CHAPTER ES
EXECUTIVE SUMMARY

This chapter provides a summary of the Environmental Impact Report (EIR) for the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). Included in this summary are areas of known controversy and issues to be resolved, a summary of Project alternatives, a summary of all Project impacts and associated mitigation measures, and a statement of the ultimate level of significance after mitigation is applied.

ES.1 DOCUMENT PURPOSE

This EIR was prepared by the March Joint Powers Authority (JPA), as lead agency, to inform decision makers and the public of the potential significant environmental effects associated with the Project. This EIR has been prepared in accordance with the California Environmental Quality Act (CEQA) of 1970 (California Public Resources Code, Section 21000 et seq.) and the Guidelines for Implementation of the California Environmental Quality Act (CEQA Guidelines; 14 CCR 15000 et seq.) published by the Public Resources Agency of the State of California.

The purpose of this EIR is to focus the discussion on those potential effects on the environment of the Project that the lead agency has determined may be significant. In addition, feasible mitigation measures are recommended, when applicable, that could reduce significant environmental impacts or avoid significant environmental impacts.

ES.2 PROJECT LOCATION

The Project site, which collectively consists of the K4 Parcel and the Cactus Avenue Drainage Channel (Cactus Channel), is located on the south side of Cactus Avenue and immediately north of March Air Reserve Base (ARB). The approximately 35.4-acre K4 Parcel is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The K4 Parcel is located within the March JPA jurisdiction, which is within unincorporated Riverside County, California. Interstate (I) 215 is located approximately 0.8 miles east of the K4 Parcel. The K4 Parcel is comprised of five parcels designated as Assessor's Parcel Numbers 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0.

The latitude and longitude of the approximate center of the K4 Parcel is 33°54′32.14″ North and 117°15′47.05″ West. The K4 Parcel sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey.

The Cactus Channel portion of the Project is located along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. The portion of the Cactus Channel that would be improved as part of the proposed Project runs a total of 7,900 linear feet.

ES.3 PROJECT DESCRIPTION

ES.3.1 Background

In 1993, the federal government mandated the realignment of March Air Force Base (AFB) and a substantial reduction in its military use. In April 1996, March AFB was re-designated an ARB. Approximately 4,400 acres of land that had historically supported March AFB was no longer needed to support the ARB. The cities of Moreno Valley, Perris, and Riverside, and the County of Riverside formed the March JPA to oversee the dispensation and management of the surplus land. A General Plan and Master EIR were prepared and adopted/certified in 1999 for the March JPA planning area, which includes the March ARB.

Concurrent with the U.S. Air Force's preparation of the Environmental Impact Statement, the March JPA and the March Joint Powers Redevelopment Agency prepared an EIR for the proposed March ARB Redevelopment Project. The Project evaluated in this EIR considered the development of approximately 7,250 acres. The area evaluated including 6,782 acres comprising the boundaries of March ARB, of which approximately 4,524 acres would fall under the authority of March JPA. The remaining 2,258 acres would remain under the control of the military. Additionally, 467 acres within the City of Moreno Valley were included in the EIR evaluation.

Upon approval by the federal government for the realignment of March ARB and the transfer of excess property from March ARB to March JPA, March JPA prepared a General Plan and certified a Master EIR for the General Plan in 1999 (SCH No. 97071095). The K4 Parcel was grouped in the Northeast Planning Subarea and assigned a land use designation of Business Park.

Meridian Park K4 LLC is now pursuing development of the K4 Parcel with an e-commerce warehouse. Additionally, the Project includes regional improvements to the Cactus Channel proposed by Riverside County Flood Control and Water Conservation District (District) as part of the District's Master Plan, which would convert the existing Cactus Channel drainage ditch into a box culvert. While the K4 Parcel was previously conceptually considered for development in the Disposal of Portions of March AFB Environmental Impact Statement, the March AFB Redevelopment Project EIR, and the Master EIR for March JPA, with a specific development plan identified, the analysis in this EIR addresses the proposed build-out of the K4 Parcel and associated Cactus Channel improvements.

ES.3.2 Project Objectives

The primary objectives of the Project include the following:

- Provide appropriate land use intensities to comply with the parameters of the March ARB/Inland Port Airport Compatibility Plan.

- Implement the goals, objectives and policies of the March JPA General Plan at the K4 Parcel, specifically encouraging the development of industrial uses to expand the employment and financial base of the March JPA Planning Area in a manner that is compatible with the nearby airbase and adjacent industrial uses.
- Provide increased job opportunities for local residents through the provision of employment-generating businesses.
- Establish a land use and facility plan that ensures project viability in consideration of existing and anticipated economic conditions.
- Develop the property with land uses that are compatible with the March AFB Reuse program.
- Encourage the use of alternative modes of transportation through the provision of a pedestrian and bicycle circulation system that is both safe and comfortable.
- Provide a range of job types for the community's residents.
- Provide a circulation system that facilitates movement and access needs of automobiles, pedestrians and bicyclists.
- Minimize impacts from construction of the development to sensitive biological resources.
- Minimize water wildlife attractants, which are hazards to aircraft flights associated with the naturalized open-air Cactus Channel drainage channel by undergrounding the drainage channel.

ES.3.3 Proposed Project

ES.3.3.1 Project Overview

The proposed Project involves the development of the five parcels on the 35.4-acre K4 Parcel with a 718,000-square-foot building conservatively assumed to be occupied by High-Cube e-commerce/fulfillment center use.[1] The maximum exterior building height would be 46 feet at the parapet. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the K4 Parcel via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. Once constructed, the e-commerce/fulfillment center use occupying the K4 Parcel could potentially be used up to 7 days per week and 24 hours per day.

[1] The proposed warehouse would operate as a High-Cube Fulfillment Center, which is characterized by a significant storage function and direct distribution of ecommerce product to end uses. These facilities typically handle smaller packages and quantities than other types of high-cube warehouses and often contain multiple mezzanine levels. This is a conservative approach because an e-commerce/fulfillment center generates the most traffic of any type of high-cube warehouse use.

The proposed Project would also include improvements to the drainage channel within the Cactus Channel Improvements Site. The drainage improvements are proposed to be an underground box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). The installation of the box culvert would require trenching through the existing swale behind the Cactus Avenue right-of-way. It is anticipated that there would be some utility relocations for existing crossings in record plans as well as removal of some existing roadway culverts and extending existing storm drain connections to the earth swale. The location of the channel course would remain in its current location. This portion of the Project is being proposed by the District as part of the District's Master Plan and is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert is being permitted by the District and it would either be constructed contemporaneously with the Project or built separately depending on permitting and timing. The Cactus Channel would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan. The installation of the box culvert would require trenching through the existing swale behind the Cactus Avenue right-of-way.

ES.3.3.2 Project Construction

Construction of the proposed warehouse would occur over a 12-month period of time, commencing in quarter 1 of 2020 and completing in quarter 1 of 2021. Generally, warehouse construction would include site grading, utility relocation/installation, and building construction. Rough grading and utility installation would last approximately 25 days, and building construction, including pad/site-specific grading activities, would occur over approximately 11 months. Heavy equipment to be used on site during construction would include flat beds, dozers, scrapers, graders, track hoes, dump trucks, forklifts, cranes, cement trucks, pavers, rollers, water trucks, rolling container trucks, and bobcats. Heavy equipment would be delivered and removed from the site throughout the construction phase. As most heavy equipment is typically not authorized to be driven on a public roadway, most of the equipment would be delivered and removed from the site via large flatbed trucks. It is anticipated that delivery of heavy equipment would not occur on a daily basis, but rather periodically throughout the construction phase based on need. During summer months, concrete pours for the warehouse could begin as early as 3:00 a.m.; during the remainder of the year, concrete pours would occur after 4:00 a.m. All other deliveries would occur at any time during the day. Any early morning concrete pours would comply with existing noise limitations identified in March JPA Development Code Sections 9.10.140 and 9.10.030.

Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Channel Improvement Site. Construction of the Cactus Channel improvements would occur over an approximately 30-month period, commencing in quarter 4 of 2020 and completing in quarter 1 of 2023. Heavy equipment to be used on site during construction would include excavators, dozers, loaders, tractors, backhoes, and cranes. Heavy equipment would be delivered and removed from

the site throughout the construction phase. Currently it is anticipated that there would be some utility relocations for existing crossings in record plans as well as removal of some existing roadway culverts and extending existing storm drain connections to the earth swale.

ES.3.3.3 Project Operations

The proposed warehouse building would include a total of 105 loading dock positions for trucks. Vehicles would access the warehouse site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. Once constructed, the e-commerce/fulfillment center use occupying the K4 Parcel could potentially be used up to 7 days per week and 24 hours per day.

Placement of the Cactus Channel in a box culvert as part of the District's Master Plan would not affect channel flows upon completion of construction. Flows would continue to the east, where the channel would connect with the Heacock Channel and turn south.

ES.3.3.4 Requested Approvals and Entitlements

To facilitate Project approval, the following would be required:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

ES.3.4 Discretionary Actions

The following additional permits, approvals, and discretionary actions may be necessary as part of Project approval:

a. U.S. Army Corps of Engineers – A Jurisdictional Determination will be required to identify and locate the boundaries of jurisdictional waters of the United States on the Project site, and if found, will be regulated by the U.S. Army Corps of Engineers under Section 404 of the Clean Water Act.

b. State Water Resources Control Board (SWRCB) – A National Pollutant Discharge Elimination System Construction General Permit will need to be obtained from the SWRCB. Permit registration documents include a Storm Water Pollution Prevention Plan.

c. SWRCB – A National Pollutant Discharge Elimination System Industrial General Permit may need to be obtained from the SWRCB, depending on the type of facility ultimately built, consistent with the requested General Plan land use designations of Industrial.

d. Regional Water Quality Control Board, Santa Ana Region – 401 Water Quality Certification – A Waste Discharge Requirement Permit will need to be obtained from the Regional Water Quality Control Board.

e. South Coast Air Quality Management District – A Dust Control Plan will need to be approved by the South Coast Air Quality Management District.

f. Federal Aviation Administration – A Form 7460-1 will need to be approved by the Federal Aviation Administration.

g. Riverside County Airport Land Use Commission – A consistency finding with Riverside County Land Use Plan will be required by Riverside County Airport Land Use Commission.

ES.4 SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Table ES-1, Summary of Environmental Impacts and Mitigation Measures, provides a summary of the impact analysis related to the Project. Table ES-1 identifies a summary of the significant environmental impacts resulting from the Project pursuant to the CEQA Guidelines Section 15123(b)(1). For more detailed discussion, please see Chapter 4, Environmental Impact Analysis, of this EIR. Table ES-1 also lists the applicable mitigation measures related to identified significant impacts, as well as the level of significance after mitigation is identified. As stated in Chapter 2, Project Description, of this EIR, the Initial Study prepared and circulated with the Notice of Preparation (NOP) for public review on the Project (see Appendix A, Initial Study, of this EIR) concluded that the Project would not result in significant impacts to agriculture and forestry resources, mineral resources, population and housing, public services, and recreation; therefore, these topics are not addressed in this EIR and not summarized in Table ES-1.

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
Aesthetics			
AES-1. In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	Less than Significant	N/A	N/A
AES-2. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	Less than Significant	N/A	N/A
Air Quality			
AQ-1. Would the project conflict with or obstruct implementation of the applicable air quality plan?	Potentially Significant	**MM-AQ-1. Construction Equipment Emissions Standards** During Project construction, the construction contractor, with oversight by March JPA, shall ensure that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the U.S. Environmental Protection Agency (EPA). In addition, the construction contractor shall utilize 50% Tier 4 Final construction equipment, based on number of pieces of construction equipment. **MM-AQ-2. Low-VOC [volatile organic compound] Architectural Coatings** The construction contractor shall be required to utilize Super-Compliant volatile organic compound (VOC) interior and exterior paints, which are defined by the South Coast Air Quality Management District (SCAQMD) as meeting the "super-compliant" VOC standard of 10 grams per liter, during construction and long-term operations (SCAQMD n.d.b).	Significant Unavoidable

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		MM-AQ-3. Construction Relations Officer The Project will provide a construction relations officer to act as a community liaison to oversee on-site construction activity and all emissions and congestion related matters. A phone number and email contact information for the construction relations officer shall be posted on signage at construction site entrance points. **MM-AQ-4. Improved Energy Efficiency and Water Reduction** The Project applicant shall incorporate the following measures into the Project design: • The Project will install approximately 4.5 MW of solar photovoltaic electricity generation. • The Project will install Energy Star certified light bulb and lighting fixtures. • The Project will install duct insulation to a minimum level of R-6 and modestly enhanced window insulation as required by 2016 Title 24 and consistent with the Riverside County Climate Action Plan criteria. • Consistent with the Riverside County Climate Action Plan criteria, the Project will include the following design elements: Construction of modest cool roof, defined as Cool Roof Rating Council (CRRC) Rated 0.15 aged solar reflectance and 0.75 thermal emittance; Use of heating, ventilation, and air conditioning equipment with a Seasonal Energy Efficiency Ratio (SEER) of 14 or higher; Installation of water heaters with an energy factor of 0.92 or higher; All rooms will have some form of daylighting (e.g., skylights or windows); At least 50% of artificial lighting unit fixtures will be high efficacy; Waterless urinals and high efficiency toilets will be used throughout the Project; and water efficient faucets will be used throughout the Project. • The Project will provide electrical outlets at building exterior areas.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		• The Project landscape non-potable water system will meet "purple" pipe standards. • The Project will exceed the Riverside County Climate Action Plan requirement for water efficient landscaping by having no turf and only drought tolerant plants and introducing additional water efficient irrigation controls such as smart irrigation controllers. • The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle charging stations and fifty-four off-site EV charging stations. **MM-AQ-5. Commute Trip Reduction** The Project applicant shall incorporate the following measures in order to encourage alternative modes of transportation and reduce commute trips. • Five percent (5%) of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools. • Tenants with more than 10,000 square feet of office space shall provide video conferencing facilities. Tenant spaces below 10,000 square feet of office space may pursue video conferencing as feasible. • The Project will provide short- and long- term bicycle parking facilities to meet peak season maximum demand (one bike rack space per 20 vehicle/employee parking spaces). • The Project will provide "end-of-trip" facilities including showers, lockers, and changing space (four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		• Each tenant will provide on-site food vending machines or refrigerator, microwave oven and mail facilities (i.e., drop box) at the Project site. Each tenant with over 5,000 square feet of office space shall provide an on-site computer, internet connection, and other services for personal employee use. Projects will consider the provision of an ATM machine as feasible. **MM-AQ-6. Truck Requirements** In order to minimize on-road mobile source criteria air pollutant emissions, March Joint Powers Authority (JPA) shall require the following measures for the Project. • For any warehouse use, the loading docks shall be designed to accommodate SmartWay trucks. The March JPA will require evidence of compliance prior to issuance of a certificate of occupancy for any warehouse use.	
AQ-2. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard	Potentially Significant	See **MM-AQ-1** through **MM AQ-6** above.	Significant Unavoidable
AQ-3. Would the project expose sensitive receptors to substantial pollutant concentrations?	Less than Significant	N/A	N/A
AQ-4. Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	Less than Significant	N/A	N/A
Biological Resources			
BIO-1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially Significant	**MM-BIO-1. Smooth Tarplant Mitigation and Monitoring Plan** Surveys shall be conducted for smooth tarplant the season prior to each phase of construction. Surveys shall occur within the Project site and include suitable habitat within a 100-foot buffer (access permitting), at the appropriate time to capture the characteristics necessary to identify the taxon. Surveys shall be conducted consistent with California	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		Department of Fish and Wildlife (CDFW) protocols and by a qualified botanist knowledgeable of the local flora. Since annual variation in weather may result in fewer specimens being observed, the locations of plants considered will be cumulative (i.e., all known plant locations over the course of the various surveys, will be noted). The full extent of the occurrence within the survey area shall be recorded using GPS. The location of smooth tarplant shall be mapped and number of individuals for each occurrence documented. The outer extent of each occurrence shall be flagged at the time of the survey and the following avoidance measures implemented: 1. Establish Environmentally Sensitive Areas (ESAs). Prior to the start of any ground- or vegetation-disturbing activities, a qualified biologist shall establish ESAs to protect and avoid special-status plants that occur outside of the Project disturbance areas and within 100 feet of Project disturbance areas. The locations of ESAs shall be clearly depicted on construction drawings, which shall also include all avoidance and minimization measures on the margins of the construction plans. ESAs shall be clearly delineated in the field (e.g., with temporary construction fencing) to ensure that avoided plants are not inadvertently harmed during construction. 2. Monitoring. A qualified biologist shall conduct weekly monitoring of the ESAs that protect special-status plant occurrences. The monitor shall have the authority to stop construction activities in the vicinity (within 100 feet) of an ESA if it is determined as a result of monitoring that corrective actions are necessary to avoid and protect the ESA. 3. Smooth Tarplant Mitigation Plan. If impacts to smooth tarplant cannot be avoided a Smooth Tarplant Mitigation Plan shall be submitted to CDFW for review and approval prior to ground disturbance to occupied habitat. Upon approval, the plan will be implemented by the applicant or its designee. The plan will demonstrate the feasibility of enhancing or	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		restoring smooth tarplant habitat in areas to be managed as natural open space (i.e., within the designated conservation areas west of Interstate 215) without conflicting with other resource management objectives. Habitat enhancement replacement will be at a 1:1 ratio (acres enhanced or restored:acres impacted). The plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals. **MM-BIO-2. Best Management Practices (BMPs)** To prevent inadvertent disturbance to areas outside the limits of the proposed Project construction limits, the following monitoring requirements and BMPs shall be implemented. A biologist shall be contracted to perform regular random checks (at minimum once a month) to ensure implementation with the following monitoring requirements and BMPs. Monitoring reports and a post-construction monitoring report will be prepared to document compliance with these requirements. 1. Workers Environmental Awareness Training. All construction personnel must attend an environmental awareness training to educate personnel about special-status species that may potentially occur on site, their protective status, avoidance and minimization measures to be implemented by all personnel, flagging/fencing of any exclusion areas, permit requirements, the boundaries within which the Project construction shall occur, trash and debris collection and disposal, spill avoidance and clean-up, and other environmental issues;	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		2. Demarcate Construction Limits. To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground disturbance activities and all construction activities, including, equipment staging and maintenance shall be conducted within the marked disturbance limits. The work limit delineation will be maintained throughout Project construction. 3. Flush Special-Status Species. Biologist will flush special-status species (i.e., avian or other mobile species) from suitable habitat areas to the maximum extent practicable immediately prior to initial vegetation removal activities. 4. Speed Limit. Construction vehicles shall not exceed 15 miles per hour or unpaved roads adjacent to the Project site or the right-of-way accessing the site. 5. Trash and Debris. If trash and debris need to be stored overnight during the maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof will be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash receptacles may be used during the day, but must be removed each night. 6. Open Trenches. At the end of each workday, check that all potential wildlife pitfalls (trenches, bores, and other excavations) have been backfilled, covered, or sloped to allow wildlife egress. Should wildlife become trapped, a qualified biologist shall remove and relocate it. 7. Vegetation Removal. Cut vegetation must be hauled out of the channel and stored, if necessary, where it cannot be washed by rainfall or runoff into the channel. When maintenance activities are completed, any excess materials or debris will be removed from the Project site.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		8. Staging/Storage. Temporary structures and staging/storage of construction equipment and materials will not be located in or within 100 feet of jurisdictional waters, including wetlands and riparian areas. 9. Pets. Pets on or adjacent to construction sites will not be permitted by the operator. 10. Construction Lighting. Construction activities will be limited to daylight hours to the extent feasible. If nighttime work is necessary, lighting will be shielded away from surrounding natural areas. Fixtures will be shielded to downcast below the horizontal plane of the fixture height and mounted as low as possible. 11. Permanent Lighting. Permanent lighting will be shielded away from surrounding natural areas. Fixtures will be shielded to downcast below the horizontal plane of the fixture height and mounted as low as possible. 12. Landscaping Guidelines. As per the Landscaping Guidelines of the Resource Management Element of the March Joint Powers Authority (JPA) General Plan (1999), drought tolerant vegetation and native vegetation will be used to the extent feasible, consistent with March JPA Landscape Water Efficiency Ordinance No. JPA 16-03, with the purpose of preserving existing mature trees and native vegetation. Landscape plans shall be reviewed by a qualified botanist to recommend appropriate provisions to minimize the spread of invasive plant species as defined by the County of Riverside, and listed by the California Invasive Plant Council (www.cal-ipc.org) and California Native Plant Society (www.cnps.org) within the Project area. Provision may include: a) installation of container plants and/or hydro-seeding areas adjacent to existing, undisturbed native vegetation areas with native plant species common within temporary impact areas; and (b) review and screening of proposed plants to identify and avoid potential invasive species and weed removal during the initial planting of landscaped.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		MM-BIO-3. Listed Vernal Pool Branchiopods and Western Spadefoot Focused surveys shall be conducted for federally listed large branchiopods and sensitive western spadefoot prior to initiation of construction related activities. Surveys for federally listed branchiopods shall be conducted according to the current U.S. Fish and Wildlife Service (USFWS) Survey Guidelines for the Listed Large Branchiopods (USFWS 2015), which describes a complete survey for branchiopods as one wet season and one dry season survey conducted according to the new guidelines and within a 3 year period. Additionally, pre-construction surveys for western spadefoot shall be conducted during a time of year when the species can be detected (i.e., when the vernal pool and/or drainage channel on the south side of Cactus Avenue is inundated). Surveys shall be initiated at least one year prior to the initiation of construction related activities to allow sufficient time to complete one wet season and one dry season survey within the Project site, including suitable habitat within a 250-foot buffer. If focused surveys are negative, no additional mitigation is required. If focused surveys are positive, the full extent of listed branchiopod and/or western spadefoot occurrence within the survey area shall be recorded using GPS. The location of occupied features shall be mapped and number of individuals for each occurrence documented. The outer extent of each occupied listed branchiopod and/or western spadefoot feature shall be flagged at the time of the survey. Consultation with USFWS shall occur and/or take authorization may be obtained from the USFWS through Section 7 Consultation for impacts to federally listed branchiopods. Alternatively, the applicant may choose to mitigate for impacts through the Western Riverside County (WRC) Multiple Species Habitat Conservation Plan (MSHCP) as	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		a participating special entity. Occupied listed branchiopod habitat shall be mitigated at a minimum 1:1 ratio for temporary impacts, 2:1 ratio for permanent impacts, as specified by the resources agencies (e.g., within take authorization), or as per the requirements within the WRC MSHCP. Occupied western spadefoot habitat shall be mitigated at a minimum 1:1 ratio. Avoidance and minimization measures shall be implemented in accordance with provisions of the take authorization and shall include, at a minimum: 1. Establish Environmentally Sensitive Areas (ESAs). Prior to the start of any ground- or vegetation-disturbing activities, a qualified biologist shall establish ESAs to protect and avoid occupied federally listed branchiopod and/or western spadefoot breeding habitat that occur outside of the Project disturbance areas and within 250 feet of Project disturbance areas. The locations of ESAs shall be clearly delineated through brightly colored fencing or other highly visible means and include a designated avoidance buffer developed in consultation with the USFWS to prevent construction from affecting the pool and its associated watershed. Construction crews will be directed not to encroach beyond the limits of construction. 2. Monitoring. A qualified biologist shall be present during construction within 300 feet of occupied or assumed occupied vernal pool habitat(s) to conduct daily monitoring of the ESAs that protect occupied federally listed branchiopod and/or western spadefoot habitat. The monitor shall have the authority to stop construction activities in the vicinity (within 250 feet) of an ESA if it is determined as a result of monitoring that corrective actions are necessary to avoid and protect the ESA. 3. Best Management Practices (BMPs). All fueling and maintenance of vehicles and other equipment and staging areas shall occur at least 100 feet from vernal pool or aquatic habitat.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		4. Mitigation, Monitoring, and Management Plan. Prior to construction within 500 feet of occupied or assumed occupied vernal pool habitat, the Project applicant shall develop and implement a mitigation, monitoring, and management plan, with input from regulatory agencies that outlines long-term management strategies and performance standards to be attained to compensate for habitat losses resulting from the Project. At a minimum, the plan shall include standards for mitigation site selection and construction specifications for mitigation sites, a description of site conditions including aerial maps, an analysis of local vernal pool habitat, and performance criteria by which site quality can be assessed over time (e.g., size, vegetation communities and plant species present, date of initial ponding, ponding duration, and wildlife usage). The mitigation, monitoring and management plan shall provide species-specific conservation objectives for covered species and habitats; success criteria for meeting conservation objectives for covered species and habitats; success criteria for meeting conservation objectives; and methods for remediating restoration/enhancement sites that do not achieve the success criteria. A monitoring program shall be established to track the development of habitat conductions that are conducive to the establishment of vernal pool wildlife species. 5. Creation/Restoration/Enhancement of Suitable Vernal Pool Habitat. If impacts to occupied listed vernal pool branchiopod habitat cannot be avoided, then creation, restoration, and/or enhancement of suitable vernal pool habitat suitable for vernal pool fairy shrimp and/or Riverside fairy shrimp shall be required, as applicable (specific to species impacted and habitat requirements). The creation, restoration, and/or enhancement effort would incorporate measures to salvage these species from on-site ponds and relocate them into created, restored, and/or enhanced pools within designated open space easement, upon coordination with the necessary regulatory agencies (i.e., USFWS and/or ACOE [U.S. Army Corps of Engineers]). The created, restored, and/or enhanced habitat would be

Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		monitored for fairy shrimp at intervals specified in the mitigation, monitoring, and management plan. Quarterly reports would be prepared by a qualified restoration specialist for the first year and annual reports thereafter. If the success criteria listed in the mitigation, monitoring, and management plan are not met at the end of a given year, remedial action would be taken, pursuant to the direction and approval from the regulatory agencies (i.e., USFWS and ACOE). Alternatively, impacts to occupied listed branchiopod habitat may be mitigated by purchasing mitigation credits at a USFWS-approved mitigation bank for listed branchiopods at a minimum of 2:1 ratio for temporary impacts and 3:1 for permanent impacts, or as otherwise required by the respective permits. **MM-BIO-4. Special-Status Small Mammals** Potentially suitable habitat to support special-status small mammals (i.e., Stephens' kangaroo rat, Northwestern San Diego pocket mouse, and Los Angeles pocket mouse) occurs within the Project site and areas adjacent to the Project site. If potential burrows may be impacted by the proposed Project activities in areas of suitable habitat for these species, a qualified permitted biologist shall conduct focused small mammal surveys for Stephens' kangaroo rat, Northwestern San Diego pocket mouse, and/or Los Angeles pocket mouse to determine presence/absence of these species on the Project site and within 200 feet of the Project site (access permitting) prior to the initiation of construction activities. The survey shall consist of a habitat assessment, followed by five consecutive nights of trapping using Sherman live trapping within suitable habitat as determined by a permitted small mammal trapping individual. If special-status species are not found, no further action is required. If special-status individuals are identified during focused surveys, potentially active special-status small mammal burrows shall be avoided to the extent feasible. If avoidance of active burrows is not	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		possible, a trapping/relocation program shall be implemented and conducted by qualified biologists in consultation with the appropriate regulatory agencies (i.e., U.S. Fish and Wildlife Service (USFWS) and/or California Department of Fish and Wildlife (CDFW)). In accordance with the trapping/relocation program, special-status small mammal individuals shall be relocated to adjacent suitable habitat areas or preserves (including within the conservation area west of Project site), and/or measures shall be provided to ensure exclusion during construction activities, including trenching. Occupied habitat for special-status mammals shall be mitigated at a minimum 1:1 ratio. The trapping/relocation program shall include submitting a plan for regulatory agency approval, with the following elements included at a minimum: 1. Allow for at least one night without disturbance to the burrow and surrounding area to allow the individuals to vacate the burrow. Remaining individuals shall be live-trapped and relocated out of impacted areas into adjacent occupied areas or into unoccupied areas within the same habitat. 2. Methods (e.g., one-way doors) shall be used to prevent reentry to any burrows not destroyed by construction until construction is complete in these areas. 3. At least 45 days before the start of construction within 200 feet of an active burrow, a trapping/relocation plan shall be submitted to the USFWS and/or CDFW for approval. The plan shall include but not be limited to the following: the methods for capturing animals, the procedures for evaluating health of the animals, the location and methods for storing live animals the methods for release (i.e., fencing), the location of release, on-site habitat restoration and methods for restoring temporarily destroyed burrows where appropriate, and remedial actions for injured or lost animals.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		MM-BIO-5. Burrowing Owl Habitat Prior to the initiation of construction activities, a qualified biologist shall conduct preconstruction surveys for burrowing owl to determine presence/absence of the species. The survey shall be conducted in accordance with the most current and applicable California Department of Fish and Wildlife (CDFW) protocol within 30 days of site disturbance to determine whether the burrowing owl is present at the site. Preconstruction surveys shall include suitable burrowing owl habitat within the Project footprint and within 500 feet of the Project footprint (or within an appropriate buffer as required in the most recent guidelines and where legal access to conduct the survey exists). If burrowing owls are not detected during the clearance survey, no additional mitigation is required. 1. If burrowing owl is located, occupied burrowing owl burrows shall not be disturbed during the nesting season (February 1 through August 31) unless a qualified biologist approved by CDFW verifies through non-invasive methods that either the birds have not begun egg-laying and incubation or that juveniles from the occurred burrows are foraging independently and capable of independent survival. A 500-foot non-disturbance buffer (where no work activities may be conducted) will be maintained between Project activities and nesting burrowing owls during the nesting season, unless otherwise authorized by CDFW. 2. If burrowing owl is detected during the non-breeding season (September 1 through January 31) or confirmed to not be nesting, a 160-foot buffer non-disturbance buffer will be maintained between the Project activities and occupied burrow. Alternatively, a Burrowing Owl Relocation and Mitigation Plan may be prepared and submitted for approval by CDFW. Once approved, the Plan would be implemented to relocate non-breeding burrowing owls from the Project site. The Plan will detail methods and guidance for passive relocation of burrowing owls from the Project site, provide monitoring and management of the	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		replacement burrow sites, reporting requirements, and ensure that a minimum of two suitable, unoccupied burrows are available off site for every burrowing owl or pair of burrowing owls to be passively relocated. Compensatory mitigation of habitat would be required if occupied burrows or territories occur within the permanent impact footprint. Ratios typically include a minimum of 19.5 acres per nesting burrow lost; however, habitat compensation will be approved by CDFW and detailed in the Burrowing Owl Relocation and Mitigation Plan. Suitable burrowing owl habitat conserved pursuant to the Settlement Agreement may be counted toward mitigation for impacts to burrowing owl habitat and would be based upon regulatory agency approval. 3. Construction work may proceed after owls have been excluded from the site following accepted protocol and approval of CDFW, and as approved by March Joint Powers Authority (JPA). Results of the surveys and relocation efforts shall be provided to CDFW. **MM-BIO-6. Suitable Habitat for Nesting Birds** The Migratory Bird Treaty Act (MBTA) of 1918 (50 C.F. R. Section 10.13) and similar provisions under the CDFG Code (Sections 3503, 3503.5, and 3513) prohibit the "Take" of any native bird. March Joint Powers Authority (JPA) shall ensure that vegetation clearing on the Project site would be conducted outside of the nesting season (February 1 through September 15). If avoidance of the nesting season is not feasible, then a qualified biologist shall conduct a nesting bird survey within three days prior to any disturbance of the site, including disking, demolition activities, and grading. If active nests of native species are identified, the biologist shall establish suitable buffers around the nests, and the buffer areas shall be avoided until the nests are no longer occupied and the juvenile birds can survive independently from the nests. Typically, established buffers are greater for raptors than songbirds and depend on the species, the nesting stage, and type of construction activity proposed. The buffer should be no less than 300 feet for raptors and	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		no less than 150 feet for songbirds, unless specifically determined by a qualified biologist familiar with the nesting phenology of the nesting species. In some cases, the buffer may need to be larger. There are no specific protocols for nesting bird surveys or for buffers once nests are found. The key is to ensure that no direct mortality of a native bird, which when nesting includes eggs and young. Implementation of this measure would ensure the Project is not in violation of the MBTA and California Fish and Game Code (CFGC). Alternatively, the Project shall comply with survey requirements imposed by U.S. Fish and Wildlife Service (USFWS) and/or California Department of Fish and Wildlife (CDFW). **MM-BIO-7. Western Spadefoot** Prior to construction, the applicant shall develop a relocation plan for adult western spadefoot. The plan should include, but not be limited to the timing and location of the surveys conducted for western spadefoot, identify the habitats and conditions in the proposed relocation site(s); methods used for trapping and relocating the species, and documentation/recordation of the species and number of the animals relocated. The plan shall be provided to California Department of Fish and Wildlife (CDFW) for approval 30 days prior to any ground-disturbing activities within potentially occupied habitat. A qualified biologist will be present during ground-disturbing activities immediately adjacent to or within the grassland or coastal scrub habitat that could support populations of western spadefoot. The qualified biologist shall possess an appropriate California scientific collecting permit to handle special-status species likely to occur in the Project area. If special-status amphibian and/or reptile species (i.e., western spadefoot) are detected in the work area during pre-construction surveys and/or monitoring, the authorized biologist will capture and relocate individuals to nearby undisturbed areas with suitable habitat outside of the construction area, but as close to their origin as possible (i.e., within designated conservation areas west of	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		Interstate 215). All wildlife moved during Project activities will be documented by the biologist on site and provided in the plan, which will be submitted to CDFW quarterly. **MM-BIO-8. San Diego Black-Tailed Jackrabbit** Thirty days prior to construction a qualified biologist shall conduct a survey within the proposed construction disturbance zone and within 200 feet of the disturbance zone for San Diego black-tailed jackrabbit. If San Diego black-tailed jackrabbits are present, non-breeding rabbits shall be flushed from areas to be disturbed. Dens, depressions, nests, or burrows occupied by pups shall be flagged and ground-disturbing activities avoided within a minimum of 200 feet during the pup-rearing season (February 15 through July 1). This buffer may be reduced based on the location of the den upon consultation with California Department of Fish and Wildlife (CDFW). Occupied maternity dens, depressions, nests, or burrows shall be flagged for avoidance, and a biological monitor shall be present during construction. If unattended young are discovered, they shall be relocated to suitable habitat by a qualified biologist. The applicant shall document all San Diego black-tailed jackrabbit identified, avoided, or moved and provide a written report to CDFW within 72 hours. Collection and relocation of animals shall only occur with the proper scientific collection and handling permits.	
BIO-2. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially Significant	See **MM-BIO-2** above**.** **MM-BIO-9.** Jurisdictional Features. In order to mitigate Project impacts to jurisdictional features under the jurisdiction of the U.S. Army Corps of Engineers (ACOE), California Department of Fish and Wildlife (CDFW), and Regional Water Quality Control Board (RWQCB), the Project applicant shall implement mitigation required by the regulatory agencies. March Joint Powers Authority (JPA) shall require proof that the applicable Section 404, 401, and 1600 permits and/or clearances have been obtained or verification that they are not required shall be obtained prior to any disturbance of the jurisdictional features on site. All mitigation	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		measures and conditions contained within the permits shall be implemented. At a minimum, the following shall be completed for mitigation for impacts to waters of the United States and jurisdictional streambeds. Mitigation options include on-site, off-site, in lieu fee mitigation, or a combination of mitigation strategies, to replace the disturbed jurisdictional features, including sensitive riparian vegetation communities, at a minimum of 1:1 ratio for temporary impacts and 2:1 for permanent impacts, or as otherwise required by the respective permits. Avoided jurisdictional waters shall be fenced or flagged for avoidance. Best management practices (BMPs) shall be implemented to avoid indirect impacts to jurisdictional waters, including the following: 1. A biologist will conduct daily site visits during the removal of riparian vegetation. 2. Vehicles and equipment will not be operated in ponded or flowing water except as described in permits. 3. Water containing mud, silt, or other pollutants from grading or other activities will not be allowed to enter jurisdictional waters or be placed in locations that may be subjected to high storm flows. 4. Spoil sites will not be located within 30 feet from the boundaries of jurisdictional waters or in locations that may be subject to high storm flows, where spoils might be washed back into drainages. 5. Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil, or other petroleum products, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from Project-related activities, will be prevented from contaminating the soil and/or entering avoided jurisdictional waters. 6. No equipment maintenance will be performed within 100-feet of jurisdictional waters, including wetlands and riparian areas, where petroleum products or other pollutants from the equipment may enter these areas. Fueling of equipment will not occur on the Project site.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
BIO-3. Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	Potentially Significant	See **MM-BIO-2 and MM-BIO-9** above.	Less than Significant
BIO-4. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Potentially Significant	See **MM-BIO-6** above.	Less than Significant
BIO-5. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	No Impact	N/A	N/A
BIO-6. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	Potentially Significant	See **MM-BIO-2** through **MM-BIO-5** and **MM-BIO-9** above.	Less than Significant
Cultural Resources			
CUL-1. Would the project cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5?	Less than Significant	N/A	N/A
CUL-2. Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5?	Potentially Significant	**MM-CUL-1. Inadvertent Discovery of Archaeological Resources** In the event that archaeological resources are inadvertently unearthed during excavation and grading activities for the Project and no monitors are present, the contractor shall cease all earth-disturbing activities within a 100-foot radius of the area of the discovery, March Joint Powers Authority (JPA) shall be notified, and a qualified archaeologist meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology shall evaluate the significance of the find and determine the	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		appropriate course of action. Depending upon the significance of the find under the California Environmental Quality Act (CEQA) (14 CCR 15064.5(f); PRC, Section 21082), the archaeologist may simply record the find and allow work to continue. If the resource is a Native American cultural resource or is prehistoric, the appropriate tribe(s) shall weigh in on the evaluation of the resource and the appropriate course of action. Pursuant to California Public Resources Code Section 21083.2(b) and CEQA Guidelines Section 15126.4, avoidance is the preferred method of preservation for archaeological resources. If avoidance of the resources is not feasible, salvage operation requirements pursuant to Section 15064.5 of the CEQA Guidelines shall be followed and shall take in to account tribal preferences and sensitivity concerns. If potentially significant features or sites are discovered, an Evaluation and Treatment Plan shall be developed by the qualified archaeologist and the Native American representative and shall contain, at a minimum, a research design and field methodology designed to address the criterion outlined in the CRHR. If a site is determined to be significant, data recovery excavations may be necessary unless the resource is avoided and preserved/protected in place. The qualified archaeologist shall also be required to curate specimens in a repository with permanent retrievable storage and submit a written report to March JPA for review and approval. Once artifact analysis is completed, a final written report detailing the results of all research procedures and interpretation of the site shall be submitted to March JPA for review and approval. Evaluation and treatment shall be supervised by an individual or individuals that meet the Secretary of the Interior's Professional Qualification Standards.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		After the find has been appropriately avoided or mitigated and cleared by March JPA, the qualified archaeologist and, if applicable, the Native American representative, work in the area may resume. Resources shall be documented on Department of Parks and Recreation 523 series forms and shall be submitted to the Eastern Information Center (EIC) along with the final written report for inclusion in the California Historical Resources Information System (CHRIS).	
CUL-3. Would the project disturb any human remains, including those interred outside of dedicated cemeteries?	Potentially Significant	**MM-CUL-2. Inadvertent Discovery of Human Remains** In accordance with Section 7050.5 of the California Health and Safety Code, if human remains are found, the Riverside County Coroner shall be immediately notified of the discovery. No further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains shall occur until the County Coroner has determined, within 2 working days of notification of the discovery, the appropriate treatment and disposition of the human remains. If the County Coroner determines that the remains are, or are believed to be, Native American, he or she shall notify the Native American Heritage Commission (NAHC) within 24 hours. In accordance with California Public Resources Code, Section 5097.98, the NAHC must immediately notify those persons it believes to be the most likely descendant (MLD) from the deceased Native American. The MLD shall complete their inspection within 48 hours of being granted access to the site. The MLD representative would then determine, in consultation with the property owner, the disposition of the human remains.	Less than Significant
Energy			
EN-1. Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	Less than Significant	N/A; also see **MM-AQ-5** and **MM-AQ-6**, above.	N/A

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
EN-2. Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	Less than Significant	N/A	N/A
Geology and Soils			
GEO-1. Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking and/or liquefaction?	Potentially Significant	**MM-GEO-1. Geotechnical Exploration Recommendations** The recommendations included within both the Geotechnical Exploration for the Proposed Industrial Warehouse Site K-4 and Geotechnical Addendum Report for the K4 Moreno Valley Storm Drain, prepared by Leighton Consulting Inc. shall be implemented throughout Project design and construction (Leighton Consulting Inc. 2018a, 2018b). Prior to the issuance of building permits, the March Joint Powers Authority (JPA)-designated plan reviewer shall ensure that design recommendations are incorporated into the K4 Warehouse and Cactus Channel improvements designs.	Less than Significant
GEO-2. Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	Potentially Significant	See **MM-GEO-1** above.	Less than Significant
GEO-3.Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	Potentially Significant	See **MM-GEO-1** above.	Less than Significant
GEO-4. Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Potentially Significant	**MM-GEO-2: Paleontological Resources** In accordance with the provisions of the California Environmental Quality Act and the proposed guidelines of SVP (2010) and the Paleontological Resources Assessment Report prepared by CRM TECH, the proposed Project shall implement the following actions: • Prior to the commencement of any grading activity, the applicant shall retain a qualified paleontologist to ensure the implementation of a paleontological monitoring program. The qualified	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		paleontologist shall obtain a repository agreement from an accredited paleontological repository such as the WSC prior to the initiation of ground disturbing activities associated with the Project. The Society of Vertebrate Paleontology (SVP 2010) defines a qualified paleontologist as having: "1. A graduate degree in paleontology or geology, and/or a publication record in peer reviewed journals; and demonstrated competence in field techniques, preparation, identification, curation, and reporting in the state or geologic province in which the project occurs. An advanced degree is less important than demonstrated competence and regional experience. 2. At least two full years professional experience as assistant to a Project Paleontologist with administration and project management experience; supported by a list of projects and referral contacts. 3. Proficiency in recognizing fossils in the field and determining significance. 4. Expertise in local geology, stratigraphy, and biostratigraphy. 5. Experience collecting vertebrate fossils in the field." • The qualified paleontologist should attend any preconstruction meetings; present a worker environmental training to construction personnel outlining pertinent laws protecting paleontological resources, typical fossils recovered from the geological units onsite, and the steps to take if paleontological resources are discovered during project implementation; and manage the paleontological monitor(s) if he or she is not doing the monitoring. A paleontological monitor should be on-site during all excavations below the depth of previously disturbed sediments. Specifically, all earth-moving operations above the depth of three feet shall be monitored periodically to identify the sediments being impacted,	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		and any earth-moving operations reaching beyond the depth of three feet will require continuous monitoring for potential paleontological remains. The SVP (2010) defines a qualified paleontological monitor as having: "1. BS or BA degree in geology or paleontology and one year experience monitoring in the state or geologic province of the specific project. An associate degree and/or demonstrated experience showing ability to recognize fossils in a biostratigraphic context and recover vertebrate fossils in the field may be substituted for a degree. An undergraduate degree in geology or paleontology is preferable, but is less important than documented experience performing paleontological monitoring, or 2. AS or AA in geology, paleontology, or biology and demonstrated two years experience collecting and salvaging fossil materials in the state or geologic province of the specific project, or 3. Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and two years of monitoring experience in the state or geologic province of the specific project. 4. Monitors must demonstrate proficiency in recognizing various types of fossils, in collection methods, and in other paleontological field techniques." • The monitor shall be prepared to quickly salvage fossils, if they are unearthed, to avoid construction delays, but must have the power to temporarily halt or divert construction equipment to allow for removal of abundant or large specimens. In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor will temporarily halt and/or divert grading activity to allow evaluation and potential recovery of paleontological resources by the qualified paleontologist. The area of discovery will be	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		roped off with a 50-foot radius buffer. Once documentation and collection of the find is completed, the monitor will remove the rope and allow grading to recommence in the area of the find. • If appropriate sedimentological indicators, as outlined in the SVP (2010) guidelines, are observed, sediment samples shall be collected and processed to recover small fossil remains following SVP (2010) guidelines for collection and processing of sediment samples. The amount of sediment collected and processsed shall be consistent with SVP (2010) or determined by the qualified paleontologist. • Recovered specimens shall be identified to the lowest taxonomic and curated at a repository with permanent retrievable storage that allows for further research in the future, such as the WSC. • If during the paleontological monitoring program, half the Project excavations have occurred with no fossil recovery, monitoring can be reduced or terminated, as determined by the qualified paleontologist. • A report of findings, including an itemized inventory of recovered specimens and a discussion of their significance when appropriate, shall be prepared upon completion of the research procedures outlined above. The report should summarize the monitoring program and include geological observations and any paleontological resources recovered during paleontological monitoring for the proposed project. The approval of the report and the inventory by the March Joint Powers Authority shall signify completion of the mitigation program.	
Greenhouse Gas Emissions			
GHG-1. Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	Less than Significant	N/A	N/A
GHG-2. Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	Less than Significant	N/A	N/A

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
Hazards and Hazardous Materials			
HAZ-1. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	Potentially Significant	**MM-HAZ-1. Hazards Materials Transport** Aboveground bulk storage of more than 6,000 gallons of hazardous or flammable materials per tank is discouraged in Zone C1, and would generally not be permitted unless no feasible alternatives are available. Any aggregate aboveground oil/fuel storage containers in Zone C1 greater than 1,320 gallons (or completely buried 42,000 gallons) shall include preparation and implementation of a Spill Prevention, Control and Containment (SPCC) plan pursuant to 40 C.F.R. 112 (or, for small quantities, a spill prevention and response plan) during construction, and if applicable, during site operations. The SPCC plan (or spill prevention and response plan) shall identify Best Management Practices for spill and release prevention and provide procedures for cleaning up and disposing of any spills or releases. **MM-HAZ-2. Hazardous Materials Contingency Plan** A Hazardous Materials Contingency Plan shall be prepared by a qualified environmental consultant and implemented during demolition, excavation, and construction activities for the Project. The Hazardous Materials Contingency Plan shall include, at a minimum, the following: • Identification of known areas with hazardous waste and hazardous materials of concern • Procedures for temporary cessation of construction activity and evaluation of the level of environmental concern • Procedures for limiting access for properly trained personnel to the contaminated area • Procedures for notification and reporting, including internal management and local agencies (e.g., local fire department, county Certified Unified Program Agency), as needed • Health and safety measures for removal and excavation of contaminated soil	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		• Procedures for characterizing and managing excavated soils • Procedures for certification of completion of remediation The Hazardous Materials Contingency Plan shall be submitted to March JPA for approval no less than 30 days prior to the initiation of construction activities at the site. **MM-HAZ-3. UXO Identification, Training, and Reporting Plan** Prior to commencement of construction activities, a UXO Identification, Training, and Reporting Plan to properly train all site workers in the recognition, avoidance, and reporting of military waste debris and ordnance shall be prepared by a qualified environmental consultant. The plan shall contain, at a minimum, the following: • A description of the training program outline and materials, and the qualifications of the trainers; • Identification of available trained experts that will respond to notification of discovery of any suspected ordnance (unexploded or not); • Procedures to stop work immediately in the vicinity of suspected UXO and to notify the Riverside County Sherriff's Department, Certified Unified Program Agency (CUPA) and the U.S. Army Corps of Engineers; • A work plan to recover and remove discovered ordnance, and complete additional field screening, possibly including geophysical surveys to investigate adjacent areas for surface, near-surface or buried ordnance in all proposed land disturbance areas; • Documentation of all surveys and investigations performed to evaluate and remove discovered ordnance.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		The UXO Identification, Training, and Reporting Plan shall be submitted to March JPA for approval no less than 30 days prior to the initiation of construction activities at the site. The results of geophysical surveys shall be submitted to March JPA within 30 days of completion of the surveys. **MM-HAZ-4. Hazards Materials Business Plan** Businesses that use 55 gallons (liquid) or 500 pounds (solid) of hazardous materials are required to submit a Hazardous Materials Business Plan (pursuant to California Health and Safety Code Section 25500) within 30 days of beginning operations. The Hazardous Materials Business Plan shall contain information on hazardous materials inventory, inspections, training, record keeping, and reporting. The Hazardous Materials Business Plan shall be submitted online through the California Environmental Reporting System website. Further information can be found on the County of Riverside Department of Environmental Health website (http://www.rivcoeh.org/HazMat/hmbp).	
HAZ-2. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	Potentially Significant	See **MM-HAZ-1** through **MM-HAZ-4,** above**.**	Less than Significant
HAZ-3. Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	Potentially Significant	See **MM-HAZ-1** through **MM-HAZ-4,** above**.**	Less than Significant
HAZ-4. Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as result, would is create a significant hazard to the public or the environment?	Potentially Significant	See **MM-HAZ-2** and **MM-HAZ-3, above.**	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
HAZ-5. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	Potentially Significant	**MM-HAZ-5. Solar Voltaic System Approval** In the event the Project Applicant chooses to include solar photovoltaic system(s) as part of the Project, the system shall be reviewed and approved by the Air Force prior to the issuance of building permits. The Project Applicant shall demonstrate that the solar panels and hardware are designed to minimize glare and spectral highlighting. Emerging technologies shall be used, such as diffusion coatings and nanotechnological innovations to effectively reduce the refractive index of the solar cells and protective glass. **MM-HAZ-6. Emittance of Steam/Smoke** In the event the Project Applicant decides to include system(s) that would result in the emittance of steam and/or smoke as part of the Project, written approval shall be granted by March Air Reserve Base and March Inland Port airport officials prior to the issuance of building permits. **MM-HAZ-7. Compliance with FAA [Federal Aviation Administration] Advisory Circular 150/5200-33B** In order to ensure proper functioning of the Project drain system to avoid potential hazards to March Air Reserve Base flights, an additional best management practice (BMP) shall be added to the Project Water Quality Management Plan, which shall require that the applicant enter into a covenant and agreement with the March Joint Powers Authority (JPA) similar to the Water Quality Management Plan and Urban Runoff Best Management Practice Transfer, Access and Maintenance Agreement between March JPA and Sun Life Assurance Company of Canada (Document No. 2014-0030862), which shall be recorded prior to issuance of a certificate of occupancy. A copy of the recorded agreement and BMP shall be provided to the Riverside County Airport Land Use Commission. The BMP shall include the following:	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		a. The property owner or its designated representative shall monitor the conditions of the detention basins and promptly inspect such basins following completion of each "significant" rain event and the 48-hour period thereafter. b. The Project includes an underground stormwater detention design so as to minimize the attraction of birds. However, if any standing water remains in a basin that is not beneath a rock, gravel, or other layer following the completion of the "significant" rain event and the 48-hour period thereafter, the property owner or its designated representative shall arrange to have such standing water either removed or covered within the next 2 business days following the conclusion of the 48-hour period. c. In the event that the standing water situation recurs on a regular basis following the 48-hour detention period, the detention basin may no longer be draining as originally designed to prevent standing water from rising above a rock, gravel, or other layer (for example, due to a rise in groundwater levels or other circumstance beyond the property owner's ability to control). In that situation, the property owner or its designated representative shall promptly engage a licensed civil engineer to prepare a design plan to ensure that such condition does not persist for more than 48 hours following the conclusion of a "significant" rain event. The required engineering design solution shall be implemented promptly, but no later than 180 days following its approval by all applicable authorities, providing that, until such time as the engineered design solution is implemented, the property owner or its designated representative will maintain the detention basins such that after 48 hours following a significant rain event, the water levels are below a rock, gravel, or other layer.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		MM-HAZ-8. Tree Planting Restrictions Trees species with masts and tree species that are suitable for roosting shall not be planted on the Project site. Prior to issuance of a grading permit, the plant palette for the proposed Project shall be reviewed and approved by the March Joint Powers Authority.	
		Hydrology and Water Quality	
HYD-1. Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	Less than Significant	N/A	N/A
HYD-2. Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	Less than Significant	N/A	N/A
HYD-3. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces in a manner which would: (i) result in substantial erosion or siltation on- or off-site; (ii) substantially increase the rate or amount of surface the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; (iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or (iv) impede or redirect flood flows?	Less than Significant	N/A	N/A

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
Land Use			
LU-1. Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	Potentially Significant	See the following mitigation: **MM-AQ-1** through **MM-AQ-6,** **MM-BIO-1** through **MM-BIO-9,** **MM-CUL-1** and **MM-CUL-2,** **MM-GEO-1** and **MM-GEO-2,** and **MM-HAZ-1** through **MM-HAZ-8,** above. Also see **MM-TRAF-1** through **MM-TRAF-19**, below.	Less than Significant
LU-2. Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?	Potentially Significant	See the following mitigation: **MM-AQ-1** through **MM-AQ-6,** **MM-BIO-1** through **MM-BIO-9,** **MM-CUL-1** and **MM-CUL-2,** **MM-GEO-1** and **MM-GEO-2,** and **MM-HAZ-1** through **MM-HAZ-8,** above. Also see **MM-TRAF-1** through **MM-TRAF-19**, below.	Less than Significant
Noise			
NOISE-1. Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Less than Significant	N/A	N/A
NOISE-2. Would the project result in generation of excessive groundborne vibration or groundborne noise levels?	Less than Significant	N/A	N/A
NOISE-3. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport,	Less than Significant	N/A	N/A

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
would the project expose people residing or working in the project area to excessive noise levels?			
Transportation			
TRAF-1. Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	Potentially Significant	Existing Conditions **MM-TRAF-1. Elsworth Street/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall contribute its fair-share towards the modification of the traffic signal to implement protected left turn phasing on the northbound and southbound approaches; and, restriping of the northbound shared left-though-right turn lane and southbound shared left-through lane. The signal modification shall include traffic signal synchronization improvements along Cactus Avenue. Opening Year Cumulative Conditions **MM-TRAF-2. Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements: • Modify the traffic signal to implement protected left turn phasing on the northbound, southbound, and eastbound approaches; and, include traffic signal synchronization improvements along Cactus Avenue • Add a second northbound left turn lane • Add a third westbound through lane • Add a westbound right turn lane **MM-TRAF-3. Elsworth Street/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements:	Significant and Unavoidable

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		• Modify the traffic signal to implement protected left turn phasing on the northbound and southbound approaches; and, include traffic signal synchronization improvements along Cactus Avenue **MM-TRAF-4. Heacock Street/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements: • Add a third eastbound through lane • Add a third westbound through lane • Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue **MM-TRAF-5. Sycamore Canyon Boulevard/Alessandro Boulevard** Prior to issuance of first certificate of occupancy, the Project shall contribute its fair share towards the installation of a second northbound left turn lane; and, the modification of the traffic signal to implement protected left turn phasing on the southbound, eastbound, and westbound approaches. <u>Horizon Year Traffic Conditions</u> **MM-TRAF-6. I-215 Southbound Ramps/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements: • Add a third eastbound through lane • Add a second westbound left turn lane • Add a third westbound through lane • Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue **MM-TRAF-7. I-215 Northbound Ramps/Alessandro Boulevard** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the installation of a second northbound left turn lane.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		MM-TRAF-8. Old 215 Frontage Road/Alessandro Boulevard Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements: • Add a third eastbound through lane • Add a third westbound through lane **MM-TRAF-9. Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share toward the following improvements: • Modify the traffic signal to implement protected left turn phasing on the southbound approaches; and, include traffic signal synchronization improvements along Cactus Avenue • Add a second northbound through lane • Add two southbound right turn lanes • Add a second eastbound left turn lane • Add a third eastbound through lane • Add an eastbound right turn lane • Add a fourth westbound through lane **MM-TRAF-10. Day Street/Alessandro Boulevard** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements: • Add a third westbound through lane **MM-TRAF-11. Elsworth Street/Alessandro Boulevard** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the addition of a second northbound left turn lane. **MM-TRAF-12. Elsworth Street/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share toward the following improvements:	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		• Add a second northbound left turn lane • Add a fourth eastbound through lane • Add a fourth westbound through lane • Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue **MM-TRAF-13. Frederick Street/Alessandro Boulevard** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the addition of a third eastbound through lane. **MM-TRAF-14. Graham Street/Riverside Drive/Cactus Avenue** Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the addition of a second eastbound left turn lane. **MM-TRAF-15. Heacock Street/Cactus Avenue** Prior to issuance of first certificate of occupancy, the project shall pay its fair share toward the following improvements: • Add a third eastbound through lane • Add a third westbound through lane • Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue **MM-TRAF-18. WRCOG TUMF Contribution** Prior to the issuance of building permits, the Project Applicant shall participate in the WRCOG TUMF fee programs by paying the requisite fees at the time of building permit. Improvements may be eligible for a fee credit or reimbursement through the program where appropriate. Table 4.11-28 provides share calculations in the event a particular facility is not included in a pre-existing fee program.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		MM-TRAF-19. Construction Traffic Management Plan Prior to the issuance of building permits, the Project Applicant would be required to develop and implement a March JPA-approved Construction Traffic Management Plan addressing potential construction-related traffic detours and disruptions. In general, the Construction Traffic Management Plan would ensure that to the extent practical, construction traffic would access the Project site during off-peak hours; and that construction traffic would be routed to avoid travel through, or proximate to, sensitive land uses.	
TRAF-2. Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	Potentially Significant	See **MM-TRAF-1** through **MM-TRAF-15, MM-TRAF-18,** and **MM-TRAF-19**, above.	Less than Significant
TRAF-3. Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	Less than Significant	N/A	N/A
TRAF-4. Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves, or dangerous intersections) or incompatible uses (e.g., farm equipment)?	Potentially Significant	**MM-TRAF-16 Veteran's Way/Driveway 1/Cactus Avenue (#21)** Prior to issuance of first certificate of occupancy, the Project shall construct the following improvements: • Construct northbound approach with left turn lane, and shared through-right lane • Re-stripe southbound left-right turn lane to a through lane • Add westbound left turn lane • Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue **MM-TRAF-17 Frederick Street/Driveway 2/Cactus Avenue (#23)** Prior to issuance of first certificate of occupancy, the Project shall construct the following improvements:	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		• Construct northbound approach with left turn lane, through lane, and right turn lane • Re-stripe southbound right turn lane to a through-right lane • Add westbound left turn lane • Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue	
TRAF-5. Would the project result in inadequate emergency access?	Less than Significant	N/A	N/A
Tribal Cultural Resources			
Threshold TCR-1 Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?	Less than Significant	N/A	N/A
b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	Potentially Significant	**MM-TCR-1. Inadvertent Discovery of Tribal Cultural Resources** While no Tribal Cultural Resources (TCRs) have been identified that may be affected by the proposed Project, the following approach for the inadvertent discovery of TCRs has been prepared to ensure there are no impacts to unanticipated resources. Should a potential TCR be encountered, construction activities near the encounter shall be temporarily halted within 50 feet of the discovery and March Joint Powers Authority (JPA) notified. March JPA will notify Native American tribes that have been identified by the Native American Heritage Commission (NAHC) to be traditionally and culturally affiliated with the	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		geographic area of the Project. If the potential resource is archaeological in nature, appropriate management requirements shall be implemented as outlined in Mitigation Measure **MM-CUL-1** (see Section 4.4.5, Mitigation Measures). If March JPA determines that the potential resource is a TCR (as defined by PRC, Section 21074), tribes consulting under AB 52 and SB 18 would be provided a reasonable period of time, typically 5 days from the date of a new discovery is made, to conduct a site visit and make recommendations regarding future ground disturbance activities as well as the treatment and disposition of any discovered TCRs. A qualified archaeologist shall implement a plan for the treatment and disposition of any discovered TCRs based on the nature of the resource and considering the recommendations of the tribe(s). Implementation of proposed recommendations made pursuant to **MM-TCR-1** will be made based on the determination of March JPA that the approach is reasonable and feasible.	
		Utilities and Service Systems	
UTIL-1. Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities or expansion of existing facilities, the construction or relocation of which could cause significant environmental effects?	Potentially Significant	**MM-UTL-1. WMWD Conditions of Approval** Prior to issuance of building permits, the applicant shall follow the conditions of approval specified in the Water Supply Assessment expected to be shortly adopted by the Western Municipal Water District (WMWD). The conditions of approval must include: 1. The Applicant shall meet with WMWD to determine if the proposed Project should include the construction of on-site and off-site water facilities as needed near the Project area. 2. The Applicant shall promptly pay all applicable fees and charges as specified in WMWD's Rules and Regulations Governing Water Service and Water Users, Water Rate Schedules and Water Rate Schedules by Service Area, Cost Recovery charges and connection and Added Facilities Charges and Fees.	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		3. The Applicant shall ensure that all landscape plans are compliant with applicable requirements. In WMWD's area, those requirements may include, but are not limited to, landscape ordinances of the County of Riverside (Water Efficient Landscape Requirements Ordinance No. 859), City of Riverside (Municipal Code 19.570), City of Murrieta (Ordinance 443-10), and March JPA Ordinance No. JP 09-05 (Water Efficient Landscape Ordinance). 4. The Applicant shall be required to plan and install water efficient devices and landscaping in accordance with applicable ordinances and requirements. 5. The Applicant shall use recycled water for landscaped areas. The proposed Project is located near existing recycled water distribution infrastructure on Cactus Avenue and the Applicant shall be required to use recycled water for landscaped areas. 6. If WMWD deems it necessary, the Applicant shall develop a specific plan of service for the proposed Project and coordination of land use decisions and water supply planning with WMWD to ensure sufficient and reliable water supply for WMWD's existing and future uses. Thereby, if WMWD adopts and implement rules, regulations, policies and procedures within its authority that may apply to the proposed Project, they will be implemented. 7. The proposed Project shall be subject to any special or additional requirements imposed by the Metropolitan Water District or WMWD on water deliveries, including increased pricing or a different pricing structure. 8. Prior to certificate of occupancy, the Applicant shall demonstrate the proposed Project complies with all provisions within the March Joint Powers Authority Ordinance No. JP 09-05 (Water Efficient Landscape Ordinance) including but not limited to: • Irrigation systems shall be designed, maintained, and managed to meet or exceed an average irrigation efficiency of 0.71.	

