A Brief Introduction

This Project-Specific WQMP Template for the **Santa Ana Region** has been prepared to help guide you in documenting compliance for your project. Because this document has been designed to specifically document compliance, you will need to utilize the WQMP Guidance Document as your "how-to" manual to help guide you through this process. Both the Template and Guidance Document go hand-in-hand, and will help facilitate a well prepared Project-Specific WQMP. Below is a flowchart for the layout of this Template that will provide the steps required to document compliance.

OWNER'S CERTIFICATION

This Project-Specific Water Quality Management Plan (WQMP) has been prepared for Meridian Park LLC by DRC Engineering, Inc. for the Cactus Avenue K-4 Parcel Industrial project.

This WQMP is intended to comply with the requirements of County of Riverside for NPDES Permit No. CAS618033 which includes the requirement for the preparation and implementation of a Project-Specific WQMP.

The undersigned, while owning the property/project described in the preceding paragraph, shall be responsible for the implementation and funding of this WQMP and will ensure that this WQMP is amended as appropriate to reflect up-to-date conditions on the site. In addition, the property owner accepts responsibility for interim operation and maintenance of Stormwater BMPs until such time as this responsibility is formally transferred to a subsequent owner. This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party (or parties) having responsibility for implementing portions of this WQMP. At least one copy of this WQMP will be maintained at the project site or project office in perpetuity. The undersigned is authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under County of Riverside Water Quality Ordinance (Municipal Code Section754).

"I, the undersigned, certify under penalty of law that the provisions of this WQMP have been reviewed and accepted and that the WQMP will be transferred to future successors in interest."

PROJECT CHARACTERISTICS	
Proposed or Potential Land Use(s)	Industrial
Proposed or Potential SIC Code(s)	4225
Area of Impervious Project Footprint (SF)	1,389,000
Total Area of proposed Impervious Surfaces within the Project Limits (SF)/or Replacement	1,389,000
Does the project consist of offsite road improvements?	☐ Y ☒ N
Does the project propose to construct unpaved roads?	☐ Y ☒ N
Is the project part of a larger common plan of development (phased project)?	☐ Y ☒ N
EXISTING SITE CHARACTERISTICS	
Total area of existing Impervious Surfaces within the project limits (SF)	0
Is the project located within any MSHCP Criteria Cell?	☐ Y ☒ N
If so, identify the Cell number:	N/A
Are there any natural hydrologic features on the project site?	☐ Y ☒ N
Is a Geotechnical Report attached?	☒ Y ☐ N
If no Geotech. Report, list the NRCS soils type(s) present on the site (A, B, C and/or D)	C
What is the Water Quality Design Storm Depth for the project?	0.625"

A.1 Maps and Site Plans

When completing your Project-Specific WQMP, include a map of the local vicinity and existing site. In addition, include all grading, drainage, landscape/plant palette and other pertinent construction plans in Appendix 2. At a **minimum**, your WQMP Site Plan should include the following:

- Drainage Management Areas
- Proposed Structural BMPs
- Drainage Path
- Drainage Infrastructure, Inlets, Overflows
- Source Control BMPs
- Buildings, Roof Lines, Downspouts
- Impervious Surfaces
- Standard Labeling

Use your discretion on whether or not you may need to create multiple sheets or can appropriately accommodate these features on one or two sheets. Keep in mind that the Co-Permittee plan reviewer must be able to easily analyze your project utilizing this template and its associated site plans and maps.

A.2 Identify Receiving Waters

Using Table A.1 below, list in order of upstream to downstream, the receiving waters that the project site is tributary to. Continue to fill each row with the Receiving Water's 303(d) listed impairments (if any), designated beneficial uses, and proximity, if any, to a RARE beneficial use. Include a map of the receiving waters in Appendix 1.

Table A.1 Identification of Receiving Waters

Receiving Waters	EPA Approved 303(d) List Impairments	Designated Beneficial Uses	Proximity to RARE Beneficial Use
Headcock Channel-Sunnymead Line B	N/A	N/A	N/A
perris valley channel	N/A	N/A	N/A
San Jacinto River Reach 1	None	MUN – AGR – GWR – REC1-REC2-WARM-WILD	Not designated as RARE
Lake Elsinore	Nutrients – Organic Enrichment / Low Dissolved Oxygen – Sedimentation / Siltation – Unknown Toxicity	REC1 - REC2 – WARM – WILD	Not designated as RARE

A.3 Additional Permits/Approvals required for the Project:

Table A.2 Other Applicable Permits

Agency	Permit Required	
State Department of Fish and Game, 1602 Streambed Alteration Agreement	☐ Y	☒ N
State Water Resources Control Board, Clean Water Act (CWA) Section 401 Water Quality Cert.	☐ Y	☒ N
US Army Corps of Engineers, CWA Section 404 Permit	☐ Y	☒ N
US Fish and Wildlife, Endangered Species Act Section 7 Biological Opinion	☐ Y	☒ N
Statewide Construction General Permit Coverage	☒ Y	☐ N
Statewide Industrial General Permit Coverage	☐ Y	☒ N
Western Riverside MSHCP Consistency Approval (e.g., JPR, DBESP)	☐ Y	☒ N
Other *(please list in the space below as required)* Grading and Building Permits	☐ Y	☐ N

If yes is answered to any of the questions above, the Co-Permittee may require proof of approval/coverage from those agencies as applicable including documentation of any associated requirements that may affect this Project-Specific WQMP.

Section B: Optimize Site Utilization (LID Principles)

Review of the information collected in Section 'A' will aid in identifying the principal constraints on site design and selection of LID BMPs as well as opportunities to reduce imperviousness and incorporate LID Principles into the site and landscape design. For example, **constraints** might include impermeable soils, high groundwater, groundwater pollution or contaminated soils, steep slopes, geotechnical instability, high-intensity land use, heavy pedestrian or vehicular traffic, utility locations or safety concerns. **Opportunities** might include existing natural areas, low areas, oddly configured or otherwise unbuildable parcels, easements and landscape amenities including open space and buffers (which can double as locations for bioretention BMPs), and differences in elevation (which can provide hydraulic head). Prepare a brief narrative for each of the site optimization strategies described below. This narrative will help you as you proceed with your LID design and explain your design decisions to others.

The 2010 Santa Ana MS4 Permit further requires that LID Retention BMPs (Infiltration Only or Harvest and Use) be used unless it can be shown that those BMPs are infeasible. Therefore, it is important that your narrative identify and justify if there are any constraints that would prevent the use of those categories of LID BMPs. Similarly, you should also note opportunities that exist which will be utilized during project design. Upon completion of identifying Constraints and Opportunities, include these on your WQMP Site plan in Appendix 1.

Site Optimization

The following questions are based upon Section 3.2 of the WQMP Guidance Document. Review of the WQMP Guidance Document will help you determine how best to optimize your site and subsequently identify opportunities and/or constraints, and document compliance.

Did you identify and preserve existing drainage patterns? If so, how? If not, why?

The proposed drainage patter is consistent with existing drainage pattern. The existing site is approximately 48.02 acres of mass graded land (Mass Grading Plans prepared by Kimley Horn). The project site currently covers portions of two mass graded dirt pads. Each existing dirt pad is between approximately 20 to 30 acres in size and generally surface flows in the northeast direction into an existing storm water collection basin. The basins are approximately 4 feet deep and fitted with a CMP riser inlet that connects to an existing storm drain pipe located in Krameria Avenue. The area west of the mass graded dirt pads surface flows to a swale that was created in the Mass Grading Plan that routes the watershed located west of Coyote Bush Road to the south towards the Ben Clark Training Center. Out of the 48.02 acres of land, approximately 42.20 acres are shown to flow north to the Krameria storm drain system, while the remaining 5.82 acres are shown to drain south into the Ben Clark Training.

Did you identify and protect existing vegetation? If so, how? If not, why?

The site is undeveloped with minimal vegetation.

Did you identify and preserve natural infiltration capacity? If so, how? If not, why?

Based on soil's report, the project site has poor percolation test results (< 0.01 in/hr) and therefore this site is not suitable for onsite infiltration.

Did you identify and minimize impervious area? If so, how? If not, why?

Proposed pervious area is shown to the maximum extent practiable while still allowing for other impervious site design requirements (ie. amount of parking stalls).

Did you identify and disperse runoff to adjacent pervious areas? If so, how? If not, why?

All stormwater will be treated by two proposed Modular Wetland Biofiltration Systems (MWS) to prior leaving the site. There are not enough adjacent pervious areas to disperse runoff from rest of the proposed development area.

Section C: Delineate Drainage Management Areas (DMAs)

Utilizing the procedure in Section 3.3 of the WQMP Guidance Document which discusses the methods of delineating and mapping your project site into individual DMAs, complete Table C.1 below to appropriately categorize the types of classification (e.g., Type A, Type B, etc.) per DMA for your project site. Upon completion of this table, this information will then be used to populate and tabulate the corresponding tables for their respective DMA classifications.

Table C.1 DMA Classifications

DMA Name or ID	Surface Type(s)[1]	Area (Sq. Ft.)	DMA Type
DMA-A	Mixed	644,690	D
DMA-B	Mixed	669,510	D
DMA-C	Mixed	108,590	D

[1]*Reference Table 2-1 in the WQMP Guidance Document to populate this column*

Table C.2 Type 'A', Self-Treating Areas

DMA Name or ID	Area (Sq. Ft.)	Stabilization Type	Irrigation Type (if any)
N/A			

Table C.3 Type 'B', Self-Retaining Areas

Self-Retaining Area				**Type 'C' DMAs that are draining to the Self-Retaining Area**		
DMA Name/ ID	Post-project surface type	Area (square feet) [A]	Storm Depth (inches) [B]	DMA Name / ID	[C] from Table C.4 = [C]	Required Retention Depth (inches) [D]
N/A						

$$[D] = [B] + \frac{[B] \cdot [C]}{[A]}$$

Table C.4 Type 'C', Areas that Drain to Self-Retaining Areas

DMA					Receiving Self-Retaining DMA		
DMA Name/ ID	Area (square feet)	Post-project surface type	Runoff factor	Product	DMA name /ID	Area (square feet)	Ratio
	[A]		[B]	[C] = [A] x [B]		[D]	[C]/[D]
N/A							

Table C.5 Type 'D', Areas Draining to BMPs

DMA Name or ID	BMP Name or ID
DMA-A	BMP A
DMA-B	BMP B
DMA-C	BMP C

Note: More than one drainage management area can drain to a single LID BMP, however, one drainage management area may not drain to more than one BMP.

Section D: Implement LID BMPs

D.1 Infiltration Applicability

Is there an approved downstream 'Highest and Best Use' for stormwater runoff (see discussion in Chapter 2.4.4 of the WQMP Guidance Document for further details)? ☐ Y ☒ N

If yes has been checked, Infiltration BMPs shall not be used for the site. If no, continue working through this section to implement your LID BMPs. It is recommended that you contact your Co-Permittee to verify whether or not your project discharges to an approved downstream 'Highest and Best Use' feature.

Geotechnical Report

A Geotechnical Report or Phase I Environmental Site Assessment may be required by the Copermittee to confirm present and past site characteristics that may affect the use of Infiltration BMPs. In addition, the Co-Permittee, at their discretion, may not require a geotechnical report for small projects as described in Chapter 2 of the WQMP Guidance Document. If a geotechnical report has been prepared, include it in Appendix 3. In addition, if a Phase I Environmental Site Assessment has been prepared, include it in Appendix 4.

Is this project classified as a small project consistent with the requirements of Chapter 2 of the WQMP Guidance Document? ☐ Y ☒ N

Infiltration Feasibility

Table D.1 below is meant to provide a simple means of assessing which DMAs on your site support Infiltration BMPs and is discussed in the WQMP Guidance Document in Chapter 2.4.5. Check the appropriate box for each question and then list affected DMAs as applicable. If additional space is needed, add a row below the corresponding answer.

Table D.1 Infiltration Feasibility

Does the project site…	YES	NO
…have any DMAs with a seasonal high groundwater mark shallower than 10 feet?	X	
If Yes, list affected DMAs: All DMAs		
…have any DMAs located within 100 feet of a water supply well?		X
If Yes, list affected DMAs:		
…have any areas identified by the geotechnical report as posing a public safety risk where infiltration of stormwater could have a negative impact?		X
If Yes, list affected DMAs:		
…have measured in-situ infiltration rates of less than 1.6 inches / hour?	X	
If Yes, list affected DMAs: All DMAs		
…have significant cut and/or fill conditions that would preclude in-situ testing of infiltration rates at the final infiltration surface?		X
If Yes, list affected DMAs:		
…geotechnical report identify other site-specific factors that would preclude effective and safe infiltration?		
Describe here:		X

If you answered "Yes" to any of the questions above for any DMA, Infiltration BMPs should not be used for those DMAs and you should proceed to the assessment for Harvest and Use below.

D.2 Harvest and Use Assessment

Please check what applies*:*

☐ Reclaimed water will be used for the non-potable water demands for the project.

☐Downstream water rights may be impacted by Harvest and Use as approved by the Regional Board (verify with the Copermittee).

☐The Design Capture Volume will be addressed using Infiltration Only BMPs. In such a case, Harvest and Use BMPs are still encouraged, but it would not be required if the Design Capture Volume will be infiltrated or evapotranspired.

If any of the above boxes have been checked, Harvest and Use BMPs need not be assessed for the site. If neither of the above criteria applies, follow the steps below to assess the feasibility of irrigation use, toilet use and other non-potable uses (e.g., industrial use).

Irrigation Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for Irrigation Use BMPs on your site:

Step 1: Identify the total area of irrigated landscape on the site, and the type of landscaping used.

Total Area of Irrigated Landscape: 1.0 Acre

Type of Landscaping (Conservation Design or Active Turf): Conservation Design

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for irrigation use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: 34.4 Acres

Step 3: Cross reference the Design Storm depth for the project site (see Exhibit A of the WQMP Guidance Document) with the left column of Table 2-3 in Chapter 2 to determine the minimum area of Effective Irrigated Area per Tributary Impervious Area (EIATIA).

Enter your EIATIA factor: 0.92

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum irrigated area that would be required.

Minimum required irrigated area: 31.6 Acres

Step 5: Determine if harvesting stormwater runoff for irrigation use is feasible for the project by comparing the total area of irrigated landscape (Step 1) to the minimum required irrigated area (Step 4).

Minimum required irrigated area (Step 4)	Available Irrigated Landscape (Step 1)
31.6 Acres	1.0 Acre

Toilet Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for toilet flushing uses on your site:

Step 1: Identify the projected total number of daily toilet users during the wet season, and account for any periodic shut downs or other lapses in occupancy:

Projected Number of Daily Toilet Users: 250

Project Type: Industrial

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for toilet use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: 34.4 Acres

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-1 in Chapter 2 to determine the minimum number or toilet users per tributary impervious acre (TUTIA).

Enter your TUTIA factor: 165

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum number of toilet users that would be required.

Minimum number of toilet users: 5,676

Step 5: Determine if harvesting stormwater runoff for toilet flushing use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

Minimum required Toilet Users (Step 4)	Projected number of toilet users (Step 1)
5,676	250

Other Non-Potable Use Feasibility

Are there other non-potable uses for stormwater runoff on the site (e.g. industrial use)? See Chapter 2 of the Guidance for further information. If yes, describe below. If no, write N/A.

N/A

Step 1: Identify the projected average daily non-potable demand, in gallons per day, during the wet season and accounting for any periodic shut downs or other lapses in occupancy or operation.

Average Daily Demand: N/A

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for the identified non-potable use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: N/A

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-3 in Chapter 2 to determine the minimum demand for non-potable uses per tributary impervious acre.

Enter the factor from Table 2-3: N/A

Step 4: Multiply the unit value obtained from Step 4 by the total of impervious areas from Step 3 to develop the minimum number of gallons per day of non-potable use that would be required.

Minimum required use: N/A

Step 5: Determine if harvesting stormwater runoff for other non-potable use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

Minimum required non-potable use (Step 4)	**Projected average daily use (Step 1)**
N/A	N/A

If Irrigation, Toilet and Other Use feasibility anticipated demands are less than the applicable minimum values, Harvest and Use BMPs are not required and you should proceed to utilize LID Bioretention and Biotreatment, unless a site-specific analysis has been completed that demonstrates technical infeasibility as noted in D.3 below.

D.3 Bioretention and Biotreatment Assessment

Other LID Bioretention and Biotreatment BMPs as described in Chapter 2.4.7 of the WQMP Guidance Document are feasible on nearly all development sites with sufficient advance planning.

Select one of the following:

☒ LID Bioretention/Biotreatment BMPs will be used for some or all DMAs of the project as noted below in Section D.4 (note the requirements of Section 3.4.2 in the WQMP Guidance Document).

☐ A site-specific analysis demonstrating the technical infeasibility of all LID BMPs has been performed and is included in Appendix 5. If you plan to submit an analysis demonstrating the technical infeasibility of LID BMPs, request a pre-submittal meeting with the Copermittee to discuss this option. Proceed to Section E to document your alternative compliance measures.

D.4 Feasibility Assessment Summaries

From the Infiltration, Harvest and Use, Bioretention and Biotreatment Sections above, complete Table D.2 below to summarize which LID BMPs are technically feasible, and which are not, based upon the established hierarchy.

Table D.2 LID Prioritization Summary Matrix

DMA Name/ID	LID BMP Hierarchy				No LID (Alternative Compliance)
	1. Infiltration	2. Harvest and use	3. Bioretention	4. Biotreatment	
DMA-A	☐	☐	☐	☒	☐
DMA-B	☐	☐	☐	☒	☐
DMA-C	☐	☐	☐	☒	☐
	☐	☐	☐	☐	☐
	☐	☐	☐	☐	☐
	☐	☐	☐	☐	☐

For those DMAs where LID BMPs are not feasible, provide a brief narrative below summarizing why they are not feasible, include your technical infeasibility criteria in Appendix 5, and proceed to Section E below to document Alternative Compliance measures for those DMAs. Recall that each proposed DMA must pass through the LID BMP hierarchy before alternative compliance measures may be considered.

D.5 LID BMP Sizing

Each LID BMP must be designed to ensure that the Design Capture Volume will be addressed by the selected BMPs. First, calculate the Design Capture Volume for each LID BMP using the V_{BMP} worksheet in Appendix F of the LID BMP Design Handbook. Second, design the LID BMP to meet the required V_{BMP} using a method approved by the Copermittee. Utilize the worksheets found in the LID BMP Design Handbook or consult with your Copermittee to assist you in correctly sizing your LID BMPs. Complete Table D.3 below to document the Design Capture Volume and the Proposed Volume for each LID BMP. Provide the completed design procedure sheets for each LID BMP in Appendix 6. You may add additional rows to the table below as needed.

Table D.3 DCV Calculations for LID BMP

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	DMA Runoff Factor	DMA Areas x Runoff Factor	*BMP -A*		
	[A]		[B]	[C]	[A] x [C]			
DMA-A	*346,690*	*Roofs*	*1.00*	*0.89*	*309,248*			
DMA-A	*267,000*	*Concrete / Asphalt*	*1.00*	*0.892*	*238,164*

[E] is obtained from Exhibit A in the WQMP Guidance Document

[G] is obtained from a design procedure sheet, such as in LID BMP Design Handbook and placed in Appendix 6

Section E: Alternative Compliance (LID Waiver Program)

LID BMPs are expected to be feasible on virtually all projects. Where LID BMPs have been demonstrated to be infeasible as documented in Section D, other Treatment Control BMPs must be used (subject to LID waiver approval by the Copermittee). Check one of the following Boxes:

☒ LID Principles and LID BMPs have been incorporated into the site design to fully address all Drainage Management Areas. No alternative compliance measures are required for this project and thus this Section is not required to be completed.

- Or -

☐ The following Drainage Management Areas are unable to be addressed using LID BMPs. A site-specific analysis demonstrating technical infeasibility of LID BMPs has been approved by the Co-Permittee and included in Appendix 5. Additionally, no downstream regional and/or sub-regional LID BMPs exist or are available for use by the project. The following alternative compliance measures on the following pages are being implemented to ensure that any pollutant loads expected to be discharged by not incorporating LID BMPs, are fully mitigated.

E.1 Identify Pollutants of Concern

Utilizing Table A.1 from Section A above which noted your project's receiving waters and their associated EPA approved 303(d) listed impairments, cross reference this information with that of your selected Priority Development Project Category in Table E.1 below. If the identified General Pollutant Categories are the same as those listed for your receiving waters, then these will be your Pollutants of Concern and the appropriate box or boxes will be checked on the last row. The purpose of this is to document compliance and to help you appropriately plan for mitigating your Pollutants of Concern in lieu of implementing LID BMPs.

Table E.1 Potential Pollutants by Land Use Type

Priority Development Project Categories and/or Project Features (check those that apply)	General Pollutant Categories							
	Bacterial Indicators	Metals	Nutrients	Pesticides	Toxic Organic Compounds	Sediments	Trash & Debris	Oil & Grease
☐ Detached Residential Development	P	N	P	P	N	P	P	P
☐ Attached Residential Development	P	N	P	P	N	P	P	P(2)
☒ Commercial/Industrial Development	P(3)	P	P(1)	P(1)	P(5)	P(1)	P	P
☐ Automotive Repair Shops	N	P	N	N	P(4, 5)	N	P	P
☐ Restaurants (>5,000 ft^2)	P	N	N	N	N	N	P	P
☐ Hillside Development (>5,000 ft^2)	P	N	P	P	N	P	P	P
☐ Parking Lots (>5,000 ft^2)	P(6)	P	P(1)	P(1)	P(4)	P(1)	P	P
☐ Retail Gasoline Outlets	N	P	N	N	P	N	P	P
Project Priority Pollutant(s) of Concern	☐	☒	☒	☐	☐	☐	☒	☒

P = Potential

N = Not Potential

(1) A potential Pollutant if non-native landscaping exists or is proposed onsite; otherwise not expected

(2) A potential Pollutant if the project includes uncovered parking areas; otherwise not expected

(3) A potential Pollutant is land use involving animal waste

(4) Specifically petroleum hydrocarbons

(5) Specifically solvents

(6) Bacterial indicators are routinely detected in pavement runoff

E.2 Stormwater Credits

Projects that cannot implement LID BMPs but nevertheless implement smart growth principles are potentially eligible for Stormwater Credits. Utilize Table 3-8 within the WQMP Guidance Document to identify your Project Category and its associated Water Quality Credit. If not applicable, write N/A.

Table E.2 Water Quality Credits

Qualifying Project Categories	Credit Percentage[2]
Total Credit Percentage[1]	

[1]*Cannot Exceed 50%*
[2]*Obtain corresponding data from Table 3-8 in the WQMP Guidance Document*

E.3 Sizing Criteria

After you appropriately considered Stormwater Credits for your project, utilize Table E.3 below to appropriately size them to the DCV, or Design Flow Rate, as applicable. Please reference Chapter 3.5.2 of the WQMP Guidance Document for further information.

Table E.3 Treatment Control BMP Sizing

DMA Type/ID	DMA Area (square feet) [A]	Post-Project Surface Type	Effective Impervious Fraction, I_f [B]	DMA Runoff Factor [C]	DMA Area x Runoff Factor [A] x [C]		*Enter BMP Name / Identifier Here*		
						Design Storm Depth (in)	*Minimum Design Capture Volume or Design Flow Rate (cubic feet or cfs)*	*Total Storm Water Credit % Reduction*	*Proposed Volume or Flow on Plans (cubic feet or cfs)*
	A_T = Σ[A]				Σ= [D]	[E]	$[F] = \frac{[D] \times [E]}{[G]}$	[F] X (1-[H])	[I]

[B], [C] is obtained as described in Section 2.3.1 from the WQMP Guidance Document
[E] is obtained from Exhibit A in the WQMP Guidance Document
[G] is for Flow-Based Treatment Control BMPs [G] = 43,560, for Volume-Based Control Treatment BMPs, [G] = 12
[H] is from the Total Credit Percentage as Calculated from Table E.2 above
[I] as obtained from a design procedure sheet from the BMP manufacturer and should be included in Appendix 6

E.4 Treatment Control BMP Selection

Treatment Control BMPs typically provide proprietary treatment mechanisms to treat potential pollutants in runoff, but do not sustain significant biological processes. Treatment Control BMPs must have a removal efficiency of a medium or high effectiveness as quantified below:

- **High**: equal to or greater than 80% removal efficiency
- **Medium**: between 40% and 80% removal efficiency

Such removal efficiency documentation (e.g., studies, reports, etc.) as further discussed in Chapter 3.5.2 of the WQMP Guidance Document, must be included in Appendix 6. In addition, ensure that proposed Treatment Control BMPs are properly identified on the WQMP Site Plan in Appendix 1.

Table E.4 Treatment Control BMP Selection

Selected Treatment Control BMP Name or ID[1]	Priority Pollutant(s) of Concern to Mitigate[2]	Removal Efficiency Percentage[3]
Proprietary Biotreatment System (Modular Wetlands Units BMP A, BMP B and BMP C)	Oil & Grease, Metals, Trash & Debris	Oil & Grease - 95% (High) Metals - 38%-69% (Med.) TSS - 85% (High)

[1] Treatment Control BMPs must not be constructed within Receiving Waters. In addition, a proposed Treatment Control BMP may be listed more than once if they possess more than one qualifying pollutant removal efficiency.
[2] Cross Reference Table E.1 above to populate this column.
[3] As documented in a Co-Permittee Approved Study and provided in Appendix 6.

Section F: Hydromodification

F.1 Hydrologic Conditions of Concern (HCOC) Analysis

Once you have determined that the LID design is adequate to address water quality requirements, you will need to assess if the proposed LID Design may still create a HCOC. Review Chapters 2 and 3 (including Figure 3-7) of the WQMP Guidance Document to determine if your project must mitigate for Hydromodification impacts. If your project meets one of the following criteria which will be indicated by the check boxes below, you do not need to address Hydromodification at this time. However, if the project does not qualify for Exemptions 1, 2 or 3, then additional measures must be added to the design to comply with HCOC criteria. This is discussed in further detail below in Section F.2.

HCOC EXEMPTION 1: The Priority Development Project disturbs less than one acre. The Copermittee has the discretion to require a Project-Specific WQMP to address HCOCs on projects less than one acre on a case by case basis. The disturbed area calculation should include all disturbances associated with larger common plans of development.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, HCOC criteria do not apply.

HCOC EXEMPTION 2: The volume and time of concentration[1] of storm water runoff for the post-development condition is not significantly different from the pre-development condition for a 2-year return frequency storm (a difference of 5% or less is considered insignificant) using one of the following methods to calculate:

- Riverside County Hydrology Manual
- Technical Release 55 (TR-55): Urban Hydrology for Small Watersheds (NRCS 1986), or derivatives thereof, such as the Santa Barbara Urban Hydrograph Method
- Other methods acceptable to the Co-Permittee

Does the project qualify for this HCOC Exemption? ☒ Y ☐ N

If Yes, report results in Table F.1 below and provide your substantiated hydrologic analysis in Appendix 7.

Table F.1 Hydrologic Conditions of Concern Summary

	2 year – 24 hour		
	Pre-condition	**Post-condition**	**% Difference**
Time of Concentration	INSERT VALUE	INSERT VALUE	INSERT VALUE
Volume (Cubic Feet)	INSERT VALUE	INSERT VALUE	INSERT VALUE

[1] Time of concentration is defined as the time after the beginning of the rainfall when all portions of the drainage basin are contributing to flow at the outlet.

HCOC EXEMPTION 3: All downstream conveyance channels to an adequate sump (for example, Prado Dam, Lake Elsinore, Canyon Lake, Santa Ana River, or other lake, reservoir or naturally erosion resistant feature) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity; no sensitive stream habitat areas will be adversely affected; or are not identified on the Co-Permittees Hydromodification Sensitivity Maps.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, HCOC criteria do not apply and note below which adequate sump applies to this HCOC qualifier:

F.2 HCOC Mitigation

If none of the above HCOC Exemption Criteria are applicable, HCOC criteria is considered mitigated if they meet one of the following conditions:

a. Additional LID BMPS are implemented onsite or offsite to mitigate potential erosion or habitat impacts as a result of HCOCs. This can be conducted by an evaluation of site-specific conditions utilizing accepted professional methodologies published by entities such as the California Stormwater Quality Association (CASQA), the Southern California Coastal Water Research Project (SCCRWP), or other Co-Permittee approved methodologies for site-specific HCOC analysis.

b. The project is developed consistent with an approved Watershed Action Plan that addresses HCOC in Receiving Waters.

c. Mimicking the pre-development hydrograph with the post-development hydrograph, for a 2-year return frequency storm. Generally, the hydrologic conditions of concern are not significant, if the post-development hydrograph is no more than 10% greater than pre-development hydrograph. In cases where excess volume cannot be infiltrated or captured and reused, discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow.

Be sure to include all pertinent documentation used in your analysis of the items a, b or c in Appendix 7.

The proposed project meets condition 'C' above with proposing two detention basins to mitigate the post-condition runoff to a level that is 10% or less than the pre-developed condition for the 2-year, 24-hour event (these basins are also sized to mitigate other appropriate storm events, i.e. the 10-year event). Refer Appendix 7 for supporting calculations.

Section G: Source Control BMPs

Source control BMPs include permanent, structural features that may be required in your project plans — such as roofs over and berms around trash and recycling areas — and Operational BMPs, such as regular sweeping and "housekeeping", that must be implemented by the site's occupant or user. The MEP standard typically requires both types of BMPs. In general, Operational BMPs cannot be substituted for a feasible and effective permanent BMP. Using the Pollutant Sources/Source Control Checklist in Appendix 8, review the following procedure to specify Source Control BMPs for your site:

1. ***Identify Pollutant Sources*:** Review Column 1 in the Pollutant Sources/Source Control Checklist. Check off the potential sources of Pollutants that apply to your site.

2. ***Note Locations on Project-Specific WQMP Exhibit*:** Note the corresponding requirements listed in Column 2 of the Pollutant Sources/Source Control Checklist. Show the location of each Pollutant source and each permanent Source Control BMP in your Project-Specific WQMP Exhibit located in Appendix 1.

3. ***Prepare a Table and Narrative*:** Check off the corresponding requirements listed in Column 3 in the Pollutant Sources/Source Control Checklist. In the left column of Table G.1 below, list each potential source of runoff Pollutants on your site (from those that you checked in the Pollutant Sources/Source Control Checklist). In the middle column, list the corresponding permanent, Structural Source Control BMPs (from Columns 2 and 3 of the Pollutant Sources/Source Control Checklist) used to prevent Pollutants from entering runoff. **Add additional narrative** in this column that explains any special features, materials or methods of construction that will be used to implement these permanent, Structural Source Control BMPs.

4. ***Identify Operational Source Control BMPs:*** To complete your table, refer once again to the Pollutant Sources/Source Control Checklist. List in the right column of your table the Operational BMPs that should be implemented as long as the anticipated activities continue at the site. Copermittee stormwater ordinances require that applicable Source Control BMPs be implemented; the same BMPs may also be required as a condition of a use permit or other revocable Discretionary Approval for use of the site.

Table G.1 Permanent and Operational Source Control Measures

Potential Sources of Runoff pollutants	Permanent Structural Source Control BMPs	Operational Source Control BMPs
On-site storm drain inlets	Mark all inlets with the words "Only Rain Down the Storm Drain" or similar.	Maintain and periodically repaint or replace markings. Provide stormwater pollution prevention information to new site owners, lessees, or operators. Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to

		storm drains or to store or deposit materials so as to create a potential discharge to storm drains."
Landscape/Outdoor Pesticide Use	State that final landscape plans will accomplish all of the following. Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution. Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions. Consider using pest-resistant plants, especially adjacent to hardscape. To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	Maintain landscaping using minimum or no pesticides. See applicable operational BMPs in "What you should know for…..Landscape and Gardening" at http://rcflood.org/stormwater/Error! Hyperlink reference not valid. Provide IPM information to new owners, lessees and operators
Loading Docks	Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas shall be drained to the sanitary sewer, or diverted and collected for ultimate discharge to the sanitary sewer.	Move loaded and unloaded items indoors as soon as possible. See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
Miscellaneous drain or Wash Water or Other Sources	Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system.	

	Roof top equipment with potential to produce pollutants shall be roofed and/or have secondary containment. Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.	
Plazas, sidewalks, and parking lots		Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.

Section H: Construction Plan Checklist

Populate Table H.1 below to assist the plan checker in an expeditious review of your project. The first two columns will contain information that was prepared in previous steps, while the last column will be populated with the corresponding plan sheets. This table is to be completed with the submittal of your final Project-Specific WQMP.

Table H.1 Construction Plan Cross-reference

BMP No. or ID	BMP Identifier and Description	Corresponding Plan Sheet(s)
BMP A	Modular Wetland System (MWS)	Conceptual Grading Plan
BMP B	Modular Wetland System (MWS)	Conceptual Grading Plan
BMP C	Modular Wetland System (MWS)	Conceptual Grading Plan

Note that the updated table — or Construction Plan WQMP Checklist — is **only a reference tool** to facilitate an easy comparison of the construction plans to your Project-Specific WQMP. Co-Permittee staff can advise you regarding the process required to propose changes to the approved Project-Specific WQMP.

Section I: Operation, Maintenance and Funding

The Copermittee will periodically verify that Stormwater BMPs on your site are maintained and continue to operate as designed. To make this possible, your Copermittee will require that you include in Appendix 9 of this Project-Specific WQMP:

1. A means to finance and implement facility maintenance in perpetuity, including replacement cost.
2. Acceptance of responsibility for maintenance from the time the BMPs are constructed until responsibility for operation and maintenance is legally transferred. A warranty covering a period following construction may also be required.
3. An outline of general maintenance requirements for the Stormwater BMPs you have selected.
4. Figures delineating and designating pervious and impervious areas, location, and type of Stormwater BMP, and tables of pervious and impervious areas served by each facility. Geo-locating the BMPs using a coordinate system of latitude and longitude is recommended to help facilitate a future statewide database system.
5. A separate list and location of self-retaining areas or areas addressed by LID Principles that do not require specialized O&M or inspections but will require typical landscape maintenance as noted in Chapter 5, pages 85-86, in the WQMP Guidance. Include a brief description of typical landscape maintenance for these areas.

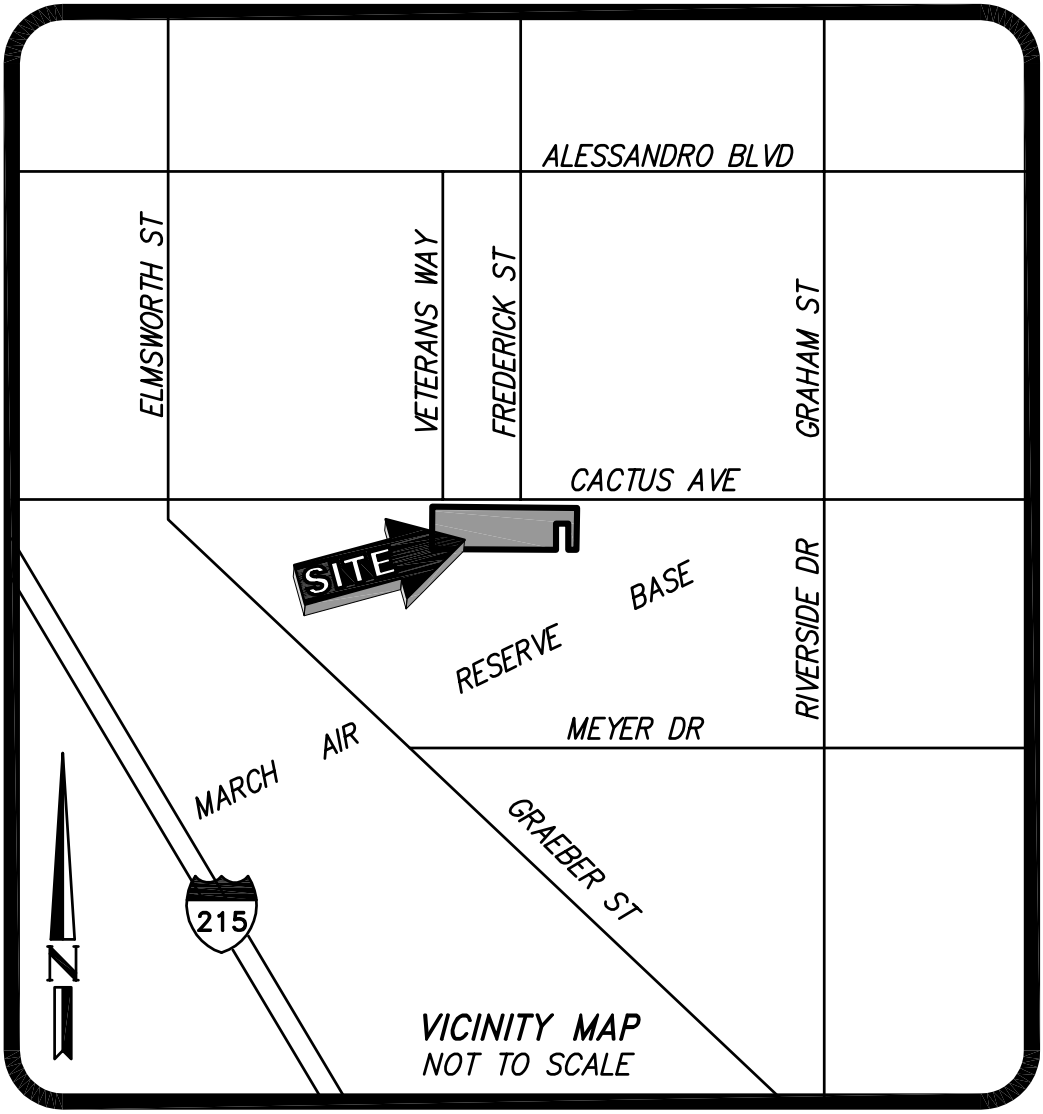
Your local Co-Permittee will also require that you prepare and submit a detailed Stormwater BMP Operation and Maintenance Plan that sets forth a maintenance schedule for each of the Stormwater BMPs built on your site. An agreement assigning responsibility for maintenance and providing for inspections and certification may also be required.

Details of these requirements and instructions for preparing a Stormwater BMP Operation and Maintenance Plan are in Chapter 5 of the WQMP Guidance Document.

Maintenance Mechanism: The property owner will be responsible to maintain the BMPs outlined in this report.

Will the proposed BMPs be maintained by a Home Owners' Association (HOA) or Property Owners Association (POA)?

☐ Y ☒ N



The maintenance of the proposed structure BMPs will be done by the property owner through site maintenance workers. The property owner will be responsible for funding of all onsite BMPs through its operating budget. The following party is responsible for the operation and maintenance of all Structural Source Control and Treatment Control BMPs until such time that the permanent sale of the parcel and transfer of ownership occurs:

Meridian Park, LLC
1156 North Mountain Avenue
Upland, CA 91785

Include your Operation and Maintenance Plan and Maintenance Mechanism in Appendix 9. Additionally, include all pertinent forms of educational materials for those personnel that will be maintaining the proposed BMPs within this Project-Specific WQMP in Appendix 10.

Appendix 3: Soils Information

Geotechnical Study and Other Infiltration Testing Data

Leighton Consulting, Inc.
A LEIGHTON GROUP COMPANY

July 30, 2018

Project No. 11979.002

Meridian Park, LLC
1156 North Mountain Avenue
Upland, California 91786

Attention: Mr. Timothy Reeves

Subject: **Results of Onsite Percolation/Infiltration Testing**
Proposed Industrial Warehouse Site K-4, Cactus Avenue
Unincorporated Riverside County, near Moreno Valley, California

References: Riverside County Flood Control District, Design Handbook for Low Impact Development Best Management Practices, dated September 2011.

RGA, 2017, Meridian K-4 Parcel, Cactus Ave, Riverside, California, Preliminary Site Plan, Scheme 02, Dated March 30, 2018.

In accordance with your request and authorization, Leighton Consulting, Inc. (Leighton) is pleased to present this percolation test report for the proposed commercial development referred to as Meridian K-4 Parcel.

PURPOSE AND SCOPE OF WORK

The purpose of our testing was to determine general infiltration rates of onsite soils for the WQMP associated with the new warehouse, parking lot, and drainage configuration. Services provided for this study consisted of the following:

- Field testing of percolation tests in accordance with the procedures outlined in the above referenced County Design Handbook, and
- Compilation of this report that presents the results of our percolation/infiltration testing and laboratory test results.

SITE DESCRIPTION

The site is generally located at the south side of Cactus Avenue between Veterans Way and Frederick Street, near Moreno Valley, in Unincorporated Riverside County, California, (see Figure 1). The property is relatively flat, draining gently in a southeastern direction. The site is currently undeveloped and vacant land covered with small vegetative growth and seasonal weeds. An earthen drainage culvert bounds the northern property, adjacent to Cactus Avenue. The County Assessor Parcel Numbers (APNs) for this site are 297-160-005-8, 297-200-400-0, 297-150-006-8, -007-9, and -

038-7. Based on the provided site plan, the primarily WQMP's will be located in the parking lot in the northern portion of the site, along Cactus Avenue and in the southern parking lot at eastside of site.

SUBSURFACE INVESTIGATION

Our field investigation consisted of excavating three (3) percolation tests to a depth of approximately 6 feet below the ground surface (bgs) in the proposed basins/WQMP at a location shown on the map provided by the project Civil Engineer. Previously, during our geotechnical exploration for the site, we had excavated, logged, and sampled nine (9) deep exploratory borings to a maximum depth of 51 feet bgs. The locations of the percolation test holes and exploratory borings are shown on Figure 2.

SOILS AND GROUNDWATER CONDITIONS

The site is underlain by Quaternary Older Alluvial deposits consisting primarily of medium dense to very dense silty to clayey sand (SM/SC). Surface water or groundwater were not observed onsite during our field exploration. During our geotechnical exploration, groundwater was encountered at a depth of approximately 19 feet (LB-2) below existing ground surface (bgs) and 23 feet bgs (LB-4). Historic groundwater data, as reported by Department of Water Resource (DWR) data for Well 338995N1171958W001 located approximately 5 miles east of the subject site, reflect a groundwater elevation of 1,470 feet (about 82 feet below site elevation) in April 2017.

PERCOLATION TEST RESULTS

After presoaking the percolation test holes on July 23, 2018, and returning to site on July 24, 2018 to perform the infiltration testing, we observed that some of presoak water remained in the holes. After testing proceeded for two hours and taking water depth readings every 30 minutes, water level remained essentially unchanged.

Summary of Percolation/Infiltration Test Results

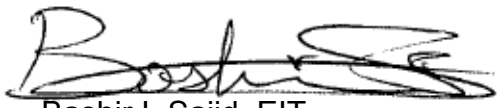
Test Hole #	Depth BGS (ft)	Percolation Rate (min/in)	Infiltration Rate (in/hr)	Soil Description/Notes
P-1	6	>120	<0.01	Dense Clayey Silty SAND (SC-SM)
P-2	6	>120	<0.01	Dense Clayey Silty SAND (SC-SM)
P-3	6	>120	<0.01	Dense Clayey Silty SAND (SC-SM)

CONCLUSIONS AND RECOMMENDATIONS

Based on the results of our testing, it is our opinion that this site is not suitable for onsite infiltration due to relatively impermeable geologic formation within the depth explored.

LIMITATIONS

The above findings and recommendations are based on a general interpretation of soils conditions between test locations, utilizing contemporary engineering principles and practice. We make no other warranty, either expressed or implied. Please notify the engineer in the event conditions are encountered that are not reflected in this report.



If you have any question, please do not hesitate to contact this office. We appreciate this opportunity to be of service.

Respectfully submitted,

Subject: Geotechnical Exploration
Proposed Industrial Warehouse Site K-4, Cactus Avenue
Unincorporated Riverside County, near Moreno Valley, California

In accordance with your request, we are pleased to provide this update geotechnical evaluation for the subject project summarizing our geotechnical findings, conclusions and recommendations regarding the design and construction of the proposed development. Based on the results of our findings and conclusions, it is our opinion that the site is suitable for the intended use provided the recommendations included in herein are implemented during design and construction phases of development. However, it should be noted that additional geotechnical evaluations and/or reviews might be required based on final site development and/or grading plans.

If you have any questions regarding this report, please do not hesitate to contact the undersigned. We appreciate this opportunity to be of service on this project.

1.0 INTRODUCTION

1.1 Purpose and Scope

This geotechnical exploration is for the proposed commercial development referred to as Meridian K-4 Parcel, located generally south of Cactus Avenue between Veterans Way and extending east to Frederick Street, near Moreno Valley, in Unincorporated Riverside County, California (see Figure 1). Our scope of services for this exploration included the following:

- Review of available site-specific geologic information and Preliminary Site Plan by RGA.
- A site reconnaissance and excavation of nine (9) exploratory borings. Approximate locations of these geotechnical borings are depicted on the *Boring Location Map (Figure 2)*. The logs of exploratory borings are presented in Appendix A.
- Geotechnical laboratory testing of selected soil samples collected during this exploration. Test results are presented in Appendix B.
- Geotechnical engineering analyses performed or as directed by a California registered Geotechnical Engineer (GE) and reviewed by a California Certified Engineering Geologist (CEG).
- Preparation of this report which presents our geotechnical conclusions and recommendations regarding the proposed structures.

This report is not intended to be used as an environmental assessment (Phase I or other), or foundation plan review.

1.2 Site and Project Description

The site is located generally south of Cactus Avenue between Veterans Way and extending east to Fredrick Street, in the County of Riverside, California (see Figure 1, Site Location Map). Topographically, the site is relatively flat, draining gently in a southeastern direction. The site is currently undeveloped and vacant land covered with small vegetative growth and seasonal weeds. The County Assessor Parcel Numbers (APNs) for this site are 297-160-005-8, 297-200-400-0, 297-150-006-8, -007-9, and -038-7. An approximately 152,000 square feet area of stockpiled soil was observed in the southern portion of the site, adjacent to the transformer station.

We understand that site development (see Figure 2) includes a proposed 718,000 square feet industrial building along with associated improvements such as parking stalls and loading docks. Grading plans were not provided as of the date of this report; however, we

anticipate cut and fill grading of less than 10 feet to create finish site grades. Structural loads are expected to be less than 250 kips per column load and 10 kips/LF of continuous wall footing. If site development plans significantly differ from those described herein, the report should be subject to further review and evaluation.

2.0 FIELD EXPLORATION AND LABORATORY TESTING

2.1 Field Exploration

Our field exploration consisted of the excavation of nine (9) hollow stem borings located generally in areas of planned building to provide basis for foundation and pavement design. During exploration, disturbed/bulk samples were collected for further laboratory testing and evaluation. Approximate locations of these and previous filed explorations are depicted on the *Geotechnical Map* (see Figure 2). Sampling was conducted by a staff geologist from our firm. After logging and sampling, the excavations were loosely backfilled with spoils generated during excavation. The exploration logs from this exploration are provided in Appendix A.

2.2 Laboratory Testing

Laboratory tests were performed on representative bulk samples to provide a basis for development of earthwork control and foundation design. The laboratory testing program included maximum density and moisture content relationship, expansion index, R-value and soluble sulfate content. The results of our laboratory testing from this and previous explorations are presented in Appendix B.

3.0 GEOTECHNICAL AND GEOLOGIC FINDINGS

3.1 Regional Geology

The site is located within a prominent natural geomorphic province in southwestern California known as the Peninsular Ranges. This province is characterized by steep, elongated ranges and valleys that trend northwestward. More specifically, the proposed site is located within the relatively stable Perris Block.

The Perris Block, approximately 20 miles by 50 miles in extent, is bounded by the San Jacinto Fault Zone to the northeast, the Elsinore Fault Zone to the southwest. The Perris Block has had a complex tectonic history, apparently undergoing relative vertical land-movements of several thousand feet in response to movement on the Elsinore and San Jacinto Fault Zones. Thin sedimentary and volcanic materials locally mantle crystalline bedrock, consisting of the Val Verde Tonalite (Kvt) and lesser amounts of Cretaceous granitic dikes (Kg).

3.2 Site Specific Geology

3.2.1 Earth Materials

Our field exploration, observations, and review of the pertinent literature indicate that the site include is underlain by localized artificial fill and older alluvium. A more detailed description of each unit is provided on the logs of borings in Appendix A.

- **Undocumented Artificial Fill:** Undocumented artificial fill is generally associated with existing Cactus Avenue and a large stockpile. Localized pockets of artificial fill that were not identified during our exploration may also be encountered elsewhere on this site below surface.
- **Older Alluvium:** Older alluvial soils were encountered in all borings. As encountered, these soils generally consist of medium dense to very dense silty to clayey sand (SM/SC) and localized layers of sandy silty to sandy clay (ML/CL). This older alluvium is expected to generally possess a low expansion potential (EI<51) and slight collapse potential (<1%).

3.3 Groundwater and Surface Water

Groundwater was encountered during this exploration at a depth of approximately 19 feet (LB-2) below existing ground surface (bgs) and 23 feet bgs (LB-4). Historic groundwater data, as reported by Department of Water Resource (DWR) data for Well 338995N1171958W001 located approximately 5 miles east of the subject site, reflect a groundwater elevation of 1,470 feet (about 82 feet below site elevation) in April 2017. According to West San Jacinto Groundwater Management Plan, 2016 Annual Report, the groundwater elevation in the subject site vicinity are at the range of 1,520 feet msl (about 32 feet below site elevation). Surface water was not observed onsite during our exploration.

3.4 Regional Faulting and Fault Activity

The subject site, like the rest of Southern California, is located within a seismically active region as a result of being located near the active margin between the North American and Pacific tectonic plates. The principal source of seismic activity is movement along the northwest-trending regional fault systems such as the San Andreas, San Jacinto, and Elsinore Fault Zones. Based on published geologic hazard maps, this site is not located within a currently designated Alquist-Priolo (AP) Earthquake Fault Zone; nor is located within a County Fault Zone.

3.5 Seismic Coefficients per 2016 CBC

Strong ground shaking can be expected at the site during moderate to severe earthquakes in this general region. This is common to virtually all of Southern California. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (soil type) characteristics. The site-specific seismic coefficients provided in this section are based on an interactive tool/program currently available on USGS website. Based on ASCE 7-10 as the Design Code Reference Document and site Class **D**, the seismic coefficients for this site are as listed in the following table:

Table 1. 2016 CBC Seismic Coefficients

CBC Categorization/Coefficient		Design Value (g)
Site Longitude (-117.26195)	Site Latitude (33.90902)	
Site Class Definition	D	
Mapped Spectral Response Acceleration at 0.2s Period, S_s		**1.50**
Mapped Spectral Response Acceleration at 1s Period, S_1		**0.60**
Short Period Site Coefficient at 0.2s Period, F_a		**1.00**
Long Period Site Coefficient at 1s Period, F_v		**1.50**
Adjusted Spectral Response Acceleration at 0.2s Period, S_{MS}		**1.50**
Adjusted Spectral Response Acceleration at 1s Period, S_{M1}		**0.90**
Design Spectral Response Acceleration at 0.2s Period, S_{DS}		***1.00***
Design Spectral Response Acceleration at 1s Period, S_{D1}		***0.60***

* g- Gravity acceleration

The results of the analysis also indicate that the adjusted Peak Ground Acceleration (PGA_M) for this site is 0.5g.

3.6 Secondary Seismic Hazards

Ground shaking can induce "secondary" seismic hazards such as liquefaction, dynamic densification, lateral spreading, flooding, seiche/tsunami, collapsible soils, and ground rupture, as discussed in the following subsections:

3.6.1 Dynamic Settlement (Liquefaction and/or Dry Settlement)

Riverside County Geologic Hazards maps indicate that the site is located in a zone of high liquefaction potential (see Figure 4). However, liquefaction-induced or dynamic dry settlement is not expected to be a significant hazard at this site due to the absence of near surface saturated sand layers and underlying dense older alluvium. Our analysis of dynamic settlement due to ground shaking based on PGA of 0.5g with a moment magnitude of 7.2 Mw is estimated to be less than 1 inch (see Appendix C). This settlement is expected to be generally global and over a large area. As such, the seismic differential settlement is not expected to exceed 0.5-inch in a 40-foot horizontal distance within this site.

3.6.2 Lateral Spreading

Due to a relatively flat terrain and dense underlying older alluvium, lateral spreading is not considered a geologic hazard on this site.

3.6.3 Flooding

The site is not within a flood plain and potential for flooding is considered very low for this site.

3.6.4 Seiche and Tsunami

Due to the site location and lack of nearby open bodies of water, the possibility of the affects due to seiches or tsunami is considered very low.

3.6.5 Collapsible Soils

Laboratory testing indicates that the onsite soils (older alluvium) are expected to possess a slight collapse potential (<1%). Based on the remedial grading recommendations to remove and compact the near surface soils (Section 4.2.1), this geologic hazard on this site is considered very low.

3.6.6 Expansive Soils

Limited laboratory testing indicated that onsite soils generally possess a low expansion potential (EI<51). The mitigation for this geologic hazard is presented in Section 4.2.4 of this report.

3.6.7 Ground Rupture

Since this site is not located within a mapped Fault Zone, the possibility of ground surface-fault-rupture is very low at this site.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 General

Based on the results of this exploration, it is our opinion that the site is suitable for the proposed development from a geotechnical viewpoint. Grading of the site should be in accordance with our recommendations included in this report and future recommendations and evaluations made during construction by the geotechnical consultant.

4.2 Earthwork

Earthwork should be performed in accordance with the General Earthwork and Grading Specifications in Appendix D as well as the following recommendations. The recommendations contained in Appendix D, are general grading specifications provided for typical grading projects and some of the recommendations may not be strictly applicable to this project. The specific recommendations contained in the text of this report supersede the general recommendations in Appendix D.

The contract between the developer and earthwork contractor should be worded such that it is the responsibility of the contractor to place fill properly in accordance with the recommendations of this report, the specifications in Appendix D, applicable County Grading Ordinances, notwithstanding the testing and observation of the geotechnical consultant during construction.

4.2.1 Site Preparation and Remedial Grading

Prior to grading, the proposed structural improvement areas (i.e. all-structural fill areas, pavement areas, buildings, etc.) should be cleared of surface and subsurface pipelines and obstructions. Heavy vegetation, roots and debris should be disposed of offsite. Any onsite wells or septic waste system should be removed or abandoned in accordance with the Riverside Country Department of Environmental Health. Voids created by removal of buried/unsuitable materials should be backfilled with properly compacted soil in general accordance with the recommendations of this report.

Building Area: To reduce the potential for excessive differential settlement, the depth of removal should extend a minimum of 6 feet BGS or 4 feet below footings, whichever is deeper.

Pavement/Street Areas: The depth of removal should extend a minimum of 3 feet BGS or 2 feet below finish subgrade, whichever is deeper.

The removal limit should be established by a 1:1 (horizontal:vertical) projection from the edge of fill soils supporting structural fill or settlement-sensitive structures downward and outward to competent material identified by the geotechnical consultant. This may require remedial grading that extends beyond the limits of design grading. Removal will also include benching into competent material as the fills rise. Areas adjacent to existing property limits or protected habitat areas may require special considerations and monitoring. Steeper temporary slopes in these areas may be considered.

After completion of the recommended removal of unsuitable soils and prior to fill placement, the exposed surface should be scarified to a minimum depth of 8-inches, moisture conditioned as necessary to optimum moisture content and compacted using heavy compaction equipment to an unyielding condition. All structural fill should be compacted throughout to 90 percent of the ASTM D 1557 laboratory maximum density, at or slightly above optimum moisture.

4.2.2 Structural Fills

The onsite soils are generally suitable for re-use as compacted fill, provided they are free of debris and organic matter. Fills placed within 10 feet of finish pad grades or slope faces should contain no rocks over 12 inches in maximum dimension. In addition, encountered expansive clayey soils layers (EI>51), if any, should be placed at a depth greater than 3 feet below finished grades.

Areas to receive structural fill and/or other surface improvements should be scarified to a minimum depth of 8 inches, conditioned to at least optimum moisture content, and recompacted. Fill soils should be placed at a minimum of 90 percent relative compaction (based on ASTM D1557) at or above optimum moisture content. Placement and compaction of fill should be performed in accordance with local grading ordinances under the observation and testing of the geotechnical consultant. The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in thickness.

Fill slope keyways will be necessary at the toe of all fill slopes and at fill-over-cut contacts. Keyway schematics, including dimensions and subdrain recommendations, are provided in Appendix D. All keyways should be excavated into dense bedrock or dense older alluvium as determined by the geotechnical engineer. The cut portions of all slope and keyway excavations should be geologically mapped and approved by a geologist prior to fill placement.

Fills placed on slopes steeper than 5:1 (horizontal:vertical) should be benched into dense soils (see Appendix D for benching detail). Benching should be of sufficient depth to remove all loose material. A minimum bench height of 2 feet into approved material should be maintained at all times.

4.2.3 Import Soils

Import soils and/or borrow sites, if needed, should be evaluated by us prior to import. Import soils should be uncontaminated, granular in nature, free of organic material (loss on ignition less-than 2 percent), have very low expansion potential (E<21) and have a low corrosion impact to the proposed improvements.

4.2.4 Utility Trenches

Utility trenches should be backfilled with compacted fill in accordance with the *Standard Specifications for Public Works Construction,* ("Greenbook"), 2018 Edition. Fill material above the pipe zone should be placed in lifts not exceeding 8 inches in uncompacted thickness and should be compacted to at least 90 percent relative compaction (ASTM D 1557) by mechanical means only. Site soils may generally be suitable as trench backfill provided these soils are screened of rocks over 1½ inches in diameter and organic matter. If imported sand is used as backfill, the upper 3 feet in building and pavement areas should be compacted to 95 percent. The upper 6 inches of backfill in all pavement areas should be compacted to at least 95 percent relative compaction.

Where granular backfill is used in utility trenches adjacent to moisture sensitive subgrades and foundation soils, we recommend that a cut-off "plug" of impermeable material be placed in these trenches at the perimeter of buildings, and at pavement edges adjacent to irrigated landscaped areas. A "plug" can consist of a 5-foot long section of clayey soils with more than 35-percent passing the No. 200 sieve, or a Controlled Low Strength Material (CLSM) consisting of one sack of Portland-cement plus one sack of bentonite per cubic-yard of sand. CLSM should generally conform to requirements of the "Greenbook". This is intended to reduce the likelihood of water permeating trenches from landscaped areas, then seeping along permeable trench backfill into the building and pavement subgrades, resulting in wetting of moisture sensitive subgrade earth materials under buildings and pavements.

Excavation of utility trenches should be performed in accordance with the project plans, specifications and the *California Construction Safety Orders* (latest Edition). The contractor should be responsible for providing a "competent person" as defined in Article 6 of the *California Construction Safety Orders*. Contractors should be advised that sandy soils (such as fills

generated from the onsite alluvium) could make excavations particularly unsafe if all safety precautions are not properly implemented. In addition, excavations at or near the toe of slopes and/or parallel to slopes may be highly unstable due to the increased driving force and load on the trench wall. Spoil piles from the excavation(s) and construction equipment should be kept away from the sides of the trenches. Leighton Consulting, Inc. does not consult in the area of safety engineering.

4.2.5 Shrinkage

The volume change of excavated onsite soils upon recompaction is expected to vary with materials, density, insitu moisture content, and location and compaction effort. The in-place and compacted densities of soil materials vary and accurate overall determination of shrinkage and bulking cannot be made. Therefore, we recommend site grading include, if possible, a balance area or ability to adjust grades slightly to accommodate some variation. Based on our geotechnical laboratory results, we expect recompaction shrinkage (when recompacted to an average 92 percent of ASTM D1557) and estimate the following earth volume changes will occur during grading, and for the older alluvium, the shrinkage is expected to be in the 5 to 15% range.

4.2.6 Drainage

All drainage should be directed away from structures and pavements by means of approved permanent/temporary drainage devices. Adequate storm drainage of any proposed pad should be provided to avoid wetting of foundation soils. Irrigation adjacent to buildings should be avoided when possible. As an option, sealed-bottom planter boxes and/or drought resistant vegetation should be used within 5-feet of buildings.

4.3 Foundation Design

4.3.1 Design Parameters – Spread/Continuous Shallow Footings

Footings should be embedded at least 12-inches below lowest adjacent grade for the proposed structure. Footing embedment should be measured from lowest adjacent finished grade, considered as the top of interior slabs-on-grade or the finished exterior grade, excluding landscape topsoil, whichever is lower. Footings located adjacent to utility trenches or vaults should be embedded below an imaginary 1:1 (horizontal:vertical) plane projected upward and outward from the bottom edge of the trench or vault, up towards the footing.

- **Bearing Capacity**: For footings on newly placed, properly compacted fill soil, an allowable vertical bearing capacity of 2,000 pounds-per-square-foot (psf) should be used. These footings should have a minimum base

width of 18 inches for continuous wall footings and a minimum bearing area of 3 square feet (1.75-ft by 1.75-ft) for pad foundations. The bearing pressure value may be increased by 250 psf for each additional foot of embedment or each additional foot of width to a maximum vertical bearing value of 3,500 psf. Additionally, these bearing values may be increased by one-third when considering short-term seismic or wind loads. A modulus of subgrade reaction, K of 200 PCI may be used to relative dense bedrock or onsite soil compacted to minimum 90% relative compaction.

- **Lateral loads**: Lateral loads may be resisted by friction between the footings and the supporting subgrade. A maximum allowable frictional resistance of 0.35 may be used for design. In addition, lateral resistance may be provided by passive pressures acting against foundations poured neat against properly compacted granular fill. We recommend that an allowable passive pressure based on an equivalent fluid pressure of 350 pounds-per-cubic-foot (pcf) be used in design. These friction and passive values have already been reduced by a factor-of-safety of 1.5.

4.3.2 Settlement Estimates

For settlement estimates, we assumed that column loads will be no larger than 250 kips, with bearing wall loads not exceeding 10 kips per foot of wall. If greater column or wall loads are required, we should re-evaluate our foundation recommendation, and re-calculate settlement estimates.

Buildings located on compacted fill soils as required per Section 4.2.1 above should be designed in anticipation of 1 inch of total static settlement and 0.5-inch of static differential settlement within a 40-foot horizontal run.

4.4 Vapor Retarder

It has been a standard of care to install a moisture-vapor retarder underneath all slabs where moisture condensation is undesirable. Moisture vapor retarders may retard but not totally eliminate moisture vapor movement from the underlying soils up through the slabs. Moisture vapor transmission may be additionally reduced by use of concrete additives. Leighton Consulting, Inc. does not practice in the field of moisture vapor transmission evaluation/mitigation. Therefore, we recommend that a qualified person/firm be engaged/consulted with to evaluate the general and specific moisture vapor transmission paths and any impact on the proposed construction. This person/firm should provide recommendations for mitigation of potential adverse impact of moisture vapor transmission on various components of the structure as deemed appropriate.

However, based on our experience, the standard of practice in Southern California has evolved over the last 15 to 20 years into a construction of a vapor retarder system that generally consisted of a membrane (such as 15-mil thick), underlain by a capillary break consisting of 4 inches of clean ½-inch-minimum gravel or 2-inch sand layer (SE>30). The structural engineer/architect or concrete contractor often require a sand layer be placed over the membrane (typically 2-inch thick layer) to help in curing and reduction of curling of concrete. If such sand layer is placed on top of the membrane, the contractor should not allow the sand to become wet prior to concrete placement (e.g., sand should not be placed if rain is expected).

In conclusion, the construction of the vapor barrier/retarder system is dependent on several variables which cannot be all geotechnically evaluated and/or tested. As such, the design of this system should be a design team/owner decision taking into consideration finish flooring materials and manufacture's installation requirements of proposed membrane. Moreover, we recommend that the design team also follow ACI Committee 302 publication for "Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials" (ACI 302.2R-06) which includes a flow chart that assists in determining if a vapor barrier/retarder is required and where it is to be placed.

4.5 Retaining Walls

Retaining wall earth pressures are a function of the amount of wall yielding horizontally under load. If the wall can yield enough to mobilize full shear strength of backfill soils, then the wall can be designed for "active" pressure. If the wall cannot yield under the applied load, the shear strength of the soil cannot be mobilized and the earth pressure will be higher. Such walls should be designed for "at rest" conditions. If a structure moves toward the soils, the resulting resistance developed by the soil is the "passive" resistance. Retaining walls backfilled with non-expansive soils can be designed using the following equivalent fluid pressures:

Table 2. Retaining Wall Design Earth Pressures (Static, Drained)

Loading Conditions	Equivalent Fluid Density (pcf)	
	Level Backfill	2:1 Backfill
Active	36	55
At-Rest	55	85
Passive*	350	150 (2:1, sloping down)

* This assumes level condition in front of the wall will remain for the duration of the project, not to exceed 3,500 psf at depth.

Unrestrained (yielding) cantilever walls should be designed for the active equivalent-fluid weight value provided above for very low to low expansive soils that are free draining. In the design of walls restrained from movement at the top (non-yielding) such as basement or elevator pit/utility vaults, the at-rest equivalent fluid weight value should be used. Total depth of retained earth for design of cantilever walls should be measured as the vertical distance below the ground surface measured at the wall face for stem design, or measured at the heel of the footing for overturning and sliding calculations. Should a sloping backfill other than a 2:1 (horizontal:vertical) be constructed above the wall (or a backfill is loaded by an adjacent surcharge load), the equivalent fluid weight values provided above should be re-evaluated on an individual case basis by us. Non-standard wall designs should also be reviewed by us prior to construction to check that the proper soil parameters have been incorporated into the wall design.

All retaining walls should be provided with appropriate drainage. The outlet pipe should be sloped to drain to a suitable outlet. Wall backfill should be non-expansive (EI $\leq$ 21) sands compacted by mechanical methods to a minimum of 90 percent relative compaction (ASTM D 1557). Clayey site soils should not be used as wall backfill. Walls should not be backfilled until wall concrete attains the 28-day compressive strength and/or as determined by the Structural Engineer that the wall is structurally capable of supporting backfill. Lightweight compaction equipment should be used, unless otherwise approved by the Structural Engineer.

4.6 Sulfate Attack

Based on past experience in this area, the onsite soils are expected to possess negligible sulfate content. Type II concrete or equivalent may be used. Further testing should be performed at the completion of site grading to confirm such conditions.

4.7 Preliminary Pavement Design

Our preliminary pavement design is based on an R-value of 16 and the Caltrans Highway Design Manual. For planning and estimating purposes, the pavement sections are calculated based on Traffic Indexes (TI) as indicated in Table below:

Table 3. Asphalt Pavement Sections

General Traffic Condition	Traffic Index (TI)	Asphalt Concrete (inches)	Aggregate Base* (inches)
Automobile Parking Lanes	4.5	3.0	6.5
	5.0	4.0	5.5
Truck Access & Driveways	6.0	4.0	9.5
	6.5	4.0	13.0

Appropriate Traffic Index (TI) should be selected or verified by the project civil engineer and actual R-value of the subgrade soils will need to be verified after completion of site grading to finalize the pavement design. Pavement design and construction should also conform to applicable local, county and industry standards. The Caltrans pavement section design calculations were based on a pavement life of approximately 20 years with periodic flexible pavement maintenance.

Where applicable, we recommend that a minimum of 7 inches of PCC pavement be used in high impact load areas or if to be subjected to truck traffic. The PCC pavement should be placed on a minimum 6-inch aggregate base. The PCC pavement may be placed directly on a compacted subgrade with an R-Value of 40 or higher. The PCC pavement should have a minimum of 28-day compressive strength of 3250 psi. Other requirements of Caltrans Standard Specifications regarding mixing and placing of concrete should be followed.

The upper 6 inches of the subgrade soils should be moisture-conditioned to near optimum moisture content, compacted to at least 95 percent relative compaction (ASTM D1557) and kept in this condition until the pavement section is constructed. Minimum relative compaction requirements for aggregate base should be 95 percent of the maximum laboratory density as determined by ASTM D1557. If applicable, aggregate base should conform to the “Standard Specifications for Public Works Construction” (green book) current edition or Caltrans Class 2 aggregate base.

If pavement areas are adjacent to heavily watered landscape areas, some deterioration of the subgrade load bearing capacity and pavement failure may result. Moisture control measures such as deepened curbs or other moisture barrier materials may be used to prevent the subgrade soils from becoming saturated. The use of concrete cutoff or edge barriers should be considered when pavement is planned adjacent to either open (unfinished) or irrigated landscaped areas.

5.0 GEOTECHNICAL CONSTRUCTION SERVICES

Geotechnical review is of paramount importance in engineering practice. Poor performances of many foundation and earthwork projects have been attributed to inadequate construction review. We recommend that Leighton Consulting, Inc. be provided the opportunity to review the grading plan and foundation plan(s) prior to bid.

Reasonably-continuous construction observation and review during site grading and foundation installation allows for evaluation of the actual soil conditions and the ability to provide appropriate revisions where required during construction. Geotechnical conclusions and preliminary recommendations should be reviewed and verified by Leighton Consulting, Inc. during construction, and revised accordingly if geotechnical conditions encountered vary from our findings and interpretations. Geotechnical observation and testing should be provided:

- After completion of site demolition and clearing,
- During over-excavation of compressible soil,
- During compaction of all fill materials,
- After excavation of all footings and prior to placement of concrete,
- During utility trench backfilling and compaction, and
- When any unusual conditions are encountered.

Additional geotechnical exploration and analysis may be required based on final development plans, for reasons such as significant changes in proposed structure locations/footprints. We should review grading (civil) and foundation (structural) plans, and comment further on geotechnical aspects of this project.

6.0 LIMITATIONS

This report was based in part on data obtained from a limited number of observations, site visits, soil excavations, samples and tests. Such information is, by necessity, incomplete. The nature of many sites is such that differing soil or geologic conditions can be present within small distances and under varying climatic conditions. Changes in subsurface conditions can and do occur over time. Therefore, our findings, conclusions and recommendations presented in this report are based on the assumption that we (Leighton Consulting, Inc.) will provide geotechnical observation and testing during construction as the Geotechnical Engineer of Record for this project. Please refer to Appendix E, GBA's *Important Information About This Geotechnical-Engineering Report*, prepared by the Geoprofessional Business Association (GBA) presenting additional information and limitations regarding geotechnical engineering studies and reports.

This report was prepared for the sole use of Client and their design team, for application to design of the proposed maintenance building, in accordance with generally accepted geotechnical engineering practices at this time in California. Any unauthorized use of or reliance on this report constitutes an agreement to defend and indemnify Leighton Consulting, Inc. from and against any liability which may arise as a result of such use or reliance, regardless of any fault, negligence, or strict liability of Leighton Consulting, Inc.

APPENDIX A

LOGS OF EXPLORATORY BORINGS

Encountered earth materials were logged and sampled in the field by our representative and described in accordance with the Unified Soil Classification System (ASTM D 2488). Representative soil samples were transported to our in-house Temecula laboratory for geotechnical testing. After logging and sampling, our borings were backfilled with spoils generated during drilling.

The attached subsurface exploration logs and related information depict subsurface conditions only at the locations indicated and at the particular date designated on these logs. Subsurface conditions at other locations may differ from conditions occurring at these logged locations. Passage of time may result in altered subsurface conditions due to environmental changes. In addition, any stratification lines on these logs represent an approximate boundary between sampling intervals and soil types; and transitions may be gradual.

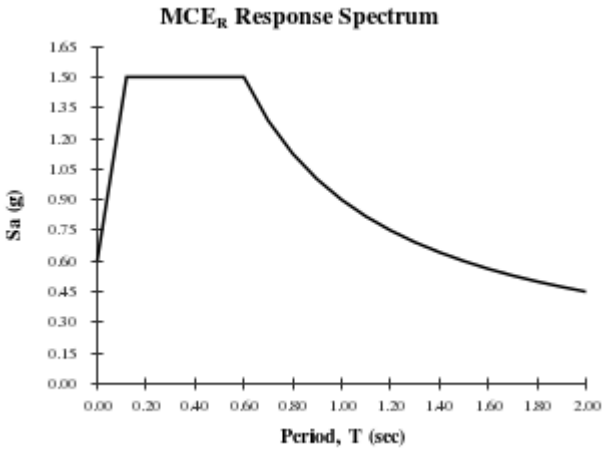
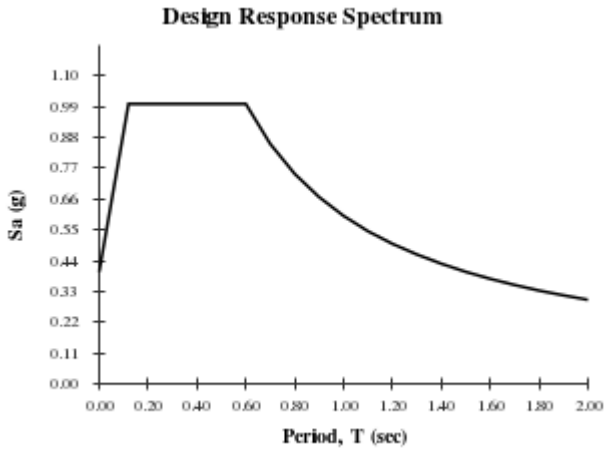
SITE SPECIFIC ANALYSIS

USGS Design Maps Summary Report

User–Specified Input



Report Title	11979.002 Wed April 18, 2018 22:12:57 UTC
Building Code Reference Document	ASCE 7-10 Standard (which utilizes USGS hazard data available in 2008)
Site Coordinates	33.90902°N, 117.26195°W
Site Soil Classification	Site Class D – "Stiff Soil"
Risk Category	I/II/III



USGS–Provided Output

S_S =	1.500 g	S_{MS} =	1.500 g	S_{DS} =	1.000 g
S_1 =	0.600 g	S_{M1} =	0.900 g	S_{D1} =	0.600 g

For information on how the SS and S1 values above have been calculated from probabilistic (risk-targeted) and deterministic ground motions in the direction of maximum horizontal response, please return to the application and select the "2009 NEHRP" building code reference document.

For PGA_M, T_L, C_{RS}, and C_{R1} values, please view the detailed report.

Although this information is a product of the U.S. Geological Survey, we provide no warranty, expressed or implied, as to the accuracy of the data contained therein. This tool is not a substitute for technical subject-matter knowledge.

USGS Design Maps Detailed Report

ASCE 7-10 Standard (33.90902°N, 117.26195°W)

Site Class D – "Stiff Soil", Risk Category I/II/III

Section 11.4.1 — Mapped Acceleration Parameters

Note: Ground motion values provided below are for the direction of maximum horizontal spectral response acceleration. They have been converted from corresponding geometric mean ground motions computed by the USGS by applying factors of 1.1 (to obtain S_S) and 1.3 (to obtain S_1). Maps in the 2010 ASCE-7 Standard are provided for Site Class B. Adjustments for other Site Classes are made, as needed, in Section 11.4.3.

From Figure 22-1 [1]	S_S = 1.500 g
From Figure 22-2 [2]	S_1 = 0.600 g

Section 11.4.2 — Site Class

The authority having jurisdiction (not the USGS), site-specific geotechnical data, and/or the default has classified the site as Site Class D, based on the site soil properties in accordance with Chapter 20.

Table 20.3–1 Site Classification

Site Class	$\overline{v}_s$	$\overline{N}$ or $\overline{N}_{ch}$	$\overline{s}_u$
A. Hard Rock	>5,000 ft/s	N/A	N/A
B. Rock	2,500 to 5,000 ft/s	N/A	N/A
C. Very dense soil and soft rock	1,200 to 2,500 ft/s	>50	>2,000 psf
D. Stiff Soil	600 to 1,200 ft/s	15 to 50	1,000 to 2,000 psf
E. Soft clay soil	<600 ft/s	<15	<1,000 psf
	Any profile with more than 10 ft of soil having the characteristics: • Plasticity index *PI* > 20, • Moisture content *w* ≥ 40%, and • Undrained shear strength $\overline{s}_u$ < 500 psf		
F. Soils requiring site response analysis in accordance with Section 21.1	See Section 20.3.1		

For SI: 1ft/s = 0.3048 m/s 1lb/ft² = 0.0479 kN/m²

Section 11.4.3 — Site Coefficients and Risk–Targeted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration Parameters

Table 11.4–1: Site Coefficient F_a

Site Class	Mapped MCE_R Spectral Response Acceleration Parameter at Short Period				
	$S_S \le 0.25$	$S_S = 0.50$	$S_S = 0.75$	$S_S = 1.00$	$S_S \ge 1.25$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of S_S

For Site Class = D and S_S = 1.500 g, F_a = 1.000

Table 11.4–2: Site Coefficient F_v

Site Class	Mapped MCE_R Spectral Response Acceleration Parameter at 1–s Period				
	$S_1 \le 0.10$	$S_1 = 0.20$	$S_1 = 0.30$	$S_1 = 0.40$	$S_1 \ge 0.50$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.7	1.6	1.5	1.4	1.3
D	2.4	2.0	1.8	1.6	1.5
E	3.5	3.2	2.8	2.4	2.4
F	See Section 11.4.7 of ASCE 7				

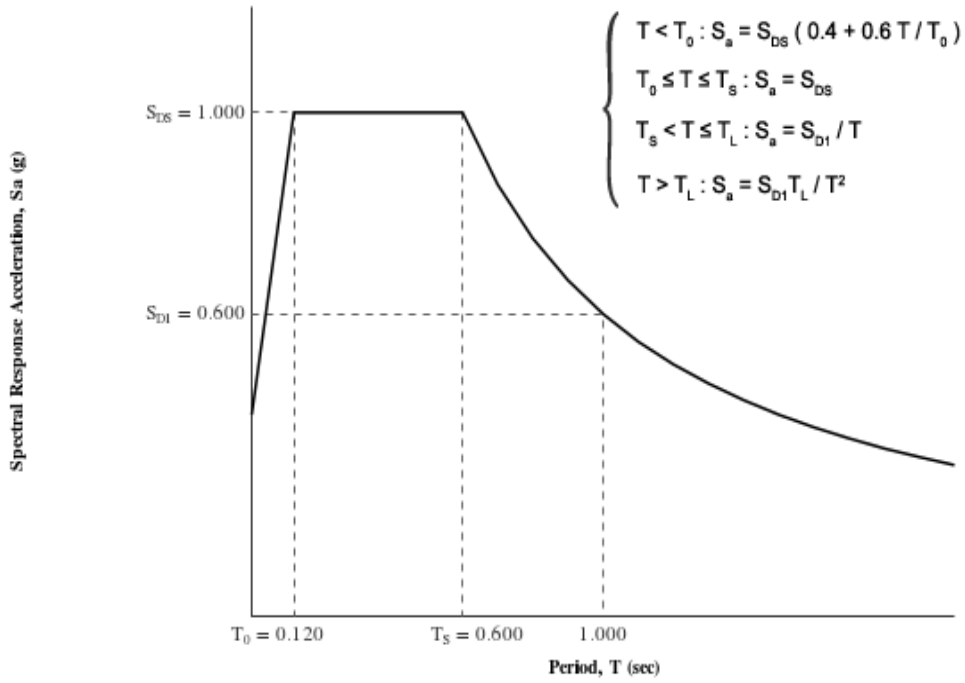
Note: Use straight–line interpolation for intermediate values of S_1

For Site Class = D and S_1 = 0.600 g, F_v = 1.500

Equation (11.4–1): $S_{MS} = F_a S_S = 1.000 \times 1.500 = 1.500$ g

Equation (11.4–2): $S_{M1} = F_v S_1 = 1.500 \times 0.600 = 0.900$ g

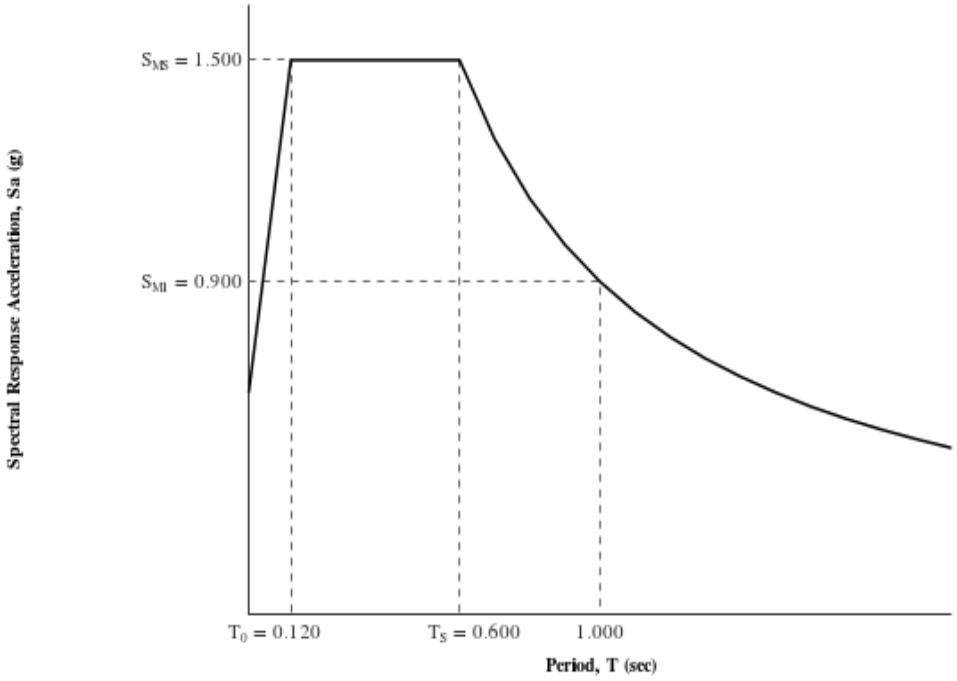
Section 11.4.4 — Design Spectral Acceleration Parameters



Equation (11.4–3): $S_{DS} = \frac{2}{3} S_{MS} = \frac{2}{3} \times 1.500 = 1.000$ g

Equation (11.4–4): $S_{D1} = \frac{2}{3} S_{M1} = \frac{2}{3} \times 0.900 = 0.600$ g

Section 11.4.5 — Design Response Spectrum



From Figure 22-12 [3] $T_L = 8$ seconds

Figure 11.4–1: Design Response Spectrum

Section 11.4.6 — Risk-Targeted Maximum Considered Earthquake (MCE_R) Response Spectrum

The MCE_R Response Spectrum is determined by multiplying the design response spectrum above by 1.5.

Section 11.8.3 — Additional Geotechnical Investigation Report Requirements for Seismic Design Categories D through F

From Figure 22-7 [4] PGA = 0.534

Equation (11.8–1): $PGA_M = F_{PGA}PGA = 1.000 \times 0.534 = 0.534$ g

Table 11.8–1: Site Coefficient F_{PGA}

Site Class	Mapped MCE Geometric Mean Peak Ground Acceleration, PGA				
	PGA ≤ 0.10	PGA = 0.20	PGA = 0.30	PGA = 0.40	PGA ≥ 0.50
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of PGA

For Site Class = D and PGA = 0.534 g, F_{PGA} = 1.000

Section 21.2.1.1 — Method 1 (from Chapter 21 – Site-Specific Ground Motion Procedures for Seismic Design)

From Figure 22-17 [5] C_{RS} = 1.059

From Figure 22-18 [6] C_{R1} = 1.027

Section 11.6 — Seismic Design Category

Table 11.6-1 Seismic Design Category Based on Short Period Response Acceleration Parameter

VALUE OF S_{DS}	RISK CATEGORY		
	I or II	III	IV
$S_{DS} < 0.167g$	A	A	A
$0.167g \le S_{DS} < 0.33g$	B	B	C
$0.33g \le S_{DS} < 0.50g$	C	C	D
$0.50g \le S_{DS}$	D	D	D

For Risk Category = I and S_{DS} = 1.000 g, Seismic Design Category = D

Table 11.6-2 Seismic Design Category Based on 1-S Period Response Acceleration Parameter

VALUE OF S_{D1}	RISK CATEGORY		
	I or II	III	IV
$S_{D1} < 0.067g$	A	A	A
$0.067g \le S_{D1} < 0.133g$	B	B	C
$0.133g \le S_{D1} < 0.20g$	C	C	D
$0.20g \le S_{D1}$	D	D	D

For Risk Category = I and S_{D1} = 0.600 g, Seismic Design Category = D

Note: When S_1 is greater than or equal to 0.75g, the Seismic Design Category is **E** for buildings in Risk Categories I, II, and III, and **F** for those in Risk Category IV, irrespective of the above.

Seismic Design Category ≡ "the more severe design category in accordance with Table 11.6-1 or 11.6-2" = D

Note: See Section 11.6 for alternative approaches to calculating Seismic Design Category.

D-1.0 GENERAL

D-1.1 Intent

These Earthwork and Grading Guide Specifications are for grading and earthwork shown on the current, approved grading plan(s) and/or indicated in the Leighton Consulting, Inc. geotechnical report(s). These Guide Specifications are a part of the recommendations contained in the geotechnical report(s). In case of conflict, the project-specific recommendations in the geotechnical report shall supersede these Guide Specifications. Leighton Consulting, Inc. shall provide geotechnical observation and testing during earthwork and grading. Based on these observations and tests, Leighton Consulting, Inc. may provide new or revised recommendations that could supersede these specifications or the recommendations in the geotechnical report(s).

D-1.2 Role of Leighton Consulting, Inc.

Prior to commencement of earthwork and grading, Leighton Consulting, Inc. shall meet with the earthwork contractor to review the earthwork contractor's work plan, to schedule sufficient personnel to perform the appropriate level of observation, mapping and compaction testing. During earthwork and grading, Leighton Consulting, Inc. shall observe, map, and document subsurface exposures to verify geotechnical design assumptions. If observed conditions are found to be significantly different than the interpreted assumptions during the design phase, Leighton Consulting, Inc. shall inform the owner, recommend appropriate changes in design to accommodate these observed conditions, and notify the review agency where required. Subsurface areas to be geotechnically observed, mapped, elevations recorded, and/or tested include (1) natural ground after clearing to receiving fill but before fill is placed, (2) bottoms of all "remedial removal" areas, (3) all key bottoms, and (4) benches made on sloping ground to receive fill.

