to upland; trapezoidal channel

APPENDIX C

SITE PHOTOGRAPHS

Appendix C – Site Photographs*

K4 Warehouse & Cactus Channel Imprveoments Project Jurisdictional Delineation

July 18, 2018

Photo 1. View of Wetland Sample Point (WSP) 1, area contains standing water and appears to have been recently mowed. Photo taken facing northwest.

Photo 2. Upstream view of WSP 2, near WSP 1. WSP 2 did not show any indicators of wetland hydrology, hydrophytic vegetation or hydric soils. Photo taken facing north.

*See Corresponding Figure 7 for Photo Point Locations

Photo 3. Downstream view of area where WSP 1 and WSP 2 data was collected; WSP 2 in foreground. Area appears to have been recently mowed; Drainage patterns observed. Photo taken facing southeast.

Photo 4. Downstream view of area between the WSP 1 and 2 near Elsworth Street toward area dominated by *Typha latifolia-dominated* area at Veterans Way. Photo taken facing east.

Photo 5. WSP 3, taken within the mowed area adjacent to the *Typha latifolia*-dominated area by Veterans Way. The sample point met the hydrophytic vegetation, wetland hydrology, and hydric soil indicators.

Photo 6. Downstream view at WSP 3 showing extent of mowed area and taller hydrophytic vegetation (*Typha latifolia*) further downstream. Photo taken facing east.

Photo 7. View of WSP 3 soils showing presence of distinct and prominent redox features.

Photo 8. View of WSP 4, taken in the uplands, the sample point did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils indicators.

Photo 9. Upstream view of area where WSP 3 and WSP 4 was taken; WSP 4 visible in foreground and determined extent/width of the wetland area. Photo taken facing west.

Photo 10. Upstream view of wetland area. The area appears to have been recently mowed and the abrupt end of *Typha latifolia* dictates where mowing stopped. Photo taken facing west.

Photo 11. Downstream view of wetland area where standing water was visible. Photo taken facing east towards the Cactus Avenue and Veterans Way culvert outlet.

Photo 12. Upstream view of large *Typha latifolia* dominated area. Photo taken near the crossing of Cactus Avenue and Veterans Way, where a large culvert feeds the area. Photo taken facing west.

Photo 13. Downstream view of large *Typha latifolia* dominated area.
Photo taken near the crossing of Cactus Avenue and Veterans Way, facing east.

Photo 14. Upstream view of wetland area where standing water was observed. These conditions continue upstream, eventually growing into a large *Typha latifolia* area. Photo taken facing west.

Photo 15. Upstream view of WSP 5, the same point met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters. Photo taken facing west.

Photo 16. View of WSP 5 soils, abundant redox features present.

Photo 17. View of WSP 6, taken in the uplands; the sample point did not meet the hydrophytic vegetation, wetland hydrology, or hydric soils parameters.

Photo 18. Downstream view of area where WSP 5 and WSP 6 was taken; WSP 6 in foreground and determined the extent of the wetland area. Photo taken facing east.

Photo 19. Downstream view from a culvert outlet at Cactus Avenue and Frederick Street. Photo taken facing east.

Photo 20. View of culvert outlet at Cactus Avenue and Frederick Street. Vegetation within the area include *Rumex crispus* and *Salix exigua*. Photo taken facing north.

Photo 21. Upstream view of wetland area at the culvert outlet at Cactus Avenue and Frederick Street. Photo taken facing west.

Photo 22. Upstream view of continued wetland area. While vegetation was disturbed in this section of the channel, wetland hydrology and hydric soils remained present. Photo taken facing east.

Photo 23. View of area with visible soil cracks that displayed similar vegetation (albeit disturbed) and soil redox features as WSP 7, downstream. Photo taken facing east, downstream.

Photo 24. View of culvert that feeds into wetland area where WSP 7 and WSP 8 was taken. Photo taken facing north.

Photo 25. View of WSP 7. The sample point met the hydrophytic vegetation, wetland hydrology, and hydric soil parameters.

Photo 26. WSP 8, taken in the uplands adjacent to WSP 7, did not meet the hydrophytic vegetation, wetland hydrology, or hydric soil parameters. Photo taken facing north.

Photo 27. Downstream view at WSP 7 and WSP 8. Large amounts of *Cyperus eragrostic* located within the wetland area. Photo taken facing south.

Photo 28. Downstream view of the area where WSP 9 and Ordinary High Water Mark (OHWM) Data Point 1 was collected. WSP 9 met the hydrophytic vegetation parameter but not the wetland hydrology or hydric soils parameters. Photo taken east. OHWM determined to be present.

Photo 29. Upstream view of OHWM 1. OHWM 1 is defined by a break in slope, change in average sediment texture and vegetation species. Photo taken facing west.

Photo 30. Upstream view of ephemeral drainage from a road overpass. Photo taken facing east.

Photo 31. Downstream view of ephemeral drainage at a road overpass. Photo taken facing east.

Photo 32. Overview of ephemeral drainage, feature is visible and consistent along Cactus Avenue from Riverside Drive to Heacock Street. Photo taken facing east.

Photo 33. WSP 10. The sample point displayed wetland hydrology; however, hydrophytic vegetation and hydric soils were not observed.

Photo 34. Upstream view of WSP 10 and OHWM Data Point 2. Photo taken facing west.

Photo 35. OHWM Data Point 2 downstream. OHWM Data Point 2 is defined by a break in slope, change in sediment texture, vegetation species, and vegetation cover. Photo taken facing east.

Photo 36. View of potential ponding area observed by RBC field staff. Protocol fairy shrimp surveys are currently being undertaken to determine species presence/absence although the area appears to be a puddle in a disturbed asphalt/unvegetated area. Photo taken on October 4, 2018.

APPENDIX D

JD REQUEST FORMS

PRELIMINARY JURISDICTIONAL DETERMINATION FORM

This preliminary JD finds that there *"may be"* waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

District Office: Los Angeles District | File/ORM #: | PJD Date:

State: CA | City/County: Moreno Valley/Riverside

Nearest Waterbody: San Jacinto River

Location: TRS, LatLong or UTM: 33.909420, -117.263420

Name/ Address of Person Requesting PJD:
Jeff Gordon
Meridian Park K4, LLC
567 San Nicholas Drive, Suite 270
Newport Beach, CA 92660
San Diego, CA 92110
JGordon@waypointpg.com
949-200-6733

Identify (Estimate) Amount of Waters in the Review Area:

Non-Wetland Waters: 2876 linear ft | 5-15 width | 0.42 acres | Stream Flow: Ephemeral

Wetlands: 1.40 acre(s) | Cowardin Class: Palustrine, emergent

Name of Any Water Bodies on the Site Identified as Section 10 Waters: Tidal: N/A | Non-Tidal: N/A

☐ Office (Desk) Determination
☐ Field Determination: Date of Field Trip:

SUPPORTING DATA: Data reviewed for preliminary JD (check all that apply - checked items should be included in case file and, where checked and requested, appropriately reference sources below):

- ☑ Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant: 2018 JD Report, prepared by Rocks Biological Consult
- ☑ Data sheets prepared/submitted by or on behalf of the applicant/consultant.
  - ☐ Office concurs with data sheets/delineation report.
  - ☐ Office does not concur with data sheets/delineation report.
- ☐ Data sheets prepared by the Corps
- ☐ Corps navigable waters' study:
- ☑ U.S. Geological Survey Hydrologic Atlas:
  - ☑ USGS NHD data.
  - ☑ USGS 8 and 12 digit HUC maps.
- ☑ U.S. Geological Survey map(s). Cite quad name: USGS 7.5-minute Riverside East and Sunnymead
- ☑ USDA Natural Resources Conservation Service Soil Survey. Citation: USDA NRCS 2005
- ☑ National wetlands inventory map(s). Cite name: USFWS and NWI 2017
- ☐ State/Local wetland inventory map(s):
- ☐ FEMA/FIRM maps:
- ☐ 100-year Floodplain Elevation is:
- ☑ Photographs: ☑ Aerial (Name & Date): See attached figures, SanGIS 2017
  ☑ Other (Name & Date): See Appendix C, Site Photographs
- ☐ Previous determination(s). File no. and date of response letter:
- ☑ Other information (please specify): 2018 JD Report, prepared by Rocks Biological Consult

IMPORTANT NOTE: The information recorded on this form has not necessarily been verified by the Corps and should not be relied upon for later jurisdictional determinations.

Signature and Date of Regulatory Project Manager (REQUIRED)

Signature and Date of Person Requesting Preliminary JD (REQUIRED, unless obtaining the signature is impracticable)

EXPLANATION OF PRELIMINARY AND APPROVED JURISDICTIONAL DETERMINATIONS:

1. The Corps of Engineers believes that there may be jurisdictional waters of the United States on the subject site, and the permit applicant or other affected party who requested this preliminary JD is hereby advised of his or her option to request and obtain an approved jurisdictional determination (JD) for that site. Nevertheless, the permit applicant or other person who requested this preliminary JD has declined to exercise the option to obtain an approved JD in this instance and at this time.

2. In any circumstance where a permit applicant obtains an individual permit, or a Nationwide General Permit (NWP) or other general permit verification requiring "preconstruction notification" (PCN), or requests verification for a non-reporting NWP or other general permit, and the permit applicant has not requested an approved JD for the activity, the permit applicant is hereby made aware of the following: (1) the permit applicant has elected to seek a permit authorization based on a preliminary JD, which does not make an official determination of jurisdictional waters; (2) that the applicant has the option to request an approved JD before accepting the terms and conditions of the permit authorization, and that basing a permit authorization on an approved JD could possibly result in less compensatory mitigation being required or different special conditions; (3) that the applicant has the right to request an individual permit rather than accepting the terms and conditions of the NWP or other general permit authorization; (4) that the applicant can accept a permit authorization and thereby agree to comply with all the terms and conditions of that permit, including whatever mitigation requirements the Corps has determined to be necessary; (5) that undertaking any activity in reliance upon the subject permit authorization without requesting an approved JD constitutes the applicant's acceptance of the use of the preliminary JD, but that either form of JD will be processed as soon as is practicable; (6) accepting a permit authorization (e.g., signing a proffered individual permit) or undertaking any activity in reliance on any form of Corps permit authorization based on a preliminary JD constitutes agreement that all wetlands and other water bodies on the site affected in any way by that activity are jurisdictional waters of the United States, and precludes any challenge to such jurisdiction in any administrative or judicial compliance or enforcement action, or in any administrative appeal or in any Federal court; and (7) whether the applicant elects to use either an approved JD or a preliminary JD, that JD will be processed as soon as is practicable. Further, an approved JD, a proffered individual permit (and all terms and conditions contained therein), or individual permit denial can be administratively appealed pursuant to 33 C.F.R. Part 331, and that in any administrative appeal, jurisdictional issues can be raised (see 33 C.F.R. 331.5(a)(2)). If, during that administrative appeal, it becomes necessary to make an official determination whether CWA jurisdiction exists over a site, or to provide an official delineation of jurisdictional waters on the site, the Corps will provide an approved JD to accomplish that result, as soon as is practicable.

PRELIMINARY JURISDICTIONAL DETERMINATION FORM

This preliminary JD finds that there *"may be"* waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

Appendix A - Sites

District Office	Los Angeles District	File/ORM #		PJD Date:	
State	CA	City/County	Moreno Valley/Riverside	Person Requestinq PJD	Jeff Gordon

Site Number	Latitude	Longitude	Cowardin Class	Est. Amount of Aquatic Resource in Review Area	Class of Aquatic Resource
CACW	33.909944442	-117.26156467	Palustrine, emergent	1.40	Non-Section 10 wetland
CACNW	33.909960615	-117.25096585	Riverine	0.42	Non-Section 10 non-wetla

Notes:

The review area for this requested PJD includes the project survey area shown on the provided figures with the K4 Warehouse & Cactus Channel Improvements Project Jurisdictional Delineation Report (Rocks Biological Consulting 2018), incorporated here by reference. A majority of the Cactus Avenue Channel (CAC) displayed evidence of federally jurisdictional wetland waters of the U.S.; while the remaining portions displayed evidence of an OHWM as discussed in the provided Jurisdictional Delineation Report.

The delineated feature on site drains from west to east along Cactus Avenue until the intersection of Cactus Avenue and Heacock Street, where flows are diverted south to drain into the Perris Valley storm drain system. Flows continue into the San Jacinto River and ultimately into Lake Elsinore.

Appendix 1 - REQUEST FOR CORPS JURISDICTIONAL DETERMINATION (JD)

To: District Name Here

- I am requesting a JD on property located at: Cactus Ave. b/w Elsworth St. to Heacock St.
  (Street Address)
  City/Township/Parish: Moreno Valley County: Riverside State: CA
  Acreage of Parcel/Review Area for JD: 42.36 acres
  Section: S15, S22 Township: T03S Range: R04W
  Latitude (decimal degrees): 33.909420 Longitude (decimal degrees): -117.263420
  (For linear projects, please include the center point of the proposed alignment.)
- Please attach a survey/plat map and vicinity map identifying location and review area for the JD.
- ✔ I currently own this property. ___ I plan to purchase this property.
  ___ I am an agent/consultant acting on behalf of the requestor.
  ___ Other (please explain): _____.
- Reason for request: (check as many as applicable)
  ___ I intend to construct/develop a project or perform activities on this parcel which would be designed to avoid all aquatic resources.
  ___ I intend to construct/develop a project or perform activities on this parcel which would be designed to avoid all jurisdictional aquatic resources under Corps authority.
  ___ I intend to construct/develop a project or perform activities on this parcel which may require authorization from the Corps, and the JD would be used to avoid and minimize impacts to jurisdictional aquatic resources and as an initial step in a future permitting process.
  ✔ I intend to construct/develop a project or perform activities on this parcel which may require authorization from the Corps; this request is accompanied by my permit application and the JD is to be used in the permitting process.
  ___ I intend to construct/develop a project or perform activities in a navigable water of the U.S. which is included on the district Section 10 list and/or is subject to the ebb and flow of the tide.
  ___ A Corps JD is required in order to obtain my local/state authorization.
  ___ I intend to contest jurisdiction over a particular aquatic resource and request the Corps confirm that jurisdiction does/does not exist over the aquatic resource on the parcel.
  ___ I believe that the site may be comprised entirely of dry land.
  ___ Other: _____
- Type of determination being requested:
  ___ I am requesting an approved JD.
  ✔ I am requesting a preliminary JD.
  ___ I am requesting a "no permit required" letter as I believe my proposed activity is not regulated.
  ___ I am unclear as to which JD I would like to request and require additional information to inform my decision.

By signing below, you are indicating that you have the authority, or are acting as the duly authorized agent of a person or entity with such authority, to and do hereby grant Corps personnel right of entry to legally access the site if needed to perform the JD. Your signature shall be an affirmation that you possess the requisite property rights to request a JD on the subject property.

*Signature: _____ Date: _____

- Typed or printed name: Jeff Gordon

Company name: Meridian Park K4, LLC

Address: 567 San Nicholas Drive, Suite 270

Upland, CA 91785
(909) 882-3612

USGS Quadrangle: Riverside East, Calif., 7.5' quadrangle (Sections 13 and 14, T3S R4W, San Bernardino Baseline and Meridian)

Project Size: Approximately 35 acres

Keywords: Phase I historical/archaeological resources survey; Assessor's Parcel Numbers 297-150-006, 297-150-007, 297-150-038, 297-160-005, and 297-200-004; Site 33-028200 (CA-RIV-12721): WWII-era earthen drainage channel; no "historic property" or "historical resource" in the APE

EXECUTIVE SUMMARY

Between May and August 2018, at the request of Lewis Retail Centers, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) for the proposed K-4 Parcel Project on the northern edge of March Air Reserve Base (ARB), near the City of Moreno Valley, Riverside County, California. The APE consists of approximately 35 acres of undeveloped land in Assessor's Parcel Numbers 297-150-006, 297-150-007, 297-150-038, 297-160-005, and 297-200-004, located on the south side of Cactus Avenue at the termini of Veterans Way and Frederick Street, in the southwest quarter of Section 13 and the southeast quarter of Section 14, T3S R4W, San Bernardino Baseline and Meridian.

The proposed undertaking entails primarily the construction of an approximately 718,000-square-foot, 46-foot-tall industrial warehouse with 289 automobile parking stalls and 317 truck trailer parking stalls. All construction staging and storage will occur within the project footprint, and no additional APE was delineated for visual, atmospheric, or other indirect effects since no historic-period buildings are known to be located adjacent to the project boundary. The maximum depth of excavation required for the undertaking, or the vertical extent of the APE below surface, will not exceed 10 feet.

The study is a part of the environmental review process for the undertaking, as required by the March Joint Powers Authority (JPA) pursuant to the California Environmental Quality Act (CEQA). As the undertaking lies within the boundaries of March ARB, future oversight by relevant federal agencies also necessitates compliance with Section 106 of the National Historic Preservation Act. The purpose of the study is to provide March JPA and the pertinent federal agencies with the necessary information and analysis to determine whether the undertaking would have an effect on any "historical resources," as defined by Title 14 CCR §15064.5(a)(1)-(3), or "historic properties," as defined by 36 CFR 800.16(l), that may exist in the APE. In order to identify such resources, CRM TECH conducted a historical/archaeological resources records search, pursued historical and geoarchaeological background research, contacted Native American representatives, and carried out an intensive-level field survey of the APE.

As a result of these research procedures, a late-historic-period earthen drainage channel, recently recorded into the California Historical Resources Inventory as Site 33-028200 (CA-RIV-12721), was found to be located partially within the APE. The channel was built in the 1941-1953 era, most likely during the expansion of March Army Air Field (now March ARB) in the early 1940s, but does not appear to meet the definition of a "historic property" or a "historical resource." No other potential "historic properties" or "historical resources" of either prehistoric or historical origin were encountered during this study, and the subsurface sediments in the vertical APE appear to be low in sensitivity for potentially significant archaeological remains in buried deposits.

Based on these findings, and pursuant to 36 CFR 800.4(d)(1) and Calif. PRC §21084.1, CRM TECH recommends to March JPA and the appropriate federal agencies a conclusion that *no "historic properties" or "historical resources" will be affected by the proposed undertaking*. No further cultural resources investigation is recommended for the undertaking unless project plans undergo such changes as to include areas not covered by this study. However, if buried cultural materials are encountered during earth-moving operations associated with the undertaking, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the find.

INTRODUCTION

Between May and August 2018, at the request of Lewis Retail Centers, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) for the proposed K-4 Parcel Project on the northern edge of March Air Reserve Base (ARB), near the City of Moreno Valley, Riverside County, California (Figure 1). The APE consists of approximately 35 acres of undeveloped land in Assessor's Parcel Numbers 297-150-006, 297-150-007, 297-150-038, 297-160-005, and 297-200-004, located on the south side of Cactus Avenue at the termini of Veterans Way and Frederick Street, in the southwest quarter of Section 13 and the southeast quarter of Section 14, T3S R4W, San Bernardino Baseline and Meridian (Figures 2, 3).

The proposed undertaking entails primarily the construction of an approximately 718,000-square-foot, 46-foot-tall industrial warehouse with 289 automobile parking stalls and 317 truck trailer parking stalls. All construction staging and storage will occur within the project footprint, and no additional APE was delineated for visual, atmospheric, or other indirect effects since no historic-period buildings are known to be located adjacent to the project boundary. The maximum depth of excavation required for the undertaking, or the vertical extent of the APE below surface, will not exceed 10 feet.

The study is a part of the environmental review process for the undertaking, as required by the March Joint Powers Authority (JPA) pursuant to the California Environmental Quality Act (CEQA). As the undertaking lies within the boundaries of March ARB, future oversight by relevant federal agencies also necessitates compliance with Section 106 of the National Historic Preservation Act

(NHPA). The purpose of the study is to provide March JPA and the pertinent federal agencies with the necessary information and analysis to determine whether the undertaking would have an effect on any "historical resources," as defined by Title 14 CCR §15064.5(a)(1)-(3), or "historic properties," as defined by 36 CFR 800.16(l), that may exist in the APE.

In order to identify such resources, CRM TECH conducted a historical/archaeological resources records search, pursued historical and geoarchaeological background research, contacted Native American representatives, and carried out an intensive-level field survey of the APE. The following report is a complete account of the methods, results, and final conclusion of the study. Personnel who participated in the study are named in the appropriate sections below, and their qualifications are provided in Appendix 1.

SETTING

CURRENT NATURAL SETTING

The City of Moreno Valley occupies a lowland area in the northern portion of the Peninsular Ranges geomorphic province, surrounded by the Santa Ana Mountains on the southwest, the San Jacinto Mountains on the southeast, and the convergence of the San Gabriel and San Bernardino Mountain Ranges on the north. The natural landscape in the Peninsular Ranges province features a host of inland valleys divided by groups of rolling hills and rocky knolls. The mild Mediterranean climate of the region is typical of inland southern California lowlands, characterized by hot and dry summers and mild and wet winters. The average annual rainfall in the region is approximately 10 inches, the majority of which typically falls seasonally between December and March.

The APE consists of five parcels of vacant land along the northern perimeter of March ARB, between the Cactus right-of-way on the north and various existing base facilities on the south (Figure 3). It is generally rectangular in shape except for the exclusion of an existing substation near the eastern end. A man-made earthen drainage channel runs along the northern edge of the APE, and several power transmission lines and stockpiles of imported soil are found in the eastern portion of the APE, near the substation (Figures 3, 4).

Figure 4. Typical landscapes in the APE. *Left*: overview to the west; *right*: soil stockpile, view to the southwest. (Photographs taken on June 1, 2018)

The terrain in the APE is relatively level except for the drainage channel, with a slight incline to the west, and the elevations range approximately between 1,535 feet and 1,550 feet above mean sea level, including the depth of the channel. The ground surface has been disturbed extensively in the past and appears to have been cleared of much of the vegetation recently. Several manholes in the APE further indicate the presence of underground utility lines. Surface soil on the property consists of a hardpacked brown silty-clay loam, and vegetation growth, concentrated mainly in the western portion of APE, features solely typical small grasses and shrubs (Figure 4).

CULTURAL SETTING

Prehistoric Context

The earliest evidence of human occupation in western Riverside County was discovered below the surface of an alluvial fan in the northern portion of the Lakeview Mountains, some 12 miles southeast of the APE, with radiocarbon dates clustering around 9,500 B.P. (Horne and McDougall 2008). Another site found near the shoreline of Lake Elsinore, close to the confluence of Temescal Wash and the San Jacinto River, yielded radiocarbon dates between 8,000 and 9,000 B.P. (Grenda 1997). Additional sites with isolated Archaic dart points, bifaces, and other associated lithic artifacts from the same age range have been found in the nearby Cajon Pass area of San Bernardino County, roughly 25 miles to the northwest, typically atop knolls with good viewsheds (Basgall and True 1985; Goodman and McDonald 2001; Goodman 2002; Milburn et al. 2008).

The cultural prehistory of southern California has been summarized into numerous chronologies, including those developed by Chartkoff and Chartkoff (1984), Warren (1984), and others. Specifically, the prehistory of Riverside County has been addressed by O'Connell et al. (1974), McDonald et al. (1987), Keller and McCarthy (1989), Grenda (1993), Goldberg (2001), and Horne and McDougall (2008). Although the beginning and ending dates of different cultural horizons vary regionally, the general framework of the prehistory of western Riverside County can be broken into three primary periods:

- Paleoindian Period (ca. 12,500-9,000 B.P.): Native peoples of this period created fluted spearhead bases designed to be hafted to wooden shafts. The distinctive method of thinning bifaces and spearhead preforms by removing long, linear flakes leaves diagnostic Paleoindian markers at tool-making sites. Other artifacts associated with the Paleoindian toolkit include choppers, cutting tools, retouched flakes, and perforators. Sites from this period are very sparse across the landscape and most are deeply buried.
- Archaic Period (ca. 9,000-1,500 B.P.): Archaic sites are characterized by abundant lithic scatters of considerable size with many biface thinning flakes, bifacial preforms broken during manufacture, and well-made groundstone bowls and basin metates. As a consequence of making dart points, many biface thinning waste flakes were generated at individual production stations, which is a diagnostic feature of Archaic sites.
- Late Prehistoric Period (ca. 1,500 B.P.-contact): Sites from this period typically contain small lithic scatters from the manufacture of small arrow points, expedient groundstone tools such as tabular metates and unshaped manos, wooden mortars with stone pestles, acorn or mesquite bean granaries, ceramic vessels, shell beads suggestive of extensive trading networks, and steatite implements such as pipes and arrow shaft straighteners.

Ethnohistoric Context

According to current ethnohistorical scholarship, the traditional territories of several Native American groups, including the Luiseño, the Serrano, the Gabrielino, and the Cahuilla, overlapped one another in the present-day Riverside-San Bernardino region during the Late Prehistoric Period, but the Moreno Valley area is generally recognized as a part of the traditional homeland of the Luiseño, a Takic-speaking people whose territory extended from present-day Riverside to Escondido and Oceanside. The name of the group derived from Mission San Luis Rey, which held jurisdiction over most of the traditional Luiseño territory during the late 18th and early 19th centuries. In modern anthropological literature, the leading sources on Luiseño culture and history are Kroeber (1925), Strong (1929), and Bean and Shipek (1978).

Anthropologists have divided the Luiseño into several autonomous lineages or kin groups, which represented the basic political unit among most southern California Indians. According to Bean and Shipek (1978:551), each Luiseño lineage possessed a permanent base camp, or village, on the valley floor and another in the mountain regions for acorn collection. Luiseño villages were made up of family members and relatives, where chiefs of the village inherited their rank and each village owned its own land. Villages were usually located in sheltered canyons or near year-round sources of freshwater, always near subsistence resources.

The Luiseño exploited nearly all resources of the environment in a highly developed seasonal mobility system. The Luiseño people were primarily hunters and gatherers. They collected seeds, roots, wild berries, acorns, wild grapes, strawberries, wild onions, and prickly pear cacti, and hunted deer, elks, antelopes, rabbits, wood rats, and a variety of insects. Bows and arrows, atlatls or spear throwers, rabbit sticks, traps, nets, clubs, and slings were the main hunting tools. Each lineage had exclusive hunting and gathering rights in their procurement ranges. These boundaries were respected and only crossed with permission (Bean and Shipek 1978:551).

It is estimated that when Spanish colonization of Alta California began in 1769, the Luiseño had approximately 50 active villages with an average population of 200 individuals each, although other estimates place the total Luiseño population at 4,000-5,000 (Bean and Shipek 1978:557). Some of the villages were forcefully moved to the Spanish missions, while others were left largely intact (*ibid.*:558). Ultimately, Luiseño population declined rapidly after European contact because of diseases such as smallpox and harsh living conditions at the missions and, later, on the Mexican ranchos, where the Native people often worked as seasonal ranch hands.

After the American annexation of Alta California, the large number of non-Native settlers further eroded the foundation of traditional Luiseño society. During the latter half of the 19th century, almost all of the remaining Luiseño villages were displaced, their occupants eventually removed to the various reservations. Today, the nearest Native American groups of Luiseño heritage live on the Soboba, Pechanga, and Pala Indian Reservations.

Historic Context

In comparison to other nearby cities like Riverside and San Jacinto, the City of Moreno Valley is a "late-boomer" both in early development in the 19th century and in urban growth in the 20th. By the

mid-19th century, the area that constitutes today's Moreno Valley remained essentially uninhabited despite its location on a plain surrounded by several large Mexican land grants. In 1853-1855, when the U.S. government initiated the first official land survey in southern California, the only man-made features observed in the area were a few roads crisscrossing the desert floor, including a wagon road from San Bernardino to Temecula, a second one leading to San Jacinto, and several unidentified roads or trails (GLO 1856).

The Moreno Valley area remained unclaimed public land until 1870, when a 13,471-acre tract was purchased from the U.S. government in a single transaction (BLM n.d.). It was on this vast acquisition that the 11,560-acre Alessandro Tract and the town of Alessandro, which is occupied by March ARB today, were laid out and offered to settlers in 1887 during a land boom that swept through southern California in the 1880s (Gunther 1984:11). After this initial development scheme failed, the developers of Redlands in San Bernardino County, fresh from their acclaimed success in creating the Bear Valley reservoir and the thriving Redlands colony, took over the Alessandro Tract with the intention of irrigating the land with an elaborate water system (*ibid.*).

Water from the Bear Valley reservoir reached the Moreno Valley area in 1891, ushering in a few years of prosperity. Two more communities formed during this brief boom: New Haven, soon to be renamed Moreno, and Midland, also known as Armada (Gunther 1984:323, 333). The boom turned to bust during the drought of the late 1890s, when Bear Valley water was no longer delivered to the Moreno Valley area. As a result, the once flourishing towns in the area were largely abandoned, and many of the buildings were taken up and moved to Riverside (*ibid.*:13, 334).

During the early 20th century, the Moreno Valley area began to recover slowly. In 1912, a 1,100-acre portion of the original Alessandro Tract was re-subdivided as the Sunnymead Orchard Tract (County of Riverside 1912), and thus the community formerly known as Midland or Armada became Sunnymead. A decade later, a series of land development projects began just to the west of Sunnymead, which ultimately resulted in the establishment of the community of Edgemont (County of Riverside 1927; Gunther 1984:171-172).

Despite these development efforts, Moreno Valley's economic prospect was severely hampered by the lack of reliable water supply until 1973, after the completion of the California Aqueduct and its southern terminus, Lake Perris (Gunther 1984:334). Since then, the promise of affordable housing brought an influx of commuters to the Moreno Valley area, setting off a period of rapid growth and urbanization. By 1984, when residents in the communities of Moreno, Sunnymead, and Edgemont voted to incorporate as the City of Moreno Valley, the new city had already become the second most populous in Riverside County (*ibid.*), thanks mainly to its attraction as a "bedroom community."

In the vicinity of the APE, in contrast, the establishment of the U.S. Army's Alessandro Aviation Field in 1918 began a long history of military installations, a tradition that was reinforced by the WWII-era Camp Haan and carried to the present time by March ARB (formerly March Air Force Base). In more recent times, the area around project location has undergone a gradual transition to an industrial/commercial "park," largely because of its convenient location in close proximity to the Interstate Highway 215 corridor.

RESEARCH METHODS

RECORDS SEARCH

On May 15, 2018, CRM TECH archaeologist Nina Gallardo completed the historical/archaeological resources records search at the Eastern Information Center (EIC), University of California, Riverside. During the records search, Gallardo examined maps and records on file at the EIC for previously identified cultural resources and existing cultural resources reports within a one-mile radius of the APE. Previously identified cultural resources include properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Historic Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resources Inventory.

GEOARCHAEOLOGICAL ANALYSIS

As part of the research procedures, CRM TECH archaeologist Ben Kerridge and project geologist Harry M. Quinn pursued geoarchaeological analysis to assess the APE's potential for the deposition and preservation of subsurface cultural deposits from the prehistoric period, which cannot be detected through a standard surface archaeological survey. Sources consulted for this purpose included a geotechnical exploration report completed for this undertaking (Leighton 2018a) as well as topographic, geologic, and soil maps pertaining to the surrounding area (e.g., Morton and Cox 1994; Morton et al. 2001). Findings from these sources were used to develop a geomorphologic history of the APE and address geoarchaeological sensitivity of the vertical APE.

NATIVE AMERICAN PARTICIPATION

On May 14, 2018, CRM TECH submitted a written request to the State of California Native American Heritage Commission (NAHC) for a records search in the commission's Sacred Lands File. In the meantime, CRM TECH notified the Soboba Band of Luiseño Indians, the Pechanga Band of Luiseño Indians, and the Morongo Band of Mission Indians of the upcoming archaeological fieldwork and invited tribal participation. Following the NAHC's recommendations and previously established consultation protocol, CRM TECH further contacted a total 17 tribal representatives in the region. The written requests for comments were sent to the tribal representatives via both U.S. mail and e-mail on May 18, 2018, and follow-up telephone solicitations were carried out on June 28 and July 5. The correspondence between CRM TECH and the Native American representatives is attached to this report as Appendix 2.

HISTORICAL RESEARCH

Historical background research for this study was conducted by CRM TECH principal investigator/ historian Bai "Tom" Tang. Sources consulted during the research included published literature in local and regional history, archival records of the County of Riverside, U.S. General Land Office (GLO) land survey plat maps dated 1856, U.S. Geological Survey (USGS) topographic maps dated 1901-1980, and aerial photographs taken in 1938-2018. The historic maps are collected at the Science Library of the University of California, Riverside, and the California Desert District of the U.S. Bureau of Land Management, located in Moreno Valley. The aerial photographs are available

at the Nationwide Environmental Title Research (NETR) Online website, through the Google Earth software, and from the Environmental Site Assessment for this undertaking (Leighton 2018b).

FIELD SURVEY

On June 1, 2018, CRM TECH archaeologists Nina Gallardo and Ben Kerridge carried out the intensive-level field survey of the APE with the assistance of Native American monitors Leno Fernandez from the Pechanga Band of Luiseño Indians and Victoria Banda from the Soboba Band of Luiseño Indians. The survey was completed by walking a series of parallel north-south transects at 15-meter (approximately 50-foot) intervals. In this way, the entire APE was surveyed systematically for any evidence of human activities dating to the prehistoric or historic period (i.e., 50 years or older). Ground visibility was excellent (nearly 100 percent) at the time of the survey with the exception of the area occupied by the soil stockpiles, where visibility of the original ground surface was poor.

RESULTS AND FINDINGS

RECORDS SEARCH

EIC records identify at least four previous cultural resources studies that covered the APE (Figure 5). Three of these were large-scale surveys prepared for the realignment of March Air Force Base in the mid-1990s (#3510, #8272, and #10093 in Figure 5). Since they are now more than 20 years old, these studies are considered to be outdated today for statutory compliance purposes. The most recent study among the four, completed in 2002, included only a records search on the project area and no systematic field survey (#5055 in Figure 5). In addition to these, a recent survey covered the northernmost portion of the APE but is yet to be processed by the EIC (Tang et al. 2019). During that study, the drainage channel lying partially within the APE was recorded into the California Historical Resources Inventory as Site 33-028200 (CA-RIV-12721; see Appendix 3).

Within the one-mile scope of the records search, EIC records show 36 other previous studies on various tracts of land and linear features, which collectively covered roughly 60 percent of the land within the one-mile scope, mostly within the boundaries of March ARB (Figure 5). As a result of these and other similar studies in the vicinity, 246 additional historical/archaeological sites and one isolate—i.e., a locality with fewer than three artifacts—have been identified within one mile of the APE (see Appendix 4). One the 246 sites consisted of archaeological remains of WWII-era buildings, and the other 245 all represented built-environment features.

Among these localities, only the isolate was of prehistoric—i.e., Native American—origin, consisting of a bifacial mano fragment found on the ground about 0.75 mile southeast of the APE. All 246 of the sites dated to the historic period and included the former California Southern Railway (a Santa Fe Railway subsidiary), two other canals/channels, structural remains from Camp Haan, and a large number of buildings and structures. The vast majority of the buildings and structures were located in the March Field Historic District within March ARB, a National Register-listed property lying roughly a half-mile to the south of the APE. Other than Site 33-028200, all of these localities was found at least 1,500 feet from the APE. Therefore, none of them requires further consideration during this study.

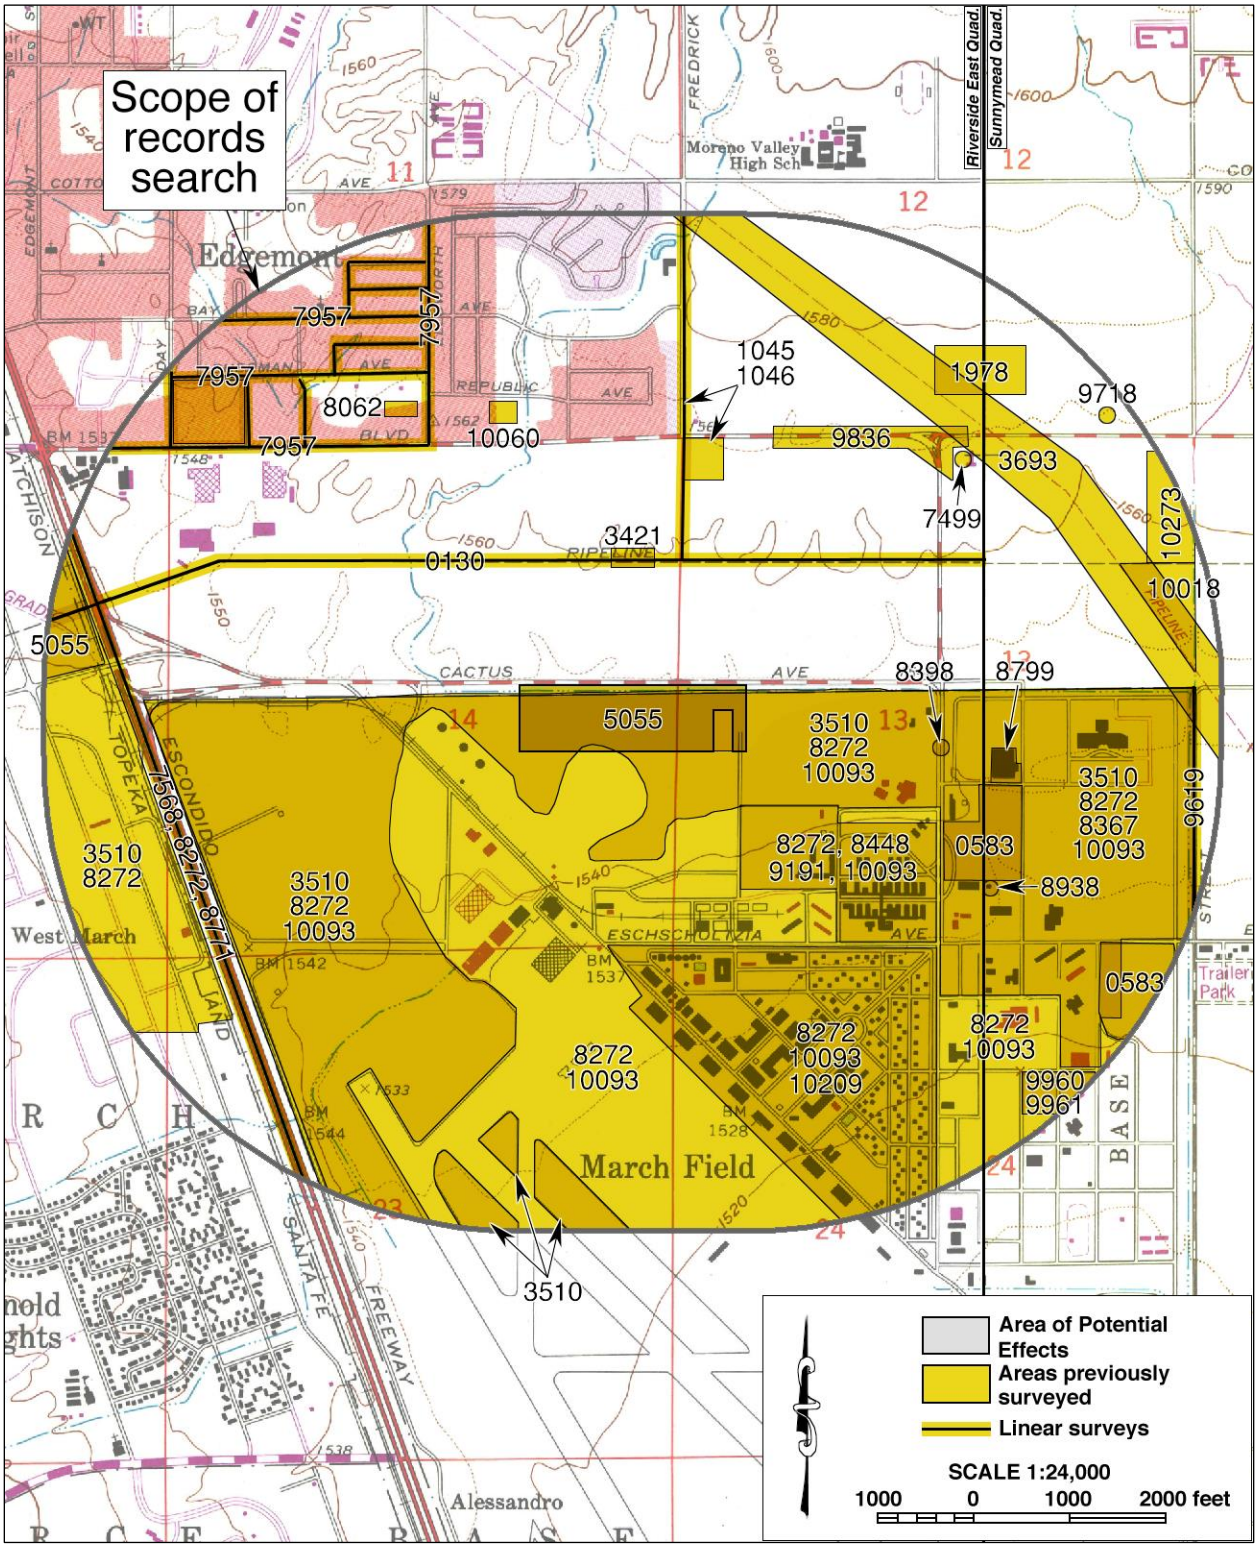

Figure 5. Previous cultural resources studies in the vicinity of the APE, listed by EIC file number. Locations of historical/archaeological sites are not shown as a protective measure.

GEOARCHAEOLOGICAL ANALYSIS

The geotechnical exploration report completed for this undertaking, based on a surface reconnaissance and nine exploratory borings, characterized the soil within the APE as a combination of undocumented artificial fill and older alluvium (Leighton 2018a:4). The artificial fill was noted mostly along Cactus Avenue and in the soil stockpiles, while the older alluvium was noted in all borings, at least below the surface (*ibid*.). The report describes these alluvial soils as "medium dense to very dense silty to clayey sand and localized layers of sandy silty to sandy clay" (*ibid*.).

The surface geology in the vicinity of the APE was mapped by Morton and Cox (1994) as *Qoa*, which represents Pleistocene-aged, "weakly to moderately indurated, yellowish-brown to reddish-brown, coarse-grained sandy alluvium" with "abundant silt and clay" as well as "silica-cemented hardpan." More recently, Morton et al. (2001) mapped the surface soils in the APE as $Qvof_a$, or very old (early Pleistocene, circa 2.6-0.8 million years ago) alluvial fan deposits, "mostly well-desiccated, well-indurated reddish-brown sand deposits." $Qvof_a$ is described further as commonly containing duripans and forming silcrete as well as being arenaceous.

According to existing ethnographic literature on Luiseño culture, "villages were usually in sheltered coves or canyons, on the side of slopes in a warm thermal zone, near good water supplies, and in defensive locations" (Bean and Shipek 1978:551). This is corroborated by observations made during numerous past studies that CRM TECH has completed in the Inland Empire region since 1993, which suggest that longer-term residential settlements of the Native population were more likely to occur near the base of hills and/or on elevated terraces or ridges near creeks or springs, while the level, unprotected valley floor was used mainly for resource procurement, travel, and occasional camping during these activities.

Based on this settlement pattern, the location of the APE, on an alluvial fan subject to occasional flooding but nearly 10 miles from any relatively steady streams, would not have provided a favorable setting for permanent or long-term habitation by the aboriginal population during prehistoric times. Instead, the area was more likely used as a travel route and for opportunistic sustenance activities, where surviving cultural remains are typically limited to the ground surface and shallow deposits.

In its current state, the APE has been disturbed by construction activities associated with March ARB, Cactus Avenue, and the drainage channel, and the surface and near-surface soils are mainly artificial fill. These soils offer a highly unlikely environment for any prehistoric archaeological deposits to survive intact. At depth, the early Pleistocene alluvial fan deposits well predate human habitation in California and would not be expected to contain deeply buried cultural materials. Overall, the proposed undertaking appears to have a minimal potential to impact any subsurface archaeological remains in the vertical APE.

NATIVE AMERICAN PARTICPATION

In response to CRM TECH's inquiry, the NAHC reported in a letter dated May 17, 2018, that the sacred lands record search identified no Native American cultural resources within the APE. Meanwhile, the NAHC cautioned that the area was sensitive for such resources and recommended

that local Native American groups be contacted for further information. For that purpose, the NAHC provided a list of potential contacts in the region (see Appendix 2).

Upon receiving the NAHC's reply, CRM TECH sent written requests for comments to all 16 tribes of Luiseño, Cahuilla, and Serrano heritage on the referral list. In addition to or in lieu of some of the individuals suggested by the NAHC, the designated spokespersons for the tribes were contacted as recommended previously by the appropriate tribal government staff. In all, the requests for comments were sent to 17 tribal representatives, and ten of the tribes have responded in writing while two others have provided their comments via telephone (see Appendix 2).

Among the 12 tribes that have responded, the San Manuel Band of Mission Indians noted that the APE was outside the tribe's ancestral territory and declined to participate in further consultations over this undertaking, while the Santa Rosa Band of Cahuilla Indians stated that the tribe had no concerns regarding the undertaking. The Agua Caliente Band of Cahuilla Indians and the Morongo Band of Mission Indians requested copies of all cultural resources documentation generated in association with the undertaking for tribal review.

The Augustine Band of Cahuilla Indians, the Cabazon Band of Mission Indians, the Cahuilla Band of Indians, the Pauma Band of Luiseño Indians, and the Rincon Band of Luiseño Indians stated that they had no information on any Native American cultural resources that may be affected by the proposed undertaking. Nonetheless, the Cahuilla Band and the Pauma Band requested to be kept appraised of future progress of the undertaking. The Augustine Band recommended further consultation with other tribes in the vicinity and monitoring during ground-disturbing activities in the APE. In addition, the Augustine Band requested to be notified if any Native American cultural resources were discovered during the undertaking, as did the Serrano Nation of Indians.

The Pechanga Band of Luiseño Indians and the Soboba Band of Luiseño Indians, which participated in the archaeological field survey of the APE, both found the project vicinity to be culturally sensitive, and both requested further government-to-government consultation with March JPA. Furthermore, the Pechanga Band and the Soboba Band requested the presence of their tribal monitors during all earth-moving activities in the APE, with the Pechanga Band also requesting the presence of an archaeological monitor. In addition, the Soboba Band provided a set of recommended procedures to address inadvertent discovery of Native American cultural remains (see Appendix 2).