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		• All irrigation systems shall be designed to prevent runoff, over-spray, low head drainage, and other similar conditions where water flows off site onto adjacent property, non-irrigated areas, walk, roadways, or structures. Irrigation systems shall be designed, constructed, installed, managed, and maintained to achieve as high an overall efficiency as possible. • Landscaped areas shall be provided with a smart irrigation controller which automatically adjusts the frequency and/or duration of irrigation events in response to changing weather conditions unless the use of the property would otherwise prohibit use of a timer.	
UTIL-2. Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	Less than Significant	N/A	N/A
UTIL-3. Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	Less than Significant	N/A	N/A
UTIL-4. Would the project be generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	Potentially Significant	**MM-UTL-2. Construction Waste Recycling Plan and Waste Recycling Report** Prior to issuance of building permits, the applicant shall complete a Construction Waste Recycling Plan and submit the plan to the Riverside County Waste Management Department (RCWMD) for approval. The plan shall identify and estimate the materials to be recycled during construction activities and shall specify where and how the recyclable materials will be stored on the site. Compliance with the plan will be a requirement in all construction contracts. The RCWMD-approved plan shall be attached to all construction plans and distributed to all construction contractors. Once construction is complete, the applicant shall prepare a Waste Recycling Report that demonstrates that the	Less than Significant

Table ES-1
Summary of Project Impacts

Environmental Topic	Impact?	Mitigation Measure(s)	Level of Significance After Mitigation
		Project recycled a minimum of 50% of its construction and demolition waste. The waste recycling report shall be submitted to and approved by the RCWMD prior to issuance of occupancy permits. **MM-UTL-3. Use of Mulch and/or Compost** The use of mulch and/or compost shall be used in the development and maintenance of all landscaped areas within the Project. Green waste shall be recycled through either on-site composting of grass (i.e., leaving the grass clippings on the lawn) or sending separated green waste to a composting facility. **MM-UTL-4. Drought-Tolerant Vegetation** The Project shall use xeriscaping and drought-tolerant low-maintenance vegetation in all landscaped areas of the Project site.	
UTIL-5. Would the project comply with federal, state, and local management reduction statutes and regulations related to solid waste?	Potentially Significant	See **MM-UTL-2,** above. **MM-UTL-5. RCWMD Approval of Buildings Plans** Prior to issuance of building permits, the Applicant shall submit building plans to the Riverside County Waste Management Department (RCWMD) and obtain approval from the RCWMD for compliance with the Riverside County Design Guidelines for Refuse and Recyclables Collection and Loading Areas, which include specifications for recyclable storage space, location and access, signage, protection and security, compatibility, and overall compliance with federal, state, and local laws.	Less than Significant

ES.5 AREAS OF CONTROVERSY/ISSUES TO BE RESOLVED

Section 15123(b) (2) of the CEQA Guidelines requires that areas of controversy known to the lead agency must be stated in the EIR summary. Issues of interest to the public and public agencies were identified during the 50-day public comment period of the Initial Study and NOP, which began on November 19, 2018 and concluded on January 7, 2019 A Scoping Meeting was held on December 3, 2018. Discussion at the December 3, 2018 Scoping Meeting included concerns regarding hazards to air flight, traffic and truck traffic, air emissions, and the Project's proximity to the March ARB. None of the comments received change the issue areas that the Initial Study determined would be discussed in the EIR. All of the issues and concerns raised in the comments have been fully addressed and analyzed in this EIR.

Written comments in response to the NOP were received from the following agencies and organizations:

- Southern California Association of Governments
- Western Municipal Water District

The Initial Study, NOP, distribution list, scoping meeting comment cards, and comment letters received during the NOP review period are included in Appendix A of this EIR.

Section 15123(b)(3) of the CEQA Guidelines requires that an EIR identify issues to be resolved; this includes the choice among alternatives and whether or how to mitigate significant impacts. The major issues to be resolved for the Project include decisions by March JPA as to whether this EIR adequately describes the potential environmental impacts of the Project, whether the recommended mitigation measures should be adopted or modified, whether additional mitigation measures need to be applied, whether the Project should or should not be approved as proposed, and/or whether the Project should be modified based on the alternatives considered in this EIR.

ES.6 SUMMARY OF PROJECT ALTERNATIVES

Section 15126.6 of the CEQA Guidelines identifies the parameters within which consideration and discussion of alternatives to the Project should occur. As stated in this section of the guidelines, alternatives must focus on those that are reasonably feasible and that attain most of the basic objectives of the Project. Each alternative should be capable of avoiding or substantially lessening any significant effects of the Project. The rationale for selecting the alternatives to be evaluated and a discussion of the No Project Alternative are also required, per Section 15126.6.

ES.6.1 Alternatives Evaluated

This EIR includes an evaluation of the following alternatives:

- Alternative 1 – No Project

- Alternative 2 – General Warehouse
- Alternative 3 – High-Cube Short-Term Storage Warehouse
- Alternative 4 – High-Cube Parcel Hub Warehouse

ES.6.1.1 Alternative 1 – No Project

Under Alternative 1, development of the Project would not occur as discussed in Chapter 2 of this EIR. The Project site would remain unchanged, and no development activity would occur. As a result, the proposed General Plan Amendment, Zoning Designation, Master Plot Plan, Tentative Tract Map, and all other applicable pending approvals associated with the Project would not be necessary, as no new development would occur on the Project site that would trigger such actions.

ES.6.1.2 Alternative 2 – General Warehouse

Under Alternative 2 – General Warehouse, the Project shell would be constructed on the K4 Parcel, and rather than operating as a High-Cube Fulfillment e-commerce Center, which is characterized by a significant storage function and direct distribution of e-commerce product to end uses, the building on the K4 Parcel would operate as a general warehouse. As a general warehouse, Alternative 2 would be primarily devoted to the storage of materials with minimal space devoted to office and maintenance areas. Alternative 2 would also require a General Plan Amendment, Zoning Designation, Master Plot Plan, Tentative Tract Map, and all other discretionary action included in Section ES.3.4, Discretionary Actions. Under Alternative 2, improvements to the Cactus Channel would also be completed.

ES.6.1.3 Alternative 3 – High-Cube Short-Term Storage Warehouse

Under Alternative 3 – High-Cube Short-Term Storage Warehouse, the Project shell would be constructed on the K4 Parcel, and rather than operating as a High-Cube Fulfillment Center, which is characterized by a significant storage function and direct distribution of ecommerce product to end uses, the building on the K4 Parcel would operate as a high-cube warehouse (HCW) building. A HCW is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly efficient processing of goods through the HCW. The HCWs included in this land use include transload and short-term facilities. Transload facilities have a primary function of consolidation and distribution of pallet loads (or larger) for manufacturers, wholesalers, or retailers. They typically have little storage duration, high throughput, and are high-efficiency facilities. Short-term HCWs are high-efficiency distribution facilities often with custom/special features built into structure for movement of large volumes of freight with only short-term storage of products. Alternative 3 would also require a General Plan

Amendment, Zoning Designation, Master Plot Plan, Tentative Tract Map, and all other discretionary action included in Section ES.3.4. Under Alternative 3, improvements to the Cactus Channel would also be completed.

ES.6.1.4 Alternative 4 – High-Cube Parcel Hub Warehouse

Under Alternative 4 – High-Cube Parcel Hub Warehouse, the Project shell would be constructed on the K4 Parcel, and rather than operating as a High-Cube Fulfillment Center, which is characterized by a significant storage function and direct distribution of ecommerce product to end uses, the building on the K4 Parcel would operate as a high-cube parcel hub warehouse. A high-cube parcel hub warehouse typically serves as a regional and local freight forwarder facility for time-sensitive shipments via airfreight and ground carriers. These sites also often include truck maintenance, wash and fueling facilities. Alternative 4 would also require a General Plan Amendment, Zoning Designation, Master Plot Plan, Tentative Tract Map, and all other discretionary action included in Section ES.3.4. Under Alternative 4, improvements to the Cactus Channel would also be completed.

ES.6.2 Environmentally Superior Alternative

Table ES-2, Comparison of Impacts of the Alternatives, provides a summary of the alternatives impact analysis considered in this EIR and identifies the areas of potential environmental effects per CEQA, and ranks each alternative as better, the same, or worse than the Project with respect to each issue area.

Table ES-2
Comparison of Project Alternatives Impacts

Environmental Issue Area	Proposed Project	Alternative 1 No Project	Alternative 2 General Warehouse	Alternative 3 High-Cube Short-Term Storage Warehouse	Alternative 4 High-Cube Parcel Hub Warehouse
Aesthetics	**LTS**	▼	—	—	—
Air Quality	**SU**	▼	▼	▼	▲
Biological Resources	**LTS-MM**	▼	—	—	—
Cultural Resources	**LTS-MM**	▼	—	—	—
Geology and Soils	**LTS**	▼	—	—	—
Greenhouse Gas Emissions	**LTS**	▼	—	—	—
Hazards and Hazardous Materials	**LTS-MM**	▼	—	—	—
Hydrology and Water Quality	**LTS**	▼	—	—	—
Land Use and Planning	**LTS-MM**	▼	—	—	—
Noise	**LTS**	▼	—	—	—

Table ES-2
Comparison of Project Alternatives Impacts

Environmental Issue Area	Proposed Project	Alternative 1 No Project	Alternative 2 General Warehouse	Alternative 3 High-Cube Short-Term Storage Warehouse	Alternative 4 High-Cube Parcel Hub Warehouse
Transportation	**SU**	▼	▼	▼	▼
Tribal Cultural Resources	**LTS-MM**	▼	—	—	—
Utilities and Service Systems	**LTS**	▼	—	—	—
Energy Conservation	**LTS**	▼	—	—	—
Meets Project Objectives?	**Yes**	**No**	**Yes**	**Yes**	**Yes**

— Alternative is likely to result in similar impacts to issue when compared to Project.
▼ Alternative is likely to result in reduced impacts to issue when compared to Project.
▲ Alternative is likely to result in greater impacts to issue when compared to Project.
LTS = less than significant impact; LTS-MM = less than significant impact with mitigation; SU = significant, unavoidable impact.

As indicated in Table ES-2, Alternative 1, the No Project Alternative would result in the fewest environmental impacts, and based on this would be considered the environmentally superior alternative. However, Section 15126.6(e)(2) of the CEQA Guidelines states that if the environmentally superior alternative is the No Project Alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

Of the alternatives evaluated above, Alternative 3 was found to be environmentally superior over the Project because it had the most reductions in impacts from the Project. Alternative 3 was found to have fewer air quality impacts and fewer overall vehicle trips. For the remaining environmental impact areas, Alternative 3 would result in the same impacts as the proposed Project. However, as with the proposed Project, identified significant and unavoidable impacts associated air quality, greenhouse gas emissions, and transportation impacts would remain under Alternative 3.

CHAPTER 1
INTRODUCTION

1.1 PURPOSE AND SCOPE

The purpose of this Environmental Impact Report (EIR) is to evaluate and disclose the potential environmental consequences of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). The proposed Project constitutes a "project" as defined in the California Environmental Quality Act (CEQA) Guidelines Section 15378. The March Joint Powers Authority (JPA) is the lead agency preparing this EIR in accordance with the CEQA statutes (California Public Resources Code, Section 21000 et seq.) and the March JPA's 2016 Local CEQA Guidelines.

The Project consists of a proposed warehouse building on the K4 Parcel, an approximately 35.4-acre site located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The K4 Parcel is located within the March JPA jurisdiction, which is within unincorporated Riverside County, California (Figure 1-1, Project Location). Interstate 215 is located approximately 0.8 miles east of the K4 Parcel. The K4 Parcel is comprised of five parcels, which would be consolidated into one, designated as Assessor's Parcel Numbers 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The latitude and longitude of the approximate center of the K4 Parcel is 33°54′32.14″ North and 117°15′47.05″ West. The K4 Parcel sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey.

Additionally, the Project includes regional improvements to the Cactus Avenue Channel proposed by Riverside County Flood Control and Water Conservation District as part of the district's master Plan, which would convert the existing Cactus Avenue Drainage Channel (Cactus Channel) drainage ditch into a box culvert. The Cactus Channel portion of the Project is located along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel (Channel Improvement Site). The portion of the Cactus Channel that would be improved as part of the proposed Project runs a total of 7,900 linear feet. The K4 Parcel and Cactus Channel are located outside of but adjacent to, and westerly of, the existing March Business Center and Meridian Specific Plan area but within the jurisdiction of the March JPA.

To facilitate Project approval, the following would be required:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing

Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.

- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000 square foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

1.2 COMPLIANCE WITH CEQA

1.2.1 Format

This chapter of this EIR sets forth the summary requirements of CEQA as required by Section 15123 of the CEQA Guidelines. Chapter 2, Project Description, also complies with CEQA project description requirements by discussing the Project location (Section 2.1), providing a statement of the document's purpose and intended use (Section ES.3.1, Background), and identifying the Project objectives (Section ES.3.2).

Issues identified in the Initial Study prepared for the Project by the March JPA that were found to have no impact or a less than significant impact are provided in Appendix A, Initial Study and Notice of Preparation, of this document. This EIR has been formatted to address the issues found to be potentially significant in the Initial Study. For the issue areas found to be potentially significant in the Initial Study, there is a corresponding EIR section. Each EIR section includes an existing setting discussion that describes the physical environmental conditions within the Project area, as they existed at the time the Notice of Preparation (NOP) was prepared, in November 2018, and that are considered the baseline physical condition from which the March JPA determines whether an impact is considered to be significant (14 CCR 15125(a)). Section 15125(d) of the CEQA Guidelines requires that an EIR "discuss any inconsistencies between the project and applicable general plans and regional plans," which will be addressed in Section 4.9, Land Use and Planning. Each EIR section identifies thresholds of significance as well as includes an analysis to determine the amount and degree of impact relative to each significance threshold that is associated with the Project. For all significant environmental impacts, mitigation measures, where feasible, are required in order to reduce the impacts to a less-than-significant level.

The analysis of impacts and identification of mitigation measures are derived from technical reports that are included as technical appendices to this EIR and from other informational resources as listed at the end, in the references subsection, within each section of this document.

1.2.2 Environmental Procedures

The basic purposes of CEQA are the following:

1. Inform governmental decision makers and the public about the potential, significant environmental effects of proposed activities;
2. Identify the ways that environmental damage can be avoided or significantly reduced;
3. Prevent significant, avoidable damage to the environment by requiring changes in the project through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible; and
4. Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved (14 CCR 15002).

The EIR process typically consists of three parts: (1) the NOP (including the Initial Study), (2) the Draft EIR, and (3) the Final EIR. Pursuant to Section 15063 of the CEQA Guidelines, the March JPA prepared an Initial Study (Environmental Checklist) for the Project in order to determine if the Project would have a significant effect on the environment. The NOP was intended to encourage interagency communication concerning the proposed action and provide sufficient background information about the proposed action so that agencies, organizations, and individuals could respond with specific comments and questions on the scope and content of the EIR. Based upon the analysis contained in the Initial Study/NOP, the March JPA concluded that an EIR should be prepared. The NOP for the EIR and a description of potential adverse impacts were distributed to the State Clearinghouse, responsible agencies, and other interested parties on November 19, 2018. Pursuant to Section 15082 of the CEQA Guidelines, recipients of the NOP were requested to provide responses within 50 days after their receipt of the NOP. During the 50-day public review period of the NOP, March JPA held a Scoping Meeting on December 3, 2018, to gather additional public input on the Project. Copies of the NOP (including the Initial Study) and the NOP distribution list are provided in Appendix A. All comments received during the NOP public notice period were considered during the preparation of this EIR. Written comments received on the NOP are included in Appendix A of this EIR.

Based on the scope of analysis for this EIR, including comments received during the NOP public scoping period, the following issues were determined to be potentially significant and are therefore addressed in Chapter 4, Environmental Impact Analysis, of this document:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality

- Land Use and Planning
- Noise
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Energy

Other potential environmental impact areas, such as agriculture and forestry resources, mineral resources, population and housing, public services, recreation, and wildfire were not found to be significant based on the results of the Initial Study. These issues are addressed in Chapter 3, Effects Found Not to Be Significant, of this EIR.

As the lead agency for the Project, the March JPA has assumed responsibility for preparing this EIR. The decision to consider the Project is within the purview of the March Joint Powers Commission. The March JPA will use the information included in this EIR to consider potential impacts to the physical environment associated with the Project when considering approval of the Project. As set forth in Section 15021 of the CEQA Guidelines, the March JPA, as lead agency, has the duty to avoid or minimize environmental damage where feasible. Furthermore, Section 15021(d) states that:

> CEQA recognizes that in determining whether and how a Project should be approved, a public agency has an obligation to balance a variety of public objectives, including economic, environmental, and social factors and in particular the goal of providing a decent home and satisfying living environment for every Californian. An agency shall prepare a statement of overriding considerations as described in Section 15093 to reflect the ultimate balancing of competing public objectives when the agency decides to approve a Project that will cause one or more significant effects on the environment (14 CCR 15021(d)).

In accordance with CEQA, the lead agency will be required to make findings for each environmental impact of the Project that cannot be mitigated to a less-than-significant level. If the lead agency determines that the benefits of the Project outweigh unmitigated, significant environmental effects, the agency will be required to adopt a statement of overriding considerations stating the reasons supporting their action notwithstanding the Project's significant environmental effects.

The EIR will be made available for review to agencies and the public for 45 days to provide comments on the "sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the Project might be avoided or mitigated" (14 CCR 15204).

1.2.3 Incorporation by Reference

Information provided in (1) the General Plan of the March Joint Powers Authority (March JPA 1999a), (2) Master Environmental Impact Report for the March Joint Powers Authority (March JPA 1999b), (3) Air Installation Compatible Use Zone Study for March Air Reserve Base (ARB) (March ARB 2005), (4) March ARB/Inland Port Airport Land Use Compatibility Plan (Mead & Hunt 2014) and other references, were reviewed in order to assist environmental review of the Project.

The March JPA's General Plan describes plans for development on the site and evaluates the environmental effects of the land uses proposed in the General Plan for the site. Accordingly, these documents are incorporated by reference (14 CCR 15150). These documents are available for review at the March JPA, 23555 Meyer Drive, Riverside, California 92518, as well as on the March JPA's website at www.marchjpa.com.

1.2.4 NOP Comment Letters and Scoping Meeting

The NOP for the Project was published on November 19, 2018, which will thus be the environmental baseline for the Project. Currently the site is flat land that is vacant and undeveloped. The public review period for the Initial Study/NOP began on November 19, 2018, and ended on January 7, 2019. A number of agencies and organizations commented on the Initial Study/NOP, and those comments can be found in Appendix A. During the 50-day public review period of the NOP, March JPA held a Scoping Meeting on December 3, 2018. Discussion at the December 3, 2018, Scoping Meeting included concerns regarding hazards to air flight, traffic and truck traffic, air emissions, and the Project's proximity to the March ARB. None of the comments received change the issue areas that the Initial Study determined would be discussed in the EIR. All of the issues and concerns raised in the comments have been fully addressed and analyzed in the EIR.

K4 Warehouse and Cactus Channel Improvements Project EIR

INTENTIONALLY LEFT BLANK

CHAPTER 2
PROJECT DESCRIPTION

This chapter describes the objectives of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) and Environmental Impact Report (EIR) and provides a detailed description of Project characteristics. This chapter also discusses the discretionary actions required and includes a brief description of the environmental effects, which are evaluated in Chapter 3, Effects Found Not to Be Significant, through Chapter 6, Cumulative Effects, of this EIR.

2.1 PROJECT LOCATION

The Project site, which collectively consists of the K4 Parcel and the Cactus Avenue Drainage Channel (Cactus Channel), is located on the south side of Cactus Avenue and immediately north of March Air Reserve Base (ARB). The approximately 35.4-acre warehouse site (K4 Parcel) is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The K4 Parcel is located within the March Joint Powers Authority (JPA) jurisdiction, which is within unincorporated Riverside County, California (Figure 2-1, Project Location). Interstate 215 is located approximately 0.8 miles east of the K4 Parcel. The K4 Parcel is comprised of five parcels designated as Assessor's Parcel Numbers 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0.

The latitude and longitude of the approximate center of the K4 Parcel is 33°54′32.14″ North and 117°15′47.05″ West. The K4 Parcel sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey.

The Cactus Channel portion of the Project is located along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel (Channel Improvement Site). The portion of the Cactus Channel that would be improved as part of the proposed Project runs a total of 7,900 linear feet.

According to the March JPA General Plan Land Use Plan (March JPA 2012), the K4 Parcel's land use designation is Business Park, as shown in Figure 2-2, March JPA General Plan Land Use Designations. The K4 Parcel has not previously been given a zoning designation per the official March JPA Zoning Map, as shown in Figure 2-3, March JPA Zoning Designations.

2.2 PROJECT BACKGROUND

In 1993, the federal government mandated the realignment of March Air Force Base (AFB) and a substantial reduction in its military use. In April 1996, March AFB was re-designated an ARB. Approximately 4,400 acres of land that had historically supported March AFB was no longer needed

to support the ARB. The cities of Moreno Valley, Perris, and Riverside, and the County of Riverside formed the March JPA to oversee the dispensation and management of the surplus land. A General Plan and Master EIR were prepared and adopted/certified in 1999 for the JPA planning area, which includes the March ARB.

Concurrent with the U.S. Air Force's preparation of the Environmental Impact Statement (U.S. Air Force 1996), the March JPA and the March Joint Powers Redevelopment Agency prepared an EIR for the proposed March ARB Redevelopment Project (March Joint Powers Redevelopment Agency 1996). The Project evaluated in this EIR considered the development of approximately 7,250 acres. The area evaluated including 6,782 acres comprising the boundaries of March ARB, of which approximately 4,524 acres would fall under the authority of March JPA. The remaining 2,258 acres would remain under the control of the military. Additionally, 467 acres within the City of Moreno Valley were included in the EIR evaluation.

Upon approval by the federal government for the realignment of March ARB and the transfer of excess property from March ARB to March JPA, March JPA prepared a General Plan and certified a Master EIR for the General Plan in 1999 (SCH No. 97071095; March JPA 1999). The K4 Parcel was grouped in the Northeast Planning Subarea and assigned a land use designation of Business Park.

Meridian Park K4 LLC is now pursuing development of the K4 Parcel with an e-commerce warehouse. Additionally, the Project includes regional improvements to the Cactus Channel proposed by Riverside County Flood Control and Water Conservation District (District) as part of the District's Master Plan (Riverside County Flood and Water Conservation District 2015), which would convert the existing Cactus Channel drainage ditch into a box culvert. While the K4 Parcel was previously conceptually considered for development in the Disposal of Portions of March AFB Environmental Impact Statement, the March AFB Redevelopment Project EIR, and the Master EIR for March JPA, with a specific development plan identified, the analysis in this EIR addresses the proposed build-out of the K4 Parcel and associated Cactus Channel improvements.

2.3 PROJECT OBJECTIVES

The primary objectives of the Project include the following:

- Provide appropriate land use intensities to comply with the parameters of the March ARB/Inland Port Airport Compatibility Plan.
- Implement the goals, objectives and policies of the March JPA General Plan at the K4 Parcel, specifically encouraging the development of industrial uses to expand the employment and financial base of the March JPA Planning Area in a manner that is compatible with the nearby airbase and adjacent industrial uses.

- Provide increased job opportunities for local residents through the provision of employment-generating businesses.
- Establish a land use and facility plan that ensures project viability in consideration of existing and anticipated economic conditions.
- Develop the property with land uses that are compatible with the March AFB Reuse program.
- Encourage the use of alternative modes of transportation through the provision of a pedestrian and bicycle circulation system that is both safe and comfortable.
- Provide a range of job types for the community's residents.
- Provide a circulation system that facilitates movement and access needs of automobiles, pedestrians and bicyclists.
- Minimize impacts from construction of the development to sensitive biological resources.
- Minimize water wildlife attractants, which are hazards to aircraft flights, associated with the naturalized open-air Cactus Channel drainage channel by undergrounding the drainage channel.

2.4 PROJECT CHARACTERISTICS

2.4.1 Project Overview

The proposed Project involves the development of the five parcels on the 35.4-acre K4 Parcel with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use, as shown in Figure 2-4, K4 Warehouse Site Plan. The maximum exterior building height would be 46 feet at the parapet. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the K4 Parcel via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. Once constructed, the e-commerce/fulfillment center use occupying the K4 Parcel could potentially be used up to 7 days per week and 24 hours per day.

The proposed Project would also include improvements to the drainage channel within the Cactus Channel Improvement Site (Figure 2-5, Cactus Channel Overview). The drainage improvements are proposed to be an underground box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot-wide box to a 9-foot-wide double box (approximately 19 feet in width). The installation of the box culvert would require trenching through the existing swale behind the Cactus Avenue right-of-way. It is anticipated that there would be some utility relocations for existing crossings in record plans as well as removal of some existing roadway culverts and extending existing storm drain connections to the earth swale. The location of the channel course would remain in its

current location. This portion of the Project is being proposed by the District as part of the District's Master Plan and is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert is being permitted by the District and it would either be constructed contemporaneously with the Project or built separately depending on permitting and timing. The Cactus Channel would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan. The installation of the box culvert would require trenching through the existing swale behind the Cactus Avenue right-of-way.

2.4.2 Project Construction

Construction of the proposed warehouse would occur over a 12-month period of time, commencing in quarter 1 of 2020 and completing in quarter 1 of 2021. Generally, warehouse construction would include site grading, utility relocation/installation, and building construction. Rough grading and utility installation would last approximately 25 days, and building construction, including pad/site-specific grading activities, would occur over approximately 11 months. Heavy equipment to be used on site during construction would include flat beds, dozers, scrapers, graders, track hoes, dump trucks, forklifts, cranes, cement trucks, pavers, rollers, water trucks, rolling container trucks, and bobcats. Heavy equipment would be delivered and removed from the site throughout the construction phase. As most heavy equipment is typically not authorized to be driven on a public roadway, most of the equipment would be delivered and removed from the site via large flatbed trucks. It is anticipated that delivery of heavy equipment would not occur on a daily basis, but rather periodically throughout the construction phase based on need. During summer months, concrete pours for the warehouse could begin as early as 3:00 a.m.; during the remainder of the year, concrete pours would occur after 4:00 a.m. All other deliveries would occur at any time during the day. Any early morning concrete pours would comply with existing noise limitations identified in March JPA Development Code Sections 9.10.140 and 9.10.030.

Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Channel Improvement Site. Construction of the Cactus Channel improvements would occur over an approximately 30-month period, commencing in quarter 4 of 2020 and completing in quarter 1 of 2023. Heavy equipment to be used on site during construction would include excavators, dozers, loaders, tractors, backhoes, and cranes. Heavy equipment would be delivered and removed from the site throughout the construction phase.

2.4.3 California Environmental Quality Act

The baseline for a project is typically the physical environmental condition that exists in the vicinity of a Project when the Notice of Preparation is published (14 CCR 15125(a)). The Notice of Preparation for the Project was published on November 19, 2018, which will thus be the

environmental baseline for the Project. Currently the K4 Parcel is flat land that is vacant and undeveloped and the Cactus Channel is an earthen ditch with drainage flowing from west to east.

2.4.4 Project Operations

The proposed warehouse building would include a total of 105 loading dock positions for trucks. Vehicles would access the warehouse site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. Once constructed, the e-commerce/fulfillment center use occupying the K4 Parcel could potentially be used up to 7 days per week and 24 hours per day.

Placement of the Cactus Channel in a box culvert as part of the District's Master Plan would not affect channel flows upon completion of construction. Flows would continue to the east, where the channel would connect with the Heacock Channel and turn south.

2.4.5 Requested Approvals and Entitlements

To facilitate Project approval, the following would be required:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

2.5 DISCRETIONARY ACTIONS

The following additional permits, approvals and discretionary actions may be necessary as part of Project approval.

a. U.S. Army Corps of Engineers – A Jurisdictional Determination will be required to identify and locate the boundaries of jurisdictional waters of the United States on the Project site,

and if found, will be regulated by the U.S. Army Corps of Engineers under Section 404 of the Clean Water Act.

b. State Water Resources Control Board (SWRCB) – A National Pollutant Discharge Elimination System Construction General Permit will need to be obtained from the SWRCB. Permit registration documents include a Storm Water Pollution Prevention Plan.

c. SWRCB – A National Pollutant Discharge Elimination System Industrial General Permit may need to be obtained from the SWRCB, depending on the type of facility ultimately built, consistent with the requested General Plan land use designations of Industrial.

d. Regional Water Quality Control Board, Santa Ana Region – 401 Water Quality Certification – A Waste Discharge Requirement Permit will need to be obtained from the Regional Water Quality Control Board.

e. South Coast Air Quality Management District – A Dust Control Plan will need to be approved by the South Coast Air Quality Management District.

f. Federal Aviation Administration – A Form 7460-1 will need to be approved by the Federal Aviation Administration.

g. Riverside County Airport Land Use Commission – A consistency finding with Riverside County Land Use Plan will be required by Riverside County Airport Land Use Commission.

CHAPTER 3
EFFECTS FOUND NOT TO BE SIGNIFICANT

3.1 EFFECTS FOUND NOT TO BE SIGNIFICANT DURING PREPARATION OF THE INITIAL STUDY/NOTICE OF PREPARATION

The California Environmental Quality Act provides that an environmental impact report (EIR) shall focus on the significant effects on the environment, discussing the effects with emphasis in proportion to their severity and probability of occurrence. Effects dismissed in an Initial Study (Environmental Checklist) as clearly insignificant and unlikely to occur need not be discussed further in the EIR unless information inconsistent with the finding in the Initial Study is subsequently received.

Section 21100 (c) of the Public Resources Code states that an EIR shall contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and were, therefore, not discussed in detail in the EIR (California Public Resources Code, Section 21000 et seq.). Section 15128 of the California Environmental Quality Act Guidelines adds, "Such a statement may be contained in an attached copy of an Initial Study" (14 CCR 15000 et seq.).

The Initial Study prepared and circulated with the Notice of Preparation (both provided in Appendix A, Initial Study and Notice of Preparation) for public review on November 19, 2018, for the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) concluded that the Project would not result in significant impacts to the following areas:

- **Agricultural Resources –** The K4 Parcel and Channel Improvement Site are located in an area designated as Urban and Built-Up Land, not Prime Farmland, Unique Farmland, or Farmland of Statewide Importance by the California Department of Conservation Farmland Mapping and Monitoring Program (DOC 2016). Additionally, the Project site is not utilized for agricultural purposes. As such, the proposed Project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. The proposed Project site is not zoned for forest land, timberland, or within a designated Timberland Production area and is instead zoned for Business Park and proposed as Industrial use. As such, the proposed Project would not conflict with zoning of forest land, timberland, or timberland production.
- **Mineral Resources** – The K4 Parcel and Channel Improvement Site lie within Mineral Resource Zone 3 as depicted on Figure OS-6 of the Riverside County General Plan (County of Riverside 2015), indicating areas where the available geologic information suggests that mineral deposits are likely to exist, but where the significance of the deposit is undetermined.

Based on the Mineral Resource Zone 3 designation and given that the site is surrounded by existing development (e.g., industrial development immediately to the east), the proposed Project is not likely to result in the loss of a known mineral resource. Additionally, implementation of industrial warehouse buildings with aboveground facilities would not compromise the potential future identification and use of mineral resources found on the K4 Parcel or the Channel Improvement Site. The K4 Parcel's land use designation is Business Park and is proposed as Industrial under the Project. These land use designations do not allow for mining activities (March JPA 2016). Additionally, the K4 Parcel and the Channel Improvement Site are surrounded by commercial, industrial and military land uses in the local vicinity that would be incompatible with a mining operation. Therefore, the proposed Project would not result in the loss of availability of a locally important mineral resource recovery site. Therefore, impacts to known mineral resources would be less than significant.

- **Population/Housing –** The proposed Project involves the development of a new industrial warehouse and associated infrastructure, and regional improvements to the Cactus Avenue Drainage Channel (Cactus Channel) proposed by Riverside County Flood Control and Water Conservation District (District) as part of the District's Master Plan (Riverside County Flood Control and Water Conservation District 2015), which would convert the existing Cactus Channel drainage ditch into a box culvert. The Project would not induce substantial population growth in the area, as no housing is proposed. The majority of the surrounding properties are already developed, planned to be developed, or designated as Military Operations and Aviation under the March Joint Powers Authority (JPA) General Plan. Additionally, implementation of the proposed Project would not require installation of new roadways, public services, or utilities; the site is currently served by existing roadways, utilities, and services, and these services would be maintained as part of the proposed Project. The proposed Cactus Channel improvements and detention basins on site would increase the existing stormwater capacity of the Project site. However, the proposed improvements to stormwater drainage facilities are designed to only control peak flows of the proposed Project. Therefore, the proposed Cactus Channel improvements and detention basins would not induce substantial unplanned population growth. The Project would enhance the jobs/housing balance of the March JPA Planning Area and adjacent jurisdictions at full buildout. Approximately 900 new jobs would be generated by the Project. The proposed industrial development would bring an additional 900 employees, which would be less than 1% of the total employment in the Southern California Association of Governments' Growth Forecast in 2040. The increase in employment would be minimal in comparison to the anticipated increase of the Southern California Association of Governments' Growth Forecast. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Therefore, it is anticipated that these new jobs could be filled by the existing residential population in

the greater Riverside County area. Minor infrastructure improvements would involve the improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, and connections to existing utilities serving areas surrounding the Project site. Based on the above, no adverse impacts related to population growth would result from the Project; impacts would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

The K4 Parcel and Channel Improvement Site do not currently support any housing; therefore, substantial numbers of existing housing or people would not be displaced and the construction of replacement housing would not be necessary as a result of the proposed Project.

- **Public Services –** The Project would be served by the Riverside County Fire Department. As part of standard development practices, prior to construction, Project plans would be reviewed by the Riverside County Fire Department, and the Project would be required to incorporate the Riverside County Fire Department's recommendations into the final Project design. The Project is subject to the payment of a development impact fee related to fire protection. The proposed Project would comply with applicable fire codes, would be consistent with the land use types and activities envisioned, and would pay the required development impact fees; therefore, the Project would not result in the need for new or expanded fire protection facilities, and impacts would be less than significant.

  The Project would be served by the Riverside County Sheriff's Department. Project implementation could result in additional enforcement calls and emergency responses to this location but is not anticipated to increase the overall demand for law enforcement personnel and services in the Project area such that new or improved facilities would be required. With payment of fees, impacts to police protection services as a result of Project implementation would be less than significant.

  As stated under Population/Housing, above, the increase in employment from the Project would be minimal in comparison to the anticipated increase of the Southern California Association of Governments' Growth Forecast. The Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. As such, the proposed Project would not generate substantial population growth, thus there would be no substantial impact to schools, parks, libraries and other public facilities.

- **Recreation –** The proposed Project involves the development of a warehouse building and regional improvements to the Cactus Channel proposed by the District as part of the District's Master Plan, which would convert the existing Cactus Channel drainage ditch into a box culvert. No housing is being proposed with this Project; therefore, the Project would not generate substantial population growth. The proposed Project would not increase the use of existing parks or recreational facilities, and thus no deterioration of existing facilities would

occur. There would not be an increase in use of the parks and recreational facilities from this Project, and thus no deterioration of existing facilities. The Project would enhance the jobs/housing balance of the March JPA Planning Area and adjacent jurisdictions at full buildout. The proposed Project would generate a maximum number of 900 jobs during operations. It is anticipated that these new jobs would be filled by the existing residential population in the greater Riverside County area. Therefore, the proposed Project would not require the construction or expansion of recreational facilities, and impacts would be less than significant. Additionally, March JPA is implementing a parks and open space development impact fee on future development which would require payment of a parks fee for non-residential projects. As such, with payment of fees on a fair share basis, the Project would not result in significant impacts to parkland or recreational facilities.

- **Wildfire –** Topographically, the K4 Parcel and Cactus Channel Improvement Site are relatively flat, draining gently in a southeastern direction. The K4 Parcel is currently undeveloped and vacant land covered with small vegetative growth and seasonal weeds. Threat from wildfire hazards is determined based on a number of factors, including fuel loading (vegetation); topography; climatic conditions, such as wind, humidity, and temperature; and the proximity of structures and urban development to fire hazards. Wildland fire hazards are most pronounced in wildland-urban interface areas, or where urban development is located close to open space areas where vegetation can serve as fuel. Generally, the periods of greatest risk for wildland fire are the late summer and early fall when vegetation is at its driest. Human activity, including residential and agricultural burning, campfires, and the use of fireworks can all trigger fires. Natural causes such as lightning strikes may also start fires.

  The California Department of Forestry and Fire Protection has mapped fire threat potential throughout California. The California Department of Forestry and Fire Protection ranks fire threat based on the availability of fuel and the likelihood of an area burning (based on topography, fire history, and climate). The Project site is designated as a Federal Responsible Area and not near any state responsible areas or area classified as very high fire hazard severity zones. The majority of the Project is located within previously graded vacant land. Furthermore, implementation of existing policies and regulations included in The March JPA Development Code Section 9.10.070 Fire and Explosive Hazards, as well as policies within the Uniform Fire Code would serve to reduce the availability of fuels to limit the spread of potential wildfires. Construction and operation/maintenance of the Project would be in compliance with the goals, policies, and implementation measures and codes of the California Fire Code and Riverside County Fire Protection Planning Customer Building Matrix Guidelines. Additionally, Project plans will be submitted for review by the Riverside County Fire Department Office of the Fire Marshall.

3.2 EFFECTS FOUND NOT TO BE SIGNIFICANT AS PART OF THE EIR PROCESS

Based on the analysis provided herein, the following areas were found to not have significant impacts:

- Aesthetics
- Geology and soils
- Greenhouse gas emissions
- Hydrology and water quality
- Noise
- Utilities and services systems
- Energy

3.3 EFFECTS FOUND TO BE LESS THAN SIGNIFICANT WITH MITIGATION MEASURES INCORPORATED

Based on the analysis provided herein, the following areas were found to have less-than-significant impacts with the incorporation of mitigation measures:

- Biological resources
- Cultural and tribal cultural resources
- Geology and soils
- Hazards and hazardous materials
- Land use and planning

3.4 EFFECTS FOUND TO BE SIGNIFICANT EVEN WITH MITIGATION MEASURES INCORPORATED

Based on the analysis provided herein, the following areas were found to have potentially significant impacts even after feasible mitigation measures were incorporated:

- Air quality – emissions of oxides of nitrogen during construction
- Transportation

CHAPTER 4
ENVIRONMENTAL IMPACT ANALYSIS

The purpose of this Environmental Impact Report (EIR) is to evaluate the potential environmental effects of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). The March Joint Powers Authority (JPA) circulated a Notice of Preparation beginning on November 19, 2018, with the public review period ending on January 7, 2019. The Notice of Preparation was transmitted to the State Clearinghouse, responsible agencies, other affected agencies, and property owners immediately adjacent to and across the street from the Project site to solicit issues and concerns related to the Project. The Notice of Preparation, Initial Study, and comment letters are contained in Appendix A, Initial Study and Notice of Preparation, of this EIR.

Sections 4.1 through 4.14 of the EIR contain the potential environmental impacts analysis associated with implementation of the Project and focus on the following issues:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Energy

As noted in Section 3.1, Effects Found Not to be Significant During Preparation of the Initial Study/Notice of Preparation, of this EIR, other potential environmental impact areas, such as agriculture and forestry resources, mineral resources, population and housing, public services, and recreation, were not found to be significant based on the results of the Initial Study. These issues are addressed in Chapter 3, Effects Found Not to Be Significant, of this EIR.

Technical Studies

Technical studies were prepared in order to accurately analyze air quality/greenhouse gas emissions and health risk assessments, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, noise and vibration, transportation, and utilities and service systems impacts, and were used in the preparation of this EIR. These documents are identified in the discussions for the individual environmental issues and included as technical appendices on a CD attached to the EIR. Hard copies are available at the March JPA and will also be available on the March JPA website, www.marchjpa.com.

The Identification and Evaluation of Historic Properties K4 Parcel Project and the Identification and Evaluation of Historic Properties Cactus Avenue Drainage Channel Improvement Project, (Appendices G and H, respectively) contain information that shall not be disclosed or governed by public disclosure requirements of the California Public Records Act. Confidential information shall be kept on record with the March JPA.

Analysis Format

The EIR assesses how the Project would impact each of these issue areas. Each environmental issue addressed in this EIR is presented in terms of the following subsections:

- **Setting**: Provides information describing the existing setting on or surrounding the Project site that may be subject to change as a result of the implementation of the Project. This setting discussion describes the conditions that existed when the Notice of Preparation was sent to responsible agencies and the State Clearinghouse.
- **Relevant Regulations, Plans, Policies, and Ordinances**: Provides a discussion of federal, state, regional, and local regulations, plans, policies, and ordinances applicable to the Project.
- **Thresholds of Significance**: Provides criteria for determining the significance of Project impacts for each environmental issue.
- **Impact Analysis**: Provides a discussion of the characteristics of the Project that may have an effect on the environment, analyzes the nature and extent to which the Project is expected to change the existing environment, and indicates whether the Project impacts meet or exceed the levels of significance thresholds.
- **Mitigation Measures**: Identifies mitigation measures to reduce significant adverse impacts to the extent feasible.
- **Environmental Impacts After Mitigation Is Incorporated**: Provides a discussion of significant adverse environmental impacts that cannot be feasibly mitigated or avoided, significant adverse environmental impacts that can be feasibly mitigated or avoided, adverse environmental impacts that are not significant, and beneficial impacts.

4.1 AESTHETICS

This section describes the existing visual setting of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) site and vicinity, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. During the preparation of the Initial Study, which is included in Appendix A, Initial Study and Notice of Preparation, of this Environmental Impact Report (EIR), potential impacts related to the Project resulting in a substantial adverse effect on a scenic vista, or damage to scenic resources including trees, rock outcroppings, and historic buildings within a State Scenic Highway were found to be less than significant. Therefore, these impacts are not discussed in this EIR. For detailed discussions related to each of these topics, please refer to Appendix A.

The following resources were used in the preparation of this section of the EIR:

- March Joint Powers Authority (JPA) General Plan (March JPA 1999)
- March Joint Powers Authority Approving Amendments to the Development Code (March JPA 2016)

As mentioned in Chapter 2 of this EIR, the Project includes the following components:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

4.1.1 Project Location

The Project site, which collectively consists of the K4 Parcel and the Cactus Avenue Drainage Channel (Cactus Channel), is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The Project site is generally rectangular in shape except for the

exclusion of an existing substation near the eastern end. The Project site is located within an urbanized area of Riverside County, east of Interstate 215, south of Cactus Avenue, and north of March Air Reserve Base (ARB). The K4 Parcel is located within the March JPA jurisdiction, which is within unincorporated Riverside County, California (Figure 2-1, Project Location). The K4 Parcel is comprised of five parcels designated as Assessor's Parcel Numbers 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The latitude and longitude of the approximate center of the site is 33°54′32.14″ North and 117°15′47.05″ West. The K4 Parcel sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, with a land use designation of Business Park, as shown in Figure 2-2, March JPA General Plan Land Use Designations.

The Cactus Channel portion of the Project is located along the south side of Cactus Avenue, extending from Elsworth Street on the west to Heacock Street and Heacock Channel on the west. The portion of the Cactus Channel that would be improved as part of the proposed Project runs a total of 7,900 linear feet.

Surrounding Land Uses

The Project is located in an urbanized area, surrounded by commercial, industrial, residential and federal uses. The Project vicinity is in proximity to the populous communities of Edgemont and Woodcrest, and cities of Moreno Valley and Riverside. Adjacent to the north of the proposed K4 Parcel, across Cactus Avenue, are commercial, office, and industrial uses. Beyond these initial uses to the north, are other office, commercial, and industrial uses within the City of Moreno Valley, such as the Riverside County Waste Management Department, and commercial concrete facility. To the east, the proposed K4 Parcel is bounded by vacant land and an electrical substation. Further east, is the March ARB which previously the March Air Force Base. To the south, the proposed K4 Parcel is bordered by March ARB including the March ARB runway. Lastly, to the west, the proposed K4 Parcel is bordered by a vacant lot and March ARB. Interstate 215 is approximately 0.7 miles west of the K4 Parcel, which intersects the March ARB. Further west is the City of Riverside, along with unincorporated areas of Riverside County.

The Cactus Channel portion of the proposed Project runs along the south side of Cactus Avenue, passing a variety of uses along the Cactus Avenue corridor, primarily consisting of March ARB, Industrial Warehouse, and commercial uses.

4.1.2 Existing Conditions

The EIR evaluates the existing visual character and quality, light and glare conditions. The existing conditions of these resource areas is discussed below.

4.1.2.1 Visual Character and Quality

The K4 Parcel is currently vacant and undeveloped, with exception to several power transmission lines and stockpiles of imported soil found in the eastern portion of the Project site. The approximately 35.4-acre K4 Parcel is characterized by relatively flat terrain crossed by a series of overhead utility lines running north–south, dirt access roads, and the Cactus Channel along the northern boundary of the site. The K4 Parcel primarily consists of upland vegetation communities dominated by disturbed goldenbush/non-native grassland and developed/disturbed land. Mount Russel is visible from the K4 Parcel when facing east, however, according to the March JPA General Plan, this view is not designated as a scenic vista (March JPA 1999; Exhibit 5-5). Additionally, according to the City of Moreno Valley General Plan Conservation Element, and the City of Riverside General Plan Open Space and Conservation Element, there is no designated scenic view or vista in the Project area (City of Moreno Valley 2006; City of Riverside 2012).

The Cactus Channel primarily contains small patches of riparian communities. The developed/disturbed areas within the Cactus Channel Project area (11.06 acres) support little to no native vegetation and are comprised of human-made disturbances. The high level of soil disturbance allows only sparse ruderal (weedy) plant species to occur. Ornamental vegetation within the Project vicinity is located along the Cactus Channel and at the far west end of the Cactus Channel.

The Project site is located in an urbanized area within Riverside County, in proximity to the populous communities of Edgemont and Woodcrest, and the cities of Moreno Valley and Riverside. Vacant undeveloped lands border the K4 Parcel to the immediate east and west. Industrial, large commercial and office spaces border the K4 Parcel to the north, and the March ARB borders the K4 Parcel to the south. The vacant undeveloped lots to the east and west are characterized by relatively flat, previously graded land with dirt access roads bordering the lots. These areas are similar to the existing conditions of the site, in that the vegetation appears to be predominantly disturbed and non-native. There are no trees or large shrubbery on either of these lots, however the Cactus Channel extends east and west from the K4 Parcel onto both of these areas. The vacant land to the east was formerly part of the March ARB and is currently owned by the U.S. Department of Agriculture (Leighton Consulting Inc. 2018). Slightly further east, there are three large circular storage tanks, near the southeast corner of Cactus Avenue and Elsworth Street. The storage tanks are a sandy earth tone and approximately 35 to 40 feet in height. The industrial, commercial, and office uses to the north of the K4 Parcel are generally large-massed buildings, up to three stories tall, with large parking lots surrounding the buildings. These buildings are generally light earth-toned colors with dark glass, with minimal ornamental landscaping bordering the sidewalk. The March ARB located to the south includes multiple uses. Directly south of the K4 Parcel, within the March ARB, appears to support housing, offices, and services facilities. The buildings on the March ARB are predominantly a sandy earth-tone color with terracotta roofing.

4.1.2.2 Light and Glare

Due to the undeveloped character of the K4 Parcel, no sources of daytime glare or nighttime lighting exists at the K4 Parcel. There is lighting in the surrounding area, which consists of street lights on Cactus Avenue, and interior and exterior lighting from commercial and office land uses north of Cactus Avenue. Although the surrounding industrial uses generally do not have windows above the first floor and produce minimal interior light visible off site, the industrial uses do use street lights in the internal parking lots which contributes to nighttime exterior lighting.

4.1.3 Relevant Plans, Policies, and Ordinances

Federal

There are no aesthetic or visual impact federal regulations applicable to the Project.

State

There are no aesthetic or visual impact state regulations applicable to the Project.

Local

March JPA General Plan

The Transportation Element identifies as Van Buren Boulevard as a scenic corridor. Additionally, the Resource Management Element of the March JPA General Plan includes goals and policies related to scenic vistas. The Resource Management Elements states, as development of the planning area occurs, open space and aesthetic amenities will be preserved through site design, site constraints, setbacks and landscape requirements. The planning area contains scenic areas from the architectural value of the historic district to the scenic vistas of the undeveloped rounded ridges in the West March Planning Subarea. Additionally, significant rock outcroppings, riparian areas and other natural features can be preserved as open space within development. The following goals and policies from the March JPA General Plan apply to the Project (March JPA 1999). Consistency with these goals and policies is discussed in Section 4.9, Land Use and Planning.

Goal 4: Develop an identity and foster quality development within the Planning Area.

Policy 4.2: Where practical, enhance and preserve natural and man-made features, such as major roadways, rail lines, drainage courses, utility corridors, groups of rock outcroppings, and tree rows to create boundaries, entryways, and separate entities for distinct geographic portions of the Planning Area.

Policy 4.4: Develop a distinctive community identity for commercial, business park, and industrial developments that reflect the character and atmosphere of March JPA Planning Area through the use of good planning and design principals, and sound development practices which serve as guidelines for building materials, colors, site design and orientation, and landscaping.

Goal 8: Preserve the natural beauty, minimize degradation of the March JPA Planning Area, and provide enhancement of environmental resources, and scenic vistas.

Policy 8.2: Sensitive biological resources and habitats, cultural resources, view shed areas shall be protected where practical.

City of Moreno Valley General Plan

The City of Moreno Valley General Plan provides a comprehensive long-term strategy for the physical development of the City. The Conservation Element includes strategies to address topics such as biological resources, cultural historical resources, archaeological and historic sites, and scenic resources. The following goals and policies from the City of Moreno Valley General Plan apply to the Project (City of Moreno Valley 2006). Consistency with these goals and policies is discussed in Section 4.9.

Policy 7.7.1: Discourage development directly upon a prominent ridgeline.

Policy 7.7.2: Require new electrical and communication lines to be placed underground

Policy 7.7.3: Implement reasonable controls on the size, number and design of signs to minimize degradation of visual quality.

Policy 7.7.4: Gilman Springs Road, Moreno Beach Drive, and State Route 60 shall be designated as local scenic roads

Policy 7.7.5: Require development along scenic roadways to be visually attractive and to allow for scenic views of the surrounding mountains and Mystic Lake.

Policy 7.7.6: Minimize the visibility of wireless communication facilities by the public. Encourage "stealth" designs and encourage new antennas to be located on existing pole, buildings and other structures.

City of Riverside General Plan

Vista points can be found throughout the City both from urban areas toward the hills and from wilderness areas looking onto Riverside. Long-distance views of natural terrain and vegetation can be

found throughout the La Sierra/Norco Hills, Sycamore Canyon Wilderness Park and Box Springs Park. The peaks of Box Springs Mountain, Mt. Rubidoux, Arlington Mountain, Alessandro Heights and the La Sierra/Norco Hills provide scenic viewpoints of the City and the region.

Policy OS-1.15: Recognize the value of major institutional passive open spaces, particularly cemeteries, as important components of the total open space systems and protect their visual character.

Policy OS-2.2: Limit the extent and intensity of uses and development in areas of unstable terrain, steep terrain, scenic vistas, arroyos and other critical environmental areas.

Policy OS-2.4: Recognize the value of ridgelines, hillsides and arroyos as significant natural and visual resources and strengthen their role as features which define the character of the City and its individual neighborhoods.

Policy OS-2.5: Review the feasibility of creating a "night-time sky" ordinance to reduce light pollution.

County of Riverside General Plan

The County of Riverside General Plan includes goals and policies related to scenic resources. The Multipurpose Open Space Element (County of Riverside 2015), Land Use Element (County of Riverside 2017), and Circulation Element (County of Riverside 2016) identify scenic corridors, scenic vistas, and scenic resources including natural landmarks and prominent or unusual features of the landscape. The County General Plan does not identify the proposed Project site to be located within the vicinity of any scenic highway corridors, scenic view corridors, or scenic vistas. The following relevant policies may apply to the Project:

OS 22.5: Utilize contour grading and slope rounding to gradually transition graded road slopes into a natural configuration consistent with the topography of the areas within scenic highway corridors.

LU 14.1: Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public.

LU 14.8: Avoid the blocking of public view by solid walls.

4.1.4 Thresholds of Significance

March JPA uses the California Environmental Quality Act (CEQA) Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the Initial

Study prepared for the Project (Appendix A) and the newly adopted CEQA Guidelines Appendix G (December 2018), would the project:

- **AES-1**: In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?
- **AES-2**: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

4.1.5 Impacts Analysis

Threshold AES-1. ***In non-urbanized areas, would the Project substantially degrade the existing visual character or quality of public views of the site and its surroundings (public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?***

As discussed in Section 4.1.2, Existing Conditions, the proposed Project collectively consists of constructing a new warehouse on the K4 Parcel and improvements to the Cactus Channel. The Project site is located in an urbanized area within the County of Riverside, with commercial, industrial, residential, and federal uses in the Project vicinity. The K4 Parcel is currently vacant and undeveloped, and characterized by relatively flat terrain crossed by a series of overhead utility lines running north–south, dirt access roads, and the east-west Cactus Channel along the northern boundary of the site. The K4 Parcel primarily consists of upland vegetation communities dominated by disturbed goldenbush/non-native grassland and developed/disturbed land. The developed/disturbed land supports little to no native vegetation and are comprised of human-made disturbances. Immediately east and west of the K4 Parcel are vacant undeveloped lots, characterized by relatively flat, previously graded land with dirt access roads bordering the lots. The industrial, commercial, and office uses to the north of the K4 Parcel are generally large-massed buildings, up to three stories tall, with large parking lots surrounding the buildings. These buildings are generally light earth-toned colors with dark glass, with minimal ornamental landscaping bordering the sidewalks. The March ARB located to the south includes multiple uses including housing, offices, and services facilities. The buildings on the March ARB are predominantly a sandy earth-tone color with terracotta roofing. The K4 Parcel is currently vacant; however, the site was previously disturbed with buildings and unpaved roads utilized under three former military bases, including the former March Air Force Base.

The Cactus Channel portion of the Project is an existing earthen drainage channel that runs along the south side of Cactus Avenue from Elsworth Street on the west to Heacock Avenue and Heacock Channel on the east. The existing earthen drainage channel is depressed below the Cactus Avenue street elevation and contains vegetation.

As the governing regulatory document, the March JPA General Plan includes policies related to scenic quality applicable to the proposed Project. Project consistency with these policies is as follows.

Goal 4: Develop an identity and foster quality development within the Planning Area.

The proposed Project would support this goal as the Project would develop an underutilized, disturbed site, resulting in quality development within the March JPA Planning Area.

Policy 4.2: Where practical, enhance and preserve natural and man-made features, such as major roadways, rail lines, drainage courses, utility corridors, groups of rock outcroppings, and tree rows to create boundaries, entryways, and separate entities for distinct geographic portions of the Planning Area.

The Cactus Channel improvements component of the proposed Project would enhance the existing Cactus Channel, through the construction of a box culvert and rectangular channel. The location of the channel course would remain in its current location. As later discussed in Section 4.3, Biological Resources, the existing K4 Parcel supports non-native grassland and developed land. Developed/disturbed land support little to no native vegetation and are comprised of human-made disturbances (agriculture, construction, or other land-clearing activities) or structures such as buildings and roads. No natural or constructed features are located on the K4 Parcel, thus no enhancements or preservation is necessary. As such, the Cactus Channel improvements and K4 Parcel would be consistent with this policy.

Policy 4.4: Develop a distinctive community identity for commercial, business park, and industrial developments that reflect the character and atmosphere of March JPA Planning Area through the use of good planning and design principals, and sound development practices which serve as guidelines for building materials, colors, site design and orientation, and landscaping.

The proposed Project would be consistent with the commercial, business park, and industrial uses in the March JPA Planning Area. The Project would be designed to use building materials, colors, and landscaping complimentary of those in the March JPA Planning Area. As shown in Appendix B, K4 Warehouse Rendering, the warehouse facade would consist of a gradient of tan-painted walls with a stucco finish, and reflective windows. The Project would include approximately 156,000 square feet of landscaping bordering the Project boundary, parking areas, and warehouse

footprint. As such, the proposed Project would support this policy through the use of good planning and design principals.

Goal 8: Preserve the natural beauty, minimize degradation of the March JPA Planning Area, and provide enhancement of environmental resources, and scenic vistas.

As previously discussed, the existing K4 Parcel supports non-native grassland and developed land. Developed/disturbed land support little to no native vegetation and are comprised of human-made disturbances (agriculture, construction, or other land-clearing activities) or structures such as buildings and roads. No natural or constructed features are located on the K4 Parcel, thus no enhancements or preservation is necessary. The Cactus Channel improvements include the construction of a box culvert and rectangular channel. The proposed Project would develop an underutilized, disturbed site, resulting in quality development within the March JPA Planning Area.

Policy 8.2: Sensitive biological resources and habitats, cultural resources, view shed areas shall be protected where practical.

Protection of biological resources and habitats is discussed in Section 4.3, and protection of cultural resources is discussed in Section 4.4, Cultural Resources. The March JPA General Plan designates the area looking east and northeast of the March JPA Planning Area toward the Box Springs Mountains and San Jacinto Mountains as a scenic vista (Exhibit 5-5, Scenic & View Shed Areas, March JPA 1999). While distant scenic vistas of the Box Springs Mountains and San Jacinto Mountains are visible from the Project site, north and northeast of the Project site are existing warehouse developments within the City of Moreno Valley. Viewers to the south and west of the Project site would be people located on the March ARB. The construction of a new 46-foot tall warehouse building on the K4 Parcel would introduce a new warehouse building closer to the ARB, but given that there are existing warehouse developments immediately north and northeast of the Cactus Channel Improvement Site, the introduction of this new warehouse building would not significantly obstruct distant views of the Box Springs Mountains and San Jacinto Mountains. Additionally, according to the City of Moreno Valley General Plan Conservation Element, no corridors within the western portion of the city boundary (which abuts the Project site to the north) are designated as scenic view areas (City of Moreno Valley 2006). Installation of the proposed box culvert within the Cactus Channel would require the placement of the culvert below grade and as such, the improvements within the Channel would not be visible or affect scenic vistas. As concluded in this section, as well as Sections 4.3 and 4.4, the proposed Project would protect sensitive biological resources, cultural resources, and view shed areas where practical. Thus, the proposed Project is consistent with this policy.

Construction

The proposed Project includes the construction of a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use and installing a new box culver within the Cactus Channel. Generally, Project construction would include site grading, utility relocation/installation, and building construction. Rough grading and utility installation would last approximately 25 days, and building construction, including pad/site-specific grading activities, would occur over approximately 11 months. Construction of the proposed Project would result in temporary changes to the visual character of the K4 Parcel and surrounding areas. Heavy construction equipment visible from surrounding areas looking toward the K4 Parcel would include flat beds, dozers, scrapers, graders, track hoes, dump trucks, forklifts, cranes, cement trucks, pavers, rollers, water trucks, rolling container trucks, and bobcats. Construction activities would also require the presence of construction workers; however, construction activities and the influx of workers would not be permanent. Heavy equipment would be delivered and removed from the K4 Parcel throughout the construction phase. Construction equipment would only be used intermittently depending on the construction phase, over a 12-month period of time.