Leighton Consulting, Inc. shall observe moisture-conditioning and processing of the subgrade and fill materials, and perform relative compaction testing of fill to determine the attained relative compaction. Leighton Consulting, Inc. shall provide *Daily Field Reports* to the owner and the Contractor on a routine and frequent basis.

D-1.3 The Earthwork Contractor

The earthwork contractor (Contractor) shall be qualified, experienced and knowledgeable in earthwork logistics, preparation and processing of ground to receive fill, moisture-conditioning and processing of fill, and compacting fill. The Contractor shall review and accept the plans, geotechnical report(s), and these Guide

Specifications prior to commencement of grading. The Contractor shall be solely responsible for performing grading and backfilling in accordance with the current, approved plans and specifications.

The Contractor shall inform the owner and Leighton Consulting, Inc. of changes in work schedules at least one working day in advance of such changes so that appropriate observations and tests can be planned and accomplished. The Contractor shall not assume that Leighton Consulting, Inc. is aware of all grading operations.

The Contractor shall have the sole responsibility to provide adequate equipment and methods to accomplish earthwork and grading in accordance with the applicable grading codes and agency ordinances, these Guide Specifications, and recommendations in the approved geotechnical report(s) and grading plan(s). If, in the opinion of Leighton Consulting, Inc., unsatisfactory conditions, such as unsuitable soil, improper moisture condition, inadequate compaction, adverse weather, etc., are resulting in a quality of work less than required in these specifications, Leighton Consulting, Inc. shall reject the work and may recommend to the owner that earthwork and grading be stopped until unsatisfactory condition(s) are rectified.

D-2.0 PREPARATION OF AREAS TO BE FILLED

D-2.1 Clearing and Grubbing

Vegetation, such as brush, grass, roots and other deleterious material shall be sufficiently removed and properly disposed of in a method acceptable to the owner, governing agencies and Leighton Consulting, Inc.. Care should be taken not to encroach upon or otherwise damage native and/or historic trees designated by the Owner or appropriate agencies to remain. Pavements, flatwork or other construction should not extend under the “drip line” of designated trees to remain.

Leighton Consulting, Inc. shall evaluate the extent of these removals depending on specific site conditions. Earth fill material shall not contain more than 3 percent of organic materials (by dry weight: ASTM D 2974). Nesting of the organic materials shall not be allowed.

If potentially hazardous materials are encountered, the Contractor shall stop work in the affected area, and a hazardous material specialist shall be informed immediately for proper evaluation and handling of these materials prior to continuing to work in that area. As presently defined by the State of California, most refined petroleum products (gasoline, diesel fuel, motor oil, grease, coolant, etc.) have chemical constituents that

are considered to be hazardous waste. As such, the indiscriminate dumping or spillage of these fluids onto the ground may constitute a misdemeanor, punishable by fines and/or imprisonment, and shall not be allowed.

D-2.2 Processing

Existing ground that has been declared satisfactory for support of fill, by Leighton Consulting, Inc., shall be scarified to a minimum depth of 6 inches (15 cm). Existing ground that is not satisfactory shall be over-excavated as specified in the following Section D-2.3. Scarification shall continue until soils are broken down and free of large clay lumps or clods and the working surface is reasonably uniform, flat, and free of uneven features that would inhibit uniform compaction.

D-2.3 Overexcavation

In addition to removals and over-excavations recommended in the approved geotechnical report(s) and the grading plan, soft, loose, dry, saturated, spongy, organic-rich, highly fractured or otherwise unsuitable ground shall be over-excavated to competent ground as evaluated by Leighton Consulting, Inc. during grading. All undocumented fill soils under proposed structure footprints should be excavated

D-2.4 Benching

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical units), (>20 percent grade) the ground shall be stepped or benched. The lowest bench or key shall be a minimum of 15 feet (4.5 m) wide and at least 2 feet (0.6 m) deep, into competent material as evaluated by Leighton Consulting, Inc.. Other benches shall be excavated a minimum height of 4 feet (1.2 m) into competent material or as otherwise recommended by Leighton Consulting, Inc.. Fill placed on ground sloping flatter than 5:1 (horizontal to vertical units), (<20 percent grade) shall also be benched or otherwise over-excavated to provide a flat subgrade for the fill.

D-2.5 Evaluation/Acceptance of Fill Areas

All areas to receive fill, including removal and processed areas, key bottoms, and benches, shall be observed, mapped, elevations recorded, and/or tested prior to being accepted by Leighton Consulting, Inc. as suitable to receive fill. The Contractor shall obtain a written acceptance (*Daily Field Report*) from Leighton Consulting, Inc. prior to fill placement. A licensed surveyor shall provide the survey control for determining elevations of processed areas, keys and benches.

D-3.0 FILL MATERIAL

D-3.1 Fill Quality

Material to be used as fill shall be essentially free of organic matter and other deleterious substances evaluated and accepted by Leighton Consulting, Inc. prior to placement. Soils of poor quality, such as those with unacceptable gradation, high expansion potential, or low strength shall be placed in areas acceptable to Leighton Consulting, Inc. or mixed with other soils to achieve satisfactory fill material.

D-3.2 Oversize

Oversize material defined as rock, or other irreducible material with a maximum dimension greater than 6 inches (15 cm), shall not be buried or placed in fill unless location, materials and placement methods are specifically accepted by Leighton Consulting, Inc.. Placement operations shall be such that nesting of oversized material does not occur and such that oversize material is completely surrounded by compacted or densified fill. Oversize material shall not be placed within 10 feet (3 m) measured vertically from finish grade, or within 2 feet (0.61 m) of future utilities or underground construction.

D-3.3 Import

If importing of fill material is required for grading, proposed import material shall meet the requirements of Section D-3.1, and be free of hazardous materials ("contaminants") and rock larger than 3-inches (8 cm) in largest dimension. All import soils shall have an Expansion Index (EI) of 20 or less and a sulfate content no greater than ($\leq$) 500 parts-per-million (ppm). A representative sample of a potential import source shall be given to Leighton Consulting, Inc. at least four full working days before importing begins, so that suitability of this import material can be determined and appropriate tests performed.

D-4.0 FILL PLACEMENT AND COMPACTION

D-4.1 Fill Layers

Approved fill material shall be placed in areas prepared to receive fill, as described in Section D-2.0, above, in near-horizontal layers not exceeding 8 inches (20 cm) in loose thickness. Leighton Consulting, Inc. may accept thicker layers if testing indicates the grading procedures can adequately compact the thicker layers, and only if the building officials with the appropriate jurisdiction approve. Each layer shall be spread evenly and mixed thoroughly to attain relative uniformity of material and moisture throughout.

D-4.2 Fill Moisture Conditioning

Fill soils shall be watered, dried back, blended and/or mixed, as necessary to attain a relatively uniform moisture content at or slightly over optimum. Maximum density and optimum soil moisture content tests shall be performed in accordance with the American Society of Testing and Materials (ASTM) Test Method D 1557.

D-4.3 Compaction of Fill

After each layer has been moisture-conditioned, mixed, and evenly spread, each layer shall be uniformly compacted to not-less-than (≥) 90 percent of the maximum dry density as determined by ASTM Test Method D 1557. In some cases, structural fill may be specified (see project-specific geotechnical report) to be uniformly compacted to at-least (≥) 95 percent of the ASTM D 1557 modified Proctor laboratory maximum dry density. For fills thicker than (>) 15 feet (4.5 m), the portion of fill deeper than 15 feet below proposed finish grade shall be compacted to 95 percent of the ASTM D 1557 laboratory maximum density. Compaction equipment shall be adequately sized and be either specifically designed for soil compaction or of proven reliability to efficiently achieve the specified level of compaction with uniformity.

D-4.4 Compaction of Fill Slopes

In addition to normal compaction procedures specified above, compaction of slopes shall be accomplished by back rolling of slopes with sheepsfoot rollers at increments of 3 to 4 feet (1 to 1.2 m) in fill elevation, or by other methods producing satisfactory results acceptable to Leighton Consulting, Inc.. Upon completion of grading, relative compaction of the fill, out to the slope face, shall be at least 90 percent of the ASTM D 1557 laboratory maximum density.

D-4.5 Compaction Testing

Field-tests for moisture content and relative compaction of the fill soils shall be performed by Leighton Consulting, Inc.. Location and frequency of tests shall be at our field representative(s) discretion based on field conditions encountered. Compaction test locations will not necessarily be selected on a random basis. Test locations shall be selected to verify adequacy of compaction levels in areas that are judged to be prone to inadequate compaction (such as close to slope faces and at the fill/bedrock benches).

D-4.6 Compaction Test Locations

Leighton Consulting, Inc. shall document the approximate elevation and horizontal coordinates of each density test location. The Contractor shall coordinate with the project surveyor to assure that sufficient grade stakes are established so that Leighton

Consulting, Inc. can determine the test locations with sufficient accuracy. Adequate grade stakes shall be provided.

D-5.0 EXCAVATION

Excavations, as well as over-excavation for remedial purposes, shall be evaluated by Leighton Consulting, Inc. during grading. Remedial removal depths shown on geotechnical plans are estimates only. The actual extent of removal shall be determined by Leighton Consulting, Inc. based on the field evaluation of exposed conditions during grading. Where fill-over-cut slopes are to be graded, the cut portion of the slope shall be made, then observed and reviewed by Leighton Consulting, Inc. prior to placement of materials for construction of the fill portion of the slope, unless otherwise recommended by Leighton Consulting, Inc..

D-6.0 TRENCH BACKFILLS

D-6.1 Safety

The Contractor shall follow all OSHA and Cal/OSHA requirements for safety of trench excavations. Work should be performed in accordance with Article 6 of the *California Construction Safety Orders*, 2009 Edition or more current (see also: http://www.dir.ca.gov/title8/sb4a6.html).

D-6.2 Bedding and Backfill

All utility trench bedding and backfill shall be performed in accordance with applicable provisions of the 2015 Edition of the *Standard Specifications for Public Works Construction* (Green Book). Bedding material shall have a Sand Equivalent greater than 30 (SE>30). Bedding shall be placed to 1-foot (0.3 m) over the top of the conduit, and densified by jetting in areas of granular soils, if allowed by the permitting agency. Otherwise, the pipe-bedding zone should be backfilled with Controlled Low Strength Material (CLSM) consisting of at least one sack of Portland cement per cubic-yard of sand, and conforming to Section 201-6 of the 2015 Edition of the *Standard Specifications for Public Works Construction* (Green Book). Backfill over the bedding zone shall be placed and densified mechanically to a minimum of 90 percent of relative compaction (ASTM D 1557) from 1 foot (0.3 m) above the top of the conduit to the surface. Backfill above the pipe zone shall **not** be jetted. Jetting of the bedding around the conduits shall be observed by Leighton Consulting, Inc. and backfill above the pipe zone (bedding) shall be observed and tested by Leighton Consulting, Inc..

D-6.3 Lift Thickness

Lift thickness of trench backfill shall not exceed those allowed in the Standard Specifications of Public Works Construction unless the Contractor can demonstrate to Leighton Consulting, Inc. that the fill lift can be compacted to the minimum relative compaction by his alternative equipment and method, and only if the building officials with the appropriate jurisdiction approve.

APPENDIX E

GBA - IMPORTANT INFORMATION ABOUT THIS GEOTECHNICAL-ENGINEERING REPORT

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, clients can benefit from a lowered exposure to the subsurface problems that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed below, contact your GBA-member geotechnical engineer. Active involvement in the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Geotechnical-Engineering Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. *Those who rely on a geotechnical-engineering report prepared for a different client can be seriously misled*. No one except authorized client representatives should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one – not even you – should apply this report for any purpose or project except the one originally contemplated.*

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read it *in its entirety*. Do not rely on an executive summary. Do not read selected elements only. *Read this report in full.*

You Need to Inform Your Geotechnical Engineer about Change

Your geotechnical engineer considered unique, project-specific factors when designing the study behind this report and developing the confirmation-dependent recommendations the report conveys. A few typical factors include:

- the client's goals, objectives, budget, schedule, and risk-management preferences;
- the general nature of the structure involved, its size, configuration, and performance criteria;
- the structure's location and orientation on the site; and
- other planned or existing site improvements, such as retaining walls, access roads, parking lots, and underground utilities.

Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.*

This Report May Not Be Reliable

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, that it could be unwise to rely on a geotechnical-engineering report whose reliability may have been affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If your geotechnical engineer has not indicated an "apply-by" date on the report, ask what it should be*, and, in general, *if you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying it. A minor amount of additional testing or analysis – if any is required at all – could prevent major problems.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface through various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing were performed*. The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgment to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team from project start to project finish, so the individual can provide informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, *they are not final*, because the geotechnical engineer who developed them relied heavily on judgment and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* revealed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a full-time member of the design team, to:

- confer with other design-team members,
- help develop specifications,
- review pertinent elements of other design professionals' plans and specifications, and
- be on hand quickly whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction observation.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for informational purposes only*. To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report, but they may rely on the factual data relative to the specific times, locations, and depths/elevations referenced. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely*. Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures*. If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. As a general rule, *do not rely on an environmental report prepared for a different client, site, or project, or that is more than six months old.*

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, none of the engineer's services were designed, conducted, or intended to prevent uncontrolled migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration.*** Confront the risk of moisture infiltration by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

INSTALLATION NOTES

1. CONTRACTOR TO PROVIDE ALL LABOR, EQUIPMENT, MATERIALS AND INCIDENTALS REQUIRED TO OFFLOAD AND INSTALL THE SYSTEM AND APPURTENANCES IN ACCORDANCE WITH THIS DRAWING AND THE MANUFACTURERS SPECIFICATIONS, UNLESS OTHERWISE STATED IN MANUFACTURERS CONTRACT.
2. UNIT MUST BE INSTALLED ON LEVEL BASE. MANUFACTURER RECOMMENDS A MINIMUM 6" LEVEL ROCK BASE UNLESS SPECIFIED BY THE PROJECT ENGINEER. CONTRACTOR IS RESPONSIBLE TO VERIFY PROJECT ENGINEERS RECOMMENDED BASE SPECIFICATIONS.
3. ALL PIPES MUST BE FLUSH WITH INSIDE SURFACE OF CONCRETE. (PIPES CANNOT INTRUDE BEYOND FLUSH). INVERT OF OUTFLOW PIPE MUST BE FLUSH WITH DISCHARGE CHAMBER FLOOR. ALL GAPS AROUND PIPES SHALL BE SEALED WATER TIGHT WITH A NON–SHRINK GROUT PER MANUFACTURERS STANDARD CONNECTION DETAIL AND SHALL MEET OR EXCEED REGIONAL PIPE CONNECTION STANDARDS.
4. CONTRACTOR TO SUPPLY AND INSTALL ALL EXTERNAL CONNECTING PIPES.
5. CONTRACTOR RESPONSIBLE FOR INSTALLATION OF ALL RISERS, MANHOLES, AND HATCHES. CONTRACTOR TO GROUT ALL MANHOLES AND HATCHES TO MATCH FINISHED SURFACE UNLESS SPECIFIED OTHERWISE.
6. DRIP OR SPRAY IRRIGATION REQUIRED ON ALL UNITS WITH VEGETATION.

GENERAL NOTES

1. MANUFACTURER TO PROVIDE ALL MATERIALS UNLESS OTHERWISE NOTED.
2. ALL DIMENSIONS, ELEVATIONS, SPECIFICATIONS AND CAPACITIES ARE SUBJECT TO CHANGE. FOR PROJECT SPECIFIC DRAWINGS DETAILING EXACT DIMENSIONS, WEIGHTS AND ACCESSORIES PLEASE CONTACT MANUFACTURER.

TREATMENT FLOW (CFS)	0.462

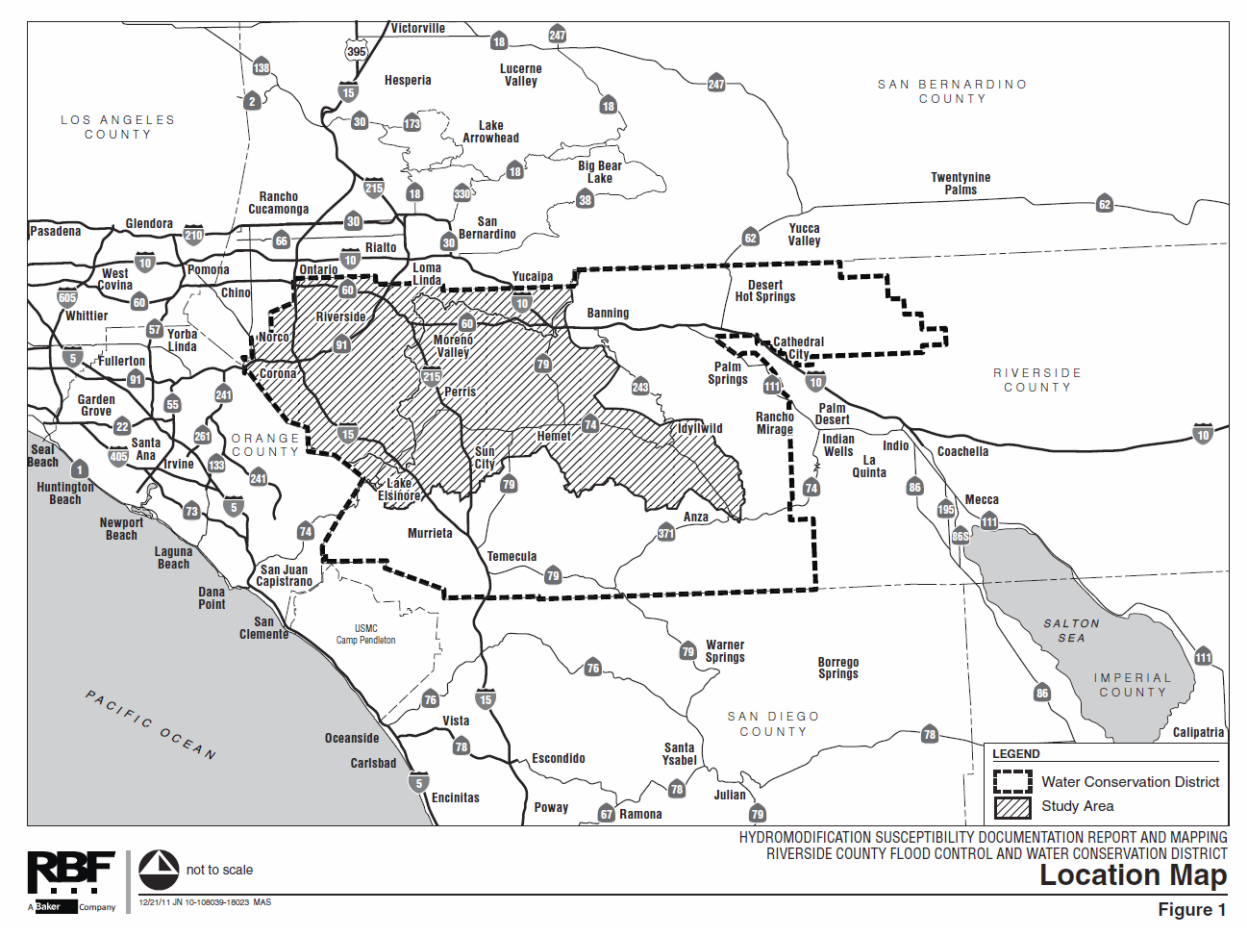
1 INTRODUCTION

This documentation report is part of the larger study for Riverside County Flood Control and Water Conservation District (District) to develop the Watershed Action Plan as required by the current Riverside County Santa Ana Region (SAR) Municipal Separate Storm Sewer System (MS4) Permit Order No. R8-2010-0033, NPDES No. CAS 618033 (MS4 Permit). This project includes the expansion of existing SAR maps to include lined and unlined channels and streams within the SAR Permit area with the goal of identifying those segments of existing stream channels that may be vulnerable to development impacts as required by the MS4 Permit.

1.1 Background

The Riverside SAR MS4 Permit identifies that the District and cities within the SAR (Permittees) shall develop a Watershed Action Plan (WAP) to address the entire Permit Area (see Figure 1). The District is the Principal Permittee for coordination of compliance with the MS4 Permit and is engaged in developing the components of the WAP on behalf of the Permittees. According to Section I of the MS4 Permit, as of 2006 the population of the Permit Area is approximately 1.2 million, occupying an area of approximately 1,396 square miles. The Permittees' MS4s include an estimated 59 miles of above ground channels and 75 miles of underground storm drain channels. The MS4 Permit regulates urban and stormwater runoff from the urban areas within the Santa Ana Regional Water Quality Control Board's jurisdiction, which makes up approximately nineteen percent (19.1%) of the County. All other portions of Riverside County are regulated by the San Diego or Colorado River Basin Regional Water Quality Control Boards.



The WAP will assist the Permittees, as well as the development and environmental communities in the SAR, to integrate water quality and water conservation policies. It also encourages the capture and infiltration of stormwater into groundwater basins and the recharge of Lake Elsinore with treated runoff. According to Section XII.B of the MS4 Permit, the objective of the WAP is to address watershed scale water quality impacts of urbanization in the Permit Area associated with Urban Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs), stream system vulnerability to Hydromodification from Urban Runoff, cumulative impacts of development on vulnerable streams, preservation of Beneficial Uses of streams in the Permit Area, and protection of water resources, including groundwater recharge areas.

As part of the WAP, the Permittees are required to develop a Hydromodification Management Plan (HMP) which includes the delineation of the existing unarmored or soft-armored stream channels in the Permit Area that are identified to be vulnerable to Hydromodification from New Development and Significant Redevelopment projects.

1.2 Hydrologic Condition of Concern (HCOC)

The findings of the MS4 Permit (Section II.G) indicate that an HCOC exists when a site's hydrologic regime is altered and there are significant impacts on downstream stream channels and aquatic habitats, alone or in conjunction with impacts of other projects. Significant development has taken place in Riverside County in the last decade and urban development generally increases runoff volume, velocity, of runoff and the amount of Pollutants in the runoff.

Figure 1: Location Map

Unmitigated high volumes and velocities of discharges from MS4 facilities associated with New Development into natural watercourses from developed areas without needed controls can alter the natural rate of change of a stream and may adversely impact aquatic ecosystems and stream habitat and may cause stream bank erosion and physical modifications. These changes are the result of Hydromodification.

According to Section XII.E.9 of the Permit, a New Development and Significant Redevelopment project does not cause a HCOC if any one of the following conditions is met:

1. The project disturbs less than one acre and is not part of a common plan of development.
2. The volume and the time of concentration of stormwater runoff for the post-development condition is not significantly different from pre-development condition for a 2-year return frequency storm (a difference of 5% or less is considered insignificant). This may be achieved through Site Design and Treatment Control BMPs.
3. All downstream conveyance channels to an Adequate Sump (e.g., Prado Dam, Lake Elsinore, Canyon Lake, Santa Ana River or other lake, reservoir or natural resistant feature) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity, and no sensitive stream habitat areas will be affected; or not identified in the Permittees' Hydromodification sensitivity maps required in Section XII.B, and no sensitive stream habitat areas will be affected.
4. The Permittees may request a variance from these criteria based on studies conducted by the Southern California Monitoring Coalition (SMC), Southern California Coastal Watershed Research Project (SCCWRP), California Association of Stormwater Quality Agencies (CASQA), or other regional studies.

1.3 Goals and Objectives

The goal of this study was to conduct a screening level analysis to identify and map stream channel segments that may be vulnerable to Hydromodification as required by the MS4 Permit. The purpose of mapping the susceptible stream channel segments was to develop a comprehensive map of the MS4 Permit area to assist the District, Co-Permittees, and project proponents to determine whether or not a project will drain to a potentially susceptible stream channel segment and may be subject to the HCOC requirements.

The study was divided into eight tasks:

1. Research and data collection;
2. Delineate and map existing stream channel segments;
3. Define and categorize groups of existing stream channel segments based on common characteristics;
4. Verify groups using provided data and site visits;
5. Identify an appropriate definition for an "engineered and regularly maintained" stream channel segment;
6. Conduct Susceptibility Assessment of the stream channels to identify segments that may be susceptible to Hydromodification;
7. Delineate and map existing hydrology watershed boundaries to stream channel segments that may be susceptible to Hydromodification; and
8. Create the comprehensive HCOC Applicability Map of the MS4 Permit area.

This report documents the methodologies used to determine whether an existing stream channel segment may be susceptible to Hydromodification due to future development. It discusses the delineation of the existing stream channel segments and the watershed areas in the MS4 Permit area. It also provides two

maps: Existing Stream Channel Delineation Map and HCOC Applicability Map as required by Sections II.G.10 and XII.B.4 of the MS4 Permit.

2 EXISTING CHANNEL DELINEATION MAP

This section discusses how the existing stream channels were delineated. It also discusses the grouping system used for the stream channel segments and provides the Existing Stream Channel Delineation Map, see Map 1.

2.1 Research and Data Collection

Data requests were provided to the Permittees (see Table 1) to assist in the collection of background data needed for the delineation of existing channels. The information collected from the Permittees included: aerial photographs, topography, as-built plans, Geographic Information System (GIS) data bases, drainage studies, Federal Emergency Management Agency (FEMA) floodplain studies, and more. The data provided by the Permittees was reviewed and verified for accuracy.

Table 1: Permittees

Principal Permittee	RCFC&WCD (District)	
Co-Permittees	1. Beaumont	9. Lake Elsinore
	2. Calimesa	10. Menifee
	3. Canyon Lake	11. Moreno Valley
	4. Corona	12. Norco
	5. County of Riverside	13. Perris
	6. Eastvale	14. Riverside
	7. Hemet	15. San Jacinto
	8. Jurupa Valley	

2.2 Delineation of Existing Stream Channels

The goal of this task was to delineate all regional stream channels (above and below ground) within the Permit Area. Local stream channels were also mapped if it was found pertinent to determining if a subwatershed drained to a stream channel segment potentially vulnerable to Hydromodification or if "all downstream conveyance channels to an Adequate Sump that will receive runoff from the project" are not vulnerable to Hydromodification.

The existing stream channels were predominately delineated using the District's GIS shapefile called: RCFC_FACILITIES_LINE. This shapefile provided GIS linework for all District above and below ground stream channels. Below ground stream channels are channel segments that convey stormwater in underground drainages structures. Typical underground drainage structures are made of reinforced concrete, corrugated metal, or material of equivalent shear resistance.

Additional stream channels were delineated using GIS shapefiles provided by the Co-Permittees and National Hydrography Dataset (NHD). This additional data was used to fill in gaps found in heavily urbanized and natural areas.

The shapefiles were verified through an investigation of as-built plans and aerial photography. Some stream channel delineations were added solely based on the aerial photography investigation. Any stream channel delineations in question were verified by site visits.

2.3 Existing Stream Channel Groups

To complete the initial mapping, the existing stream channels were categorized into five groups to better describe the individual stream channel segments by common traits. The groups are described below:

1. **Engineered, Fully Hardened and Maintained (EFHM):** This group includes constructed facilities that are fully armored (e.g., concrete, soil cement, riprap rock, etc.) on three sides and verified by as-builts, aerial photographs and/or a site visit. This group includes piped and boxed stream channel segments. The facility must also be maintained and designed based on an engineering criteria (e.g., a specific storm event.)

2. **Engineered, Partially Hardened and Maintained (EPHM):** This group includes constructed facilities that have some armoring (e.g., concrete, soil cement, riprap rock, turf reinforcing mats, etc.) on less than three sides and verified by as-builts, aerial photographs and/or a site visit. The armoring can include bank and/or invert lining that has been placed based on engineering criteria. The facility must also be maintained.

3. **Engineered, Earthen and Maintained (EEM):** This group includes constructed facilities that do not contain armoring but have been engineered to be stable systems and are verified by as-builts. The facility must also be maintained. This group is intended to be channel segments constructed for flood conveyance, which generally have a design capacity in excess of a 10-year storm event.

4. **Not Engineered and Earthen (NEE):** This group includes constructed facilities that are modified by anthropogenic activities, which may include floodplain encroachments by development, culverts, bridges, privately owned bank and/or invert stabilization (such as riprap or other forms of bank protection, roads, etc.) and other man-made modifications to the natural channel system that are not necessarily continuous or designed to meet any specific engineering standard, but have modified the natural hydrologic characteristics of the facility. The improvements may or may not be maintained.

5. **Natural (NAT):** This group includes stream channel facilities that are in a natural state, where the geometry has not been modified. The stream channel facility may or may not be maintained.

2.4 Categorization of Existing Stream Channel Groups

A desktop study was conducted to categorize each individual stream channel segment into one of the above groups. The desktop study included an examination of as-built plans and aerial photography. The segments that were in question were field verified. Field verification included visiting an accessible location along the segment of stream channel. Photographs and notes were taken in regards to the stream channel segment condition and armoring.

Any stream channel facilities that could not be accessed and/or were still in question were discussed and verified with the Permittee with jurisdictional responsibility for the facility.

3 SUSCEPTIBILITY ASSESSMENT

This section discusses the definition for an "engineered and regularly maintained" stream channel and the characteristics of stream channels that are identified to be not susceptible to adverse impacts from Hydromodification.

3.1 Definition for "Engineered and Regularly Maintained"

To satisfy Condition iii from Section XII.E.9.b of the MS4 Permit (refer to Section 1.2 of this Report), an "engineered and regularly maintained "stream channel must be defined. The basic definition is a stream channel facility constructed for storm water conveyance that is owned and maintained by a responsible agency and is not susceptible to adverse impacts from Hydromodification, but a more comprehensive definition is hard to establish because it is subjective. After careful consideration, this study has combined the five stream channel groups (EFHM, EPHM, EEM, NEE, and NAT) into two categories: Potentially Susceptible and Not Susceptible to Hydromodification. The groups themselves can then be used as the term's definition.

The five groups were combined into the two categories as shown below:

1. Not Susceptible

    a. EFHM – The risk for adverse impacts caused by Hydromodification is insignificant due to the armoring of the stream channel segment and the engineered design which would prevent erosion and degradation of the channel.

    b. EPHM - The risk for adverse impacts caused by Hydromodification is very low due to the partial armoring of the stream channel segment and the engineered design which would significantly lower the risk of erosion and degradation of the channel.

    c. EEM - The risk for adverse impacts caused by Hydromodification is low due to the engineered design of the stream channel segment which would lower the risk of erosion and degradation of the channel.

2. Potentially Susceptible

    a. NEE – It cannot be verified that the stream channel segment could handle the changes in runoff volume and duration associated with New Development or Significant Redevelopment without degradation. The risk for adverse impacts caused by Hydromodification is potentially significant. Future technical studies could determine the level of risk of Hydromodification in individual stream channel segments.

    b. NAT – The findings of the MS4 Permit indicate that these stream channel segments are vulnerable to Hydromodification resulting from runoff from New Development or Significant Redevelopment. The risk for adverse impacts caused by Hydromodification is potentially significant. The level of risk may be determined through future technical studies.

3.2 Adequate Sump

An Adequate Sump is a river, reservoir, or basin that provides significant regional flood protection for the downstream watershed areas and mitigates flows such that any New Development or Significant Redevelopment project upstream will not cause a significant change in the downstream flow conditions.

The MS4 Permit identifies Prado Dam, Lake Elsinore, Canyon Lake, and the Santa Ana River as Adequate Sumps.

The Permittees reserve the right to add additional facilities if they are identified to meet the above definition of an Adequate Sump. Mystic Lake, and Lake Matthews have been identified as reservoirs and basins that meet the Adequate Sump criteria. In the future, additional updates to the associated maps may be required in order to reflect the identification of additional Adequate Sumps.

3.3 San Jacinto River

Based on the hydrology assessment and analysis of the 3.8 mile reach of the San Jacinto River upstream of Canyon Lake, it has been determined that the San Jacinto River is a natural resistant feature that exhibits the following characteristics:

- Drainage area higher than 100 square-miles and a 100-year peak discharge higher than 20,000 cfs;
- The natural hydrology and sediment loading of different watercourses within the SAR are significantly impacted by the upstream impoundments, which regulate downstream flow;
- Permittees participate in the National Flood Insurance Program and enforce a floodplain management ordinance to regulate development in mapped flood hazard areas; and
- The low-gradient of this segment of the San Jacinto River are results in deposition of coarse-grained sediments.

Under the existing and future hydrologic conditions, there will be no scouring of the bed and bank of the stream. The additional lines of evidence show that the San Jacinto River is not an HCOC:

- The river has a flat slope and a wide alluvial floodplain;
- A review of historical aerial photographs did not identify lateral migration of the streambed, even though historical urbanization has occurred;
- The production of bed sediment occurs in the San Jacinto Mountain, thus future development in the alluvial floodplain will not impact the production and conveyance of bed sediment to the downstream reaches;
- Field observations did not identify erosion within the bed and banks of the channel. Deposition of sediment within the streambed indicated that the stream exhibits aggradation;
- Dense vegetation is present within the streambed, particularly within the low-flow channel. The vegetation provides a higher resiliency to erosive forces.
- Bed sediment is composed of coarse sand and very fine gravel, which are typical in an alluvial floodplain environment. The bed is predominantly composed of very fine gravel (D50 = 6mm), which provides a high resiliency to erosive forces; and
- The rapid stream assessment concluded that the 3.8-mile segment has a low-risk for future erosion.

The San Jacinto Assessment and is included as Attachment A.

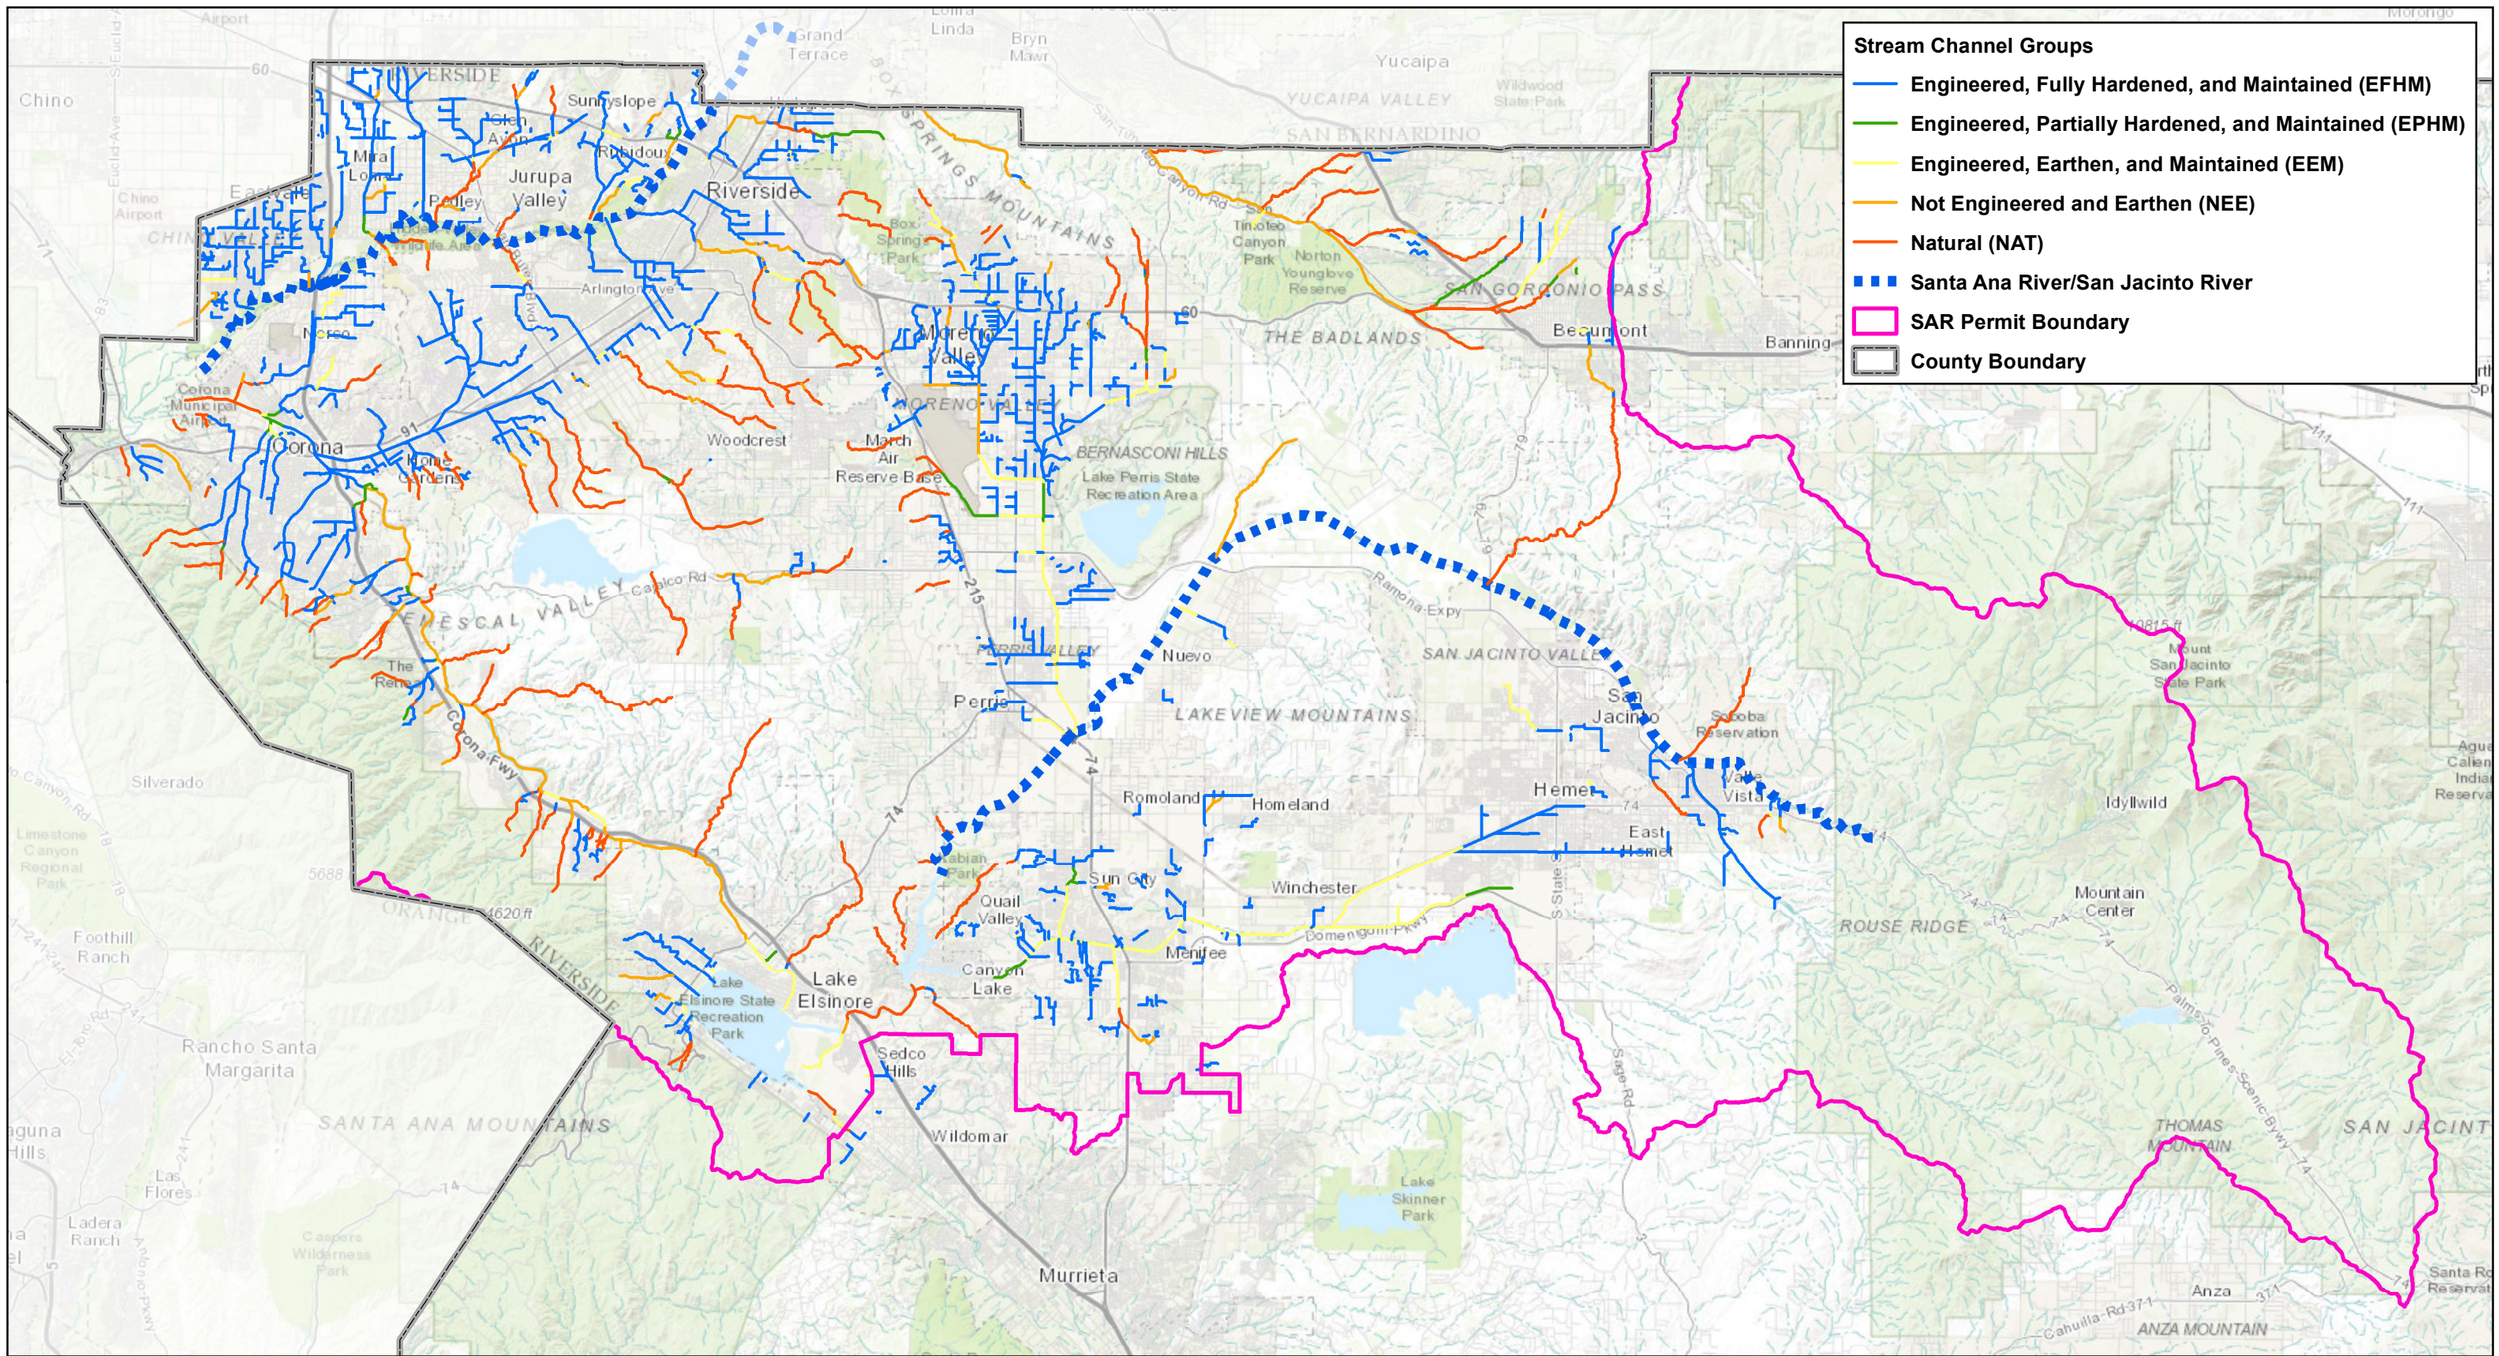
4 APPLICABILITY CRITERIA

This section describes the HCOC applicability criteria and discusses the methodology for determining watershed areas where HCOC requirements may be applicable. The results of the HCOC Applicability Assessment are used to develop a comprehensive map of the MS4 Permit area which identifies those areas that are tributary to potentially susceptible stream channel segments and where runoff from New Development or Significant Redevelopment may cause a HCOC. The HCOC Applicability Map (see Map 2) provides a delineation of the potentially susceptible stream channel segments and the watershed areas that are applicable to the HCOC requirements.

4.1 Delineation of Existing Hydrology Watershed Boundaries

The existing hydrology watershed boundaries were delineated using a desktop approach. The NHD GIS shapefile called: NHDArea, provided GIS linework for the Santa Ana River Basin watershed. The NHD data was compared with Drainage Area Plans and GIS data provided by the Permittees (drainage areas and local system storm drain data) and USGS topography.

The watershed boundaries were simplified using the collected data to delineate areas tributary and adjacent to stream channel segments that are not potentially susceptible to Hydromodification.



4.2 HCOC Applicability Map

The Permit Area has been divided into two different watershed areas: Applicable and Not Applicable. The Not Applicable watershed areas would potentially be excluded from the HCOC requirements. New Development and Significant Redevelopment projects in the "applicable areas" shall continue to determine applicability in accordance with the HCOC requirements in Section XII.E.9 of the MS4 Permit.

- Applicable Watershed Areas – Watershed areas that drain to susceptible stream channels, where future New Development and/or Significant Redevelopment projects may adversely impact downstream erosion, sedimentation, or stream habitat by increasing the volume and/or duration of storm runoff.
    - Susceptible stream channels include watershed areas tributary to:
        - Non-Engineered, Earthen Stream Channels (NEE); and
        - Natural Stream Channels (NAT).
    - New Development and Significant Redevelopment projects that are located within an Applicable Watershed Area should reference the HMP or WQMP for the specific qualifying criteria to meet the HCOC requirements.
- Not Applicable Watershed Areas - Watershed areas that drain directly to an Adequate Sump (e.g., Santa Ana River, Lake Elsinore, Canyon Lake, and Prado Dam) or naturally resistant feature such as the San Jacinto River (see Section 3.3) via a drainage facility that is not susceptible to Hydromodification.
    - Not Susceptible drainage facilities fall under the term "Engineered and Regularly Maintained" per the Permit and includes:
        - Engineered, Fully Hardened and Maintained Drainage Facilities (EFHM);
        - Engineered, Partial Hardened and Maintained Drainage Facilities (EPHM); and
        - Engineered, Earthen and Maintained Drainage Facilities (EEM).

- For New Development or Significant Redevelopment projects in a Not Applicable watershed area, if the site does not drain directly to a mapped stream channel, then the project must show that all downstream conveyance channels to the mapped segment are "engineered and regularly maintained" facilities. Refer to the HMP or WQMP for the specific qualifying criteria to meet the HCOC requirements.

San Jacinto River Study

September 16, 2016
Submitted by:
Santa Ana Region MS4 Permittees

1 INTRODUCTION

The Upper San Jacinto Subwatershed is located on the northeast portion of the SAR. The headwaters of the San Jacinto River originate in the San Jacinto Mountains of San Bernardino County. The downstream point of the Upper San Jacinto Subwatershed is at the confluence of Bautista Creek, Poppet Creek, and the San Jacinto River in the city of San Jacinto. The subwatershed drainage area to this confluence encompasses 190 square miles. The upper portion of the San Jacinto River flows through the San Bernardino National Forest and unincorporated land of Riverside County. The upper portion of the San Jacinto River is about 23 miles long and ranges from the outlet of Lake Hemet and the confluence herein specified.

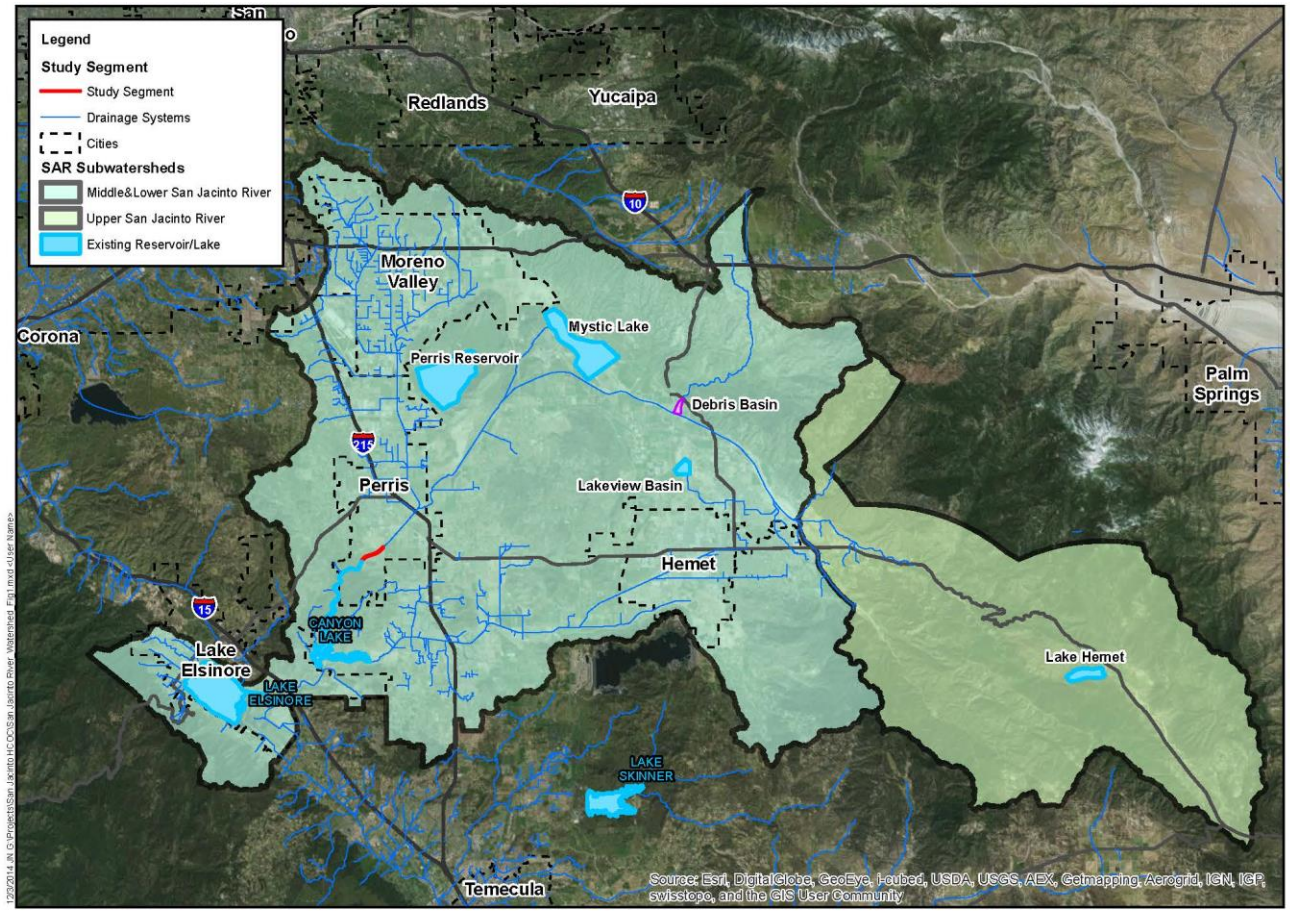
The middle and lower San Jacinto subwatershed is located within the central part of the Santa Ana River (SAR) watershed. The downstream point of the lower San Jacinto subwatershed is the outlet of Lake Elsinore. The drainage area of the middle and lower San Jacinto subwatershed encompasses 510 square miles (approximately 700 sq. miles including the upper subwatershed). The combined middle and lower segments of the San Jacinto River are 35 miles long. Major tributaries to the subwatershed include Potrero Creek, Perris Valley Channel, and Salt Creek Channel. The San Jacinto River flows through the cities of San Jacinto, Perris, Menifee, Canyon Lake, and Lake Elsinore. The upper and middle and lower subwatershed areas are included in Figure 1 below.

The findings of the municipal separate storm sewer system (MS4) Permit (Section II.G) indicate that a Hydrologic Condition of Concern (HCOC) exists when the hydrologic regime of a Priority Development Project (PDP) site is altered resulting in hydromodification of downstream channels and aquatic habitats, alone or in conjunction with impacts of other PDPs.

The San Jacinto River is an example of the following:

- The *Flood Insurance Study: Riverside County, California and Incorporated Areas* (Federal Emergency Management Agency (FEMA), 2014) reports a 100-year 24-hour peak discharge of 24,500 cubic-feet per second and a 692 square-mile watershed at Canyon Lake Spillway;
- The natural hydrology and sediment loading of the San Jacinto River is significantly modified by the reservoirs and Lakes, which provide significant peak flow attenuation and control the sediment discharge. These impoundments include Lake Hemet, Mystic Lake (due to continued subsidence increasing the storage capacity), Canyon Lake, Lake Elsinore (due to reconfiguration of the Lake) and a number of federal and locally built facilities.
- Lower gradients are observed in the San Jacinto River downstream of the existing Army Corps Levee, downstream of the confluence with Bautista Creek to Canyon Lake (less than 0.001 feet/feet). The low-gradient of the San Jacinto River results in deposition of coarse-grained sediments.
- The San Jacinto River exhibits a wide floodplain as illustrated in Figure 6. This floodplain is managed by the Permittees through floodplain management ordinances consistent with the requirements of the National Flood Insurance Program.
- Finally, the SAR is located within the Peninsular Zone per the California Geological Survey. The geology of the Peninsular Zone is characterized by the granitic rocks intruding the older metamorphic rocks, which contributes to the erosion and deposition of coarse-grained sediment

within the San Jacinto River. The San Jacinto River Watershed exhibits similar macro-scale geomorphic trends as the watersheds of Large Rivers within San Diego County.



At the request of the Santa Ana Regional Water Quality Control Board (Santa Ana Regional Board), a stream stability study for the 3.8-mile segment of the San Jacinto River upstream of Canyon Lake was performed (Figure 1) to show that the San Jacinto River is not an HCOC. The reach is representative of the conditions observed along the San Jacinto River, downstream of the confluence with Bautista Creek. The analysis demonstrates that both drainage and stream characteristics provide a basis to exempt the San Jacinto River from the HCOC mitigation requirements.

Investigations included:

- A thorough understanding of the hydrology of the San Jacinto River and its hydraulic infrastructure;
- A review of the sediment processes within the watershed by performing a Geomorphic Landscape Units (GLU) analysis as recommended by Southern California Coastal Watershed Research Project (SCCWRP);
- A review of historical aerial photographs, 1962-2010, depicting the geomorphological evolution of the stream segment, along with adjacent urbanization;
- Field observations of channel morphology, vegetation, bed sediment, and signs of channel degradation if any, at three field assessment sites that are representative of the conditions observed along the 3.8-mile segment;
- A review of both bed sediment and vegetation cover, in terms of resiliency to scouring, at three field assessment sites;
- A Rapid Stream Assessment (RSA) characterizing the future risk for channel degradation.

Figure 1 shows the location of the 3.8 mile study reach and watershed boundaries.

Figure 1 - Watershed Map

2 HYDROLOGY & GEOMORPHICALLY SIGNIFICANT FLOWS

Lake Hemet is the major water storage facility within this subwatershed. The dam was established in 1895 downstream of the Garner Valley Basin and operates on the principles of water supply. In addition to regulating the flow rate downstream the dam acts as a major debris basin.

Mystic Lake provides regulation of flow in the middle and lower San Jacinto River. Mystic Lake is a 200-acre ephemeral lake in the San Jacinto Valley that lies parallel to the San Jacinto River. The lake acts as a natural sump where flows from the San Jacinto River flow into the lake area during moderate to high storm events. Information provided by the Riverside County Flood Control and Water Conservation District (District) indicates that an earthen levee near Mystic Lake was constructed to contain low-flows (5-year storm events and below) within the San Jacinto River channel. Lower frequency events overtop the levees and flow into Mystic Lake. The Application for a Letter of Map Revision (LOMR) for a portion of the San Jacinto River was prepared for submittal to FEMA (Webb, 2010). The LOMR identifies that, when there is significant flooding into the San Jacinto River, flows will "break out" of the low flow channelization of the river and flow towards Mystic Lake. A relatively small amount of runoff is allowed to flow along the channel to the south. Once Mystic Lake is full, storm runoff flows around the small hill that is in the middle of the floodplain. The San Jacinto River comes back together near Davis Road, and flows then progress downstream towards Railroad Canyon. Flood flows recharge the San Jacinto Wildlife Area Waterfowl sites located on the southeastern parts of Mystic Lake's bed (California Department of Fish and Wildlife Project).

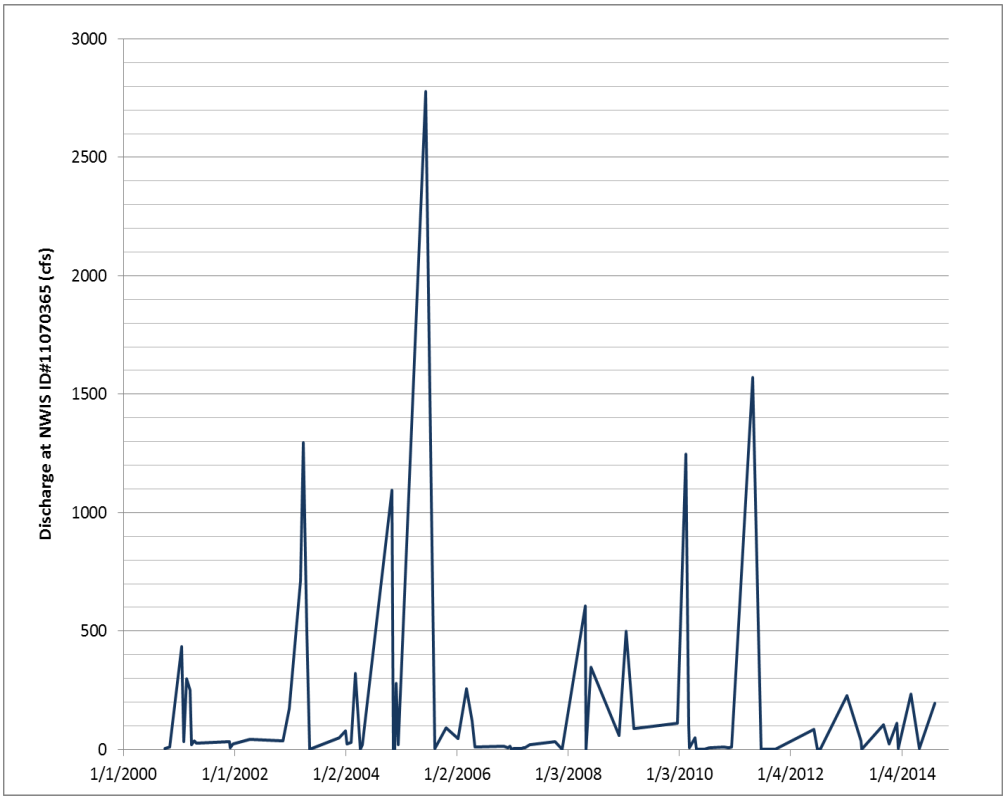
Other physical modifications that affect flow include the construction of the California Interstate 215 Freeway Bridge over the San Jacinto River, which constricts flow creating a backwater condition upstream of the Railroad Canyon Gorge. The existing bridge and culvert crossing have a relatively small conveyance capacity compared to the 100-year flow rate of the San Jacinto River. The road embankment causes a significant backwater upstream of Ramona Expressway. This backwater extends over several thousands of acres into the Mystic Lake area. Within this backwater is a significant storage area that can attenuate peak flows (and corresponding water surfaced elevations) downstream of Ramona Expressway (Webb, 2010).

The stream discharges along San Jacinto River were obtained from FEMA and the District. Table 1 summarizes the 10 year and 100-year peak discharges measured on the San Jacinto River. The peak flow rate along the study reach is in excess of 24,500 cfs for a 100-year storm event. This flow rate exceeds previous standards that have been used to exempt streams from Hydromodification requirements throughout the state. The peak discharges reported in the 2014 Flood Insurance Study were computed on the assumption that Mystic Lake is full, to conservatively ensure the level of flood protection required by the District enrollment in the National Flood Insurance Program.

Table 1 – 2014 Flood Insurance Study Peak Discharge

River Name	Concentration Point	Drainage Area	100-year Flow Rate	10-year Flow Rate
		(sq. mi)	(cfs)	(cfs)
San Jacinto River	At Canyon Lake Spillway	692	24,500[1]	1,200[1]

San Jacinto River	At Escondido Freeway (I-215)	509	22,403[1]	8,737[1]



1 – 2014 FEMA Flood Insurance Study

An evaluation of USGS Streamgage 11070365, located 2,900 feet downstream of Goetz Road on the San Jacinto River, was performed to characterize the actual peak discharges resulting from the engineered levees in the San Jacinto River adjacent to Mystic Lake, the backwater effects caused by the Ramona Expressway bridge and culvert, while not hypothetically assuming that Mystic Lake is full. Limited available data at USGS Streamgage 11070365 extends from October 01, 2000 to November 07, 2014. The maximum discharge observed at the streamgage was approximately 2,780 cfs in December 2005.

A Flood Frequency Analysis (FFA) was performed on daily discharges at gage #11070365. The FFA assumed partial duration series, a 48-hour interval separating two independent events, and the Cunnane plotting position. The assumptions are consistent with FFAs performed on streams in Southern California for flood events that are more frequent than the 10-year flood event. The 2-year discharge and the 10-year discharge equaled 544 cfs and 1,658 cfs, respectively. These actual peak discharges are used as the basis for assessing the resiliency of bed and banks to erosive forces in Section 7.

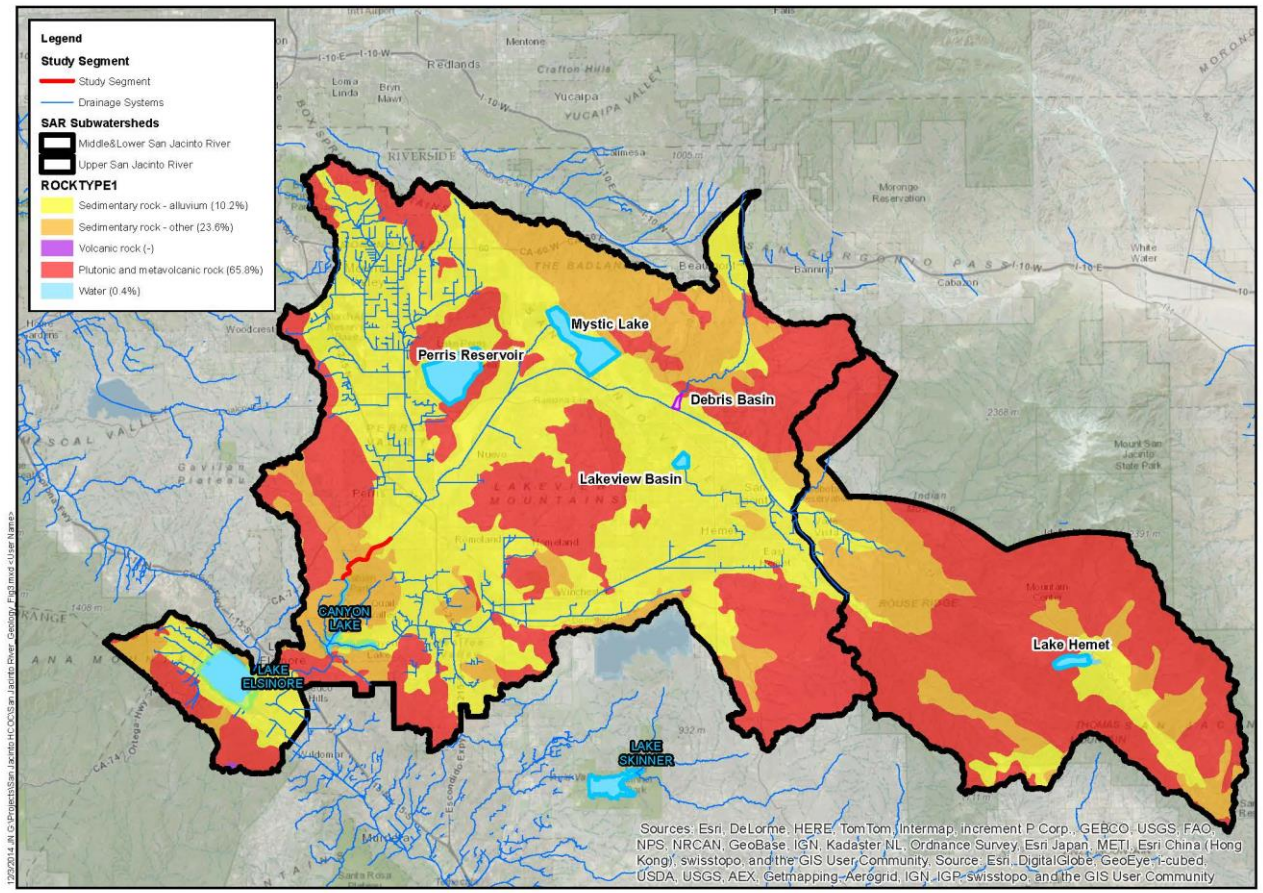
The selection of the 2-year discharge and 10-year discharge is supported by the current state of the science on hydromodification in Southern California. The 2-year discharge has been identified as the dominant discharge by Leopold (1964), i.e. which performs the most work cumulatively on the channel that may result in channel degradation and serves as the basis to the SAR HMP. Additional studies have identified the range of geomorphically-significant flows, i.e. the range of flows that perform 95-percent of the cumulative work on the channel (10-percent of the 2-year discharge to the 10 year discharge). Conservatively, hydraulic computations and the rapid stream assessment of this stream stability study are based on the upper boundary of the range of geomorphically-significant flows, i.e. the 10-year discharge. The construction of Lake Hemet, the operation of historical levees to the San Jacinto River adjacent to Mystic Lake, and the backwater effects caused by the Ramona Expressway bridge all play a major part in attenuating flows into the lower reach of San Jacinto River as seen on the flow records at the streamgage(s) of Figure 2.

Figure 2 - USGS Gage #11070365

3 SEDIMENT DISCHARGE

The evaluation of the sediment discharge along the study reach was prepared using the guideline developed by SCCWRP entitled "Hydromodification Screening Tools: GIS-Based Catchment Analyses of Potential Changes in Runoff and Sediment Discharge" dated March 2010. The report states that three factors were found to exert the greatest influence on the variability of sediment production rates in a watershed:

1. Geology Types;
2. Land Cover; and
3. Hillslope Gradient



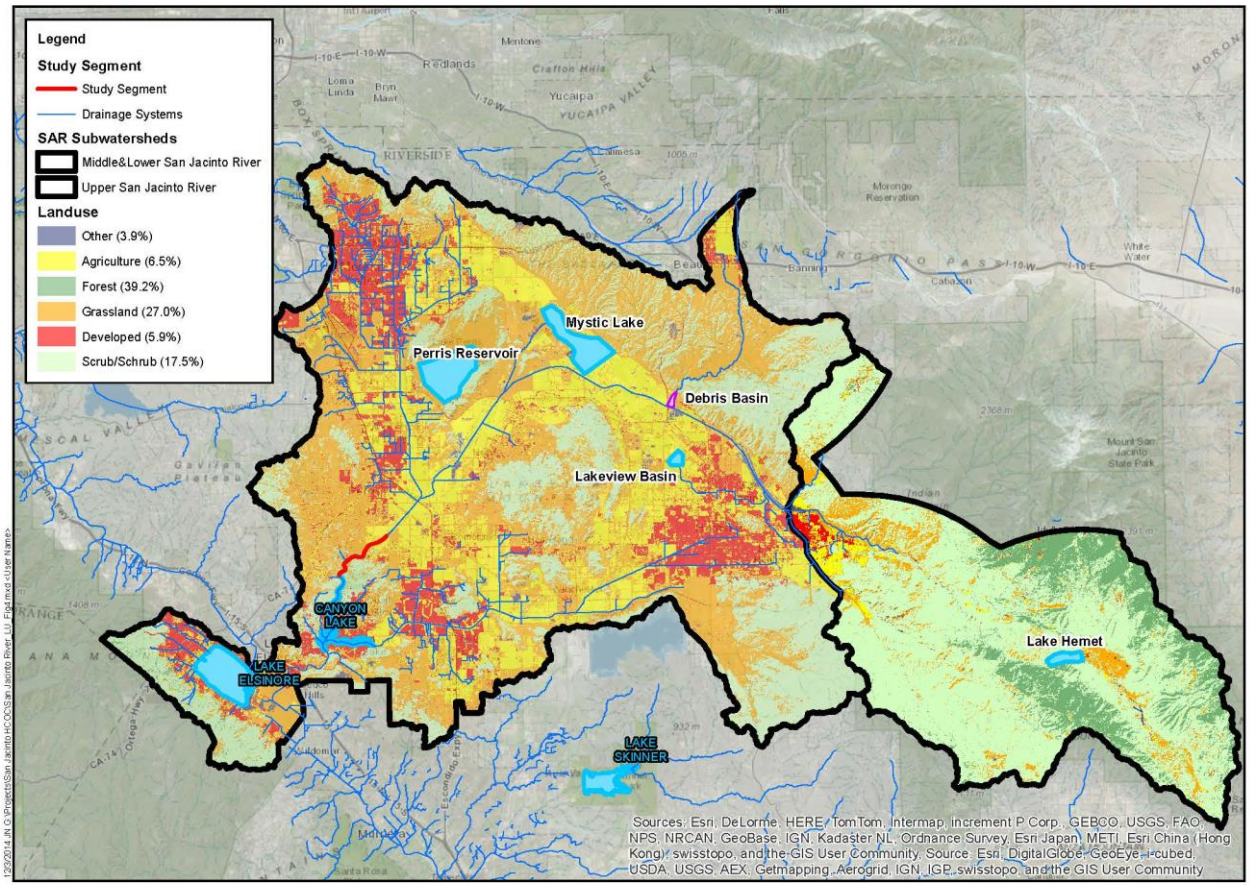
The SCCWRP report used the three factors to create GLUs. In this study the factors were investigated separately.

3.1 Geology Type

The Upper San Jacinto River Subwatershed is dominated by plutonic and metavolcanic rocks (65.8%) in the upper reaches. Lower reaches of the upper San Jacinto River subwatershed, as well as the Lake Hemet plateau, are for the most part made of sedimentary rock, including alluvium, gneiss, argillite, and sandstone. Sedimentary rocks have the highest relative potential for erosion. The presence of Lake Hemet contributes to the capture of coarse grained sediments detached from reaches upstream of the Lake; the clear reservoir outflow increases the potential for erosion along the lower reaches.

The soils present within the middle and lower San Jacinto River valley consist primarily of sedimentary rocks (67.6%). Sedimentary rocks notably account for 50.7% of alluvium and have the highest relative potential for erosion. Plutonic and metavolcanic rocks account for 32.4% of soil types within the middle and lower subwatershed, notably on the Santa Rosa Hills and the Lakeview Mountains that are in proximity to the San Jacinto River. The soil types in the San Jacinto River watershed are illustrated in Figure 3.

Figure 3 - San Jacinto River Watershed Geology Types



3.2 Land Uses

Urbanization potentially leads to reduced sediment supply to a receiving channel, increased runoff discharge and volume, and decreased infiltration. The development of several communities within the subwatershed tributary to the study segment has resulted in an increase in the imperviousness and associated increase in the frequency and flow experienced in the channel. Areas of urban land use (31.6% of the middle and lower San Jacinto River subwatershed) are concentrated within Moreno Valley, the Hemet area down gradient from the Santa Rosa Hills, Menifee and Canyon Lake, as well as the northwest side of Lake Elsinore. Agriculture and grassland remain the predominant land uses within the lowlands of the middle and lower subwatershed, constituting more than 49.1% of the area. Aerial photographs confirmed that several segments of the San Jacinto River have been channelized to convey runoff from the observed urban development.

The Upper San Jacinto Subwatershed is for the most part undeveloped. Valle Vista, along with pockets of development in the upper reaches of the subwatershed, account for 5.9% of the entire drainage area located within Riverside County. Undeveloped areas include forest (39.2%), scrub/shrub (17.5%), grassland (27.0%), and agriculture (6.5%). The low levels of development have contributed to the maintenance of the natural hydrologic response of the subwatershed. The land use types in the San Jacinto River watershed are illustrated in Figure 4.

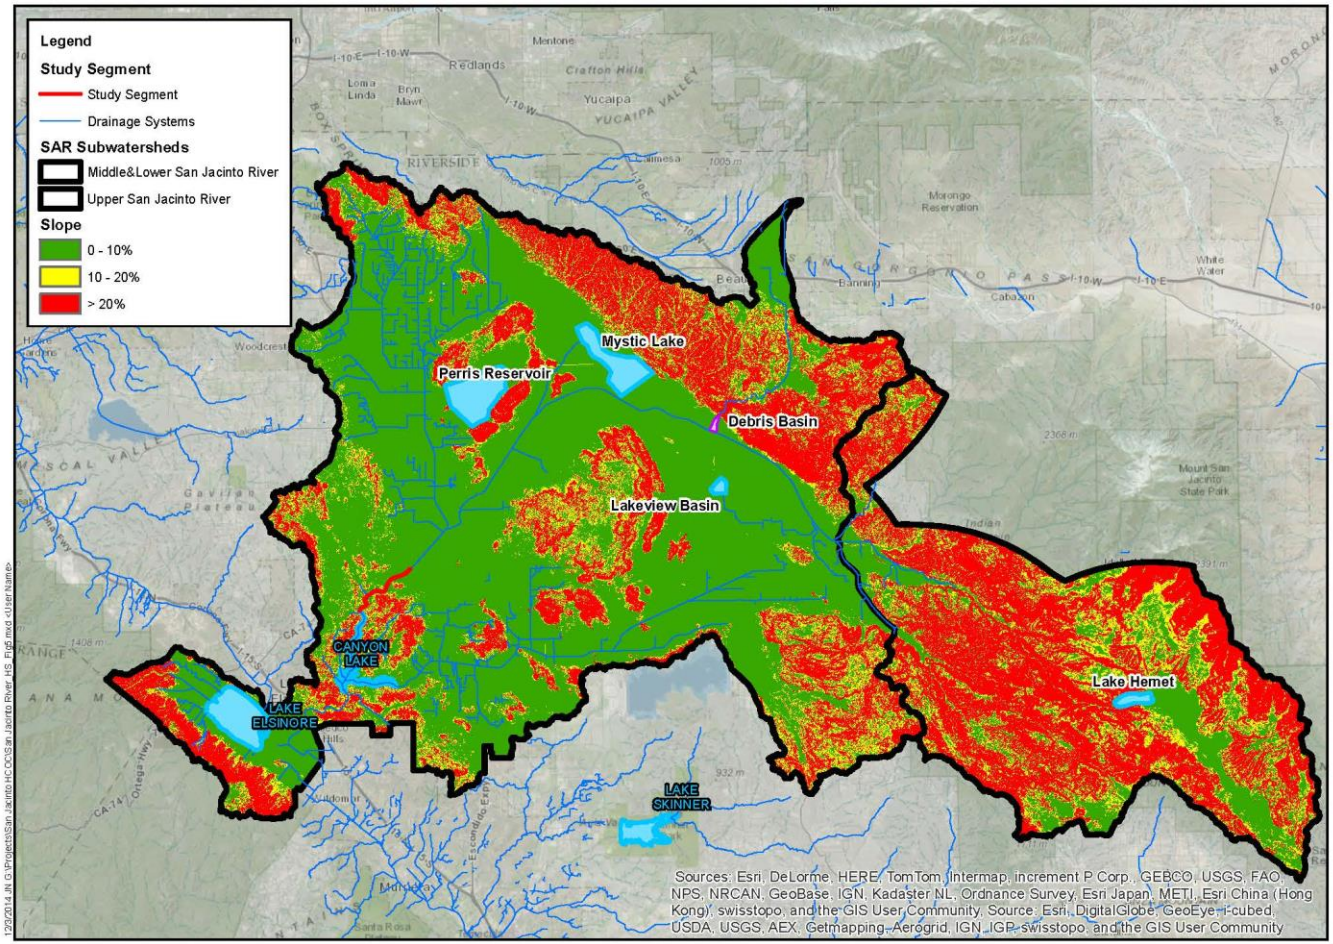


Figure 4 - San Jacinto River Watershed Land use Types

3.3 Hillslope Gradient

The subwatershed areas with a hillslope gradient greater than 21% provide the highest potential for erosion. These areas are concentrated on the upper reaches of the San Jacinto River near the San Jacinto Mountains, the Santa Rosa Hills, the Lakeview Mountains, and the Santa Ana Mountains surrounding Lake Elsinore. Majority of the middle and lower subwatershed has a hillslope gradient of 0-10% and has a lower potential for sediment production. While the majority of the developed land is located in the lower sediment production areas, the construction of the impoundments mentioned in section 1 have effectively obstructed a majority of the coarse sediment produced in high yield areas from reaching the downstream watercourse. The hillslope gradients for the San Jacinto River watershed are illustrated in Figure 5.

Figure 5 - San Jacinto River Watershed Hillslope Gradients

3.4 Sediment Assessment

Most of the sediment within San Jacinto River watershed is produced by the upper watershed where open space land use and steeper slopes are predominant. Most of the sediment produced is captured by Lake Hemet, Mystic Lake, I-215 Freeway Bridge, and a number of federal and locally built facilitates and therefore a small fraction is transported downstream to the lower and middle reaches of the river.

4 CHANNEL FLOODPLAIN

A review of the FEMA Flood Insurance Study (FIS),effective Flood Insurance Rate Maps (FIRMs) dated 08/18/2014 and historical FIRMs dated, 04/15/1980, 11/20/1996, and 08/28/2008 for the study segment indicate little to no change in the floodplain limits. Portions of the floodplain have been revised based on improvements that allow for new development along the study segment.

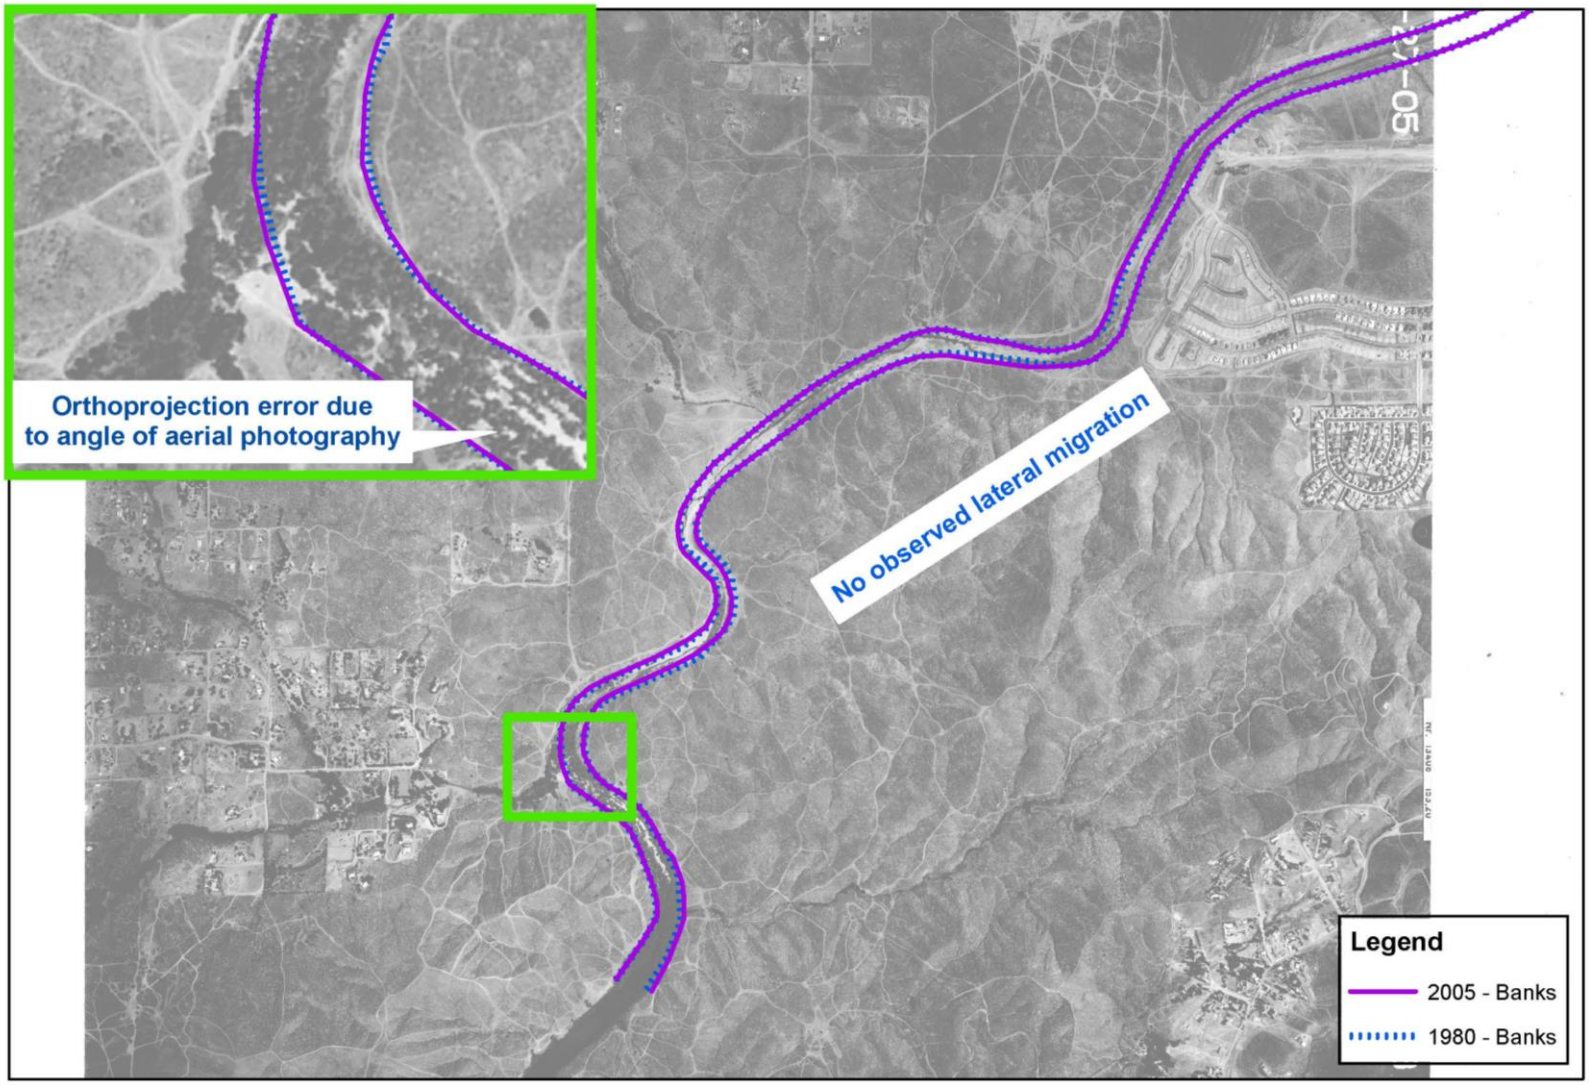
5 HISTORICAL EVOLUTION & LATERAL MIGRATION

A qualitative overview of historical movement and trends was conducted using a sequence of historical aerial photographs (1962-2010), focusing on the planimetric form and relative width as well as the encroachment of urban development and agricultural operations. The results of this historical assessment identified the channel shape as remaining consistent, with no lateral migration being observed.

The 2013 Riverside County Progress Report (RCTLMA, 2013) identifies that significant housing development has occurred within the San Jacinto River watershed between 1980 and 2013. For instance, housing has increased by a factor of 5 and a factor of 6 in the City of San Jacinto and in the City of Perris, respectively. Between 1980 and 2014, the historical aerials do not show any significant lateral migration. As illustrated in Figure 7, there is some lateral migration of the channel, which can be attributed to the ortho-rectification of the historical aerial photographs and the angle at which they were taken. Figure 8 shows that both the width of the stream and the distance to the reference marks have not changed over time.

Historical aerial photographs also show no noticeable erosion on the bed and banks of the channel. In addition, the vegetation within the streambed has remained dense and consistent over time along the study reach. Historical aerial photographs are included in Appendix A.