HISTORICAL RESEARCH

Historical sources consulted during this study yielded no evidence of any settlement or development activities in the APE prior to the establishment of present-day March ARB. In the mid-1850s, when the U.S. government conducted the first systematic land surveys in the Moreno Valley-Riverside area, the only man-made feature observed in the vicinity was a "Wagon Road to Timicula" running generally north-south just to the west of the APE (Figure 6). By end of the 19th century, some widely scattered buildings had appeared in the surrounding area, but the only man-made feature in existence within or adjacent to the APE was part of a grid of crisscrossing roads (Figure 7).

In 1918, the U.S. Army built Alessandro Aviation Field in the project vicinity (Gunther 1984:13). The facility was renamed March Field later that year, and later the name was further changed to

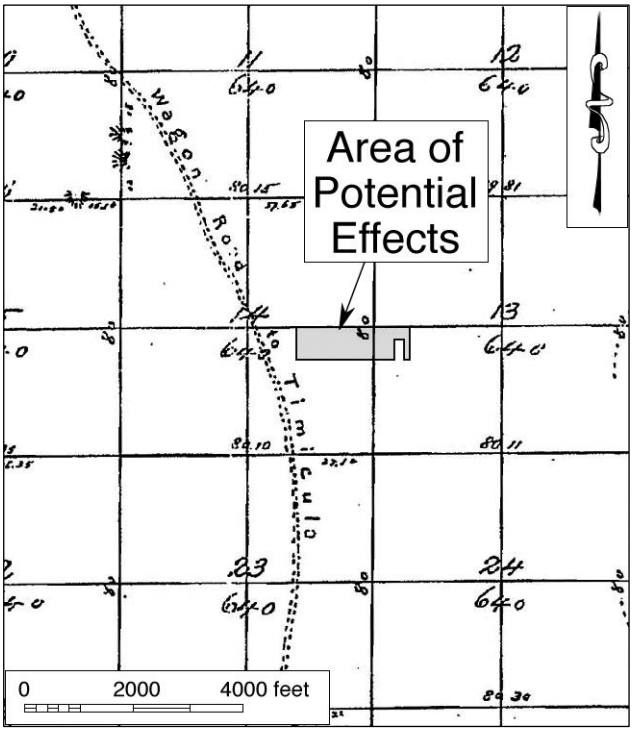

Figure 6. The APE and vicinity in 1853-1855. (Source: GLO 1856)

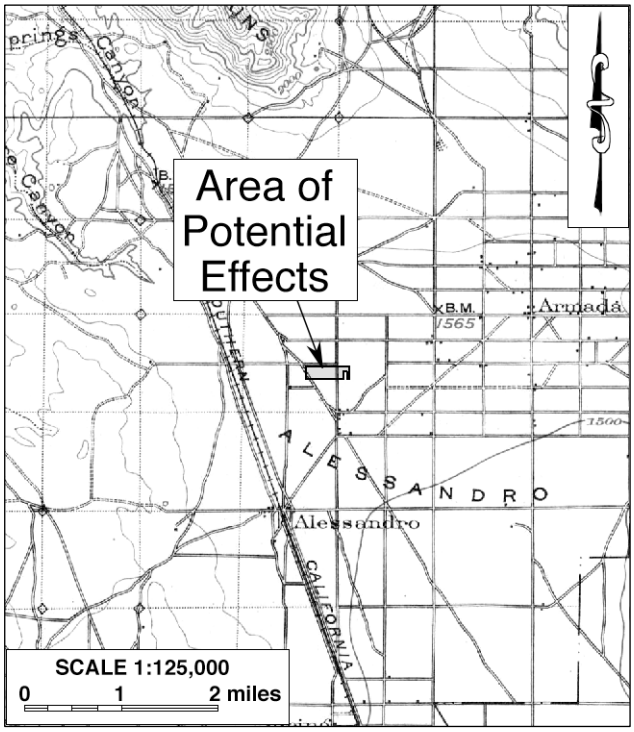

Figure 7. The APE and vicinity in 1897-1898. (Source: USGS 1901)

March Army Air Field in 1941, March Army Air Base in 1942, March Air Force Base in 1947, and finally March Air Reserve Base in 1996 (*ibid*.:310; March ARB n.d.). In 1941-1942, the APE became a part of the base when the U.S. government acquired several hundred acres in Sections 13 and 14 of T3S R4W, including the land "south of the centerline of Cactus Avenue," for a major base expansion in preparation for its wartime service as a bomber crew training facility that hosted as many as 75,000 troops (County Assessor 1937-1948; March ARB n.d.).

In the late 1930s, no man-made features were known to be present in the APE (Figure 8; Leighton 2018b). By the early 1950s, the drainage channel in the northern portion of the APE had been completed (Figure 9). The channel was most likely excavated during the 1941-1942 base expansion to convey seasonal storm runoff from the north to a preexisting channel along Heacock Street to the east (USGS 1943) and around the perimeter of the base. By the 1950s, the northern end of present-day Chanute Avenue was observed in the easternmost portion of the APE, and Cactus Avenue had been extended across the project vicinity, just outside the northern boundary of the APE (Figure 9; Leighton 2018b).

Between 1949 and 1959, a few small, apparently temporary structures were noted in the APE, while the eastern portion of the property was cleared and used for parking or storage (Leighton 2018b). All of these uses had ceased by the mid-1960s, however, and the entire APE has been vacant and largely unused since then (Fig. 10; NETR Online 1966-2012; Google Earth 1994-2018; Leighton 2018b). The substation adjacent to the APE was built sometime between 1989 and 1994, and the soil stockpiles appeared on the property in 2006-2008 (NETR Online 1978; 1994; Google Earth 2006;

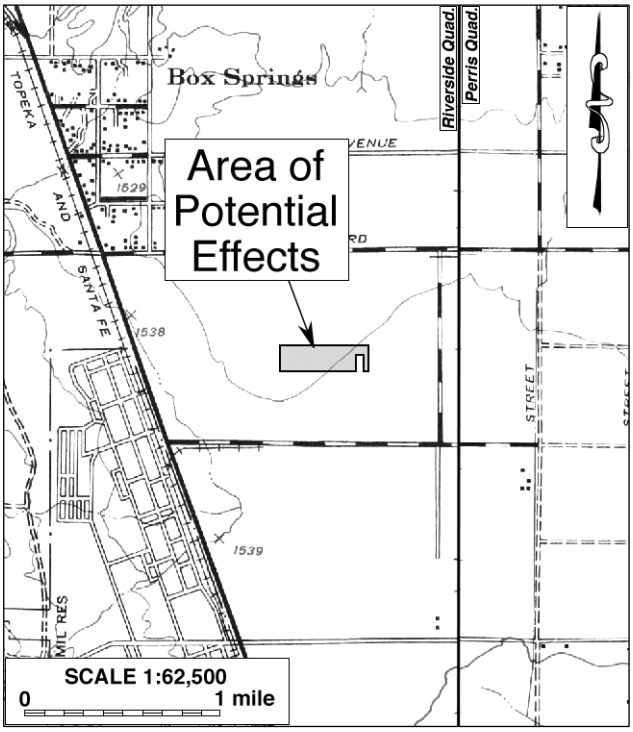

Figure 8. The APE and vicinity in 1939. (Source: USGS 1942; 1943)

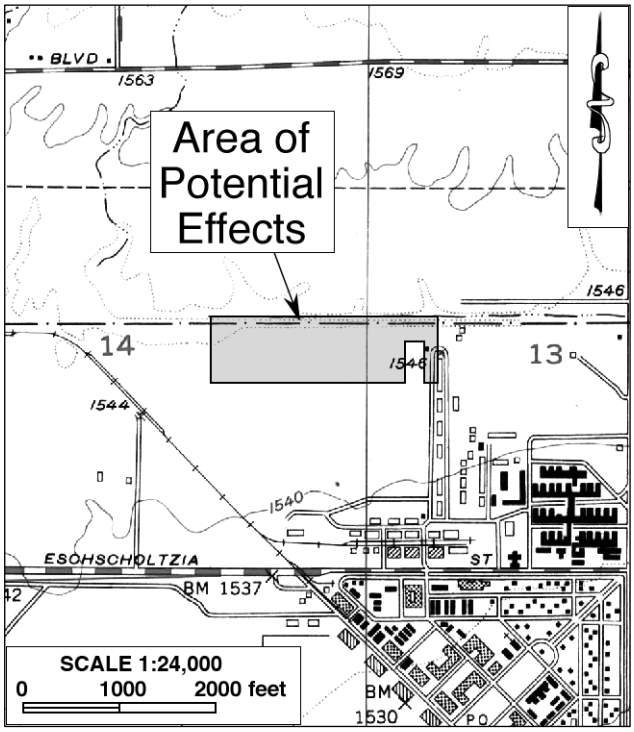

Figure 9. The APE and vicinity in 1951-1953. (Source: USGS 1953)

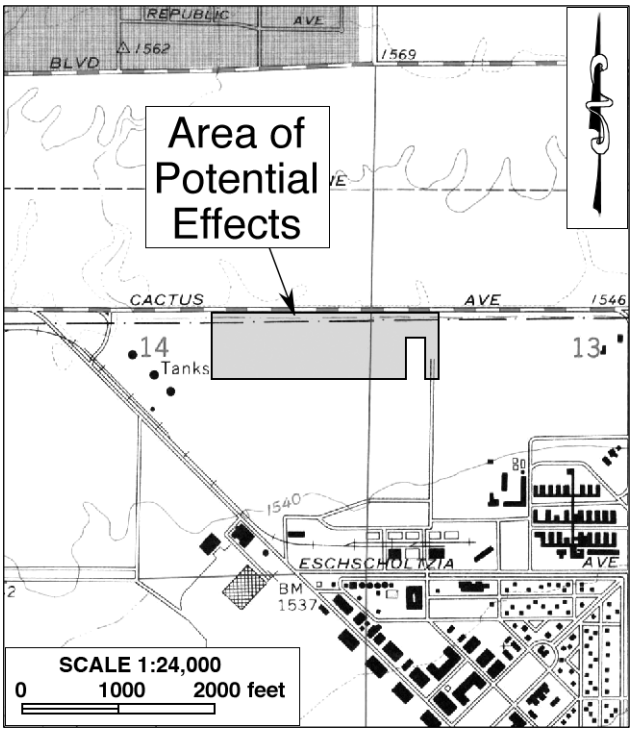

Figure 10. The APE and vicinity in 1966-1967. (Source: USGS 1967)

2008; Leighton 2018b). Other than these and the various dirt roads, no additional features have appeared within or immediately adjacent to the APE.

FIELD SURVEY

As mentioned above, the drainage channel across the northernmost portion of the APE was recorded during a recent study as Site 33-028200 (see Appendix 3). The segment of the channel in the APE measures typically 41 feet wide across the top, 18 feet wide across the bottom, and six feet deep, with gentle slopes along the banks. The bottom of the channel is covered by dense vegetation growth, and a part of the channel in the westernmost portion of the APE is filled with standing water (Figure 11). As a typical and unremarkable open earthen ditch, the drainage channel demonstrates no distinctively historical characteristics or features.

Figure 11. Earthen drainage channel across the northern edge of the APE (Site 33-028200), view to the northeast. (Photograph taken on June 1, 2018)

Figure 12. Abandoned segment of Chanute Avenue in the southeastern corner of the APE, view to the northwest. (Photograph taken on June 1, 2018)

Besides the channel, the small segment of Chanute Avenue in the southeastern corner of the APE is known to date to the 1950s (Leighton 2018b). The road was apparently well maintained and in use for accessing the substation until around 2006, but has since been largely abandoned (Google Earth 1994-2018; Figure 12). As a minor, ubiquitous late-historic-period infrastructure feature that remained functional until recent years, the segment of Chanute Avenue in the APE does not retain any distinctively historical character, and is not considered a potential "historic property" or "historical resource." Therefore, it requires no further study or formal recordation into the California Historical Resources Inventory.

No other features or artifacts more than 50 years of age were encountered within the APE. The APE is devoid of any bedrock outcrops, which often contain bedrock milling features, the most common type of prehistoric archaeological sites to be found in the Moreno Valley area, nor was any other indication of prehistoric or historical cultural remains observed during the field survey.

MANAGEMENT CONSIDERATIONS

APPLICABLE STATUTORY/REGULATORY FRAMEWORK

Section 106 of NHPA mandates that federal agencies take into account the effects of their undertakings on historic properties and seek ways to avoid, minimize, or mitigate any adverse effects on such properties (36 CFR 800.1(a)). Similarly, CEQA establishes that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired."

The purpose of this study is to identify any "historic properties" or "historical resources" that may exist within the APE. "Historic properties," as defined by the Advisory Council on Historic

Preservation, include "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior" (36 CFR 800.16(l)). The eligibility for inclusion in the National Register is determined by applying the following criteria, developed by the National Park Service as per provision of NHPA:

> The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and
> (a) that are associated with events that have made a significant contribution to the broad patterns of our history; or
> (b) that are associated with the lives of persons significant in our past; or
> (c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
> (d) that have yielded, or may be likely to yield, information important in prehistory or history. (36 CFR 60.4)

For CEQA-compliance considerations, the State of California's Public Resources Code (PRC) establishes the definitions and criteria for "historical resources," which require similar protection to what NHPA Section 106 mandates for "historic properties." "Historical resources," according to PRC §5020.1(j), "includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California."

More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the lead agency (Title 14 CCR §15064.5(a)(1)-(3)). Regarding the proper criteria for the evaluation of historical significance, CEQA guidelines mandate that "generally a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

> (1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
> (2) Is associated with the lives of persons important in our past.
> (3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
> (4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

A local register of historical resources, as defined by PRC §5020.1(k), "means a list of properties officially designated or recognized as historically significant by a local government pursuant to a local ordinance or resolution." For properties in the County of Riverside, the County maintains a list of officially designated Historic Landmarks, but the lead local agency for this undertaking, namely March JPA, does not maintain its own register of officially designated or recognized historical

resources, nor has it implemented any additional regulations or guidelines to be applied to cultural resources under its jurisdiction.

DISCUSSION

In summary of the research results presented above, Site 33-028200, the earthen drainage channel across the northernmost portion of the APE, is the only potential "historic property"/"historical resource" that may be affected by the proposed undertaking. The construction of the channel dates to the 1941-1953 era, most likely the early 1940s. As stated in the recent study that resulted in the recordation of the site:

> Evidently excavated during the expansion of March Army Air Field, the channel is a peripheral feature associated with the establishment the large WWII-era military base, but does not demonstrate a unique or particularly close association with that event or with any other events (Criterion A/1) or persons (Criterion B/2) of recognized historic significance. Simple in design and utilitarian in character, the channel does not stand out as an important example of any style, type, period, region, or method of construction, nor is it known to represent the work of a prominent architect, designer, engineer, or builder (Criterion C/3). Finally, as a late-historic-period infrastructure feature of standard construction, it demonstrates little potential for any important historical/archaeological information (Criterion D/4). (Tang et al. 2019:14-15)

Based on these considerations, and in light of the criteria listed above, the drainage channel at Site 33-028200 does not appear to meet any of the criteria for listing in the National Register of Historic Places or the California Register of Historical Resources, and does not qualify as a "historic property" or a "historical resource." No other potential "historic properties" or "historical resources" of either prehistoric or historical origin were identified throughout the various avenues of research, and the subsurface sediments in the vertical APE appear to be low in sensitivity for potentially significant archaeological remains in buried deposits. Therefore, the present study concludes that no "historic properties" or "historical resources" are present within the APE.

CONCLUSION AND RECOMMENDATIONS

In conclusion, the results of this study indicate that no "historic properties" or "historical resources" are known to be present within the APE, and the subsurface sediments in the APE appear to be low in sensitivity for potentially significant archaeological deposits. Based on these findings, and pursuant to 36 CFR 800.4(d)(1) and Calif. PRC §21084.1, CRM TECH presents the following recommendations to March JPA and the appropriate federal agencies:

- No "historic properties" or "historical resources" will be affected by the proposed undertaking.
- No further cultural resources investigation will be necessary for the undertaking unless project plans undergo such changes as to include areas not covered by this study.
- If buried cultural materials are inadvertently discovered during earth-moving operations associated with the undertaking, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the find.

Subject: Cultural Study and Participation in Fieldwork for the Proposed K-4 Parcel Project, near the City of Moreno Valley, Riverside County (CRM TECH No. 3347)

Hello,

I'm emailing to inform you that CRM TECH will be conducting a cultural study for the Proposed K-4 Parcel Project near the City of Moreno Valley, Riverside County (CRM TECH No. 3347). I'm contacting you to see if the tribe would like to participate in the field survey for the project and we will contact the tribe again when we have a specific time and date for the fieldwork. We would appreciate any information regarding the project area. We will be sending an NA scoping letter with additional information in a few weeks. I'm attaching the proposed project area map and other information.

Thank you for your time and input on this project.

RE: Proposed K-4 Parcel (CRM TECH No. 3347) Project, near the Community of Edgemont; Riverside East and Sunnymead USGS Quadrangles, Riverside County, California

Dear Ms. Gallardo:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results however the area within the APE provided is sensitive for cultural resources. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE.

Attached is a list of tribes culturally affiliated to the project area. I suggest you contact all of the listed Tribes. If they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton

RE: Proposed K-4 Parcel Project
Assessor's Parcel Numbers 297-150-006, -007, 297-150-038, 297-160-005, and 297-200-004
35.4 Acres near the City of Moreno Valley, Riverside County, California
CRM TECH Contract #3347

Dear Ms. Garcia-Plotkin:

I am writing to bring your attention to an ongoing CEQA- and Section 106-compliance study for the proposed project referenced above. The undertaking entails the construction of a business park on approximately 35.4 acres of vacant land in APNs 297-150-006, 297-150-007, 297-150-038, 297-160-005, and 297-200-004, located along the south side of Cactus Avenue between Veterans Way and Frederick Street within the March Joint Powers Authority jurisdiction in unincorporated Riverside County. The Area of Potential Effects (APE) previously was part of a 2,500-acre cultural resources study conducted in 1995, but no cultural resources were identified at that time. The accompanying map, based on the USGS Riverside East and Sunnymead, Calif., 7.5' quadrangles, depicts the location of the project area in Sections 13 and 14, T3S R4W, SBBM.

In a letter dated May 17, 2018, the Native American Heritage Commission (NAHC) reports that the sacred lands record search identified no Native American cultural resources within the APE, but the area is sensitive for cultural resources. The NAHC recommends that local Native American groups be contacted for further information (see attached). Therefore, as part of the cultural resources study for this project, I am writing to request your input on potential Native American cultural resources in or near the APE.

Please respond at your earliest convenience if you have any specific knowledge of sacred/religious sites or other sites of Native American traditional cultural value in or near the APE, or any other information to consider during the cultural resources investigations. Any information or concerns may be forwarded to CRM TECH by telephone, e-mail, facsimile, or standard mail. Requests for documentation or information we cannot provide will be forwarded to our client and/or the lead agency, namely the March Joint Powers Authority.

We would also like to clarify that, as the cultural resources consultant for the project, CRM TECH is not involved in the AB 52-compliance process or in government-to-government consultations. The purpose of this letter is to seek any information that you may have to help us determine if there are cultural resources in or near the project area that we should be aware of and to help us assess the sensitivity of the APE. Thank you for your time and effort in addressing this important matter.

Respectfully,

Nina Gallardo
Project Archaeologist/Native American liaison

Hi Nina,

Thank you for contacting the San Manuel Band of Mission Indians (SMBMI) regarding the above referenced project. SMBMI appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on 18 May 2018. The proposed project is located just outside of Serrano ancestral territory and, as such, SMBMI will not request consulting party status or elect to participate in the scoping, development, and/or review of documents created pursuant to these legal and regulatory mandates.

Regards,

Jessica Mauck

Dear Ms. Gallardo,

The Cahuilla Band of Indians has received your letter on May 18, 2018 regarding the proposed K-4 Parcel Project APN 297-150-006, -007, 297-150-038, 297-160-005, and 297-200-004 in the City of Moreno Valley, Riverside County, CA. The Cahuilla band does not have knowledge of any cultural resources/sites within or near the project site. Although the project is outside the Cahuilla reservation boundary, it is within the Cahuilla traditional land use area. We respectfully request to be notified of all updates and /or changes with the project moving forward and appreciate your help in preserving Tribal Cultural Resources in your project.

Respectfully,

CRM TECH Contract #3347

Dear Ms. Gallardo:

Thank you for contacting the Cabazon Band of Mission Indians concerning cultural resource information relative to the above referenced project.

The project is located outside of the Tribe's current reservation boundaries. The Tribe has no specific archival information on the site indicating that it may be a sacred/religious site or other site of Native American traditional cultural value within the project area.

We look forward to continued collaboration in the preservation of cultural resources or areas of traditional cultural importance.

Best regards,

Judy Stapp
Director of Cultural Affairs

CRM TECH Contract #3347

Dear Ms. Gallardo -

Thank you for the opportunity to offer input concerning the development of the above-identified project. We appreciate your sensitivity to the cultural resources that may be impacted by your project, and the importance of these cultural resources to the Native American peoples that have occupied the land surrounding the area of your project for thousands of years. Unfortunately, increased development and lack of sensitivity to cultural resources has resulted in many significant cultural resources being destroyed or substantially altered and impacted. Your invitation to consult on this project is greatly appreciated.

At this time we are unaware of specific cultural resources that may be affected by the proposed project. We encourage you to contact other Native American Tribes and individuals within the immediate vicinity of the project site that may have specific information concerning cultural resources that may be located in the area. We also encourage you to contract with a monitor who is qualified in Native American cultural resources identification and who is able to be present on-site full-time during the pre-construction and construction phase of the project. Please notify us immediately should you discover any cultural resources during the development of this project.

Very truly yours,

Victoria Martin
Tribal Secretary

RE: Request for Information for the Proposed K-4 Parcel Project in the City of Moreno Valley.

Dear Mr. Gallardo,

The Pechanga Band of Luiseño Indians ("the Tribe") appreciates your request for information regarding the above referenced Project. After reviewing the provided maps and our internal documents, we have determined that the Project area is not within reservation lands although it is within our ancestral territory.

At this time, the Tribe is interested in participating in this Project since it is located within a highly sensitive Luiseño cultural area. The project site is located less than 2 miles of an extensive Luiseño habitation area, which includes sacred and ceremonial resources. The Tribe understands that the eastern portion of the APE has been previously disturbed; however, due to the projects proximity to a very large habitation area the Tribe believes that there is a possibility of recovering subsurface resources during ground-disturbing activities.

The Tribe is dedicated to providing comprehensive cultural information to you and your firm for inclusion in the archaeological study as well as to the Lead Agency for CEQA review. At this time, the Tribe requests the following so we may continue the consultation process and to provide adequate and appropriate recommendations for the Project:

1) Notification once the Project begins the entitlement process, if it has not already;
2) Copies of all applicable archaeological reports, site records, proposed grading plans and environmental documents (EA/IS/MND/EIR, etc.);
3) Government-to-government consultation with the Lead Agency; and
4) The Tribe believes that monitoring by a Riverside County qualified archaeologist and a professional Pechanga Tribe monitor may be required during earthmoving activities. Therefore, the Tribe reserves its right to make additional comments and recommendations once the environmental documents have been received and fully reviewed. Further, in the event that subsurface cultural resources are identified, the

RECEIVED

BY: .....

Tribe requests consultation with the Project proponent and Lead Agency regarding the treatment and disposition of all artifacts.

As a sovereign governmental entity, the Tribe is entitled to appropriate and adequate government-to-government consultation regarding the proposed Project. We would like you and your client to know that the Tribe does not consider initial inquiry letters from project consultants to constitute appropriate government-to-government consultation, but rather tools to obtain further information about the Project area. Therefore, the Tribe reserves its rights to participate in the formal environmental review process, including government-to-government consultation with the Lead Agency, and requests to be included in all correspondence regarding this Project.

Please note that we are interested in participating in surveys within Luiseño ancestral territory. Prior to conducting any surveys, please contact the Cultural Department to schedule specifics. Please be advised, the lead contact for this project is our Cultural Analyst, Ebru Ozdil, and she can be reached at eozdil@pechanga-nsn.gov or at (951) 770-6313. If you have any questions or concerns regarding this letter, please contact me at crs@pechanga-nsn.gov or 951-770-6314.

Sincerely,

Molly Earp-Escobar
Cultural Resource Specialist

Re: K-4 Parcel Project

Dear Gallardo:

This letter is written on behalf of the Rincon Band of Luiseño Indians. We have received your notification regarding the K-4 Parcel Project and we thank you for the opportunity to consult on this project. The identified location is within the Territory of the Luiseño people, and is also within Rincon's specific area of Historic interest.

Embedded in the Luiseño territory are Rincon's history, culture and identity. Rincon does not have knowledge of any known cultural resources in the proposed project area. We do not request consultation at this time.

If you have additional questions or concerns please do not hesitate to contact our office at your convenience at (760) 297-2635.

Thank you for the opportunity to protect and preserve our cultural assets.

Sincerely,

Destiny Colocho

Re: K-4 Parcel Development

Dear Ms. Nina Gallardo,

The Agua Caliente Band of Cahuilla Indians (ACBCI) appreciates your efforts to include the Tribal Historic Preservation Office (THPO) in the K-4 Parcel Development project. The project area is not located within the boundaries of the ACBCI Reservation. However, it is within the Tribe's Traditional Use Area. For this reason, the ACBCI THPO requests the following:

*A copy of the records search with associated survey reports and site records from the information center.

*Copies of any cultural resource documentation (report and site records) generated in connection with this project.

Again, the Agua Caliente appreciates your interest in our cultural heritage. If you have questions or require additional information, please call me at (760)699-6829. You may also email me at ACBCI-THPO@aguacaliente.net.

Cordially,

Katie Croft

SOBOBA BAND OF LUISEÑO INDIANS
EST. JUNE 19, 1883

RE: Proposed K-4 Parcel Project – along the south side of Cactus Avenue between Veterans Way and Frederick Street within the March Joint Powers Authority jurisdiction (APNs 297-150-006, 297-150-007, 297-150-038, 297-160-005, 297-200-004) – City of Moreno Valley, Riverside County, CA

The Soboba Band of Luiseño Indians appreciates your observance of Tribal Cultural Resources and their preservation in your project. The information provided to us on said project has been assessed through our Cultural Resource Department, where it was concluded that although it is outside the existing reservation, the project area does fall within the bounds of our Tribal Traditional Use Areas. This project location is in proximity to known sites, is a shared use area that was used in ongoing trade between the tribes, and is considered to be culturally sensitive by the people of Soboba.

Soboba Band of Luiseño Indians is requesting the following:

1. To initiate a consultation with the project proponents and lead agency.
2. The transfer of information to the Soboba Band of Luiseno Indians regarding the progress of this project should be done as soon as new developments occur.
3. Soboba Band of Luiseño Indians continues to act as a consulting tribal entity for this project.
4. Working in and around traditional use areas intensifies the possibility of encountering cultural resources during the construction/excavation phase. For this reason the Soboba Band of Luiseño Indians requests that Native American Monitor(s) from the Soboba Band of Luiseño Indians Cultural Resource Department to be present during any ground disturbing proceedings. Including surveys and archaeological testing.
5. Request that proper procedures be taken and requests of the tribe be honored (Please see the attachment)

Multiple areas of potential impact were identified during an in-house database search. Specifics to be discussed in consultation with the lead agency.

Sincerely,

Joseph Ontiveros, Tribal Historic Preservation Officer

jontiveros@soboba-nsn.gov

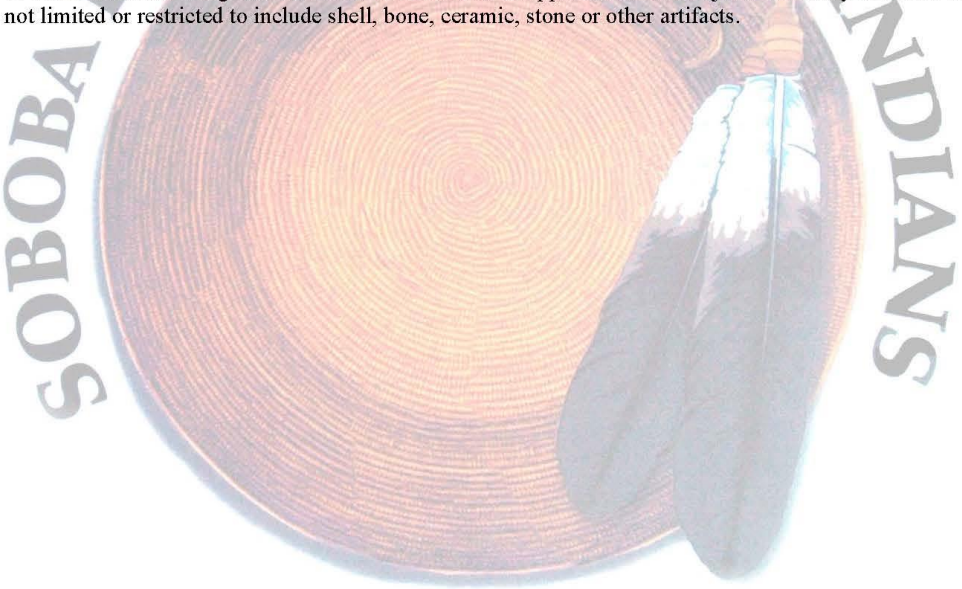
Cultural Items (Artifacts). Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer should agree to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

The Developer should waive any and all claims to ownership of Native American ceremonial and cultural artifacts that may be found on the Project site. Upon completion of authorized and mandatory archeological analysis, the Developer should return said artifacts to the Soboba Band within a reasonable time period agreed to by the Parties and not to exceed (30) days from the initial recovery of the items.

Treatment and Disposition of Remains.

A. The Soboba Band shall be allowed, under California Public Resources Code § 5097.98 (a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity.

B. The Soboba Band, as MLD, shall complete its inspection within twenty-four (24) hours of receiving notification from either the Developer or the NAHC, as required by California Public Resources Code § 5097.98 (a). The Parties agree to discuss in good faith what constitutes "appropriate dignity" as that term is used in the applicable statutes.



C. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code § 5097.98 (a) and (b). The Soboba Band, as the MLD in consultation with the Developer, shall make the final discretionary determination regarding the appropriate disposition and treatment of human remains.

D. All parties are aware that the Soboba Band may wish to rebury the human remains and associated ceremonial and cultural items (artifacts) on or near, the site of their discovery, in an area that shall not be subject to future subsurface disturbances. The Developer should accommodate on-site reburial in a location mutually agreed upon by the Parties.

E. The term "human remains" encompasses more than human bones because the Soboba Band's traditions periodically necessitated the ceremonial burning of human remains. Grave goods are those artifacts associated with any human remains. These items, and other funerary remnants and their ashes are to be treated in the same manner as human bone fragments or bones that remain intact

Coordination with County Coroner's Office. The Lead Agencies and the Developer should immediately contact both the Coroner and the Soboba Band in the event that any human remains are discovered during implementation of the Project. If the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, the Coroner shall ensure that notification is provided to the NAHC within twenty-four (24) hours of the determination, as required by California Health and Safety Code § 7050.5 (c).

Non-Disclosure of Location Reburials. It is understood by all parties that unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and shall not be governed by public disclosure requirements of the California Public Records Act. The Coroner, parties, and Lead Agencies, will be asked to withhold public disclosure information related to such reburial, pursuant to the specific exemption set forth in California Government Code § 6254 (r). Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer agrees to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

Confidentiality: The entirety of the contents of this letter shall remain confidential between Soboba and the March Joint Powers Authority, as well as hired consultant (CRM TECH). No part of the contents of this letter may be shared, copied, or utilized in any way with any other individual, entity, municipality, or tribe, whatsoever, without the expressed written permission of the Soboba Band of Luiseño Indians.

Re: Cactus Avenue Channel/K-4 Parcel Development

Dear Ms. Nina Gallardo,

The Agua Caliente Band of Cahuilla Indians (ACBCI) appreciates your efforts to include the Tribal Historic Preservation Office (THPO) in the K-4 Parcel Development project. The project area is not located within the boundaries of the ACBCI Reservation. However, it is within the Tribe's Traditional Use Area. For this reason, the ACBCI THPO requests the following:

*A copy of the records search with associated survey reports and site records from the information center.

*Copies of any cultural resource documentation (report and site records) generated in connection with this project.

Again, the Agua Caliente appreciates your interest in our cultural heritage. If you have questions or require additional information, please call me at (760)699-6829. You may also email me at ACBCI-THPO@aguacaliente.net.

***P3a.** **Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries) The site consists of an approximately 1.5-mile segment of drainage channel along the southern side of Cactus Avenue and the northern edge of March Air Reserve Base. The unlined open earthen channel is built of natural material (hardened soil), and measures approximately 41-47 feet wide across the top, 13-18 feet wide across the bottom, and 6-24 feet deep, with steep, sloping sides that show signs of erosion caused by periodic flooding. It was excavated sometime between 1941 and 1953, most likely during the expansion of March Army Air Field (now March Air Reserve Base) in the early 1940s, to channel seasonal storm runoff from the north to a preexisting channel along Heacock Street to the east and around the perimeter of the base. As a typical and largely nondescript infrastructure feature, it demonstrates no distinctively historical characteristics.

Keywords: Phase I historical/archaeological resources survey; APNs 297-150-006, 297-150-007, 297-150-037, 297-150-038, 297-200-004, 297-200-012, 297-250-011, 297-250-013, and 297-250-014; Site 33-028200 (CA-RIV-12721): WWII-era earthen drainage channel; no "historic property" or "historical resource" in the APE

EXECUTIVE SUMMARY

In July and August 2018, at the request of Lewis Retail Centers, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) for the proposed Cactus Avenue Drainage Channel Improvement Project on the northern edge of March Air Reserve Base, near the City of Moreno Valley, Riverside County, California. The APE consists of the right-of-way of an approximately 1.5-mile segment of earthen drainage channel on the south side of Cactus Avenue between Graeber/Elsworth Street and Heacock Street, across Sections 13 and 14 of T3S R4W, San Bernardino Baseline and Meridian.

The study is part of the environmental review process for the undertaking, which entails primarily the conversion of the open ditch to an underground concrete culvert, along with minor improvements such as extending a number of existing storm drains. The APE is delineated to encompass the maximum extent of ground disturbance required for the undertaking and measures generally 80-100 feet in width. All construction staging and storage will occur within the footprint of an associated undertaking known as the K-4 Parcel Project, for which a cultural resources study is prepared under separate cover. The vertical extent of the APE, represented by the maximum depth of excavations required, will be 5.0 to 6.5 feet below the bottom of the existing channel, depending on the location.

The March Joint Powers Authority (JPA), as the lead agency, required the study in compliance with the California Environmental Quality Act (CEQA). In anticipation of future federal review of the undertaking by the United States Army Corps of Engineers (USACE), the study was also completed in compliance Section 106 of the National Historic Preservation Act. The purpose of the study is to provide March JPA and USACE with the necessary information and analysis to determine whether the proposed undertaking would have an effect on any "historic properties," as defined by 36 CFR 800.16(l), or "historical resources," as defined by Title 14 CCR §15064.5(a)(1)-(3), that may exist in or near the APE. In order to identify such properties, CRM TECH conducted a historical/archaeological resources records search, pursued historical and geoarchaeological background research, contacted Native American representatives, and carried out an intensive-level field survey of the entire APE.

The results of these research procedures indicate that the existing channel in the APE was built in the 1941-1953 era, most likely during the expansion of March Army Air Field (now March Air Reserve Base) in the early 1940s. In light of its age, the channel was recorded into the California Historical Resources Inventory as Site 33-028200 (CA-RIV-12721) during this study, but it does not appear to meet any of the criteria for listing in the National Register of Historic Places or the California Register of Historical Resources. Therefore, it does not meet the definition of a "historic property" or a "historical resource." No other potential "historic properties" or "historic resources" of either prehistoric or historical origin were encountered during this study, and the subsurface sediments within the APE appear to be low in sensitivity for potentially significant archaeological deposits.

Based on these findings, and pursuant to 36 CFR 800.4(d)(1) and Calif. PRC §21084.1, CRM TECH recommends to March JPA and USACE a conclusion that *no "historic properties" or "historical resources" will be affected by the proposed undertaking*. No further cultural resources investigation is recommended for the undertaking unless project plans undergo such changes as to include areas not covered by this study. However, if buried cultural materials are encountered during any earth-moving operations associated with the undertaking, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

INTRODUCTION

In July and August 2018, at the request of Lewis Retail Centers, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) for the proposed Cactus Avenue Drainage Channel Improvement Project on the northern edge of March Air Reserve Base (ARB), near the City of Moreno Valley, Riverside County, California (Fig. 1). The APE consists of the right-of-way of an approximately 1.5-mile segment of earthen drainage channel on the south side of Cactus Avenue between Graeber/Elsworth Street and Heacock Street, across Sections 13 and 14 of T3S R4W, San Bernardino Baseline and Meridian (Figs. 2, 3).

The study is part of the environmental review process for the undertaking, which entails primarily the conversion of the open ditch to an underground concrete culvert, along with minor improvements such as extending a number of existing storm drains. The APE is delineated to encompass the maximum extent of ground disturbance required for the undertaking and measures generally 80-100 feet in width. All construction staging and storage will occur within the footprint of an associated undertaking known as the K-4 Parcel Project, for which a cultural resources study is prepared under separate cover (Tang et al. 2018). The vertical extent of the APE, represented by the maximum depth of excavations required, will be 5.0 to 6.5 feet below the bottom of the existing channel, depending on the location.

The March Joint Powers Authority (JPA), as the lead agency, required the study in compliance with the California Environmental Quality Act (CEQA). In anticipation of future federal review of the undertaking by the United States Army Corps of Engineers (USACE), the study was also completed in compliance Section 106 of the National Historic Preservation Act (NHPA). The purpose of the study is to provide March JPA and USACE with the necessary information and analysis to determine whether the proposed undertaking would have an effect on any "historic properties," as defined by 36 CFR 800.16(l), or "historical resources," as defined by Title 14 CCR §15064.5(a)(1)-(3), that may exist in or near the APE.

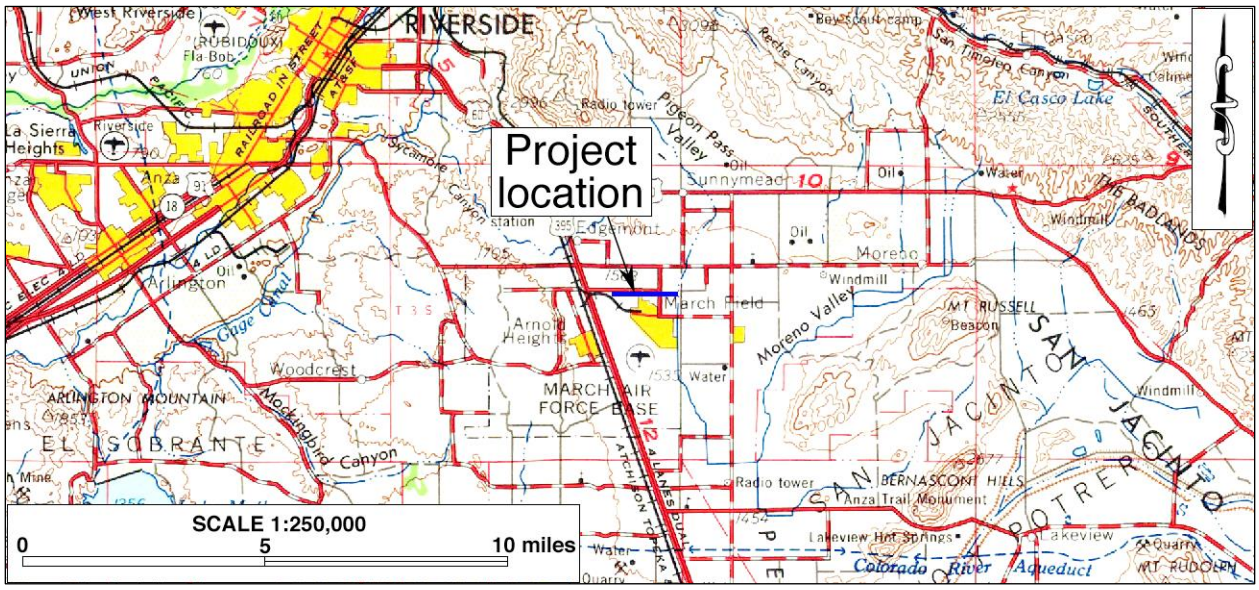

Figure 1. Project vicinity. (Based on USGS Santa Ana quadrangle [USGS 1979])

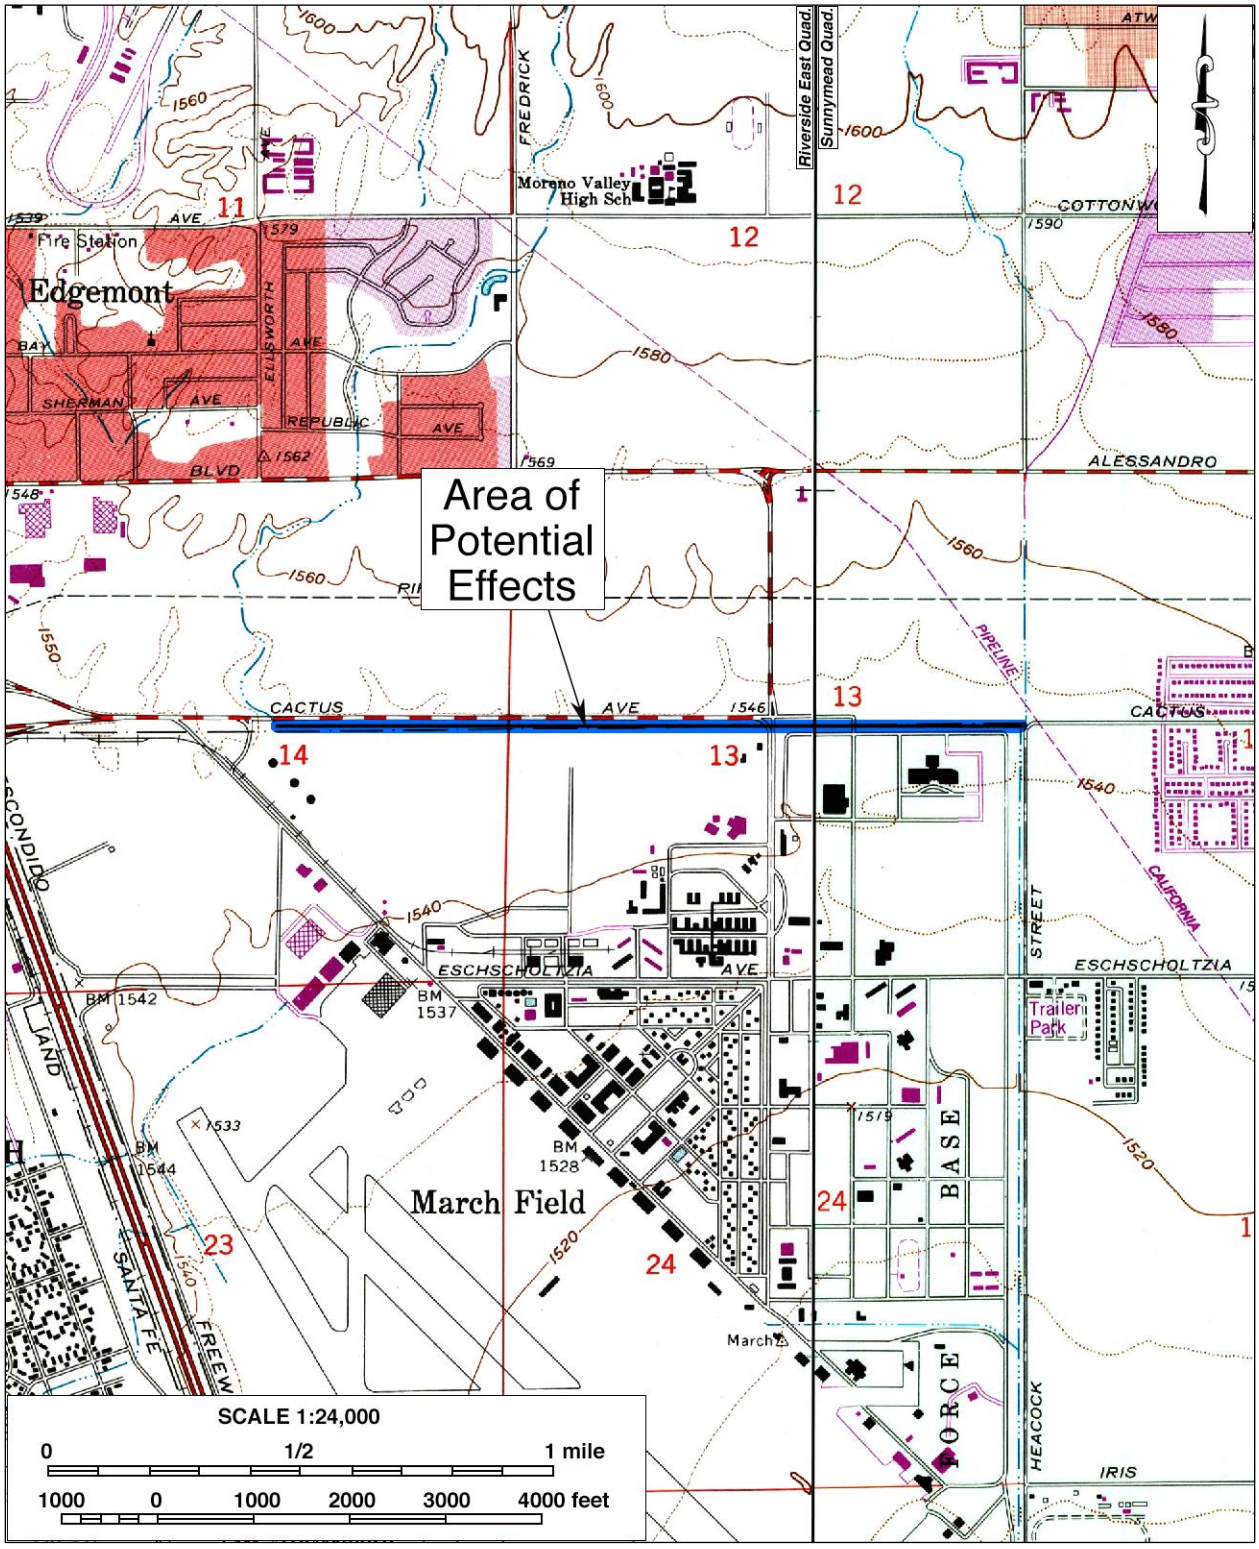

Figure 2. Project location. (Based on USGS Riverside East and Sunnymead, Calif., 1:24,000 quadrangles [USGS 1980a; 1980b])