While equipment such as cranes would display a tall, vertical profile that would rise above the K4 Parcel and roofline and frames of proposed structures, the height of construction equipment would not obstruct any existing scenic views. However, the construction staging area would be located in areas that would create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the K4 Parcel during all Project construction. Therefore, Project construction staging on the K4 Parcel would be setback from Cactus Avenue. At the completion of construction, all equipment would be removed from the K4 Parcel.

The Project would also include improvements to the drainage channel that runs along the south side of Cactus Avenue from just east of Elsworth Street, then along the K4 Parcel frontage, and further to the east ending at the Heacock Channel. The drainage improvements are proposed to be an underground box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). The installation of the box culvert would require trenching through the existing swale behind the Cactus Avenue right-of-way. It is anticipated that there would be some utility relocations for existing crossings in record plans as well as removal of some existing roadway culverts and extending existing storm drain connections to the earth swale.

Although the presence of heavy construction equipment associated with the proposed Project would alter the visual character and quality of the site, the visual character in the Project vicinity would change daily throughout the course of the construction phase. As activities progress, the graded K4 Parcel would begin to resemble industrial and commercial developments located immediately to the north of Cactus Avenue. Although the presence of construction activities

associated with the proposed Project would alter the visual character and quality of the site, the visual presence of vehicles, equipment, and workers would be present on site up to 12 months. Additionally, the proposed Project would adhere to all applicable building regulations and ordinances that would ensure staging areas be sited and/or screened to minimize impacts on public views to the maximum extent practicable. Since construction activities would be temporary, no substantial degradation of views would occur during construction, and ultimately the Project would be developed in a manner consistent the visual character of existing development in the immediate vicinity. Therefore, construction impacts associated with substantial degradation of existing visual character and quality would be **less than significant**.

Operations

Upon completion of construction, the Project would involve the use of the K4 Parcel as a warehouse, and the Cactus Channel would be underground within a box culvert. The K4 Parcel is currently undeveloped, and the proposed Project would result in a permanent change in the visual appearance of the proposed K4 Parcel. The proposed Project would change the topography of the site due to site grading, and introduce new landscaping, architectural design, and density. The proposed Project would result in the construction of a 718,000 square-foot building, with 289 automobile parking stalls, 317 truck trailer parking stalls, and 105 loading dock positions for trucks. The maximum exterior building height would be 46 feet at the parapet. As shown in Appendix B, the proposed warehouse would include architectural elements emphasizing the windows and entrance on the northeastern corner of the warehouse. The building façade along the remainder of the proposed warehouse would incorporate similar architectural elements, including a complementary neutral color palette and a variety of building materials, to existing development located in the Project area.

The proposed warehouse was designed to include vertical and horizontal elements that would break up the overall massing of the building and provide visual interest. The building mass and landscaping create a sense of unity and visual consistency both on and off. Setback landscape areas along the K4 Parcel frontages, as shown in Appendix B, would also soften views of the K4 Parcel and enhance the visual quality of the proposed Project. Design concepts and considerations such as building orientation, screening, and lighting were also incorporated into site design. All lighting would be directed downward or at a narrow beam angle, in order to focus all light only on the desired area. As a condition of approval, March JPA requires full screening of all parking by mounding and contouring of landscaped areas, by landscape shrubs, by screening walls, or by a combination of these techniques. As such, the proposed drainage improvements would result in only minor changes to the existing visual character or quality of the site.

The Project would also include improvements to a portion of Cactus Channel, extending from Elsworth Street on the west to Heacock Channel on the east. The drainage improvements are proposed to be an

underground box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). It is anticipated that there would be some utility relocations for existing crossings in record plans as well as removal of some existing roadway culverts and extending existing storm drain connections to the earth swale. The proposed drainage improvements would result in noticeable visual changes from nearby public uses due to the removal of existing in-channel vegetation and replacement with a closed, yet depressed, box culvert. These changes would also affect the expectation of nearby casual observers that are accustomed to views of natural-appearing and unmaintained in-channel vegetation. However, the proposed approximately 19-foot underground box culvert would be concealed through irrigated landscaping contoured mounds. Any future maintenance required to the Cactus Channel would be temporary in nature and any equipment would be located on site. Should any major maintenance of the Cactus Channel be required, additional environmental analysis under CEQA may be required.

Therefore, given that the new warehouse on the K4 Parcel would be generally consistent and compatible with the visual character along the Cactus Avenue corridor and that the underground box culvert with be relatively non-visible and concealed through irrigated landscaping, long-term operational impacts associated with the existing visual character and quality would be **less than significant**.

Threshold AES-2. Would the Project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

The proposed Project involves the development of a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use and improvements to the Cactus Channel. The maximum exterior building height on the K4 Parcel would be 46 feet at the parapet. Construction of the proposed warehouse would occur over a 12-month period of time. Construction would include site grading, utility relocation/installation, and installation improvements to the drainage ditch that runs along the south side of Cactus Avenue from just east of Elsworth Street, then along the K4 Parcel frontage, and further to the east ending at the Heacock Channel.

The K4 Parcel is currently undeveloped and does not contain lighting or reflective building materials. However, as discussed above, there is lighting in the surrounding area consisting of street lights on Cactus Avenue, and interior and exterior lighting from commercial and office land uses. Structures in the surrounding area are constructed with low reflective building materials. Implementation of the proposed Project would include installation of new lighting along the interior roadways, building exteriors, and along walkways and landscaped areas. The proposed lighting would have a maximum of 750-watt, with a maximum light fixture height of 25 feet above finished grade. Lighting associated with the proposed Project would be of a similar nature to the daytime and nighttime illumination currently generated by surrounding commercial, and industrial developments, as well as existing light associated vehicle traffic. There would be no lighting

associated with the Cactus Channel improvements; therefore, that portion of the Project would have no impact in regards to substantial light or glare.

All lighting proposed for the Project would be subject to compliance with the provisions of March JPA Development Code Section 0.080.100 Lighting, which requires all outdoor lights with nonresidential uses to not exceed 0.5 candle per foot at the property line and shall not blink, flash, oscillate or be of unusually high intensity or brightness (March JPA 2016). Additionally, with compliance with March JPA Development Code Section 9.10.110 Light and Glare, all Project lighting would project downward and would not create glare on adjacent properties. Therefore, compliance with applicable design guidelines would ensure proper design, installation, and operation of all exterior lighting, thereby reducing the potential for glare effects and light spillover onto adjacent properties. Therefore, impacts related to light and glare would be **less than significant**.

4.1.6 Mitigation Measures

The proposed Project would not result in any significant impacts related to visual resources. No mitigation measures are required.

4.1.7 Level of Significance After Mitigation

With compliance of applicable design guidelines and standards, impacts related to aesthetics were found to be less than significant; therefore no mitigation is included herein.

4.10 NOISE

This section describes the existing noise setting of the Project site, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). This section evaluates whether the Project would expose persons to or generate noise levels in excess of standards established in the local General Plan or Noise Code, or applicable standards of other agencies; whether the proposed Project expose persons to or generate ground-borne noise levels; whether the proposed Project would create a permanent or substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project; whether the Project is located within an airport land use plan, within two miles of a public airport, or being located within the vicinity of a private airstrip such that the Project would expose people residing or working in the Project area to excessive noise levels resulting from implementation of the Project.

The following references were used in the preparation of this section of the EIR:

- *K4 Parcel Noise Impact Analysis* (Appendix Q)
- *Health Risk Assessment Technical Report* (Appendix D)

As mentioned in Chapter 2, Project Description, of this EIR, the Project includes the development of the five parcels on approximately 35.4-acre site (K4 Parcel) with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Drainage Channel (Cactus Channel) that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel (Cactus Channel Improvement Site). The proposed Project includes the following components:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The proposed Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial (IND) for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000 square foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

4.10.1 Existing Conditions

The Project site, collectively consisting of the K4 Parcel and Cactus Channel Improvement Site, is located within the March Joint Powers Authority (JPA) jurisdiction, which is within unincorporated Riverside County, California. The adjacent properties to the north, are located in the City of Moreno Valley. The Project site is located in an urbanized environment and is subject to typical urban noises, such as noise generated by traffic, industrial/business park operations, and day-to-day outdoor activities. The predominant noise sources at the site include weed abatement activities as the site is currently vacant and undeveloped. "Transportation noise" typically refers to noise from automobile use, trucking, airport operations, and rail operations. "Stationary noise" typically refers to noise from sources such as heating, ventilation, and air conditioning (HVAC) systems, compressors, landscape maintenance equipment, or machinery associated with local industrial or commercial activities. Site-specific ambient noise measurements are discussed later in this section.

The Project site is located directly north of the March Air Reserve Base (ARB). Based on the Riverside County Airport Land Use Compatibility Plan (ALUCP) noise level contours of the March ARB/Inland Port Authority, the Project is partially located in the C1 Primary Approach/Departure Zone, which represents areas of moderate to high noise and moderate accidental potential risk. The noise contour boundaries are used to determine the potential aircraft-related noise impacts at the Project.

Noise Characteristics

Noise has been simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Table 4.10-1 presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

Range of Noise

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA

at approximately 100 feet, which can cause serious discomfort. Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

Noise Descriptors

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period and is commonly used to describe the "average" noise levels within the environment.

Table 4.10-1
Typical Noise Levels

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		SPEECH INTERFERENCE
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	SLEEP DISTURBANCE
QUIET URBAN NIGHTTIME	THEATER, LARGE CONFERENCE ROOM (BACKGROUND)	40		
QUIET SUBURBAN NIGHTTIME	LIBRARY	30	FAINT	NO EFFECT
QUIET RURAL NIGHTTIME	BEDROOM AT NIGHT, CONCERT HALL (BACKGROUND)	20		
	BROADCAST/RECORDING STUDIO	10	VERY FAINT	
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0		

Source: Environmental Protection Agency Office of Noise Abatement and Control, Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (EPA/ONAC 550/9-74-004) March 1974, as cited in Appendix Q.

To describe the time-varying character of environmental noise, the statistical or percentile noise descriptors L_{50}, L_{25}, L_8 and L_2, are commonly used. The percentile noise descriptors are the noise levels equaled or exceeded during 50%, 25%, 8%, and 2% of a stated time. Sound levels associated with the L_2 and L_8 typically describe transient or short-term events, while

levels associated with the L_{50} describe the steady state (or median) noise conditions. While the L_{50} describes the mean noise levels occurring 50% of the time, the L_{eq} accounts for the total energy (average) observed for the entire hour. Therefore, the L_{eq} noise descriptor is generally 1–2 dBA higher than the L_{50} noise level.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the CNEL, representing a composite 24-hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 PM to 10:00 PM, and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 PM and 7:00 AM. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure. The March JPA relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

Sound Propagation

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

Geometric Spreading

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source.

Ground Absorption

The propagation path of noise from a highway to a receptor is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (e.g., sites with a reflective surface between the source and the receptor, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (e.g., those sites with an absorptive ground surface between the source and the receptor such as soft dirt, grass, or scattered bushes and trees), an excess ground

attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source.

Atmospheric Effects

Receptors located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (e.g., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects.

Shielding

A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an "out of sight, out of mind" effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby resident. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure.

Traffic Noise Prediction

Vehicle noise is a combination of the noise produced by the engine, exhaust, and tires on the roadway. Per the *Highway Traffic Noise Analysis and Abatement Policy and Guidance*, provided by the Federal Highway Administration (FHWA), the level of traffic noise depends on three primary factors: the volume of the traffic, the speed of the traffic, and the vehicle mix within the flow of traffic. Generally, the loudness of traffic noise is increased by heavier traffic volumes, higher speeds, and a greater number of trucks. A doubling of the traffic volume, if the speed and vehicle mix do not change, results in a noise level increase of 3 dBA. The vehicle mix on a given roadway may also influence on community noise levels. As the number of medium and heavy trucks increases and becomes a larger percentage of the vehicle mix, adjacent noise level impacts will increase.

Noise Control

Noise control is the process of obtaining an acceptable noise environment for an observation point or receptor by controlling the noise source, transmission path, receptor, or all three. This concept

is known as the source-path-receptor concept. In general, noise control measures can be applied to these three elements.

Noise Barrier Attenuation

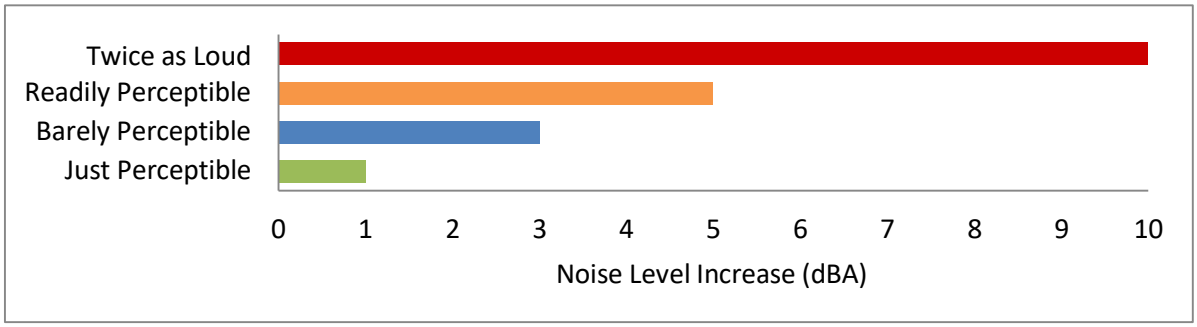
Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receptor. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source.

Land Use Compatibility with Noise

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages state and local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized.

Community Response to Noise

Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon everyone's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:



- Fear associated with noise producing activities;
- Socio-economic status and educational level;
- Perception that those affected are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Belief that the noise source can be controlled.

Approximately 10% of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Another 25% of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. Surveys have shown that about 10% of the people exposed to traffic noise of 60 dBA will report

being highly annoyed with the noise, and each increase of one dBA is associated with approximately 2% more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain.

Despite this variability in behavior on an individual level, the population can be expected to exhibit the following responses to changes in noise levels as shown on Table 4.10-2. An increase or decrease of 1 dBA cannot be perceived except in carefully controlled laboratory experiments, a change of 3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*.

Table 4.10-2
Noise Level Increase Perception

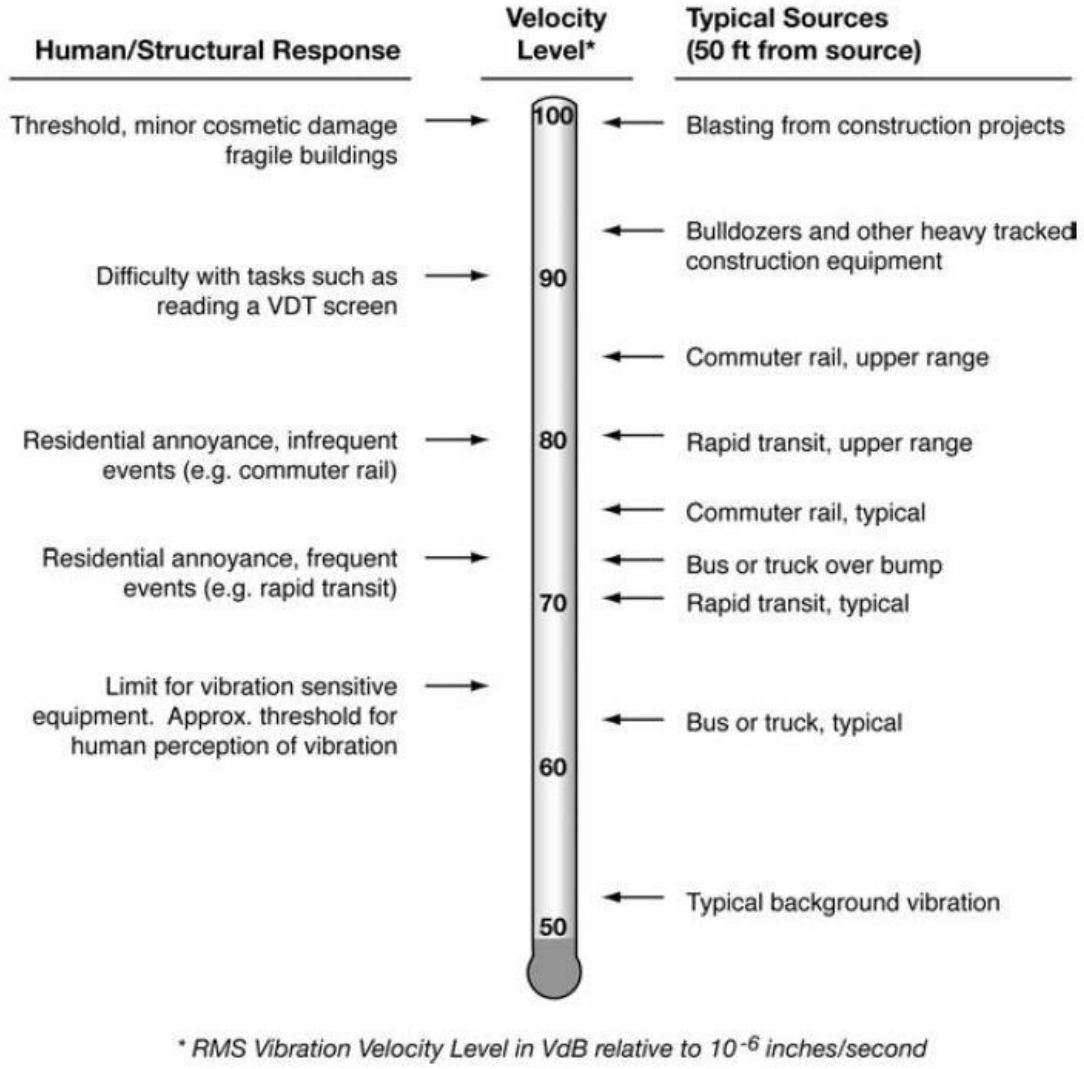
Vibration Characteristics



Per the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Assessment*, vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings, but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal, and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to

vibration. Typically, ground-borne vibration generated by human-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Table 4.10-3 illustrates common vibration sources and the human and structural response to ground-borne vibration.

Table 4.10-3
Typical Levels of Ground-Borne Vibration

Source: Appendix Q.

Sensitive Receptors

Noise- and vibration-sensitive land uses are locations where people reside or where the presence of unwanted sound could adversely affect the use of the land. Residences, schools, hospitals, guest lodging, libraries, and some passive recreation areas would be considered noise- and vibration-sensitive and may warrant unique measures for protection from intruding noise. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, natural open space, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals. Sensitive receptors are located within City of Moreno Valley.

As discussed in the Noise Technical Report (Appendix Q), noise measurements were taken as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. The noise measurement locations uses represent a location of noise sensitive areas and were used to estimate to future noise level impacts, and generally include schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. No sensitive receiver locations are located closer than the non-noise sensitive receiver locations identified below; however, existing noise-sensitive residential homes, represented by receiver location R6, are located east of the Project site at roughly 4,777 feet adjacent to Heacock Street and the off-site channel construction associated with the Project, within the City of Moreno Valley. Noise levels that would be experienced at these residential homes would be less than those identified at receiver location, R5, which represent a closer receiver location with direct line-of-sight to the Project site.

As shown on Figure 4.10-1, Receiver Locations, receiver location (R1) represents receivers near the existing office and commercial uses north of Cactus Avenue (approximately 0.03 miles from the Project boundary). Receiver location, R2, represents the existing non-noise sensitive March ARB facilities (approximately 0.02 miles from the Project boundary). Receiver location, R3, represents the existing non-noise-sensitive office uses on Fredrick Street (approximately 0.15 miles from the Project boundary). Receiver location, R4, represents the non-noise-sensitive uses at the existing Marine Corps Recruiting Station building on Riverside Drive (approximately 0.42 miles from the Project boundary). Receiver location, R5, represents the non-noise-sensitive uses at the existing March ARB buildings on Castle Street (approximately 0.13 miles from the Project boundary). Lastly, receiver location, R6, represents existing noise-sensitive residential uses approximately 0.9 miles from the Project boundary. As stated in the Health Risk Assessment Technical Report (Appendix D), four sensitive receptors were identified within a one-quarter mile radius from the Project boundary. These include:

- Emagine U At Play, Daycare Center, Moreno Valley CA (approximately 0.18 miles from the Project boundary)
- Think Together Learning Center, Moreno Valley, CA (approximately 0.18 miles from the Project boundary)
- Innovation High School San Diego – Moreno Valley, Moreno Valley, CA (approximately 1 mile from the Project boundary)
- Serrano Elementary School, Moreno Valley, CA (approximately 0.95 miles from the Project boundary)

Considering noise measurement location L1 was taken at a distance of approximately 0.10 miles from the Project boundary and the nearest identified sensitive receptor is 0.18 miles away from the Project, this noise measurement therefore represent a conservative approach. Additional sensitive receptors

within the City and County are located farther from the Project site in the surrounding community and would be less impacted by noise and vibration levels than the nearest sensitive receptor.

Non-noise-sensitive receivers near the Project site include existing office uses in the City of Moreno Valley and March ARB facilities, as described below. No sensitive receiver locations are located closer than the non-noise sensitive receiver locations identified below; however, existing noise-sensitive residential homes are located east of the Project site adjacent to Heacock Street and the off-site channel construction associated with the Project. Additional noise-sensitive receiver locations in the Project study area include residential homes located roughly 0.5 miles southeast of the Project site, south of Meyer Drive. However, receiver locations which are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures. Therefore, noise levels that would be experienced at these residential homes would be less than a closer receiver location with direct line-of-sight to the Project site.

Existing Noise Conditions

To assess the existing noise level environment, four 24-hour noise level measurements were taken at potential receiver locations in the Project study area. The Project study area is based on the measurement locations discussed in this section, in addition to the receiver locations used. The receiver locations were selected to describe and document the existing noise environment within the Project area, as shown in Figure 4.10-1. The background ambient noise levels in the Project study area are dominated by the transportation-related noise associated with the arterial roadway network and March ARB/Inland Port Airport (March ARB/IPA). This includes the auto and heavy truck activities near the noise level measurement locations and aircraft overflight noise from the March ARB/IPA. The 24-hour existing noise level measurements are shown on Table 4.10-4. Noise measurement were taken from the following four locations:

- Location L1 represents the north of the Project site on Goldencrest Drive near existing office and commercial uses.
- Location L2 represents the noise levels south of Cactus Avenue near the northern Project site boundary, north of March Air Reserve Base.
- Located north of the Project site, location L3 represents the noise levels near existing office uses on Calle San Juan De Los Lagos.
- Location L4 represents the noise levels east of the Project site near an existing Marine Corps Recruiting Station building on Riverside Drive.

Table 4.10-4
Existing 24-Hour Ambient Noise Level Measurements

Location[1]	Distance to Project Boundary (Feet)	Description	Energy Average Noise Level (dBA L_{eq})[2]		CNEL
			Daytime	*Nighttime*	
L1	530'	Located north of the Project site on Goldencrest Drive near existing office and commercial uses.	58.5	56.2	62.6
L2	0'	Located south of Cactus Avenue near the northern Project site boundary, north of March Air Reserve Base.	60.3	59.6	66.2
L3	1,420'	Located north of the Project site near existing office uses on Calle San Juan De Los Lagos.	52.9	49.9	56.8
L4	2,100'	Located east of the Project site near an existing Marine Corps Recruiting Station building on Riverside Drive.	61.7	57.2	64.2

Notes: dBA = A-weighted decibel; Leq = energy equivalent level; CNEL = Community Noise Equivalent Level.
1 See Figure 4.10-1, Receiver Locations, for the noise level measurement locations.
2 Energy (logarithmic) average hourly levels. The long-term 24-hour measurement worksheets are included in Appendix 5.2 of Appendix Q. "Daytime" = 8:00 a.m. to 10:00 p.m.; "Nighttime" = 10:01 p.m. to 7:59 a.m.

The Project site is partially located in the C1 Primary Approach/Departure Zone C1, which represents areas of moderate to high noise and moderate accidental potential risk. The noise contour boundaries used to determine the potential aircraft-related noise impacts at the Project are presented in Figure 4.10-2, MARB IPA Future Airport Noise Contours. As shown in Figure 4.10-2, the Project site is located in the Unmitigated 60 dBA CNEL Noise Level Contour Boundary.

4.10.2 Relevant Plans, Policies, and Ordinances

Federal

Title 40 of the Code of Federal Regulations, Part 205, Subpart B

Federal regulations establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under Title 40 of the Code of Federal Regulations, Part 205, Subpart B. The federal truck pass-by noise standard is 80 dBA at 50 feet from the vehicle pathway centerline, under specific test procedures. These controls are implemented through regulatory controls on truck manufacturers. There are no comparable standards for vibration, which tend to be specific to the roadway surface, the vehicle load, and other factors.

In 1972, the Noise Control Act (42 USC Section 4901 et seq.) was passed by Congress to promote noise environments in support of public health and welfare. It also established the U.S. Environmental Protection Agency (EPA) Office of Noise Abatement and Control to coordinate federal noise control activities. The U.S. EPA established guidelines for noise levels that would be considered safe for community exposure without the risk of adverse health or welfare effects. The

U.S. EPA found that to prevent hearing loss over the lifetime of a receptor, the yearly average Leq should not exceed 70 dBA, and the L_{dn} should not exceed 55 dBA in outdoor activity areas or 45 dBA indoors to prevent interference and annoyance. However, in 1982, the U.S. EPA phased out the office's funding as part of a shift in federal noise control policy to transfer the primary responsibility of regulating noise to state and local governments. The U.S. EPA retains authority to investigate and study noise and its effects, disseminate information to the public regarding noise pollution and its adverse health effects, respond to inquiries on matters relating to noise, and evaluate the effectiveness of existing regulations for protecting the public health and welfare.

State

State of California Noise Requirements

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared according to guidelines adopted by the Governor's Office of Planning and Research (OPR). The purpose of the Noise Element is to limit the exposure of the community to excessive noise levels.

State of California Building Code

The 2014 State of California's Green Building Standards Code contains mandatory measures for non-residential building construction in Section 5.506 on Environmental Comfort. These noise standards are applied to new construction in California for the purpose of controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when non-residential structures are developed in areas where the exterior noise levels exceed 65 dBA CNEL, such as within a noise contour of an airport, freeway, railroad, and other areas where noise contours are not readily available. If the development falls within an airport or freeway 65 dBA CNEL noise contour, the combined sound transmission class (STC) rating of the wall and roof-ceiling assemblies must be at least 50. For those developments in areas where noise contours are not readily available and the noise level exceeds 65 dBA Leq for any hour of operation, a wall and roof-ceiling STC rating of 45, and exterior windows with a minimum STC rating of 40 are required (Section 5.507.4.1).

State of California Green Building Standards Code

The 2016 State of California's Green Building Standards Code contains mandatory measures for non-residential building construction in Section 5.507 on Environmental Comfort. These noise standards are applied to new construction in California for the purpose of controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must

be prepared when non-residential structures are developed in areas where the exterior noise levels exceed 65 dBA CNEL, such as within a noise contour of an airport, freeway, railroad, and other areas where noise contours are not readily available. If the development falls within an airport or freeway 65 dBA CNEL noise contour, the combined sound transmission class (STC) rating of the wall and roof-ceiling assemblies must be at least 50. For those developments in areas where noise contours are not readily available, and the noise level exceeds 65 dBA Leq for any hour of operation, a wall and roof-ceiling combined STC rating of 45, and exterior windows with a minimum STC rating of 40 are required (Section 5.507.4.1).

Government Code Section 65302(g)

California Government Code Section 65302(g) requires the preparation of a Noise Element in a General Plan, which shall identify and appraise the noise problems in the community. The Noise Element shall recognize the guidelines adopted by the Office of Noise Control in the State Department of Health Services and shall quantify, to the extent practicable, current and projected noise levels for the following sources:

- Highways and freeways
- Primary arterials and major local streets
- Passenger and freight on-line railroad operations and ground rapid transit systems
- Aviation and airport-related operations
- Local industrial plants
- Other ground stationary noise sources contributing to the community noise environment.

California General Plan Guidelines

The California General Plan Guidelines, published by the Governor's Office of Planning and Research (OPR), provides guidance for the acceptability of specific land use types within areas of specific noise exposure. Table 4.10-5 presents guidelines for determining acceptable and unacceptable community noise exposure limits for various land use categories. The guidelines also present adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution. OPR guidelines are advisory in nature.

Table 4.10-5
Land Use Compatibility for Community Noise Environments

	Community Noise Exposure (dBA CNEL)			
	Normally Acceptable[1]	*Conditionally Acceptable*[2]	*Normally Unacceptable*[3]	*Clearly Unacceptable*[4]
Residential-low density, single-family, duplex, mobile homes	50–60	55–70	70–75	75–85
Residential – multiple-family	50–65	60–70	70–75	70–85
Transit lodging – motel, hotels	50–65	60–70	70–80	80–85
Schools, libraries, churches, hospitals, nursing homes	50–70	60–70	70–80	80–85
Auditoriums, concert halls, amphitheatres	NA	50–70	NA	65–85
Sports arenas, outdoor spectator sports	NA	50–75	NA	70–85
Playgrounds, neighborhood parks	50–70	NA	67.5–77.5	72.5–85
Golf courses, riding stables, water recreation, cemeteries	50–70	NA	70–80	80–85
Office buildings, business commercial and professional	50–70	67.5–77.5	75–85	NA
Industrial, manufacturing, utilities, agriculture	50–75	70–80	75–85	NA

Source: OPR 2017.
Notes: dBA = A-weighted decibel; CNEL = community noise equivalent level; NA = not applicable.
1 Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
2 Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features have been included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning, will normally suffice.
3 Normally Unacceptable: New construction or development should be discouraged. If new construction of development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise-insulation features must be included in the design.
4 Clearly Unacceptable: New construction or development should generally not be undertaken.

Local

March Joint Powers Authority Adopted 1999 General Plan Noise/Air Quality Element

The March JPA Adopted 1999 General Plan Noise/Air Quality Element identifies several goals and policies to protect and enhance the quality of life for those who live and work in the March JPA jurisdiction. The March JPA Adopted 1999 General Plan Noise/Air Quality Element contains the following three goals (March JPA 1999):

Goal 1: Ensure that land uses are protected from excessive and unwanted noise.

Goal 2: Minimize incompatible noise level exposures throughout the Planning Area, and where possible, mitigate the effect of noise incompatibilities to provide a safe and healthy environment.

Goal 3: Work toward the reduction of noise impacts from vehicular traffic, and aviation and rail operations.

The noise policies specified in the March JPA Adopted 1999 Noise/Air Quality Element provide the guidelines necessary to satisfy these goals. The policies are provided below.

Policy 1.1: Establish acceptable limits of noise for various land uses throughout the March JPA Planning Area. Future development that could increase ambient noise levels shall be required to mitigate the anticipated noise increase, to the extent possible.

Policy 1.2: Noise sensitive uses (such as schools, libraries, hospitals, medical facilities, residential uses, etc.) shall be discouraged in areas where noise levels exceed acceptable limits.

Policy 1.3: Encourage good acoustical design in new construction.

Policy 1.4: Provide buffer areas between noise sources and other developments, where practical.

Policy 2.1: Avoid placing noise sensitive land uses in proximity to areas devoted to noise generating facilities such as areas of aviation related activities, industrial parks, transportation facilities, and other noise generating land uses.

Policy 2.2: Noise generating facilities shall be located in areas with compatible noise generating land uses (i.e., airport noise contour areas) to minimize land use incompatibilities, noise abatement and mitigation measures needed.

Policy 2.3: Noise sensitive land uses shall not be located in areas influenced by noise generating land uses, in particular the noise contours associated with the joint use airfield, unless appropriate mitigation is utilized.

Policy 2.4: March JPA shall evaluate noise sensitivity and noise generation when considering land use projects and transportation improvement projects, and where appropriate mitigation measures shall be employed.

Policy 2.5: March JPA shall utilize and comply with the CALTRANS standards for noise compatibility for aviation generated noise to proposed land use development.

Policy 3.1: Include mitigating measures such as landscaping, berming and site orientation, in the design of projects located near noise generating sources such as arterial roadways.

Policy 3.2: Coordinate with adjacent cities and county agencies for noise abatement.

Policy 3.3: Adhere to the adopted AICUZ and Comprehensive Land Use Plan standards and promote the use of newer and quieter aircraft and support equipment.

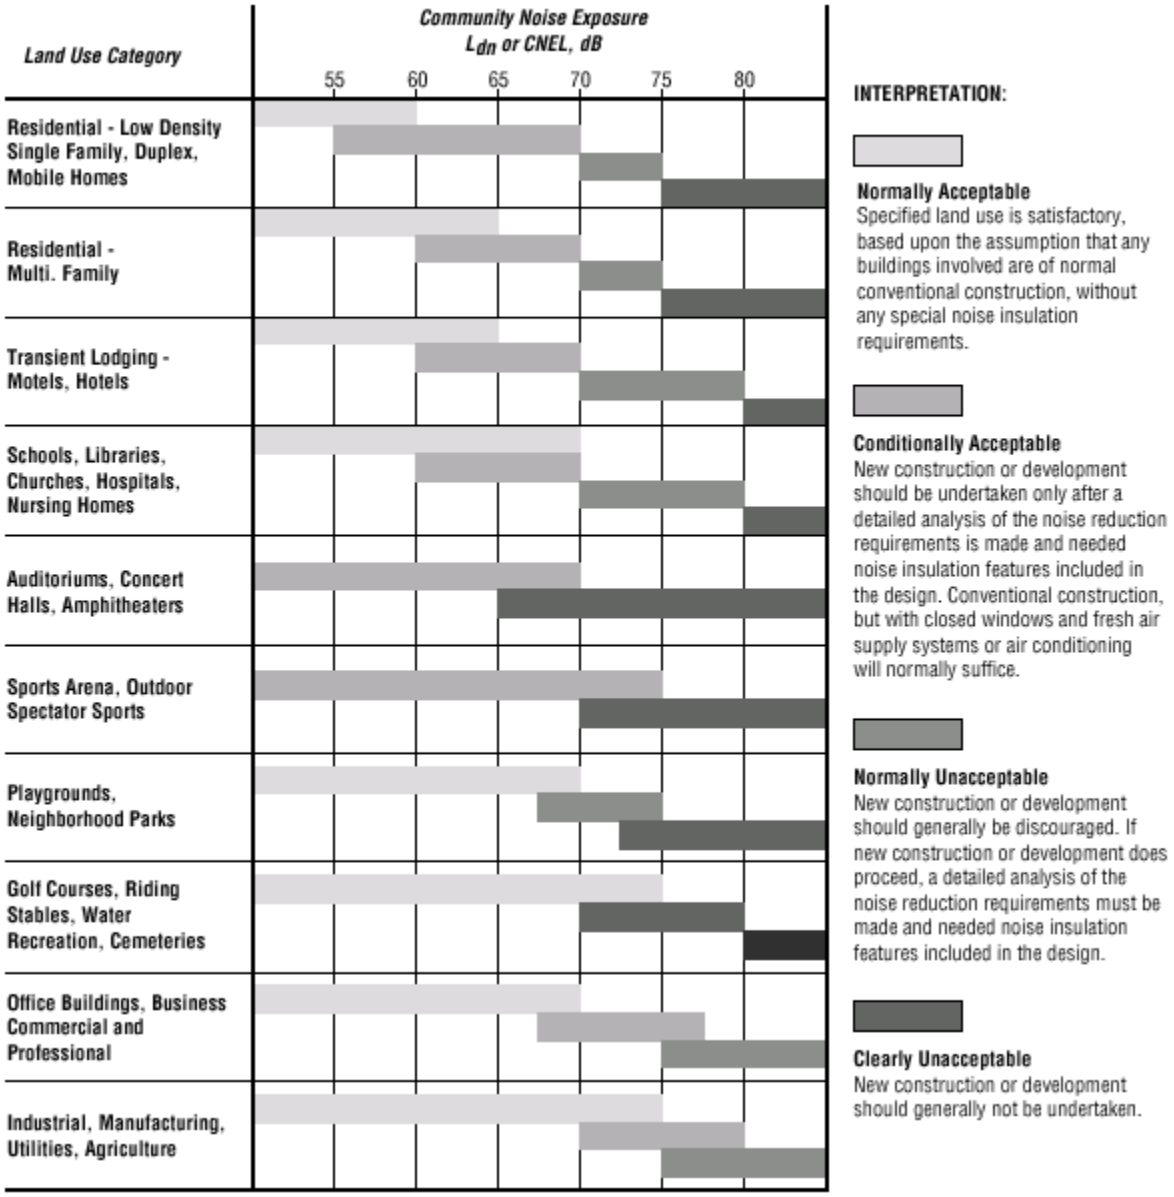
Policy 3.4: Where appropriate, noise mitigation measures shall be incorporated in the design and approval of development on property located adjacent to aviation and rail facilities.

Policy 3.5: Where appropriate, development in areas adjacent to freeways, arterial streets, and other noise source shall be designed to reduce the potential for noise impacts.

Policy 3.6: Regulate the use of local streets by trucks, trailers, and construction vehicles, to the extent possible.

Policy 3.7: Limit trucking operations to appropriate routes, times and speeds.

Policy 3.8: Appropriate muffling systems for construction equipment and operations shall be required, as necessary.



Policy 3.9: March JPA shall encourage and facilitate the use of mass transit services and alternative transportation systems to minimize dependence of the automobile within the Planning Area, thereby minimizing the level of noise generated by surface transportation.

Land Use Compatibility

The State of California OPR published recommendations for noise exposure levels applicable to various land uses, which form the basis of community noise planning activities (OPR 2017). These recommendations, as shown in Table 4.10-6, provide March JPA with a planning tool to gauge the compatibility of land uses relative to existing and future exterior noise levels. The State Land Use Compatibility guidelines indicate that industrial and manufacturing land uses, such as the Project, are considered normally acceptable with noise levels below 70 dBA CNEL and conditionally acceptable with noise levels of less than 75 dBA CNEL.

Table 4.10-6
State Land Use Compatibility

FIGURE 2

Source: OPR 2017.

March Joint Powers Authority Construction Noise Standards

The March JPA Development Code Section 9.10.030, Exemptions, states that construction activities are considered exempt from the noise performance standards if they occur within the permitted hours of 7:00 AM to 7:00 PM. The March JPA Development Code does not identify a specific noise level standard for construction activity.

March Joint Powers Authority Operational Noise Standards

Section 9.10.140 of the March JPA Development Code identifies the exterior stationary-source noise level standards for commercial and industrial land uses. Based on Section 9.10.140 of the March JPA Development Code, the exterior noise level shall not exceed 55 dBA Leq at any time.

City of Moreno Valley Construction Noise Standards

The City of Moreno Valley Municipal Code noise standards for construction are described below to determine the potential noise impacts at nearby sensitive receiver locations. As a subset of its stationary-source noise regulations, the City Municipal Code establishes permitted hours of construction activity. More specifically, Municipal Code Section 11.80.030 (D)(7), Construction and Demolition, provides the following:

> No person shall operate, or cause operation of any tools or equipment used in construction, drilling, repair, alteration, or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee.

Therefore, based on the Section 11.80.030 (D)(7) construction regulations, a construction related noise disturbance occurs if Project construction activity occurs outside of the permitted hours. For this analysis, both the more restrictive daytime and nighttime City of Moreno Valley noise level limits of 65 dBA L_{eq} and 60 dBA L_{eq}, respectively, and the 90 dBA L_{eq} 8-hour limit are used as appropriate thresholds for the nearby sensitive land uses (e.g., residential homes) in the Project study area. The City of Moreno Valley construction noise standards are shown on Table 4.10-7. As previously discussed, the construction noise level threshold used in this noise study represents a conservative approach, since it is more restrictive than the continuous sound level limits of Table 11.80.030-1 of the City of Moreno Valley Municipal Code.

Table 4.10-7
City of Moreno Valley Construction Noise Standards

Jurisdiction	Permitted Hours of Construction Activity	Construction Noise Level Standard (dBA L_{eq})[1]	
		Daytime	*Nighttime*
March JPA	7:00 a.m. to 7:00 p.m.	n/a	
City of Moreno Valley	General Activity: 7:00 a.m. to 8:00 p.m. on any day. Grading is limited to 7:00 a.m. to 6:00 p.m. Monday to Friday; 8:00 a.m. to 4:00 p.m. on weekends and holidays.	65	60[2]
		90 (anytime)	

Source: Appendix Q.
Notes: dBA = A-weighted decibel; L_{eq} = energy equivalent level; JPA = Joint Powers Authority.

[1] Acceptable threshold for determining the relative significance of short-term Project construction noise levels, based on the City of Moreno Valley stationary noise standards shown on Table 3-1 of Appendix Q.

[2] Any nighttime construction activity requires an exemption from the City of Moreno Valley Municipal Code as indicated in Section 11.80.030 (E) (8) for a special event permit (Section 11.80.040). The special event permit application shall be submitted to the City of Moreno Valley Planning Department for approval and meet the requirements of Municipal Code Section 11.80.040.

"Daytime" = 8:00 a.m. to 10:00 p.m.; "Nighttime" = 10:01 p.m. to 7:59 a.m.; "n/a" = The March JPA Development Code does not identify construction-specific noise level limits.

City of Moreno Valley Operational Noise Standards

The City of Moreno Valley Municipal Code defines Maximum Sound Levels (in dB(A)) for Source Land Uses in Table 11.80.030-2 for Residential and Commercial land uses. As defined by the Municipal Code, Section 11.80.020 Definitions, Commercial land use means all uses of land not otherwise classified as residential, and Residential land use means all uses of land primarily for dwelling units, as well as hospitals, schools, colleges and universities, and places of religious assembly. For the purpose of this analysis, the K4 Parcel is considered Commercial land use since it is not classified as residential. Based on this standard, the operational noise level limits for commercial land use, from Table 11.80.030-2, of 65 dBA Leq during the daytime (8:00 a.m. to 10:00 p.m.) hours and 60 dBA Leq during the nighttime (10:01 p.m. to 7:59 a.m.) hours shall apply to the operational noise from the Project.

Further, Section 11.80.030(C) Prohibited Acts, Nonimpulsive Sound Decibel Limits, states: No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimpulsive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 when measured at a distance of 200 feet or more from the real property line of the source of the sound, if the sound occurs on a privately owned property. Therefore, at a distance of 200 feet from the property line, the Project's operational noise levels shall not exceed the 65 dBA Leq daytime and 60 dBA Leq nighttime noise level standards for commercial land uses, as shown on Table 4.10-8.

The City of Moreno Valley Municipal Code also identifies continuous sound level limits in Table 11.80.030-1 based on the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health (NIOSH) noise exposure guidelines. A division of the U.S. Department of Health and Human Services, NIOSH identifies a noise level threshold based on the duration of exposure to the source. The City of Moreno Valley noise level threshold starts at 90 dBA for more than eight hours per day, and for every increase, the exposure time is reduced. The City of Moreno Valley identifies noise level thresholds of 92 dBA for more than 6 hours per day, 95 dBA for more than 4 hour per day, 97 dBA for more than 3 hours per day, and up to 100 dBA for more than 2 hours per day. The noise study uses both the more restrictive daytime and nighttime City of Moreno Valley noise level limits of 65 dBA L_{eq} and 60 dBA L_{eq}, respectively, and the 90 dBA L_{eq} 8-hour limit, shown on Table 4.10-8 of this report, to evaluate the potential operational noise levels due to the operation of the Project.

Table 4.10-8
City of Moreno Valley Operational Noise Standards

Jurisdiction	Source Land Use	Time Period	Exterior Noise Level Standards (dBA L_{eq})[2]
March JPA	Commercial/ Industrial	Any Time	55
City of Moreno Valley	Commercial (at 200 feet)	Daytime (8:00 a.m.–10:00 p.m.)	65
		Nighttime (10:01 p.m.–7:59 a.m.)	60
	Any	8 Hours per Day	90

Notes: dBA = A-weighted decibel; L_{eq} = energy equivalent level; JPA = Joint Powers Authority.

County of Riverside Construction Noise Standards

Noise-sensitive receivers potentially impacted by the Project's construction noise activities are located in the County of Riverside. Therefore, to accurately describe the potential Project -related construction noise level contributions, this analysis presents the County of Riverside's construction noise standards.

Section 9.52.020 of the County's Noise Regulation ordinance indicates that noise associated with any private construction activity located within one-quarter of a mile from an inhabited dwelling is considered exempt between the hours of 6:00 AM and 6:00 PM, during the months of June through September, and 7:00 AM and 6:00 PM, during the months of October through May. Neither the County's General Plan nor Municipal Code establish numeric maximum acceptable construction source noise levels at potentially affected receivers, which would allow for a quantified determination of what California Environmental Quality Act (CEQA) constitutes a substantial temporary or periodic noise increase (County of Riverside 2015).

To allow for a quantified determination of what the Noise Control Ordinance constitutes as noise that may jeopardize the health, safety or general welfare of Riverside County residents and degrade their quality of life due to Project construction activity, relevant quantified stationary source noise standards established in the General Plan, Policy N 4.1, are used in this analysis to assess the Project construction noise levels at nearby sensitive receivers. Therefore, the daytime noise level standard of 65 dBA Leq and nighttime noise level standard of 45 dBA Leq are used to evaluate the potential Project -related construction noise impacts.

County of Riverside Operational Noise Standards

Noise-sensitive receivers potentially impacted by the Project's operational noise activities are located in the County of Riverside. Therefore, to accurately describe the potential Project -related operational noise level contributions, this analysis presents the County of Riverside's operational noise standards.

The County of Riverside has set exterior noise limits to control community noise impacts from non-transportation noise sources (such as playgrounds, trash compactors, air-conditioning units, etc.). Policy N 4.1 of the County's Noise Element sets an exterior noise limit not to be exceeded for a cumulative period of more than ten minutes in any hour of 65 dBA Leq for daytime hours of 7:00 AM to 10:00 PM, and 45 dBA Leq during the noise-sensitive nighttime hours of 10:00 PM to 7:00 AM. These stationary-source noise level standards are consistent with the County of Riverside Office of Industrial Hygiene guidelines for noise studies within the County.

March Air Reserve Base/Inland Port Airport Land Use Compatibility

The March ARB/Inland Port Airport is located approximately 0.7 mile southwest of the Project site. The Riverside County (RC) ALUCP Policy Document includes the policies for determining the land use compatibility of the Project since it is located within 2 miles of an airport runway. Policy 4.1.5, Noise Exposure for Other Land Uses of the Riverside County ALUCP requires that land uses, such as the Industrial land use of the Project site, demonstrate compatibility with the acceptable noise levels as shown on Table 4.10-9. Table 4.10-9 indicates that clearly compatible business park land uses experience exterior noise levels below 55 dBA CNEL, which industrial land uses experience clearly compatible exterior noise levels below 60 dBA CNEL. Normally acceptable noise levels for Industrial land uses range from 60 to 65 dBA CNEL. Marginally acceptable noise levels at Industrial land uses range from 65 to 70 dBA CNEL. For marginally acceptable noise levels, the indicated noise exposure will cause moderate interference with outdoor activities and with indoor activities when windows are open. The land use is acceptable on the conditions that outdoor activities are minimal and construction features which provide sufficient noise attenuation are used (e.g., installation of air conditioning so that windows can be kept closed). Under other circumstances, the land use should be discouraged.

Vibration Standards

The March JPA and City of Moreno Valley General Plans and Municipal Codes do not identify specific vibration level standards. However, the United States Department of Transportation FTA provides guidelines for maximum acceptable vibration criteria for different types of land uses. These guidelines allow 80 VdB for residential uses and buildings where people normally sleep. Operational and construction activities can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates

little or no ground vibration. Large bulldozers and loaded trucks can cause perceptible vibration levels to proximate receptors. The FTA guidelines of 80 VdB for sensitive land uses provide a substantiated basis for determining the relative significance of potential Project -related vibration impacts due to on-site operational and construction activities.

Table 4.10-9
Riverside County Airport Land Use Compatibility Criteria: Noise

Land Use Category	CNEL (dB) 50–55	55–60	60–65	65–70	70–75
Residential *					
single-family, nursing homes, mobile homes	++	o	–	– –	– –

golf courses, riding stables, water recreation	++	++	+	o	o
outdoor spectator sports	++	+	+	o	–
amphitheaters	+	o	–	– –	– –

Land Use Acceptability		Interpretation/Comments
++	*Clearly Acceptable*	The activities associated with the specified land use can be carried out with essentially no interference from the noise exposure.
+	*Normally Acceptable*	Noise is a factor to be considered in that slight interference with outdoor activities may occur. Conventional construction methods will eliminate most noise intrusions upon indoor activities.
o	*Marginally Acceptable*	The indicated noise exposure will cause moderate interference with outdoor activities and with indoor activities when windows are open. The land use is acceptable on the conditions that outdoor activities are minimal and construction features which provide sufficient noise attenuation are used (e.g., installation of air conditioning so that windows can be kept closed). Under other circumstances, the land use should be discouraged.
–	*Normally Unacceptable*	Noise will create substantial interference with both outdoor and indoor activities. Noise intrusion upon indoor activities can be mitigated by requiring special noise insulation construction. Land uses which have conventionally constructed structures and/or involve outdoor activities which would be disrupted by noise should generally be avoided.
– –	*Clearly Unacceptable*	Unacceptable noise intrusion upon land use activities will occur. Adequate structural noise insulation is not practical under most circumstances. The indicated land use should be avoided unless strong overriding factors prevail and it should be prohibited if outdoor activities are involved.

* Subtract 5 dB for low-activity outlying airports (Chiriaco Summit and Desert Center)

4.10.3 Thresholds of Significance

March JPA uses the CEQA Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the IS prepared for the Project (Appendix A, Initial Study and Notice of Preparation) and the newly adopted CEQA Guidelines Appendix G (December 2018), the Project could have a significant noise impact if the Project would result in:

- **NOI-1**: Generation of substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
- **NOI-2**: Generation of excessive groundborne vibration or groundborne noise levels.
- **NOI-3**: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the Project area to excessive noise levels.

Noise Significance Criteria

Classification of Substantial Noise Increases

Permanent Noise Level Increase (Operational Related)

There is no completely satisfactory way to measure the subjective effects of noise or of the corresponding human reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, one way to measure a person's subjective reaction to a new noise is to compare the new noise to the existing ambient environment.

The Federal Interagency Committee on Noise (FICON) developed guidance to be used for the assessment of Project -generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (e.g., CNEL).

For example, if the ambient noise environment is quiet (<60 dBA) and the new noise source greatly increases the noise levels, an impact may occur if the noise criteria may be exceeded. Therefore, or this analysis, FICON identifies a readily perceptible 5 dBA or greater Project -related noise level increase is considered a significant impact when the noise criteria for a given land use is exceeded. Per the FICON, in areas where the without Project noise levels range from 60 to 65

dBA, a 3 dBA barely perceptible noise level increase appears to be appropriate for most people. When the without Project noise levels already exceed 65 dBA, any increase in community noise louder than 1.5 dBA or greater is considered a significant impact if the noise criteria for a given land use is exceeded, since it likely contributes to an existing noise exposure exceedance. Table 4.10-10 below provides a summary of the potential noise impact significance criteria, based on guidance from FICON, which inform the Significance Thresholds.

Table 4.10-10
Significance of Noise Impacts at Noise-Sensitive Receivers

Without Project Noise Level	Potential Significant Impact
<60 dBA	5 dBA or more
60–65 dBA	3 dBA or more
>65 dBA	1.5 dBA or more

Source: FICON 1992.
Notes: dBA = A-weighted decibel.

Temporary Noise Level Increase (Construction Related)

Due to the temporary, short-term nature of noise-generating construction activities, the temporary or periodic noise level increases over the existing ambient conditions must be considered under threshold Noise-4. Therefore, the 12 dBA L_{eq} noise increase threshold from Caltrans Traffic Noise Analysis Protocol is used in this analysis to assess temporary noise level increases (Caltrans 2013b). If the Project-related construction noise levels generate a temporary noise level increase above the existing ambient noise levels of up to 12 dBA L_{eq}, then the Project construction noise level increases will be considered a potentially significant impact. Although the Caltrans recommendations were specifically developed to assess traffic noise impacts, the 12 dBA L_{eq} substantial noise level increase threshold is used in California to address noise level increases with the potential to exceed existing conditions.

Noise-Sensitive Land Uses

Noise sensitive land uses generally include residences, hospitals, nursing care facilities, and lodging. The OPR guidance on noise exposure is used as the basis for determining acceptable exposure limits for noise sensitive land uses in the Project study area (Table 4.10-6). The normally acceptable noise level for residential is up to 60 dB CNEL.

Non-Noise-Sensitive Land Uses

Land use compatibility criteria outlined in the OPR guidance on noise exposure are also used to identify thresholds for non-noise-sensitive land uses; the exterior noise level criteria for non-noise-sensitive land use, such as industrial use, is 70 dBA CNEL. Noise levels greater than 70 dBA

CNEL are considered conditionally acceptable per the State Land Use Compatibility matrix, previously shown on Table 4.10-6.

To determine if Project-related traffic noise level increases are significant at off-site non-noise-sensitive land uses, the readily perceptible 5 dBA and barely perceptible 3 dBA criteria are used. When the noise levels at the non-noise-sensitive land uses without the Project are below the normally acceptable 70 dBA CNEL compatibility criteria, a readily perceptible 5 dBA or greater noise level increase is considered a significant impact. When the noise levels without the Project are greater than the normally acceptable 70 dBA CNEL land use compatibility criteria, a barely perceptible 3 dBA or greater noise level increase is considered a significant impact. The noise level increases used to determine significant impacts for non-noise-sensitive land uses is generally consistent with the FICON noise level increase thresholds for noise-sensitive land uses but instead rely on the March JPA General Plan Noise/Air Quality Element, Policy 1f 70 dBA CNEL exterior noise level criteria.

As such, noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development.

Off-Site Traffic Noise

A significant impact would occur when the noise levels at existing and future noise-sensitive land uses (e.g., residential):

- Are less than 60 dBA and the Project creates a readily perceptible 5 dBA or greater Project -related noise level increase; or
- Range from 60 to 65 dBA and the Project creates a barely perceptible 3 dBA or greater Project-related noise level increase; or
- Already exceed 65 dBA, and the Project creates a community noise level impact of greater than 1.5 dBA.

A significant impact would occur when the noise levels at existing and future non-noise-sensitive land uses (e.g., industrial, etc.) are:

- Less than the March JPA General Plan Noise/Air Quality Element, Policy 1f, 70 dBA and the Project creates a readily perceptible 5 dBA or greater Project-related noise level increase; or
- Greater than the March JPA General Plan Noise/Air Quality Element, Policy 1f, 70 dBA and the Project creates a barely perceptible 3 dBA or greater Project -related noise level increase.

Construction Noise and Vibration

Noise impacts shall be considered significant if Project-related construction activities:

- create noise levels at sensitive residential receivers in the City of Moreno which exceed the short-term construction noise level threshold of 65 dBA Leq during the daytime hours, or 60 dBA Leq during the nighttime hours, or the continuous noise level limit of 90 dBA Leq, as shown in Table 4.10-10 (based on the City of Moreno Valley Municipal Code, Table 11.80.030-2 source land use noise level limits, and the Table 11.80.030-1 continuous noise level limits); or
- generate temporary Project construction-related noise level increases which exceed the 12 dBA Leq substantial noise level increase threshold at noise-sensitive receiver locations (Caltrans 2013b).
- generate construction source vibration levels could exceed the FTA maximum acceptable vibration standard of 80 vibration decibels (VdB) at noise-sensitive receiver locations.

Operational Noise

A significant impact would occur if Project-related operational (i.e., on-site activities and stationary-sources) noise levels:

- Exceed the exterior 55 dBA Leq noise level standards at nearby sensitive residential land uses within the March Joint Powers Authority jurisdiction (March Joint Powers Authority Development Code, Section 9.10.140); or
- Exceed the 65 dBA Leq daytime or 60 dBA Leq nighttime noise level standards at 200 feet from the property line of the noise source (City of Moreno Valley Municipal Code, Table 11.80.030-2); or
- Exceed the 65 dBA Leq daytime or 60 dBA Leq nighttime noise level standards at residential receivers in the City of Moreno Valley (City of Moreno Valley Municipal Code, Table 11.80.030-2);
- To present a conservative approach, the adjacent office uses in the Project study area are also analyzed based on the more conservative operational noise level limits required for noise-sensitive residential receiver locations.

A significant impact would occur if the existing ambient noise levels at the noise-sensitive land uses near the Project site:

- Are less than 60 dBA Leq and the Project creates a readily perceptible 5 dBA Leq or greater Project -related noise level increase; or

- Range from 60 to 65 dBA L_{eq} and the Project creates a barely perceptible 3 dBA L_{eq} or greater Project -related noise level increase; or
- Already exceed 65 dBA L_{eq}, and the Project creates a community noise level impact of greater than 1.5 dBA L_{eq}.

Table 4.10-11 illustrates the noise significance criteria described above.

Table 4.10-11
Significance Criteria Summary

Analysis	Receiving Land Use	Condition(s)	Significance Criteria	
			Daytime	*Nighttime*
Off-Site	Noise-Sensitive	if ambient is <60 dBA CNEL	≥5 dBA CNEL project increase	
		if ambient is 60–65 dBA CNEL	≥3 dBA CNEL project increase	
		if ambient is >65 dBA CNEL	≥1.5 dBA CNEL project increase	
	Non-Noise-Sensitive	if ambient is <70 dBA CNEL	≥5 dBA CNEL project increase	
		if ambient is >70 dBA CNEL	≥3 dBA CNEL project increase	
Operational	Noise-Sensitive	Exterior Noise Level Standards		
		if ambient is <60 dBA L_{eq}[1]	≥5 dBA L_{eq} project increase	
		if ambient is 60–65 dBA L_{eq}[1]	≥3 dBA L_{eq} project increase	
		if ambient is >65 dBA L_{eq}[1]	≥1.5 dBA L_{eq} project increase	
		Vibration Level Threshold[3]	80 VdB	
		At residential land use[4]	65 dBA L_{eq}	60 dBA L_{eq}
Construction	Noise-Sensitive		90 dBA L_{eq}	
		Vibration Level Threshold[3]	80 VdB

Methodology

On-Site Traffic Noise

The expected on-site roadway noise level increases from vehicular traffic were calculated by Urban Crossroads using a computer program that replicates the FHWA Traffic Noise Prediction Model—FHWA-RD-77-108.

Off-Site Traffic Noise

To assess the off-site traffic CNEL noise level impacts associated with the proposed Project, noise contours were developed based on the *Traffic Impact Analysis* Report (Appendix R), prepared by

Urban Crossroads. Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway. Noise contours were developed for the following traffic scenarios:

- Existing Conditions Without/With Project: This scenario refers to the existing present-day noise conditions without and with the proposed Project.
- Opening Year 2023 Without/With the Project: This scenario refers to Opening Year noise conditions without and with the proposed Project. This scenario includes all cumulative projects identified in the *Traffic Impact Analysis*.
- Horizon Year 2040 Without/With the Project: This scenario refers to Horizon Year noise conditions without and with the proposed Project. This scenario includes all cumulative projects identified in the *Traffic Impact Analysis*.

Noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA noise levels. The noise contours do not take into account the effect of any existing noise barriers or topography that may attenuate ambient noise levels and therefore present a conservative scenario for purposes of this analysis.

Vibrations

However, while vehicular traffic is rarely perceptible, construction has the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the human response (annoyance) using the following vibration assessment methods defined by the FTA (Table 4.10-12).

Table 4.10-12
Vibration Source Levels for Construction Equipment

Equipment	Vibration Decibels (VdB) at 25 feet
Small bulldozer	58
Jackhammer	79
Loaded Trucks	86
Large bulldozer	87

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment, May 2006.
Notes: VdB = velocity vibration decibel.

Receiver Locations

To assess the potential for long-term operational and short-term construction noise impacts, the following receiver locations, as shown on Figure 4.10-1, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land.

4.10.4 Impacts Analysis

Threshold NOI-1. Would the Project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction

The March Joint Powers Authority Development Code, Section 9.10.030 Exemptions, states that construction activities are considered exempt from the noise performance standards if they occur within the permitted hours of 7:00 a.m. to 7:00 p.m. The March Joint Powers Authority Development Code does not identify a specific noise level standard for construction activity. The City of Moreno Valley Municipal Code noise standards for construction restrict construction activities to the hours of 7:00 a.m. to 8:00 p.m. For this analysis, both the more restrictive daytime and nighttime City of Moreno Valley noise level limits of 65 dBA L_{eq} and 60 dBA L_{eq}, respectively, and the 90 dBA L_{eq} 8-hour limit are used as appropriate thresholds for the nearby sensitive land uses (e.g., residential homes) in the Project study area (Appendix Q).