Figure 7 - Historical Streambank Comparison



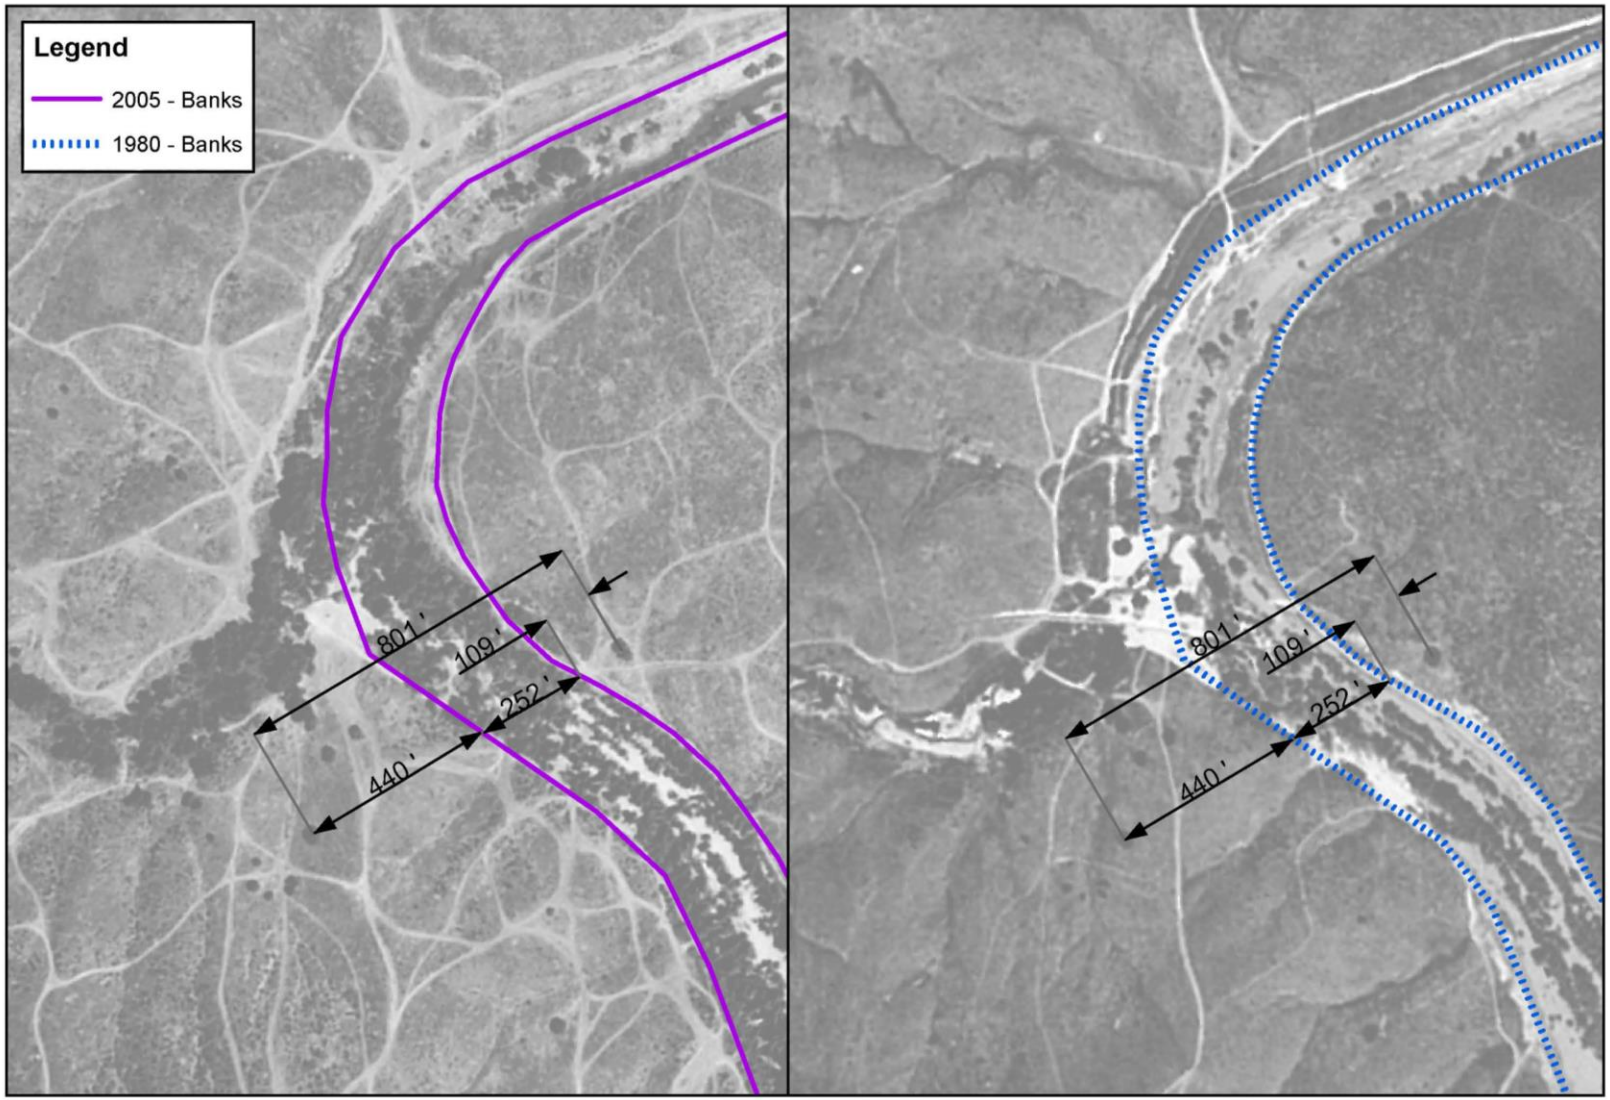


Figure 8 - No Lateral Migration

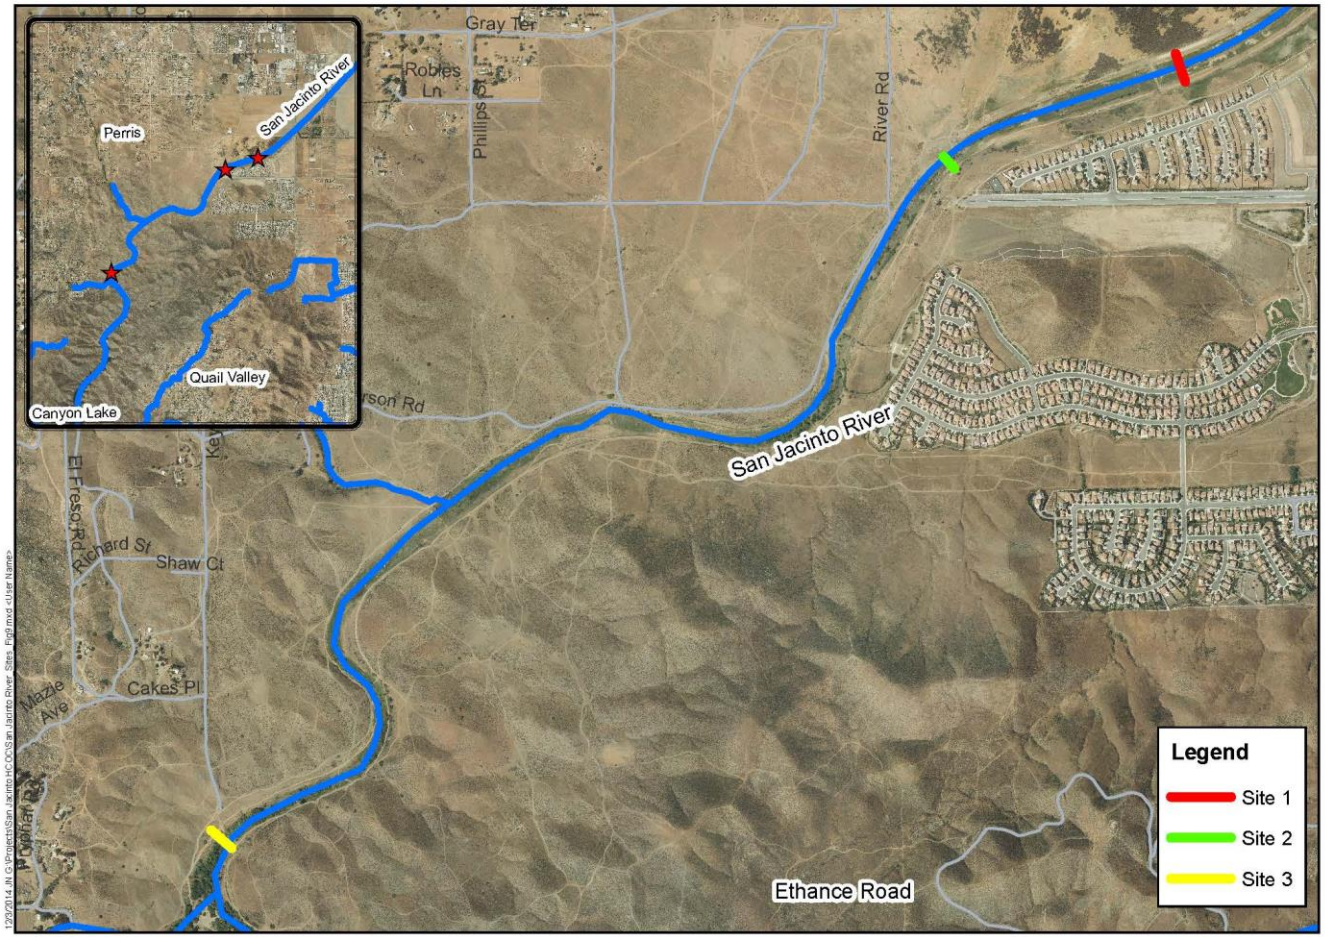
6 FIELD ASSESSMENT

A field assessment was conducted at three sites within the study segment to show that the San Jacinto River is not an HCOC. The geomorphologic condition of the stream segment is based on channel platform/planform and stream features.

The lower San Jacinto River is a meandering channel. Meandering channels act as a natural grade control feature by elongating the channel length and decreasing the slope. The channel slope for the study segment is approximately 0.02%. As the water meanders energy is lost and velocities reduced.



As part of the development of the Canyon Lake community, the upper 1.4-mile of the study segment was improved prior to 1980 to provide 100-year flood protection to the community adjacent to the left bank of the San Jacinto River. The improvements included straightening of a wide and flat channel, construction of a levee on the left bank, establishment and maintenance of vegetation, and creation of a low-flow channel of dense vegetation. Both field assessment sites 1 and 2 are within a segment of improved channel.

Field assessment site 3 is 2.4-mile downstream of field assessment site 2. At this location, the San Jacinto River flows through a canyon of defined topography, meanders, and includes tall and dense vegetation.

The three field assessment sites were selected as they are representative of the conditions found along the 3.8-mile stream segment. Below is a description of the field observations made at each of the field assessment sites.

Figure 9 shows the location of the field assessments.

Figure 9 – Field Assessment Locations

Site 1: The channel at this field assessment site shows no signs of headcutting or channel incision. The channel is fairly vegetated with grass, and trees have grown within the low-flow channel. This location is 3,000 feet downstream of Goetz Road. There is a dip crossing roadway 200 feet downstream of this location. These features act as a hard point and resist erosive forces which help with channel stabilization. The channel width is approximately 200-ft with a bank height of approximately 20-ft. The site location is along an engineered earthen section/levee. The low-flow channel at this location has a capacity of approximately 150 cfs.

Vegetation on the channel banks

Low Flow channel – Looking upstream

Looking downstream at dip crossing

Site 2: This field assessment site is located within the segment of improved channel. There is no active erosion or headcuts visible, the channel is moderately vegetated and the toe of the natural channel bank is in good condition. There is a dip crossing roadway 2,500-foot upstream of this site location. This feature could act as a grade control by reducing the stream slope and flow velocity. The channel bottom width is approximately 130-ft with a height of approximately 25-ft. The low-flow channel is approximately 15-ft wide by 5-ft high. The low-flow channel at this location has a capacity of approximately 340 cfs.

<table>

</tr>
</table>

Site 3: This field assessment site contains some bedrock features along with dense vegetation. There are limited signs of toe erosion along the channel bank (less than 0.5'). The bed sediment is composed of coarser sediment (D50 = 6 mm), as determined by a pebble count analysis. The channel width is uniform at this location. Low-flow channels are braided and separated by tall trees and dense vegetation, although the dominant discharge will submerge the entire bed uniformly. The low-flow channel at this location has a capacity of approximately 870 cfs.

7 BANKS AND STREAMBED ASSESSMENT

7.1 Bank conditions

Channel banks are a significant parameter in determining channel resistance to erosion. Based on the field assessment and desktop aerial study the reach of the San Jacinto River consists of earthen banks with moderate to dense vegetation. Vegetation typically plays a major role in river mechanics which include flow resistance, strengthening of channel banks and restricting sediment. The study reach is 60%-90% covered with vegetation.

Field observations did not identify any noticeable erosion at the three locations along the streambed or on the banks, with the exception of a minimum toe erosion (less than 0.5 feet) of the low flow braided channel at Field Assessment Site 3. The dense and established vegetation provides resiliency to stresses engendered by geomorphically-significant flows. In addition, the field observation identifies coarse bed sediment at field assessment site 3.

Bed sediment deposition was observed in the low-flow channel at the three field assessment sites, and is an indication of potential aggradation of the bed profile.

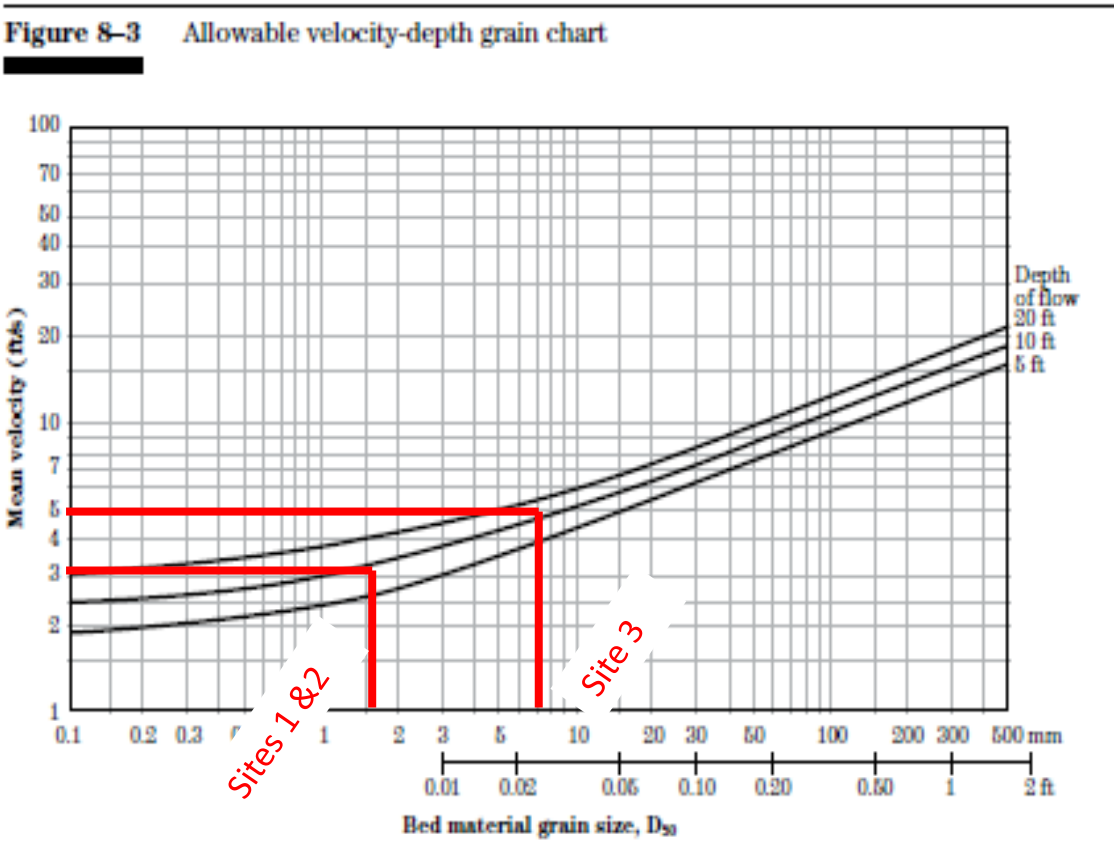
Table 2 – San Jacinto River Bank and streambed conditions

Field Assessment Site	**1**	**2**	**3**
	Bank Conditions		
Bedrock	No	No	No (gravel in low flow bed)
Bank protection	Good (Vegetated)	Good (Vegetated)	None
Vegetation	Dense (60 to 90%)	Dense (60 to 90%)	Dense (40 to 60%)
Stratification	No	No	No
Bank erosion	None	None	None
Toe erosion	None	None	None
	Streambed Conditions		
Headcuts	No	No	No
Degradation	No	No	Less than 0.5’ in low flow channel
Downstream hardpoint	Yes (dip crossing)	No	No

Sediment source	No	No	Yes

7.2 Sediment Composition and Allowable Velocity

The watershed soil characteristics were established to assess the erosion potential incorporating vegetative/land cover and soil. Surface pebble count was performed on October 20, 2014 at the three field assessment sites and found that the channel invert consisted of sand to medium cobble particles.



At field assessment Site 1 (D50 = 1.5 mm) and Site 2 (D50 = 2.0 mm), bed sediment is composed primarily of very coarse sand. Uniform flow computations performed using HEC-RAS show a water surface elevation of 8.57 feet and 8.67 feet for the 10-year flow event, respectively. Uniform flow computations performed using the Flowmaster normal depth model determined a mean flow velocity of 2.40 feet per second and 2.01 feet per second for the 10-year flow event, respectively. Comparatively, the 2014 FEMA FIS for the study segment shows the velocity ranging from 6.2 feet per second to 12.1 feet per second within the 100-year floodway.

At field assessment Site 3 (D50 = 6 mm), bed sediment is primarily composed of fine gravel. Uniform flow computations performed using HEC-RAS show a water surface elevation of 14.58 feet for the 10-year flow event. Uniform flow computations performed using the Flowmaster normal depth model determined a mean flow velocity of 3.36 feet per second for the 10-year flow event, respectively.

The *Allowable velocity-depth grain* chart developed by United States Army Corp of Engineers (USACE) (1991b) identifies the allowable mean velocity of unprotected and non-vegetated stream bed that will not engender any scouring. The chart accounts for the average sediment grain size and the depth of flow. At field assessment site 3, the allowable mean velocity is of 5 feet per second, if the stream was fully unvegetated. At field assessment Sites 1 and 2, the hypothetical allowable mean velocity is of 3 feet per second. Practically, the allowable mean velocity is higher because of the established and maintained vegetation (see Section 6.3).

The evaluated stream segment lies within the alluvial floodplain of the San Jacinto River watershed. Because of its topographic location, the field-verified longitudinal slopes are lower than 0.05-percent, thus the mean velocities associated with the 10-year event do not exceed the allowable mean velocities at the three field assessment sites.

Figure 10 - Allowable velocity-depth grain chart (USACE, 1991)

7.3 Role of Vegetation Allowable Velocity

As part of the development of master-planned community adjacent to the East bank of the study segment, the channel was improved to provide a 100-year flood protection to the community. Channel improvements included the implementation of vegetation to stabilize soils and offer additional resiliency against potential scouring and the construction of a levee to protect the community.

	
Established vegetation on the channel bed	Left bank levee protecting the community

The established and maintained vegetation provides a higher allowable velocity without observing any scouring at field assessment Sites 1 and 2. USACE (1991b) provided allowable velocity criteria for nonscouring channel, which are consistent with the findings of the United States Department of Agriculture (USDA) Agricultural Handbook #667 (1987). At field assessment Sites 1 and 2, grass and vegetation provides an allowable velocity of 4 to 6 feet per second without scouring.

Uniform flow computations at field assessment Sites 1 and 2 show mean flow velocities for the 10-year flow event of 2.4 feet per second and 2.01 feet per second, respectively (see Flowmaster normal depth model results in Appendix B). For the higher boundary of the range of geomorphically significant flows, no scouring is expected at field assessment Sites 1 and 2 because of the heightened resiliency to shear stress provided by the established and maintained vegetation.

7.4 Rapid Stream Assessment

A Rapid Stream Assessment (RSA) was performed for the Study segment. This methodology was created by WEST Consultants (see Appendix D) and also used for stream classification in the San Bernardino County Stormwater Program. The *Channel Assessment and Classification* study was reviewed by the Santa Ana Regional Board (Appendix C of the Phase II Watershed Action Plan, May 2013). The Rapid Stream Risk Classification (RSRC) for Hydromodification Mapping assessed the study segments based on 6 criteria:

1. **Shear Ratio (SR) -** An indicator of channel's bed shear stress sensitivity to increased discharge; Aggradation of bed sediment was observed at each of the three field assessment sites. In addition, the channel was improved and is maintained to prevent from any scouring to occur at locations 1 and 2.

Table 3 - RSA Shear Ratio Results

Stream Name	Field Assessment Site	Slope	Ho	Q_o	SR	Aggradation	Engineered	Risk
San Jacinto River	1	0.0003	8.57	1658	1.30	Yes	Yes	Low
	2	0.0003	8.67	1658	1.23	Yes	Yes	Low
	3	0.0002	14.58	1658	1.15	Yes	No	Medium

Ho – Normal Depth based on bankfull discharge.
Qo – Bankfull Discharge (design discharge)
Risk – Indicates the channel potential to degradation based on shear ratio.

2. **Entrainment Ratio (ER)** - Represents the channel erosion potential;

As identified in Section 6.2, the presence of maintained vegetation at field assessment Sites 1 and 2 allows for high permissible flow velocities, which are higher than the mean flow velocity associated with the 10-year flow event. Similarly, Section 6.3 identifies that very fine gravel is found at field assessment Site 3, which allows for high permissible flow velocities.

Table 4 - RSA Entrainment Ration Results

Stream Name	Field Assessment Site	D50 (mm)	D50 (ft)	V (fps)	ER	Risk
San Jacinto River	1	1.5	0.00	2.4	0.03	Low
	2	2	0.01	2.01	0.01	Low
	3	6	0.02	3.36	0.02	Low

D50 – Median bed sediment size
V – Average velocity of flow within the channel
ER – Entrainment ratio

3. **Geotechnical Stability Number** - measures the lateral channel stability;

Samples of the soil composing the banks were tested for cohesiveness. However, both aggradation of bed sediment was observed at each of the three field assessment sites. In addition, at field assessment sites 1 and 2 the channel was improved and is maintained to prevent scouring.

Table 5 - RSA Geotechnical Stability Number (GSN) Results

Stream Name	Field Assessment Site	Ho	H_o/H_c (GSN)	Aggradation	Engineered	Risk
San Jacinto River	1	8.57	0.45	Yes	Yes	Low
	2	8.67	0.46	Yes	Yes	Low

	3	14.58	0.77	Yes	No	Low

Ho – Normal Depth based on bankfull discharge.
Hc – Critical Bank Height based on cohesion of the in-situ soil properties.
Risk – Measures the potential for bank failure. A low-risk classification indicates the channel banks are engineered to withstand erosive forces.

4. **Confinement Class Number** - measures the amount of room that exists for the channel to actively move lateral and is useful indicator of a channel's vulnerability to erosion;

At field assessment Sites 1 and 2, the improvements of the channel included the construction of a levee offering a 100-year flood protection to the community adjacent to the left bank (looking downstream). The curvature of the channel being rectilinear, it is not expected that the channel will migrate laterally and erode the improved right bank.

At field assessment Site 3, the river flows from an alluvial floodplain to a canyon of more pronounced topography. Because of the curvature of the stream, it is expected that the stream may slightly migrate laterally.

Table 6 - RSA Confinement Class Number Results

Stream Name	Field Assessment Site	W	B	W/B	Risk
San Jacinto River	1	200	17.7	11.30	Medium
	2	316	50	6.32	Medium
	3	217	21.4	10.14	Medium

W – Valley bottom width
B – Channel width

5. **Banks and Streambed Conditions** – identifies the ability of the banks and streambed to resist to erosive stresses

The analysis is described in Section 6.1 and the results are summarized below.

Table 7 - RSA Banks and Streambed Condition Results

Stream Name	Field Assessment Site	Bank Risk	Streambed Risk
San Jacinto River	1	Low	Low
	2	Low	Medium
	3	Low	Medium

Bank Risk - This criterion is based on detailed field observations. In general, the following factors that contribute to banks' resistance to erosion would classify as low-risk: bank stabilization in good condition, presence of bedrock, dense vegetation, highly consolidated bank material, no stratification, no signs of active erosion, toe in good condition. The opposite would classify as high-risk.

Streambed Risk - This criterion is based on detailed field observations to assess the streambed sedimentation/erosion characteristics. A low-risk classification is triggered by the following factors: not braided or sand bed, highly armored, erosion resistant bedrock, no active headcuts, small degradation (< 1 ft.), presence of downstream hard point in good condition (< 100 ft. away), no widening, no aggradation, no obvious sources of sediments from bank failures of upstream sources. The opposite classifies as high-risk.

The overall risks of future erosion determined by the Rapid Stream Assessment are summarized in Table 8. There is a low risk of future erosion at each of three field assessment sites. The low risk for future erosion is supported by channel geometry (large width, flat slope), the presence of dense and maintained vegetation, the presence of coarse bed sediment, and observed aggradation of the bed.

Table 8 - RSA Risk Results

STREAM NAME	FIELD ASSESSMENT SITE	CLASSIFICATION
San Jacinto River	1	Low
	2	Low
	3	Low

8 CONCLUSION

Based on the hydrology assessment and analysis of the 3.8 mile reach of the San Jacinto River upstream of Canyon Lake, it has been determined that the San Jacinto River is a natural resistant feature that exhibits the following characteristics:

- Drainage area higher than 100 square-miles and a 100-year peak discharge higher than 20,000 cfs.
- The natural hydrology and sediment loading of different watercourses within the SAR are significantly impacted by the upstream impoundments, which regulate downstream flow.
- Permittees participate in the National Flood Insurance Program and enforce a floodplain management ordinance to regulate development in mapped flood hazard areas.
- The low-gradient of this segment of the San Jacinto River are results in deposition of coarse-grained sediments.

Under the existing and future hydrologic conditions, there will be no scouring of the bed and bank of the stream at each of the three field assessment sites. The additional lines of evidence support that the San Jacinto River is not an HCOC:

- The river has the characteristic geomorphology of a large river, including a flat slope and a wide alluvial floodplain;
- A review of historical aerial photographs did not identify lateral migration of the streambed, even though historical urbanization has occurred;
- The production of bed sediment occurs in the San Jacinto Mountain, thus future development in the alluvial floodplain will not impact the production and conveyance of bed sediment to the downstream reaches;
- Field observations at the three field assessment sites did not identify erosion within the bed and banks of the channel. Deposition of sediment within the streambed indicated that the stream exhibits aggradation;
- Dense vegetation is present within the streambed, particularly within the low-flow channel. In addition, the 1.4-mile segment of improved channel exhibits permanent and maintained vegetation over its streambed and banks. The vegetation provides a higher resiliency to erosive forces.
- Bed sediment is composed of coarse sand and very fine gravel, which are typical of large rivers in alluvial floodplain environment. At field assessment site 3, the bed is predominantly composed of very fine gravel (D50 = 6mm), which provides a high resiliency to erosive forces;
- The rapid stream assessment concluded that the 3.8-mile segment has a low-risk for future erosion.

The lower San Jacinto River watershed has a very low-gradient which limits the discharge velocity along the channel and decreases the erosive energy that would be shown in steeper streams. The 52-year (1962-2014) historical aerial photographs evaluated show no significant change and the floodplain over the study reach is fairly consistent.

Appendix 8: Source Control

Pollutant Sources/Source Control Checklist

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

How to use this worksheet (also see instructions in Section G of the WQMP Template):

1. Review Column 1 and identify which of these potential sources of stormwater pollutants apply to your site. Check each box that applies.
2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your WQMP Exhibit.
3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in your WQMP. Use the format shown in Table G.1on page 23 of this WQMP Template. Describe your specific BMPs in an accompanying narrative, and explain any special conditions or situations that required omitting BMPs or substituting alternative BMPs for those shown here.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
☒ A. **On-site storm drain inlets**	☒ **Locations of inlets.**	☒ **Mark all inlets with the words "Only Rain Down the Storm Drain" or similar. Catch Basin Markers may be available from the Riverside County Flood Control and Water Conservation District, call 951.955.1200 to verify.**	☒ **Maintain and periodically repaint or replace inlet markings.** ☒ **Provide stormwater pollution prevention information to new site owners, lessees, or operators.** ☒ **See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com** ☒ **Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."**
☐ B. **Interior floor drains and elevator shaft sump pumps**		☐ **State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.**	☐ **Inspect and maintain drains to prevent blockages and overflow.**

❑ I. **Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.)**	❑ **Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area.** ❑ **Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults.** ❑ **Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.**	**Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains.** **Where appropriate, reference documentation of compliance with the requirements of Hazardous Materials Programs for:** ▪ **Hazardous Waste Generation** ▪ **Hazardous Materials Release Response and Inventory** ▪ **California Accidental Release (CalARP)** ▪ **Aboveground Storage Tank** ▪ **Uniform Fire Code Article 80 Section 103(b) & (c) 1991** ▪ **Underground Storage Tank** **www.cchealth.org/groups/hazmat/**	❑ **See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ J. **Vehicle and Equipment Cleaning**	❑ **Show on drawings as appropriate:** **(1) Commercial/industrial facilities having vehicle/equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses.** **(2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use).** **(3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer.** **(4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed.**	❑ **If a car wash area is not provided, describe any measures taken to discourage on-site car washing and explain how these will be enforced.**	**Describe operational measures to implement the following (if applicable):** ❑ **Washwater from vehicle and equipment washing operations shall not be discharged to the storm drain system.** Refer to "Outdoor Cleaning Activities and Professional Mobile Service Providers" for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/ ❑ **Car dealerships and similar may rinse cars with water only.**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ K. **Vehicle/Equipment Repair and Maintenance**	❑ **Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of stormwater.** ❑ **Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas.** ❑ **Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained.**	❑ **State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area.** ❑ **State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.** ❑ **State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.**	**In the Stormwater Control Plan, note that all of the following restrictions apply to use the site:** ❑ **No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinsewater from parts cleaning into storm drains.** ❑ **No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately.** ❑ **No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.** Refer to "Automotive Maintenance & Car Care Best Management Practices for Auto Body Shops, Auto Repair Shops, Car Dealerships, Gas Stations and Fleet Service Operations". Brochure can be found at http://rcflood.org/stormwater/ Refer to Outdoor Cleaning Activities and Professional Mobile Service Providers for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ L. **Fuel Dispensing Areas**	❑ **Fueling areas[6] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of stormwater to the maximum extent practicable.** ❑ **Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area.**		❑ **The property owner shall dry sweep the fueling area routinely.** ❑ **See the Fact Sheet SD-30 , "Fueling Areas" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**

[6] **The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
☒ M. **Loading Docks**	☒ **Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas shall be drained to the sanitary sewer, or diverted and collected for ultimate discharge to the sanitary sewer.** ☐ **Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation.** ☐ **Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer.**		☐ **Move loaded and unloaded items indoors as soon as possible.** ☒ **See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ N. **Fire Sprinkler Test Water**		❑ **Provide a means to drain fire sprinkler test water to the sanitary sewer.**	❑ **See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**
O. **Miscellaneous Drain or Wash Water or Other Sources** ❑ **Boiler drain lines** ❑ **Condensate drain lines** ❑ **Rooftop equipment** ❑ **Drainage sumps** ❑ **Roofing, gutters, and trim.** ❑ **Other sources**		❑ **Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system.** ❑ **Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system.** ❑ **Rooftop equipment with potential to produce pollutants shall be roofed and/or have secondary containment.** ❑ **Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water.** ❑ **Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.** **Include controls for other sources as specified by local reviewer.**	

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE

☒ P. **Plazas, sidewalks, and parking lots.**			☒ **Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.**

Appendix 9: O&M

Operation and Maintenance Plan and Documentation of Finance, Maintenance and Recording Mechanisms

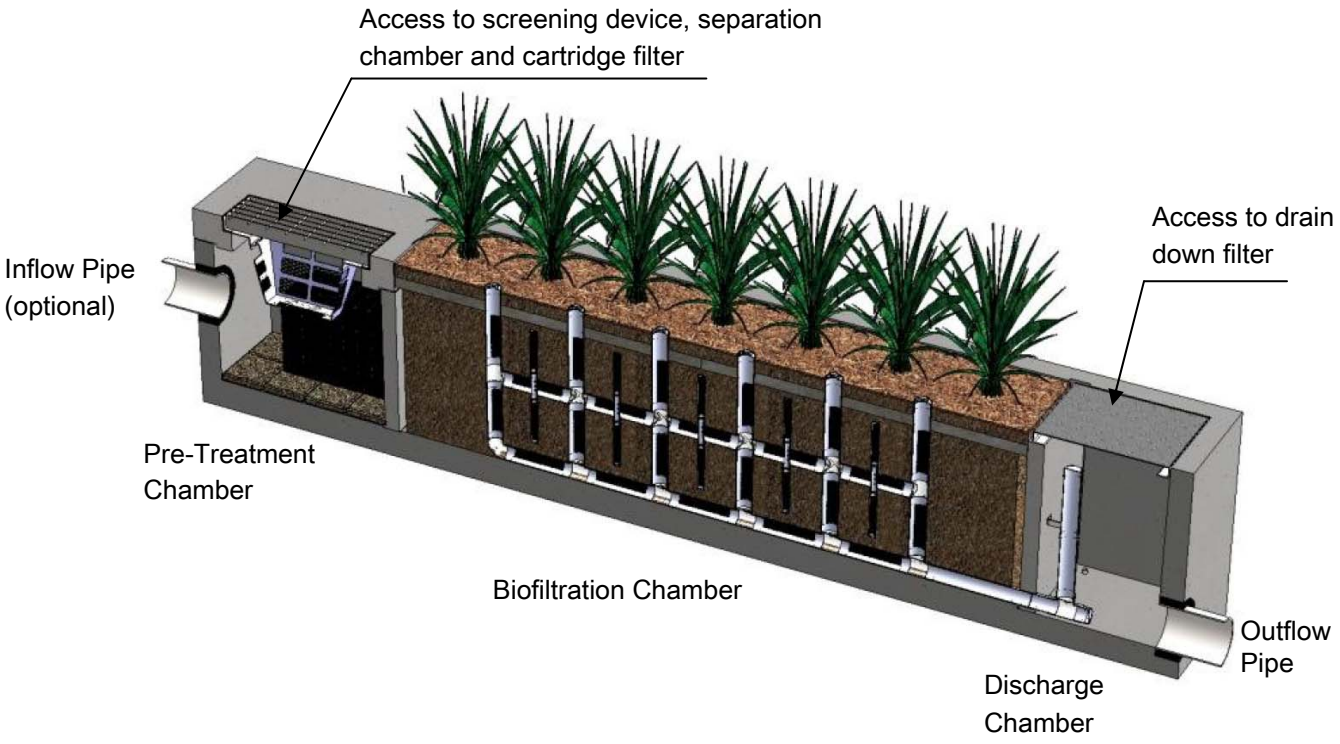
BMP Type	Inspection/Maintenance Required	Minimum Frequency of Activities
Irrigation	Inspect irrigation equipment. Check water sensors and adjust irrigation heads and timing.	Monthly or according to established maintenance schedule
Landscape Areas	Landscape maintenance will consist of trimming and replanting of vegetation, repair and maintenance of irrigation systems, and appropriate use of fertilizers and pesticides.	Monthly or according to established maintenance schedule
Proprietary Biotreatment (MWS)	Inspect for trash and debris in system inlet and outlet. Clean as necessary per manufacturer's recommendations. Inspect and record condition of plants. Replace media surface per manufacturer's recommendations. Cleanout unit per manufacturer's recommendations.	Prior to rainy season, immediately after rainy season, and after any storm events
Storm Drain (Detention System)	Inspect for structural issues, leaks, or damage.	Quarterly and after storm events
Trash Enclosure	Pick up trash on ground and place in receptacles. Close any lids that are left open. Make repairs to structural elements as necessary. Remove accumulations of trash.	Daily to inspect trash lids and dumpster areas. Monthly to inspect structural elements.

Irrigation Systems: Water conservation is to be maintained at all times per the approved irrigation plans. Monitoring of the irrigation system should be provided at least twice monthly or as necessary to ensure that appropriate watering levels are maintained as well as to verify that no piping or irrigation heads are leaking. Any debris, sediment, mineral and grit deposits should be removed from the irrigation system at regular intervals to provide consistent watering.

Landscaped Areas: Open space areas, including unpaved yards, shall be kept free of trash and debris. All trimming, pruning, and removal of fallen organic material from plants, shrubs, and trees are to be collected per an established landscape maintenance plan and disposed in the appropriate location or transported to a green-waste collection facility. The planting materials are to remain as indicated on the approved set of landscape planting plans. Additional actions should be taken to ensure that the surface flow paths, storm drain outlet and inlet in the area are cleared of debris or vegetation obstructions.

Biotreatment: The biotreatment system shall be inspected for erosion, dead vegetation, soggy soils, or standing water. The use of fertilizers and pesticides on the plants inside the Facility should be minimized. Keep adjacent landscape areas maintained, remove clippings from landscape maintenance activities, remove trash and debris, replace damaged grass and/or plants, and replace surface mulch/cobble as needed to maintain a 2-3 inch soil cover. Facilities should be inspected for ponding after storm events. See manufacturer's recommendations.

Storm Drain System: Inlets, outlets, cleanouts, manholes, and pipelines are to be inspected quarterly and after each storm event or according to an existing maintenance program. All parts of the system are to be periodically cleaned to ensure that the system works properly during any storm event. All hardscape, landscape, parking, and driveway areas shall be kept clean, sanitary and free from any accumulation of debris, sediments and waste materials that could enter the storm drain system.



Trash Enclosure: Trash will be removed by the local solid waste management contractor on a weekly basis or as need to avoid overflow for proper disposal to a landfill. Recyclable materials and greenwastes to be processed offsite. The proposed trash enclosure shall be covered with a solid roof per MJPA requirements. And designed to not allow runon from adjoining areas. The trash enclosure is also designed to divert drainage from pavement around the area and walled off to prevent off-site transport of trash. Post signage on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Maintenance Guidelines for Modular Wetland System - Linear

Maintenance Summary

- Remove Trash from Screening Device – average maintenance interval is 6 to 12 months.
  - (*5 minute average service time*).
- Remove Sediment from Separation Chamber – average maintenance interval is 12 to 24 months.
  - (*10 minute average service time*).
- Replace Cartridge Filter Media – average maintenance interval 12 to 24 months.
  - (*10-15 minute per cartridge average service time*).
- Replace Drain Down Filter Media – average maintenance interval is 12 to 24 months.
  - (*5 minute average service time*).
- Trim Vegetation – average maintenance interval is 6 to 12 months.
  - (*Service time varies*).

System Diagram

Maintenance Procedures

Screening Device

1. Remove grate or manhole cover to gain access to the screening device in the Pre-Treatment Chamber. Vault type units do not have screening device. Maintenance can be performed without entry.
2. Remove all pollutants collected by the screening device. Removal can be done manually or with the use of a vacuum truck. The hose of the vacuum truck will not damage the screening device.
3. Screening device can easily be removed from the Pre-Treatment Chamber to gain access to separation chamber and media filters below. Replace grate or manhole cover when completed.

Separation Chamber

1. Perform maintenance procedures of screening device listed above before maintaining the separation chamber.
2. With a pressure washer spray down pollutants accumulated on walls and cartridge filters.
3. Vacuum out Separation Chamber and remove all accumulated pollutants. Replace screening device, grate or manhole cover when completed.

Cartridge Filters

1. Perform maintenance procedures on screening device and separation chamber before maintaining cartridge filters.
2. Enter separation chamber.
3. Unscrew the two bolts holding the lid on each cartridge filter and remove lid.
4. Remove each of 4 to 8 media cages holding the media in place.
5. Spray down the cartridge filter to remove any accumulated pollutants.
6. Vacuum out old media and accumulated pollutants.
7. Reinstall media cages and fill with new media from manufacturer or outside supplier. Manufacturer will provide specification of media and sources to purchase.
8. Replace the lid and tighten down bolts. Replace screening device, grate or manhole cover when completed.

Drain Down Filter

1. Remove hatch or manhole cover over discharge chamber and enter chamber.
2. Unlock and lift drain down filter housing and remove old media block. Replace with new media block. Lower drain down filter housing and lock into place.
3. Exit chamber and replace hatch or manhole cover.

Maintenance Notes

1. Following maintenance and/or inspection, it is recommended the maintenance operator prepare a maintenance/inspection record. The record should include any maintenance activities performed, amount and description of debris collected, and condition of the system and its various filter mechanisms.

2. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time.

3. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.

4. Entry into chambers may require confined space training based on state and local regulations.

5. No fertilizer shall be used in the Biofiltration Chamber.

6. Irrigation should be provided as recommended by manufacturer and/or landscape architect. Amount of irrigation required is dependent on plant species. Some plants may require irrigation.

Maintenance Procedure Illustration

Screening Device

The screening device is located directly under the manhole or grate over the Pre-Treatment Chamber. It's mounted directly underneath for easy access and cleaning. Device can be cleaned by hand or with a vacuum truck.

Separation Chamber

The separation chamber is located directly beneath the screening device. It can be quickly cleaned using a vacuum truck or by hand. A pressure washer is useful to assist in the cleaning process.

Cartridge Filters

The cartridge filters are located in the Pre-Treatment chamber connected to the wall adjacent to the biofiltration chamber. The cartridges have removable tops to access the individual media filters. Once the cartridge is open media can be easily removed and replaced by hand or a vacuum truck.

Drain Down Filter

The drain down filter is located in the Discharge Chamber. The drain filter unlocks from the wall mount and hinges up. Remove filter block and replace with new block.

Trim Vegetation

Vegetation should be maintained in the same manner as surrounding vegetation and trimmed as needed. No fertilizer shall be used on the plants. Irrigation per the recommendation of the manufacturer and or landscape architect. Different types of vegetation requires different amounts of irrigation.

Inspection Checklist

Modular Wetland System Type (Curb, Grate or UG Vault): _____ Size (22', 14' or etc.): _____

Structural Integrity:	**Yes**	**No**	**Comments**
Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?			
Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?			
Working Condition:			
Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?			
Is there standing water in inappropriate areas after a dry period?			
Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?			
Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes, specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber.			Depth:
Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?			Chamber:
Any signs of improper functioning in the discharge chamber? Note issues in comments section.			
Other Inspection Items:			
Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?			
Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.			
Is there a septic or foul odor coming from inside the system?			

Waste:	**Yes**	**No**
Sediment / Silt / Clay		
Trash / Bags / Bottles		
Green Waste / Leaves / Foliage

Appendix 10: Educational Materials

BMP Fact Sheets, Maintenance Guidelines and Other End-User BMP Information

After the Storm

A Citizen's Guide to Understanding Stormwater

What is stormwater runoff?

Stormwater runoff occurs when precipitation from rain or snowmelt flows over the ground. Impervious surfaces like driveways, sidewalks, and streets prevent stormwater from naturally soaking into the ground.

Why is stormwater runoff a problem?

Stormwater can pick up debris, chemicals, dirt, and other pollutants and flow into a storm sewer system or directly to a lake, stream, river, wetland, or coastal water. Anything that enters a storm sewer system is discharged untreated into the waterbodies we use for swimming, fishing, and providing drinking water.

The effects of pollution

Polluted stormwater runoff can have many adverse effects on plants, fish, animals, and people.

- Sediment can cloud the water and make it difficult or impossible for aquatic plants to grow. Sediment also can destroy aquatic habitats.
- Excess nutrients can cause algae blooms. When algae die, they sink to the bottom and decompose in a process that removes oxygen from the water. Fish and other aquatic organisms can't exist in water with low dissolved oxygen levels.
- Bacteria and other pathogens can wash into swimming areas and create health hazards, often making beach closures necessary.

- Debris—plastic bags, six-pack rings, bottles, and cigarette butts—washed into waterbodies can choke, suffocate, or disable aquatic life like ducks, fish, turtles, and birds.
- Household hazardous wastes like insecticides, pesticides, paint, solvents, used motor oil, and other auto fluids can poison aquatic life. Land animals and people can become sick or die from eating diseased fish and shellfish or ingesting polluted water.
- Polluted stormwater often affects drinking water sources. This, in turn, can affect human health and increase drinking water treatment costs.

Stormwater Pollution Solutions

Residential

Recycle or properly dispose of household products that contain chemicals, such as insecticides, pesticides, paint, solvents, and used motor oil and other auto fluids. Don't pour them onto the ground or into storm drains.

Lawn care

Excess fertilizers and pesticides applied to lawns and gardens wash off and pollute streams. In addition, yard clippings and leaves can wash into storm drains and contribute nutrients and organic matter to streams.

- Don't overwater your lawn. Consider using a soaker hose instead of a sprinkler.
- Use pesticides and fertilizers sparingly. When use is necessary, use these chemicals in the recommended amounts. Use organic mulch or safer pest control methods whenever possible.
- Compost or mulch yard waste. Don't leave it in the street or sweep it into storm drains or streams.
- Cover piles of dirt or mulch being used in landscaping projects.

Auto care

Washing your car and degreasing auto parts at home can send detergents and other contaminants through the storm sewer system. Dumping automotive fluids into storm drains has the same result as dumping the materials directly into a waterbody.

- Use a commercial car wash that treats or recycles its wastewater, or wash your car on your yard so the water infiltrates into the ground.
- Repair leaks and dispose of used auto fluids and batteries at designated drop-off or recycling locations.

Septic systems

Leaking and poorly maintained septic systems release nutrients and pathogens (bacteria and viruses) that can be picked up by stormwater and discharged into nearby waterbodies. Pathogens can cause public health problems and environmental concerns.

- Inspect your system every 3 years and pump your tank as necessary (every 3 to 5 years).
- Don't dispose of household hazardous waste in sinks or toilets.

Pet waste

Pet waste can be a major source of bacteria and excess nutrients in local waters.

- When walking your pet, remember to pick up the waste and dispose of it properly. Flushing pet waste is the best disposal method. Leaving pet waste on the ground increases public health risks by allowing harmful bacteria and nutrients to wash into the storm drain and eventually into local waterbodies.

Education is essential to changing people's behavior. Signs and markers near storm drains warn residents that pollutants entering the drains will be carried untreated into a local waterbody.

Residential landscaping

Permeable Pavement—Traditional concrete and asphalt don't allow water to soak into the ground. Instead these surfaces rely on storm drains to divert unwanted water. Permeable pavement systems allow rain and snowmelt to soak through, decreasing stormwater runoff.

Rain Barrels—You can collect rainwater from rooftops in mosquito-proof containers. The water can be used later on lawn or garden areas.

Rain Gardens and Grassy Swales—Specially designed areas planted with native plants can provide natural places for rainwater to collect and soak into the ground. Rain from rooftop areas or paved areas can be diverted into these areas rather than into storm drains.

Vegetated Filter Strips—Filter strips are areas of native grass or plants created along roadways or streams. They trap the pollutants stormwater picks up as it flows across driveways and streets.

Commercial

Dirt, oil, and debris that collect in parking lots and paved areas can be washed into the storm sewer system and eventually enter local waterbodies.

- Sweep up litter and debris from sidewalks, driveways and parking lots, especially around storm drains.
- Cover grease storage and dumpsters and keep them clean to avoid leaks.
- Report any chemical spill to the local hazardous waste cleanup team. They'll know the best way to keep spills from harming the environment.

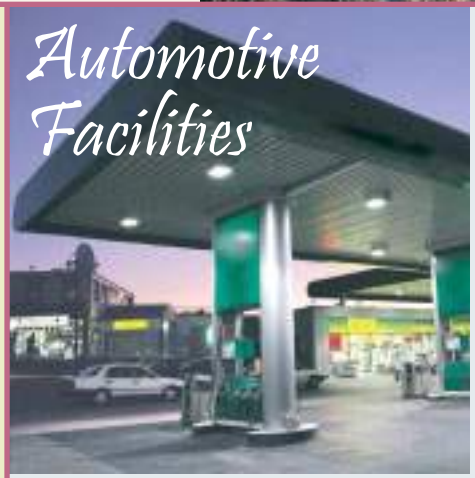
Erosion controls that aren't maintained can cause excessive amounts of sediment and debris to be carried into the stormwater system. Construction vehicles can leak fuel, oil, and other harmful fluids that can be picked up by stormwater and deposited into local waterbodies.

- Divert stormwater away from disturbed or exposed areas of the construction site.
- Install silt fences, vehicle mud removal areas, vegetative cover, and other sediment and erosion controls and properly maintain them, especially after rainstorms.
- Prevent soil erosion by minimizing disturbed areas during construction projects, and seed and mulch bare areas as soon as possible.

Construction

Agriculture

Lack of vegetation on streambanks can lead to erosion. Overgrazed pastures can also contribute excessive amounts of sediment to local waterbodies. Excess fertilizers and pesticides can poison aquatic animals and lead to destructive algae blooms. Livestock in streams can contaminate waterways with bacteria, making them unsafe for human contact.



- Keep livestock away from streambanks and provide them a water source away from waterbodies.
- Store and apply manure away from waterbodies and in accordance with a nutrient management plan.
- Vegetate riparian areas along waterways.
- Rotate animal grazing to prevent soil erosion in fields.
- Apply fertilizers and pesticides according to label instructions to save money and minimize pollution.

Forestry

Improperly managed logging operations can result in erosion and sedimentation.

- Conduct preharvest planning to prevent erosion and lower costs.
- Use logging methods and equipment that minimize soil disturbance.
- Plan and design skid trails, yard areas, and truck access roads to minimize stream crossings and avoid disturbing the forest floor.
- Construct stream crossings so that they minimize erosion and physical changes to streams.
- Expedite revegetation of cleared areas.

Automotive Facilities

Uncovered fueling stations allow spills to be washed into storm drains. Cars waiting to be repaired can leak fuel, oil, and other harmful fluids that can be picked up by stormwater.

- Clean up spills immediately and properly dispose of cleanup materials.
- Provide cover over fueling stations and design or retrofit facilities for spill containment.
- Properly maintain fleet vehicles to prevent oil, gas, and other discharges from being washed into local waterbodies.
- Install and maintain oil/water separators.

Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. Fats, oils and grease from restaurants and food service facilities can cause sewer line blockages that may result in sewage overflow into your facility and into storm drains. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways and should never contain washwater, trash, grease or other materials.

You would never dump oil and trash into the ocean, so don't let it enter the storm drains. Follow these tips to help prevent water pollution.

For more information,
please call the
Orange County Stormwater Program
at **1-877-89-SPILL** (1-877-897-7455)
or visit

Help Prevent Ocean Pollution:

Tips for the Food Service Industry

The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Best Kitchen Practices

Food Waste Disposal

- Scrape food waste off of plates, utensils, pots, food preparation and cooking areas and dispose of it in the trash.
- Never put food waste down the drain. Food scraps often contain grease, which can clog sewer pipes and result in sewage backups and overflows.

Grease & Oil Disposal

- Never put oil or grease down the drain. Contain grease and oil by using covered grease storage containers or installing a grease interceptor.
- Never overfill your grease storage container or transport it without a cover.
- Grease control devices must be emptied and cleaned by permitted companies.
- Keep maintenance records on site.

- For a list of oil/grease recycling companies, contact the CIWMB at **www.ciwmb.ca.gov/foodwaste/render.htm** or contact your local sanitation district.

Minor Spill Cleanup

- Always use dry cleanup methods, such as a rag, damp mop or broom.
- Never hose a spill into the street, gutter or storm drain.

Major Spill Cleanup

- Have spill containment and clean-up kits readily available, and train all employees on how to use them.
- Immediately contain and clean the spill using dry methods.
- If the spill leaves your site, call **(714) 567-6363**.

Dumpster Cleanup

- Pick up all debris around the dumpster.
- Always keep the lid on the dumpster closed.

- Never pour liquids into the dumpster or hose it out.

Floor Mat Cleaning

- Sweep the floor mats regularly, discarding the debris into the trash.
- Hose off the mats in a mop sink, at a floor drain, or in an outdoor area that can contain the water.

- Never hose the mats in an area where the wastewater can flow to the street, gutter or storm drain.

Washwater Disposal

- Dispose of washwater in a mop sink or an area with a floor drain.
- Never dispose of washwater in the street, gutter or storm drain.

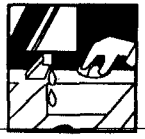
What Communities Can Do

What Communities Can Do

A water supplier or wastewater system operator (public or private) has cost-effective options to process and deliver water more efficiently. A community can do the same, and can foster ways to use water wisely.



Not all of these steps are expensive. The best choices vary by region and by community; start by asking if these are appropriate where you live and work.

A Water Supplier or Wastewater Processor Can:

- ☞ Identify who uses water, and reduce unaccounted-for water use.
- ☞ Find and repair leaking pipes.
- ☞ Consider a new pricing scheme which encourages conservation.
- ☞ Reduce excess pressure in water lines.
- ☞ Explore the reuse of treated wastewater for uses other than drinking water.
- ☞ Charge hookup fees which encourage more efficient water use in new buildings.
- ☞ Build water efficiency into future demand projections, facility planning, and drought planning.

A Community Can:

- ☞ Adopt plumbing and building codes that require water-efficient equipment and practices.
- ☞ Adopt a water-efficient landscaping ordinance to reduce the water used for golf courses and commercial landscapes.
- ☞ Retrofit older buildings with water-efficient equipment, starting with public buildings.
- ☞ Reduce municipal water use for landscaping and other uses.
- ☞ Conduct a public education campaign.
- ☞ Require developers to build in water efficiency measures.

Other Reasons to Use Water Wisely

Preventing pollution is only one reason why using water efficiently makes sense. Here are a few more:

Money Saved

- Less water use results in fewer pumping and treatment costs.
- Saving money on water and wastewater operations frees money for meeting water quality, public health and water treatment goals.
- Water saved is also energy, and money, saved for you and your community.

Improved Reliability

- Water conservation provides a hedge against drought impacts.
- Improving water efficiency may be quicker and cheaper than developing a new supply.
- Reduced water use may extend the life of your water or wastewater facility.
- Reduced water use may increase the efficiency of wastewater treatment, and reduce overflows during storms.
- Communities which use water efficiently are better prepared to cope with effects of possible future climate change.

What Individuals Can Do

More efficient water use begins with individuals, in the home and place of work. Taking these and other steps, and encouraging others to do so, makes good economic as well as environmental sense.

In The Home

- Install a toilet dam or plastic bottle in your toilet tank.
- Install a water-efficient showerhead (2.5 gallons or less per minute).
- When you buy a new toilet, purchase a low flow model (1.6 gallons or less per flush).

Outdoors

- Water in the morning or evening, to minimize evaporation.
- Install a drip-irrigation watering system for valuable plants.
- Use drought-tolerant plants and grasses for landscaping, and reduce grass-covered areas.

At Work or School

- Adopt the same water-saving habits that are effective at home.
- Ask about installing water-efficient equipment and reducing outdoor water use.
- Encourage employers to explore the use of recycled "gray-water" or reclaimed wastewater.

How Efficient Water Use Helps Prevent Pollution

Using water more efficiently can help prevent pollution as well as protect and conserve our finite water resources. More efficient water use by you and your community has many other benefits.

Fewer Pollutants

- Using less water reduces the amount of wastewater discharged into our lakes, streams, rivers, and marine waters.
- The amount of pollutants wastewater carries can also be reduced, as treatment efficiency improves.
- Recycled process water can reduce pollutants from industry.
- More efficient irrigation can minimize runoff of agricultural pollutants and reduce the use of fertilizers and pesticides.

Protection of Aquatic Habitats

- Building fewer and smaller new water projects can help preserve wetlands, which naturally treat pollutants.
- Diverting less water preserves more streamflow to maintain a healthy aquatic environment.

Protection of Drinking Water Sources

- Less pumping of groundwater lowers the chance that pollutants will be drawn into a water supply well.
- With less water use, septic system performance can improve, reducing the risk of groundwater contamination.
- Highest quality water sources are preserved for drinking water by using treated wastewater for other uses.

Energy Conservation

- Efficient water use means less power needed to pump and treat water and wastewater.
- Less water use reduces the amount of energy required for heating hot water.
- Less energy demand results in fewer harmful by-products from power plants.

Preventing water pollution at your commercial/industrial site

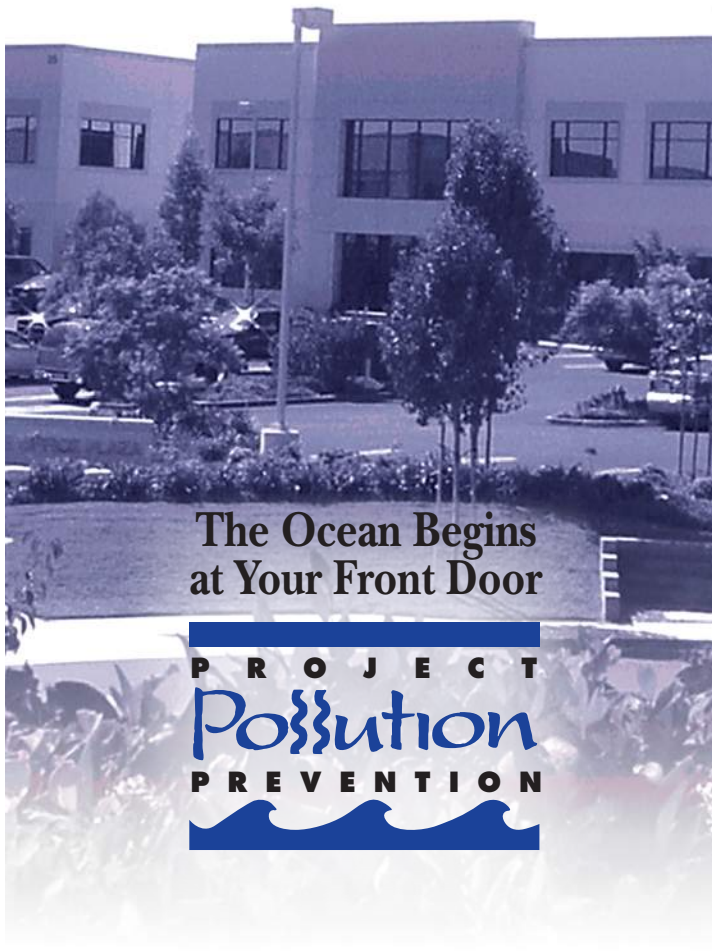
Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many landscape and building maintenance activities can lead to water pollution if you're not careful. Paint, chemicals, plant clippings and other materials can be blown or washed into storm drains that flow to the ocean. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never pour soap or fertilizers into the ocean, so why would you let them enter the storm drains? Follow these easy tips to help prevent water pollution.

Some types of industrial facilities are required to obtain coverage under the State General Industrial Permit. For more information visit: **www.swrcb.ca.gov/stormwater/industrial.html**

For more information, please call the **Orange County Stormwater Program** at **1-877-89-SPILL** (1-877-897-7455) or visit **www.ocwatersheds.com**

To report a spill, call the **Orange County 24-Hour Water Pollution Problem Reporting Hotline** at **1-877-89-SPILL** (1-877-897-7455).



For emergencies, dial 911.

Help Prevent Ocean Pollution:

Proper Maintenance Practices for Your Business

The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Proper Maintenance Practices for your Business

Landscape Maintenance

- Compost grass clippings, leaves, sticks and other vegetation, or dispose of it at a permitted landfill or in green waste containers. Do not dispose of these materials in the street, gutter or storm drain.
- Irrigate slowly and inspect the system for leaks, overspraying and runoff. Adjust automatic timers to avoid overwatering.
- Follow label directions for the use and disposal of fertilizers and pesticides.
- Do not apply pesticides or fertilizers if rain is expected within 48 hours or if wind speeds are above 5 mph.
- Do not spray pesticides within 100 feet of waterways.
- Fertilizers should be worked into the soil rather than dumped onto the surface.
- If fertilizer is spilled on the pavement or sidewalk, sweep it up immediately and place it back in the container.

Building Maintenance

- Never allow washwater, sweepings or sediment to enter the storm drain.
- Sweep up dry spills and use cat litter, towels or similar materials to absorb wet spills. Dispose of it in the trash.
- If you wash your building, sidewalk or parking lot, you **must** contain the water. Use a shop vac to collect the water and contact your city or sanitation agency for proper disposal information. Do not let water enter the street, gutter or storm drain.
- Use drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of materials in the trash.
- Use a ground cloth or oversized tub for mixing paint and cleaning tools.
- Use a damp mop or broom to clean floors.
- Cover dumpsters to keep insects, animals, rainwater and sand from entering. Keep the area around the dumpster clear of trash and debris. Do not overfill the dumpster.
- Call your trash hauler to replace leaking dumpsters.
- Do not dump any toxic substance or liquid waste on the pavement, the ground, or near a storm drain. Even materials that seem harmless such as latex paint or biodegradable cleaners can damage the environment.

Never Dispose of Anything in the Storm Drain.

- Recycle paints, solvents and other materials. For more information about recycling and collection centers, visit **www.oclandfills.com**.
- Store materials indoors or under cover and away from storm drains.
- Use a construction and demolition recycling company to recycle lumber, paper, cardboard, metals, masonry, carpet, plastic, pipes, drywall, rocks, dirt, and green waste. For a listing of construction and demolition recycling locations in your area, visit **www.ciwmb.ca.gov/recycle.**
- Properly label materials. Familiarize employees with Material Safety Data Sheets.

Protecting Water Quality *from* URBAN RUNOFF

Clean Water Is Everybody's Business

In urban and suburban areas, much of the land surface is covered by buildings and pavement, which do not allow rain and snowmelt to soak into the ground. Instead, most developed areas rely on storm drains to carry large amounts of runoff from roofs and paved areas to nearby waterways. The stormwater runoff carries pollutants such as oil, dirt, chemicals, and lawn fertilizers directly to streams and rivers, where they seriously harm water quality. To protect surface water quality and groundwater resources, development should be designed and built to minimize increases in runoff.

The most recent National Water Quality Inventory reports that runoff from urbanized areas is the leading source of water quality impairments to surveyed estuaries and the third-largest source of impairments to surveyed lakes.

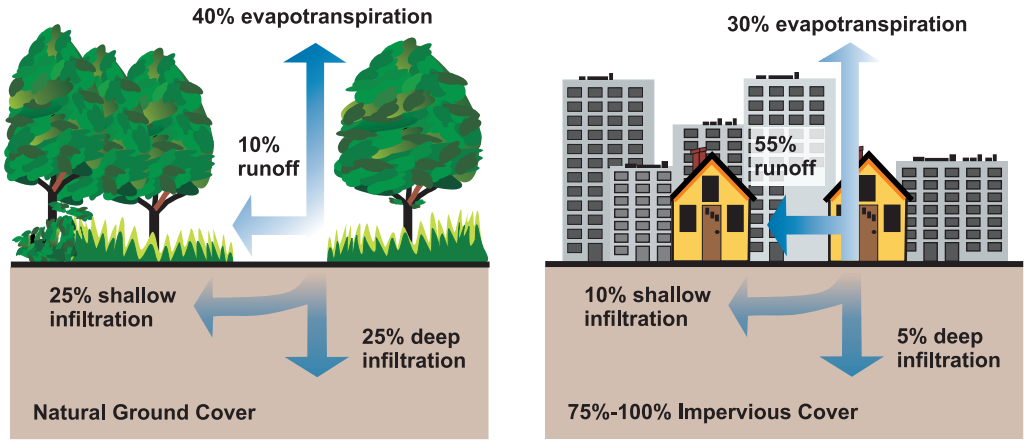
Did you know that because of impervious surfaces like pavement and rooftops, a typical city block generates more than 5 times more runoff than a woodland area of the same size?

How Urbanized Areas Affect Water Quality

Increased Runoff

The porous and varied terrain of natural landscapes like forests, wetlands, and grasslands traps rainwater and snowmelt and allows them to filter slowly into the ground. In contrast, impervious (nonporous) surfaces like roads, parking lots, and rooftops prevent rain and snowmelt from infiltrating, or soaking, into the ground. Most of the rainfall and snowmelt remains above the surface, where it runs off rapidly in unnaturally large amounts.

Storm sewer systems concentrate runoff into smooth, straight conduits. This runoff gathers speed and erosional power as it travels underground. When this runoff leaves the storm drains and empties into a stream, its excessive volume and power blast out streambanks, damaging streamside vegetation and wiping out aquatic habitat. These increased storm flows carry sediment loads from construction sites and other denuded surfaces and eroded streambanks. They often carry higher water temperatures from streets, roof tops, and parking lots, which are harmful to the health and reproduction of aquatic life.



The loss of infiltration from urbanization may also cause profound groundwater changes. Although urbanization leads to great increases in flooding during and immediately after wet weather, in many instances it results in lower stream flows during dry weather. Many native fish and other aquatic life cannot survive when these conditions prevail.

Increased Pollutant Loads

Urbanization increases the variety and amount of pollutants carried into streams, rivers, and lakes. The pollutants include:

- Sediment
- Oil, grease, and toxic chemicals from motor vehicles
- Pesticides and nutrients from lawns and gardens
- Viruses, bacteria, and nutrients from pet waste and failing septic systems
- Road salts
- Heavy metals from roof shingles, motor vehicles, and other sources
- Thermal pollution from dark impervious surfaces such as streets and rooftops

These pollutants can harm fish and wildlife populations, kill native vegetation, foul drinking water supplies, and make recreational areas unsafe and unpleasant.

Relationship between impervious cover and surface runoff. Impervious cover in a watershed results in increased surface ruunoff. As little as 10 percent impervious cover in a watershed can result in stream degradation.

Managing Urban Runoff

What Homeowners Can Do

To decrease polluted runoff from paved surfaces, households can develop alternatives to areas traditionally covered by impervious surfaces. Porous pavement materials are available for driveways and sidewalks, and native vegetation and mulch can replace high maintenance grass lawns. Homeowners can use fertilizers sparingly and sweep driveways, sidewalks, and roads instead of using a hose. Instead of disposing of yard waste, they can use the materials to start a compost pile. And homeowners can learn to use Integrated Pest Management (IPM) to reduce dependence on harmful pesticides.

In addition, households can prevent polluted runoff by picking up after pets and using, storing, and disposing of chemicals properly. Drivers should check their cars for leaks and recycle their motor oil and antifreeze when these fluids are changed. Drivers can also avoid impacts from car wash runoff (e.g., detergents, grime, etc.) by using car wash facilities that do not generate runoff. Households served by septic systems should have them professionally inspected and pumped every 3 to 5 years. They should also practice water conservation measures to extend the life of their septic systems.

Controlling Impacts from New Development

Developers and city planners should attempt to control the volume of runoff from new development by using low impact development, structural controls, and pollution prevention strategies. Low impact development includes measures that conserve natural areas (particularly sensitive hydrologic areas like riparian buffers and infiltrable soils); reduce development impacts; and reduce site runoff rates by maximizing surface roughness, infiltration opportunities, and flow paths.

Controlling Impacts from Existing Development

Controlling runoff from existing urban areas is often more costly than controlling runoff from new developments. Economic efficiencies are often realized through approaches that target "hot spots" of runoff pollution or have multiple benefits, such as high-efficiency street sweeping (which addresses aesthetics, road safety, and water quality). Urban planners and others responsible for managing urban and suburban areas can first identify and implement pollution prevention strategies and examine source control opportunities. They should seek out priority pollutant reduction opportunities, then protect natural areas that help control runoff, and finally begin ecological restoration and retrofit activities to clean up degraded water bodies. Local governments are encouraged to take lead roles in public education efforts through public signage, storm drain marking, pollution prevention outreach campaigns, and partnerships with citizen groups and businesses. Citizens can help prioritize the clean-up strategies, volunteer to become involved in restoration efforts, and mark storm drains with approved "don't dump" messages.

Help Prevent Ocean Pollution:

Tips for Landscape & Gardening

The Ocean Begins at Your Front Door

PROJECT Pollution PREVENTION

Tips for Landscape & Gardening

Never allow gardening products or polluted water to enter the street, gutter or storm drain.

General Landscaping Tips

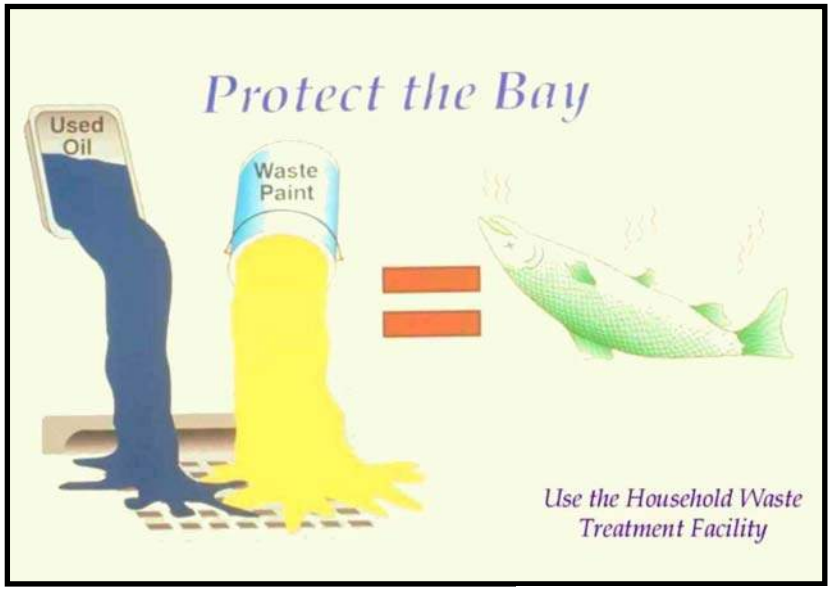
- Protect stockpiles and materials from wind and rain by storing them under tarps or secured plastic sheeting.
- Prevent erosion of slopes by planting fast-growing, dense ground covering plants. These will shield and bind the soil.
- Plant native vegetation to reduce the amount of water, fertilizers, and pesticide applied to the landscape.

- Never apply pesticides or fertilizers when rain is predicted within the next 48 hours.

Garden & Lawn Maintenance

- Do not overwater. Use irrigation practices such as drip irrigation, soaker hoses or micro spray systems. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead, dispose of green waste by composting, hauling it to a permitted landfill, or recycling it through your city's program.

- Use slow-release fertilizers to minimize leaching, and use organic fertilizers.
- Read labels and use only as directed. Do not over-apply pesticides or fertilizers. Apply to spots as needed, rather than blanketing an entire area.
- Store pesticides, fertilizers and other chemicals in a dry covered area to prevent exposure that may result in the deterioration of containers and packaging.



- Rinse empty pesticide containers and re-use rinse water as you would use the product. Do not dump rinse water down storm drains. Dispose of empty containers in the trash.
- When available, use non-toxic alternatives to traditional pesticides, and use pesticides specifically designed to control the pest you are targeting. For more information, visit **www.ipm.ucdavis.edu**.
- If fertilizer is spilled, sweep up the spill before irrigating. If the spill is liquid, apply an absorbent material such as cat litter, and then sweep it up and dispose of it in the trash.
- Take unwanted pesticides to a Household Hazardous Waste Collection Center to be recycled. Locations are provided below.

Household Hazardous Waste Collection Centers

Anaheim:	1071 N. Blue Gum St.
Huntington Beach:	17121 Nichols St.
Irvine:	6411 Oak Canyon

Metals	☑
Bacteria	☑
Oil and Grease	☑
Organics	☑
Oxygen Demanding	☑

Description

Non-stormwater discharges are those flows that do not consist entirely of stormwater. For municipalities non-stormwater discharges present themselves in two situations. One is from fixed facilities owned and/or operated by the municipality. The other situation is non-stormwater discharges that are discovered during the normal operation of a field program. Some non-stormwater discharges do not include pollutants and may be discharged to the storm drain. These include uncontaminated groundwater and natural springs. There are also some non-stormwater discharges that typically do not contain pollutants and may be discharged to the storm drain with conditions. These include car washing, and surface cleaning. However, there are certain non-stormwater discharges that pose environmental concern. These discharges may originate from illegal dumping or from internal floor drains, appliances, industrial processes, sinks, and toilets that are connected to the nearby storm drainage system. These discharges (which may include: process waste waters, cooling waters, wash waters, and sanitary wastewater) can carry substances (such as paint, oil, fuel and other automotive fluids, chemicals and other pollutants) into storm drains. The ultimate goal is to effectively eliminate non-stormwater discharges to the stormwater drainage system through implementation of measures to detect, correct, and enforce against illicit connections and illegal discharges.

Approach

The municipality must address non-stormwater discharges from its fixed facilities by assessing the types of non-stormwater discharges and implementing BMPs for the discharges determined to pose environmental concern. For field programs

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

the field staff must be trained to now what to look for regarding non-stormwater discharges and the procedures to follow in investigating the detected discharges.

Suggested Protocols

Fixed Facility

General

- Post "No Dumping" signs with a phone number for reporting dumping and disposal. Signs should also indicate fines and penalties for illegal dumping.
- Stencil storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as "Dump No Waste Drains to Stream" stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- Landscaping and beautification efforts of hot spots might also discourage future dumping, as well as provide open space and increase property values.
- Lighting or barriers may also be needed to discourage future dumping.

Illicit Connections

- Locate discharges from the fixed facility drainage system to the municipal storm drain system through review of "as-built" piping schematics.
- Use techniques such as smoke testing, dye testing and television camera inspection (as noted below) to verify physical connections.
- Isolate problem areas and plug illicit discharge points.

Visual Inspection and Inventory

- Inventory and inspect each discharge point during dry weather.
- Keep in mind that drainage from a storm event can continue for several days following the end of a storm and groundwater may infiltrate the underground stormwater collection system. Also, non-stormwater discharges are often intermittent and may require periodic inspections.

Review Infield Piping

- Review the "as-built" piping schematic as a way to determine if there are any connections to the stormwater collection system.
- Inspect the path of floor drains in older buildings.

Smoke Testing

- Smoke testing of wastewater and stormwater collection systems is used to detect connections between the two systems.

- During dry weather the stormwater collection system is filled with smoke and then traced to sources. The appearance of smoke at the base of a toilet indicates that there may be a connection between the sanitary and the stormwater system.

Dye Testing

- A dye test can be performed by simply releasing a dye into either your sanitary or process wastewater system and examining the discharge points from the stormwater collection system for discoloration.

TV Inspection of Storm Sewer

- TV Cameras can be employed to visually identify illicit connections to the fixed facility storm drain system.

Illegal Dumping

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- Clean up spills on paved surfaces with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Sweep up the material and dispose of properly.
- Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.
- For larger spills, a private spill cleanup company or Hazmat team may be necessary.
- See fact sheet SC-11 Spill Prevention, Control, and Clean Up.

Field Program

General

- Develop clear protocols and lines of communication for effectively prohibiting non-stormwater discharges, especially ones that involve more than one jurisdiction and those that are not classified as hazardous, which are often not responded to as effectively as they need to be.
- Stencil storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as “Dump No Waste Drains to Stream” stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- See SC-74 Stormwater Drainage System Maintenance for additional information.

Field Inspection

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- During routine field program maintenance field staff should look for evidence of illegal discharges or illicit connection:
  - Is there evidence of spills such as paints, discoloring, etc.
  - Are there any odors associated with the drainage system
  - Record locations of apparent illegal discharges/illicit connections and notify appropriate investigating agency.
- If trained, conduct field investigation of non-stormwater discharges to determine whether they pose a threat to water quality.

Recommended Complaint Investigation Equipment

- Field Screening Analysis
  - pH paper or meter
  - Commercial stormwater pollutant screening kit that can detect for reactive phosphorus, nitrate nitrogen, ammonium nitrogen, specific conductance, and turbidity
  - Sample jars
  - Sample collection pole
  - A tool to remove access hole covers
- Laboratory Analysis
  - Sample cooler
  - Ice
  - Sample jars and labels
  - Chain of custody forms.
- Documentation
  - Camera
  - Notebook
  - Pens
  - Notice of Violation forms

- Educational materials

Reporting

- A database is useful for defining and tracking the magnitude and location of the problem.
- Report prohibited non-stormwater discharges observed during the course of normal daily activities so they can be investigated, contained and cleaned up or eliminated.
- Document that non-stormwater discharges have been eliminated by recording tests performed, methods used, dates of testing, and any onsite drainage points observed.
- Maintain documentation of illicit connection and illegal dumping incidents, including significant conditionally exempt discharges that are not properly managed.

Enforcement

- Educate the responsible party if identified on the impacts of their actions, explain the stormwater requirements, and provide information regarding Best Management Practices (BMP), as appropriate. Initiate follow-up and/or enforcement procedures.
- If an illegal discharge is traced to a commercial, residential or industrial source, conduct the following activities or coordinate the following activities with the appropriate agency:
  - Contact the responsible party to discuss methods of eliminating the non-stormwater discharge, including disposal options, recycling, and possible discharge to the sanitary sewer (if within POTW limits).
  - Provide information regarding BMPs to the responsible party, where appropriate.
  - Begin enforcement procedures, if appropriate.
  - Continue inspection and follow-up activities until the illicit discharge activity has ceased.
- If an illegal discharge is traced to a commercial or industrial activity, coordinate information on the discharge with the jurisdiction's commercial and industrial facility inspection program.

Training

- Train technical staff to identify and document illegal dumping incidents.
- Well-trained employees can reduce human errors that lead to accidental releases or spills. The employee should have the tools and knowledge to immediately begin cleaning up a spill if one should occur. Employees should be familiar with the Spill Prevention Control and Countermeasure Plan.
- Train employees to identify non-stormwater discharges and report them to the appropriate departments.
- Train staff who have the authority to conduct surveillance and inspections, and write citations for those caught illegally dumping.

- Train municipal staff responsible for surveillance and inspection in the following:
  - OSHA-required Health and Safety Training (29 CFR 1910.120) plus annual refresher training (as needed).
  - OSHA Confined Space Entry training (Cal-OSHA Confined Space, Title 8 and federal OSHA 29 CFR 1910.146).
  - Procedural training (field screening, sampling, smoke/dye testing, TV inspection).
- Educate the identified responsible party on the impacts of his or her actions.

Spill Response and Prevention

- See SC-11 Spill Prevention Control and Clean Up

Other Considerations

- The elimination of illegal dumping is dependent on the availability, convenience, and cost of alternative means of disposal. The cost of fees for dumping at a proper waste disposal facility are often more than the fine for an illegal dumping offense, thereby discouraging people from complying with the law. The absence of routine or affordable pickup service for trash and recyclables in some communities also encourages illegal dumping. A lack of understanding regarding applicable laws or the inadequacy of existing laws may also contribute to the problem.
- Municipal codes should include sections prohibiting the discharge of soil, debris, refuse, hazardous wastes, and other pollutants into the storm drain system.
- Many facilities do not have accurate, up-to-date schematic drawings.
- Can be difficult to locate illicit connections especially if there is groundwater infiltration.

Requirements

Costs

- Eliminating illicit connections can be expensive especially if structural modifications are required such re-plumbing cross connections under an existing slab.
- Minor cost to train field crews regarding the identification of non-stormwater discharges. The primary cost is for a fully integrated program to identify and eliminate illicit connections and illegal dumping. However, by combining with other municipal programs (i.e. pretreatment program) cost may be lowered.
- Municipal cost for containment and disposal may be borne by the discharger.

Maintenance

Not applicable

Supplemental Information

Further Detail of the BMP

What constitutes a "non-stormwater" discharge?

- Non-stormwater discharges are discharges not made up entirely of stormwater and include water used directly in the manufacturing process (process wastewater), air conditioning condensate and coolant, non-contact cooling water, cooling equipment condensate, outdoor secondary containment water, vehicle and equipment wash water, landscape irrigation, sink and drinking fountain wastewater, sanitary wastes, or other wastewaters.

Permit Requirements

- Current municipal NPDES permits require municipalities to effectively prohibit non-stormwater discharges unless authorized by a separate NPDES permit or allowed in accordance with the current NPDES permit conditions. Typically the current permits allow certain non-stormwater discharges in the storm drain system as long as the discharges are not significant sources of pollutants. In this context the following non-stormwater discharges are typically allowed:
  - Diverted stream flows;
  - Rising found waters;
  - Uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20));
  - Uncontaminated pumped ground water;
  - Foundation drains;
  - Springs;
  - Water from crawl space pumps;
  - Footing drains;
  - Air conditioning condensation;
  - Flows from riparian habitats and wetlands;
  - Water line and hydrant flushing ;
  - Landscape irrigation;
  - Planned and unplanned discharges from potable water sources;
  - Irrigation water;
  - Individual residential car washing; and
  - Lawn watering.

Municipal facilities subject to industrial general permit requirements must include a certification that the stormwater collection system has been tested or evaluated for the presence of non-stormwater discharges. The state's General Industrial Stormwater Permit requires that non-stormwater discharges be eliminated prior to implementation of the facility's SWPPP.

Illegal Dumping

- Establish a system for tracking incidents. The system should be designed to identify the following:
  - Illegal dumping hot spots
  - Types and quantities (in some cases) of wastes
  - Patterns in time of occurrence (time of day/night, month, or year)
  - Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
  - Responsible parties

Outreach

One of the keys to success of reducing or eliminating illegal dumping is increasing the number of people on the street who are aware of the problem and who have the tools to at least identify the incident, if not correct it. There we a number of ways of accomplishing this:

- Train municipal staff from all departments (public works, utilities, street cleaning, parks and recreation, industrial waste inspection, hazardous waste inspection, sewer maintenance) to recognize and report the incidents.
- Deputize municipal staff who may come into contact with illegal dumping with the authority to write illegal dumping tickets for offenders caught in the act (see below).
- Educate the public. As many as 3 out of 4 people do not understand that in most communities the storm drain does not go to the wastewater treatment plant. Unfortunately, with the heavy emphasis in recent years on public education about solid waste management, including recycling and household hazardous waste, the sewer system (both storm and sanitary) has been the likely recipient of cross-media transfers of waste.
- Provide the public with a mechanism for reporting incidents such as a hot line and/or door hanger (see below).
- Help areas where incidents occur more frequently set up environmental watch programs (like crime watch programs).
- Train volunteers to notice and report the presence and suspected source of an observed pollutant to the appropriate public agency.

What constitutes a "non-stormwater" discharge?

- Non-stormwater discharges are discharges not made up entirely of stormwater and include water used directly in the manufacturing process (process wastewater), air conditioning condensate and coolant, non-contact cooling water, cooling equipment condensate, outdoor secondary containment water, vehicle and equipment wash water, landscape irrigation, sink and drinking fountain wastewater, sanitary wastes, or other wastewaters.

Permit Requirements

- Current municipal NPDES permits require municipalities to effectively prohibit non-stormwater discharges unless authorized by a separate NPDES permit or allowed in accordance with the current NPDES permit conditions. Typically the current permits allow certain non-stormwater discharges in the storm drain system as long as the discharges are not significant sources of pollutants. In this context the following non-stormwater discharges are typically allowed:

  - Diverted stream flows;
  - Rising found waters;
  - Uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20));
  - Uncontaminated pumped ground water;
  - Foundation drains;
  - Springs;
  - Water from crawl space pumps;
  - Footing drains;
  - Air conditioning condensation;
  - Flows from riparian habitats and wetlands;
  - Water line and hydrant flushing ;
  - Landscape irrigation;
  - Planned and unplanned discharges from potable water sources;
  - Irrigation water;
  - Individual residential car washing; and
  - Lawn watering.

Municipal facilities subject to industrial general permit requirements must include a certification that the stormwater collection system has been tested or evaluated for the presence

of non-stormwater discharges. The state's General Industrial Stormwater Permit requires that non-stormwater discharges be eliminated prior to implementation of the facility's SWPPP.

Storm Drain Stenciling

- Stencil storm drain inlets with a message to prohibit illegal dumpings, especially in areas with waste handling facilities.
- Encourage public reporting of improper waste disposal by a HOTLINE number stenciled onto the storm drain inlet.
- See Supplemental Information section of this fact sheet for further detail on stenciling program approach.

Oil Recycling

- Contract collection and hauling of used oil to a private licensed used oil hauler/recycler.
- Comply with all applicable state and federal regulations regarding storage, handling, and transport of petroleum products.
- Create procedures for collection such as; collection locations and schedule, acceptable containers, and maximum amounts accepted.
- The California Integrated Waste Management Board has a Recycling Hotline, (800) 553-2962, that provides information and recycling locations for used oil.

Household Hazardous Waste

- Provide household hazardous waste (HHW) collection facilities. Several types of collection approaches are available including permanent, periodic, or mobile centers, curbside collection, or a combination of these systems.

Training

- Train municipal employees and contractors in proper and consistent methods for waste disposal.
- Train municipal employees to recognize and report illegal dumping.
- Train employees and subcontractors in proper hazardous waste management.

Spill Response and Prevention

- Refer to SC-11, Spill Prevention, Control & Cleanup
- Have spill cleanup materials readily available and in a known location.
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- Federal Regulations (RCRA, SARA, CERCLA) and state regulations exist regarding the disposal of hazardous waste.
- Municipalities are required to have a used oil recycling element and a HHW element within their integrated waste management plan.
- Significant liability issues are involved with the collection, handling, and disposal of HHW.

Examples

The City of Palo Alto has developed a public participation program for reporting dumping violations. When a concerned citizen or public employee encounters evidence of illegal dumping, a door hanger (similar in format to hotel "Do Not Disturb" signs) is placed on the front doors in the neighborhood. The door hanger notes that a violation has occurred in the neighborhood, informs the reader why illegal dumping is a problem, and notes that illegal dumping carries a significant financial penalty. Information is also provided on what citizens can do as well as contact numbers for more information or to report a violation.

The Port of Long Beach has a state of the art database incorporating storm drain infrastructure, potential pollutant sources, facility management practices, and a pollutant tracking system.

The State Department of Fish and Game has a hotline for reporting violations called CalTIP (1-800-952-5400). The phone number may be used to report any violation of a Fish and Game code (illegal dumping, poaching, etc.).

The California Department of Toxic Substances Control's Waste Alert Hotline, 1-800-69TOXIC, can be used to report hazardous waste violations.

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Description

Many activities that occur at an industrial or commercial site have the potential to cause accidental or illegal spills. Preparation for accidental or illegal spills, with proper training and reporting systems implemented, can minimize the discharge of pollutants to the environment.

Spills and leaks are one of the largest contributors of stormwater pollutants. Spill prevention and control plans are applicable to any site at which hazardous materials are stored or used. An effective plan should have spill prevention and response procedures that identify potential spill areas, specify material handling procedures, describe spill response procedures, and provide spill clean-up equipment. The plan should take steps to identify and characterize potential spills, eliminate and reduce spill potential, respond to spills when they occur in an effort to prevent pollutants from entering the stormwater drainage system, and train personnel to prevent and control future spills.

Targeted Constituents

Sediment	
Nutrients	
Trash	
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Approach

Pollution Prevention

- Develop procedures to prevent/mitigate spills to storm drain systems. Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.

- Develop a Spill Prevention Control and Countermeasure (SPCC) Plan. The plan should include:

- Description of the facility, owner and address, activities and chemicals present
- Facility map
- Notification and evacuation procedures
- Cleanup instructions
- Identification of responsible departments
- Identify key spill response personnel

- Recycle, reclaim, or reuse materials whenever possible. This will reduce the amount of process materials that are brought into the facility.