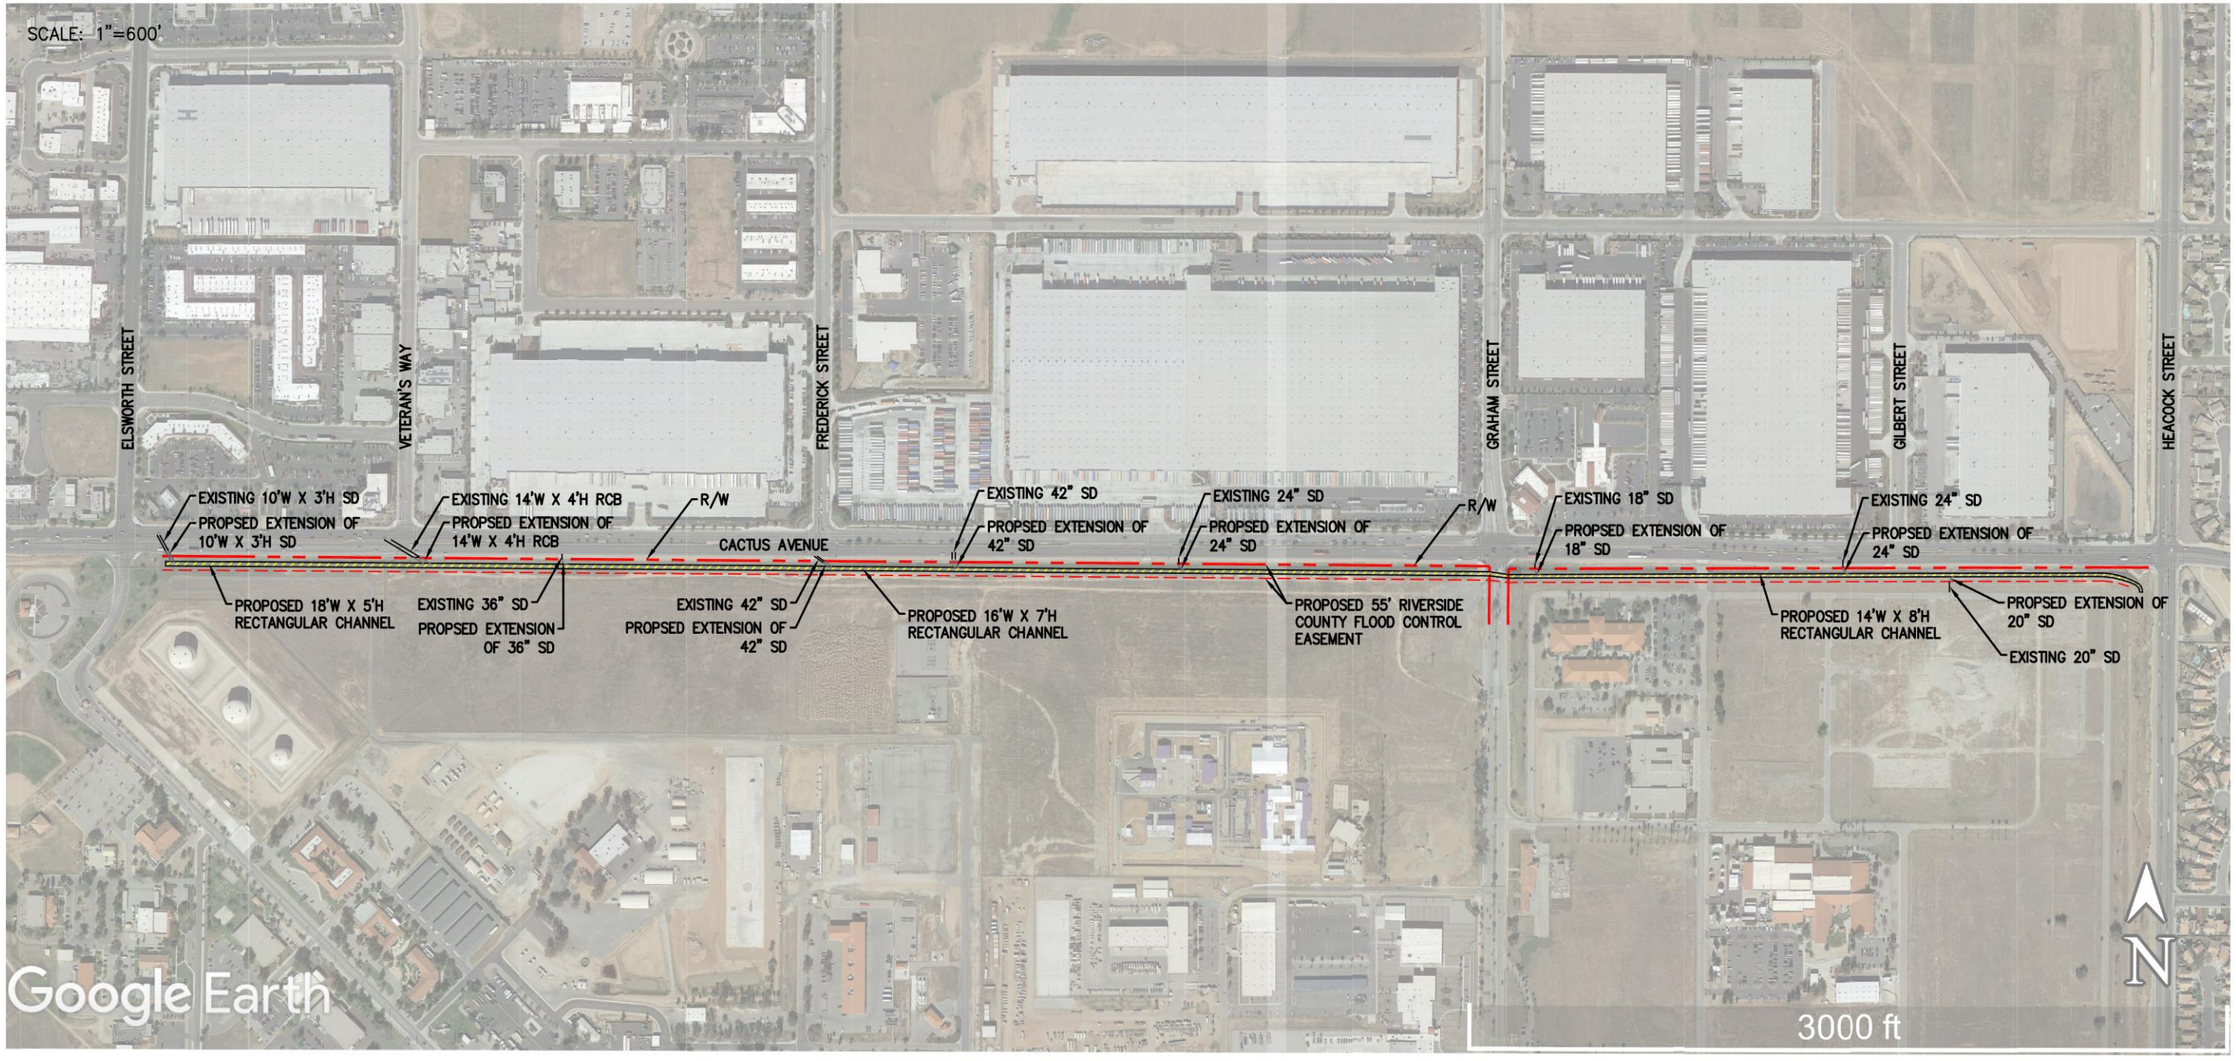

Figure 3. Project plans and aerial view of the project location.

In order to identify such properties, CRM TECH conducted a historical/archaeological resources records search, pursued historical and geoarchaeological background research, contacted Native American representatives, and carried out an intensive-level field survey of the entire APE. The following report is a complete account of the methods and results of the various avenues of research, and the final conclusion of the study.

SETTING

CURRENT NATURAL SETTING

The City of Moreno Valley occupies a lowland area in the northern portion of the Peninsular Ranges geomorphic province, surrounded by the Santa Ana Mountains on the southwest, the San Jacinto Mountains on the southeast, and the convergence of the San Gabriel and San Bernardino Mountain Ranges on the north. The natural landscape in the Peninsular Ranges province features a host of inland valleys divided by groups of rolling hills and rocky knolls. The mild Mediterranean climate of the region is typical of inland southern California lowlands, characterized by hot and dry summers and mild and wet winters. The average annual rainfall in the region is approximately 10 inches, the majority of which typically falls seasonally between December and March.

As stated above, the APE for this undertaking comprises entirely the right-of-way of the existing earthen drainage channel along the south side of Cactus Avenue. One of the major east-west thoroughfares and commercial corridors across the Moreno Valley area, Cactus Avenue serves as the boundary between the City of Moreno Valley and March ARB, and the perimeter fence of the base marks the southern limit of the APE (Fig. 4). Elevations along the APE range approximately from 1,520 feet to 1,550 feet above mean sea level (including the depth of the channel), and the topsoil generally consists of cemented brown silty-clay loam. Vegetation in the APE consists solely of the typical small grasses and shrubs, often in dense growth at the bottom of the channel (Fig. 4).

CULTURAL SETTING

Prehistoric Context

The earliest evidence of human occupation in western Riverside County was discovered below the surface of an alluvial fan in the northern portion of the Lakeview Mountains, some 12 miles southeast of the APE, with radiocarbon dates clustering around 9,500 B.P. (Horne and McDougall 2008). Another site found near the shoreline of Lake Elsinore, close to the confluence of Temescal Wash and the San Jacinto River, yielded radiocarbon dates between 8,000 and 9,000 B.P. (Grenda 1997). Additional sites with isolated Archaic dart points, bifaces, and other associated lithic artifacts from the same age range have been found in the nearby Cajon Pass area of San Bernardino County, roughly 25 miles to the northwest, typically atop knolls with good viewsheds (Basgall and True 1985; Goodman and McDonald 2001; Goodman 2002; Milburn et al. 2008).

The cultural prehistory of southern California has been summarized into numerous chronologies, including those developed by Chartkoff and Chartkoff (1984), Warren (1984), and others. Specifically, the prehistory of Riverside County has been addressed by O'Connell et al. (1974), McDonald et al. (1987), Keller and McCarthy (1989), Grenda (1993), Goldberg (2001), and Horne

Figure 4. Overview of the APE. (Photograph taken on July 27, 2018; view to the west from the eastern end)

and McDougall (2008). Although the beginning and ending dates of different cultural horizons vary regionally, the general framework of the prehistory of western Riverside County can be broken into three primary periods:

- Paleoindian Period (ca. 18,000-9,000 B.P.): Native peoples of this period created fluted spearhead bases designed to be hafted to wooden shafts. The distinctive method of thinning bifaces and spearhead preforms by removing long, linear flakes leaves diagnostic Paleoindian markers at tool-making sites. Other artifacts associated with the Paleoindian toolkit include choppers, cutting tools, retouched flakes, and perforators. Sites from this period are very sparse across the landscape and most are deeply buried.
- Archaic Period (ca. 9,000-1,500 B.P.): Archaic sites are characterized by abundant lithic scatters of considerable size with many biface thinning flakes, bifacial preforms broken during manufacture, and well-made groundstone bowls and basin metates. As a consequence of making dart points, many biface thinning waste flakes were generated at individual production stations, which is a diagnostic feature of Archaic sites.
- Late Prehistoric Period (ca. 1,500 B.P.-contact): Sites from this period typically contain small lithic scatters from the manufacture of small arrow points, expedient groundstone tools such as tabular metates and unshaped manos, wooden mortars with stone pestles, acorn or mesquite bean granaries, ceramic vessels, shell beads suggestive of extensive trading networks, and steatite implements such as pipes and arrow shaft straighteners.

Ethnohistoric Context

According to current ethnohistorical scholarship, the traditional territories of several Native American groups, including the Luiseño, the Serrano, the Gabrielino, and the Cahuilla, overlapped one another in the present-day Riverside-San Bernardino region during the Late Prehistoric Period,

but the Moreno Valley area is generally recognized as a part of the traditional homeland of the Luiseño, a Takic-speaking people whose territory extended from present-day Riverside to Escondido and Oceanside. The name of the group derived from Mission San Luis Rey, which held jurisdiction over most of the traditional Luiseño territory during the late 18th and early 19th centuries. In modern anthropological literature, the leading sources on Luiseño culture and history are Kroeber (1925), Strong (1929), and Bean and Shipek (1978).

Anthropologists have divided the Luiseño into several autonomous lineages or kin groups, which represented the basic political unit among most southern California Indians. According to Bean and Shipek (1978:551), each Luiseño lineage possessed a permanent base camp, or village, on the valley floor and another in the mountain regions for acorn collection. Luiseño villages were made up of family members and relatives, where chiefs of the village inherited their rank and each village owned its own land. Villages were usually located in sheltered canyons or near year-round sources of freshwater, always near subsistence resources.

The Luiseño exploited nearly all resources of the environment in a highly developed seasonal mobility system. The Luiseño people were primarily hunters and gatherers. They collected seeds, roots, wild berries, acorns, wild grapes, strawberries, wild onions, and prickly pear cacti, and hunted deer, elks, antelopes, rabbits, wood rats, and a variety of insects. Bows and arrows, atlatls or spear throwers, rabbit sticks, traps, nets, clubs, and slings were the main hunting tools. Each lineage had exclusive hunting and gathering rights in their procurement ranges. These boundaries were respected and only crossed with permission (Bean and Shipek 1978:551).

It is estimated that when Spanish colonization of Alta California began in 1769, the Luiseño had approximately 50 active villages with an average population of 200 individuals each, although other estimates place the total Luiseño population at 4,000-5,000 (Bean and Shipek 1978:557). Some of the villages were forcefully moved to the Spanish missions, while others were left largely intact (*ibid.*:558). Ultimately, Luiseño population declined rapidly after European contact because of diseases such as smallpox and harsh living conditions at the missions and, later, on the Mexican ranchos, where the Native people often worked as seasonal ranch hands.

After the American annexation of Alta California, the large number of non-Native settlers further eroded the foundation of traditional Luiseño society. During the latter half of the 19th century, almost all of the remaining Luiseño villages were displaced, their occupants eventually removed to the various reservations. Today, the nearest Native American groups of Luiseño heritage live on the Soboba, Pechanga, and Pala Indian Reservations.

Historic Context

In comparison to other nearby cities like Riverside and San Jacinto, the City of Moreno Valley is a "late-boomer" both in early development in the 19th century and in urban growth in the 20th. By the mid-19th century, the area that constitutes today's Moreno Valley remained essentially uninhabited despite its location on a plain surrounded by several large Mexican land grants. In 1853-1855, when the U.S. government initiated the first official land survey in southern California, the only man-made features observed in the area were a few roads crisscrossing the desert floor, including a wagon road from San Bernardino to Temecula, a second one leading to San Jacinto, and several unidentified roads or trails (GLO 1856a).

The present-day Moreno Valley area remained unclaimed public land until 1870, when a 13,471-acre tract was purchased from the U.S. government in a single transaction (BLM n.d.). It was on this vast acquisition that the 11,560-acre Alessandro Tract and the town of Alessandro, which is occupied by March ARB today, were laid out and offered to settlers in 1887 during a land boom that swept through southern California in the 1880s (Gunther 1984:11). After this initial development scheme failed, the developers of Redlands in San Bernardino County, fresh from their acclaimed success in creating the Bear Valley reservoir and the thriving Redlands colony, took over the Alessandro Tract with the intention of irrigating the land with an elaborate water system (*ibid.*).

Water from the Bear Valley reservoir reached the Moreno Valley area in 1891, ushering in a few years of prosperity. Two more communities formed during this brief boom: New Haven, soon to be renamed Moreno, and Midland, also known as Armada (Gunther 1984:323, 333). The boom turned to bust during the drought of the late 1890s, when Bear Valley water was no longer delivered to the Moreno Valley area. As a result, the once flourishing towns in the area were largely abandoned, and many of the buildings were taken up and moved to Riverside (*ibid.*:13, 334).

During the early 20th century, the Moreno Valley area began to recover slowly. In 1912, a 1,100-acre portion of the original Alessandro Tract was re-subdivided as the Sunnymead Orchard Tract (County of Riverside 1912), and thus the community formerly known as Midland or Armada became Sunnymead. A decade later, a series of land development projects began just to the west of Sunnymead, which ultimately resulted in the establishment of the community of Edgemont (County of Riverside 1927; Gunther 1984:171-172).

Despite these development efforts, Moreno Valley's economic prospect was severely hampered by the lack of reliable water supply until 1973, after the completion of the California Aqueduct and its southern terminus, Lake Perris (Gunther 1984:334). Since then, the promise of affordable housing brought an influx of commuters to the Moreno Valley area, facilitating growth and urbanization. By 1984, when residents in the communities of Moreno, Sunnymead, and Edgemont voted to incorporate as the City of Moreno Valley, the new city had already become the second most populous in Riverside County (*ibid.*), thanks mainly to its attraction as a "bedroom community."

In the project vicinity, in contrast, the establishment of the U.S. Army's Alessandro Aviation Field in 1918 began a long history of military installations, a tradition that was reinforced by the WWII-era Camp Haan and carried to the present time by March ARB (formerly March Air Force Base). In more recent times, the area around project location has undergone a gradual transition to an industrial/commercial "park," largely because of its convenient location in close proximity to the Interstate Highway 215 corridor.

RESEARCH METHODS

RECORDS SEARCH

On July 19, 2018, CRM TECH archaeologist Nina Gallardo (see App. 1 for qualifications) completed the records search at the Eastern Information Center (EIC). Located at the University of

California, Riverside, the EIC is the State of California's official cultural resource records repository for the County of Riverside. During the records search, Gallardo examined maps and records on file at the EIC for previously identified cultural resources and existing cultural resources reports within a one-mile radius of the APE. Previously identified cultural resources include properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Historic Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resources Inventory.

NATIVE AMERICAN PARTICIPATION

Prior to the commencement of this study, CRM TECH submitted a written request to the State of California Native American Heritage Commission (NAHC) for a Sacred Lands File records search on a property adjacent to the APE, and the NAHC's reply was used to identify known Native American cultural resources in the vicinity and local tribes to contact regarding the current undertaking. Following the NAHC's recommendations and previously established consultation protocol, CRM TECH sought consultation with 17 tribal representatives in the region in writing as well as by telephone between July 18 and August 3, 2018, for further information on Native American cultural resources in the project vicinity. In addition, on July 23 CRM TECH notified the nearby Soboba Band of Luiseño Indians and Pechanga Band of Luiseño Indians of the upcoming archaeological fieldwork and invited tribal participation. The correspondence between CRM TECH and the Native American representatives is attached as Appendix 2.

HISTORICAL BACKGROUND RESEARCH

Historical background research for this study was conducted by CRM TECH historian Terri Jacquemain (see App. 1 for qualifications) for the purpose of establishing a historical context for the APE and ascertaining the history of the existing drainage channel. In addition to published literature in local history, sources consulted during the research included archival records of the County of Riverside, various online genealogical databases, U.S. General Land Office (GLO) land survey plat maps dated 1856, U.S. Geological Survey (USGS) topographic maps dated 1901-1980, and aerial photographs taken in 1938-2012. In an effort to locate archival records pertaining to the construction and maintenance of the channel, Jacquemain also contacted staff members of the March JPA Planning Department.

GEOARCHAEOLOGICAL ANALYSIS

As part of the research procedures, CRM TECH principal investigator/archaeologist Michael Hogan (see App. 1 for qualifications) pursued geoarchaeological analysis to assess the APE's potential for the deposition and preservation of subsurface cultural deposits from the prehistoric period, which could not be determined through standard surface archaeological survey procedures. Sources consulted for this purpose included a geotechnical exploration report completed for the adjacent K-4 Parcel Project (Leighton 2018) as well as topographic, geologic, and soil maps pertaining to the surrounding area (e.g., Morton et al. 2001a; 2001b). Findings from these sources were used to develop a geomorphologic history of the APE and address the geoarchaeological sensitivity of the vertical APE.

FIELD SURVEY

On July 27, 2018, CRM TECH archaeologist Salvadore Boites (see App. 1 for qualifications) carried out the field survey of the APE with the assistance of Native American monitor Talitha Arceo from the Soboba Band of Luiseno Indians. In light of the narrow, linear configuration of the APE, the survey was conducted by walking a transect on each side of the existing channel for the entire length of the APE. In this way all of the ground surface within the APE was systematically and carefully examined for any evidence of human activities dating to prehistoric or historic period (i.e., 50 years or older).

Ground visibility ranged from greater than 80% on the topsides and slopes of the channel to less than 5% at the bottom, due to vegetation grown and dumped refuse items. In light of the extensively disturbed condition of the ground surface thought the APE, the visibility was deemed adequate for this study. As a part of the fieldwork, Boites made detailed notations, photo-documentation, and scaled sketches of the drainage channel, and the field data were then compiled on standard archaeological site record forms for submittal to the EIC and inclusion in the California Historical Resources Inventory (see App. 3).

RESULTS AND FINDINGS

RECORDS SEARCHES

According to EIC records, the APE was entirely or partially included in as many as six previous cultural resources studies (Fig. 5), but all but one of them were completed between 1991 and 2008 and are thus considered outdated for regulatory compliance purposes today. In any event, the APE was not the focus of any of those studies, and the only recent study, completed in 2014, focused on a similar drainage channel along Heacock Street and included only the easternmost fraction of the current APE. That channel, which evidently predates 1939 (USGS 1943), was not addressed in the 2014 study as a potential "historic property" or "historical resource" (Gust et al. 2014), and no historical/archaeological resources were recorded within or adjacent to the APE during any of the six previous studies.

Outside the APE but within the scope of the records search, EIC records show 44 other previous cultural resources studies on various tracts of land and linear features, which collectively covered roughly half of the land within the one-mile scope, mostly within the boundaries of March ARB (Fig. 5). As a result of these and other similar studies in the vicinity, 245 historical/archaeological sites and one isolate—i.e., a locality with fewer than three artifacts—have been identified within one mile of the APE (see App. 3). One the 245 sites consisted of archaeological remains of WWII-era buildings, and the other 244 all represented built-environment features.

Among these localities, only the isolate was of prehistoric—i.e., Native American—origin, consisting of a bifacial mano fragment found on the ground more than a half-mile south of the eastern portion of the APE. All 245 of the sites dated to the historic period and included a farm, the former California Southern Railway (a Santa Fe Railway subsidiary), two canals/channels unrelated to the one in the APE, structural remains from Camp Haan, and a large number of buildings and structures. The nearest one among them, 33-017972, was recorded more than 300 feet south of the

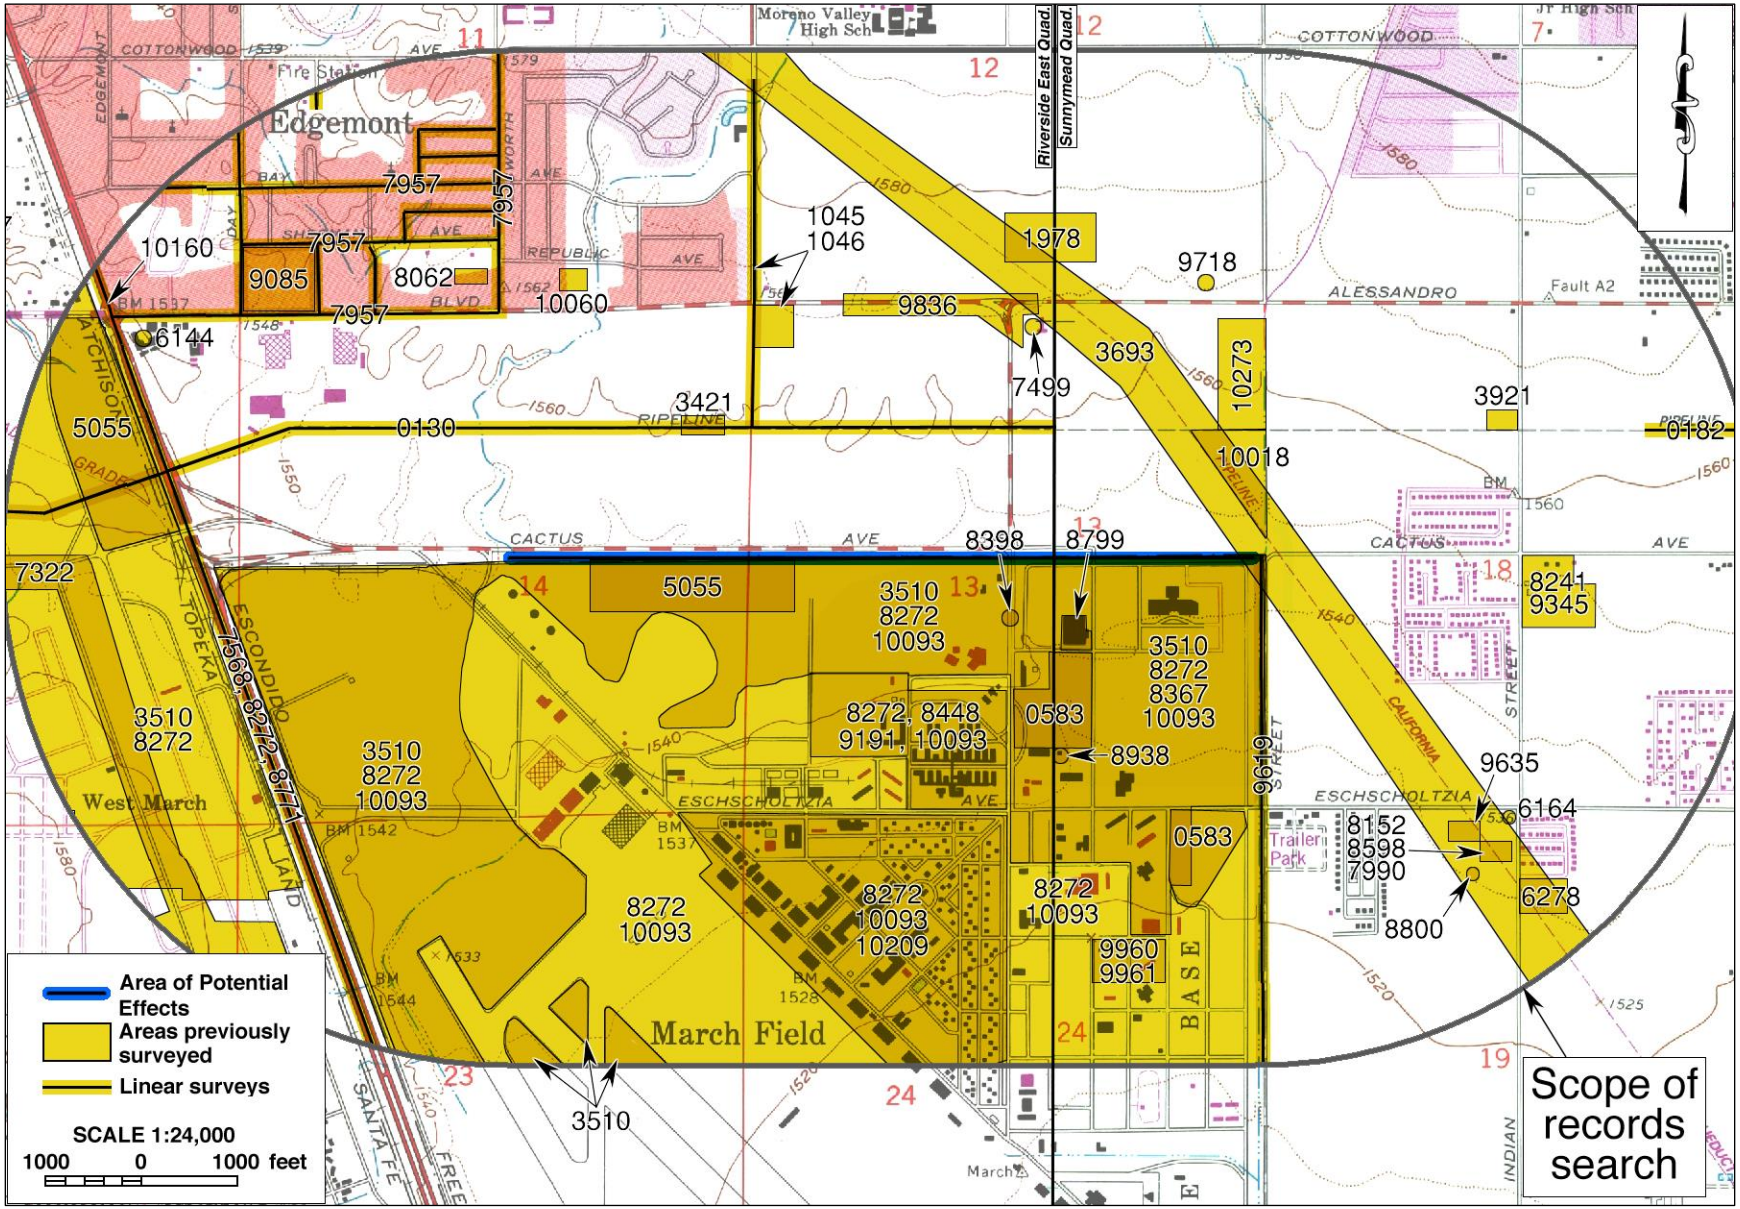

Figure 5. Previous cultural resources studies in the vicinity of the APE, listed by EIC file number. Locations of historical/archaeological sites are not shown as a protective measure.

APE (see App. 3). The vast majority of the buildings and structures were located in the March Field Historic District within March ARB, a National Register-listed property lying roughly a half-mile to the south of the APE. Since none of these known cultural resources was found within or adjacent to the APE, none of them requires further consideration during this study.

NATIVE AMERICAN PARTICPATION

In a letter dated May 17, 2018, the NAHC stated that the sacred lands record search identified no Native American cultural resources in the vicinity of the APE. However, the NAHC indicated the area to be sensitive for such resources and recommended further contact with local Native American groups for additional information. For that purpose, the NAHC provided a list of potential contacts in the region (see App. 2). For this study, CRM TECH sent written requests for comments to all of the tribes on the referral list that are affiliated with the Luiseño group and/or the nearby Cahuilla and Serrano groups (see App. 2). In addition to or in lieu of some of the individuals recommended by the NAHC, the following designated spokespersons for the tribes were also contacted:

- Judy Stapp, Director of Cultural Affairs, Cabazon Band of Mission Indians;
- Bobby Ray Esparza, Cultural Coordinator, Cahuilla Band of Indians;
- Raymond Huaute, Tribal Historic Preservation Officer, Morongo Band of Mission Indians;
- Chris Devers, Cultural Liaison, Pauma Band of Luiseño Indians;
- Tuba Ebru Ozdil, Planning Specialist, Pechanga Band of Luiseño Indians;
- Destiny Colocho, Tribal Historic Preservation Officer, Rincon Band of Luiseño Indians;
- Gabriella Rubalcava, Environmental Director, Santa Rosa Band of Cahuilla Indians.

In all, 17 individuals from a total of 16 tribal organizations were contacted via both U.S. mail and e-mail on July 18, 2018, followed by telephone calls on August 1-3. As of this time, nine of the tribes have responded in writing, and another has provided their comment by telephone (see App. 2). Among them, Tuba Ebru Ozdil stated that the Pechanga Band of Luiseño Indians had no comments regarding the undertaking at this time, while Judy Stapp stated that the Cabazon Band of Mission Indians had no specific information on any Native American cultural resources in the APE. Jessica Mauk, Cultural Resources Analyst for the San Manuel Band of Mission Indians, noted that the APE was outside the tribe's ancestral territory and declined to participate in further consultations over this undertaking.

Destiny Colocho of the Rincon Band of Luiseño Indians and Victoria Martin, Tribal Secretary for the Augustine Band of Cahuilla Indians, also indicated that their tribes had no information on any Native American cultural resources in or near the APE. Ms. Colocho requested to review the records search results in this study, while Ms. Martin encouraged further consultation with other tribes in the vicinity and monitoring during ground-disturbing activities in the APE. In addition, Ms. Martin requested to be notified immediately if any Native American cultural resources were discovered during the undertaking, as did Chris Devers of the Pauma Band of Luiseño Indians.

In their replies, Katie Croft, Cultural Resources Manager for the Agua Caliente Band of Cahuilla Indians, Bobby Ray Esparza of the Cahuilla Band of Indians, and the Morongo Tribal Historic Preservation Office identified the APE as a part of their tribes' traditional use area. Mr. Esparza stated that the tribe was not aware of any Native American cultural resources in or near the APE but

requested that tribal monitors be present during all ground-disturbing activities for the undertaking. Ms. Croft and the Morongo Tribal Historic Preservation Office both requested copies of the completed cultural resources study for tribal review.

As mentioned above, the Soboba Band of Luiseño Indians, the nearest tribe of Luiseño heritage, participated in the field survey of the APE on July 27, 2018. In a subsequent written response, Tribal Historic Preservation Officer Joseph Ontiveros also identified the APE to be a part of the tribe's traditional use area and found the location to be culturally sensitive. The Soboba Band requested to participate in further consultation with Lewis Retail Centers, March JPA, and USACE, and to monitor future ground-disturbing activities associated with the undertaking. In addition, Mr. Ontiveros stated that an in-house database search identified "multiple areas of potential impacts" and offered to share specific information during future consultation with March JPA and USACE.

HISTORICAL BACKGROUND RESEARCH

Historic maps from the mid-1850s, when the U.S. government conducted the first systematic land surveys in the Moreno Valley-Riverside area, show that the only notable man-made feature observed in the project vicinity at the time was a "Wagon Road to Timicula," which extended from San Bernardino to Temecula along a generally north-south alignment across the western end of the APE (Fig. 6). By the late 1890s, the project vicinity was occupied by a regular grid of roads but no settlements or buildings, while the main transportation corridor had moved further west to the Atchison, Topeka and Santa Fe (now Burlington Northern Santa Fe) Railway (Fig. 7). Other than a few roads running north-south across the area and patches of agricultural fields, no man-made features were known to be present in or near the APE in the late 1940s (Fig. 8; Leighton 2018).

In 1941-1942, the U.S. government acquired from Mary H. Trautwein et al. several hundred acres in Sections 13 and 14 of T3S R4W, including the land "south of the centerline of Cactus Avenue" (County Assessor 1937-1948). The acquisition was undoubtedly a part of the expansion of what was then March Army Air Field in preparation for its wartime service as a bomber crew training facility that hosted as many as 75,000 troops (March ARB n.d.). Genealogical sources indicate that Mary Henrietta Trautwein (1916-1954) was born in Pennsylvania but was bought to the Pasadena area in California as an infant and later moved to Los Angeles (Ancestry.com n.d.). There is no evidence that any development or construction activities occurred in the vicinity of the APE during the Trautwein ownership.

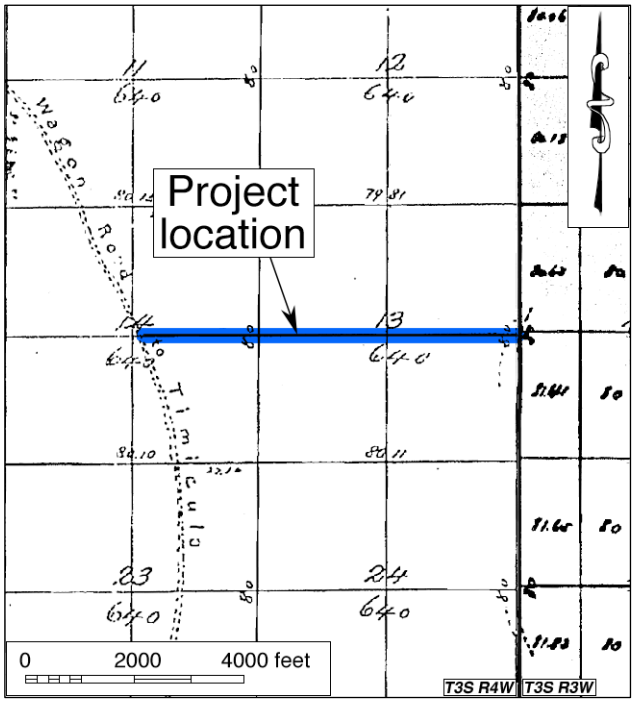

Figure 6. The APE and vicinity in 1853-1855. (Source: GLO 1856a; 1856b)

As the result of the 1941-1942 expansion, March Army Air Field was doubled in size (March

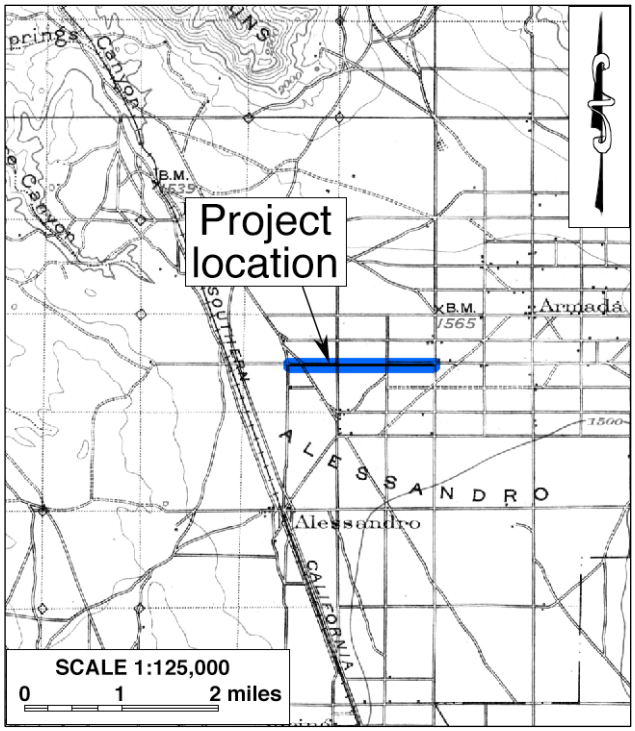

Figure 7. The APE and vicinity in 1897-1898. (Source: USGS 1901)

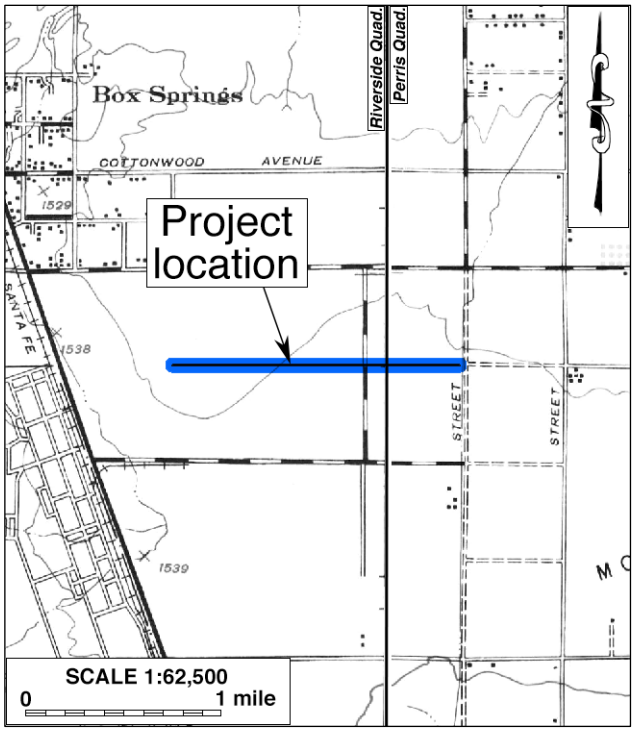

Figure 8. The APE and vicinity in 1939. (Source: USGS 1942; 1943)

ARB n.d.). By 1953, March Air Force Base, as the installation was renamed in 1947, had reached its current perimeters in the vicinity of the APE, and the drainage channel in the APE was evidently in existence as of 1949 (Figs. 8, 9; LOR 2018). The channel was most likely excavated during the 1941-1942 expansion to convey seasonal storm runoff from the north to the preexisting channel along Heacock Street to the east (Fig. 8) and around the perimeter of the base. Other than the channel, the only man-made feature known to extend into the APE in the 1949-1978 era was the forerunner of present-day Graham Street/Riverside Drive, which crosses the project alignment in the north-south direction (RCFCWCD 1960; LOR 2018).

The segment of Cactus Avenue between Graham Street/Riverside Drive and present-day Highway 215 was turned into a paved road sometime between 1953 and 1966, and the road was extended further east to Fourth Street in 1966-1967 and finally to Heacock Street in 1978-1994 (Figs. 2, 9, 10; NETR Online 1966-1994; LOR 2018). These projects may have had some impact on the current configuration and appearance of the channel, but the extent of the impact is unclear due to the lack of specific documentation. Today, the right-of-way for the channel remains the property of March ARB (County of Riverside n.d.). However, inquiries to the March JPA Planning Department have so far yielded no archival records pertaining to the construction, modifications, and maintenance of the channel.

GEOARCHAEOLOGICAL ANALYSIS

The surface geology of the entire APE was mapped by Morton et al. (2001a; 2001b) as *Qvof*$_a$. Defined as very old alluvial fan deposits from the early Pleistocene age (circa 2.6-0.8 million years

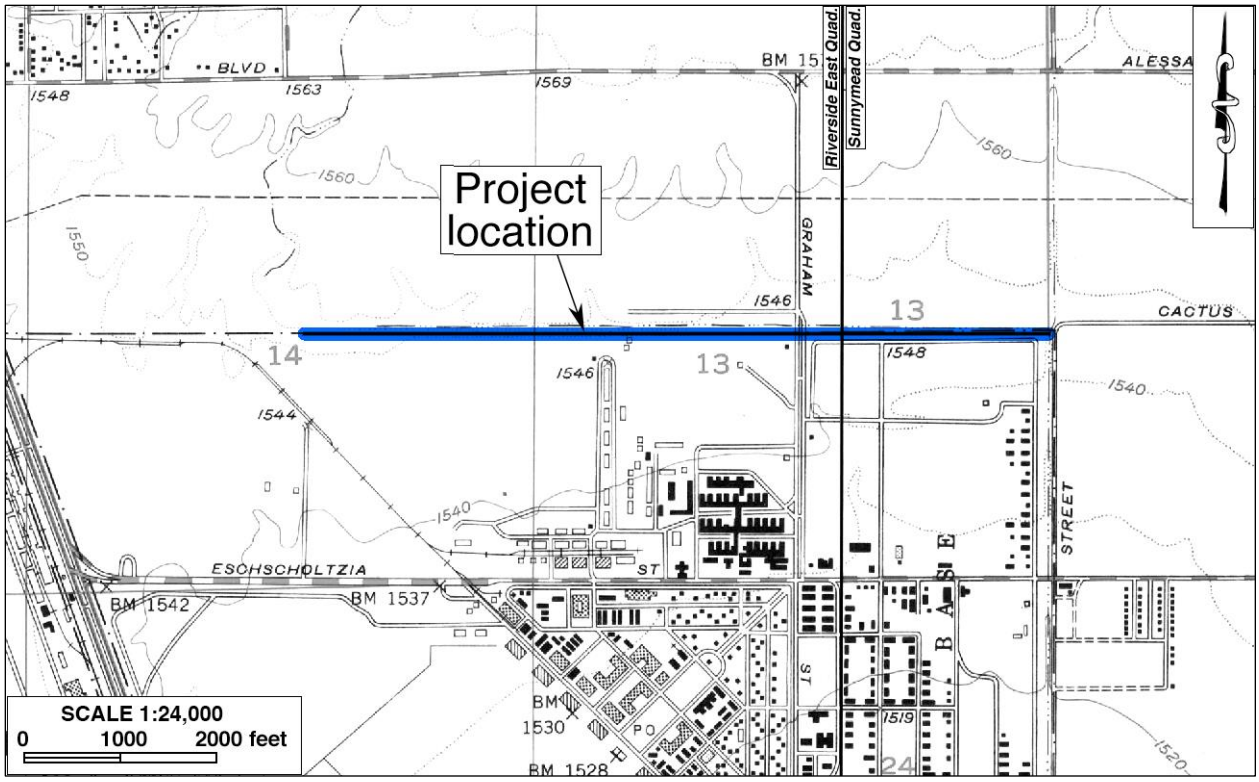

Figure 9. The APE and vicinity in 1951-1953. (Source: USGS 1953a; 1953b)

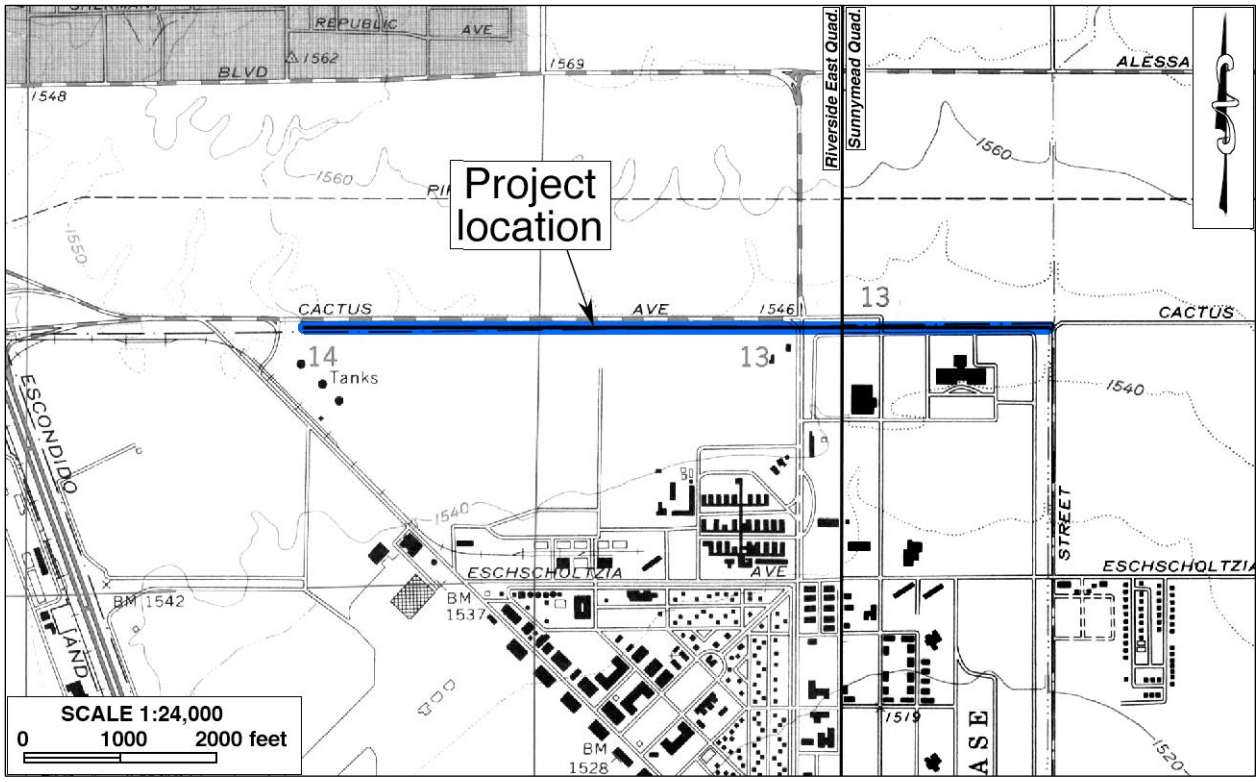

Figure 10. The APE and vicinity in 1966-1967. (Source: USGS 1967a; 1967b)

ago) that forms widespread deposits north and south of Moreno Valley, $Qvof_a$ is characterized as mostly well-dissected, well-indurated, reddish-brown, and very coarse through very fine sands mixed with a minor gravel component. The geotechnical analysis for the adjacent K-4 Parcel Project (Leighton 2018) characterized the soil in the vicinity as a combination of undocumented artificial fill and the older alluvium. The artificial fill was noted mostly along Cactus Avenue and the existing drainage channel (*ibid.*:28-37).