Noise generated by the Project construction equipment would include a combination of trucks, power tools, concrete mixers and portable generators that when combined can reach high levels. The number and mix of construction equipment is expected to occur in the following stages:

- Site Preparation
- Grading
- Building Construction
- Paving
- Architectural Coating
- Off-Site Channel (Cactus Avenue)
- Nighttime Concrete Pours

The construction noise analysis included in Appendix Q was prepared consistent with the FTA Transit Noise and Vibration Impact Assessment Manual (FTA 2018) for general construction noise assessment which states, "Compare the combined $L_{eq.equip(1hr)}$ for the two noisiest pieces of equipment for each phase of construction". Since the reference construction activity noise level measurements already include multiple pieces of equipment operating simultaneously, the highest reference noise level from all reference activities associated with the given stage of Project construction is used to present a conservative approach. Moreover, the highest reference noise level of each stage is analyzed as operating at the closest point from primary construction activities to each receiver location.

Noise levels generated by heavy construction equipment could range from approximately 68 dBA to in excess of 80 dBA, when measured at 50 feet. However, these noise levels diminish with distance from the construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 80 dBA measured at 50 feet from the noise source to the receiver would be reduced to 74 dBA at 100 feet from the source to the receiver and would be further reduced to 68 dBA at 200 feet from the source to the receiver. Table 4.10-13 provides a summary of the construction reference noise level measurements. Since the reference noise levels were collected at varying distances of 30 feet and 50 feet, all construction noise level measurements presented on Table 4.10-13 have been adjusted for consistency to describe a common reference distance of 50 feet.

Table 4.10-13
Construction Reference Noise Levels

ID	Noise Source	Reference Distance From Source (Feet)	Reference Noise Levels at Reference Distance (dBA L_{eq})	Reference Noise Levels at 50 Feet (dBA L_{eq})[1]
1	Truck Pass-Bys and Dozer Activity (Single Dozer)	30	63.6	59.2
2	Dozer Activity (Multiple Dozers)	30	68.6	64.2
3	Construction Vehicle Maintenance Activities	30	71.9	67.5
4	Foundation Trenching	30	72.6	68.2
5	Rough Grading Activities	30	77.9	73.5
6	Framing	30	66.7	62.3
7	Concrete Mixer Truck Movements	50	71.2	71.2
8	Concrete Paver Activities	30	70.0	65.6
9	Concrete Mixer Pour and Paving Activities	30	70.3	65.9
10	Concrete Mixer Backup Alarms and Air Brakes	50	71.6	71.6
11	Concrete Mixer Pour Activities	50	67.7	67.7

Notes: dBA = A-weighted decibel; L_{eq} = energy equivalent level.
[1] **Reference** noise levels are calculated at 50 feet using a drop off rate of 6 dBA per doubling of distance (point source).

As shown on Table 4.10-13, above, the unmitigated Project daytime and nighttime construction noise levels satisfy the 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime City of Moreno Valley Municipal Code thresholds, respectively, during Project construction activity at all receiver locations, including the off-site Cactus Channel construction. Project daytime and nighttime construction noise levels would satisfy the nighttime City of Moreno Valley Municipal Code thresholds 8-hour continuous noise level limit identified in the City of Moreno Valley Municipal Code. As described in Section 4.10.1, Existing Conditions, sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include: schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, natural open space, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals. No sensitive receiver locations are located closer than the non-noise sensitive receiver locations identified below. Table 4.10-14 provides a summary of the construction noise levels by stage at the noise receiver locations (Figure 4.10-1). Based on the stages of construction, the noise impacts associated with the proposed Project are expected to create temporarily high noise levels at the nearby receiver locations.

Table 4.10-14
Unmitigated Construction Equipment Noise Level Summary

Receiver Location	Daytime Construction Noise Levels (dBA L_{eq})							Nighttime Concrete Pour Noise Levels (dBA L_{eq})	Threshold Exceeded?	
	Site Preparation	*Grading*	*Building Construction*	*Paving*	*Architectural Coating*	*Off-Site Channel*	*Highest Construction Noise Levels*		*Daytime (65 dBA L_{eq})*	*Nighttime (60 dBA L_{eq})*
R1	51.1	60.4	55.1	58.5	54.4	51.1	60.4	58.5	No	n/a
R2	51.7	61.0	55.7	59.1	55.0	46.7	61.0	54.1	No	n/a
R3	40.2	49.5	44.2	47.6	43.5	40.2	49.5	47.6	No	n/a
R4	31.1	40.4	35.1	38.6	34.4	50.4	50.4	38.6	No	n/a
R5	41.2	50.5	45.2	48.6	44.5	39.9	50.5	48.6	No	n/a
R6	24.5	33.8	28.5	31.9	27.8	47.3	47.3	31.9	No	No

Notes: dBA = A-weighted decibel; L_{eq} = energy equivalent level; n/a = receiver location represents a use that would be unoccupied during nighttime construction activity.

As discussed previously, based on the stages of construction, the noise impacts associated with the proposed Project are expected to create temporarily high noise levels at the nearby receiver locations. As shown on Table 4.10-14, above, the unmitigated Project daytime and nighttime construction noise levels satisfy the 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime City of Moreno Valley Municipal Code thresholds, respectively, during Project construction activity at all receiver locations, including the off-site Cactus Channel construction. Further, the closest receiver locations represent office uses that are typically unoccupied during the hours when nighttime concrete pours would take place, and as such, are not analyzed against the nighttime noise level standards. Temporary noise level increases due to Project construction at noise-sensitive receiver locations are shown to range from 0.0 to 0.2 dBA L_{eq} and will remain below the Caltrans 12 dBA L_{eq} threshold. Further, the unmitigated Project-related construction noise levels would satisfy the less restrictive 90 dBA L_{eq} 8-hour continuous noise level limit identified in the City of Moreno Valley Municipal Code.

To quantify the off-site traffic noise levels during construction, the Project related truck trips were added to the heavy truck category in the FHWA noise prediction model. The addition of the Project related truck trips increases the percentage of heavy trucks in the vehicle mix. Therefore, impacts related to ambient Project construction noise would be considered **less than significant**.

Implementation of the proposed improvements to the seven-acre Cactus Channel drainage ditch would either be constructed contemporaneously with the Project or built separately depending on permitting and timing.

As shown on Table 4.10-14, above, the unmitigated Project daytime and nighttime construction noise levels would not exceed the applicable threshold and would therefore not result in a significant impact. However, as conditions of approval to further reduce noise and vibration levels produced by the construction of the proposed Project, the following Best Management Practices (BMPs) would reduce noise and vibration levels produced by the construction equipment to the nearby receiver locations:

- During all Project site construction, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receivers nearest the Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the Project site during all Project construction.
- The construction contractor shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.

Therefore, construction activities would result in exposure of persons to or generation of noise levels that are **less than significant**.

Operations

The Cactus Channel improvements would result in improvements to the Cactus Channel, including an underground box culvert that would run approximately 7,900 linear feet. The existing channel is an open-air drainage channel, therefore, with implementation of the Cactus Channel improvements, there would be no increase in operational noise. Therefore, the Cactus Channel improvements are not anticipated to include operational noise sources requiring analysis because, and as such, are not included in the Project operational noise sources analyzed herein.

Operational on-site noise-generating activities associated with proposed Project would include: idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements. To present the potential worst-case operational noise conditions, the models and analysis contained in the Noise Impact Analysis (Appendix Q) assume the Project would operation 24 hours per day, seven days a week. The operational noise level calculations, shown on Table 4.10-15, account for the distance attenuation provided due to geometric spreading when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. With geometric spreading, sound levels attenuate (or decrease) at a rate of 6 dB for each doubling of distance from a point source. Further, existing non-noise-sensitive March ARB facilities located south of the Project site will benefit from additional barrier attenuation/shielding provided by the Project building and site design, which locates all truck activity north of the Project site building. For the purpose of the operational noise analysis, the Project building is modeled at a height of 30 feet.

Table 4.10-15 presents the combined total operational noise level projections at 200 feet consistent with the City of Moreno Valley Municipal Code. The Project operational noise levels at 200 feet are estimated at 51.5 dBA L_{eq}. Based on the results of this analysis, the Project operational noise levels associated with operations would satisfy the City of Moreno Valley Municipal Code 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime exterior noise level standards at 200 feet from the source land use. The Project would contribute a daytime operational noise level increase of up to 0.3 dBA Leq and a nighttime operational noise level increase of up to 0.5 dBA Leq at the sensitive receiver locations. Further, it should be noted that the land uses within 200 feet of the Project site boundary are designated as business park, office, and commercial land use.

Table 4.10-15
Operational Noise Levels at 200 Feet

Noise Source	Ref. Noise Level (dBA L_{eq})	Distance Atten. at 200 feet (dBA L_{eq})[1]	Hourly Activity (Mins.)[2]	Hourly Activity Adjustment (dBA L_{eq})	Noise Level at 200 feet (dBA L_{eq})
Truck Unloading/Docking Activity	67.2	-16.5	60	0.0	50.7
Roof-Top Air Conditioning Units	77.2	-32.0	39	-1.9	43.3
Parking Lot Vehicle Movements	52.2	-19.5	60	0.0	32.7
Combined Total:	**51.5**				

Notes: dBA = A-weighted decibel; Leq = energy equivalent level.
1 Drop off rate of 6 dBA per doubling of distance (point source) and 4.5 dBA per doubling of distance (line source).
2 Anticipated duration (minutes within the hour) of noise activity during peak hourly conditions expected at the Project site.

Table 4.10-16 indicates that the unmitigated hourly noise levels associated with the K4 Parcel at the nearby sensitive receiver locations are expected to range from 30.4 to 46.7 dBA Leq. The Project -related operational noise levels, as shown on Table 4.10-16, would satisfy the March JPA and City of Moreno Valley exterior noise level standards at all nearby sensitive receiver locations. March ARB facilities south of the Project site are not included in this analysis since they would experience lower noise levels than those presented at the closest receiver locations, below applicable thresholds, due to additional benefit from additional barrier attenuate on and shielding provided by the Project building and site design, which locates all truck activity north of the Project site building which reduces the line-of-sight to Project noise sources.

Table 4.10-16
Unmitigated Operational Noise Levels at Receiver Locations

Receiver Location[1]	Land Use	Noise Levels by Noise Source (dBA L_{eq})			Combined Operational Noise Levels (dBA L_{eq})	Threshold Exceeded?

Notes:
1 City of Moreno Valley 2017.

Noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA noise levels. The noise contours do not take into account the effect of any existing noise barriers or topography that may attenuate ambient noise levels and therefore present a conservative scenario for purposes of this analysis. In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the Project study area (Appendix Q). The expected roadway noise level increases from vehicular traffic were calculated by Urban Crossroads Inc. using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model—FHWA-RD-77-108. To quantify the off-site noise levels, the Project related truck trips were added to the heavy truck category in the FHWA noise prediction model. The average daily trips (ADT) volumes used for the following

traffic scenarios: Existing, Opening Year 2023, and Horizon Year 2040 conditions. Table 4.10-19 presents a summary of the existing exterior traffic noise levels, with the addition of the proposed Project. As shown in Table 4.10-19, the Project is expected to generate an exterior noise level increase of up to 0.6 dBA CNEL at adjacent land uses, which would satisfy the significance thresholds. Furthermore, Table 4.10-20 and Table 4.10-21 present a comparison of the Opening Year 2023 and Horizon Year 2040 respectively, without and with Project conditions CNEL noise levels. As shown in Tables 4.10-20 and 4.10-21, the Project is expected to generate an exterior noise level increase up to 0.5 dBA CNEL at adjacent land uses, which will satisfy the significance threshold. Therefore, the off-site Project -related traffic noise level increase is considered a **less than significant** impact.

18	Cactus Av.	e/o Heacock St.	78.7	78.7	0.0	Yes	1.5	No
19	Van Buren Bl.	w/o Meridian Pkwy.	82.0	82.0	0.0	No	1.5	No

Notes: CNEL = Community Noise Equivalent Level; dBA = A-weighted decibel.
1 The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest adjacent land use.
2 "Yes" = Existing, noise-sensitive land uses adjacent to the study area roadway segment.
3 Significance Criteria (Section 4).

Since the 24-hour seven days per week Project-related operational noise level contributions would satisfy the significance criteria discussed in Section 4.10.3, Thresholds of Significance, the increases at the sensitive receiver locations would be **less than significant**. In addition, there would not be a substantial permanent increase in ambient noise levels in the Project vicinity above the levels existing without the Project.

Threshold NOI-2. Would the Project result in generation of excessive groundborne vibration or groundborne noise levels?

Construction

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. The proposed Project's construction activities most likely to cause vibration impacts are:

- Heavy Construction Equipment: Although all heavy mobile construction equipment has the potential of causing at least some perceptible vibration while operating close to buildings, the vibration is usually short-term and is not of sufficient magnitude to cause building damage.

- Trucks: Trucks hauling building materials to construction sites can be sources of vibration intrusion if the haul routes pass through residential neighborhoods on streets with bumps or potholes. Repairing the bumps and potholes generally eliminates the problem.

Ground-borne vibration levels resulting from construction activities occurring within the Project site were estimated by data published by the FTA. Construction activities that would have the potential to generate low levels of ground-borne vibration within the Project site include grading. Using the vibration source level of construction equipment and the construction vibration assessment methodology published by the FTA, it is possible to estimate the Project vibration impacts. Table 4.10-22 presents the expected Project related vibration levels at the nearby receiver locations.

Table 4.10-22
Construction Equipment Vibration Levels

Receiver Location	Distance to Construction Activity (Feet)	Receiver Vibration Levels (VdB)[2]					Threshold Exceeded?[1]
		Small Bulldozer	*Jackhammer*	*Loaded Trucks*	*Large Bulldozer*	*Highest Vibration Level*	
R1	225'	29.4	50.4	57.4	58.4	58.4	No
R2	210'	30.3	51.3	58.3	59.3	59.3	No
R3	792'	13.0	34.0	41.0	42.0	42.0	No
R4	244'	28.3	49.3	56.3	57.3	57.3	No
R5	703'	14.5	35.5	42.5	43.5	43.5	No
R6	350'	23.6	44.6	51.6	52.6	52.6	No

Source: Appendix Q.
Notes: VdB = vibration velocity decibel.
1 Does the peak vibration exceed the Federal Transit Administration (FTA) maximum acceptable vibration standard of 80 VdB? (City of Moreno Valley 2017).

Based on the reference vibration levels provided by the FTA, a large bulldozer represents the peak source of vibration with a reference level of 87 VdB at 25 feet. At distances ranging from 140 to 4,823 feet from the Project construction activities, construction vibration levels are expected to range from 42.0 to 64.6 VdB. Using the construction vibration assessment methods provided by the FTA, Project construction vibration levels would remain below the FTA 80 VdB threshold at all sensitive receiver locations, and therefore construction vibration would be considered a less than significant impact; no mitigation measures are required. Further, vibration levels at the site of the closest sensitive receiver are unlikely to be sustained during the entire construction period but would occur rather only during the times that heavy construction equipment is operating at the Project site perimeter. Though construction noise is temporary, intermittent and of short duration,

and would not present any long-term impacts, the following BMPs would reduce noise and vibration levels produced by the construction equipment to the nearby receiver locations:

- During all Project site construction, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receivers nearest the Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the Project site during all Project construction.
- The construction contractor shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.

Therefore, construction-related vibration impacts are considered **less than significant** and would be further reduced with implementation of the BMPs described above.

Operations

Although the human threshold of perception for vibration is around 65 VdB, human response to vibration is not usually significant unless the vibration exceeds 70 VdB. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement condition. Typical vibration levels for heavy trucks at normal traffic speeds do not exceed 65 VdB, and therefore, would result in a less than significant impact as vibration levels would remain below the FTA vibration threshold of 80 VdB at nearby receiver locations. Therefore, no mitigation is required; operational impacts would be **less than significant**.

Threshold NOI-3. ***For a Project located within the vicinity of a private airstrip an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the Project area to excessive noise levels?***

The Project site is not within the vicinity of a private airstrip. March Air Reserve Base/Inland Port Airport (March ARB/IPA) is considered a joint-use airport utilized for both commercial and military purposes. As such, no impacts associated with exposing people residing or working within the vicinity of a private airstrip to excessive noise levels would result from Project implementation. The March ARB/IPA runway is located approximately 0.7 miles southwest of the Project site. The Project site is located within the C1 compatibility zone, as depicted in the March ARB/Inland Port Airport Land Use Compatibility Plan (Mead & Hunt 2014). Zone C1, Primary Approach/Departure Zone, encompasses areas of moderate to high noise

and moderate accidental potential risk. The Riverside County Airport Land Use Compatibility Plan Policy Document (RC ALUCP) includes the policies for determining the land use compatibility of the Project since it is located within 2 miles of an airport runway. Policy 4.1.5 Noise Exposure for Other Land Uses of the RC ALUCP requires that land uses, such as the industrial land use of the Project site, demonstrate compatibility with the acceptable noise levels on Table 2B of the RC ALUCP. The Table 2B Supporting Compatibility Criteria: Noise matrix, shown in Table 4.10-9, indicates that normally acceptable industrial land uses experience exterior noise levels between 60 to 65 dBA CNEL. Normally acceptable noise levels for industrial land uses indicate that noise is a factor to be considered in that slight interference with outdoor activities may occur. Conventional construction methods will eliminate most noise intrusions upon indoor activities. The noise contour boundaries used to determine the potential aircraft-related noise impacts at the Project site are found in the RC ALUCP and are presented in Table 4.10-9.

The Project site is partially located within the 60 to 65 dBA CNEL noise level contour boundaries of March ARB/IPA. Based on the RC ALUCP noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the RC ALUCP compatibility criteria, and no noise mitigation is required with typical building construction. Therefore, construction and operational noise impacts associated with exposing people residing or working within the vicinity of a public airport would be considered **less than significant**.

4.10.5 Mitigation Measures

No significant impacts would occur; therefore, no mitigation is required.

4.10.6 Level of Significance After Mitigation

No significant impacts would result from implementation of the proposed Project, and no mitigation is required.

4.11 TRANSPORTATION

This section describes the existing traffic/circulation setting of the K4 Warehouse and Cactus Channel Improvement Project (proposed Project or Project) site, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. The traffic analysis provided in this section is based on the information provided in the Traffic Impact Analysis (TIA) report, prepared by Urban Crossroads in April 2019 (Appendix R).

This section analyzes the potential of the proposed Project to conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system; conflict with an applicable congestion management program (CMP); substantially increase hazards due to a design feature or incompatible uses; result in inadequate emergency access; and conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

As mentioned in Chapter 2, Project Description, of this EIR, the Project includes the following components:

- **General Plan Amendment**: The Project site has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial (IND) for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger**: A parcel merger is required to merge the five separate parcels on the Project site into on 35.4-acre parcel.

4.11.1 Existing Conditions

This section provides a summary of the existing circulation network, the March JPA General Plan Circulation Network, and a review of existing peak-hour intersection operations, roadway segment operations, freeway mainline operations, and traffic signal warrant analyses.

The approximately 35.4-acre Project site is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west, to where Frederick Street terminates at Cactus Avenue on the east. The Project site is located within the March Joint Powers Authority (JPA) jurisdiction, which is within unincorporated Riverside County, California as

shown in Figure 2-1, Project Location. The Interstate 215 Freeway (I-215) is located approximately 0.8 miles east of the Project site.

Existing Circulation Network

The Project's study area includes a total of 25 existing and future intersections as shown in Figure 4.11-1, Study Area. Figure 4.11-2 and 4.11-3 identify the number of through traffic lanes for existing roadways and intersection traffic controls.

General Plan Circulation Element

The Project site is located within the March JPA (Northeast Planning Subarea), but the study area includes intersections that share borders with the neighboring jurisdictions of the County of Riverside, City of Riverside, City of Moreno Valley, and the California Department of Transportation (Caltrans).

March Joint Powers Authority (JPA)

The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the March JPA General Plan Circulation Element, are described subsequently. The March JPA General Plan Circulation Element (March JPA 1999) roadway classification map and roadway cross-sections are shown on Exhibits 3-2, and 3-3 in the Traffic Impact Analysis (TIA) (Appendix R). The March JPA is currently undergoing a General Plan Update, but the work effort associated with the General Plan Update had not been completed at the time of this analysis. March JPA Resolution 16-05 amended the General Plan Transportation Element. The roadway system classifications from the March JPA General Plan Circulation Element are shown on Exhibit 3-2 of the TIA.

County of Riverside, City of Riverside, and City of Moreno Valley

The roadway classifications and planned (ultimate) roadway cross-sections of the major roadways within the study area, as identified on the County of Riverside General Plan Circulation Element, City of Riverside General Plan Circulation Element, and City of Moreno Valley General Plan Circulation Element are shown on Exhibits 3-4 through 3-9 in Appendix R.

Truck Routes

The March JPA designated truck route map is shown on Exhibit 3-10 in Appendix R. I-215, Alessandro Boulevard (west of I-215), Meridian Parkway, Innovation Drive, Opportunity Way, Van Buren Boulevard, Krameria Avenue, Street Y, and Cactus Avenue are identified as designated truck routes. Truck traffic westbound onto Alessandro Boulevard from Meridian Parkway and San Gorgonio Drive is limited to local deliveries.

Transit Service

The study area within the March JPA and the surrounding Cities of Riverside and Moreno Valley are currently served by the Riverside Transit Authority (RTA), a public transit agency serving various jurisdictions within Riverside County. The existing bus routes provided within the Project area by RTA are shown on Exhibit 3-11 in the TIA (Appendix R).

RTA Route 20 operates along Alessandro Boulevard to the north of the Project site, providing access to RUHS Medical Center, Kaiser Permanente Hospital, Moreno Valley College, and the Moreno Valley/March Field Metrolink Station. Route 20 operates from 4:27 a.m. to 10:11 p.m. in the eastbound direction and from 3:53 a.m. to 10:54 p.m. in the westbound direction during weekday service. The route also offers weekend/holiday service ranging from approximately 7:00 a.m. to 9:30 p.m.

RTA Route 11 operates along Cactus Avenue northeast of the Project site, and Frederick Street north of the Project site, providing access to the Moreno Valley Mall, Moreno Valley High School, two middle schools, the Riverside County Superior Court, and Kaiser Medical Offices. The clockwise loop of Route 11 operates from 5:15 a.m. to 9:42 p.m., and the counterclockwise loop operates from 5:51 a.m. to 9:30 p.m. during weekday service. The route also offers weekend/holiday service ranging from approximately 7:30 a.m. to 8:30 p.m.

Transit service is reviewed and updated by RTA periodically to address ridership, budget, and community demand needs. Changes in land use can affect these periodic adjustments, which may lead to either enhanced or reduced service where appropriate.

The recently opened Moreno Valley/March Field Metrolink Station is located on Meridian Parkway, approximately 1.5 miles to the Project site. The Metrolink Perris Valley Line serves the Riverside area, providing access to the City of Perris, Riverside, Anaheim, and downtown Los Angeles. The Perris Valley Line also provides transfer service to the Riverside and Inland Empire – Orange County Metrolink Lines, and operates from 4:57 a.m. to 2:05 p.m. in the northbound direction and from 8:35 a.m. to 7:20 p.m. in the southbound direction at this station. Weekend and holiday service does not serve the Moreno Valley/March Field Station.

Bicycle and Pedestrian Facilities

Field observations conducted in May 2018 indicate nominal pedestrian and bicycle activity within the study area. Existing pedestrian facilities within the study area are shown on Exhibit 3-12 in the TIA (Appendix R). There are currently Class II bike lanes along Alessandro Boulevard northwest of the Project site; Elsworth Street between Alessandro Boulevard and Cactus Avenue; and, Cactus Avenue between Veterans Way and Heacock Street. Existing sidewalks are currently in place along both sides of Elsworth Street, Veterans Way, and Alessandro Boulevard. Cactus Avenue has existing sidewalks on the north side of the street.

Study Scenarios

The following study scenarios are included in the analysis of traffic conditions:

- **Existing Conditions**: Information for the Existing condition is disclosed to represent the baseline traffic conditions as they existed at the time the analysis was conducted in 2018.
- **Existing with Project Conditions**: This scenario analyzes existing traffic conditions with trips added due to the Project. The Existing with Project analysis is intended to identify the Project-specific traffic impacts associated solely with the development of the Project based on a comparison of the Existing with Project Conditions to Existing conditions. As such, Existing with Project Conditions were evaluated for each phase of development to determine the Project-specific traffic impacts associated with each phase.
- **Opening Year Cumulative (2023) Conditions**: The Opening Year Cumulative condition analyses identifies potential near-term cumulative circulation system deficiencies in year 2023. To account for background traffic growth, an ambient growth factor and traffic associated with other cumulative Projects were added to existing traffic volumes. With and without Project conditions were compared to isolate Project related impacts.
- **Horizon Year Traffic (2040) Conditions**: The Horizon Year (buildout year 2040) traffic volume forecasts were derived from the Riverside County Transportation Analysis Model (RivTAM) using accepted procedures for model forecast refinement and smoothing. Horizon Year with Project traffic was determined by adding the Project traffic to the Horizon Year without Project forecasts from the RivTAM model.

The traffic impacts for those conditions outlined above are based on weekday AM (7:00 a.m. to 9:00 a.m.) and PM (4:00 p.m. to 6:00 p.m.) peak period traffic volumes collected in May 2018 in the study area. The weekday AM and PM peak commute hours represent the highest overall hourly volumes in the study area (during the AM and PM peak periods), while the remaining off-peak hours would have lower overall traffic volumes. All four representative agencies (March JPA, cities of Moreno Valley and Riverside, and Riverside County) require that project traffic impacts be based on traffic conditions during the weekday AM and PM peak hours.

Study Area

A traffic study scoping agreement was reviewed and approved by March JPA staff prior to the preparation of the TIA. The traffic study scoping agreement provided an outline of the Project's study area, trip generation, trip distribution, and analysis methodology. This agreement is included in Appendix 1.1 of the TIA (Appendix R).

Intersections

The 25 study area intersections, shown in Figure 4.11-1 and listed in Table 4.11-1, were selected for analysis based on consultation with March JPA and City of Moreno Valley staff. In general, the study area includes intersections where the Project is anticipated to contribute 50 or more peak-hour trips. Table 4.11-1 also indicates whether an intersection is part of the CMP, described further in Section 4.11.2, Methodology.

Table 4.11-1
Intersection Analysis Locations

CMP = Congestion Management Program
JPA = March Joint Powers Authority

Freeway Mainline Segments

The Project's study area freeway mainline analysis was performed under the Highway Capacity Manual (TRB 2010) methodology for the Basic Freeway Segments utilizing actual vehicle traffic

volumes, where heavy trucks were accounted for as a percentage of total traffic. Table 4.11-2 shows the study freeway mainline segments, in each direction of flow, that were analyzed.

Table 4.11-2
Freeway Mainline Segment Analysis Locations

ID	Freeway Mainline Segments
1	I-215 Freeway – southbound, north of Cactus Avenue
2	I-215 Freeway – southbound, south of Cactus Avenue
3	I-215 Freeway – northbound, north of Cactus Avenue
4	I-215 Freeway – northbound, south of Cactus Avenue

Source: Appendix R.

Freeway Merge/Diverge Ramp Junctions

The study area freeway merge/diverge ramp junction analysis was also performed under the Highway Capacity Manual (TRB 2010) methodology for the freeway merge/diverge ramp locations, and direction of flow, listed below in Table 4.11-3.

Table 4.11-3
Freeway Merge/Diverge Ramp Junction Analysis Locations

ID	Freeway Merge/Diverge Ramp Junctions
1	I-215 Freeway – southbound, off-ramp at Cactus Avenue (diverge)

3	I-215 Freeway – southbound, on-ramp at Cactus Avenue (merge)
4	I-215 Freeway – northbound, on-ramp at Cactus Avenue (merge)
5	I-215 Freeway – northbound, loop on-ramp at Cactus Avenue (merge)
6	I-215 Freeway – northbound, off-ramp at Cactus Avenue (diverge)

Source: Appendix R.

Traffic Signal Warrant Analysis

The term "signal warrants" refers to the list of established criteria in the *California Manual of Uniform Traffic Control Devices* (CA MUTCD) used by Caltrans and other public agencies to quantitatively assess the need for traffic signal installation at an unsignalized intersection. The future intersection of Meridian Parkway/Street A (under March JPA jurisdiction) has been assessed for the need for signalization.

Existing Conditions Traffic

The analysis results of Existing Conditions is presented below. Traffic operations of roadway facilities are described using the term "level of service" (LOS). Section 4.11.2 describes the analysis methodologies in detail.

Traffic Volumes

As previously mentioned, the existing intersection LOS analysis is based on the weekday AM and PM peak hour traffic volumes collected in May 2018. Consistent with standard traffic engineering practice, these traffic counts were conducted either on Tuesday, Wednesday, or Thursday due to potential fluctuations in traffic that typically occur on Mondays, Fridays, holidays, or weekends. There were no observations made in the field that would indicate atypical traffic conditions on the count dates, such as construction activity or detour routes. In addition, nearby schools were in session and operating on normal schedules. The traffic counts include the following vehicle classifications: passenger cars, 2-axle trucks, 3-axle trucks, and 4- or more axle trucks.

To represent the impact of large trucks, buses, and recreational vehicles on traffic flow, truck traffic has been accounted for in the analysis as a percentage of total traffic at the study area intersections. The traffic volumes utilized in the analysis of intersections, basic freeway segments, and merge/diverge ramp junctions utilize the actual vehicle traffic flow, and trucks are reflected in the analysis as a percentage of the total traffic flow, and not as passenger-car equivalents (PCE).

Existing weekday average daily traffic (ADT) volumes on arterial highways throughout the study area are shown in Figure 4.11-4. Where 24-hour tube count data was not available, existing ADT volumes were based upon factored intersection peak hour counts. Existing weekday AM and weekday PM peak-hour intersection volumes (in actual vehicles) are shown in Figure 4.11-5.

Intersection Operations

Existing peak-hour traffic operations have been evaluated for the study area intersections based on the intersection analysis methodology presented in Section 4.11.2 of this chapter. The intersection operations analysis worksheets are provided in Appendix R. The intersection operations analysis results are provided in Table 4.11-4 and shown in Figure 4.11-6, Existing (2018) Summary of LOS, which indicate that the following study area intersections are currently operating at an unsatisfactory LOS (LOS E or F) during one or both peak hours:

- Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard – LOS F AM and PM peak hours
- Mission Grove Parkway/Alessandro Boulevard – LOS E AM peak hour
- Sycamore Canyon Boulevard/Alessandro Boulevard – LOS E AM peak hour
- Elsworth Street/Cactus Avenue – LOS F AM and PM peak hours

The deficiencies at Overlook Parkway/Canyon Crest Drive and Alessandro Boulevard are caused by minimum green times necessary for pedestrian crossing time. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at both these intersections (also validated by peak hour count data).

Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS).
1 CSS = cross-street stop; TS = traffic signal
2 Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

Traffic Signal Warrants

Traffic signal warrants are based on existing peak hour intersection approach volumes. Based on the warrants, the only existing unsignalized intersection in the study area, Meridian Parkway/Innovation Drive, does not currently warrant a traffic signal. The analysis worksheets are provided in Appendix R.

Off-Ramp Queuing Analysis

A queuing analysis was performed for the off-ramps at the I-215/Cactus Avenue interchange to assess vehicle queues of the off-ramps that may potentially result in deficient peak hour operations at the ramp-to-arterial intersections, and may potentially "spill back" onto the I-215 mainline. The queuing analysis findings are presented in Table 4.11-5. It is important to note that off-ramp lengths are consistent with the measured distance between the intersection and the freeway mainline. Analysis worksheets are provided in Appendix R.

Table 4.11-5
Existing Conditions Peak-Hour Freeway Off-Ramp Queuing

Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet)[1]		Satisfactory?[2]	
			AM	*PM*	*AM*	*PM*
I-215 SB ramps/Cactus Avenue	SBR	1,115	128	0	Yes	Yes
	NBR	1,850	0	0	Yes	Yes
I-215 NB ramps/Cactus Avenue	NBL	145	541[4]	45	Yes[3]	Yes
	NBT/R	1,650	294	54	Yes	Yes

Source: Appendix R.
SBL = southbound left turn lane; SBR = southbound right turn lane; NBL = northbound left turn lane; NBR = northbound right turn lane
1 Maximum queue length for the approach reported

2 Stacking Distance is satisfactory if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking, which is assumed to be provided in the transition for turn pockets, is reflected in the stacking distance shown in this table, where applicable.
3 Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 mainline.
4 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

As shown on Table 4.11-5, there are no existing queues that spill onto the I-215 mainline. While the AM peak hour queue (541 feet) at the northbound left-turn lane of the off-ramp exceeds the 145 foot storage lane, that queue combined with the queue (294 feet) of the shared through plus right-turn lane, on a single off-ramp lane, would not spillover to the I-215 mainline.

Basic Freeway Segment Analysis

Existing mainline directional volumes for the weekday AM and PM peak hours are shown in Figure 4.11-7. As provided in Table 4.11-6, the basic freeway segments analyzed were found to operate at a satisfactory LOS (LOS D or better) during the peak hours. Analysis worksheets are provided in Appendix R. However, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the PM peak hour, and the I-215 northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

Table 4.11-6
Existing Conditions Freeway Segment Analysis

Freeway	Direction	Mainline Segment	Lanes[2]	Volume		Truck %	Truck %	Density[3]		LOS	
				AM	*PM*	*AM*	*PM*	*AM*	*PM*	*AM*	*PM*
I-215	SB	north of Cactus Avenue	4	3,766	3,120	3%	3%	15.1	--[4]	B	**F**
		south of Cactus Ave	4	3,600	3,476	2%	2%	14.3	--[4]	B	**F**
	NB	north of Cactus Avenue	4	1,954	3,377	3%	3%	--[4]	--[4]	**F**	**F**
		south of Cactus Ave	4	3,446	3,606	2%	2%	--[4]	--[4]	**F**	**F**

Source: Appendix R.
Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS).
1 NB = Northbound; SB = Southbound
2 Number of lanes are in the specified direction and are based on existing conditions.
3 Density is measured by passenger cars per mile per lane (pc/mi/ln).
4 Observations made in field indicate that the freeway segments experience traffic congestion due to queuing from downstream bottlenecks.

Freeway Merge/Diverge Analysis

Ramp merge and diverge operations were also evaluated based on the HCM freeway merge/diverge analysis methodology presented in Section 4.11.2 of this chapter. As shown in

Table 4.11-7, the freeway ramps currently operate at LOS D or better. Existing freeway ramp junction operations analysis worksheets are provided in Appendix R. However, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the AM peak hour, and the I-215 northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

Table 4.11-7
Existing Conditions Freeway Ramp Junction Merge/Diverge Analysis

Freeway	Direction	Ramp or Segment	Lanes on Freeway[2]	AM Peak Hour		PM Peak Hour	
				Density[3]	*LOS*	*Density*[3]	*LOS*
I-215	SB	off-ramp at Alessandro Boulevard	4	15.4	B	--[4]	**F**
		off-ramp at Cactus Avenue	4	16.1	C	--[4]	**F**
		on-ramp at Cactus Avenue	3	21.0	C	--[4]	**F**
	NB	on-ramp at Alessandro Boulevard	3	--[4]	**F**	--[4]	**F**
		loop on-ramp at Cactus Ave – downstream	3	--[4]	**F**	--[4]	**F**
		loop on-ramp at Cactus Ave – upstream	3	--[4]	**F**	--[4]	**F**

Source: Appendix R.
Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS).
1 NB = Northbound; SB = Southbound
2 The number of lanes on the freeway prior to the merge with on-ramp is used in the analysis. Number of lanes are in the specified direction and are based on existing conditions.
3 Density is measured by passenger cars per mile per lane (pc/mi/ln).
4 Observations made in field indicate that the freeway segments experience traffic congestion due to queuing from downstream bottlenecks.

4.11.2 Methodology

This section summarizes the methodologies used to perform the traffic analyses. The methodologies described are consistent with March JPA traffic study guidelines. Study locations and study scenarios are discussed in Section 4.11.1, Existing Conditions.

Level of Service

Traffic operations of roadway facilities are described using LOS. LOS is a qualitative description of traffic flow based on several factors, including speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

Intersection Analysis

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The March JPA, City of Riverside, City of Moreno Valley, and County of Riverside require signalized and unsignalized intersection operations analysis to be based on the methodology described in the Highway Capacity Manual (HCM).

Signalized Intersections

Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections, LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as provided in Table 4.11-8.

Study area intersections, including freeway ramps, located within the March JPA, City of Riverside, City of Moreno Valley and Caltrans jurisdiction have been analyzed using the software package Synchro (Version 10). Synchro is a traffic software program that is based on the signalized intersection capacity analysis as specified in the HCM. Common practice for LOS analysis is to use a peak 15-minute rate of flow. Therefore, the peak-hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15 minute volumes. Signal timing for the freeway arterial-to-ramp intersections was obtained from Caltrans District 8.

Table 4.11-8
Signalized Intersection LOS Thresholds

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths	80.01 and up	F

Source: HCM 2010.
V/C = volume to capacity ratio

Unsignalized Intersections

The LOS rating is based on the weighted average control delay expressed in seconds per vehicle, as shown in Table 4.11-9. At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. For all-way stop controlled intersections, LOS is computed for the intersection as a whole.

Table 4.11-9
Unsignalized Intersection Level of Service Thresholds

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service
Little or no delay	0 to 10.00	A
Short traffic delay	10.01 to 15.00	B
Average traffic delay	15.01 to 25.00	C
Long traffic delay	25.01 to 35.00	D
Very long traffic delay	35.01 to 50.00	E
Extreme traffic delays with intersection capacity exceeded	> 50.00	F

Source: HCM 2010.

Freeway Off-Ramp Queuing Analysis

Consistent with Caltrans requirements, the 95th percentile queuing of vehicles has been assessed at the study area off-ramps to determine potential queuing impacts at the freeway ramp intersections. Specifically, the queuing analysis is used to identify any potential queuing and spill-back onto the I-215 mainline from the off-ramps.

Traffic Signal Warrant Analysis

The term "signal warrants" refers to the list of established criteria used by Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This traffic analysis uses the signal warrant criteria presented in the latest edition of the *California Manual on Uniform Traffic Control Devices* (CA MUTCD) for all unsignalized study area intersections. Existing and future unsignalized intersections that provide access to the Project were assessed for the potential need for new traffic signals based on ADT volumes and the Caltrans planning level ADT-based signal warrant analysis worksheets.

Note that a signal warrant defines only one condition (traffic volumes) of several conditions under which the installation of a traffic signal might be warranted. Meeting this threshold does not require that a traffic control signal be installed at a particular location, but, rather, that other traffic factors and conditions be

evaluated to determine whether the signal is truly justified. Signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above satisfactory LOS, or vice-versa, operate below satisfactory LOS and not meet a signal warrant.

Freeway Mainline Segment Analysis

The specific freeway mainline segments that were analyzed were discussed with the March JPA traffic consultant during the TIA scoping process and is consistent with previous traffic studies in prepared for the March JPA. Freeway analysis locations were included in the approved scoping document dated June 6, 2018. Consistent with recent March JPA guidance, and because impacts to freeway segments dissipate with distance from the point of State Highway System (SHS) entry, quantitative study of freeway segments beyond those immediately adjacent to the point of entry is not required.

The freeway segments were evaluated based on peak-hour directional volumes. The freeway segment analysis is based on the methodology described in the HCM and performed using HCS7 software. The performance measure preferred by Caltrans to calculate LOS is density. Density is expressed in terms of passenger cars per mile per lane. Table 4.11-10 provides a summary of the freeway segment LOS descriptions for each density range.

Table 4.11-10
Description of Freeway Mainline Level of Service

Level of Service	Description	Density Range (pc/mi/ln)
A	Free-flow operations in which vehicles are relatively unimpeded in their ability to maneuver within the traffic stream. Effects of incidents are easily absorbed.	0.0–11.0
B	Relative free-flow operations in which vehicle maneuvers within the traffic stream are slightly restricted. Effects of minor incidents are easily absorbed.	11.1–18.0
C	Travel is still at relative free-flow speeds, but freedom to maneuver within the traffic stream is noticeably restricted. Minor incidents may be absorbed, but local deterioration in service will be substantial. Queues begin to form behind significant blockages.	18.1–26.0
D	Speeds begin to decline slightly and flows and densities begin to increase more quickly. Freedom to maneuver is noticeably limited. Minor incidents can be expected to create queuing as the traffic stream has little space to absorb disruptions.	26.1–35.0
E	Operation at capacity. Vehicles are closely spaced with little room to maneuver. Any disruption in the traffic stream can establish a disruption wave that propagates throughout the upstream traffic flow. Any incident can be expected to produce a serious disruption in traffic flow and extensive queuing.	35.1–45.0
F	Breakdown in vehicle flow.	>45.0

Source: HCM, 2010.
pc/mi/ln = passenger cars per mile per lane.

The number of lanes for the baseline conditions was obtained from field observations conducted in May 2018. These existing freeway geometrics were used for all analysis scenarios.

I-215 mainline volume data was obtained from the Caltrans Performance Measurement System (PeMS) website for the I-215 segments. The data is from May 2018. In addition, truck traffic, represented as a percentage of total traffic, has been used in an effort to not overstate traffic volumes and peak-hour deficiencies. As such, actual vehicles (as opposed to PCE volumes) have been used for the purposes of the freeway segment analysis.

Freeway Merge/Diverge Ramp Junction Analysis

The freeway system in the study area was broken into segments defined by freeway-to-arterial interchange locations, resulting in three existing on- and off-ramp locations. Although the HCM indicates the influence area for a merge/diverge junction is 1,500 feet, the analysis was performed at all ramp locations with respect to the nearest on- or off-ramp at each interchange to be consistent with Caltrans guidance and comments received on similar Projects in the region.

The merge/diverge analysis is based on the HCM Ramps and Ramp Junctions analysis method and performed using HCS7 software. The measures of effectiveness (reported in passenger car/mile/lane) are calculated based on the existing number of travel lanes, number of lanes at the on- and off-ramps both at the analysis junction and at upstream and downstream locations (if applicable) and acceleration/deceleration lengths at each merge/diverge point. Table 4.11-11 provides a summary of the merge/diverge area LOS descriptions for each density range used.

Table 4.11-11
Description of Freeway Merge/Diverge Level of Service

Level of Service	Density Range (pc/mi/ln)
A	≤10.0
B	10.0 – 20.0
C	20.0 – 28.0
D	28.0 – 35.0
E	>35.0
F	Demand Exceeds Capacity

Source: HCM, 2010.
pc/mi/ln = passenger cars per mile per lane.

Project Fair Share Calculation Methodology

In cases where this traffic analysis identifies that the proposed Project would contribute additional traffic volumes to cumulative traffic deficiencies, Project fair share costs of improvements necessary to address deficiencies were identified. The Project's fair share cost of improvements is determined based on the following equation, which is the ratio of Project traffic to total future (Horizon Year) traffic:

Project Fair Share % = Project Traffic/2040 Total Traffic

4.11.3 Relevant Plans, Policies, and Ordinances

The following section describes regulations, plans, policies, and ordinances relevant to the study area. These include policies or regulations regarding minimum LOS standards. State, regional, and local regulations are described. There are no traffic-specific federal regulations applicable to the Project. A summary of minimum LOS standards as applicable to the Project is provided in Section 4.11.4, Thresholds of Significance.

State

Senate Bill 743

On September 27, 2013, Governor Brown signed SB 743, which became effective on January 1, 2014. The purpose of SB 743 is to streamline the review under the California Environmental Quality Act (CEQA) process for several categories of development projects including the development of infill projects in transit priority areas and to balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions. SB 743 adds Chapter 2.7: Modernization of Transportation Analysis for Transit Oriented Infill Projects to the CEQA Statute (Section 21099). Section 21099(d)(1) provides that aesthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment. In addition, SB 743 mandates that alternative metric(s) for determining impacts relative to transportation shall be developed to replace the use of LOS in CEQA documents.

Currently, environmental review of transportation impacts focuses on the delay that vehicles experience at intersections and on roadway segments, which is often measured using LOS. Mitigation for impacts on vehicular delay often involves increasing capacity such as widening a roadway or the size of an intersection, which in turns encourages more vehicular travel and greater pollutant emissions. Additionally, improvements to increase vehicular capacity can often discourage alternative forms of transportation such as biking and walking. SB743 directs the office of Planning and Research (OPR) to develop an alternative metric(s) for analyzing transportation impacts in CEQA document. The alternative shall promote the state's goals of reducing greenhouse gas emissions and traffic-related air pollution, promoting the development of multimodal transportation system, and providing clean, efficient access to destinations. Under SB 743, it is anticipated that the focus of transportation analysis will shift from vehicle delay to vehicle miles traveled (VMT) within transit priority areas (i.e., areas well served by transit).

Pursuant to SB743, OPR released the draft revised CEQA Guidelines in November 2017, recommending the use of vehicles miles traveled (VMT) for analyzing transportation impacts. Additionally, OPR released Updates to Technical Advisory on Evaluating Transportation Impacts

in CEQA, to provide guidance on VMT analysis. In this Technical Advisory, OPR provides its recommendations to assist lead agencies in screening out projects from VMT analysis and selecting a significance threshold that may be appropriate for their particular projects. While OPR's Technical Advisory is not binding on public agencies, CEQA allows lead agencies to "consider thresholds of significance... recommended by other public agencies, provided the decision to adopt those thresholds is supported by substantial evidence." (CEQA Guidelines, § 15064.7, subd. (c).)

In December 2018 CEQA Guidelines were updated to add new section 15064.3 "Determining the Significance of Transportation Impacts" that describes specific considerations for evaluating a project's transportation impacts using the VMT methodology. This new methodology is required to be used for projects beginning on July 1, 2020. This new CEQA Guideline section applies prospectively, meaning that projects such as the proposed Project are not currently required to incorporate VMT as the primary transportation impact metric.

Sustainable Communities Strategies: Senate Bill 375

The Sustainable Communities and Climate Protection Act of 2008 (Sustainable Communities Act, Senate Bill (SB) 375, Chapter 728, Statutes of 2008) supports the state's climate action goals to reduce greenhouse gas emissions through coordinated transportation and land use planning with the goal of more sustainable communities. Under the Sustainable Communities Act, the California Air Resources Board (ARB) sets regional targets for greenhouse gas emissions reductions from passenger vehicle use. In 2010, ARB established these targets for 2020 and 2035 for each region covered by one of the state's metropolitan planning organizations (MPO). ARB will periodically review and update the targets, as needed.

Each of California's MPOs must prepare a sustainable communities strategy (SCS) as an integral part of its regional transportation plan (RTP). The SCS contains land use, housing, and transportation strategies that, if implemented, would allow the region to meet its greenhouse gas emission reduction targets. Once adopted by the MPO, the RTP/SCS guides the transportation policies and investments for the region. ARB must review the adopted SCS to confirm and accept the MPO's determination that the SCS, if implemented, would meet the regional greenhouse gas targets. If the combination of measures in the SCS would not meet the regional targets, the MPO must prepare a separate alternative planning strategy (APS) to meet the targets. The APS is not a part of the RTP.

The Sustainable Communities Act also establishes incentives to encourage local governments and developers to implement the SCS or the APS. Developers can get relief from certain environmental review requirements under the California Environmental Quality Act (CEQA) if their new residential and mixed-use Projects are consistent with a region's SCS (or APS) that meets the targets (see Cal. Public Resources Code Sections 21155, 21155.1, 21155.2, 21159.28.).

Caltrans

Based on guidance from Caltrans, the LOS for operating state highway facilities is based on Measures of Effectiveness (MOE) identified in the HCM (Caltrans 2002). Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on state highway facilities; however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing state highway facility is operating at less than this target LOS, the existing MOE should be maintained. In general, the region-wide goal for a satisfactory LOS on all freeways, roadways segments, and intersections is D. For undeveloped or not densely developed locations, the goal may be to achieve LOS C. For the purposes of this study the LOS standard of D is used. The Caltrans facilities studied provide access to well developed or quickly developing areas and therefore it was found that a standard of D is more appropriate. Per Caltrans guidance, at locations that are already operating at deficient LOS (E or F) an impact occurs if 50 or more peak-hour trips are added (Caltrans 2002).

Regional

Southern California Association of Governments (SCAG)

The Southern California Association of Governments (SCAG) develops the Regional Transportation Plan (RTP), which presents the transportation vision for Los Angeles, Orange, San Bernardino, Imperial, Riverside, and Ventura Counties. SB 375 was enacted to reduce greenhouse gas emissions from automobiles and light trucks through integrated transportation, land use, housing and environmental planning. Under the law, SCAG is tasked with developing a Sustainable Communities Strategy (SCS), an element of the Regional Transportation Plan (RTP) that provides a plan for meeting emissions reduction targets set forth by the California Air Resources Board.

The 2016 RTP/SCS identifies priorities for transportation planning within the Southern California region, sets goals and policies, and identifies performance measures for transportation improvements to ensure that future Projects are consistent with other planning goals for the area (SCAG 2016). The RTIP, also prepared by SCAG based on the RTP, lists all of the regional funded/programmed improvements within the next 7 years. To qualify for CEQA streamlining benefits under SB 375, a Project must be consistent with the RTP/SCS.

County of Riverside Congestion Management Program

The passage of Proposition 111 in June 1990 established a process for each metropolitan county in California that has an urbanized area with a population over 50,000 (which would include the County of Riverside) to prepare a CMP. Additionally, the passage of Proposition 111 provided additional transportation funding through a $0.09 per gallon increase in the state gas tax. The Riverside County Transportation Commission (RCTC) was designated as the CMA in 1990, and therefore, prepares the CMP updates.

Although implementation of the CMP was made voluntary by the passage of AB 2419, the CMP requirement has been retained in all five urbanized counties within the SCAG region. In addition to their value as a transportation management tool, CMPs have been retained in these counties because of the federal Congestion Management System requirement that applies to all large, urban areas that are not in attainment of federal air quality standards. These counties recognize that the CMP provides a mechanism through which locally implemented programs can fulfill most aspects of a regional requirement that would otherwise have to be addressed by the regional agency (for the County of Riverside, SCAG).

The most recent CMP that was prepared by the RCTC was developed in consultation with the county and cities in Riverside County and is an effort to more directly align land use, transportation, and air quality management efforts and to promote reasonable growth management programs that effectively use statewide transportation funds while ensuring that new development pays its fair share of needed transportation improvements (RCTC 2011).

Per the CMP-adopted LOS standard of E, when a CMP facility falls to LOS F, a deficiency plan is required. Preparation of a deficiency plan would be the responsibility of the local agency where the deficiency is located. Other agencies identified as contributors to the deficiency would also be required to coordinate with the development of the plan. The plan must contain mitigation measures, including transportation demand management strategies and transit alternatives, and a schedule of mitigating the deficiency. To ensure that the Congestion Management System is appropriately monitored to reduce the occurrence of CMP deficiencies, it is the responsibility of local agencies, when reviewing and approving development proposals, to consider the traffic impacts on the Congestion Management System.

Transportation Uniform Mitigation Fee (TUMF)

The Western Riverside Council of Governments (WRCOG) is responsible for establishing and updating the Transportation Uniform Mitigation Fee (TUMF) program. TUMF is a multijurisdictional impact fee program that funds transportation improvements on a regional and sub-regional basis associated with new growth. All new development in each of the participating jurisdictions is subject to TUMF, based on the proposed intensity and type of development. TUMF fees are submitted by the applicant and are passed on to WRCOG as the ultimate program administrator. TUMF funds are distributed on a formula basis to the regional, local, and transit components of the program. March JPA participates in the TUMF program.

TUMF identifies a network of backbone and local roadways that are needed to accommodate growth through 2035. This regional program was put into place to ensure that development pays its fair share and that funding is in place for construction of facilities needed to maintain the requisite level of service critical to mobility in the region. TUMF fees and other applicable fair

share contributions are collected as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the Projected vehicle trip increases.

The TUMF program is based upon a regional Nexus Study completed in early 2003 and updated in 2009 to address major changes in right of way acquisition and improvement cost factors. An update to the WRCOG TUMF Nexus Study is anticipated in early 2017.

Local

March JPA

Based on the March JPA Traffic Impact Study Preparation Guide (March JPA 2011), all intersections and roadway segments within the March JPA Planning Area shall operate at LOS D or better with limiting circumstances of LOS E to occur. LOS E may also be allowed to the extent that would support transit-oriented development (TOD) and walkable communities. A lower LOS in TOD environments encourages people to shift from dependency on single occupancy vehicles to use of public transit and other modes of transportation. This is acceptable in TOD environments because alternative modes of transportation are readily accessible and are more convenient than in non-TOD land use environments. LOS E is also acceptable during peak hours at interchange ramp intersections where ramp metering occurs. The Project is not proposed to be a TOD and neither the Alessandro Boulevard nor Cactus Avenue on-ramps are currently metered; as such, the minimum LOS used for the purposes of this analysis is LOS D.

General Plan

The Transportation Element of the March JPA General Plan includes goals and policies related to transportation. The following goals and polices are from the March JPA General Plan that apply to the Project.

Policy 2.1: March JPA shall balance the need for free traffic flow with economic realities and environmental and aesthetic consideration, such that transportation facilities are capable of normal patterns and volume, with tolerance of peak and high level usage with minimal disruption, delays or impacts.

Policy 2.6: FAA standards, military AICUZ, and appropriate Comprehensive Land Use Plan for March Airfield shall be upheld and supported to encourage and realize a safe environment in and around the aviation field.

Policy 2.7: On-street parking shall be de-emphasized throughout the planning area to permit maximum capacity of roadways to be actuated by vehicular and bicycle transportation modes.

Policy 3.5: Driveway entrances onto surrounding arterial highways, major and minor arterials streets should be redistricted when practical, and through traffic on interior streets should be minimized.

Policy 4.3: Arterial roads should carry both local and through traffic and be planned and improved to maintain a Level of Service "D" or better with limiting circumstances of Level of Service "E" to occur.

Policy 4.4: Through traffic planning, measures should be implemented to alleviate direct impacts to adjoining jurisdictions which decrease roadway function Level of Service below the jurisdiction's adopted accepted Level of Service, as appropriate.

Policy 4.5: Require the dedication and improvement of arterial roadways prior to the issuance of certificates of occupancy.

Goal 6: Establish vehicular access control policies in order to maintain and insure the effectiveness and capacity of arterial roadways.

Policy 6.1: To the extent possible, access shall be provided on local or collector streets where the frontage is available on both local and arterials streets.

Policy 6.2: Access to an arterial road shall be limited to one point for every 300 feet of frontage or one point for parcels with less than 300 feet of frontage.

Policy 6.4: For corner lots, whenever possible, vehicular access points on arterial roadways shall be located a minimum of 300 feet from the centerline of the intersection.

Policy 8.8: Require the installation of bus improvements such as bus turnouts, bus stops, and terminals as part of the conditions of development for employment centers and land uses that attract large numbers of persons, where appropriate.

Goal 9: Develop measures which will reduce the number of vehicle miles traveled during peak travel periods.

Goal 10: Regulate the travel of trucks on March JPA Planning Area streets.

Policy 10.1: Establish a truck route system which designates truck commercial vehicle routes and provides adequately sized and designated roadways to meet the needs of trucks and commercial vehicles. This will eliminate truck and commercial vehicle traffic through inappropriate areas of the March JPA Planning Area.

Goal 12: Plan for and seek to establish an area-wide system of bicycling trails, with linkages within the planning area and with adjacent jurisdictions, and in compliance with sub-regional plans.

Policy 12.5: Provide adequate right-of-way and improvements for bike lanes in accordance with the Transportation Plan.

Policy 12.7: Require sidewalks on both sides of the all streets. The March JPA encourages alternate designs including parkways and meandering and enhanced paving.

Goal 15: In accordance with state and federal law, promote and provide mobility for the disabled.

Policy 15.1: Require that all development comply with the requirements of the state and federal law for the disabled. Requirements may include ramps at street corners, access to public buildings, traffic signal timing and the like.

City of Riverside

The City of Riverside General Plan states the City will strive to maintain LOS D or better on arterial streets wherever possible (City of Riverside 2007). At some key locations, such as City arterial roadways, which are used as freeway bypass by regional through traffic and at heavily traveled freeway intersections, LOS E may be acceptable as determined on a case-by-case basis. These situations may include roadways where capacity expansion is not feasible or would not mitigate the congestion. Locations that may warrant the LOS E standard include portions of Arlington Avenue/Alessandro Boulevard, Van Buren Boulevard throughout the City, portions of La Sierra Avenue, and selected freeway interchanges. However, the General Plan does not specify which portions of these roadways segments are acceptable to operate at LOS E. A higher standard, such as LOS C or better, may be adopted for Local and Collector streets in residential areas. The City recognizes that along key freeway feeder segments during peak commute hours, LOS F may be expected due to regional travel patterns.

For the purposes of this study, LOS D was used as the standard as it is consistent with the policies and practices in other cities and the March JPA and it is the highest standard applicable to non-residential areas.

General Plan

The Circulation Element of the City of Riverside General Plan includes goals and policies that apply to the Project related to transportation (City of Riverside 2007).

Policy CCM-2.3: Maintain LOS D or better on Arterial Streets wherever possible. At key locations, such as City Arterials that are used by regional freeway bypass traffic and at heavily traveled freeway interchanges, allow LOS E at peak hours as the acceptable standard on a case-by-case basis.

Policy CCM-2.7: Limit driveway and local street access on Arterial Streets to maintain a desired quality of traffic flow. Wherever possible, consolidate driveways and implement access controls during redevelopment of adjacent parcels. Policy CCM-5.7 Work with Riverside County and as a member of the March Joint Powers Authority to ensure adequate circulation within the JPA jurisdictional area and around Riverside National Cemetery.

City of Moreno Valley

The City of Moreno Valley General Plan states that LOS C should be maintained wherever possible and LOS D in the vicinity of State Route 60 and high employment centers. Figure 9-2 of the General Plan indicates which standard should be used for each roadway (City of Moreno Valley 2006). All of the study intersections located in the City of Moreno Valley are on roadways with a LOS standard of D. Therefore, for the purposes of this study LOS D is the standard used of intersections in the City of Moreno Valley.

General Plan

The Circulation Element of the City of Moreno Valley General Plan includes goals objectives, and policies related to transportation and traffic that apply to the Project related to transportation and traffic.

Policy 5.1.1: Plan access and circulation of each development Project to accommodate vehicles (including emergency vehicles and trash trucks), pedestrians, and bicycles.

Policy 5.1.3: Require adequate off-street parking for all developments.

Policy 5.1.4: Driveway placement shall be designed for safety and to enhance circulation wherever possible.

Policy 5.1.6: Design new developments to provide opportunity for access and circulation to future adjacent developments.

Objective 5.3: Maintain Level of Service (LOS) "C" on roadway links, wherever possible, and LOS "D" in the vicinity of SR 60 and high employment centers. Figure 9-2 depicts the LOS standards that are applicable to all segments of the General Plan Circulation Element Map.

Policy 5.3.5: Ensure that new development pays a fair share of costs to provide local and regional transportation improvements and to mitigate cumulative traffic impacts. For this purpose, require new developments to participate in Transportation Uniform Mitigation Fee Program (TUMF), the Development Impact Fee Program (DIF) and any other applicable transportation fee programs and benefit assessment districts.

Policy 5.5.8: Whenever possible, require private and public land developments to provide on-site and off-site improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development Project shall be undertaken to identify Project impacts to the circulation system. The City may require developers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.

Policy 5.11.2: Driveways shall be designed to avoid conflicts with pedestrian and bicycle travel.

County of Riverside

The Circulation Element of the County of Riverside General Plan includes policies related to traffic that require County facilities to maintain LOS C, except in certain Area Plans and Community Development Areas where LOS D is the standard that should be maintained. Intersections in the study area that fall under County of Riverside jurisdiction are within the Community Development Areas of Mead Valley and Lake Mathews/Woodcrest. These Community Development Areas are required to maintain the LOS standard of D (County of Riverside 2016). As such, LOS D is used as the standard for intersections located under the jurisdiction of the County.

Policy C 2.1: The following minimum target levels of service have been designated for the review of development proposals in the unincorporated areas of Riverside County with respect to transportation impacts on roadways designated in the Riverside County Circulation Plan (Figure C-1) which are currently County maintained, or are intended to be accepted into the County maintained roadway system:

LOS C shall apply to all development proposals in any area of the Riverside County not located within the boundaries of an Area Plan, as well those areas located within the following Area Plans: REMAP, Eastern Coachella Valley, Desert Center, Palo Verde Valley, and those non- Community Development areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans.

LOS D shall apply to all development proposals located within any of the following Area Plans: Eastvale, Jurupa, Highgrove, Reche Canyon/Badlands, Lakeview/Nuevo, Sun City/Menifee Valley, Harvest Valley/Winchester, Southwest Area, The Pass, San Jacinto Valley, Western Coachella Valley and those Community Development Areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans. LOS E may be allowed by the Board of Supervisors within designated areas where transit oriented development and walkable communities are proposed.