Suggested Protocols (including equipment needs)

Spill Prevention

- Develop procedures to prevent/mitigate spills to storm drain systems. Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.

- If consistent illegal dumping is observed at the facility:
  - Post "No Dumping" signs with a phone number for reporting illegal dumping and disposal. Signs should also indicate fines and penalties applicable for illegal dumping.
  - Landscaping and beautification efforts may also discourage illegal dumping.
  - Bright lighting and/or entrance barriers may also be needed to discourage illegal dumping.

- Store and contain liquid materials in such a manner that if the tank is ruptured, the contents will not discharge, flow, or be washed into the storm drainage system, surface waters, or groundwater.

- If the liquid is oil, gas, or other material that separates from and floats on water, install a spill control device (such as a tee section) in the catch basins that collects runoff from the storage tank area.

- Routine maintenance:
  - Place drip pans or absorbent materials beneath all mounted taps, and at all potential drip and spill locations during filling and unloading of tanks. Any collected liquids or soiled absorbent materials must be reused/recycled or properly disposed.
  - Store and maintain appropriate spill cleanup materials in a location known to all near the tank storage area; and ensure that employees are familiar with the site's spill control plan and/or proper spill cleanup procedures.
  - Sweep and clean the storage area monthly if it is paved, *do not hose down the area to a storm drain.*

  - Check tanks (and any containment sumps) daily for leaks and spills. Replace tanks that are leaking, corroded, or otherwise deteriorating with tanks in good condition. Collect all spilled liquids and properly dispose of them.

- Label all containers according to their contents (e.g., solvent, gasoline).
- Label hazardous substances regarding the potential hazard (corrosive, radioactive, flammable, explosive, poisonous).
- Prominently display required labels on transported hazardous and toxic materials (per US DOT regulations).
- Identify key spill response personnel.

Spill Control and Cleanup Activities

- Follow the Spill Prevention Control and Countermeasure Plan.
- Clean up leaks and spills immediately.
- Place a stockpile of spill cleanup materials where it will be readily accessible (e.g., near storage and maintenance areas).
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste. Physical methods for the cleanup of dry chemicals include the use of brooms, shovels, sweepers, or plows.
- Never hose down or bury dry material spills. Sweep up the material and dispose of properly.
- Chemical cleanups of material can be achieved with the use of adsorbents, gels, and foams. Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.
- For larger spills, a private spill cleanup company or Hazmat team may be necessary.

Reporting

- Report spills that pose an immediate threat to human health or the environment to the Regional Water Quality Control Board.
- Federal regulations require that any oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).
- Report spills to local agencies, such as the fire department; they can assist in cleanup.
- Establish a system for tracking incidents. The system should be designed to identify the following:

  - Types and quantities (in some cases) of wastes

  - Patterns in time of occurrence (time of day/night, month, or year)

- Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)

- Responsible parties

Training

- Educate employees about spill prevention and cleanup.

- Well-trained employees can reduce human errors that lead to accidental releases or spills:

  - The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur.

  - Employees should be familiar with the Spill Prevention Control and Countermeasure Plan.

- Employees should be educated about aboveground storage tank requirements. Employees responsible for aboveground storage tanks and liquid transfers should be thoroughly familiar with the Spill Prevention Control and Countermeasure Plan and the plan should be readily available.

- Train employees to recognize and report illegal dumping incidents.

Other Considerations (Limitations and Regulations)

- A Spill Prevention Control and Countermeasure Plan (SPCC) is required for facilities that are subject to the oil pollution regulations specified in Part 112 of Title 40 of the Code of Federal Regulations or if they have a storage capacity of 10,000 gallons or more of petroleum. (Health and Safety Code 6.67)

- State regulations also exist for storage of hazardous materials (Health & Safety Code Chapter 6.95), including the preparation of area and business plans for emergency response to the releases or threatened releases.

- Consider requiring smaller secondary containment areas (less than 200 sq. ft.) to be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.

Requirements

Costs (including capital and operation & maintenance)

- Will vary depending on the size of the facility and the necessary controls.

- Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil or water can be quite expensive.

Maintenance (including administrative and staffing)

- This BMP has no major administrative or staffing requirements. However, extra time is needed to properly handle and dispose of spills, which results in increased labor costs.

Supplemental Information

Further Detail of the BMP

Reporting

Record keeping and internal reporting represent good operating practices because they can increase the efficiency of the facility and the effectiveness of BMPs. A good record keeping system helps the facility minimize incident recurrence, correctly respond with appropriate cleanup activities, and comply with legal requirements. A record keeping and reporting system should be set up for documenting spills, leaks, and other discharges, including discharges of hazardous substances in reportable quantities. Incident records describe the quality and quantity of non-stormwater discharges to the storm sewer. These records should contain the following information:

- Date and time of the incident
- Weather conditions
- Duration of the spill/leak/discharge
- Cause of the spill/leak/discharge
- Response procedures implemented
- Persons notified
- Environmental problems associated with the spill/leak/discharge

Separate record keeping systems should be established to document housekeeping and preventive maintenance inspections, and training activities. All housekeeping and preventive maintenance inspections should be documented. Inspection documentation should contain the following information:

- The date and time the inspection was performed
- Name of the inspector
- Items inspected
- Problems noted
- Corrective action required
- Date corrective action was taken

Other means to document and record inspection results are field notes, timed and dated photographs, videotapes, and drawings and maps.

Aboveground Tank Leak and Spill Control

Accidental releases of materials from aboveground liquid storage tanks present the potential for contaminating stormwater with many different pollutants. Materials spilled, leaked, or lost from

tanks may accumulate in soils or on impervious surfaces and be carried away by stormwater runoff.

The most common causes of unintentional releases are:

- Installation problems
- Failure of piping systems (pipes, pumps, flanges, couplings, hoses, and valves)
- External corrosion and structural failure
- Spills and overfills due to operator error
- Leaks during pumping of liquids or gases from truck or rail car to a storage tank or vice versa

Storage of reactive, ignitable, or flammable liquids should comply with the Uniform Fire Code and the National Electric Code. Practices listed below should be employed to enhance the code requirements:

- Tanks should be placed in a designated area.
- Tanks located in areas where firearms are discharged should be encapsulated in concrete or the equivalent.
- Designated areas should be impervious and paved with Portland cement concrete, free of cracks and gaps, in order to contain leaks and spills.
- Liquid materials should be stored in UL approved double walled tanks or surrounded by a curb or dike to provide the volume to contain 10 percent of the volume of all of the containers or 110 percent of the volume of the largest container, whichever is greater. The area inside the curb should slope to a drain.
- For used oil or dangerous waste, a dead-end sump should be installed in the drain.
- All other liquids should be drained to the sanitary sewer if available. The drain must have a positive control such as a lock, valve, or plug to prevent release of contaminated liquids.
- Accumulated stormwater in petroleum storage areas should be passed through an oil/water separator.

Maintenance is critical to preventing leaks and spills. Conduct routine inspections and:

- Check for external corrosion and structural failure.
- Check for spills and overfills due to operator error.
- Check for failure of piping system (pipes, pumps, flanger, coupling, hoses, and valves).
- Check for leaks or spills during pumping of liquids or gases from truck or rail car to a storage facility or vice versa.

- Visually inspect new tank or container installation for loose fittings, poor welding, and improper or poorly fitted gaskets.
- Inspect tank foundations, connections, coatings, and tank walls and piping system. Look for corrosion, leaks, cracks, scratches, and other physical damage that may weaken the tank or container system.
- Frequently relocate accumulated stormwater during the wet season.
- Periodically conduct integrity testing by a qualified professional.

Vehicle Leak and Spill Control

Major spills on roadways and other public areas are generally handled by highly trained Hazmat teams from local fire departments or environmental health departments. The measures listed below pertain to leaks and smaller spills at vehicle maintenance shops.

In addition to implementing the spill prevention, control, and clean up practices above, use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- Perform all vehicle fluid removal or changing inside or under cover to prevent the run-on of stormwater and the runoff of spills.
- Regularly inspect vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Immediately drain all fluids from wrecked vehicles.
- Store wrecked vehicles or damaged equipment under cover.
- Place drip pans or absorbent materials under heavy equipment when not in use.
- Use adsorbent materials on small spills rather than hosing down the spill.
- Remove the adsorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.
- Oil filters disposed of in trashcans or dumpsters can leak oil and contaminate stormwater. Place the oil filter in a funnel over a waste oil recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask your oil supplier or recycler about recycling oil filters.

- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- Design the fueling area to prevent the run-on of stormwater and the runoff of spills:
  - Cover fueling area if possible.
  - Use a perimeter drain or slope pavement inward with drainage to a sump.
  - Pave fueling area with concrete rather than asphalt.
- If dead-end sump is not used to collect spills, install an oil/water separator.
- Install vapor recovery nozzles to help control drips as well as air pollution.
- Discourage "topping-off' of fuel tanks.
- Use secondary containment when transferring fuel from the tank truck to the fuel tank.
- Use adsorbent materials on small spills and general cleaning rather than hosing down the area. Remove the adsorbent materials promptly.
- Carry out all Federal and State requirements regarding underground storage tanks, or install above ground tanks.
- Do not use mobile fueling of mobile industrial equipment around the facility; rather, transport the equipment to designated fueling areas.
- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Train employees in proper fueling and cleanup procedures.

Industrial Spill Prevention Response

For the purposes of developing a spill prevention and response program to meet the stormwater regulations, facility managers should use information provided in this fact sheet and the spill prevention/response portions of the fact sheets in this handbook, for specific activities. The program should:

- Integrate with existing emergency response/hazardous materials programs (e.g., Fire Department)
- Develop procedures to prevent/mitigate spills to storm drain systems
- Identify responsible departments
- Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures
- Address spills at municipal facilities, as well as public areas

- Provide training concerning spill prevention, response and cleanup to all appropriate personnel

Building & Grounds Maintenance SC-41

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	☑
Oil and Grease	☑
Organics	☑
Oxygen Demanding	☑

Description

Stormwater runoff from building and grounds maintenance activities can be contaminated with toxic hydrocarbons in solvents, fertilizers and pesticides, suspended solids, heavy metals, and abnormal pH. Utilizing the following protocols will prevent or reduce the discharge of pollutants to stormwater from building and grounds maintenance activities by washing and cleaning up with as little water as possible, following good landscape management practices, preventing and cleaning up spills immediately, keeping debris from entering the storm drains, and maintaining the stormwater collection system.

Approach

Pollution Prevention

- Switch to non-toxic chemicals for maintenance when possible.
- Choose cleaning agents that can be recycled.
- Encourage proper lawn management and landscaping, including use of native vegetation.
- Encourage use of Integrated Pest Management techniques for pest control.
- Encourage proper onsite recycling of yard trimmings.
- Recycle residual paints, solvents, lumber, and other material as much as possible.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Suggested Protocols

Pressure Washing of Buildings, Rooftops, and Other Large Objects

- In situations where soaps or detergents are used and the surrounding area is paved, pressure washers must use a waste water collection device that enables collection of wash water and associated solids. A sump pump, wet vacuum or similarly effective device must be used to collect the runoff and loose materials. The collected runoff and solids must be disposed of properly.
- If soaps or detergents are not used, and the surrounding area is paved, wash water runoff does not have to be collected but must be screened. Pressure washers must use filter fabric or some other type of screen on the ground and/or in he catch basin to trap the particles in wash water runoff.
- If you are pressure washing on a grassed area (with or without soap), runoff must be dispersed as sheet flow as much as possible, rather than as a concentrated stream. The wash runoff must remain on the grass and not drain to pavement. Ensure that this practice does not kill grass.

Landscaping Activities

- Do not apply any chemicals (insecticide, herbicide, or fertilizer) directly to surface waters, unless the application is approved and permitted by the state.
- Dispose of grass clippings, leaves, sticks, or other collected vegetation as garbage, or by composting. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures on exposed soils.
- Check irrigation schedules so pesticides will not be washed away and to minimize non-stormwater discharge.

Building Repair, Remodeling, and Construction

- Do not dump any toxic substance or liquid waste on the pavement, the ground, or toward a storm drain.
- Use ground or drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of collected material daily.
- Use a ground cloth or oversized tub for activities such as paint mixing and tool cleaning.
- Clean paint brushes and tools covered with water-based paints in sinks connected to sanitary sewers or in portable containers that can be dumped into a sanitary sewer drain. Brushes and tools covered with non-water-based paints, finishes, or other materials must be cleaned in a manner that enables collection of used solvents (e.g., paint thinner, turpentine, etc.) for recycling or proper disposal.

- Use a storm drain cover, filter fabric, or similarly effective runoff control mechanism if dust, grit, wash water, or other pollutants may escape the work area and enter a catch basin. The containment device(s) must be in place at the beginning of the work day, and accumulated dirty runoff and solids must be collected and disposed of before removing the containment device(s) at the end of the work day.
- If you need to de-water an excavation site, you may need to filter the water before discharging to a catch basin or off-site. In which case you should direct the water through hay bales and filter fabric or use other sediment filters or traps.
- Store toxic material under cover with secondary containment during precipitation events and when not in use. A cover would include tarps or other temporary cover material.

Mowing, Trimming, and Planting

- Dispose of leaves, sticks, or other collected vegetation as garbage, by composting or at a permitted landfill. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Use mulch or other erosion control measures when soils are exposed.
- Place temporarily stockpiled material away from watercourses and drain inlets, and berm or cover stockpiles to prevent material releases to the storm drain system.
- Consider an alternative approach when bailing out muddy water; do not put it in the storm drain, pour over landscaped areas.
- Use hand or mechanical weeding where practical.

Fertilizer and Pesticide Management

- Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers and pesticides and training of applicators and pest control advisors.
- Follow manufacturers' recommendations and label directions. Pesticides must never be applied if precipitation is occuring or predicted. Do not apply insecticides within 100 feet of surface waters such as lakes, ponds, wetlands, and streams.
- Use less toxic pesticides that will do the job, whenever possible. Avoid use of copper-based pesticides if possible.
- Do not use pesticides if rain is expected.
- Do not mix or prepare pesticides for application near storm drains.
- Use the minimum amount needed for the job.
- Calibrate fertilizer distributors to avoid excessive application.
- Employ techniques to minimize off-target application (e.g. spray drift) of pesticides, including consideration of alternative application techniques.

- Apply pesticides only when wind speeds are low.
- Work fertilizers into the soil rather than dumping or broadcasting them onto the surface.
- Irrigate slowly to prevent runoff and then only as much as is needed.
- Clean pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
- Dispose of empty pesticide containers according to the instructions on the container label.
- Use up the pesticides. Rinse containers, and use rinse water as product. Dispose of unused pesticide as hazardous waste.
- Implement storage requirements for pesticide products with guidance from the local fire department and County Agricultural Commissioner. Provide secondary containment for pesticides.

Inspection

- Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering, and repair leaks in the irrigation system as soon as they are observed.

Training

- Educate and train employees on use of pesticides and in pesticide application techniques to prevent pollution.
- Train employees and contractors in proper techniques for spill containment and cleanup.
- Be sure the frequency of training takes into account the complexity of the operations and the nature of the staff.

Spill Response and Prevention

- Refer to SC-11, Spill Prevention, Control & Cleanup
- Keep your Spill Prevention Control and countermeasure (SPCC) plan up-to-date, and implement accordingly.
- Have spill cleanup materials readily available and in a known location.
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- Alternative pest/weed controls may not be available, suitable, or effective in many cases.

Requirements

Costs

- Overall costs should be low in comparison to other BMPs.

Maintenance

- Sweep paved areas regularly to collect loose particles, and wipe up spills with rags and other absorbent material immediately, do not hose down the area to a storm drain.

Supplemental Information

Further Detail of the BMP

Fire Sprinkler Line Flushing

Building fire sprinkler line flushing may be a source of non-stormwater runoff pollution. The water entering the system is usually potable water though in some areas it may be non-potable reclaimed wastewater. There are subsequent factors that may drastically reduce the quality of the water in such systems. Black iron pipe is usually used since it is cheaper than potable piping but it is subject to rusting and results in lower quality water. Initially the black iron pipe has an oil coating to protect it from rusting between manufacture and installation; this will contaminate the water from the first flush but not from subsequent flushes. Nitrates, poly-phosphates and other corrosion inhibitors, as well as fire suppressants and antifreeze may be added to the sprinkler water system. Water generally remains in the sprinkler system a long time, typically a year, between flushes and may accumulate iron, manganese, lead, copper, nickel and zinc. The water generally becomes anoxic and contains living and dead bacteria and breakdown products from chlorination. This may result in a significant BOD problem and the water often smells. Consequently dispose fire sprinkler line flush water into the sanitary sewer. Do not allow discharge to storm drain or infiltration due to potential high levels of pollutants in fire sprinkler line water.

Building Repair and Construction SC-42

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Recycle

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

Description

Modifications are common particularly at large industrial sites. The activity may vary from minor and normal building repair to major remodeling, or the construction of new facilities. These activities can generate pollutants including solvents, paints, paint and varnish removers, finishing residues, spent thinners, soap cleaners, kerosene, asphalt and concrete materials, adhesive residues, and old asbestos installation. Protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants to stormwater from building repair, remodeling, and construction by using soil erosion controls, enclosing or covering building material storage areas, using good housekeeping practices, using safer alternative products, and training employees.

Approach

Pollution Prevention

- Recycle residual paints, solvents, lumber, and other materials to the maximum extent practical.
- Buy recycled products to the maximum extent practical.
- Inform on-site contractors of company policy on these matters and include appropriate provisions in their contract to ensure certain proper housekeeping and disposal practices are implemented.

CASQA California Stormwater Quality Association

- Make sure that nearby storm drains are well marked to minimize the chance of inadvertent disposal of residual paints and other liquids.

Suggested Protocols

Repair & Remodeling

- Follow BMPs identified in Construction BMP Handbook.
- Maintain good housekeeping practices while work is underway.
- Keep the work site clean and orderly. Remove debris in a timely fashion. Sweep the area.
- Cover materials of particular concern that must be left outside, particularly during the rainy season.
- Do not dump waste liquids down the storm drain.
- Dispose of wash water, sweepings, and sediments properly.
- Store materials properly that are normally used in repair and remodeling such as paints and solvents.
- Sweep out the gutter or wash the gutter and trap the particles at the outlet of the downspout if when repairing roofs, small particles have accumulated in the gutter. A sock or geofabric placed over the outlet may effectively trap the materials. If the downspout is tight lined, place a temporary plug at the first convenient point in the storm drain and pump out the water with a vactor truck, and clean the catch basin sump where you placed the plug.
- Properly store and dispose waste materials generated from construction activities. See Construction BMP Handbook.
- Clean the storm drain system in the immediate vicinity of the construction activity after it is completed.

Painting

- Enclose painting operations consistent with local air quality regulations and OSHA.
- Local air pollution regulations may, in many areas of the state, specify painting procedures which if properly carried out are usually sufficient to protect water quality.
- Develop paint handling procedures for proper use, storage, and disposal of paints.
- Transport paint and materials to and from job sites in containers with secure lids and tied down to the transport vehicle.
- Test and inspect spray equipment prior to starting to paint. Tighten all hoses and connections and do not overfill paint containers.
- Mix paint indoors before using so that any spill will not be exposed to rain. Do so even during dry weather because cleanup of a spill will never be 100% effective.
- Transfer and load paint and hot thermoplastic away from storm drain inlets.

- Do not transfer or load paint near storm drain inlets.
- Plug nearby storm drain inlets prior to starting painting and remove plugs when job is complete when there is significant risk of a spill reaching storm drains.
- Cover nearby storm drain inlets prior to starting work if sand blasting is used to remove paint.
- Use a ground cloth to collect the chips if painting requires scraping or sand blasting of the existing surface. Dispose the residue properly.
- Cover or enclose painting operations properly to avoid drift.
- Clean the application equipment in a sink that is connected to the sanitary sewer if using water based paints.
- Capture all cleanup-water and dispose of properly.
- Dispose of paints containing lead or tributyl tin and considered a hazardous waste properly.
- Store leftover paints if they are to be kept for the next job properly, or dispose properly.
- Recycle paint when possible. Dispose of paint at an appropriate household hazardous waste facility.

Training

Proper education of off-site contractors is often overlooked. The conscientious efforts of well trained employees can be lost by unknowing off-site contractors, so make sure they are well informed about what they are expected to do.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Clean up spills immediately.
- Excavate and remove the contaminated (stained) soil if a spill occurs on dirt.

Limitations

- This BMP is for minor construction only. The State's General Construction Activity Stormwater Permit has more requirements for larger projects. The companion "Construction Best Management Practice Handbook" contains specific guidance and best management practices for larger-scale projects.
- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.
- Be certain that actions to help stormwater quality are consistent with Cal- and Fed-OSHA and air quality regulations.

SC-42 Building Repair and Construction

Requirements

Costs

These BMPs are generally low to modest in cost.

Maintenance

N/A

Supplemental Information

Further Detail of the BMP

Soil/Erosion Control

If the work involves exposing large areas of soil, employ the appropriate soil erosion and control techniques. See the Construction Best Management Practice Handbook. If old buildings are being torn down and not replaced in the near future, stabilize the site using measures described in SC-40 Contaminated or Erodible Areas.

If a building is to be placed over an open area with a storm drainage system, make sure the storm inlets within the building are covered or removed, or the storm line is connected to the sanitary sewer. If because of the remodeling a new drainage system is to be installed or the existing system is to be modified, consider installing catch basins as they serve as effective "in-line" treatment devices. See Treatment Control Fact Sheet TC-20 Wet Pond/Basin in Section 5 of the New Development and Redevelopment Handbook regarding design criteria. Include in the catch basin a "turn-down" elbow or similar device to trap floatables.

- Product Substitution

Targeted Constituents

Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	☑
Oil and Grease	☑
Organics	☑
Oxygen Demanding	☑

Description

Parking lots and storage areas can contribute a number of substances, such as trash, suspended solids, hydrocarbons, oil and grease, and heavy metals that can enter receiving waters through stormwater runoff or non-stormwater discharges. The following protocols are intended to prevent or reduce the discharge of pollutants from parking/storage areas and include using good housekeeping practices, following appropriate cleaning BMPs, and training employees.

Approach

Pollution Prevention

- Encourage alternative designs and maintenance strategies for impervious parking lots. (See New Development and Redevelopment BMP Handbook).
- Keep accurate maintenance logs to evaluate BMP implementation.

Suggested Protocols

General

- Keep the parking and storage areas clean and orderly. Remove debris in a timely fashion.
- Allow sheet runoff to flow into biofilters (vegetated strip and swale) and/or infiltration devices.
- Utilize sand filters or oleophilic collectors for oily waste in low concentrations.

- Arrange rooftop drains to prevent drainage directly onto paved surfaces.
- Design lot to include semi-permeable hardscape.

Controlling Litter

- Post "No Littering" signs and enforce anti-litter laws.
- Provide an adequate number of litter receptacles.
- Clean out and cover litter receptacles frequently to prevent spillage.
- Provide trash receptacles in parking lots to discourage litter.
- Routinely sweep, shovel and dispose of litter in the trash.

Surface cleaning

- Use dry cleaning methods (e.g. sweeping or vacuuming) to prevent the discharge of pollutants into the stormwater conveyance system.
- Establish frequency of public parking lot sweeping based on usage and field observations of waste accumulation.
- Sweep all parking lots at least once before the onset of the wet season.
- If water is used follow the procedures below:
  - Block the storm drain or contain runoff.
  - Wash water should be collected and pumped to the sanitary sewer or discharged to a pervious surface, do not allow wash water to enter storm drains.
  - Dispose of parking lot sweeping debris and dirt at a landfill.
- When cleaning heavy oily deposits:
  - Use absorbent materials on oily spots prior to sweeping or washing.
  - Dispose of used absorbents appropriately.

Surface Repair

- Pre-heat, transfer or load hot bituminous material away from storm drain inlets.
- Apply concrete, asphalt, and seal coat during dry weather to prevent contamination form contacting stormwater runoff.
- Cover and seal nearby storm drain inlets (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc., where applicable. Leave covers in place until job is complete and until all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal.

- Use only as much water as necessary for dust control, to avoid runoff.
- Catch drips from paving equipment that is not in use with pans or absorbent material placed under the machines. Dispose of collected material and absorbents properly.

Inspection

- Have designated personnel conduct inspections of the parking facilities and stormwater conveyance systems associated with them on a regular basis.
- Inspect cleaning equipment/sweepers for leaks on a regular basis.

Training

- Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.
- Train employees and contractors in proper techniques for spill containment and cleanup.

Spill Response and Prevention

- Refer to SC-11, Spill Prevention, Control & Cleanup.
- Keep your Spill Prevention Control and countermeasure (SPCC) plan up-to-date, nad implement accordingly.
- Have spill cleanup materials readily available and in a known location.
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- Limitations related to sweeping activities at large parking facilities may include high equipment costs, the need for sweeper operator training, and the inability of current sweeper technology to remove oil and grease.

Requirements

Costs

Cleaning/sweeping costs can be quite large, construction and maintenance of stormwater structural controls can be quite expensive as well.

Maintenance

- Sweep parking lot to minimize cleaning with water.
- Clean out oil/water/sand separators regularly, especially after heavy storms.
- Clean parking facilities on a regular basis to prevent accumulated wastes and pollutants from being discharged into conveyance systems during rainy conditions.

SC-43 Parking/Storage Area Maintenance

Supplemental Information

Further Detail of the BMP

Surface Repair

Apply concrete, asphalt, and seal coat during dry weather to prevent contamination form contacting stormwater runoff. Where applicable, cover and seal nearby storm drain inlets (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and until all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal. Use only as much water as necessary for dust control, to avoid runoff.

Drainage System Maintenance SC-44

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize

Description

As a consequence of its function, the stormwater conveyance system collects and transports urban runoff and stormwater that may contain certain pollutants. The protocols in this fact sheet are intended to reduce pollutants reaching receiving waters through proper conveyance system operation and maintenance.

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	
Bacteria	✓
Oil and Grease	
Organics	

Approach

Pollution Prevention

Maintain catch basins, stormwater inlets, and other stormwater conveyance structures on a regular basis to remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, restore catch basins' sediment trapping capacity, and ensure the system functions properly hydraulically to avoid flooding.

Suggested Protocols

Catch Basins/Inlet Structures

- Staff should regularly inspect facilities to ensure compliance with the following:
  - Immediate repair of any deterioration threatening structural integrity.
  - Cleaning before the sump is 40% full. Catch basins should be cleaned as frequently as needed to meet this standard.
  - Stenciling of catch basins and inlets (see SC34 Waste Handling and Disposal).

- Clean catch basins, storm drain inlets, and other conveyance structures before the wet season to remove sediments and debris accumulated during the summer.
- Conduct inspections more frequently during the wet season for problem areas where sediment or trash accumulates more often. Clean and repair as needed.
- Keep accurate logs of the number of catch basins cleaned.
- Store wastes collected from cleaning activities of the drainage system in appropriate containers or temporary storage sites in a manner that prevents discharge to the storm drain.
- Dewater the wastes if necessary with outflow into the sanitary sewer if permitted. Water should be treated with an appropriate filtering device prior to discharge to the sanitary sewer. If discharge to the sanitary sewer is not allowed, water should be pumped or vacuumed to a tank and properly disposed. Do not dewater near a storm drain or stream.

Storm Drain Conveyance System

- Locate reaches of storm drain with deposit problems and develop a flushing schedule that keeps the pipe clear of excessive buildup.
- Collect and pump flushed effluent to the sanitary sewer for treatment whenever possible.

Pump Stations

- Clean all storm drain pump stations prior to the wet season to remove silt and trash.
- Do not allow discharge to reach the storm drain system when cleaning a storm drain pump station or other facility.
- Conduct routine maintenance at each pump station.
- Inspect, clean, and repair as necessary all outlet structures prior to the wet season.

Open Channel

- Modify storm channel characteristics to improve channel hydraulics, increase pollutant removals, and enhance channel/creek aesthetic and habitat value.
- Conduct channel modification/improvement in accordance with existing laws. Any person, government agency, or public utility proposing an activity that will change the natural (emphasis added) state of any river, stream, or lake in California, must enter into a Steam or Lake Alteration Agreement with the Department of Fish and Game. The developer-applicant should also contact local governments (city, county, special districts), other state agencies (SWRCB, RWQCB, Department of Forestry, Department of Water Resources), and Federal Corps of Engineers and USFWS.

Illicit Connections and Discharges

- Look for evidence of illegal discharges or illicit connections during routine maintenance of conveyance system and drainage structures:
  - Is there evidence of spills such as paints, discoloring, etc?

- Are there any odors associated with the drainage system?
- Record locations of apparent illegal discharges/illicit connections?
- Track flows back to potential dischargers and conduct aboveground inspections. This can be done through visual inspection of upgradient manholes or alternate techniques including zinc chloride smoke testing, fluorometric dye testing, physical inspection testing, or television camera inspection.
- Eliminate the discharge once the origin of flow is established.

- Stencil or demarcate storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as "Dump No Waste Drains to Stream" stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Illegal Dumping

- Inspect and clean up hot spots and other storm drainage areas regularly where illegal dumping and disposal occurs.
- Establish a system for tracking incidents. The system should be designed to identify the following:
  - Illegal dumping hot spots
  - Types and quantities (in some cases) of wastes
  - Patterns in time of occurrence (time of day/night, month, or year)
  - Mode of dumping (abandoned containers, "midnight dumping" from moving vehicles, direct dumping of materials, accidents/spills)
  - Responsible parties
- Post "No Dumping" signs in problem areas with a phone number for reporting dumping and disposal. Signs should also indicate fines and penalties for illegal dumping.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Training

- Train crews in proper maintenance activities, including record keeping and disposal.
- Allow only properly trained individuals to handle hazardous materials/wastes.
- Have staff involved in detection and removal of illicit connections trained in the following:
  - OSHA-required Health and Safety Training (29 CFR 1910.120) plus annual refresher training (as needed).

- OSHA Confined Space Entry training (Cal-OSHA Confined Space, Title 8 and Federal OSHA 29 CFR 1910.146).

- Procedural training (field screening, sampling, smoke/dye testing, TV inspection).

Spill Response and Prevention

- Investigate all reports of spills, leaks, and/or illegal dumping promptly.
- Clean up all spills and leaks using "dry" methods (with absorbent materials and/or rags) or dig up, remove, and properly dispose of contaminated soil.
- Refer to fact sheet SC-11 Spill Prevention, Control, and Cleanup.

Other Considerations (Limitations and Regulations)

- Clean-up activities may create a slight disturbance for local aquatic species. Access to items and material on private property may be limited. Trade-offs may exist between channel hydraulics and water quality/riparian habitat. If storm channels or basins are recognized as wetlands, many activities, including maintenance, may be subject to regulation and permitting.
- Storm drain flushing is most effective in small diameter pipes (36-inch diameter pipe or less, depending on water supply and sediment collection capacity). Other considerations associated with storm drain flushing may include the availability of a water source, finding a downstream area to collect sediments, liquid/sediment disposal, and prohibition against disposal of flushed effluent to sanitary sewer in some areas.
- Regulations may include adoption of substantial penalties for illegal dumping and disposal.
- Local municipal codes may include sections prohibiting discharge of soil, debris, refuse, hazardous wastes, and other pollutants into the storm drain system.

Requirements

Costs

- An aggressive catch basin cleaning program could require a significant capital and O&M budget.
- The elimination of illegal dumping is dependent on the availability, convenience, and cost of alternative means of disposal. The primary cost is for staff time. Cost depends on how aggressively a program is implemented. Other cost considerations for an illegal dumping program include:

  - Purchase and installation of signs.

  - Rental of vehicle(s) to haul illegally-disposed items and material to landfills.

  - Rental of heavy equipment to remove larger items (e.g., car bodies) from channels.

  - Purchase of landfill space to dispose of illegally-dumped items and material.

- Methods used for illicit connection detection (smoke testing, dye testing, visual inspection, and flow monitoring) can be costly and time-consuming. Site-specific factors, such as the level of impervious area, the density and ages of buildings, and type of land use will determine the level of investigation necessary.

Maintenance

- Two-person teams may be required to clean catch basins with vactor trucks.
- Teams of at least two people plus administrative personnel are required to identify illicit discharges, depending on the complexity of the storm sewer system.
- Arrangements must be made for proper disposal of collected wastes.
- Technical staff are required to detect and investigate illegal dumping violations.

Supplemental Information

Further Detail of the BMP

Storm Drain Flushing

Flushing is a common maintenance activity used to improve pipe hydraulics and to remove pollutants in storm drainage systems. Flushing may be designed to hydraulically convey accumulated material to strategic locations, such as an open channel, another point where flushing will be initiated, or the sanitary sewer and the treatment facilities, thus preventing resuspension and overflow of a portion of the solids during storm events. Flushing prevents "plug flow" discharges of concentrated pollutant loadings and sediments. Deposits can hinder the designed conveyance capacity of the storm drain system and potentially cause backwater conditions in severe cases of clogging.

Storm drain flushing usually takes place along segments of pipe with grades that are too flat to maintain adequate velocity to keep particles in suspension. An upstream manhole is selected to place an inflatable device that temporarily plugs the pipe. Further upstream, water is pumped into the line to create a flushing wave. When the upstream reach of pipe is sufficiently full to cause a flushing wave, the inflated device is rapidly deflated with the assistance of a vacuum pump, thereby releasing the backed up water and resulting in the cleaning of the storm drain segment.

To further reduce impacts of stormwater pollution, a second inflatable device placed well downstream may be used to recollect the water after the force of the flushing wave has dissipated. A pump may then be used to transfer the water and accumulated material to the sanitary sewer for treatment. In some cases, an interceptor structure may be more practical or required to recollect the flushed waters.

It has been found that cleansing efficiency of periodic flush waves is dependent upon flush volume, flush discharge rate, sewer slope, sewer length, sewer flow rate, sewer diameter, and population density. As a rule of thumb, the length of line to be flushed should not exceed 700 feet. At this maximum recommended length, the percent removal efficiency ranges between 65-75% for organics and 55-65% for dry weather grit/inorganic material. The percent removal efficiency drops rapidly beyond that. Water is commonly supplied by a water truck, but fire hydrants can also supply water. To make the best use of water, it is recommended that reclaimed water be used or that fire hydrant line flushing coincide with storm sewer flushing.

Site Design & Landscape Planning SD-10

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- ☑ Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Each project site possesses unique topographic, hydrologic, and vegetative features, some of which are more suitable for development than others. Integrating and incorporating appropriate landscape planning methodologies into the project design is the most effective action that can be done to minimize surface and groundwater contamination from stormwater.

Approach

Landscape planning should couple consideration of land suitability for urban uses with consideration of community goals and projected growth. Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for site design and landscapes planning should conform to applicable standards and specifications of agencies with jurisdiction and be consistent with applicable General Plan and Local Area Plan policies.

Designing New Installations

Begin the development of a plan for the landscape unit with attention to the following general principles:

- Formulate the plan on the basis of clearly articulated community goals. Carefully identify conflicts and choices between retaining and protecting desired resources and community growth.
- Map and assess land suitability for urban uses. Include the following landscape features in the assessment: wooded land, open unwooded land, steep slopes, erosion-prone soils, foundation suitability, soil suitability for waste disposal, aquifers, aquifer recharge areas, wetlands, floodplains, surface waters, agricultural lands, and various categories of urban land use. When appropriate, the assessment can highlight outstanding local or regional resources that the community determines should be protected (e.g., a scenic area, recreational area, threatened species habitat, farmland, fish run). Mapping and assessment should recognize not only these resources but also additional areas needed for their sustenance.

Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Conserve Natural Areas during Landscape Planning

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Cluster development on least-sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

Maximize Natural Water Storage and Infiltration Opportunities Within the Landscape Unit

- Promote the conservation of forest cover. Building on land that is already deforested affects basin hydrology to a lesser extent than converting forested land. Loss of forest cover reduces interception storage, detention in the organic forest floor layer, and water losses by evapotranspiration, resulting in large peak runoff increases and either their negative effects or the expense of countering them with structural solutions.
- Maintain natural storage reservoirs and drainage corridors, including depressions, areas of permeable soils, swales, and intermittent streams. Develop and implement policies and

regulations to discourage the clearing, filling, and channelization of these features. Utilize them in drainage networks in preference to pipes, culverts, and engineered ditches.

- Evaluating infiltration opportunities by referring to the stormwater management manual for the jurisdiction and pay particular attention to the selection criteria for avoiding groundwater contamination, poor soils, and hydrogeological conditions that cause these facilities to fail. If necessary, locate developments with large amounts of impervious surfaces or a potential to produce relatively contaminated runoff away from groundwater recharge areas.

Protection of Slopes and Channels during Landscape Design

- Convey runoff safely from the tops of slopes.
- Avoid disturbing steep or unstable slopes.
- Avoid disturbing natural channels.
- Stabilize disturbed slopes as quickly as possible.
- Vegetate slopes with native or drought tolerant vegetation.
- Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.
- Stabilize temporary and permanent channel crossings as quickly as possible, and ensure that increases in run-off velocity and frequency caused by the project do not erode the channel.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.
- Line on-site conveyance channels where appropriate, to reduce erosion caused by increased flow velocity due to increases in tributary impervious area. The first choice for linings should be grass or some other vegetative surface, since these materials not only reduce runoff velocities, but also provide water quality benefits from filtration and infiltration. If velocities in the channel are high enough to erode grass or other vegetative linings, riprap, concrete, soil cement, or geo-grid stabilization are other alternatives.
- Consider other design principles that are comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define “redevelopment” in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of “ redevelopment” must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under “designing new installations” above should be followed.

Redevelopment may present significant opportunity to add features which had not previously been implemented. Examples include incorporation of depressions, areas of permeable soils, and swales in newly redeveloped areas. While some site constraints may exist due to the status of already existing infrastructure, opportunities should not be missed to maximize infiltration, slow runoff, reduce impervious areas, disconnect directly connected impervious areas.

Roof Runoff Controls SD-11

Rain Garden

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Various roof runoff controls are available to address stormwater that drains off rooftops. The objective is to reduce the total volume and rate of runoff from individual lots, and retain the pollutants on site that may be picked up from roofing materials and atmospheric deposition. Roof runoff controls consist of directing the roof runoff away from paved areas and mitigating flow to the storm drain system through one of several general approaches: cisterns or rain barrels; dry wells or infiltration trenches; pop-up emitters, and foundation planting. The first three approaches require the roof runoff to be contained in a gutter and downspout system. Foundation planting provides a vegetated strip under the drip line of the roof.

Approach

Design of individual lots for single-family homes as well as lots for higher density residential and commercial structures should consider site design provisions for containing and infiltrating roof runoff or directing roof runoff to vegetative swales or buffer areas. Retained water can be reused for watering gardens, lawns, and trees. Benefits to the environment include reduced demand for potable water used for irrigation, improved stormwater quality, increased groundwater recharge, decreased runoff volume and peak flows, and decreased flooding potential.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Designing New Installations

Cisterns or Rain Barrels

One method of addressing roof runoff is to direct roof downspouts to cisterns or rain barrels. A cistern is an above ground storage vessel with either a manually operated valve or a permanently open outlet. Roof runoff is temporarily stored and then released for irrigation or infiltration between storms. The number of rain

barrels needed is a function of the rooftop area. Some low impact developers recommend that every house have at least 2 rain barrels, with a minimum storage capacity of 1000 liters. Roof barrels serve several purposes including mitigating the first flush from the roof which has a high volume, amount of contaminants, and thermal load. Several types of rain barrels are commercially available. Consideration must be given to selecting rain barrels that are vector proof and childproof. In addition, some barrels are designed with a bypass valve that filters out grit and other contaminants and routes overflow to a soak-away pit or rain garden.

If the cistern has an operable valve, the valve can be closed to store stormwater for irrigation or infiltration between storms. This system requires continual monitoring by the resident or grounds crews, but provides greater flexibility in water storage and metering. If a cistern is provided with an operable valve and water is stored inside for long periods, the cistern must be covered to prevent mosquitoes from breeding.

A cistern system with a permanently open outlet can also provide for metering stormwater runoff. If the cistern outlet is significantly smaller than the size of the downspout inlet (say ¼ to ½ inch diameter), runoff will build up inside the cistern during storms, and will empty out slowly after peak intensities subside. This is a feasible way to mitigate the peak flow increases caused by rooftop impervious land coverage, especially for the frequent, small storms.

Dry wells and Infiltration Trenches

Roof downspouts can be directed to dry wells or infiltration trenches. A dry well is constructed by excavating a hole in the ground and filling it with an open graded aggregate, and allowing the water to fill the dry well and infiltrate after the storm event. An underground connection from the downspout conveys water into the dry well, allowing it to be stored in the voids. To minimize sedimentation from lateral soil movement, the sides and top of the stone storage matrix can be wrapped in a permeable filter fabric, though the bottom may remain open. A perforated observation pipe can be inserted vertically into the dry well to allow for inspection and maintenance.

In practice, dry wells receiving runoff from single roof downspouts have been successful over long periods because they contain very little sediment. They must be sized according to the amount of rooftop runoff received, but are typically 4 to 5 feet square, and 2 to 3 feet deep, with a minimum of 1-foot soil cover over the top (maximum depth of 10 feet).

To protect the foundation, dry wells must be set away from the building at least 10 feet. They must be installed in solids that accommodate infiltration. In poorly drained soils, dry wells have very limited feasibility.

Infiltration trenches function in a similar manner and would be particularly effective for larger roof areas. An infiltration trench is a long, narrow, rock-filled trench with no outlet that receives stormwater runoff. These are described under Treatment Controls.

Pop-up Drainage Emitter

Roof downspouts can be directed to an underground pipe that daylights some distance from the building foundation, releasing the roof runoff through a pop-up emitter. Similar to a pop-up irrigation head, the emitter only opens when there is flow from the roof. The emitter remains flush to the ground during dry periods, for ease of lawn or landscape maintenance.

Foundation Planting

Landscape planting can be provided around the base to allow increased opportunities for stormwater infiltration and protect the soil from erosion caused by concentrated sheet flow coming off the roof. Foundation plantings can reduce the physical impact of water on the soil and provide a subsurface matrix of roots that encourage infiltration. These plantings must be sturdy enough to tolerate the heavy runoff sheet flows, and periodic soil saturation.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Efficient Irrigation SD-12

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
  - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
  - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect
  - Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
  - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Storm Drain Signage SD-13

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include “NO DUMPING

– DRAINS TO OCEAN" and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of "redevelopment", then the requirements stated under " designing new installations" above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner's association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.

- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Maintenance Bays & Docks SD-31

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Several measures can be taken to prevent operations at maintenance bays and loading docks from contributing a variety of toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to the stormwater conveyance system.

Approach

In designs for maintenance bays and loading docks, containment is encouraged. Preventative measures include overflow containment structures and dead-end sumps. However, in the case of loading docks from grocery stores and warehouse/distribution centers, engineered infiltration systems may be considered.

Suitable Applications

Appropriate applications include commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for vehicle maintenance and repair are governed by Building and Fire Codes, and by current local agency ordinances, and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code requirements.

Designing New Installations

Designs of maintenance bays should consider the following:

- Repair/maintenance bays and vehicle parts with fluids should be indoors; or designed to preclude urban run-on and runoff.
- Repair/maintenance floor areas should be paved with Portland cement concrete (or equivalent smooth impervious surface).

- Repair/maintenance bays should be designed to capture all wash water leaks and spills. Provide impermeable berms, drop inlets, trench catch basins, or overflow containment structures around repair bays to prevent spilled materials and wash-down waters form entering the storm drain system. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.
- Other features may be comparable and equally effective.

The following designs of loading/unloading dock areas should be considered:

- Loading dock areas should be covered, or drainage should be designed to preclude urban run-on and runoff.
- Direct connections into storm drains from depressed loading docks (truck wells) are prohibited.
- Below-grade loading docks from grocery stores and warehouse/distribution centers of fresh food items should drain through water quality inlets, or to an engineered infiltration system, or an equally effective alternative. Pre-treatment may also be required.
- Other features may be comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Stormwater and non-stormwater will accumulate in containment areas and sumps with impervious surfaces. Contaminated accumulated water must be disposed of in accordance with applicable laws and cannot be discharged directly to the storm drain or sanitary sewer system without the appropriate permit.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Trash Storage Areas SD-32

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Trash storage areas are areas where a trash receptacle (s) are located for use as a repository for solid wastes. Stormwater runoff from areas where trash is stored or disposed of can be polluted. In addition, loose trash and debris can be easily transported by water or wind into nearby storm drain inlets, channels, and/or creeks. Waste handling operations that may be sources of stormwater pollution include dumpsters, litter control, and waste piles.

Approach

This fact sheet contains details on the specific measures required to prevent or reduce pollutants in stormwater runoff associated with trash storage and handling. Preventative measures including enclosures, containment structures, and impervious pavements to mitigate spills, should be used to reduce the likelihood of contamination.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Design requirements for waste handling areas are governed by Building and Fire Codes, and by current local agency ordinances and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code and ordinance requirements. Hazardous waste should be handled in accordance with legal requirements established in Title 22, California Code of Regulation.

Wastes from commercial and industrial sites are typically hauled by either public or commercial carriers that may have design or access requirements for waste storage areas. The design criteria in this fact sheet are recommendations and are not intended to be in conflict with requirements established by the waste hauler. The waste hauler should be contacted prior to the design of your site trash collection areas. Conflicts or issues should be discussed with the local agency.

Designing New Installations

Trash storage areas should be designed to consider the following structural or treatment control BMPs:

- Design trash container areas so that drainage from adjoining roofs and pavement is diverted around the area(s) to avoid run-on. This might include berming or grading the waste handling area to prevent run-on of stormwater.
- Make sure trash container areas are screened or walled to prevent off-site transport of trash.

- Use lined bins or dumpsters to reduce leaking of liquid waste.
- Provide roofs, awnings, or attached lids on all trash containers to minimize direct precipitation and prevent rainfall from entering containers.
- Pave trash storage areas with an impervious surface to mitigate spills.
- Do not locate storm drains in immediate vicinity of the trash storage area.
- Post signs on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Maintenance Considerations

The integrity of structural elements that are subject to damage (i.e., screens, covers, and signs) must be maintained by the owner/operator. Maintenance agreements between the local agency and the owner/operator may be required. Some agencies will require maintenance deed restrictions to be recorded of the property title. If required by the local agency, maintenance agreements or deed restrictions must be executed by the owner/operator before improvement plans are approved.

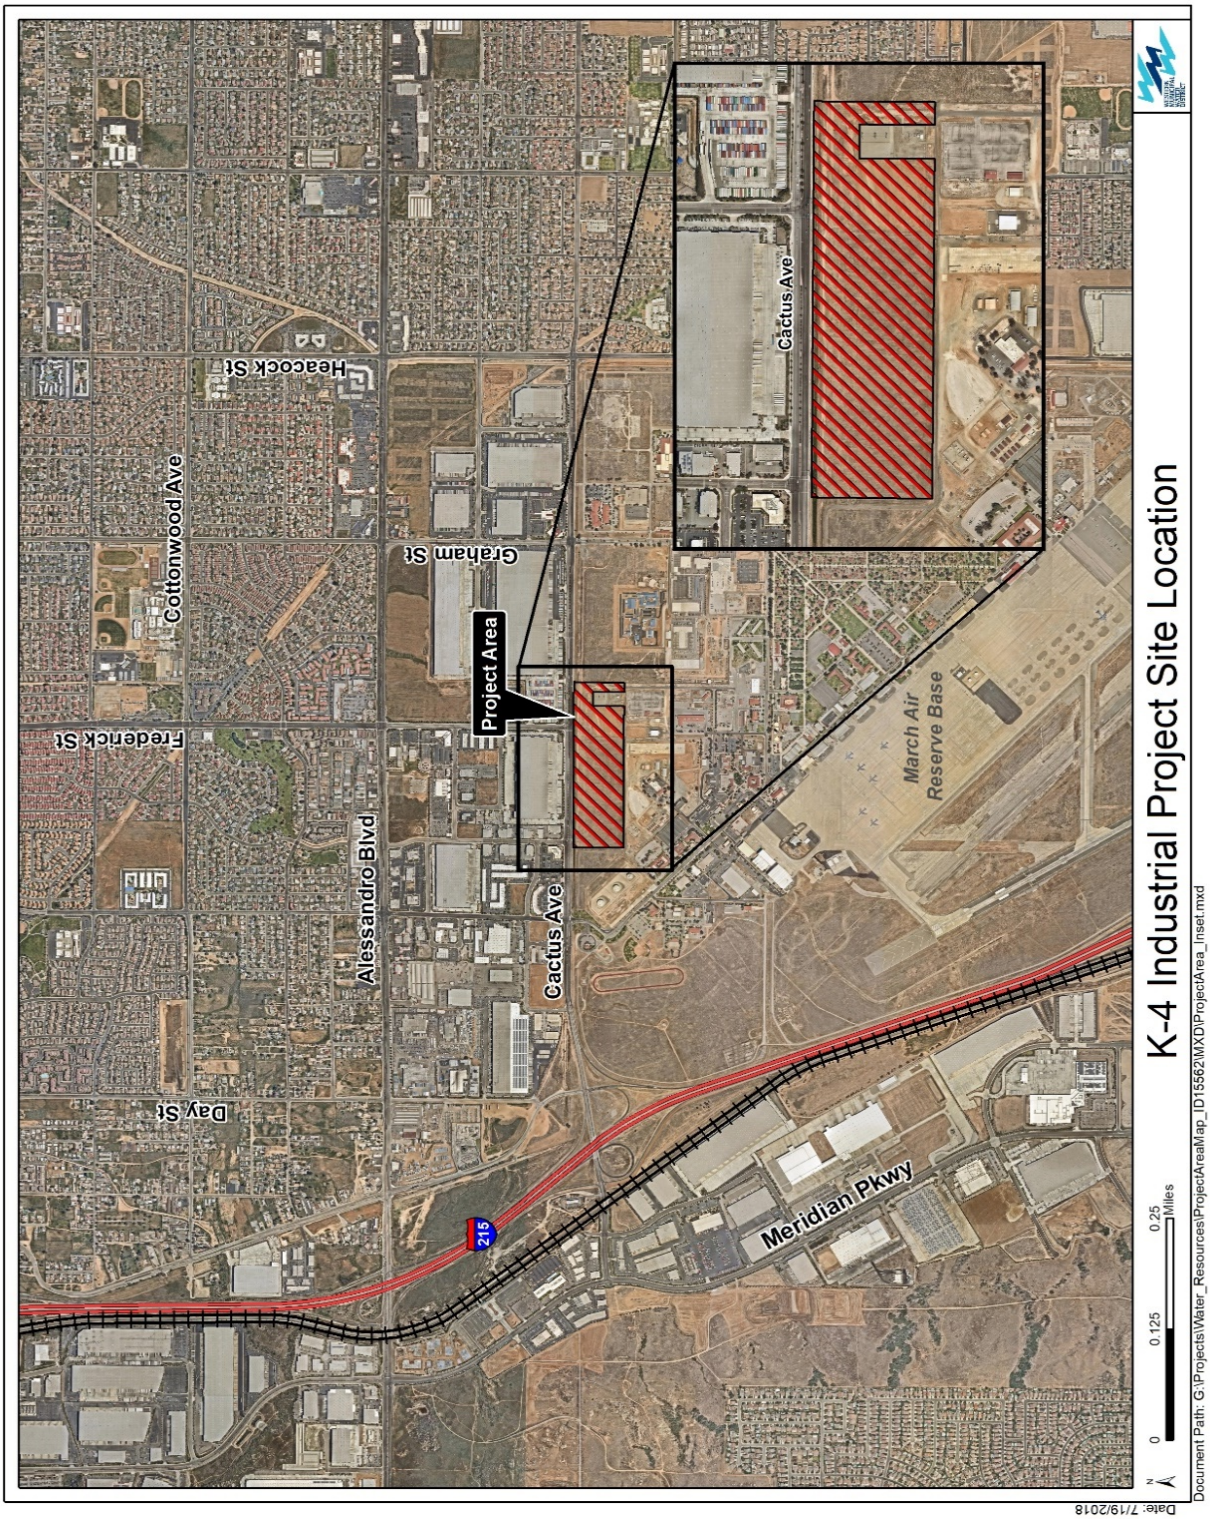
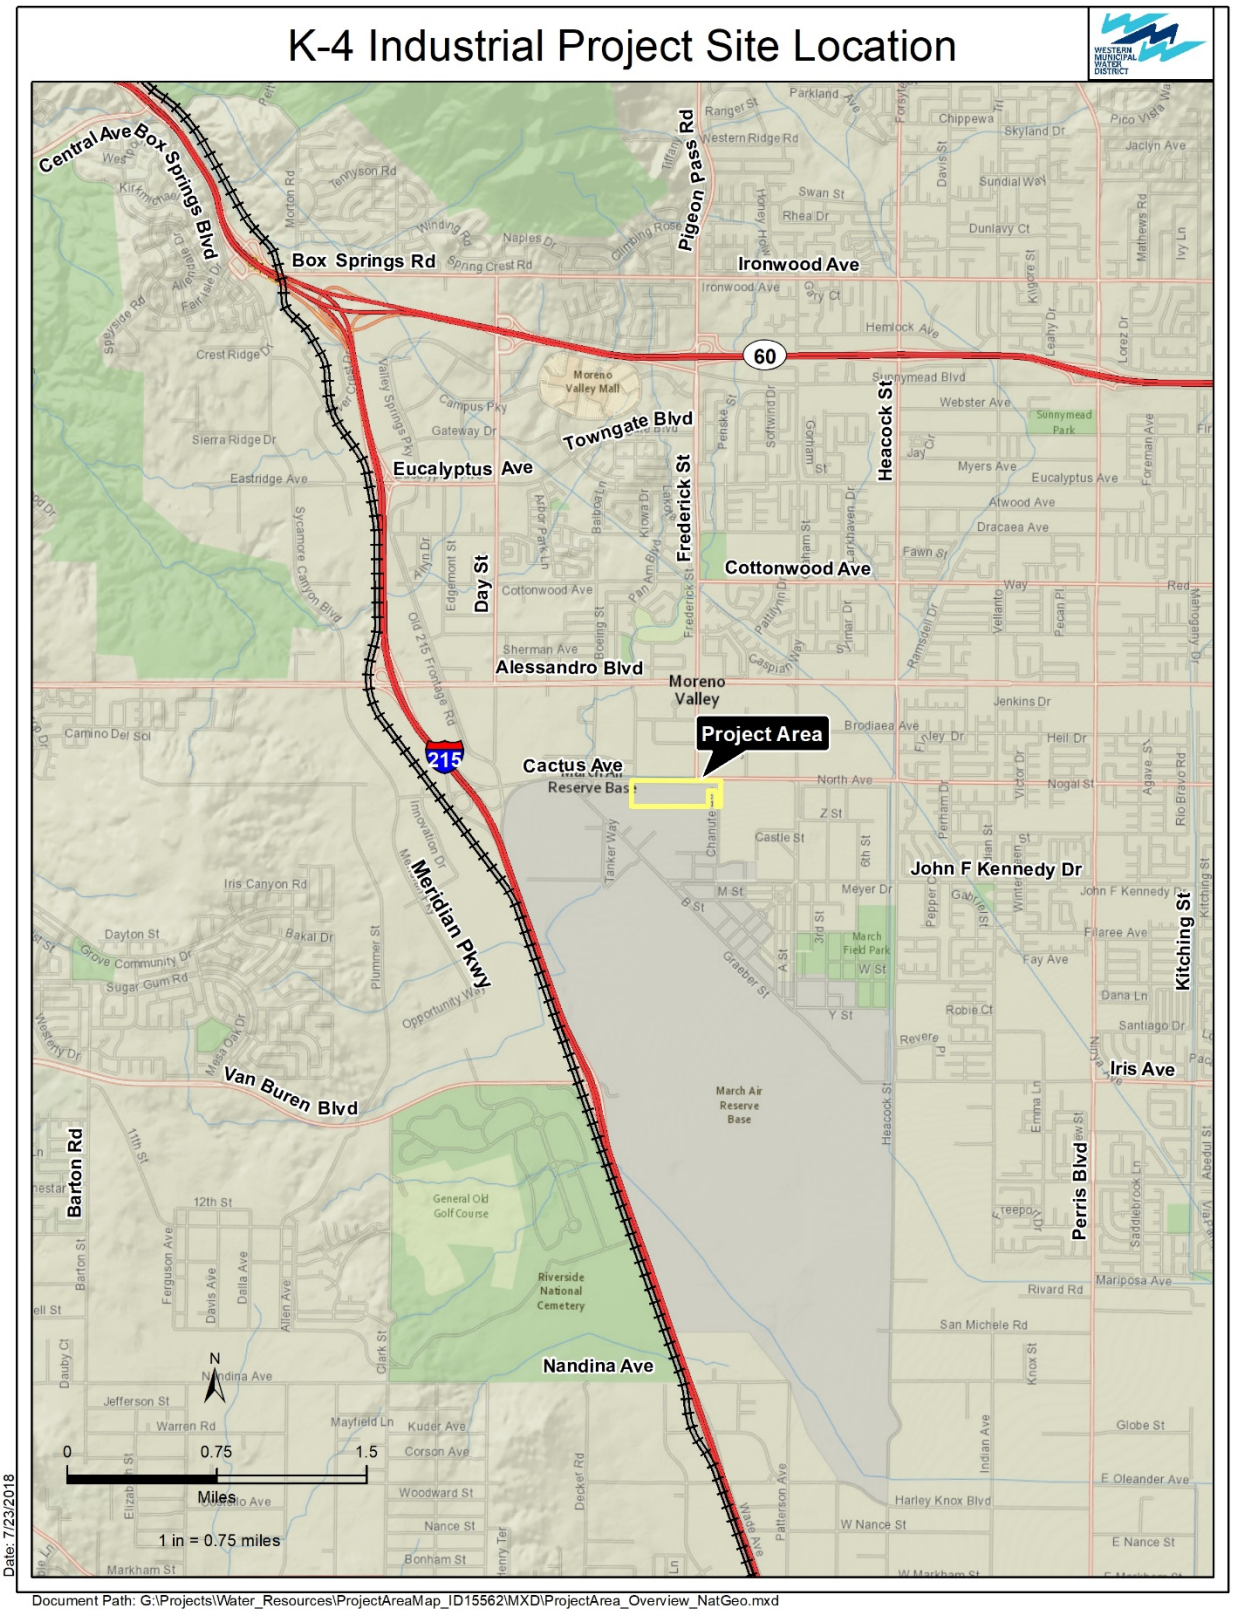
Introduction



The purpose of this water supply assessment ("WSA") is to evaluate whether the total projected water supplies available to Western Municipal Water District ("Western") during normal, single-dry, and multiple-dry years over the next 20-year period are sufficient to meet the projected demands of the proposed K-4 Industrial ("Project"), in addition to Western's existing and planned future uses, including agricultural and manufacturing. This WSA has been prepared in accordance with the requirements of Water Code section 10910 *et seq.*, commonly referred to as California Senate Bill 610 ("SB 610").

Proposed Project – K-4 Industrial



The Project is an approximately 35.4-acre site with a 718,000 square-foot building located in the March Joint Powers Authority ("JPA") jurisdiction in unincorporated Riverside County. The Project site is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. Interstate 215 (I-215) is located approximately 0.8 mile west of the Project site. The Project site is comprised of five parcels designated as Assessor's Parcel Numbers ("APNs") 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. A total of 289 automobile parking stalls and 317 truck trailers parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. Once constructed, the Project site would be used up to 7 days per week and 24 hours per day. The anticipated water use is 12 acre-feet per year ("AFY") which includes the estimated water demand of 130,312 square feet of landscaping and approximately 750 employees.

Additionally, the Project will include improvements to the draining ditch that runs along the south side of Cactus Avenue, commencing one parcel to the west of the Project site, then along the Project frontage, and further to the east ending at Heacock Avenue. The current drainage ditch will be undergrounded in a box culvert. This portion of the Project is being discussed with Riverside County Flood Control and Water Conservation District and the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District as part of its Master Plan.

Project Location Map

Project Area Map

Water Supply Assessment Statute

Senate Bill 610

SB 610 requires the preparation of a WSA for certain projects that are subject to review under the California Environmental Quality Act ("CEQA") and that meet any of the following criteria:[1]

1. A residential development of more than 500 units,
2. A business/shopping center with more than 1,000 employees or 500,000 square feet of floor space,
3. A commercial office building with more than 1,000 employees or 250,000 square feet of floor space,
4. A hotel/motel with more than 500 rooms,
5. An industrial/manufacturing/processing plant or industrial park with more than 1,000 employees, encompassing more than 650,000 square feet of floor space, or occupying more than 40 acres of land (provided; however, that until January 1, 2017, a photovoltaic or wind energy generation facility is not a project that requires a WSA if the facility would demand no more than 75 acre-feet ("AF") of water annually),
6. A mixed-use development project that includes one or more of the projects specified in subsections 1. through 5., above,
7. A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500-dwelling unit project, or
8. For a public water system with 5,000 or fewer connections, a project that will increase the number of connections by 10 percent or more.

As an industrial park occupying more than 40 acres of land and encompassing more than 650,000 square feet of floor space, the proposed Project meets the criteria in Water Code section 10912 (a)(5), and thus requires preparation of a WSA. Under SB 610, at the time the local/lead agency determines a "project" (as defined by Water Code section 10912) is subject to review under CEQA, the agency must identify the public water system that will provide water service to the project and request the water provider to prepare a WSA for the project.[2]

Generally, the WSA must include an analysis of whether the total projected water supplies available to the water provider over the next 20-year period during normal, single-dry, and multiple-dry years, are sufficient to meet the projected water demand associated with the proposed project, in addition to the water provider's other existing and planned future uses.[3] Additional analysis is required if the water supplies identified to serve the project include groundwater. Here, to ensure a comprehensive discussion regarding Western's overall water supply availability and reliability, this WSA includes a detailed analysis of the groundwater supplies available to Western, as further set forth below.

[1] California Water Code § 10912(a)-(b)
[2] California Water Code § 10910(b)
[3] California Water Code § 10910(c)

Upon the water provider's adoption of the WSA, the WSA must be forwarded to the lead agency and incorporated into the CEQA document being prepared for the project. The lead agency must then determine, based on the entire record, whether the total projected water supplies available to the water provider over the next 20-year projection during normal, single-dry, and multiple-dry years will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses.[4]

Western Municipal Water District

Western was formed by the voters in 1954, primarily to bring supplemental water to western Riverside County. Today, Western serves eight wholesale customers and approximately 24,000 retail customers. Western's water supply portfolio consists mainly of imported supplies from the Colorado River and the State Water Project ("SWP") but also includes recycled water and supplemental water obtained from the cities of Corona and Riverside, and other local projects. Western's general district consists of a 527-square mile area of western Riverside County and an estimated population of more than 860,000.

As a member agency of the Metropolitan Water District of Southern California ("MWD"), Western provides supplemental water on a wholesale basis to the cities of Corona, Norco, and Riverside and the water agencies of Box Springs Mutual Water Company, Eagle Valley Mutual Water Company, Elsinore Valley Municipal Water District ("EVMWD"), Temescal Valley Water District, and Rancho California Water District. Western serves retail customers in the unincorporated areas of El Sobrante, Eagle Valley, Temescal Creek, Woodcrest, Lake Mathews, and March Air Reserve Base.

Retail Service Area

Western's retail service area covers about 104 square miles and provides water to an estimated population of 95,000, via approximately 24,000 service connections. Western purchases water from MWD comprised of Colorado River and SWP supplies to serve its wholesale and retail customers. Most of the water purchased by Western is imported from the SWP with about 20 percent from the Colorado River. As set forth below, Western also obtains water through several local water supply projects and agreements.

Western's main retail service area is within the County of Riverside. Based on the total number of domestic customers, Western's retail service area experienced an annual average growth of approximately 5.8 percent between 2001 and 2010. Western's growth rate was influenced by the undeveloped land in its retail service area compared to historically urban areas. This annual average growth rate then attenuated to approximately 1.14 percent between 2010 and 2015.[5] The Southern California Association of Governments ("SCAG") projected the annual growth rate for regional population will be only 0.7 percent through the year 2040.[6] Western's 2015 Urban

[4] California Water Code § 10911(b)-(c)
[5] 2015 Urban Water Management Plan, Western Municipal Water District
[6] Regional Transportation Plan, 2016–2040 Sustainable Communities Strategy Report Chapter 3 "Challenges in a Changing Region," Average Annual Population Growth Rate, Page 47, Southern California Association of Governments, December 2015

Water Management Plan projected the annual population growth rate within Western's service area at an average of 1.4 percent through the year 2040.

The WSA Process

In accordance with the requirements of SB 610, this WSA evaluates:

1. The total projected water supplies available to Western during normal, single-dry, and multiple-dry water years during a 20-year projection, and

2. Whether Western's total projected supplies are sufficient to meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

SB 610 provides: "If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the Urban Water Management Plan in preparing the elements of the assessment..."[7] The Urban Water Management Planning Act, Water Code section 10610 *et seq.*, requires water providers to perform various planning analyses with the goal of ensuring overall long-term water supply sufficiency and reliability within their service areas. For instance, Urban Water Management Plans ("UWMP") must include a water supply reliability assessment, including a detailed evaluation of the supplies necessary to meet demands over at least a 20-year period in average, single-year, and multi-year drought conditions. Urban water providers must also prepare a water shortage contingency plan that documents the stages of actions needed to address up to a 50 percent reduction in an agency's water supplies. Water shortage contingency plans must also identify actions to be taken in the event of a catastrophic interruption in water supplies and describe mandatory prohibitions against specific water use practices during water shortages. All such elements are included in Western's 2015 UWMP.

Western, as a member agency of MWD, closely coordinated the preparation of its 2015 UWMP and analyses with MWD's 2015 Regional Urban Water Management Plan ("RUWMP"), MWD's 2015 Integrated Resources Plan ("IRP"), and related analyses. Western's 2015 UWMP, MWD's 2015 RUWMP, and MWD's 2015 IRP are the most recent local and regional water supply analyses prepared and adopted pursuant to the Urban Water Management Planning Act. Thus, as authorized by SB 610, certain information and analyses from those and other documents were utilized in preparing this WSA. In addition, and as further discussed below, information and analyses from MWD's 2015 RUWMP and 2015 IRP were used, in part, to address and analyze recent legal, regulatory, and environmental conditions having the potential to affect the availability and reliability of imported water supplies from MWD.

The projected water demands associated with the proposed Project were not specifically accounted for in Western's 2015 UWMP; however, the overall projected demands for the land use were accounted for by population growth. Therefore, in preparing this WSA, projected and adjusted demand information for Western's service area has been reviewed and presented in

[7] California Water Code § 10910(c)(2)

relation to Western's 2015 UWMP and MWD's 2015 RUWMP to evaluate the sufficiency of Western's total projected water supplies to serve the proposed Project in addition to Western's existing and planned future uses. This WSA also identifies conservation and water-budgeted tiered rates as a means of reducing demand in Western's retail area.

Among other data and analyses, the following documentation was utilized in the preparation of this WSA:

Metropolitan Water District of Southern California

- 2015 Integrated Water Resources Plan
- 2015 Regional Urban Water Management Plan

California Department of Water Resources

- State Water Project Final Delivery Capability Report, July 2015

Water Supply

Under normal water year conditions, Western's retail service area relies on imported water supplies from MWD. However, as discussed in greater detail below, Western has developed various local supplies that can be used for potable and non-potable purposes during normal, off-season, extraordinary, or emergency conditions.

Imported Water Supplies – Metropolitan Water District of Southern California

Below are the imported water supplies that Western has received from MWD for the last five years.

Total Western Calendar Year Imported Water from MWD (AF)				
2013	**2014**	**2015**	**2016**	**2017**
75,697	81,895	58,269	65,320	70,535

MWD is a legislatively created agency charged with regional water supply management for large portions of Southern California. MWD holds contractual rights to receive SWP and Colorado River water supplies, and has developed various other water supply programs and projects to augment its overall portfolio. From that perspective, MWD has developed comprehensive and highly specialized modeling techniques to evaluate short, intermediate, and long-term

availability and reliability of its total projected supplies used to serve and supplement the needs of its 26 member agencies, including Western.

MWD's mission statement is "[T]o provide its service area with adequate and reliable supplies of high quality water to meet present and future needs in an environmentally and economically responsible way."[8] To fulfill this mission, MWD takes a coordinated approach to regional planning through its IRP. The first IRP was developed in 1996. MWD and its member agencies worked cooperatively to compile and analyze water demand and supply data, then applied that information in developing a diverse water supply portfolio. The 1996 plan stated that MWD and its member agencies would meet all full-service water demands without interruption through 2020. The IRP also set targets for conservation, development of local supplies, imported water supplies, groundwater banking, and water transfers.

MWD has updated its IRP several times. The most recently updated 2015 IRP was adopted on January 12, 2016. The 2015 IRP Update identifies various strategies to ensure water supply reliability including:

1. Diversified portfolio of actions calling for stabilization and maintenance of imported supplies,
2. Meeting future growth through increased water conservation and sustaining and developing new local supplies,
3. Pursuing a comprehensive transfer and exchange strategy, and
4. Building storage in wet and normal years to manage risks and drought.

MWD's IRP process used the MWD-MAIN Water Forecasting System to calculate demand projections among the MWD member agencies. The model incorporates demographic and economic data (and, thus, projected demand) obtained from regional planning agencies. Supply reliability was evaluated through another computer model developed by MWD known as the Integrated Resources Planning Simulation Model ("IRPSIM"). This model uses historical hydrologic data from 1922 to 2012 to generate water shortage/surplus estimates over a 25-year planning horizon.

The 2015 IRP Update provides a roadmap for maintaining regional water supply reliability over the next 25 years and beyond and addresses many of the key factors affecting SWP and Colorado River supplies. In addition, the update incorporated those factors into its forecasts, analyses, and future planning actions to ensure an adequate and reliable water supply for its member agencies.

The 2015 IRP Update presents a three-component approach:

1. A core resources strategy represents baseline efforts to manage water supply and demand conditions and to stabilize MWD's traditional imports from the Colorado River and northern California through the Sacramento-San Joaquin Delta. This strategy is based on known factors, including detailed planning assumptions about future demographic scenarios, water supply yields, and a range of observed historical weather patterns. Under

[8] http://www.mwdh2o.com/WhoWeAre/Mission

this strategy, MWD and its member agencies will advance water use efficiency through conservation and recycling, and with further local development such as groundwater recovery and seawater desalination.

2. A cost-effective "supply buffer" will enable the region to adapt to future circumstances and foreseeable challenges. The buffer helps protect the region from possible shortages caused by conditions that exceed the core resources strategy, starting with increased conservation and water-use efficiency on a region-wide basis.

3. Foundational actions guide the region in determining alternative supply options for long-range planning. If future changed conditions, such as climate change or the availability of resources, exceed what is covered by MWD's core resources and supply buffer, these alternatives would provide a greater contribution to water reliability than MWD's imported water sources or any other single supply. These actions, including feasibility studies, research, and regulatory review would provide the foundation to develop alternative resources, if needed.[9]

The 2015 IRP Update builds upon the adaptive management strategy established in the 2010 IRP, and continues to refine that strategy to ensure water supply reliability throughout MWD's service area. This strategy includes a diversified portfolio of actions that calls for stabilizing and maintaining imported water supplies; meeting future growth through increased water conservation, and sustaining and developing new local supplies; pursuing a comprehensive transfer and exchange strategy; building storage in wet and normal years to manage risks and drought; and preparing for uncertainty with future water supply actions. Among other water supply strategies, the 2015 IRP Update includes the following reliability targets for the SWP, Colorado River Aqueduct, local water supplies, and conservation:

1. Maintain Colorado River Supplies. The 2015 IRP Update goal for Colorado River Aqueduct ("CRA") supplies is to maintain current levels of water supplies from existing programs, while also developing flexibility through dry-year programs and storage. In order to accomplish this goal, the 2015 IRP Update targets development of sufficient base supply programs to ensure that a minimum of 900,000 AF of diversions are available when needed and to ensure access to 1.2 million AF of supplies in dry years through flexible programs and storage.

2. Stabilize SWP Supplies. The goal for SWP supplies is to adaptively manage flow and export regulations in the near term and to achieve a long-term Delta solution that addresses ecosystem and water reliability challenges. Achieving this goal will require continued participation and a successful outcome in the California WaterFix and the California EcoRestore efforts. This approach targets an average of 980,000 AF of SWP supplies in the near term and 1.2 million AF on average starting in 2030 when a long-term Delta solution is estimated to be in place.

3. Achieve Additional Conservation Savings. Conservation is crucial to the 2015 IRP Update strategy. While Metropolitan and its member agencies continue to work toward

[9] 2015 Integrated Water Resources Plan Update, Press Release, January 12, 2016.

achieving water savings consistent with 20x2020 goals, the 2015 IRP Update seeks further savings though increased emphasis on outdoor water use efficiency, largely through enhanced regional compliance with the state's Model Water Efficient Landscape Ordinance. Metropolitan would work with its member agencies to develop a combination of incentive, education/outreach, and other programs in support of this approach. The 2015 IRP Update target for conservation would result in approximately 485,000 AF of new water savings by 2040.

4. Develop Additional Local Water Supplies. Local supplies are a key to providing water supply reliability into the future. Over half of the region's water supplies come from locally developed sources. The 2015 IRP Update goal for local water supplies is primarily to maintain existing and under-construction supply sources. The 2015 IRP Update target for local supplies totals 2.2 million AF in 2016; this target grows to a total of 2.4 million AF by 2040. In comparison, local supplies produced a total of about 1.94 million AF in calendar year 2014. Over the next 25 years, up to 460,000 AF of additional local supplies would be developed.

Imported Water Supplies – Determination of MWD available supplies

MWD Regional Urban Water Management Plan

With respect to imported supply, MWD's 2015 Regional Urban Water Management Plan has evaluated projected near, intermediate, and long-term water supply availability and reliability using historic hydrology. The year 1977 was identified as the single driest and 1990–1992 was used for the three-year dry period. MWD's water supply estimates are provided below in Table 2-4 for the single driest year, Table 2-5 for multi-year dry period, and Table 2-6 for the average year hydrology.

Table 2-4
Single Dry-Year
Supply Capability[1] and Projected Demands
Repeat of 1977 Hydrology
(Acre-feet per year)

Forecast Year	2020	2025	2030	2035	2040
Current Programs					
In-Region Supplies and Programs	693,000	774,000	852,000	956,000	992,000
California Aqueduct[2]	691,000	712,000	723,000	749,000	749,000

[5] Total demands are adjusted to include IID-SDCWA transfer and exchange and canal linings. These supplies are calculated as local supply, but need to be shown for the purposes of CRA capacity limit calculations without double counting.

Based on these tables and the supporting analyses and information in its most recent 2015 RUWMP, MWD has concluded that:

1. MWD has supply capabilities that would be sufficient to meet expected demands from 2020 through 2040 under single dry-year and multiple dry-year conditions, as presented in Figure ES-1 (2015 RUWMP, pp. ES-5 through ES-6).

Figure ES -1 Supply Capabilities under Single Dry-Year and Multiple Dry-Year Hydrologies

Note:
1. Supply capabilities are derived using the simulated median storage level going into each of five-year increments based on the balances of supplies and demands. Under the median storage condition, there is an estimated 50 percent probability that storage levels would be higher than the assumption used, and a 50 percent probability that storage levels would be lower than the assumption used.
2. Under some conditions, Metropolitan may choose to implement the WSAP in order to preserve storage reserves for a future year, instead of using the full supply capability. This can result in impacts at the retail level even under conditions where there may be adequate supply capabilities to meet firm demands.
3. All storage capability figures shown in the 2015 UWMP reflect actual storage program conveyance constraints.

2. MWD has comprehensive plans for stages of actions it would undertake to address up to 50 percent reduction in its water supplies and a catastrophic interruption in water supplies through its Water Surplus and Drought Management and Water Supply Allocation Plans. MWD also developed an Emergency Storage Requirement to prepare for potential interruption in water supplies resulting from catastrophic occurrences within the southern California region, including, but not limited to, seismic events along the San Andreas Fault. In addition, MWD is working with the State to implement a comprehensive improvement plan to address catastrophic occurrences that could occur outside of the southern California region, such as a maximum probable seismic event in the Delta that would cause levee failure and disruption of SWP deliveries.

3. MWD has plans for supply implementation and continued development of a diversified resource portfolio including Colorado River and SWP supplies, Central Valley transfers, local resource projects, and in-region storage that enables MWD to meet the water supply needs of its member agencies, including Western.

Importantly, MWD's conclusions and water supply capabilities have been developed to specifically account for several critical factors, as further discussed in this WSA:

Water Demand Growth: Despite the recent residential development slowdown, population growth in the southern California region has continued to increase overall water demands, and MWD has accounted for that growth.

State Water Supply: Recent regulatory issues, court decisions, and climate conditions have imposed restrictions on the amount and timing of deliveries from the SWP.

Colorado River Supplies: The Colorado River Basin has experienced a multi-year drought and ongoing legal and regulatory factors continue to have potential effects on California's use of Colorado River supplies.

To address these and other factors, MWD notes that it continues to evaluate and develop resource alternatives to provide a reliable and high quality water supply, while exploring ways to reduce demands through water conservation and efficiency programs and allocating supplies among its member agencies when necessary through its WSAP. MWD's recent adoption of its 2015 IRP Update is an example of its ongoing water supply planning efforts. Also discussed herein, various statewide, regional, and local measures are being enacted to change historic water use practices, increase conservation, and reduce per capita water demands.

State Water Project Deliveries

Various legal, regulatory, climatic, and environmental factors have the potential to affect the availability and reliability of SWP supplies. As further discussed below, the California Department of Water Resources ("DWR") specifically accounts for these and other factors in evaluating the projected delivery capability of SWP supplies to MWD and other State contractors.

DWR Final 2015 SWP Delivery Capability Report

DWR continues to evaluate the issues affecting SWP exports from the Delta and how those issues may affect the long-term availability and reliability of SWP deliveries to water agencies that hold SWP contracts. As indicated above, DWR has released its Final 2015 SWP Delivery Capability Report. According to the 2015 Final Report, the average delivery of contractual SWP Table A supply is projected to be 62 percent under current conditions. Within that long-term average, SWP Table A deliveries can range from 11 percent (single dry-year) to 98 percent (single wet-year) of contractual amounts under current conditions, under current conditions, contractual amounts are projected to range from 28 to 33 percent during multiple-dry year periods, and from 76 to 95 percent during multiple wet periods.[10] The 2015 Final Report also presents the following findings:

The average annual delivery of Table A water estimated for the 2015 Report is 2,553,000 AF per year (an increase of 1 percent from the 2013 Report).

[10] DWR 2015 Final Report at 26-27, Tables 6-3, 6-4.

The estimated maximum Table A deliveries for the 2015 Final Report is 4,055,000 AF, which is higher by 1.5 percent than 2013 Report. The 2015 Final Report also shows 74 percent likelihood (79 percent with the 2013 Report) that more than 2,000,000 AF/year of Table A water will be delivered under the current estimates.

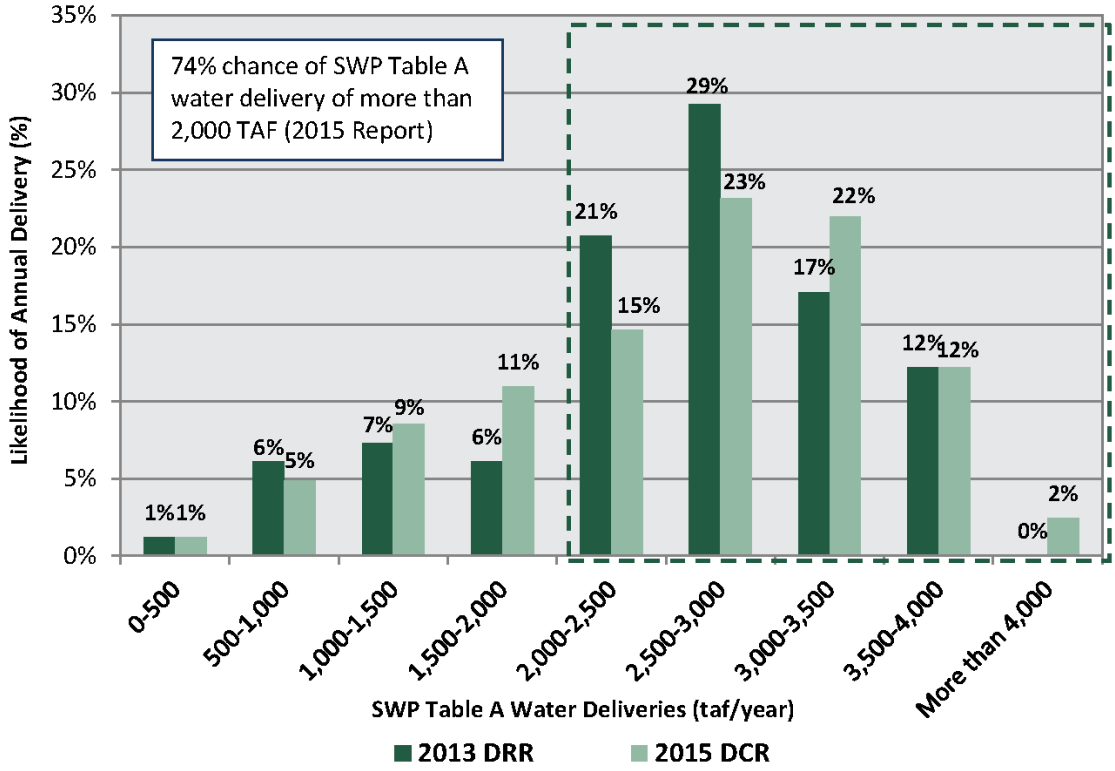

Figure 6-2. Estimated Likelihood of SWP Table A Water Deliveries, by Increments of 500 taf (Existing Conditions)

taf = trillion acre-feet

To ensure a conservative analysis, DWR's 2015 Final Report expressly assumes and accounts for the institutional, environmental, regulatory, and legal factors affecting SWP supplies, including but not limited to: water quality constraints, fishery protections, other D-1641 requirements, and the operational limitations imposed by the FWS and NMFS BiOps that are discussed above. The 2015 Final Report also considers the potential effects of Delta levee failures and evaluates the potential impacts on Delta water supplies associated with continued land subsidence, earthquakes, and flood events.[11] Notably, the 2015 Final Report assumes that all of these restrictions and limitations will remain in place over the next 20-year period and that no actions to improve the Delta will occur, even though numerous legal proceedings, various Delta restoration processes, and new legal and legislative requirements and efforts for Delta improvements are currently underway (i.e., Bay Delta Conservation Plan, Delta Vision, Delta Plan). Finally, DWR's long-term SWP delivery reliability analyses incorporate assumptions intended to account for potential supply shortfalls related to climate change.[12] These and other

[11] See, e.g., DWR 2015 Final Report, Section 4, pp. 13–16.
[12] See, e.g., DWR 2015 Report, Section 6 pp. 21–30.

factors result in DWR presenting a conservative projection of SWP delivery reliability in its 2015 Final Report.

DWR's 2015 Final Report demonstrates the projected long-term average delivery amounts of contractual SWP Table A supplies are essentially the same as those projected in the 2013 Final Report. As noted, the projections developed by DWR are predicated on several conservative assumptions, which make the projections useful from a long-range water supply planning perspective. While various factors could lead DWR to increase its delivery projections, the 2015 Final Report remains the best available information concerning the long-term delivery reliability of SWP supplies.

Colorado River Water Deliveries

The CRA, which is owned and operated by MWD, transports water from the Colorado River approximately 242 miles to its terminus at Lake Mathews in Riverside County. After deducting for conveyance losses and considering maintenance requirements, up to 1.2 million AF of water a year may be conveyed through the CRA to MWD's member agencies, subject to availability of Colorado River water for delivery to MWD. Similar to SWP supplies discussed above, various legal, regulatory, climatic and environmental factors have the potential to affect the availability and reliability of Colorado River supplies.

Western Municipal Water District – Local Water Supplies and Water Supply Projects

Below is a summary of water supplies that Western received from the Bunker Hill Basin for the last five years.

Total Western Calendar Year Imported Water from Bunker Hill Basin (AF)				
2013	**2014**	**2015**	**2016**	**2017**
5,438	4,194	7,150	8,505	8,182

To reduce its dependency on imported water, Western has aggressively sought to develop and/or expand local sources of supply for use under both non-emergency and emergency conditions. Western's Water Resources staff have evaluated a number of projects under the following criteria:

- Reliability – Meet system demands and ensure supply reliability under droughts and emergency conditions.
- Water Quality – Provide a safe and high quality water supply that meets or exceeds safe drinking quality regulations, and supports the development of recycled water and conjunctive use.
- Cost – Provide reliable and high quality water supply at a cost-effective price.
- Ability to Implement – Prioritize projects that have the greatest chance for successful implementation.
- Flexibility – Prioritize projects that have the greatest potential for operational flexibility.
- Environment – Consider the environmental impacts when developing and utilizing future water supplies.

Using these criteria, a number of water supply projects have been identified:

I. Interconnections
    A. City of Riverside
        1. Existing Mockingbird Canyon Pump Station
        2. Existing Whitegates Interconnection
        3. Proposed Campbell Interconnection
    B. City of Corona
        1. Emergency 4 cubic-feet-per-second (CFS) connection at the end of Reach F
II. Arlington Desalter Expansion
III. Chino Desalter Expansion
IV. Banking Programs (Storage of SWP in San Bernardino Basin Area ("SBBA") and wheeled to Western via City of Riverside conveyance facilities)
V. Riverside North Aquifer Storage and Recovery Project

Many of the new local water supplies identified below will be implemented through a variety of instruments including: (1) Cooperative Agreement with the City of Riverside for Water Production and Conveyance, (2) Reciprocal Use Agreement between Western, the City of Riverside, and EVMWD, and (3) Agreement regarding the Corona-Western Promenade Connection. While these resources will become part of Western's total water supply portfolio used to meet overall water demands of Western's Riverside Retail service area, they are not identified as specific sources that will supply the proposed Project. Rather, these local sources offset the overall demand on Western's imported supplies, thus, increasing system-wide water supply availability and reliability.