According to existing ethnographic literature on Luiseño culture, "villages were usually in sheltered coves or canyons, on the side of slopes in a warm thermal zone, near good water supplies, and in defensive locations" (Bean and Shipek 1978:551). This is corroborated by observations made during numerous past studies that CRM TECH has completed in the Inland Empire region since 1993, which suggest that longer-term residential settlements of the Native population were more likely to occur near the base of hills and/or on elevated terraces or ridges near creeks or springs, while the level, unprotected valley floor was used mainly for resource procurement, travel, and occasional camping during these activities.

Based on this settlement pattern, the location of the APE, on an alluvial fan subject to occasional flooding but nearly 10 miles from any relatively steady streams, would not have provided a favorable setting for permanent or long-term habitation by the aboriginal population during prehistoric times. Instead, the area was more likely used as a travel route and for opportunistic sustenance activities, where surviving cultural remains are typically limited to the ground surface and shallow deposits.

In its current state, the APE has been heavily disturbed by construction activities associated with the channel and Cactus Avenue, and the surface and near-surface soils are mainly artificial fill. These soils offer a highly unlikely environment for any prehistoric archaeological deposits to survive intact. At depth, the early Pleistocene alluvial fan deposits well predate human habitation in California and would not be expected to contain deeply buried cultural materials. Overall, the proposed undertaking appears to have a minimal potential to impact any subsurface archaeological remains in the vertical APE.

FIELD SURVEY

During the field survey, the segment of the drainage channel in the APE was recorded into the California Historical Resources Inventory and subsequently designated by the EIC as Site 33-028200 (CA-RIV-12721; see App. 4). The channel measures approximately 41-47 feet wide across the top, 13-18 feet wide across the bottom, and 6-24 feet deep, with steep, sloping sides that show signs of erosion due to periodic flooding (Fig. 4). As a typical and unremarkable open earthen ditch, it demonstrates no distinctively historical characteristics or features.

Beside the channel, several streets lying across or adjacent to the APE are also known to date to the late historic period, namely Riverside Drive, Fourth Street, and Cactus Avenue. However, their current configuration and appearance reflect the results of repeated upgrading and constant maintenance over the years, and none of them retains any distinctively historical character. As working components of the modern transportation infrastructure, these streets are not considered potential "historic properties" or "historical resources," and require no further study.

No other buildings, structures, objects, sites, features, or artifacts more than 50 years of age were encountered within the APE, and no remnants of the 1850s "Wagon Road to Timicula" or any associated artifacts were observed across the APE. The APE is devoid of any bedrock outcrops, which often contain bedrock milling features, the most common type of prehistoric archaeological sites to be found in the Moreno Valley area, nor was any other indication of prehistoric or historical cultural remains observed during the field survey. As mentioned above, the ground surface in the APE has been extensively disturbed in the past, and it is currently littered with small piles of rubble and a larger pile of asphalt near Riverside Drive, interspersed with modern refuse. None of these items is of any historical/archaeological interest.

MANAGEMENT CONSIDERATIONS

APPLICABLE STATUTORY/REGULATORY FRAMEWORK

Section 106 of NHPA mandates that federal agencies take into account the effects of their undertakings on historic properties and seek ways to avoid, minimize, or mitigate any adverse effects on such properties (36 CFR 800.1(a)). Similarly, CEQA establishes that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment" (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired."

The purpose of this study is to identify any "historic properties" or "historical resources" that may exist within the APE. "Historic properties," as defined by the Advisory Council on Historic Preservation, include "prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior" (36 CFR 800.16(l)). The eligibility for inclusion in the National Register is determined by applying the following criteria, developed by the National Park Service as per provision of NHPA:

> The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and
> (a) that are associated with events that have made a significant contribution to the broad patterns of our history; or
> (b) that are associated with the lives of persons significant in our past; or
> (c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
> (d) that have yielded, or may be likely to yield, information important in prehistory or history. (36 CFR 60.4)

For CEQA-compliance considerations, the State of California's Public Resources Code (PRC) establishes the definitions and criteria for "historical resources," which require similar protection to what NHPA Section 106 mandates for historic properties. "Historical resources," according to PRC §5020.1(j), "includes, but is not limited to, any object, building, site, area, place, record, or

manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California."

More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the lead agency (Title 14 CCR §15064.5(a)(1)-(3)). Regarding the proper criteria for the evaluation of historical significance, CEQA guidelines mandate that "generally a resource shall be considered by the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

A local register of historical resources, as defined by PRC §5020.1(k), "means a list of properties officially designated or recognized as historically significant by a local government pursuant to a local ordinance or resolution." For properties in the County of Riverside, the County maintains a list of officially designated Historic Landmarks, but the lead local agency for this undertaking, namely March JPA, does not maintain its own register of officially designated or recognized historical resources, nor has it implemented any additional regulations or guidelines to be applied to cultural resources under its jurisdiction.

DISCUSSION

In summary of the research results presented above, the earthen drainage channel recorded as Site 33-028200 during this study dates to the 1941-1953 era, most likely the early 1940s. Evidently excavated during the expansion of March Army Air Field, the channel is a peripheral feature associated with the establishment the large WWII-era military base, but does not demonstrate a unique or particularly close association with that event or with any other events (Criterion A/1) or persons (Criterion B/2) of recognized historic significance. Simple in design and utilitarian in character, the channel does not stand out as an important example of any style, type, period, region, or method of construction, nor is it known to represent the work of a prominent architect, designer, engineer, or builder (Criterion C/3). Finally, as a late-historic-period infrastructure feature of standard construction, it demonstrates little potential for any important historical/archaeological information (Criterion D/4).

Based on these considerations, and in light of the criteria listed above, the drainage channel at Site 33-028200 does not appear to meet any of the criteria for listing in the National Register of Historic Places or the California Register of Historical Resources, and does not qualify as a "historic property" or a "historical resource." No other potential "historic properties" or "historical resources"

of either prehistoric or historical origin were identified throughout the various avenues of research. Therefore, the present study concludes that no "historic properties" or "historical resources" are present within to the APE.

CONCLUSION AND RECOMMENDATIONS

In conclusion, the results of this study indicate that no "historic properties" or "historical resources" are known to be present within the APE, and the subsurface sediments in the APE appear to be low in sensitivity for potentially significant archaeological deposits. Based on these findings, and pursuant to 36 CFR 800.4(d)(1) and Calif. PRC §21084.1, CRM TECH presents the following recommendations to March JPA and USACE:

- No "historic properties" or "historical resources" will be affected by the proposed undertaking.
- No further cultural resources investigation will be necessary for the undertaking unless project plans undergo such changes as to include areas not covered by this study.
- If buried cultural materials are inadvertently discovered during earth-moving operations associated with the undertaking, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the find.

APPENDIX 1:
PERSONNEL QUALIFICATIONS

PRINCIPAL INVESTIGATOR, HISTORY
Bai "Tom" Tang, M.A.

Education

1988-1993	Graduate Program in Public History/Historic Preservation, UC Riverside.
1987	M.A., American History, Yale University, New Haven, Connecticut.
1982	B.A., History, Northwestern University, Xi'an, China.
2000	"Introduction to Section 106 Review," presented by the Advisory Council on Historic Preservation and the University of Nevada, Reno.
1994	"Assessing the Significance of Historic Archaeological Sites," presented by the Historic Preservation Program, University of Nevada, Reno.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside/Colton, California.
1993-2002	Project Historian/Architectural Historian, CRM TECH, Riverside, California.
1993-1997	Project Historian, Greenwood and Associates, Pacific Palisades, California.
1991-1993	Project Historian, Archaeological Research Unit, UC Riverside.
1990	Intern Researcher, California State Office of Historic Preservation, Sacramento.
1990-1992	Teaching Assistant, History of Modern World, UC Riverside.
1988-1993	Research Assistant, American Social History, UC Riverside.
1985-1988	Research Assistant, Modern Chinese History, Yale University.
1985-1986	Teaching Assistant, Modern Chinese History, Yale University.
1982-1985	Lecturer, History, Xi'an Foreign Languages Institute, Xi'an, China.

Cultural Resources Management Reports

Preliminary Analyses and Recommendations Regarding California's Cultural Resources Inventory System (with Special Reference to Condition 14 of NPS 1990 Program Review Report). California State Office of Historic Preservation working paper, Sacramento, September 1990.

Numerous cultural resources management reports with the Archaeological Research Unit, Greenwood and Associates, and CRM TECH, since October 1991.

PRINCIPAL INVESTIGATOR, ARCHAEOLOGY
Michael Hogan, Ph.D., RPA*

Education

1991	Ph.D., Anthropology, University of California, Riverside.
1981	B.S., Anthropology, University of California, Riverside; with honors.
1980-1981	Education Abroad Program, Lima, Peru.
2002	Section 106—National Historic Preservation Act: Federal Law at the Local Level. UCLA Extension Course #888.
2002	"Recognizing Historic Artifacts," workshop presented by Richard Norwood, Historical Archaeologist.
2002	"Wending Your Way through the Regulatory Maze," symposium presented by the Association of Environmental Professionals.
1992	"Southern California Ceramics Workshop," presented by Jerry Schaefer.
1992	"Historic Artifact Workshop," presented by Anne Duffield-Stoll.

Professional Experience

2002-	Principal Investigator, CRM TECH, Riverside/Colton, California.
1999-2002	Project Archaeologist/Field Director, CRM TECH, Riverside.
1996-1998	Project Director and Ethnographer, Statistical Research, Inc., Redlands.
1992-1998	Assistant Research Anthropologist, University of California, Riverside
1992-1995	Project Director, Archaeological Research Unit, U. C. Riverside.
1993-1994	Adjunct Professor, Riverside Community College, Mt. San Jacinto College, U.C. Riverside, Chapman University, and San Bernardino Valley College.
1991-1992	Crew Chief, Archaeological Research Unit, U. C. Riverside.
1984-1998	Archaeological Technician, Field Director, and Project Director for various southern California cultural resources management firms.

Research Interests

Cultural Resource Management, Southern Californian Archaeology, Settlement and Exchange Patterns, Specialization and Stratification, Culture Change, Native American Culture, Cultural Diversity.

Cultural Resources Management Reports

Author and co-author of, contributor to, and principal investigator for numerous cultural resources management study reports since 1986.

Memberships

* Register of Professional Archaeologists; Society for American Archaeology; Society for California Archaeology; Pacific Coast Archaeological Society; Coachella Valley Archaeological Society.

PROJECT HISTORIAN/ARCHITECTURAL HISTORIAN
Terri Jacquemain, M.A.

Education

2004 M.A., Public History and Historic Resource Management, University of California, Riverside.
2002 B.S., Anthropology, University of California, Riverside.

Professional Experience

2003- Historian/Report Writer, CRM TECH, Riverside/Colton, California.
- Writer/co-author of cultural resources reports for CEQA and NHPA Section 106 compliance;
- Historic context development, historical/archival research, oral historical interviews, consultation with local historical societies;
- Historic building surveys and recordation, research in architectural history.

2002-2003 Teaching Assistant, Religious Studies Department, University of California, Riverside.
1997-2000 Reporter, *Inland Valley Daily Bulletin*, Ontario, California.
1991-1997 Reporter, *The Press-Enterprise*, Riverside, California.

Memberships

California Council for the Promotion of History.
Friends of Public History, University of California, Riverside.

PROJECT ARCHAEOLOGIST
Nina Gallardo, B.A.

Education

2004 B.A., Anthropology/Law and Society, University of California, Riverside.

Professional Experience

2004- Project Archaeologist, CRM TECH, Riverside/Colton, California.

Honors and Awards

2000-2002 Dean's Honors List, University of California, Riverside.

PROJECT ARCHAEOLOGIST
Salvadore Boites, M.A.

Education

2013	M.A., Applied Anthropology, California State University, Long Beach.
2003	B.A., Anthropology/Sociology, University of California, Riverside.

Professional Experience

2003-	Project Archaeologist, CRM TECH, Riverside/Colton, California.
2010-2011	Adjunct Instructor, Anthropology etc., Everest College, Anaheim, California.
2001-2002	Teaching Assistant, Moreno Elementary School, Moreno Valley, California.
1999-2003	Research Assistant, Anthropology Department, University of California, Riverside.

APPENDIX 2

CORRESPONDENCE WITH NATIVE AMERICAN REPRESENTATIVES*

* Seventeen local Native American representatives were contacted during this study, representing a total of 16 tribal organizations (highlighted in the NAHC referral list); a sample letter is included in the appendix.

RE: Proposed K-4 Parcel (CRM TECH No. 3347) Project, near the Community of Edgemont; Riverside East and Sunnymead USGS Quadrangles, Riverside County, California

Dear Ms. Gallardo:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results however the area within the APE provided is sensitive for cultural resources. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE.

Attached is a list of tribes culturally affiliated to the project area. I suggest you contact all of the listed Tribes. If they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton

RE: An Undertaking Involving the Channel along Cactus Avenue
Approximately 1.5 Linear Miles
Moreno Valley Area, Riverside County, California
CRM TECH Contract #3375

Dear Ms. Garcia-Plotkin:

In May 2018, CRM TECH began a cultural resources assessment on a property near the City of Moreno Valley (APNs 297-150-006, -007, 297-150-038, 297-160-005, and 297-200-004; see attached map). In response to CRM TECH's inquiry, the Native American Heritage Commission reported that the Sacred Lands File search was completed for the Area of Potential Effects with negative results. On May 18, 2018, a letter was sent to you requesting your input on potential Native American cultural resources in or near that APE.

Currently there is a proposed undertaking that entails construction work on a channel situated along the south side of Cactus Avenue, from Elsworth Street to Heacock Street, a distance of approximately 1.5 miles (see attached map). As part of the cultural resources study for this undertaking, we are writing to request your input on potential Native American cultural resources in and near the current APE or any concerns you may have regarding the undertaking.

Please respond at your earliest convenience if you have any specific knowledge of sacred/religious sites or other sites of Native American traditional cultural value in or near the APE, or any other information to consider during the cultural resources investigation. Any information or concerns may be forwarded to CRM TECH Native American liaison Nina Gallardo by telephone, facsimile, standard mail, or email (ngallardo@crmtech.us). Requests for documentation or information we cannot provide will be forwarded to our client and/or the lead agency, namely the March Joint Powers Authority.

Respectfully,

Sal Z. Boites
Project Archaeologist

Subject: Re: Scoping letter

Hello,

The Cahuilla Band of Indians received your letter July 18, 2018 regarding An Undertaking Involving the Channel along Cactus Avenue in the City of Moreno Valley, Riverside County, CA. The Cahuilla band does not have knowledge of any cultural resources/sites within or near the project area. Although this project is outside the Cahuilla reservation boundary it is within the Cahuilla traditional land use area. Therefore we do have an interest in this project. We respectfully request to have tribal monitors be present during all ground disturbing activities as there is possibility of unearthing cultural resources during construction. We appreciate your help in preserving Tribal Cultural Resources in your project.

Respectfully,

BobbyRay Esparza
Cultural Coordinator

Hi Sal,

Thank you for contacting the San Manuel Band of Mission Indians (SMBMI) regarding the above referenced project. SMBMI appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on 19 July 2018. The proposed project area is located just outside of Serrano ancestral territory and, as such, SMBMI will not request consulting party status or elect to participate in the scoping, development, and/or review of documents created pursuant to these legal and regulatory mandates.

For your knowledge, I am the Tribe's CEQA point of contact and all information requests can be sent directly to me.

Regards,

Jessica Mauck, Cultural Resources Analyst

Subject: Participation in Archaeological Fieldwork for the Channel along Cactus Avenue, near the City of Moreno Valley, Riverside (CRM TECH #3375)

Hello,

I am contacting you to see if the tribe would like to participate in the archaeological fieldwork for the above-referenced project. We will conduct a field inspection and recording on the channel along Cactus Avenue, just north of the parcel that we surveyed on June 1, 2018, with Soboba monitor Victoria Banda. Please let me know if the tribe will be interested in joining us for the fieldwork on the channel. A project location map and aerial map are attached to this e-mail.

We will contact you again when we have a specific time and date for the fieldwork.

Thank you for your time and input on this project.

Nina,

Yes, we can go ahead and piggy back the surveys tomorrow. Please provide us with the following details: start time, meeting location/address, as well as name and contact information for an on-site representative. Once we receive the specifics, we will be able to schedule a monitor accordingly.

Hi Jessica,

That's great. I spoke with Sal Boites, (559) 396-8896, who will be conducting both surveys tomorrow. He stated that he will start on the Cactus Channel project first (CRM TECH #3375), and he will be out there in the morning around 6:30 am on the southwest corner of Heacock Street and Cactus Avenue. After the Cactus Channel project, he will directly head to the 3373 Survey (northeast corner of Spruce Street and Rustin Avenue). Please let me know if you have any questions or there is any change in plans.

Thank for your time,

Nina Gallardo

Re:
CRM TECH CONTRACT #3375 – Cactus Avenue project

Dear,
Nina Gallardo
Project Archaeologist/Native American Liaison
CRM TECH

Thank you for contacting the Morongo Band of Mission Indians (MBMI) Cultural Heritage Department regarding the above referenced project(s). After conducting a preliminary review of the project, the tribe would like to respectfully issue the following comments and/or requests:

☐ The project is located outside of the Tribe's aboriginal territory and is not within an area considered to be a traditional use area or one in which the Tribe has cultural ties. We recommend contacting the appropriate tribe(s) who may have cultural affiliations to the project area. We have no further comments at this time.

☒ The project is located within the Tribe's aboriginal territory or in an area considered to be a traditional use area or one in which the Tribe has cultural ties. In order to further evaluate the project for potential impacts to tribal cultural resources, we would like to formally request the following:

- ☒ A thorough records search be conducted by contacting one of the California Historical Resources Information System (CHRIS) Archaeological Information Centers and a copy of the search results be provided to the tribe.
- ☒ Tribal monitor participation during the initial pedestrian field survey of the Phase I Study of the project and a copy of the results of that study. In the event the pedestrian survey has already been conducted, MBMI requests a copy of the Phase I study be provided to the tribe as soon as it can be made available.
- ☐ MBMI Tribal Cultural Resource Monitor(s) be present during all required ground disturbing activities pertaining to the project.

☐ The project is located with the current boundaries of the Morongo Indian Reservation. Please contact the Morongo Cultural Heritage Department for further details.

Please be aware that this letter is merely intended to notify your office that the tribe has received your letter requesting tribal consultation for the above mentioned project and is requesting to engage in consultation. Specific details regarding the tribe's involvement in the project must be discussed on a project by project basis during the tribal consultation process. This letter does not constitute "meaningful" tribal consultation nor does it conclude the consultation process. Under federal and state law, "meaningful" consultation is understood to be an ongoing government-to-government process and may involve requests for additional information, phone conferences and/or face-to-face meetings.

Sincerely,

Tribal Historic Preservation Office

RE: **An Undertaking Involving the Channel along Cactus Avenue, Approximately 1.5 linear miles. City of Moreno Valley, Riverside County, California**
CRM TECH Contract #3375

Dear Mr. Boites-

Thank you for the opportunity to offer input concerning the development of the above-identified project. We appreciate your sensitivity to the cultural resources that may be impacted by your project, and the importance of these cultural resources to the Native American peoples that have occupied the land surrounding the area of your project for thousands of years. Unfortunately, increased development and lack of sensitivity to cultural resources has resulted in many significant cultural resources being destroyed or substantially altered and impacted. Your invitation to consult on this project is greatly appreciated.

At this time we are unaware of specific cultural resources that may be affected by the proposed project. We encourage you to contact other Native American Tribes and individuals within the immediate vicinity of the project site that may have specific information concerning cultural resources that may be located in the area. We also encourage you to contract with a monitor who is qualified in Native American cultural resources identification and who is able to be present on-site full-time during the pre-construction and construction phase of the project. Please notify us immediately should you discover any cultural resources during the development of this project.

Very truly yours,

Victoria Martin
Tribal Secretary

Re: Cactus Avenue Channel/K-4 Parcel Development

Dear Ms. Nina Gallardo,

The Agua Caliente Band of Cahuilla Indians (ACBCI) appreciates your efforts to include the Tribal Historic Preservation Office (THPO) in the K-4 Parcel Development project. The project area is not located within the boundaries of the ACBCI Reservation. However, it is within the Tribe's Traditional Use Area. For this reason, the ACBCI THPO requests the following:

*A copy of the records search with associated survey reports and site records from the information center.

*Copies of any cultural resource documentation (report and site records) generated in connection with this project.

Again, the Agua Caliente appreciates your interest in our cultural heritage. If you have questions or require additional information, please call me at (760)699-6829. You may also email me at ACBCI-THPO@aguacaliente.net.

Cordially,

Katie Croft

Dear Ms. Gallardo:

Thank you for contacting the Cabazon Band of Mission Indians concerning cultural resource information relative to the above referenced project.

The project is located outside of the Tribe's current reservation boundaries. The Tribe has no specific archival information on the site indicating that it may be a sacred/religious site or other site of Native American traditional cultural value within the project area.

We look forward to continued collaboration in the preservation of cultural resources or areas of traditional cultural importance.

Best regards,

Judy Stapp
Director of Cultural Affairs

Re: Moreno Valley Channel Project

Dear Mr. Smith,

This letter is written on behalf of the Rincon Band of Luiseño Indians. We have received your notification regarding the above referenced project and we thank you for the opportunity to provide information pertaining to cultural resources. The identified location is within the Territory of the Luiseño people, and is also within Rincon's specific area of Historic interest.

Embedded in the Luiseño territory are Rincon's history, culture and identity. We do not have knowledge of cultural resources within or near the proposed project area. However, this does not mean that none exist. We recommend that an archaeological record search be conducted and ask that a copy of the results be provided to the Rincon Band.

If you have additional questions or concerns please do not hesitate to contact our office at your convenience at (760) 297-2635.

Thank you for the opportunity to protect and preserve our cultural assets.

Sincerely,
Destiny Colocho
Tribal Historic Preservation Officer

RE: An Undertaking Involving the Channel along Cactus Avenue – APNs 297-150-006, -007, 297-150-038, 297-160-005, 297-200-004) – City of Moreno Valley, Riverside County, CA – CRM TECH Contract # 3375

The Soboba Band of Luiseño Indians appreciates your observance of Tribal Cultural Resources and their preservation in your project. The information provided to us on said project has been assessed through our Cultural Resource Department, where it was concluded that although it is outside the existing reservation, the project area does fall within the bounds of our Tribal Traditional Use Areas. This project location is in proximity to known sites, is a shared use area that was used in ongoing trade between the tribes, and is considered to be culturally sensitive by the people of Soboba.

Soboba Band of Luiseño Indians is requesting the following:

1. To initiate a consultation with the project proponents and lead agency.

2. The transfer of information to the Soboba Band of Luiseno Indians regarding the progress of this project should be done as soon as new developments occur.

3. Soboba Band of Luiseño Indians continues to act as a consulting tribal entity for this project.

4. Working in and around traditional use areas intensifies the possibility of encountering cultural resources during the construction/excavation phase. For this reason the Soboba Band of Luiseño Indians requests that Native American Monitor(s) from the Soboba Band of Luiseño Indians Cultural Resource Department to be present during any ground disturbing proceedings. Including surveys and archaeological testing.

5. Request that proper procedures be taken and requests of the tribe be honored (Please see the attachment)

Multiple areas of potential impact were identified during an in-house database search. Specifics to be discussed in consultation with the lead agency.

Sincerely,

Joseph Ontiveros, Tribal Historic Preservation Officer

RECEIVED
AUG 28 2018

Cultural Items (Artifacts). Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer should agree to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

The Developer should waive any and all claims to ownership of Native American ceremonial and cultural artifacts that may be found on the Project site. Upon completion of authorized and mandatory archeological analysis, the Developer should return said artifacts to the Soboba Band within a reasonable time period agreed to by the Parties and not to exceed (30) days from the initial recovery of the items.

Treatment and Disposition of Remains.

A. The Soboba Band shall be allowed, under California Public Resources Code § 5097.98 (a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity.

B. The Soboba Band, as MLD, shall complete its inspection within twenty-four (24) hours of receiving notification from either the Developer or the NAHC, as required by California Public Resources Code § 5097.98 (a). The Parties agree to discuss in good faith what constitutes "appropriate dignity" as that term is used in the applicable statutes.

C. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code § 5097.98 (a) and (b). The Soboba Band, as the MLD in consultation with the Developer, shall make the final discretionary determination regarding the appropriate disposition and treatment of human remains.

D. All parties are aware that the Soboba Band may wish to rebury the human remains and associated ceremonial and cultural items (artifacts) on or near, the site of their discovery, in an area that shall not be subject to future subsurface disturbances. The Developer should accommodate on-site reburial in a location mutually agreed upon by the Parties.

E. The term "human remains" encompasses more than human bones because the Soboba Band's traditions periodically necessitated the ceremonial burning of human remains. Grave goods are those artifacts associated with any human remains. These items, and other funerary remnants and their ashes are to be treated in the same manner as human bone fragments or bones that remain intact

Coordination with County Coroner's Office. The Lead Agencies and the Developer should immediately contact both the Coroner and the Soboba Band in the event that any human remains are discovered during implementation of the Project. If the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, the Coroner shall ensure that notification is provided to the NAHC within twenty-four (24) hours of the determination, as required by California Health and Safety Code § 7050.5 (c).

Non-Disclosure of Location Reburials. It is understood by all parties that unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and shall not be governed by public disclosure requirements of the California Public Records Act. The Coroner, parties, and Lead Agencies, will be asked to withhold public disclosure information related to such reburial, pursuant to the specific exemption set forth in California Government Code § 6254 (r). Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer agrees to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

***P3a.** **Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries) The site consists of an approximately 1.5-mile segment of drainage channel along the southern side of Cactus Avenue and the northern edge of March Air Reserve Base. The unlined open earthen channel is built of natural material (hardened soil), and measures approximately 41-47 feet wide across the top, 13-18 feet wide across the bottom, and 6-24 feet deep, with steep, sloping sides that show signs of erosion caused by periodic flooding. It was excavated sometime between 1941 and 1953, most likely during the expansion of March Army Air Field (now March Air Reserve Base) in the early 1940s, to channel seasonal storm runoff from the north to a preexisting channel along Heacock Street to the east and around the perimeter of the base. As a typical and largely nondescript infrastructure feature, it demonstrates no distinctively historical characteristics.

Attention: Mr. Timothy Reeves

Subject: Geotechnical Exploration
Proposed Industrial Warehouse Site K-4, Cactus Avenue
Unincorporated Riverside County, near Moreno Valley, California

In accordance with your request, we are pleased to provide this update geotechnical evaluation for the subject project summarizing our geotechnical findings, conclusions and recommendations regarding the design and construction of the proposed development. Based on the results of our findings and conclusions, it is our opinion that the site is suitable for the intended use provided the recommendations included in herein are implemented during design and construction phases of development. However, it should be noted that additional geotechnical evaluations and/or reviews might be required based on final site development and/or grading plans.

If you have any questions regarding this report, please do not hesitate to contact the undersigned. We appreciate this opportunity to be of service on this project.

Respectfully submitted,

LEIGHTON CONSULTING, INC.

1.0 INTRODUCTION

1.1 Purpose and Scope

This geotechnical exploration is for the proposed commercial development referred to as Meridian K-4 Parcel, located generally south of Cactus Avenue between Veterans Way and extending east to Frederick Street, near Moreno Valley, in Unincorporated Riverside County, California (see Figure 1). Our scope of services for this exploration included the following:

- Review of available site-specific geologic information and Preliminary Site Plan by RGA.
- A site reconnaissance and excavation of nine (9) exploratory borings. Approximate locations of these geotechnical borings are depicted on the *Boring Location Map (Figure 2)*. The logs of exploratory borings are presented in Appendix A.
- Geotechnical laboratory testing of selected soil samples collected during this exploration. Test results are presented in Appendix B.
- Geotechnical engineering analyses performed or as directed by a California registered Geotechnical Engineer (GE) and reviewed by a California Certified Engineering Geologist (CEG).
- Preparation of this report which presents our geotechnical conclusions and recommendations regarding the proposed structures.

This report is not intended to be used as an environmental assessment (Phase I or other), or foundation plan review.

1.2 Site and Project Description

The site is located generally south of Cactus Avenue between Veterans Way and extending east to Fredrick Street, in the County of Riverside, California (see Figure 1, Site Location Map). Topographically, the site is relatively flat, draining gently in a southeastern direction. The site is currently undeveloped and vacant land covered with small vegetative growth and seasonal weeds. The County Assessor Parcel Numbers (APNs) for this site are 297-160-005-8, 297-200-400-0, 297-150-006-8, -007-9, and -038-7. An approximately 152,000 square feet area of stockpiled soil was observed in the southern portion of the site, adjacent to the transformer station.

We understand that site development (see Figure 2) includes a proposed 718,000 square feet industrial building along with associated improvements such as parking stalls and loading docks. Grading plans were not provided as of the date of this report; however, we

anticipate cut and fill grading of less than 10 feet to create finish site grades. Structural loads are expected to be less than 250 kips per column load and 10 kips/LF of continuous wall footing. If site development plans significantly differ from those described herein, the report should be subject to further review and evaluation.

2.0 FIELD EXPLORATION AND LABORATORY TESTING

2.1 Field Exploration

Our field exploration consisted of the excavation of nine (9) hollow stem borings located generally in areas of planned building to provide basis for foundation and pavement design. During exploration, disturbed/bulk samples were collected for further laboratory testing and evaluation. Approximate locations of these and previous filed explorations are depicted on the *Geotechnical Map* (see Figure 2). Sampling was conducted by a staff geologist from our firm. After logging and sampling, the excavations were loosely backfilled with spoils generated during excavation. The exploration logs from this exploration are provided in Appendix A.

2.2 Laboratory Testing

Laboratory tests were performed on representative bulk samples to provide a basis for development of earthwork control and foundation design. The laboratory testing program included maximum density and moisture content relationship, expansion index, R-value and soluble sulfate content. The results of our laboratory testing from this and previous explorations are presented in Appendix B.

3.0 GEOTECHNICAL AND GEOLOGIC FINDINGS

3.1 Regional Geology

The site is located within a prominent natural geomorphic province in southwestern California known as the Peninsular Ranges. This province is characterized by steep, elongated ranges and valleys that trend northwestward. More specifically, the proposed site is located within the relatively stable Perris Block.

The Perris Block, approximately 20 miles by 50 miles in extent, is bounded by the San Jacinto Fault Zone to the northeast, the Elsinore Fault Zone to the southwest. The Perris Block has had a complex tectonic history, apparently undergoing relative vertical land-movements of several thousand feet in response to movement on the Elsinore and San Jacinto Fault Zones. Thin sedimentary and volcanic materials locally mantle crystalline bedrock, consisting of the Val Verde Tonalite (Kvt) and lesser amounts of Cretaceous granitic dikes (Kg).

3.2 Site Specific Geology

3.2.1 Earth Materials

Our field exploration, observations, and review of the pertinent literature indicate that the site include is underlain by localized artificial fill and older alluvium. A more detailed description of each unit is provided on the logs of borings in Appendix A.

- **Undocumented Artificial Fill:** Undocumented artificial fill is generally associated with existing Cactus Avenue and a large stockpile. Localized pockets of artificial fill that were not identified during our exploration may also be encountered elsewhere on this site below surface.
- **Older Alluvium:** Older alluvial soils were encountered in all borings. As encountered, these soils generally consist of medium dense to very dense silty to clayey sand (SM/SC) and localized layers of sandy silty to sandy clay (ML/CL). This older alluvium is expected to generally possess a low expansion potential (EI<51) and slight collapse potential (<1%).

3.3 Groundwater and Surface Water

Groundwater was encountered during this exploration at a depth of approximately 19 feet (LB-2) below existing ground surface (bgs) and 23 feet bgs (LB-4). Historic groundwater data, as reported by Department of Water Resource (DWR) data for Well 338995N1171958W001 located approximately 5 miles east of the subject site, reflect a groundwater elevation of 1,470 feet (about 82 feet below site elevation) in April 2017. According to West San Jacinto Groundwater Management Plan, 2016 Annual Report, the groundwater elevation in the subject site vicinity are at the range of 1,520 feet msl (about 32 feet below site elevation). Surface water was not observed onsite during our exploration.

3.4 Regional Faulting and Fault Activity

The subject site, like the rest of Southern California, is located within a seismically active region as a result of being located near the active margin between the North American and Pacific tectonic plates. The principal source of seismic activity is movement along the northwest-trending regional fault systems such as the San Andreas, San Jacinto, and Elsinore Fault Zones. Based on published geologic hazard maps, this site is not located within a currently designated Alquist-Priolo (AP) Earthquake Fault Zone; nor is located within a County Fault Zone.

3.5 Seismic Coefficients per 2016 CBC

Strong ground shaking can be expected at the site during moderate to severe earthquakes in this general region. This is common to virtually all of Southern California. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (soil type) characteristics. The site-specific seismic coefficients provided in this section are based on an interactive tool/program currently available on USGS website. Based on ASCE 7-10 as the Design Code Reference Document and site Class **D**, the seismic coefficients for this site are as listed in the following table:

Table 1. 2016 CBC Seismic Coefficients

CBC Categorization/Coefficient		Design Value (g)
Site Longitude (-117.26195)	Site Latitude (33.90902)	
Site Class Definition	D	
Mapped Spectral Response Acceleration at 0.2s Period, S_s		**1.50**
Mapped Spectral Response Acceleration at 1s Period, S_1		**0.60**
Short Period Site Coefficient at 0.2s Period, F_a		**1.00**
Long Period Site Coefficient at 1s Period, F_v		**1.50**
Adjusted Spectral Response Acceleration at 0.2s Period, S_{MS}		**1.50**
Adjusted Spectral Response Acceleration at 1s Period, S_{M1}		**0.90**
Design Spectral Response Acceleration at 0.2s Period, S_{DS}		***1.00***
Design Spectral Response Acceleration at 1s Period, S_{D1}		***0.60***

* g- Gravity acceleration

The results of the analysis also indicate that the adjusted Peak Ground Acceleration (PGA_M) for this site is 0.5g.

3.6 Secondary Seismic Hazards

Ground shaking can induce "secondary" seismic hazards such as liquefaction, dynamic densification, lateral spreading, flooding, seiche/tsunami, collapsible soils, and ground rupture, as discussed in the following subsections:

3.6.1 Dynamic Settlement (Liquefaction and/or Dry Settlement)

Riverside County Geologic Hazards maps indicate that the site is located in a zone of high liquefaction potential (see Figure 4). However, liquefaction-induced or dynamic dry settlement is not expected to be a significant hazard at this site due to the absence of near surface saturated sand layers and underlying dense older alluvium. Our analysis of dynamic settlement due to ground shaking based on PGA of 0.5g with a moment magnitude of 7.2 Mw is estimated to be less than 1 inch (see Appendix C). This settlement is expected to be generally global and over a large area. As such, the seismic differential settlement is not expected to exceed 0.5-inch in a 40-foot horizontal distance within this site.

3.6.2 Lateral Spreading

Due to a relatively flat terrain and dense underlying older alluvium, lateral spreading is not considered a geologic hazard on this site.

3.6.3 Flooding

The site is not within a flood plain and potential for flooding is considered very low for this site.

3.6.4 Seiche and Tsunami

Due to the site location and lack of nearby open bodies of water, the possibility of the affects due to seiches or tsunami is considered very low.

3.6.5 Collapsible Soils

Laboratory testing indicates that the onsite soils (older alluvium) are expected to possess a slight collapse potential (<1%). Based on the remedial grading recommendations to remove and compact the near surface soils (Section 4.2.1), this geologic hazard on this site is considered very low.

3.6.6 Expansive Soils

Limited laboratory testing indicated that onsite soils generally possess a low expansion potential (EI<51). The mitigation for this geologic hazard is presented in Section 4.2.4 of this report.

3.6.7 Ground Rupture

Since this site is not located within a mapped Fault Zone, the possibility of ground surface-fault-rupture is very low at this site.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 General

Based on the results of this exploration, it is our opinion that the site is suitable for the proposed development from a geotechnical viewpoint. Grading of the site should be in accordance with our recommendations included in this report and future recommendations and evaluations made during construction by the geotechnical consultant.

4.2 Earthwork

Earthwork should be performed in accordance with the General Earthwork and Grading Specifications in Appendix D as well as the following recommendations. The recommendations contained in Appendix D, are general grading specifications provided for typical grading projects and some of the recommendations may not be strictly applicable to this project. The specific recommendations contained in the text of this report supersede the general recommendations in Appendix D.

The contract between the developer and earthwork contractor should be worded such that it is the responsibility of the contractor to place fill properly in accordance with the recommendations of this report, the specifications in Appendix D, applicable County Grading Ordinances, notwithstanding the testing and observation of the geotechnical consultant during construction.

4.2.1 Site Preparation and Remedial Grading

Prior to grading, the proposed structural improvement areas (i.e. all-structural fill areas, pavement areas, buildings, etc.) should be cleared of surface and subsurface pipelines and obstructions. Heavy vegetation, roots and debris should be disposed of offsite. Any onsite wells or septic waste system should be removed or abandoned in accordance with the Riverside Country Department of Environmental Health. Voids created by removal of buried/unsuitable materials should be backfilled with properly compacted soil in general accordance with the recommendations of this report.

Building Area: To reduce the potential for excessive differential settlement, the depth of removal should extend a minimum of 6 feet BGS or 4 feet below footings, whichever is deeper.

Pavement/Street Areas: The depth of removal should extend a minimum of 3 feet BGS or 2 feet below finish subgrade, whichever is deeper.

The removal limit should be established by a 1:1 (horizontal:vertical) projection from the edge of fill soils supporting structural fill or settlement-sensitive structures downward and outward to competent material identified by the geotechnical consultant. This may require remedial grading that extends beyond the limits of design grading. Removal will also include benching into competent material as the fills rise. Areas adjacent to existing property limits or protected habitat areas may require special considerations and monitoring. Steeper temporary slopes in these areas may be considered.

After completion of the recommended removal of unsuitable soils and prior to fill placement, the exposed surface should be scarified to a minimum depth of 8-inches, moisture conditioned as necessary to optimum moisture content and compacted using heavy compaction equipment to an unyielding condition. All structural fill should be compacted throughout to 90 percent of the ASTM D 1557 laboratory maximum density, at or slightly above optimum moisture.

4.2.2 Structural Fills

The onsite soils are generally suitable for re-use as compacted fill, provided they are free of debris and organic matter. Fills placed within 10 feet of finish pad grades or slope faces should contain no rocks over 12 inches in maximum dimension. In addition, encountered expansive clayey soils layers (EI>51), if any, should be placed at a depth greater than 3 feet below finished grades.

Areas to receive structural fill and/or other surface improvements should be scarified to a minimum depth of 8 inches, conditioned to at least optimum moisture content, and recompacted. Fill soils should be placed at a minimum of 90 percent relative compaction (based on ASTM D1557) at or above optimum moisture content. Placement and compaction of fill should be performed in accordance with local grading ordinances under the observation and testing of the geotechnical consultant. The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in thickness.

Fill slope keyways will be necessary at the toe of all fill slopes and at fill-over-cut contacts. Keyway schematics, including dimensions and subdrain recommendations, are provided in Appendix D. All keyways should be excavated into dense bedrock or dense older alluvium as determined by the geotechnical engineer. The cut portions of all slope and keyway excavations should be geologically mapped and approved by a geologist prior to fill placement.

Fills placed on slopes steeper than 5:1 (horizontal:vertical) should be benched into dense soils (see Appendix D for benching detail). Benching should be of sufficient depth to remove all loose material. A minimum bench height of 2 feet into approved material should be maintained at all times.

4.2.3 Import Soils

Import soils and/or borrow sites, if needed, should be evaluated by us prior to import. Import soils should be uncontaminated, granular in nature, free of organic material (loss on ignition less-than 2 percent), have very low expansion potential (E<21) and have a low corrosion impact to the proposed improvements.

4.2.4 Utility Trenches

Utility trenches should be backfilled with compacted fill in accordance with the *Standard Specifications for Public Works Construction,* ("Greenbook"), 2018 Edition. Fill material above the pipe zone should be placed in lifts not exceeding 8 inches in uncompacted thickness and should be compacted to at least 90 percent relative compaction (ASTM D 1557) by mechanical means only. Site soils may generally be suitable as trench backfill provided these soils are screened of rocks over 1½ inches in diameter and organic matter. If imported sand is used as backfill, the upper 3 feet in building and pavement areas should be compacted to 95 percent. The upper 6 inches of backfill in all pavement areas should be compacted to at least 95 percent relative compaction.

Where granular backfill is used in utility trenches adjacent to moisture sensitive subgrades and foundation soils, we recommend that a cut-off "plug" of impermeable material be placed in these trenches at the perimeter of buildings, and at pavement edges adjacent to irrigated landscaped areas. A "plug" can consist of a 5-foot long section of clayey soils with more than 35-percent passing the No. 200 sieve, or a Controlled Low Strength Material (CLSM) consisting of one sack of Portland-cement plus one sack of bentonite per cubic-yard of sand. CLSM should generally conform to requirements of the "Greenbook". This is intended to reduce the likelihood of water permeating trenches from landscaped areas, then seeping along permeable trench backfill into the building and pavement subgrades, resulting in wetting of moisture sensitive subgrade earth materials under buildings and pavements.

Excavation of utility trenches should be performed in accordance with the project plans, specifications and the *California Construction Safety Orders* (latest Edition). The contractor should be responsible for providing a "competent person" as defined in Article 6 of the *California Construction Safety Orders*. Contractors should be advised that sandy soils (such as fills

generated from the onsite alluvium) could make excavations particularly unsafe if all safety precautions are not properly implemented. In addition, excavations at or near the toe of slopes and/or parallel to slopes may be highly unstable due to the increased driving force and load on the trench wall. Spoil piles from the excavation(s) and construction equipment should be kept away from the sides of the trenches. Leighton Consulting, Inc. does not consult in the area of safety engineering.

4.2.5 Shrinkage

The volume change of excavated onsite soils upon recompaction is expected to vary with materials, density, insitu moisture content, and location and compaction effort. The in-place and compacted densities of soil materials vary and accurate overall determination of shrinkage and bulking cannot be made. Therefore, we recommend site grading include, if possible, a balance area or ability to adjust grades slightly to accommodate some variation. Based on our geotechnical laboratory results, we expect recompaction shrinkage (when recompacted to an average 92 percent of ASTM D1557) and estimate the following earth volume changes will occur during grading, and for the older alluvium, the shrinkage is expected to be in the 5 to 15% range.

4.2.6 Drainage

All drainage should be directed away from structures and pavements by means of approved permanent/temporary drainage devices. Adequate storm drainage of any proposed pad should be provided to avoid wetting of foundation soils. Irrigation adjacent to buildings should be avoided when possible. As an option, sealed-bottom planter boxes and/or drought resistant vegetation should be used within 5-feet of buildings.

4.3 Foundation Design

4.3.1 Design Parameters – Spread/Continuous Shallow Footings

Footings should be embedded at least 12-inches below lowest adjacent grade for the proposed structure. Footing embedment should be measured from lowest adjacent finished grade, considered as the top of interior slabs-on-grade or the finished exterior grade, excluding landscape topsoil, whichever is lower. Footings located adjacent to utility trenches or vaults should be embedded below an imaginary 1:1 (horizontal:vertical) plane projected upward and outward from the bottom edge of the trench or vault, up towards the footing.

- **Bearing Capacity**: For footings on newly placed, properly compacted fill soil, an allowable vertical bearing capacity of 2,000 pounds-per-square-foot (psf) should be used. These footings should have a minimum base

width of 18 inches for continuous wall footings and a minimum bearing area of 3 square feet (1.75-ft by 1.75-ft) for pad foundations. The bearing pressure value may be increased by 250 psf for each additional foot of embedment or each additional foot of width to a maximum vertical bearing value of 3,500 psf. Additionally, these bearing values may be increased by one-third when considering short-term seismic or wind loads. A modulus of subgrade reaction, K of 200 PCI may be used to relative dense bedrock or onsite soil compacted to minimum 90% relative compaction.

- **Lateral loads**: Lateral loads may be resisted by friction between the footings and the supporting subgrade. A maximum allowable frictional resistance of 0.35 may be used for design. In addition, lateral resistance may be provided by passive pressures acting against foundations poured neat against properly compacted granular fill. We recommend that an allowable passive pressure based on an equivalent fluid pressure of 350 pounds-per-cubic-foot (pcf) be used in design. These friction and passive values have already been reduced by a factor-of-safety of 1.5.