Notwithstanding the forgoing minimum LOS targets, the Board of Supervisors may, on occasion by virtue of their discretionary powers, approve a Project that fails to meet these LOS targets in order to balance congestion management considerations in relation to benefits, environmental impacts and costs, provided an Environmental Impact Report, or equivalent, has been completed to fully evaluate the impacts of such approval. Any such approval must incorporate all feasible mitigation measures, make specific findings to support the decision, and adopt a statement of overriding considerations. (AI 3)

Policy C 2.2: Require that new development prepare a traffic impact analysis as warranted by the Riverside County Traffic Impact Analysis Preparation Guidelines or as approved by the Director of Transportation. Apply level of service targets to new development per the Riverside County Traffic Impact Analysis Preparation Guidelines to evaluate traffic impacts and identify appropriate mitigation measures for new development. (AI 3)

Policy C 2.3: Traffic studies prepared for development entitlements (tracts, public use permits, conditional use permits, etc.) shall identify Project related traffic impacts and determine the significance of such impacts in compliance with CEQA and the Riverside County Congestion Management Program Requirements. (AI 3)

Policy C 2.4: The direct Project related traffic impacts of new development proposals shall be mitigated via conditions of approval requiring the construction of any improvements identified as necessary to meet level of service targets.

Policy C 2.5: The cumulative and indirect traffic impacts of development may be mitigated through the payment of various impact mitigation fees such as County Development Impact Fees, Road and Bridge Benefit District Fees, and Transportation Uniform Mitigation Fees to the extent that these programs provide funding for the improvement of facilities impacted by development.

Policy C 3.4: Allow roundabouts or other innovative design solutions such as triple left turn lanes, continuous flow intersections, or other capacity improvements, when a thorough traffic impact assessment has been conducted demonstrating that such an intersection design alternative would manage traffic flow, and improve safety, if it is physically and economically feasible.

Policy C 3.6: Require private developers to be primarily responsible for the improvement of streets and highways that serve as access to developing commercial, industrial, and residential areas. These may include road construction or widening, installation of turning lanes and traffic signals, and the improvement of any drainage facility or other auxiliary facility necessary for the safe and efficient movement of traffic or the protection of road facilities.

Policy C 3.8: Restrict heavy duty truck through-traffic in residential and community center areas and plan land uses so that trucks do not need to traverse these areas.

Policy C 3.10: Require private and public land developments to provide all on-site auxiliary facility improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development Project shall be undertaken to identify Project impacts to the circulation system and its auxiliary facilities. The Transportation Department may require developers and/or subdividers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.

Policy C 7.1: Work with incorporated cities to mitigate the cumulative impacts of incorporated and unincorporated development on the transportation system. (AI 2, 49, 50, 53)

Policy C 7.8: Collaborate with all incorporated cities and all adjacent counties to implement and integrate right-of-way requirements and improvement standards for General Plan roads that cross jurisdictional boundaries. Detailed procedures have been developed and include the following:

c. Transition areas at meeting points of roadways designed to differing city and Riverside County standards or differing functional classifications should be individually designed to facilitate satisfactory operational and safety performance. Further, Riverside County should update the road standards to reflect the intent of this policy and standards agreed upon by the County of Riverside and other local agencies. (AI 4, 50)

4.11.4 Thresholds of Significance

The significance criteria used to evaluate the Project impacts to traffic and circulation are based on Appendix G of the CEQA Guidelines. According to Appendix G of the CEQA Guidelines, a significant impact related to traffic and circulation would occur if the Project would:

- **TRAF-1**: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.
- **TRAF-2**: Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.
- **TRAF-3**: Substantially increase hazards due to a geometric design feature (e.g., sharp curves, or dangerous intersections) or incompatible uses (e.g., farm equipment).
- **TRAF-4**: Result in inadequate emergency access.

LOS is used as the measure of effectiveness for the performance of the circulation system by the agencies with jurisdiction over the Project study area. (See Section 4.11.2 for a detailed description of LOS.) However, the standard varies for each agency. Table 4.11-12 shows the applicable standards for LOS based on the type or location of the intersection or roadway facility. Where more than one agency has jurisdiction over an intersection the higher standard is used.

Table 4.11-12
LOS Significance Criteria by Jurisdiction[1]

Type of Roadway	Non-CMP Intersection	CMP Intersection	Applies to Project?[2]	Standard Used for Analysis
Caltrans				
All Facilities	D	E	Yes	D
March JPA				
Non-TOD Developments	D	E	Yes	D
TOD Developments	E	E	No	n/a
Ramp Metered Interchanges	E	E	No	n/a
City of Riverside				
Arterials	D	E	Yes	D
Freeway Bypass Roadways	E	E	Yes[3]	D
Key Freeway Feeder Segments	F	E	No	n/a
Local and Collector Roads in Residential Areas	C	E	No	n/a
City of Moreno Valley				
Roadways Adjacent to Freeways or Employment Generating Land Uses[4]	D	E	Yes	D
All other roadways	C	E	No	n/a
County of Riverside				
Outside of Area Plans or Non-Community Development Areas[5]	C	E	No	n/a
Within Area Plans or Community Development Areas[6]	D	E	Yes	D
Transit Oriented Development[7]	D	E	No	n/a

Source: Dudek 2018

CMP = Congestion Management Program; TOD = transit-oriented development

1 Intersections already operating at unsatisfactory LOS are considered to be significantly impacted if Project traffic comprises 2% or more of the total peak-hour traffic.

2 States whether there are any intersections or roadways in the Project study area that meet the definition of the land use or context to which the LOS standard applies.

3 While some of the arterials listed as freeway bypass roads include roadways in the study area, the more stringent standard of LOS D is used due to lack of specificity of exact locations that may use LOS E and for consistency with other agency policies in the study area.

4 Figure 9-2 of the City of Moreno General Plan shows which standard applies to which roadway. All of the study area intersections are located on roadways with a LOS standard of D.

5 Specifically, LOS C shall apply to all development proposals in any area of the Riverside County not located within the boundaries of an Area Plan, as well those areas located within the following Area Plans: REMAP, Eastern Coachella Valley, Desert Center, Palo Verde Valley, and those non-Community Development areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans.

6 LOS D shall apply to all development proposals located within any of the following Area Plans: Eastvale, Jurupa, Highgrove, Reche Canyon/Badlands, Lakeview/Nuevo, Sun City/Menifee Valley, Harvest Valley/Winchester, Southwest Area, The Pass, San Jacinto Valley, Western 9 Coachella Valley and those Community Development Areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans.

7 Requires approval of County Board of Supervisors

Direct Project Impacts

Direct impacts are those impacts for which the addition of Project-only trips result in an identifiable degradation in LOS to unsatisfactory LOS from the existing conditions, thereby triggering the need for specific Project-related improvements.

March JPA

To determine whether the addition of Project traffic at a study intersection would result in a direct Project-specific traffic impact, the Existing without Project Conditions is compared to Existing with Project Conditions. If the comparison reveals that one of the two following conditions are met, then a direct Project impact occurs per the March JPA Traffic Impact Preparation Guide (March JPA 2011):

- Impact is significant if the pre-Project condition is at or better than LOS D (or acceptable LOS) and the Project-generated traffic causes deterioration below acceptable levels (to LOS E or F), a deficiency is deemed to occur. OR;
- If the pre-Project condition is already below LOS D (or acceptable LOS), the impact is significant if the Project contributes more than 2% of the total traffic.

City of Riverside

For the study area intersections that lie within the City of Riverside, to determine whether the addition of Project traffic (as defined through the comparison of Existing traffic conditions to E+P traffic conditions) at a study intersection would result in a direct Project-specific traffic impact, the following will be utilized:

- When the pre-Project condition is at or better than LOS D (i.e., unsatisfactory LOS), and Project-generated traffic, as measured by 50 or more peak hour trips, causes deterioration below LOS D or increases to the peak hour delay as defined by Table 4.11-13, a deficiency is deemed to occur.

Table 4.11-13
City of Riverside – Thresholds of Significance

Pre-Project LOS	Project-Related Delay Increase	Mitigation Measure
A/B	10.0 Seconds or More	Achieve pre-Project delay or better
C	8.0 Seconds or More	Achieve pre-Project delay or better
D	5.0 Seconds or More	Achieve pre-Project delay or better
E	2.0 Seconds or More	Achieve pre-Project delay or better
F	1.0 Second or More	Achieve pre-Project delay or better

Source: Appendix R.

City of Moreno Valley

The minimum LOS for the City of Moreno Valley is LOS D for intersections that are adjacent to freeway on/off ramps, and/or adjacent to employment generating land uses. LOS C is applicable to all other intersections. Boundary intersections are assumed to be LOS D.

For the study area intersections that lie within the City of Moreno Valley, March JPA or County of Riverside thresholds of significance apply as the City of Moreno Valley does not have its own threshold criteria.

County of Riverside

For the study area intersections that lie within the County of Riverside, to determine whether the addition of Project traffic (as defined through the comparison of Existing traffic conditions to E+P traffic conditions) at a study intersection would result in a direct Project-specific traffic impact, the following will be utilized:

- When the pre-Project condition is at or better than LOS D (i.e., acceptable LOS), and Project-generated traffic, as measured by 50 or more peak hour trips, causes deterioration below LOS D/LOS E (i.e., unacceptable LOS), a deficiency is deemed to occur.

Caltrans Facilities

To determine if the addition of Project traffic to the State Highway System freeway segments under Caltrans jurisdiction would result in a deficiency, both of the following must be found:

- The traffic study finds that the LOS of a segment would degrade from D or better to E or F; and
- The traffic study finds that the Project would exacerbate an already deficient condition by contributing 50 or more peak-hour trips. A segment that is operating at or near capacity is deemed to be deficient.

Cumulative Project Impacts

Cumulatively considerable impact indicates that the incremental effects of an individual Project are significant when viewed in connection with the effects of past Projects, the effects of other current Projects, and the effects of probable future Projects. Cumulative traffic impacts are created by a combination of the proposed Project together with other future developments which contribute to the overall traffic impacts. Because the impacts are cumulative, additional improvements to maintain satisfactory LOS operations would be required with or without the Project. A Project's contribution to a significant and cumulatively considerable impact can be reduced to less than

significant if the Project contributes its fair share of improvements designed to alleviate its cumulatively considerable contribution to the impact.

4.11.5 Impacts Analysis

Threshold TRAF-1. Would the Project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

The study area within the March JPA and the surrounding Cities of Riverside and Moreno Valley are currently served by the Riverside Transit Authority (RTA), a public transit agency serving various jurisdictions within Riverside County. As discussed in 4.11.1, Existing Conditions, RTA Route 20 could potentially serve the Project, as it currently operates along Alessandro Boulevard to the north of the Project site. RTA Route 11 could serve the Project, as it currently operates along Cactus Avenue northeast of the Project site and Frederick Street north of the Project site. Transit service is reviewed and updated by RTA periodically to address ridership, budget, and community demand needs. Changes in land use can affect these periodic adjustments, which may lead to either enhanced or reduced service where appropriate. The recently opened Moreno Valley/March Field Metrolink Station is located on Meridian Parkway, approximately 1.5 miles to the Project site.

Field observations conducted in May 2018 indicate nominal pedestrian and bicycle activity within the study area. Existing pedestrian facilities within the study area are shown on Exhibit 3-12 in the TIA (Appendix R). There are currently Class II bike lanes along Alessandro Boulevard northwest of the Project site, Elsworth Street, and Cactus Avenue between Veterans Way and Heacock Street. Existing sidewalks are currently in place along Elsworth Street, Veterans Way, Alessandro Boulevard, and Cactus Avenue on the north side of the street.

The Project would not include any off-site improvements that would extend into adjacent roadways or otherwise impede public transit, bicycle, or pedestrian facilities. The Project would not include any improvements that would extend into Cactus Avenue and interfere with the construction of pedestrian or bicycle facilities in the future. Additionally, primarily based on the Project area's urbanized nature, no existing recreational trails serve the immediate Project area. Therefore, there are **no impacts** to alternative transportation facilities, and no mitigation measures are required.

Threshold TRAF-2. Would the Project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

In December 2018 CEQA Guidelines were updated to include a threshold for evaluating traffic impacts using the VMT methodology. This new methodology is required to be used statewide

beginning on July 1, 2020. As such, and because March JPA as the lead agency has not yet adopted VMT thresholds, the analysis for this Project utilizes the LOS methodology.

RTP/SCS Consistency Analysis

The Southern California Association of Governments (SCAG) Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) establishes regional policies and goals for transportation to improve mobility, promote sustainability, facilitate economic development, and preserve the quality of life for residents in the region (SCAG 2016). SCAG reviews environmental documents for regionally significant Projects for their consistency with the adopted RTP/SCS. Lead agencies have the sole discretion in determining a Project's consistency with the RTP/SCS. Based on the analysis shown in Table 4.11-14, the Project is consistent with the RPT/SCS and there is **no impact**.

Table 4.11-14
RTP/SCS Consistency Analysis

No	Goal	Consistency
G-1	Align the plan investments and policies with improving regional economic development and competitiveness.	Consistent: The Project would provide employment and economic stimulation.
G-2	Maximize mobility and accessibility for all people and goods in the region.	Consistent: The Project includes roadway improvements that take into consideration all modes of transportation. New roadways and improved existing roadways will provide improved mobility and accessibility to regional destinations.
G-3	Ensure travel safety and reliability for all people and goods in the region.	Consistent: The Project's transportation facilities are planned with state-of-the-practice standards and considers safety of all new facilities. The March JPA coordinates with transit providers with regard to safety and reliability, but does not have direct authority over transit facilities.
G-4	Preserve and ensure a sustainable regional transportation system.	Consistent: The March JPA coordinates with regional transit providers, other jurisdictions and Caltrans to provide sustainable options for transportation.
G-5	Maximize the productivity of our transportation system.	Not applicable: Transportation Systems Management and Intelligent Transportation Systems are implemented by SCAG and Transportation Demand Management is implemented within the March JPA on a Project level basis if or when appropriate.
G-6	Protect the environment and health of our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking).	Consistent: The Project includes improvements to the circulation system for bicyclists and pedestrians that will help improve mobility options for active modes of travel.
G-7	Actively encourage and create incentives for energy efficiency, where possible.	Consistent: In addition to state and federal incentives, the Project EIR includes MM-AQ-4, which includes energy saving strategies. (See Section 4.2, Air Quality, for more detail.)

Table 4.11-14
RTP/SCS Consistency Analysis

No	Goal	Consistency
G-8	Encourage land use and growth patterns that facilitate transit and active transportation.	Consistent: The Project will locate employment near residential areas and includes a mix of uses thereby providing opportunities for employees to reside close to work. The Project includes street designs that call for bicycle and pedestrian facilities encouraging people to use these forms of transportation from nearby residences.
G-9	Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.	Not applicable: The regional transportation system is managed by regional agencies and Caltrans. However, the March JPA coordinates with these agencies on safety and security where applicable.

Source: Dudek 2018.

Project Traffic

In considering whether the proposed Project would conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, it is necessary to analyze the Project's potential impacts relative to the significance criteria used by the March JPA and the cities or agencies that have jurisdiction over each of the study intersections, as discussed in Section 4.11.4. Where necessary, mitigation measures were introduced to reduce and/or avoid potentially significant traffic impacts. Mitigation measures are provided in Section 4.11.6 of this EIR.

Trip Generation

Trip generation represents the amount of traffic which is both attracted to and produced by a development. The Institute of Traffic Engineers (ITE) *Trip Generation, 10th Edition* (2017) publication provides the industry standards for trip generation rates. Based on the proposed land use, it was determined that use of the ITE High-Cube Fulfillment Center Warehouse (ITE Land Use Code 155) trip rates would be the appropriate trip generation rates to use. The following is the description of a high-cube fulfillment center warehouse from ITE's *Trip Generation*:

> A typical high-cube warehouse (HCW) has a high level of on-site automation and logistics management. The automation and logistics enable highly-efficient processing of goods through the HCW. High-cube fulfillment center warehouses include warehouses characterized by a significant storage function and direct distribution of ecommerce product to end users. These facilities typically handle smaller packages and quantities than other types of HCWs and often contain multiple mezzanine levels...

The 2017 ITE Trip Generation Manual trip generation rates for high-cube fulfillment center use (ITE land use code 155) are based on limited data (i.e., one to two surveyed sites) and the ITE Trip

Generation Manual recommends the use of local data sources where available. As such, Project trip generation has been calculated based on the trip-generation statistics published in the TUMF High-Cube Warehouse Trip Generation Study which was commissioned by Western Riverside Council of Governments (WRCOG) in support of the Transportation Uniform Mitigation Fee (TUMF) update WRCOG TUMF High-Cube Warehouse Trip Generation Study (Appendix R).

To accurately reflect the impact that heavy trucks would have on the street system, Project trips have been further broken down between passenger cars and trucks for each of the peak hours and weekday daily trip generation. The trip generation summary illustrating daily and peak-hour trip generation estimates for the proposed Project are shown in Table 4.11-15. As indicated in the table, the proposed Project would generate approximately 5,873 vehicle trips per day (5,356 passenger-cars and 517 trucks), with 425 AM peak hour trips (412 passenger-cars and 13 trucks), and 983 PM peak hour trips (965 passenger-cars and 18 trucks). As shown in Table 4.11-15, using the ITE land use code 155 generates far more trips than using the WRCOG rates. The WRCOG data is far more accurate for estimating the number of trips that the proposed Project will generate. The proposed Project's impacts were conservatively analyzed using the ITE land use code 155 which vastly overstates the proposed Project's contribution to traffic, as well as impacts from traffic such as air quality, noise, greenhouse gas, and health risks.

Table 4.11-15
Project Trip Generation

Land Use	Quantity (TSF)[1]	Type of Vehicle[2]	AM Peak Hour			PM Peak Hour			Daily
			In	*Out*	*Total*	*In*	*Out*	*Total*	
High-Cube Warehouse/ Distribution Center	718.000	passenger-cars	317	95	412	270	695	965	5,356
		trucks	10	3	13	5	13	18	517
Fulfillment Center Total Net Trips (WRCOG Rates)[3]			67	20	87	33	85	118	1,530
Total Trips			**327**	**98**	**425**	**275**	**708**	**983**	**5,873**
Variance (WRCOG Rates – TIA)			-260	-78	-338	-242	-623	-865	-4,343

Source: Appendix R.
1 TSF = thousand square feet
2 Total truck percentage source from ITE Trip Generation Manual
3 Trips based on WRCOG TUMF High Cube Warehouse Trip Generation Study

The potential for non-truck Project trips to be reduced by the use of public transit, walking, or bicycling have not been included as part of the Project's estimated trip generation. Essentially, the Project's traffic projections are conservative in that these alternative travel modes would reduce Project traffic volumes.

Trip Distribution

The Project trip distribution and assignment process represents the directional orientation of traffic to and from the Project site. The trip distribution pattern of passenger cars is heavily influenced by the

geographical location of the Project site, the location of surrounding land uses, and the proximity to the regional freeway system. The trip distribution pattern for truck traffic is influenced by land use as well as by the local truck routes approved by the March JPA, City of Riverside, City of Moreno Valley, and Caltrans. Exhibit 4-1 of Appendix R shows the trip distribution patterns for passenger cars, and Exhibit 4-2 of Appendix R illustrates the truck trip distribution patterns.

Trip Assignment

The assignment of traffic from the Project area to the adjoining roadway system is based on the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the proposed Project. Based on the identified traffic generation and trip distribution patterns, ADT and peak-hour intersection turning movement volumes of the proposed Project are shown in Figure 4.11-8, Project Only Average Daily Traffic (ADT), and 4.11-9, Project Only Traffic Volumes.

Existing with Project Traffic Conditions

This section discusses the traffic analysis for Existing with Project Conditions and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

Roadway Improvements

The lane configurations and traffic controls assumed to be in place for Existing with Project Conditions are consistent with those shown in Figures 4.11-2 and 4.11-3, respectively, with the exception of Project driveways and those facilities assumed to be constructed by the Project to provide site access (e.g., intersection and roadway improvements at the Project's frontage and driveways).

Traffic Volumes

To derive traffic volumes for the Existing with Project scenario, Project traffic is added to the existing traffic volumes. Figures 4.11-10 and 4.11-11 show the resulting ADT and peak-hour volumes, respectively.

Intersection Operations

Peak-hour traffic operations were evaluated for the study area intersections based on the analysis methodologies presented in Section 4.11.2. The intersection analysis results are summarized in Table 4.11-16 and Figure 4.11-12, E+P Summary of LOS, which indicates that same following four study area intersections that currently operate with unsatisfactory LOS in the existing condition are forecast to continue to operate with unsatisfactory LOS in the Existing plus Project condition:

1. Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard – LOS F AM and PM peak hours
3. Mission Grove Parkway/Alessandro Boulevard – LOS E AM peak hour
6. Sycamore Canyon Boulevard/Alessandro Boulevard – LOS F AM and PM peak hours
19. Elsworth Street/Cactus Avenue – LOS F AM and PM peak hours

The proposed Project is anticipated to result in significant impacts at the following intersections, as the Project would meet the significance criteria for its respective jurisdiction(s):

1. Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard: Addition of 1.0 second or more of delay at LOS F (City of Riverside) in both peak hours.
19. Elsworth Street/Cactus Avenue: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley); and, addition of 2% or more to the total peak hour traffic at LOS E-F (March JPA) in both peak hours.

At the Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard intersection, the roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. The LOS deficiency at this intersection is caused by the minimum green times necessary for pedestrian crossing time. As a result, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. Potential physical improvements such as grade-separated pedestrian crossings would not be financially feasible based on the pedestrian and bicycle activity at this location. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at this intersection (also validated by peak hour count data). As such, the impact is considered **significant and unavoidable**.

Mitigation measure **MM-TRAF-1** shall be incorporated at Elsworth Street/Cactus Avenue to reduce the peak-hour delay and improve LOS to D or better in the Existing with Project condition. Section 4.12.6 describes the mitigation measure in detail. With the implementation of mitigation measure **MM-TRAF-1**, the impact to traffic conditions at Elsworth Street/Cactus Avenue under the Existing with Project condition would be **less than significant.**

Table 4.11-16
Existing with Project Intersection Analysis

#	Intersection	Traffic Control[2]	Existing (2018)				Existing with Project				Acceptable LOS	Jurisdiction	Significance Threshold	Significant Impact?

Source: Appendix R.

Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS). **Bold and highlighted** = significant impact.

1 Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

2 CSS = cross-street stop; TS = traffic signal

3 Intersection forecast to continue to operate with satisfactory LOS (LOS D or better) with addition of Project traffic.

Traffic Signal Warrants Analysis

Traffic signal warrants are prepared for the only existing unsignalized intersection in the study area, Meridian Parkway/Innovation Drive. Based on the warrant analysis, Meridian Parkway/Innovation Drive would not warrant a traffic signal in the Existing with Project condition. The analysis worksheets are provided in Appendix R.

Freeway Analysis

Off-Ramp Queuing

A queuing analysis was performed for the off-ramps at the I-215/Cactus Avenue interchanges to assess vehicle queues that may potentially result in deficient peak-hour operations at the ramp-to-arterial intersections and potentially cause spill-back onto the I-215 mainline. Worksheets for Existing with Project Conditions off-ramp queuing analysis are provided in Appendix R. Queuing analysis findings are shown in Table 4.11-17 for Existing with Project Conditions.

Table 4.11-17
Existing with Project Peak-Hour Freeway Off-Ramp Queuing

Intersection	Movement	Available Stacking Distance (Feet)	Existing				Existing with Project			
			95th Percentile Queue (Feet)[3]		*Satisfactory?*[1]		*95th Percentile Queue (Feet)*[3]		*Satisfactory?*[1]	
			AM	*PM*	*AM*	*PM*	*AM*	*PM*	*AM*	*PM*
I-215 SB ramps/ Cactus Avenue	SBR	1,115	128	0	Yes	Yes	128	0	Yes	Yes
	NBR	1,850	0	0	Yes	Yes	14	23	Yes	Yes
I-215 NB ramps/ Cactus Avenue	NBL	145	541[2]	45	Yes[4]	Yes	550	45	Yes[4]	Yes
	NBT/R	1,650	294	54	Yes	Yes	300	54	Yes	Yes

Source: Appendix R.
SBL = southbound left turn lane; SBR = southbound right turn lane; NBL = northbound left turn lane; NBR = northbound right turn lane; T = through-lane

1 Stacking Distance is satisfactory if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.
2 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
3 Maximum queue length for the approach reported.
4 Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through-lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 mainline.

As shown on Table 4.11-17, there are no queues forecast in the Existing with Project condition that would spill onto the I-215 mainline. While the AM peak hour queue (550 feet) at the northbound left-turn lane of the northbound off-ramp exceeds the 145 foot storage lane, that queue combined with the queue (300 feet) of the shared through plus right-turn lane, on a single off-ramp lane of 1,650 feet, would not spillover to the I-215 mainline.

Freeway Segment

A freeway mainline segment analysis was conducted for the Existing with Project condition per the HCM methodology. Freeway mainline directional volumes for the Existing plus Project weekday AM and PM peak hours are shown in Figure 4.11-13. Analysis worksheets are provided in Appendix R. As shown in Table 4.11-18, the study area freeway mainline segments are forecast to continue to operate with satisfactory LOS during the peak hours in Existing with Project condition. However, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the AM peak hour, and the I-215 northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F, and because the Project would add more than 50 peak hour trips to those segments that are anticipated to continue to operate at unacceptable LOS, the Project would have a potentially significant impact.

Table 4.11-18
Existing with Project Freeway Segment Analysis

Freeway	Direction	Mainline Segment	Lanes[2]	Existing				Existing with Project			
				Density[3]		*LOS*		*Density*[3]		*LOS*	
				AM	*PM*	*AM*	*PM*	*AM*	*PM*	*AM*	*PM*
I-215	SB	north of Cactus Avenue	4	15.1	--[4]	B	**F**	15.3	--[4]	B	**F**
		south of Cactus Avenue	4	14.3	--[4]	B	**F**	14.3	--[4]	B	**F**
	NB	north of Cactus Avenue	4	--[4]	--[4]	**F**	**F**	--[4]	--[4]	**F**	**F**
		south of Cactus Avenue	4	--[4]	--[4]	**F**	**F**	--[4]	--[4]	**F**	**F**

Source: Appendix R.
Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS).
1 NB = Northbound; SB = Southbound
2 Density is measured by passenger cars per mile per lane (pc/mi/ln).
3 Number of lanes are in the specified direction and is based on existing conditions.
4 Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

Freeway Merge/Diverge Analysis

Ramp merge and diverge operations were also evaluated for Existing with Project conditions per HCM methodology. Analysis worksheets are provided in Appendix R. As shown in Table 4.11-19, the freeway ramp merge and diverge areas are anticipated to continue to operate at LOS D or better with the addition of Project traffic in the Existing with Project condition. However, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the AM peak hour, and the I-215 northbound mainline experiences significant

traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F, and because the Project would add more than 50 peak hour trips to those segments that are anticipated to continue to operate at unacceptable LOS, the Project would have a potentially significant impact.

Table 4.11-19
Existing with Project Freeway Ramp Junction Merge/Diverge Analysis

Freeway	Direction	Ramp or Segment	Lanes on Fwy[2]	Existing				Existing with Project			
				AM Peak Hour		*PM Peak Hour*		*AM Peak Hour*		*PM Peak Hour*	
				Density[3]	*LOS*	*Density*[3]	*LOS*	*Density*[3]	*LOS*	*Density*[3]	*LOS*
I-215	SB	off-ramp at Cactus Ave	4	15.4	B	--[4]	**F**	15.7	B	--[4]	**F**
		loop off-ramp at Cactus	4	16.1	C	--[4]	**F**	16.5	C	--[4]	**F**
		on-ramp at Cactus Ave	3	21.0	C	--[4]	**F**	21.2	C	--[4]	**F**
	NB	on-ramp at Cactus Ave	3	--[4]	**F**	--[4]	**F**	--[4]	**F**	--[4]	**F**
		loop on-ramp at Cactus	3	--[4]	**F**	--[4]	**F**	--[4]	**F**	--[4]	**F**
		off-ramp at Cactus Ave	3	--[4]	**F**	--[4]	**F**	--[4]	**F**	--[4]	**F**

Source: Appendix R.
Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS)
1 NB = Northbound; SB = Southbound
2 Number of lanes are in the specified direction and is based on existing conditions.
3 Density is measured by passenger cars per mile per lane (pc/mi/ln).
4 Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

Freeway Analysis Impacts

As described above, there are no identified significant Project impacts to the study area off-ramp queues at I-215/Cactus Avenue with implementation of the proposed Project. Therefore, there **is no impact.**

However, due to observed queuing from downstream bottlenecks, there are identified significant Project impacts to the study area I-215 mainline segments and I-215 merge/diverge areas with implementation of the proposed Project. At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development Projects in the JPA (or other neighboring jurisdictions) on SHS roadway segments. The WRCOG TUMF Program

identifies this interchange, inclusive of on/off-ramps as a transportation mitigation Project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along the I-215 Freeway. As such, no improvements have been recommended, and the impact to these freeway facilities is **significant and unavoidable**.

Opening Year Cumulative with Project Conditions

The Opening Year Cumulative condition analyses identifies potential near-term cumulative circulation system deficiencies in year 2023, without and with the proposed Project. To account for background traffic growth, an ambient growth factor and traffic associated with other cumulative Projects were added to existing traffic volumes. Without and with Project conditions were compared to isolate potential Project impacts to the study area intersection operations, freeway mainline operations, and traffic signal warrant analyses.

Roadway Improvements

The lane configurations and traffic controls assumed to be in place for Opening Year Cumulative Conditions are consistent with existing lane configurations and traffic controls, with the exception of Project driveways and those facilities assumed to be constructed by the Project to provide site access (e.g., intersection and roadway improvements along the Project's frontage). These Project-specific improvements are only included in the with-Project conditions.

Additionally, driveways and those facilities assumed to be constructed by cumulative development Projects to provide site access are also assumed to be in place for the Opening Year Cumulative condition (e.g., intersection and roadway improvements along the cumulative developments' frontages and driveways). The future proposed Plateau development would also use the extension of Cactus Avenue, west of Meridian Parkway. Other connections assumed include the extension of San Gorgonio Avenue to the south of Alessandro Boulevard, and the extension of Cactus Avenue to the west of Meridian Parkway.

Traffic Volumes

Opening year traffic forecasts are calculated based upon 5 years of background (ambient) growth at 2% per year to account for regional traffic growth between 2018 (existing conditions) and 2023 (opening year). The total ambient growth is 10.41% for 2020 traffic conditions (compounded growth of 2.0% per year over 5 years). This ambient growth rate is added to existing traffic volumes to account for area-wide growth not reflected by cumulative development Projects. A cumulative Project list was developed for the purposes of this analysis through consultation with planning and engineering staffs from the Cities of Riverside and Moreno Valley, and the County to include related cumulative Projects in their respective jurisdictions.

Exhibit 4-5 in Appendix R shows a comprehensive cumulative development location map. A summary of cumulative development Projects and their proposed land uses are shown in Table 4-3 of the TIA (Appendix R). All cumulative Projects were considered and reviewed to determine which Projects would likely contribute measurable traffic (i.e., 50 or more peak-hour trips) to study area intersections. The determination was made based on anticipated trip generation and potential travel patterns. The traffic generated by individual cumulative Projects has been manually added to the study area network to generate Opening Year Cumulative (2023) forecasts for those cumulative Projects that were anticipated to contribute measurable traffic to a study area intersection. Opening Year Cumulative without Project development ADT and peak-hour intersection turning movement volumes are shown on Figures 4.11-14 and 4.11-15. Opening Year Cumulative with Project daily and peak hour traffic volumes are shown in Figures 4.11-17 and 4.11-18, respectively.

Intersection Operations

An intersection LOS analysis was conducted for the study intersections to evaluate their operations under Opening Year Cumulative conditions. The analysis worksheets are included in Appendix R. As shown in Table 4.11-20 and Figure 4.11-16, most of the study area intersections are anticipated to operate with satisfactory LOS in the Opening Year Cumulative (without Project) condition, with the exception of the following intersections:

1. Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard – LOS F AM and PM peak hours
3. Mission Grove Parkway/Alessandro Boulevard – LOS F AM peak hour
6. Sycamore Canyon Boulevard/Alessandro Boulevard – LOS F AM and PM peak hours
7. Meridian Parkway/Cactus Avenue – LOS E AM peak hour
10. Meridian Parkway/Van Buren Boulevard – LOS F AM and PM peak hours
11. Innovation Drive/Cactus Avenue – LOS F PM peak hour
16. Old 215 Frontage Road – I-215 northbound ramps/Cactus Avenue – LOS F AM peak hour
19. Elsworth Street/Cactus Avenue – LOS F AM and PM peak hours
25. Heacock Street/Cactus Avenue – LOS F AM peak hour; LOS E PM peak hour

For the Opening Year plus Project, as shown in Table 4.11-20 and Figure 4.11-19, the proposed Project is anticipated to result in significant impacts at the following intersections, as the Project would meet the significance criteria for its respective jurisdiction(s):

1. Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard: Addition of 1.0 second or more of delay at LOS F (City of Riverside) in PM peak hour.
6. Sycamore Canyon Boulevard/Alessandro Boulevard: Addition of 1.0 second or more of delay at LOS F (City of Riverside) in both peak hours.
16. Old 215 Frontage Road – I-215 northbound ramps/Cactus Avenue: Addition of 2% or more of total peak hour traffic at LOS E-F (March JPA); and, addition of 50 or more peak hour trips to LOS E-F (Caltrans) in both peak hours.
19. Elsworth Street/Cactus Avenue: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley); and, addition of 2% or more to the total peak hour traffic at LOS E-F (March JPA) in both peak hours.
25. Heacock Street/Cactus Avenue: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley); and, addition of 2% or more to the total peak hour traffic (March JPA) in both peak hours.

At the Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard and Sycamore Canyon Boulevard/Alessandro Boulevard intersections, the roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. The LOS deficiency at these intersections is caused by the minimum green times necessary for pedestrian crossing time. As a result, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. Potential physical improvements such as grade-separated pedestrian crossings would not be financially feasible based on the pedestrian and bicycle activity at this location. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at both these intersections (also validated by peak hour count data). As such, the impact to the Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard and Sycamore Canyon Boulevard & Alessandro Boulevard intersections is considered **significant and unavoidable**.

The incorporation of mitigation measures **MM-TRAF-2**, **MM-TRAF-3**, and **MM-TRAF-4** to Old 215 Frontage Road – I-215 northbound ramps/Cactus Avenue, Elsworth Street/Cactus Avenue, and Heacock Street/Cactus Avenue, respectively, would reduce off-site impacts associated with the development of the proposed Project and improve to less than significant levels for Opening Year Cumulative with Project condition.

The proposed Project would impact several roadways outside of the jurisdiction of the lead agency. The proposed Project would be required to pay its fair share toward the costs of specific

improvements under mitigation measure **MM-TRAF-18** to the County of Riverside and the Cities of Riverside and Moreno Valley. However, it cannot be guaranteed that these fees would be applied to the specific improvements summarized herein. Currently, since at least some of these improvements are not scheduled in their respective City's Capital Improvement Program (CIP), Development Impact Fee (DIF), or similar program, there are no established programs to accept the fees contributed by the applicant and bundle them with fees from other cumulative Projects that also contribute to traffic impacts at those roadway facilities. In addition, because the March JPA does not have plenary control over intersections under other jurisdictions, the March JPA cannot guarantee that such improvement will be constructed. Therefore, the proposed Project's contribution to cumulative impacts is **cumulative considerable** as well as **significant and unavoidable**.

Traffic Signal Warrants Analysis

Traffic signal warrants were prepared for the only unsignalized intersection in the study area, Meridian Parkway/Innovation Drive. Based on the warrant analysis, Meridian Parkway/Innovation Drive would not warrant a traffic signal in the Opening Year Cumulative with Project condition. The analysis worksheets are provided in Appendix R.

Freeway Analysis

Off-Ramp Queuing

A queuing analysis was performed for the off-ramps at the I-215/Cactus Avenue interchange to assess vehicle queues that may potentially result in deficient peak-hour operations at the ramp intersections, and cause spill-back onto the I-215 mainline. Analysis worksheets are provided in Appendix R.

SBL = southbound left turn lane; SBR = southbound right turn lane; NBL = northbound left turn lane; NBR = northbound right turn lane; T = through-lane

1 Stacking distance is satisfactory if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

2 95th percentile volume exceeds capacity; queue may be longer. Queue shown is maximum after two cycles.

3 Maximum queue length for the approach reported.

4 Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 mainline.

As shown on Table 4.11-21, there are no queues forecast in the Opening Year Cumulative with Project condition that would spill onto the I-215 mainline. While the AM peak hour queue (892 feet) at the northbound left-turn lane of the northbound off-ramp exceeds the 145 foot storage lane, that queue combined with the queue (367 feet) of the shared through plus right-turn lane, on a single off-ramp lane of 1,650 feet, would not spillover to the I-215 mainline.

Freeway Segments

Opening Year Cumulative mainline directional volumes for the weekday AM and PM peak hours, without and with, the proposed Project are shown in Figures 4.11-20 and 4.11-21, respectively. As shown in Table 4.11-22, the study area freeway segments are forecast to continue to operate with satisfactory LOS during both peak hours, without and with, the proposed Project. Analysis worksheets are provided in Appendix R. However, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the AM peak hour, and the I-215 northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

Table 4.11-22
Opening Year Cumulative Conditions Freeway Segment Analysis

Freeway	Direction	Mainline Segment	Lanes[2]	2023 without Project				2023 with Project

2 Number of lanes are in the specified direction and is based on existing conditions.
3 Density is measured by passenger cars per mile per lane (pc/mi/ln).
4 Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

Freeway Merge/Diverge

Ramp merge and diverge operations were evaluated for the Opening Year Cumulative, without and with, Project conditions and the results of this analysis are shown in Table 4.11-23.

Table 4.11-23
Opening Year Cumulative Conditions Freeway Ramp Junction Merge/Diverge Analysis

		off-ramp at Cactus Ave	3	--[4]	F	--[5]	F	--[4]	F	--[5]	F

Source: Appendix R.
1 NB = Northbound; SB = Southbound
2 Number of lanes are in the specified direction and is based on existing conditions.
3 Density is measured by passenger cars per mile per lane (pc/mi/ln).
4 HCS7 does not report density for freeway facilities operating at LOS F.
5 Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

As shown in Table 4.11-23, most of the study area freeway ramp merge/diverge ramp junctions are forecast to operate with satisfactory LOS (LOS D or better), with exception of the I-215 northbound off-ramp (diverge) at Cactus Avenue, which is forecast to operate at LOS F in the AM peak hour in both, without and with, Project conditions. While the addition of Project traffic is not anticipated to result in an LOS letter grade change to this deficient ramp diverge junction, it would contribute to its deficiency. In addition, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the AM peak hour, and the I-215 northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

Freeway Analysis Impacts

As described above, there are no identified significant Project impacts to the study area off-ramp queues at I-215/Cactus Avenue, and the I-215 mainline segments with implementation of the proposed Project. Therefore, there **is no impact.**

However, the ramp (diverge) junction at the northbound I-215 off-ramp at Cactus Avenue is forecast to continue to operate with unsatisfactory LOS under Opening Year Cumulative with Project conditions. The Cactus Avenue overcrossing is the subject of a Project Study Report (PSR) prepared by the City of Moreno Valley in conjunction with Caltrans. The WRCOG TUMF Program identifies this interchange, inclusive of on/off-ramps as a transportation mitigation Project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along I-215. At this time, Caltrans has no fee programs or other improvement programs

in place to address the deficiencies caused by development Projects in the March JPA (or other neighboring jurisdictions) on State Highway System (SHS) roadway segments. As such, no improvements have been recommended, and the impact to the ramp (diverge) junction at the northbound I-215 off-ramp at Cactus Avenue is **significant and unavoidable**.

Furthermore, due to observed queuing from downstream bottlenecks, there are identified significant Project impacts to the study area I-215 mainline segments and other I-215 merge/diverge areas with implementation of the proposed Project. At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development Projects in the JPA (or other neighboring jurisdictions) on SHS roadway segments. The WRCOG TUMF Program identifies this interchange, inclusive of on/off-ramps as a transportation mitigation Project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along the I-215 Freeway. Additionally, the March JPA cannot guarantee the timing or implementation of such improvements as the facilities are under the jurisdiction of Caltrans. As such, no improvements have been recommended, and the impact to these freeway facilities is **significant and unavoidable** and **cumulatively considerable**.

Horizon Year with Project Traffic Conditions

This section discusses the methods used to develop the Horizon Year, without and with Project, traffic conditions and the resulting intersection operations, freeway mainline operations, and traffic signal warrant analyses.

Roadway Improvements

The study area lane configurations and traffic controls assumed to be in place for the Horizon Year conditions are consistent with existing conditions, with the exception of Project driveways and other intersection and roadway improvements along the Project's frontage and driveways. Additionally, driveways and those facilities assumed to be constructed by cumulative development Projects to provide site access are also assumed to be in place for the Horizon Year conditions (e.g., intersection and roadway improvements along the cumulative development's frontage and driveways). Other connections assumed include the extension of San Gorgonio Avenue to the south of Alessandro Boulevard; and, the extension of Cactus Avenue to the west of Meridian Parkway.

Traffic Volumes

The Horizon Year (2040) without Project traffic conditions were derived from the Riverside County Transportation Analysis Model (RivTAM) using accepted procedures for model forecast refinement and smoothing. Figures 4.11-22 and 4.11-23 show the ADT and intersection volumes, respectively for Horizon Year traffic conditions without the Project. The Horizon Year with Project traffic forecasts were determined by adding the Project traffic to the Horizon Year without Project

traffic forecasts from the RivTAM model. Figures 4.11-25 and 4.11-26 show the ADT and intersection volumes, respectively, for Horizon Year Conditions with the Project.

Intersection Operations

An intersection LOS analysis was conducted for the study intersections to evaluate their operations under Horizon Year without Project Conditions. The analysis worksheets are included in Appendix R. As shown in Table 4.11-24 and Figure 4.11-24, the following study area intersections are anticipated to operate with unsatisfactory LOS:

1. Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard – LOS F AM and PM peak hours
3. Mission Grove Parkway/Alessandro Boulevard – LOS F AM peak hour; LOS E PM peak hour
6. Sycamore Canyon Boulevard/Alessandro Boulevard – LOS F AM and PM peak hours
7. Meridian Parkway/Cactus Avenue – LOS F AM peak hour; LOS E PM peak hour
10. Meridian Parkway/Van Buren Boulevard – LOS F AM and PM peak hours
11. Innovation Drive/Cactus Avenue – LOS E AM peak hour; LOS F PM peak hour
13. I-215 southbound ramps/Cactus Avenue – LOS F PM peak hour only
14. I-215 northbound ramps/Alessandro Boulevard – LOS E AM and PM peak hours
15. Old 215 Frontage Road/Alessandro Boulevard – LOS F AM peak hour only
16. Old 215 Frontage Road – I-215 northbound ramps/Cactus Avenue – LOS F AM and PM peak hours
17. Day Street/Alessandro Boulevard – LOS E PM peak hour only
18. Elsworth Street/Alessandro Boulevard – LOS F PM peak hour only
19. Elsworth Street/Cactus Avenue – LOS F AM and PM peak hours
22. Frederick Street/Alessandro Boulevard – LOS F AM and PM peak hours
24. Graham Street – Riverside Drive/Cactus Avenue – LOS F AM and PM peak hours
25. Heacock Street/Cactus Avenue – LOS F AM peak hour; LOS E PM peak hour

For the Horizon Year plus Project condition, as shown in Table 4.11-24 and Figure 4.11-27, the Project is anticipated to result in significant impacts at the following intersections, as the Project would meet the significance criteria for its respective jurisdiction(s):

1. Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard: Addition of 1.0 second or more of delay at LOS F (City of Riverside) in both peak hours.

6. Sycamore Canyon Boulevard/Alessandro Boulevard: Addition of 1.0 second or more of delay at LOS F in both peak hours (City of Riverside) in both peak hours.

13. I-215 southbound ramps/Cactus Avenue: Addition of 2% or more of total peak hour traffic at LOS E-F (March JPA); and, addition of 50 or more peak hour trips to LOS E-F (County and Caltrans) in PM peak hour.

14. I-215 northbound ramps/Alessandro Boulevard: Addition of 2.0 seconds or more of delay at LOS E (City of Riverside); and, addition of 50 or more peak hour trips to LOS E-F (County and Caltrans) in PM peak hour.

15. Old 215 Frontage Road/Alessandro Boulevard: Addition of 1.0 seconds or more of delay at LOS F (City of Riverside); and, addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley and County) in PM peak hour.

16. Old 215 Frontage Road/I-215 northbound ramps/Cactus Avenue: Addition of 2% or more of total peak hour traffic at LOS E-F (March JPA); and, addition of 50 or more peak hour trips to LOS E-F (Caltrans) in both peak hours.

17. Day Street/Alessandro Boulevard: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley) in PM peak hour.

18. Elsworth Street/Alessandro Boulevard: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley) in PM peak hour.

19. Elsworth Street/Cactus Avenue: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley); and, addition of 2% or more to the total peak hour traffic at LOS E-F (March JPA) in both peak hours.

22. Frederick Street/Alessandro Boulevard: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley) in both peak hours.

24. Graham Street/Riverside Drive/Cactus Avenue: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley); and, addition of 2% or more to the total peak hour traffic at LOS E-F (March JPA) in both peak hours.

25. Heacock Street/Cactus Avenue: Addition of 50 or more peak hour trips to LOS E-F (City of Moreno Valley); and, addition of 2% or more to the total peak hour traffic at LOS E-F (March JPA) in both peak hours.

At the Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard intersection, the roadway improvements have been built up to the ultimate width of the intersection as designated in the General Plan. The LOS deficiency at this intersection is caused by the minimum green times necessary for pedestrian crossing time. As a result, there are no feasible physical improvements to bring the vehicular LOS to acceptable levels without the removal of crosswalks. Potential physical improvements such as grade-separated pedestrian crossings would not be financially feasible based

on the pedestrian and bicycle activity at this location. The deficiency exists only when a pedestrian call occurs during the peak hour and nominal pedestrian and bicycle activity was observed at this intersection (also validated by peak hour count data). As such, the impact is considered **significant and unavoidable**. As such, the impact to the Overlook Parkway/Canyon Crest Drive & Alessandro Boulevard intersection is considered **significant and unavoidable**.

The incorporation of mitigation measures **MM-TRAF-5** through **MM-TRAF-15** would reduce off-site impacts associated with the development of the proposed Project to less than significant levels for Horizon Year with Project conditions. Table 4.11-24 shows the resulting LOS and delay with and without these mitigations. The intersection operations analysis worksheets are provided in Appendix R.

However, since some of the mitigation measures required are either the responsibility and jurisdiction of another public agency, and not the lead agency, or have been deemed infeasible by the lead agency, impacts associated with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, as well as impacts related to an applicable congestion management program, would be considered **significant and unavoidable** following the incorporation of mitigation measures identified herein. Additionally, the Project's contribution to these impacts is **cumulative considerable.**

Traffic Signal Warrants Analysis

Traffic signal warrants were prepared for the only unsignalized intersection in the study area, Meridian Parkway/Innovation Drive. Based on the warrant analysis, Meridian Parkway/Innovation Drive would not warrant a traffic signal in the Horizon Year, without and with, Project conditions. The analysis worksheets are provided in Appendix R.

Source: Appendix R.
Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS). **Bold and highlighted** = significant impact.
1 CSS = cross-street stop; TS = traffic signal
2 Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.
3 Intersection forecast to continue to operate with satisfactory LOS (LOS D or better) with addition of Project traffic.

Freeway Analysis

Off-Ramp Queuing

A queuing analysis was performed for the off-ramps from I-215/Cactus Avenue interchange to assess vehicle queues that may potentially result in deficient peak-hour operations at intersections and cause spill-back onto the I-215 mainline. Analysis worksheets are provided in Appendix R. The analysis findings are shown in Table 4.11-25 for Horizon Year without and with Project Conditions.

Table 4.11-25
Horizon Year Traffic Conditions Peak-Hour Freeway Off-Ramp Queuing

Intersection	Movement	Available Stacking Distance (Feet)	2020 Without Project				2020 With Project			
			95th Percentile Queue (Feet)[3]		*Satisfactory?*[1]		*95th Percentile Queue (Feet)*[3]		*Satisfactory?*[1]	
			AM	*PM*	*AM*	*PM*	*AM*	*PM*	*AM*	*PM*
I-215 SB ramps/ Cactus Avenue	SBR	1,115	167	14	Yes	Yes	167	20	Yes	Yes
	NBR	1,850	148[2]	216[2]	Yes	Yes	339[2]	312[2]	Yes	Yes
I-215 NB ramps/ Cactus Avenue	NBL	145	952[2]	245	Yes[4]	Yes[4]	952[2]	245[2]	Yes[4]	Yes[4]
	NBT/R	1,650	663[2]	222	Yes	Yes	663[2]	224	Yes	Yes

Source: Appendix R.
SBL = southbound left turn lane; SBR = southbound right turn lane; NBL = northbound left turn lane; NBR = northbound right turn lane; T = through-lane

1 Stacking distance is satisfactory if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.
2 95th percentile volume exceeds capacity; queue may be longer. Queue shown is maximum after two cycles.
3 Maximum queue length for the approach reported.
4 Although the 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-215 mainline.

As shown in Table 4.11-25, there are no queues forecast in the Horizon Year with Project condition that would spill onto the I-215 mainline. While the AM peak hour queue (952 feet) at the northbound left-turn lane of the northbound off-ramp exceeds the 145 foot storage lane, that queue combined with the queue (663 feet) of the shared through plus right-turn lane, on a single off-ramp lane of 1,650 feet, would not spillover to the I-215 mainline.

Freeway Segments

The Project Study Report/Project Development Support in Riverside County on I-215 and State Route 60 between Nuevo Road and I-215/State Route 60 Junction and Box Springs Road and Day Street (Caltrans 2008), also known as the I-215 North Project, includes construction of a high-occupancy-vehicle (HOV) (i.e., carpool) lane in each direction of I-215 between Nuevo Road and Box Springs Road within the existing median. According to the RCTC and Caltrans websites, the

I-215 North Project is a long-term project, as priority has been given to the southern and central projects along the I-215 corridor.

Caltrans typically assumes a reduction of 14% to the freeway mainline through volumes in this region to account for vehicles using the HOV lanes. The reduction to the I-215 mainline volumes has been applied to account for the proposed HOV lanes. The analysis has been performed assuming the same number of mixed-flow lanes and on and off-ramp configurations as existing baseline conditions at the I-215 and Alessandro Boulevard interchange.

Horizon Year traffic conditions mainline directional volumes for the weekday AM and PM peak hours without and with the Project are shown in Figures 4.11-28 and 4.11-29, respectively. Table 4.11-26 presents the results for the freeway segment analysis, and includes LOS for without and with Project conditions, and without and with the I-215 North Project. Analysis worksheets are provided in Appendix R.

Table 4.11-26

Source: Appendix R.
Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS).
1 NB = Northbound; SB = Southbound
2 Number of lanes are in the specified direction and is based on existing conditions.
3 Density is measured by passenger cars per mile per lane (pc/mi/ln).
4 HCS7 does not report density for freeway facilities operating at LOS F.
5 Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

As shown in Table 4.11-26, the following freeway segments analyzed for this study are anticipated to operate at an unsatisfactory LOS (LOS E or worse) during the peak hours without the Project:

- I-215 northbound, north of Cactus Avenue – LOS F PM peak hour only
- I-215 northbound, south of Cactus Avenue – LOS F AM peak hour; LOS E PM peak hour

With the addition of Project traffic, the two segments noted above would continue to operate with unsatisfactory LOS, with the addition of the segment of I-215 southbound, south of Cactus Avenue, which is forecast to operate at an unsatisfactory LOS (LOS E PM peak hour) from LOS D (without the Project).

With the improvements from the I-215 North Project in place, most of the freeway segments that were forecast to operate with unsatisfactory LOS would operate with satisfactory LOS, with the exception of I-215 northbound, south of Cactus Avenue, which is forecast to continue to operate with unsatisfactory LOS (LOS E AM peak hour). It should be noted, however, that the LOS would improve from LOS F to LOS E.

However, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the AM peak hour, and the I-215 northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. Where applicable, the freeway mainline is assumed to operate at LOS F.

Freeway Merge/Diverge

Ramp merge and diverge operations were evaluated for Horizon Year traffic conditions, without and with, the proposed Project and the results of this analysis are presented in Table 4.11-27.

Table 4.11-27
Horizon Year Traffic Conditions Freeway Ramp Junction Merge/Diverge Analysis

Source: Appendix R.
Bold = LOS does not meet the applicable jurisdictional requirements (i.e., unsatisfactory LOS).
[1] NB = Northbound; SB = Southbound

[2] Number of lanes are in the specified direction and is based on existing conditions.
[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).
[4] HCS7 does not report density for freeway facilities operating at LOS F.
[5] Observations made in the field indicate that the freeway segments experience traffic congestion during the peak hours due to queuing from downstream bottlenecks.

As shown in Table 4.11-27, the following study area freeway ramp merge and diverge areas are anticipated to operate with unsatisfactory LOS (LOS E or F) during one or more peak hours without the Project:

- I-215 southbound, loop off-ramp at Cactus Avenue – LOS E PM peak hour
- I-215 southbound, on-ramp at Cactus Avenue – LOS F PM peak hour
- I-215 northbound, on-ramp at Cactus Avenue –LOS E PM peak hour
- I-215 northbound, loop on-ramp at Cactus Avenue – LOS F AM and PM peak hours
- I-215 northbound, off-ramp at Cactus Avenue – LOS F AM and PM peak hours

As shown in Table 4.11-27, with the addition of Project traffic, those merge/diverge areas listed above would continue to operate with unsatisfactory LOS, and there would be no additional freeway merge/diverge ramp junctions forecast to operate with unsatisfactory LOS. Analysis worksheets are provided in Appendix R.

With improvements implemented from the I-215 North Project, discussed above, two of the five ramp junctions listed above would operate with satisfactory LOS (LOS D or better). However, the following ramp junctions are anticipated to continue to operate at an unsatisfactory LOS:

- I-215 southbound, on-ramp at Cactus Avenue – LOS F PM peak hour
- I-215 northbound, loop on-ramp at Cactus Avenue – LOS F PM peak hour only
- I-215 northbound, off-ramp at Cactus Avenue – LOS F AM and PM peak hours

However, observations made in the field indicated that the I-215 southbound mainline experiences significant traffic congestion in the AM peak hour, and the I-215 northbound mainline experiences significant traffic congestion in both the AM and PM peak hours due to queuing from downstream bottlenecks. The queuing analysis is utilized to identify any potential queueing and "spill back" onto the freeway mainline from the off-ramps. Caltrans Guidelines do not provide a significance criteria for off-ramp queues. Where applicable, the freeway mainline is assumed to operate at LOS F.

Freeway Analysis Impacts

The Project is anticipated to have a **cumulatively considerable** impact to the identified freeway mainline segments and merge/diverge ramp junctions. No mitigation measures have been identified as no other improvements beyond those planned by the I-215 North Project have been evaluated. Neither Caltrans

nor the state have adopted a fee program that can ensure that locally contributed impact fees will be tied to improvements to freeway mainlines, and only Caltrans has the jurisdiction over mainline improvements. Because Caltrans has exclusive control over state highway improvements, ensuring that fair share contributions to mainline improvements are actually part of a program tied to implementation is within the jurisdiction of Caltrans and beyond the control of the March JPA (refer to **MM-TRAF-18**). As such, the impacts are considered **significant and unavoidable**.

Construction Traffic

Traffic operations during the proposed construction phase of the Project may potentially result in short-term traffic deficiencies related to construction employees, export of materials, and import of construction materials, etc. It is anticipated that the following construction-related activities would generate traffic and may potentially result in temporary construction-related traffic deficiencies:

- Construction employee commutes;
- Import of construction materials and soils; and
- Transport and use of heavy construction equipment.

Additionally, the Project would include improvements to the Cactus Avenue Drainage Channel that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project's frontage, and further to the east ending at the Heacock Channel. The current drainage ditch is planned to be undergrounded in a box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). This portion of the Project is being discussed with Riverside County Flood Control and Water Conservation District and the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan.

To minimize the impact of construction activities, the applicant would be required to develop and implement a March JPA-approved Construction Traffic Management Plan addressing potential construction-related traffic detours and disruptions. In general, the Construction Traffic Management Plan would ensure that to the extent practical, construction traffic would access the Project site during off-peak hours; and that construction traffic would be routed to avoid travel through, or proximate to, sensitive land uses. With the incorporation of **MM-TRAF-19**, short term construction impacts would be **less than significant**.

Threshold TRAF-3. Would the Project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

The March JPA designated truck route map is shown on Exhibit 3-10 in the TIA (Appendix R). I-215, Alessandro Boulevard (west of I-215), Meridian Parkway, Innovation Drive, Van Buren Boulevard, and Cactus Avenue are identified as designated truck routes. As shown on Exhibit 4-2 in Appendix R, 100% of outbound truck trips are estimated to utilize Cactus Avenue, with 90% of trips distributed to the west towards I-215 and 10% of trips distributed to the east. Cactus Avenue and I-215 are designated truck routes, and these roadways have been identified by March JPA as being designed to adequately support tractor trailer traffic. As the majority of truck traffic will be distributed along these roadways, the introduction of Project-related truck trips would not be considered an incompatible use.

All roadway improvements required as a result of the Project, whether located on or off site, would be designed and constructed in accordance with all applicable local, state, and federal roadway standards and practices. The Project driveways at Veteran's Way/Driveway 1/Cactus Avenue (#21) and Frederick Street/Driveway 2/Cactus Avenue (#23) will be improved and designed per local standards to accommodate Project traffic. Implementation of these improvements would be overseen by the lead agency and their qualified traffic engineers and are detailed in **MM-TRAF-16** and **MM-TRAF-17**.

This approach would ensure compliance with any and all applicable roadway design requirements. As such, no hazardous design features would be part of the Project's roadway improvements. Therefore, impacts associated with hazardous design features or incompatible uses in conjunction with the implementation of MM-TRAF-16 and MM-TRAF-17 would be **less than significant**.

Threshold TRAF-4. Would the Project result in inadequate emergency access?

All areas of the Project site would be accessible to emergency responders during both Project construction and operation. Local access to the proposed Project would be provided via existing roadways, including Cactus Avenue and Alessandro Boulevard.

A total of two driveways off Cactus Avenue would be provided, each of which would be designed and constructed according to March JPA standards. Similarly, the internal drive aisles, and loading and parking areas would be designed to comply with March JPA width, clearance, and turning radius requirements.

In addition, due to the typical wide turning radius of large trucks, a truck turning template was overlaid on the site plan at Veteran's Way (Driveway 1) and Frederick's Street (Driveway 2) on Cactus Avenue, which are anticipated to be utilized by heavy trucks, in order to determine

appropriate curb radii and to verify that trucks would have sufficient space to execute turning maneuvers. For the purposes of this evaluation, the WB-67 class truck template was used. WB-67 class trucks are approximately 73.5 feet in length.

Exhibit 1-5 in the TIA (Appendix R) illustrates the proposed truck access for the site and circulation for each of the applicable Project driveways and turning movements. The recommended curb radii of 40 feet for both driveways are anticipated to accommodate the ingress and egress of trucks. Therefore, impacts associated with hazardous design features or emergency access would be **less than significant**.

4.11.6 Mitigation Measures

Measures to Reduce Operational-Related Impacts

The recommended on-site and site-adjacent roadway measures for the Project are provided below. These mitigation measures would be imposed as conditions of approval as part of the Project approval. Construction of on-site and site-adjacent improvements shall occur in conjunction with adjacent Project development activity, or as needed for Project access purposes. The mitigation measures are organized by the scenario in which the impact occurs: Existing, Cumulative or Horizon Year.

Existing Conditions

MM-TRAF-1 Elsworth Street/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall contribute its fair-share towards the modification of the traffic signal to implement protected left turn phasing on the northbound and southbound approaches; and, restriping of the northbound shared left-though-right turn lane and southbound shared left-through lane. The signal modification shall include traffic signal synchronization improvements along Cactus Avenue

Opening Year Cumulative Conditions

MM-TRAF-2 Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements:

- Modify the traffic signal to implement protected left turn phasing on the northbound, southbound, and eastbound approaches; and, include traffic signal synchronization improvements along Cactus Avenue
- Add a second northbound left turn lane
- Add a third westbound through lane
- Add a westbound right turn lane

MM-TRAF-3 Elsworth Street/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements:

- Modify the traffic signal to implement protected left turn phasing on the northbound and southbound approaches; and, include traffic signal synchronization improvements along Cactus Avenue

MM-TRAF-4 Heacock Street/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements:

- Add a third eastbound through lane
- Add a third westbound through lane
- Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue

Horizon Year Traffic Conditions

MM-TRAF-5 Sycamore Canyon Boulevard/Alessandro Boulevard: Prior to issuance of first certificate of occupancy, the Project shall contribute its fair share towards the installation of a second northbound left turn lane; and, the modification of the traffic signal to implement protected left turn phasing on the southbound, eastbound, and westbound approaches.