Interconnections

Meeks & Daley Asset Exchange Agreement – Pursuant to various agreements, Western has access to up to 4,208 AF annually of groundwater from the Bunker Hill Basin and the Colton and Riverside Basins. A "Cooperative Wheeling Agreement" (Cooperative Agreement for Water Production and Conveyance between the City of Riverside and Western) was finalized in February 2009. With this agreement, Western is able to convey groundwater obtained from EVMWD's groundwater rights (referred to as Meeks & Daley water), which is delivered via Riverside Public Utilities via the existing Mockingbird Canyon Pump Station and Whitegates Reservoir. Presently, Western does not itself extract groundwater from the Bunker Hill Basin. To the extent it utilizes native groundwater produced from the Bunker Hill Basin, it uses up to 4,208 AFY of Meeks & Daley water rights and water it purchases on an off-season basis from the City of Riverside, which has an adjudicated right of 53,918 AF per year, including new conservation allocation. This agreement can be canceled with a year's notice. Thus, although Western uses this agreement to utilize less expensive water, Western does not account for this supply as a firm source of water. In preparation of the 2015 Urban Water Management Plan (UWMP), EVMWD requested that Western remove the Meeks & Daley water from Western's UWMP as EVMWD intends to utilize this supply for its own customers.

City of Corona (Promenade Interconnection) – the City of Corona Promenade Avenue Connection is a two-way interconnection located in Promenade Avenue easterly of McKinley Street, in the city of Corona, that will provide multiple benefits to a number of regional water purveyors.

1) Western will have the capability of furnishing water to Corona from Western's Arlington Desalter using Western's 30-inch diameter, 930 hydraulic grade line ("HGL"), while Corona will have the ability to receive water into its 30-inch diameter, 905 HGL Zone 2 pipeline.
2) Corona will have the capability of furnishing water to Western from Corona's 24-inch diameter, 1060 HGL Zone 3 pipeline and Western will have the ability to receive the water into its 30-inch diameter, 930 HGL Arlington Desalter Pipeline.
3) Corona will realize water quality benefits by receiving Western's Arlington Desalter water with a total dissolved solids ("TDS") of 350 milligrams per liter ("mg/L") in lieu of Colorado River water with a TDS range of 600–700 mg/L.
4) Both parties will realize water supply reliability benefits when other water supply facilities are out of service for planned or unplanned maintenance.

This project is fully operable and can provide 400 AFY.

Bunker Hill Basin Coordinated Use Agreement

The Bunker Hill Basin has been adjudicated since 1969. Its safe yield, as determined by the Western-SBVMWD Watermaster, is 232,100 AF per year. Total groundwater storage capacity for the Basin is approximately 5,976,000 AF. Recharge to the Bunker Hill Basin historically has resulted from infiltration of runoff from the San Gabriel and San Bernardino Mountains. The Bunker Hill Basin is also replenished by deep percolation of water from precipitation and resulting runoff, percolation from delivered water, and water spread in streambeds and spreading grounds.

Western, SBVMWD, and MWD have executed a coordinated-use agreement that allows Western to purchase surplus SWP supplies and store them in the San Bernardino/Bunker Hill Basin Area. The agreement allows Western to purchase up to 15,000 AF in any given year. The water is stored and retrieved as needed to meet demands. Western currently has 6,000 AF stored under this agreement. This project is fully approved and being implemented. All associated documents and agreements are on file with Western.

Arlington Basin Recharge

The Arlington Groundwater Basin is a shallow, alluvial-filled valley located in western Riverside County within the limits of the city of Riverside. Total groundwater storage in the Arlington Basin is less than 80,000 AF. The quality of groundwater in Arlington Basin is generally poor, with TDS concentrations of approximately 1,000 mg/L and nitrate-nitrogen concentrations of approximately 20 mg/L. Without treatment, this water is not usable as a drinking water resource. The Arlington Desalter, owned and operated by Western, is a reverse-osmosis groundwater

treatment facility located within the Arlington Basin that is supplied by five nearby production wells. The Arlington Desalter treats this groundwater so that it can be used as a potable resource.

Western has a contractual obligation to deliver up to 4,400 AFY of Arlington Desalter water to the City of Norco. Any additional production from the facility combined with other resources from the Chino Desalter can be available to Western's Riverside Retail customers once the La Sierra Pipeline (discussed below) is constructed. This will provide up to 2,800 AFY of additional supplies above current operation of the Arlington Desalter. To avoid the chance of Arlington Basin overdraft, Western is planning a project to stabilize the Arlington Basin, the "Arlington Basin Recharge Project." This project will recharge the Arlington Basin with storm runoff, urban runoff, and recycled water in the future using surface ponds. This project will increase the plant capacity by 1,800 AFY and allow the plant to operate at its permitted capacity of up to 7.25 million gallons per day ("MGD") and production to about 7,200 AF annually.

The estimated cost for the Arlington Recharge Project is approximately $10 million, which will be reduced by funding for construction costs from three agencies: (1) $1 million from Riverside County Flood Control and Water Conservation District, (2) $1 million from Santa Ana Watershed Project Authority awarded through Proposition 84, Round 1, and (3) $1 million of a federal WaterSMART grant. The net cost of the project, including grant commitments, is approximately $7 million.

La Sierra Pipeline and Sterling Pump Station Project

The La Sierra pipeline will convey potable water from the Arlington Desalter to Western's retail service area in the city of Riverside. The project includes construction of an approximately 4.5-mile pipeline and two pump stations. The La Sierra Pipeline project will provide additional conveyance facilities within Western's retail area, thus, improving the reliability of Western's water supply to its customers and reducing the potential effect of water supply allocations by MWD, as discussed above. The pipeline includes three reaches: Reach 1 starts from the Sterling Pump Station to its turnout at the intersection of Pierce Street and Indiana Avenue; Reach 2 starts from the Arlington Desalter Turnout to La Sierra Turnout; and Reach 3 starts at La Sierra Turnout to La Sierra Tank and Mills Gravity Pipeline ("MGL"). A pump station will be located near the Arlington Desalter, pumping water from approximately a HGL of 720′ to the MGL at a variable HGL of 1,600′ to 1,650′. Water would then flow by gravity back through the MGL to the Mockingbird Pump Station which would be required to lift water to Western's 1650 pressure zone, a total lift of approximately 136′. The total cost of the La Sierra Pipeline is estimated at $25 million.

Chino II Desalter Expansion

Western, in coordination with the City of Ontario and Jurupa Community Services District, is expanding the Chino II Desalter from a capacity of 10.5 MGD to 20.5 MGD, resulting in additional annual production capability of 10,500 AF. Western's portion of the additional supply is 3,534 AF annually. The project includes treatment, conveyance, and well facilities that will be constructed in the Chino Basin. A programmatic EIR for this project was completed in 2002, with a subsequent EIR for the expansion project completed in 2008. This water will be utilized to

meet, in part, the 4,400 AFY obligation Western has to provide the City of Norco desalted water (see discussion above under Arlington Desalter) thereby allowing a like amount of water produced at Arlington Desalter to be used by Riverside Retail once the La Sierra Pipeline and Sterling Pump Station are constructed.

The Chino Basin was adjudicated in 1978, and groundwater storage and production within the Chino Basin is managed and reported by the Chino Basin Watermaster pursuant to the Judgment. In 2000, the various groundwater-producing entities entered into the court-approved "Peace Agreement," and then in 2007 the parties entered the court-approved "Peace II Agreement," which together formalized and fostered a new level of cooperation in groundwater management. These agreements paved the way for the implementation of the Optimum Basin Management Plan ("OBMP"), by which the Watermaster develops and enacts comprehensive programs for groundwater monitoring, salt management and desalter production, groundwater recharge, recycled water use and groundwater storage and recovery.

The safe yield of a groundwater basin has been defined as the amount of water that can be withdrawn annually without producing an undesirable results. Withdrawal in excess of safe yield is termed overdraft. The Judgment established the safe yield of the Chino Basin in the amount of 140,000 AFY; however, Watermaster may determine that the operating safe yield can be higher or lower from year-to-year depending on factors including favorable precipitation and management efforts that maximize the beneficial use of the groundwater basin. These management efforts, which ensure the long-term sufficiency of groundwater from the Chino Basin, including dry years.

The Chino Basin Watermaster began a Safe Yield redetermination process in 2013. Watermaster has primarily indicated the Safe Yield may be determined to be less than 140,000 AFY in the future; however, impacts on Judgment parties' share of Safe Yield and Operating Safe Yield from year-to-year will depend on Chino Basin management projects and programs that may enable future Safe Yield production to remain in the range of 130,000–140,000 AFY. The process is ongoing and anticipated to be completed by 2019.

Riverside Wheeling and Purchase Agreement

The City of Riverside's ability to deliver Meeks & Daley and other waters is seasonally limited due to capacity constraints when demands are at their peak. On an annual basis, all this water can be moved during the eight non-peak periods of the year. To address the seasonality issue, the City of Riverside and Western are collaborating on projects. Western has recently completed construction of improvements to its Mockingbird Pump Station to increase reliability of water deliveries from the City of Riverside at this location, which is the major delivery point. Western is also in the planning stages on the construction of a new Campbell Pump Station that will allow Western a third robust interconnection with the City of Riverside. Western purchased a property for the Campbell Pump Station in the city of Riverside. The City of Riverside has identified two projects within their distribution system in which Western may want to participate by oversizing certain major transmission pipelines to accommodate firm delivery capability throughout the year. Participation in these future projects will be dependent on timing and cost.

In 2013, Western started purchasing water from Riverside Highland Water Company ("RHWC"), which is produced by the City of Riverside and wheeled through its conveyance system for delivery to Western. In 2015, Western and RHWC signed one-year lease agreement allowing Western to purchase 1,500 AF unused water from RHWC. The basis of this agreement is that RHWC has groundwater rights in the SBBA in excess of its demands and is willing to lease those rights, on an annual basis, to Western until such time that RHWC's demands increase. Total water purchased from RHWC for year 2015 was 1,500 AF. Western and RHWC are currently developing a longer term agreement for up to 1,500 AFY, which is anticipated to be completed in 2018.

This water is not considered a firm source of supply because of RHWC's future demands and because the arrangement is subject to available capacity in the City of Riverside's conveyance system.

The following table provides estimates of the potential yield from Western's water supply projects described above and expected operational dates:

	Western – Local Water Supply Project Yields (AF/year)						
Project	**Projected Date of Operation**	**2018**	**2020**	**2025**	**2030**	**2035**	**2040**
Meeks & Daley Asset Exchange Agreement	Operable	4,208					
Non-potable Water Purchase – Riverside Public Utilities	Operable	2,000	2,000	2,000			
Riverside Highland Water Company (RHWC)	Operable	1,000					
Bunker Hill Basin Coordinated Use Agreement	Operable		A total 6,000 AF is currently in storage (more may be added as replenishment water is available).				
Arlington Desalter	2018		2,800	2,800	2,800	2,800	2,800
Chino Desalter II Expansion	2017		3,534	3,534	3,534	3,534	3,534
Riverside Wheeling and Purchase Agreement	2017	2,000	2,000	2,000	2,000	2,000	2,000

Recycled Water Program

Western provides wastewater service to the unincorporated Riverside County areas north and east of Lake Mathews within its retail water service boundaries. This area is served by the Western Water Recycling Facility ("WWRF"), which is currently a three-MGD (3.0) wastewater treatment facility producing tertiary treated recycled water.

Treated water from the facility is provided to the Riverside National Cemetery and General Archie Old Golf Course as well as parks, schools, groves, and nurseries, representing a set of customers who previously were dependent on MWD supplies. With conversion of the distribution system from a non-potable system (when delivering raw MWD non-potable CRA

water) to a recycled water system, those customers now have a new local and reliable supply which offsets demands for imported potable water supplies.

The following table provides projected WWRF recycled water production and uses:

Western Water Recycling Facility Projected Recycled Water Production and Use			
Year	**Plant Design Capacity (AFY)**	**Expected Effluent (AFY)**	**Recycled (AFY)**
2015	3,360	1,304	1,109
2020	3,360	1,600	1,600
2025	5,600	1,900	1,900
2030	5,600	2,100	2,100
2035	5,600	2,400	2,400
2040	5,600	2,700	2,700

Water Use Efficiency

Given the factors affecting imported water supplies, there is increasing focus on water conservation—or water use efficiency—at the state, regional, and local levels.

On November 10, 2009, the state Legislature passed Senate Bill 7 ("SBX7-7"), more commonly referred to as "20 x 2020". This law seeks to achieve a 20 percent reduction in urban per capita water use across California by 2020. This law codifies a similar reduction referenced in the Governor's 2009 Executive Order.

In addition to creating methodologies to define specific water-use reduction targets, SBX7-7 includes reporting requirements for all retail urban water suppliers. It is intended to promote urban conservation standards consistent with the California Urban Water Conservation Council's ("CUWCC") Best Management Practices.

In 2011, Western implemented a water budget-based rate structure. The structure provides every customer with an individualized water allocation based on efficient indoor and outdoor practices. Monthly water bills now provide a regular signal of efficient water use. In an effort to assist customers to remain within their water budget, Western offers a portfolio of water use efficiency/customer support programs.

Examples of the programs currently offered by Western include:

- *Free irrigation efficiency evaluations* – Western contracts with irrigation professionals to evaluate irrigation systems and provide a written report to the customer highlighting opportunities to increase water use efficiency.
- *Rebate Programs* – Numerous rebates are available to retail customers for high-efficiency clothes washers, smart irrigation controllers, and high-efficiency sprinkler

nozzles. The SoCal WaterSmart program (www.socalwatersmart.com) is administered by MWD. Western adds additional funding to some of the water-saving devices.

Western's Water Conservation and Management Measures

Retail Measures

In response to the recent regulatory actions requiring enhanced water conservation, Western's Board of Directors adopted Resolution 2958 on June 1, 2016, implementing Water Shortage Stage 3(b) of Western's Retail Customer Water Supply Shortage Contingency Program ("Program") as provided in Western's Ordinance 384. The Program establishes five (5) stages of water conservation and supply shortage response measures which may be implemented. Stage One establishes permanent water use standards intended to alter behavior related to efficiency for non-shortage conditions. Stages Two through Five further establish levels of shortage response actions to be implemented during times of water supply shortage. Stage 3(b) provides conservation and supply shortage measures, such as:

- Tier 4 water rates in Western's water budget rate structure have been removed, and all water use 125 percent above a customer's water budget will be charged the applicable Tier 5 water rate.
- All construction water used for moisture conditioning soil and dust control shall be non-potable or recycled water unless the source of supply is more than 1,000 feet from the site.
- Irrigation with potable water for ornamental turf or grass in public street medians or parkways is prohibited.

Water budgeted tiered rates are intended to promote the efficient use of water and provide customers with economic signals as their water use increases. Essentially, the rate structure is based upon providing customers with the water they need at a lower rate, while inefficient use is penalized with higher rates. Western's budgeted tiered rate system has demonstrated the ability to result in reductions in water consumption. Implementation of the measures outlined in Stage 3(b), plus additional measures defined in Resolution 2958, are designed to maximize water conservation and reduce retail water demands throughout Western's retail service area.

Wholesale Measures

As discussed above, Western also updated its Drought Allocation Plan ("DAP") in May 2015 to provide Western's wholesale customers with a means for potentially allocating limited imported water supplies from MWD under shortage conditions. The updated 2015 DAP is consistent with the allocation methodology adopted as part of MWD's WSAP and provides a range of potential imported water shortage scenarios. The goal of the 2015 DAP is to equitably share potential water shortage allocations by MWD between Western and its wholesale agencies, and to avoid proposed MWD penalty rates in scenarios where its WSAP is implemented.

The updated 2015 DAP would be used to allocate water for municipal and industrial ("M&I") purposes among Western's wholesale water customers:

- City of Corona
- City of Norco
- City of Riverside
- Eagle Valley Mutual Water Company
- Elsinore Valley Municipal Water District
- Temescal Valley Water District
- Rancho California Water District
- Western Municipal Water District Retail Customers (including Box Springs Mutual Water Company)

The 2015 DAP[13] was prepared with the input and support from Western's wholesale customers. Recognizing the importance of wholesale customer involvement, Western created a Drought Allocation Plan Workgroup, made up of staff from Western and its wholesale customers. The DAP allocates supply to wholesale agencies based on:

- demand during the base period using data for the two most recent non-allocation years;
- base period local supplies;
- base period gallons per capita daily; and
- adjustments for growth.

Long Term Conservation Legislation

On May 31, 2018 Governor Jerry Brown signed into law Senate Bill 606 (Hertzberg) and Assembly Bill 1668 (Friedman). These bills require urban water providers in California to set permanent water use targets by 2022. Western and other agencies throughout the State are working with the State Water Resources Control Board and the Department of Water and Power to develop the long term urban efficiency standards.

Western Riverside Retail Demand

Western tracks retail water usage by customer types including residential, commercial, industrial, institutional, and agricultural accounts. Tracking is done by user code and reports can be generated to determine the number of accounts and quantities of water consumed. The number of future residential and commercial/industrial customers is expected to increase at the same rate as the estimated population growth.

Although population in Western's retail service grew tremendously during the early 2000s, the recent economic slowdown has substantially curtailed this trend. Data from the SCAG *2015 Regional Transportation Plan* suggests that future growth in the Inland Empire will be over the next 25 years less than one percent per year. As discussed above, for water supply planning purposes, Western's 2015 UWMP has projected the annual population growth rate within Western's service area at an average of 1.4 percent through the year 2040.

[13] Drought Allocation Plan for the Western Municipal Water District of Riverside County, Adopted May 20, 2015.

Agricultural land use is expected to continue decreasing with continued urbanization within the retail service area. The following table summarizes water demands for Western's retail service area from 2013–2017.

Total Western Calendar Year Retail Demands (AF)				
2013	**2014**	**2015**	**2016**	**2017**
24,258	24,237	23,357	21,772	22,240

Project Demand

According to information submitted by the lead agency, Riverside County Planning Department, and the Project proponent, the projected water demand for the proposed Project is approximately 12 AFY.

Water Supply Analysis

In addition to the foregoing, the following analyses and figures provide a detailed assessment of whether the total projected water supplies available to Western during normal, single-dry, and multiple-dry years over the next 20-year period are sufficient to meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. As a conservative measure, this WSA specifically analyzes how Western would address potential shortfalls in the availability and reliability of imported water supplies in demonstrating that sufficient water supplies are available to Western to serve the proposed Project according to the standards set forth by SB 610.

With respect to analyzing total projected water supplies available in normal, single-dry and multiple-dry years, this WSA addresses potential water supply reductions under MWD's WSAP, which presents drier conditions than have existed under historic "single-dry" and "multiple-dry" scenarios. MWD's 2015 RUWMP identified 1977 as the single-dry year and 1990–1992 as the multiple-dry year scenarios. These years were selected based on delivery conditions for the SWP only because it is MWD's largest and most variable water supply. In 1977, SWP deliveries to MWD were approximately one-third of 1976 and 1978 deliveries. Nevertheless, MWD delivered more water in 1977 than either 1976 or 1978 (due to increased Colorado River supplies). During the early 1990's multiple-dry year period, SWP deliveries ranged from approximately 78 percent to 94 percent of average 1985–1999 deliveries. Total MWD (i.e., SWP plus Colorado River) deliveries during this same period averaged 94.82 percent of "normal" Although MWD requested voluntary conservation during this three-year period, there were no delivery cutbacks or drought allocations.

The water supply and demand data used for scenarios below (normal, single-dry, and multiple-dry years) are derived from Western's 2015 UWMP. Through Western's WUEMP implementation, Western has already implemented most of the conservation elements including Free Irrigation Efficiency Evaluations, Smart Yard, Turf Replacement, and Rebate programs throughout the retail service area, especially in the single-family residence outdoor watering arena. Water conservation is included in all the scenarios illustrated in the following Tables.

Normal Year

Table 1 illustrates Western's water supply and demand projections under normal conditions, where no types of imported water supply reductions are being implemented by MWD. This scenario also assumes additional local water supplies being available from the WWRF for future demands.

Table 1: Western Municipal Water District Water Supply Portfolio
Normal Year with Future Projects that Western Controls

Normal Year Hydrology K-4 Industrial Project		2020	2025	2030	2035	2040
Western Full-Service Demand[1]		30,814	33,714	36,415	39,170	41,704
Loss Due to Drought Allocation (Normal Year – 0% reduction)						
Annual Allocation from MWD		**30,814**	**33,714**	**36,415**	**39,170**	**41,704**
Supplemental Water Supply Projects	***Projected Operation***					
Meeks & Daley Asset Exchange Agreement[2]	Operable					
Riverside Highland Water Company (RHWC)[3]	Operable					
Riverside Wheeling and Purchase Agreement[4]	Operable	2,000	2,000	2,000	2,000	2,000
Arlington/Corona Exchange	Operable					
Arlington Desalter Expansion (Arlington Basin Recharge)	2018	2,800	2,800	2,800	2,800	2,800
Chino Desalter II Expansion/La Sierra Pipeline	2017	3,534	3,534	3,534	3,534	3,534
Western Water Recycling Facility	Operable	1,600	1,900	2,100	2,400	2,700
Net supplemental water supply		**9,934**	**10,234**	**10,434**	**10,734**	**11,034**
Total water supply (supplemental & MWD water)		**40,748**	**43,948**	**46,849**	**49,904**	**52,738**
Total water demand approved for projects since Western's 2015 UWMP, excluding this project		2,194	2,194	2,194	2,194	2,194
Total water supply less approved projects since Western's 2015 UWMP		38,554	41,754	44,655	47,710	50,544
Total water supply less Western's demand		7,740	8,040	8,240	8,540	8,840
K-4 Industrial Project water demand		12	12	12	12	12
(Shortfall)/Surplus		**7,728**	**8,028**	**8,228**	**8,528**	**8,828**

(1) Based on Western's 2015 Urban Water Management Plan projections for 2020, 2025, 2030, 2035, and 2040. (2) Up to 4,208 AFY of groundwater is available from the SBBA and the Colton and Riverside Basins pursuant to agreements with Riverside and EVMWD. (3) Western and RHWC periodically enter into agreements to purchase water. This water is not considered a firm supply because of RHWC's future demands and Riverside's ability to wheel it through its conveyance system. (4) Riverside and Western have a long-term wheeling and purchase agreement for the purchase and delivery of 2,000 AFY. In addition, Western currently stores 6,000 AF in the Bunker Hill Basin. This water is wheeled through the city of Riverside. (5) Western is planning to increase groundwater production from the San Bernardino Basin Area and deliver it through existing interconnections at Mockingbird and Whitegates and a future intertie with the Riverside Campbell Reservoir up to 10,000 AFY combined.

The total annual demand for the proposed Project is estimated at 12 AFY. Table 1 demonstrates that Western will have sufficient supplies in a normal year scenario to serve the projected demands associated with the proposed Project over the 20-year projection, in addition to Western's existing and planned future uses.

Single-Dry Year

Table 2, below, illustrates Western's supply and demand projections under single-dry year conditions, which for conservative purposes in this analysis are represented by a ten percent reduction in imported water supplies pursuant to a potential MWD water supply allocation. This scenario assumes additional local water supplies would only be used from the WWRF for future demands.

Table 2: Western Municipal Water District Water Supply Portfolio
Near-Term Shortage/Single-Dry Year Scenario (10%)
with Future Projects that Western Controls

Single-Dry Year Hydrology K-4 Industrial Project		2020	2025	2030	2035	2040
Western Full-Service Demand[1]		30,814	33,714	36,415	39,170	41,704
Loss Due to Drought Allocation (10% reduction)		3,081	3,371	3,642	3,917	4,170
Annual Allocation from MWD		**27,733**	**30,343**	**32,774**	**35,253**	**37,534**

Total water supply (supplemental & MWD water)		**37,667**	**40,577**	**43,208**	**45,987**	**48,568**
Total water demand approved for projects since Western's 2015 UWMP, excluding this project		2,194	2,194	2,194	2,194	2,194
Total water supply less approved project since Western's 2015 UWMP		35,473	38,383	41,014	43,793	46,374
Water supply less Western's demand		4,659	4,669	4,599	4,623	4,670
K-4 Industrial Project water demand		12	12	12	12	12
(Shortfall)/Surplus		**4,647**	**4,657**	**4,587**	**4,611**	**4,658**

(1) Based on Western's 2015 Urban Water Management Plan projections for 2020, 2025, 2030, 2035, and 2040. (2) Up to 4,208 AFY of groundwater is available from the SBBA and the Colton and Riverside Basins pursuant to agreements with Riverside and EVMWD. (3) Western and RHWC periodically enter into agreements to purchase water. This water is not considered a firm supply because of RHWC's future demands and Riverside's ability to wheel it through its conveyance system. (4) Riverside and Western have a long-term wheeling and purchase agreement for the purchase and delivery of 2,000 AFY. In addition, Western currently stores 6,000 AF in the Bunker Hill Basin. This water is wheeled through the city of Riverside. (5) Western is planning to increase groundwater production from the San Bernardino Basin Area and deliver it through existing interconnections at Mockingbird and Whitegates and a future intertie with the Riverside Campbell Reservoir up to 10,000 AFY combined.

As noted above, the total annual demand for the proposed Project is estimated at 12 AFY. Table 2 demonstrates that Western will have sufficient supplies in a single-dry year scenario to serve the projected demands associated with the proposed Project over the 20-year projection, in additional to Western's existing and planned future uses.

Multiple-Dry Year

The following tables, Tables 3-1 through 3-2, illustrate Western's water supply and demand projections under multiple-dry year conditions, which for purposes of this analysis are conservatively represented by a 20 percent reduction in imported water supplies pursuant to a potential MWD water supply allocation, and where Western implements alternative supply projects.

Table 3-1 includes only supply projects Western has developed and can control such as the Arlington Desalter Expansion and Chino Desalter Expansion. Western is planning to increase water production from the Arlington Desalter up to 7,200 AFY. This project includes construction of an artificial recharge basin and a new production well. This project is anticipated to be on line in 2018. Western has a contractual obligation to deliver up to 4,400 AFY of Arlington Desalter water to the city of Norco. This project will provide up to 2,800 AFY of additional supplies above current operation of the Arlington Desalter. Any additional production from the facility combined with other resources from the Chino Desalter can be available to Western's Riverside Retail customers once the La Sierra Pipeline is constructed.

As discussed above, Western is a member of the Chino Desalter Authority ("CDA"). The CDA is a collaborative effort among its members and other water users in the Chino Basin with the goal of maintaining water yield and water quality. Upon completion of the Chino Desalter Expansion, Western will receive 3,534 AFY. This will be allocated to the City of Norco, and thus free up 3,534 AFY of the Arlington Desalter water that was previously delivered to Norco. This 3,534 AFY will be delivered to Western's Riverside Retail System via the La Sierra Pipeline.

Because those water supplies will be from adjudicated and highly managed groundwater basins (Arlington and Chino), the amounts are categorized as reliable sources in normal, single-dry year, and multiple-dry year conditions.

Table 3-1: Western Municipal Water District Water Supply Portfolio Intermediate and Long-Term Shortage/Multiple-Dry Year Scenario (20%) with Future Projects Western Controls

Multiple-Dry Years Hydrology K-4 Industrial Project		2020	2025	2030	2035	2040
Western Full-Service Demand[1]		30,814	33,714	36,415	39,170	41,704
Loss Due to Drought Allocation (20% reduction)		6,163	6,743	7,283	7,834	8,341

Total water demand approved for projects since Western's 2015 UWMP, excluding this project		2,194	2,194	2,194	2,194	2,194
Total water supply less approved project since Western's 2015 UWMP		36,083	38,703	41,064	43,568	45,895
Water supply less Western's demand		5,269	4,989	4,649	4,398	4,191
K-4 Industrial Project water demand		12	12	12	12	12
(Shortfall)/Surplus		**5,257**	**4,977**	**4,637**	**4,386**	**4,179**

(1) Based on Western's 2015 Urban Water Management Plan projections for 2020, 2025, 2030, 2035, and 2040. (2) Up to 4,208 AFY of groundwater is available from the SBBA and the Colton and Riverside Basins pursuant to agreements with Riverside and EVMWD. (3) Western and RHWC periodically enter into agreements to purchase water. This water is not considered a firm supply because of RHWC's future demands and Riverside's ability to wheel it through its conveyance system. (4) Riverside and Western have a long-term wheeling and purchase agreement for the purchase and delivery of 2,000 AFY. In addition, Western currently stores 6,000 AF in the Bunker Hill Basin. This water is wheeled through the city of Riverside. (5) Western is planning to increase groundwater production from the San Bernardino Basin Area and deliver it through existing interconnections at Mockingbird and Whitegates and a future intertie with the Riverside Campbell Reservoir up to 10,000 AFY combined.

Table 3-2 further demonstrates that Western has sufficient supplies in multiple-dry year scenarios to serve the projected demands (12 AFY) associated with the proposed Project, in addition to existing and planned future uses over the 20-year projection.

Conditions of Approval

As with all projects within the Western retail service area, the proposed K-4 Industrial may be conditioned to construct on-site and off-site water facilities needed near the project area. Water service also is contingent upon prompt payment of all applicable fees and charges as specified in Western's Rules and Regulations Governing Water Service and Water Users, Water Rate Schedules, Cost Recovery Charges, and Connection and Added Facilities Charges and Fees.

Landscape plans are required to ensure compliance with applicable requirements. In Western's area, those requirements may include, but are not limited to, landscape ordinances of the County of Riverside (Water Efficient Landscape Requirements Ordinance No. 859), and the City of Riverside (Municipal Code 19.570), as those authorities may be amended from time to time. The applicant/developer will be required to plan and install water efficient devices and landscaping in accordance with applicable ordinances and requirements.

As noted in this WSA, the projected water demands associated with the proposed Project (12 AFY) fall within the overall projected increase in residential water demand within Western's Riverside Retail Area as set forth in Western's 2015 UWMP. Notwithstanding, nothing in this WSA is intended to create a right or entitlement to water service or any specific level of water service, nor does this WSA impose, expand, or limit any duty concerning the obligation of Western to provide service to its existing customers or to any future potential customers. (Water Code section 10914.) Nor does anything in this WSA prevent or otherwise interfere with Western's discretionary authority to declare a water shortage emergency in accordance with Water Code section 350 *et seq*. and to take any and all related and other actions authorized by law. Western retains complete discretion to adopt and implement rules, regulations, policies and procedures within its authority that may apply to the proposed Project, to develop a specific plan of service for the proposed Project, and to coordinate land use decisions and water supply planning to ensure a sufficient and reliable water supply for Western's existing and planned future uses.

This WSA is not a commitment to serve the proposed Project, but a review of Western's total projected water supplies based on information presently available. This WSA and the analyses and conclusions herein are conditioned on MWD's ability to continue to supply imported water to meet Western's requirements, including the requirements for the proposed Project. The proposed Project is subject to any special or additional requirements imposed by MWD or Western on water deliveries, including increased and/or varying pricing structure.

Conclusion

The projected water demand associated with the proposed Project is 12 AF per year, which represents about 0.05 percent of Western's total demand of Calendar Year 2015. Based on the information and analyses contained in this WSA, Western concludes that the total projected water supplies available to Western during normal, single-dry and multiple-dry years throughout the next 20-year period are sufficient to meet the projected water demands of the proposed Project in addition to Western's existing and planned future uses, including agricultural and manufacturing uses.

EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to determine the noise exposure and the necessary noise mitigation measures for the proposed K4 Parcel development ("Project"). The Project site is located on the south side of Cactus Avenue between Veterans Way and Frederick Street within the jurisdiction of the March Joint Powers Authority. The Project is proposed to consist of the development of the approximately 35.4-acre site with 718,000 square foot building and a seven-acre drainage channel (Cactus Avenue Channel) bordering the parcel to the north (south side of Cactus Avenue). This study has been prepared to satisfy the March Joint Powers Authority noise standards and thresholds of significance based on guidance in Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1)

OFF-SITE TRAFFIC NOISE ANALYSIS

Traffic generated by the operation of the proposed Project will influence the traffic noise levels in surrounding off-site areas. To quantify the off-site traffic noise increases on the surrounding off-site areas, the changes in traffic noise levels on 19 roadway segments surrounding the Project site were calculated based on the change in the average daily traffic (ADT) volumes. The traffic noise levels provided in this analysis are based on the traffic forecasts found in the *K4 Parcel Traffic Impact Analysis* prepared by Urban Crossroads, Inc. (2) To assess the off-site noise level impacts associated with the proposed Project, noise contour boundaries were developed for Existing, Opening Year 2023, and Horizon Year 2040 traffic conditions. The analysis shows that the Project-related traffic noise level increases under all traffic scenarios will be *less than significant*.

OPERATIONAL NOISE ANALYSIS

Using reference noise levels to represent the expected noise sources from the K4 Parcel site, this analysis estimates the Project-related stationary-source noise levels at nearby sensitive receiver locations. The normal activities associated with the proposed K4 Parcel are anticipated to include idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements. The operational noise analysis shows that the Project-related stationary-source noise levels due to the idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements will satisfy the March Joint Powers Authority 55 dBA L_{eq} any time and City of Moreno Valley 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime noise level standards at the nearby receiver locations. Further, since the Project-related operational noise levels will satisfy the more restrictive 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime exterior noise level standards, they will also comply with the 90 dBA L_{eq} 8-hour continuous noise level limit identified in the City of Moreno Valley Municipal Code.

In addition, this analysis demonstrates that the Project will contribute *less than significant* operational noise level contributions to the existing ambient noise environment during the daytime and nighttime hours at all of the sensitive receiver locations. Therefore, the operational noise level impacts associated with the proposed 24-hour seven days per week Project activities,

such as the idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements, will be *less than significant*.

OPERATIONAL VIBRATION ANALYSIS

The operation of the Project site will include heavy trucks transiting on site to and from the loading dock areas. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement conditions. Typical vibration levels for heavy trucks at normal traffic speeds do not exceed 65 VdB, and therefore, will be below the Federal Transit Administration (FTA) vibration threshold of 80 VdB at nearby sensitive receiver locations. Since truck deliveries transiting on site will be travelling at very low speeds it is expected that delivery truck vibration impacts at nearby receiver locations will be *less than significant*.

CONSTRUCTION NOISE ANALYSIS

Construction-related noise impacts are expected to create temporary and intermittent high-level noise conditions at receivers surrounding the Project site when certain activities occur at the Project site boundary. Using sample reference noise levels to represent the planned construction activities of the K4 Parcel site, this analysis estimates the Project-related construction noise levels at nearby sensitive receiver locations. The Project-related short-term construction noise levels, from both on-site Project construction activities and off-site Cactus Avenue channel construction activities, are shown to satisfy City of Moreno Valley Municipal Code 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime noise level thresholds used in this analysis to assess Project construction noise levels. Moreover, temporarr noise level increases due to Project construction at noise-sensitive receiver locations are shown to range from 0.0 to 0.2 dBA L_{eq} and will remain below the Caltrans 12 dBA L_{eq} threshold.Therefore, based on the results of this analysis, all receiver locations will experience *less than significant* impacts due to Project construction noise levels.

CONSTRUCTION VIBRATION ANALYSIS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. The analysis shows that the unmitigated Project-construction vibration levels will remain below the Federal Transit Administration (FTA) 80 VdB threshold at all receiver locations, and are therefore, considered a *less than significant* impact. Further, vibration levels at the site of the closest receiver are unlikely to be sustained during the entire construction period but will occur rather only during the times that heavy construction equipment is operating at the Project site perimeter.

CONSTRUCTION NOISE AND VIBRATION BEST PRACTICES

Though construction noise is temporary, intermittent and of short duration, and will not present any long-term impacts, the following practices would reduce noise and vibration levels produced by the construction equipment to the nearby receiver locations:

- During all Project site construction, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards (March JPA General Plan Noise Element, Policy 2e). (3) The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the Project site during all Project construction.
- The construction contractor shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.

SUMMARY OF SIGNIFICANCE FINDINGS

The results of this K4 Parcel Noise Impact Analysis are summarized below based on the significance criteria in Section 4 of this report. Table ES-1 shows the findings of significance for each potential noise and/or vibration impact before and after any required mitigation measures.

TABLE ES-1: SUMMARY OF SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
Off-Site Traffic Noise	7	*Less Than Significant*	-
Operational Noise	9	*Less Than Significant*	-
Operational Vibration		*Less Than Significant*	-
Construction Noise	10	*Less Than Significant*	-
Construction Vibration		*Less Than Significant*	-

1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed K4 Parcel ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, describes the local regulatory setting, provides the study methods and procedures for traffic noise analysis, and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related long-term operational and short-term construction noise impacts.

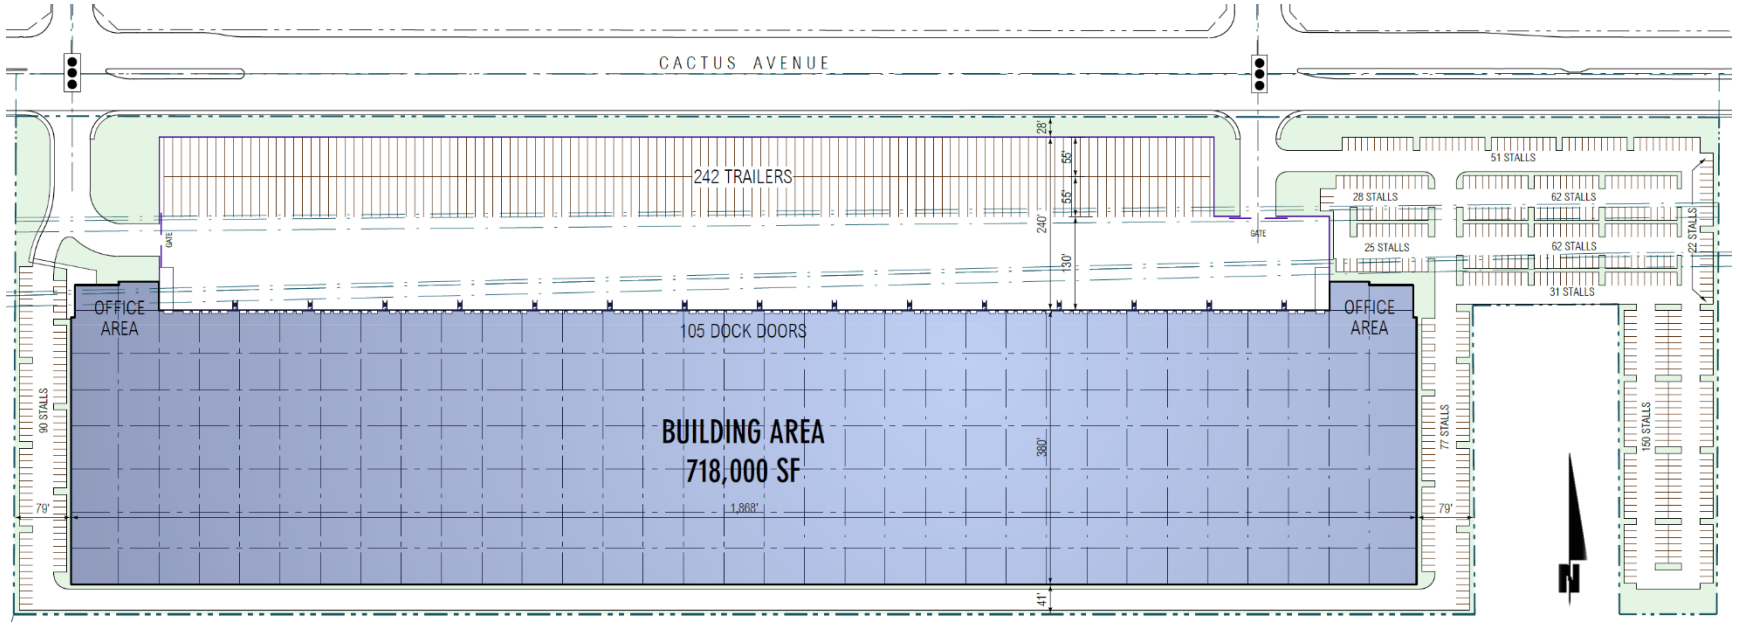
1.1 SITE LOCATION

The proposed K4 Parcel site is located on the south side of Cactus Avenue between Veterans Way and Frederick Street within the jurisdiction of the March Joint Powers Authority, as shown on Exhibit 1-A. Existing uses in the Project study area include office and commercial uses to the northwest, existing office and industrial uses to the north, vacant and March Air Reserve Base (MARB) uses to the east, and existing MARB facilities to the south. The March Air Reserve Base/Inland Port Airport (MARB/IPA) runway is located approximately 0.7 miles southwest of the Project site, and Interstate 215 (I-215) is located roughly 0.6 miles west of the Project site.

1.2 PROJECT DESCRIPTION

The proposed Project involves the development of the approximately 35.4-acre site with 718,000 square foot building, as shown on Exhibit 1-B. Additionally, the Project would include implementing regional improvements to the seven-acre Cactus Avenue Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. This portion of the Project is being proposed by Riverside County Flood Control and Water Conservation District as part of the District's Master Plan and is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert is being permitted by the Riverside County Flood Control District and Water Conservation District ("District") and it would either be constructed contemporaneously with the Project or built separately depending on permitting and timing. The channel would function as part of the District's Master Plan and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan.

At the time this noise analysis was prepared the future tenants of the proposed Project were unknown. To present the potential worst-case noise conditions, this analysis assumes the Project would be operational 24 hours per day, seven days per week. The Project business operations would primarily be conducted within the enclosed buildings, except for traffic movement, parking, as well as loading and unloading of trucks at designated loading bays. The on-site Project-related noise sources are expected to include: idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements. This noise analysis is intended to describe noise level impacts associated with the expected typical warehouse and distribution storage activities at the Project



site. At the time of this analysis, no cold storage was planned at the Project site, and therefore is not analyzed in this report. Further, the off-site channel associated with Project construction is not anticipated to include operational noise sources requiring analysis, and as such, is not included in the Project operational noise sources analyzed herein.

According to the *K4 Parcel Traffic Impact Analysis* prepared by Urban Crossroads, Inc., the Project is expected to generate a net total of approximately 5,873 trip-ends per day (actual vehicles). (2) The Project trip generation includes 517 truck trip-ends per day from the Project site. This noise study relies on the actual Project trips to accurately account for the effect of individual truck trips on the study area roadway network.

EXHIBIT 1-A: LOCATION MAP

EXHIBIT 1-B: SITE PLAN

2 FUNDAMENTALS

Noise has been simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		SPEECH INTERFERENCE
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	SLEEP DISTURBANCE

Source: Environmental Protection Agency Office of Noise Abatement and Control, Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (EPA/ONAC 550/9-74-004) March 1974.

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (4) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA

at approximately 100 feet, which can cause serious discomfort. (5) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period and is commonly used to describe the "average" noise levels within the environment.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Day-Night Average Noise Level (LDN) and the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The LDN and CNEL are weighted averages of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The LDN time of day corrections include the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. The CNEL time of day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., in addition to the corrections for the LDN. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. LDN and CNEL do not represent the actual sound level heard at any particular time, but rather represent the total sound exposure.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The manner in which noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (4)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receptor is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been

expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receptor, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receptor such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (6)

2.3.3 ATMOSPHERIC EFFECTS

Receptors located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (4)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an "out of sight, out of mind" effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby resident. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure. (6)

2.4 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for a particular observation point or receptor by controlling the noise source, transmission path, receptor, or all three. This concept is known as the source-path-receptor concept. In general, noise control measures can be applied to any and all of these three elements.

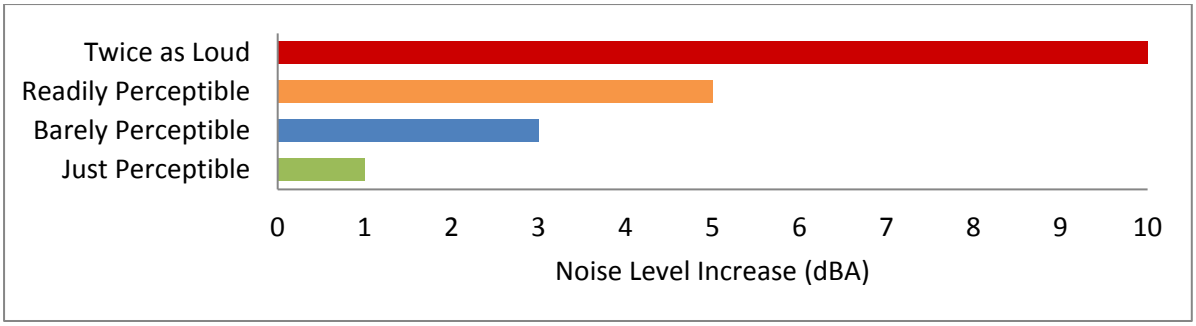
2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receptor. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source. (6)

2.6 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (7)

2.7 COMMUNITY RESPONSE TO NOISE



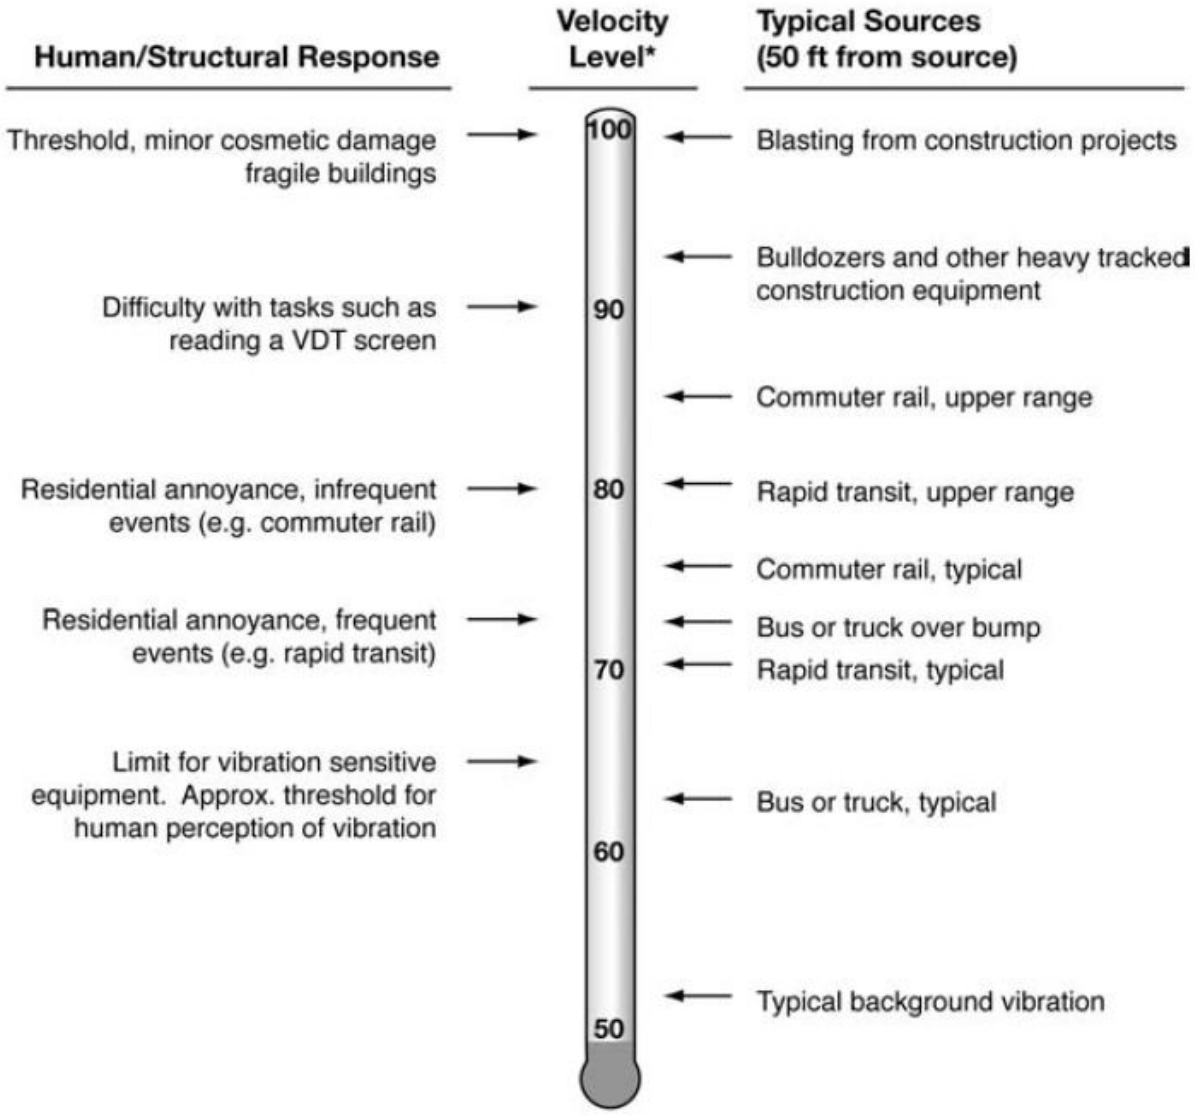
Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon each individual's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:

- Fear associated with noise producing activities;
- Socio-economic status and educational level;
- Perception that those affected are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Belief that the noise source can be controlled.

Approximately ten percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Another twenty-five percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. (8) Surveys have shown that about ten percent of the people exposed to traffic noise of 60 dBA will report being highly annoyed with the noise, and each increase of one dBA is associated with approximately two percent more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain. (8)

Despite this variability in behavior on an individual level, the population as a whole can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. An increase or decrease of 1 dBA cannot be perceived except in carefully controlled laboratory experiments, a change of 3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*. (6)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.8 VIBRATION

According to the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Assessment* (9), vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

** RMS Vibration Velocity Level in VdB relative to 10^{-6} inches/second*

Source: Federal Transit Administration (FTA) Transit Noise Impact and Vibration Assessment.

3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains fairly constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared according to guidelines adopted by the Governor's Office of Planning and Research (OPR). (10) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*.

3.2 STATE OF CALIFORNIA GREEN BUILDING STANDARDS CODE

The 2016 State of California's Green Building Standards Code contains mandatory measures for non-residential building construction in Section 5.507 on Environmental Comfort. (11) These noise standards are applied to new construction in California for the purpose of controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when non-residential structures are developed in areas where the exterior noise levels exceed 65 dBA CNEL, such as within a noise contour of an airport, freeway, railroad, and other areas where noise contours are not readily available. If the development falls within an airport or freeway 65 dBA CNEL noise contour, the combined sound transmission class (STC) rating of the wall and roof-ceiling assemblies must be at least 50. For those developments in areas where noise contours are not readily available, and the noise level exceeds 65 dBA L_{eq} for any hour of operation, a wall and roof-ceiling combined STC rating of 45, and exterior windows with a minimum STC rating of 40 are required (Section 5.507.4.1).

3.3 MARCH JOINT POWERS AUTHORITY GENERAL PLAN NOISE/AIR QUALITY ELEMENT

The March Joint Powers Authority (March JPA) General Plan is currently being updated, so both the draft (yet to be approved) General Plan Update 2030 and adopted General Plan 1999 policies are described in this section in relation to the Project. The Noise/Air Quality Element of each version of the General Plan identify several goals and policies to protect and enhance the quality of life for those who live and work in the March JPA jurisdiction. (12) (3) The Noise Element provides policy guidance which addresses the generation, mitigation, avoidance, and the control of excessive noise.

3.3.1 GENERAL PLAN UPDATE 2030

To reduce noise levels within the March Joint Powers Authority jurisdiction, the General Plan Update 2030 Noise/Air Quality Element contains the following three goals:

3.4.2.1 Reduction of noise impacts through proper land use planning.
3.4.2.2 Analyze noise impacts caused by transportation.
3.4.2.3 Minimize noise impacts attributable to civilian aviation.

The noise policies specified in the March Joint Powers Authority Noise/Air Quality Element provide the guidelines necessary to satisfy these goals. The policies are provided below:

Policy 1a The MJPA will use the State Land Use Compatibility matrix (Figure III-1 of this Element) as the standard when approving future projects to ensure the reduction of potential noise impacts.
Policy 1b 60 dBA CNEL is established as the acceptable outdoor noise exposure level for schools, libraries, churches, hospitals, nursing homes and other medical facilities, and parks.
Policy 1c 65 dBA CNEL is established as the acceptable outdoor noise exposure level for transient lodging.
Policy 1d Indoor noise exposure levels of 45 dBA CNEL shall be maintained for all hospitals, nursing homes and other medical facilities, and transient lodging.
Policy 1e 70 dBA CNEL is the established acceptable outdoor noise exposure level for office buildings, businesses, commercial, professional, and mixed-use development.
Policy 1f 70 dBA CNEL is the established outdoor noise exposure level for golf courses, cemeteries, industrial, manufacturing, warehouse/distribution, and public facilities.
Policy 1g Land uses that are particularly sensitive to noise (such as schools, libraries, day care, residential uses, medical facilities, etc.) shall not be approved in areas that exceed the acceptable limits on noise as set forth in Figure III-1: State Land Use Compatibility of this Element.
Policy 1h The MJPA shall encourage site design that places structures such that noise generating uses are buffered from other developments, either through distance, human-made buffers, or other means.
Policy 1i Noise generating facilities shall be located in areas with compatible noise generating land uses (i.e., airport noise contour areas) to minimize land use incompatibilities, noise abatement and the necessity of extensive mitigation measures.
Policy 2a Noise impacts resulting from traffic shall be minimized through the use of sound attenuation measures such as berms, walls, or a combination thereof.
Policy 2b Truck routes shall be established and not located near areas where there are sensitive receptors that may be impacted.
Policy 2c Trucking operations shall be limited to appropriate routes, times and speeds.
Policy 2d The March JPA shall evaluate noise sensitivity and noise generation when considering transportation improvement projects. If necessary, these impacts shall be mitigated to acceptable levels.
Policy 2e Appropriate muffling systems for construction equipment and operations shall be required, as necessary.
Policy 3a March JPA shall adhere to the adopted 2005 AICUZ and draft Joint Land Use Plan criteria (or more current document) and promote the use of newer and quieter aircraft.

Policy 3b *March JPA shall analyze noise impacts associated with General Aviation as a component of the environmental review for the General Aviation ramp.*

Policy 3c *At a future date when the market demand and likely development of aviation facilities is known beyond speculation, March JPA shall prepare a comprehensive environmental analysis of noise impacts as part of a CEQA review for the build-out of the 21,000 annual operation civilian operations at March Inland Port.*

LAND USE COMPATIBILITY

The noise criteria identified in the March Joint Powers Authority General Plan Update 2030 Noise/Air Quality Element (Figure III-1) are guidelines to evaluate the land use compatibility of transportation-related noise. The compatibility criteria, shown on Exhibit 3-A, provides the City with a planning tool to gauge the compatibility of land uses relative to existing and future exterior noise levels. The *State Land Use Compatibility* guidelines indicate that industrial and manufacturing land uses, such as the Project, are considered *normally acceptable* with noise levels below 70 dBA CNEL and *conditionally acceptable* with noise levels of less than 75 dBA CNEL.

3.3.2 ADOPTED GENERAL PLAN 1999

The adopted March JPA General Plan includes the following goals in the Noise/Air Quality Element:

1 *Ensure that land uses are protected from excessive and unwanted noise.*

2 *Minimize incompatible noise level exposures throughout the Planning Area, and where possible, mitigate the effect of noise incompatibilities to provide a safe and health environment.*

3 *Work toward the reduction of noise impacts from vehicular traffic, and aviation and rail operations.*

The noise policies specified in the March Joint Powers Authority Noise/Air Quality Element provide the guidelines necessary to satisfy these goals. The policies are provided below:

Policy 1.1 *Establish acceptable limits of noise for various land uses throughout the March JPA Planning Area. Future development that could increase ambient noise levels shall be required to mitigate the anticipated noise increase, to the extent possible.*

Policy 1.2 *Noise sensitive uses (such as schools, libraries, hospitals, medical facilities, residential uses, etc.) shall be discouraged in areas where noise levels exceed acceptable limits.*

Policy 1.3 *Encourage good acoustical design in new construction.*

Policy 1.4 *Provide buffer areas between noise sources and other developments, where practical.*

Policy 2.1 *Avoid placing noise sensitive land uses in proximity to areas devoted to noise generating facilities such as areas of aviation related activities, industrial parks, transportation facilities, and other noise generating land uses.*

Policy 2.2 *Noise generating facilities shall be located in areas with compatible noise generating land uses (i.e., airport noise contour areas) to minimize land use incompatibilities, noise abatement and mitigation measures needed.*

Policy 2.3 *Noise sensitive land uses shall not be located in areas influenced by noise generating land uses, in particular the noise contours associated with the joint use airfield, unless appropriate mitigation is utilized.*

Policy 2.4 *March JPA shall evaluate noise sensitivity and noise generation when considering land use projects and transportation improvement projects, and where appropriate mitigation measures shall be employed.*

Policy 2.5 *March JPA shall utilize and comply with the CALTRANS standards for noise compatibility for aviation generated noise to proposed land use development.*

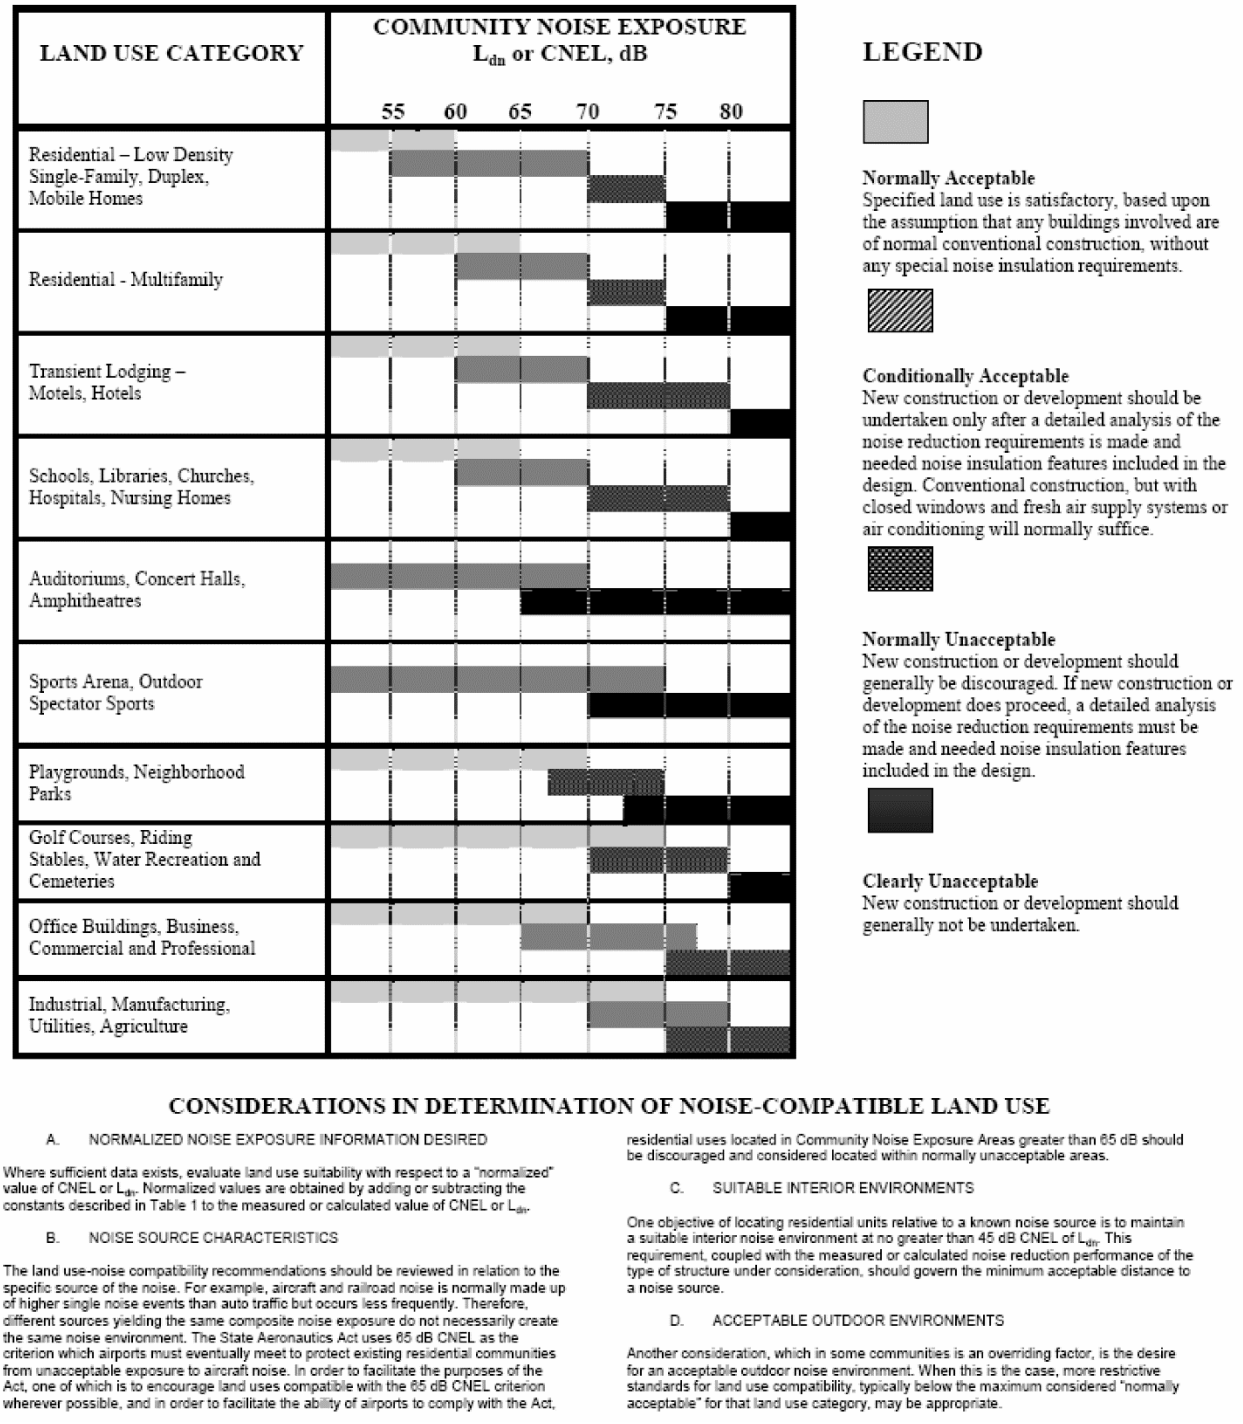
Policy 3.1 *Include mitigating measures such as landscaping, berming and site orientation, in the design of projects located near noise generating sources such as arterial roadways.*

Policy 3.2 *Coordinate with adjacent cities and county agencies for noise abatement.*

Policy 3.3 *Adhere to the adopted AICUZ and Comprehensive Land Use Plan standards and promote the use of newer and quieter aircraft and support equipment.*

Policy 3.4 *Where appropriate, noise mitigation measures shall be incorporated in the design and approval of development on property located adjacent to aviation and rail facilities.*

Policy 3.5 *Where appropriate, development in areas adjacent to freeways, arterial streets, and other noise source shall be designed to reduce the potential for noise impacts.*



Policy 3.6 *Regulate the use of local streets by trucks, trailers, and construction vehicles, to the extent possible.*

Policy 3.7 *Limit trucking operations to appropriate routes, times and speeds.*

Policy 3.8 *Appropriate muffling systems for construction equipment and operations shall be required, as necessary.*

Policy 3.9 *March JPA shall encourage and facilitate the use of mass transit services and alternative transportation systems to minimize dependence of the automobile within the Planning Area, thereby minimizing the level of noise generated by surface transportation.*

3.4 OPERATIONAL NOISE STANDARDS

To analyze noise impacts originating from a designated fixed location or private property such as the K4 Parcel Project, stationary-source (operational) noise such as the expected idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements are typically evaluated against standards established under a jurisdiction's Municipal Code. Although the Project site is located within the March Joint Powers Authority, noise-sensitive receivers potentially impacted by operational noise activities are also located in the City of Moreno Valley jurisdiction. Therefore, to accurately describe the potential Project-related operational noise level contributions, this analysis presents the appropriate operational noise standards for each jurisdiction adjacent to the Project site. The March Joint Powers Authority and City of Moreno Valley operational noise level standards are shown on Table 3-1.

3.4.1 MARCH JOINT POWERS AUTHORITY OPERATIONAL NOISE STANDARDS

The March Joint Powers Authority Development Code, Chapter 9.10 *Performance Standards*, Section 9.10.140 identifies the exterior stationary-source noise level standards for commercial and industrial land uses. Based on Section 9.10.140 of the Development Code, the exterior noise level shall not exceed 55 dBA L_{eq} at any time beyond the boundaries of the property. (13) The March Joint Powers Authority Development Code is included in Appendix 3.1.

3.4.2 CITY OF MORENO VALLEY OPERATIONAL NOISE STANDARDS

The City of Moreno Valley Municipal Code defines *Maximum Sound Levels (in dB(A)) for Source Land Uses* in Table 11.80.030-2 for *Residential* and *Commercial* land uses. As defined by the Municipal Code, Section 11.80.020 *Definitions*, *Commercial* land use *means all uses of land not otherwise classified as residential,* and *Residential* land use *means all uses of land primarily for dwelling units, as well as hospitals, schools, colleges and universities, and places of religious assembly.* (14) For the purpose of this analysis, the K4 Parcel Project is considered *Commercial* land use since it is not classified as residential. Based on this standard, the operational noise level limits for commercial land use, from Table 11.80.030-2, of 65 dBA L_{eq} during the daytime (8:00 a.m. to 10:00 p.m.) hours and 60 dBA L_{eq} during the nighttime (10:01 p.m. to 7:59 a.m.) hours shall apply to the operational noise from the Project.

Further, Section 11.80.030 (C) *Prohibited Acts*, *Nonimpulsive Sound Decibel Limits*, states: *No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimpulsive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on a privately owned property…* (14) Therefore, at a distance of 200 feet from the property line, the Project's operational noise levels shall not exceed the 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime noise level standards for commercial land uses, as shown on Table 3-1.

The City of Moreno Valley Municipal Code also identifies continuous sound level limits in Table 11.80.030-1 based on the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health (NIOSH) noise exposure guidelines. A division of the U.S. Department of Health and Human Services, NIOSH identifies a noise level threshold based on the duration of exposure to the source. The City of Moreno Valley noise level threshold starts at 90 dBA for more than eight hours per day, and for every increase, the exposure time is reduced. The City of Moreno Valley identifies noise level thresholds of 92 dBA for more than 6 hours per day, 95 dBA for more than 4 hour per day, 97 dBA for more than 3 hours per day, and up to 100 dBA for more than 2 hours per day. This noise study uses both the more restrictive daytime and nighttime City of Moreno Valley noise level limits of 65 dBA L_{eq} and 60 dBA L_{eq}, respectively, and the 90 dBA L_{eq} 8- hour limit, shown on Table 3-1 of this report, to evaluate the potential operational noise levels due to the operation of the Project.

TABLE 3-1: OPERATIONAL NOISE STANDARDS

Jurisdiction	Source Land Use	Time Period	Exterior Noise Level Standards (dBA L_{eq})[2]
March JPA[1]	Commercial/ Industrial	Any Time	55
City of Moreno Valley[2]	Commercial (@ 200')	Daytime (8:00 a.m. - 10:00 p.m.)	65
		Nighttime (10:01 p.m. - 7:59 a.m.)	60
	Any	8 Hours per Day	90

[3] L_{eq} represents a steady state sound level containing the same total energy as a time varying signal over a given sample period.
"JPA" = Joint Powers Authority

3.5 CONSTRUCTION NOISE STANDARDS

To accurately describe the potential Project-related construction noise levels, including both on-site Project and off-site channel construction activities, this noise study presents the appropriate construction noise standards for each jurisdiction adjacent to the Project site including the March Joint Powers Authority and City of Moreno Valley. However, the permitted hours of construction for the March JPA are the only applicable hour restrictions for the Project since the construction activity will be within the March JPA jurisdiction.

3.5.1 MARCH JOINT POWERS AUTHORITY CONSTRUCTION NOISE STANDARDS

The March Joint Powers Authority Development Code, Section 9.10.030 *Exemptions*, states that construction activities are considered exempt from the noise performance standards if they occur within the permitted hours of 7:00 a.m. to 7:00 p.m. The March Joint Powers Authority Development Code does not identify a specific noise level standard for construction activity. The March Joint Powers Authority Development Code construction noise standards are shown on Table 3-2.

3.5.2 CITY OF MORENO VALLEY CONSTRUCTION NOISE STANDARDS

The City of Moreno Valley Municipal Code noise standards for construction are described below to determine the potential noise impacts at nearby sensitive receiver locations. As a subset of its stationary-source noise regulations, the City Municipal Code establishes permitted hours of construction activity. More specifically, Municipal Code Section 11.80.030 (D) (7), *Construction and Demolition*, provides the following:

> *No person shall operate, or cause operation of any tools or equipment used in construction, drilling, repair, alteration, or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee.*

Therefore, based on the Section 11.80.030 (D) (7) construction regulations, a construction-related *noise disturbance* occurs if Project construction activity occurs outside of the permitted hours. For this analysis, both the more restrictive daytime and nighttime City of Moreno Valley noise level limits of 65 dBA L_{eq} and 60 dBA L_{eq}, respectively, and the 90 dBA L_{eq} 8- hour limit are used as appropriate thresholds for the nearby sensitive land uses (e.g. residential homes) in the Project study area. The City of Moreno Valley construction noise standards are shown on Table 3-2. As previously discussed in Section 3.4, the construction noise level threshold used in this noise study represents a conservative approach, since it is more restrictive than the continuous sound level limits of Table 11.80.030-1 of the City of Moreno Valley Municipal Code.

TABLE 3-2: CONSTRUCTION NOISE STANDARDS

Jurisdiction	Permitted Hours of Construction Activity	Construction Noise Level Standard (dBA L_{eq})[2]	
		Daytime	Nighttime
March JPA	7:00 a.m. to 7:00 p.m.	n/a	
City of Moreno Valley[1]	General Activity: 7:00 a.m. to 8:00 p.m. on any day. Grading is limited to 7:00 a.m. to 6:00 p.m. Monday to Friday; 8:00 a.m. to 4:00 p.m. on weekends and holidays.	65	60[3]
		90 (anytime)	

[1] Source: City of Moreno Valley Municipal Code, Section 11.80.030 (D) (7) and Section 8.21.050 (O) (Appendix 3.2).
[2] Acceptable threshold for determining the relative significance of short-term Project construction noise levels, based on the City of Moreno Valley stationary noise standards shown on Table 3-1.
[3] Any nighttime construction activity requires an exemption from the City of Moreno Valley Municipal Code as indicated in Section 11.80.030 (E) (8) for a special event permit (Section 11.80.040). The special event permit application shall be submitted to the City of Moreno Valley Planning Department for approval and meet the requirements of Municipal Code Section 11.80.040.
"Daytime" = 8:00 a.m. to 10:00 p.m.; "Nighttime" = 10:01 p.m. to 7:59 a.m.; "n/a" = The March JPA Development Code does not identify construction-specific noise level limits.

3.6 VIBRATION STANDARDS

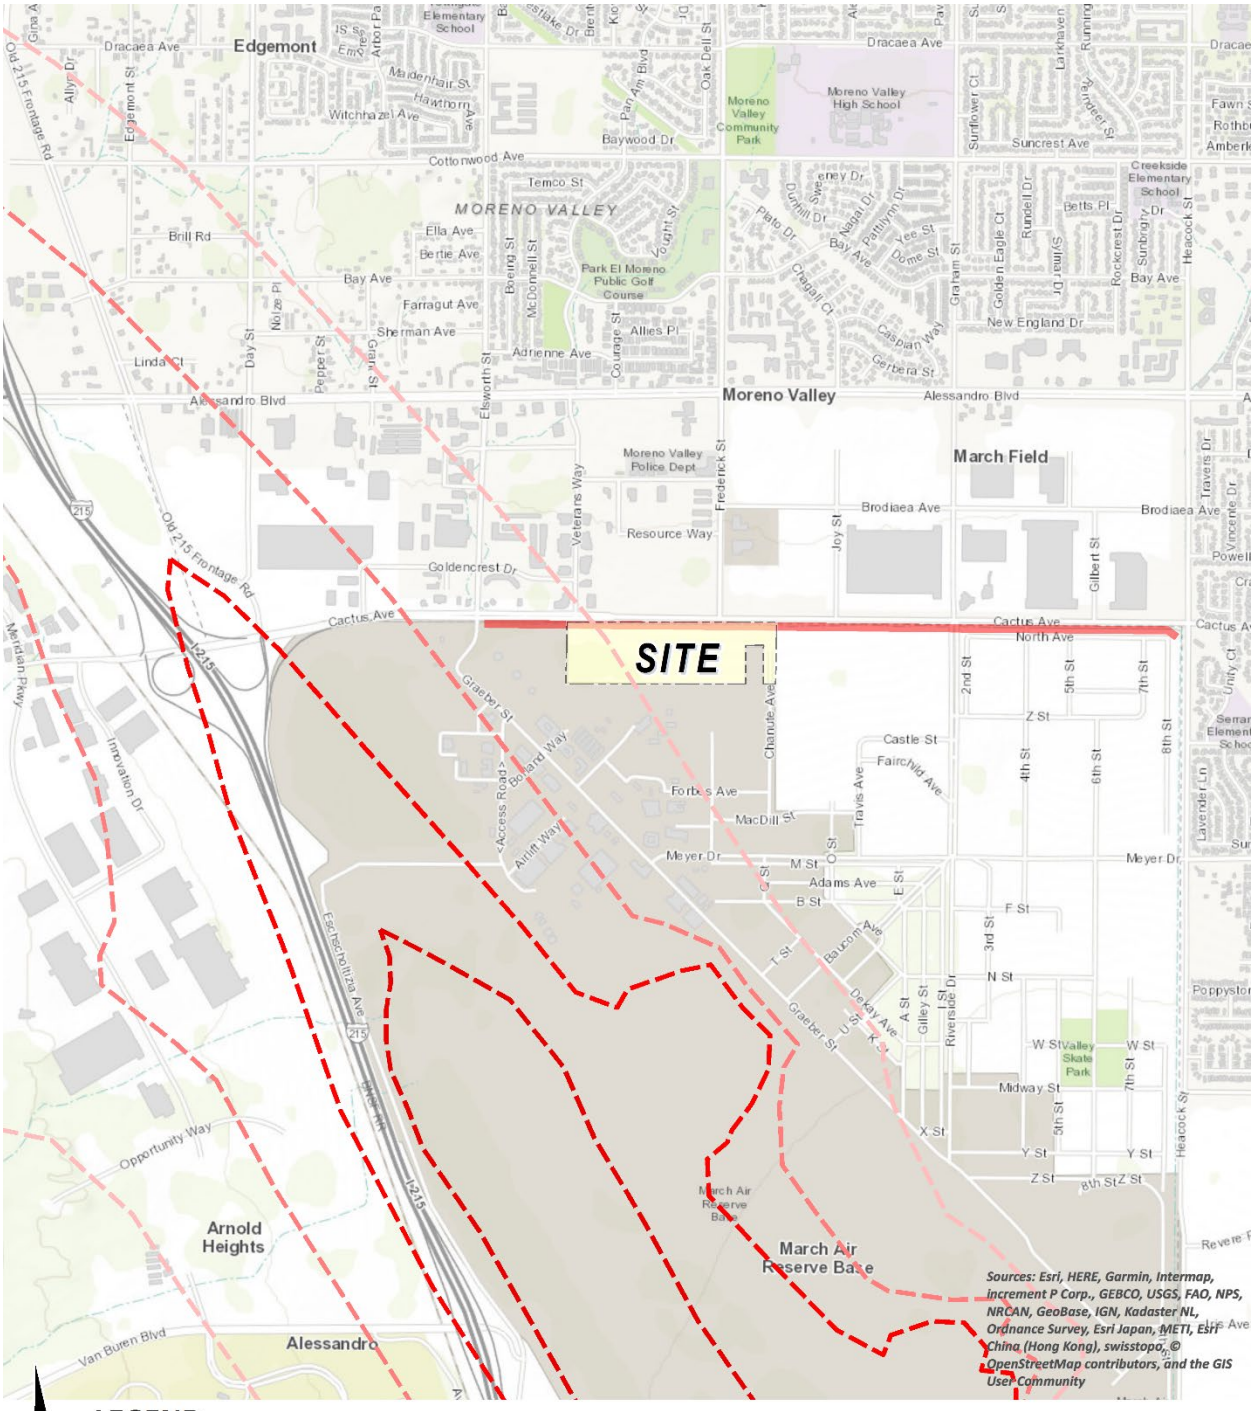
The March Joint Powers Authority and City of Moreno Valley General Plans and Municipal Codes do not identify specific vibration level standards. However, the United States Department of Transportation Federal Transit Administration (FTA) provides guidelines for maximum-acceptable vibration criteria for different types of land uses. These guidelines allow 80 VdB for residential uses and buildings where people normally sleep. (9) Operational and construction activities can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates little or no ground vibration. Large bulldozers and loaded trucks can cause perceptible vibration levels proximate receptors. The FTA guidelines of 80 VdB for sensitive land uses provide a substantiated basis for determining the relative significance of potential Project-related vibration impacts due to on-site operational and construction activities.

3.7 MARCH AIR RESERVE BASE/INLAND PORT AIRPORT LAND USE COMPATIBILITY

The March Air Reserve Base/Inland Port Airport (MARB/IPA) runway is located approximately 0.7 miles southwest of the Project site. The *Riverside County Airport Land Use Compatibility Plan Policy Document* (RC ALUCP) includes the policies for determining the land use compatibility of the Project since it is located within 2 miles of an airport runway. Policy 4.1.5 *Noise Exposure for Other Land Uses* of the RC ALUCP requires that land uses, such as the industrial land use of the Project site, demonstrate compatibility with the acceptable noise levels on Table 2B. The Table 2B *Supporting Compatibility Criteria: Noise* matrix is shown on Exhibit 3-B and indicates that *normally acceptable* industrial land uses experience exterior noise levels between 60 to 65 dBA CNEL. *Normally acceptable* noise levels for industrial land uses indicate that *noise is a factor to be considered in that slight interference with outdoor activities may occur. Conventional construction methods will eliminate most noise intrusions upon indoor activities*. (15)

The noise contour boundaries used to determine the potential aircraft-related noise impacts at the Project site are found on Exhibit MA-4 of the RC ALUCP and are presented on Exhibit 3-C of this report.

EXHIBIT 3-B: RC ALUCP SUPPORTING COMPATIBILITY CRITERIA: NOISE



Land Use Category	CNEL (dB) 50–55	55–60	60–65	65–70	70–75

Land Use Acceptability		Interpretation/Comments
++	*Clearly Acceptable*	The activities associated with the specified land use can be carried out with essentially no interference from the noise exposure.
+	*Normally Acceptable*	Noise is a factor to be considered in that slight interference with outdoor activities may occur. Conventional construction methods will eliminate most noise intrusions upon indoor activities.
o	*Marginally Acceptable*	The indicated noise exposure will cause moderate interference with outdoor activities and with indoor activities when windows are open. The land use is acceptable on the conditions that outdoor activities are minimal and construction features which provide sufficient noise attenuation are used (e.g., installation of air conditioning so that windows can be kept closed). Under other circumstances, the land use should be discouraged.
–	*Normally Unacceptable*	Noise will create substantial interference with both outdoor and indoor activities. Noise intrusion upon indoor activities can be mitigated by requiring special noise insulation construction. Land uses which have conventionally constructed structures and/or involve outdoor activities which would be disrupted by noise should generally be avoided.
– –	*Clearly Unacceptable*	Unacceptable noise intrusion upon land use activities will occur. Adequate structural noise insulation is not practical under most circumstances. The indicated land use should be avoided unless strong overriding factors prevail and it should be prohibited if outdoor activities are involved.

* Subtract 5 dB for low-activity outlying airports (Chiriaco Summit and Desert Center)

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

B. Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels.

C. A substantial permanent increase in ambient noise levels in the Project vicinity above existing levels without the proposed Project; or

D. A substantial temporary or periodic increase in ambient noise levels in the Project vicinity above noise levels existing without the proposed Project.

E. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the Project area to excessive noise levels.

F. For a project within the vicinity of a private airstrip, expose people residing or working in the Project area to excessive noise levels.

While the CEQA Guidelines and the March Joint Powers Authority General Plan Guidelines provide direction on noise compatibility and establish noise standards by land use type that are sufficient to assess the significance of noise impacts under CEQA Guideline A, they do not define the levels at which increases are considered substantial for use under Guidelines B, C, and D. CEQA Guidelines E and F apply to nearby public and private airports, if any, and the Project's land use compatibility. The closest airport which would require additional noise analysis under CEQA guidelines E and F is the MARB/IPA. As previously shown on Exhibit 3-C, the Project site is partially located within the 60 to 65 dBA CNEL noise level contour boundaries of MARB/IPA. Based on the RC ALUCP noise level contours for the MARB/IPA, the Project represents *normally acceptable* land use based on the RC ALUCP compatibility criteria, and no noise mitigation is required with typical building construction. Therefore, the potential impacts under CEQA guidelines E and F are considered to be *less than significant* and are not further analyzed in this noise study.

4.1 NOISE-SENSITIVE RECEIVERS

Noise level increases resulting from the Project are evaluated based on the Appendix G CEQA Guidelines described above at the closest sensitive receiver locations. Under CEQA, consideration must be given to the magnitude of the increase, the existing ambient noise levels and the location of noise-sensitive receivers in order to determine if a noise increase represents a significant adverse environmental impact. This approach recognizes *that there is no single noise increase that renders the noise impact significant.* (16)

4.1.1 SUBSTANTIAL PERMANENT NOISE LEVEL INCREASES

Unfortunately, there is no completely satisfactory way to measure the subjective effects of noise or of the corresponding human reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment.

In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged. The Federal Interagency Committee on Noise (FICON) (17) developed guidance to be used for the assessment of project-generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (i.e., CNEL) and equivalent continuous noise level (L_{eq}).

For example, if the ambient noise environment is quiet (<60 dBA) and the new noise source greatly increases the noise levels, an impact may occur if the noise criteria may be exceeded. Therefore, for this analysis, FICON identifies a *readily perceptible* 5 dBA or greater project-related noise level increase is considered a significant impact when the noise criteria for a given land use is exceeded. According to the FICON, in areas where the without project noise levels range from 60 to 65 dBA, a 3 dBA *barely perceptible* noise level increase appears to be appropriate for most people. When the without project noise levels already exceed 65 dBA, any increase in community noise louder than 1.5 dBA or greater is considered a significant impact if the noise criteria for a given land use is exceeded, since it likely contributes to an existing noise exposure exceedance. Table 4-1 below provides a summary of the potential noise impact significance criteria, based on guidance from FICON, which inform the Significance Thresholds identified in Section 4.3 below.

TABLE 4-1: SIGNIFICANCE OF NOISE IMPACTS AT NOISE-SENSITIVE RECEIVERS

Without Project Noise Level	Potential Significant Impact
< 60 dBA	5 dBA or more
60 - 65 dBA	3 dBA or more
> 65 dBA	1.5 dBA or more

Federal Interagency Committee on Noise (FICON), 1992.

4.1.2 SUBSTANTIAL TEMPORARY OF PERIODIC NOISE LEVEL INCREASES

Due to the temporary, short-term nature of noise-generating construction activities, the temporary or periodic noise level increases over the existing ambient conditions must be considered under CEQA Guideline D. Therefore, the Caltrans *Traffic Noise Analysis Protocol* 12 dBA L_{eq} *substantial* noise level increase threshold is used in this analysis to assess temporary noise level increases. (18) If the Project-related construction noise levels generate a temporary noise level increase above the existing ambient noise levels of up to 12 dBA L_{eq}, then the Project construction noise level increases will be considered a potentially significant impact. Although the Caltrans recommendations were specifically developed to assess traffic noise impacts, the 12 dBA L_{eq} substantial noise level increase threshold is used in California to address noise level increases with the potential to exceed existing conditions. (18)

4.2 NON-NOISE-SENSITIVE RECEIVERS

The March Joint Powers Authority General Plan Update 2030 Noise/Air Quality Element, Policy 1f is used to establish the satisfactory noise levels of significance for non-noise-sensitive land uses in the Project study area. While not yet adopted, the March Joint Powers Authority General Plan Update 2030 Noise/Air Quality Element contains specific land use compatibility criteria for different land uses, while the currently adopted 1999 General Plan does not identify any noise compatibility criteria. Therefore, the noise study relies on the specific land use compatibility criteria and noise policies outlined in the draft 2030 General Plan Update. As indicated in Policy 1f, the exterior noise level criteria for non-noise-sensitive land use, such as industrial use, is 70 dBA CNEL. Noise levels greater than 70 dBA CNEL are considered *conditionally acceptable* per the *State Land Use Compatibility* matrix, previously shown on Exhibit 3-A.

To determine if Project-related traffic noise level increases are significant at off-site non-noise-sensitive land uses, a *readily perceptible* 5 dBA and *barely perceptible* 3 dBA criteria are used. When the without Project noise levels at the non-noise-sensitive land uses are below the *normally acceptable* 70 dBA CNEL compatibility criteria, a *readily perceptible* 5 dBA or greater noise level increase is considered a significant impact. When the without Project noise levels are greater than the *normally acceptable* 70 dBA CNEL land use compatibility criteria, a *barely perceptible* 3 dBA or greater noise level increase is considered a significant impact since the noise level criteria is already exceeded. The noise level increases used to determine significant impacts for non-noise-sensitive land uses is generally consistent with the FICON noise level increase thresholds for noise-sensitive land uses but instead rely on the March Joint Powers Authority General Plan Noise/Air Quality Element, Policy 1f 70 dBA CNEL exterior noise level criteria.