4.3.2 Settlement Estimates

For settlement estimates, we assumed that column loads will be no larger than 250 kips, with bearing wall loads not exceeding 10 kips per foot of wall. If greater column or wall loads are required, we should re-evaluate our foundation recommendation, and re-calculate settlement estimates.

Buildings located on compacted fill soils as required per Section 4.2.1 above should be designed in anticipation of 1 inch of total static settlement and 0.5-inch of static differential settlement within a 40-foot horizontal run.

4.4 Vapor Retarder

It has been a standard of care to install a moisture-vapor retarder underneath all slabs where moisture condensation is undesirable. Moisture vapor retarders may retard but not totally eliminate moisture vapor movement from the underlying soils up through the slabs. Moisture vapor transmission may be additionally reduced by use of concrete additives. Leighton Consulting, Inc. does not practice in the field of moisture vapor transmission evaluation/mitigation. Therefore, we recommend that a qualified person/firm be engaged/consulted with to evaluate the general and specific moisture vapor transmission paths and any impact on the proposed construction. This person/firm should provide recommendations for mitigation of potential adverse impact of moisture vapor transmission on various components of the structure as deemed appropriate.

However, based on our experience, the standard of practice in Southern California has evolved over the last 15 to 20 years into a construction of a vapor retarder system that generally consisted of a membrane (such as 15-mil thick), underlain by a capillary break consisting of 4 inches of clean ½-inch-minimum gravel or 2-inch sand layer (SE>30). The structural engineer/architect or concrete contractor often require a sand layer be placed over the membrane (typically 2-inch thick layer) to help in curing and reduction of curling of concrete. If such sand layer is placed on top of the membrane, the contractor should not allow the sand to become wet prior to concrete placement (e.g., sand should not be placed if rain is expected).

In conclusion, the construction of the vapor barrier/retarder system is dependent on several variables which cannot be all geotechnically evaluated and/or tested. As such, the design of this system should be a design team/owner decision taking into consideration finish flooring materials and manufacture's installation requirements of proposed membrane. Moreover, we recommend that the design team also follow ACI Committee 302 publication for "Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials" (ACI 302.2R-06) which includes a flow chart that assists in determining if a vapor barrier/retarder is required and where it is to be placed.

4.5 Retaining Walls

Retaining wall earth pressures are a function of the amount of wall yielding horizontally under load. If the wall can yield enough to mobilize full shear strength of backfill soils, then the wall can be designed for "active" pressure. If the wall cannot yield under the applied load, the shear strength of the soil cannot be mobilized and the earth pressure will be higher. Such walls should be designed for "at rest" conditions. If a structure moves toward the soils, the resulting resistance developed by the soil is the "passive" resistance. Retaining walls backfilled with non-expansive soils can be designed using the following equivalent fluid pressures:

Table 2. Retaining Wall Design Earth Pressures (Static, Drained)

Loading Conditions	Equivalent Fluid Density (pcf)	
	Level Backfill	2:1 Backfill
Active	36	55
At-Rest	55	85
Passive*	350	150 (2:1, sloping down)

* This assumes level condition in front of the wall will remain for the duration of the project, not to exceed 3,500 psf at depth.

Unrestrained (yielding) cantilever walls should be designed for the active equivalent-fluid weight value provided above for very low to low expansive soils that are free draining. In the design of walls restrained from movement at the top (non-yielding) such as basement or elevator pit/utility vaults, the at-rest equivalent fluid weight value should be used. Total depth of retained earth for design of cantilever walls should be measured as the vertical distance below the ground surface measured at the wall face for stem design, or measured at the heel of the footing for overturning and sliding calculations. Should a sloping backfill other than a 2:1 (horizontal:vertical) be constructed above the wall (or a backfill is loaded by an adjacent surcharge load), the equivalent fluid weight values provided above should be re-evaluated on an individual case basis by us. Non-standard wall designs should also be reviewed by us prior to construction to check that the proper soil parameters have been incorporated into the wall design.

All retaining walls should be provided with appropriate drainage. The outlet pipe should be sloped to drain to a suitable outlet. Wall backfill should be non-expansive (EI $\leq$ 21) sands compacted by mechanical methods to a minimum of 90 percent relative compaction (ASTM D 1557). Clayey site soils should not be used as wall backfill. Walls should not be backfilled until wall concrete attains the 28-day compressive strength and/or as determined by the Structural Engineer that the wall is structurally capable of supporting backfill. Lightweight compaction equipment should be used, unless otherwise approved by the Structural Engineer.

4.6 Sulfate Attack

Based on past experience in this area, the onsite soils are expected to possess negligible sulfate content. Type II concrete or equivalent may be used. Further testing should be performed at the completion of site grading to confirm such conditions.

4.7 Preliminary Pavement Design

Our preliminary pavement design is based on an R-value of 16 and the Caltrans Highway Design Manual. For planning and estimating purposes, the pavement sections are calculated based on Traffic Indexes (TI) as indicated in Table below:

Table 3. Asphalt Pavement Sections

General Traffic Condition	Traffic Index (TI)	Asphalt Concrete (inches)	Aggregate Base* (inches)
Automobile Parking Lanes	4.5	3.0	6.5
	5.0	4.0	5.5
Truck Access & Driveways	6.0	4.0	9.5
	6.5	4.0	13.0

Appropriate Traffic Index (TI) should be selected or verified by the project civil engineer and actual R-value of the subgrade soils will need to be verified after completion of site grading to finalize the pavement design. Pavement design and construction should also conform to applicable local, county and industry standards. The Caltrans pavement section design calculations were based on a pavement life of approximately 20 years with periodic flexible pavement maintenance.

Where applicable, we recommend that a minimum of 7 inches of PCC pavement be used in high impact load areas or if to be subjected to truck traffic. The PCC pavement should be placed on a minimum 6-inch aggregate base. The PCC pavement may be placed directly on a compacted subgrade with an R-Value of 40 or higher. The PCC pavement should have a minimum of 28-day compressive strength of 3250 psi. Other requirements of Caltrans Standard Specifications regarding mixing and placing of concrete should be followed.

The upper 6 inches of the subgrade soils should be moisture-conditioned to near optimum moisture content, compacted to at least 95 percent relative compaction (ASTM D1557) and kept in this condition until the pavement section is constructed. Minimum relative compaction requirements for aggregate base should be 95 percent of the maximum laboratory density as determined by ASTM D1557. If applicable, aggregate base should conform to the “Standard Specifications for Public Works Construction” (green book) current edition or Caltrans Class 2 aggregate base.

If pavement areas are adjacent to heavily watered landscape areas, some deterioration of the subgrade load bearing capacity and pavement failure may result. Moisture control measures such as deepened curbs or other moisture barrier materials may be used to prevent the subgrade soils from becoming saturated. The use of concrete cutoff or edge barriers should be considered when pavement is planned adjacent to either open (unfinished) or irrigated landscaped areas.

5.0 GEOTECHNICAL CONSTRUCTION SERVICES

Geotechnical review is of paramount importance in engineering practice. Poor performances of many foundation and earthwork projects have been attributed to inadequate construction review. We recommend that Leighton Consulting, Inc. be provided the opportunity to review the grading plan and foundation plan(s) prior to bid.

Reasonably-continuous construction observation and review during site grading and foundation installation allows for evaluation of the actual soil conditions and the ability to provide appropriate revisions where required during construction. Geotechnical conclusions and preliminary recommendations should be reviewed and verified by Leighton Consulting, Inc. during construction, and revised accordingly if geotechnical conditions encountered vary from our findings and interpretations. Geotechnical observation and testing should be provided:

- After completion of site demolition and clearing,
- During over-excavation of compressible soil,
- During compaction of all fill materials,
- After excavation of all footings and prior to placement of concrete,
- During utility trench backfilling and compaction, and
- When any unusual conditions are encountered.

Additional geotechnical exploration and analysis may be required based on final development plans, for reasons such as significant changes in proposed structure locations/footprints. We should review grading (civil) and foundation (structural) plans, and comment further on geotechnical aspects of this project.

6.0 LIMITATIONS

This report was based in part on data obtained from a limited number of observations, site visits, soil excavations, samples and tests. Such information is, by necessity, incomplete. The nature of many sites is such that differing soil or geologic conditions can be present within small distances and under varying climatic conditions. Changes in subsurface conditions can and do occur over time. Therefore, our findings, conclusions and recommendations presented in this report are based on the assumption that we (Leighton Consulting, Inc.) will provide geotechnical observation and testing during construction as the Geotechnical Engineer of Record for this project. Please refer to Appendix E, GBA's *Important Information About This Geotechnical-Engineering Report*, prepared by the Geoprofessional Business Association (GBA) presenting additional information and limitations regarding geotechnical engineering studies and reports.

This report was prepared for the sole use of Client and their design team, for application to design of the proposed maintenance building, in accordance with generally accepted geotechnical engineering practices at this time in California. Any unauthorized use of or reliance on this report constitutes an agreement to defend and indemnify Leighton Consulting, Inc. from and against any liability which may arise as a result of such use or reliance, regardless of any fault, negligence, or strict liability of Leighton Consulting, Inc.

APPENDIX A

LOGS OF EXPLORATORY BORINGS

Encountered earth materials were logged and sampled in the field by our representative and described in accordance with the Unified Soil Classification System (ASTM D 2488). Representative soil samples were transported to our in-house Temecula laboratory for geotechnical testing. After logging and sampling, our borings were backfilled with spoils generated during drilling.

The attached subsurface exploration logs and related information depict subsurface conditions only at the locations indicated and at the particular date designated on these logs. Subsurface conditions at other locations may differ from conditions occurring at these logged locations. Passage of time may result in altered subsurface conditions due to environmental changes. In addition, any stratification lines on these logs represent an approximate boundary between sampling intervals and soil types; and transitions may be gradual.

GEOTECHNICAL BORING LOG LB-5

Project No.	11979.002	**Date Drilled**	4-19-18
Project	Meridian K-4 Warehouse	**Logged By**	BSS
Drilling Co.	Martini Drilling	**Hole Diameter**	8"
Drilling Method	Hollow Stem Auger - 140lb - Autohammer - 30" Drop	**Ground Elevation**	1552'
Location	See Boring Location Plan	**Sampled By**	BSS

Elevation Feet	Depth Feet	Graphic Log (N / S)	Attitudes	Sample No.	Blows Per 6 Inches	Dry Density pcf	Moisture Content, %	Soil Class. (U.S.C.S.)	SOIL DESCRIPTION	Type of Tests
	0							SM	**Quaternary Older Alluvium (Qoa):** SILTY SAND, medium dense, light reddish brown, dry, fine sand, few gravel	
1550				R-1	50-5.5"	98	8		very dense, brown, dry to moist, fine sand, some interbedded clay layers	
	5			R-2	35 50-4"				very dense, light reddish brown, dry to moist, fine to medium sand, some clay, trace gravel	
1545										
	10			R-3	16 35 50	120	13		dense, reddish brown, moist, fine sand, some mica	
1540										
	15			R-4	15 21 50	121	12	SC	CLAYEY SAND, dense, reddish brown, moist, fine to coarse sand, some gravel, weathered (CO = 0.14)	CO
1535										
	20			R-5	11 27 37			SC-SM	SILTY, CLAYEY SAND, dense, dark reddish brown, moist, fine sand, micaceous	
1530									Drilled to 20' Sampled to 21.5' Groundwater not encountered Backfilled with soil cuttings (4/19/18)	
	25									
1525										
	30									

SOIL DESCRIPTION: This Soil Description applies only to a location of the exploration at the time of sampling. Subsurface conditions may differ at other locations and may change with time. The description is a simplification of the actual conditions encountered. Transitions between soil types may be gradual.

SAMPLE TYPES:
- B BULK SAMPLE
- C CORE SAMPLE
- G GRAB SAMPLE
- R RING SAMPLE
- S SPLIT SPOON SAMPLE
- T TUBE SAMPLE

TYPE OF TESTS:

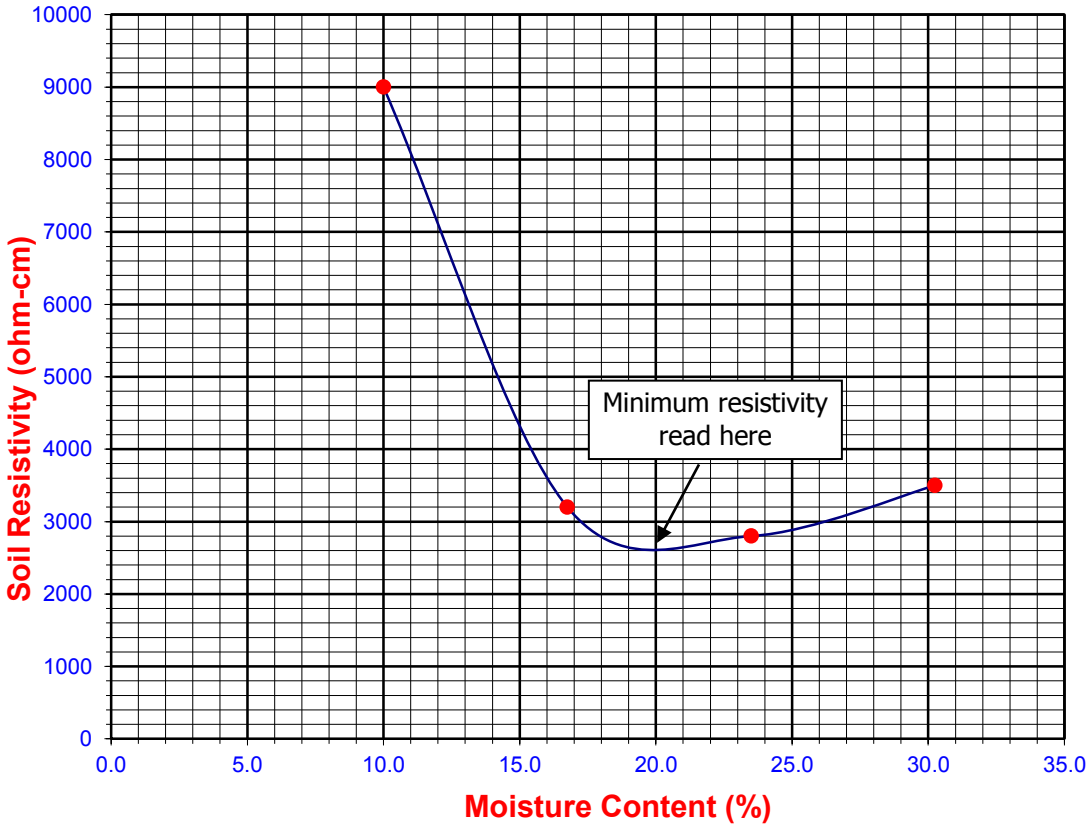
SOIL RESISTIVITY TEST

DOT CA TEST 643



Project Name:	Meridian Site K-4		Tested By :	M. Vinet	Date: 05/03/18
Project No. :	11979.002		Data Input By:	M. Vinet	Date: 05/04/18
Boring No.:	LB-3		Depth (ft.) :	0 - 5.0	
Sample No. :	B-1				
Soil Identification:*	s(CL-ML)				

*California Test 643 requires soil specimens to consist only of portions of samples passing through the No. 8 US Standard Sieve before resistivity testing. Therefore, this test method may not be representative for coarser materials.

Specimen No.	Water Added (ml) (Wa)	Adjusted Moisture Content (MC)	Resistance Reading (ohm)	Soil Resistivity (ohm-cm)
1	40	10.00	9000	9000
2	67	16.75	3200	3200
3	94	23.50	2800	2800
4	121	30.25	3500	3500
5				

Moisture Content (%) (MCi)	0.00
Wet Wt. of Soil + Cont. (g)	100.00

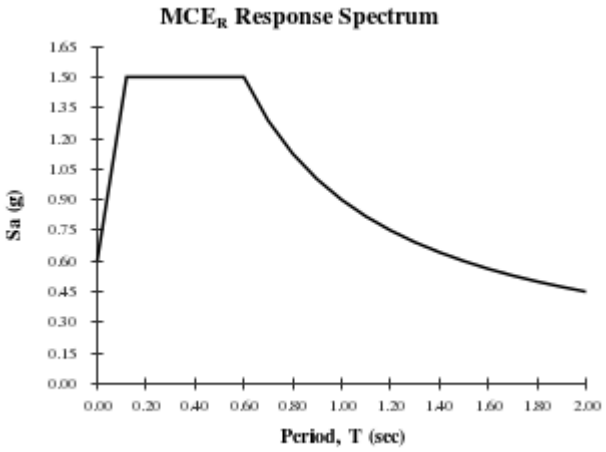
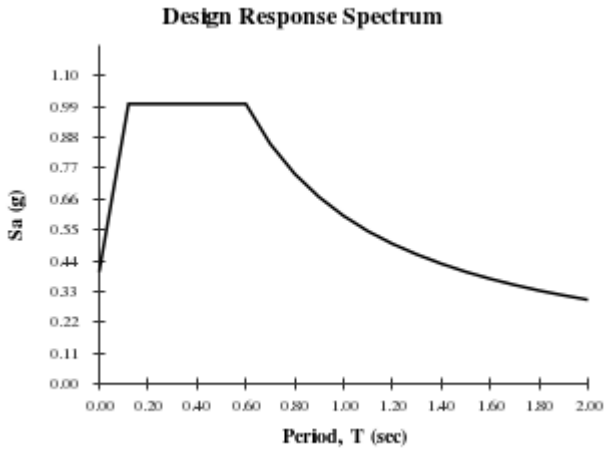
SITE SPECIFIC ANALYSIS

USGS Design Maps Summary Report

User–Specified Input



Report Title	11979.002 Wed April 18, 2018 22:12:57 UTC
Building Code Reference Document	ASCE 7-10 Standard (which utilizes USGS hazard data available in 2008)
Site Coordinates	33.90902°N, 117.26195°W
Site Soil Classification	Site Class D – "Stiff Soil"
Risk Category	I/II/III



USGS–Provided Output

S_S =	1.500 g	S_{MS} =	1.500 g	S_{DS} =	1.000 g
S_1 =	0.600 g	S_{M1} =	0.900 g	S_{D1} =	0.600 g

For information on how the SS and S1 values above have been calculated from probabilistic (risk-targeted) and deterministic ground motions in the direction of maximum horizontal response, please return to the application and select the "2009 NEHRP" building code reference document.

For PGA_M, T_L, C_{RS}, and C_{R1} values, please view the detailed report.

Although this information is a product of the U.S. Geological Survey, we provide no warranty, expressed or implied, as to the accuracy of the data contained therein. This tool is not a substitute for technical subject-matter knowledge.

USGS Design Maps Detailed Report

ASCE 7-10 Standard (33.90902°N, 117.26195°W)

Site Class D – "Stiff Soil", Risk Category I/II/III

Section 11.4.1 — Mapped Acceleration Parameters

Note: Ground motion values provided below are for the direction of maximum horizontal spectral response acceleration. They have been converted from corresponding geometric mean ground motions computed by the USGS by applying factors of 1.1 (to obtain S_S) and 1.3 (to obtain S_1). Maps in the 2010 ASCE-7 Standard are provided for Site Class B. Adjustments for other Site Classes are made, as needed, in Section 11.4.3.

From Figure 22-1 [1]	S_S = 1.500 g
From Figure 22-2 [2]	S_1 = 0.600 g

Section 11.4.2 — Site Class

The authority having jurisdiction (not the USGS), site-specific geotechnical data, and/or the default has classified the site as Site Class D, based on the site soil properties in accordance with Chapter 20.

Table 20.3–1 Site Classification

Site Class	$\overline{v}_s$	$\overline{N}$ or $\overline{N}_{ch}$	$\overline{s}_u$
A. Hard Rock	>5,000 ft/s	N/A	N/A
B. Rock	2,500 to 5,000 ft/s	N/A	N/A
C. Very dense soil and soft rock	1,200 to 2,500 ft/s	>50	>2,000 psf
D. Stiff Soil	600 to 1,200 ft/s	15 to 50	1,000 to 2,000 psf
E. Soft clay soil	<600 ft/s	<15	<1,000 psf
	Any profile with more than 10 ft of soil having the characteristics: • Plasticity index *PI* > 20, • Moisture content *w* ≥ 40%, and • Undrained shear strength $\overline{s}_u$ < 500 psf		
F. Soils requiring site response analysis in accordance with Section 21.1	See Section 20.3.1		

For SI: 1ft/s = 0.3048 m/s 1lb/ft² = 0.0479 kN/m²

Section 11.4.3 — Site Coefficients and Risk–Targeted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration Parameters

Table 11.4–1: Site Coefficient F_a

Site Class	Mapped MCE_R Spectral Response Acceleration Parameter at Short Period				
	$S_S \le 0.25$	$S_S = 0.50$	$S_S = 0.75$	$S_S = 1.00$	$S_S \ge 1.25$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of S_S

For Site Class = D and S_S = 1.500 g, F_a = 1.000

Table 11.4–2: Site Coefficient F_v

Site Class	Mapped MCE_R Spectral Response Acceleration Parameter at 1–s Period				
	$S_1 \le 0.10$	$S_1 = 0.20$	$S_1 = 0.30$	$S_1 = 0.40$	$S_1 \ge 0.50$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.7	1.6	1.5	1.4	1.3
D	2.4	2.0	1.8	1.6	1.5
E	3.5	3.2	2.8	2.4	2.4
F	See Section 11.4.7 of ASCE 7				

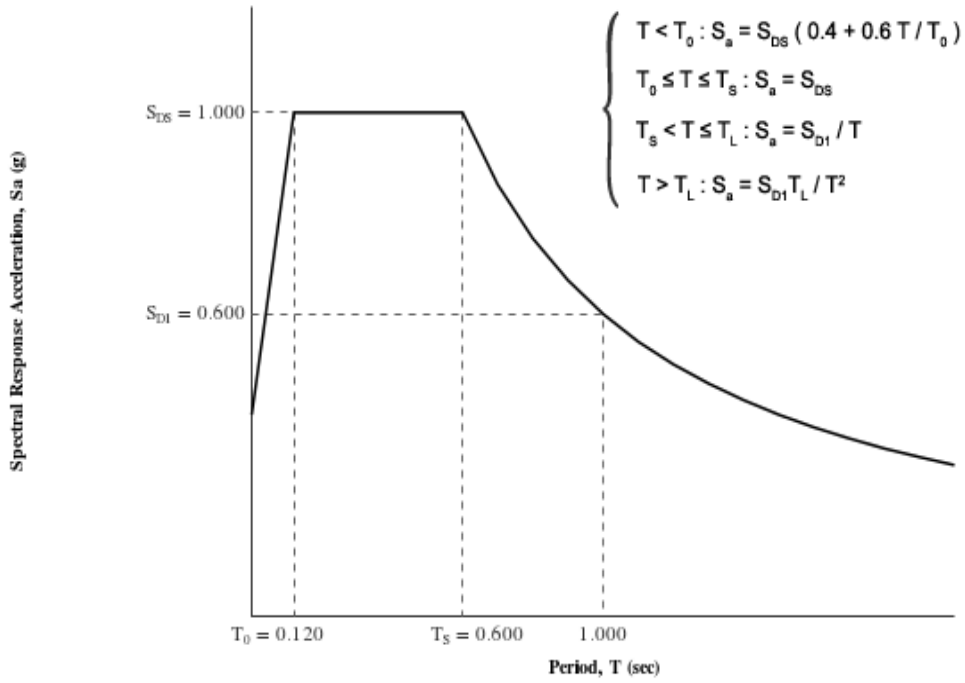
Note: Use straight–line interpolation for intermediate values of S_1

For Site Class = D and S_1 = 0.600 g, F_v = 1.500

Equation (11.4–1): $S_{MS} = F_a S_S = 1.000 \times 1.500 = 1.500$ g

Equation (11.4–2): $S_{M1} = F_v S_1 = 1.500 \times 0.600 = 0.900$ g

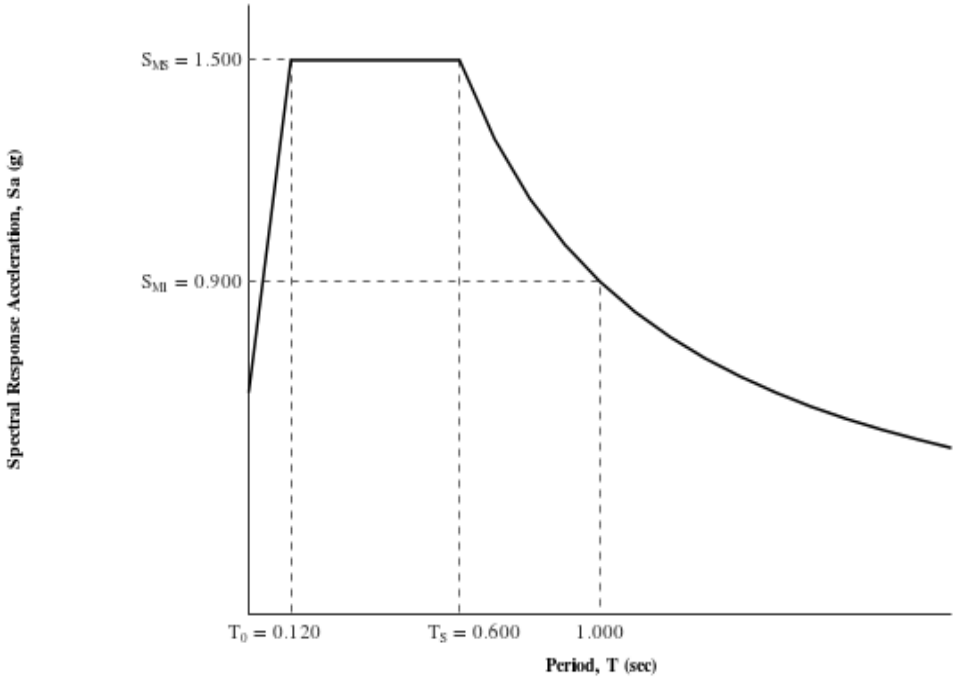
Section 11.4.4 — Design Spectral Acceleration Parameters



Equation (11.4–3): $S_{DS} = \frac{2}{3} S_{MS} = \frac{2}{3} \times 1.500 = 1.000$ g

Equation (11.4–4): $S_{D1} = \frac{2}{3} S_{M1} = \frac{2}{3} \times 0.900 = 0.600$ g

Section 11.4.5 — Design Response Spectrum



From Figure 22-12 [3] $T_L = 8$ seconds

Figure 11.4–1: Design Response Spectrum

Section 11.4.6 — Risk-Targeted Maximum Considered Earthquake (MCE_R) Response Spectrum

The MCE_R Response Spectrum is determined by multiplying the design response spectrum above by 1.5.

Section 11.8.3 — Additional Geotechnical Investigation Report Requirements for Seismic Design Categories D through F

From Figure 22-7 [4] PGA = 0.534

Equation (11.8–1): $PGA_M = F_{PGA}PGA = 1.000 \times 0.534 = 0.534$ g

Table 11.8–1: Site Coefficient F_{PGA}

Site Class	Mapped MCE Geometric Mean Peak Ground Acceleration, PGA				
	PGA ≤ 0.10	PGA = 0.20	PGA = 0.30	PGA = 0.40	PGA ≥ 0.50
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of PGA

For Site Class = D and PGA = 0.534 g, F_{PGA} = 1.000

Section 21.2.1.1 — Method 1 (from Chapter 21 – Site-Specific Ground Motion Procedures for Seismic Design)

From Figure 22-17 [5] C_{RS} = 1.059

From Figure 22-18 [6] C_{R1} = 1.027

Section 11.6 — Seismic Design Category

Table 11.6-1 Seismic Design Category Based on Short Period Response Acceleration Parameter

VALUE OF S_{DS}	RISK CATEGORY		
	I or II	III	IV
$S_{DS} < 0.167g$	A	A	A
$0.167g \le S_{DS} < 0.33g$	B	B	C
$0.33g \le S_{DS} < 0.50g$	C	C	D
$0.50g \le S_{DS}$	D	D	D

For Risk Category = I and S_{DS} = 1.000 g, Seismic Design Category = D

Table 11.6-2 Seismic Design Category Based on 1-S Period Response Acceleration Parameter

VALUE OF S_{D1}	RISK CATEGORY		
	I or II	III	IV
$S_{D1} < 0.067g$	A	A	A
$0.067g \le S_{D1} < 0.133g$	B	B	C
$0.133g \le S_{D1} < 0.20g$	C	C	D
$0.20g \le S_{D1}$	D	D	D

For Risk Category = I and S_{D1} = 0.600 g, Seismic Design Category = D

Note: When S_1 is greater than or equal to 0.75g, the Seismic Design Category is **E** for buildings in Risk Categories I, II, and III, and **F** for those in Risk Category IV, irrespective of the above.

Seismic Design Category ≡ "the more severe design category in accordance with Table 11.6-1 or 11.6-2" = D

Note: See Section 11.6 for alternative approaches to calculating Seismic Design Category.

D-1.1 Intent

These Earthwork and Grading Guide Specifications are for grading and earthwork shown on the current, approved grading plan(s) and/or indicated in the Leighton Consulting, Inc. geotechnical report(s). These Guide Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the project-specific recommendations in the geotechnical report shall supersede these Guide Specifications. Leighton Consulting, Inc. shall provide geotechnical observation and testing during earthwork and grading. Based on these observations and tests, Leighton Consulting, Inc. may provide new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

D-1.2 Role of Leighton Consulting, Inc.

Prior to commencement of earthwork and grading, Leighton Consulting, Inc. shall meet with the earthwork contractor to review the earthwork contractor's work plan, to schedule sufficient personnel to perform the appropriate level of observation, mapping and compaction testing. During earthwork and grading, Leighton Consulting, Inc. shall observe, map, and document subsurface exposures to verify geotechnical design assumptions. If observed conditions are found to be significantly different than the interpreted assumptions during the design phase, Leighton Consulting, Inc. shall inform the owner, recommend appropriate changes in design to accommodate these observed conditions, and notify the review agency where required. Subsurface areas to be geotechnically observed, mapped, elevations recorded, and/or tested include (1) natural ground after clearing to receiving fill but before fill is placed, (2) bottoms of all "remedial removal" areas, (3) all key bottoms, and (4) benches made on sloping ground to receive fill.

Leighton Consulting, Inc. shall observe moisture-conditioning and processing of the subgrade and fill materials, and perform relative compaction testing of fill to determine the attained relative compaction. Leighton Consulting, Inc. shall provide *Daily Field Reports* to the owner and the Contractor on a routine and frequent basis.

D-1.3 The Earthwork Contractor

The earthwork contractor (Contractor) shall be qualified, experienced and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Guide

Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing grading and backfilling in accordance with the current, approved plans and specifications.

The Contractor shall inform the owner and Leighton Consulting, Inc. of changes in work schedules at least one working day in advance of such changes so that appropriate observations and tests can be planned and accomplished. The Contractor shall not assume that Leighton Consulting, Inc. is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish earthwork and grading in accordance with the applicable grading codes and agency ordinances, these Guide Specifications, and recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of Leighton Consulting, Inc., unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, adverse weather, etc., are resulting in a quality of work less than required in these specifications, Leighton Consulting, Inc. shall reject the work and may recommend to the owner that earthwork and grading be stopped until unsatisfactory condition(s) are rectified.

D-2.0 PREPARATION OF AREAS TO BE FILLED

D-2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies and Leighton Consulting, Inc.. Care should be taken not to encroach upon or otherwise damage native and/or historic trees designated by the Owner or appropriate agencies to remain. Pavements, flatwork or other construction should not extend under the “drip line” of designated trees to remain.

Leighton Consulting, Inc. shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 3 percent of organic materials (by dry weight: ASTM D 2974). Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area. As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that

are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed.

D-2.2 Processing

Existing ground that has been declared satisfactory for support of fill, by Leighton Consulting, Inc., shall be scarified to a minimum depth of 6 inches (15 cm). Existing ground that is not satisfactory shall be over-excavated as specified in the following Section D-2.3. Scarification shall continue until soils are broken down and free of large clay lumps or clods and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

D-2.3 Overexcavation

In addition to removals and over-excavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be over-excavated to competent ground as evaluated by Leighton Consulting, Inc. during grading. All undocumented fill soils under proposed structure footprints should be excavated

D-2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), (>20 percent grade) the ground shall be stepped or benched. The lowest bench or key shall be a minimum of 15 feet (4.5 m) wide and at least 2 feet (0.6 m) deep, into competent material as evaluated by Leighton Consulting, Inc.. Other benches shall be excavated a minimum height of 4 feet (1.2 m) into competent material or as otherwise recommended by Leighton Consulting, Inc.. Fill placed on ground sloping flatter than 5:1 (horizontal to vertical units), (<20 percent grade) shall also be benched or otherwise over-excavated to provide a flat subgrade for the fill.

D-2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by Leighton Consulting, Inc. as suitable to receive fill. The Contractor shall obtain a written acceptance (*Daily Field Report*) from Leighton Consulting, Inc. prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys and benches.

D-3.0 FILL MATERIAL

D-3.1 Fill Quality

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by Leighton Consulting, Inc. prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to Leighton Consulting, Inc. or mixed with other soils to achieve satisfactory fill material.

D-3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 6 inches (15 cm), shall not be buried or placed in fill unless location, materials and placement methods are specifically accepted by Leighton Consulting, Inc.. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 feet (3 m) measured vertically from finish grade, or within 2 feet (0.61 m) of future utilities or underground construction.

D-3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of Section D-3.1, and be free of hazardous materials ("contaminants") and rock larger than 3-inches (8 cm) in largest dimension. All import soils shall have an Expansion Index (EI) of 20 or less and a sulfate content no greater than ($\leq$) 500 parts-per-million (ppm). A representative sample of a potential import source shall be given to Leighton Consulting, Inc. at least four full working days before importing begins, so that suitability of this import material can be determined and appropriate tests performed.

D-4.0 FILL PLACEMENT AND COMPACTION

D-4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill, as described in Section D-2.0, above, in near-horizontal layers not exceeding 8 inches (20 cm) in loose thickness. Leighton Consulting, Inc. may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers, and only if the building officials with the appropriate jurisdiction approve. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

D-4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM) Test Method D 1557.

D-4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, each layer shall be uniformly compacted to not-less-than (≥) 90 percent of the maximum dry density as determined by ASTM Test Method D 1557. In some cases, structural fill may be specified (see project-specific geotechnical report) to be uniformly compacted to at-least (≥) 95 percent of the ASTM D 1557 modified Proctor laboratory maximum dry density. For fills thicker than (>) 15 feet (4.5 m), the portion of fill deeper than 15 feet below proposed finish grade shall be compacted to 95 percent of the ASTM D 1557 laboratory maximum density. Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

D-4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by back rolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet (1 to 1.2 m) in fill elevation, or by other methods producing satisfactory results acceptable to Leighton Consulting, Inc.. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of the ASTM D 1557 laboratory maximum density.

D-4.5 Compaction Testing

Field-tests for moisture content and relative compaction of the fill soils shall be performed by Leighton Consulting, Inc.. Location and frequency of tests shall be at our field representative(s) discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

D-4.6 Compaction Test Locations

Leighton Consulting, Inc. shall document the approximate elevation and horizontal coordinates of each density test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that Leighton

Consulting, Inc. can determine the test locations with sufficient accuracy. Adequate grade stakes shall be provided.

D-5.0 EXCAVATION

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by Leighton Consulting, Inc. during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by Leighton Consulting, Inc. based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, then observed and reviewed by Leighton Consulting, Inc. prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by Leighton Consulting, Inc..

D-6.0 TRENCH BACKFILLS

D-6.1 Safety

The Contractor shall follow all OSHA and Cal/OSHA requirements for safety of trench excavations. Work should be performed in accordance with Article 6 of the *California Construction Safety Orders*, 2009 Edition or more current (see also: http://www.dir.ca.gov/title8/sb4a6.html).

D-6.2 Bedding and Backfill

All utility trench bedding and backfill shall be performed in accordance with applicable provisions of the 2015 Edition of the *Standard Specifications for Public Works Construction* (Green Book). Bedding material shall have a Sand Equivalent greater than 30 (SE>30). Bedding shall be placed to 1-foot (0.3 m) over the top of the conduit, and densified by jetting in areas of granular soils, if allowed by the permitting agency. Otherwise, the pipe-bedding zone should be backfilled with Controlled Low Strength Material (CLSM) consisting of at least one sack of Portland cement per cubic-yard of sand, and conforming to Section 201-6 of the 2015 Edition of the *Standard Specifications for Public Works Construction* (Green Book). Backfill over the bedding zone shall be placed and densified mechanically to a minimum of 90 percent of relative compaction (ASTM D 1557) from 1 foot (0.3 m) above the top of the conduit to the surface. Backfill above the pipe zone shall **not** be jetted. Jetting of the bedding around the conduits shall be observed by Leighton Consulting, Inc. and backfill above the pipe zone (bedding) shall be observed and tested by Leighton Consulting, Inc..

D-6.3 Lift Thickness

Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to Leighton Consulting, Inc. that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method, and only if the building officials with the appropriate jurisdiction approve.

APPENDIX E

GBA - IMPORTANT INFORMATION ABOUT THIS GEOTECHNICAL-ENGINEERING REPORT

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, clients can benefit from a lowered exposure to the subsurface problems that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed below, contact your GBA-member geotechnical engineer. Active involvement in the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Geotechnical-Engineering Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. *Those who rely on a geotechnical-engineering report prepared for a different client can be seriously misled*. No one except authorized client representatives should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one – not even you – should apply this report for any purpose or project except the one originally contemplated.*

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read it *in its entirety*. Do not rely on an executive summary. Do not read selected elements only. *Read this report in full.*

You Need to Inform Your Geotechnical Engineer about Change

Your geotechnical engineer considered unique, project-specific factors when designing the study behind this report and developing the confirmation-dependent recommendations the report conveys. A few typical factors include:

- the client's goals, objectives, budget, schedule, and risk-management preferences;
- the general nature of the structure involved, its size, configuration, and performance criteria;
- the structure's location and orientation on the site; and
- other planned or existing site improvements, such as retaining walls, access roads, parking lots, and underground utilities.

Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.*

This Report May Not Be Reliable

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, that it could be unwise to rely on a geotechnical-engineering report whose reliability may have been affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If your geotechnical engineer has not indicated an "apply-by" date on the report, ask what it should be*, and, in general, *if you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying it. A minor amount of additional testing or analysis – if any is required at all – could prevent major problems.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface through various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing were performed*. The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgment to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team from project start to project finish, so the individual can provide informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, *they are not final*, because the geotechnical engineer who developed them relied heavily on judgment and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* revealed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a full-time member of the design team, to:

- confer with other design-team members,
- help develop specifications,
- review pertinent elements of other design professionals' plans and specifications, and
- be on hand quickly whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction observation.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for informational purposes only*. To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report, but they may rely on the factual data relative to the specific times, locations, and depths/elevations referenced. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely*. Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures*. If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. As a general rule, *do not rely on an environmental report prepared for a different client, site, or project, or that is more than six months old.*

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, none of the engineer's services were designed, conducted, or intended to prevent uncontrolled migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration.*** Confront the risk of moisture infiltration by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

Attention: Mr. Timothy Reeves

Subject: Geotechnical Addendum Report
K4 Moreno Valley Storm Drain - Cactus Avenue
Unincorporated Riverside County, near Moreno Valley, California

In accordance with your authorization, this addendum report is to provide our preliminary geotechnical recommendations for design and construction of the proposed K4 Moreno Valley Storm Drain associated with the proposed K4 Warehouse Project located along Cactus Avenue, in Moreno Valley area, California. Our recommendations are based primarily on field observations during our recent site visit and the results of our subsurface exploration performed for the K4 Warehouse site.

Based on the results of our evaluation, the proposed storm drain is feasible from a geotechnical perspective provided our recommendations included in this report are properly implemented during design and construction. The soil conditions along the proposed alignment generally consist of alluvial deposits. The site is not located within an Alquist-Priolo or Riverside County Earthquake Fault Zone.

The opportunity to be of service is sincerely appreciated. If you should have questions, please do not hesitate to call our office.

Respectfully submitted,
LEIGHTON CONSULTING, INC.

1.0 INTRODUCTION

1.1 Site and Project Description

As indicated on Figure 1, the proposed K4 Storm Drain is located along the south side of Cactus Avenue between Elsworth Street and Heacock Street. The total alignment is approximately 7,850 linear feet, which is currently an open earthen channel with a depth of 5 to 6 feet below adjacent ground surface with variable slopes gradient. According to the provided conceptual plans (DRC, 2018), the K4 Storm Drain will connect to an existing earthen channel along the west of Heacock Street and have a typical soils cover ranging from 3 feet to 8 feet. According to provided plans, this RCB storm drain will vary in size as follows:

- Double-cell box (9'Wx5'H) between Stations 62+46 and 88+47
- Double-cell box (8'Wx7'H) between Stations 36+06 and 62+46
- Single box (14'Wx8'H) between Stations 10+00 and 36+06

1.2 Purpose and Scope of Evaluation

The purpose of our evaluation is to (1) evaluate geotechnical engineering characteristics of the soil at the project site based on existing information, and (2) provide geotechnical recommendations for design and construction of the proposed storm drain. This report does not address the potential for encountering hazardous materials. Important information about limitations of geotechnical reports, in general, is presented in Appendix B, *GBA Important Information about This Geotechnical Report.*

1.3 Field Exploration

Based on recent site reconnaissance and review of our soils report for the K4 Warehouse project (Leighton, 2018), the soils conditions along the alignment are expected to consist of dense older alluvium with surficial and local younger/recent sediments. Approximate locations of our field exploration borings at the K-4 site are depicted on Figure 2, Boring Location Map.

1.4 Laboratory Testing

No laboratory testing was performed as part of this addendum report. Our analyses were based solely on the results of our laboratory testing performed during our subsurface exploration for the Warehouse project (Leighton, 2018) and included in Appendix A.

2.0 SUMMARY OF GEOTECHNICAL FINDINGS

A summary of our findings from research of pertinent literature and field exploration performed for the K4 Warehouse project (Leighton, 2018) is discussed in this section.

2.1 Overall Site Geology

As shown on the *Regional Geology Map* (Figure 3), the site is primarily located within Quaternary-age very old fan deposits (Qvof).

2.2 Subsurface Conditions

Based on the results of our geotechnical exploration, the alignment of the proposed storm drain is expected to be underlain by the following:

- ***Recent Sediments/Young Alluvium***: These are likely generated during past cycles of flooding within this earthen channel. Based on our visual observations, these sediments generally consist of fine sands and silt and are expected to be loose and possess low expansion (EI<51).
- ***Older Alluvium*****:** The older alluvial deposits are expected to consist of medium dense to very dense silty to clayey sand (SM/SC) and localized layers of sandy silty to sandy clay (ML/CL). This older alluvium is expected to generally possess a low expansion potential (EI<51) and slight collapse potential (<1%).

2.3 Excavation Characteristics

Relatively easy to moderate excavation using heavy grading equipment is expected within the proposed depth of excavation. Grading and/or trench excavation characteristics using conventional excavators or earthmoving equipment may vary based on the specific equipment used. It is important that a contractor with excavation experience in similar conditions should be consulted for the proper excavation method, equipment, and production rate based on the findings of this report. Caving of excavations in the non-cohesive sands should be anticipated.

2.4 Surface and Groundwater

Surface water was observed along certain portions of the alignment during our site visit, from approximately Station 57+00 to 69+00. In addition, areas between Station 69+00 and 79+00 appeared to be overly saturated, mainly at the storm drain inlet connections. Groundwater was encountered during our exploration for K4 Warehouse site at a depth of approximately 19 feet (LB-2) below existing

ground surface (bgs) and 23 feet bgs (LB-4). Historic groundwater data, as reported by Department of Water Resource (DWR) data for Well 338995N1171958W001 located approximately 5 miles east of the subject site, reflect a groundwater elevation of 1,470 feet (about 82 feet below site elevation) in April 2017. According to West San Jacinto Groundwater Management Plan, 2016 Annual Report, the groundwater elevation in the subject site vicinity are at the range of 1,520 feet msl (about 32 feet below site elevation). In addition, groundwater conditions can fluctuate seasonally and can be encountered during construction.

2.5 Faulting and Seismicity

The subject site, like the rest of Southern California, are located within a seismically active region as a result of being located near the active margin between the North American and Pacific tectonic plates. The principal source of seismic activity on this site is movement along the northwest-trending regional fault systems such as the San Andreas and San Jacinto. Based on our review of published geologic map (Hart, 2007), the subject site is not included within an Earthquake Fault Zone per the Alquist-Priolo Earthquake Fault Zoning Act.

For the purpose of structural design, seismic coefficients based on the 2016 California Building Code (CBC) are provided below. These seismic coefficients were calculated based on a software program, available on the United States Geological Survey website), which follows the procedures, included in American Society of Civil Engineers (ASCE) Publication ASCE 7-10 and Chapter 16 of 2016 CBC.

Table 1. CBC Site Categorization and Seismic Coefficients

Categorization /Coefficient	Values
Site Longitude (decimal degrees)	-117.2592
Site Latitude (decimal degrees)	33.9101
Site Class Definition	D
Mapped Spectral Response Acceleration at 0.2s Period, S_s	1.50g
Mapped Spectral Response Acceleration at 1s Period, S_1	**0.60g**
Short Period Site Coefficient at 0.2s Period, F_a	1.0
Long Period Site Coefficient at1s Period, F_v	1.5
Adjusted Spectral Response Acceleration at 0.2s Period, S_{MS}	1.50g
Adjusted Spectral Response Acceleration at 1s Period, S_{M1}	0.90g
Design Spectral Response Acceleration at 0.2s Period, S_{DS}	***1.00g***
Design Spectral Response Acceleration at 1s Period, S_{D1}	***0.60g***

3.0 CONCLUSIONS AND RECOMMENDATIONS

3.1 General

Construction of the proposed RCB storm drain is feasible from a geotechnical viewpoint provided that the following recommendations are incorporated into the design and construction phases of development. The encountered alluvium should be considered CalOSHA Type C soil, and sloped excavations will be required to protect workers in the excavations, if shoring and/or shields are not used. Geotechnical recommendations for design and construction of the proposed pipelines are presented below.

3.2 Earthwork Considerations

Earthwork associated with the proposed pipeline should be performed in accordance with applicable RCFC&WCD/District Specifications, "Standard Specifications for Public Works Construction" (Green Book, latest edition) and the recommendations included in the text of this report.