MM-TRAF-6 I-215 southbound ramps/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements:

- Add a third eastbound through lane
- Add a second westbound left turn lane
- Add a third westbound through lane
- Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue

MM-TRAF-7 I-215 northbound ramps/Alessandro Boulevard: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the installation of a second northbound left turn lane.

MM-TRAF-8 Old 215 Frontage Road/Alessandro Boulevard: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements:

- Add a third eastbound through lane
- Add a third westbound through lane

MM-TRAF-9 Old 215 Frontage Road/I-215 northbound ramps/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share toward the following improvements:

- Modify the traffic signal to implement protected left turn phasing on the southbound approaches; and, include traffic signal synchronization improvements along Cactus Avenue
- Add a second northbound through lane
- Add two southbound right turn lanes
- Add a second eastbound left turn lane
- Add a third eastbound through lane
- Add an eastbound right turn lane
- Add a fourth westbound through lane

MM-TRAF-10 Day Street/Alessandro Boulevard: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the following improvements:

- Add a third westbound through lane

MM-TRAF-11 Elsworth Street/Alessandro Boulevard: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the addition of a second northbound left turn lane.

MM-TRAF-12 Elsworth Street/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share toward the following improvements:

- Add a second northbound left turn lane
- Add a fourth eastbound through lane
- Add a fourth westbound through lane
- Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue

MM-TRAF-13 Frederick Street/Alessandro Boulevard: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the addition of a third eastbound through lane.

MM-TRAF-14 Graham Street/Riverside Drive/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share towards the addition of a second eastbound left turn lane.

MM-TRAF-15 Heacock Street/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall pay its fair share toward the following improvements:

- Add a third eastbound through lane
- Add a third westbound through lane
- Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue

On-Site Access and Driveways

MM-TRAF-16 Veteran's Way/Driveway 1/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall construct the following improvements:

- Construct northbound approach with left turn lane, and shared through-right lane
- Re-stripe southbound left-right turn lane to a through lane
- Add westbound left turn lane
- Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue

MM-TRAF-17 Frederick Street/Driveway 2/Cactus Avenue: Prior to issuance of first certificate of occupancy, the Project shall construct the following improvements:

- Construct northbound approach with left turn lane, through lane, and right turn lane
- Re-stripe southbound right turn lane to a through-right lane
- Add westbound left turn lane
- Modify traffic signal to include traffic signal synchronization improvements along Cactus Avenue

MM-TRAF-18 WRCOG TUMF Contribution: Prior to the issuance of building permits, the Project applicant shall participate in the WRCOG TUMF fee programs by paying the requisite fees at the time of building permit. Improvements may be eligible for a fee credit or reimbursement through the program where appropriate. Table 4.11-28 provides share calculations in the event a particular facility is not included in a pre-existing fee program.

Measures to Reduce Construction-Related Impacts

MM-TRAF-19 Construction Traffic Management Plan: Prior to the issuance of building permits, the Project applicant would be required to develop and implement a March JPA-approved Construction Traffic Management Plan addressing potential construction-related traffic detours and disruptions. In general, the Construction Traffic Management Plan would ensure that to the extent practical, construction traffic would access the Project site during off-peak hours; and that construction traffic would be routed to avoid travel through, or proximate to, sensitive land uses.

Source: Appendix R.

1 Improvements included in TUMF fee program. Although identified as a TUMF facility, the improvement is not currently identified on the Northwest Zone 5-Year Transportation Improvement Program Amendment (adopted January 6, 2014).

2 Costs have been estimated using the data provided in Appendix G of the CMP (2003 Update) for preliminary construction costs.

3 Appendix G costs escalated by a factor of 1.484 except Traffic Signals. This is consistent with the methodology used by other near-by agencies.

4 Program improvements constructed by Project may be eligible for fee credit, at discretion of the March JPA. See Table 1-5 for Fair Share Calculations.

5 Rough order of magnitude cost estimate.

6 Improvements are Project design features as they are either site adjacent roadway improvements or needed for site access.

7 Total Project fair share contribution consists of the improvements which are not already included in the County TUMF for those intersections wholly or partially within the March JPA.

8 Total Project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Riverside.

9 Total Project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the County of Riverside.

10 Total Project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within the City of Moreno Valley.

11 Total Project fair share contribution consists of the improvements which are not already included in a fee program for those intersections wholly or partially within Caltrans' jurisdiction.

12 The TUMF nexus study identifies I-215/Cactus overcrossing ($22,280,000). Although the individual improvements are not specifically identified in the nexus study, they are likely to be part of the overall interchange improvements.

4.11.7 Level of Significance after Mitigation

On-Site, Site-Adjacent, and Off-Site Circulation (Thresholds TRAF-1 and TRAF-2)

With **MM-TRAF-1**, the Project shall modify the traffic signal at the intersection of Veteran's Way/Driveway 1/Cactus Avenue, reducing Project impacts to **less than significant.**

With **MM-TRAF-2**, the Project shall modify the traffic signal at the intersection of Frederick Street/Driveway 2/Cactus Avenue, reducing Project impacts to **less than significant**.

With **MM-TRAF-3**, the Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the south leg of the Overlook Parkway/Canyon Crest/Alessandro Boulevard, increasing intersection operations to LOS D and reducing Project impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-4**, the Project shall pay its fair share towards the modification of the traffic signal at the intersection of Elsworth Street/Cactus Avenue, increasing intersection operations to LOS C and reducing the Project impacts to **less than significant**.

With **MM-TRAF-5**, the Project shall pay its fair share towards the restriping of lanes and the modification of the traffic signal at the intersection of Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-6**, the Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the southbound approach at the intersection of Sycamore Canyon Boulevard/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of City and County of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-7**, the intersection of Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards the traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the

improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-8**, the intersection of Heacock Street/Cactus Avenue is anticipated to operate at LOS D during with fair share contributions to lane additions, thus reducing the Project's contribution to cumulative impact to **less than significant**.

With **MM-TRAF-9**, the intersection of Sycamore Canyon Boulevard/Alessandro Boulevard is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-10**, the intersection of I-215 southbound ramps/Cactus Avenue is anticipated to operate at LOS A during the AM peak hour and at LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-11**, the intersection of I-215 northbound ramps/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-12**, the intersection of Old 215 Frontage Road/Alessandro Boulevard is anticipated to operate at LOS C with fair share contributions towards lane modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of Moreno Valley and the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-13**, the intersection of Old 215 Frontage Road/I-215 northbound ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-14**, the intersection of Elsworth Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-15**, the intersection of Elsworth Street/Cactus Avenue is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impacts to **less than significant**.

With **MM-TRAF-16**, the intersection of Frederick Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered **significant and unavoidable**.

With **MM-TRAF-17**, the intersection of Graham Street/Riverside Drive/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impacts to **less than significant**.

With **MM-TRAF-18**, the intersection of Heacock Street/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impacts to **less than significant**.

Despite the incorporation of **MM-TRAF-19,** since some of the required improvements identified herein are within the jurisdiction of another public agency and not the lead agency, impacts associated with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, as well as impacts related to an applicable congestion management program, would be considered **significant and unavoidable** following the incorporation of mitigation measures. (See intersection mitigations immediately above for intersections that are outside of the jurisdiction of the March JPA.)

Construction Traffic (Thresholds TRAF-1 and TRAF-2)

With the incorporation of **MM-TRAF-19**, short-term construction impacts associated with the delivery and removal of heavy equipment would be **less than significant**.

Hazardous Design Features and Incompatible Uses (Threshold TRAF-4)

No mitigation measures associated with hazardous design features and incompatible uses are required. Impacts would be **less than significant**.

Emergency Access (Threshold TRAF-5)

No mitigation measures associated with air traffic patterns are required. Impacts would be **less than significant**.

Public Transit and Alternative Transpiration Facilities (Threshold TRAF-6)

No mitigation measures associated with Public Transit and Alternative Transpiration Facilities are required. Impacts would be **less than significant**.

4.12 TRIBAL CULTURAL RESOURCES

This section provides an analysis of the potential impacts to tribal cultural resources (TCRs) from the implementation of the K4 Warehouse and Cactus Channel Improvements (proposed Project or Project). This analysis is based on a review of two separate technical studies prepared by CRM TECH in support of the proposed Project. These studies include the following reports: *Identification and Evaluation of Historic Properties K4 Parcel Project* and the *Identification and Evaluation of Historic Properties Cactus Avenue Drainage Channel Improvement Project*, both prepared in August 2018 (Appendices G and H, respectively, of this Environmental Impact Report (EIR)).

Both studies (Appendix G and H) were prepared in compliance with the California Environmental Quality Act (CEQA); however, the Cactus Channel improvements include a federal nexus. The Cactus Channel improvements are subject to federal review by the United States Army Corp of Engineers as a responsible agency under CEQA. Therefore, Appendix H was also completed in accordance with Section 106 of the National Historic Preservation Act (NHPA). Furthermore, this analysis includes the review of existing cultural resources; technical data; and applicable laws, regulations, and guidelines from each study to adequately assess the potential impacts to TCRs.

As discussed in Chapter 2, Project Description, of the EIR, the proposed Project includes the development of an approximately 718,000-square-foot industrial warehouse with 598 automobile parking stalls and 242 truck trailer parking stalls on the K4 Parcel and the conversion of the existing Cactus Avenue Drainage Channel (Cactus Channel) from an open-air earthen channel into an underground concrete culvert for approximately 7,900 linear feet between Elsworth Street on the west and Heacock Street and Heacock Channel on the east. The K4 Parcel is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The proposed Project includes the following components:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The proposed Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial (IND) for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

4.12.1 Existing Conditions

The K4 Parcel is located within the March Joint Powers Authority (JPA) jurisdiction, which is within unincorporated Riverside County, California (Figure 2-1, Project Location). The Interstate (I) 215 is located approximately 0.8 miles east of the K4 Parcel. The K4 Parcel is comprised of five parcels designated as Assessor's Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The Cactus Channel runs along the south side of Cactus Avenue until it reaches Heacock Street and connected with the Heacock Channel.

The Project Area of Potential Effects (APE), which collectively consists of the K4 Parcel and the Cactus Channel, is located on the south side of Cactus Avenue and immediately north of March Air Reserve Base (ARB). The five parcels within the K4 Parcel consists of undeveloped land situated along the northern perimeter of the March ARB. In addition, the Cactus Channel runs approximately 7,900 linear feet along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the K4 Parcel frontage, and further to the east ending at the Heacock Channel.

Appendices G and H of this EIR, document the results of a California Historical Resources Information System (CHRIS) search conducted at the Eastern Information Center (EIC), and a search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) and tribal coordination.

Eastern Information Center Records Search

CRM TECH completed a CHRIS search at the EIC for the Project APE and surrounding 1-mile radius on May 15, 2018 for the K4 Parcel (Appendix G) and July 19, 2018 for the Cactus Channel (Appendix H). This search included mapped prehistoric, historical, and built-environment resources; Department of Parks and Recreation site records; technical reports; properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Landmarks. Additional consulted sources included the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), and the California Historical Resources Inventory. No prehistoric resources or TCRs were identified in the Project APE as a result of the CHRIS records search (see Section 4.4, Cultural Resources).

Native American Coordination-Sacred Lands File Search and Tribal Outreach

CRM TECH requested a search of the Sacred Lands File (SLF) from the California NAHC for the K4 Parcel on May 14, 2018; this was later deemed adequate for the Cactus Channel Improvement Site. The NAHC responded in a letter dated May 17, 2018, stating that the results of the SFL search failed to indicate the presence of Native American cultural resources within the Project APE. The NAHC also provided a list of Native American groups and/or individuals who may have knowledge of cultural resources in the Project APE. In addition to or in lieu of some of the

individuals recommended by the NAHC, CRM TECH also contacted other spokespersons for the tribes provided by the NAHC. Twelve responses were received related to the K4 Parcel, and ten responses were received related to the Cactus Channel, and are summarized in Table 4.12-1 (Appendices G and H).

Table 4.12-1
Native American Tribal Communications

Native American Tribes	Response Received
K4 Parcel (Appendix G)	
San Manuel Band of Mission Indians	Stated that the Project APE is outside of tribe's ancestral territory and declined consulting party status.
Santa Rosa Band of Cahuilla Indians	No concerns regarding the Proposed Project.
Agua Caliente Band of Cahuilla Indians	Requested all documentation associated with the cultural study for tribal review.
Morongo Band of Mission Indians	Requested all documentation associated with the cultural study for tribal review.
Augustine Band of Cahuilla Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the proposed Project. The tribe recommended further consultation with other tribes in the vicinity, to be notified of the discovery of any Native American cultural resources, and monitoring of ground-disturbing work in the Project APE.
Cabazon Band of Mission Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the Proposed Project
Cahuilla Band of Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the Proposed Project. However, the tribe requested to be informed on the progress of the Project.
Pauma Band of Luiseno Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the Proposed Project. However, the tribe requested to be informed on the progress of the Project.
Rincon Band of Luiseno Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the Proposed Project
Serrano Nation of Indians	The tribe requested to be notified if any Native American cultural resources are encountered during the implementation of the Proposed Project.
Pechanga Band of Luiseno Indians	The tribe participated in the survey of the Project APE and found the Project vicinity to be culturally sensitive and requested further consultation with March JPA. Furthermore, the tribe requested that a representative from their tribe and monitor for all earth-moving work associated with the Proposed Project along with an archaeological monitor.
Soboba Band of Luiseno Indians	The tribe participated in the survey of the Project APE and found the Project vicinity to be culturally sensitive and requested further consultation with March JPA. Furthermore, the tribe requested that a representative from their tribe monitor for all earth-moving work associated with the Proposed Project.

Table 4.12-1
Native American Tribal Communications

Native American Tribes	Response Received
Cactus Channel (Appendix H)	
Pechanga Band of Luiseño Indians	The representative had no comments regarding the undertaking at this time.
Cabazon Band of Mission Indians	The representative had no specific information on any Native American cultural resources in the APE.
San Manuel Band of Mission Indians	The representative noted that the APE was outside the tribe's ancestral territory and declined to participate in further consultations over this undertaking.
Rincon Band of Luiseño Indians	The representative indicated that their tribes had no information on any Native American cultural resources in or near the APE. The representative requested to review the records search results in this study.
Augustine Band of Cahuilla Indians	The representative indicated that their tribes had no information on any Native American cultural resources in or near the APE, and encouraged further consultation with other tribes in the vicinity and monitoring during ground-disturbing activities in the APE. The representative requested to be notified immediately if any Native American cultural resources were discovered during the undertaking.
Pauma Band of Luiseño Indians	The representative requested to be notified immediately if any Native American cultural resources were discovered during the undertaking.
Agua Caliente Band of Cahuilla Indians	The representative identified the APE as a part of their tribes' traditional use area, and requested copies of the completed cultural resources study for tribal review.
Cahuilla Band of Indians	The representative identified the APE as a part of their tribes' traditional use area, and stated that the tribe was not aware of any Native American cultural resources in or near the APE but requested that tribal monitors be present during all ground-disturbing activities for the undertaking.
Morongo Tribal Historic Preservation Office	The representative identified the APE as a part of their tribes' traditional use area, and requested copies of the completed cultural resources study for tribal review.
Soboba Band of Luiseño Indians	The representative identified the APE to be a part of the tribe's traditional use area and found the location to be culturally sensitive, and requested to participate in further consultation with Lewis Retail Centers, March JPA, and ACOE, and to monitor future ground-disturbing activities associated with the undertaking. In addition, the representative stated that an in-house database search identified "multiple areas of potential impacts" and offered to share specific information during future consultation with March JPA and ACOE.

Notes: APE = area of potential effect; JPA = Joint Powers Authority; ACOE = U.S. Army Corps of Engineers.

The results of the tribal outreach process conducted for both the K4 Parcel and Cactus Channel, are available as Appendix 2 in both Cultural Resources Studies prepared by CRM TECH, which are included as Appendices G and H of this EIR. This outreach was conducted for informational purposes only and did not constitute formal government-to-government consultation as specified by AB 52, which is discussed in detail in the following section.

Assembly Bill 52

A project with an effect that may cause a substantial adverse change in the significance of a TCR is a project that may have a significant effect on the environment (PRC Section 21084.2). Under AB 52, a TCR must have tangible, geographically defined properties that can be impacted by project implementation. The proposed Project is subject to compliance with AB 52.

The lead agency, March JPA, sent notification of the proposed Project to all California Native American tribal representatives that have requested Project notifications from March JPA pursuant to AB 52 and that are on file with the NAHC as being traditionally or culturally affiliated with the geographic area on March 24, 2018. These notification letters included a Project map and description, and inquired if the tribe would like to consult to discuss the Project and the potential to impact any TCRs. AB 52 allows tribes 30 days after receiving notification to request consultation. If a response is not received within the allotted 30 days, it is assumed that consultation is declined. As discussed in Appendices G and H, requests for comments were sent to 17 tribal representatives. Twelve tribes responded to the request related to the K4 Parcel, and ten tribes responded to the request related to the Cactus Channel. To date, government-to-government consultation initiated by the March JPA has not resulted in the identification of a TCR within or near the Project site.

Senate Bill 18

According to SB 18, March JPA has a responsibility to initiate consultation with tribes/groups listed on the California NAHC's official SB 18 contact list for amendment of a General Plan. SB 18 requires March JPA to send a letter to each contact on the NAHC's SB 18 list, extending an invitation for consultation. Tribes will have 90 days from receipt of the letter to request consultation. March JPA must also send a notice to all contacts 45 days prior to adopting the amended General Plan, as well as a third notice 10 days prior to any public hearing regarding the General Plan amendment.

March JPA sent notification of the proposed Project to all California Native American tribal representatives that have requested Project notifications pursuant to SB 18 and that are on file with the NAHC as being traditionally or culturally affiliated with the geographic area on March 24, 2018. These notification letters included a Project map and description inquiring if the tribe would like to consult on the proposed Project. To date, government-to-government consultation initiated by March JPA has not resulted in the identification of any cultural resources within or near the Project site.

Cultural Resources Survey

CRM TECH conducted a pedestrian survey on June 1, 2018 for the K4 Parcel and on July 27, 2018 for the Cactus Channel and did not result in the identification of Native American cultural resources (see Section 4.4).

In summary, no Native American cultural resources were identified within the Project APE as a result of the CHRIS records search, Native American outreach, or intensive pedestrian survey.

4.12.2 Relevant Plans, Policies, and Ordinances

State

The California Register of Historical Resources

In California, the term "historical resource" includes, but is not limited to, "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated as follows. According to Public Resources Code (PRC) Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

> (1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
>
> (2) Is associated with the lives of persons important in our past.
>
> (3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
>
> (4) Has yielded, or may be likely to yield, information important in prehistory or history.

To understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

California Environmental Quality Act

As described further, the following CEQA statutes (PRC Section 21000 et seq.) and CEQA Guidelines (14 CCR 15000 et seq.) are of relevance to the analysis of archaeological, historic, and TCRs:

- PRC Section 21083.2(g) defines "unique archaeological resource."
- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource"; it also defines the circumstances when a project would materially impair the significance of a historical resource.
- PRC Section 21074(a) defines "tribal cultural resources."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; 14 CCR 15064.5(b)). If a site is listed or eligible for listing in the CRHR, included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1(q)), it is an "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; 14 CCR 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; 14 CCR 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the

resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (14 CCR 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project does any of the following:

> (1) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
>
> (2) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
>
> (3) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA (14 CCR 15064.5(b)(2)).

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a)–(c)).

Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

> (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
>
> (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.
>
> (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person (PRC Section 21083.2(g)).

Impacts on non-unique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); 14 CCR 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as a TCR (PRC Sections 21074(c) and 21083.2(h)), further consideration of significant impacts is required.

CEQA Guidelines Section 15064.5 assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. Described as follows, these procedures are detailed in PRC Section 5097.98.

California State Assembly Bill 52

AB 52 of 2014 amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 established that TCRs must be considered under CEQA and also provided for additional Native American consultation requirements for the lead agency. Section 21074 describes a TCR as a site, feature, place, cultural landscape, sacred place, or object that is considered of cultural value to a California Native American tribe. A TCR is either:

- On the CRHR or a local historic register; Eligible or determined eligible for the CRHR or included in a local historic register; or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the geographic area of the project if the tribe has requested in writing to be informed of projects by the lead agency and if the tribe requested consultation regarding the project in writing within 30 days of receipt of the lead agency's formal notification of the project. Lead agencies are required to begin consultation within 30 days of receiving the tribe's request for consultation and prior to the release of a negative declaration, mitigated negative declaration, or EIR.

Any information submitted by a California Native American tribe during the environmental review process shall not be included in the environmental review document or otherwise disclosed (PRC, Section 21082.3). No document prepared for public examination shall include information about the location of sacred sites (CEQA, Section 15120(d)).

Section 1 (a)(9) of AB 52 establishes that "a substantial adverse change to a TCR has a significant effect on the environment." Effects on TCRs shall be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American

tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to TCRs, the consultation shall include those topics (PRC Section 21080.3.2(a)). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3(a)).

California State Senate Bill 18

The Local and Tribal Intergovernmental Consultation process, commonly known as SB 18 was signed into law September of 2004 and took effect March 1, 2005. SB 18 refers to PRC Sections 5097.9 and 5097.995 which defines cultural places as:

- Native American sanctified cemetery place of worship, religious or ceremonial site, or sacred shrine (PRC Section 5097.9).
- Native American historic, cultural, or sacred site, that is listed or may be eligible for listing in the California Register of Historic Resources pursuant to Section 5024.1, including any historic or prehistoric ruins, any burial ground, any archaeological or historic site (PRC Section 5097.993).

SB 18 established responsibilities for local governments to contact, provide notice to, refer plans to, and consult with California Native American Tribes that have been identified by the NAHC and if that tribe requests consultation after local government outreach as stipulated in Government Code (GC) Section 65352.3. The purpose of this consultation process is to protect the identity of the cultural place and to develop appropriate and dignified treatment of the cultural place in any subsequent Project. The consultation is required whenever a general plan, specific plan, or open space designation is proposed for adoption or to be amended.

In addition to the requirements stipulated above, SB 18 amended GC Section 65560 to "allow the protection of cultural places in open space element of the general plan" and amended Civil Code Section 815.3 to add "California Native American tribes to the list of entities that can acquire and hold conservation easements for the purpose of protecting their cultural places."

As part of the application process, California Native American Tribes must be given the opportunity to consult with the applicant of the Project and with the March JPA for the purpose of preserving, mitigating impacts to, and identifying cultural places located on Project land within the March JPA's jurisdiction. The Project involves a General Plan Amendment to approximately 35.4-acres of the Project APE (APNs 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0); therefore, SB 18 applies to the Project. The consultation process initiated by March JPA for the Project began on [insert date], 2018. The period for the tribes to request consultation is 90 days after this request is received. To date, March JPA has received zero SB 18 letters. Once local governments have sent notification, tribes are responsible for requesting

consultation. Pursuant to GC Section 65352.3(a)(2), each tribe has 90 days from the date on which they receive notification to respond and request consultation.

4.12.3 Thresholds of Significance

March JPA uses the California Environmental Quality Act (CEQA) Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the IS prepared for the Project (Appendix A, Initial Study and Notice of Preparation) and the newly adopted CEQA Guidelines Appendix G (December 2018), a significant impact related to TCRs would occur if the project would:

- **TCR-1**: Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
  a. Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or
  b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

4.12.4 Impacts Analysis

Threshold TCR-1. ***Would the Project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:***

a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

As described in Section 4.4, a CHRIS records search was conducted at the EIC on May 15, 2018 for the K4 Parcel (Appendix G) and July 19, 2018 for the Cactus Channel (Appendix H), for the proposed Project APE and within a 1-mile buffer around the APE. No Native American cultural resources were identified within the Project APE as a result of the CHRIS records search. To date, government-to-government consultation initiated

by the March JPA has not resulted in the identification of a TCR within or near the Project site. Further, no TCRs have been identified by California Native American tribes as part of March JPA's AB 52 or SB 18 notification and consultation process. **Impacts are considered less than significant.** No mitigation is required.

b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

As discussed previously in this section, there are no resources on the Project APE that have been determined by March JPA to be significant pursuant to the criteria set forth in PRC Section 5024.1. To date, government-to-government consultation initiated by the March JPA has not resulted in the identification of a TCR within or near the Project site. Further, no TCRs were identified in the Project APE by California Native American tribes as part of the March JPA's AB 52 or SB 18 notification and consultation process.

As no information regarding TCRs has been received by March JPA, it has determined that no TCRs are present on the Project APE. However, there is still a low potential for unknown subsurface TCRs to be impacted by the Project. The following approach (see mitigation measure **MM-TCR-1**) for the inadvertent discovery of TCRs has been prepared to ensure there are no impacts to unanticipated resources. Should a potential TCR be inadvertently encountered, construction activities near the encounter would be temporarily halted within 50 feet of the discovery and March JPA notified. March JPA will notify Native American tribes that have been identified by the NAHC to be traditionally and culturally affiliated with the geographic area of the Project. If the unanticipated resource is archaeological in nature, appropriate management requirements would be implemented, as outlined in mitigation measure **MM-CUL-1** (see Section 4.4). If March JPA determines that the potential resource appears to be a TCR (as defined by Public Resources Code, Section 21074), any affected tribes consulting under AB 52 would be provided a reasonable period of time, typically five days from the date a new discovery is made, to conduct a site visit and make recommendations regarding future ground-disturbance activities, as well as the treatment and disposition of any discovered TCRs. Depending on the nature of the potential resource and tribal recommendations, review by a qualified archaeologist may be required. Implementation of proposed recommendations will be made based on the determination of March JPA that the approach is reasonable and feasible. With the implementation of mitigation measure MM-TCR-1, all activities would be conducted

in accordance with regulatory requirements. As such, impacts are considered **less than significant with mitigation incorporated.**

4.12.5 Mitigation Measures

The following mitigation measures would ensure that the Project has a less-than-significant impact on TCRs.

MM-TCR-1 **Inadvertent Discovery of Tribal Cultural Resources.** While no Tribal Cultural Resources (TCRs) have been identified that may be affected by the proposed Project, the following approach for the inadvertent discovery of TCRs has been prepared to ensure there are no impacts to unanticipated resources. Should a potential TCR be encountered, construction activities near the encounter shall be temporarily halted within 50 feet of the discovery and March Joint Powers Authority (JPA) notified. March JPA will notify Native American tribes that have been identified by the Native American Heritage Commission (NAHC) to be traditionally and culturally affiliated with the geographic area of the Project. If the potential resource is archaeological in nature, appropriate management requirements shall be implemented as outlined in Mitigation Measure **MM-CUL-1** (see Section 4.4.5, Mitigation Measures). If March JPA determines that the potential resource is a TCR (as defined by PRC, Section 21074), tribes consulting under AB 52 and SB 18 would be provided a reasonable period of time, typically 5 days from the date of a new discovery is made, to conduct a site visit and make recommendations regarding future ground disturbance activities as well as the treatment and disposition of any discovered TCRs. A qualified archaeologist shall implement a plan for the treatment and disposition of any discovered TCRs based on the nature of the resource and considering the recommendations of the tribe(s). Implementation of proposed recommendations made pursuant to **MM-TCR-1** will be made based on the determination of March JPA that the approach is reasonable and feasible.

4.12.6 Level of Significance After Mitigation

With adherence to the aforementioned mitigation measure, the potential for impacts to TCRs would be **less than significant**.

INTENTIONALLY LEFT BLANK

4.13 UTILITIES AND SERVICE SYSTEMS

This section describes the existing utilities setting of the K4 Warehouse and Cactus Channel Improvement Project (proposed Project or Project) site, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. The section will analyze stormwater drainage facilities, water supplies, wastewater treatment, solid waste disposal, and compliance with applicable statues and regulations related to utilities and service systems.

In addition to other documents, the following references were used in preparation of this section of the EIR.

- Greenhouse Gas Technical Report (prepared by Ramboll, December 2018) (Appendix J)
- Water Supply Assessment K-4 Industrial Project (prepared for Western Municipal Water District, September 2018) (Appendix P)
- Hydrology Study for Cactus Avenue K-4 Parcel Industrial (prepared for Meridian Park LLC, July 2018) (Appendix M)
- Hydrology Study for Cactus Avenue Channel (prepared for Meridian Park LLC, August 2018) (Appendix N)
- Project Specific Water Quality Management Plan (prepared for Meridian Park LLC, March 2018) (Appendix O)

As mentioned in Chapter 2, Project Description, of this EIR, the proposed Project involves the development of the K4 Parcel with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use and improvements to the Cactus Avenue Drainage Channel at the Channel Improvement Site. The Project includes the following components for Project approval:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial (IND) for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.

- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into one 35.4-acre parcel.

4.13.1 Existing Conditions

The Project site, which collectively consists of the K4 Parcel and the Cactus Avenue Drainage Channel (Cactus Channel), is located south of Cactus Avenue and immediately north of March Air Reserve Base (ARB). The K4 Parcel is located within the March Joint Powers Authority (JPA) jurisdiction, which is within unincorporated Riverside County, California. The K4 Parcel is located within the former boundaries of the March Air Force Base (now known as the March ARB), in the northern area. The Cactus Channel portion of the Project is located along the south side of Cactus Avenue, extending from Elsworth Street on the west to Heacock Street and Heacock Channel on the east. The portion of the Cactus Channel that would be improved as part of the proposed Project runs a total of 7,900 linear feet.

The surrounding area consists of vacant land, commercial and industrial properties and the March ARB. Adjacent to the north of the K4 Parcel and Cactus Channel, across Cactus Avenue, is an industrial and commercial center. To the east, the K4 Parcel is bounded by vacant land and an electrical substation. To the south, the K4 Parcel is bordered by March ARB and to the west the K4 Parcel is bordered by a vacant lot and March ARB.

Stormwater

The existing site is approximately 35.4 acres of natural open brush. Generally, surface flows on the Project drain in a southeast direction, onto the March ARB, eventually entering the Heacock Channel, located approximately 1.5 miles to the southeast (Appendix M). Flows within the existing Cactus Channel flow from west to east, where they then turn south and flow into the Heacock Channel.

The Project site is located in the Santa Ana River Region, which is within the Riverside County Drainage Area Management Plan area. The plan addresses the requirements of the municipal separate storm sewer system (MS4) permits issued to the Riverside County co-permittees by the Santa Ana Regional Water Quality Control Board (RWQCB). The March JPA is not a co-permittee of the Riverside County MS4 Permit; however, the March JPA has chosen to meet the intent of the Riverside County MS4 Permit related to compliance with stormwater discharge requirements by establishing submittal requirements – including design guidelines for best management practices and Water Quality Management Plans – for projects under its authority.

Existing Watersheds

The majority of the March JPA planning area, where the Project site is located, is within the San Jacinto Watershed. The San Jacinto Watershed is one of the three major geographical subdivisions

of the Santa Ana Basin and encompasses 760 square miles, including the San Jacinto River, which is the major drainage feature in the region. The northwest corner and part of the southwestern corner of the March JPA planning area are within the Upper Santa Ana watershed, which drains tributaries of the Upper Santa Ana River.

Water Supplies

The Western Municipal Water District (WMWD) supplies water for customers in Riverside County. WMWD serves eight wholesale customers and approximately 24,000 retail customers. WMWD's water supply portfolio consists mainly of imported supplies from the Colorado River and the State Water Project (SWP) but also includes recycled water and supplemental water obtained from the cities of Corona and Riverside, and other local projects. Various legal, regulatory, climatic, and environmental factors have the potential to affect the availability and reliability of SWP supplies. The California Department of Water Resources specifically accounts for these and other factors in evaluating the projected delivery capability of SWP supplies to MWD and other state contractors. The California Department of Water Resources' 2015 Final Report demonstrates the projected long-term average delivery amounts of the contractual SWP supply is projected to be 62% under current conditions. The goal for SWP supplies is to adaptively manage flow and export regulations in the near term and to achieve a long-term Delta solution that addresses ecosystem and water reliability challenges. Achieving this goal will require continued participation and a successful outcome in the California WaterFix and the California EcoRestore efforts. This approach targets an average of 980,000 AF of SWP supplies in the near term and 1.2 million AF on average starting in 2030 when a long-term Delta solution is estimated to be in place (Appendix P).

WMWD's general district consists of a 527-square-mile area of western Riverside County and an estimated population of more than 860,000. As a member agency of the Metropolitan Water District of Southern California (MWD), WMWD provides supplemental water on a wholesale basis to the cities of Corona, Norco, and Riverside and the water agencies of Box Springs Mutual Water Company, Eagle Valley Mutual Water Company, Elsinore Valley Municipal Water District, Temescal Valley Water District, and Rancho California Water District. WMWD serves retail customers in the unincorporated areas of El Sobrante, Eagle Valley, Temescal Creek, Woodcrest, Lake Mathews, and March Air Reserve Base.

In addition, the Project could be served by the Eastern Water District who has jurisdiction for water supply across the street and also has existing facilities directly across the street from the site that have sufficient capacity to serve the site. The option of water supply from Eastern Water District would require the approval of the Local Agency Formation Commission. Thus, a Water Supply Assessment (WSA) has been requested from Eastern Water District as an alternative option for water supply.

As discussed in Chapter 2, once constructed, the Project site could potentially be used up to 7 days per week and 24 hours per day. The anticipated water use is 12 acre-feet per year (AFY), which includes the estimated water demand of 130,212 square feet of landscaping and water use estimates of 750 employees (Appendix P).

Imported Water Supplies

Under normal water year conditions, WMWD service area relies on imported water supplies from MWD. The MWD is legislatively created agency charged with regional water supply management for large parts of Southern California. MWD holds contractual rights to receive SWP and Colorado River water supplies, and has developed other water supply programs and projects to expand its overall water portfolio. From that perspective, MWD has developed comprehensive and highly specialized modeling techniques to evaluate short, intermediate, and long-term availability and reliability of its total project supplies that are used to serve and supplement the needs of member agencies, including WMWD. The MWD's 2015 Regional Urban Water Management Plan has evaluated projected near, intermediate, and long-term water supply availability and reliability using historic hydrology. The MWD has capabilities that are sufficient to meet expected demands for its member agencies from 2020 through 2040 under single dry-year and multiple dry-year conditions. Additionally, the MWD has plans for supply implementation and continued development of a diversified resource portfolio including the Colorado River and SWP supplies, Central Valley transfers, local resource projects, and in-region storage that enables MWD to meet the water supply needs of its member agencies, including WMWD.

Potable Water

WMWD's retail service area covers approximately 104 square miles and provides water to an estimated population of 95,000 via about 24,000 service connections. WMWD purchases water from MWD that consists of both Colorado River and SWP supplies to serve its wholesale and retail customers. Most of the water purchased by WMWD is imported from the SWP with about 20% from the Colorado River. WMWD also obtains water through several local water supply projects and agreements.

WMWD's retail service area covers about 104 square miles and provides water to an estimated population of 95,000, via approximately 24,000 service connections. WMWD purchases water from MWD comprised of Colorado River and SWP supplies to serve its wholesale and retail customers. Most of the water purchased by WMWD is imported from the SWP with about 20% from the Colorado River. As set forth below, WMWD also obtains water through several local water supply projects and agreements. WMWD's main retail service area is within the County of Riverside.

Based on the total number of domestic customers, WMWD's retail service area experienced an annual average growth of approximately 5.8% between 2001 and 2010. WMWD's growth rate

was influenced by the undeveloped land in its retail service area compared to historically urban areas. This annual average growth rate then attenuated to approximately 1.14% between 2010 and 2015.5 The Southern California Association of Governments (SCAG) projected the annual growth rate for regional population will be only 0.7% through the year 2040.6 WMWD's 2015 Urban Water Management Plan projected the annual population growth rate within WMWD's service area at an average of 1.4% through the year 2040.

Groundwater

Groundwater resources in the Riverside County portion of the San Jacinto River hydrologic unit include the Perris, San Jacinto and Elsinore Valley hydrologic areas. The proposed Project is located within the San Jacinto Valley hydrologic area, and within the Perris Valley Hydrologic Subarea. The main aquifer in the Perris Valley is formed by coarse grained alluvial deposits. These deposits are highly permeable and can yield large amounts of water under unconfined conditions, The groundwater system in the Perris and Moreno Valleys is almost completely surrounded by non-water bearing rock to the extent that the amount of the water flowing into our out of the basin in negligible. Additionally, natural recharge to the aquifer results from primarily infiltration and precipitation. Recharge occurs by both natural and artificial means. Within the central portion of the March JPA planning area, artificial recharge occurs due to the Peacock Channel and irrigated areas within March Air Reserve Base and the Northeast Planning Subarea. The artificial recharge causes localized groundwater heights, which may impact the direction of groundwater flows. Groundwater movement in the region tends to follow surface topography. East of the planning area, groundwater primarily flows southwest through the Moreno Valley and into Perris Valley while groundwater gradient slopes gently to the southeast. In the northwest portion of the planning area, groundwater tends to flow towards the northwest, which is illustrative of the presence of a groundwater divide. North of the divide, groundwater flows generally to Sycamore Canyon. Most of the wells in the planning area have been abandoned due to insufficient yield and trichloroethylene (TCE) contamination.

Recycled Water

WMWD provides wastewater service to the unincorporated Riverside County areas north and east of Lake Matthews within its retail water service boundaries. This area is served by the Western Water Recycling Facility (WWRF). Treated water from the facility is provided to the Riverside National Cemetery and General Archie Old Golf Course as well as parks, schools, groves, and nurseries, representing a set of customers who previously were dependent on MWD supplies. With conversion of the distribution system from a non-potable system (when delivering raw MWD non-potable CRA water) to a recycled water system, those customers now have a new local and reliable supply which offsets demands for imported potable water supplies.

Wastewater Treatment

As stated above, WMWD provides wastewater service to the unincorporated Riverside County areas, which is served by the Wester Water Recycling Facility (WWRF), which is currently a three million gallon per day wastewater treatment facility producing tertiary treated recycled water.

Solid Waste

The Riverside County Waste Management Department (RCWMD) is responsible for the landfill disposal of non-hazardous county waste. RCWMD operates six active landfills and administers a contract agreement for waste disposal at the private El Sobrante Landfill. All of the active landfills currently located in Riverside County are rated as Class III landfills according to Title 27 of the California Code of Regulations (CCR). Class III landfills accept nonhazardous, municipal solid wastes including household refuse and yard trimmings as well as furniture, household appliances, televisions and computers, and other electronic wastes. According to the Riverside County General Plan EIR, waste originating from anywhere within Riverside County may be accepted for disposal at any of the County's sites. Table 4.13-1 summarizes the permitted daily capacity, current design capacity, remaining capacity, and estimated closure dates of the active landfills in Riverside County.

Table 4.13-1
Riverside County Active Landfills

Active Landfill	Permitted Daily Capacity (tons/day)	Current Design Capacity (cubic yards)	Remaining Capacity (cubic yards)	Estimated Landfill Closure Date
Badlands	4,800	34,400,000	15,748,799	1/1/2022
Blythe	400	6,229,670	3,834,470	8/1/2047
Desert Center	60	115,341	35,714	4/1/2087
El Sobrante	16,054	209,910,000	143,977,170	1/1/2051
Lamb Canyon	5,000	38,935,653	19,242,950	4/1/2029

Oasis	400	1,097,152	433,779	9/1/2055
Total:	**N/A**	**291,139,998**	**183,279,253**	**N/A**

Source: CalRecycle 2018.

Electricity

Electricity is provided to unincorporated Riverside County and the Project site by Southern California Edison (SCE). SCE provides electricity to March JPA. SCE, a subsidiary of Edison International, serves approximately 180 cities in 11 counties across central and Southern California. According to the California Public Utilities Commission (CPUC), approximately 76 billion kilowatt-hours (kWh) of electricity were used in SCE's service area in 2014. Demand

forecasts anticipate that approximately 75 billion kWh of electricity will be used in SCE's service area in 2020 (CPUC 2016).

SCE receives electric power from a variety of sources. According to CPUC's 2016 Biennial RPS Program Update, 23.2% of SCE's power came from eligible renewables, such as biomass/waste, geothermal, small hydroelectric, solar, and wind sources during the 2014–2016 compliance period (CPUC 2016). This is an increase from the 19.9% that SCE maintained for the 2011–2013 compliance period (CPUC 2014). SCE maintains a lower percentage of renewable energy procurement when compared with California's two other large Investor-Owned Utilities. The other two large utilities, Pacific Gas and Electric Company and San Diego Gas and Electric Company, procured 28% and 36% of their electric power, respectively, from eligible renewables in the 2014–2016 compliance period (CPUC 2016). SCE also maintains a slightly lower percentage of renewables relative to statewide procurement. The California Energy Commission estimates that about 26% of the state's electricity retail sales in 2015 came from renewable energy (CEC 2017). The RPS Program establishes a goal for California to increase the amount of electricity generated from renewable energy resources to 20% by 2010 and to 33% by 2020. Recent legislation revised the current RPS target for California to obtain 50% of total retail electricity sales from renewable sources by 2030, with interim targets of 40% by 2024, and 45% by 2027 (CPUC 2016).

The Air Quality Technical Report and Greenhouse Gas Technical Report, prepared by Ramboll (Appendices C and J), provides electricity consumption estimates for the proposed Project. The energy consumption developed for this Project uses factors published in the Southern California Air Quality Management District (SCAQMD) "CEQA Air Quality Handbook." Background information and energy sector forecasts were collected from a number of reports issued by the CEC and CPUC, which regulate these utilities, as well as the providers themselves. In situations where projects with large power loads are planned, this is considered together with other loads in the project vicinity, and electrical substations are upgraded.

Natural Gas

According to the CEC California Energy Consumption Database, California used approximately 10,054 million therms of natural gas in 2015 (CEC 2016), which is the most recent year of data available. The CPUC regulates natural gas utility service for approximately 10.8 million customers that receive natural gas from Pacific Gas & Electric, Southern California Gas (SoCalGas), San Diego Gas & Electric (SDG&E), Southwest Gas, and several smaller natural gas utilities. Pacific Gas & Electric and Southern California Gas own and operate several natural gas storage fields that are located in Northern and Southern California. These storage fields, and four independently owned storage utilities help meet peak seasonal natural gas demand and allow California natural gas customers to secure natural gas supplies more efficiently (CPUC 2017). SoCalGas would provide natural gas service to the land uses proposed for the Project site. SoCalGas provides March

JPA with natural gas service. SoCalGas' service territory encompasses approximately 20,000 square miles and more than 500 communities. In the California Energy Demand mid-energy demand scenario, natural gas demand is projected to have an annual growth rate of 0.03% in SoCalGas' service territory. As of 2012, approximately 7,357 million therms[1] were used in SoCalGas' service area per year. Around the time of Project building in 2020, natural gas demand is anticipated to be approximately 7,388 million therms per year in SoCalGas' service area (CEC 2014). The total capacity of natural gas available to SoCalGas in 2016 is estimated to be 3.9 billion cubic feet per day. In 2020, the total capacity available is also estimated to be 3.9 billion cubic feet per day[2] (California Gas and Electric Utilities 2016). This amount is approximately equivalent to 3.98 billion thousand British thermal units (kBTU) per day or 39.8 million therms per day. Over the course of a year, the available capacity would therefore be 14.5 billion therms per year, which is well above the existing and future anticipated natural gas demand in SoCalGas' service area.

Telecommunication

Communications systems for telephones, computers, and cable television are serviced by utility providers such as Verizon, Frontier, Spectrum, and other independent cable companies. In addition, television services are available from the two satellite services, Direct TV and Dish. Facilities are located aboveground and belowground within private easements. The County also works with service providers to underground overhead wires, cables, conductors, and other overhead structures associated with communication systems in accordance with proposed development projects. The proposed Project site would be serviced by Verizon and Frontier for communication services.

4.13.2 Relevant Plans, Policies, and Ordinances

Federal

National Pollution Discharge Elimination System

Section 402 of the Clean Water Act established the National Pollutant Discharge Elimination System (NPDES) to regulate the discharge of pollutants from point sources. The U.S. Environmental Protection Agency has authorized California to administer its NPDES permitting program. The program is administered at the local level by the RWQCBs, as described below.

[1] One therm is equal to 100,000 Btu or 100 kBtu.

[2] One cubic foot of natural gas has approximately 1,020 BTUs of natural gas or 1.02 kBTUs of natural gas.

State

Urban Water Management Planning Act

In 1983, the California legislature enacted the Urban Water Management Planning Act (California Water Code, Sections 10610–10656), which requires specified urban water suppliers within the state to prepare an urban water management plan (UWMP) and update it every 5 years. State and local agencies and the public frequently use UWMPs to determine if agencies are planning adequately to reliably meet water demands in various service areas. As such, UWMPs serve as an important element in documenting water supply availability and reliability for purposes of compliance with Senate Bill (SB) 610 and SB 221, which link water supply sufficiency to large land-use development project approvals. Urban water suppliers also must prepare UWMPs, pursuant to the Urban Water Management Planning Act, to be eligible for state funding and drought assistance.

A UWMP provides information on water usage, water supply sources, and water reliability planning within a specified water agency service area. It also may provide implementation schedules to meet projected demands over the planning horizon, a description of opportunities for new development of desalinated water, groundwater information (where groundwater is identified as an existing or planned water source), description of water quality over the planning horizon, and identification of water management tools that maximize local resources and minimize imported water supplies. Additionally, a UWMP evaluates the reliability of water supplies within the specified service area. This includes a water supply reliability assessment, water shortage contingency plan, and development of a plan in case of an interruption of water supplies.

Senate Bills 610 and 221

On January 1, 2002, SB 610 took effect. SB 610, which was codified in the Water Code beginning with Section 10910, requires the preparation of a WSA for projects within cities and counties that meet any of the following criteria:

1. A residential development of more than 500 units;
2. A business/shopping center with more than 1,000 employees or 500,000 square feet of floor space;
3. A commercial office building with more than 1,000 employees or 250,000 square feet of floor space;
4. A hotel/motel with more than 500 rooms;
5. An industrial/manufacturing/processing plant or industrial park with more than 1,000 employees, encompassing more than 650,000 square feet of floor space, or occupying more than 40 acres of land (however after January 1, 2017, a photovoltaic or wind energy

generation facility project does not require a WSA if the facility would demand no more than 75 acre-feet of water annually);

6. A mixed-used development Project that includes one or more of the Projects specified in subsections 1) through 5), above;
7. A Project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit Project; or
8. For a supplier with 5,000 or fewer connections, a Project that will increase the number of connections by 10% or more.

SB 610 stipulates that when environmental review of certain development projects is required, the water agency that is to serve the development must complete the WSA to evaluate water supplies that are or will be available during normal, single-dry, and multiple-dry years during a 20-year projection to meet existing and planned future demands, including the demand associated with a proposed project.

SB 221, enacted in 2001 and codified in the Water Code, requires a city, county, or local agency to include a condition to any tentative subdivision map that a sufficient water supply shall be available to serve the subdivision. The term "sufficient water supply" is defined as the total water supplies available during normal, single-dry, and multiple-dry years within a 20-year projection that would meet the proposed subdivision project's projected water demand, in addition to existing and planned future water uses, including agricultural and industrial uses, within the specified service area. SB 221 further requires any verification of "projected" water supplies to be based on entitlement contracts, capital outlay programs and regulatory permits and approvals.

California SB 7

SB 7 (SB X7-7) was enacted in November 2009 to require all water suppliers to increase water use efficiency. The legislation sets an overall goal of reducing per-capita urban water use by 20% by December 31, 2020 (California Water Code Section 10608.20). To reach this goal, SB X7-7 requires each urban retail water supplier to report progress in meeting water use targets (California Water Code Section 10608.40). The law also requires wholesale water suppliers to support their retail member agencies' efforts to comply with SB X7-7 through a combination of regionally and locally administered active and passive water conservation measures, programs, and policies, as well as the use of recycled water.

California Water Code

California's Porter–Cologne Water Quality Control Act (1969), which became Division 7 (Water Quality) of the California Water Code, establishes the responsibilities and authorities of the nine RWQCBs and the State Water Resources Control Board (SWRCB). Among other things, it directs

each RWQCB to formulate and adopt a water quality control plan—known as a basin plan—for all areas within the region. The water quality objectives used for this study are primarily those set forth in the Water Quality Control Plan for the Santa Ana Basin (Region 8) adopted by the RWQCB. The basin plan defines existing and potential beneficial uses and water quality objectives for coastal waters, groundwater, surface waters, imported surface waters, and reclaimed waters in the basin (RWQCB 2016).

Statewide Storm Water Management Plan

The Statewide Storm Water Management Plan (SWMP) (Caltrans 2016) describes a program to reduce the discharge of pollutants associated with the stormwater drainage systems that serve highways and highway-related properties, facilities, and activities. It identifies how the California Department of Transportation will comply with the provisions of the NPDES permit (Order No. 99-06-DWQ) (permit) issued by the SWRCB on July 15, 1999. The permit requires that the previous edition of the statewide SWMP be revised to include or describe procedures for implementing the requirements stated in several provisions of the permit. This statewide SWMP has been revised to show compliance with this requirement, although the format employed differs somewhat from the specific chapter designations outlined in the permit.

Urban Water Management Plans

UWMPs are prepared by California's urban water suppliers to support their long-term resource planning and ensure adequate water suppliers are available to meet existing and future water demands. Urban water purveyors are required to prepare and update a UWMP every 5 years. UWMPs address water supply, treatment, reclamation, water conservation, and contain a water shortage contingency plan. Local UWMPs are supplemental to the regional plans prepared by the MWD. The Water Conservation Bill of 2009 (SB X7-7) requires each urban retail water supplier to develop an urban water use target and an interim urban water use target. SB X7-7 authorizes urban retail water suppliers to determine and report progress toward achieving these targets on an individual agency basis.

Executive Order – Conditions of Statewide Drought

On April 1, 2015, Governor Brown issued an Executive Order calling for a 25% reduction in consumer water use in response to the historically dry conditions throughout California. The Executive Order also includes mandatory actions aimed at reducing water demands, with a particular focus on outdoor water use. In addition to the broad call for mandatory use reductions, the order announces initiatives to do the following:

- Remove and replace turf with drought-tolerate landscape options.
- Support rebate programs for water efficient devices.

- Restrict water use on commercial, industrial, and institutional properties to achieve 25% reduction in potable water use.
- Prohibit irrigation of ornamental turf on street medians with potable water supplies.
- Prohibit irrigation of new construction with potable water unless drip or micro spray systems are used.
- Direct water supplies to develop rate structures and pricing mechanisms to maximize water conservation consistent with statewide restrictions.

State Board Emergency Water Conservation Regulations

In May 2015, pursuant to the Governor's Executive Order, the SWRCB adopted emergency regulations designed to achieve an overall 25% reduction in potable urban water use across California. The regulations are in response to the current 4-year drought and mark the first time in the state's history for such action. Under the regulations, the state's 411 urban water suppliers (e.g., those serving more than 3,000 customers or delivering more than 3,000 acre-feet of water per year, but not including suppliers functioning solely in a wholesale capacity) must achieve assigned water saving targets that collectively would result in a 25% reduction in potable urban water production across the state. The regulations are effective through February 2016. The regulations include a tiered framework designed to place the greatest conservation demands on those agencies with the highest residential gallons per capita/per day water usage. The nine tiers have construction standards ranging from 4% to 36%. Urban water suppliers are assigned to the tiers based on 3 months of summer residential gallons per capita/per day water usage data (July through September of 2014). The SWRCB adjusted a provision in the final regulations to enable urban water suppliers to subtract the amount of water provided for commercial agricultural use from their potable water production total, subject to reporting and other criteria.

Urban water suppliers must reduce total potable water production by the amount in their assigned conservation tiers. Compliance would be determined by comparing total potable water production between June 2015 and February 2016 with total potable water production in the same months of 2013. Urban water suppliers would have discretion in deciding how to achieve their conservation standards across residential, commercial, industrial, and institutional sectors. The SWRCB would assess compliance on a rolling cumulative basis starting July 15, 2015, and urban suppliers must submit monthly reports on water production. The regulations include enforcement provisions, including the ability of the state to issue conservation orders requiring additional actions on the part of suppliers not complying with their conservation standard. The SWRCB has indicated that the emphasis would be working cooperatively with agencies that are having difficulty achieving their mandated water savings.

WMWD's Water Conservation and Management Measures

WMWD's tier under the emergency regulations provides that WMWD must reduce its water use by 32% as compared to water use in 2013. In response to the emergency regulations, WMWD's Board adopted Resolution 2910 on May 20, 2015, implementing Water Shortage Stage 4(b) of WMWD's Retail Customer Water Supply Shortage Contingency Program (Program) as provided in WMWD's Ordinance 384. The Program establishes five stages of water conservation and supply shortage response measures that may be implemented. Stage One establishes permanent water use standards intended to alter behavior related to efficiency for non-shortage conditions. Stages Two through Five further establish levels of shortage response actions to be implemented during times of water supply shortage. Stage 4(b) provides conservation and supply shortage measures, such as the following:

- Tier 3 and Tier 4 water rates in the WMWD's water budget rate structure have been removed, and all water use above a customer's water budget would be charged the applicable Tier 5 water rate.
- All outdoor water budgets are reduced by 30%. Residential customers whose water use exceeds 100% of their Tier 1 and 70% of their Tier 2 rates would be charged at the applicable Tier 5 water rates. Landscapes customers whose water use exceeds 70% of their water budget would be charged the applicable Tier 5 water rates.
- Commercial, industrial, or institutional customers shall reduce their water consumption by 10% and would be charged Tier 5 water rates if their water use exceeds 90% of their water budget.

Water budgeted tiered rates are intended to promote the efficient use of water and provide customers with economic signals as their water use increases. Essentially, the rate structure is based upon providing customers with the water they need at a lower rate, while inefficient use is penalized with higher rates. WMWD's budgeted tiered rate system has demonstrated the ability to result in reductions in water consumptions. Implementation of the measures outlined in Stage 4(b), plus additional measures defined in Resolution 2910, are designed to maximize water conservation and reduce retail water demands throughout WMWD's retail service area in an effort to comply with the SWRCB's regulations.

As discussed above, WMWD also updated its Drought Allocation Plan (DAP) in May 2015 to provide WMWD's wholesale customers with a means for potentially allocating limited imported water supplies from MWD under shortage conditions. The updated 2015 DAP is consistent with the allocation methodology adopted as part of MWD's 2014 WSAP and provides a range of potential imported water shortage scenarios. The goal of 2015 DAP is to equitably share potential water shortage allocations by MWD between WMWD and its wholesale agencies, and to avoid proposed MWD penalty rates, should allocation be imposed.

The updated 2015 DAP would be used to allocate water for municipal and industrial purposes among WMWD's wholesale water customers:

- City of Corona
- City of Norco
- City of Riverside
- Eagle Valley Mutual Water Company
- Elsinore Valley Municipal Water District
- Temescal Valley Water District
- Rancho California Water District
- WMWD Retail Customers (including Box Springs Mutual Water Company)

The 2015 DAP was prepared with the input and support from WMWD's wholesale customers. Recognizing the importance of wholesale customer involvement, WMWD created a DAP Workgroup, made up of staff from WMWD and its wholesale customers. The DAP allocates supply to wholesale agencies based on the following:

- Demand during the base period using data for the two most recent non-allocation years
- Base period local supplies
- Base period gallons per capita daily
- Adjustments for growth

California Integrated Waste Management Act of 1989

The California Integrated Waste Management Act of 1989, also known as Assembly Bill (AB) 939, requires local jurisdictions to meet solid waste diversion goals of 25% by 1995 and 50% by 2000. A number of changes to the municipal solid waste diversion requirements under the Integrated Waste Management Act were adopted, including a revision to the statutory requirement for 50% diversion of solid waste. In 2011, AB 341 was passed, requiring the California Department of Resources Recycling and Recovery (CalRecycle) to require local agencies to include strategies to enable the diversion of 75% of all solid waste by 2020. The March JPA does not have its own integrated waste management plan; but since the Project site is located within unincorporated Riverside County, the County's integrated waste management plan is used as part of this analysis. In 2015, the County's reported waste diversion rate was in compliance with disposal rate requirements in the Integrated Waste Management Act (CalRecycle 2019).

Local

March JPA General Plan

The Land Use Element of the March JPA General Plan includes goals and policies that are relevant to the Project related to flood hazards and stormwater runoff. The following goals and policies from the March JPA General Plan (March JPA 1999) apply to the Project. Consistency with these goals and policies is discussed in Section 4.9, Land Use and Planning.

Goal 12: Ensure, plan, and provide adequate infrastructure for all facility reuse and new development, including but not limited to, integrated infrastructure planning, financing, and implementation.

Policy 12.1: Coordinate the provision of all public utilities and services to ensure a consistent, complete and efficient system of service to development.

Policy 12.2: Require new construction to pay its "fair share" for the regional infrastructure system by providing appropriate dedications, improvements, and/or fee assessment districts or other financing mechanisms.

Policy 12.3: Require new development projects to provide for the extension of infrastructure to serve the development, including over-sizing facilities for future needs.

Goal 13: Secure adequate water supply system capable of meeting normal and emergency demands for existing and future land uses.

Policy 13.1: Only approve development which can demonstrate an adequate and secure water supply for the proposed use.

Goal 14: Establish, extend, maintain, and finance a safe and efficient wastewater collection, treatment, and disposal system which maximizes treatment and water recharges, minimizes water use, and prevents groundwater contamination.

Policy 14.1: Require all development to adequately collect, treat, and dispose of wastewater in accordance with the Santa Ana Regional Water Quality Control Board requirements.

Policy 14.3: Encourage reuse of reclaimed and treated non-potable water for irrigation and maintenance of recreation areas, landscaping, and open space preservation.

Goal 15: In compliance with state law, ensure solid waste collection, siting and construction of transfer and/or disposal facilities, operation of waste reduction and recycling

programs, and household hazardous waste disposal programs and education are consistent with the County Solid Waste Management Plan.

Policy 17.1: Provide for the adequate drainage of storm runoff to protect the lives and property within the Planning Area.

Policy 17.3: Require new development to construct new or upgrade existing drainage facilities to accommodate the additional storm runoff caused by the development.

Policy 17.4: Require all storm drain and flood control facilities to be approved and operational prior to the issuance of certificates of occupancy for the associated development.

March JPA Development Code 9.10.080 Liquid and Solid Wastes

No operation or action otherwise permitted under this Title shall discharge at any point into any public street, public sewer, private sewage disposal system, stream, body of water or into the ground, any materials which can contaminate any water supply, interfere with bacterial processes in sewage treatment, or otherwise cause the emission of dangerous or offensive elements, except in accordance with standards approved by the California Department of Public Health or other governmental agency having jurisdiction over liquid and solid waste.

March JPA Ordinance No. JPA 09-05

March JPA's Water Efficient Landscape Ordinance implements the JPA's General Plan policies for water conservation, including Resource Management pursuant to Policies 1.4 and 1.5 of the General Plan, which promote the use of efficient irrigation systems, reclaimed irrigation water, and low and moderate water use plants. Water-efficient landscape regulations pursuant to this ordinance include the following (March JPA 2016):

1. Irrigation systems shall be designed, maintained, and managed to meet or exceed an average irrigation efficiency of 0.71.
2. All irrigation systems shall be designed to prevent runoff, over-spray, low head drainage, and other similar conditions where water flows off site on to adjacent property, non-irrigated areas, walk, roadways, or structures. Irrigation systems shall be designed, constructed, installed, managed, and maintained to achieve as high an overall efficiency as possible.
3. Landscaped areas shall be provided with a smart irrigation controller which automatically adjusts the frequency and/or duration of irrigation events in response to changing weather conditions unless the use of the property would otherwise prohibit use of a timer.

Riverside County Waste Management Department – Design Guidelines

The Riverside County Waste Management Department (RCWMD) Design Guidelines for Refuse and Recyclables Collection and Loading Areas are intended to assist Project proponents in identifying space and other design considerations for refuse/recyclables collection and loading areas per the California Solid Waste Reuse and Recycling Act of 1991. The Design Guidelines require one 4-cubic-yard refuse bin and one 4-cubic-yard recyclables bin per each 20,000 square feet of office, general commercial, or industrial space. Compliance with the Design Guidelines is necessary for obtaining an RCWMD clearance for issuance of a building permit. Prior to building permit issuance, a site plan that indicates the location and capacity of solid waste and recycling collection and loading areas must be submitted to the RCWMD for review and approval (RCWMD 2019).