4.3 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development. Table 4-2 shows the significance criteria summary matrix.

OFF-SITE TRAFFIC NOISE

- When the noise levels at existing and future noise-sensitive land uses (e.g., residential, etc.):
    - are less than 60 dBA CNEL and the Project creates a *readily perceptible* 5 dBA CNEL or greater Project-related noise level increase; or
    - range from 60 to 65 dBA CNEL and the Project creates a *barely perceptible* 3 dBA CNEL or greater Project-related noise level increase; or
    - already exceed 65 dBA CNEL, and the Project creates a community noise level impact of greater than 1.5 dBA CNEL (FICON, 1992).
- When the noise levels at existing and future non-noise-sensitive land uses (e.g., commercial, industrial, etc.):
    - are less than the March Joint Powers Authority General Plan Noise/Air Quality Element, Policy 1f, 70 dBA and the Project creates a *readily perceptible* 5 dBA or greater Project-related noise level increase; or
    - are greater than the March Joint Powers Authority General Plan Noise/Air Quality Element, Policy 1f, 70 dBA and the Project creates a *barely perceptible* 3 dBA or greater Project-related noise level increase.

OPERATIONAL NOISE

- If Project-related operational (stationary-source) noise levels:
    - exceed the exterior 55 dBA L_{eq} noise level standards at nearby receiver locations within the March Joint Powers Authority jurisdiction (March Joint Powers Authority Development Code, Section 9.10.140); or
    - exceed the 65 dBA L_{eq} daytime or 60 dBA L_{eq} nighttime noise level standards at 200 feet from the property line of the noise source (City of Moreno Valley Municipal Code, Table 11.80.030-2); or
    - exceed the 65 dBA L_{eq} daytime or 60 dBA L_{eq} nighttime noise level standards at residential receivers in the City of Moreno Valley (City of Moreno Valley Municipal Code, Table 11.80.030-2);
    - To present a conservative approach, the adjacent office uses in the Project study area are also analyzed based on the more conservative operational noise level limits required for noise-sensitive residential receiver locations.
- If the existing ambient noise levels at the nearby noise-sensitive receivers near the Project site:
    - are less than 60 dBA L_{eq} and the Project creates a *readily perceptible* 5 dBA L_{eq} or greater Project-related noise level increase; or
    - range from 60 to 65 dBA L_{eq} and the Project creates a *barely perceptible* 3 dBA L_{eq} or greater Project-related noise level increase; or
    - already exceed 65 dBA L_{eq}, and the Project creates a community noise level increase of greater than 1.5 dBA L_{eq} (FICON, 1992).

CONSTRUCTION NOISE AND VIBRATION

- If Project-related construction activities:
    - create noise levels at sensitive residential receivers in the City of Moreno Valley which exceed the short-term construction noise level threshold of 65 dBA L_{eq} during the daytime

hours, or 60 dBA L_{eq} during the nighttime hours, or the continuous noise level limit of 90 dBA L_{eq} (based on the City of Moreno Valley Municipal Code, Table 11.80.030-2 source land use noise level limits, and the Table 11.80.030-1 continuous noise level limits); or

- o generate temporary Project construction-related noise level increases which exceed the 12 dBA L_{eq} substantial noise level increase threshold at noise-sensitive receiver locations (Caltrans, Traffic Noise Analysis Protocol).

- If short-term project generated construction source vibration levels could exceed the FTA maximum acceptable vibration standard of 80 vibration decibels (VdB) at noise-sensitive receiver locations.

TABLE 4-2: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Receiving Land Use	Condition(s)	Significance Criteria	
			Daytime	Nighttime
Off-Site	Noise-Sensitive[1]	if ambient is < 60 dBA CNEL	≥ 5 dBA CNEL Project increase	
		if ambient is 60 - 65 dBA CNEL	≥ 3 dBA CNEL Project increase	
		if ambient is > 65 dBA CNEL	≥ 1.5 dBA CNEL Project increase	
	Non-Noise-Sensitive[2]	if ambient is < 70 dBA CNEL	≥ 5 dBA CNEL Project increase	
		if ambient is > 70 dBA CNEL	≥ 3 dBA CNEL Project increase	
Operational	Noise-Sensitive	Exterior Noise Level Standards	See Table 3-1.	
		if ambient is < 60 dBA L_{eq}[1]	≥ 5 dBA L_{eq} Project increase	
		if ambient is 60 - 65 dBA L_{eq}[1]	≥ 3 dBA L_{eq} Project increase	
		if ambient is > 65 dBA L_{eq}[1]	≥ 1.5 dBA L_{eq} Project increase	
		Vibration Level Threshold[3]	80 VdB	
Construction	Noise-Sensitive	At residential land use[4]	65 dBA L_{eq}	60 dBA L_{eq}
			90 dBA L_{eq}	
		Noise Level Increase[5]	12 dBA L_{eq}	
		Vibration Level Threshold[3]	80 VdB

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, four 24-hour noise level measurements were taken at potential receiver locations in the Project study area. The Project study area is based on the measurement locations discussed in this Section, in addition to the receiver locations used in this noise study, further described in Section 8. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A shows the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Friday, June 22nd, 2018. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (19)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent every part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (4) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (9)

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. (9) In other words, the area represented by the receiver shares similar shielding, terrain, and geometric relationship to the reference noise source. Receivers represent a location of noise sensitive areas and are used to estimate the

future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (L_{eq}). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (8:00 a.m. to 10:00 p.m.) and nighttime (10:01 p.m. to 7:59 a.m.) noise levels at each noise level measurement location consistent with the City of Moreno Valley Municipal Code. Appendix 5.2 provides a summary of the existing hourly ambient noise levels described below:

- Location L1 represents the north of the Project site on Goldencrest Drive near existing office and commercial uses. The noise level measurements collected show an overall 24-hour exterior noise level of 62.6 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 58.5 dBA L_{eq} with an average nighttime noise level of 56.2 dBA L_{eq}.
- Location L2 represents the noise levels south of Cactus Avenue near the northern Project site boundary, north of March Air Reserve Base. The noise level measurements collected show an overall 24-hour exterior noise level of 66.2 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 60.3 dBA L_{eq} with an average nighttime noise level of 59.6 dBA L_{eq}.
- Located north of the Project site, location L3 represents the noise levels near existing office uses on Calle San Juan De Los Lagos. The noise level measurements collected show an overall 24-hour exterior noise level of 56.8 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 52.9 dBA L_{eq} with an average nighttime noise level of 49.9 dBA L_{eq}.
- Location L4 represents the noise levels east of the Project site near an existing Marine Corps Recruiting Station building on Riverside Drive. The noise level measurements collected show an overall 24-hour exterior noise level of 64.2 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 61.7 dBA L_{eq} with an average nighttime noise level of 57.2 dBA L_{eq}.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

The background ambient noise levels in the Project study area are dominated by the transportation-related noise associated with the arterial roadway network and MARB/IPA. This includes the auto and heavy truck activities near the noise level measurement locations and aircraft overflight noise from the MARB/IPA. The 24-hour existing noise level measurements are shown on Table 5-1.

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Distance to Project Boundary (Feet)	Description	Energy Average Noise Level (dBA L_{eq})[2]		CNEL
			Daytime	Nighttime	
L1	530'	Located north of the Project site on Goldencrest Drive near existing office and commercial uses.	58.5	56.2	62.6
L2	0'	Located south of Cactus Avenue near the northern Project site boundary, north of March Air Reserve Base.	60.3	59.6	66.2
L3	1,420'	Located north of the Project site near existing office uses on Calle San Juan De Los Lagos.	52.9	49.9	56.8
L4	2,100'	Located east of the Project site near an existing Marine Corps Recruiting Station building on Riverside Drive.	61.7	57.2	64.2

EXHIBIT 5-A: NOISE MEASUREMENT LOCATIONS

6 METHODS AND PROCEDURES

The following section outlines the methods and procedures used to model and analyze the future traffic noise environment.

6.1 FHWA TRAFFIC NOISE PREDICTION MODEL

The expected roadway noise level increases from vehicular traffic were calculated by Urban Crossroads, Inc. using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108. (20) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. (21) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period. Research conducted by Caltrans has shown that the use of soft site conditions is appropriate for the application of the FHWA traffic noise prediction model used in this analysis. (22)

6.2 OFF-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

Table 6-1 presents the roadway parameters used to assess the Project's off-site transportation noise impacts. Table 6-1 identifies the 19 study area roadway segments, the distance from the centerline to adjacent land use based on the functional roadway classifications according to the March Joint Powers Authority *General Plan Circulation Element*, and the posted vehicle speeds. The ADT volumes used in this study are presented on Table 6-2 were obtained from the *K4 Parcel Traffic Impact Analysis* prepared by Urban Crossroads, Inc., for the following traffic scenarios: Existing, Opening Year 2023, and Horizon Year 2040 conditions. (2) Table 6-3 provides the time of day (daytime, evening, and nighttime) vehicle splits.

TABLE 6-1: OFF-SITE ROADWAY PARAMETERS

TABLE 6-3: TIME OF DAY VEHICLE SPLITS

Vehicle Type	Time of Day Splits[1]			Total of Time of Day Splits
	Daytime	Evening	Nighttime	
Autos	69.14%	10.62%	20.24%	100.00%
Medium Trucks	70.51%	7.68%	21.81%	100.00%
Heavy Trucks	59.86%	10.26%	29.88%	100.00%

[1] Based on existing ADT counts by vehicle type taken on 5/17/2018 on Cactus Avenue west of Veterans Way (K4 Parcel Traffic Impact Analysis, Urban Crossroads, Inc., June 2018). All values rounded to the nearest one-hundredth.
"Daytime" = 7:00 a.m. to 7:00 p.m.; "Evening" = 7:00 p.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

According to the *K4 Parcel Traffic Impact Analysis* prepared by Urban Crossroads, Inc., the Project is expected to generate a net total of approximately 5,873 trip-ends per day (actual vehicles). (2) The Project trip generation includes 517 truck trip-ends per day from the Project site. This noise study relies on the actual Project trips to accurately account for the effect of individual truck trips on the study area roadway network.

To quantify the off-site noise levels, the Project related truck trips were added to the heavy truck category in the FHWA noise prediction model. The addition of the Project related truck trips increases the percentage of heavy trucks in the vehicle mix. This approach recognizes that the FHWA noise prediction model is significantly influenced by the number of heavy trucks in the vehicle mix.

The daily Project truck trip-ends were assigned to the individual off-site study area roadway segments based on the Project truck trip distribution percentages documented in the *Traffic Impact Analysis*. Using the Project truck trips in combination with the Project trip distribution, Urban Crossroads, Inc. calculated the number of additional Project truck trips and vehicle mix percentages for each of the study area roadway segments. Table 6-4 shows the traffic flow by vehicle type (vehicle mix) used for all without Project traffic scenarios, and Tables 6-5 to 6-7 show the vehicle mixes used for the with Project traffic scenarios.

TABLE 6-4: WITHOUT PROJECT CONDITIONS VEHICLE MIX

6.3 VIBRATION ASSESSMENT

This analysis focuses on the potential ground-borne vibration associated with vehicular traffic and construction activities. Ground-borne vibration levels from automobile traffic are generally overshadowed by vibration generated by heavy trucks that roll over the same uneven roadway surfaces. However, due to the rapid drop-off rate of ground-borne vibration and the short duration of the associated events, vehicular traffic-induced ground-borne vibration is rarely perceptible beyond the roadway right-of-way, and rarely results in vibration levels that cause damage to buildings in the vicinity.

However, while vehicular traffic is rarely perceptible, construction has the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used. Ground vibration levels associated with various types of construction equipment are summarized on Table 6-8. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the human response (annoyance) using the following vibration assessment methods defined by the FTA. To describe

the human response (annoyance) associated with vibration impacts the FTA provides the following equation: $L_{VdB}(D) = L_{VdB}(25\ ft) - 30\log(D/25)$

TABLE 6-8: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	Vibration Decibels (VdB) at 25 feet[1]
Small bulldozer	58
Jackhammer	79
Loaded Trucks	86
Large bulldozer	87

7 OFF-SITE TRAFFIC NOISE IMPACTS

To assess the off-site traffic CNEL noise level impacts associated with the proposed Project, noise contours were developed based on the *K4 Parcel Traffic Impact Analysis*. (2) Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway. Noise contours were developed for the following traffic scenarios:

- Existing Conditions Without / With Project: This scenario refers to the existing present-day noise conditions without and with the proposed Project.
- Opening Year 2023 Without / With the Project: This scenario refers to Opening Year noise conditions without and with the proposed Project. This scenario includes all cumulative projects identified in the *Traffic Impact Analysis*.
- Horizon Year 2040 Without / With the Project: This scenario refers to Horizon Year noise conditions without and with the proposed Project. This scenario includes all cumulative projects identified in the *Traffic Impact Analysis*.

7.1 TRAFFIC NOISE CONTOURS

Noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA noise levels. The noise contours do not take into account the effect of any existing noise barriers or topography that may attenuate ambient noise levels and therefore present a conservative scenario for purposes of this analysis. In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the Project study area. An analysis of Project-related operational noise level increases over existing ambient conditions is provided in Section 9. Tables 7-1 through 7-6 present a summary of the exterior traffic noise levels, without barrier attenuation, for the study area roadway segments analyzed from the without Project to the with Project conditions in each of the three timeframes: Existing, Opening Year 2023, and Horizon Year 2040 conditions. Appendix 7.1 includes a summary of the traffic noise level contours for each of the traffic scenarios.

"RW" = Location of the respective noise contour falls within the right-of-way of the road.

7.2 EXISTING CONDITION PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-1 presents the Existing without Project conditions CNEL noise levels. The Existing without Project exterior noise levels are expected to range from 68.3 to 81.9 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-2 shows the Existing with Project conditions will range from 68.4 to 81.9 dBA CNEL. As shown on Table 7-7 the Project is expected to generate an exterior noise level increase of up to 0.6 dBA CNEL at adjacent land uses, which will satisfy the significance thresholds identified in Section 4. Therefore, the off-site Project-related traffic noise level increase is considered a *less than significant* impact under Existing conditions.

TABLE 7-7: EXISTING CONDITION OFF-SITE PROJECT-RELATED TRAFFIC NOISE IMPACT

[3] Significance Criteria (Section 4).

7.3 OPENING YEAR 2023 PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-8 presents a comparison of the Opening Year 2023 without and with Project conditions CNEL noise levels. Table 7-3 shows that the exterior noise levels without accounting for any noise attenuation features are expected to range from 68.7 to 82.4 dBA CNEL without the Project. Table 7-4 presents the Opening Year 2023 with Project conditions noise level contours that are expected to range from 68.8 to 82.4 dBA CNEL. As shown on Table 7-8 the Project is expected to generate an exterior noise level increase of up to 0.5 dBA CNEL at adjacent land uses, which will satisfy the significance thresholds identified in Section 4. Therefore, the off-site Project-related traffic noise level increase is considered a *less than significant* impact under Opening Year 2023 conditions and mitigation measures are not required.

7.4 HORIZON YEAR 2040 PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-9 presents a comparison of the Horizon Year 2040 without and with Project conditions CNEL noise levels. Table 7-5 shows that the exterior noise levels without accounting for any noise attenuation features are expected to range from 69.1 to 82.8 dBA CNEL without the Project. Table 7-6 presents the Horizon Year 2040 with Project conditions noise level contours that are expected to range from 69.2 to 82.8 dBA CNEL. As shown on Table 7-9 the Project is expected to generate an exterior noise level increase of up to 0.5 dBA CNEL at adjacent land uses, which will satisfy the significance thresholds identified in Section 4. Therefore, the off-site Project-related traffic noise level increase is considered a *less than significant* impact under Horizon Year 2040 conditions and mitigation measures are not required.

TABLE 7-9: HORIZON YEAR OFF-SITE PROJECT-RELATED TRAFFIC NOISE IMPACTS

[3] Significance Criteria (Section 4).

8 RECEIVER LOCATIONS

To assess the potential for long-term operational and short-term construction noise impacts, the following receiver locations, as shown on Exhibit 8-A, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include: schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include: multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, natural open space, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

Non-noise-sensitive receivers near the Project site include existing office uses in the City of Moreno Valley and MARB facilities, as described below. No sensitive receiver locations are located closer than the non-noise sensitive receiver locations identified below; however, existing noise-sensitive residential homes, represented by receiver location R6, are located east of the Project site at roughly 4,777 feet, adjacent to Heacock Avenue and the off-site channel construction associated with the Project. Additional noise-sensitive receiver locations in the Project study area include residential homes located roughly 0.5 miles southeast of the Project site, south of Meyer Drive. However, receiver locations which are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures. Therefore, noise levels that would be experienced at these residential homes would be less than those identified at R5, which represent a closer receiver location with direct line-of-sight to the Project site.

Further, existing non-noise-sensitive MARB facilities located south of the Project site will benefit from additional barrier attenuation/shielding provided by the Project building and site design, which locates all truck activity north of the Project site building. For the purpose of the operational noise analysis, the Project building is modeled at a height of 30 feet. Other noise-sensitive and/or non-noise-sensitive receiver locations in the Project study area which are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures.

R1: Located approximately 188 feet north of the Project site, R1 represents existing non-noise-sensitive office uses north of Cactus Avenue. A long-term noise measurement was taken near this location, L1, to describe the existing ambient noise environment.

R2: Located roughly 100 feet south of the Project site, R2 represents existing non-noise-sensitive MARB facilities. A long-term noise measurement was taken near this location, L2, to describe the existing ambient noise environment.

R3: Located north of the Project site at approximately 771 feet on Frederick Street, R3 represents existing non-noise-sensitive office uses. A long-term noise measurement was taken near this location, L3, to describe the existing ambient noise environment.

R4: Located approximately 2,231 feet east of the Project site, R4 represents the existing non-noise-sensitive Marine Corps Recruiting Station building on Riverside Drive. A long-term noise measurement was taken near this location, L4, to describe the existing ambient noise environment.

R5: Located approximately 669 feet southeast of the Project site, R5 represents existing non-noise-sensitive MARB buildings on Castle Street. A long-term noise measurement, L4, is used to describe the existing ambient noise environment at this location due to limited access to MARB.

R6: Located approximately 4,777 feet east of the Project site, R6 represents existing noise-sensitive residential uses. Receiver location R6 has been identified to assess potential off-site construction of the off-site Cactus Avenue channel as part of Project-related construction activities, and as such, is only included in the construction noise analysis. Exhibit 10-A of this report shows the off-site channel location in relation to the receiver locations. Operational noise levels due to the Project at this location would be lower than those presented in this report at closer receiver locations due to the additional attenuation from distance and the shielding of intervening structures.

9 OPERATIONAL NOISE IMPACTS

This section analyzes the potential stationary-source operational noise impacts at the nearby receiver locations, identified in Section 8, resulting from operation of the proposed K4 Parcel Project. Exhibit 9-A identifies the representative receiver locations and noise source locations used to assess the operational noise levels.

9.1 OPERATIONAL NOISE SOURCES

At the time this noise analysis was prepared the future tenants of the proposed Project were unknown. To present the potential worst-case noise conditions, this analysis assumes the Project would be operational 24 hours per day, seven days per week. The Project business operations would primarily be conducted within the enclosed buildings, except for traffic movement, parking, as well as loading and unloading of trucks at designated loading bays. The on-site Project-related noise sources are expected to include: idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements.

9.2 REFERENCE NOISE LEVELS

To estimate the Project operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. This section provides a detailed description of the reference noise level measurements shown on Table 9-1 used to estimate the Project operational noise impacts. It is important to note that the following projected noise levels assume the worst-case noise environment with the idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements all operating continuously. These noise level impacts will likely vary throughout the day.

9.2.1 TRUCK IDLING, DELIVERIES, BACKUP ALARMS, AND LOADING/UNLOADING

Short-term reference noise level measurements were collected on Wednesday, January 7th, 2015, by Urban Crossroads, Inc. at the Motivational Fulfillment & Logistics Services distribution facility located at 6810 Bickmore Avenue in the City of Chino. The noise level measurements represent the typical weekday dry goods logistics warehouse operation in a single building, of roughly 285,000 square feet, with a loading dock area on the western side of the building façade. Up to ten trucks were observed in the loading dock area including a combination of track trailer semi-trucks, two-axle delivery trucks, and background forklift operations.

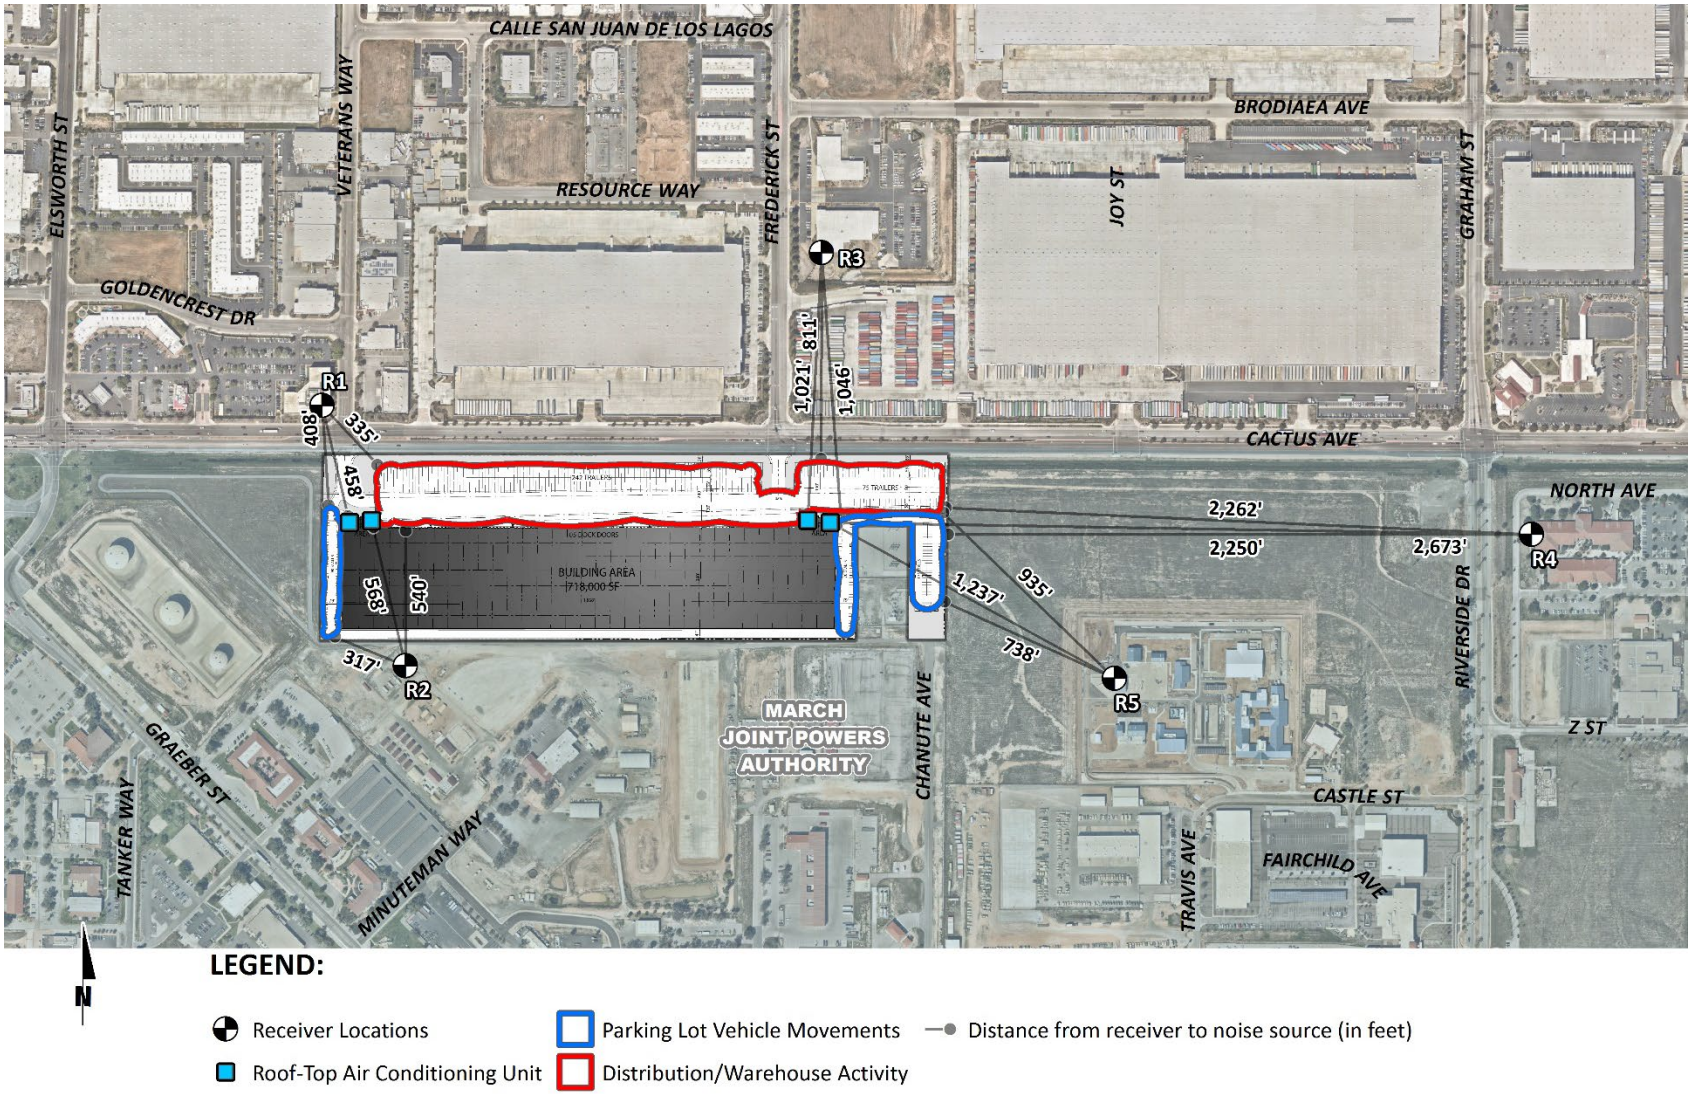
The unloading/docking activity noise level measurement was taken over a fifteen-minute period and represents multiple noise sources taken from the center of loading dock activities generating a reference noise level of 62.8 dBA L_{eq} at a uniform reference distance of 50 feet. At this measurement location, the noise sources associated with employees unloading a docked truck container included the squeaking of the truck's shocks when weight was removed from the truck, employees playing music over a radio, as well as a forklift horn and backup alarm. In addition,

during the noise level measurement a truck entered the loading dock area and proceeded to reverse and dock in a nearby loading bay, adding truck engine and air brakes noise.

9.2.2 ROOF-TOP AIR CONDITIONING UNITS

In order to assess the impacts created by the roof-top air conditioning units at the Project buildings, reference noise levels measurements were taken at the Santee Walmart on July 27th, 2015. Located at 170 Town Center Parkway in the City of Santee, the noise level measurements describe mechanical roof-top air conditioning units on the roof of an existing Walmart store. The reference noise level represents Lennox SCA120 series 10-ton model packaged air conditioning units. At 5 feet from the closest roof-top air conditioning unit, the exterior noise levels were measured at 77.2 dBA L_{eq}. Using the uniform reference distance of 50 feet, the noise level is 57.2 dBA L_{eq}. The operating conditions of the reference noise level measurement reflect peak summer cooling requirements with measured temperatures approaching 96 degrees Fahrenheit (°F) with average daytime temperatures of 82°F. The roof-top air condition units were observed to operate the most during the daytime hours, for a total of 39 minutes per hour, and are anticipated to operate during the daytime and nighttime hours at the Project site. The noise attenuation provided by a parapet wall is not reflected in this reference noise level measurement.

9.2.3 PARKING LOT VEHICLE MOVEMENTS (AUTOS)



To determine the noise levels associated with parking lot vehicle movements, Urban Crossroads collected reference noise level measurements over a 24-hour period on May 17th, 2017 at the parking lot for the Panasonic Avionics Corporation in the City of Lake Forest. The peak hour of activity measured over the 24-hour noise level measurement period occurred between 12:00 p.m. to 1:00 p.m., or the typical lunch hour for employees working in the area. The measured reference noise level at 50 feet from parking lot vehicle movements was measured at 41.7 dBA L_{eq}. The parking lot noise levels are mainly due to cars pulling in and out of spaces during peak lunch hour activity and employees talking. Noise associated with parking lot vehicle movements is expected to operate for the entire hour (60 minutes).

TABLE 9-1: REFERENCE NOISE LEVEL MEASUREMENTS

Noise Source	Duration (hh:mm:ss)	Ref. Distance (Feet)	Noise Source Height (Feet)	Hourly Activity (Mins)[4]	Reference Noise Level (dBA L_{eq})	
					@ Ref. Dist.	@ 50 Feet
Truck Unloading/Docking Activity[1]	0:15:00	30'	8'	60	67.2	62.8
Roof-Top Air Conditioning Units[2]	96:00:00	5'	5'	39	77.2	57.2
Parking Lot Vehicle Movements[3]	01:00:00	10'	5'	60	52.2	41.7

[1] Reference noise level measurements were collected from the existing operations of the Motivational Fulfillment & Logistics Services distribution facility located at 6810 Bickmore Avenue in the City of Chino on Wednesday, January 7, 2015.
[2] As measured by Urban Crossroads, Inc. on 7/27/2015 at the Santee Walmart located at 170 Town Center Parkway.
[3] As measured by Urban Crossroads, Inc. on 5/17/2017 at the Panasonic Avionics Corporation parking lot in the City of Lake Forest.
[4] Anticipated duration (minutes within the hour) of noise activity during typical hourly conditions expected at the Project site based on the reference noise level measurement activity.

EXHIBIT 9-A: OPERATIONAL NOISE SOURCE LOCATIONS

9.3 PROJECT OPERATIONAL NOISE LEVELS

Using the reference noise levels to represent the proposed warehouse operations that include idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements, Urban Crossroads, Inc. calculated the operational source noise levels that are expected to be generated at the Project site and the Project-related noise level increases that would be experienced at each of the receiver locations. The operational noise level calculations, shown on Table 9-2, account for the distance attenuation provided due to geometric spreading when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. With geometric spreading, sound levels attenuate (or decrease) at a rate of 6 dB for each doubling of distance from a point source (e.g. idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements).

Table 9-2 presents the combined total operational noise level projections at 200 feet consistent with the City of Moreno Valley Municipal Code. The Project operational noise levels at 200 feet are estimated at 51.5 dBA L_{eq}. Based on the results of this analysis, the Project operational noise levels associated with the K4 Parcel will satisfy the City of Moreno Valley Municipal Code 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime exterior noise level standards at 200 feet from the source land use. Further, it should be noted that the land uses within 200 feet of the Project site boundary are designated as business park, office, and commercial land use.

TABLE 9-2: OPERATIONAL NOISE LEVELS AT 200 FEET

Noise Source	Ref. Noise Level (dBA L_{eq})	Distance Atten. @ 200' (dBA L_{eq})[1]	Hourly Activity (Mins.)[2]	Hourly Activity Adjustment (dBA L_{eq})	Noise Level @ 200' (dBA L_{eq})
Truck Unloading/Docking Activity	67.2	-16.5	60	0.0	50.7
Roof-Top Air Conditioning Units	77.2	-32.0	39	-1.9	43.3
Parking Lot Vehicle Movements	52.2	-19.5	60	0.0	32.7
				Combined Total:	51.5

[1] Drop off rate of 6 dBA per doubling of distance (point source) and 4.5 dBA per doubline of distance (line source).
[2] Anticipated duration (minutes within the hour) of noise activity during peak hourly conditions expected at the Project site.

Table 9-3 indicates that the unmitigated hourly noise levels associated with the K4 Parcel Project at the nearby sensitive receiver locations are expected to range from 30.4 to 46.7 dBA L_{eq}. The Project-related operational noise levels, as shown on Table 9-3, will satisfy the March Joint Powers Authority and City of Moreno Valley exterior noise level standards at all nearby sensitive receiver locations. The operational noise level calculations are included in Appendix 9.1.

TABLE 9-3: UNMITIGATED OPERATIONAL NOISE LEVELS AT RECEIVER LOCATIONS

Receiver Location[1]	Land Use	Noise Levels by Noise Source (dBA L_{eq})[2]			Combined Operational Noise Levels (dBA L_{eq})[3]	Threshold Exceeded?[4]

R5	Office	37.3	27.4	24.2	37.9	No	No	No

[1] See Exhibit 9-A for the receiver and noise source locations.
[2] Reference noise sources as shown on Table 9-1.
[3] Calculations for each noise source are provided in Appendix 9.1.
[4] Do the Project operational noise levels exceed the standards (Table 3-1)?

9.4 PROJECT OPERATIONAL NOISE CONTRIBUTION

To describe the Project operational noise level contributions, the Project operational noise levels are combined with the existing ambient noise levels measurements for the nearby receiver locations potentially impacted by Project operational noise sources. Since the units used to measure noise, decibels (dB), are logarithmic units, the Project-operational and existing ambient noise levels cannot be combined using standard arithmetic equations. (4) Instead, they must be logarithmically added using the following base equation:

$$SPL_{Total} = 10\log_{10}[10^{SPL1/10} + 10^{SPL2/10} + \ldots 10^{SPLn/10}]$$

Where "SPL1," "SPL2," etc. are equal to the sound pressure levels being combined, or in this case, the Project-operational and existing ambient noise levels. The difference between the combined Project and ambient noise levels describe the Project noise level contributions to the existing ambient noise environment. Noise levels that would be experienced at receiver locations when Project-source noise is added to the ambient daytime and nighttime conditions are presented on Tables 9-4 and 9-5.

As indicated on Tables 9-4 and 9-5, the Project will contribute a daytime operational noise level increase of up to 0.3 dBA L_{eq} and a nighttime operational noise level increase of up to 0.5 dBA L_{eq} at the sensitive receiver locations. Since the Project-related operational noise level contributions will satisfy the significance criteria discussed in Section 4, the increases at the sensitive receiver locations will be *less than significant* and mitigation measures are not required.

As previously indicated in Section 8, receiver location R6 is identified in this report to assess potential off-site construction of the off-site Cactus Avenue channel as part of Project-related construction activities, and as such, is not included in the operational noise analysis. Exhibit 10-A of this report shows the off-site channel location in relation to the receiver locations. Operational noise levels due to the Project at R6 would be lower than those presented in this

report at closer receiver locations due to the additional attenuation from distance and the shielding of intervening structures.

TABLE 9-4: PROJECT DAYTIME NOISE LEVEL CONTRIBUTIONS

[6] The noise level increase expected with the addition of the proposed Project activities.
[7] Significance Criteria as defined in Section 4.

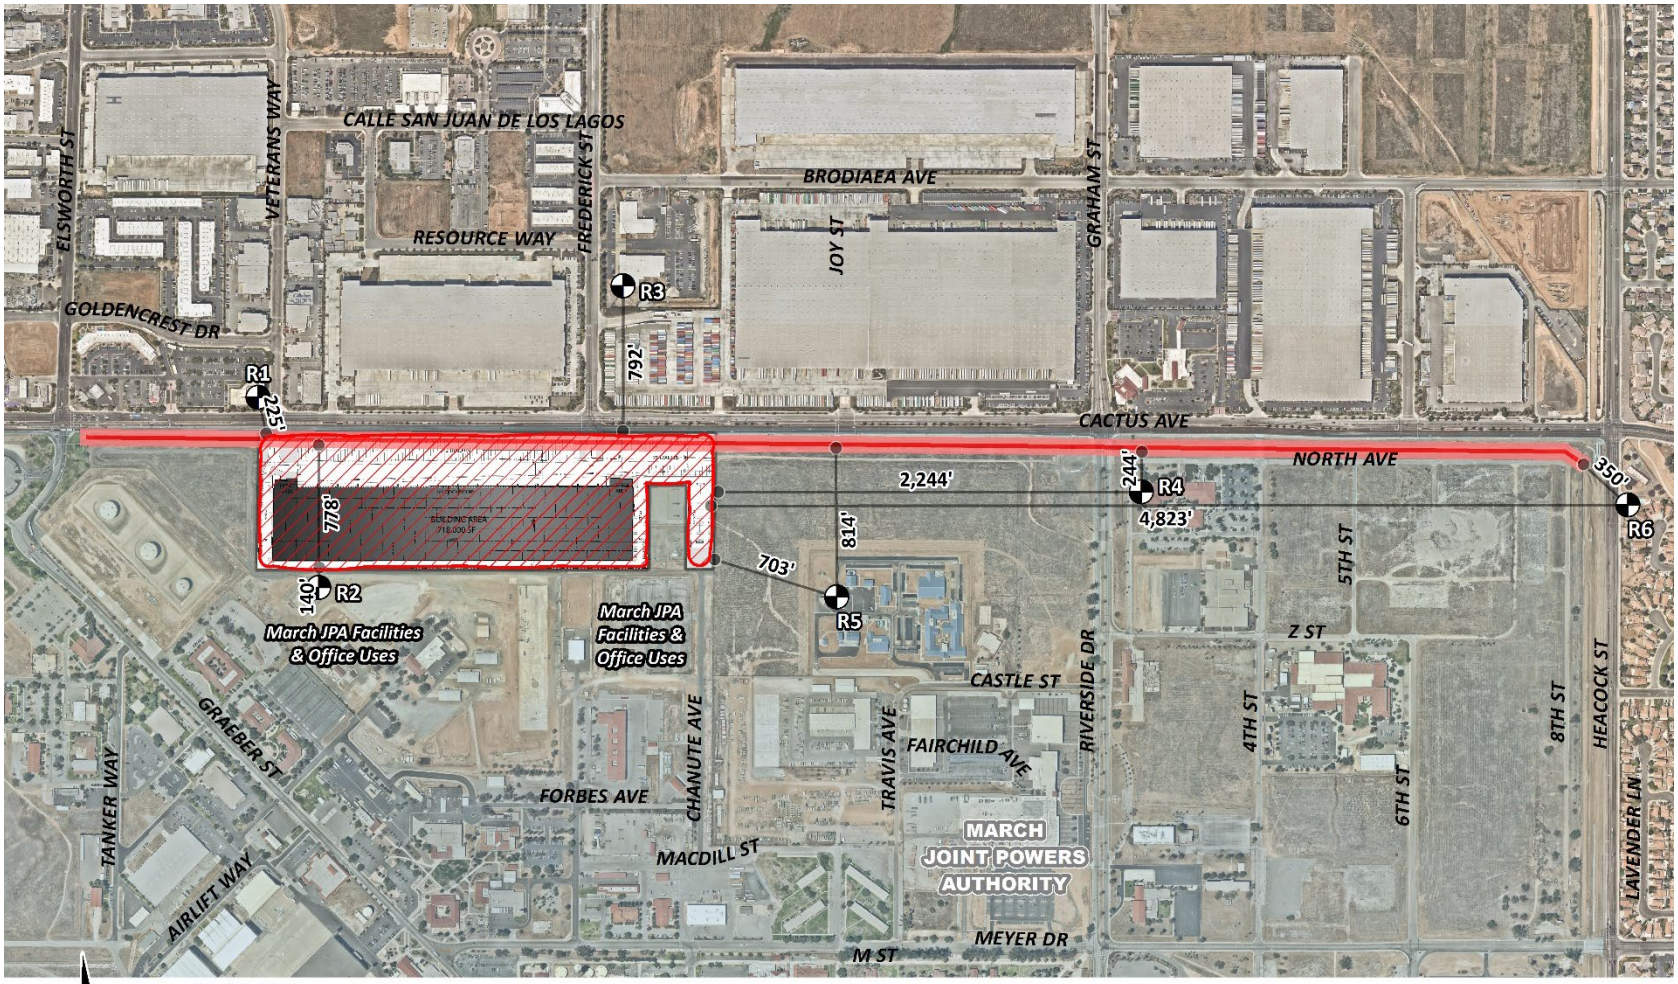
9.5 OPERATIONAL VIBRATION IMPACTS

Although the human threshold of perception for vibration is around 65 VdB, human response to vibration is not usually significant unless the vibration exceeds 70 VdB. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement condition. Typical vibration levels for heavy trucks at normal traffic speeds do not exceed 65 VdB, and therefore, will be a *less than significant* impact as vibration levels would remain below the FTA vibration threshold of 80 VdB at nearby receiver locations. Therefore, no mitigation is required.

This page intentionally left blank

10 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the short-term construction activities associated with the development of the Project. Exhibit 10-A shows the construction noise source locations in relation to the nearby receiver locations previously described in Section 8.



10.1 CONSTRUCTION NOISE LEVELS

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers and portable generators that when combined can reach high levels. The number and mix of construction equipment is expected to occur in the following stages:

- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating
- Off-Site Channel (Cactus Avenue)
- Nighttime Concrete Pours

This construction noise analysis was prepared using reference noise level measurements taken by Urban Crossroads, Inc. to describe the typical construction activity noise levels for each stage of Project construction. The construction reference noise level measurements represent a list of typical construction activity noise levels. Noise levels generated by heavy construction equipment can range from approximately 68 dBA to in excess of 80 dBA when measured at 50 feet. However, these noise levels diminish with distance from the construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 80 dBA measured at 50 feet from the noise source to the receiver would be reduced to 74 dBA at 100 feet from the source to the receiver and would be further reduced to 68 dBA at 200 feet from the source to the receiver. The construction stages are based on the *K4 Parcel Construction Equipment List* provided by the Project Applicant. (23)

EXHIBIT 10-A: CONSTRUCTION NOISE SOURCE LOCATIONS

10.2 CONSTRUCTION REFERENCE NOISE LEVELS

To describe the Project construction noise levels, measurements were collected for similar activities at several construction sites. Table 10-1 provides a summary of the construction reference noise level measurements. Since the reference noise levels were collected at varying distances of 30 feet and 50 feet, all construction noise level measurements presented on Table 10-1 have been adjusted for consistency to describe a common reference distance of 50 feet.

TABLE 10-1: CONSTRUCTION REFERENCE NOISE LEVELS

ID	Noise Source	Reference Distance From Source (Feet)	Reference Noise Levels @ Reference Distance (dBA L_{eq})	Reference Noise Levels @ 50 Feet (dBA L_{eq})[5]
1	Truck Pass-Bys & Dozer Activity (Single Dozer)[1]	30'	63.6	59.2
2	Dozer Activity (Multiple Dozers)[1]	30'	68.6	64.2
3	Construction Vehicle Maintenance Activities[2]	30'	71.9	67.5
4	Foundation Trenching[2]	30'	72.6	68.2
5	Rough Grading Activities[2]	30'	77.9	73.5
6	Framing[2]	30'	66.7	62.3
7	Concrete Mixer Truck Movements[3]	50'	71.2	71.2
8	Concrete Paver Activities[3]	30'	70.0	65.6
9	Concrete Mixer Pour & Paving Activities[3]	30'	70.3	65.9
10	Concrete Mixer Backup Alarms & Air Brakes[3]	50'	71.6	71.6
11	Concrete Mixer Pour Activities[3]	50'	67.7	67.7

[1] As measured by Urban Crossroads, Inc. on 10/14/15 at a business park construction site located at the northwest corner of Barranca Parkway and Alton Parkway in the City of Irvine.
[2] As measured by Urban Crossroads, Inc. on 10/20/15 at a construction site located in Rancho Mission Viejo.
[3] Reference noise level measurements were collected from a nighttime concrete pour at an industrial construction site, located at 27334 San Bernardino Avenue in the City of Redlands, between 1:00 a.m. to 2:00 a.m. on 7/1/15.
[4] As measured by Urban Crossroads, Inc. on 9/9/16 during the demolition of an existing parking lot at 41 Corporate Park in Irvine.
[5] Reference noise levels are calculated at 50 feet using a drop off rate of 6 dBA per doubling of distance (point source).

10.3 DAYTIME CONSTRUCTION NOISE ANALYSIS

Using the reference construction equipment noise levels, calculations of the daytime Project construction noise level impacts at the nearby sensitive receiver locations were completed. Tables 10-2 to 10-7 present the short-term daytime construction noise levels for each stage of construction. Table 10-9 provides a summary of the construction noise levels by stage at the noise receiver locations. Based on the stages of construction, the noise impacts associated with the proposed Project are expected to create temporarily high noise levels at the nearby receiver locations. To assess the peak daytime construction noise levels, this analysis shows the highest noise impacts when the equipment with the highest reference noise level is operating at the closest point from the primary construction activity to each receiver location.

10.4 NIGHTTIME CONCRETE POUR NOISE ANALYSIS

Using the reference concrete pour activity construction equipment noise levels, calculations of the nighttime Project construction noise level impacts at the nearby receiver locations were completed. Table 10-8 presents the short-term nighttime construction noise levels at the receiver locations which are expected to range from 38.6 to 62.7 dBA L_{eq}. To assess the peak nighttime construction noise levels, this analysis shows the highest noise impacts when the equipment with the highest reference noise level is operating at the closest point from the primary construction activity to each receiver location.

TABLE 10-8: NIGHTTIME CONCRETE POUR EQUIPMENT NOISE LEVELS

[4] Estimated barrier attenuation (if any) from existing barriers/berms in the Project study area.

10.5 CONSTRUCTION NOISE THRESHOLDS OF SIGNIFICANCE

The construction noise analysis shows that the highest construction noise levels will occur when equipment is operating at the closest point from primary construction activity to each sensitive receiver location. As shown on Table 10-9, the highest unmitigated daytime construction noise levels are expected to range from 49.5 to 64.5 dBA L_{eq} and nighttime construction noise levels are expected to range from 38.6 to 62.7 dBA L_{eq} at the nearby receiver locations.

As shown on Table 10-9, the unmitigated Project daytime and nighttime construction noise levels satisfy the 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime City of Moreno Valley Municipal Code thresholds, respectively, during Project construction activity at all receiver locations, including the off-site Cactus Avenue channel construction. Further, the closest receiver locations represent non-noise-sensitive uses that are typically unoccupied during the hours when nighttime concrete pours would take place, and as such, are not analyzed against the nighttime noise level standards. Further, the unmitigated Project-related construction noise levels will satisfy the less restrictive 90 dBA L_{eq} 8-hour continuous noise level limit identified in the City of Moreno Valley Municipal Code. Therefore, impacts from Project construction noise levels are considered *less than significant* and mitigation measures are not required.

10.5 TEMPORARY CONSTRUCTION NOISE LEVEL CONTRIBUTIONS

To describe the temporary Project construction noise level contributions to the existing ambient noise environment, the Project construction noise levels were combined with the existing ambient noise levels measurements at the off-site noise-sensitive receiver locations. The difference between the combined Project-construction and ambient noise levels are used to describe the construction noise level contributions. Temporary noise level increases that would be experienced at sensitive receiver locations when Project construction-source noise is added to the ambient daytime and nighttime ambient conditions are presented on Tables 10-10 and 10-11, respectively. A temporary noise level increase of 12 dBA L_{eq} is considered a potentially significant impact based on the Caltrans substantial noise level increase criteria which is used to assess the Project-construction noise level increases. (18) To evaluate potential nighttime construction activity at the Project site, both daytime and nighttime noise level increases above the ambient measured noise levels are analyzed in this noise study.

As indicated in Table 10-10, the Project will contribute unmitigated, worst-case construction noise level increases approaching 0.2 dBA L_{eq} during the daytime hours at the closest sensitive receiver location, R6. Table 10-11 shows the Project will not contribute an unmitigated, worst-case construction noise level increase during the nighttime hours at the closest sensitive receiver location, R6. Since the worst-case temporary noise level increases during Project construction will satisfy the 12 dBA L_{eq} significance threshold, the unmitigated construction noise level increases are considered *less than significant* temporary noise impacts at all receiver locations.

TABLE 10-9: CONSTRUCTION EQUIPMENT NOISE LEVEL SUMMARY

Receiver Location	Daytime Construction Noise Levels (dBA L_{eq})[1]							Nighttime Concrete Pour Noise Levels (dBA L_{eq})[2]	Threshold Exceeded?[3]	
	Site Preparation	Grading	Building Construction	Paving	Architectural Coating	Off-Site Channel	Highest Construction Noise Levels		Daytime (65 dBA L_{eq})	Nighttime (60 dBA L_{eq})
R1	51.1	60.4	55.1	58.5	54.4	51.1	60.4	58.5	No	n/a
R2	55.2	64.5	59.2	62.7	58.5	40.3	64.5	62.7	No	n/a

[6] The noise level increase expected with the addition of the proposed Project activities.
[7] Significance Criteria as defined in Section 4.

10.7 CONSTRUCTION VIBRATION IMPACTS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. The proposed Project's construction activities most likely to cause vibration impacts are:

- Heavy Construction Equipment: Although all heavy mobile construction equipment has the potential of causing at least some perceptible vibration while operating close to buildings, the vibration is usually short-term and is not of sufficient magnitude to cause building damage.
- Trucks: Trucks hauling building materials to construction sites can be sources of vibration intrusion if the haul routes pass through residential neighborhoods on streets with bumps or potholes. Repairing the bumps and potholes generally eliminates the problem.

Ground-borne vibration levels resulting from construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration. Construction activities that would have the potential to generate low levels of ground-borne vibration within

the Project site include grading. Using the vibration source level of construction equipment provided on Table 6-8 and the construction vibration assessment methodology published by the FTA, it is possible to estimate the Project vibration impacts. Table 10-12 presents the expected Project related vibration levels at the nearby receiver locations.

Based on the reference vibration levels provided by the FTA, a large bulldozer represents the peak source of vibration with a reference level of 87 VdB at 25 feet. At distances ranging from 140 to 4,823 feet from the Project construction activities, construction vibration levels are expected to range from 42.0 to 64.6 VdB, as shown on Table 10-12. Using the construction vibration assessment methods provided by the FTA, Project construction vibration levels will remain below the FTA 80 VdB threshold at all sensitive receiver locations, and therefore, is considered a *less than significant* impact and mitigation measures are not required.

Further, vibration levels at the site of the closest sensitive receiver are unlikely to be sustained during the entire construction period but will occur rather only during the times that heavy construction equipment is operating at the Project site perimeter.

TABLE 10-12: UNMITIGATED CONSTRUCTION EQUIPMENT VIBRATION LEVELS

Receiver Location[1]	Closest Distance to Construction Activity (Feet)	Receiver Vibration Levels (VdB)[2]					Threshold Exceeded?[3]
		Small Bulldozer	Jackhammer	Loaded Trucks	Large Bulldozer	Highest Vibration Level	
R1	225'	29.4	50.4	57.4	58.4	58.4	No
R2	140'	35.6	56.6	63.6	64.6	64.6	No
R3	792'	13.0	34.0	41.0	42.0	42.0	No
R4	244'	28.3	49.3	56.3	57.3	57.3	No
R5	703'	14.5	35.5	42.5	43.5	43.5	No
R6	350'	23.6	44.6	51.6	52.6	52.6	No

[1] Noise receiver locations are shown on Exhibit 10-A. Distance to closest Project-related construction activity (on- or off-site).
[2] Based on the Vibration Source Levels of Construction Equipment included on Table 6-8.
[3] Does the peak vibration exceed the FTA maximum acceptable vibration standard of 80 VdB?

10.8 CONSTRUCTION NOISE AND VIBRATION BEST PRACTICES

Though construction noise is temporary, intermittent and of short duration, and will not present any long-term impacts, the following practices would reduce noise and vibration levels produced by the construction equipment to the nearby receiver locations:

- During all Project site construction, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receivers nearest the Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the Project site during all Project construction.
- The construction contractor shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.

APPENDIX 3.1:

MARCH JOINT POWERS AUTHORITY DEVELOPMENT CODE

This page intentionally left blank

Except as otherwise provided in this Title, all open areas shall be landscaped, surfaced, or treated and maintained permanently in a dust-free, weed-free condition.

Section 9.10.130 Mechanical and Electrical Equipment

All mechanical and electrical equipment, including air conditioners, antennas, pumps, transformers, and heating and ventilating equipment shall be located, operated and screened in a manner that does not disturb adjacent uses and activities. In addition, all central building electrical controlling equipment and switching facilities shall be located within the building for all commercial, industrial and business facilities.

Section 9.10.140 Noise and Sound

Unless otherwise specified in Chapter 9.08, General Development Standards, or Chapter 9.09, Specific Use Development Standards, all commercial and industrial uses shall be operated so that noise created by any loudspeaker, bells, gongs, buzzers, or other noise attention or attracting devices shall not exceed 55 dBA at any one time beyond the boundaries of the property.

Section 9.10.150 Odors

No operation or activity shall be permitted which emits odorous gases or other odorous matter in such quantities as to be dangerous, injurious, noxious, or otherwise objectionable to a level that is detectable with or without the aid of instruments at or beyond the lot line of the property containing said operation or activity.

Section 9.10.160 Outdoor Storage, Trash Areas, and Service Areas

All storage areas for storage of maintenance equipment or vehicles or refuse, and all collection areas and service areas, shall be enclosed or effectively screened from public view with a fence, wall, landscaping, berming or a combination thereof. Doors to trash enclosures shall be closed at all times except when the enclosure is being accessed for refuse disposal or pick-up. The screening requirements of Section 9.08.150 are also referenced and not intended to be superseded hereby.

Section 9.10.170 Vibration

No vibration shall be permitted which can be felt at or beyond the property line.

APPENDIX 3.2:

CITY OF MORENO VALLEY MUNICIPAL CODE

This page intentionally left blank

Chapter 11.80 NOISE REGULATION

11.80.010 Legislative findings.

It is found and declared that:

A. Excessive sound within the limits of the city is a condition which has existed for some time, and the amount and intensity of such sound is increasing.

B. Such excessive sound is a detriment to the public health, safety, and welfare and quality of life of the residents of the city.

C. The necessity in the public interest for the provisions and prohibitions hereinafter contained and enacted is declared as a matter of legislative determination and public policy, and it is further declared that the provisions and prohibitions hereinafter contained and enacted are in pursuance of and for the purpose of securing and promoting the public health, safety, welfare and quality of life of the city and its inhabitants. (Ord. 740 § 1.2, 2007)

11.80.020 Definitions.

For purposes of this chapter, certain words and phrases used herein are defined as follows:

"A-weighted sound level" means the sound pressure level in decibels as measured with a sound level meter using the A-weighting network. The unit of measurement is the dB(A).

"Commercial" means all uses of land not otherwise classified as residential, as defined in this section.

"Construction" means any site preparation, and/or any assembly, erection, repair, or alteration, excluding demolition, of any structure, or improvements to real property.

"Continuous airborne sound" means sound that is measured by the slow-response setting of a meter manufactured to the specifications of ANSI Section 1.4-1983 (R2006) "Specification for Sound Level Meters," or its successor.

"Daytime" means eight a.m. to ten p.m. the same day.

"Decibel" (dB) means a unit for measuring the amplitude of sound, equal to twenty (20) times the logarithm to the base ten (10) of the ratio of the pressure of the sound measured to the reference pressure, which is twenty (20) microPascals (twenty (20) microNewtons per square meter.)

"Demolition" means any dismantling, intentional destruction or removal of structures or other improvements to real property.

"Disturb" means to interrupt, interfere with, or hinder the enjoyment of peace or quiet or the normal listening activities or the sleep, rest or mental concentration of the hearer.

"Emergency" means any occurrence or set of circumstances involving actual or imminent physical trauma or significant property damage which necessitates immediate action. Economic loss alone shall not constitute an emergency. It shall be the burden of an alleged violator to prove an "emergency."

"Emergency work" means any work made necessary to restore property to a safe condition following an emergency, or to protect persons or property threatened by an imminent emergency, to the extent such work is, in fact, necessary to protect persons or property from exposure to imminent danger or damage.

"Frequency" means the number of complete oscillation cycles per unit of time.

"Impulsive sound" means sound of short duration, usually less than one second, with an abrupt onset and rapid decay. Examples of sources of impulsive sound include explosions, drop forge impacts, and discharge of firearms.

"Nighttime" means 10:01 p.m. to 7:59 a.m. the following day.

"Noise disturbance" means any sound which:

1. Disturbs a reasonable person of normal sensitivities;

2. Exceeds the sound level limits set forth in this chapter; or

3. Is plainly audible as defined in this section. Where no specific distance is set forth for the determination of audibility, references to noise disturbance shall be deemed to mean plainly audible at a distance of two hundred (200) feet from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right of way, public space or other publicly owned property.

"Person" means any person, person's firm, association, copartnership, joint venture, corporation, or any entity public or private in nature.

"Plainly audible" means that the sound or noise produced or reproduced by any particular source, can be clearly distinguished from ambient noise by a person using his/her normal hearing faculties.

"Public right-of-way" means any street, avenue, boulevard, sidewalk, bike path or alley, or similar place normally accessible to the public which is owned or controlled by a governmental entity.

"Public space" means any park, recreational or community facility, or lot which contains at least one building that is open to the general public during its hours of operation.

"Residential" means all uses of land primarily for dwelling units, as well as hospitals, schools, colleges and universities, and places of religious assembly.

"Sound" means an oscillation in pressure, particle displacement, particle velocity or other physical parameter, in a medium with internal forces that causes compression and rarefaction of that medium capable of producing an auditory impression. The description of sound may include any characteristic of such sound, including duration, intensity and frequency.

"Sound level" means the weighted sound pressure level as measured in dB(A) by a sound level meter and as specified in American National Standards Institute (ANSI) specifications for sound-level meters (ANSI Section 1.4-1971 (R1976)). If the frequency weighting employed is not indicated, the A-weighting shall apply.

"Sound level meter" means an instrument, demonstrably capable of accurately measuring sound levels as defined above.

All technical definitions not defined above shall be in accordance with applicable publications and standards of the American National Standards Institute (ANSI). (Ord. 740 § 1.2, 2007)

11.80.030 Prohibited acts.

A. General Prohibition. It is unlawful and a violation of this chapter to maintain, make, cause, or allow the making of any sound that causes a noise disturbance, as defined in Section 11.80.020.

B. Sound causing permanent hearing loss.

1. Sound level limits. Based on statistics from the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health, Table 1 and Table 1-A specify sound level limits which, if exceeded, will have a high probability of producing permanent hearing loss in anyone in the area where the sound levels are being exceeded. No sound shall be permitted within the city which exceeds the parameters set forth in Tables 11.80.030-1 and 11.80.030-1-A of this chapter:

Table 11.80.030-1

MAXIMUM CONTINUOUS SOUND LEVELS*

Duration per Day Continuous Hours	**Sound level [db(A)]**
8	90
6	92
4	95
3	97

2	100
1.5	102
1	105
0.5	110
0.25	115

* When the daily sound exposure is composed of two or more periods of sound exposure at different levels, the combined effect of all such periods shall constitute a violation of this section if the sum of the percent of allowed period of sound exposure at each level exceeds 100 percent

Table 11.80.030-1A

MAXIMUM IMPULSIVE SOUND LEVELS

Number of Repetitions per 24-Hour Period	Sound level [dB(A)]
1	145
10	135
100	125

2. Exemptions. No violation shall exist if the only persons exposed to sound levels in excess of those listed in Tables 11.80.030-1 and 11.80.030-1A are exposed as a result of:

a. Trespass;

b. Invitation upon private property by the person causing or permitting the sound; or

c. Employment by the person or a contractor of the person causing or permitting the sound.

C. Nonimpulsive Sound Decibel Limits. No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimplusive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance.

Table 11.80.030-2

MAXIMUM SOUND LEVELS (IN dB(A)) FOR SOURCE LAND USES

Residential		Commercial	
Daytime	**Nighttime**	**Daytime**	**Nighttime**
60	55	65	60

D. Specific Prohibitions. In addition to the general prohibitions set out in subsection A of this section, and unless otherwise exempted by this chapter, the following specific acts, or the causing or permitting thereof, are regulated as follows:

1. Motor Vehicles. No person shall operate or cause to be operated a public or private motor vehicle, or combination of vehicles towed by a motor vehicle, that creates a sound exceeding the sound level limits in Table 11.80.030-2 when the vehicle(s) are not otherwise subject to noise regulations provided for by the California Vehicle Code.

2. Radios, Televisions, Electronic Audio Equipment, Musical Instruments or Similar Devices from a Stationary Source. No person shall operate, play or permit the operation or playing of any radio, tape player, television, electronic audio equipment, musical instrument, sound amplifier or other mechanical or electronic sound making device that produces, reproduces or amplifies sound in such a manner as to create a noise disturbance. However, this subsection shall not apply to any use or activity exempted in subsection E of this section and any use or activity for which a special permit has been issued pursuant to Section 11.80.040.

3. Radios, Electronic Audio Equipment, or Similar Devices from a Mobile Source Such as a Motor Vehicle. Sound amplification or reproduction equipment on or in a motor vehicle is subject to regulation in accordance with the California Vehicle Code when upon the public right-of-way. When upon public space or publicly owned property other than the public right-of-way or upon private property open to the public, sound amplification or reproduction equipment shall not be operated in such a manner that it is plainly audible at a distance of fifty (50) feet in any direction from the vehicle.

4. Portable, Hand-Held Music or Sound Amplification or Reproduction Equipment. Such equipment shall not be operated on a public right-of-way, public space or other publicly owned property in such a manner as to be plainly audible at a distance of fifty (50) feet in any direction from the operator.

5. Loudspeakers and Public Address Systems.

a. Except as permitted by Section 11.80.040, no person shall operate, or permit the operation of, any loudspeaker, public address system or similar device, for any commercial purpose:

1. Which produces, reproduces or amplifies sound in such a manner as to create a noise disturbance; or

2. During nighttime hours on a public right-of-way, public space or other publicly owned property.

b. No person shall operate, or permit the operation of, any loudspeaker, public address system or similar device, for any noncommercial purpose, during nighttime hours in such a manner as to create a noise disturbance.

6. Animals. No person shall own, possess or harbor an animal or bird that howls, barks, meows, squawks, or makes other sounds that:

a. Create a noise disturbance;

b. Are of frequent or continued duration for ten (10) or more consecutive minutes and are plainly audible at a distance of fifty (50) feet from the real property line of the source of the sound; or

c. Are intermittent for a period of thirty (30) or more minutes and are plainly audible at a distance of fifty (50) feet from the real property line of the source of the sound.

7. Construction and Demolition. No person shall operate or cause the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee. This section shall not apply to the use of power tools as provided in subsection (D)(9) of this section.

8. Emergency Signaling Devices. No person shall intentionally sound or permit the sounding outdoors of any fire, burglar or civil defense alarm, siren or whistle, or similar stationary emergency signaling device, except for emergency purposes or for testing as follows:

a. Testing of a stationary emergency signaling device shall not occur between seven p.m. and seven a.m. the following day;

b. Testing of a stationary emergency signaling device shall use only the minimum cycle test time, in no case to exceed sixty (60) seconds;

c. Testing of a complete emergency signaling system, including the functioning of the signaling device and the personnel response to the signaling device, shall not occur more than once in each calendar month. Such testing shall only occur only on weekdays between seven a.m. and seven p.m. and shall be exempt from the time limit specified in subsection (D)(8)(2) of this section.

9. Power Tools. No person shall operate or permit the operation of any mechanically, electrically or gasoline motor-driven tool during nighttime hours so as to cause a noise disturbance across a residential real property boundary.

10. Pumps, Air Conditioners, Air-Handling Equipment and Other Continuously Operating Equipment. Notwithstanding the general prohibitions of subsection a of this section, no person shall operate or permit the operation of any pump, air

conditioning, air-handling or other continuously operating motorized equipment in a state of disrepair or in a manner which otherwise creates a noise disturbance distinguishable from normal operating sounds.

E. Exemptions. The following uses and activities shall be exempt from the sound level regulations except the maximum sound levels provided in Tables 11.80.030-1 and 11.80.030-1A:

1. Sounds resulting from any authorized emergency vehicle when responding to an emergency call or acting in time of an emergency.

2. Sounds resulting from emergency work as defined in Section 11.80.020

3. Any aircraft operated in conformity with, or pursuant to, federal law, federal air regulations and air traffic control instruction used pursuant to and within the duly adopted federal air regulations; and any aircraft operating under technical difficulties in any kind of distress, under emergency orders of air traffic control, or being operated pursuant to and subsequent to the declaration of an emergency under federal air regulations.

4. All sounds coming from the normal operations of interstate motor and rail carriers, to the extent that local regulation of sound levels of such vehicles has been preempted by the Noise Control Act of 1972 (42 U.S.C. § 4901 et seq.) or other applicable federal laws or regulations

5. Sounds from the operation of motor vehicles, to the extent they are regulated by the California Vehicle Code.

6. Any constitutionally protected noncommercial speech or expression conducted within or upon a any public right-of-way, public space or other publicly owned property constituting an open or a designated public forum in compliance with any applicable reasonable time, place and manner restrictions on such speech or expression or otherwise pursuant to legal authority.

7. Sounds produced at otherwise lawful and permitted city-sponsored events, organized sporting events, school assemblies, school playground activities, by permitted fireworks, and by permitted parades on public right-of-way, public space or other publicly owned property.

8. An event for which a temporary use permit or special event permit has been issued under other provisions of this code, where the provisions of Section 11.80.040 are met, the permit granted expressly grants an exemption from specific standards contained in this chapter, and the permittee and all persons under the permittee's reasonable control actually comply with all conditions of such permit. Violation of any condition of such a permit related to sound or sound equipment shall be a violation of this chapter and punishable as such.

F. Nothing in this chapter shall be construed to limit, modify or repeal any other regulation elsewhere in this code relating to the regulation of noise sources, nor shall any such other regulation be read to permit the emission of noise in violation of any provision of this chapter. (Ord. 740 § 1.2, 2007)

11.80.040 Special provisions for temporary use and special event permits.

The exemption by permit set forth in Section 11.80.030(E)(8) shall be subject to the following requirements and conditions:

A. The permit application shall include the name, address and telephone number of the permit applicant; the date, hours and location for which the permit is requested; and the nature of the event or activity. It shall also specify the types of sounds and/or sound equipment to be permitted, the proposed duration of such sound, the specific standards from which the sound is to be exempted, and the reasons for each requested exemption.

B. The permit shall be issued provided the proposed activity meets the requirements of this section and the issuing official determines that the sound to be emitted at the event as proposed would not be detrimental to the public health, safety or welfare, that the event cannot reasonably achieve its legitimate aims and purposes without the exemption and that the sound levels proposed will not unreasonably damage the peace and quiet enjoyment of the lawful users of surrounding properties, nor constitute a public nuisance.

C. The official issuing the permit may prescribe any reasonable conditions or requirements he/she deems necessary to minimize noise disturbances upon the community or the surrounding neighborhood, and/or to protect the health, safety or welfare of the public, including participants in the permitted event, including use of mufflers, screens or other sound-attenuating devices.

D. Any permit granted must be in writing and shall contain all conditions upon which the permit shall be effective.

E. No more than six events requiring a sound limit exemption may be held at any particular location upon privately owned or controlled property per calendar year, provided further that the number of events shall not exceed the number permitted under the regulations for the type of permit issued. For purposes of this subsection, "location" means a legal parcel of real property or a complete shopping or commercial center or mall sharing common parking and access even if comprised of multiple legal parcels.

F. The exemption from sound limits under such permit shall not exceed maximum period of four hours in one twenty-four (24) hour day.

G. The permit will only be granted for hours between nine a.m. and ten p.m. on all days other than Friday and Saturday; and, on Friday and Saturday, between the hours of nine a.m. and one a.m. of the following day, except in the following circumstances:

1. A permit may be granted for hours between nine a.m. on New Year's Eve and one a.m. the following day (New Year's Day).

2. A permit may be granted for hours between nine a.m. and two a.m. the following day if there are no residences, hospitals, or nursing homes within a 0.5 mile radius of the property where the function is taking place.

H. Functions for which the permits are issued shall be limited to a continuous airborne sound level not to exceed seventy (70) dB(A), as measured two hundred (200) feet from the real property boundary of the source property if on private property, or from the source if on public right of way, public space or other publicly owned property. (Ord. 740 § 1.2, 2007)

11.80.050 Measurement or assessment of sound.

A. Measurement With Sound Meter.

1. The measurement of sound shall be made with a sound level meter meeting the standards prescribed by ANSI Section 1.4-1983 (R2006). The instruments shall be maintained in calibration and good working order. A calibration check shall be made of the system at the time of any sound level measurement. Measurements recorded shall be taken so as to provide a proper representation of the source of the sound. The microphone during measurement shall be positioned so as not to create any unnatural enhancement or diminution of the measured sound. A windscreen for the microphone shall be used at all times. However, a violation of this chapter may occur without the occasion of the measurements being made as otherwise provided.

2. The slow meter response of the sound level meter shall be used in order to best determine the average amplitude.

3. The measurement shall be made at any point on the property into which the sound is being transmitted and shall be made at least three feet away from any ground, wall, floor, ceiling, roof and other plane surface.

4. In case of multiple occupancy of a property, the measurement may be made at any point inside the premises to which any complainant has right of legal private occupancy; provided that the measurement shall not be made within three feet of any ground, wall, floor, ceiling, roof or other plane surface.

5. All measurements of sound provided for in this chapter will be made by qualified officials of the city who are designated by the city manger or designee to operate the apparatus used to make the measurements.

B. Assessment Without Sound Level Meter. Any police officer, code enforcement officer, or other official designated by the city manager or designee who hears a noise or sound that is plainly audible, as defined in Section 11.80.020, in violation of this chapter, may enforce this chapter and shall assess the noise or sound according to the following standards:

1. The primary means of detection shall be by means of the official's normal hearing faculties, not artificially enhanced.

2. The official shall first attempt to have a direct line of sight and hearing to the vehicle or real property from which the sound or noise emanates so that the official can readily identify the offending source of the sound or noise and the distance involved. If the official is unable to have a direct line of sight and hearing to the vehicle or real property from which the sound or noise emanates, then the official shall confirm the source of the sound or noise by approaching the suspected vehicle or real property until the official is able to obtain a direct line of sight and hearing, and confirm the source of the sound or noise that was heard at the place of the original assessment of the sound or noise.

3. The official need not be required to identify song titles, artists, or lyrics in order to establish a violation. (Ord. 740 § 1.2, 2007)

11.80.060 Violation.

A. Violation of Sound Level Limits. Any person violating any of the provisions of this chapter shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punishable by a fine not to exceed one thousand dollars ($1,000.00) and/or six months in the county jail, or both. Notwithstanding the foregoing, any violation of the provisions of this chapter may, in the discretion of the citing officer or the city attorney, be cited and/or prosecuted as an infraction or be subject to civil citation pursuant to Chapter 1.10.

B. Joint and Several Responsibility. In addition to the person causing the offending sound, the owner, tenant or lessee of property, or a manager, overseer or agent, or any other person lawfully entitled to possess the property from which the offending sound is emitted at the time the offending sound is emitted, shall be responsible for compliance with this chapter if the additionally responsible party knows or should have known of the offending noise disturbance. It shall not be a lawful defense to assert that some other person caused the sound. The lawful possessor or operator of the premises shall be responsible for operating or maintaining the premises in compliance with this chapter and may be cited regardless of whether or not the person actually causing the sound is also cited.

C. Violation May be Declared a Public Nuisance. The operation or maintenance of any device, equipment, instrument, vehicle or machinery in violation of any provisions of this chapter which endangers the public health, safety and quality of life of residents in the area is declared to be a public nuisance, and may be subject to abatement summarily or by a restraining order or injunction issued

by a court of competent jurisdiction. (Ord. 824 § 1.2, 2011; Ord. 740 § 1.2, 2007)

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing Without Project
Road Name: Alessandro Bl.
Road Segment: n/o Trautwein Rd.
Project Name: K4 Parcel
Job Number: 11743

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	81,372 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	8,137 vehicles
Vehicle Speed:	50 mph
Near/Far Lane Distance:	48 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	55.0 feet
Centerline Dist. to Observer:	55.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	69.1%	10.6%	20.2%	92.30%
Medium Trucks:	70.5%	7.7%	21.8%	3.22%
Heavy Trucks:	59.9%	10.3%	29.9%	4.48%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.004	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	49.739
Medium Trucks:	49.561
Heavy Trucks:	49.578

TABLE OF CONTENTS

TABLE OF CONTENTS ..... **III**
APPENDICES ..... **V**
LIST OF EXHIBITS ..... **VII**
LIST OF TABLES ..... **IX**
LIST OF ABBREVIATED TERMS ..... **XI**
1 INTRODUCTION **1**
1.1 Project Description 1
1.2 Analysis Scenarios 3
1.3 Study Area 5
1.4 Summary of Findings 6
1.5 Local and Regional Funding Mechanisms 16
1.6 Site Adjacent Roadway and Site Access Improvements 17
1.7 Truck Access and Circulation 24
1.8 Parking Evaluation 24
2 METHODOLOGIES **27**
2.1 Level of Service 27
2.2 Intersection Capacity Analysis 27
2.3 Freeway Off-Ramp Queuing Analysis 29
2.4 Traffic Signal Warrant Analysis Methodology 29
2.5 Freeway Mainline Segment Analysis Methodology 30
2.6 Freeway Merge/Diverge Ramp Junction Analysis 31
2.7 Minimum Level of Service (LOS) 32
2.8 Thresholds of Significance 34
2.9 Project Fair Share Calculation Methodology 36
2.10 SB 743 Requirements 36
3 AREA CONDITIONS **37**
3.1 Existing Circulation Network 37
3.2 General Plan Circulation Element 37
3.3 Truck Routes 43
3.4 Transit Service 43
3.5 Bicycle & Pedestrian Facilities 43
3.6 Existing (2018) Traffic Counts 53
3.7 Existing (2018) Conditions Intersection Operations Analysis 56
3.8 Existing (2018) Conditions Traffic Signal Warrants Analysis 56
3.9 Existing (2018) Conditions Off-Ramp Queuing Analysis 56
3.10 Existing (2018) Conditions Basic Freeway Segment Analysis 60
3.11 Existing (2018) Conditions Freeway Merge/Diverge Analysis 60
4 PROJECTED FUTURE TRAFFIC **65**
4.1 Project Trip Generation 65
4.2 Project Trip Distribution 68
4.3 Modal Split 68
4.4 Project Trip Assignment 68
4.5 Construction Traffic 68
4.6 Background Traffic 72

4.7 Cumulative Development Traffic 73
4.8 Near-Term Traffic Forecasts 81
4.9 Horizon Year (2040) Volume Development 81
5 E+P TRAFFIC CONDITIONS 83
5.1 Roadway Improvements 83
5.2 Traffic Volume Forecasts 83
5.3 Intersection Operations Analysis 83
5.4 Traffic Signal Warrants Analysis 88

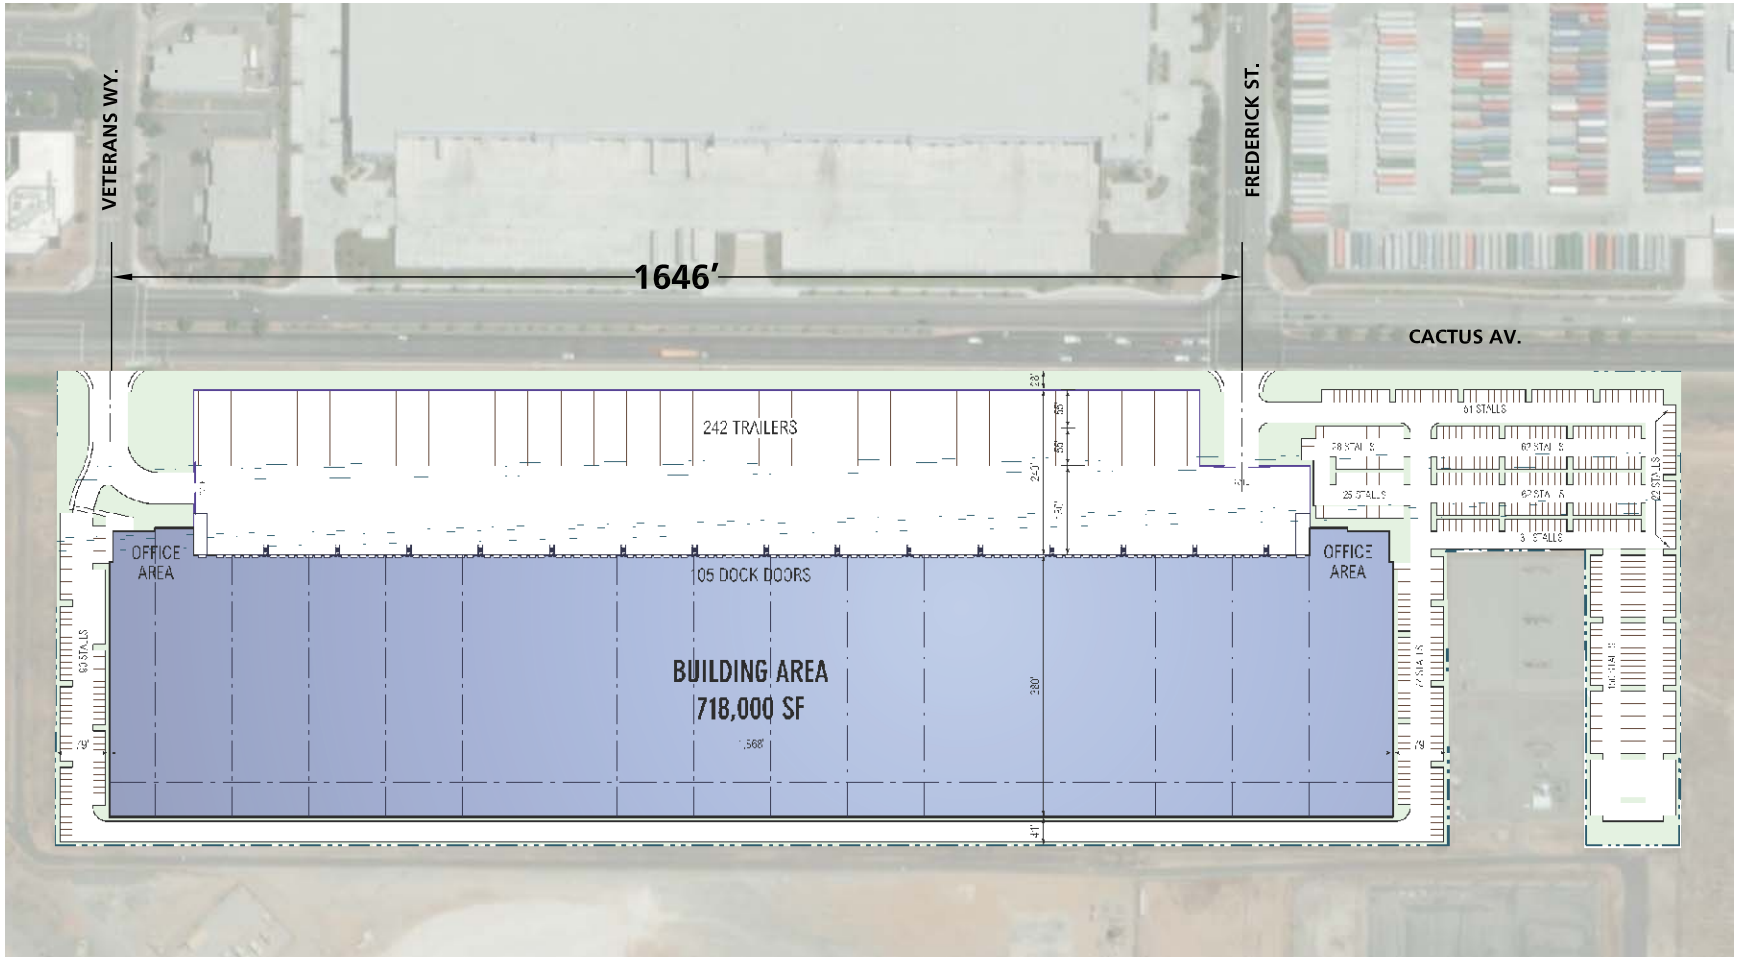
1 INTRODUCTION

This report presents the results of the traffic impact analysis (TIA) prepared for the proposed K4 Parcel ("Project"), which is located on the south side of Cactus Avenue between Veterans Way and Frederick Street, within the jurisdiction of the March Joint Powers Authority (March JPA) as shown on Exhibit 1-1.

The purpose of this traffic impact analysis is to evaluate the potential circulation system deficiencies that could result from the development of the proposed Project, and if necessary to recommend mitigation to achieve acceptable circulation system performance. As directed by March JPA staff, this traffic study has been prepared in accordance with the March JPA *Final Traffic Impact Study Preparation Guide* (August 3, 2011), the California Department of Transportation (Caltrans) *Guide for the Preparation of Traffic Impact Studies* (December 2002), and consultation with March JPA and City of Moreno Valley staff during the scoping process. (1) (2) The approved Project Traffic Study Scoping agreement is provided in Appendix 1.1 of this TIA.



1.1 PROJECT DESCRIPTION

The proposed Project involves the development of the approximately 35.4-acre site with a 718,000 square foot High-Cube Warehouse building (see Exhibit 1-1). A total of 598 automobile parking stalls and 242 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. Once constructed, the Project site would be used up to 7 days per week and 24 hours per day.

Additionally, the Project would include improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. The current drainage ditch is planned to be undergrounded in a box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). This portion of the Project is being discussed with Riverside County Flood Control and Water Conservation District and the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan.

The High-Cube Fulfillment Center Warehouse use has been analyzed in the TIA as it represents the worst-case scenario in terms of traffic generation. Similar land uses such as High-Cube Transload and Short-Term Storage Warehouse would generate fewer trips with the same square footage.

EXHIBIT 1-1: PRELIMINARY SITE PLAN

Trips generated by the Project's proposed land uses have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, 10th Edition, 2017. (3) The Project is estimated to generate a net total of 5,873 trip-ends per day (in actual vehicles) with 425 AM peak hour trips and 983 PM peak hour trips. The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in Section 4.1 *Project Trip Generation* of this report.

The ITE Trip Generation Manual (2017) trip generation rates for high-cube fulfillment center use (ITE land use code 155) are based on limited data (i.e., one to two surveyed sites) and the ITE Trip Generation Manual recommends the use of local data sources where available. As such, Project trip generation has been calculated based on the trip-generation statistics published in the TUMF High-Cube Warehouse Trip Generation Study (WSP, January 29, 2019) which was commissioned by Western Riverside Council of Governments (WRCOG) in support of the Transportation Uniform Mitigation Fee (TUMF) update WRCOG TUMF High-Cube Warehouse Trip Generation Study). The WRCOG trip generation rates are based on data collected at 11 local high-cube fulfillment center sites in Riverside and San Bernardino Counties. This is the exact type of local data source that the ITE Manual recommends be used. The WRCOG TUMF High-Cube Warehouse Trip Generation Study was not adopted by WRCOG when the data for this report was prepared but going forward it will be the more appropriate rate to use to study warehouse uses in the region. As shown in Table 4-3, using the ITE land use code 155 generates far more trips than using the WRCOG rates. The WRCOG data is far more accurate for estimating the number of trips that the proposed Project will generate. The proposed Project's impacts were conservatively analyzed using the ITE land use code 155 which vastly overstates the proposed project's contribution to traffic, as well as impacts from traffic such as air quality, noise, greenhouse gas, and health risks.

1.2 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential impacts to traffic and circulation have been assessed for each of the following conditions:

- Existing (2018)
- Existing plus Project (E+P)
- Opening Year Cumulative (2023) Without Project
- Opening Year Cumulative (2023) With Project
- Horizon Year (2040) Without Project
- Horizon Year (2040) With Project

1.2.1 EXISTING (2018) CONDITIONS

Information for Existing (2018) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared.

1.2.2 EXISTING PLUS PROJECT CONDITIONS

Consistent with the March JPA traffic study guidelines, the Existing Plus Project (E+P) analysis determines circulation system deficiencies that would occur on the existing roadway system in the scenario of the Project being placed upon Existing conditions. The E+P analysis is intended to identify the project-specific traffic impacts associated solely with the development of the proposed Project based on a comparison of the E+P traffic conditions to Existing conditions. As such, E+P traffic conditions were evaluated for each phase of development to determine the project-specific traffic impacts associated with each phase.

1.2.3 OPENING YEAR CUMULATIVE CONDITIONS

To account for growth in traffic between Existing Conditions (2018) and the Project Opening Year Cumulative (2023)[1], a compounded annual traffic growth rate of 2.0 percent was assumed (10.41 percent aggregate growth in background traffic for the period from 2018 through 2023). The 2.0 percent annual growth rate is intended to capture non-specific ambient traffic growth. Conservatively, the TIA estimates area-wide traffic growth, then adds traffic generated by other known or probable related projects. These related projects are at least in part already accounted for in the assumed annual 2.0 percent ambient growth in traffic noted above; and in some instances, these related projects would likely not be implemented and operational within the 2023 Opening Year Cumulative time frame assumed for the Project. The resulting traffic growth rate used in the TIA (2.0 percent compounded annual ambient growth plus traffic generated by related projects) would therefore tend to overstate rather than understate background cumulative traffic impacts under 2023 traffic conditions.

1.2.4 HORIZON YEAR (2040) CONDITIONS

The Horizon Year (2040) Without Project traffic conditions were derived from the Riverside County Transportation Analysis Model (RivTAM) using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between Existing conditions and Horizon Year conditions. The Horizon Year With Project traffic forecasts were determined by adding the Project traffic to the Horizon Year Without Project traffic forecasts from the RivTAM model. The Horizon Year traffic forecasts used in the traffic analysis were refined with existing peak hour traffic count data collected at intersection analysis locations. The initial estimate of the future peak hour turning movements have, therefore, been reviewed for reasonableness. The reasonableness checks performed include a review of traffic flow conservation in addition to a comparison with the Existing and Opening Year Cumulative traffic volumes. Where necessary, the Horizon Year volumes have been adjusted to achieve flow conservation, reasonable growth, and reasonable diversion between parallel routes.