3.2.1. Trench Excavation

Based on the results of our exploratory borings, the onsite fill and younger/older alluvium should generally be easy to excavate with conventional earthmoving equipment.

Excavation should be performed in accordance with the project plans, specifications, and applicable OSHA requirements. The contractor should be responsible for providing the "competent person" required by OSHA standards. Contractors should be advised that sandy soil (such as existing, onsite fill and alluvium) could make excavations particularly unsafe, and hence necessary safety precautions should be taken.

3.2.2. Subgrade Preparation

Medium dense to dense silty sand and clayey sand are expected below the bottom of the proposed storm drain. The exposed grade should be suitable for foundation support. However, depending on actual field conditions encountered during construction, localized over-excavation may be required if loose or expansive soils (EI>51) are encountered. The resulting voids or over-excavations (not to exceed 2 feet) should be properly backfilled with suitable soil.

3.2.3. Fill and Backfill

The onsite undocumented fill and alluvium within the proposed excavation depths are generally suitable as fill soil provided they are relatively free of rocks over 6 inches in diameter and organic matter. Backfill materials should be placed in thin lifts, moisture conditioned, as necessary, and mechanically compacted using a minimum standard of 90 percent relative compaction, relative to the ASTM D 1557 laboratory maximum dry density or as required per District standard specifications.

3.3 Recommended Soil Parameters

3.3.1. Soil Erodibility (K) factor

Based on the results of our laboratory testing (grain size analysis), the Soil Erodibility Factor (K) is expected to range from 0.15 to 0.35 per the Erickson/USDA nomograph. These values are applicable to the on-site alluvium and locally derived silty sand sediments.

3.3.2. Rankine's Factor (K)

Based on the results of our laboratory testing (shear strength), a Rankine's ratio of active lateral pressure to vertical unit pressure (K) of 0.33 may be used for pipe D-Load calculations. This value is applicable to the on-site alluvium and locally derived soil.

3.3.3. Sliding Friction (μ')

Based on the results of our laboratory testing (shear strength), a coefficient of sliding friction (μ'), between backfill soil and trench walls of 0.58 may be used for pipe D-Load calculations. This value is applicable to the on-site alluvium and locally derived fill soil.

3.4 Lateral Earth Pressures

3.4.1. Lateral Pressure

Soil's resistance ability to withstand lateral loads on a shallow foundation is a function of the frictional resistance along the base of the footing and the passive resistance that may develop as the face of the structure tends to move into the soil. The frictional resistance between the base of the concrete and the subgrade soil may be computed using a coefficient of friction of 0.35. The passive resistance may be computed using an equivalent fluid pressure of 300 pounds-per-cubic-foot (pcf), assuming there is constant contact between concrete and undisturbed soil. These friction and passive values have already been reduced by a factor-of-

safety of 1.5, and can be increased by one-third when considering short-duration wind or seismic loads.

3.4.2. Other Soil Parameters for Design

Structural design of pipes requires proper evaluation of possible loads acting on the pipe, including dead and live or transient loads. Stresses and strains induced in a buried pipe depend on many factors, including the type of pipe, depth and width of trench, bedding and embedment conditions, soil density, angle of internal friction, coefficient of passive earth pressure, and coefficient of friction at the interface between the backfill and in-situ soil. We recommend the following soil parameters for the proposed concrete pipe design:

Table 2. Soil Parameters for Pipe Design

Soil Parameters	Recommended Values
Average Compacted fill moist unit weight, (pcf)	120-130
Angle of internal friction of soil (degrees)	33
Soil cohesion, c (psf)	200
Sliding friction between concrete pipe and native soil	0.38
Coefficient of active earth pressure/Rankine, Ka	0.33
Coefficient of earth pressure at rest, Ko	0.50

3.5 Temporary Cut Slopes

The contractor is responsible for temporary slopes and trenches excavated at the site and the design of required temporary shoring. Shoring, bracing and benching should be performed by the contractor in accordance with the current edition of the *California Construction Safety Orders*, see:
http://www.dir.ca.gov/title8/sb4a6.html

During construction, exposed soil conditions should be regularly evaluated to check that conditions are as anticipated. The contractor is responsible for providing the "competent person" required by OSHA standards to evaluate soil conditions. Close coordination between the competent person and geotechnical consultant should be maintained to facilitate construction while providing safe excavations. The existing alluvial soil encountered is classified as OSHA soil Type C. Unshored temporary cut slopes should be no steeper than 1½:1 (horizontal:vertical), for a height no-greater-than (≤) 20 feet (*California Construction Safety Orders*, Appendix B to Section 1541.1, Table B-1). Dense cohesive older alluvium may be considered as OSHA soil Type B and temporary slopes can be cut at 1:1 gradient

provided further field verification and testing performed during construction. These recommended temporary cut slopes assume a level ground surface for a distance equal to one-and-a-half (x1.5) the depth of excavation. For steeper temporary slopes, deeper excavations, and/or where slopes terrain exists within close proximity to excavation (<1.5xdepth), appropriate shoring methods or flatter slopes may be required to protect the workers in the excavation and adjacent improvements. Such methods should be implemented by the contractor and reviewed by the geotechnical consultant.

3.6 Temporary Shoring

If the sloped open cut excavation is not feasible based on requirements above and due to existing structures, excavations should be supported by a temporary shoring system such as cross-braced hydraulic shoring, conventional shields, sheet piles, or soldier piles and wood lagging. The choice should be left to the contractor's judgment since economic considerations and/or the individual contractor's construction experience may be important factors. The contractor and shoring designer should also perform additional geotechnical studies as necessary to refine the means-and-methods of shoring construction.

The support of adjacent existing structures during excavation and construction (including pavements) without distress is the contractor's responsibility. In addition, it should be the contractor's responsibility to undertake a pre-construction survey with benchmarks and photographs of the adjacent properties. Shoring systems should be designed by a California licensed civil or structural engineer. As preliminary design guidelines, we present the following geotechnical parameters for shoring design. The following lateral earth pressures are recommended for temporary shoring supporting the anticipated alignment soil types with level ground behind the shoring. Passive pressure also may be used to compute lateral soil resistance, if necessary, for sheet piles. Earth pressures provided are ultimate values and a safety factor should be applied as appropriate.

Table 3. Static Lateral Earth Pressures

Conditions[1]	Static Equivalent Fluid Weight (pcf)
Active (cantilever)	37
At-Rest (braced)	55
Passive[2]	300

1. For temporary excavations only, with level backfill, not including surcharges
2. Passive equivalent fluid pressure may be doubled for isolated soldier piles spaced at least 2½ diameters on-center. Passive resistance should not exceed 3,500 pounds-per-square-foot (psf)

Determination of appropriate design conditions (active or at-rest) depends on shoring flexibility. If a rotation of more than 0.001 radian (0.06 degrees) is allowed, active pressure conditions apply; otherwise, at-rest condition governs.

Surcharge loads (dead or live) should be added to the indicated lateral earth pressures and should be applied uniformly, if such loads are within a horizontal distance that is less-than the exposed shoring height. The corresponding lateral earth pressure will approximately be 33-percent of the vertical surcharge for active conditions, and 50-percent for at-rest conditions. Surcharge pressures from concentrated loads should be evaluated after geometric constraints and loading conditions are evaluated on individual basis.

3.7 Dewatering during Trenching and Pipeline Construction

Based on the results of our exploration, groundwater was not encountered and thus not expected to be a geotechnical concern during construction. However, if encountered during excavations, groundwater control, such as dewatering, will be required to limit instability of the excavation bottom, side and face, and aid construction and soil backfill. Groundwater due to perched saturated conditions can be dewatered utilizing sump-pumps. Dewatering or other suitable methods for stabilizing the excavation bottom may be selected by the contractor based on actual groundwater conditions encountered and based on the contractor's chosen means-and-methods of construction. The method selected by the contractor should be able to effectively mitigate for bottom heave or stabilize subgrade soil during construction and backfilling.

3.8 Additional Geotechnical Services

This report was based in part on data obtained from a limited number of observations, site visits, soil excavations, samples and tests. Such information is, by necessity, incomplete. The nature of many construction projects is such that differing soil or geologic conditions can be present within relatively small distances between borings and under varying climatic conditions. Changes in subsurface conditions can and do occur over time. Therefore, our findings, conclusions and recommendations presented in this report are only valid if Leighton Consulting, Inc. has the opportunity to observe subsurface conditions during construction, to confirm that our preliminary data are representative for the site. Geotechnical observation and testing should be provided by Leighton Consulting, Inc. during backfill and when unusual conditions are encountered.

4.0 LIMITATIONS

This report was necessarily based in part upon data obtained from a limited number of observances, site visits, soil samples, tests, analyses, histories of occurrences, spaced subsurface explorations and limited information on historical events and observations. Such information is necessarily incomplete. The nature of many sites is such that differing characteristics can be experienced within small distances and under various climatic conditions. Changes in subsurface conditions can and do occur over time. This investigation was performed with the understanding that the subject site is proposed for development as described in Section 1.1 of this report. The client is referred to Appendix B regarding important information provided by the Geoprofessional Business Council (GBC) on geotechnical engineering studies and reports and their applicability.

This report was prepared for Meridian Park, LLC based on Meridian Park, LLC needs, directions, and requirements at the time of our investigation. This report is not authorized for use by, and is not to be relied upon by any party except Meridian Park, LLC , and its successors and assigns as owner of the property, with whom Leighton Consulting, Inc. has contracted for the work. Use of or reliance on this report by any other party is at that party's risk. Unauthorized use of or reliance on this report constitutes an agreement to defend and indemnify Leighton Consulting, Inc. from and against any liability which may arise as a result of such use or reliance, regardless of any fault, negligence, or strict liability of Leighton Consulting, Inc.

APPENDIX A

Logs of Previous Exploratory Borings and Laboratory Testing

Relatively undisturbed soil samples were obtained at selected intervals within the borings using a California ring sampler, with 2.42-inch inside diameter brass rings, driven into the soil with a 140-pound hammer falling 30-inches in general accordance with ASTM Test Method D3550. The numbers of blows required for each 6 inches of drive penetration were noted in the field and are recorded on the boring logs. Unless otherwise indicated, the blows per foot recorded on the boring logs represent the number of blows required to drive 18 inches in 6 inch increments. In addition, disturbed bag (or bulk) samples were also obtained from soil cuttings. Types of samples obtained from each location are shown on the boring logs at corresponding depths. Our borings were backfilled with soil cuttings obtained during the drilling. Representative soil samples obtained from these subsurface explorations were transported to our Temecula geotechnical laboratory for evaluation and appropriate testing.

The attached subsurface exploration logs and related information depict subsurface conditions only at the locations indicated and at the particular date designated on the logs. Subsurface conditions at other locations may differ from conditions occurring at these locations. The passage of time may result in altered subsurface conditions due to environmental changes. In addition, stratification lines on the logs represent the approximate boundary between soil types and the transition may be gradual.

GBA Important Information about This Geotechnical Report

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, clients can benefit from a lowered exposure to the subsurface problems that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed below, contact your GBA-member geotechnical engineer. Active involvement in the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Geotechnical-Engineering Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. *Those who rely on a geotechnical-engineering report prepared for a different client can be seriously misled*. No one except authorized client representatives should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one – not even you – should apply this report for any purpose or project except the one originally contemplated.*

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read it *in its entirety*. Do not rely on an executive summary. Do not read selected elements only. *Read this report in full.*

You Need to Inform Your Geotechnical Engineer about Change

Your geotechnical engineer considered unique, project-specific factors when designing the study behind this report and developing the confirmation-dependent recommendations the report conveys. A few typical factors include:

- the client's goals, objectives, budget, schedule, and risk-management preferences;
- the general nature of the structure involved, its size, configuration, and performance criteria;
- the structure's location and orientation on the site; and
- other planned or existing site improvements, such as retaining walls, access roads, parking lots, and underground utilities.

Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.*

This Report May Not Be Reliable

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, that it could be unwise to rely on a geotechnical-engineering report whose reliability may have been affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If your geotechnical engineer has not indicated an "apply-by" date on the report, ask what it should be*, and, in general, *if you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying it. A minor amount of additional testing or analysis – if any is required at all – could prevent major problems.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface through various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing were performed*. The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgment to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team from project start to project finish, so the individual can provide informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, *they are not final*, because the geotechnical engineer who developed them relied heavily on judgment and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* revealed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a full-time member of the design team, to:

- confer with other design-team members,
- help develop specifications,
- review pertinent elements of other design professionals' plans and specifications, and
- be on hand quickly whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction observation.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for informational purposes only*. To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report, but they may rely on the factual data relative to the specific times, locations, and depths/elevations referenced. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely*. Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures*. If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. As a general rule, *do not rely on an environmental report prepared for a different client, site, or project, or that is more than six months old.*

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, none of the engineer's services were designed, conducted, or intended to prevent uncontrolled migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration.*** Confront the risk of moisture infiltration by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

CRM TECH Contract #3424
Approximately 35 Acres and 1.5 linear miles
USGS Riverside East and Sunnymead, Calif., 7.5' (1:24,000) Quadrangles
Section 13 and 14, T3S R4W, San Bernardino Baseline and Meridian

EXECUTIVE SUMMARY

Between June 2018 and January 2019, at the request of Lewis Retail Centers, CRM TECH performed a paleontological resource assessment for the proposed K-4 Parcel Project and the Cactus Avenue Drainage Channel Improvement Project on the northern edge of March Air Reserve Base near the City of Moreno Valley, Riverside County, California. The K-4 Parcel Project consist of the construction of an approximately 718,000-square-foot industrial warehouse with 289 automobile parking stalls and 317 truck trailer parking stalls on 35 acres of undeveloped land in Assessor's Parcel Numbers 297-150-006, 297-150-007, 297-150-038, 297-160-005, and 297-200-004, and the Cactus Avenue Drainage Channel Improvement Project entails the conversion of an approximately 1.5-mile segment of earthen drainage channel to an underground concrete culvert, along with minor improvements such as extending a number of existing storm drains. The combined project area is located on the south side of Cactus Avenue between Graeber/Elsworth Street and Heacock Street, in Sections 13 and 14 of T3S R4W, San Bernardino Baseline and Meridian. The maximum depth of excavation required for the projects, or the vertical extent of anticipated project impact, will not exceed 10 feet.

The present study is part of the environmental review process for these projects, as required by the March Joint Powers Authority (JPA) in compliance with the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The purpose of the study is to provide the JPA and the pertinent federal agencies with the necessary information and analysis to determine whether the proposed projects would adversely affect any significant, nonrenewable paleontological resources and to design a paleontological mitigation program, if necessary. In order to identify any paleontological localities that may exist in or near the project area and to assess the possibility for such resources to be encountered during the projects, CRM TECH initiated a records search at the Western Science Center in Hemet, conducted a literature review, and carried out a systematic field survey of the project area. Findings from these research procedures indicate that the projects' potential to impact paleontological resources appears to be low in the surface soils but high in the undisturbed subsurface deposits of older Quaternary age.

Based on these findings, CRM TECH recommends that a mitigation program be developed and implemented for the proposed projects to prevent potential impact on significant, nonrenewable paleontological resources or reduce such impact to a level less than significant. As the primary component of the mitigation program, all earth-moving operations above the depth of three feet should be monitored periodically to identify the sediments being impacted, and any earth-moving operations reaching beyond the depth of three feet will require continuous monitoring for potential paleontological remains. Under this condition, CRM TECH further recommends that the proposed projects may be cleared to proceed in compliance with CEQA and NEPA provisions on paleontological resources.

INTRODUCTION

Between June 2018 and January 2019, at the request of Lewis Retail Centers, CRM TECH performed a paleontological resource assessment for the proposed K-4 Parcel Project and the Cactus Avenue Drainage Channel Improvement Project on the northern edge of March Air Reserve Base near the City of Moreno Valley, Riverside County, California (Figure 1). The K-4 Parcel Project consist of the construction of an approximately 718,000-square-foot industrial warehouse with 289 automobile parking stalls and 317 truck trailer parking stalls on 35 acres of undeveloped land in Assessor's Parcel Numbers 297-150-006, 297-150-007, 297-150-038, 297-160-005, and 297-200-004, and the Cactus Avenue Drainage Channel Improvement Project entails the conversion of an approximately 1.5-mile segment of earthen drainage channel to an underground concrete culvert, along with minor improvements such as extending a number of existing storm drains. The combined project area is located on the south side of Cactus Avenue between Graeber/Elsworth Street and Heacock Street, in Sections 13 and 14 of T3S R4W, San Bernardino Baseline and Meridian (Figures 2, 3). The maximum depth of excavation required for the projects, or the vertical extent of anticipated project impact, will not exceed 10 feet.

The present study is part of the environmental review process for these projects, as required by the March Joint Powers Authority (JPA) in compliance with the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The purpose of the study is to provide the JPA and the pertinent federal agencies with the necessary information and analysis to determine whether the proposed projects would adversely affect any significant, nonrenewable paleontological resources and to design a paleontological mitigation program, if necessary. In order to identify any

paleontological localities that may exist in or near the project area and to assess the possibility for such resources to be encountered during the projects, CRM TECH initiated a records search at the Western Science Center in Hemet, conducted a literature review, and carried out a systematic field survey of the project area. The following report is a complete account of the methods, results, and final conclusion of this study. Personnel who participated in the study are named in the appropriate sections below, and their qualifications are provided in Appendix 1.

PALEONTOLOGICAL RESOURCES

DEFINITION

Paleontological resources represent the remains of prehistoric life, exclusive of any human remains, and include the localities where fossils were collected as well as the sedimentary rock formations in which they were found. The defining character of fossils or fossil deposits is their geologic age, which is typically regarded as older than approximately 12,000 years, the generally accepted temporal boundary marking the end of the last late Pleistocene (circa 2.6 million to 12,000 years B.P.) glaciation and the beginning of the current Holocene epoch (circa 12,000 years B.P. to the present).

Common fossil remains include marine shells; the bones and teeth of fish, amphibians, reptiles, and mammals; leaf assemblages; and petrified wood. Fossil traces, another type of paleontological resource, include internal and external molds (impressions) and casts created by these organisms. These items can serve as important guides to the age of the rocks and sediments in which they are contained, and may prove useful in determining the temporal relationships between rock deposits from one area and those from another as well as the timing of geologic events. They can also provide information regarding evolutionary relationships, development trends, and environmental conditions.

Fossil resources generally occur only in areas of sedimentary rock (e.g., sandstone, siltstone, mudstone, claystone, or shale). Because of the infrequency of fossil preservation, fossils, particularly vertebrate fossils, are considered nonrenewable paleontological resources. Occasionally fossils may be exposed at the surface through the process of natural erosion or because of human disturbances; however, they generally lay buried beneath the surficial soils. Thus, the absence of fossils on the surface does not preclude the possibility of their being present within subsurface deposits, while the presence of fossils at the surface is often a good indication that more remains may be found in the subsurface.

SIGNIFICANCE CRITERIA

According to guidelines proposed by Eric Scott and Kathleen Springer (2003) of the San Bernardino County Museum, paleontological resources can be considered to be of significant scientific interest if they meet one or more of the following criteria:

1. The fossils provide information on the evolutionary relationships and developmental trends exhibited among organisms, living or extinct;

2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;
3. The fossils provide data regarding the development of biological communities or the interactions between paleobotanical and paleozoological biotas;
4. The fossils demonstrate unusual or spectacular circumstances in the history of life; and/or
5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

PALEONTOLOGICAL SENSITIVITY

The fossil record is unpredictable, and the preservation of organic remains is rare, requiring a particular sequence of events involving physical and biological factors. Skeletal tissue with a high percentage of mineral matter is the most readily preserved within the fossil record; soft tissues not intimately connected with the skeletal parts, however, are the least likely to be preserved (Raup and Stanley 1978). For this reason, the fossil record contains a biased selection not only of the types of organisms preserved but also of certain parts of the organisms themselves. As a consequence, paleontologists are unable to know with certainty, the quantity of fossils or the quality of their preservation that might be present within any given geologic unit.

Sedimentary units that are paleontologically sensitive are those geologic units (mappable rock formations) with a high potential to contain significant nonrenewable paleontological resources. More specifically, these are geologic units within which vertebrate fossils or significant invertebrate fossils have been determined by previous studies to be present or are likely to be present. These units include, but are not limited to, sedimentary formations that contain significant paleontological resources anywhere within their geographical extent as well as sedimentary rock units temporally or lithologically amenable to the preservation of fossils.

A geologic formation is defined as a stratigraphic unit identified by its lithic characteristics (e.g., grain size, texture, color, and mineral content) and stratigraphic position. There is a direct relationship between fossils and the geologic formations within which they are enclosed and, with sufficient knowledge of the geology and stratigraphy of a particular area, it is possible for paleontologists to reasonably determine the formation's potential to contain significant nonrenewable vertebrate, invertebrate, marine, or plant fossil remains.

The paleontological sensitivity for a geologic formation is determined by the potential for that formation to produce significant nonrenewable fossils. This determination is based on what fossil resources the particular geologic formation has produced in the past at other nearby locations. Determinations of paleontologic sensitivity must consider not only the potential for yielding vertebrate fossils but also the potential of yielding a few significant fossils that may provide new and significant taxonomic, phylogenetic, and/or stratigraphic data.

The Society of Vertebrate Paleontology issued a set of standard guidelines intended to assist paleontologists to assess and mitigate any adverse effects/impacts to nonrenewable paleontological resources. The guidelines defined four categories of paleontological sensitivity for geologic units that might be impacted by a proposed project, as listed below (Society of Vertebrate Paleontology 2010:1-2):

- **High Potential**: Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered.
- **Undetermined Potential**: Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment.
- **Low Potential**: Rock units that are poorly represented by fossil specimens in institutional collections, or based on general scientific consensus only preserve fossils in rare circumstances.
- **No Potential**: Rock units that have no potential to contain significant paleontological resources, such as high-grade metamorphic rocks and plutonic igneous rocks.

SETTING

March Air Reserve Base is located in a valley floor area in the northern portion of the Peninsular Ranges geomorphic province, which is bounded on the north by the Transverse Ranges province, on the northeast by the Colorado Desert province, and on the west by the Pacific Ocean (Jenkins 1980:40-41; Harms 1996:150). The Peninsular Ranges province extends southward to the southern tip of Baja California (Jahns 1954:Plate 3). The natural landscape in the Transverse Ranges province features a host of inland valleys divided by groups of rolling hills and rocky knolls. The mild Mediterranean climate of the region is typical of inland southern California lowlands, characterized by hot and dry summers and mild and wet winters. The average annual rainfall in the region is approximately 10 inches, the majority of which typically falls seasonally between December and March.

The project area lies on the edge of a high portion of the Perris Block, which was defined by English (1926) as a region between the San Jacinto and Elsinore-Chino fault zones and consisting of a series of tectonically controlled valleys and ridges. The block is bounded on the north by the Cucamonga (San Gabriel) Fault and on the south by a vaguely delineated boundary near the southern end of the Temecula Valley (*ibid*.). The structural blocks are considered to have been active since Pliocene time (Woodford et al. 1971:3421). The Pliocene- and Pleistocene-age non-marine sedimentary rocks found filling the valley areas have produced vertebrate fossils, as well as plant and invertebrate fossil remains (Mann 1955:13).

The project area consists of five parcels of vacant land on the northern perimeter of March Air Reserve Base as well as the right-of-way of the earthen drainage channel across other parcels on the south side of Cactus Avenue between its intersections with Graeber/Elsworth Street and Heacock Street (Figure 3). The terrain in the project area is relatively level except for the channel, with a slight incline to the west, and the elevations range approximately between 1,520 feet and 1,550 feet above mean sea level, including the depth of the channel (Figure 4). Several power transmission lines and stockpiles of imported soil are found in the eastern portion of the K-4 Parcel project site, near a substation located immediately outside the project boundary.

The ground surface in the project vicinity has been disturbed extensively in the past and appears to have been cleared of much of the vegetation recently, except in the drainage channel. Several manholes in the project area suggest the presence of underground utility lines. Surface soil consists mostly of a hardpacked brown silty-clay loam, and vegetation growth, concentrated mainly in the western portion of project area, features solely typical small grasses and shrubs, often in dense growth at the bottom of the channel (Figure 4).

Figure 4. Typical landscapes in the project area. *Left*: overview of the K-4 Parcel project site to the west; *right*: Cactus Avenue Drainage Channel, view to the west from the eastern end. (Photographs taken on June 1 and July 27, 2018)

METHODS AND PROCEDURES

RECORDS SEARCHES

The records search service for this study was provided by the Western Science Center in Hemet, California, which maintains files of regional paleontological localities as well as supporting maps and documents. The records search results were used to identify previously performed paleontological resource assessments as well as known paleontological localities within a one-mile radius of the project area.

LITERATURE REVIEW

In conjunction with the records searches, CRM TECH geologist/paleontologist Harry M. Quinn, California Professional Geologist #3477, pursued a literature review on the project area and vicinity. Sources consulted during the review include primarily topographic, geologic, and soil maps of the Moreno Valley-Riverside area, published geologic literature pertaining to the project location, and other materials in the CRM TECH library and Quinn's personal library, including unpublished reports produced during similar surveys in the vicinity.

FIELD SURVEY

On June 1 and July 27, 2018, CRM TECH paleontological surveyors Salvadore Boites, Nina Gallardo, and Ben Kerridge carried out the field survey of the project area under the direction of Harry M. Quinn. The survey was accomplished by walking a series of parallel north-south transects at 15-meter (approximately 50-foot) intervals across the K-4 Parcel project site and two east-west transects along either side of the drainage channel. In this way, the entire project area was systematically examined for any indications of paleontological remains and to verify the geological formations and the soil types. Ground visibility was good to excellent (80-100 percent) in most of the project area but was reduced to poor (0-5 percent) where soil stockpiles covered the ground surface or dense vegetation growth obscured the bottom of the channel.

RESULTS AND FINDINGS

RECORDS SEARCHES

The Western Science Center found no known paleontological localities within the boundaries of the project area or within a one-mile radius (Radford 2018; see Appendix 2). However, hundreds of localities and thousands of specimens have been reported in areas further away from the project location but from sediment lithologies similar to those that are known to occur in the project vicinity (*ibid.*).

According to the Western Science Center, the project area lies atop very old alluvial fan deposits dating from the early Pleistocene. These deposits are considered to be sensitive for paleontological resources, and any fossils unearthed during the proposed projects would likely be scientifically significant (Radford 2018). Therefore, the Western Science Center assigned the projects a high potential for impacting significant, nonrenewable fossil resources in the surface soils (*ibid.*).

LITERATURE REVIEW

The surface geology within the project area was mapped by Rogers (1965) as *Qal*, or alluvium of Recent (Holocene) age. Morton et al. (2001a; 2001b) mapped the area as $Qvof_a$, or very old alluvial fan deposits of early Pleistocene age, which were described as well dissected, well indurated, reddish-brown sand deposits containing minor amounts of gravel (*ibid.*; Figure 5). Dibblee (2003a; 2003b) mapped the area as *Qa*, or alluvium of Holocene age. According to Dibblee (*ibid.*), *Qa* is composed of alluvial sand, gravel, and clay of valley areas. It is locally covered by soil and rests directly atop *Qoa*, or alluvial fan deposits of Pleistocene age, at an undetermined depth (*ibid.*).

Knecht (1971:Map Sheets 43, 44) mapped the surface soils in the project vicnity as mainly *MmB* with some *RaB2*. *MmB* belongs to the Monserate sandy loam, 0-5 percent slope, and consists of well-drained soils developed in alluvium derived mainly from granitic materials (*ibid.*:46). These soils commonly have layers cemented with dark-brown iron and silica at roughly 28 inches (*ibid.*). *RaB2* belongs to the Ramona sandy loam, 2-5 percent slopes (*ibid.*:53). It tends to be eroded and occurr on alluvial fans and terraces (*ibid.*).

FIELD SURVEY

During the field survey, no evidence of any paleontological resources was observed on the ground surface throughout the project area. The field observations confirmed that the surface sediments in and near the project area had been extensively disturbed in the past, especially along the drainage channel and the various roadways nearby.

DISCUSSION

The geologic and soil maps of the project vicinity indicate that it is an area of outcropping soils developed from the in-place decomposition of underlying igneous rock or washed in as alluvial fan deposits from nearby bedrock outcrops. The surface geology at the project location consists of exposures of locally formed alluvium of Pleistocene and Holocene (Recent) age. Holocene alluvium

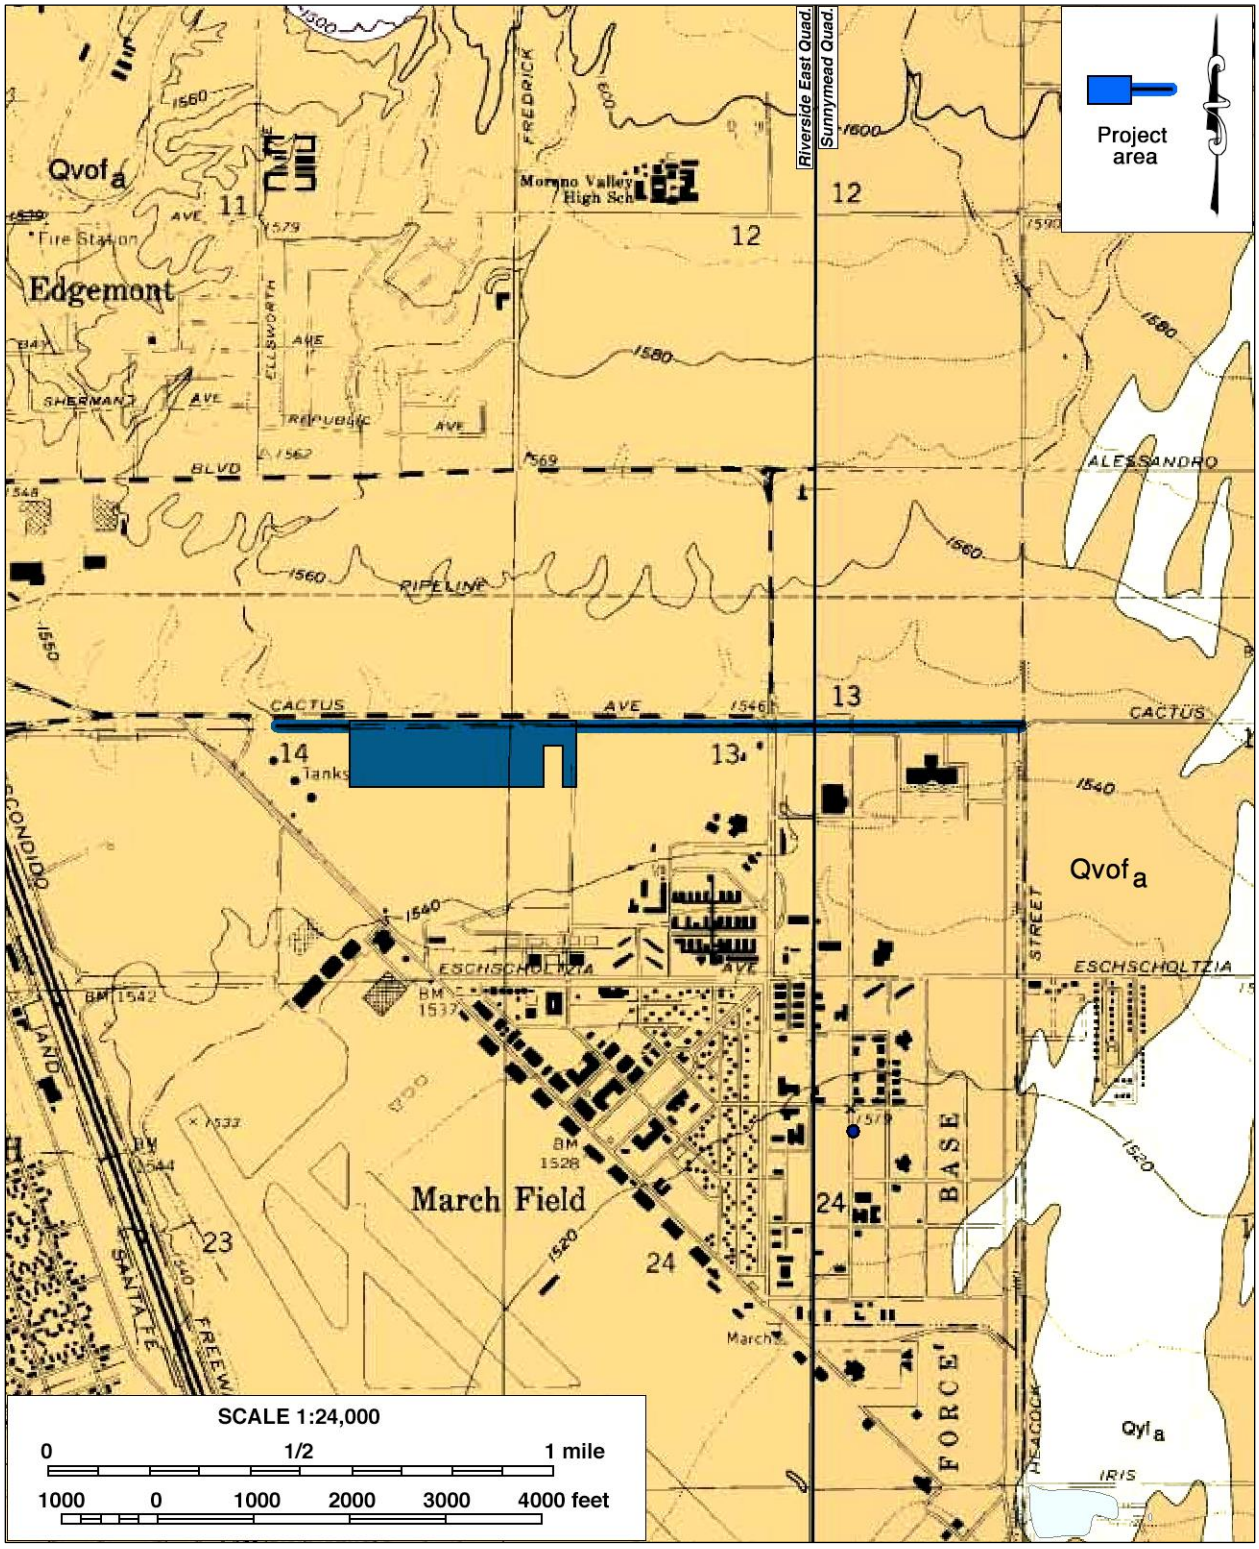

Figure 5. Geologic map of the project vicinity. (Based on Morton et al. 2001a; 2001b)

has a low potential for containing nonrenewable paleontological resources, but these surface sediments rest atop older, Pleistocene-age sediments that have a high potential for such resources. The presence of the Pleistocene alluvium subsurface in the project area may be ascertained from on-site boring logs, should they be available. If boring logs are not available, or if they are not definitive as to the depth of the older sediments, periodic inspection, or "spot-checking," will be needed in the top stratum of soils during the project in order to the determine the age of the sediments being impacted, as discussed further below.

CONCLUSION AND RECOMMENDATIONS

The results of the records searches, literature research, and field survey demonstrate that the proposed projects' potential to impact paleontological resources appears to be low in the surface soils but high in the undisturbed subsurface deposits of older Quaternary age. Based on these findings, CRM TECH recommends that a mitigation program be developed and implemented for the projects to prevent potential impact on significant, nonrenewable paleontological resources or reduce such impact to a level less than significant. The mitigation program should be developed in accordance with the provisions of CEQA as well as the proposed guidelines of the Society of Vertebrate Paleontology (2010), and should include but not be limited to the following:

- All earth-moving operations above the depth of three feet should be monitored periodically to identify the sediments being impacted, and any earth-moving operations reaching beyond the depth of three feet will require continuous monitoring for potential paleontological remains. The monitor should be prepared to quickly salvage fossils, if they are unearthed, to avoid construction delays, but must have the power to temporarily halt or divert construction equipment to allow for removal of abundant or large specimens.
- Samples of sediments should be collected and processed to recover small fossil remains.
- Recovered specimens should be identified and curated at a repository with permanent retrievable storage that would allow for further research in the future.
- A report of findings, including an itemized inventory of recovered specimens and a discussion of their significance when appropriate, should be prepared upon completion of the research procedures outlined above. The approval of the report and the inventory by the March JPA would signify completion of the mitigation program.

Under this condition, CRM TECH further recommends that the proposed projects may be cleared to proceed in compliance with CEQA and NEPA provisions on paleontological resources.

PERSONNEL QUALIFICATIONS

PROJECT GEOLOGIST/PALEONTOLOGIST
Harry M. Quinn, M.S., California Professional Geologist #3477

Education

1968 M.S., Geology, University of Southern California, Los Angeles, California.
1964 B.S, Geology, Long Beach State College, Long Beach.
1962 A.A., Los Angeles Harbor College, Wilmington, California.

- Graduate work oriented toward invertebrate paleontology; M.S. thesis completed as a stratigraphic paleontology project on the Precambrian and Lower Cambrian rocks of Eastern California.

Professional Experience

2000- Project Paleontologist, CRM TECH, Riverside/Colton, California.
1998- Project Archaeologist, CRM TECH, Riverside/Colton, California.
1992-1998 Independent Geological/Geoarchaeological/Environmental Consultant, Pinyon Pines, California.
1994-1996 Environmental Geologist, E.C E.S., Inc, Redlands, California.
1988-1992 Project Geologist/Director of Environmental Services, STE, San Bernardino, California.
1987-1988 Senior Geologist, Jirsa Environmental Services, Norco, California.
1986 Consulting Petroleum Geologist, LOCO Exploration, Inc. Aurora, Colorado.
1978-1986 Senior Exploration Geologist, Tenneco Oil E & P, Englewood, Colorado.
1965-1978 Exploration and Development Geologist, Texaco, Inc., Los Angeles, California.

Previous Work Experience in Paleontology

1969-1973 Attended Texaco company-wide seminars designed to acquaint all paleontological laboratories with the capability of one another and the procedures of mutual assistance in solving correlation and paleo-environmental reconstruction problems.
1967-1968 Attended Texaco seminars on Carboniferous coral zonation techniques and Carboniferous smaller foraminifera zonation techniques for Alaska and Nevada.
1966-1972, 1974, 1975 Conducted stratigraphic section measuring and field paleontological identification in Alaska for stratigraphic controls. Pursued more detailed fossil identification in the paleontological laboratory to establish closer stratigraphic controls, mainly with Paleozoic and Mesozoic rocks and some Tertiary rocks, including both megafossil and microfossil identification, as well as fossil plant identification.
1965 Conducted stratigraphic section measuring and field paleontological identification in Nevada for stratigraphic controls. Pursued more detailed fossil identification in the paleontological laboratory to establish closer stratigraphic controls, mainly with Paleozoic rocks and some Mesozoic and Tertiary rocks. The Tertiary work included identification of ostracods from the Humboldt and Sheep Pass Formations and vertebrate and plant remains from Miocene alluvial sediments.

Memberships

Society of Vertebrate Paleontology; American Association of Petroleum Geologists; Association of Environmental Professionals; Rocky Mountain Association of Geologists, Pacific Section; Society of Economic Paleontologists and Mineralogists; San Bernardino County Museum.

Publications in Geology

Five publications in Geology concerning an oil field study, a ground water and earthquake study, a report on the geology of the Santa Rosa Mountain area, and papers on vertebrate and invertebrate Holocene Lake Cahuilla faunas.

PALEONTOLOGICAL SURVEYOR
Salvadore Boites, M.A.

Education

2013 M.A., Applied Anthropology, California State University, Long Beach.
2003 B.A., Anthropology/Sociology, University of California, Riverside.
1996-1998 Archaeological Field School, Fullerton Community College, Fullerton, California.

Professional Experience

2014- Project Archaeologist/Paleontological Surveyor, CRM TECH, Colton, California.
- Cross-trained in paleontological field procedures and identifications by CRM TECH Geologist/Paleontologist Harry M. Quinn.
- Paleontological surveys and monitoring at various locations in southern California; fossil recovery; soil sample collection; stratigraphic profile sketches.

2010-2011 Adjunct Instructor, Anthropology, Everest College, Anaheim, California.
2003-2008 Project Archaeologist, CRM TECH, Riverside/Colton, California.
2001-2002 Teaching Assistant, Moreno Elementary School, Moreno Valley, California.
1999-2003 Research Assistant, Anthropology Department, University of California, Riverside.

Research Interests

Cultural Resource Management, Applied Archaeology/Anthropology, Indigenous Cultural Identity, Poly-culturalism.

PALEONTOLOGICAL SURVEYOR
Nina Gallardo, B.A.

Education

2004 B.A., Anthropology/Law and Society, University of California, Riverside.

Professional Experience

2014- Project Archaeologist/Paleontological Surveyor, CRM TECH, Colton, California.
- Cross-trained in paleontological field procedures and identifications by CRM TECH Geologist/Paleontologist Harry M. Quinn.
- Paleontological surveys and monitoring at various locations in southern California; fossil recovery; soil sample collection; stratigraphic profile sketches.

2004- Project Paleontologist, CRM TECH, Riverside/Colton, California.

Honors and Awards

2000-2002 Dean's Honors List, University of California, Riverside.

PALEONTOLOGICAL SURVEYOR/REPORT WRITER

RECORDS SEARCH RESULTS

WESTERN SCIENCE CENTER

December 13, 2018

CRM Tech
Nina Gallardo
1016 E. Cooley Drive, Suite A/B
Colton, CA 92324

Dear Ms. Gallardo,

This letter presents the results of a record search conducted for the Proposed K-4 Parcel Project (CRM TECH no. 3424P) in unincorporated Riverside County, California. The project site consists of 35 acres located on the south side of Cactus Avenue between Veterans Way and Frederick Street within the March Joint Powers Authority jurisdiction, Township 3 South, Range 4 West, Sections 13 and 14 of the Riverside East and Sunnymead USGS 7.5 minute quadrangles.

The geologic units underlying this project are mapped entirely as very old alluvial fan deposits dating from the early Pleistocene period (Morton & Cox, 1988, 1996-1997). Very old alluvial fan units are considered to be of high paleontological sensitivity. The Western Science Center does not have localities within the project area or within a one mile radius, but does have numerous paleontological sites within similarly mapped Pleistocene alluvial units including the Aldi Distribution Center in Moreno Valley and the Diamond Valley Lake Project in Hemet. Similar Pleistocene alluvial units have resulted in hundreds of fossil localities and thousands of Pleistocene fossil specimens within Riverside County.

Any fossils recovered from the Proposed K-4 Parcel Project area would be scientifically significant. Excavation activity associated with development of the project area would impact the paleontologically sensitive early Pleistocene units and it is the recommendation of the Western Science Center that a paleontological resource mitigation program be put in place to monitor, salvage, and curate any recovered fossils associated with the study area.

If you have any questions, or would like further information about the Aldi Distribution Project or the Diamond Valley Lake Project, please feel free to contact me at dradford@westerncentermuseum.org

Sincerely,

Darla Radford

EXECUTIVE SUMMARY

K4 and Cactus Channel Improvement Project proposes a high-cube fulfillment center warehouse for industrial use in Riverside County, California, known as the K4 and Cactus Channel Improvement Project (the Project). The Project includes an approximately 718,000 square feet building on an approximately 35.4-acre site that includes surface parking areas for automobiles and truck trailers, and a 7.0-acre drainage channel (Cactus Avenue Channel) bordering the parcel to the north (south side of Cactus Avenue). The warehouse development will be used up to 7 days per week and 24 hours per day. Currently, the site is vacant land. The Project site is located south of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 0.8 miles west of the Project site.

This Project will result in both one-time and annual direct and indirect emissions of greenhouse gases (GHGs). The term, "direct emissions of GHGs" refers to GHGs that are emitted directly as a result of the project and include land use change and construction emissions. Indirect emissions are those emissions that the Project will enable, but that are not controlled by the Project proponent. This report discusses the scientific and regulatory developments surrounding global climate change and provides an inventory surveying the emissions that would result from approving the Project.

Employees and patrons of buildings and services use electricity and heating and are transported by motor vehicles. These activities directly or indirectly emit GHGs. The most significant GHG emissions resulting from such industrial developments are emissions of carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions are typically measured in terms of tonnes of CO_2 equivalents (CO_2e), calculated as the product of the mass emitted of a given GHG and its specific global warming potential (GWP).

The GHG emissions inventory for this analysis includes the following sources of emissions: energy use, mobile sources, area sources, solid waste, water and wastewater, vegetation change, and construction. The ongoing operational emissions consist of the first five categories, while the one-time emissions are associated with the vegetation change and construction. This report includes the direct emissions associated with the Project as well as the indirect emissions that may result from the Project. These indirect emissions are associated with electricity generation, the embodied energy used in supplying potable water, and emissions associated with solid waste disposal. The electrical power for the Project will be supplied by Southern California Edison (SCE). Accordingly, indirect GHG emissions from electricity usage are calculated using the SCE carbon-intensity factor.

This analysis primarily utilized the California Emission Estimator Model version 2016.3.2 (CalEEMod®)[1] to assist in quantifying the GHG emissions in the inventories presented in this report for the Project. CalEEMod® is a statewide program designed to calculate both criteria and GHG emissions from development projects in California. Third-party studies were also relied upon to support analyses and assumptions made outside of CalEEMod®. CalEEMod® incorporates EMFAC2014 to calculate mobile source emissions. EMFAC2014 has been superseded by EMFAC2017.[2] In order to allow a more

[1] California Air Pollution Control Officers Association (CAPCOA). 2017. California Emissions Estimator Model. Available at: http://www.CalEEMod.com/. Accessed: August 2018.

[2] EMFAC2017 was initially released by the California Air Resources Board (CARB), which establishes California's air quality regulations, on December 22, 2017 and then updated on March 1, 2017. USEPA is currently reviewing this model to determine if it can be used in State Implementation Plans and conformity modeling. Since this

DRAFT

accurate representation of mobile source operational emissions associated with the Project, mobile source emission factors were estimated using EMFAC2017. These emissions factors were then used to estimate mobile source operational emissions based on CalEEMod® methodology and defaults along with Project specific values where available.