Riverside County Waste Management Department – Construction and Demolition Recycling

The RCWMD also requires that projects that have the potential to generate construction and demolition waste complete a waste recycling plan to identify the estimated quality and location of recycling of construction and demolition waste from the project. A waste recycling report is then required upon completion of the project that demonstrates that the project recycled a minimum of 50% of its construction and demolition waste (RCWMD 2018).

County of Riverside Ordinance No. 657 - Regulating the Collection, Transfer, and Removal of Solid Waste

Section 4. Solid Waste Removal Responsibility. A) Every tenant, occupier, operator, or owner of a residence or construction or demolition site shall, not less than once a week, cause to be removed all solid waste created, produced or brought upon the property to an approved disposal facility. Every person in charge of a commercial unit or industrial unit shall, not less than twice a week, cause to be removed from the property upon which the building is located all solid waste created, produced or brought upon the property. Reduced commercial, or industrial collection may be allowed upon written approval of the Health Officer. Should conditions warrant at any commercial, industrial or multiresidential unit, the Health Officer may require increased frequency of collection.

Section 5. D) No person shall accept solid waste at any place, location, tract of land, area or premises that is not a solid waste facility as defined in Public Resources Code 40194, which facility is duly licensed, permitted, properly zoned and approved by all governmental bodies and agencies having jurisdiction.

4.13.3 Thresholds of Significance

March JPA uses the California Environmental Quality Act (CEQA) Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the IS prepared for the Project (Appendix A, Initial Study and Notice of Preparation) and the newly adopted CEQA

Guidelines Appendix G (December 2018), the Project could have a significant impact on utilities and service systems if the Project would:

- **UTL-1**: Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.
- **UTL-2**: Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.
- **UTL-3**: Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.
- **UTL-4**: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.
- **UTL-5**: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

4.13.4 Impacts Analysis

Threshold UTL-1. Would the Project require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Water Facilities

The Project would be served by WMWD. Upon implementation, the proposed Project would add demand for water services within the service area of WMWD. Since the Project consists of an industrial development exceeding 650,000 square feet in floor area, in accordance with SB 610, a WSA shall be considered for approval by WMWD (Appendix P). The WSA evaluated the total projected water supplies available to WMWD during normal, single-dry, and multiple-dry water years during a 20-year Project and whether WMWD's total projected supplies are sufficient to meet the projected water demand associated with the Project, in addition to existing and planned future uses.

Assuming the Project's total employee count would be 750 employees with an anticipated water use of 12 AFY which includes the estimated water demand of 130,312 square feet of landscaping. As explained in the WSA, treated water from the WWRF is projected to provide recycled water supply ranges from 1,304 acre-feet in 2015 to 2,700 acre-feet in 2040. As discussed in the WSA,

water supplies through 2040 would be sufficient to meet the projected annual water demand of 12 acre-feet associated for the Project (Appendix P).

WMWD's ability to meet these demands in combination with the projected future demands throughout WMWD, is dependent in part upon the available supply of water that can be purchased from MWD each year and completion of several water supply projects, including the Chino II Desalter Expansion and the 2017 Cooperative Agreement for Long-Term Wheeling and Surplus Water Sales. These WMWD water supply projects have been completed and can therefore be relied upon as a source of water for the Project (WMWD 2017; Inland Empire Utilities Agency 2019). The Arlington Desalter Project is still underway, however is expected to supply an additional 6.4 million gallons per day of new water for the region (WMWD 2018). WMWD currently has 6,000 acre-feet of water stored in the Bunker Hill Basin, and plans to purchase replenishment water from MWD when water is available in the future.

The WSA concluded the total projected water supplies available to WMWD during normal, single-dry, and multiple-dry years over the next 20-year period are sufficient to meet the projected water demand associated with the proposed Project. As a conservative measure, the WSA specifically analyzed how WMWD would address potential shortfalls in the availability and reliability of imported water supplies in demonstrating that sufficient water supplies are available to WMWD to serve the proposed Project according to the standards set forth by SB 610. As shown in Tables 1, 2, 3-1, and 3-2 in the WSA, WMWD has sufficient supplies in all analyzed scenarios to serve the projected Project demands, in addition to existing and planned future uses over the 20-year projection.

In addition, the Project could be served by the Eastern Water District who has jurisdiction for water supply across the street and also has existing facilities directly across the street from the site that have sufficient capacity to serve the site. The option of water supply from Eastern Water District would require the approval of the Local Agency Formation Commission. Thus, a WSA has been requested from Eastern Water District as an alternative option for water supply.

Based on the above, and the information included within the WSA, WMWD has adequate water supplies exist to serve the proposed Project, assuming implementation of required conditions or approval, as detailed **Mitigation Measure (MM) UTL-1**. Thus, with implementation of the conditions identified in **MM-UTL-1**, impacts to water supplies would be **less than significant**.

Wastewater Facilities

The proposed Project site is serviced by Western Municipal Water District (WMWD). Upon its implementation, the proposed Project would add demand for wastewater services within the service area of WMWD. The proposed Project's wastewater flows would be treated at the (WWRF), which is currently a 3 million gallons a day (MGD) treatment facility producing tertiary treated recycled water. As calculated in the Greenhouse Gas Technical Report (Appendix J), Project indoor water usage was estimated assuming each employee resulted in a water demand of 10 gallons/day. Therefore, the

indoor water usage would be 3,285,000 gallons/year for the proposed Project, as such the estimated amount of wastewater generated by the Project would be comparable. The estimated outdoor water usage for the proposed Project was estimated at 1,755,193 gallons/year. Based upon the anticipated wastewater generated from the Project, it is anticipated that off-site improvements to the WWRF facilities would not be required for the anticipated occupancy and use.

The WWRF is subject to the waste discharge requirements set forth in RWQCB Order No R8-2015-0013 (NPDES No CA8000316), which expires July 31, 2020. The anticipated water use for the proposed K4 Warehouse component is 12 AFY (Appendix P). The Cactus Channel improvements would not generate a demand for wastewater treatment at the WWRF. Considering the WWRF's capacity of 3 MGD (3,360 AFY), the proposed Project's 12 AFY which represents about 0.36% of WMWD's total demand of the 2015 Calendar Year (Appendix P). Therefore, the proposed Project would not generate a substantial demand for wastewater and would not exceed wastewater treatment requirements. Since the proposed Project would be served by the existing WWRF, which operates in compliance with the treatment and discharge requirements of the Santa Ana RWQCB, impacts would be less than significant. Additionally, the proposed Project would not result in the construction of new wastewater treatment facilities or expansion of existing facilities; thus, impacts to wastewater supplies would be **less than significant**.

Storm Water Drainage Facilities

The existing site is approximately 35.4 acres of mass graded land with surface flows draining in the northeast direction into an existing stormwater collection basin that connect to an existing storm drain pipe (Appendix O). The K4 Parcel would include the operations of a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. The K4 Parcel would also include paved parking areas, drive aisles, storm drains, utilities, and associated landscaping areas. As detailed in the Preliminary WQMP (Appendix O) the K4 Parcel will be divided into three Drainage Management Areas (DMAs). On-site runoff would be conveyed to the proposed on-site detention basins via proposed on-site catch basins and storm drains. The proposed basins will be located along the northern boundary of the site, separated into Detention Basin 'A', Detention Basin 'B', and Detention Basin 'C'. Detention system 'A' will consist of 14 rows of 750 linear feet of 42" diameter pipe for a total volume provided of 101,042 cubic feet (cf). The central 15.37 acres of the Project site will drain to underground detention system 'B'. Detention system 'B' will consist of 13 rows of 685 linear feet of 42" diameter pipe for a total volume provided of 85,693 cf. The easterly 2.47 acres of the Project site will drain to underground detention system 'C'. Detention system 'C' will consist of 10 rows of 515 linear feet of 42" diameter pipe for a total volume provided of 49,559 cf. Table 4.13-2 summarizes the data and results for the 100-year storm in the proposed Project conditions.

Table 4.13-2
100-Year 24-Hour Storm Hydrograph Table

	Existing Total	Proposed System A	Proposed System B	Proposed System C	Proposed Total	Difference
Flowrate	14.85 cfs	7.44 cfs	7.73 cfs	1.22 cfs	16.37 cfs	—
Volume to be detained	—	96,028 cf	75,152 cf	13,206 cf	184,386 cf	—
Flowrate after detention	—	6.90 cfs	6.98 cfs	0.90 cfs	14.78 cfs	0.5% decrease

Source: Appendix M.
Notes: cfs = cubic feet per second; — = no data available.

Under proposed K4 Parcel conditions, the low flows will outlet from the detention system to a Modular Wetlands treatment system. The highflows will bypass the treatment system and outlet to the Cactus Channel. Flows that enter the Cactus Channel would drain to the Heacock Channel, then the Perris Valley Channel, San Jacinto River Reach 1, and finally Lake Elsinore. The proposed Project would contain measures to control the peak flows and would not have a negative impact on downstream facilities (Appendix M).

The Cactus Channel improvements component of the Project consists of channel improvements that would provide increased flood protection and contain 100-year storm flows. Thus, the Cactus Channel improvements would not generate a need for new or expanded stormwater drainage facilities. Considering the proposed Project would provide increased flood protection and contain 100-year storm flows, and would not have a negative impact on downstream facilities, the proposed stormwater drainage facilities would not cause significant environmental effects.

Electric Power Facilities

Temporary electric power for as-necessary lighting and electronic equipment such as computers inside temporary construction trailers would be provided by SCE. The amount of electricity used during construction would be minimal because typical demand stems from the use of several construction trailers that are used by managerial staff during the hours of construction activities in addition to electrically powered hand tools. The majority of the energy used during construction would be from petroleum. The electricity used for such activities would be temporary and negligible.

Long-term energy consumption associated with the Project includes electricity consumption by employees, energy from water conveyance, and long-term vehicle operations by employees. The Project would use electricity for lighting, appliances, and other uses associated with the Project's industrial land use. As later discussed in Section 4.14, Energy, the operation of the Project is estimated to have an electricity demand of approximately 1,928,892 kilowatt hours per year not accounting for mitigation measures such as Energy Star lighting. This equates to

approximately 1,929 megawatt-hours (MWh) per year. Including mitigation measures, the Project would consume approximately 1,633,043 kWh per year or 1,633 MWh.

The electricity demand calculation for the Project assumes compliance with Title 24 standards for 2016. The Project would be required to meet the California Building Energy Efficiency Standards (24 CCR, Part 6) which improve the energy efficiency of non-residential buildings. The Title 24, Part 6, standards are updated every three years.

Although electricity consumption would increase due to the implementation of the Project, the building envelope, HVAC, lighting, and other systems, such as electric motor equipment, shall be designed to maximize energy performance. The Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. Prior to Project approval, March JPA would ensure that the Project would meet Title 24 requirements applicable at that time, as required by state regulations through their plan review process. Project-consumed electricity is also subject to the cap-and-trade regulation. For these reasons, the electricity consumption of the Project would not be considered inefficient or wasteful, and impacts would be less than significant.

Natural Gas Facilities

The proposed Project would be served by existing utility lines, including natural gas. There is an existing transmission line that the Project would connect to approximately 0.26 miles north of the Project site that operates at pressures above 200 pounds per square inch (psi) and transports gas from supply points to the gas distribution system.

The Air Quality and Greenhouse Gas Emissions Analysis also provides natural gas consumption data for Riverside County from the California Energy Commission (CEC). San Diego Gas and Electric and Southern California Gas Company serve all of Southern California, a total of over 20,000 square miles, including Riverside County.

In unincorporated western Riverside County, much of the area is urbanized and existing infrastructure networks are present. As such, additional connections to such networks would be feasible without extensive new pipelines. Natural gas is not anticipated to be required during construction of the Project. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed below under the "petroleum" subsection. Any minor amounts of natural gas that may be consumed as a result of Project construction would be substantially less than that required for Project operation and would have a negligible contribution to the Project's overall energy consumption.

Natural gas consumption during operation would be required for various purposes, including, but not limited to, building heating and cooling. Default natural gas generation rates in CalEEMod for the proposed land use and climate zone were used and adjusted based on compliance with 2016 Title 24 (see Appendix J for calculations). According to these estimations, the Project would consume approximately 1,457,540 thousand British thermal units (kBTU) per year.

As with electricity demand, natural gas demand calculation for the Project assumes compliance with Title 24 standards for 2016. Although natural gas consumption would increase due to the implementation of the Project, the building envelope, HVAC, lighting, and other systems shall be designed to maximize energy performance. The Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. Prior to Project approval, March JPA would ensure that the Project would meet Title 24 requirements applicable at that time, as required by state regulations through their plan review process. Project-consumed natural gas is also subject to the cap-and-trade regulation. For these reasons, the natural gas consumption of the Project would not be considered inefficient or wasteful, and impacts would be less than significant.

Telecommunications Facilities

The proposed Project site would be serviced by Verizon and Frontier as the communications providers. Connections to Verizon and Frontier infrastructure would be made via existing undergrounded lines. No specific systems upgrades are proposed with the proposed Project, and the location and extent of future facilities is not known at this time. Future siting of communications infrastructure would be in accordance with the March JPA Development Code, including Section 9.14.130 and 9.09.040 regulating electrical and communications facilities. Therefore, impacts would be less than significant.

Threshold UTL-2. Would the Project have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry, and multiple dry years?

As discussed in Threshold UTL-1 and the K-4 Industrial Project WSA, under normal water year conditions, WMWD's retail service area relies on imported water supplies from MWD which is supplied by the Colorado River and SWP, but received recycled water and supplemental water from the cities of Corona and Riverside. The WSA analyzed availability of water supplies to serve the K4 Parcel. The WSA includes an analysis of whether the total projected water supplies available to the water provider over the next 20-year period during normal, single-dry, and multiple-dry years, are sufficient to meet the projected water demand associated with the proposed K4 Parcel, in addition to the water provider's other existing and planned future uses.

As concluded in the WSA, the projected water demand associated with the K4 Parcel is 12 AF per year, WMWD concludes that the total projected water supplies available to WMWD during normal, single-dry and multiple-dry years throughout the next 20-year period are sufficient to meet the projected water demands of the proposed Project in addition to WMWD's existing and planned future uses, including agricultural and manufacturing uses. As such, the K4 Parcel would not require the construction of new water treatment facilities or the expansion of existing facilities. The Cactus Channel improvements would not involve activities that would require new or expanded permanent water supplies. As such, impacts would be considered **less than significant**.

Threshold UTL-3. Would the Project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

WMWD provides wastewater service to the unincorporated Riverside County areas, which is served by the Western Water Recycling Facility (WWRF), which is currently a 3 MGD wastewater treatment facility producing tertiary treated recycled water. The K4 Parcel would connect to existing wastewater infrastructure beneath Cactus Avenue. The receiving wastewater pipes would have the capacity for the K4 Parcel. The Cactus Channel improvements would not generate wastewater. Thus, no new wastewater facilities are required as a result of the Cactus Channel improvements.

As such, the existing wastewater facilities would have adequate capacity to serve the proposed Project's demand; impacts would be **less than significant**.

Threshold UTL-4. Would the Project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

The proposed Project site would be served by Waste Management (17700 Indian Avenue, Moreno Valley, California 92551) for solid waste pickup and removal. In the future, Waste Management or another waste hauling company is expected to collect solid waste generated on the site and transport it to the Moreno Valley Transfer Station, which is owned and operated by the City of Moreno Valley. From the transfer station, the solid waste is expected to be transferred to the El Sobrante Landfill; however, waste could also be transferred to either the Badlands Landfill or the Lamb Canyon Landfill.

Construction of the Project would generate construction waste (e.g., concrete rubble, asphalt rubble, wood, drywall) that would result in an increased demand for solid waste collection and disposal capacity. As stated in Section 4.13.2, Relevant Plans, Policies, and Ordinances, the RCWMD would require the completion and submittal of a waste recycling plan to the RCWMD for approval prior to issuance of building permits for the site, which would be required as a Condition of Approval and is therefore included as **MM-UTL-2**. The waste recycling plan would identify and estimate the

materials to be recycled during construction and demolition activities and would specify where and how the recyclable materials would be stored on the site. A waste recycling report that demonstrates that the Project recycles a minimum of 50% of its construction and demolition waste must then be submitted to and approved by the RCWMD prior to issuance of occupancy permits.

Waste generated from the Project was calculated using California Emissions Estimator Model (CalEEMod) generation. The proposed Project would generate approximately 245.46 tons (approximately 909 cubic yards) per year of solid waste annually with consideration of required solid waste diversion rates (Appendix J). As previously shown in Table 4.13-1, the total remaining capacity for the six active landfills in Riverside County is 183,279,253 cubic yards. Waste generated by the proposed Project could have the potential to affect landfill capacity, but the permitted capacity of the landfills where the proposed Project's waste would be taken are currently sufficient to handle the waste that would be generated by the proposed Project. However, to further reduce waste generated by and transported away from the Project site, **MM-UTL-3**, requiring the use of mulch and/or compost in the development and maintenance of landscaped areas, and **MM-UTL-4**, requiring the use of drought tolerant low maintenance vegetation in all landscaped areas of the Project, would further reduce waste generated by and transported from the Project site. Thus, impacts would be **less than significant** with implementation of mitigation.

Threshold UTL-5. Would the Project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

During both construction and operation of the proposed Project, the Project would comply with all state and local statutes or regulations related to solid waste generation, storage, and disposal, including the California Integrated Waste Management Act as amended. There are no federal regulations or statutes related to solid waste that apply to the Project. As noted above, during construction, all wastes would be recycled to the maximum extent possible, and per **MM-UTL-2**, the Project shall prepare a recycling plan addressing how its construction waste would be recycled. All non-hazardous solid waste generated from the Project site, once operational (such as plastic and glass bottles and jars, paper, newspaper, metal containers, and cardboard), would be recycled, with a goal of 75%, in compliance with the Integrated Waste Management Act. Incorporation of **MM-UTL-5** requires that the RCWMD approve recycling plans on the building plans for the Project, ensuring that proper space for recycling efforts has been allowed on the Project site. The remaining non-hazardous solid waste would be disposed of at one of the County landfills (hazardous waste is managed and disposed of in compliance with all applicable federal, state, and local laws). Additionally, a Recyclables Collection and Loading Area plot plan would be prepared by the Project applicant and provided to the March JPA for review and approval prior to building permit issuance. Since the Project would comply with state and local statutes and regulations related to solid waste during construction and operation of the Project, impacts would be considered **less than significant**. However, **MM-UTL-2** and **MM-UTL-5** have been included to ensure preparation of waste recycling plans.

4.13.5 Mitigation Measures

The following mitigation measures would reduce potentially significant impacts to utilities and service systems to a less-than-significant level. Additionally, mitigation measures have been included to ensure preparation of waste recycling plans:

MM-UTL-1 **WMWD Conditions of Approval.** Prior to issuance of building permits, the applicant shall follow the conditions of approval specified in the Water Supply Assessment expected to be shortly adopted by the Western Municipal Water District (WMWD). The conditions of approval must include:

1. The Applicant shall meet with WMWD to determine if the proposed Project should include the construction of on-site and off-site water facilities as needed near the Project area.
2. The Applicant shall promptly pay all applicable fees and charges as specified in WMWD's Rules and Regulations Governing Water Service and Water Users, Water Rate Schedules and Water Rate Schedules by Service Area, Cost Recovery charges and connection and Added Facilities Charges and Fees.
3. The Applicant shall ensure that all landscape plans are compliant with applicable requirements. In WMWD's area, those requirements may include, but are not limited to, landscape ordinances of the County of Riverside (Water Efficient Landscape Requirements Ordinance No. 859), City of Riverside (Municipal Code 19.570), City of Murrieta (Ordinance 443-10), and March JPA Ordinance No. JP 09-05 (Water Efficient Landscape Ordinance).
4. The Applicant shall be required to plan and install water efficient devices and landscaping in accordance with applicable ordinances and requirements.
5. The Applicant shall use recycled water for landscaped areas. The proposed Project is located near existing recycled water distribution infrastructure on Cactus Avenue and the Applicant shall be required to use recycled water for landscaped areas.
6. If WMWD deems it necessary, the Applicant shall develop a specific plan of service for the proposed Project and coordination of land use decisions and water supply planning with WMWD to ensure sufficient and reliable water supply for WMWD's existing and future uses. Thereby, if WMWD adopts and implement rules, regulations, policies and procedures within its authority that may apply to the proposed Project, they will be implemented.

7. The proposed Project shall be subject to any special or additional requirements imposed by the Metropolitan Water District or WMWD on water deliveries, including increased pricing or a different pricing structure.

8. Prior to certificate of occupancy, the Applicant shall demonstrate the proposed Project complies with all provisions within the March Joint Powers Authority Ordinance No. JP 09-05 (Water Efficient Landscape Ordinance) including but not limited to:

   - Irrigation systems shall be designed, maintained, and managed to meet or exceed an average irrigation efficiency of 0.71.
   - All irrigation systems shall be designed to prevent runoff, over-spray, low head drainage, and other similar conditions where water flows off site onto adjacent property, non-irrigated areas, walk, roadways, or structures. Irrigation systems shall be designed, constructed, installed, managed, and maintained to achieve as high an overall efficiency as possible.
   - Landscaped areas shall be provided with a smart irrigation controller which automatically adjusts the frequency and/or duration of irrigation events in response to changing weather conditions unless the use of the property would otherwise prohibit use of a timer.

MM-UTL-2 **Construction Waste Recycling Plan and Waste Recycling Report.** Prior to issuance of building permits, the applicant shall complete a Construction Waste Recycling Plan and submit the plan to the Riverside County Waste Management Department (RCWMD) for approval. The plan shall identify and estimate the materials to be recycled during construction activities and shall specify where and how the recyclable materials will be stored on the site. Compliance with the plan will be a requirement in all construction contracts. The RCWMD-approved plan shall be attached to all construction plans and distributed to all construction contractors. Once construction is complete, the applicant shall prepare a Waste Recycling Report that demonstrates that the Project recycled a minimum of 50% of its construction and demolition waste. The waste recycling report shall be submitted to and approved by the RCWMD prior to issuance of occupancy permits.

MM-UTL-3 **Use of Mulch and/or Compost.** The use of mulch and/or compost shall be used in the development and maintenance of all landscaped areas within the Project. Green waste shall be recycled through either on-site composting of grass (i.e., leaving the grass clippings on the lawn) or sending separated green waste to a composting facility.

MM-UTL-4 **Drought-Tolerant Vegetation.** The Project shall use xeriscaping and drought-tolerant low-maintenance vegetation in all landscaped areas of the Project site.

MM-UTL-5 **RCWMD Approval of Building Plans.** Prior to issuance of building permits, the Applicant shall submit building plans to the Riverside County Waste Management Department (RCWMD) and obtain approval from the RCWMD for compliance with the Riverside County Design Guidelines for Refuse and Recyclables Collection and Loading Areas, which include specifications for recyclable storage space, location and access, signage, protection and security, compatibility, and overall compliance with federal, state, and local laws.

4.13.6 Level of Significance After Mitigation

The Project would result in less-than-significant impacts related to storm drain and wastewater services. Implementation of **MM-UTL-1** would reduce potential impacts related to water services to below a level of significance. Because mitigation measures (**MM-UTL-2** and **MM-UTL-5**) require the Project to prepare and submit plans that outline and provide for recycling of construction and operation waste that are already required by regulations, as well as limit the amount of green waste generated by the proposed Project (**MM-UTL-3** and **MM-UTL-4**), solid waste impacts would be less than significant.

INTENTIONALLY LEFT BLANK

4.14 ENERGY

The following discussion and analysis is based on the California Environmental Quality Act (CEQA) Guidelines, Section 15126.4, and Appendix F of the CEQA Guidelines, which require that environmental impact reports (EIRs) include a discussion of the potential energy impacts of projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy (14 CCR 15000 et seq.). The section is also related to the potential impacts to energy consumption, including electricity, natural gas, and gasoline, from implementation of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). This analysis is based on emission calculations and California Emissions Estimator Model (CalEEMod) outputs presented in the Greenhouse Gas Technical Report, incorporated by reference, and included in Appendix J.

As mentioned in Chapter 2, Project Description, of this EIR, the Project includes the development of the five parcels on approximately 35.4-acre site ("K4 Parcel") with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. The maximum exterior building height would be 46 feet at the parapet. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the K4 Parcel via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. Once constructed, the e-commerce/fulfillment center use occupying the K4 Parcel could potentially be used up to 7 days per week and 24 hours per day. Additionally, the Project includes regional improvements to the 7-acre Cactus Avenue Drainage Channel (Cactus Channel) within the Cactus Channel Improvement Site. This portion of the Project is being proposed by Riverside County Flood Control and Water Conservation District as part of its Master Plan, which would convert the existing Cactus Channel drainage ditch into a box culvert, which would either be constructed contemporaneously with the Project or built separately depending on permitting and timing.

4.14.1 Existing Conditions

Electricity

According to the CEC's *California Energy Demand Updated Forecast 2016–2026*, California used approximately 280,536 gigawatt-hours of electricity in 2014 (CEC 2016). Electricity usage in California for differing land uses varies substantially by the type of uses in a building, type of construction materials used in a building, and the efficiency of all electricity-consuming devices within a building. Because of the state's energy efficiency standards and efficiency and conservation programs, California's per capita energy use has remained stable for more than 30 years, while the national average has steadily increased.

Southern California Edison (SCE) provides electricity to March JPA. SCE, a subsidiary of Edison International, serves approximately 180 cities in 11 counties across central and Southern California. According to the CPUC, approximately 76 billion kilowatt-hours (kWh) of electricity were used in SCE's service area in 2014. Demand forecasts anticipate that approximately 75 billion kWh of electricity will be used in SCE's service area in 2020 (CPUC 2016).

SCE receives electric power from a variety of sources. According to CPUC's 2016 Biennial RPS Program Update, 23.2% of SCE's power came from eligible renewables, such as biomass/waste, geothermal, small hydroelectric, solar, and wind sources during the 2014–2016 compliance period (CPUC 2016). This is an increase from the 19.9% that SCE maintained for the 2011–2013 compliance period (CPUC 2014). SCE maintains a lower percentage of renewable energy procurement when compared with California's two other large Investor-Owned Utilities. The other two large utilities, Pacific Gas and Electric Company and San Diego Gas and Electric Company, procured 28% and 36% of their electric power, respectively, from eligible renewables in the 2014–2016 compliance period (CPUC 2016). SCE also maintains a slightly lower percentage of renewables relative to statewide procurement. The California Energy Commission estimates that about 26% of the state's electricity retail sales in 2015 came from renewable energy (CEC 2017). The RPS Program establishes a goal for California to increase the amount of electricity generated from renewable energy resources to 20% by 2010 and to 33% by 2020. Recent legislation revised the current RPS target for California to obtain 50% of total retail electricity sales from renewable sources by 2030, with interim targets of 40% by 2024, and 45% by 2027 (CPUC 2016).

Natural Gas

According to the California Energy Commission, the state used approximately 12,571 million therms of natural gas in 2017 (CEC 2019a). By sector, industrial uses utilize 35.9% of the state's natural gas, followed by 35.5% from electric power, 16.9% from residential, 10.1% from commercial, and 1.6% from transportation uses (EIA 2016a). While the supply of natural gas in the United States and production in the lower 48 states has increased greatly since 2008, California produces little, and imports 90% of its supply of natural gas (CEC 2019a).

The Southern California Gas Company (SoCalGas) provides March JPA with natural gas service. SoCalGas' service territory encompasses approximately 20,000 square miles and more than 500 communities. In the California Energy Demand mid-energy demand scenario, natural gas demand is projected to have an annual growth rate of 0.03% in SoCalGas' service territory. As of 2012, approximately 7,357 million therms[1] were used in SoCalGas' service area per year. Around the time of Project building in 2020, natural gas demand is anticipated to be approximately 7,388 million therms per year in SoCalGas' service area (CEC 2014). The total capacity of natural gas available to SoCalGas in 2016 is estimated to be 3.9 billion cubic feet per day. In 2020, the total

[1] One therm is equal to 100,000 BTU or 100 kBTU.

capacity available is also estimated to be 3.9 billion cubic feet per day[2] (California Gas and Electric Utilities 2016). This amount is approximately equivalent to 3.98 billion thousand British thermal units kBTU per day or 39.8 million therms per day. Over the course of a year, the available capacity would therefore be 14.5 billion therms per year, which is well above the existing and future anticipated natural gas demand in SoCalGas' service area.

Petroleum

According to the California Energy Commission, the state used approximately 18.6 billion gallons of petroleum in 2017 (CEC 2019b). This equates to a daily use of approximately 51 million gallons of petroleum.

By sector, transportation uses utilize 86.7% of the state's petroleum, followed by 11.6% from industrial, 1.0% from commercial, 0.8% from residential, and 0.02% from electric power uses (EIA 2016b). In California, petroleum fuels refined from crude oil are the dominant source of energy for transportation sources. Petroleum usage in California includes petroleum products such as motor gasoline, distillate fuel, liquefied petroleum gases, and jet fuel. Production of petroleum in the United States was 9.7 million barrels per day during April 2015, which was the highest output since April 1971 (CEC 2015).

4.14.2 Relevant Plan, Policies, and Ordinances

Federal

Federal Energy Policy and Conservation Act

In 1975, Congress enacted the Federal Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the act, the National Highway Traffic Safety Administration (NHTSA) is responsible for establishing additional vehicle standards.

Energy Independence and Security Act of 2007

On December 19, 2007, the Energy Independence and Security Act of 2007 was signed into law. In addition to setting increased Corporate Average Fuel Economy standards for motor vehicles, the act includes other provisions related to energy efficiency:

- Renewable fuel standard (RFS) (Section 202)
- Appliance and lighting efficiency standards (Sections 301–325)
- Building energy efficiency (Sections 411–441)

[2] One cubic foot of natural gas has approximately 1,020 BTUs of natural gas or 1.02 kBTUs of natural gas.

This federal legislation requires ever-increasing levels of renewable fuels to replace petroleum (Section 202, RFS). The U.S. Environmental Protection Agency (EPA) is responsible for developing and implementing regulations to ensure that transportation fuel sold in the United States contains a minimum volume of renewable fuel. The RFS program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders.

The RFS program was created under the Energy Policy Act of 2005 and established the first renewable fuel volume mandate in the United States. As required under the act, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under the Energy Independence and Security Act of 2007 (EISA), the RFS program was expanded in several key ways that laid the foundation for achieving significant reductions of greenhouse gas (GHG) emissions through the use of renewable fuels, for reducing imported petroleum, and for encouraging the development and expansion of our nation's renewable fuels sector. The updated program is referred to as RFS2 and includes the following:

- EISA expanded the RFS program to include diesel, in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- EISA established new categories of renewable fuel and set separate volume requirements for each one.
- EISA required the EPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces (EPA 2015).

Additional provisions of the EISA address energy savings in government and public institutions, promoting research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

Federal Vehicle Standards

In 2009, the NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011; and, in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, President Barack Obama issued a memorandum directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards

projected to achieve 163 grams per mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021, and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for carbon dioxide (CO_2) emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6%–23% over the 2010 baselines.

In August 2016, the EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

In August 2018, The USEPA and NHTSA released a notice of proposed rulemaking called Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks (SAFE Vehicles Rule). This rule would modify the existing Corporate Average Fuel Economy (CAFE) standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establish new standards covering model years 2021 through 2026. SAFE standards are expected to uphold model year 2020 standards through 2026 (NHTSA 2018).

Clean Power Plan and New Source Performance Standards for Electric Generating Units

On October 23, 2015, EPA published a final rule (effective December 22, 2015) establishing Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units (80 FR 64510–64660), also known as the Clean Power Plan. These guidelines prescribe how states must develop plans to reduce GHG emissions from existing fossil-fuel-fired electric generating units. The guidelines establish CO_2 emission performance rates representing the best system of emission reduction for two subcategories of existing fossil-fuel-fired electric generating units: (1) fossil-fuel-fired electric utility steam-generating units and (2) stationary combustion turbines. The rule includes state-specific CO_2 goals reflecting the CO_2 emission performance rates and guidelines for the development, submittal, and implementation of state plans that establish emission standards or other measures to implement the CO_2 emission performance rates. Initial plan compliance with state emission goals begins in 2022 with full compliance with final goals

required in 2030. The goals are established by state in units of pounds of CO_2 per net megawatt-hour (MWh) or total short tons of CO_2. For California, the goals for 2030 are 828 pounds of CO_2 per net megawatt-hour or 96.8 million short tons of CO_2. CARB anticipates that the state's plan will rely heavily on existing programs such as the cap-and-trade program, Renewable Portfolio Standard, energy efficiency standards, and Mandatory GHG Reporting Regulation (for compliance determinations) (CARB 2015).

Concurrently, EPA published a final rule (effective October 23, 2015) establishing Standards of Performance for Greenhouse Gas Emissions from New, Modified, and Reconstructed Stationary Sources: Electric Utility Generating Units (80 FR 64661–65120). The rule prescribes CO_2 emission standards for newly constructed, modified, and reconstructed affected fossil fuel-fired electric utility generating units. Separate standards of performance were set for fossil fuel-fired electric utility steam-generating units and fossil fuel-fired stationary combustion turbines. The standards apply to new units commencing construction after January 8, 2014, or existing units commencing modification or reconstruction after June 18, 2014. The rule applies only to units with a base load rating greater than 250 million Btu of fossil fuel per hour and serving a generator or generators capable of selling greater than 25 MW of electricity to a utility power distribution system. Implementation of the Clean Power Plan has been stayed by the US Supreme Court pending resolution of several lawsuits.

State

Title 24 of the California Code of Regulations

Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. Energy consumption by new buildings in California is regulated by the State Building Energy Efficiency Standards, embodied in Title 24 of the California Code of Regulations. The efficiency standards apply to new construction of both residential and non-residential buildings, and regulate energy consumed for heating, cooling, ventilation, water heating, and lighting. The building efficiency standards are enforced through the local building permit process. Local government agencies may adopt and enforce energy standards for new buildings, provided these standards meet or exceed those provided in Title 24 guidelines. The standards are updated periodically to allow consideration and possible incorporation of new energy-efficiency technologies and methods. The premise for the standards is that energy-efficient buildings require less electricity, natural gas, and other fuels. The Title 24, Part 6 standards are updated every three years. The most recent amendments to Title 24, Part 6, referred to as the 2016 standards, will become effective on January 1, 2017. The previous amendments were referred to as the 2013 standards and are currently effective. The 2013 standards are 21.8% and 16.8% more efficient for electricity and natural gas in non-residential construction as compared to the 2008 standards. The Project will comply with Title 24 Part 6 per state requirements.

Title 24 also includes Part 11, known as California's Green Building Standards (CALGreen). The CALGreen standards took effect in January 2011, and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings, as well as schools and hospitals. The mandatory standards require:

- 20% mandatory reduction in indoor water use
- 50% of construction and demolition waste must be diverted from landfills
- Mandatory inspections of energy systems to ensure optimal working efficiency
- Low-pollutant emitting exterior and interior finish materials, such as paints, carpets, vinyl flooring, and particle boards

The Project will comply with Title 24 Part 11 per state requirements.

The CALGreen standards also include voluntary efficiency measures that are provided at two separate tiers and implemented per the discretion of local agencies and applicants. CALGreen's Tier 1 standards call for a 15% improvement in energy requirements through more strict water conservation, 65% diversion of construction and demolition waste, 10% recycled content in building materials, 20% permeable paving, 20% cement reduction, and cool/solar reflective roofs. CALGreen's more rigorous Tier 2 standards call for a 30% improvement in energy requirements through even more strict water conservation, 75% diversion of construction and demolition waste, 15% recycled content in building materials, 30% permeable paving, 30% cement reduction, and cool/solar reflective roofs.

Senate Bill 1368

On September 29, 2006, Governor Arnold Schwarzenegger signed into law Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006). The law limits long-term investments in baseload generation by the state's utilities to those power plants that meet an emissions performance standard jointly established by the CEC and the California Public Utilities Commission (CPUC).

The CEC has designed regulations that:

- Establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, of 1,100 pounds CO_2 per megawatt-hour. This would encourage the development of power plants that meet California's growing energy needs while minimizing their emissions of GHGs;

- Require posting of notices of public deliberations by publicly owned utilities on long-term investments on the CEC website. This would facilitate public awareness of utility efforts to meet customer needs for energy over the long-term while meeting the state's standards for environmental impact; and
- Establish a public process for determining the compliance of proposed investments with the emissions performance standard (EPS) (Perata, Chapter 598, Statutes of 2006).

Executive Order S-1-07

Issued on January 18, 2007, Executive Order S-1-07 sets a declining Low Carbon Fuel Standard for GHG emissions measured in CO_2-equivalent grams per unit of fuel energy sold in California. The target of the Low Carbon Fuel Standard is to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020. The carbon intensity measures the amount of GHG emissions in the lifecycle of a fuel, including extraction/feedstock production, processing, transportation, and final consumption, per unit of energy delivered. CARB adopted the implementing regulation in April 2009. The regulation is expected to increase the production of biofuels, including those from alternative sources, such as algae, wood, and agricultural waste. In addition, the Low Carbon Fuel Standard would drive the availability of plug-in hybrid, battery electric, and fuel-cell power motor vehicles. The Low Carbon Fuel Standard is anticipated to lead to the replacement of 20% of the fuel used in motor vehicles with alternative fuels by 2020.

Senate Bill 375

In August 2008, the legislature passed, and on September 30, 2008, Governor Schwarzenegger signed, SB 375 (Steinberg), which addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. Regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035, as determined by CARB, are required to consider the emission reductions associated with vehicle emission standards (see Assembly Bill 1493), the composition of fuels (see Executive Order S-1-07), and other CARB-approved measures to reduce GHG emissions. Regional metropolitan planning organizations will be responsible for preparing a Sustainable Communities Strategy (SCS) within their Regional Transportation Plan (RTP). The goal of the SCS is to establish a development plan for the region, which, after considering transportation measures and policies, will achieve, if feasible, the GHG reduction targets. If an SCS is unable to achieve the GHG reduction target, a metropolitan planning organization must prepare an alternative planning strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies. SB 375 provides incentives for streamlining CEQA requirements by substantially reducing the requirements for "transit priority projects," as specified in SB 375, and eliminating the analysis of the impacts of certain residential projects on global warming and the growth-inducing impacts of those projects when the projects are consistent with the SCS or alternative planning strategy.

In September 2010, CARB adopted the SB 375 targets for the regional metropolitan planning organizations. The targets for the Southern California Association of Governments are an 8% reduction in emissions per capita by 2020 and a 13% reduction by 2035. Achieving these goals through adoption of a SCS will be the responsibility of the metropolitan planning organizations. The Southern California Association of Governments prepared its Final RTP/SCS, which was adopted by the Southern California Association of Governments Regional Council in April 2016. The plan quantified a 8% reduction by 2020 and a 18% reduction by 2035.

California Air Resources Board's Airborne Toxics Control Measures

CARB's Airborne Toxic Control Measures (ATCMs) was approved by CARB on April 26, 2007. The list of Mobile and Stationary Source ATCMs are codified in the CCR. Regulatory measures apply to in-use off-road and on-road regulations, and the California Cap-and-Trade Program.

Advanced Clean Cars Program

In January 2012, CARB approved the Advanced Clean Cars program, a new emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars (CARB 2011). To improve air quality, CARB will propose new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that in 2025 cars will emit 75% less smog-forming pollution than the average new car sold today. To reduce GHG emissions, CARB, in conjunction with the EPA and the NHTSA, has adopted new GHG standards for model year 2017 to 2025 vehicles; the new standards are estimated to reduce GHG emissions by 34% in 2025. The zero-emissions vehicles (ZEV) program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018 to 2025 model years. The Clean Fuels Outlet regulation will ensure that fuels such as electricity and hydrogen are available to meet the fueling needs of the new advanced technology vehicles as they come to the market.

Heavy-Duty Vehicle Greenhouse Gas Regulation

CARB adopted a regulation in December 2008 (and issued amendments in December 2010) to reduce GHG emissions by improving the fuel efficiency of heavy-duty tractors that pull 53-foot or longer box-type trailers. Fuel efficiency is improved through improvements in tractor and trailer aerodynamics and the use of low rolling resistance tires. The tractors and trailers subject to this regulation must use EPA SmartWay certified tractors and trailers, or retrofit their existing fleet with SmartWay verified technologies. Trucks serving the Project that are not drayage trucks will be regulated under this statute and required to comply with SmartWay standards to reduce GHG emissions. As part of the regulatory package for the Heavy-Duty Vehicle GHG Regulation, CARB

also reviewed and implemented the Drayage Truck Regulation and Truck and Bus Regulation. These three regulations were collectively adopted to address emissions from trucks (CARB 2010).

Executive Order B-16-12

Governor Brown issued Executive Order B-16-12 on March 23, 2012. The Executive Order requires that state entities under the governor's direction and control support and facilitate the rapid commercialization of ZEVs. It orders CARB, the CEC, the CPUC, and other relevant agencies work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve the following by 2015:

- The state's major metropolitan areas will be able to accommodate ZEVs, each with infrastructure plans and streamlined permitting
- The state's manufacturing sector will be expanding ZEV and component manufacturing
- The private sector's investment in ZEV infrastructure will be growing
- The state's academic and research institutions will be contributing to ZEV research, innovation and education.

CARB, the CEC, and CPUC, are also directed to establish benchmarks to help achieve the following goals by 2020:

- The state's ZEV infrastructure will be able to support up to one million vehicles
- The costs of ZEV will be competitive with conventional combustion vehicles
- ZEVs will be accessible to mainstream consumers
- There will be widespread use of ZEVs for public transportation and freight transport
- Transportation sector GHG emissions will be falling as a result of the switch to ZEVs
- Electric vehicle charging will be integrated into the electricity grid
- The private sector's role in the supply chain for ZEV component development and manufacturing will be expanding.

Benchmarks are also to be established to help achieve the following goals by 2025:

- Over 1.5 million ZEVs will be on California roads and their market share will be expanding
- Californians will have easy access to ZEV infrastructure
- The ZEV industry will be a strong and sustainable part of California's economy

- California's clean, efficient vehicles will annually displace at least 1.5 billion gallons of petroleum fuels.

On a statewide basis, the Executive Order establishes a target reduction of GHG emissions from the transportation sector equaling 80% less than 1990 levels by 2050.

Renewable Energy Sources

Established in 2002 under Senate Bill (SB) 1078, and accelerated by SB 107 (2006) and SB 2 (2011), California's Renewables Portfolio Standard obligates investor-owned utilities, energy service providers, and community choice aggregators to procure 33% of their electricity from renewable energy sources by 2020. Eligible renewable resources are defined in the 2013 Renewables Portfolio Standard to include biodiesel; biomass; hydroelectric and small hydro (30 megawatts or less); Los Angeles Aqueduct hydro power plants; digester gas; fuel cells; geothermal, landfill gas; municipal solid waste; ocean thermal, ocean wave, and tidal current technologies; renewable derived biogas; multifuel facilities using renewable fuels; solar photovoltaic; solar thermal electric; wind; and other renewables that may be defined later. Governor Jerry Brown signed SB 350 on October 7, 2015, which expands the RPS by establishing a goal of 50% of the total electricity sold to retail customers in California per year by December 31, 2030. In addition, SB 350 includes the goal to double the energy efficiency savings in electricity and natural gas final end uses (such as heating, cooling, lighting, or class of energy uses upon which an energy efficiency program is focused) of retail customers through energy conservation and efficiency. The bill also requires the CPUC, in consultation with the CEC, to establish efficiency targets for electrical and gas corporations consistent with this goal. SB 350 also provides for the transformation of the California Independent System Operator into a regional organization to promote the development of regional electricity transmission markets in the western states and to improve the access of consumers served by the California Independent System Operator to those markets, pursuant to a specified process. In 2013, Southern California Edison (SCE) produced 21.6% of its electricity from renewable sources. By 2020, SCE is required to produce 33% of its electricity from renewable sources. This represents the off-site renewable sources available to the Project through electricity provided by SCE.

On September 10, 2018, SB 100 was signed, which revised RPS goals to a 50% renewable resources target by December 21, 2026, and to a 60% target by December 31, 2030.

Executive Order B-55-18

On September 10, 2018, Governor Brown signed EO B-55-18, to achieve carbon neutrality by moving the State of California to 100% clean energy by 2045. This Executive Order also includes specific measures to reduce GHG emissions via clean transportation, energy efficient buildings, directing cap-and-trade funds to disadvantaged communities, and better management of state's forest land.

Local

March JPA General Plan

The Noise/Air Quality Element of the March JPA General Plan (March JPA 1999) includes the following policies related to energy conservation that would be applied to the Project. The following policies from the March JPA General Plan apply to the Project. Consistency with these policies is discussed in Section 4.9, Land Use and Planning.

Policy 7.1: Support the use of energy-efficient equipment and design in the March JPA Planning Area for facilities and infrastructure.

Policy 7.2: Encourage incorporation of energy conservation features in development.

Policy 7.3: Support passive solar design in new construction.

Policy 7.5: Support drought-resistant vegetation in landscaping areas to reduce energy needed to pump water.

4.14.3 Thresholds of Significance

The CEQA Guidelines provide no specific thresholds for impacts associated with energy consumption. However, Appendix F of the CEQA Guidelines (14 CCR 15000 et seq.) provides guidance for evaluating whether a development project may result in significant impacts with regard to energy. Based on Appendix F of the CEQA Guidelines, a project could have a significant impact on energy conservation if the project would:

- **ENG-1**: Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
- **ENG-2**: Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

4.14.4 Impacts Analysis

Threshold ENG-1. Would the Project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Implementation of the Project would increase the demand for electricity and natural gas at the Project site and gasoline consumption in the region during construction and operation.

Electricity

Construction Use. Temporary electric power for as-necessary lighting and electronic equipment such as computers may be needed inside temporary construction trailers. However, the electricity used for such activities would be temporary and would be substantially less than that required for Project operation and would have a negligible contribution to the Project's overall energy consumption.

Operational Use. The operational phase would require electricity for multiple purposes including, but not limited to, building heating and cooling, lighting, appliances, and electronics.

CalEEMod (version 2016.3.2) was used to estimate Project emissions from energy uses (see Appendix J for calculations). Default electricity generation rates in CalEEMod were used (based on the proposed land use and climate zone) based on compliance with 2016 Title 24. According to these estimations, the Project would consume approximately 1,928,892 kilowatt-hours (kWh) per year, not accounting for mitigation measures such as Energy Star lighting. This equates to approximately 1,929 megawatt-hours (MWh) per year. Including mitigation measures, the Project would consume approximately 1,633,043 kWh per year or 1,633 MWh.

As described above, the electricity demand calculation for the Project assumes compliance with Title 24 standards for 2016. The Project would be required to meet the California Building Energy Efficiency Standards (24 CCR, Part 6) which improve the energy efficiency of non-residential buildings. The Title 24, Part 6, standards are updated every three years.

Although electricity consumption would increase due to the implementation of the Project, the building envelope, HVAC, lighting, and other systems, such as electric motor equipment, shall be designed to maximize energy performance. The Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. Prior to Project approval, March JPA would ensure that the Project would meet Title 24 requirements applicable at that time, as required by state regulations through their plan review process. Project-consumed electricity is also subject to the cap-and-trade regulation. For these reasons, the electricity consumption of the Project would not be considered inefficient or wasteful, and impacts would be less than significant.

Natural Gas

Construction Use. Natural gas is not anticipated to be required during construction of the Project. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed below under the "petroleum" subsection. Any minor amounts of natural gas that may be consumed

as a result of Project construction would be substantially less than that required for Project operation and would have a negligible contribution to the Project's overall energy consumption.

Operational Use. Natural gas consumption during operation would be required for various purposes, including, but not limited to, building heating and cooling.

Default natural gas generation rates in CalEEMod for the proposed land use and climate zone were used and adjusted based on compliance with 2016 Title 24 (see Appendix J for calculations). According to these estimations, the Project would consume approximately 1,457,540 thousand British thermal units (kBTU) per year.

As with electricity demand, natural gas demand calculation for the Project assumes compliance with Title 24 standards for 2016. Although natural gas consumption would increase due to the implementation of the Project, the building envelope, HVAC, lighting, and other systems shall be designed to maximize energy performance. The Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. Prior to Project approval, March JPA would ensure that the Project would meet Title 24 requirements applicable at that time, as required by state regulations through their plan review process. Project-consumed natural gas is also subject to the cap-and-trade regulation. For these reasons, the natural gas consumption of the Project would not be considered inefficient or wasteful, and impacts would be **less than significant**.

Petroleum

Construction Use

Petroleum would be consumed throughout construction of the Project. Fuel consumed by construction equipment would be the primary energy resource expended over the course of construction, and vehicle miles traveled (VMT) associated with the transportation of construction materials and construction worker commutes would also result in petroleum consumption. Heavy-duty construction equipment associated with construction activities, and haul trucks involved in relocating dirt around the Project site would rely on diesel fuel. Construction workers would travel to and from the Project site throughout the duration of construction. It is assumed that construction workers would travel to and from the Project site in gasoline-powered vehicles.

Heavy-duty construction equipment of various types would be used during construction. CalEEMod was used to estimate construction equipment usage; results are included in Appendix J of this EIR. Based on that analysis, diesel-fueled construction equipment would operate for an estimated 19,042 hours, as summarized in Table 4.14-1.

Table 4.14-1
Hours of Operation for Construction Equipment

Phase	Hours of Equipment Use
Rough Grading and Utility Installation	1,760
Pad/Site-Specific Grading Activities	1,120
Building Construction	10,070
Paving	672
Architectural Coatings	156
Cactus Channel Phase 1	4,224
Cactus Channel Phase 2	1,040
Total	**19,042**

Source: Appendix J.

Fuel consumption from construction equipment was estimated by converting the total CO_2 emissions from each construction phase to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 9.13 kilograms per metric ton CO_2 per gallon, and the conversion factor for diesel is 10.35 kilograms per metric ton CO_2 per gallon (The Climate Registry 2018). The estimated diesel fuel use from construction equipment is shown in Table 4.14-2.

Table 4.14-2
Construction Equipment Diesel Demand

Phase	Pieces of Equipment[a]	Equipment CO_2 (MT)[a]	kg CO_2/Gallon[b]	Gallons
Rough Grading and Utility Installation	4	57.53	10.35	5,558.22
Pad/Site-Specific Grading Activities	7	61.74	10.35	5,964.97

Notes: CO_2 = carbon dioxide; kg = kilogram; MT = metric ton.

Fuel consumption from worker and vendor trips was estimated by converting the total CO_2 emissions from the construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. Worker vehicles are assumed to be gasoline fueled, and vendor/hauling vehicles are assumed to be diesel fueled.

Calculations for total worker, vendor, and hauler fuel consumption are provided in Table 4.14-3, Table 4.14-4, and Table 4.14-5.

Table 4.14-3
Construction Worker Vehicle Gasoline Demand

Phase	Trips	Vehicle CO_2 (MT)[a]	kg CO_2/Gallon[b]	Gallons
Rough Grading and Utility Installation	550	2.61	9.13	286.02

			Total	**56,364.71**

Sources:
[a] Appendix J.
[b] The Climate Registry 2018.
Notes: CO_2 = carbon dioxide; kg = kilogram; MT = metric ton.

As shown in Tables 4.14-2 through 4.14-5, the Project is estimated to consume 210,568 gallons of petroleum during the construction phase. By comparison, approximately 15.4 billion gallons of petroleum would be consumed in California over the course of the Project's construction phase based on the California daily petroleum consumption estimate of approximately 52.9 million gallons per day (CEC 2019b). The Project would be required to comply with CARB's Airborne Toxics Control Measures, which restrict heavy-duty diesel vehicle idling time to 5 minutes. Therefore, because petroleum use during construction would be temporary and relatively minimal, and would not be wasteful or inefficient, impacts would be **less than significant**.

Operational Use

The majority of fuel consumption resulting from the Project's operational phase would be attributable to workers traveling to and from the Project site, and worker vehicles traveling around the Project site.

Petroleum fuel consumption associated with motor vehicles and water trucks traveling to and from the Project site during operation is a function of VMT. As shown in Appendix R, Traffic Impact Analysis, the annual VMT attributable to the Project is expected to be 31,661,414 VMT per year. Similar to construction worker and vendor trips, fuel consumption for operation was estimated by converting the total CO_2 emissions from each land use type to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. The worker vehicles were assumed to be gasoline powered and the water trucks were assumed to be diesel.

Calculations for annual mobile-source fuel consumption are provided in Table 4.14-6. Mobile sources from the Project would result in approximately 759,255 gallons of gasoline per year and 953,720 gallons of diesel consumed per year beginning in 2020. By comparison, California as a whole consumes approximately 19.3 billion gallons of petroleum per year (CEC 2019b).

Table 4.14-6
Petroleum Consumption – Operation

Fuel	Vehicle MT CO_2	kg CO_2/Gallon	Gallons
Gasoline	6,932	9.13	759,255.20
Diesel	9,871	10.35	953,719.81
		Total	**1,712,975.01**

Sources:
[a] Appendix J.
[b] The Climate Registry 2018.
Notes: CO_2 = carbon dioxide; kg = kilogram; MT = metric ton.

Over the lifetime of the Project, the fuel efficiency of the vehicles being used by the employees is expected to increase. As such, the amount of petroleum consumed as a result of vehicular trips to and from the Project site during operation would decrease over time. There are numerous regulations in place that require and encourage increased fuel efficiency. For example, CARB has adopted an approach to passenger vehicles by combining the control of smog-causing pollutants and GHG emissions into a single, coordinated package of standards. The approach also includes efforts to support and accelerate the number of plug-in hybrids and zero-emissions vehicles in California (CARB 2013). Additionally, in response to SB 375, CARB adopted the goal of reducing per-capita GHG emissions from 2005 levels by 8% by 2020, and 18% by 2035 for light-duty passenger vehicles in the planning area for the Southern California Association of Governments. As such, operation of the Project is expected to use decreasing amounts of petroleum over time due to advances in fuel economy.

In summary, although the Project would increase petroleum use during operation as a result of employees commuting to the site and haul trucks, the use would be a small fraction of the statewide use and, due to efficiency increases, would diminish over time. Given these considerations, petroleum consumption associated with the Project would not be considered inefficient or wasteful and would result in a **less-than-significant** impact. Also, although not quantified herein, **MM-AQ-5** would reduce petroleum use during operation as it would reduce the amount of VMT generated by employees. **MM-AQ-6** would also reduce petroleum use from trucks during operation as SmartWay trucks use less fuel than non-SmartWay trucks.

Threshold ENG-2. Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency ?

Title 24 of the California Code of Regulations contains energy efficiency standards for residential and non-residential buildings based on a state mandate to reduce California's energy demand. Specifically, Title 24 addresses a number of energy efficiency measures that impact energy used for lighting, water heating, heating, and air conditioning, including the energy impact of the building envelope such as windows, doors, skylights, wall/floor/ceiling assemblies, attics, and roofs.

Part 6 of Title 24 specifically establishes energy efficiency standards for residential and non-residential buildings constructed in the State of California in order to reduce energy demand and consumption. The Project would comply with Title 24, Part 6 per state regulations. In accordance with Title 24 Part 6, March JPA would have: (a) sensor based lighting controls—for fixtures located near windows, the lighting would be adjusted by taking advantage of available natural light; and, (b) efficient process equipment—improved technology offers significant savings through more efficient processing equipment.

Title 24, Part 11, contains voluntary and mandatory energy measures that are applicable to the Project under the California Green Building Standards Code. As discussed under the previous threshold, the Project would result in an increased demand for electricity, natural gas, and petroleum. In accordance with Title 24 Part 11 mandatory compliance, the March JPA would have: (a) 50% of its construction and demolition waste diverted from landfills; (b) mandatory inspections of energy systems to ensure optimal working efficiency; (c) low-pollutant emitting exterior and interior finish materials, such as paints, carpets, vinyl flooring and particle boards; and, (d) a 20% reduction in indoor water use. Compliance with all of these mandatory measures would decrease the consumption of electricity, natural gas, and petroleum.

Because the Project would comply with Title 24, Part 6 and Part 11, no conflict with existing energy standards and regulations would occur. Therefore, impacts would be considered **less than significant**.

4.14.5 Mitigation Measures

Impacts to energy were found to be less than significant. Therefore, no mitigation measures are required.

4.14.6 Level of Significance After Mitigation

Since there would be no significant impacts requiring mitigation, residual impacts would be **less than significant.** However, there are various Project design features, compliance with state and local regulations, and mitigation measures (**MM-AQ-4** through **MM-AQ-6**) as identified in the Air Quality section of the EIR which would further reduce the Project's impacts. As discussed in Section 4.14.4, Impacts Analysis, **MM-AQ-5** would reduce petroleum use during operation as it would reduce the amount of VMT generated by employees. **MM-AQ-6** would also reduce petroleum use from trucks during operation as SmartWay trucks use less fuel than non-SmartWay trucks.

INTENTIONALLY LEFT BLANK

4.2 AIR QUALITY

This section analyzes the potential impacts of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) on air quality resulting from construction and operation of the Project. This analysis is based on emission calculations and California Emissions Estimator Model (CalEEMod) outputs presented in the *Air Quality Technical Report* (Appendix C) and the *Health Risk Assessment Technical Report* (Appendix D).

As mentioned in Chapter 2, Project Description, of this EIR, the Project includes the development of the five parcels on approximately 35.4-acre site ("K4 Parcel") with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. The maximum exterior building height would be 46 feet at the parapet. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the K4 Parcel via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. Once constructed, the e-commerce/fulfillment center use occupying the K4 Parcel could potentially be used up to 7 days per week and 24 hours per day. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Drainage Channel (Cactus Channel) that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel ("Channel improvement site"). This portion of the Project is being proposed by Riverside County Flood Control and Water Conservation District as part of the District's Master Plan, which would convert the existing Cactus Channel into a box culvert, which would either be constructed contemporaneously with the Project or built separately depending on permitting and timing.

4.2.1 Existing Conditions

The Project is located within the South Coast Air Basin (SCAB). The SCAB is characterized as having a Mediterranean climate (typified as semiarid with mild winters, warm summers, and moderate rainfall). The SCAB is a 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. It includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties.

Climate and Meteorology

The SCAB generally lies in the semi-permanent, high-pressure zone of the eastern Pacific. As a result, the climate is mild and tempered by cool sea breezes. The usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The extent and severity of the air pollution problem in the SCAB is a function of the

area's natural physical characteristics (e.g., weather and topography) as well as of human-made influences (e.g., development patterns and lifestyle). Factors such as wind, sunlight, temperature, humidity, rainfall, and topography all affect the accumulation and/or dispersion of pollutants throughout the SCAB.

Climate

Moderate temperatures, comfortable humidity, and limited precipitation characterize the climate in the SCAB. The average annual temperature varies little throughout the basin, averaging 75°F. However, with a less pronounced oceanic influence, the eastern inland portions of the basin show greater variability in annual minimum and maximum temperatures. All portions of the SCAB have recorded temperatures over 100°F in recent years. Although the SCAB has a semiarid climate, the air near the surface is moist because of the presence of a shallow marine layer. Except for infrequent periods when dry air is brought into the basin by offshore winds, the ocean effect is dominant. Periods with heavy fog are frequent, and low stratus clouds, occasionally referred to as "high fog," are a characteristic climate feature. Annual average relative humidity is 70% at the coast and 57% in the eastern part of the basin. Precipitation in the SCAB is typically 9 to 14 inches annually and is rarely in the form of snow or hail, due to typically warm weather. The frequency and amount of rainfall is greater in the coastal areas of the basin. The March Air Reserve Base, located proximate to the Project, is an area that is characterized by relatively low rainfall, with warm summers and mild winters. Average temperatures range from a high of 95°F in July to a low of 40°F in December (City-Data 2015).

Sunlight

The presence and intensity of sunlight are necessary prerequisites for the formation of photochemical smog. Under the influence of the ultraviolet radiation of sunlight, certain "primary" pollutants (mainly reactive hydrocarbons and oxides of nitrogen (NO_x)) react to form "secondary" pollutants (primarily oxidants). Since this process is time dependent, secondary pollutants can be formed many miles downwind of the emission sources. Due to the prevailing daytime winds and time-delayed nature of photochemical smog, oxidant concentrations are highest in the inland areas of Southern California.