The Horizon Year Without and With Project traffic conditions analyses will be utilized to determine if improvements funded through regional transportation mitigation fee programs, such as the Transportation Uniform Mitigation Fee (TUMF) and Development Impact Fee (DIF) programs, or

[1] The opening year for the project is 2020. However, 2023 is used as the opening year for the purposes of traffic analysis as per City of Moreno Valley's policy of minimum 5 years of growth as stated in the Traffic Impact Analysis Preparation Guide (August 2007) Exhibit B Section V.

other approved funding mechanism can accommodate the long-range cumulative traffic at the target Level of Service (LOS) identified in the March JPA General Plan. (4) If the "funded" improvements can provide the target LOS, then the Project's payment into TUMF and/or DIF will be considered as long-range cumulative mitigation through the conditions of approval. Other improvements needed beyond the "funded" improvements (such as localized improvements to non-TUMF facilities) are identified as such. Post-processing worksheets for Horizon Year (2040) Without Project traffic conditions are provided in Appendix 4.1.

1.3 STUDY AREA

To ensure that this TIA satisfies the March JPA's traffic study requirements, Urban Crossroads, Inc. prepared a project traffic study scoping package for review by March JPA staff and their traffic consultant prior to the preparation of this report. The Agreement provides an outline of the Project study area, trip generation, trip distribution, and analysis methodology. The Agreement approved by the March JPA is included in Appendix 1.1.

1.3.1 INTERSECTIONS

The following 25 study area intersections listed in Table 1-1 and shown on Exhibit 1-2 were selected for this TIA based on consultation with March JPA and City of Moreno Valley staff.

The study area was determined based on consultation with March JPA and City of Moreno Valley staff. In general, the study area includes intersections where the Project is anticipated to contribute 50 or more peak hour trips.

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

1.3.2 FREEWAY MAINLINE SEGMENTS

The study area freeway mainline analysis locations include the following freeway segments for each direction of flow as shown on Table 1-2:

TABLE 1-2: FREEWAY MAINLINE SEGMENT ANALYSIS LOCATIONS

ID	Freeway Mainline Segments
1	I-215 Freeway – Southbound, North of Cactus Av.
2	I-215 Freeway – Southbound, South of Cactus Av.
3	I-215 Freeway – Northbound, North of Cactus Av.
4	I-215 Freeway – Northbound, South of Cactus Av.

The analysis performed for the basic freeway segments utilizes actual vehicles, where heavy trucks are accounted for as a percentage of total traffic. (2)

1.3.3 FREEWAY MERGE/DIVERGE RAMP JUNCTIONS

The study area freeway merge/diverge ramp junction analysis locations include the following freeway ramp junctions for each direction of flow as shown on Table 1-3:

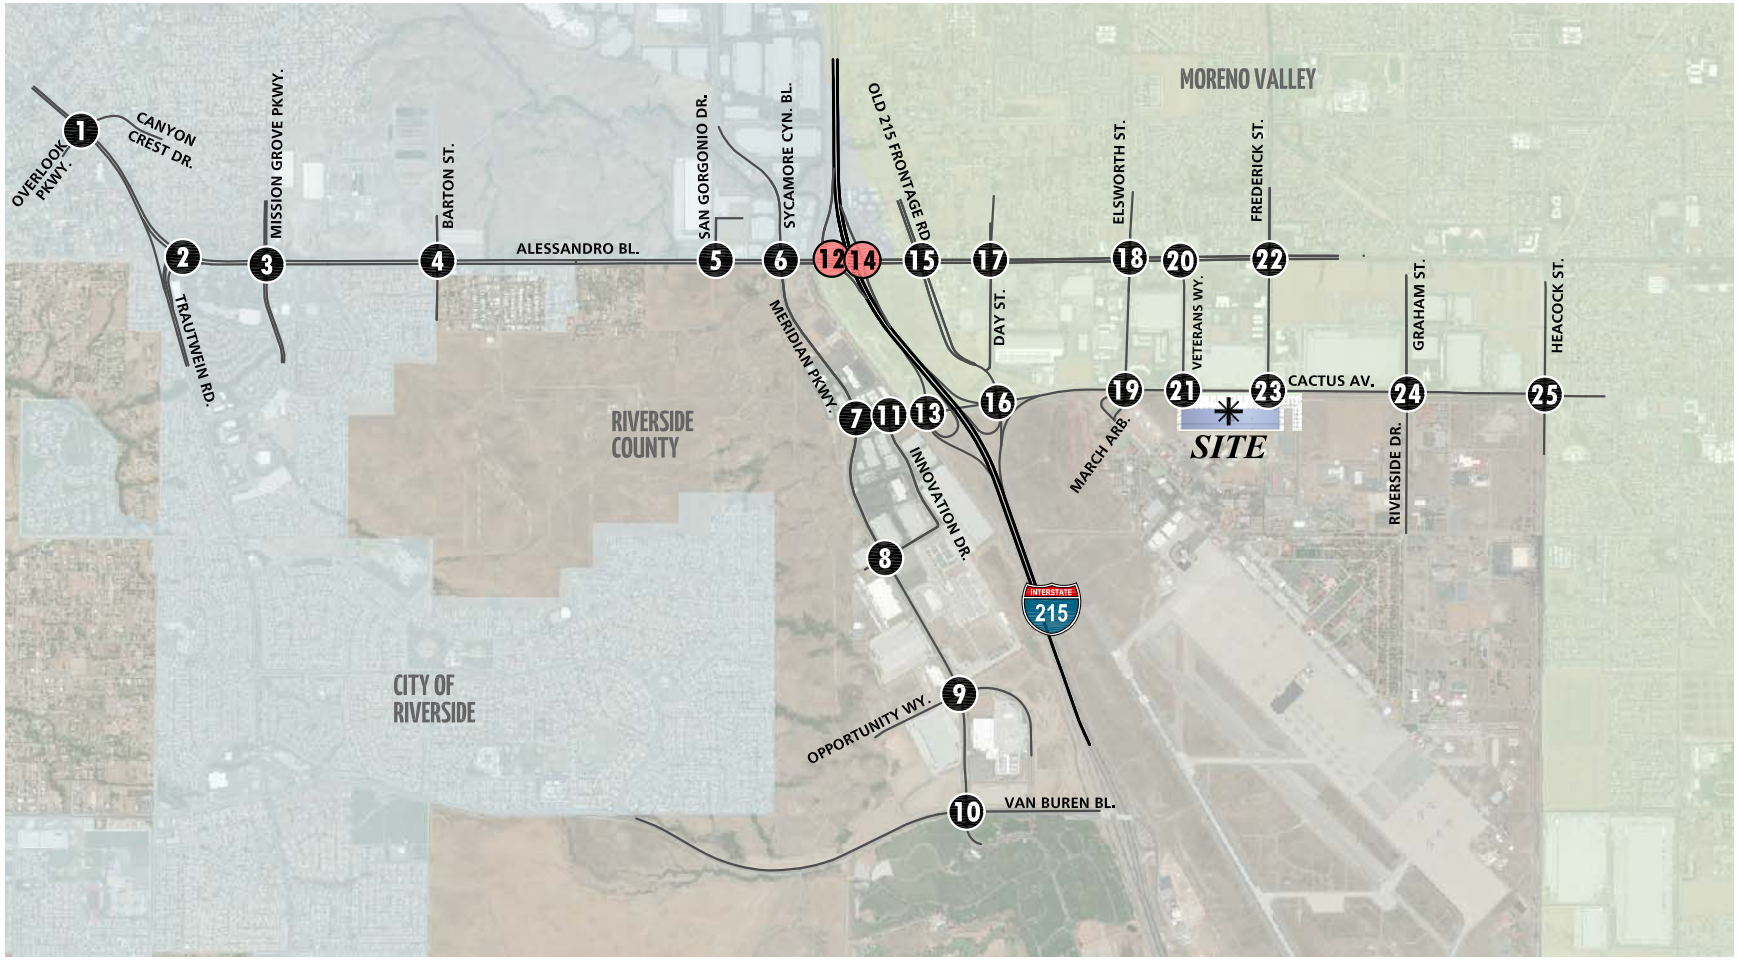

TABLE 1-3: FREEWAY MERGE/DIVERGE RAMP JUNCTION ANALYSIS LOCATIONS

ID	Freeway Merge/Diverge Ramp Junctions
1	I-215 Freeway – Southbound, Off-Ramp at Cactus Av. (Diverge)
2	I-215 Freeway – Southbound, Loop Off-Ramp at Cactus Av. (Diverge)
3	I-215 Freeway – Southbound, On-Ramp at Cactus Av. (Merge)
4	I-215 Freeway – Northbound, On-Ramp at Cactus Av. (Merge)
5	I-215 Freeway – Northbound, Loop On-Ramp at Cactus Av. (Merge)
6	I-215 Freeway – Northbound, Off-Ramp at Cactus Av. (Diverge)

1.4 SUMMARY OF FINDINGS

This section provides a summary of the analysis results for Existing (2018), E+P, Opening Year Cumulative (2023), and Horizon Year (2040) traffic conditions.

LEGEND:

- AM PEAK HOUR
- PM PEAK HOUR
- LOS A-D
- LOS E
- LOS F

1.4.1 EXISTING (2018) CONDITIONS

Intersection Operations Analysis

A summary of LOS results for Existing traffic conditions are presented in Exhibit 1-3. As shown, a total of 4 intersections within the study area are currently operating at a deficient LOS.

Off-Ramp Queuing Analysis

A queuing analysis was performed for the I-215 Freeway off-ramps at Cactus Avenue for Existing (2018) traffic conditions. The analysis indicates there are currently no queuing issues that may potentially "spill back" onto the I-215 Freeway mainline at the I-215 Cactus Avenue interchange.

Freeway Facilities

There are no freeway segments or merge and diverge ramp junction areas that are currently operating at an unacceptable LOS under Existing (2018) traffic conditions based on reported traffic levels and lane geometry. However, observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks. As such, the following freeway segments have been identified as operating at unacceptable LOS under Existing (2018) traffic conditions during the peak hours:

- I-215 Freeway – Southbound, North of Cactus Avenue (#1) – LOS F PM peak hour only
- I-215 Freeway – Southbound, South of Cactus Avenue (#2) – LOS F PM peak hour only
- I-215 Freeway – Northbound, North of Cactus Avenue (#3) – LOS F AM and PM peak hours
- I-215 Freeway – Northbound, South of Cactus Avenue (#4) – LOS F AM and PM peak hours

The following merge and diverge ramp junction areas are identified as operating at an unacceptable LOS under Existing (2018) traffic conditions:

- I-215 Freeway – Southbound, Off-Ramp at Cactus Avenue (#1) – LOS F PM peak hour only
- I-215 Freeway – Southbound, Loop Off-Ramp at Cactus Avenue (#2) – LOS F PM peak hour only
- I-215 Freeway – Southbound, On-Ramp at Cactus Avenue (#3) – LOS F PM peak hour only
- I-215 Freeway – Northbound, On-Ramp at Cactus Avenue (#4) – LOS F AM and PM peak hours
- I-215 Freeway – Northbound, Loop On-Ramp at Cactus Avenue (#5) – LOS F AM and PM peak hours
- I-215 Freeway – Northbound, Off-Ramp at Cactus Avenue (#6) – LOS F AM and PM peak hours

1.4.2 E+P CONDITIONS

Intersection Operations Analysis

The addition of Project traffic is not anticipated to result in any new LOS deficiencies under E+P traffic conditions (see Exhibit 1-3).

Off-Ramp Queuing Analysis

A queuing analysis was performed for the I-215 Freeway off-ramps at Cactus Avenue for E+P traffic conditions. The analysis indicates there are no additional queuing issues that may potentially "spill back" onto the I-215 Freeway mainline at the I-215 Cactus Avenue interchange under E+P traffic conditions.

Freeway Facilities

There are no additional freeway segments or merge and diverge ramp junction areas that are anticipated to operate at an unacceptable LOS under E+P traffic conditions in addition to the locations previously identified under Existing (2018) traffic conditions.

Impacts and Mitigation Measures

Based on the applicable jurisdiction's significance criteria, the following study area intersection was found to be significantly impacted by the Project for E+P traffic conditions:

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1)
- Elsworth St. & Cactus Av. (#19)

The following improvements are recommended to improve each impacted intersection's LOS back to pre-project conditions, or better:

Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 1.1 – Elsworth Street & Cactus Avenue (#19)

- Contribute fair share towards the modification of the traffic signal to implement protected left turn phasing on the northbound and southbound approaches and restriping of the northbound shared left-through-right turn lane and southbound shared left-through lane.

Mitigation Measure 13.1 – Traffic Signal Synchronization

- Provide traffic signal synchronization for the signalized intersections on Cactus Avenue in the vicinity of the Project to improve the peak period traffic flow along the corridor.

The locations where only a fair share contribution has been identified would remain a significant impact until such time the recommended improvement is implemented. Because the March JPA does not have plenary control over intersections under other jurisdictions, the March JPA cannot guarantee that such improvements will be constructed. As such, the impacts are considered significant and unavoidable.

Freeway Facilities

At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the March JPA (or other neighboring jurisdictions) on SHS roadway segments. The WRCOG TUMF Program identifies this interchange, inclusive of on/off-ramps as a transportation mitigation project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along the I-215 Freeway. As such, no improvements have been recommended, and the impact to the freeway facility is significant and unavoidable.

1.4.3 OPENING YEAR CUMULATIVE (2023) CONDITIONS

Intersection Operations

As shown on Exhibit 1-3, there are 9 study area intersections that are anticipated to operate at an unacceptable LOS under Opening Year Cumulative (2023) Without Project traffic conditions during one or both peak hours. With the addition of Project traffic, there are no additional study area intersections anticipated to operate at a deficient LOS.

Off-Ramp Queuing Analysis

A queuing analysis was performed for the I-215 Freeway off-ramps at Cactus Avenue for Opening Year Cumulative (2023) traffic conditions. The analysis indicates there are no additional queuing issues that may potentially "spill back" onto the I-215 Freeway mainline at the I-215 Cactus Avenue interchange under Opening Year Cumulative (2023) traffic conditions.

Freeway Facilities

There are no additional freeway segments or merge and diverge ramp junction areas that are anticipated to operate at an unacceptable LOS under Opening Year Cumulative (2023) Without and With Project traffic conditions in addition to the locations previously identified under Existing (2018) traffic conditions.

Impacts and Mitigation Measures

Cumulative traffic impacts are deficiencies that are not directly caused by the Project, but occur as a result of regional growth combined with that or other nearby cumulative development projects or if the project is anticipated to contribute traffic to a deficient intersection under pre-project conditions. The Project's contribution to a particular cumulative transportation deficiency is deemed cumulatively considerable if the Project adds significant traffic to the forecasted deficiency.

Based on the applicable jurisdiction's significance criteria, the following study area intersections were found to be significantly impacted by the Project for Opening Year Cumulative (2023) traffic conditions:

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1)
- Sycamore Canyon Bl. & Alessandro Bl. (#6)

- Old 215 Frontage Rd./I-215 NB Ramps & Cactus Av. (#16)
- Elsworth St. & Cactus Av. (#19)
- Heacock St. & Cactus Av. (#25)

In conjunction with Mitigation Measure 1.1 identified previously for E+P traffic conditions, the following additional improvements are recommended to improve the impacted intersection's LOS back to pre-project conditions, or better:

Mitigation Measure 2.1 – Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- Contribute fair share towards the restriping of the SB shared left-through lane as a 3rd left turn lane and the SB right turn lane as a shared through-right turn lane, and the modification of the traffic signal to implement protected left turn phasing on the northbound and southbound approaches.

Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Sycamore Canyon Boulevard & Alessandro Boulevard (#6)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 3.1 – Old 215 Frontage Road/I-215 Northbound Ramps & Cactus Avenue (#16)

- Contribute fair share towards the modification of the traffic signal to implement protected left turn phasing on the northbound, southbound, and eastbound approaches, a 2nd northbound left turn lane, a 3rd westbound through lane, and a westbound right turn lane.

Mitigation Measure 4.1 – Heacock Street & Cactus Avenue (#25)

- Contribute fair share towards a 3rd eastbound through lane and a 3rd westbound through lane.

The locations where only a fair share contribution has been identified would remain a significant impact until such time the recommended improvement is implemented. Because the March JPA does not have plenary control over intersections under other jurisdictions, the March JPA cannot guarantee that such improvements will be constructed. As such, the impacts are considered significant and unavoidable.

Off-Ramp Queuing Analysis

With the proposed intersection improvements at Old 215 Frontage Road/I-215 Northbound Ramps & Cactus Avenue, the analysis indicates there are no queuing issues anticipated that may potentially "spill back" onto the I-215 Freeway mainline during the peak hours for Opening Year Cumulative (2023) With Project traffic conditions.

Freeway Facilities

At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the March JPA (or other neighboring jurisdictions) on SHS roadway segments. The WRCOG TUMF Program identifies this interchange, inclusive of on/off-ramps as a transportation mitigation project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along the I-215 Freeway. As such, no improvements have been recommended, and the impact to the freeway facility is significant and unavoidable.

1.4.4 HORIZON YEAR (2040) CONDITIONS

Intersection Operations

As shown on Exhibit 1-3, there are 17 study area intersections that are anticipated to operate at an unacceptable LOS under Horizon Year (2040) traffic conditions during one or both peak hours. With the addition of Project traffic, there are no additional study area intersections anticipated to operate at a deficient LOS.

Off-Ramp Queuing Analysis

A queuing analysis was performed for the I-215 Freeway off-ramps at Cactus Avenue for Horizon Year (2040) traffic conditions. The analysis indicates there are no additional queuing issues that may potentially "spill back" onto the I-215 Freeway mainline at the I-215 Cactus Avenue interchange under Horizon Year (2040) traffic conditions.

Freeway Facilities

There are no additional freeway segments or merge and diverge ramp junction areas that are anticipated to operate at an unacceptable LOS under Horizon Year (2040) Without and With Project traffic conditions in addition to the locations previously identified under Existing (2018) traffic conditions.

Impacts and Mitigation Measures

Cumulative traffic impacts are deficiencies that are not directly caused by the Project, but occur as a result of regional growth combined with that or other nearby cumulative development projects or if the project is anticipated to contribute traffic to a deficient intersection under pre-project conditions. The Project's contribution to a particular cumulative transportation deficiency is deemed cumulatively considerable if the Project adds significant traffic to the forecasted deficiency.

Based on the applicable jurisdiction's significance criteria, the following study area intersections were found to be significantly impacted by the Project for Horizon Year (2040) traffic conditions:

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1)
- Sycamore Canyon Bl. & Alessandro Bl. (#6)
- I-215 Southbound Ramps & Cactus Av. (#13)
- I-215 NB Ramps & Alessandro Bl. (#14)
- Old 215 Frontage Rd. & Alessandro Bl. (#15)
- Old 215 Frontage Rd./I-215 Northbound Ramps & Cactus Av. (#16)
- Day St. & Alessandro Bl. (#17)
- Elsworth St. & Alessandro Bl. (#18)
- Elsworth St. & Cactus Av. (#19)
- Frederick St. & Alessandro Bl. (#22)
- Graham St./Riverside Dr. & Cactus Av. (#24)
- Heacock St. & Cactus Av. (#25)

In conjunction with Mitigation Measures 1.1 through 4.1 identified previously for E+P and Opening Year Cumulative (2023) traffic conditions, the following additional improvements are recommended to improve the impacted intersection's LOS back to pre-project conditions, or better:

Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 5.1 – Sycamore Canyon Boulevard & Alessandro Boulevard (#6)

- Contribute fair share towards a 2nd northbound left turn lane and the modification of the traffic signal to implement protected left turn phasing on the southbound, eastbound, and westbound approaches.

Sycamore Canyon Boulevard & Alessandro Boulevard (#6)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 6.1 – I-215 Southbound Ramps & Cactus Avenue (#13)

- Contribute fair share towards a 3rd eastbound through lane, a 2nd westbound left turn lane, and a 3rd westbound through lane.

Mitigation Measure 7.1 – I-215 NB Ramps & Alessandro Boulevard (#14)

- Contribute fair share towards a 2nd northbound left turn lane.

Mitigation Measure 8.1 – Old 215 Frontage Road & Alessandro Boulevard (#15)

- Contribute fair share towards a 3rd eastbound through lane and a 3rd westbound through lane.

Mitigation Measure 3.2 – Old 215 Frontage Road/I-215 Northbound Ramps & Cactus Avenue (#16)

- Contribute fair share towards the modification of the traffic signal to implement protected left turn phasing on the southbound approaches, a 2nd northbound through lane, 2 southbound right turn lanes, a 2nd eastbound left turn lane, a 3rd eastbound through lane, an eastbound right turn lane, and a 4th westbound through lane.

Mitigation Measure 9.1 – Frederick Street & Alessandro Boulevard (#17)

- Contribute fair share towards a 3rd westbound through lane.

Mitigation Measure 10.1 – Elsworth Street & Alessandro Boulevard (#18)

- Contribute fair share towards a 2nd northbound left turn lane.

Mitigation Measure 1.2 – Elsworth Street & Cactus Avenue (#19)

- Contribute fair share towards a 2nd northbound left turn lane, a 4th eastbound through lane, and a 4th westbound through lane.

Mitigation Measure 11.1 – Frederick Street & Alessandro Boulevard (#22)

- Contribute fair share towards a 3rd eastbound through lane.

Mitigation Measure 12.1 – Graham Street/Riverside Drive & Cactus Avenue (#24)

- Contribute fair share towards a 2nd eastbound left turn lane.

Mitigation Measure 4.2 – Heacock Street & Cactus Avenue (#25)

- Contribute fair share towards a 3rd eastbound through lane and a 3rd westbound through lane.

The locations where only a fair share contribution has been identified would remain a significant impact until such time the recommended improvement is implemented. Because the March JPA does not have plenary control over intersections under other jurisdictions, the March JPA cannot guarantee that such improvements will be constructed. As such the impacts are considered significant and unavoidable.

Off-Ramp Queuing Analysis

With the proposed intersection improvements at Old 215 Frontage Road/I-215 Northbound Ramps & Cactus Avenue, the analysis indicates there are no queuing issues anticipated that may

potentially "spill back" onto the I-215 Freeway mainline during the peak hours for Horizon Year (2040) With Project traffic conditions.

Freeway Operations Analyses

The Project Study Report/Project Development Support in Riverside County on I-215 and SR-60 between Nuevo Road (I-215) & I-215/SR-60 Junction and Box Springs Road (I-215) & Day Street (SR-60) (prepared by Caltrans in April 2008), also known as the I-215 North Project, includes the construction of an HOV lane in each direction of the I-215 Freeway between Nuevo Road and Box Springs Road within the existing median. (5) According to the Riverside County Transportation Commission (RCTC) and Caltrans websites, the I-215 North Project is a longer term project, as priority has been given to the southern and central projects along the I-215 corridor.

The following freeway segments are anticipated to continue to operate at an unacceptable LOS with the addition of the planned freeway improvements under Horizon Year (2040) traffic conditions during the peak hours:

- I-215 Freeway – Northbound, South of Cactus Avenue (#4) – LOS E AM peak hour only

The following merge and diverge ramp junction areas are anticipated to continue to operate at an unacceptable LOS under Horizon Year (2040) traffic conditions:

- I-215 Freeway – Southbound, On-Ramp at Cactus Avenue (#3) – LOS F PM peak hour only
- I-215 Freeway – Northbound, Loop On-Ramp at Cactus Avenue (#5) – LOS F PM peak hour only
- I-215 Freeway – Northbound, Off-Ramp at Cactus Avenue (#6) – LOS F AM and PM peak hours

The Project is anticipated to have a cumulatively considerable impact to the identified freeway mainline segments and merge/diverge ramp junctions, however, no mitigation measures have been identified as no other improvements beyond those planned by the I-215 North Project have been evaluated. Neither Caltrans or the State have adopted a fee program that can ensure that locally-contributed impact fees will be tied to improvements to freeway mainlines, and only Caltrans has the jurisdiction over mainline improvements. Because Caltrans has exclusive control over state highway improvements, ensuring that fair share contributions to mainline improvements are actually part of a program tied to implementation is within the jurisdiction of Caltrans. As such, the impacts are considered significant and unavoidable.

1.5 LOCAL AND REGIONAL FUNDING MECHANISMS

Transportation improvements within the March JPA are funded through a combination of direct Project mitigation, TUMF fees, or fair share contributions. Identification and timing of needed improvements is generally determined through local jurisdictions based upon a variety of factors.

1.5.1 TRANSPORTATION UNIFORM MITIGATION FEE (TUMF) PROGRAM

In 2002, the TUMF program was initiated in Western Riverside County. March JPA participates in the TUMF program. Under the TUMF, developers of residential, industrial and commercial property are required to pay a development fee to fund regional transportation projects, which mitigates cumulative impacts to the intersections included in the TUMF program. The TUMF funds both local and regional arterial projects. The applicant shall participate in the funding of off-site improvements, including traffic signals that are needed to serve cumulative traffic conditions through the payment of required Western Riverside County TUMF and other applicable fair share contributions, as directed by the March JPA. These fees are collected as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected vehicle trip increases.

The TUMF program is administered by WRCOG based upon a regional Nexus Study completed in early 2003 and updated in 2016 to address major changes in right of way acquisition and improvement cost factors. TUMF identifies a network of backbone and local roadways that are needed to accommodate growth through 2040. This regional program was put into place to ensure that development pays its fair share and that funding is in place for construction of facilities needed to maintain the requisite level of service and critical to mobility in the region.

As shown in Table 1-4, a few of the facilities anticipated to be cumulatively impacted by the Project are planned for improvements through the TUMF Program. The Project Applicant will be subject to the TUMF fee program, and will pay the requisite TUMF fees at the rates then in effect. The Project Applicant's payment of the requisite TUMF fees at the rates then in effect pursuant to the TUMF Program will mitigate its impacts to TUMF-funded facilities.

1.5.2 FAIR SHARE CONTRIBUTION

The Project's mitigation will include fee payments to TUMF and construction of specific improvements to facilitate site access. Improvements constructed by development may be eligible for a fee credit or reimbursement through the program where appropriate (to be determined at the March JPA's discretion). In the event a particular facility is not included in a pre-existing fee program, fair share calculations have been provided on Table 1-5.

1.6 SITE ADJACENT ROADWAY AND SITE ACCESS IMPROVEMENTS

This section summarizes Project site access and on-site circulation recommendations. Vehicular and truck traffic access will be provided via the following driveways:

- Veteran's Way/Driveway 1 & Cactus Avenue – Full access driveway (both passenger cars and trucks)
- Frederick Street/Driveway 2 & Cactus Avenue – Full access driveway (both passenger cars and trucks)

Regional access to the Project site is provided via the I-215 Freeway at Alessandro Boulevard and Cactus Avenue interchanges.

1.6.1 SITE ADJACENT ROADWAY IMPROVEMENTS

Since Cactus Avenue is built out to its ultimate cross-section, according to the March JPA and City of Moreno Valley General Plans, there are no roadway widening recommendations. However, additional curb, gutter, and sidewalk improvements are recommended, as needed for site access along the Project's frontage consistent with March JPA standards.

1.6.2 SITE ACCESS IMPROVEMENTS

The recommended site access driveway improvements for the Project are described below. Exhibit 1-4 illustrates the on-site and site adjacent recommended roadway lane improvements. Construction of on-site and site adjacent improvements are recommended to occur in conjunction with adjacent Project development activity or as needed for Project access purposes.

Veteran's Way/Driveway 1 & Cactus Avenue (#21) – Modify the traffic signal to include the fourth leg and construct the intersection with the following geometrics:

Northbound Approach: One left turn lane and one shared through-right turn lane.

Southbound Approach: One left turn lane, one through lane, and one right turn lane.

Eastbound Approach: One left turn lane, two through lanes, and one shared through-right turn lane.

Westbound Approach: One left turn lane, three through lanes, and one right turn lane.

Frederick Street/Driveway 2 & Cactus Avenue (#23) – Modify the traffic signal to include the fourth leg and construct the intersection with the following geometrics:

Northbound Approach: One left turn lane, one through lane, and one right turn lane.

Southbound Approach: Two left turn lanes and one shared through right turn lane.

Eastbound Approach: One left turn lane, two through lanes, and one shared through-right turn lane.

Westbound Approach: One left turn lane, three through lanes, and one right turn lane.

1.6.3 QUEUING ANALYSIS AT THE PROJECT DRIVEWAYS

A queuing analysis was conducted for the Project driveways for Horizon Year (2040) traffic conditions to determine the turn pocket lengths necessary to accommodate near-term and long-range 95th percentile queues.

The minimum storage length for turn pockets to accommodate the 95th percentile queues at the intersections of Veterans Way/Driveway 1 & Cactus Avenue and Frederick Street/Driveway 2 & Cactus Avenue were previously shown on Exhibit 1-4. Queuing worksheets are included in Appendix 1.2.

Table 1-4

Summary of Improvements by Analysis Scenario and Rough Order of Magnitude Costs

#	Intersection Location	Jurisdiction	E+P	2023 With Project	Horizon Year (2040) With Project	Improvements in TUMF?[1, 13]	Total Cost[2,3,4]	Fair Share %[4]	Fair Share Cost[5]

						Total Project Fair Share Contribution to the March JPA (non-TUMF)[7]	**$1,648,716**		**$1,021,105**
						Total Project Fair Share Contribution to the City of Riverside[8]	**$240,530**		**$1,870**
						Total Project Fair Share Contribution to the County of Riverside[9]	**$153,064**		**$1,697**
						Total Project Fair Share Contribution to the City of Moreno Valley[10]	**$844,039**		**$212,105**
						Total Project Fair Share Contribution to Caltrans[11]	**$87,465**		**$1,493**
						Total	**$2,973,813**		**$1,238,270**

[1] Improvements included in TUMF fee program. Although identified as a TUMF facility, the improvement is not currently identified on the Northwest Zone 5-Year Transportation Improvement Program Amendment (adopted January 6, 2014).

[2] Costs have been estimated using the data provided in Appendix "G" of the CMP (2003 Update) for preliminary construction costs.

[3] Appendix "G" costs escalated by a factor of 1.484 except Traffic Signals. This is consistent with the methodology used by other near-by agencies.

[4] Program improvements constructed by Project may be eligible for fee credit, at discretion of the March JPA. See Table 1-5 for Fair Share Calculations.

[5] Rough order of magnitude cost estimate.

[6] Improvements are Project design features as they are either site adjacent roadway improvements or needed for site access.

[7] Total project fair share contribution consists of the improvements which are not already included in the County TUMF for those intersections wholly or partially within the March JPA.

[8] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Riverside.

[9] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the County of Riverside.

[10] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Moreno Valley.

[11] Total project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within Caltrans' jurisdiction.

[12] The TUMF nexus study identifies I-215/Cactus overcrossing ($22,280,0000). Although the individual improvements are not specifically identified in the nexus study, they are likely to be part of the overall interchange improvements.

[13] Because the March JPA does not have plenary control over intersections under other jurisdictions, the March JPA cannot guarantee that such improvements will be constructed. As such the impacts are considered significant and unavoidable.

- 100' = MINIMUM TURN POCKET LENGTH

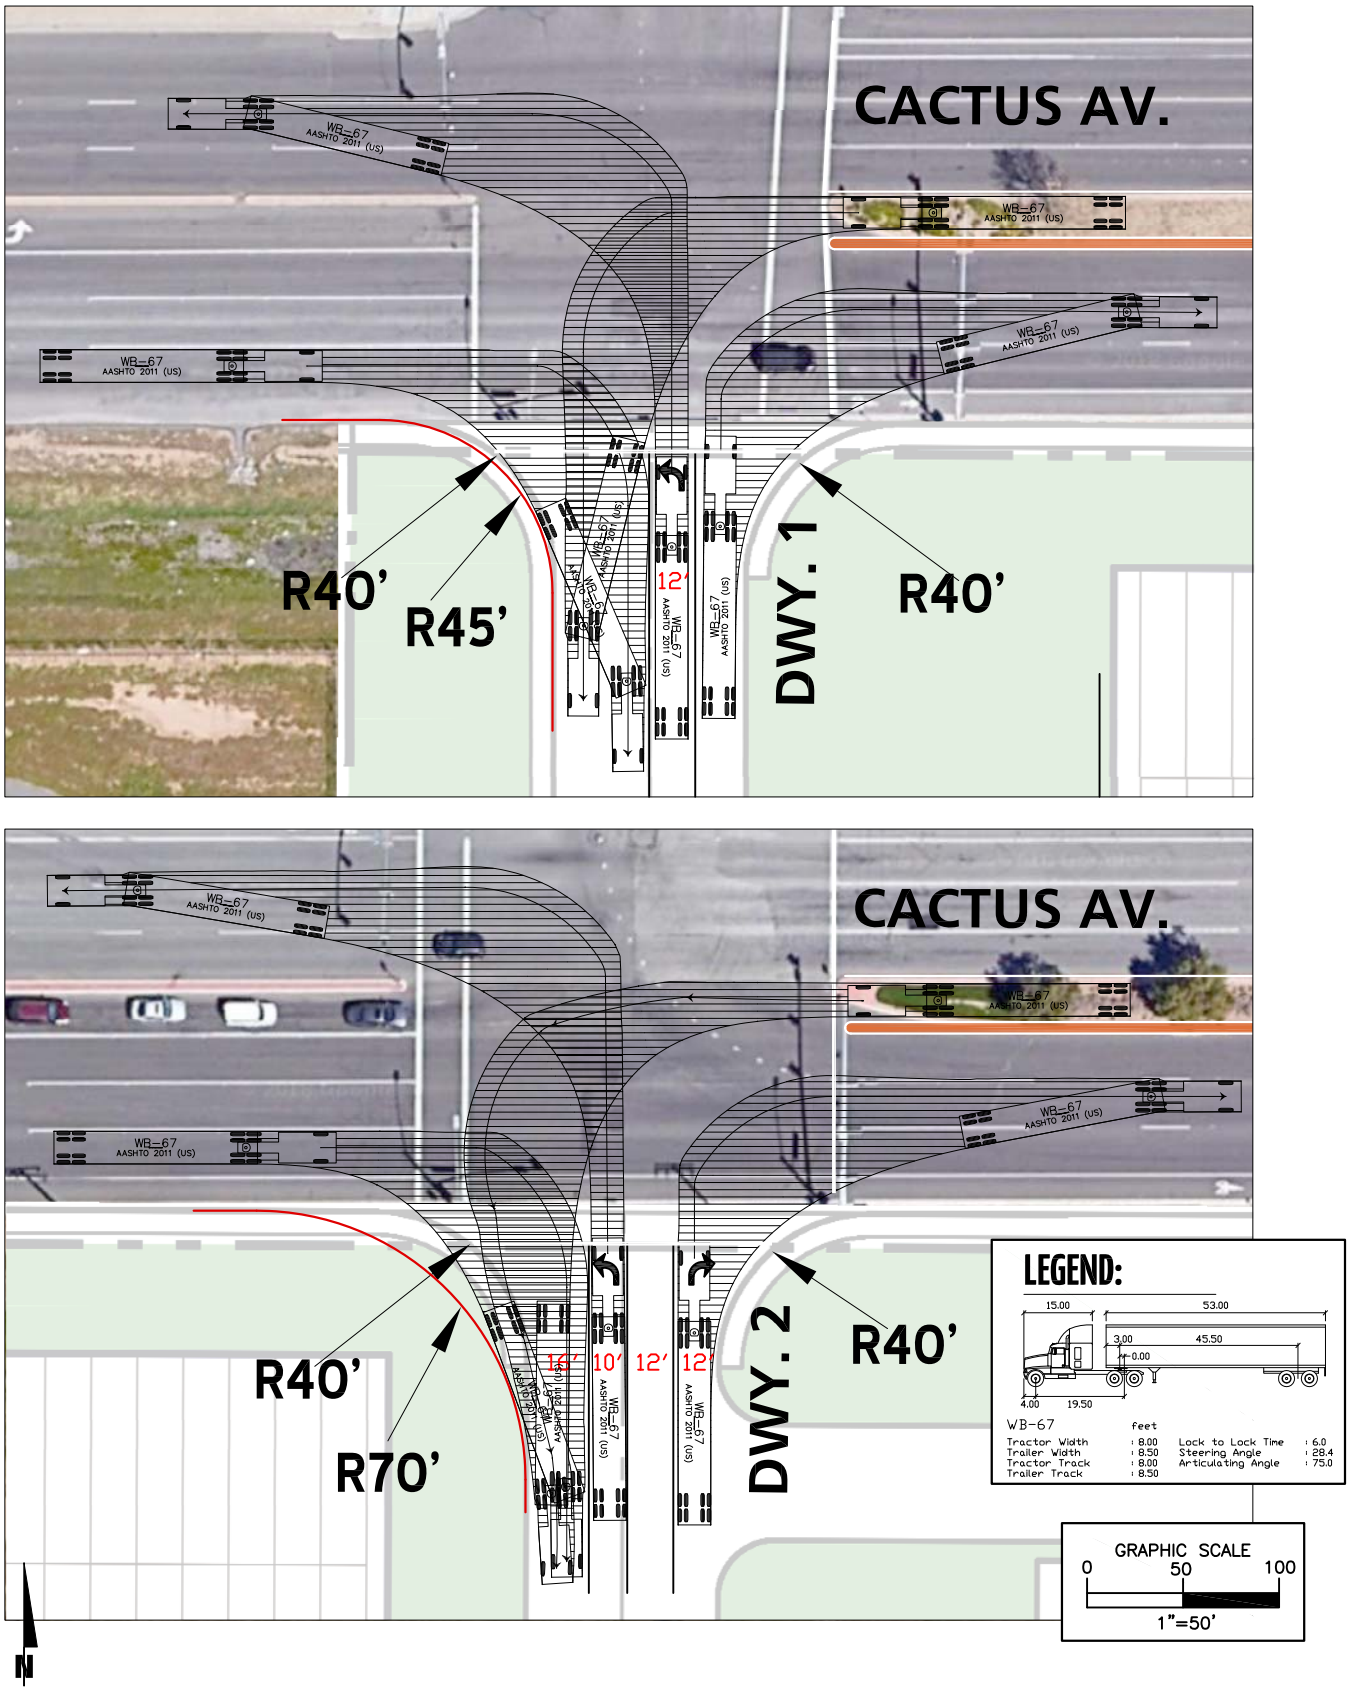
N

1.7 TRUCK ACCESS AND CIRCULATION

A truck turning template has been overlaid on the site plan at Veteran's Way/Driveway 1 on Cactus Avenue and Frederick Street/Driveway 2 on Cactus Avenue, which are anticipated to be utilized by heavy trucks, in order to determine the appropriate curb radii and to verify that trucks will have sufficient space to execute turning maneuvers. For the purposes of this evaluation, the WB-67 class truck template has been utilized. WB-67 class trucks are approximately 73.5 feet in length.

Exhibit 1-5 illustrates the proposed truck access for the site and circulation for Driveway 1 and Driveway 2. The recommended curb radii as shown on Exhibit 1-5 are anticipated to accommodate the ingress and egress of trucks.

1.8 PARKING EVALUATION



March JPA Development Code (Table 9.11040C-12) provides the following off-street parking requirements for warehouse and distribution land uses:

- 0 – 50,000 sq. ft.: 1/1,000 sq. ft. of gross floor area
- 50,000 – 200,000 sq. ft.: 50 spaces + (0.33 per ksf > 50,000 sq. ft.)
- 200,00 sq. ft. or greater: 100 spaces + (0.20 per ksf > 200,000 sq. ft.)

Per the March JPA Development Code, 260 passenger car stalls would be required. However, a total of 598 automobile parking stalls and 242 truck trailer parking stalls are proposed to be provided to accommodate higher parking demands for a fulfilment center use. The proposed 598 passenger car stalls are anticipated to be adequate to support the expected 900 employees with 2 shifts. However, if there are parking issues during peak season (i.e., October to January), it is recommended that a third shift be added to reduce the peak parking demand.

Transportation demand management (i.e., carpool, public transit) would further reduce parking demand, but have not been considered in order to present a conservative analysis.

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are consistent with March JPA traffic study guidelines.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The *Highway Capacity Manual* (HCM) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (6) The HCM uses different procedures depending on the type of intersection control. Study area intersections located within the March JPA, City of Riverside, and City of Moreno Valley have been analyzed using the software package Synchro (Version 10).

2.2.1 SIGNALIZED INTERSECTIONS

March Joint Powers Authority, City of Riverside, City of Moreno Valley, County of Riverside

The March JPA, City of Riverside, City of Moreno Valley, and County of Riverside require signalized intersection operations analysis based on the methodology described in the HCM. (6) Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1.

TABLE 2-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A	F
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B	F

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C	F
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D	F
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E	F
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths	80.01 and up	F	F

Source: HCM

Study area intersections located within the March JPA, City of Riverside, and City of Moreno Valley have been analyzed using the software package Synchro (Version 10).

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15 minute volumes. Common practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g. PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. It is unlikely that the PHF would decrease from their current values and would more likely increase. However, in an effort to conduct a conservative analysis and overstate as opposed to understate potential traffic impacts, existing PHFs have been used for all analysis scenarios.

California Department of Transportation (Caltrans)

Per the Caltrans *Guide for the Preparation of Traffic Impact Studies*, the traffic modeling and signal timing optimization software package Synchro (Version 10) has also been utilized to analyze signalized intersections under Caltrans' jurisdiction, which include interchange to arterial ramps (i.e. I-215 Freeway ramps at Alessandro Boulevard, I-215 Freeway ramps at Cactus Avenue). (2) Synchro is a macroscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the HCM. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length. The level of service and capacity analysis performed by Synchro takes into consideration optimization and coordination of signalized intersections within a network. Signal timing for the freeway arterial-to-ramp intersections have been obtained from Caltrans District 8 and were utilized for the purposes of this analysis.

2.2.2 UNSIGNALIZED INTERSECTIONS

The March JPA, City of Riverside, City of Moreno Valley, and County of Riverside require the operations of unsignalized intersections be evaluated using the methodology described the HCM. (6) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2).

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Little or no delays.	0 to 10.00	A	F
Short traffic delays.	10.01 to 15.00	B	F
Average traffic delays.	15.01 to 25.00	C	F
Long traffic delays.	25.01 to 35.00	D	F
Very long traffic delays.	35.01 to 50.00	E	F
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F	F

Source: HCM

At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. For all-way stop controlled intersections, LOS is computed for the intersection as a whole.

2.3 FREEWAY OFF-RAMP QUEUING ANALYSIS

The study area for this TIA includes the freeway-to-arterial interchange of the I-215 Freeway at Cactus Avenue off-ramps. Consistent with Caltrans requirements, the 95th percentile queuing of vehicles has been assessed at the off-ramps to determine potential queuing impacts at the freeway ramp intersections on Cactus Avenue. Specifically, the queuing analysis is utilized to identify any potential queuing and "spill back" onto the I-215 Freeway mainline from the off-ramps.

2.4 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by the California Department of Transportation (Caltrans) and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TIA uses the signal warrant criteria presented in the latest edition of the Caltrans California Manual on Uniform Traffic Control Devices (CA MUTCD) for all unsignalized study area intersections. (7)

The signal warrant criteria for Existing study area intersections are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. The CA MUTCD indicate that the installation of a traffic signal should be considered if one or more of the signal warrants are met. (7) Specifically, this TIA utilizes the Peak Hour

Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing traffic conditions. Warrant 3 is appropriate to use for this TIA because it provides specialized warrant criteria for intersections with urban characteristics (e.g. located in communities with populations of more than 10,000 persons or with adjacent major streets operating below 40 miles per hour). For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection.

Future unsignalized intersections, that currently do not exist, have been assessed regarding the potential need for new traffic signals based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets.

As shown on Table 2-3, traffic signal warrant analyses were performed for the following unsignalized study area intersections operating at LOS E or F during the peak weekday conditions wherein the Project is anticipated to contribute the highest trips:

TABLE 2-3: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

ID	Intersection Location	Jurisdiction
8	Meridian Pkwy. & Innovation Dr.	March JPA

The Existing conditions traffic signal warrant analysis is presented in the subsequent section, Section 3 *Area Conditions* of this report. The traffic signal warrant analyses for future conditions are presented in Section 5 *E+P Traffic Analysis,* Section 6 *Opening Year Cumulative (2023) Traffic Analysis,* and Section 7 *Horizon Year (2040) Traffic Analysis* of this report.

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.5 FREEWAY MAINLINE SEGMENT ANALYSIS METHODOLOGY

Consistent with recent March JPA guidance, past experiences with projects relating to freeway mainline segment analysis, and because impacts to freeway segments dissipate with distance from the point of State Highway System (SHS) entry, quantitative study of freeway segments beyond those immediately adjacent to the point of entry is not required.

The freeway system in the study area has been broken into segments defined by the freeway-to-arterial interchange locations. The freeway segments have been evaluated in this TIA based upon peak hour directional volumes. The freeway segment analysis is based on the methodology described in the HCM and performed using HCS7 software. The performance measure preferred by Caltrans to calculate LOS is density. Density is expressed in terms of passenger cars per mile per lane. Table 2-4 illustrates the freeway segment LOS descriptions for each density range utilized for this analysis.

The number of lanes for existing baseline conditions has been obtained from field observations conducted by Urban Crossroads in May 2018. These existing freeway geometrics have been utilized for Existing, E+P, Opening Year Cumulative Without and With Project, and Horizon Year Without and With Project traffic conditions.

The I-215 mainline volume data were obtained from the Caltrans Performance Measurement System (PeMS) website for the segments along the I-215 Freeway. The data was obtained from May 2018. In an effort to conduct a conservative analysis, the maximum value observed within the 3-day period was utilized for the weekday morning (AM) and weekday evening (PM) peak hours. In addition, truck traffic, represented as a percentage of total traffic, has been utilized for the purposes of this analysis in an effort to not overstate traffic volumes and peak hour deficiencies. As such, actual vehicles (as opposed to passenger-car-equivalent (PCE) volumes) have been utilized for the purposes of the basic freeway segment analysis. (8)

TABLE 2-4: DESCRIPTION OF FREEWAY MAINLINE LOS

Level of Service	Description	Density Range (pc/mi/ln)[1]
A	Free-flow operations in which vehicles are relatively unimpeded in their ability to maneuver within the traffic stream. Effects of incidents are easily absorbed.	0.0 – 11.0
B	Relative free-flow operations in which vehicle maneuvers within the traffic stream are slightly restricted. Effects of minor incidents are easily absorbed.	11.1 – 18.0
C	Travel is still at relative free-flow speeds, but freedom to maneuver within the traffic stream is noticeably restricted. Minor incidents may be absorbed, but local deterioration in service will be substantial. Queues begin to form behind significant blockages.	18.1 – 26.0
D	Speeds begin to decline slightly and flows and densities begin to increase more quickly. Freedom to maneuver is noticeably limited. Minor incidents can be expected to create queuing as the traffic stream has little space to absorb disruptions.	26.1 – 35.0
E	Operation at capacity. Vehicles are closely spaced with little room to maneuver. Any disruption in the traffic stream can establish a disruption wave that propagates throughout the upstream traffic flow. Any incident can be expected to produce a serious disruption in traffic flow and extensive queuing.	35.1 – 45.0
F	Breakdown in vehicle flow.	>45.0

[1] pc/mi/ln = passenger cars per mile per lane. Source: HCM

2.6 FREEWAY MERGE/DIVERGE RAMP JUNCTION ANALYSIS

The freeway system in the study area has been broken into segments defined by freeway-to-arterial interchange locations resulting in three existing on and off ramp locations. Although the HCM indicates the influence area for a merge/diverge junction is 1,500 feet, the analysis presented in this traffic study has been performed at all ramp locations with respect to the nearest on or off ramp at each interchange in an effort to be consistent with Caltrans guidance/comments on other projects Urban Crossroads has worked on in the region.

The merge/diverge analysis is based on the HCM Ramps and Ramp Junctions analysis method and performed using HCS7 software. The measure of effectiveness (reported in passenger car/mile/lane) are calculated based on the existing number of travel lanes, number of lanes at

the on and off ramps both at the analysis junction and at upstream and downstream locations (if applicable) and acceleration/deceleration lengths at each merge/diverge point. Table 2-5 presents the merge/diverge area level of service descriptions for each density range utilized for this analysis.

TABLE 2-5: DESCRIPTION OF FREEWAY MERGE AND DIVERGE LOS

Level of Service	Density Range (pc/mi/ln)[1]
A	≤10.0
B	10.0 – 20.0
C	20.0 – 28.0
D	28.0 – 35.0
E	>35.0
F	Demand Exceeds Capacity

[1] pc/mi/ln = passenger cars per mile per lane. Source: HCM

Similar to the basic freeway segment analysis, the I-215 Freeway mainline volume data were obtained from the Caltrans PeMS website for the segments of the I-215 Freeway, between Cactus Avenue and Van Buren Boulevard. The ramp data (per the count data presented in Appendix 3.1, then adjusted for flow conservation) were then utilized to flow conserve the mainline volumes to determine the remaining I-215 Freeway mainline segment volumes near the interchange. Flow conservation checks ensure that traffic flows from east to west and north to south (and vice versa) of the interchange area with no unexplained loss of vehicles. The data was obtained from May 2018. (8) In an effort to conduct a conservative analysis, the maximum value observed within the 3-day period was utilized for the weekday morning (AM) and weekday evening (PM) peak hours. In addition, truck traffic, represented as a percentage of total traffic, has been utilized for the purposes of this analysis in an effort to not overstate traffic volumes and peak hour deficiencies. As such, actual vehicles (as opposed to PCE volumes) have been utilized.

2.7 MINIMUM LEVEL OF SERVICE (LOS)

The definition of an intersection deficiency has been obtained from each of the applicable surrounding jurisdictions.

2.7.1 MARCH JOINT POWERS AUTHORITY

As identified in the March JPA Traffic Impact Study Preparation Guide (August 3, 2011) all intersections within the March JPA Planning Area shall operate at LOS D or better with limiting circumstances of LOS E to occur. LOS E may also be allowed to the extent that would support transit-oriented development (TOD) and walkable communities. (1) LOS E is also acceptable during peak hours at interchange ramp intersections where ramp metering occurs. The Project is not proposed to be a TOD and neither the Alessandro Boulevard nor Cactus Avenue on-ramps are currently metered; as such, the minimum LOS utilized for the purposes of this analysis is LOS D.

2.7.2 CITY OF RIVERSIDE

The City of Riverside General Plan states the City will strive to maintain LOS D or better on arterial streets wherever possible. At some key locations, such as City arterial roadways, which are used as freeway bypass by regional through traffic and at heavily traveled freeway intersections, LOS E may be acceptable as determined on a case-by-case basis. Locations that may warrant the LOS E standard include portions of Arlington Avenue/Alessandro Boulevard, Van Buren Boulevard throughout the City, portions of La Sierra Avenue, and selected freeway interchanges. A higher standard, such as LOS C or better, may be adopted for Local and Collector streets in residential areas. The City recognizes that along key free-way feeder segments during peak commute hours, LOS F may be expected due to regional travel patterns. A minimum LOS utilized for the purposes of this analysis is LOS D.

2.7.3 CITY OF MORENO VALLEY

The Minimum LOS for the City of Moreno Valley is LOS D for intersections that are adjacent to freeway on/off ramps, and/or adjacent to employment generating land uses. LOS C is applicable to all other intersections. Boundary intersections are assumed to be LOS D.

2.7.4 COUNTY OF RIVERSIDE

County of Riverside General Plan Policy C 2.1 states that the following minimum target levels of service have been designated for the review of development proposals in the unincorporated areas of Riverside County:

- LOS C shall apply to all development proposals in any area of the Riverside County not located within the boundaries of an Area Plan, as well those areas located within the following Area Plans: REMAP, Eastern Coachella Valley, Desert Center, Palo Verde Valley, and those non- Community Development areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans.
- LOS D shall apply to all development proposals located within any of the following Area Plans: Eastvale, Jurupa, Highgrove, Reche Canyon/Badlands, Lakeview/Nuevo, Sun City/Menifee Valley, Harvest Valley/Winchester, Southwest Area, The Pass, San Jacinto Valley, Western Coachella Valley and those Community Development Areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans. LOS E may be allowed by the Board of Supervisors within designated areas where transit oriented development and walkable communities are proposed.

Notwithstanding the forgoing minimum LOS targets, the Board of Supervisors may, on occasion by virtue of their discretionary powers, approve a project that fails to meet these LOS targets in order to balance congestion management considerations in relation to benefits, environmental impacts and costs, provided an Environmental Impact Report, or equivalent, has been completed to fully evaluate the impacts of such approval. Any such approval must incorporate all feasible mitigation measures, make specific findings to support the decision, and adopt a statement of overriding considerations.

2.7.5 CALTRANS

Based on recent guidance from Caltrans District 8, the LOS for operating State highway facilities is based on Measures of Effectiveness (MOE) identified in the Highway Capacity Manual (HCM). Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on State highway facilities; however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than this target LOS< the existing MOE should be maintained. In general, the region-wide goal for an acceptable LOS on all freeways, roadways segments, and intersections is D. For undeveloped or not densely developed locations, the goal may be to achieve LOS C.

2.8 THRESHOLDS OF SIGNIFICANCE

This section outlines the methodology used in this analysis related to identifying circulation system deficiencies.

2.8.1 INTERSECTIONS

Direct impacts are those impacts for which the addition of project-only trips result in an identifiable degradation in LOS to unacceptable LOS on freeway segments or intersections from the Existing condition thereby triggering the need for specific project-related improvement strategies through a comparison of Existing and E+P traffic conditions.

For the study area intersections that lie within March JPA, to determine whether the addition of project traffic (as defined through the comparison of Existing to E+P traffic conditions) at a study intersection would result in a direct project-specific traffic impact, both of the following conditions must occur:

- Peak hour project traffic plus existing traffic causes an intersection to operate at LOS E or F; and
- Peak hour project traffic comprises 2% or more of the total peak hour traffic on the intersection for LOS E and 2% or more for LOS F.

For the study area intersections that lie within the City of Riverside, to determine whether the addition of Project traffic (as defined through the comparison of Existing traffic conditions to E+P traffic conditions) at a study intersection would result in a direct project-specific traffic impact, the following will be utilized:

- When the pre-Project condition is at or better than LOS D (i.e., acceptable LOS), and project-generated traffic, as measured by 50 or more peak hour trips, causes deterioration below LOS D (i.e., unacceptable LOS) or increases to the peak hour delay as defined in Table 2-6, a deficiency is deemed to occur.

TABLE 2-6: THRESHOLDS OF SIGNIFICANCE

Pre-Project LOS	Project-Related Delay Increase	Mitigation Measure
A/B	10.0 Seconds or More	Achieve Pre-project delay or better
C	8.0 Seconds or More	Achieve Pre-project delay or better
D	5.0 Seconds or More	Achieve Pre-project delay or better
E	2.0 Seconds or More	Achieve Pre-project delay or better
F	1.0 Second or More	Achieve Pre-project delay or better

For the study area intersections that lie within the County of Riverside, to determine whether the addition of project traffic (as defined through the comparison of Existing traffic conditions to E+P traffic conditions) at a study intersection would result in a direct project-specific traffic impact, the following will be utilized:

- When the pre-Project condition is at or better than LOS D (i.e., acceptable LOS), and project-generated traffic, as measured by 50 or more peak hour trips, causes deterioration below LOS D/LOS E (i.e., unacceptable LOS), a deficiency is deemed to occur.

For the study area intersections that lie within the City of Moreno Valley, March JPA or County of Riverside thresholds of significance apply as the City of Moreno Valley does not have its own threshold criteria.

However, when the pre-Project condition is already below LOS D (i.e., unacceptable LOS), the Project will be responsible for mitigating its impact to a level of service equal to or better than it was without the Project for intersections that receive 50 or more peak hour project-related trips. This is a standard protocol in many urban jurisdictions because to require a Project to mitigate to LOS D or better would in effect force the Project to mitigate beyond its Project impacts, which is prohibited under California law. Thus, for intersections currently operating at unacceptable LOS during either the AM and/or PM peak hour under Existing traffic conditions, improvements have been identified to mitigate the impacts of the Project to an intersection LOS that is equal to or better than pre-Project conditions.

Cumulative traffic impacts are created as a result of a combination of the proposed Project together with other future developments contributing to the overall traffic impacts requiring additional improvements to maintain acceptable level of service operations with or without the Project. A Project's contribution to a significant cumulative impact can be reduced to less-than-

significant if the Project is required to implement or fund its fair share of improvements designed to alleviate its cumulatively considerable contribution to the impact.

2.8.2 CALTRANS FACILITIES

To determine that the addition of project traffic to the SHS freeway segments would result in a deficiency, both of the following must be found:

- The traffic study finds that the LOS of a segment will degrade from D or better to E or F.
- The traffic study finds that the project will exacerbate an already deficient condition by contributing 50 or more peak hour trips. A segment that is operating at or near capacity is deemed to be deficient.

2.9 PROJECT FAIR SHARE CALCULATION METHODOLOGY

In cases where this TIA identifies that the Project would contribute additional traffic volumes to cumulative traffic deficiencies, Project fair share costs of improvements necessary to address deficiencies have been identified. The Project's fair share cost of improvements is determined based on the following equation, which is the ratio of Project traffic to total future (Horizon Year) traffic:

Project Fair Share % = Project Traffic / 2040 Total Traffic

2.10 SB 743 REQUIREMENTS

In the fall of 2013, Senate Bill 743 (SB 743) was passed by the legislature and signed into law by the governor. For some parts of California (and eventually the entire state), this legislation will eventually change the way that transportation studies are conducted for environmental documents. In the areas where SB 743 is implemented, delay-based metrics such as roadway capacity and level of service will no longer be the performance measures used for the determination of the transportation impacts of projects in studies conducted under the California Environmental Quality Act (CEQA). Instead, new performance measures such as vehicle miles travelled (VMT) or other similar measures will be used.

During the preparation of this traffic impact study, guidelines for the implementation of SB 743 were not yet incorporated into CEQA. Therefore, this traffic impact study follows current practice regarding state and local guidance as of the date of preparation.

In December 2018 CEQA Guidelines were updated to include a threshold for evaluating traffic impacts using the VMT methodology. This new methodology is required to be used statewide after July 2020. As such, and because March JPA as the lead agency has not yet adopted VMT thresholds, the analysis for this project utilizes the LOS methodology.

3 AREA CONDITIONS

This section provides a summary of the existing circulation network, the March JPA General Plan Circulation Network, and a review of existing peak hour intersection operations, freeway mainline operations, and traffic signal warrant analyses.

3.1 EXISTING CIRCULATION NETWORK

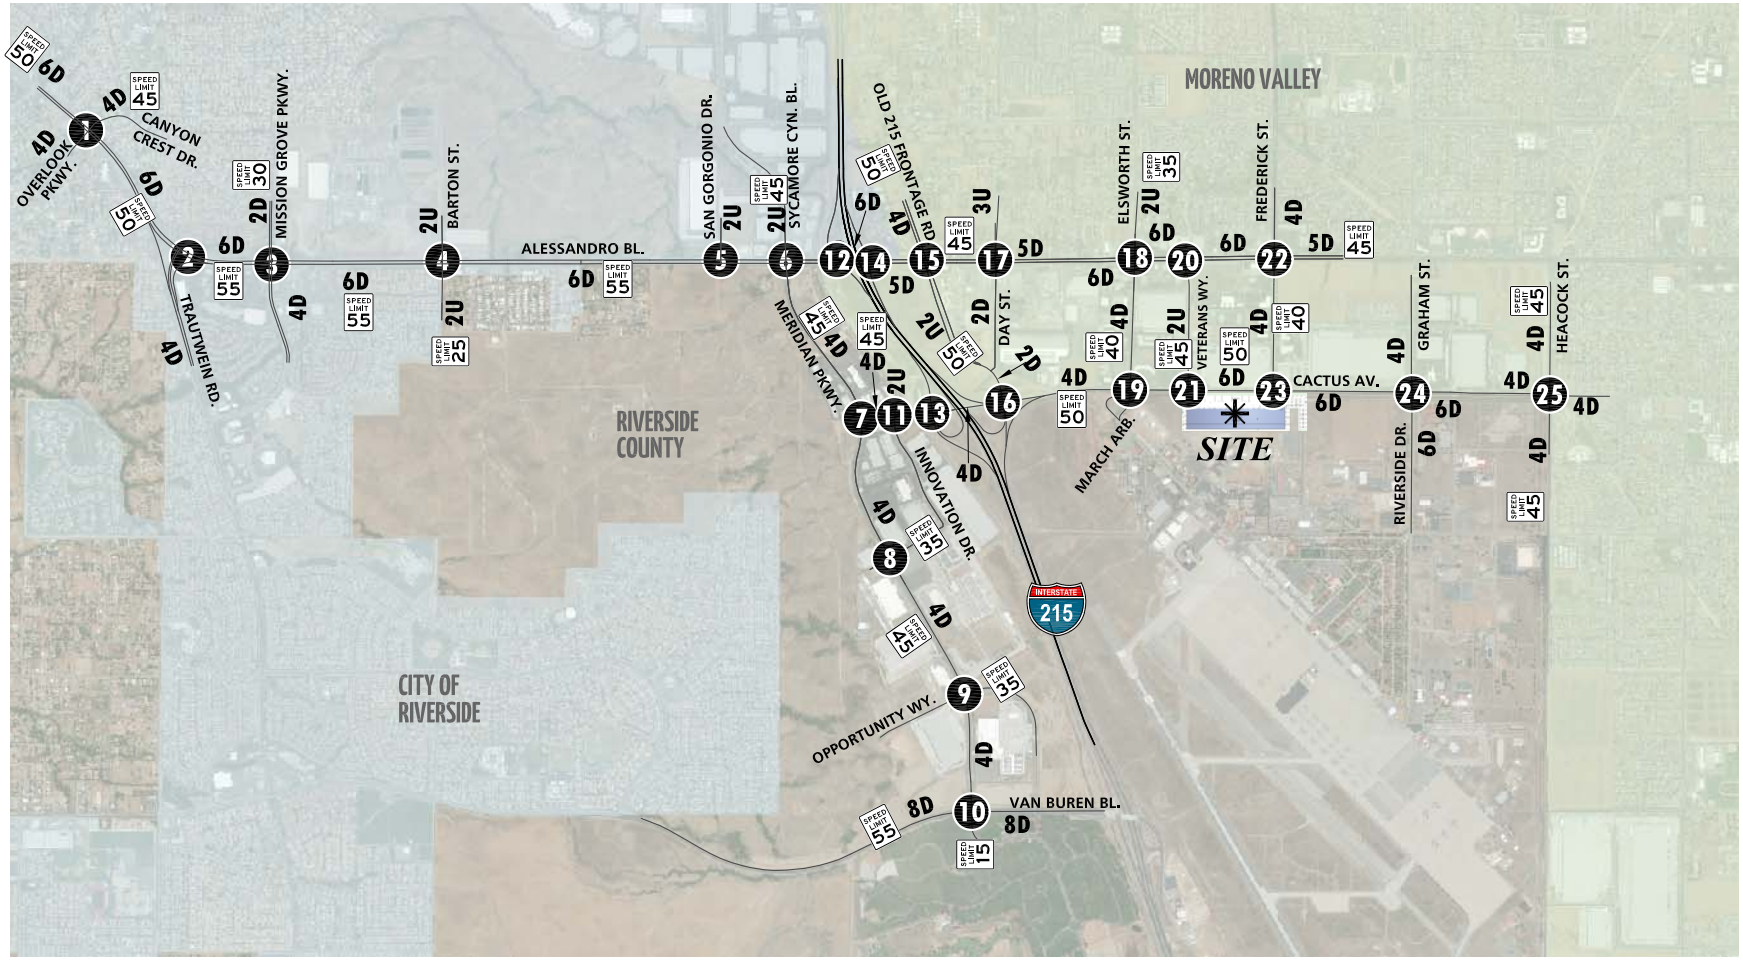
Pursuant to the agreement with March JPA staff (Appendix 1.1), the study area includes a total of 25 existing and future intersections as shown previously on Exhibit 1-2. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 GENERAL PLAN CIRCULATION ELEMENT

As noted previously, the Project site is located within the March JPA. However, the study area includes intersections that share borders with the neighboring jurisdictions of the County of Riverside, the City of Riverside, the City of Moreno Valley, and Caltrans.

3.2.1 MARCH JPA

The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the March JPA General Plan Circulation Element, are described subsequently. Exhibit 3-2 shows the March JPA General Plan Circulation Element, and Exhibit 3-3 illustrates the March JPA General Plan roadway cross-sections. It is our understanding that the March JPA is currently undergoing a General Plan Update, however, the work effort associated with the General Plan Update had not been completed at the time this TIA was prepared. JPA Resolution 16-05 had minor amendments to General Plan Transportation Element. The roadway system and cross-sections from Meridian General Plan Amendment (JPA#16-05) is shown on Exhibit 3-3 A.



3.2.2 COUNTY OF RIVERSIDE

The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the County of Riverside General Plan Circulation Element are shown on Exhibit 3-4 and Exhibit 3-5 illustrates the County of Riverside General Plan roadway cross-sections.

3.2.3 CITY OF RIVERSIDE

The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the City of Riverside General Plan Circulation Element are shown on Exhibit 3-6 and Exhibit 3-7 illustrates the City of Riverside General Plan roadway cross-sections.

3.2.4 CITY OF MORENO VALLEY

The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the City of Moreno Valley General Plan Circulation Element are shown on Exhibit 3-8 and Exhibit 3-9 illustrates the City of Moreno Valley General Plan roadway cross-sections.

3.3 TRUCK ROUTES

The March JPA designated truck route map is shown on Exhibit 3-10. The I-215 Freeway, Alessandro Boulevard (west of the I-215 Freeway), Meridian Parkway, Innovation Drive, Van Buren Boulevard, and Cactus Avenue are identified as designated truck routes. It is our understanding that truck traffic westbound onto Alessandro Boulevard from Meridian Parkway is limited to local deliveries.

3.4 TRANSIT SERVICE

The study area within the March JPA and the surrounding Cities of Riverside and Moreno Valley are currently served by the Riverside Transit Authority (RTA), a public transit agency serving various jurisdictions within Riverside County. The existing bus routes provided within the area by RTA are shown on Exhibit 3-11. RTA Route 11 could potentially serve the Project as it currently operates along Cactus to the north of the Project site. Transit service is reviewed and updated by RTA periodically to address ridership, budget and community demand needs. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate.

It should also be noted that the Moreno Valley/March Field Metrolink Station is located on Meridian Parkway.

3.5 BICYCLE & PEDESTRIAN FACILITIES

Field observations conducted in May 2018 indicate nominal pedestrian and bicycle activity within the study area. Existing pedestrian facilities within the study area are shown on Exhibit 3-12. There are currently Class II bike lanes along Alessandro Boulevard, Meridian Parkway, and Van Buren Boulevard within the study area. Class II bikeways are bike lanes which are established adjacent to traffic lanes and shared the same roadway. Existing sidewalks are currently in place along the Cactus Avenue on the north side of the street.

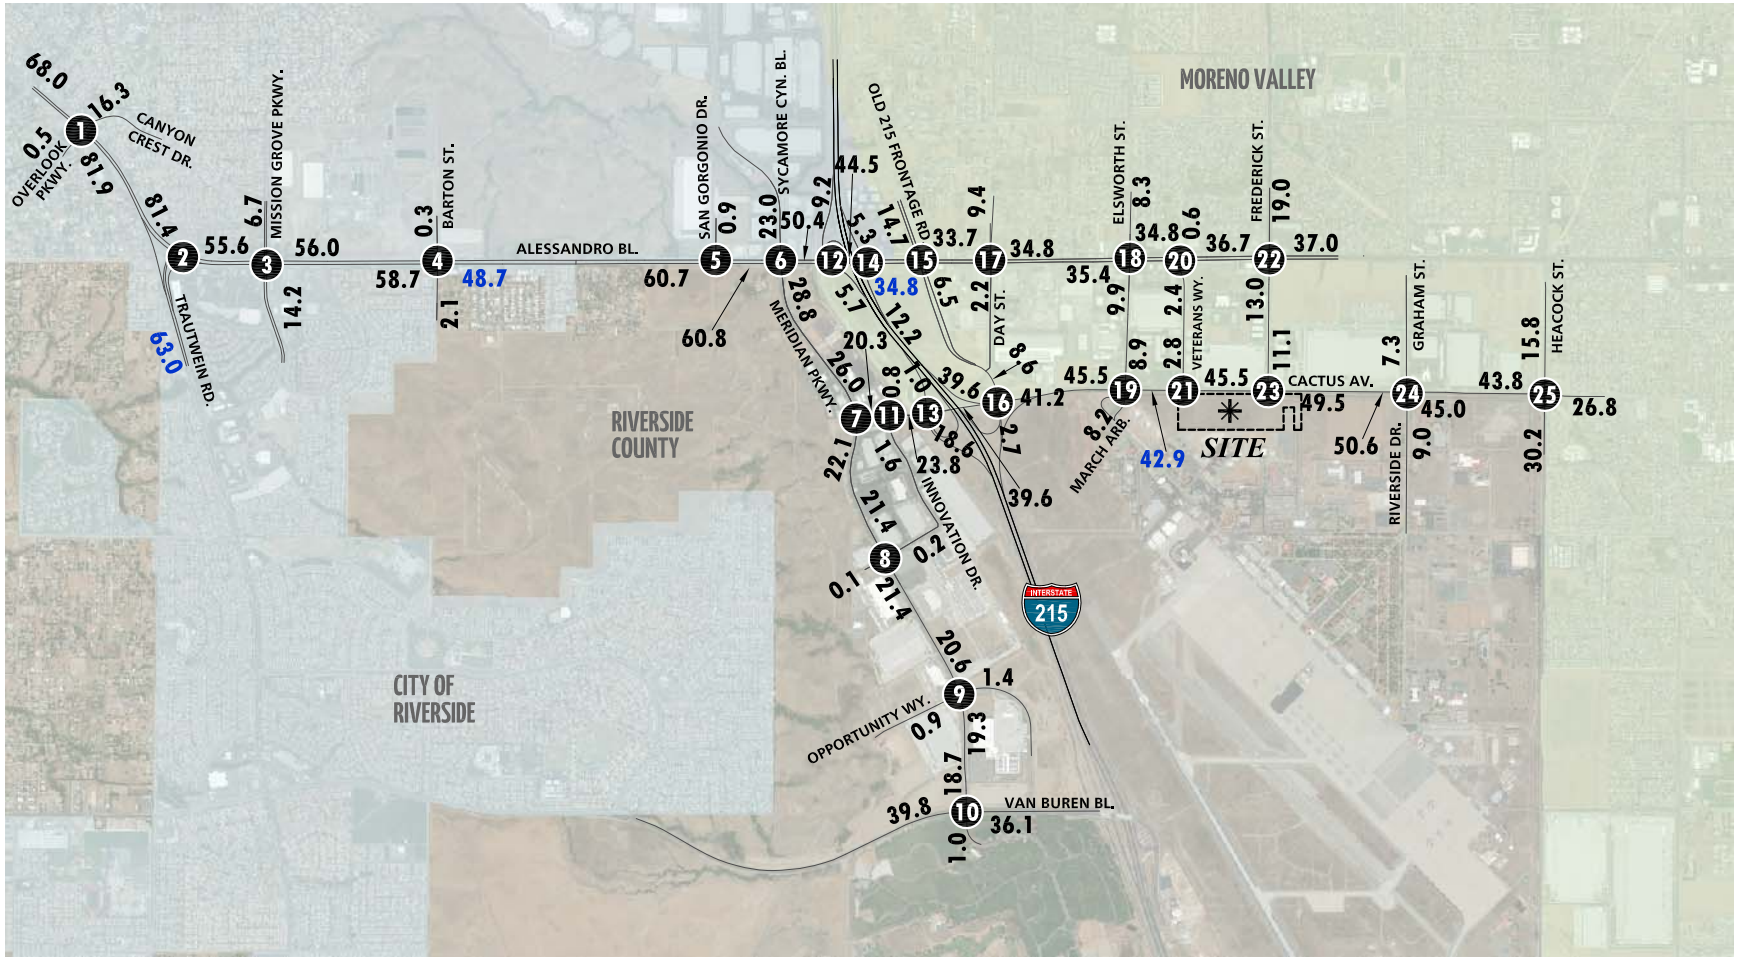
3.6 EXISTING (2018) TRAFFIC COUNTS

The intersection LOS analysis is based on the traffic volumes observed during the peak hour conditions using traffic count data collected in May 2018. Consistent with standard traffic engineering practice, these traffic counts were conducted either on Tuesday, Wednesday, or Thursday due to potential fluctuations in traffic that typically occur on Mondays, Fridays, Holidays, or weekends. The following peak hours were selected for analysis:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 9:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 6:00 PM)

The weekday AM and weekday PM peak hour count data is representative of typical weekday peak hour traffic conditions in the study area. There were no observations made in the field that would indicate atypical traffic conditions on the count dates, such as construction activity or detour routes, and nearby schools were in session and operating on normal schedules. The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1. These raw turning volumes have been flow conserved between intersections with limited access, no access and where there are currently no uses generating traffic (e.g., between ramp-to-arterial intersections, etc.). The traffic counts include the following vehicle classifications: Passenger Cars, 2-Axle Trucks, 3-Axle Trucks, and 4 or More Axle Trucks.



To represent the impact large trucks, buses and recreational vehicles have on traffic flow, truck traffic has been accounted for in the analysis as a percentage of total traffic at the study area intersections. The actual vehicle mix (passenger cars vs. trucks) was taken into consideration at the ramp-to-arterial junctions for the purposes of conducting the freeway mainline analysis and all study area intersections for the peak hour operations analysis. In other words, the traffic volumes utilized for intersections, basic freeway segment, and merge/diverge ramp junction analyses utilize the actual vehicle traffic flow and trucks are reflected in the analysis as a percentage of the total traffic flow, not PCE.

Existing weekday average daily traffic (ADT) volumes on arterial highways throughout the study area are shown on Exhibit 3-13. Where 24-hour tube count data was not available, Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

Weekday PM Peak Hour (Approach Volume + Exit Volume) x 14.32 = Leg Volume

A comparison of the PM peak hour and daily traffic volumes of various roadway segments within the study area indicated that the peak-to-daily relationship is approximately 6.98 percent. As such, the above equation utilizing a factor of 14.32 estimates the ADT volumes on the study area roadway segments assuming a peak-to-daily relationship of approximately 6.98 percent (i.e., 1/0.0698 = 14.32) and was assumed to sufficiently estimate average daily traffic (ADT) volumes for planning-level analyses. Existing weekday AM and weekday PM peak hour intersection volumes (in actual vehicles) are shown on Exhibit 3-14.

N

EXHIBIT 3-14: EXISTING (2018) TRAFFIC VOLUMES

3.7 EXISTING (2018) CONDITIONS INTERSECTION OPERATIONS ANALYSIS

Existing (2018) peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 3-1 which indicates that the Existing study area intersections are all currently operating at acceptable LOS during the peak hours, with the exception of the following locations:

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1) – LOS F AM and PM peak hours
- Mission Grove Pkwy. & Alessandro Bl. (#3) – LOS E AM peak hour only
- Sycamore Canyon Bl. & Alessandro Bl. (#6) – LOS E AM peak hour only
- Elsworth St. & Cactus Av. (#19) – LOS F AM and PM peak hours

As the deficiencies at Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard are caused by minimum green times necessary for pedestrian crossing time, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at both these intersections (also validated by peak hour count data).

Consistent with Table 3-1, a summary of the peak hour intersection LOS for Existing conditions are shown on Exhibit 3-15. The intersection operations analysis worksheets are included in Appendix 3.2 of this TIA.

3.8 EXISTING (2018) CONDITIONS TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Existing traffic conditions are based on existing peak hour intersection turning volumes and conducted for unsignalized intersections operating at LOS E or F. For Existing traffic conditions, there are no unsignalized study area intersections that currently operate at an unacceptable LOS.

3.9 EXISTING (2018) CONDITIONS OFF-RAMP QUEUING ANALYSIS

A queuing analysis was performed for the off-ramps at the I-215 Freeway at Cactus Avenue interchange to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-215 Freeway mainline. Queuing analysis findings are presented in Table 3-2. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown on Table 3-2, there are no existing queuing issues. Worksheets for Existing traffic conditions off-ramp queuing analysis are provided in Appendix 3.4.

EXHIBIT 3-15: EXISTING (2018) SUMMARY OF LOS

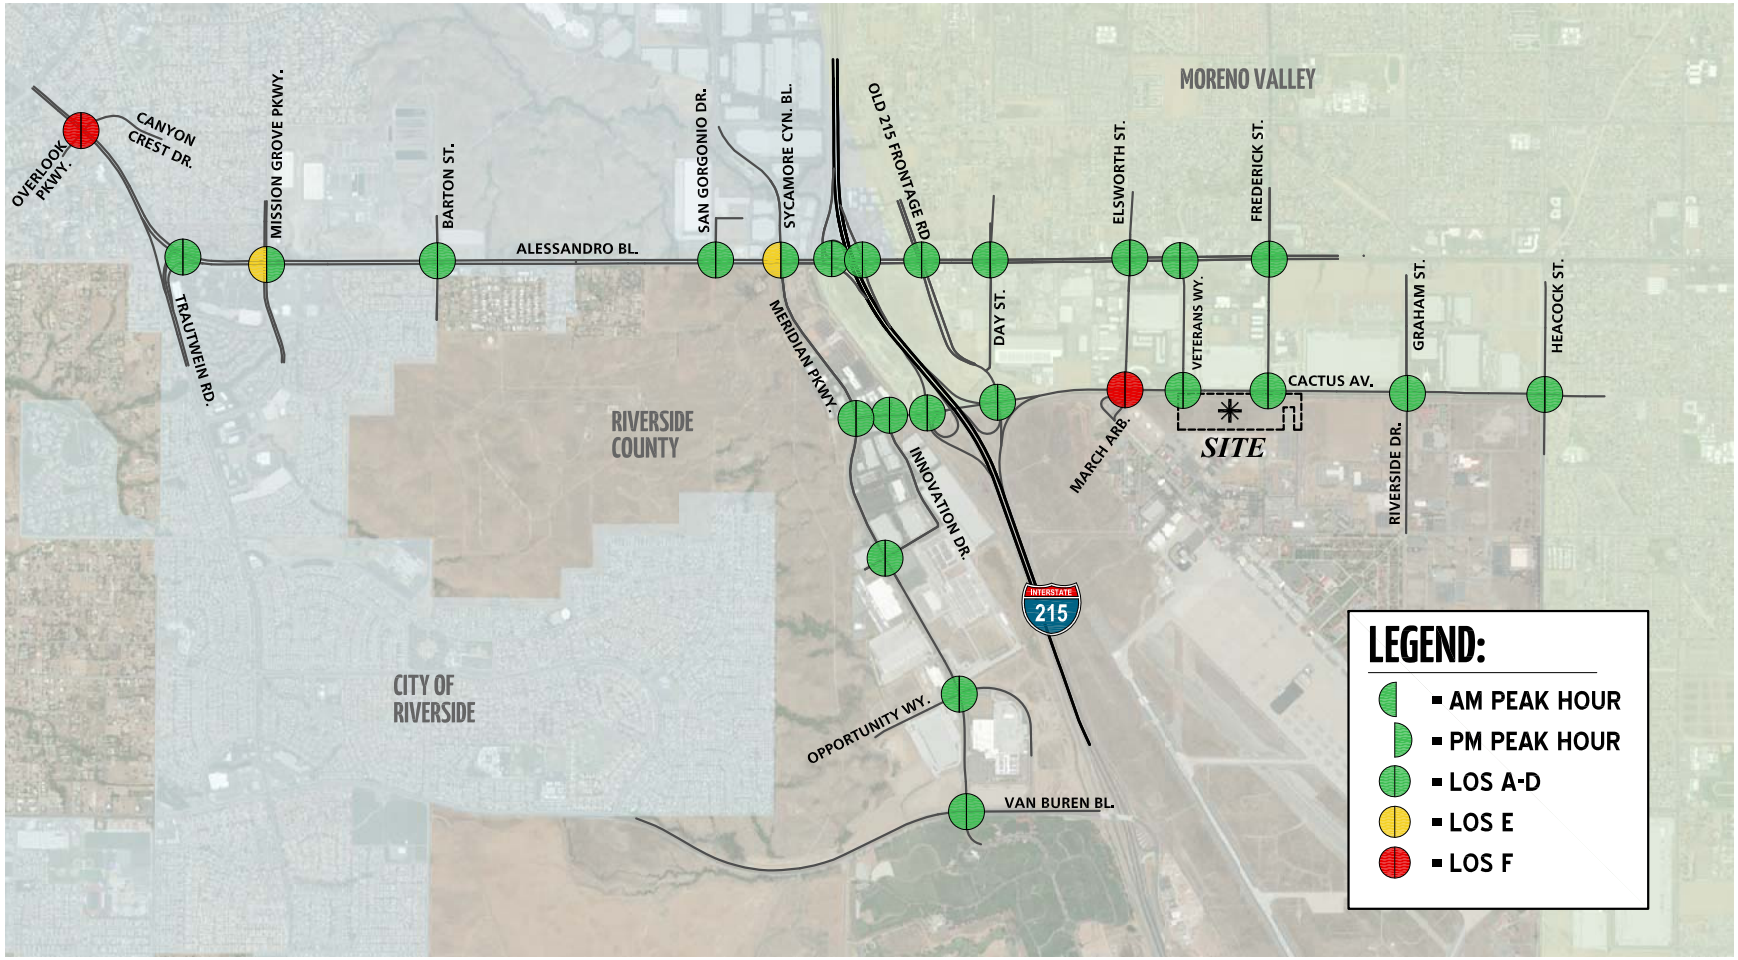

Table 3-1

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free-Right Turn Lane; d= Defacto Right Turn Lane

[2] Per the Highway Capacity Manual 6th Edition, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-street Stop; TS = Traffic Signal

Table 3-2

Peak Hour Freeway Off-Ramp Queuing Summary for Existing (2018) Conditions

Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet)[3]		Acceptable?[1]	
			AM Peak Hour	PM Peak Hour	AM	PM
I-215 SB Ramps & Cactus Av.	SBR	1,115	128	0	Yes	Yes
	NBR	1,850	0	0	Yes	Yes
I-215 NB Ramps & Cactus Av.	NBL	145	541[2]	45	Yes[4]	Yes
	NBT/R	1,650	294	54	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Maximum queue length for the approach reported.

[4] Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 Freeway mainline.

3.10 EXISTING (2018) CONDITIONS BASIC FREEWAY SEGMENT ANALYSIS

Existing mainline directional volumes for the weekday AM and PM peak hours are provided on Exhibit 3-16. As shown on Table 3-3, the basic freeway segments analyzed for this study were found to operate at an acceptable LOS (i.e., LOS D or better) during the peak hours. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the PM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F. Existing basic freeway segment analysis worksheets are provided in Appendix 3.4.

3.11 EXISTING (2018) CONDITIONS FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations were also evaluated for Existing conditions and the results of this analysis are presented in Table 3-4. As shown in Table 3-4, the freeway ramp merge and diverge areas currently operate at LOS D or better. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F. Existing freeway ramp junction operations analysis worksheets are provided in Appendix 3.5.

[3] LOS = Level of Service

[4] Observations made in the field indicate that the freeway segments experience traffic congestion due to queuing from downstream bottlenecks.

This Page Intentionally Left Blank

4 PROJECTED FUTURE TRAFFIC

This section presents the traffic volumes estimated to be generated by the Project, as well as the Project's trip assignment onto the study area roadway network. The proposed Project involves the development of the approximately 35.4-acre site with a 718,000 square foot building. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. The Project is located within Zone D of the Riverside County Airport Land Use Commission (RCALUC) Plan. Due to the proximity of the Project to the airport, there are occupancy restrictions that are applicable for the industrial uses. As such, there are generally no incompatible industrial uses with Zone D of the RCALUC.

The Project site plan proposes access along Cactus Avenue. Cactus Avenue is assumed to allow full-access turning movements. Regional access to the project site is provided via the I-215 Freeway at Alessandro Boulevard and Cactus Avenue interchanges.

4.1 PROJECT TRIP GENERATION

Trip generation represents the amount of traffic which is both attracted to and produced by a development. Determining traffic generation for a specific project is therefore based upon forecasting the amount of traffic that is expected to be both attracted to and produced by the specific land uses being proposed for a given development.

Trip generation rates for the Project in actual vehicles are shown in Table 4-1.

The trip generation summary illustrating daily and peak hour trip generation estimates for the proposed Project are shown on Table 4-2 based on actual vehicles. The trip generation rates used for this analysis are based upon information collected by the ITE as provided in their *Trip Generation* manual, 10th Edition, 2017. (3) For purposes of this analysis, ITE land use code 155 (High-Cube Fulfillment Center Warehouse) have been used to derive site-specific trip generation estimates. In order to accurately reflect the impact that heavy trucks would have on the street system, Project trips have been further broken down between passenger cars and trucks for each of the peak hours and weekday daily trip generation. As noted on Table 4-1, refinements to the raw trip generation estimates have been made to provide a more detailed breakdown of trips by vehicle mix. Total vehicle mix percentages were also obtained from the ITE Trip Generation manual in conjunction with the SCAQMD recommended truck mix, by axle type.

As shown on Table 4-2, the proposed Project is anticipated to generate a net total of 5,873 trip-ends per day with 425 AM peak hour trips and 983 PM peak hour trips (actual vehicles as opposed to PCE).

For the purposes of this analysis, it is proposed that the actual vehicles be utilized in order to most accurately reflect the effects of heavy trucks in the analysis. Trucks will be accounted for in the analysis as a percentage of total traffic, which will be input into the analysis software (Synchro, Version 10).