At this time, there are no adopted numeric thresholds that govern the determination of the significance of the Project's GHG emissions. The South Coast Air Quality Management District (SCAQMD or District) has not adopted a quantification methodology or a significance threshold for GHG emissions from land use development projects.[3] However, the District did release a tiered approach in September 2008 as discussed by the SCAQMD GHG working group for discussion purposes. This Greenhouse Gas Technical Report assesses the significance of GHG impacts using three different methodologies consistent with the tiered approach discussed by the District. Each of the three methodologies is a separate and independent ground for the significance determination, which are: 1) consistency and compliance with applicable statewide and local regulatory programs designed to reduce GHG emissions consistent with AB 32; 2) consistency with County of Riverside Climate Action Plan (CAP); and 3) consistency with the Southern California Association of Governments (SCAG) RTP/SCS as it relates to SB 375 reduction targets. Additionally, this Greenhouse Gas Technical Report includes a comparison of the Project's GHG emissions to a SCAQMD service population efficiency for informational purposes. The conclusions of these evaluations are summarized below:

1. As outlined in Section 4, the Project is consistent and compliant with a number of statewide and local regulatory programs. These programs will help the state reach the GHG reduction goals as included in the Climate Change Scoping Plan.
2. The Project is also consistent with the CAP. The results of the screening analysis show that the Project would meet the point requirements of the CAP.
3. The Project was evaluated for consistency with the SCAG RTP/SCS and SB 375 reduction targets. The results of the consistency analysis show that the Project is within the growth projections for the area.
4. The Project emissions are presented in **Table ES-1**. Both the one-time emissions and emissions that are expected to occur each year after build-out of the Project are presented. One-time emissions from construction were amortized over a 30-year period because no significance threshold has been adopted for construction GHG emissions.[4] The Project's estimated operational GHG emissions plus amortized construction emissions were evaluated for service population efficiency. A summary of GHG emissions for the service population efficiency analysis is presented in **Table ES-2**. As shown in this table, dividing the total Project 2020 scenario mitigated GHG emissions by the estimated service population yields an efficiency metric of 6.02 MT CO_2e per service population per year. This is based on a project emissions inventory to ensure an apples-to-

report has been prepared for CEQA purposes, and CEQA is a state regulation, EMFAC2017 (the most current version of the model released by CARB) was used.

[3] SCAQMD has adopted interim significance thresholds for industrial sources of 10,000 metric tons of carbon dioxide equivalents per year. The Board adopted these December 5, 2008. These thresholds are not applicable to the Project because it is not an industrial source of CO_2e emissions. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgboardsynopsis.pdf?sfvrsn=2. Accessed: August 2018.

[4] This approach to one-time construction and vegetation change GHG emissions is based on the GHG Threshold Working Group Meeting #13 Minutes from August 26, 2009. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-13/ghg-meeting-13-minutes.pdf?sfvrsn=2. Accessed: August 2018.

DRAFT

apples analysis for the project emission and service population. This comparison is provided for informational purposes.

DRAFT

1. INTRODUCTION

The purpose of this technical report is to present the analyses that were used to evaluate the Project's greenhouse gas (GHG) emissions. Emissions during both construction and operations of the Project were quantified. Legislation and rules regarding climate change, as well as scientific understanding of the extent to which different activities emit GHGs, continue to evolve; as such, the inventory in this report is a reflection of the guidance and knowledge currently available.

1.1 Project Description

K4 and Cactus Channel Improvement Project (the Project) proposes a high-cube fulfillment center warehouse for industrial use in Riverside County, California, known as the K4 and Cactus Channel Improvement Project (the Project). The Project is a building consisting of approximately 718,000 square feet on an approximately 35.4-acre site that includes surface parking areas for automobiles and truck trailers. The warehouse development will be used up to 7 days per week and 24 hours per day. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. This portion of the Project is being proposed by Riverside County Flood Control and Water Conservation District as part of the District's Master Plan and is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert is being permitted by the Riverside County Flood Control District and Water Conservation District ("District") and it would either be constructed contemporaneously with the project or built separately depending on permitting and timing. The channel would function as part of the District's Master Plan and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan. Currently, the site is vacant land. The Project site is located south of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 0.8 miles west of the Project site. The closest residential land uses are located approximately 0.5 miles to the north and southeast of the Project Site. The proposed Project land use summary is presented in **Table 1.**

Analysis of the Project's GHG emissions incorporates the following regulatory measures and mitigation measures:

Regulatory Measures

- Pavley regulation mandating higher fuel efficiency standards for cars and light-duty vehicles and the Advanced Clean Cars are included in vehicle emissions estimate for the Project;
- In addition to the regulations applicable to cars and light-duty trucks, on August 9, 2011, the United States Environmental Protection Agency (USEPA) and the National Highway Traffic Safety Administration (NHTSA) announced fuel economy and GHG standards for

DRAFT

medium- and heavy-duty trucks, which applies to vehicles from model year 2014-2018.[5] USEPA and NHTSA have adopted standards for CO_2 emissions and fuel consumption, respectively, tailored to each of three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to USEPA, this program will reduce GHG emissions and fuel consumption for affected vehicles by 9 percent to 23 percent. As part of the regulatory package for the HDV GHG Regulation, California Air Resources Board (CARB) implemented the Drayage Truck Regulation and Truck and Bus Regulation.

- The Project will also benefit from USEPA/NHTSA advanced fuel economy and GHG standards (Phase 2) which were adopted in 2016 for medium- and heavy-duty trucks for model years 2018 and beyond.6
- The California Energy Commission's (CEC) 2016 Building Energy Efficiency Standards (Title 24) are the currently applicable building energy efficiency standards and became effective on January 1, 2017. In general, single-family homes built to the 2016 standards are anticipated to use about 28% less energy for lighting, heating, cooling, ventilation, and water heating than those built to the 2013 standards, and nonresidential buildings built to the 2016 standards will use an estimated 5% less energy than those built to the 2013 standards.[7]
- California Green Building Code regulation to reduce indoor potable water use by 20% using water saving fixtures and/or flow restrictors is included in the water use and emissions estimate for the Project.
- The California Integrated Waste Management Act of 1989 requiring diversion of 50 percent of all solid waste after January 1, 2000, through source reduction, recycling, and composting facilities and also indicates that 75 percent of all solid waste will be recycled or composted by 2020 and annually thereafter.[8] In August 2015, CalRecycle released AB 341 Report to the Legislature, which identifies strategies to achieve the 75 percent goal.

Mitigation Measures

- **MM-GHG-1:** The applicant shall incorporate MM-AQ-1 (Construction Equipment Emissions Standards), MM-AQ-2 (Low-VOC Architectural Coatings), MM-AQ-3 (Construction Relations Officer), MM-AQ-4 (Improved Energy Efficiency and Water Reduction), MM-AQ-5 (Commute Trip Reduction), and MM-AQ-6 (Truck Requirements).
- MM-AQ-1 and MM-AQ-2 are not quantified as a part of the GHG analyses as these measures pertain to criteria air pollutants only. As a conservative approach, the

DRAFT

reductions from MM-AQ-3, MM-AQ-5, and MM-AQ-6 were not quantified due to lack of clarity on the quantity of reductions associated with these mitigation measures.

As discussed in Section 3.6.1.2, the following portions of MM-AQ-4 were quantified:

- The Project will install approximately 4.5 MW of solar photovoltaic electricity generation.
- The Project will install Energy Star certified light bulb and lighting fixtures.
- The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle (EV) charging stations and fifty-four off-site EV charging stations.

The mitigation measure (MM-GHG-1) discussed above reflects the requirements from the from Riverside CAP screening analysis as discussed in Section 4.2.

1.2 Existing Conditions

As noted above, the Project site is currently vacant land. The plot of land is located with a United States Air Force base to the south and an industrial area to the north.

DRAFT

2. DRAFT SIGNIFICANCE THRESHOLDS AND REGULATORY BACKGROUND

2.1 Regulatory Setting

The following regulations relate to the calculation of the Project's GHG emissions.

2.1.1 International Treaties and Other Developments

The Kyoto Protocol is an international agreement linked to the United Nations Framework Convention on Climate Change. It was adopted in Kyoto, Japan, on December 11, 1997 and entered into force on February 16, 2005. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing GHG emissions. The targets amount to an average of five percent reduction against 1990 levels over the five-year period 2008-2012. The major distinction between the Protocol and the Convention is that while the Convention encouraged industrialized countries to stabilize GHG emissions, the Protocol commits them to do so. Recognizing that developed countries are principally responsible for the current high levels of GHG emissions in the atmosphere as a result of more than 150 years of industrial activity, the Protocol places a heavier burden on developed nations under the principle of "common but differentiated responsibilities."[9]

Negotiations after Kyoto have continued in an attempt to address the period after the first "commitment period" of the Kyoto Protocol, concluded at the end of 2012. In Durban, South Africa in 2011, parties to the protocol agreed in principle to negotiate a new comprehensive and legally binding climate agreement by 2015 and to enter it into force for all parties starting from 2020. However, significant divisions remain in determining the parameters of any such new protocol, including its enforcement mechanisms and the degree to which developing economies will begin to be subject to binding emissions targets.

During the Paris Climate Conference (21st Conference of the Parties or COP) on December 12, 2015, parties to the United Nations Framework Convention on Climate Change (UNFCCC) reached "a landmark agreement to combat climate change and to accelerate and intensify the actions and investments needed for a sustainable low carbon future." The Paris Agreement aims to limit global warming to "well below 2 degrees Celsius above pre-industrial levels".[10] On August 4, 2017 President Trump's administration delivered an official notice for the United States of America to withdraw from the Paris Agreement.[11] Under Article 28 of the Agreement, the United States of America is required to stay in the pact until at least 2019.[12]

2.1.2 Federal

2.1.2.1 Supreme Court Ruling in Massachusetts et al. v. Environmental Protection Agency

In April 2007, in Massachusetts v. EPA, the U.S. Supreme Court directed the Administrator of the U.S. Environmental Protection Agency (USEPA) to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In making these decisions, the USEPA Administrator was directed to follow the language of Section 202(a) of the Clean Air Act (CAA). In December 2009, the Administrator signed a final rule with two distinct findings regarding GHGs under Section 202(a) of the CAA:

- Elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6)—in the atmosphere threaten the public health and welfare of current and future generations. This is referred to as the "endangerment finding."
- The combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is referred to as the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the CAA. By regulating the emissions of GHGs from new motor vehicles, energy conservation benefits typically result through increased engine efficiency and the reduced consumption of petroleum-based fuels (e.g., gasoline).

2.1.2.2 Federal Vehicle Standards

In response to the *Massachusetts v. EPA* decision discussed above, in 2007, President Bush directed the USEPA, the Department of Transportation (DOT), and the Department of Energy (DOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, the National Highway Traffic Safety Administration (NHTSA) issued a final rule regulating fuel efficiency for and GHG emissions from cars and light-duty trucks for model year 2011; and, in 2010, the USEPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, President Obama issued a memorandum directing the same federal agencies to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the USEPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model year 2017–2025 light-duty vehicles. The proposed standards are projected to achieve 163 grams/mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon (mpg) if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intended to set standards for model years 2022–2025 in a potential future rulemaking. The standards for model years 2022-2025 were not finalized due to a statutory requirement that prevents NHTSA from setting average fuel economy standards for more than 5 years at a time.[13]

[13] EPA and NHTSA, 2012. Federal Register - 2017 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions and Corporate Average Fuel Economy Standards, PDF pg. 5. Available at: https://www.gpo.gov/fdsys/pkg/FR-2012-10-15/pdf/2012-21972.pdf. Accessed: October 2018.

DRAFT

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the USEPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles.

In August 2016, the USEPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans and all types of sizes of buses and work trucks. The final standards are expected to lower carbon dioxide emissions by approximately 1.1 billion MT and reduce oil consumption by up to two billion barrels over the lifetime of the vehicles sold under the program.[14]

In August 2018, The USEPA and NHTSA released a notice of proposed rulemaking called Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks (SAFE Vehicles Rule). This rule would modify the existing Corporate Average Fuel Economy (CAFE) standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establish new standards covering model years 2021 through 2026. SAFE standards are expected to uphold model year 2020 standards through 2026.[15]

2.1.2.3 Energy Independence and Security Act

The Energy Independence and Security Act of 2007 (EISA) facilitates the reduction of national GHG emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard that requires fuel producers to use at least 36 billion gallons of biofuel in 2022;
- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances;
- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and
- While superseded by the USEPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of EISA address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

DRAFT

2.1.3 Multi-State/Regional

2.1.3.1 The Western Regional Climate Action Initiative (WCI)

The Western Regional Climate Action Initiative (WCI) is a partnership among seven states including California and four Canadian provinces to implement a regional, economy-wide cap-and-trade system to reduce global warming pollution. The WCI will cap GHG emissions from the region's electricity, industrial, and transportation sectors with the goal to reduce the heat trapping emissions that cause global warming to 15 percent below 2005 levels by 2020. When the WCI adopted this goal in 2007, it estimated this would require 2007 levels to be reduced worldwide between 50 and 85 percent by 2050. California is working closely with the other states and provinces to design a regional GHG reduction program that includes a cap-and-trade approach. CARB's planned Cap-and-Trade Program, discussed below, is also intended to link California and the other member states and provinces. As of January 1, 2014, California's Cap-and-Trade Program is linked to Quebec's pursuant to the Agreement Between the CARB and the Gouvernement du Québec Concerning the Harmonization and Integration of Cap-and-Trade Programs Reducing Greenhouse Gas Emissions, in accordance with the direction in CARB Board Resolution 13-7 (CARB 2013b). As of January 1, 2018, California's Cap-and-Trade Program along with Québec's Program linked with Ontario's Cap-and-Trade Program (Ontario Program). However, on July 3, 2018 the Ontario government revoked its cap-and-trade regulation. With Ontario's withdrawal from the linked program, California and Québec will work together to ensure environmental integrity and stringency of the Cap-and-Trade program/market is sustained.[16]

2.1.3.2 Pacific Coast Action Plan on Climate and Energy

On October 28, 2013, the Governors of California, Oregon, and Washington and the Premier of British Columbia (together known as the Pacific Coast Collaborative or PCC) signed a clean energy pact, known as the Pacific Coast Action Plan on Climate and Energy (Pacific Coast Action Plan). In 2016, the cities of Los Angeles, Oakland, Portland, San Francisco, Seattle, and Vancouver joined the PCC through the Pacific North America Climate Leadership Agreement. Although the Action Plan does not impose legally enforceable obligations and lacks a specific schedule for implementation, the pact sets out a number of goals and aspirational measures. The Action Plan calls upon each of the parties to undertake a number of measures to address the use of carbon-based fuels in the transportation sector, including the adoption or maintenance of low-carbon fuel standards, the development of targets and action plans in order to encourage public and private investment in low-carbon commercial fleets that use alternative fuels, and the expansion of the sale of zero-emissions vehicles (ZEV). PCC's goal for a low-carbon transportation system includes achieving a hundred percent ZEV in all new passenger vehicle sales by 2050 and working with urban transit agencies to procure only zero-emission transit buses by 2025.[17]

2.1.4 State

2.1.4.1 Executive Order S-3-05

In 2005, former Governor Schwarzenegger signed Executive Order (EO) S-3-05, which established the following statewide GHG emission reduction goals for California: (1) by 2010, reduce GHG emissions to 2000 levels; (2) by 2020, reduce GHG emissions to 1990 levels; and (3) by 2050, reduce GHG emissions to 80 percent below 1990 levels.

2.1.4.2 Assembly Bill 32

Assembly Bill (AB) 32 (Nunez, 2006), the California Global Warming Solutions Act of 2006, entails that statewide GHG emissions be reduced to 1990 levels by 2020. In order to achieve this reduction mandate, AB 32 requires CARB to adopt rules and regulations in an open public process that achieve the maximum technologically feasible and cost-effective GHG reductions.

In 2008, CARB adopted the *Climate Change Scoping Plan: A Framework for Change* (2008 Scoping Plan). In the Scoping Plan, CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of approximately 28.5 percent from the otherwise projected 2020 emissions level; i.e., those emissions that would occur in 2020, absent GHG-reducing laws and regulations (referred to as "Business-As-Usual" [BAU]).[18] Multiple Scoping Plan measures broadly cover emissions associated with new residential and commercial land use development, including, but not limited to:

- Energy Efficiency/Green Buildings: The Scoping Plan highlights the importance of energy efficiency efforts in reducing GHG emissions from residential and commercial development and indicates that zero net energy (ZNE) should be the overarching and unifying concept for energy efficiency.
- Regional Transportation-Related GHG Targets (SB 375): The Scoping Plan relies on Senate Bill (SB) 375, discussed above, as an important mechanism to reduce mobile GHG emissions by integrating land use planning and transportation planning at the regional and local level.
- Vehicle Emissions: The Scoping Plan relies on various engine, fuel and other efficiency improvement programs, and increasing electrification of the vehicle fleet.
- Cap-and-Trade Program: The Scoping Plan identifies the Cap-and-Trade program as a lynchpin, overarching strategy for California to reduce GHG emissions. As explained in the Scoping Plan, the program's implementing regulations provide assurance that California's 2020 limit will be met because the regulation sets a firm limit on 85 percent of California's GHG emissions.

In 2014, CARB adopted the *First Update to the Climate Change Scoping Plan: Building on the Framework* (2014 First Update).[19] The First Update found that California is on track to meet the 2020 emissions reduction mandate established by AB 32, and noted that California could reduce emissions further by 2030 to levels squarely in line with those needed to stay on

[18] CARB, Climate Change Scoping Plan: A Framework for Change (December 2008), p. 12.

[19] Health & Safety Code Section 38561(h) requires CARB to update the Scoping Plan every five years.

track to reduce emissions to 80 percent below 1990 levels by 2050 if the State realizes the expected benefits of existing policy goals.[20]

Most recently, on December 14, 2017, CARB approved the 2017 Climate Change Scoping Plan (Second Update).[21] This update identifies CARB's strategy for achieving the state's 2030 GHG target as established in SB 32 (discussed below).The strategy includes continuation of the Cap-and-Trade Program through 2030, and incorporates a Mobile Source Strategy that includes strategies targeted to increase zero emission vehicle fleet penetration and a more stringent target for the Low Carbon Fuel Standard by 2030. The Second Update also incorporates approaches to cutting short-lived climate pollutants (SLCPs) under the Short-Lived Climate Pollutant Reduction Strategy (a planning document that was adopted by CARB in March 2017) and acknowledges the need for reducing emissions in agriculture and highlights the work underway to ensure that California's natural and working lands increasingly sequester carbon.

2.1.4.3 Executive Order B-30-15

In April 2015, Governor Brown signed EO B-30-15, which established the following GHG emission reduction goal for California: by 2030, reduce GHG emissions to 40 percent below 1990 levels. This EO also directed all state agencies with jurisdiction over GHG-emitting sources to implement measures designed to achieve the new interim 2030 goal, as well as the pre-existing, long-term 2050 goal identified in EO S-3-05. Additionally, the EO directed CARB to update its Scoping Plan (see discussion above) to address the 2030 goal.

2.1.4.4 Senate Bill 32 and Assembly Bill 197

Enacted in 2016, SB 32 (Pavley, 2016) codifies the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40 percent below 1990 levels by 2030.

SB 32 was coupled with a companion bill: AB 197.[22] Designed to improve the transparency of CARB's regulatory and policy-oriented processes, AB 197 created the Joint Legislative Committee on Climate Change Policies, a committee with the responsibility to ascertain facts and make recommendations to the Legislature concerning statewide programs, policies, and investments related to climate change. AB 197 also requires CARB to make certain GHG emissions inventory data publicly available on its website; consider the social costs of GHG emissions when adopting rules and regulations designed to achieve GHG emission reductions; and, include specified information in all Scoping Plan updates for the emission reduction measures contained therein.

2.1.4.5 Supreme Court Ruling in Center for Biological Diversity. v. California Fish and Wildlife

In its recent decision, *Center for Biological Diversity v. Department of Fish and Wildlife,* S217763 (*Newhall*), the Court evaluated the California Department of Fish and Wildlife's (DFW) analysis of potential impacts caused by GHG emissions contained in the Environmental Impact Report (EIR) for the proposed land development called Newhall

[20] Ibid. at p. 34.

[21] CARB. 2017. 2017 Climate Change Scoping Plan Update. December. Available at: https://www.arb.ca.gov/board/res/2017/res17-46.pdf. Accessed: February 2019.

[22] AB 197, Eduardo Garcia. State Air Resources Board: greenhouse gases: regulations. Available at: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160AB197. Accessed: August 2018.

DRAFT

Ranch. In the EIR, the DFW analyzed GHG emissions under AB 32, using the BAU comparison as its sole criterion of significance.

In *Newhall*, the California Supreme Court concluded that a finding of consistency with meeting statewide emission reduction goals is a legally permissible criterion of significance when analyzing potential impacts of GHG emissions under CEQA. However, the Court found that the EIR's conclusion that the project's emissions would be less than significant under that criterion was not supported by substantial evidence and remanded back to the appellate court the narrow issue of whether substantial evidence supported the application of AB 32 statewide GHG reduction goal of 29% to new land use projects.

The Court then identified "potential options" for lead agencies evaluating cumulative significance of a proposed land use development's GHG emissions in future CEQA documents:

1. Business As Usual (BAU) Model: While the Court cautioned that the Scoping Plan may not be appropriate at the project-level, the BAU model might be used to determine what level of reduction from business as usual a new land use development at the proposed location must contribute in order to comply with statewide goals pursuant to AB 32.
2. Compliance With Regulatory Programs Designed To Reduce Greenhouse Gas Emissions: The Court suggests that a lead agency could rely on a showing of compliance with regulatory programs designed to reduce greenhouse gas emissions. The Court clarifies that a significance analysis based on compliance with such statewide regulations only goes to impacts within the area governed by the regulations.
3. Local Climate Action Plan Or Other "Geographically Specific Greenhouse Gas Emission Reduction Plans": The Court points out that these plans may provide a basis for the tiering or streamlining of project-level CEQA analysis, so long as the plan is "sufficiently detailed and adequately supported." Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
4. Regional Sustainable Community Strategy (SCS): The Court also articulates that a lead agency need not additionally analyze greenhouse gas emissions from cars and light trucks in CEQA documents for certain residential, mixed use and transit priority projects that are consistent with an applicable SCS adopted pursuant to SB 375.
5. Numerical GHG Significance Thresholds: Although noting that use of such thresholds are not required, the Court favorably cited to the (Bay Area Air Quality Management District) BAAQMD GHG significance thresholds, which are based on compliance with AB 32, and use a "service population" GHG ratio threshold for land use projects and a 10,000-ton annual GHG emission threshold for industrial projects. The Court remanded for further consideration the application of the 29% overall Scoping Plan metric, which is used by several Air Districts and, like the favorably-cited BAAQMD metric, is based on AB 32.

Citing to Executive Order Nos. S-3-05 and B-30-15, the Court cautioned that those EIRs taking a goal-consistency approach to CEQA significance may in the future need to consider the project's effects on meeting emissions reduction targets beyond 2020.

DRAFT

2.1.4.6 Executive Order B-55-18

On September 10, 2018, Governor Brown signed EO B-55-18, to achieve carbon neutrality by moving the state of California to hundred percent clean energy by 2045. This EO also includes specific measures to reduce GHG emissions via clean transportation, energy efficient buildings, directing cap-and-trade funds to disadvantaged communities, and better management of state's forest land.[23]

2.1.4.7 Energy-Related Sources

a) Renewable Portfolio Standards (SB 1078; SB 107; SBX1-2; and SB 100)

As most recently amended by SB 350,[24] California's Renewables Portfolio Standard Program requires retail sellers of electric services and local publicly-owned electric utilities to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 40 percent of total retail sales by 2024, 45 percent of total retail sales by 2027, and 50 percent of total retail sales by 2030. On September 10, 2018 the goals of this standard were revised to a 50 percent renewable resources target by December 21, 2026, and to a 60 percent target by December 31, 2030.[25]

b) GHG Emissions Standard for Baseload Generation (SB 1368)

SB 1368 (September 29, 2006) prohibits any retail seller of electricity in California from entering into a long-term financial commitment for baseload generation if the GHG emissions are higher than those from a combined-cycle natural gas power plant. This performance standard applies to electricity generated both within and outside of California, and to publicly owned as well as investor-owned electric utilities.

c) Building Energy Efficiency Standards

Title 24, Part 6 of the California Code of Regulations regulates the design of building shells and building components. The standards are updated periodically to allow for consideration and possible incorporation of new energy efficiency technologies and methods. The California Energy Commission's (CEC) 2016 Building Energy Efficiency Standards (2016 Building Standards), which become effective on January 1, 2017, are the most current version of these standards.

In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as CalGreen Building Standard (CalGreen) and establishes voluntary and mandatory standards pertaining to the planning and design of sustainable site development, energy efficiency, water conservation, material conservation, and interior air quality.

DRAFT

[23] State of California, Executive Department, 2018. Executive Order B-55-18 To Achieve Carbon Neutrality. Available at: https://www.gov.ca.gov/wp-content/uploads/2018/09/9.10.18-Executive-Order.pdf. Accessed: September 2018.

[24] SB 350, De León. Clean Energy and Pollution Reduction Act of 2015. Available at: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160SB350. Accessed: August 2018.

[25] SB 100, De León. California Renewables Portfolio Standard Program. Available at: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201720180SB100. Accessed: September 2018.

The 2016 Title 24 standards are the currently applicable building energy efficiency standards and became effective on January 1, 2017. In general, single-family homes built to the 2016 standards are anticipated to use about 28% less energy for lighting, heating, cooling, ventilation, and water heating than those built to the 2013 standards, and nonresidential buildings built to the 2016 standards will use an estimated 5% less energy than those built to the 2013 standards.[26]

The Title 24 standards are updated on an approximately three-year cycle. The 2019 standards will continue to improve upon the 2016 Standards for new construction of, and additions and alterations to, residential and nonresidential buildings. The 2019 Standards will go into effect on January 1, 2020.[27] The 2019 standards require solar photovoltaic systems for newly constructed single-family homes. The standards have also introduced requirements for new healthcare facilities.

2.1.4.8 Mobile Sources

a) Sustainable Communities Strategy Plans

SB 375 (Steinberg, 2008), the Sustainable Communities and Climate Protection Act, coordinates land use planning, regional transportation plans, and funding priorities to reduce GHG emissions from passenger vehicles through better-integrated regional transportation, land use, and housing planning that provides easier access to jobs, services, public transit, and active transportation options. SB 375 specifically requires the Metropolitan Planning Organization (MPO) relevant to the Project area (here, Southern California Association of Governments [SCAG]) to include a Sustainable Communities Strategy in its Regional Transportation Plan (RTP) that will achieve GHG emission reduction targets set by CARB by reducing vehicle miles traveled from light-duty vehicles through the development of more compact, complete, and efficient communities.

For the area under SCAG's jurisdiction, including the Project Site, CARB adopted regional targets for reduction of mobile source-related GHG emissions by 8 percent for 2020 and by 13 percent for 2035.

b) Pavley Regulations

AB 1493 (Pavley, 2002) required CARB to adopt regulations to reduce GHG emissions from non-commercial passenger vehicles and light-duty trucks for model years 2009–2016. CARB obtained a waiver from the USEPA that allows for implementation of these regulations notwithstanding possible federal preemption concerns.

c) Low Carbon Fuel Standard

EO S-1-07, as issued by former Governor Schwarzenegger, called for a 10 percent or greater reduction in the average fuel carbon intensity for transportation fuels in California regulated by CARB by 2020.[28] In response, CARB approved the Low Carbon Fuel Standard (LCFS)

[26] CEC. 2015. 2016 Building Energy Efficiency Standards – Frequently Asked Questions. Available at: http://www.energy.ca.gov/title24/2016standards/rulemaking/documents/2016_Building_Energy_Efficiency_Standards_FAQ.pdf. Accessed: August 2018.

[27] CEC. 2019 Building Energy Efficiency Standards. Available at: https://www.energy.ca.gov/title24/2019standards/index.html. Accessed: August 2018.

[28] Carbon intensity is a measure of the GHG emissions associated with the various production, distribution, and use steps in the "lifecycle" of a transportation fuel.

DRAFT

regulations in 2009, which became fully effective in April 2010. Thereafter, a lawsuit was filed challenging CARB's adoption of the regulations; and, in 2013, a court order was issued compelling CARB to remedy substantive and procedural defects of the LCFS adoption process under CEQA.[29] However, the court allowed implementation of the LCFS to continue pending correction of the identified defects. In September 2015, CARB re-adopted the LCFS regulations.

d) Advanced Clean Cars Program

In 2012, CARB approved the Advanced Clean Cars (ACC) program, a new emissions-control program for non-commercial passenger vehicles and light-duty truck for model years 2017-2025. The program combines the control of smog, soot, and GHGs with requirements for greater numbers of zero emission vehicles. By 2025, when the rules will be fully implemented, new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.

e) Zero Emission Vehicles

Zero emission vehicles (ZEVs) include hydrogen fuel cell electric vehicles and plug-in electric vehicles, such as battery electric vehicles and plug-in hybrid electric vehicles.

In 2012, Governor Brown issued EO B-16-2012, which calls for the increased penetration of ZEVs into California's vehicle fleet in order to help California achieve a reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels by 2050. In furtherance of that statewide target for the transportation sector, the EO also calls upon CARB, the CEC and the California Public Utilities Commission to establish benchmarks that will: (1) allow over 1.5 million ZEVs to be on California roadways by 2025, and (2) provide the State's residents with easy access to ZEV infrastructure.

EO B-16-2012 specifically directed California to "encourage the development and success of zero-emission vehicles to protect the environment, stimulate economic growth, and improve the quality of life in the state."[30]

2.1.4.9 Solid Waste Diversion

California Integrated Waste Management Act of 1989 and Assembly Bill 341

The California Integrated Waste Management Act of 1989, as modified by AB 341 ,[31] requires each jurisdiction's source reduction and recycling element to include an implementation schedule that shows: (1) diversion of 25 percent of all solid waste by January 1, 1995, through source reduction, recycling, and composting activities; (2) diversion of 50 percent of all solid waste on and after January 1, 2000; and (3) source reduction, recycling and composting of 75 percent of all solid waste on or after 2020, and annually thereafter. The California Department of Resources Recycling and Recovery (CalRecycle) is required to develop strategies, including source reduction, recycling, and composting activities, to achieve the 2020 goal.

DRAFT

CalRecycle published a discussion document, entitled *California's New Goal: 75 Percent Recycling,* which identified concepts that would assist the State in reaching the 75 percent goal by 2020. Subsequently, in August 2015, CalRecycle released the *AB 341 Report to the Legislature*, which identifies five priority strategies for achievement of the 75 percent goal: (1) moving organics out of landfills; (2) expanding recycling/ manufacturing infrastructure; (3) exploring new approaches for State and local funding of sustainable waste management programs; (4) promoting State procurement of post-consumer recycled content products; and, (5) promoting extended producer responsibility.

2.1.4.10 Other Potentially Applicable State Regulations or Policies

a) Executive Order S-13-08

On November 14, 2008, Governor Arnold Schwarzenegger signed Executive Order S-13-08, which called on State agencies to develop a strategy for identification of and preparation for expected climate change impacts in California. The resulting 2009 California Climate Adaptation Strategy (CAS) report was developed by the California Natural Resources Agency in coordination with the Climate Action Team (CAT). The report presents the best available science relevant to climate impacts in California and proposes a set of recommendations for California decision-makers to assess vulnerability and promote resiliency in order to reduce California's vulnerability to climate change. Guidance regarding adaptation strategies is general in nature and emphasizes incorporation of strategies into existing planning policies and processes. An update to the CAS report was released for public comment by the end of 2013.[32]

In addition to requiring the CAT to create a Climate Adaptation Strategy, Executive Order S-13-08 ordered the creation of a comprehensive Sea Level Rise Assessment Report. The report, published in June 2012, indicates that the sea level along most of California's coast is expected to rise about 1 meter over the next century and is likely to increase the risk of damage in the form of flooding, coastal erosion, and wetland loss due to storm surges and high waves. The sea level increase is slightly higher than projected for global sea levels.[33, 34]

Executive Order S-13-08 also called for the California Ocean Protection Council (OPC) to work with the other CAT State agencies to develop interim guidance for assessing the potential impacts of sea level rise due to climate change in California. In coordination with National Academy of Sciences (NAS) efforts, the OPC drafted interim guidance recommending that State agencies consider a range of sea level rise scenarios for the years 2050 and 2100 in order to assess project vulnerability, reduce expected risks, and increase resiliency to sea level rise. The draft resolution and interim guidance document is consistent with the Ocean Protection Act (Division 26.5, Public Resource Code Section 3561 5(a)(1)),

DRAFT

which specifically directs the OPC to coordinate activities of State agencies to improve the effectiveness of State efforts to protect ocean resources.[35, 36]

b) Assembly Bill 1613 (Waste Heat and Carbon Emissions Reduction Act)

AB 1613 directed the CEC, the California Public Utilities Commission (CPUC), and CARB to implement the Waste Heat and Carbon Emissions Reduction Act, which is designed to encourage development of new combined heat and power (CHP) systems in California with a generating capacity of not more than 20 megawatts. In June 2010, the CEC published modified final guidelines establishing technical criteria for eligibility of CHP systems for programs to be developed by the CPUC and publicly owned utilities.[37] Section 2843 of the Act provides that the CEC's guidelines require that CHP systems:

- Be designed to reduce waste energy;
- Have a minimum efficiency of 60%;
- Have NO_x emissions of no more than 0.07 pounds per megawatt-hour;
- Be sized to meet the eligible customer generation thermal load;
- Operate continuously in a manner that meets the expected thermal load and optimizes the efficient use of waste heat; and
- Be cost-effective, technologically feasible, and environmentally beneficial.

As directed by AB 1613, the CPUC also established (1) a standard tariff for the sale of electricity to electricity corporations for delivery to the electrical grid;[38] and (2) a "pay as you save" pilot program requiring electricity corporations to finance the installation of qualifying CHP systems by non-profit and government entities. A January 2011 decision by an administrative law judge determined that the pilot program will not be established due to lack of customer interest and difficulties in instituting a program that meets California Department of Corporations requirements.[39]

c) Senate Bill X7-7(Water Conservation Act of 2009)

The Water Conservation Act of 2009 sets an overall goal of reducing per-capita urban water use by 20% by December 31, 2020. The state was required to make incremental progress toward this goal by reducing per-capita water use by at least 10% by December 31, 2015. Reduction in water consumption directly reduces the energy necessary and the associated

DRAFT

emissions to convene, treat, and distribute the water; it also reduces emissions from wastewater treatment.

The Department of Water Resources adopted a regulation on February 16, 2011 that sets forth criteria and methods for exclusion of industrial process water from the calculation of gross water use for purposes of urban water management planning. The regulation would apply to all urban retail water suppliers required to submit an Urban Water Management Plan, as set forth in the Water Code, Division 6, Part 2.6, Sections 10617 and 10620.

2.1.5 Regional

2.1.5.1 South Coast Air Quality Management District Policies

CEQA Guidelines and Proposed GHG Thresholds

SCAQMD is principally responsible for comprehensive air pollution control in the Basin, which includes Los Angeles, Orange, and the urbanized portions of Riverside and San Bernardino Counties, including the Project site. SCAQMD works directly with Southern California Association of Governments (SCAG), County transportation commissions, and local governments and cooperates actively with all federal and State government agencies to regulate air quality.

In April 2008, SCAQMD convened a Working Group to develop GHG significance thresholds. On December 5, 2008, the SCAQMD Governing Board adopted its staff proposal for an interim CEQA GHG significance threshold for projects where the SCAQMD is the lead agency. As to all other projects, where the SCAQMD is not the lead agency, the Board has, to date, only adopted an interim threshold of 10,000 $MTCO_2e$ per year for industrial stationary source projects.[40]

For all other projects, SCAQMD staff proposed a multiple tier analysis to determine the appropriate threshold to be used. The draft proposal suggests the following tiers: Tier 1 is any applicable CEQA exemptions, Tier 2 is consistency with a GHG reduction plan, Tier 3 is a screening value or bright line, Tier 4 is a performance-based standard, and Tier 5 is GHG mitigation offsets.[41]

According to the presentation given at the September 28, 2010 Working Group meeting, SCAQMD staff reviewed the tiered significance threshold approach[42]. The proposed tiers are as follows:

Tier 1: Determine if CEQA categorical exemptions are applicable. If not move to Tier 2;

Tier 2: Consider whether or not the proposed project is consistent with a locally adopted GHG reduction plan (often called a Climate Action Plan) that has gone through public

[40] South Coast Air Quality Management District, Board Meeting Date: December 5, 2008, Agenda No. 31, Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans for use by the AQMD, website. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgboardsynopsis.pdf?sfvrsn=2http://www.aqmd.gov/hb/2008/December/081231a.htm. Accessed: August 2018.

[41] Ibid.

DRAFT

hearings and CEQA review, which has an approved inventory that includes monitoring, etc. If not move to Tier 3;

Tier 3: For all land use types, if projects are less than 3,000 metric tonnes/year of CO_2e, the project is presumed to be less than significant for GHGs. If the project exceeds 3,000 metric tonnes of CO_2 equivalent per year ($MTCO_2e/yr$); move to Tier 4. More specific screening thresholds were also provided, which include 1,400 $MTCO_2e/yr$ for commercial projects and 3,500 $MTCO_2e/yr$ for residential projects. These thresholds were based on a review of the Office of Planning and Research database which included 711 CEQA projects using a 90% capture approach;

Tier 4: The proposed performance standards include three options:

1. Percent Emission Reduction Target (no further recommendation)
2. Early Implementation of Applicable AB 32 Scoping Plan Measures (incorporated into option 3)
3. SCAQMD Efficiency Target

For option 3, there are targets for 2020 and 2035, using an approach similar to the BAAQMD Thresholds. The proposed 2020 target is:

- 4.8 MT/year CO_2e per service population for project level threshold (land use employment only)
- 6.6 MT/year CO_2e per service population for plan level threshold

The proposed 2035 target is:

- 3.0 MT/year CO_2e per service population for project level threshold
- 4.1 MT/year CO_2e per service population for plan level threshold
- Incorporate Sustainable Communities and Climate Protection Act of 2008 or SB 375 regional targets.

Tier 5: Off-site mitigation for life of project (30 years), if this threshold is to be used, GHG emissions must be mitigated to less than the Tier 3 screening significance threshold. The SCAQMD clarified that offsets should have a 30-year project life, should be real, quantifiable, verifiable, and surplus and will be considered in the following prioritized manner:

- Project design feature/onsite reduction measures;
- Offsite within neighborhood;
- Offsite within district;
- Offsite within state;
- Offsite out of state; and
- Substitution allowed via enforceable commitment (e.g. when an offset project ends prematurely).

If the Project cannot meet any of the Tiers, it is presumed to be significant for GHG emissions.

DRAFT

The Tier 4 percent emission reduction target is based on a percent reduction target that is based on consistency with AB 32. This is because the Tier 4 percent emission reduction target is based on the same numeric reductions calculated in the Scoping Plan to reach 1990 levels by 2020.

The Working Group has not convened since the fall of 2010. As of April 2017, the proposal has not been considered or approved for use by the SCAQMD Board. In the meantime, no GHG significance thresholds are approved for use in the Basin.

2.1.5.2 Southern California Association of Governments' Regional Transportation Plan/Sustainable Communities Strategy

As previously discussed, SB 375 requires SCAG to incorporate a Sustainable Communities Strategy into its RTP that achieves the GHG emission reduction targets set by CARB. As required by SB 375, CARB adopted year 2020 and 2035 GHG reduction targets for each metropolitan region. The SB 375 targets for the Southern California region under SCAG's jurisdiction in 2020 and 2035 are reductions in per capita GHG emissions of 8 percent and 13 percent, respectively.[43]

Pursuant to Government Code Section 65080(b)(2)(K), a Sustainable Communities Strategy does not: (i) regulate the use of land; (ii) supersede the land use authority of cities and counties; or (iii) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it.

In April 2016, SCAG adopted the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy: A Plan for Mobility, Accessibility, Sustainability and a High Quality of Life (2016 RTP/SCS). SCAG's 2016 Sustainable Communities Strategy is expected to reduce per capita transportation emissions by 8 percent in 2020, 18 percent in 2035, and 22 percent in 2040. In June 2016, CARB accepted SCAG's determination that the 2016 Sustainable Communities Strategy would meet the regions' GHG reduction targets for 2020 and 2035.[44]

2.1.6 Local: Riverside County General Plan

The current Riverside County General Plan was adopted in December 2015. The current General Plan includes a number of policies regarding the reduction of GHG impacts. The EIR identifies GHG-related policies in the County's General Plan that are relevant to the Proposed Project and analyzes the Project's consistency with these policies. This analysis does not assume any emissions reductions based on General Plan policies.

2.1.6.1 Riverside County Climate Action Plan

In conjunction with the General Plan the County prepared a Climate Action Plan (CAP). Notably, the CAP sets County-wide GHG emissions targets consistent with state reduction goals in AB 32. The CAP is not part of the General Plan per se; rather, it is a separate document that provides another implementation tool of the General Plan to guide development in the County (CAP § 1.3).

The CAP identifies actions necessary to reduce GHGs across a variety of sectors, and includes:

[43] CARB, Executive Order G-11-024 (February 2011).

[44] CARB, Executive Order G-16-066 (June 2016).

DRAFT

- An analysis of GHG emissions and sources attributable to Riverside County.
- Estimates on how those emissions are expected to increase.
- Recommended policies and actions that can reduce GHG emissions to meet state, federal, and international targets.
- A timeline of implementation.
- A defined tracking and reporting mechanism that will measure progress toward the goals.

The CAP includes a series of implementation measures that may be used by new development proposals to demonstrate consistency with the CAP, and by extension, AB 32. A Riverside County GHG Screening Table[45, 46] containing a menu of GHG reduction options is included as Appendix F to the CAP. If a project can obtain 100 points from the screening table, the mitigated project will implement pertinent reduction measures to meet the CAP GHG reduction goals, and a "less than significant" finding can be made under CEQA (CAP § 7.5). Several of the categories are not assigned points and are listed as "TBD." As such, the Project's point value for these categories cannot be assessed at this time. Alternatively, the CAP provides that individual developments that wish to model and mitigate projects directly may do so; in such case, consistency with the CAP is shown by demonstrating a 25% reduction in GHG emissions compared to the adjusted BAU scenario[47] for residential, commercial, industrial, institutional, and mixed-use projects, and by including all measures necessary to achieve such reductions in the Project's design, Conditions of Approval, or project-specific CEQA mitigation measures (General Plan, Policy AQ 19.3).[48]

2.2 Significance Threshold

This Greenhouse Gas Technical Report assesses significance of GHG impacts using three different methodologies. Each of the three methodologies is a separate and independent ground for the significance determination.

First, this report assesses consistency with AB 32 through evaluating the Project's consistency and compliance with applicable statewide and local regulatory programs designed to reduce GHG emissions consistent with AB 32.

DRAFT

[45] Riverside County Climate Action Plan GHG Screening Table. Available at: http://planning.rctlma.org/Portals/0/genplan/general_plan_2014/CAP/Appendix%20F%20-%20CAP.pdf. Accessed: August 2018.

[46] Riverside County, 2015. Climate Action Plan Errata. August. Available at: http://planning.rctlma.org/Portals/0/genplan/general_plan_2015/FEIR%20DOCS/Climate%20Action%20Plan%20Errata.pdf. Accessed: August 2018.

[47] The adjusted BAU is based on the 2020 adjusted BAU found in the Final Supplement to the AB 32 Scoping Plan (CARB 2011). County of Riverside Draft EIR No. 521, Section 4.7 (Public Review Draft February 2015). Available at: http://planning.rctlma.org/Portals/0/genplan/general_plan_2015/DEIR%20521/04-07_GreenhouseGases.pdf. Accessed: August 2018.

[48] The December 2015 General Plan Policy AQ 19.3, states: "Require new development projects subject to County discretionary approval to achieve the greenhouse gas reduction targets established in the CAP either through: (a) Garnishing 100 points through the Implementation Measures found the County's CAP; or (b) Requiring quantification of project-specific GHG emissions and reduction of GHG emissions to, at minimum, the applicable GHG reduction threshold established in the CAP."

Second, this report assesses if the Project is consistent with the CAP using the CAP screening tables. Since the County of Riverside CAP was developed using AB 32, this approach is also an AB 32 compliance pathway.

Third, this report assesses the Project's consistency with SB 375. Consistency with SB 375 was evaluated based on the growth assumptions of Southern California Association of Governments' (SCAG) 2016-2040 Regional Transportation Plan/Sustainable Community Strategy (RTP/SCS).

In addition to the methodologies listed above, this report quantitatively reports the Project's GHG emissions and compares these emissions to a service population threshold for informational purposes. This methodology utilizes an efficiency metric expressed in relation to a project's service population, which is defined to include the total number of the residents and workers associated with a project. For informational purposes, this evaluation includes a comparison to the SCAQMD proposed 4.8 MT/year CO_2e per service population for project level threshold (land use employment only) for 2020.[49]

DRAFT

[49] SCAQMD has adopted interim significance thresholds for industrial sources of 10,000 metric tons of carbon dioxide equivalents per year. The Board adopted these December 5, 2008. These thresholds are not applicable to the Project because it is not an industrial source of CO_2e emissions. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgboardsynopsis.pdf?sfvrsn=2. Accessed: February 2019.

3. GREENHOUSE GAS INVENTORY FOR PROJECT

This section describes the methods that Ramboll US Corporation (Ramboll) used to develop the GHG emissions inventories associated with the Project, which include construction emissions and operational emissions. Sub-categories of GHG operational emissions include: vegetation change, area sources, energy use, water and wastewater, solid waste, and mobile sources. These emissions are compared to applicable statewide and local regulatory programs designed to reduce GHG emissions consistent with AB 32. Legislation and rules regarding climate change, as well as the scientific understanding of the extent to which different activities emit GHGs, continue to evolve; as such, the inventories in this report reflect the guidance and knowledge currently available.

3.1 Units of Measurement: Tonnes of CO_2 and CO_2e

The term "GHGs" includes gases that contribute to the natural greenhouse effect, such as CO_2, CH_4, N_2O, and water, as well as gases that are only man-made and that are emitted through the use of modern industrial products, such as hydrofluorocarbons (HFCs) and chlorofluorocarbons (CFCs). The most important greenhouse gas in human-induced global warming is CO_2. While many gases have much higher GWPs than CO_2, CO_2 is emitted in such vastly higher quantities that it accounts for 81.6% of the GWP of all GHGs emitted by the United States.[50]

The effect each of these gases has on global warming is a combination of the volume of their emissions and their GWP. GWP indicates, on a pound for pound basis, how much a gas will contribute to global warming relative to how much warming would be caused by the same mass of CO_2. CH_4 and N_2O are substantially more potent than CO_2, with GWPs of 25 and 298, respectively. GHG emissions are typically measured in terms of mass of CO_2e. CO_2e are calculated as the product of the mass of a given GHG and its specific GWP.[51]

In many sections of this report, including the final summary sections, emissions are presented in units of CO_2e either because the GWPs of CH_4 and N_2O were accounted for explicitly, or the CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the CO_2 emissions from that particular emissions category.

In this report, a tonne refers to a metric tonne (1,000 kilograms). Additionally, exact totals presented in all tables and report sections may not equal the sum of components due to independent rounding of numbers.

3.2 Methodology Resources

CalEEMod®

Ramboll primarily utilized the California Emission Estimator Model version 2016.3.2 (CalEEMod®)[52] to assist in quantifying the GHG emissions in the inventories presented in this

[50] Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2016, U.S. Environmental Protection Agency. Available online at: https://www.epa.gov/sites/production/files/2018-01/documents/2018_complete_report.pdf. Accessed: August 2018.

[51] In the updated Draft Climate Change Scoping Plan published by CARB in 2014, the GWPs for CH_4 and N_2O were updated from 21 to 25 and from 310 to 298, respectively. This report relies upon the newly proposed GWPs in the Draft Climate Change Scoping Plan.

[52] California Air Pollution Control Officers Association (CAPCOA). 2017. California Emissions Estimator Model. Available at: http://www.CalEEMod.com/. Accessed: August 2018.

DRAFT

report for the Project. CalEEMod® is a statewide program designed to calculate both criteria and GHG emissions from development projects in California.

CalEEMod® is based upon CARB-approved Off-Road and On-Road Mobile-Source Emission Factor models (OFFROAD and EMFAC, respectively), and is designed to estimate construction and operational emissions for land use development projects and allows for the input of project specific information. OFFROAD2011[53] is an emissions factor model used to calculate emission rates from off-road mobile sources (e.g., construction equipment, agricultural equipment). EMFAC2014[54] is the emissions factor model used in CalEEMod® to calculate emissions rates from on-road vehicles (e.g., passenger vehicles, haul trucks). As noted above, EMFAC2014 has been superseded by EMFAC2017.[55] In order to allow for a more accurate representation of mobile source operational emissions associated with the Project, operational mobile source emission factors were estimated using EMFAC2017. These emissions factors were then used to estimate mobile source operational emissions based on CalEEMod® methodology and defaults along with Project specific values where available.

CalEEMod® provides a simple platform to calculate both construction emissions and operational emissions from a land use project. It calculates both the daily maximum and annual average for criteria pollutants as well as total or annual GHG emissions. The model also provides default values for water and energy use.

CalEEMod® contains default values and existing regulation methodologies to use in each specific local air district region. Appropriate statewide default values can be utilized if regional default values are not defined. Ramboll used default factors for the Riverside County area that is within the SCAQMD jurisdiction for the GHG emission inventory, unless otherwise noted in the methodology descriptions below. Details regarding the specific methodologies used by CalEEMod® can be found in the CalEEMod® User's Guide and associated appendices.[56] The CalEEMod® output files are provided for reference in **Appendix A** to this report.

3.3 Indirect GHG Emissions from Electricity Use

Project-related electricity use results in indirect emissions, due to electricity generation activities occurring at off-site power plant locations. For this Project, electrical power will be supplied to the Project site by Southern California Edison (SCE). The indirect GHG emissions created as a result of Project-related electricity use are estimated through application of the following methodology.

Using CalEEMod®, the electricity intensities are multiplied by the emission intensity factors for the GHGs and are classified as indirect emissions. Emission intensity factors are GHG emission rates from a given source relative to the intensity of a specific activity in term of

[53] CARB, 2007. Off Road Mobile Source Emission factors. Available at: http://www.arb.ca.gov/msei/msei.htm. Accessed: August 2018.

DRAFT

the amount of GHG released per megawatt of energy produced. The default electricity intensity for SCE in CalEEMod® for CO_2, CH_4, and N_2O are 702.44, 0.029, and 0.006 pounds (lbs) per megawatt-hour (MWh), respectively. The CO_2 default factor is based on the 2012 SCE Corporate Responsibility and Sustainability Report.[57] The CH_4 and N_2O default factors are based on CARB's and USEPA's e-Grid values as included in CalEEMod®.[58]

While CalEEMod®'s intensity factors for CH_4 and N_2O were used for this Project, CalEEMod®'s CO_2 intensity factor was modified based on the SCE's 2015 and 2016 energy delivery data, to account for the RPS requirements for 2020 (33 percent RPS).[59] The SCE Corporate Responsibility Report and the Preliminary Annual 33% RPS Compliance Report, provides the mix of renewable and non-renewable energy sources in SCE's energy supply, which were both used to calculate the emission factors. The emission factors were estimated by multiplying the percentage of energy delivered by SCE from non-renewable energy resources by the CO_2 emissions per total non-renewable energy metric calculated. Details regarding the specific methodologies used by CalEEMod® can be found in the CalEEMod® User's Guide and associated appendices[60]. The CalEEMod® output files are provided for reference in **Appendix A** to this report.

3.4 One-Time Emissions

One-time emissions are those emissions that are not recurring over the life of the project. This includes emissions associated with construction and emissions associated with vegetation and land use changes. The emission estimation methodology for both construction and vegetation changes are described in this section. Since the site is currently vacant land, one-time emissions associated with planting of new trees at the Project site was evaluated

3.4.1 Construction Activities

This section describes the estimation of GHG emissions from construction activities at the Project site. Construction of the Project warehouse is anticipated to occur across five phases, beginning in 2020. This analysis assumes construction begins in mid-2019. This is conservative, as emission factors improve in future years and; therefore, actual construction emissions will be lower than shown in this report. Construction for the Cactus Channel improvements could occur contemporaneously with the warehouse or separately depending on permitting and timing. For purposes of this analyses we have conservatively assumed that construction associated with Cactus Channel would occur at the same time as the warehouse construction.

DRAFT

[59] The CH_4 and N_2O intensity factors from CalEEMod® are based on emissions from California's mix of power generation sources in 2009. As more renewable energy is integrated into the electricity grid, these intensity factors will also decrease.

[60] SCAQMD, 2017, California Emissions Estimator Model User's Guide. Version 2016.3.2. July. Available at: http://www.CalEEMod.com/. Accessed: August 2018.

The major construction phases for the Project warehouse included in this analysis are:

- Site Preparation: involves clearing any vegetation (grubbing and tree/stump removal) and stones prior to grading. It also involves some rough grading and utility installation.
- Grading: involves the cut and fill of land to ensure the proper base and slope for the construction foundation.
- Building Construction: involves the construction of structures and buildings.
- Architectural Coating: involves the application of coatings to both the interior and exterior of buildings or structures
- Paving: involves the laying of concrete or asphalt such as in parking lots or roads.

There will not be a demolition phase for this Project since the construction will occur on previously undeveloped land. GHG emissions from these construction phases are largely attributable to fuel use from construction equipment and worker commuting to the Project site.

The construction for Cactus Channel improvements is classified as site preparation in CalEEMod® and will include excavation and box culvert installation activities.

Ramboll used CalEEMod® to assist in quantification of the construction emissions. The analysis was based on a mix of project specific estimates including the numbers and types of equipment that will be used in the construction of the Project as well as the duration of the different construction phases. The construction equipment parameters (horsepower, load factor, and hours of operation) and worker/vendor trip amounts were based on CalEEMod® default data. Vendor trips include vehicles such as water trucks and concrete trucks. The hauling trip amounts were estimated using project specific data for volume of soil imported/exported and the CalEEMod® default assumption for haul truck capacity of 16 cubic yards per truck. Worker and vendor trip distances are based on CalEEMod® default assumptions. The haul trip distance for the warehouse construction soil import is 3 miles, based on Project specific data. The haul trip distance for Cactus Channel construction soil export is based on CalEEMod® default assumptions. The Project area was assumed to be developed over a two-year time frame commencing in 2020. This analysis assumes construction begins in mid-2019. This is conservative, as emission factors improve in future years and; therefore, actual construction emissions will be lower than shown in this report. The construction schedule, equipment lists, and construction related on-road trips are shown in **Tables 2 through 4**, respectively. The CalEEMod® output files are included in **Appendix A**.

3.4.1.1 Emissions from Construction Equipment

The emission calculations associated with construction equipment are from off-road equipment engine use based on the equipment list and phase length.

Since the majority of the off-road construction equipment used for construction projects are diesel-fueled, CalEEMod® assumes all of the equipment operates on diesel fuel. The calculations associated with construction equipment include the running exhaust emissions from off-road equipment. Since the equipment is assumed to be diesel, there are no starting or evaporative emissions associated with the equipment as these are *de minimis* for

DRAFT

diesel-fueled equipment. CalEEMod® calculates the exhaust emissions based on default values for horsepower and load factor from CARB's OFFROAD2011 model.[61]

The GHG emissions associated with off-road construction equipment are shown in **Table 5.** Most of the emissions occur during the building construction phase. While the Project has committed to using 50% Tier 3 and 50% Tier 4 Final off-road equipment during all construction phases, there is no quantitative GHG reduction estimated from this reduction given the limitations of information from CalEEMod® and OFFROAD2011.

3.4.1.2 GHG Emissions from On-Road Trips

Construction generates on-road vehicle exhaust (including evaporative emissions) from personal vehicles for worker/vendor commuting and trucks for soil/material hauling. These emissions are calculated in CalEEMod® based on the number of trips and vehicle miles traveled (VMT) along with emission factors from EMFAC2014 which are embedded in CalEEMod®. The numbers of worker and vendor trips represent defaults from CalEEMod® based on the construction equipment to be used. The number of haul trips was estimated based on the volume of soil to be imported (220,000 cubic yards) and exported (60,000 cubic yards), and the CalEEMod® default assumption for haul truck capacity of 16 cubic yards per truck.

The mobile source emissions were calculated using trip rates and lengths, as well as emission factors from EMFAC2014 as outlined in the CalEEMod® user's guide.[62] Details regarding on-road trips generated during the construction phase are presented in **Table 4**.

The emissions associated with on-road activities are shown in **Table 6**. Most of the emissions were estimated to occur from the workers' and vendors' trips during the building construction phase.

3.4.1.3 Total Construction Emissions

The total emissions from construction are summarized in **Table 7.** Total GHG emissions from all project construction phases for off-road and on-road emissions are 458 and 1,656 MT CO_2e, respectively. Total GHG emissions from the construction activities are 2,114 MT CO_2e. When amortized over 30-year project lifetime, the construction GHG emissions are 70 MT CO_2e/year.[63] Detailed emission inventories from the CalEEMod® output files are included in **Appendix A.**

3.4.1.4 Regulatory Measures

The construction emissions will comply with the applicable regulations and programs. These include the CARB ATCM to limit diesel fueled commercial motor vehicle idling, CARB in-use Off-Road and On-Road regulations, and the California Cap-and-Trade Program.

[63] This approach to one-time construction GHG emissions is based on the GHG Threshold Working Group Meeting #13 Minutes from August 26, 2009. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-13/ghg-meeting-13-minutes.pdf?sfvrsn=2. Accessed: August 2018.

3.4.2 Vegetation Changes

This section presents the calculation of GHG emissions associated with any vegetation removal and re-vegetation at the Project site. As described previously, the existing site is vacant and has little to no vegetation. Planting trees will sequester CO_2 and is considered to result in a one-time carbon-stock change. Trees sequester CO_2 while they are actively growing. The amount of CO_2 sequestered depends on the type of tree. In this case, new trees will be planted at the Project site. This will result in carbon sequestration. Therefore, planting of new trees results in decrease in overall GHG emissions. GHG emissions associated with planting of new trees are amortized over a 30-year project lifetime (see **Table 8**).

3.4.2.1 Regulatory Measures

No applicable regulatory measures related to GHG emissions from vegetation changes were identified.

3.5 Annual Operational Emissions

Operational emissions are emissions that would occur after build-out of the Project. This analysis identifies operational emissions for source categories including direct emissions from area and mobile sources and indirect emissions from energy use, water/wastewater, and waste management. There is no operational activity associated with the Cactus Channel, hence operational emissions are zero.

3.5.1 Area Sources

Area sources are those emissions that are generally too small to be uniquely identified as point sources and are thus generally aggregated as a group. CalEEMod® estimates emissions for the following sources, which are included under the category of "area" sources: landscaping equipment (e.g., lawn mowers), consumer products, and architectural coatings. There are no GHG emissions from consumer product and architectural coating activities. The area source GHG emissions included in this analysis result from landscaping maintenance equipment related fuel combustion sources, such as lawn mowers. Based on CalEEMod® defaults, all operational days (i.e., 250 days per year) were assumed to be summer days, with no snow days. GHG emissions due to natural gas combustion in buildings are excluded from this section since they are included in the emissions associated with building energy use (described in Section 3.5.2). The GHG emissions for the Project were calculated using CalEEMod® defaults based upon the land uses that will be part of the Project.

The resulting GHG emissions from the use of landscape maintenance equipment are presented in **Table 9**.

3.5.1.1 Regulatory Measures

No applicable regulatory measures related to GHG emissions from landscape maintenance equipment were identified.

3.5.2 Energy Use

GHGs are emitted from buildings as a result of activities for which electricity and natural gas are typically used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building. GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered to be indirect emissions. Climate Zone 10 was selected based on the CEC forecast climate zone map shown in the CalEEMod® User's Guide.

DRAFT

Project emissions have been calculated using a SCE emission factor that accounts for the 33% RPS required by 2020, as discussed in Section 3.3. The adjusted SCE emission factor is based on their Corporate Responsibility Report and the Preliminary Annual 33% RPS Compliance Report, which provides the mix of renewable and non-renewable sources in SCE's energy supply. With this data, the SCE emission factor is adjusted to represent what the emissions from SCE would be in 2020 (see **Table 10**).

3.5.2.1 Emissions Estimation from Energy Use

As mentioned above, GHGs are emitted from buildings as a result of activities for which electricity and natural gas are typically used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building. Electricity and natural gas use in buildings is divided into energy consumed by the built environment and energy consumed by uses that are independent of the construction of the building such as in plug-in appliances.

The Project's unmitigated and mitigated CO_2e emissions from electricity and natural gas usage are presented in **Table 11**. The mitigated scenario reflects reduced emissions due to installation of Energy Star-certified lighting.

3.5.2.2 Regulatory Measures

In California, Title 24 governs energy consumed by the built environment, mechanical systems, and some types of fixed lighting.[64] The 2016 Title 24 standards are the currently applicable building energy efficiency standards and became effective on January 1, 2017. In general, single-family homes built to the 2016 standards are anticipated to use about 28% less energy for lighting, heating, cooling, ventilation, and water heating than those built to the 2013 standards, and nonresidential buildings built to the 2016 standards will use an estimated 5% less energy than those built to the 2013 standards. The Project's GHG emissions calculations reflect that the Project is meeting the 2016 Title 24 Part 6 Building Code for nonresidential construction.

Emission factors for electricity are dependent on statewide renewable energy generation targets. The RPS established a target of 33% energy from renewable sources for all electricity providers in California by 2020. SCE-specific electricity intensity factors were derived; the energy intensity factors for CO_2, CH_4, and N_2O mass emissions per kilowatt hour are described in **Section 3.3** and Section **3.5.2**.

3.5.3 Water Supply, Treatment and Distribution

Indirect GHG emissions result from the production of electricity used to convey, treat, and distribute water and wastewater. The amount of electricity required to convey, treat, and distribute water depends on the volume of water as well as the sources of the water. Additional emissions from wastewater treatment include CH_4 and N_2O, which are emitted directly from the wastewater.

The Project's total water demand values were based on site-specific annual demand projections (**Table 12**). The GHG emissions associated with water conveyance, treatment, and distribution, as well as wastewater treatment were calculated using CalEEMod® default assumptions.

[64] Title 24, Part 6, of the California Code of Regulations: California's Energy Efficiency Standards for Residential and Nonresidential Buildings. Available at: http://www.energy.ca.gov/title24/. Accessed: August 2018.

DRAFT

The Project unmitigated and mitigated indoor and outdoor water usage's resulting GHG emissions are presented in **Table 12**. The indoor and outdoor water usage includes measures for low use faucets and water efficient landscapes.

3.5.3.1 Regulatory Measures

The Project will comply with the California Green Building Code, which requires that indoor potable water use be reduced by 20 percent through the use of water saving fixtures and/or flow restrictors.

3.5.4 Solid Waste

Municipal solid waste (MSW) is the amount of material that is disposed of by land filling, recycling, or composting. CalEEMod® calculates the indirect GHG emissions associated with waste that is disposed of at a landfill. The program uses annual waste disposal rates from the CalRecycle data for individual land uses. The emission estimates for this Project were based on CalEEMod® default factors adjusted to a 75% waste diversion rate using CalRecycle waste disposal rates for unincorporated Riverside County. CalEEMod® uses the overall California Waste Stream composition to generate the necessary types of different waste disposed into landfills. The program quantifies the GHG emissions associated with the decomposition of the waste, which generates methane based on the total amount of degradable organic carbon. The program quantifies the CO_2 emissions associated with the combustion of methane, if applicable. Default landfill gas concentrations were used as reported in Section 2.4 of AP-42. The IPCC has a similar method to calculate GHG emissions from MSW in its 2006 Guidelines for National Greenhouse Gas Inventories.

The CalEEMod® solid waste module determines the GHG emissions associated with the disposal of solid waste into landfills, in quantities that are based upon land use type according to waste disposal studies conducted by CalRecycle. For this module, CalEEMod® default and CalRecycle waste generation rates were used since site specific information was not available. GHG emissions associated with non-landfill diverted waste streams are not considered, because it is generally assumed that these diversions do not result in any appreciable amounts of GHG emissions when operated effectively.[65] These waste diversion alternatives may result in differences in life-cycle emissions of GHGs, but it is not appropriate to combine life-cycle emissions for only one category of emissions.[66]. As mentioned previously, biogenic CO_2 emissions were not included when CARB analyzed the GHG emissions inventory under AB 32. Therefore, they are not included in the Project emissions inventory.

Project GHG emissions from solid waste are presented in **Table 13**.

3.5.4.1 Regulatory Measures

The analysis has assumed that the Project will be consistent with the state's waste diversion goal of 75% waste diversion by 2020.[67]

---

[65] CARB. 2010. Local Government Operations Protocol. Chapter 9.4.

[66] This inventory represents scope 1 and 2 emission categories. A life-cycle analysis of waste diversion would be a scope 3 inventory. CARB's Local Government Operations Protocol Version 1.1 (May 2010) clearly states that scope 3 emissions should not be combined with scope 1 and 2 emissions.

[67] CalRecycle. 2013. California's 75 Percent Initiative. Available at: http://www.calrecycle.ca.gov/75percent/. Accessed: August 2018.

DRAFT

3.5.5 Mobile Source Emissions

The GHG emissions associated with on-road mobile sources are generated by employees and trucks visiting the proposed Project. The emissions associated with on-road mobile sources includes running exhaust emissions, starting emissions and idling exhaust emissions. Running exhaust emissions are dependent on VMT. Starting emissions are associated with the number of starts or time between vehicle uses and the assumptions used in determining these values are described below. Idling exhaust emissions are based on the amount of time a vehicle spends idling. As noted in Section 3.1, CalEEMod® relies upon EMFAC2014 to estimate mobile source emission factors. EMFAC2014 has been superseded by EMFAC2017. To allow for a more accurate representation of mobile source operational emissions associated with the Project, mobile source emission factors were estimated using EMFAC2017. Emission factors were obtained from EMFAC2017 for Riverside County. EMFAC2017 model outputs are included in **Appendix B**. These emissions factors were then used to estimate mobile source operational emissions based on CalEEMod® methodology and defaults along with Project specific traffic activity data such as the trip rates specified in the Project's Traffic Impact Analysis (TIA)[68] and trip length information as noted below.

3.5.5.1 Trip Rates

Trip rates are one of the parameters used to calculate Project mobile source emissions. CalEEMod® relies upon trip generation rates by land use types and associated average trip length by trip type to estimate the air quality and GHG emissions. Urban Crossroads[69] provided peak daily trip rates by vehicle type for the Project that would occur during the holiday season (November 15th to January 15th). Daily trips during the non-peak period were estimated to be two-thirds of the peak daily trips based on the ratio of peak period to non-peak period employment at a similar high-cube fulfillment center warehouse. As shown in **Table 14**, annual average truck trips were estimated using the daily trip estimates for each time period (peak and non-peak) and the number of days in that time period.

3.5.5.2 Trip Lengths

Trip lengths are another factor used to calculate Project mobile source emissions. Annual VMT is estimated as a product of annual average trips and trip length for each vehicle type. The default CalEEMod® trip length of 16.6 miles for commercial-work trips (i.e., trips made by someone who is employed by the commercial land use sector) for Riverside County located within SCAQMD jurisdiction were used for passenger vehicles that represent vehicles used by employees. The trip length for trucks was assumed to be 60 miles based on likely geographical travel by trucks in the South Coast Air Basin.[70, 71] The default commercial-nonwork trip length for trucks in CalEEMod® is 6.9 miles. Therefore, the use of a 60-mile trip length is conservative assumption. Trip lengths and total VMT are presented in **Table 14**.

DRAFT

3.5.5.3 Vehicle Fleet Mix

Vehicle fleet mix is another parameter used to estimate mobile source emissions from Project operation. Each vehicle type has a different emission factor for each pollutant, so CalEEMod® relies upon vehicle fleet mixes by land use type to estimate the GHG emissions for each land use. The fleet mix for passenger vehicles was calculated based on the CalEEMod® default fleet mix for the Unrefrigerated Warehouse – No Rail land use in Riverside County (South Coast). Passenger vehicles represent vehicles used by employees to commute to work. The fleet mix for trucks was estimated based on trip rates from the TIA, with 2-axle trucks further distributed into LHD1 and LHD2 based on the ratio of their CalEEMod® defaults. The vehicle fleet mix is presented in **Table 15**.

3.5.5.4 Mobile Source Emission Factors

Emission factors were obtained from EMFAC2017 for Riverside County. The emission factors used to estimate running exhaust emissions are presented in **Table 16.** These emission factors are on a "per mile" basis and thus the emissions were calculated by multiplying these factors by the estimated VMT for each vehicle type listed in **Table 14**. The emission factors for starting exhaust are presented in **Table 17**. These emission factors are on a "per trip" basis and thus starting emissions were calculated by multiplying these emission factors by the estimated number of trips for each vehicle type listed in **Table 14**. The emission factors used to estimate GHG emissions from truck idling are presented in **Table 18.** These emission factors are on a "per minute of idling" basis and thus the idling emissions were calculated by multiplying these emissions factors by the estimated idle duration of 15 minutes per round trip (5 minutes at entry gate, 5 minutes at dock, and 5 minutes at exit gate) for each truck type and total number of truck round trips.[72] Please note that the trip counts shown in **Table 14** are one-way trips; hence these trip counts were divided by two to estimate the number of round trips.

3.5.5.5 Estimated Emissions from Mobile Sources

The Project was estimated to generate approximately 31,661,414 VMT/yr and 1,550,472 annual one-way trips, which would result in GHG emissions as shown in **Table 19**.

3.5.5.6 Regulatory Measures

AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other vehicles determined by CARB to be vehicles whose primary use is non-commercial personal transportation in the state. In addition, the NHTSA and EPA have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles, and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the proposed project's motor vehicles. The effectiveness of fuel economy improvements and the GHG emission standards over time was evaluated by using the EMFAC2017 emission factors for motor vehicles.

The analysis includes the benefit of reductions from some adopted regulatory programs, which are accounted for as follows:

[72] Idle duration at any one location is limited to 5 minutes, based on CARB Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. Available at: https://www.arb.ca.gov/regact/idling/idling.htm. Accessed: February 2019.

DRAFT

- AB 1493 ("the Pavley Standard") required CARB to adopt regulations by January 1, 2005, to reduce GHG emissions from non-commercial passenger vehicles and light-duty trucks of model year 2009 and thereafter. EMFAC2017 includes emission reductions for non-commercial passenger vehicles and light-duty trucks of model year 2017 – 2025.
- The ACC program, introduced in 2012, combines the control of smog, soot causing pollutants and GHG emissions into a single coordinated package of requirements for model years 2017 through 2025. EMFAC2017 includes reductions associated with this regulation that are represented in this analysis.
- The USEPA/NHTSA advanced fuel economy and GHG standards (Phase 1) were adopted in 2011 for medium- and heavy-duty trucks for model years 2014-2018. This Heavy-Duty National Program is intended to reduce fuel use and GHG emissions from medium- and heavy-duty vehicles, semi-trucks, pickup trucks and vans, and all types and sizes of work trucks and buses in between. EMFAC2017 emission factors used for the analyses in this report include reductions associated with this regulation.
- The USEPA/NHTSA advanced fuel economy and GHG standards (Phase 2) were adopted in 2016 for medium- and heavy-duty trucks for model years 2018 and beyond. The Phase 2 program includes technology-advancing standards that substantially reduce GHG emissions and fuel consumption resulting in an ambitious, yet achievable, program that will allow manufacturers to meet the applicable standards over time, at reasonable cost, through a mix of different technologies. This standard will phase in beginning with model year 2021 and will culminate with model year 2027. Based on the Phase 2 standards, it is assumed that the Project's GHG emissions will continue to decrease over time beyond what is presented herein.

The Cap-and-Trade Program for Stationary Sources and Fuels will help the state reduce GHG emissions to meet the statewide targets. The San Joaquin Valley Air Pollution Control District (SJVAPCD) approved Policy APR-2025 (CEQA Determinations of Significance for Projects Subject to CARB's GHG Cap-and-Trade Regulation) to evaluate whether projects subject to the cap-and-trade regulation would comply with plans for reducing GHG emissions supported by an environmental review compliant with CEQA requirements, and that compliance with this plan would adequately mitigate GHG emissions for CEQA purposes under the SJVAPCD thresholds. SJVAPCD concluded that the cap-and-trade regulation is such a plan, and that compliance would result in a project having a less than significant impact for GHG emissions that are subject to the cap-and-trade regulations. Transportation fuels (and thus transportation) are included in the cap-and-trade program. The regulation requires that emissions generated by these facilities and combustion of fuels be reduced over time. Accordingly, the SJVAPCD found that "GHG emission increases caused by fuel use (other than jet fuels [which are not regulated under the cap-and-trade regulation] are determined to have a less than significance impact on global climate change under CEQA."

Emissions associated with transportation fuels and energy (electricity and natural gas) are the largest portions of GHG emissions associated with the Project, and these sectors are now subject to the cap-and-trade regulation. This project analysis conservatively includes all mobile emission without accounting for mitigation resulting from Cap-and-Trade.

DRAFT

3.6 Mitigation Measures

This section presents the methodology used to evaluate the Project's GHG emissions reductions associated with mitigation measures. Since the emissions reductions associated with some mitigation measure were not readily available as a simple CalEEMod® output, the following methodology was used to estimate the emission reductions for each mitigation measure as applicable. Mitigation Measure MM-GHG-1 provides that the applicant shall incorporate MM-AQ-1 (Construction Equipment Emissions Standards), MM-AQ-2 (Low-VOC Architectural Coatings), MM-AQ-3 (Construction Relations Officer), MM-AQ-4 (Improved Energy Efficiency and Water Reduction), MM-AQ-5 (Commute Trip Reduction), and MM-AQ-6 (Truck Requirements). The emissions reduction estimation methods are presented below for each mitigation measure that is listed within MM-GHG-1.

3.6.1.1 Quantified Mitigation Measures

Emission reductions associated with the following mitigation measures were incorporated into the emissions analysis for the Project.

MM-AQ-4 (Improved Energy Efficiency and Water Reduction):

- The Project will install approximately 4.5 MW of solar photovoltaic electricity generation (**Table 20**).
- The Project will install Energy Star certified light bulb and lighting fixtures[73] (estimated within CalEEMod®, see **Table 11**).
- The Project will exceed the Riverside County Climate Action Plan requirement for water efficient landscaping by having no turf and only drought tolerant plants and introducing additional water efficient irrigation controls such as smart irrigation controllers (accounted for while estimating Project operational water demand, see **Table 12**).
- The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle (EV) charging stations and fifty-four off-site EV charging stations (**Table 21**).

3.6.1.2 Unquantified Mitigation Measures

Emission reductions associated MM-AQ-1 and MM-AQ-2 are not quantified as a part of the GHG analyses as these measures pertain to criteria air pollutants only. As a conservative approach, the reductions from MM-AQ-3, parts of MM-AQ-4, MM-AQ-5, and MM-AQ-6 were not quantified due to lack of clarity on the quantity of reductions associated with these mitigation measures. A list of these unquantified mitigation measures is presented below:

MM-AQ-1 (Construction Equipment Emission Standards): During Project construction, the construction contractor, with oversight by March JPA, shall ensure that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the United States Environmental Protection Agency (USEPA). In addition, construction contractor

[73] Energy Star. Energy Star Qualified LED Lighting. Available at: https://www.energystar.gov/products/lighting_fans/light_fixtures/why_choose_energy_star_qualified_led_lighting. Accessed: May 2018.

DRAFT

shall utilize 50% Tier 4 Final construction equipment, based on number of pieces of construction equipment.

MM-AQ-2 (Low-VOC Architectural Coatings): The construction contractor shall be required to utilize Super-Compliant VOC interior and exterior paints, which are defined by SCAQMD as meeting the "super-compliant" VOC standard of 10 grams per liter (g/L), during construction and long-term operations.[74]

MM-AQ-3 (Construction Relations Officer): The Project will provide a construction relations officer to act as a community liaison to oversee on-site construction activity and all emissions and congestion related matters. A phone number and email contact information for the construction relations officer shall be posted on signage at construction site entrance points.

MM-AQ-4 (Improved Energy Efficiency and Water Reduction):

- The Project will install duct insulation to a minimum level of R-6 and modestly enhanced window insulation (for a 5% improvement over the 2016 Title 24 requirement) consistent with the Riverside County Climate Action Plan criteria.
- Consistent with the Riverside County Climate Action Plan criteria, the Project will include the following design elements: Construction of modest cool roof, defined as CRRC Rated 0.15 aged solar reflectance and 0.75 thermal emittance; Use of HVAC equipment with a SEER of 14 or higher; Installation of water heaters with an energy factor of .92 or higher; All rooms will have some form of daylighting (e.g., skylights or windows); At least 50% of artificial lighting unit fixtures will be high efficacy; Waterless urinals and high efficiency toilets will be used throughout the Project; and water efficient faucets will be used throughout the Project.
- The Project will provide electrical outlets at building exterior areas.
- The Project landscape non-potable water system will meet "purple" pipe standards.

MM-AQ-5 (Commute Trip Reduction):

- Five percent (5%) of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools.
- The Project will provide short- and long- term bicycle parking facilities to meet peak season maximum demand (one bike rack space per 20 vehicle/employee parking spaces).
- The Project will provide "end-of-trip" facilities including showers, lockers, and changing space (four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).
- Each tenant will provide on-site food vending machines or refrigerator, microwave oven and mail facilities (i.e., drop box) at the Project site. Projects will also consider the provision of an ATM machine as feasible.

[74] SCAQMD. Super-Compliant Architectural Coatings. Available at: http://www.aqmd.gov/home/programs/business/business-detail?title=super-compliant-coatings. Accessed: August 2018.

DRAFT

MM-AQ-6 (Truck Requirements):

- For any warehouse use, the loading docks shall be designed to accommodate SmartWay trucks.[75] The March JPA will require evidence of compliance prior to issuance of a certificate of occupancy for any warehouse use.

4. ANALYSIS OF CONSISTENCY WITH GHG SIGNIFICANCE THRESHOLDS

This section examines the Project's significance of GHG impacts using three different methodologies. Additionally, this Greenhouse Gas Technical Report includes a comparison of the Project's GHG emissions to a SCAQMD service population efficiency for informational purposes. Total project operational GHG emissions are summarized in **Table 22**.

4.1 Consistency with AB 32 Regulatory Programs

The Project is consistent and compliant with applicable statewide and local regulatory programs. As discussed above, the Project will be subject to a number of regulatory programs designed to reduce GHG emissions consistent with AB 32. The list below summarizes the regulations and programs related to the emission source categories.

- Energy Use:

  California Title 20 Standards
  California Title 24, Part 6 Standards (2013 and 2016)
  California Title 24, Part 11 Standards
  California Renewable Portfolio Standard (SB X1 2)
  California Cap-and-Trade Program

- Water Supply, Treatment and Distribution:

  Executive Order B-29-15
  California Title 24, Part 11 Standards
  County of Riverside Ordinance No. 859
  Senate Bill X7-7

- Solid Waste:

  California AB 341 (waste diversion)

- Mobile Sources:

  California AB 1493/Pavley Standards (through model year 2025)
  California Advanced Clean Cars Standards (through model year 2025)
  California Low Carbon Fuel Standard
  USEPA/NHTSA CAFÉ Standards (through model year 2018)
  California Cap-and-Trade Program

- Construction:

  CARB In-Use Off-Road Regulation
  CARB In-Use On-Road Heavy-Duty Diesel Vehicles Regulation
  California Cap-and-Trade Program

4.2 Consistency with County of Riverside CAP

The Project's significance with respect to GHG emissions is also evaluated based on its consistency with the County of Riverside CAP. The CAP includes screening tables, which "provide guidance in measuring the reduction of greenhouse gas emissions attributable to certain design and construction measures incorporated into development projects." The CAP further indicates that "the Screening Table assigns points for each option incorporated into a

DRAFT

project as mitigation or a project design feature." and also summarizes that "Projects that garner at least 100 points will be consistent with the reduction quantities anticipated in the County's GHG Technical Report. As such, those projects that garner a total of 100 points or greater would not require quantification of project specific GHG emissions. Consistent with CEQA Guidelines, such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions."

The Project's points are shown in the table in **Appendix C**. The results of the screening analysis show that the Project would earn 656 points based on planned reduction measures. As such, the Project would meet the requirement of the CAP.

The Project earned points for the following planned reduction measures:

- **Insulation:** Walls will have a minimum of R-13 insulation and the roof will have R-38 insulation for all office space associated with the Project, as required by 2016 Title 24.
- **Windows:** All windows will have modestly enhanced window insulation.
- **Cool Roofs:** Modest cool roof will be constructed.
- **Heating/Cooling System:** Project will install a minimum of R-6 duct insulation, as required by 2016 Title 24.
- **Space Heating/Cooling Equipment:** Those areas that are cooled and heated will have HVAC equipment of 14 SEER or higher.
- **Water Heaters:** The water heaters installed will be of .92 energy factor or higher.
- **Daylighting:** All rooms will have some form of daylighting be it skylights or windows.
- **Artificial Lighting:** 50% of in unit fixtures will be high efficacy.
- **Photovoltaic:** 2016 Title 24 requires that nonresidential solar ready requirements apply to hotel/motel occupancies with ten habitable stories or fewer, high-rise multi-family buildings with ten stories or fewer, and all other nonresidential buildings with three habitable stories or fewer. The Project will further install solar photovoltaic panels to generate electricity equal to 100% of the power needs of the project.
- **Water Efficient Landscaping:** No turf; only drought tolerant plants.
- **Water Efficient Irrigation Systems**: Smart irrigation controllers only.
- **Toilets:** Waterless urinals and high efficiency toilets will be used throughout.
- **Faucets:** Water efficient faucets will be used throughout.
- **Recycled Water:** Graywater (purple pipe) irrigation system will be used for outdoor water.
- **Signal Improvements:** At least one traffic signal along a nearby arterial will be synchronized.
- **Sidewalks:** Sidewalks exist on the north side of the street and will be added on the south side.
- **Electric Vehicle Recharging:** 2016 CALGreen (Title 24, Part 11) requires circuit and capacity for electric vehicle charging in non-residential areas where the total number of

DRAFT

parking spaces is 10 or more. The Project will additionally install eleven on-site and fifty-four off-site EV charging stations.

- **Commercial Vehicle Idling Restriction:** All commercial vehicles are restricted to 5-minutes or less per trip on site and at loading docks.

4.3 Consistency Evaluation with SB 375 (SCAG RTP/SCS)

The Southern California Association of Governments (SCAG) RTP is a long-range transportation plan that is developed and updated by SCAG every four years. The RTP provides a vision for transportation investments throughout the region. The SCS will integrate land use and transportation strategies that will achieve GHG emissions reduction targets that are forecasted to achieve reduction in GHG emissions to achieve the state's 2035 and 2040 GHG reduction goals.[76]

The Project lies entirely within Traffic Analysis Zone (TAZ) 43268200. The 2016 RTP/SCS projects that within TAZ 43268200, there will be a total of 8,755 jobs by 2020 and 22,196 by 2045.[77] As of 2016, there are 4,531 jobs in the March JPA jurisdiction. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Adding jobs consistent with 2016 RTP/SCS projections supports SCAG's achievement of ARB emissions reductions targets.

The SCS also indicates that this is a jobs poor area so providing more jobs will actually reduce GHG emissions and reduce VMT as it will provide local jobs to achieve a more favorable jobs-housing balance.

Additionally, the March JPA Draft General Plan[78] discusses the need to create more jobs as described below:

- March JPA has a stated goal of providing 38,000 jobs, through development of its Planning Area, to the western Riverside County area thereby creating a much-needed job center. The creation of a job center is important to reduce the existing jobs/housing imbalance that exists in this region such that it can help reduce traffic congestion, pollution, fossil fuel dependence and improve the overall quality of life for the residents of western Riverside County. (p. 1-11)
- March JPA has a mission to replace regional economic benefit that was lost with the realignment of the active duty March Air Force Base into a Reserve Base in April 1996. The quantified benefits are the creation of at least 38,000 jobs, and more that $500 million annual economic contribution to the Riverside County region. (p. 5-4)

The Project is expected to generate 900 jobs. This is approximately 21% of the projected job growth in TAZ 43268300 in 2020 as compared to 2016, and approximately 5.1% of projected job growth in 2045 as compared to 2016. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Since the jobs created by the Project are within the job growth projections in the 2016 RTP/SCS, will not impair the

[76] 2016. The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy. April. Available at: http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS.pdf. Accessed: December 2018.

DRAFT

region's ability to achieve the GHG reductions from Project related mobile sources as required by SB 375 because the land use development pattern proposed by the Project results in jobs within the total number of jobs projected by SCAG's 2016 RTP/SCS, and is consistent with the underlying assumptions upon which SCAG's 2016 RTP/SCS was based.

4.4 Quantitative Analysis of Updated Scoping Plan (Service Population)

For informational purposes, an additional comparison to a service population target is included since no numeric threshold for determining the significance of construction or operational GHG emissions from a residential/commercial development project has been adopted by the lead agency or by the SCAQMD. The SCAQMD's draft 2020 target for project-level analysis is 4.8 $MTCO_2e$ per year per service population (land use employment only).[79] The service population estimate for the Project is 900 employees on an annual average basis. Non-peak period service population is estimated to be two-thirds of the peak period based on Project specific estimates.

The Project's mitigated efficiency metric is estimated to be 17.5 MT CO_2e per year per service population, which is above the draft threshold, however, this is based on a comparison that does not fairly compare the Project emissions inventory to the associated service population. In this case, the trucks associated with Project operation are the predominant emissions source, however, those drivers are not considered in the SCAQMD's service population since they are not included in the employment for the Project land use.[80] With the analysis described in **Table 23**, the emissions from these trucks are included in the total emissions, but the drivers are excluded from the service population.

Further, this analysis also evaluates the Project's GHG emissions utilizing a modified emissions inventory to compare against the efficiency target because the District's draft definition of "service population" leads to a negative bias for projects with emissions not related to the residents or workers of the project. The modified emissions inventory used in this analysis evaluates the emissions associated with the defined service population – the workers at the project site and not the truck workers and the truck emissions; as such, mobile source emissions associated with the operational trucks are excluded from the emissions total. In this analysis, shown in **Table 24**, the Project's efficiency metric is estimated to be 6.02 MT CO_2e per year per service population, which is above the draft threshold. This analysis is included for informational purposes only.

DRAFT

[79] SCAQMD has adopted interim significance thresholds for industrial sources of 10,000 metric tons of carbon dioxide equivalents per year. The Board adopted these December 5, 2008. These thresholds are not applicable to the Project because it is not an industrial source of CO_2e emissions. Available at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgboardsynopsis.pdf?sfvrsn=2. Accessed: February 2019.

Table 10. Utility GHG Emission Factor Associated with Renewable Portfolio Standard
K4 and Cactus Channel Improvement Project
Riverside County, California

Energy Delivered [MWh]				
	2015	**2016**	**Average**	**Units**
Total Energy Delivery[2]	75,374,350	73,268,226	--	MWh
from renewables[2]	18,315,967	20,734,908		MWh
from non-renewables	57,058,383	52,533,318	--	MWh
% of Total Energy From Renewables[1]	24.3%	28.3%	--	
% of Total Energy From Non-Renewables	76%	72%	--	
CO_2 Intensity Factor per Total Energy Delivered[1]	517.00	529.00	523.00	lbs CO_2/MWh delivered
CO_2 Intensity Factor per Total Non-Renewable Energy[3]	682.96	737.80	--	lbs CO_2/MWh delivered

Estimated Intensity Factors for Total Energy Delivered[4]				
2020 RPS (33%)	**457.6**	**494.3**	**475.95**	lbs CO_2/MWh delivered

Notes:

[1]2015 and 2016 intensity factor per total energy delivered and percent of total energy from renewables information provided in the 2016 SCE Corporate Responsibility Report, page 8 and 45. Available at: https://www.edison.com/content/dam/eix/documents/investors/corporate_responsibility/2016-eix-corporate-responsibility-and-sustainability-report.pdf. Accessed: May 2018.

[2] The total energy from renewable energy as provided in the SCE 2016 Preliminary Annual 33% RPS Compliance Report Appendix A - Page 5. Available at: http://www3.sce.com/sscc/law/dis/dbattach5e.nsf/0/7501D8430F71FC7688258183007868CD/$FILE/R1502020-SCE%202016%20Annual%20RPS%20Compliance%20Report-PUBLIC.pdf. Accessed: May 2018.

[3] The emissions metric presented here is calculated based on the total CO_2 emissions divided by the energy delivered from non-renewable sources.

[4] The intensity factors for default RPS assumption are estimated by multiplying the percentage of energy delivered from non-renewable energy by the CO_2 emissions per total non-renewable energy metric calculated above. The emission factor presented here is 33% RPS for 2020. The estimate provided here and the PUP reports issued by SCE assume that renewable energy sources do not result in any CO_2 emissions.

Abbreviations:

CO_2 - carbon dioxide
GHG - greenhouse gases
lbs - pounds
MT - metric tonnes
MWh - megawatt-hour

Table 14. Operational Mobile Source Trip Parameters and Vehicle Miles Traveled
K4 and Cactus Channel Improvement Project
Riverside County, California

Vehicle Type	Peak Period Daily Trips[1,2]	Non-Peak Period Daily Trips[3]	Annual Average Trips[4]	Trip Length[5,6]	Annual Average VMT[7]
Passenger Cars	5,356	3,571	1,413,984	16.6	23,472,134
2-Axle Trucks	86	57	22,704	60	1,362,240
3-Axle Trucks	107	71	28,248	60	1,694,880
4-Axle+ Trucks	324	216	85,536	60	5,132,160

Notes:

[1] Project-specific vehicle trip rates prepared by Urban Crossroads in the *K4 Parcel Project Traffic Impact Analysis* dated July 20, 2018.

[2] Peak period daily trip rates in this table represent the maximum daily one-way trips that would occur during the holiday season (November 15th to January 15th).

[3] Non-peak period daily trips are estimated to be 2/3rd of the peak daily trips based on the ratio of peak period to non peak period employment.

[4] Annual trips are calculated using the daily trip estimates for each time period (peak and non-peak) and the number of days in that time period.

[5] Passenger cars represent vehicles used by employee to commute to work. Average trip length for these vehicles is assumed to be equal to the CalEEMod® default trip length for commercial-work trips in Riverside County.

[6] Commercial non-work trip lengths for truck trips is assumed to be 60 miles based on an anticipated truck usage similar to recent Environmental Impact Reports for warehouse distribution centers in the region. The CalEEMod® default for commercial non-work trip length is 6.9 miles. Therefore, the use of a 60-mile trip length is conservative.

[7] Estimated as a product of trip length and annual average trips for each vehicle type.

Abbreviations:

CalEEMod® - CALifornia Emissions Estimator MODel
VMT - vehicle miles traveled

Table 23. Summary of Unmitigated and Mitigated Service Population Efficiency (2020)
K4 and Cactus Channel Improvement Project
Riverside County, California

Emissions Category[1]	GHG Emissions[2]	
	Unmitigated 2020	Mitigated 2020[3]
	MT CO_2e/yr	
Area Sources	0.04	0.04
Energy Usage	497	-1,342
Energy Star Lighting	-	*-175*
Solar PV	-	*-1,664*
Water	18.0	18.0
Waste Disposed	123	123
Traffic	17,298	16,856
EV charging, on-site and off-site	-	*-441*
Operational Sub-Total	**17,936**	**15,656**
Construction[4]	70	70
Vegetation[4]	0	-5
Total[5]	**18,007**	**15,721**
Service Population[6]	**900**	
Total Emissions per Service Population (MT CO_2e/SP/yr)	**20.0**	**17.5**

Notes:

[1] One-time emissions (i.e., construction and vegetation) and operational emissions were calculated using CalEEMod® for the build-out year.

[2] Emissions are presented as CO_2e, which include CO_2, CH_4, and N_2O emissions, weighted by their respective global warming potentials.

[3] Emissions reductions associated with mitigation measures are shown as negative values due to the decrease in emissions.

[4] One-time emissions from construction and vegetation sequestration were amortized over a 30-year period.

[5] Sum of annualized one-time emissions and operational emissions.

[6] The service population is a Project-specific estimate.

Abbreviations:

CalEEMod - CALifornia Emissions Estimator MODel
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalents
EV - electric vehicle
GHG - greenhouse gases
kW - kilowatt
MT - metric tons
N_2O - nitrous oxide
PV - photovoltaic
SP - service population
yr - year