Table 4-1

Project Trip Generation Rates

Land Use[1]	ITE LU Code	Units[2]	AM Peak Hour			PM Peak Hour			Daily
			In	Out	Total	In	Out	Total	
Trip Generation Rates (Actual Vehicles)[1]									
High-Cube Fulfillment Center Warehouse[3]	155	TSF	0.454	0.136	0.590	0.384	0.986	1.370	8.180
Passenger Cars (AM-97.2%; PM-98.2%; Daily-91.2%)			0.442	0.132	0.573	0.377	0.969	1.345	7.460
2-Axle Trucks (AM-0.47%; PM-0.30%; Daily-1.47%)			0.002	0.001	0.003	0.001	0.003	0.004	0.120

[1] Trip Generation Source: Institute of Transportation Engineers (ITE), Trip Generation Manual, Tenth Edition (2017).

[2] TSF = Thousand Square Feet

[3] TOTAL NET TRIPS (Actual Vehicles) = Passenger Cars + Net Truck Trips (Actual Trucks).

The ITE Trip Generation Manual (2017) trip generation rates for high-cube fulfillment center use (ITE land use code 155) are based on limited data (i.e., one to two surveyed sites) and the ITE Trip Generation Manual recommends the use of local data sources where available. As such, Project trip generation has been calculated based on the trip-generation statistics published in the TUMF High-Cube Warehouse Trip Generation Study (WSP, January 29, 2019) which was commissioned by Western Riverside Council of Governments (WRCOG) in support of the Transportation Uniform Mitigation Fee (TUMF) update. The WRCOG trip generation rates are based on data collected at 11 local high-cube fulfillment center sites in Riverside and San Bernardino Counties. As shown in Table 4-3, using the ITE land use code 155 generates far more trips than using the WRCOG rates. The WRCOG data is far more accurate for estimating the number of trips that the proposed Project will generate. However, the proposed Project's impacts were conservatively analyzed using the ITE land use code 155 which vastly overstates the proposed project's contribution to traffic, as well as impacts from traffic such as air quality, noise, greenhouse gas, and health risks.

4.2 PROJECT TRIP DISTRIBUTION

The Project trip distribution and assignment process represents the directional orientation of traffic to and from the Project site. The trip distribution pattern of passenger cars is heavily influenced by the geographical location of the site, the location of surrounding land uses, and the proximity to the regional freeway system. The trip distribution pattern for truck traffic is also influenced by the local truck routes approved by the March JPA, City of Riverside, City of Moreno Valley, and Caltrans. Given these differences, separate trip distributions were generated for both passenger cars and truck trips. Exhibit 4-1 illustrates the trip distribution patterns for passenger cars. Exhibits 4-2 illustrates the truck trip distribution patterns.

4.3 MODAL SPLIT

The potential for Project trips (non-truck) to be reduced by the use of public transit, walking or bicycling have not been included as part of the Project's estimated trip generation. Essentially, the Project's traffic projections are "conservative" in that these alternative travel modes would reduce the forecasted traffic volumes (non-truck trips only or employee trips).

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project ADT and peak hour intersection turning movement volumes are shown on Exhibit 4-3 and 4-4, respectively.

4.5 CONSTRUCTION TRAFFIC

Project construction activities may potentially result in temporary and transient traffic deficiencies related to:

- Construction employee commutes;
- Import of construction materials and soils; and
- Transport and use of heavy construction equipment.

The Applicant would be required to develop and implement a March JPA-approved Construction Traffic Management Plan addressing potential construction-related traffic detours and disruptions. In general, the Construction Traffic Management Plan would ensure that to the extent practical, construction traffic would access the Project site during off-peak hours; and that construction traffic would be routed to avoid travel through, or proximate to, sensitive land uses.

Additionally, the Project would include improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. The current drainage ditch is planned to be undergrounded in a box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). This portion of the Project is being discussed with Riverside County Flood Control and Water Conservation District and the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan.

4.6 BACKGROUND TRAFFIC

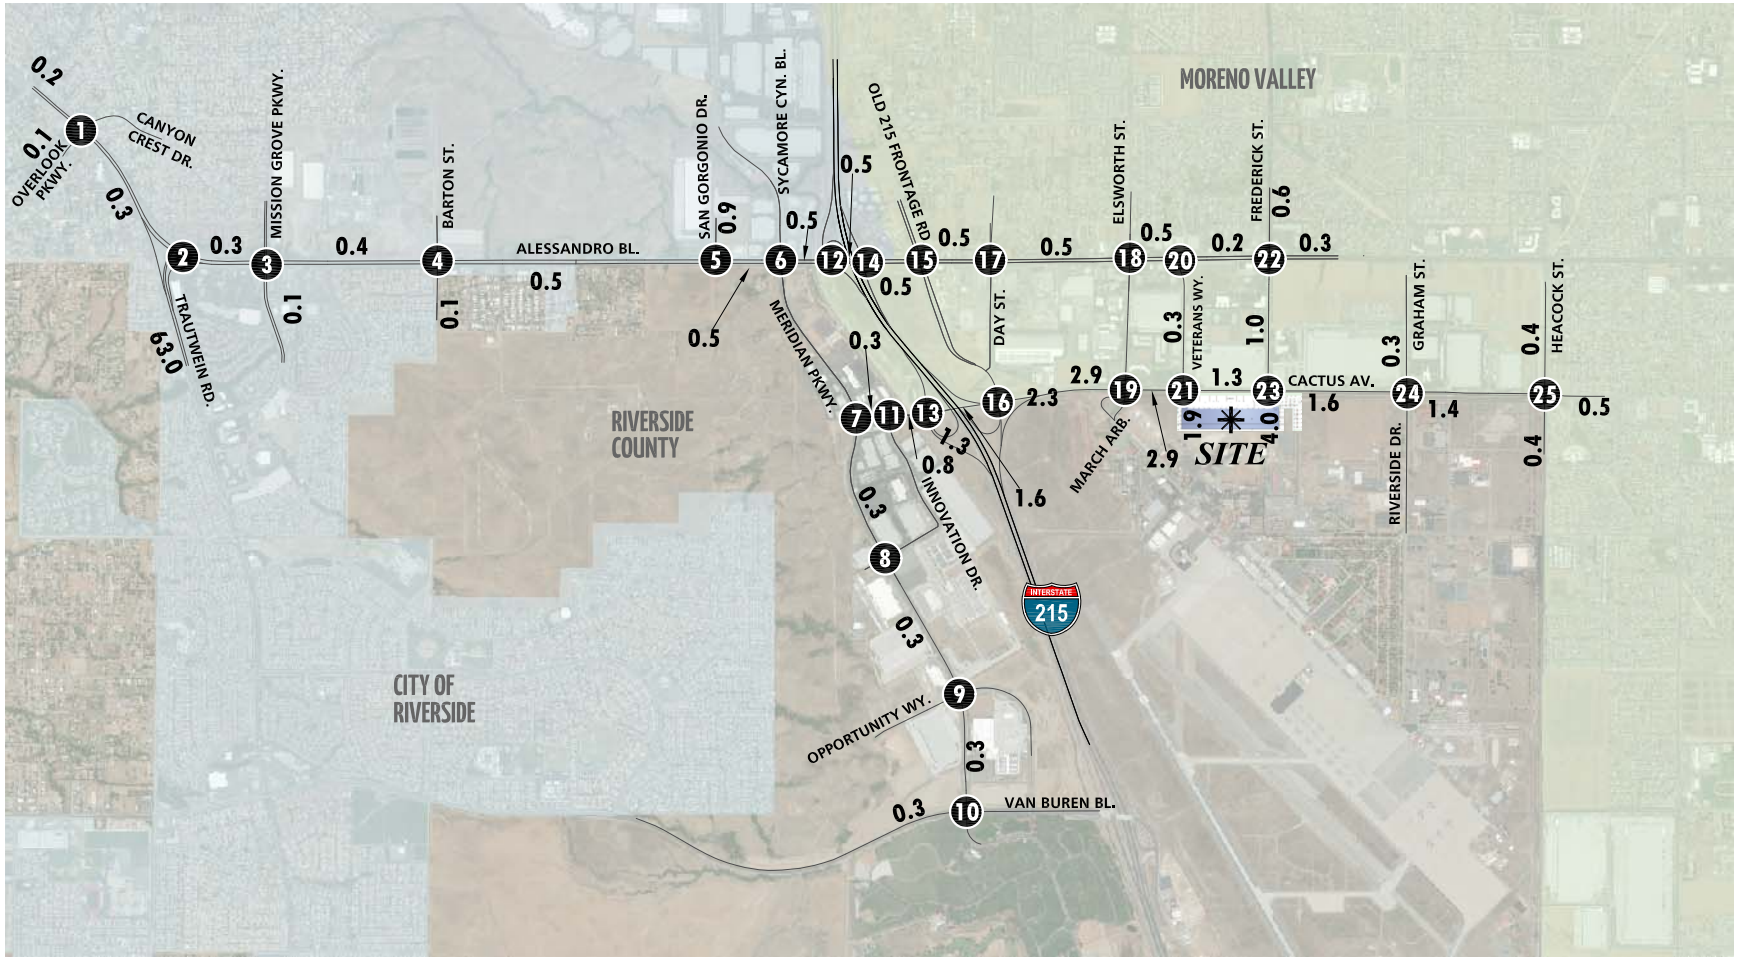
To account for growth in traffic between Existing Conditions (2018) and the Project Opening Year Cumulative (2023), a compounded annual traffic growth rate of 2.0 percent was assumed (10.41 percent aggregate growth in background traffic for the period between 2018 and 2023). The 2.0 percent annual growth rate is intended to capture non-specific ambient traffic growth.

In context, the TIA's assumed 2.0 percent compounded annual growth rate is considered a reasonable approximation of future traffic growth when compared to demographic projections reflected in other local and regional growth modeling efforts. More specifically, the Southern California Association of Governments (SCAG) 2016—2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) growth forecasts for the unincorporated County of Riverside assume the County population to increase from 359,000 in 2012 to 499,200 by the year 2040, or an approximate 1.18 percent growth rate compounded annually. The RTP/SCS assumed growth in households over the same 28-year period reflects an increase from 112,300 households to 162,900 households; a rate of 1.34 percent compounded annually. At the upper end of assumed RTP/SCS growth rates, employment over the same 28-year period is projected to increase from 70,500 jobs to 156,600 jobs; a rate of approximately 2.89 percent compounded annually. (9) The 2.0 percent compounded annual traffic growth rate used in the TIA reflects the fact that not all persons comprising population growth, household growth, or employment growth would translate on a one-to-one basis as a new vehicle trip in the region; and establishes a judicious midrange estimate lying between the RTP/SCS assumed regional

population growth rate (1.18 percent) and the RTP/SCS assumed regional employment growth rate (2.89 percent).

Conservatively, the TIA estimates of area traffic growth then add traffic generated by other known or probable related projects defined in Section 4.6 *Cumulative Development Traffic*. These related projects are at least in part already accounted for in the assumed annual 2.0 percent ambient growth in traffic noted above; and in some instances, these related projects would likely not be implemented and functional within the 2023 Opening Year Cumulative time frame assumed for the Project. The resulting traffic growth rate used in the TIA (2.0 percent annual ambient growth plus traffic generated by related projects) would therefore tend to overstate rather than understate background cumulative traffic impacts under 2023 conditions.

4.7 CUMULATIVE DEVELOPMENT TRAFFIC



California Environmental Quality Act (CEQA) guidelines require that other reasonably foreseeable development projects which are either approved or being processed concurrently in the study area also be included as part of a cumulative analysis scenario. A cumulative project list was developed for the purposes of this analysis through consultation with planning and engineering staff from the March JPA. The cumulative project list includes known and foreseeable projects that are anticipated to contribute traffic to the study area intersections.

Where applicable, cumulative projects anticipated to contribute measurable traffic (i.e. 50 or more peak hour trips) to study area intersections have been manually added to the study area network to generate Opening Year Cumulative forecasts. In other words, this list of cumulative development projects has been reviewed to determine which projects would likely contribute measurable traffic through the study area intersections (e.g., those cumulative projects in close proximity to the proposed Project). For the purposes of this analysis, the cumulative projects that were determined to affect one or more of the study area intersections are shown on Exhibit 4-5, listed on Table 4-4, and have been considered for inclusion. Based on the cumulative development traffic generation and trip distribution patterns, cumulative development ADT and peak hour intersection turning movement volumes are shown on Exhibit 4-6 and 4-7, respectively.

Although it is unlikely that all of these cumulative projects would be fully built and occupied by Year 2023, they have been included in an effort to conduct a conservative analysis and overstate as opposed to understate potential traffic impacts.

Any other cumulative projects that are not expected to contribute measurable traffic to study area intersections have not been included since the traffic would dissipate due to the distance from the Project site and study area intersections. Any additional traffic generated by other projects not on the cumulative projects list is accounted for through background ambient growth factors that have been applied to the peak hour volumes at study area intersections as discussed in Section 4.5 *Background Traffic*.

4.8 NEAR-TERM TRAFFIC FORECASTS

To provide a comprehensive assessment of potential transportation network deficiencies, a "buildup" analysis was performed in support of this work effort. The "buildup" method was used to approximate the Opening Year Cumulative traffic forecasts, and is intended to identify the cumulative impacts on both the existing and planned near-term circulation system. The Opening Year Cumulative traffic forecasts include background traffic, traffic generated by other cumulative development projects within the study area, and the traffic generated by the proposed Project.

The "buildup" approach combines existing traffic counts with a background ambient growth factor to forecast the near-term 2023 traffic conditions. An ambient growth factor of 10.41% (2023) accounts for background (area-wide) traffic increases that occur over time, up to the year 2023 from the year 2018 (compounded two percent per year growth over a 5-year period). Traffic volumes generated by the Project are then added to assess the Opening Year Cumulative traffic conditions. The 2023 roadway network is similar to the existing conditions roadway network with the exception of future roadways and intersections proposed to be developed by the Project.

As noted previously, an analysis of the proposed Project at various development tiers has been assessed for the purposes of this traffic study. The near-term traffic analysis includes the following traffic conditions, with the various traffic components:

- Opening Year Cumulative (2023) Without Project
    - Existing 2018 counts
    - Ambient growth (10.41%)
    - Cumulative Development traffic
- Opening Year Cumulative (2023) With Project
    - Existing 2018 counts
    - Ambient growth (10.41%)
    - Cumulative Development traffic
    - Project traffic

4.9 HORIZON YEAR (2040) VOLUME DEVELOPMENT

The Horizon Year (2040) Without Project traffic conditions were derived from the RivTAM modified to represent Horizon Year conditions using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between Existing conditions and Horizon Year conditions.

In most instances the traffic model zone structure is not designed to provide accurate turning movements along arterial roadways unless refinement and reasonableness checking is performed. Therefore, the Horizon Year Without Project peak hour forecasts were refined using the model derived long-range forecasts, along with existing peak hour traffic count data collected

at each analysis location in May 2018. Future estimated peak hour traffic data was used for new intersections and intersections with an anticipated change in travel patterns to further refine the Horizon Year Without Project peak hour forecasts.

The refined future peak hour approach and departure volumes obtained from the model output data are then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program (NCHRP Report 255), along with initial estimates of turning movement proportions. A linear programming algorithm is used to calculate individual turning movements which match the known directional roadway segment forecast volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

Typically, the model growth is prorated and is subsequently added to the existing (base validation) traffic volumes to represent Long Range traffic conditions. However, review of the resulting model growth indicates negative growth for several study area intersections. In an effort to conduct a conservative analysis, reductions to traffic forecasts from either Existing or Opening Year Cumulative traffic conditions were not assumed as part of this analysis. Additional growth has also been applied on a movement-by-movement basis, where applicable, to estimate reasonable Horizon Year forecasts. Horizon Year turning volumes were compared to Opening Year Cumulative volumes in order to ensure a minimum growth as a part of the refinement process. The minimum growth includes any additional growth between Opening Year Cumulative and Horizon Year traffic conditions that is not accounted for by the traffic generated by cumulative development projects and ambient growth rates assumed between Existing (2018) and Horizon Year traffic conditions. Future estimated peak hour traffic data was used for new intersections and intersections with an anticipated change in travel patterns to further refine the Horizon Year peak hour forecasts.

The future Horizon Year without Project peak hour turning movements were then reviewed by Urban Crossroads for reasonableness, and in some cases, were adjusted to achieve flow conservation, reasonable growth, and reasonable diversion between parallel routes. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two freeway ramp locations, is verified in order to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there are no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis.

The truck component of RivTAM has data that is unusually low. As such, in an effort to conduct a conservative analysis, the presence of trucks has been accounted for based on the manual volume adjustments made to demonstrate growth above Opening Year Cumulative traffic forecasts, which are presented and evaluated in actual vehicles. As such, the Horizon Year forecasts are also assumed to be in actual vehicles for the purposes of this analysis.

Post-processing worksheets for Horizon Year Without Project traffic conditions are provided in Appendix 4.1.

5 E+P TRAFFIC CONDITIONS

This section discusses the traffic forecasts for E+P (Project Buildout) conditions and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

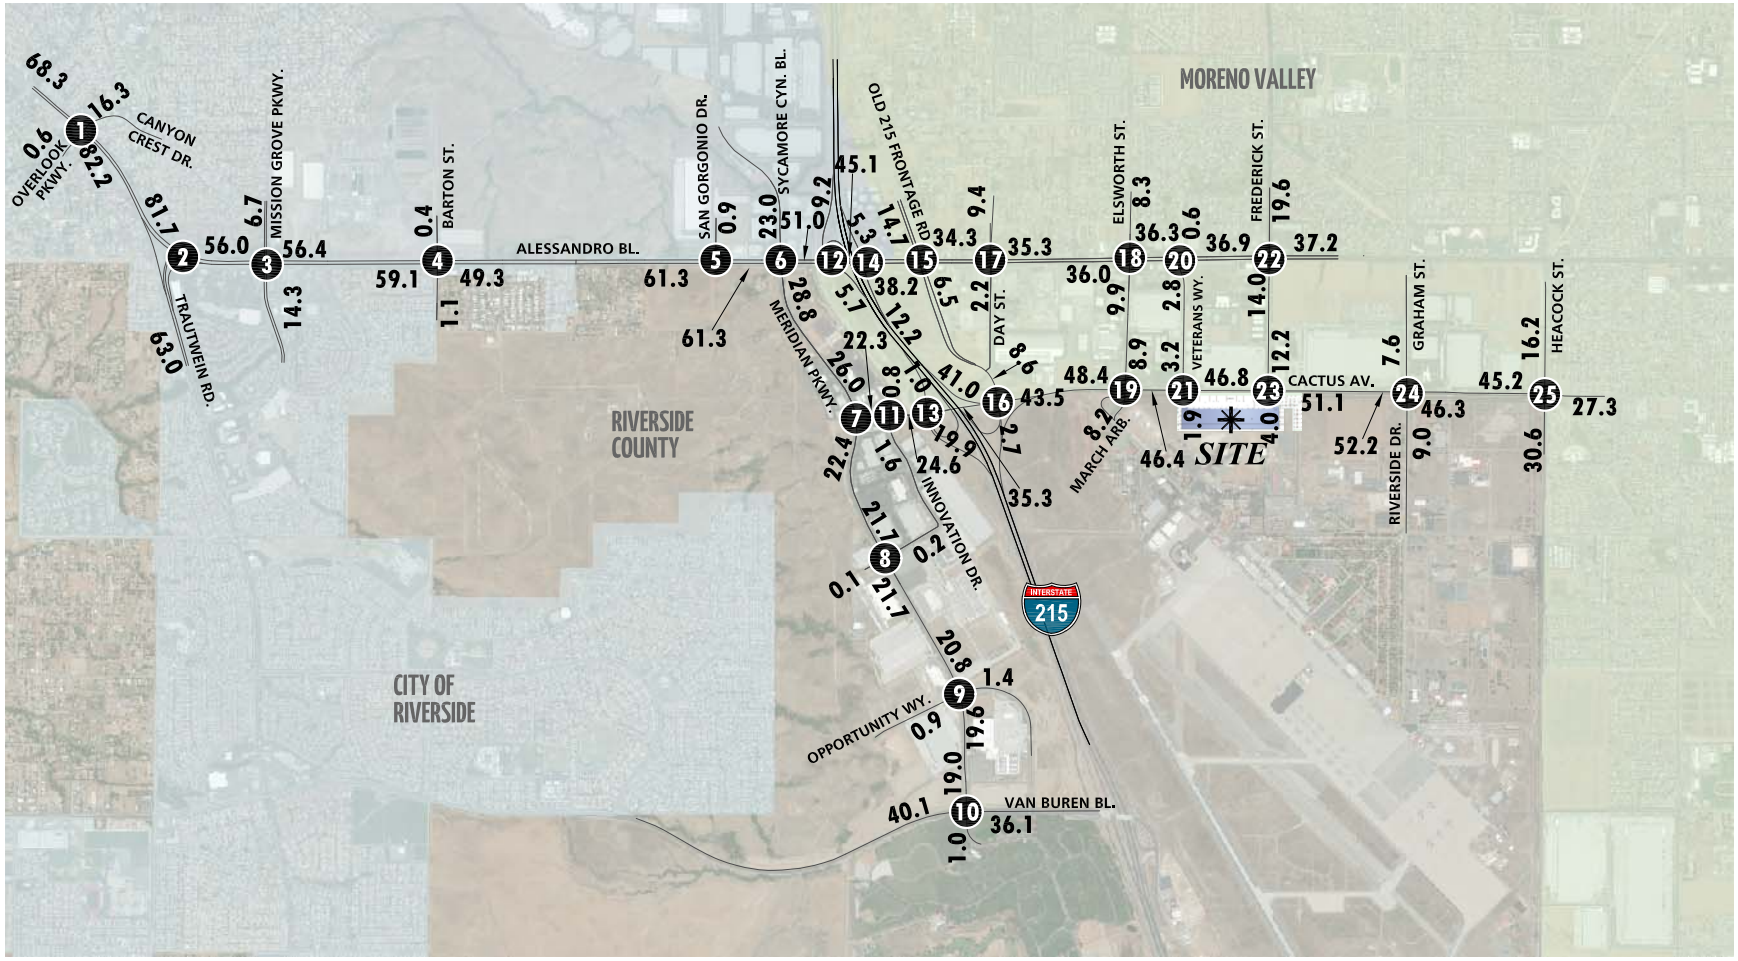
5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for E+P conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for E+P conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).

5.2 TRAFFIC VOLUME FORECASTS

This scenario includes Existing traffic volumes plus Project Buildout traffic. Exhibits 5-1 and 5-2 show the ADT and peak hour volumes which can be expected for E+P traffic conditions.



5.3 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TIA. The intersection analysis results are summarized in Table 5-1, which indicates that four study area intersections are anticipated to operate at the same unacceptable LOS for E+P traffic conditions, as previously identified under Existing (2018) conditions (see Section 3.7). The significant impacts are summarized in Table 5-2, which indicates that two study area intersections are anticipated to be significantly impacted.

Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1) – Although this intersection was found to operate at an unacceptable LOS (LOS F) during the AM and PM peak hours under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during the peak hours with the addition of Project traffic. The increase in peak hour delay is anticipated to be greater than one second. Therefore, there is a significant impact based of the City of Riverside's peak hour delay criteria for intersections operating at LOS F.

As the deficiency is caused by minimum green times necessary for pedestrian crossing time, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. Potential physical improvements such as grade-separated pedestrian crossings would not be financially feasible based on the pedestrian and bicycle activity at this location. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at both these intersections (also validated by peak hour count data).

* **BOLD** = Significant Impact

N/A = Not Applicable

[1] For intersections within the jurisdiction of March JPA, impact is significant if the pre-project condition is at or better than LOS D (or acceptable LOS) and the project-generated traffic causes deterioration below acceptable levels, a deficiency is deemed to occur. However, if the pre-project condition is already below LOS D (or acceptable LOS), impact is significant if the Project contributes more than 2% of the total traffic.

[2] For intersections within the jurisdiction of the City of Riverside, a significant impact occurs at a study area intersection when the addition of project related trips causes either peak hour LOS to degrade from acceptable (LOS A through D) to unacceptable levels (LOS E/F) or the peak hour delay to increase as follows:
- LOS A/B = By 10.0 seconds
- LOS C = By 8.0 seconds
- LOS D = By 5.0 seconds
- LOS E = By 2.0 seconds
- LOS F = By 1.0 seconds

[3] For intersections within the jurisdiction of Caltrans, the County of Riverside, or City of Moreno Valley, impact is significant if the pre-project condition is at or better than LOS D (or acceptable LOS) and the project-generated traffic causes deterioration below acceptable levels, a deficiency is deemed to occur. An impact is also significant if the Project contributes 50 or more peak hour trips to an already deficient intersection.

Mission Grove Parkway & Alessandro Boulevard (#3) – Although this intersection was found to operate at an unacceptable LOS (LOS E) during the AM peak hour under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during the peak hours with the addition of Project traffic. The increase in peak hour delay is anticipated to be less than two seconds. Therefore, there is no significant impact based of the City of Riverside's peak hour delay criteria for intersections operating at LOS E.

Sycamore Canyon Boulevard & Alessandro Boulevard (#6) – Although this intersection was found to operate at an unacceptable LOS (LOS E) during the AM peak hour under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels (LOS F) during the peak hours with the addition of Project traffic. The increase in peak hour delay is anticipated to be less than two seconds. Therefore, there is no significant impact based of the City of Riverside's peak hour delay criteria for intersections operating at LOS E.

Elsworth Street & Cactus Avenue (#19) – Although this intersection was found to operate at an unacceptable LOS (LOS F) during the AM and PM peak hours under Existing traffic conditions, the intersection is anticipated to continue to operate at unacceptable levels during the AM peak hour with the addition of Project traffic. The project traffic is more than 2% of the total traffic for E+P conditions. Therefore, there is a significant impact based on March JPA's 2% significance criteria.

A summary of the peak hour intersection LOS for E+P conditions are shown on Exhibit 5-3. The intersection operations analysis worksheets for E+P traffic conditions are included in Appendix 5.1 of this TIA.

5.4 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants are conducted for unsignalized intersections operating at LOS E or F. For E+P traffic conditions, there are no unsignalized study area intersections that operate at an unacceptable LOS.

5.5 OFF-RAMP QUEUING ANALYSIS

A queuing analysis was performed for the off-ramps at the I-215 Freeway at Cactus Avenue interchanges to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-215 Freeway mainline. Queuing analysis findings are presented in Table 5-3 for E+P traffic conditions. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown on Table 5-3 and consistent with Existing traffic conditions, the anticipated vehicle queues would be accommodated by the turning lane's available storage length.

Worksheets for E+P traffic conditions off-ramp queuing analysis are provided in Appendix 5.2.

EXHIBIT 5-3: E+P SUMMARY OF LOS

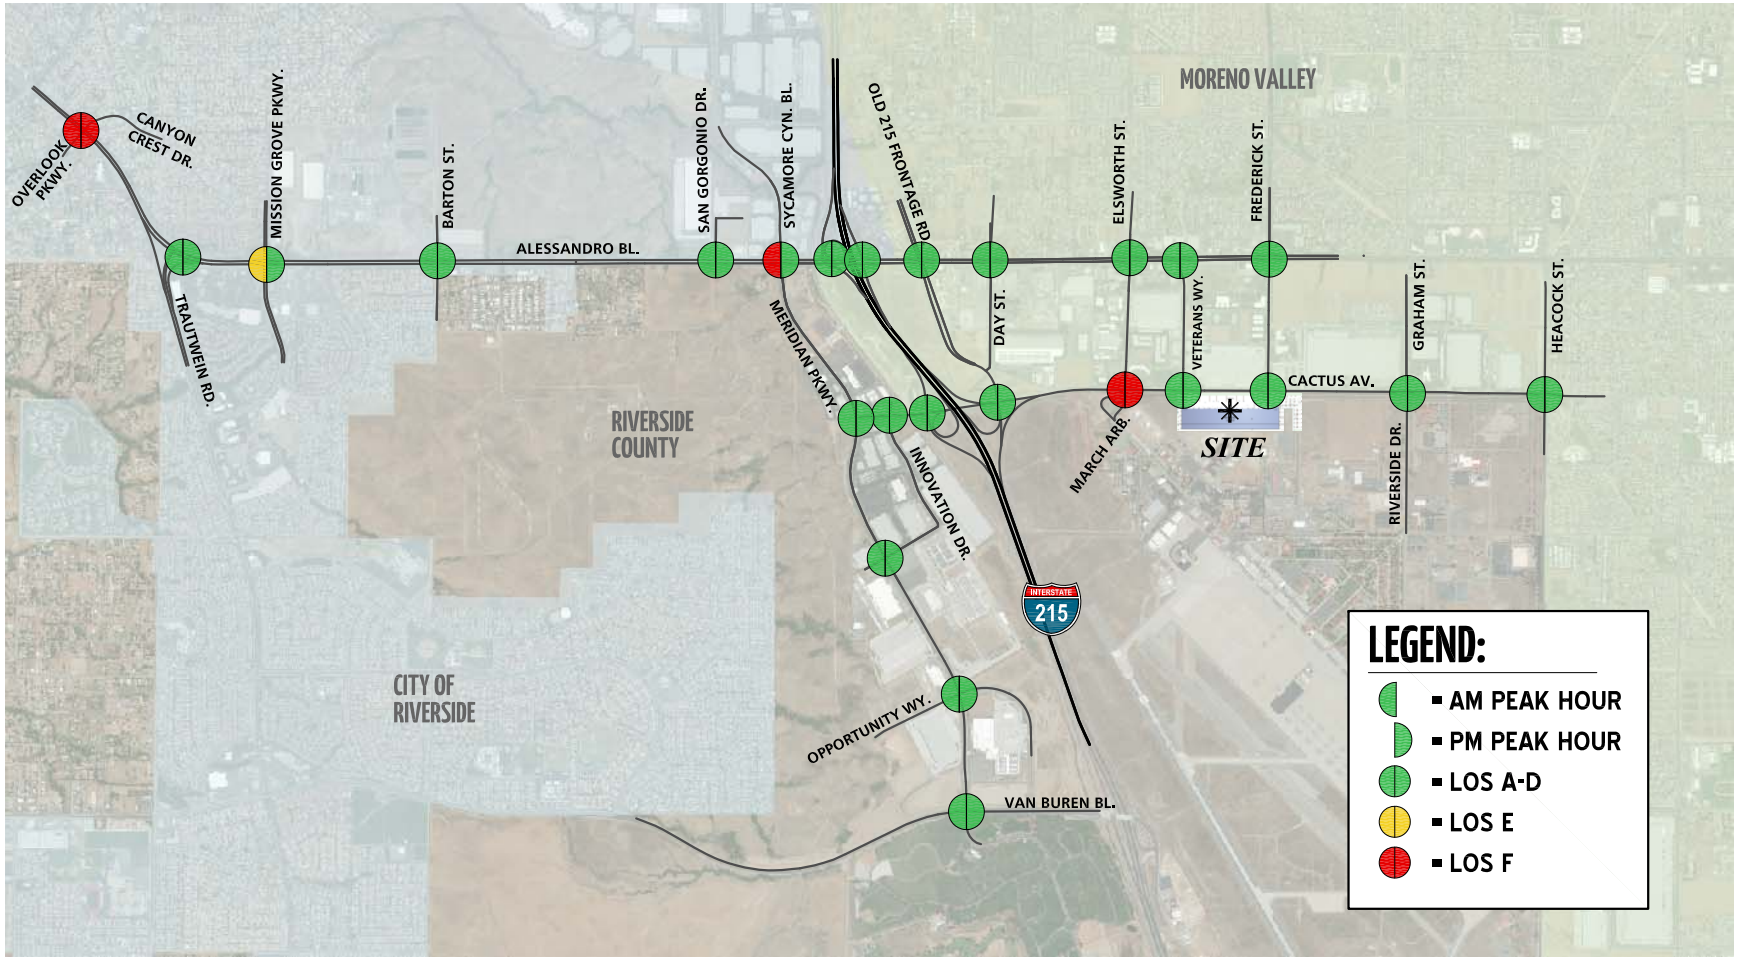

Table 5-3

Peak Hour Freeway Off-Ramp Queuing Summary for E+P Conditions

Intersection	Movement	Available Stacking Distance (Feet)	Existing (2018)				E+P			
			95th Percentile Queue (Feet)[3]		Acceptable?[1]		95th Percentile Queue (Feet)[3]		Acceptable?[1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
I-215 SB Ramps & Cactus Av.	SBR	1,115	128	0	Yes	Yes	128	0	Yes	Yes
	NBR	1,850	0	0	Yes	Yes	14	23	Yes	Yes
I-215 NB Ramps & Cactus Av.	NBL	145	541[2]	45	Yes[4]	Yes	550[2]	45	Yes[4]	Yes
	NBT/R	1,650	294	54	Yes	Yes	300	54	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Maximum queue length for the approach reported.

[4] Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 Freeway mainline.

5.6 BASIC FREEWAY SEGMENT ANALYSIS

E+P mainline directional volumes for the weekday AM and PM peak hours are provided on Exhibit 5-4. As shown on Table 5-4 and consistent with Existing traffic conditions, the basic freeway segments analyzed for this study are anticipated to operate at an acceptable LOS (i.e., LOS D or better) during the peak hours, with the addition of Project traffic. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

E+P basic freeway segment analysis worksheets are provided in Appendix 5.3.

5.7 FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations were also evaluated for E+P traffic conditions and the results of this analysis are presented in Table 5-5. As shown in Table 5-5 and consistent with Existing traffic conditions, the freeway ramp merge and diverge areas are anticipated to operate at LOS D or better. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

E+P freeway ramp junction operations analysis worksheets are provided in Appendix 5.4.

EXHIBIT 5-4: E+P FREEWAY MAINLINE VOLUMES

Table 5-4

Basic Freeway Segment Analysis for E+P Conditions

Freeway	Direction[1]	Mainline Segment	Lanes[2]	Existing (2018)				E+P			
				Density[3]		LOS[4]		Density[3]		LOS[4]	
				AM	PM	AM	PM	AM	PM	AM	PM
I-215	SB	North of Cactus Av.	4	15.1	--[5]	B	**F**	15.3	--[5]	B	**F**
		South of Cactus Av.	4	14.3	--[5]	B	**F**	14.3	--[5]	B	**F**
	NB	North of Cactus Av.	4	--[5]	--[5]	**F**	**F**	--[5]	--[5]	**F**	**F**
		South of Cactus Av.	4	--[5]	--[5]	**F**	**F**	--[5]	--[5]	**F**	**F**

* **BOLD** = Unacceptable Level of Service

[1] NB = Northbound; SB = Southbound

[2] Number of lanes are in the specified direction and is based on existing conditions.

[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[4] LOS = Level of Service

[5] Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

Table 5-5

Freeway Ramp Junction Merge/Diverge Analysis for E+P Conditions

Freeway	Direction	Ramp or Segment	Lanes on Freeway[1]	Existing (2018)				E+P			
				AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
				Density[2]	LOS[3]	Density[2]	LOS[3]	Density[2]	LOS[3]	Density[2]	LOS[3]
I-215	Southbound	Off-Ramp at Cactus Av.	4	15.4	B	--[4]	**F**	15.7	B	--[4]	**F**
		Loop Off-Ramp at Cactus Av.	4	16.1	C	--[4]	**F**	16.5	C	--[4]	**F**
		On-Ramp at Cactus Av.	3	21.0	C	--[4]	**F**	21.2	C	--[4]	**F**
	Northbound	On-Ramp at Cactus Av.	3	--[4]	**F**	--[4]	**F**	--[4]	**F**	--[4]	**F**
		Loop On-Ramp at Cactus Av.	3	--[4]	**F**	--[4]	**F**	--[4]	**F**	--[4]	**F**
		Off-Ramp at Cactus Av.	3	--[4]	**F**	--[4]	**F**	--[4]	**F**	--[4]	**F**

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Number of lanes are in the specified direction and is based on existing conditions.

[2] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[3] LOS = Level of Service

[4] Observations made in the field indicate that the freeway segments experience traffic congestion due to queuing from downstream bottlenecks.

5.8 RECOMMENDED IMPROVEMENTS

5.8.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed recommended improvements is presented in Table 5-6 for E+P traffic conditions. As shown on Table 5-6, the recommended improvements for each of the deficient and significantly impacted intersections are the same for Existing and E+P traffic conditions. Based on the each jurisdiction's significance criteria (see Table 5-2), the Project is anticipated to result in a significant impact at the intersections of Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard and Elsworth Street & Cactus Avenue. As the Project would not contribute significantly to the total traffic for E+P traffic conditions at the other intersections mentioned previously in Section 5.3, the Project would result in a less-than-significant impact at these locations.

Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 1.1 – Elsworth Street & Cactus Avenue (#19)

- Contribute fair share towards the modification of the traffic signal to implement protected left turn phasing on the northbound and southbound approaches and restriping of the northbound shared left-through-right turn lane and southbound shared left-through lane.

The intersection operations analysis worksheets for E+P, with improvements, are included in Appendix 5.5.

The locations where only a fair share contribution has been identified would remain a significant impact until such time the recommended improvement is implemented. Because the March JPA does not have plenary control over intersections under other jurisdictions, the March JPA cannot guarantee that such improvements will be constructed. As such, the impacts are considered significant and unavoidable.

5.8.2 RECOMMENDED IMPROVEMENTS TO ADDRESS OFF-RAMP QUEUES

As shown previously on Table 5-2 and consistent with Existing traffic conditions, there are no peak hour queuing issues anticipated at the I-215 Freeway at Cactus Avenue interchange for E+P traffic conditions. As such, no improvements have been recommended.

Table 5-6

Intersection Analysis for E+P Conditions With Improvements

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
			Northbound			Southbound			Eastbound			Westbound						
			L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
19	Elsworth St. & Cactus Av.																	
	Existing (2018)	TS	1	1	0	1	1	1>	1	3	1>>	1	3	1	**189.6**	**99.1**	**F**	**F**
	- With Improvements[4]	TS	1	1	0	1	1	1>	1	3	1>>	1	3	1	21.6	28.8	C	C
	E+P (Project Buildout)	TS	1	1	0	1	1	1>	1	3	1>>	1	3	1	**212.3**	**160.3**	**F**	**F**
	- With Improvements[4]	TS	1	1	0	1	1	1>	1	3	1>>	1	3	1	21.8	31.1	C	C

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free Right Turn Lane; **1** = Improvement

[2] Per the Highway Capacity Manual 6th Edition, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal

[4] Recommended improvement consists of modifying the traffic signal to implement protected left turn phasing on the northbound and southbound approaches.

5.8.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

As shown previously on Table 5-3 and Table 5-4 and consistent with Existing traffic conditions, the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the March JPA (or other neighboring jurisdictions) on SHS roadway segments. The WRCOG TUMF Program identifies this interchange, inclusive of on/off-ramps as a transportation mitigation project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along the I-215 Freeway. As such, no improvements have been recommended, and the impact to the freeway facility is significant and unavoidable.

This Page Intentionally Left Blank

6 OPENING YEAR CUMULATIVE (2023) TRAFFIC CONDITIONS

This section discusses the methods used to develop Opening Year Cumulative (2023) Without and With Project traffic forecasts, and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

6.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Opening Year Cumulative (2023) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by the cumulative development projects to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the cumulative development's frontage and driveways). Other connections assumed include the extension of San Gorgonio Avenue, south of Alessandro Boulevard, and the extension of Cactus Avenue, west of Meridian Parkway as shown in Exhibit 6-1.

6.2 OPENING YEAR CUMULATIVE (2023) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2023) Without Project traffic conditions are shown on Exhibits 6-2 and 6-3, respectively.

6.3 OPENING YEAR CUMULATIVE (2023) WITH PROJECT TRAFFIC VOLUME FORECASTS

The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Opening Year Cumulative (2023) With Project traffic conditions are shown on Exhibits 6-4 and 6-5, respectively.

EXHIBIT 6-5: OPENING YEAR CUMULATIVE (2023) WITH PROJECT TRAFFIC VOLUMES

6.4 INTERSECTION OPERATIONS ANALYSIS

6.4.1 OPENING YEAR CUMULATIVE (2023) WITHOUT PROJECT TRAFFIC CONDITIONS

LOS calculations have been conducted for the study intersections to evaluate their operations under Opening Year Cumulative (2023) Without Project conditions with roadway and intersection geometrics consistent with Section 6.1 Roadway Improvements. As shown in Table 6-1, the following intersections were found to operate at a deficient LOS:

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1) – LOS F AM and PM peak hours
- Mission Grove Pkwy. & Alessandro Bl. (#3) – LOS F AM peak hour only
- Sycamore Canyon Bl. & Alessandro Bl. (#6) – LOS F AM and PM peak hours
- Meridian Pkwy. & Cactus Av. (#7) – LOS F AM and PM peak hours
- Meridian Pkwy. & Van Buren Bl. (#10) – LOS F AM and PM peak hours
- Innovation Dr. & Cactus Av. (#11) – LOS F PM peak hour only
- Old 215 Frontage Rd./I-215 NB Ramps & Cactus Av. (#16) – LOS F AM peak hour; LOS E PM peak hour
- Elsworth St. & Cactus Av. (#19) – LOS F AM and PM peak hours
- Heacock St. & Cactus Av. #25) – LOS F AM peak hour; LOS E PM peak hour

A summary of the peak hour intersection LOS for Opening Year Cumulative (2023) Without Project conditions are shown on Exhibit 6-6. The intersection operations analysis worksheets for Opening Year Cumulative (2023) Without Project traffic conditions are included in Appendix 6.1 of this TIA.

6.4.2 OPENING YEAR CUMULATIVE (2023) WITH PROJECT TRAFFIC CONDITIONS

As shown on Table 6-1 and illustrated on Exhibit 6-7, there are no additional study area intersections anticipated to operate at an unacceptable LOS with the addition of Project traffic during one or more peak hours, in addition to those previously identified under Opening Year Cumulative (2023) Without Project traffic conditions. The intersection operations analysis worksheets for Opening Year Cumulative (2023) With Project traffic conditions are included in Appendix 6.2 of this TIA. The significant impacts are summarized in Table 6-2. Measures to address near-term deficiencies for Opening Year Cumulative traffic conditions are discussed in Section 6.9 *Opening Year Cumulative (2023) Deficiencies and Recommended Improvements.*

As the deficiencies at Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard and Sycamore Canyon Boulevard & Alessandro Boulevard are caused by minimum green times necessary for pedestrian crossing time, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. Potential physical improvements such as grade-separated pedestrian crossings would not be financially feasible based on the pedestrian and bicycle activity at this location. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at both these intersections (also validated by peak hour count data).

Table 6-1

Intersection Analysis for Opening Year Cumulative (2023) Conditions

* **BOLD** = Significant Impact

N/A = Not Applicable

[1] For intersections within the jurisdiction of March JPA, impact is significant if the pre-project condition is at or better than LOS D (or acceptable LOS) and the project-generated traffic causes deterioration below acceptable levels, a deficiency is deemed to occur. However, if the pre-project condition is already below LOS D (or acceptable LOS), impact is significant if the Project contributes more than 2% of the total traffic.

[2] For intersections within the jurisdiction of the City of Riverside, a significant impact occurs at a study area intersection when the addition of project related trips causes either peak hour LOS to degrade from acceptable (LOS A through D) to unacceptable levels (LOS E/F) or the peak hour delay to increase as follows:
- LOS A/B = By 10.0 seconds
- LOS C = By 8.0 seconds
- LOS D = By 5.0 seconds
- LOS E = By 2.0 seconds
- LOS F = By 1.0 seconds

[3] For intersections within the jurisdiction of Caltrans, the County of Riverside, or City of Moreno Valley, impact is significant if the pre-project condition is at or better than LOS D (or acceptable LOS) and the project-generated traffic causes deterioration below acceptable levels, a deficiency is deemed to occur. An impact is also significant if the Project contributes 50 or more peak hour trips to an already deficient intersection.

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Opening Year Cumulative (2023) traffic conditions are conducted for unsignalized intersections operating at LOS E or F. For Opening Year Cumulative (2023) traffic conditions, there are no unsignalized study area intersections that currently operate at an unacceptable LOS.

6.6 OFF-RAMP QUEUING ANALYSIS

A queuing analysis was performed for the off-ramps at the I-215 Freeway at Cactus Avenue interchange to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-215 Freeway mainline. Queuing analysis findings are presented in Table 6-3 for Opening Year Cumulative (2023) Without and With Project traffic conditions. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown on Table 6-3, there are no queuing issues anticipated for Opening Year Cumulative (2023) Without and With Project traffic conditions.

Worksheets for Opening Year Cumulative (2023) Without Project conditions off-ramp queuing analysis are provided in Appendix 6.5. Worksheets for Opening Year Cumulative (2023) With Project conditions off-ramp queuing analysis are provided in Appendix 6.6.

6.7 BASIC FREEWAY SEGMENT ANALYSIS

6.7.1 OPENING YEAR CUMULATIVE (2023) WITHOUT PROJECT TRAFFIC CONDITIONS

Opening Year Cumulative (2023) Without Project mainline directional volumes for the weekday AM and PM peak hours are provided on Exhibit 6-8. As shown on Table 6-4, the freeway segments analyzed for this study are anticipated to operate at an acceptable LOS (i.e., LOS D or better) during the peak hours under Opening Year Cumulative (2023) With Project traffic conditions. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F. Opening Year Cumulative (2023) Without Project basic freeway segment analysis worksheets are provided in Appendix 6.7.

Table 6-3

Peak Hour Freeway Off-Ramp Queuing Summary for Opening Year Cumulative (2023) Conditions

Intersection	Movement	Available Stacking Distance (Feet)	2023 Without Project				2023 With Project			
			95th Percentile Queue (Feet)[3]		Acceptable? [1]		95th Percentile Queue (Feet)[3]		Acceptable? [1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
I-215 SB Ramps & Cactus Av.	SBR	1,115	147	0	Yes	Yes	146	0	Yes	Yes
	NBR	1,850	48	80	Yes	Yes	157 [2]	369	Yes	Yes
I-215 NB Ramps & Cactus Av.	NBL	145	892 [2]	111	Yes[4]	Yes	892 [2]	111	Yes[4]	Yes
	NBT/R	1,650	367 [2]	60	Yes	Yes	367 [2]	60	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Maximum queue length for the approach reported.

[4] Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 Freeway mainline.

Table 6-4

Basic Freeway Segment Analysis for Opening Year Cumulative (2023) Conditions

Freeway	Direction[1]	Mainline Segment	Lanes[2]	2023 Without Project				2023 With Project			
				Density[3]		LOS[4]		Density[3]		LOS[4]	
				AM	PM	AM	PM	AM	PM	AM	PM
I-215	SB	North of Cactus Av.	4	18.5	--[5]	C	**F**	18.9	--[5]	C	**F**
		South of Cactus Av.	4	17.6	--[5]	B	**F**	17.7	--[5]	B	**F**
	NB	North of Cactus Av.	4	--[5]	--[5]	**F**	**F**	--[5]	--[5]	**F**	**F**
		South of Cactus Av.	4	--[5]	--[5]	**F**	**F**	--[5]	--[5]	**F**	**F**

[1] NB = Northbound; SB = Southbound

[2] Number of lanes are in the specified direction and is based on existing conditions.

[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[4] LOS = Level of Service

[5] Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

EXHIBIT 6-8: OPENING YEAR CUMULATIVE (2023) WITHOUT PROJECT FREEWAY MAINLINE VOLUMES

6.7.2 OPENING YEAR CUMULATIVE (2023) WITH PROJECT TRAFFIC CONDITIONS

Opening Year Cumulative (2023) With Project mainline directional volumes for the weekday AM and PM peak hours are provided on Exhibit 6-9. As shown on Table 6-4, the freeway segments are anticipated to continue to operate at an acceptable LOS with the addition of Project traffic. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F. Worksheets for Opening Year Cumulative (2023) With Project conditions basic freeway segment analysis worksheets are provided in Appendix 6.8.

6.8 FREEWAY MERGE/DIVERGE ANALYSIS

6.8.1 OPENING YEAR CUMULATIVE (2023) WITHOUT PROJECT TRAFFIC CONDITIONS

Ramp merge and diverge operations were also evaluated for Opening Year Cumulative (2023) Without Project conditions and the results of this analysis are presented in Table 6-5. As shown in Table 6-5, the following freeway ramp merge and diverge areas evaluated for the purposes of this traffic study are anticipated to operate at unacceptable LOS during the peak hours (LOS E) during one or more of the peak hours:

- I-215 Freeway – Northbound, Off-Ramp at Cactus Avenue (#6) – LOS F AM peak hour only

However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. . Where applicable, the freeway mainline is assumed to operate at LOS F.

Opening Year Cumulative (2023) Without Project freeway ramp junction operations analysis worksheets are provided in Appendix 6.9.

Table 6-5

Freeway Ramp Junction Merge/Diverge Analysis for Opening Year Cumulative (2023) Conditions

Freeway	Direction	Ramp or Segment	Lanes on Freeway[1]	2023 Without Project				2023 With Project			
				AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
				Density[2]	LOS[3]	Density[2]	LOS[3]	Density[2]	LOS[3]	Density[2]	LOS[3]
I-215	Southbound	Off-Ramp at Cactus Av.	4	19.1	C	--[5]	**F**	19.4	C	--[5]	**F**
		Loop Off-Ramp at Cactus Av.	4	19.4	C	--[5]	**F**	20.4	C	--[5]	**F**
		On-Ramp at Cactus Av.	3	26.6	C	--[5]	**F**	26.7	C	--[5]	**F**
	Northbound	On-Ramp at Cactus Av.	3	--[5]	**F**	--[5]	**F**	--[5]	**F**	--[5]	**F**
		Loop On-Ramp at Cactus Av.	3	--[5]	**F**	--[5]	**F**	--[5]	**F**	--[5]	**F**
		Off-Ramp at Cactus Av.	3	--[4]	**F**	--[5]	**F**	--[4]	**F**	--[5]	**F**

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Number of lanes are in the specified direction and is based on existing conditions.

[2] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[3] LOS = Level of Service

[4] HCS7 does not report density for freeway facilities operating at LOS F.

[4] Observations made in the field indicate that the freeway segments experience traffic congestion due to queuing from downstream bottlenecks.

EXHIBIT 6-9: OPENING YEAR CUMULATIVE (2023) WITH PROJECT FREEWAY MAINLINE VOLUMES

6.8.2 OPENING YEAR CUMULATIVE (2023) WITH PROJECT TRAFFIC CONDITIONS

As shown on Table 6-5, there are no additional freeway merge/diverge ramp junctions anticipated to operate at an unacceptable LOS with the addition of Project traffic, in addition to those previously identified under Opening Year Cumulative (2023) Without Project conditions. However, the addition of Project traffic is not anticipated to result in an LOS letter grade change to the total Opening Year Cumulative traffic forecasts along the deficient freeway ramp junctions. As such, the Project's impact would be less than significant. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

Worksheets for Opening Year Cumulative (2023) With Project conditions freeway ramp junction operations analysis worksheets are provided in Appendix 6.10.

6.9 OPENING YEAR CUMULATIVE (2023) DEFICIENCIES AND MITIGATION MEASURES

6.9.1 MITIGATION MEASURES TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed mitigation measures for significantly impacted intersections (see Table 6-2) is presented in Table 6-6 for Opening Year Cumulative (2023) traffic conditions. Based on the each jurisdiction's significance criteria, the Project is anticipated to result in significant impacts at the following intersections, as the Project would contribute significantly to the total Opening Year Cumulative With Project traffic forecasts:

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1)
- Sycamore Canyon Bl. & Alessandro Bl. (#6)
- Old 215 Frontage Rd./I-215 NB Ramps & Cactus Av. (#16)
- Elsworth St. & Cactus Av. (#19)
- Heacock St. & Cactus Av. (#25)

The improvements identified at the remaining cumulatively impacted intersections are those needed to reduce the impact to less-than-significant, in addition to the improvements mentioned previously under E+P conditions. The impacts and mitigation measures for Opening Year Cumulative (2023) conditions are described below.

Mitigation Measure 2.1 – Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- Contribute fair share towards the restriping of the SB shared left-through lane as a 3rd left turn lane and the SB right turn lane as a shared through-right turn lane, and the modification of the traffic signal to implement protected left turn phasing on the northbound and southbound approaches.

Table 6-6

Intersection Analysis for Opening Year Cumulative (2023) Conditions With Improvements

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
			Northbound			Southbound			Eastbound			Westbound						
			L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
1	Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl.

	- 2023 With Project[5,6,7]	TS	1	2	d	**3**	1	**0**	1	3	0	1	3	1>	**66.6**	**68.8**	**E**	**E**
16	Old 215 Frontage Rd./I-215 NB Ramps & Cactus Av.																	
	- 2023 Without Project[4]	TS	**2**	1	0	1	1	0	1	2	0	0	**3**	**1**	46.4	32.0	D	C
	- 2023 With Project[4]	TS	**2**	1	0	1	1	0	1	2	0	0	**3**	**1**	48.1	35.3	D	D
19	Elsworth St. & Cactus Av.																	
	- 2023 Without Project[5]	TS	1	1	0	1	1	1>	1	3	1>>	1	3	1	40.1	48.8	D	D
	- 2023 With Project[5]	TS	1	1	0	1	1	1>	1	3	1>>	1	3	1	41.3	53.4	D	D
25	Heacock St. & Cactus Av.																	
	- 2023 Without Project	TS	2	2	0	1	2	0	1	**3**	1>	1	**3**	0	45.5	32.5	D	D
	- 2023 With Project	TS	2	2	0	1	2	0	1	**3**	1>	1	**3**	0	49.7	35.2	D	D

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free Right Turn Lane; **1** = Improvement

[2] Per the Highway Capacity Manual 6th Edition, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal

[4] Recommended improvements consist of modifying the traffic signal to implement protected left turn phasing on the northbound, southbound, and eastbound approaches.

[5] Recommended improvements consist of modifying the traffic signal to implement protected left turn phasing on the northbound and southbound approaches.

[6] As the deficiencies are caused by minimum green times necessary for pedestrian crossing time, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at both these intersections (also validated by peak hour count data).

[7] The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. As such, the deficiency is significant and unavoidable.

Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Sycamore Canyon Boulevard & Alessandro Boulevard (#6)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 3.1 – Old 215 Frontage Road/I-215 Northbound Ramps & Cactus Avenue (#16)

- Contribute fair share towards the modification of the traffic signal to implement protected left turn phasing on the northbound, southbound, and eastbound approaches, a 2nd northbound left turn lane, a 3rd westbound through lane, and a westbound right turn lane.

Mitigation Measure 4.1 – Heacock Street & Cactus Avenue (#25)

- Contribute fair share towards a 3rd eastbound through lane and a 3rd westbound through lane.

The intersection operations analysis worksheets for Opening Year Cumulative (2023) Without and With Project traffic conditions, with improvements, are included in Appendix 6.11 and Appendix 6.12, respectively.

6.9.2 RECOMMENDED IMPROVEMENTS TO ADDRESS OFF-RAMP QUEUES

As shown previously on Table 6-3, there are no peak hour queuing issues anticipated at the I-215 Freeway at Cactus Avenue interchange for Opening Year Cumulative (2023) traffic conditions. However, the off-ramp at Old 215 Frontage Road/I-215 Northbound Ramps at Cactus Avenue has been improved to achieve acceptable LOS. The improvement to the off-ramp queues is shown on Table 6-7. This improvement is not required to achieve acceptable off-ramp queues and is shown for informational purposes only.

Table 6-7

Peak Hour Freeway Off-Ramp Queuing Summary for Opening Year Cumulative (2023) Conditions With Improvements

Intersection	Movement	Available Stacking Distance (Feet)	2023 Without Project				2023 With Project			
			95th Percentile Queue (Feet)[3]		Acceptable?[1]		95th Percentile Queue (Feet)[3]		Acceptable?[1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
I-215 NB Ramps & Cactus Av.	NBL	145	469 [2]	89	Yes[4]	Yes	469 [2]	89	Yes[4]	Yes
	NBT/R	1,650	568 [2]	109	Yes	Yes	568 [2]	109	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Maximum queue length for the approach reported.

[4] Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 Freeway mainline.

6.9.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

As shown previously on Tables 6-4 and 6-5, the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the March JPA (or other neighboring jurisdictions) on SHS roadway segments. The WRCOG TUMF Program identifies this interchange, inclusive of on/off-ramps as a transportation mitigation project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along the I-215 Freeway. As such, no improvements have been recommended, and the impact to the freeway facility is significant and unavoidable.

This Page Intentionally Left Blank

7 HORIZON YEAR (2040) TRAFFIC CONDITIONS

This section discusses the methods used to develop Horizon Year (2040) Without and With Project traffic forecasts, and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

7.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Horizon Year (2040) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of the following:

- Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the Project's frontage and driveways).
- Driveways and those facilities assumed to be constructed by the cumulative development projects to provide site access are also assumed to be in place for Opening Year Cumulative conditions only (e.g., intersection and roadway improvements along the cumulative development's frontage and driveways). Other connections assumed include the extension of San Gorgonio Avenue, south of Alessandro Boulevard, and the extension of Cactus Avenue, west of Meridian Parkway as shown in Exhibit 7-1.

7.2 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) Without Project traffic conditions are shown on Exhibits 7-2 and 7-3, respectively.

7.3 HORIZON YEAR (2040) WITH PROJECT TRAFFIC VOLUME FORECASTS

The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) With Project traffic conditions are shown on Exhibits 7-4 and 7-5, respectively.

EXHIBIT 7-5: HORIZON YEAR (2040) WITH PROJECT TRAFFIC VOLUMES

7.4 INTERSECTION OPERATIONS ANALYSIS

7.4.1 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC CONDITIONS

LOS calculations were conducted for the study intersections to evaluate their operations under Horizon Year (2040) Without Project conditions with intersection geometrics consistent with Section 7.1 *Roadway Improvements*. As shown in Table 7-1, the following study area intersections are anticipated to operate at an unacceptable level of service (e.g., LOS E or worse):

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1) – LOS F AM and PM peak hours
- Mission Grove Pkwy. & Alessandro Bl. (#3) – LOS F AM peak hour; LOS E PM peak hour
- Sycamore Canyon Bl. & Alessandro Bl. (#6) – LOS F AM and PM peak hours
- Meridian Pkwy. & Cactus Av. (#7) – LOS F AM peak hour; LOS E PM peak hour
- Meridian Pkwy. & Van Buren Bl. (#10) – LOS F AM and PM peak hours
- Innovation Dr. & Cactus Av. (#11) – LOS E AM peak hour; LOS F PM peak hour
- I-215 SB Ramps & Cactus Av. (#13) – LOS F PM peak hour only
- I-215 NB Ramps & Alessandro Bl. (#14) – LOS E AM and PM peak hours
- Old 215 Frontage Rd. & Alessandro Bl. (#15) – LOS F AM peak hour only
- Old 215 Frontage Rd./I-215 NB Ramps & Cactus Av. (#16) – LOS F AM and PM peak hours
- Day St. & Alessandro Bl. (#17) – LOS E PM peak hour only
- Elsworth St. & Alessandro Bl. (#18) – LOS F PM peak hour only
- Elsworth St. & Cactus Av. (#19) – LOS F AM and PM peak hours
- Frederick St. & Alessandro Bl. (#22) – LOS F AM and PM peak hours
- Graham St./Riverside Dr. & Cactus Av. (#24) – LOS F AM and PM peak hours
- Heacock St. & Cactus Av. (#25) – LOS F AM and PM peak hours

A summary of the peak hour intersection LOS for Horizon Year Without Project conditions are shown on Exhibit 7-6. The intersection operations analysis worksheets for Horizon Year Without Project traffic conditions are included in Appendix 7.1 of this TIA.

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS)

[1] Per the Highway Capacity Manual 6th Edition, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[2] CSS = Cross-street Stop; TS = Traffic Signal

[3] See Table 7-2 for a detailed summary of significant impacts.

EXHIBIT 7-6: HORIZON YEAR (2040) WITHOUT PROJECT SUMMARY OF LOS

7.4.2 HORIZON YEAR (2040) WITH PROJECT TRAFFIC CONDITIONS

As shown on Table 7-1 and illustrated on Exhibit 7-7, there are no additional study area intersections anticipated to operate at an unacceptable LOS (LOS E or worse) with the addition of Project traffic, other than those previously identified under Horizon Year Without Project conditions. The intersection operations analysis worksheets for Horizon Year With Project traffic conditions are included in Appendix 7.2 of this TIA. The significant impacts are summarized in Table 7-2. Measures to address long range deficiencies for Horizon Year traffic conditions are discussed in Section 7.9 *Horizon Year Deficiencies and Recommended Improvements.*

7.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Horizon Year (2040) traffic conditions are conducted for unsignalized intersections operating at LOS E or F. For Horizon Year (2040) traffic conditions, there are no unsignalized study area intersections that currently operate at an unacceptable LOS.

7.6 OFF-RAMP QUEUING ANALYSIS

A queuing analysis was performed for the off-ramps at the I-215 Freeway at Cactus Avenue interchange to assess vehicle queues for the off ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections and may potentially "spill back" onto the I-215 Freeway mainline. Queuing analysis findings are presented in Table 7-3 for Horizon Year (2040) Without and With Project traffic conditions. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. As shown on Table 7-3, there are no queuing issues anticipated for Horizon Year (2040) Without and With Project traffic conditions.

Worksheets for Horizon Year (2040) Without Project conditions off-ramp queuing analysis are provided in Appendix 7.5. Worksheets for Horizon Year (2040) With Project conditions off-ramp queuing analysis are provided in Appendix 7.6.

7.7 BASIC FREEWAY SEGMENT ANALYSIS

7.7.1 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC CONDITIONS

Horizon Year (2040) Without Project mainline directional volumes for the weekday AM and PM peak hours are provided on Exhibit 7-8. As shown on Table 7-4, the following freeway segments analyzed for this study are anticipated to operate at an unacceptable LOS (i.e., LOS E or worse) during the peak hours:

- I-215 Freeway – Northbound, North of Cactus Avenue (#3) – LOS E PM peak hour only
- I-215 Freeway – Northbound, South of Cactus Avenue (#4) – LOS F AM peak hour; LOS E PM peak hour

EXHIBIT 7-7: HORIZON YEAR (2040) WITH PROJECT SUMMARY OF LOS

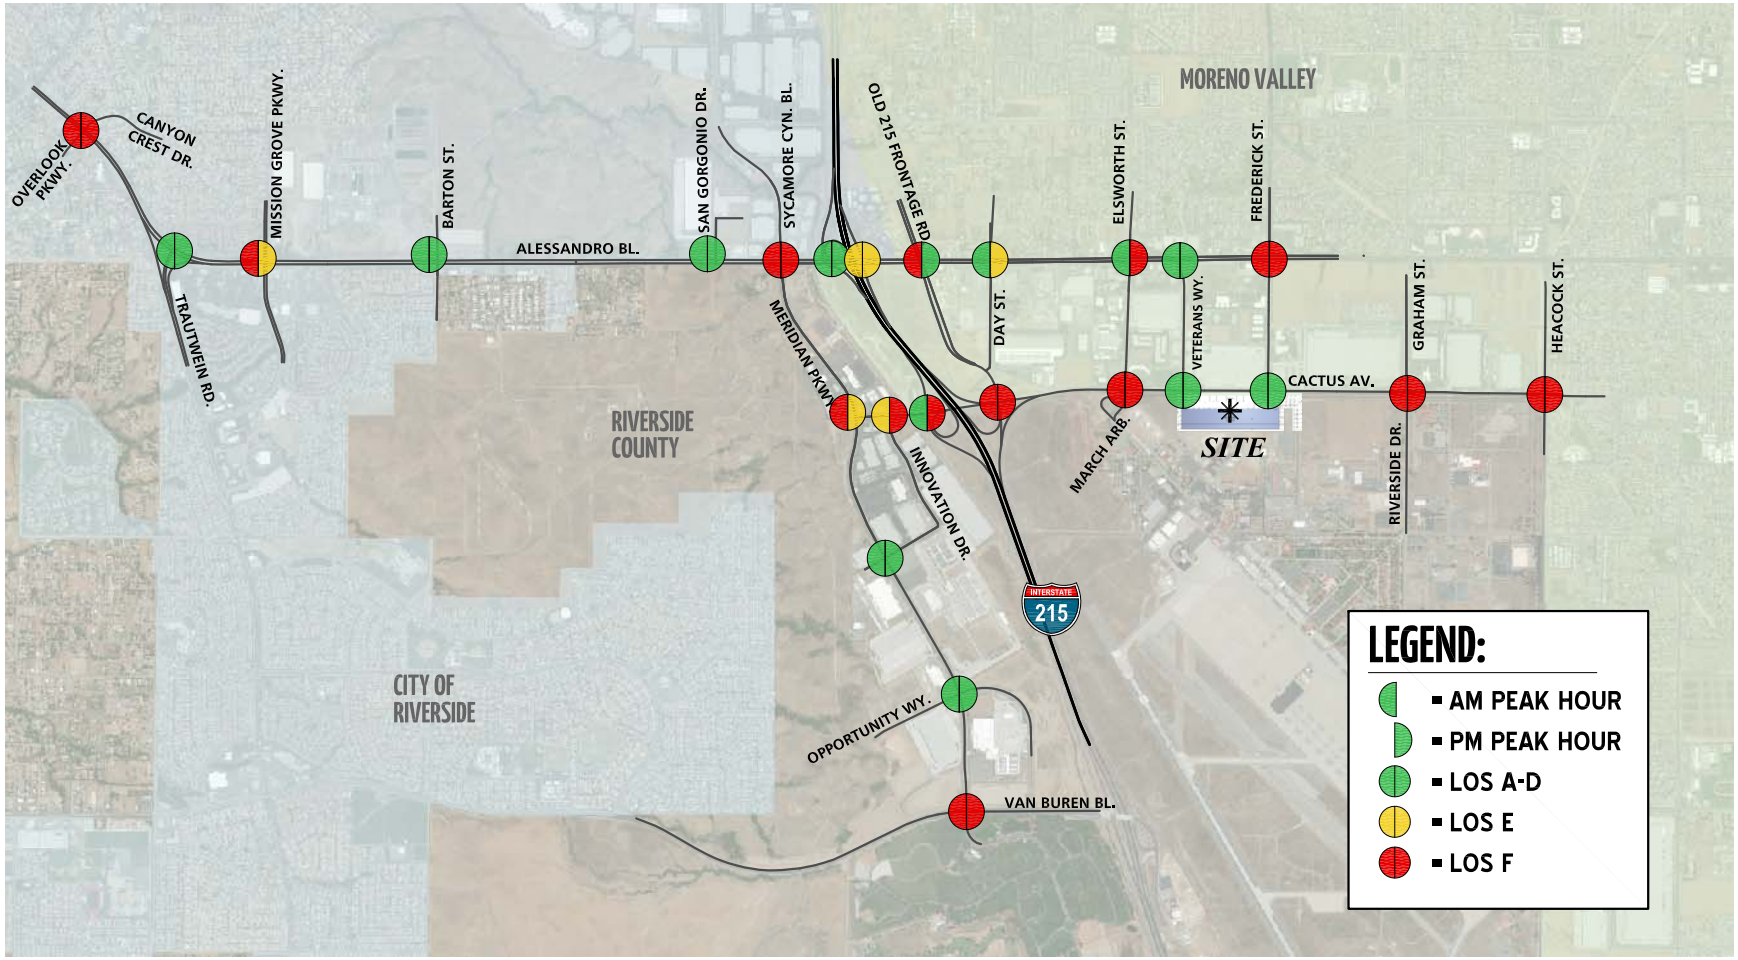

Table 7-2

Significant Impact Summary for Horizon Year (2040) Conditions

#	Intersection	Jurisdiction	Project % of Total Traffic		Change in Delay (secs.)		Project Trip Contribution		Significant Impact? [1,2,3]

* **BOLD** = Significant Impact

N/A = Not Applicable

[1] For intersections within the jurisdiction of March JPA, impact is significant if the pre-project condition is at or better than LOS D (or acceptable LOS) and the project-generated traffic causes deterioration below acceptable levels, a deficiency is deemed to occur. However, if the pre-project condition is already below LOS D (or acceptable LOS), impact is significant if the Project contributes more than 2% of the total traffic.

[2] For intersections within the jurisdiction of the City of Riverside, a significant impact occurs at a study area intersection when the addition of project related trips causes either peak hour LOS to degrade from acceptable (LOS A through D) to unacceptable levels (LOS E/F) or the peak hour delay to increase as follows:
- LOS A/B = By 10.0 seconds
- LOS C = By 8.0 seconds
- LOS D = By 5.0 seconds
- LOS E = By 2.0 seconds
- LOS F = By 1.0 seconds

[3] For intersections within the jurisdiction of Caltrans, the County of Riverside, or City of Moreno Valley, impact is significant if the pre-project condition is at or better than LOS D (or acceptable LOS) and the project-generated traffic causes deterioration below acceptable levels, a deficiency is deemed to occur. An impact is also significant if the Project contributes 50 or more peak hour trips to an already deficient intersection.

Table 7-3

Peak Hour Freeway Off-Ramp Queuing Summary for Horizon Year (2040) Conditions

Intersection	Movement	Available Stacking Distance (Feet)	2040 Without Project				2040 With Project			
			95th Percentile Queue (Feet)[3]		Acceptable?[1]		95th Percentile Queue (Feet)[3]		Acceptable?[1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
I-215 SB Ramps & Cactus Av.	SBR	1,115	167	14	Yes	Yes	167	20	Yes	Yes
	NBR	1,850	148 [2]	216 [2]	Yes	Yes	339 [2]	312 [2]	Yes	Yes
I-215 NB Ramps & Cactus Av.	NBL	145	952 [2]	245 [2]	Yes[4]	Yes[4]	952 [2]	245 [2]	Yes[4]	Yes[4]
	NBT/R	1,650	663 [2]	222	Yes	Yes	663 [2]	224	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Maximum queue length for the approach reported.

[4] Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 Freeway mainline.

Table 7-4

Basic Freeway Segment Analysis for Horizon Year (2040) Conditions

Freeway	Direction[1]	Mainline Segment	Lanes[2]	2040 Without Project				2040 With Project			
				Density[3, 5]		LOS[4]		Density[3, 5]		LOS[4]	
				AM	PM	AM	PM	AM	PM	AM	PM
I-215	SB	North of Cactus Av.	4	22.3	--[6]	C	**F**	22.7	--[6]	C	**F**
		South of Cactus Av.	4	21.2	--[6]	C	**F**	21.5	--[6]	C	**F**
	NB	North of Cactus Av.	4	--[6]	--[6]	**F**	**F**	--[6]	--[6]	**F**	**F**
		South of Cactus Av.	4	--[6]	--[6]	**F**	**F**	--[6]	--[6]	**F**	**F**

[1] NB = Northbound; SB = Southbound

[2] Number of lanes are in the specified direction and is based on existing conditions.

[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[4] LOS = Level of Service

[5] HCS7 does not report density for freeway facilities operating at LOS F.

[6] Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

EXHIBIT 7-8: HORIZON YEAR (2040) WITHOUT PROJECT FREEWAY MAINLINE VOLUMES

However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F. Horizon Year (2040) Without Project basic freeway segment analysis worksheets are provided in Appendix 7.5.

7.7.2 HORIZON YEAR (2040) WITH PROJECT TRAFFIC CONDITIONS

Horizon Year (2040) With Project mainline directional volumes for the weekday AM and PM peak hours are provided on Exhibit 7-9. As shown on Table 7-4, the following freeway segment is anticipated to operate at an unacceptable LOS with the addition of Project traffic under Horizon Year (2040) With Project traffic conditions during the peak hours, in addition to the freeway segments previously identified under Horizon Year (2040) Without Project traffic conditions:

- I-215 Freeway – Southbound, South of Cactus Avenue (#2) – LOS E PM peak hour only

However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F. Worksheets for Horizon Year (2040) With Project conditions basic freeway segment analysis worksheets are provided in Appendix 7.6.

7.8 FREEWAY MERGE/DIVERGE ANALYSIS

7.8.1 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC CONDITIONS

Ramp merge and diverge operations were also evaluated for Horizon Year (2040) Without Project conditions and the results of this analysis are presented in Table 7-5. As shown in Table 7-5, the following freeway ramp merge and diverge areas evaluated for the purposes of this traffic study are anticipated to operate at unacceptable LOS during one or more peak hours:

- I-215 Freeway – Southbound, Loop Off-Ramp at Cactus Avenue (#2) – LOS E PM peak hour only
- I-215 Freeway – Southbound, On-Ramp at Cactus Avenue (#3) – LOS F PM peak hour only
- I-215 Freeway – Northbound, On-Ramp at Cactus Avenue (#4) – LOS E PM peak hour only
- I-215 Freeway – Northbound, Loop On-Ramp at Cactus Avenue (#5) – LOS F AM and PM peak hours

However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. . Where applicable, the freeway mainline is assumed to operate at LOS F. Horizon Year (2040) Without Project freeway ramp junction operations analysis worksheets are provided in Appendix 7.7.

		Off-Ramp at Cactus Av.	3	--[4]	**F**	--[4]	**F**	--[4]	**F**	--[4]	**F**

[1] Number of lanes are in the specified direction and is based on existing conditions.

[2] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[3] LOS = Level of Service

[4] HCS7 does not report density for freeway facilities operating at LOS F.

[4] Observations made in the field indicate that the freeway segments experience traffic congestion due to queuing from downstream bottlenecks.

7.8.2 HORIZON YEAR (2040) WITH PROJECT TRAFFIC CONDITIONS

As shown on Table 7-5, there are no additional freeway merge/diverge ramp junctions anticipated to operate at an unacceptable LOS with the addition of Project traffic, other than those previously identified under Horizon Year (2040) Without Project conditions. However, observations made in the field indicated that the I-215 Southbound mainline experiences significant traffic congestion in the AM peak hour and the I-215 Northbound mainline experiences significant traffic congestion in both the AM and PM peak hours. Where applicable, the freeway mainline is assumed to operate at LOS F.

Horizon Year (2040) With Project freeway ramp junction operations analysis worksheets are provided in Appendix 7.8.

7.9 HORIZON YEAR (2040) DEFICIENCIES AND RECOMMENDED IMPROVEMENTS

7.9.1 MITIGATION MEASURES TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the proposed mitigation measures are presented in Table 7-6 for Horizon Year (2040) traffic conditions. Based on the each jurisdiction's significance criteria, the Project is anticipated to result in significant impacts at the following intersections, as the Project would contribute significantly to the total Horizon Year With Project traffic forecasts:

- Overlook Pkwy./Canyon Crest Dr. & Alessandro Bl. (#1)
- Sycamore Canyon Bl. & Alessandro Bl. (#6)
- I-215 Southbound Ramps & Cactus Av. (#13)
- I-215 NB Ramps & Alessandro Bl. (#14)
- Old 215 Frontage Rd. & Alessandro Bl. (#15)
- Old 215 Frontage Rd./I-215 Northbound Ramps & Cactus Av. (#16)
- Day St. & Alessandro Bl. (#17)
- Elsworth St. & Alessandro Bl. (#18)
- Elsworth St. & Cactus Av. (#19)
- Frederick St. & Alessandro Bl. (#22)
- Graham St./Riverside Dr. & Cactus Av. (#24)
- Heacock St. & Cactus Av. (#25)

The improvements identified at the remaining cumulatively impacted intersections are those needed to reduce the impact to less-than-significant, in addition to the improvements mentioned previously under E+P and Opening Year Cumulative (2023) conditions. The impacts and mitigation measures for Horizon Year (2040) conditions are described below.

Table 7-6

Intersection Analysis for Horizon Year (2040) Conditions With Improvements

	- 2040 With Project	TS	2	2	0	1	2	0	1	**3**	1>	1	**3**	0	54.8	37.3	D	D

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; >> = Free Right Turn Lane; **1** = Improvement

[2] Per the Highway Capacity Manual 6th Edition, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal

[4] Recommended improvements consist of modifying the traffic signal to implement protected left turn phasing on the northbound, southbound, and eastbound approaches.

[5] Recommended improvements consist of modifying the traffic signal to implement protected left turn phasing on the northbound and southbound approaches.

[6] As the deficiencies are caused by minimum green times necessary for pedestrian crossing time, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at both these intersections (also validated by peak hour count data).

[7] The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. As such, the deficiency is significant and unavoidable.

Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard (#1)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 5.1 – Sycamore Canyon Boulevard & Alessandro Boulevard (#6)

- Contribute fair share towards a 2nd northbound left turn lane and the modification of the traffic signal to implement protected left turn phasing on the southbound, eastbound, and westbound approaches.

Sycamore Canyon Boulevard & Alessandro Boulevard (#6)

- The roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. Additional improvements may be infeasible due to physical constraints. As such, the impact is considered significant and unavoidable.

Mitigation Measure 6.1 – I-215 Southbound Ramps & Cactus Avenue (#13)

- Contribute fair share towards a 3rd eastbound through lane, a 2nd westbound left turn lane, and a 3rd westbound through lane.

Mitigation Measure 7.1 – I-215 NB Ramps & Alessandro Boulevard (#14)

- Contribute fair share towards a 2nd northbound left turn lane.

Mitigation Measure 8.1 – Old 215 Frontage Road & Alessandro Boulevard (#15)

- Contribute fair share towards a 3rd eastbound through lane and a 3rd westbound through lane.

Mitigation Measure 3.2 – Old 215 Frontage Road/I-215 Northbound Ramps & Cactus Avenue (#16)

- Contribute fair share towards the modification of the traffic signal to implement protected left turn phasing on the southbound approaches, a 2nd northbound through lane, 2 southbound right turn lanes, a 2nd eastbound left turn lane, a 3rd eastbound through lane, an eastbound right turn lane, and a 4th westbound through lane.

Mitigation Measure 9.1 – Frederick Street & Alessandro Boulevard (#17)

- Contribute fair share towards a 3rd westbound through lane.

Mitigation Measure 10.1 – Elsworth Street & Alessandro Boulevard (#18)

- Contribute fair share towards a 2nd northbound left turn lane.

Mitigation Measure 1.2 – Elsworth Street & Cactus Avenue (#19)

- Contribute fair share towards a 2nd northbound left turn lane, a 4th eastbound through lane, and a 4th westbound through lane.

Mitigation Measure 11.1 – Frederick Street & Alessandro Boulevard (#22)

- Contribute fair share towards a 3rd eastbound through lane.

Mitigation Measure 12.1 – Graham Street/Riverside Drive & Cactus Avenue (#24)

- Contribute fair share towards a 2nd eastbound left turn lane.

Mitigation Measure 4.2 – Heacock Street & Cactus Avenue (#25)

- Contribute fair share towards a 3rd eastbound through lane and a 3rd westbound through lane.

The applicant shall participate in the funding of off-site improvements, including traffic signals that are needed to serve cumulative traffic conditions through the payment of TUMF. These fees shall be collected by the March JPA, with the proceeds solely used as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected population increases.

Worksheets for Horizon Year (2040) Without and With Project conditions, with improvements, HCM calculation worksheets are provided in Appendix 7.9 and 7.10, respectively.

The locations where only a fair share contribution has been identified would remain a significant impact until such time the recommended improvement is implemented. Because the March JPA does not have plenary control over intersections under other jurisdictions, the March JPA cannot guarantee that such improvements will be constructed. As such the impacts are considered significant and unavoidable.

7.9.2 RECOMMENDED IMPROVEMENTS TO ADDRESS OFF-RAMP QUEUES

As shown previously on Table 7-2, there are no peak hour queuing issues anticipated at the I-215 Freeway at Cactus Avenue interchange for Horizon Year (2040) traffic conditions. However, the off-ramps at I-215 Freeway & Cactus Avenue has been improved to achieve acceptable LOS. The improvements to the off-ramp queues is shown on Table 7-7. These improvements are not required to achieve acceptable off-ramp queues and are shown for informational purposes only.

Worksheets for Horizon Year (2040) Without and With Project conditions, with improvements, off-ramp queuing analysis are provided in Appendix 7.11 and Appendix 7.12, respectively.

Table 7-7

Peak Hour Freeway Off-Ramp Queuing Summary for Horizon Year (2040) Conditions With Improvements

Intersection	Movement	Available Stacking Distance (Feet)	2040 Without Project				2040 With Project			
			95th Percentile Queue (Feet)[3]		Acceptable?[1]		95th Percentile Queue (Feet)[3]		Acceptable?[1]	
			AM Peak Hour	PM Peak Hour	AM	PM	AM Peak Hour	PM Peak Hour	AM	PM
I-215 SB Ramps & Cactus Av.	SBR	1,115	137	31	Yes	Yes	137	36	Yes	Yes
	NBR	1,850	409 [2]	353 [2]	Yes	Yes	525 [2]	449 [2]	Yes	Yes
I-215 NB Ramps & Cactus Av.	NBL	145	457 [2]	94	Yes[4]	Yes	457 [2]	94	Yes[4]	Yes
	NBT/R	1,650	355 [2]	203 [2]	Yes	Yes	355 [2]	203 [2]	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown in this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Maximum queue length for the approach reported.

[4] Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 Freeway mainline.

7.9.3 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON FREEWAY FACILITIES

The Project Study Report/Project Development Support in Riverside County on I-215 and SR-60 between Nuevo Road (I-215) & I-215/SR-60 Junction and Box Springs Road (I-215) & Day Street (SR-60) (prepared by Caltrans in April 2008), also known as the I-215 North Project, includes the construction of an HOV lane in each direction of the I-215 Freeway between Nuevo Road and Box Springs Road within the existing median. (5) According to the Riverside County Transportation Commission (RCTC) and Caltrans websites, the I-215 North Project is a longer term project, as priority has been given to the southern and central projects along the I-215 corridor.

Caltrans typically assumes a reduction of 14 percent to the freeway mainline through volumes in this region to account for vehicles utilizing the carpool (HOV) lanes. The reduction to the I-215 Freeway mainline volumes has been applied to account for the proposed HOV lanes. The analysis has been performed assuming the same number of mixed-flow lanes and on and off-ramp configurations as existing baseline conditions at the I-215 Freeway and Alessandro Boulevard interchange.

As shown on Tables 7-8 and 7-9, the I-215 freeway mainline segments and ramp junctions are anticipated to continue to operate at unacceptable LOS with the improvements discussed above. Worksheets for Horizon Year (2040) Without and With Project conditions freeway mainline level of service analysis, with improvements, are provided in Appendix 7.15 and Appendix 7.16.

The Project is anticipated to have a cumulatively considerable impact to the identified freeway mainline segments and merge/diverge ramp junctions, however, no mitigation measures have been identified as no other improvements beyond those planned by the I-215 North Project have been evaluated. Neither Caltrans or the State have adopted a fee program that can ensure that locally-contributed impact fees will be tied to improvements to freeway mainlines, and only Caltrans has the jurisdiction over mainline improvements. Because Caltrans has exclusive control over state highway improvements, ensuring that fair share contributions to mainline improvements are actually part of a program tied to implementation is within the jurisdiction of Caltrans. As such, the impacts are considered significant and unavoidable.

Horizon Year (2040) Without and With Project freeway ramp junction level of service analysis worksheets, with improvements, are provided in Appendix 7.15 and Appendix 7.16.

Table 7-8

Basic Freeway Segment Analysis for Horizon Year (2040) Conditions With Improvements

Freeway	Direction[1]	Mainline Segment	Lanes[2]	2040 Without Project				2040 With Project			
				Density[3]		LOS[4]		Density[3]		LOS[4]	
				AM	PM	AM	PM	AM	PM	AM	PM
I-215	SB	North of Cactus Av.	4	18.9	--[6]	C	**F**	19.2	--[6]	C	**F**
		South of Cactus Av.	4	18.0	--[6]	B	**F**	18.3	--[6]	C	**F**
	NB	North of Cactus Av.	4	--[6]	--[6]	**F**	**F**	--[6]	--[6]	**F**	**F**
		South of Cactus Av.	4	--[6]	--[6]	**F**	**F**	--[6]	--[6]	**F**	**F**

[1] NB = Northbound; SB = Southbound

[2] Number of lanes are in the specified direction and is based on existing conditions.

[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[4] LOS = Level of Service

[5] HCS7 does not report density for freeway facilities operating at LOS F.

[6] Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

Table 7-9

Freeway Ramp Junction Merge/Diverge Analysis for Horizon Year (2040) Conditions With Improvements

Freeway	Direction	Ramp or Segment	Lanes on Freeway[1]	2040 Without Project				2040 With Project			
				AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
				Density[2, 4]	LOS[3]	Density[2]	LOS[3]	Density[2, 4]	LOS[3]	Density[2]	LOS[3]
I-215	Southbound	Off-Ramp at Cactus Av.	4	19.4	C	--[5]	**F**	19.7	C	--[5]	**F**
		Loop Off-Ramp at Cactus Av.	4	20.5	C	--[5]	**F**	20.9	C	--[5]	**F**
		On-Ramp at Cactus Av.	3	27.3	C	--[5]	**F**	27.5	C	--[5]	**F**
	Northbound	On-Ramp at Cactus Av.	3	--[5]	**F**	--[5]	**F**	--[5]	**F**	--[5]	**F**
		Loop On-Ramp at Cactus Av.	3	--[5]	**F**	--[5]	**F**	--[5]	**F**	--[5]	**F**
		Off-Ramp at Cactus Av.	3	--[5]	**F**	--[5]	**F**	--[4]	**F**	--[5]	**F**

[1] Number of lanes are in the specified direction and is based on existing conditions.

[2] Density is measured by passenger cars per mile per lane (pc/mi/ln).

[3] LOS = Level of Service

[4] HCS7 does not report density for freeway facilities operating at LOS F.

[5] Observations made in the field indicate that the freeway segments experience traffic congestion due to queuing from downstream bottlenecks. The freeway mainline is anticipated to operate at a deficient LOS with the planned improvements