Temperature Inversions

Under ideal meteorological conditions and irrespective of topography, pollutants emitted into the air mix and disperse into the upper atmosphere. However, the Southern California region frequently experiences temperature inversions in which pollutants are trapped and accumulate close to the ground. The inversion, a layer of warm, dry air overlaying cool, moist marine air, is a normal condition in coastal Southern California. The cool, damp, and hazy sea air capped by coastal clouds is heavier than the warm, clear air, which acts as a lid through which the cooler marine layer cannot rise. The height of the inversion is important in determining pollutant concentration. When the

inversion is approximately 2,500 feet above mean sea level (amsl), the sea breezes carry the pollutants inland to escape over the mountain slopes or through the passes. At a height of 1,200 feet amsl, the terrain prevents the pollutants from entering the upper atmosphere, resulting in the pollutants settling in the foothill communities. Below 1,200 feet amsl, the inversion puts a tight lid on pollutants, concentrating them in a shallow layer over the entire coastal basin. Usually, inversions are lower before sunrise than during the daylight hours. Mixing heights for inversions are lower in the summer and inversions are more persistent, being partly responsible for the high levels of ozone (O_3) observed during summer months in the SCAB. Smog in Southern California is generally the result of these temperature inversions combining with coastal day winds and local mountains to contain the pollutants for long periods, allowing them to form secondary pollutants by reacting in the presence of sunlight. The basin has a limited ability to disperse these pollutants due to typically low wind speeds and the surrounding mountain ranges.

The Project site is located in an area that is susceptible to air inversions. This traps a layer of stagnant air near the ground where pollutants are further concentrated. These inversions produce haziness, which is caused by moisture, suspended dust, and a variety of chemical aerosols emitted by trucks, automobiles, furnaces, and other sources.

4.2.1.1 Air Quality Characteristics

Air quality varies as a direct function of the amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion for the pollutants. Reduced visibility, eye irritation, and adverse health impacts on people who are deemed sensitive receptors are the most serious hazards that can result from changes in existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution include children, the elderly, and people with cardiovascular and chronic respiratory diseases. According to the South Coast Air Quality Management District (SCAQMD), sensitive receptors include residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993).

The Project area's local ambient air quality is monitored by the SCAQMD. Air quality monitoring stations usually measure pollutant concentrations 10 feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. The Perris Monitoring Station, located at 237½ North D Street, Perris, California, is approximately 8.9 miles south of the Project site and is characterized by topography that resembles the Project area. Both are proximate to Interstate 215. The data collected at this station are considered representative of the air quality experienced in the Project vicinity. Air quality data from 2015 through 2017 for the Perris Monitoring Station are provided in Table 4.2-1. Because particulate matter with an aerodynamic diameter equal to or less than 2.5

microns ($PM_{2.5}$), nitrogen dioxide (NO_2), carbon monoxide (CO), and sulfur dioxide (SO_2) levels were not monitored at the Perris Monitoring Station, reported values were taken from the Riverside-Magnolia Monitoring Station, located approximately 6.9 miles northwest of the Project site or from the Riverside-Rubidoux Monitoring Station, located approximately 9.3 miles northwest of the Project site, which are the next closest monitoring stations to the Project site that monitor those pollutants.

Table 4.2-1
Ambient Air Quality Data
(ppm unless otherwise indicated)

Pollutant	Averaging Time	2015	2016	2017	Most Stringent Ambient Air Quality Standard	Monitoring Station
O_3	1 hour	0.124	0.131	0.120	0.09 ppm (State)	Perris[a]
	State exceedances	25	23	33	—	
	8 hours	0.103	0.099	0.106	0.070 ppm (State/National)	
	Federal exceedances	49	55	52	—	
	State exceedances	50	56	86	—	
PM_{10}	24 hours	188.0	76.0	75.4	50 µg/m³ (State)	Perris[a]
	Federal exceedances (Estimated)	6.6	0.0	0.0	—	
	State exceedances (Estimated)	25.7	—	—	—	
	Annual	31.4	—	—	20 µg/m³ (State)	
$PM_{2.5}$	24 hours	54.7	51.5	50.3	35 µg/m³ (National)	Riverside-Rubidoux[b]
	Federal exceedances (Estimated)	10.3	5.1	7.2	—	
	Annual	11.8	12.5	12.2	12 µg/m³ (National)

	24 hours	0.001	0.001	0.001	0.04 ppm (State)	
NO_2	1 hour	0.057	0.073	0.063	0.100 ppm (National)	Riverside-Rubidoux[b]
	Annual	0.014	0.014	0.014	0.030 ppm (State)	
CO	1 hour	4	1.7	2.4	20 ppm (State)	Riverside-Rubidoux[b]
	8 hours	1.5	1.3	1.8	9.0 ppm (State)	

Sources: CARB 2017; EPA 2018a.
Notes: ppm = parts per million; O_3 = ozone; PM_{10} = coarse particulate matter; µg/m3 = micrograms per cubic meter; $PM_{2.5}$ = fine particulate matter; SO_2 = sulfur dioxide; NO_2 = nitrogen dioxide; CO = carbon monoxide.
Data were taken from California Air Resources Board (CARB) iADAM (http://www.arb.ca.gov/adam) or Environmental Protection Agency (EPA) AirData (http://www.epa.gov/airdata/) and represent the highest concentrations experienced over a given year. Exceedances of federal and state standards are only shown for ozone and particulate matter. Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed either federal or state standards during the years shown. There is no federal standard for 1-hour ozone, annual PM_{10}, or 24-hour $S0_2$, nor is there a state 24-hour standard for $PM_{2.5}$.
[a] Perris Monitoring Station is located at 237½ North D Street, Perris, California.
[b] Riverside-Rubidoux Monitoring Station is located at 5888 Mission Boulevard, Rubidoux, California.

The SCAQMD is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the SCAB, where the Project is located. The entire SCAB is designated as a nonattainment area for federal and state O_3 standards. EPA has classified the SCAB as an extreme nonattainment area and has mandated that it achieve attainment no later than June 15, 2024. The SCAB is designated as an attainment area for state and federal CO standards. The SCAB is designated as an attainment area under the state and federal standards for NO_2. The entire SCAB is in attainment with both federal and state SO_2 standards. Only the Los Angeles County portion of the SCAB has been designated as nonattainment for the federal rolling 3-month average lead standard, and the SCAB is designated attainment for the state lead standard. The SCAB is designated as a nonattainment area for state PM_{10} standards; however, it is designated as an attainment area for federal standards. In regard to $PM_{2.5}$ attainment status, the SCAB is designated as a nonattainment area by CARB and the EPA. The attainment classifications for these criteria pollutants are outlined in Table 4.2-2.

Table 4.2-2
South Coast Air Basin Attainment Classification

Pollutant	Averaging Time	Designation/Classification
Federal Standards		
O_3	8 hours	Nonattainment/Extreme
NO_2	1 hour	Unclassifiable/attainment
	Annual arithmetic mean	Attainment (maintenance)
CO	1 hour; 8 hours	Attainment (maintenance)
SO_2	24 hours; annual arithmetic mean	Unclassifiable/attainment
PM_{10}	24 hours	Attainment (maintenance)
$PM_{2.5}$	24 hours; annual arithmetic mean	Nonattainment (serious)
Lead	Quarter	Unclassifiable/attainment
	3-month average	Nonattainment (partial)[a]
State Standards		
O_3	1 hour; 8 hours	Nonattainment
NO_2	1 hour; annual arithmetic mean	Attainment
CO	1 hour; 8 hours	Attainment
SO_2	1 hour; 24 hours	Attainment
PM_{10}	24 hours; annual arithmetic mean	Nonattainment
$PM_{2.5}$	Annual arithmetic mean	Nonattainment
Lead[b]	30-day average	Attainment
Sulfates (SO_4)	24 hours	Attainment
Hydrogen sulfide (H_2S)	1 hour	Unclassified
Vinyl chloride[b]	24 hours	No designation
Visibility-reducing particles	8 hours (10:00 a.m.–6:00 p.m.)	Unclassified

Source: EPA 2016a (federal); CARB 2016b (state).

Notes: O_3 = ozone; NO_2 = nitrogen dioxide; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.

[a] Partial Nonattainment designation – Los Angeles County portion of Basin only for near-source monitors. Expected to remain in attainment based on current monitoring data.

[b] California Air Resources Board (CARB) has identified lead and vinyl chloride as toxic air contaminants (TACs) with no threshold level of exposure for adverse health effects determined.

4.2.1.2 Pollutants and Effects

Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The federal and state standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive people from illness or discomfort. Pollutants of concern include O_3, NO_2, CO, sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter equal to or less than 10 microns (PM_{10}), $PM_{2.5}$, and lead. In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants. These pollutants are discussed in the following paragraphs.[1]

Ozone. O_3 is a colorless gas that is formed in the atmosphere when volatile organic compounds (VOCs), sometimes referred to as reactive organic gases, and NO_x react in the presence of ultraviolet sunlight. O_3 is not a primary pollutant; it is a secondary pollutant formed by complex interactions of two pollutants directly emitted into the atmosphere. The primary sources of VOCs and NO_x, the precursors of O_3, are automobile exhaust and industrial sources. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. Short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes.

Nitrogen Dioxide. Most NO_2, like O_3, is not directly emitted into the atmosphere but is formed by an atmospheric chemical reaction between nitric oxide (NO) and atmospheric oxygen. NO and NO_2 are collectively referred to as NO_x and are major contributors to O_3 formation. High concentrations of NO_2 can cause breathing difficulties and result in a brownish-red cast to the atmosphere, causing reduced visibility. There is some indication of a relationship between NO_2

[1] The descriptions of health effects for each of the criteria air pollutants associated with Project construction and operation are based on the U.S. Environmental Protection Agency's (EPA's) "Six Common Air Pollutants" (EPA 2015), the CARB "Glossary of Air Pollutant Terms" (CARB 2015), and the CARB "Fact Sheet: Air Pollution Sources, Effects, and Control" (CARB 2009).

and chronic pulmonary fibrosis, and some increase in bronchitis in children (2 and 3 years old) has also been observed at concentrations below 0.3 parts per million (ppm) by volume.

Carbon Monoxide. CO is a colorless and odorless gas formed by the incomplete combustion of fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, such as the Project location, automobile exhaust accounts for the majority of CO emissions. CO is a non-reactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions, primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas between November and February. The highest levels of CO typically occur during the colder months of the year when inversion conditions, where a layer of warm air sits atop cool air, are more frequent and can trap pollutants close to the ground. In terms of health, CO competes with oxygen, often replacing it in the blood, thus reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can be dizziness, fatigue, and impairment of central nervous system functions.

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily by the combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits placed on the sulfur content of fuels. SO_2 is an irritant gas that attacks the throat and lungs, and can cause acute respiratory symptoms and diminished ventilator function in children. SO_2 can also yellow plant leaves and erode iron and steel.

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Fine particulate matter, or $PM_{2.5}$, is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., motor vehicles, power generation, and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs. Inhalable or coarse particulate matter, or PM_{10}, is about one-seventh the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport absorbed gases, such as chlorides or ammonium, into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle, as well as produce haze and reduce regional visibility.

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paint, ink, ceramics, ammunition, and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phase-out of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phase-out of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emission sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time, and growth.

Sulfates. Sulfates are the fully oxidized form of sulfur, which typically occur in combination with metals or hydrogen ions. Sulfates are produced from reactions of SO_2 in the atmosphere. Sulfates can result in respiratory impairment, as well as reduced visibility.

Vinyl Chloride. Vinyl chloride is a colorless gas with a mild, sweet odor, which has been detected near landfills, sewage plants, and hazardous waste sites, due to the microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in air can cause nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation can cause liver damage, including liver cancer.

Hydrogen Sulfide. Hydrogen sulfide is a colorless and flammable gas that has a characteristic odor of rotten eggs. Sources of hydrogen sulfide include geothermal power plants, petroleum refineries, sewers, and sewage treatment plants. Exposure to hydrogen sulfide can result in nuisance odors, as well as headaches and breathing difficulties at higher concentrations.

Visibility-Reducing Particles. Visibility-reducing particles are any particles in the air that obstruct the range of visibility. Effects of reduced visibility can include obscuring the view shed of natural scenery, reduced airport safety, and discouraging tourism. Sources of visibility-reducing particles are the same as for $PM_{2.5}$ described above.

Non-Criteria Pollutants

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure or acute and/or chronic non-cancer health effects. A toxic substance released into the air is considered a hazardous air pollutant (HAP) by the U.S. Environmental Protection Agency (EPA), or a toxic air contaminant (TAC) by the California Air Resources Board (CARB).[2] Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and non-carcinogenic effects. Non-carcinogenic effects typically affect one or more target organ systems and may be experienced either on short-term (acute) or long-term (chronic) exposure to a given TAC.

Diesel Particulate Matter. Diesel particulate matter (DPM) is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. The CARB classified "particulate emissions from diesel-fueled engines" (i.e., DPM) as a TAC in August 1998. DPM is emitted from a broad range of diesel engines: on-road diesel engines of trucks, buses, and cars, and off-road diesel engines including locomotives, marine vessels, and heavy-duty construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with DPM, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000).

4.2.2 Relevant Plans, Policies, and Ordinances

Regulatory oversight for air quality in the SCAB is maintained by the EPA at the federal level, CARB at the state level, and by the SCAQMD at the local level. Applicable laws, regulations, and standards of these three agencies are described in the following subsections.

[2] The EPA defines HAPs as air pollutants that are known or suspected to cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental effects. The CARB defines TACs as air pollutants which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. Since the CARB's TAC list includes all federal HAPs (as discussed in Section 4.2.2, Relevant Plans, Policies, and Ordinances), the term TAC is used in this analysis to represent air toxics in general.

Federal

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The EPA is responsible for implementing most aspects of the Clean Air Act, including the setting of National Ambient Air Quality Standards (NAAQS; federal standards) for major air pollutants, HAP standards, approval of state attainment plans, motor vehicle emission standards, stationary source emission standards and permits, acid rain control measures, stratospheric O_3 protection, and enforcement provisions. Federal standards are established for criteria pollutants under the Clean Air Act, which are O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The federal standards describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The federal standards (other than for O_3, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. Federal standards for O_3, NO_2, SO_2, PM_{10}, and $PM_{2.5}$ are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires the EPA to reassess the federal standards at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the federal standards must prepare a state implementation plan that demonstrates how those areas will attain the standards within mandated time frames.

The federal Clean Air Act delegates the regulation of air pollution control and the enforcement of the federal standards to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels.

The 1977 federal Clean Air Act Amendments required the EPA to identify National Emission Standards for Hazardous Air Pollutants to protect public health and welfare. HAPs include certain volatile organic chemicals, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 federal Clean Air Act Amendments, which expanded the control program for HAPs, 189 substances and chemical families were identified as HAPs.

State

CARB, which became part of the California EPA in 1991, is responsible for ensuring implementation of the California Clean Air Act of 1988, responding to the federal Clean Air Act, and regulating emissions from motor vehicles and consumer products.

CARB has established California Ambient Air Quality Standards (CAAQS; state standards), which are generally more restrictive than the federal standards. The state standards describe adverse conditions; that is, pollution levels must be below these standards before a basin can attain the standard.

The state standards for O_3, CO, SO_2 (1 hour and 24 hours), NO_2, PM_{10}, and $PM_{2.5}$ and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. The federal and state standards are presented in Table 4.2-3.

Table 4.2-3
Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	*Primary*[c,d]	*Secondary*[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as Primary Standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as Primary Standard
	Annual Arithmetic Mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	
SO_2[h]	1 hour	0.25 ppm (655 µg/m³)	0.075 ppm (196 µg/m³)	—
	3 hours	—	—	0.5 ppm (1,300 µg/m³)
	24 hours	0.04 ppm (105 µg/m³)	0.14 ppm (for certain areas)[g]	—
	Annual	—	0.030 ppm (for certain areas)[g]	—
PM_{10}[i]	24 hours	50 µg/m³	150 µg/m³	Same as Primary Standard
	Annual Arithmetic Mean	20 µg/m³	—	
$PM_{2.5}$[i]	24 hours	—	35 µg/m³	Same as Primary Standard
	Annual Arithmetic Mean	12 µg/m³	12.0 µg/m³	15.0 µg/m³
Lead[j,k]	30-day Average	1.5 µg/m³	—	—
	Calendar Quarter	—	1.5 µg/m³ (for certain areas)[k]	Same as Primary Standard
	Rolling 3-Month Average	—	0.15 µg/m³	
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m³)	—	—
Vinyl chloride[j]	24 hours	0.01 ppm (26 µg/m³)	—	—
Sulfates	24- hours	25 µg/m³	—	—
Visibility reducing particles	8 hour (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer due to particles when the relative humidity is less than 70%	—	—

Source: CARB 2016a.

Notes: O_3 = ozone; μg/m^3 = micrograms per cubic meter; ppm = parts per million by volume; NO_2 = nitrogen dioxide; CO = carbon monoxide; mg/m^3= milligrams per cubic meter; SO_2 = sulfur dioxide; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns; PST = Pacific Standard Time.

[a] California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter—PM_{10}, $PM_{2.5}$, and visibility-reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The O_3 standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 μg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[e] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the primary and secondary NAAQS for O_3 were lowered from 0.075 ppm to 0.070 ppm

[g] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 μg/m^3 to 12.0 μg/m^3. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 μg/m^3, as was the annual secondary standard of 15 μg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 μg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[j] CARB has identified lead and vinyl chloride as toxic air contaminant (TACs) with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 μg/m^3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

The state Air Toxics Program was established in 1983 under Assembly Bill (AB) 1807 (Tanner). The California TAC list identifies more than 700 pollutants, of which carcinogenic and noncarcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. In accordance with AB 2728, the state list includes the (federal) HAPs. The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) was enacted by the legislature in 1987 to address public concern over the release of TACs into the atmosphere. AB 2588 law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment (HRA), and if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

In 2000, the CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines (CARB 2000). Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy Duty Diesel Vehicle (In-Use) Regulation (CARB 2014), the On-Road Heavy Duty (New) Vehicle Program (CARB 2005a), the In-Use Off-Road Diesel Vehicle Regulation (CARB 2011), and the New Off-Road Compression-Ignition (Diesel) Engines and Equipment program (CARB 2008). All of these regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. Several Airborne Toxic Control Measures that reduce diesel emissions including In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

Local

South Coast Air Quality Management District

The SCAQMD is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the SCAB, where the Project is located. The SCAQMD operates monitoring stations in the SCAB, develops rules and regulations for stationary sources and equipment, prepares emissions inventory and air quality management planning documents, and conducts source testing and inspections. The SCAQMD's Air Quality Management Plans (AQMPs) include control measures and strategies to be implemented to attain state and federal ambient air quality standards in the SCAB. The SCAQMD then implements these control measures as regulations to control or reduce criteria pollutant emissions from stationary sources or equipment.

The most recent adopted AQMP is the 2016 AQMP (SCAQMD 2017), which was adopted by the SCAQMD governing board on March 3, 2017. The 2016 AQMP is a regional blueprint for achieving air quality standards and healthful air. The 2016 AQMP represents a new approach, focusing on available, proven, and cost effective alternatives to traditional strategies, while seeking to achieve multiple goals in partnership with other entities promoting reductions in greenhouse gases and toxic risk, as well as efficiencies in energy use, transportation, and goods movement (SCAQMD 2017). Because mobile sources are the principal contributor to the SCAB's air quality challenges, the SCAQMD has been and will continue to be closely engaged with CARB and the EPA, who have primary responsibility for these sources. The 2016 AQMP recognizes the critical importance of working with other agencies to develop funding and other incentives that encourage the accelerated transition of vehicles, buildings, and industrial facilities to cleaner technologies in a manner that benefits not only air quality but also local businesses and the regional economy. These "win-win" scenarios are key to implementation of this 2016 AQMP with broad support from a wide range of stakeholders. The SCAQMD 2016 AQMP (SCAQMD 2017) applies the updated Southern California

Association of Governments (SCAG) growth forecasts assumed in the *2016–2040 Regional Transportation Plan/Sustainable Communities Strategy* (2016 RTP/SCS) (SCAG 2016).

Potentially Applicable Rules

Emissions that would result from stationary and area sources during operation under the Project may be subject to SCAQMD rules and regulations. The SCAQMD rules applicable to the Project may include the following:

Rule 201: **Permit to Construct.** This rule establishes an orderly procedure for the review of new and modified sources of air pollution through the issuance of permits. Rule 201 specifies that any facility installing nonexempt equipment that causes or controls the emissions of air pollutants must first obtain a permit to construct from SCAQMD.

Rule 401: **Visible Emissions.** This rule establishes the limit for visible emissions from stationary sources.

Rule 402: **Nuisance.** This rule prohibits the discharge of air pollutants from a facility that cause injury, detriment, nuisance, or annoyance to the public or damage to business or property.

Rule 403: **Fugitive Dust.** This rule requires fugitive dust sources to implement best available control measures for all sources to ensure all forms of visible particulate matter are prohibited from crossing any property line. SCAQMD Rule 403 is intended to reduce PM_{10} emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust.

Rule 431.2: **Sulfur Content of Liquid Fuel.** The purpose of this rule is to limit the sulfur content in diesel and other liquid fuels for the purpose of both reducing the formation of SO_x and particulates during combustion and enabling the use of add-on control devices for diesel-fueled internal combustion engines. The rule applies to all refiners, importers, and other fuel suppliers, such as distributors, marketers, and retailers, as well as to users of diesel, low-sulfur diesel, and other liquid fuels for stationary-source applications in the district. The rule also affects diesel fuel supplied for mobile-source applications.

Rule 1113: **Architectural Coatings.** This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

Regulation XIV: Toxics and Other Non-Criteria Pollutants. This regulation includes rules that regulate toxics and other non-criteria pollutants. It provides specifications for maximum individual cancer risk, cancer burden, and noncancer acute and chronic hazard index (HI) from new permit units, relocations, or modifications to existing

permit units that emit TACs. The rules establish allowable risks for permit units requiring new permits pursuant to Rules 201 or 203.

March Joint Powers Authority (JPA) General Plan

The Noise/Air Quality Element of the adopted March JPA General Plan includes goals and policies that will be applied to the Project related to air quality (March JPA 1999). The following goals and policies are from the March JPA General Plan that would apply to the Project. Consistency with these goals and policies is discussed in Section 4.9, Land Use and Planning.

Goal 6: Reduce emissions associated with vehicle/engine use.

Policy 6.1: Reduce idling emissions by increasing traffic flow through synchronized traffic signals.

Policy 6.2: Work with Riverside Transit Authority to develop a local transit system and facilitate connections of the local transit system with regional transit systems.

Policy 6.3: Encourage diversion of peak hour truck traffic, whenever feasible, to off-peak periods to reduce roadway congestion and associated emissions.

Policy 6.4: Work with Caltrans and traffic engineers to insure that roadways and freeway on-ramps that are heavily utilized by trucks are designed to safely accommodate trucks.

Policy 6.5: Encourage trucks operating within March JPA Planning Area to maintain safety equipment and operate at safe speeds so as to reduce the potential for accidents which create congestion and related emissions.

Policy 6.6: Reduce vehicle emissions through improved parking design and management that provide for safe pedestrian access to and from various facilities.

Policy 6.8: Encourage the use of compressed natural gas, clean diesel and/or alternative fuels in engines.

Goal 8: Reduce air pollution emissions and impacts through siting and building design.

Policy 8.1: Support the use of low polluting construction materials and coatings.

Policy 8.3: Encourage the separation of sensitive receptors from potential carbon monoxide hotspots.

Goal 9: Reduce fugitive dust and particulate matter emissions.

Policy 9.1: Require all feasible fugitive dust reduction techniques to be utilized during construction activities.

Policy 9.3: Support land division design which minimizes grading and maintains the natural topography to the maximum extent feasible.

Local Attainment Status

Pursuant to the 1990 federal Clean Air Act Amendments, the EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant, based on whether the NAAQS have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "nonattainment" for that pollutant. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to be meet the standard despite a lack of monitoring data. Areas that achieve the standards after a nonattainment designation are redesignated as maintenance areas and must have approved Maintenance Plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, called for the designation of areas as "attainment" or "nonattainment," but based on CAAQS rather than the NAAQS.

4.2.3 Thresholds of Significance

March JPA uses the California Environmental Quality Act (CEQA) Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the IS prepared for the Project (Appendix A, Initial Study and Notice of Preparation) and the newly adopted CEQA Guidelines Appendix G (December 2018), the Project could have a significant impact on air quality if the Project would:

- **AQ-1**: Conflict with or obstruct implementation of the applicable air quality plan.
- **AQ-2**: Result in a cumulatively considerable new increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
- **AQ-3**: Expose sensitive receptors to substantial pollutant concentrations.
- **AQ-4**: Result in other remissions (such as those leading to odors) adversely affecting a substantial number of people.

Appendix G of the CEQA Guidelines indicates that, where available, the significance criteria established by the applicable air quality management district or pollution control district may be relied

upon to determine whether the Project would have a significant impact on air quality. The SCAQMD *CEQA Air Quality Handbook* (SCAQMD 1993, 2015a), as revised in March 2015, sets forth quantitative emission significance thresholds below which a project would not have a significant impact on ambient air quality (SCAQMD 2015b). Project-related air quality impacts estimated in this environmental analysis would be considered significant if any of the applicable significance thresholds presented in Table 4.2-4 are exceeded.

A project would result in a substantial contribution to an existing air quality violation of the NAAQS or CAAQS for O_3 (see Table 4.2-2), which is a nonattainment pollutant, if the project's construction or operational emissions would exceed the SCAQMD VOC or NO_x thresholds shown in Table 4.2-4. These emission-based thresholds for O_3 precursors are intended to serve as a surrogate for an "ozone significance threshold" (i.e., the potential for adverse O_3 impacts to occur) because O_3 itself is not emitted directly (see the previous discussion of O_3 and its sources), and the effects of an individual project's emissions of O_3 precursors (VOC and NO_x) on O_3 levels in ambient air cannot be determined through air quality models or other quantitative methods.

Table 4.2-4
South Coast Air Quality Management District Air Quality Significance Thresholds

Pollutant	Construction	Operation
Criteria Pollutants Mass Daily Thresholds		
VOCs	75 lb/day	55 lb/day
NO_x	100 lb/day	55 lb/day
CO	550 lb/day	550 lb/day
SO_x	150 lb/day	150 lb/day
PM_{10}	150 lb/day	150 lb/day
$PM_{2.5}$	55 lb/day	55 lb/day
Lead[a]	3 lb/day	3 lb/day
TACs and Odor Thresholds		
TACs[b]	Maximum incremental cancer risk ≥10 in 1 million Chronic and acute hazard index ≥1.0 (project increment)	
Odor	Project creates an odor nuisance pursuant to SCAQMD Rule 402	
Ambient Air Quality Standards for Criteria Pollutants[c]		
NO_2 1-hour average NO_2 annual arithmetic mean	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 0.18 ppm (state) 0.030 ppm (state) and 0.0534 ppm (federal)	
CO 1-hour average CO 8-hour average	SCAQMD is in attainment; project is significant if it causes or contributes to an exceedance of the following attainment standards: 20 ppm (state) and 35 ppm (federal) 9.0 ppm (state/federal)	
PM_{10} 24-hour average PM_{10} annual average	10.4 μg/m^3 (construction)[d] 2.5 μg/m^3 (operation) 1.0 μg/m^3	

Table 4.2-4
South Coast Air Quality Management District Air Quality Significance Thresholds

Pollutant	Construction	Operation
$PM_{2.5}$ 24-hour average	10.4 μg/m³ (construction)[d] 2.5 μg/m³ (operation)	

Source: SCAQMD 2015b.
Notes: VOC = volatile organic compounds; lb/day = pounds per day; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns; TAC = toxic air contaminant; SCAQMD = South Coast Air Quality Management District; NO_2 = nitrogen dioxide; ppm = parts per million; μg/m³ = micrograms per cubic meter.
[a] The phase-out of leaded gasoline started in 1976. Since gasoline no longer contains lead, the proposed Project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.
[b] TACs include carcinogens and non-carcinogens.
[c] Ambient air quality standards for criteria pollutants based on SCAQMD Rule 1303, Table A-2, unless otherwise stated.
[d] Ambient air quality threshold based on SCAQMD Rule 403.

In addition to the emission-based thresholds in Table 4.2-4, the SCAQMD also recommends the evaluation of localized air quality impacts to sensitive receptors in the immediate vicinity of the Project as a result of construction and operation activities. Such an evaluation is referred to as a localized significance threshold (LST) analysis. The LST significance thresholds for NO_2 and CO represent the allowable increase in concentrations above background levels in the vicinity of a project that would not cause or contribute to an exceedance of the relevant ambient air quality standards, while the threshold for PM_{10} represents compliance with Rule 403 (Fugitive Dust). The LST significance threshold for $PM_{2.5}$ is intended to ensure that construction emissions do not contribute substantially to existing exceedances of the $PM_{2.5}$ ambient air quality standards. The allowable emission rates depend on the following parameters:

a. Source receptor area in which the project is located
b. Size of the project site
c. Distance between the project site and the nearest sensitive receptor (e.g., residences, schools, hospitals).

Based on the Project location, LSTs for Source Receptor Area 23 (Metropolitan Riverside County) would be applicable. As detailed in Appendix C, the construction LST thresholds were conservatively determined based on a disturbed Project area of 5-acres, which is conservative since the Project site is approximately 35.4 acres. This approach is conservative as the LSTs increase with increasing project activity area size. Thus, evaluating the current Project as though it will be over a 5-acre area is conservative since if it were over a larger area it would be allowed to have more emissions before triggering the LST. The thresholds for receptor distances of 25 meters for each pollutant were used to linearly interpolate thresholds for the closest receptor, located approximately 30 meters (98 feet) from the Project boundary. The LSTs applicable to construction and operation of the Project are shown in Table 4.2-5. Notably, if localized emissions exceed the applicable LSTs and refined dispersion

modeling is required, the most stringent NAAQS or CAAQS (included in Table 4.2-2) would be used as the threshold of significance.

Table 4.2-5
Localized Significance Thresholds for the Project

Pollutant	Threshold[a,b] (pounds/day)
Construction	
NO_x	270
CO	1,577
PM_{10}	13
$PM_{2.5}$	8
NO_2	150[c]
Operations	
NO_x	270
CO	1,577
PM_{10}	4
$PM_{2.5}$	2
NO_2	150[c]

Source: SCAQMD 2008. See also Appendix C of this Environmental Impact Report (EIR) for a description of localized significance threshold (LST) determination.
Notes: NO_x = oxides of nitrogen; CO = carbon monoxide; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns; NO_2 = nitrogen dioxide.
[a] South Coast Air Quality Management District (SCAQMD) localized significance thresholds are shown for a 5-acre project site at 25 meters and are assumed to be conservative thresholds for larger project areas.
[b] Allowable emissions are the maximum emissions that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard (based on site size and distance to receptor).
[c] An approximated LST was estimated to evaluate the federal 1-hour NO2 standard, as the SCAQMD significance threshold has not been updated to reflect this standard. Calculated by scaling the Metropolitan Riverside County NO_2 LST for a 5-acre site by the ratio of 1-hour NO_2 standards (federal/state). The federal standard is 0.10 ppm and the state standard is 0.18 ppm (i.e., interpolated LST * (0.10/0.18)).

4.2.4 Approach and Methodology

Construction Emissions

The proposed land uses would consist of approximately 718,000 square feet of warehouse space a parking lot of 289 automobile parking stalls and 317 truck trailer parking stalls, and improvements to Cactus Channel. Construction of the Project would result in criteria air pollutant emissions that are primarily associated with use of off-road construction equipment and on-road construction trucks and worker vehicles. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. Therefore, such emission levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts. Construction emissions associated with the Project were calculated using the CalEEMod Version 2016.3.2. Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2019 and 2020). The emissions analysis

conservatively assumed a construction start year of 2019, although it is likely to start in 2020. Default values provided by the program were used where detailed Project information was not available.

For this analysis, construction of the Project would begin in May 2019 and be completed in June 2020. The analysis presented herein assumes a construction start date of May 2019, which represents the earliest date at which construction would initiate. Assuming the earliest start date for construction represents the worst-case scenario for criteria air pollutant emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years. Thus, for purposes of estimating Project construction emissions, the analysis contained herein is conservatively based on the following assumptions as described in Appendix C (duration is approximate):

Warehouse

- Rough Grading and Utility Installation: May 2019 (55 days)
- Pad/Site-Specific Grading Activities: August 2019 (20 days)
- Building Construction: September 2019 through May 2020 (190 days)
- Paving: May 2020 through June 2020 (14 days)
- Architectural Coating: June 2020 (13 days)

Cactus Channel

- Phase 1 Site Preparation: May 2019 through November 2019 (132 days)
- Phase 2 Site Preparation: November 2019 through May 2020 (130 days)

The construction equipment mix and estimated hours of equipment operation per day used for the air emissions modeling of the Project are shown in Table 4.2-6. For this analysis, it was assumed that heavy construction equipment would operate 5 days a week (22 days per month) and up to 8 hours per day during Project construction. Because no specific information regarding on-road trips during construction is known at this time, worker, vendor, and haul truck trips were estimated using CalEEMod defaults. Project construction is anticipated to involve approximately 220,000 cubic yards of import of soil and 60,000 cubic yards of export. Vendor truck trips were estimated using CalEEMod default values, which are based on building square footage. The lengths of worker, vendor, and haul truck trips were estimated using CalEEMod defaults (worker trip length: 14.7 miles; vendor trip length: 6.9 miles; hauling trip length: 20 miles). Estimated daily worker and vendor trips and total estimated haul truck trips are provided in Appendix C.

Table 4.2-6
Construction Scenario Assumptions

Construction Phase	One Way Worker Trips	One-way Vendor Truck Trips	One-way Haul Truck Trips	Equipment[a]	Quantity	Hours/Day
Warehouse						
Rough Grading and Utility Installation	10	0	27,500	Rubber-Tired Dozers	2	8
				Tractors/Loaders/Backhoes	2	8
Pad/Site-Specific Grading Activities	18	0	0	Rubber-Tired Dozers	2	8
				Scrapers	3	8
				Tractors/Loaders/Backhoes	2	8
Building Construction	583	227	0	Cranes	1	7
				Forklifts	2	8
				Tractors/Loaders/Backhoes	2	7
				Welders	2	8
Paving	15	0	0	Pavers	2	8
				Paving Equipment	2	8
				Rollers	2	8
Architectural Coating	117	0	0	Air Compressors	2	6
Cactus Channel						
Phase 1 Site Preparation	10	0	7,500	Excavators	2	8
				Rubber-Tired Loaders	2	8
Phase 2 Site Preparation	3	0	0	Crane	1	8

Notes: See Appendix C for complete assumptions.

[a] Construction equipment list and usage are Project-specific estimates. California Emissions Estimator Model (CalEEMod) defaults were used for off-road construction equipment horsepower and load factors.

Implementation of the Project would generate construction-related air pollutant emissions from entrained dust, equipment and vehicle exhaust emissions, architectural coatings, and pavement off-gassing. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. To account for dust control measures to comply with SCAQMD Rule 403 in the calculations, it was assumed that the active sites would be watered at least twice daily, resulting in a 55% reduction in fugitive dust as implemented by CalEEMod. Exhaust from internal combustion engines used by construction equipment, hauling trucks, vendor trucks, and worker vehicles would result in emissions of NO_x, VOCs, CO, PM_{10}, and $PM_{2.5}$. Asphalt paving associated with the parking lot land use construction would generate VOC off-gassing emissions. The application of architectural coatings, such as exterior/interior paint and other finishes, would also produce VOC emissions; however, the contractor would be required to procure architectural coatings from a supplier in compliance with the requirements of SCAQMD's Rule 1113 (Architectural Coatings). Unmitigated emissions for coating categories were calculated based on default VOC content data from CalEEMod, which was provided by the air districts, including SCAQMD where the Project would be located. The

CalEEMod default VOC content for SCAQMD is based on the 2013 version of Rule 1113. Mitigated emissions reflect the use of Super Compliant coatings with a VOC content less than 10 grams per liter VOC (SCAQMD 2018).

Operational Emissions

Operation of the Project would result in criteria air pollutant emissions through energy use, area sources, and motor vehicle trips to the Project. CalEEMod was used to estimate emissions from motor vehicles, which was adjusted to include information (including trip rates, trip length for haul trucks, and fleet mix) derived from the Traffic Impact Analysis prepared by Urban Crossroads (Appendix R). According to the Traffic Impact Analysis, the Project would generate 5,873 average daily trips. Default CalEEMod trip lengths were used for all trips types and land uses with the exception of commercial-nonwork (C-NW) trips for haul trucks, which were assumed to have a trip length of 60-miles based on an anticipated haul truck usage similar to recent distribution centers in the region (Appendix C). The default commercial-work (C-W) trip length of 16.6-miles were used. These trip lengths are summarized in Table 9 of the *Air Quality Technical Report* in Appendix C. For the fleet mix detailed in Appendix C, default CalEEMod assumptions were used for the unrefrigerated warehouse based on the vehicle trip rates provided in Appendix R. The 2016.3.2 version of CalEEMod incorporates EMFAC2014 to calculate mobile source emissions. EMFAC2014 has been superseded by EMFAC2017. In order to allow for a more accurate representation of mobile source operational emissions associated with the Project, mobile source emission factors were estimated using EMFAC2017. These emissions factors were then used to estimate mobile source operational emissions based on CalEEMod methodology along with Project specific values where available.

Operational emissions were modeled in CalEEMod under the assumption that Project buildout would occur in 2020. Assuming the earliest start date for Project buildout represents the worst-case scenario for criteria air pollutant emissions because vehicle emission factors for later years would be slightly less due to more stringent standards, as well as fleet turnover replacing older vehicles in later years, the model is considered to be conservative. Default CalEEMod assumptions were used to estimate emissions from the Project area sources, which include gasoline-powered landscape maintenance equipment, consumer products, and architectural coatings for the maintenance of buildings. Emissions from energy sources, which include natural gas appliances and space and water heating, were estimated using CalEEMod and reflect compliance with the 2016 Title 24 standards for nonresidential construction.

Localized Criteria Air Pollutant Emissions

As indicated in the discussion of the thresholds of significance, the SCAQMD also recommends the evaluation of localized NO_2, CO, PM_{10}, and $PM_{2.5}$ impacts as a result of construction and

operational activities to sensitive receptors in the immediate vicinity of the Project site. On-site construction and operational emissions were calculated using CalEEMod and compared to the SCAQMD LST thresholds (see Appendix C). The impacts were analyzed using methods consistent with those in the SCAQMD's *Final Localized Significance Threshold Methodology* (SCAQMD 2008). LSTs were chosen assuming a Project site area of 5 acres and based on a receptor distance of 25 meters. Notably, both the construction and operational LST analyses are based on the combination of maximum emissions that may occur with the worst-case meteorological conditions, which equates to conservatively high estimates that may never occur.

Carbon Monoxide Hotspots

Mobile source impacts occur on two scales of motion. Regionally, Project-related travel would add to regional trip generation and increase the vehicle miles traveled within the local airshed and the SCAB. Locally, Project traffic would be added to the County of Riverside, City of Riverside, and City of Moreno Valley roadway system near the Project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of a large number of vehicles "cold-started" and operating at pollution-inefficient speeds, and is operating on roadways already crowded with non-Project traffic, there is a potential for the formation of microscale CO "hotspots" in the area immediately around points of congested traffic. With the turnover of older vehicles and introduction of cleaner fuels, CO concentrations in the SCAB have steadily declined.

Based on the comparative analysis presented in Appendix C, a quantitative CO hotspots analysis was not needed to determine whether the change in the level of service (LOS) of an intersection by the Project would have the potential to result in exceedances of the CAAQS or NAAQS. CO attainment was thoroughly analyzed as part of the SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan). In the 1992 CO Plan, a CO hot spot analysis was conducted for four busy intersections in Los Angeles at the peak morning and afternoon time periods. The intersections evaluated included: Long Beach Blvd. and Imperial Highway (Lynwood); Wilshire Blvd. and Veteran Ave. (Westwood); Sunset Blvd. and Highland Ave. (Hollywood); and La Cienega Blvd. and Century Blvd. (Inglewood). These analyses did not predict a violation of CO standards. The busiest intersection evaluated was that at Wilshire Blvd. and Veteran Ave., which had a daily traffic volume of approximately 100,000 vehicles per day. The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm.[3] The most recent three years (2014 through 2016) of background 1-hour CO concentrations in the Project vicinity range from 1.7 to 2.5 ppm (SCAQMD n.d.a). This indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 380,000 vehicles per day.[4] The Los Angeles County Metropolitan

[3] It is conservatively assumed that 4.6 ppm does not account for background CO concentration.

[4] Based on the ratio of the CO standard (20.0 ppm) minus background (2.5 ppm) and the modelled value (4.6 ppm).

Transportation Authority evaluated the LOS in the vicinity of the Wilshire Boulevard/Veteran Avenue intersection[5] and found it to be Level E at peak morning traffic and Level F at peak afternoon traffic (Metropolitan Transportation Authority 2004).

At buildout of the Project, the highest average daily trips at an intersection would be approximately 228,500 at the Trautwein Road/Alessandro Boulevard intersection, which is below the daily traffic volumes that would be expected to generate CO exceedances as evaluated in the 2003 AQMP. This daily trip estimate is based on the average daily traffic rate conditions of the intersection. There is no reason unique to SCAB meteorology to conclude that the CO concentrations at the Trautwein Road/Alessandro Boulevard intersection would exceed the 1-hour CO standard if modeled in detail, based on the studies undertaken for the 2003 AQMP.

Health Risk Assessment

An HRA was prepared to evaluate the potential mobile source health risk impacts to sensitive receptors as a result of exposure to DPM as a result of heavy-duty diesel trucks accessing the site. The HRA is based on the methodologies prescribed in the Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2015). To implement the 2015 OEHHA Guidelines based on Project information, the estimated annual average ambient DPM concentrations at the nearest sensitive receptor were determined using American Meteorological Society/EPA Regulatory Model Improvement Committee Model; 5 years of local meteorological data obtained from the SCAQMD; and the estimated DPM emissions associated with on-site heavy duty truck idling, on-site circulation of heavy duty trucks, and heavy-duty trucks traveling on local roads up to the freeways. For a detailed description of emissions calculations and methodologies, the HRA report is included in Appendix D.

Cancer risk is defined as the increase in probability (chance) of an individual developing cancer due to exposure to a carcinogenic compound, typically expressed as the increased chances in one million. The cancer risk from exposure to a TAC is estimated by calculating the inhalation (and if applicable, ingestion or dermal) dose in units of milligrams/kilogram body weight per day based on a ambient concentration in units of micrograms per cubic meter ($\mu g/m^3$), age sensitivity factors, breathing rates, exposure period, fraction of time spent at home, and multiplying the dose by the inhalation cancer potency factor, expressed as (milligrams/kilogram body weight per day)-1. The SCAQMD *CEQA Air Quality Handbook* (1993) states that emissions of TACs are considered significant if an HRA shows an increased risk of greater than 10 in one million. Based on guidance from the SCAQMD in the document *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel*

[5] The Metropolitan Transportation Authority measured traffic volumes and calculated the LOS for the intersection Wilshire Boulevard/Sepulveda Avenue, which is a block west along Wilshire Blvd., still east of Highway 405.

Idling Emissions for CEQA Air Quality Analysis (SCAQMD 2003), for purposes of this analysis, 10 in 1 million is used as the cancer risk threshold for the proposed Project.

The SCAQMD has also established non-carcinogenic risk parameters for use in HRAs. Non-carcinogenic risks are quantified by calculating a "hazard index" (HI), expressed as the ratio between the ambient pollutant concentration and its toxicity or reference exposure level. A reference exposure level is a concentration at or below which health effects are not likely to occur. A HI less than one (1.0) means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

4.2.5 Impacts Analysis

Threshold AQ-1. Would the Project conflict with or obstruct implementation of the applicable air quality plan?

As discussed previously, the Project site is located within the SCAB under the jurisdiction of the SCAQMD, which is the local agency responsible for administration and enforcement of air quality regulations for the area. Construction and operation of the development proposed as part of the Project may result in the emission of additional short- and long-term criteria air pollutants in conflict with the SCAQMD AQMPs.

The SCAQMD has established criteria for determining consistency with the AQMP in Chapter 12, Sections 12.2 and 12.3 of the SCAQMD *CEQA Air Quality Handbook* (SCAQMD 1993). The criteria are:

- **Consistency Criterion No. 1**: The proposed project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards of the interim emissions reductions specified in the AQMP.
- **Consistency Criterion No. 2**: The proposed project will not exceed the assumptions in the AQMP or increments based on the year of project build-out phase.

Consistency Criterion No. 1

As discussed under Threshold AQ-2 below, the Project would result in a significant and unavoidable impact associated with the violation of an air quality standard. Because the Project could result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, the Project would conflict with Consistency Criterion No. 1 of the SCAQMD *CEQA Air Quality Handbook*. Construction of the Project would result in a **potentially significant** impact to air quality related to NOx and VOC only.

Consistency Criterion No. 2

While striving to achieve the NAAQS for O_3 and $PM_{2.5}$ through a variety of air quality control measures, the 2016 AQMP also accommodates planned growth in the SCAB. Projects are considered consistent with, and would not conflict with or obstruct implementation of, the AQMP if the growth in socioeconomic factors (e.g., population, employment) is consistent with the underlying regional plans used to develop the AQMP (per Consistency Criterion No. 2 of the SCAQMD *CEQA Air Quality Handbook)*. The future emissions forecasts are primarily based on demographic and economic growth projections provided by SCAG. Thus, demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by SCAG for their 2016 RTP/SCS were used to estimate future emissions in the 2016 AQMP (SCAQMD 2017).

The 2016 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The 2016 RTP/SCS charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The 2016 RTP/SCS was prepared through a collaborative, continuous, and comprehensive process with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders within the Counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. In June 2016, SCAG received its conformity determination from the Federal Highway Administration and the Federal Transit Administration indicating that all air quality conformity requirements for the 2016 RTP/SCS and associated 2015 Federal Transportation Improvement Program Consistency Amendment through Amendment 15-12 have been met (SCAG 2016). Consistency with the RTP/SCS would demonstrate consistency with SCAQMD's 2016 AQMP.

The Project lies entirely within Traffic Analysis Zone 43268200. The 2016 RTP/SCS projects that within Traffic Analysis Zone 43268200, there will be a total of 8,755 jobs by 2020 and 22,196 by 2045.[6] As of 2016, there are 4,531 jobs in the March JPA jurisdiction. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Adding jobs consistent with 2016 RTP/SCS projections supports SCAG's achievement of March Air Reserve Base emissions reductions targets.

The SCS also indicates that this is a jobs poor area so providing more jobs will actually reduce greenhouse gas emissions and reduce VMT as it will provide local jobs to achieve a more favorable

[6] Jobs data provided by March JPA.

jobs housing balance. The March JPA General Plan (March JPA 1999) discusses the need to create more jobs, including the following examples:

- March JPA has a stated goal of providing 38,000 jobs, through development of its Planning Area, to the western Riverside County area thereby creating a much-needed job center. The creation of a job center is important to reduce the existing jobs/housing imbalance that exists in this region such that it can help reduce traffic congestion, pollution, fossil fuel dependence and improve the overall quality of life for the residents of western Riverside County. (p. 1-11)
- March JPA has a mission to replace regional economic benefit that was lost with the realignment of the active duty March Air Force Base into a Reserve Base in April 1996. The quantified benefits are the creation of at least 38,000 jobs, and more that $500 million annual economic contribution to the Riverside County region. (p. 5-4)

The Project is expected to generate 1,132 jobs. This is approximately one-fourth of the projected job growth in Traffic Analysis Zone 43268300 in 2020 as compared to 2016, and approximately 6.4% of projected job growth in 2045 as compared to 2016. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Since the jobs created by the Project are within the job growth projections in the 2016 RTP/SCS, the Project would not conflict with the 2016 AQMP and, as such, would not jeopardize attainment of CAAQS and NAAQS in the area under the jurisdiction of the SCAQMD. Therefore, the Project is consistent with Consistency Criterion No. 2.Overall, since the Project would conflict with Consistency Criterion No. 1, impacts are considered **potentially significant** for Threshold AQ-1.

Threshold AQ-2. Would the Project result in a cumulatively considerable new increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

In considering cumulative impacts from a project, the analysis must specifically evaluate a project's contribution to the cumulative increase in pollutants for which the SCAB is designated as nonattainment for the CAAQS and NAAQS. If a project's emissions would exceed the SCAQMD significance thresholds, it would be considered to have a cumulatively considerable contribution to nonattainment status in the SCAB. If a project does not exceed thresholds and is determined to have less-than-significant project-specific impacts, it may still contribute to a significant cumulative impact on air quality. A project would be considered to have a significant cumulative impact, however, if the project's contribution accounts for a significant proportion of the cumulative total emissions (i.e., it represents a "cumulatively considerable contribution" to the cumulative air quality impact).

Construction and operation of the Project may result in emission of criteria air pollutants from mobile, area, and energy sources, which may cause exceedances of federal and state ambient air quality standards or contribute to existing nonattainment of ambient air quality standards. The

following discussion identifies potential short- and long-term construction impacts that would result from implementation of the Project. Feasible mitigation measures to reduce potential significant impacts, as appropriate, are proposed.

Construction Emissions

Construction of the Project would result in the addition of pollutants to the local airshed caused by soil disturbance, fugitive dust emissions, and combustion pollutants from on-site construction equipment, as well as from off-site trucks hauling construction materials.

Table 4.2-7 presents the estimated maximum unmitigated and mitigated daily construction emissions generated during construction of the Project in each year. The values shown are the maximum summer or winter daily emissions (i.e., worst-case) results from CalEEMod. Details of the emission calculations are provided in Appendix C.

Table 4.2-7
Estimated Maximum Daily Construction Emissions (pounds/day)

	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Unmitigated Emissions[a]						
Year 2019	7.7	125.8	55.9	0.2	11.8	6.8
Year 2020	527.4	44.7	42.5	0.1	9.2	3.3
Maximum daily emissions	**527.4**	**125.8**	**55.9**	**0.2**	**11.8**	**6.8**
Pollutant threshold	*75*	*100*	*550*	*150*	*150*	*55*
Threshold exceeded?	**Yes**	**Yes**	**No**	**No**	**No**	**No**
Mitigated Emissions[a,b]						
Year 2019	5.2	94.4	60.2	0.2	10.0	4.7
Year 2020	53.3	35.6	43.8	0.1	8.7	2.8
Maximum daily emissions	**53.3**	**94.4**	**60.2**	**0.2**	**10.0**	**4.7**
Pollutant threshold	*75*	*100*	*550*	*150*	*150*	*55*
Threshold exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compounds; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns. See Appendix C for complete results.

[a] Emissions are based on Project-specific construction schedule, equipment list, and amount of hauling material. California Emissions Estimator Model (CalEEMod) defaults were used for off-road construction equipment horsepower and load factors and on-road construction emissions. The off-road emissions calculations assume that fugitive dust is controlled by watering two times daily, as required by South Coast Air Quality Management District (SCAQMD) Rule 403. The emissions analysis conservatively assumed a start year of 2019; therefore, emissions presented here reflect years 2019 and 2020.

[b] Mitigated emissions include implementation of MM-AQ-1, which requires all off-road diesel-powered construction equipment above 50 horsepower to meet the Tier 3 emission standards for non-road diesel engines promulgated by the U.S. Environmental Protection Agency (EPA) at a minimum, as well as requires 50% of all construction equipment to meet the EPA Tier 4 Final standards. Additionally, MM-AQ-2 requires Super Compliant architectural coatings with a VOC content less than 10 grams per liter VOC.

As shown in Table 4.2-7, in the unmitigated scenario, daily construction emissions would not exceed the SCAQMD significance thresholds for CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction. Furthermore, construction-generated emissions would be temporary and would not represent a long-term source of criteria air pollutant emissions. In addition, the Project would be required to comply with SCAQMD Rule 403 to control dust emissions generated during grading activities. Standard construction practices that would be employed to reduce fugitive dust emissions include watering the active sites approximately two times daily, depending on weather conditions. As shown in Table 4.2-7, maximum unmitigated construction-generated VOC and NO_x emissions would exceed the SCAQMD's respective quantitative significance thresholds.

Operational Emissions

Following the completion of construction activities, the Project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources including vehicular traffic generated by delivery trucks and employee vehicles, stationary sources including area sources (consumer products, architectural coatings for maintenance, landscaping equipment), and energy sources (natural gas appliances, space, and water heating).

Table 4.2-8 presents the maximum daily area source emissions, energy source emissions, and vehicle source emissions for the Project operations.[7] The values shown are the maximum summer or winter daily emissions (i.e., worst-case) results from CalEEMod. Details of the emission calculations are provided in Appendix C.

Table 4.2-8
Estimated Maximum Daily Operational Emissions (pounds/day unmitigated)

	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Unmitigated Emissions[a]						
Area source emissions	16.3	<0.1	0.1	<0.1	<0.1	<0.1
Energy source emissions	<0.1	0.4	0.3	<0.1	<0.1	<0.1
Mobile source emissions[b]	26.3	252	237	1.3	100	30.3
Combined total emissions	**42.7**	**253**	**238**	**1.4**	**100**	**30.3**
Pollutant threshold	*55*	*55*	*550*	*150*	*150*	*55*
Threshold exceeded?	**No**	**Yes**	**No**	**No**	**No**	**No**
Mitigated Emissions[a,c]						
Area source emissions	14.7	<0.1	0.1	<0.1	<0.1	<0.1
Energy source emissions	<0.1	0.4	0.3	<0.1	<0.1	<0.1
Mobile source emissions[b]	26.3	252	237	1.3	100	30.3

[7] The CalEEMod analysis assumed operation in year 2020, which is a conservative assumption for the operational emissions analysis since the CalEEMod model has decreasing emission factors for later years.

Table 4.2-8
Estimated Maximum Daily Operational Emissions (pounds/day unmitigated)

	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Combined total emissions	**41.0**	**253**	**238**	**1.4**	**100**	**30.3**
Pollutant threshold	*55*	*55*	*550*	*150*	*150*	*55*
Threshold exceeded?	**No**	**Yes**	**No**	**No**	**No**	**No**

Note: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns.
See Appendix C for detailed results.

[a] Emissions were estimated using methodology consistent with California Emissions Estimator Model (CalEEMod) 2016.3.2.

[b] on-road vehicle emissions were estimated using EMFAC2017 for calendar year 2020. Vehicle trip rates for each land use type were obtained from the Project-specific Traffic Impact Analysis. Additionally, a Project-specific fleet mix was calculated for the unrefrigerated warehouse land use types based on the Traffic Impact Analysis.

[c] Mitigated architectural coating emissions include the utilization of Super Compliant coatings with a VOC content less than 10 grams per liter VOC.

As shown in Table 4.2-8, in the unmitigated scenario, the combined daily area, energy, and vehicular source emissions would not exceed the SCAQMD operational thresholds for VOC, CO, SO_x, PM_{10}, or $PM_{2.5}$. However, Project emissions would exceed the SCAQMD operational thresholds for NO_x which is attributed to the vehicular source emissions from trucks traveling to and from the Project site.

The SCAB has been designated as federal nonattainment area for O_3 and $PM_{2.5}$ and a state nonattainment area for O_3, PM_{10} and $PM_{2.5}$ emissions. The nonattainment status is the result of cumulative emissions from all sources of these air pollutants and their precursors within the SCAB. As discussed above, the NO_x and VOC emissions during Project construction would be above the significance threshold without mitigation.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site project. Construction schedules for potential future projects within 1,000 feet of the Project site are currently unknown; therefore, potential construction impacts associated with two or more simultaneous projects would be considered speculative. However, future projects would be subject to CEQA and would require air quality analysis and, where necessary, mitigation if the project would exceed SCAQMD thresholds. The CEQA Guidelines state that if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145). This analysis is nonetheless provided in an effort to show good faith analysis and comply with CEQA's information disclosure requirements.

The construction of the Project would generate VOC and NO_x emissions (which are precursors to O_3) that would exceed SCAQMD's emission-based significance threshold. Thus, the Project would have a cumulatively considerable increase in emissions due to construction prior to mitigation. Therefore, construction of the Project would contribute to the SCAB's O_3 nonattainment designation, and impacts would be **potentially significant**.

As detailed in Impact AQ-2, operational emissions generated by the Project would not result in a significant impact regarding VOC, CO, SO_x, PM_{10}, or $PM_{2.5}$; however, Project emissions would exceed the SCAQMD operational threshold for NO_x (precursors to O_3). As described above, if a Project's emissions exceed the SCAQMD significance thresholds for a pollutant or a precursor to a pollutant the SCAB is in nonattainment of under the CAAQS and/or NAAQS, it would have a cumulatively considerable contribution to the SCAB's nonattainment status of that pollutant. Therefore, operation of the Project would contribute to the SCAB's O_3 nonattainment designation, and impacts would be **potentially significant**.

Threshold AQ-3. Would the Project expose sensitive receptors to substantial pollutant concentrations?

Localized Significance Thresholds Analysis

Sensitive receptors are those more susceptible to the effects of air pollution than are the population at large. People most likely to be affected by air pollution include children, the elderly, and people with cardiovascular and chronic respiratory diseases. According to the SCAQMD, sensitive receptors include residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993). The closest off-site sensitive receptors to the Project site is March Air Reserve Base located approximately 30 meters south from the Project boundary, as shown in Figure 4.2-1, Location of Sensitive Receptors, and as depicted in Appendix C.

Table 4.2-9 presents the estimated maximum on-site unmitigated and mitigated daily construction emissions generated during construction of the Project in each year and compares the emissions to the applicable LSTs. The construction emissions are based on conservative assumptions to represent the maximum level of construction activity that may occur on the Project site on a given day. Details of the emission calculations are provided in Appendix C.

Table 4.2-9
Comparison of Project On-Site Construction Emissions to Localized Significance Thresholds (pounds/day)

	NO_x	CO	PM_{10}	$PM_{2.5}$
Unmitigated On-Site Emissions[a]				
Year 2019	82.6	47.2	10.5	6.4
Year 2020	19.5	14.7	1.0	0.9
Mitigated On-Site Emissions[a,b]				
Year 2019	27.7	50.1	8.0	4.3
Year 2020	10.4	17.3	0.5	0.5

Table 4.2-9
Comparison of Project On-Site Construction Emissions to Localized Significance Thresholds (pounds/day)

	NO_x	CO	PM_{10}	$PM_{2.5}$
Comparison to SCAQMD LSTs[c]				
Allowable Emissions	*270*	*1,577*	*13*	*8*
Threshold exceeded?	**No**	**No**	**No**	**No**
Comparison to 1-hour NO_2 NAAQS[d]				
Allowable Emissions	*150*	—	—	—
Threshold exceeded?	**No**	—	—	—

Notes: NO_x = oxides of nitrogen; CO = carbon monoxide; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns; SCAQMD = South Coast Air Quality Management District; LST = localized significance threshold; NO_2 = nitrogen dioxide; NAAQS = National Ambient Air Quality Standards; — = no threshold available.
See Appendix C for complete results.

[a] Emissions estimated using methodology consistent with California Emissions Estimator Model (CalEEMod) 2016.3.2. Only on-site emissions are compared with the LST mass rate table. The off-road emissions calculations assume that fugitive dust is controlled by watering two times daily, as required by SCAQMD Rule 403. The emissions analysis conservatively assumed a start year of 2019; therefore emissions presented here reflect years 2019 and 2020.

[b] Mitigated emissions include implementation of MM-AQ-1, which requires all off-road diesel-powered construction equipment above 50 horsepower to meet the Tier 3 emission standards for non-road diesel engines promulgated by the U.S. Environmental Protection Agency (EPA) at a minimum, as well as requires 50% of all construction equipment to meet the EPA Tier 4 Final standards. Mitigated emissions also include implementation of MM-AQ-2, which requires the utilization of Super Compliant coatings with a volatile organic compound (VOC) content less than 10 grams per liter.

[c] Using the SCAQMD LSTs, 'Allowable Emissions' are the maximum emissions that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard. Metropolitan Riverside County LSTs shown are for a 5-acre site at a 25 meter distance, and are assumed to be conservative thresholds for larger project sites.

[d] An approximated LST was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD significance threshold has not been updated to reflect this standard. Calculated by scaling the Metropolitan Riverside County NO_2 LST for a 5-acre site at a 25-meter distance by the ratio of the 1-hour NO_2 standards (federal/state).

As shown in Table 4.2-9, construction of the Project is not anticipated to result in an exceedance of the interpolated SCAQMD LSTs or of the approximated LST for the 1-hour NO_2 NAAQS. Localized ambient air quality impacts would be **less than significant**. Since the analysis shows that on-site construction emissions are below the mass-rate LSTs, further air dispersion modeling was not required.

Table 4.2-10 presents the estimated maximum Project on-site operational emissions and compares the emissions to the applicable interpolated LSTs. This analysis conservatively estimated on-site mobile emissions assuming a 0.6-mile one-way trip length. Details of the emission calculations are provided in Appendix C.

Table 4.2-10
Comparison of Project On-Site Operational Emissions to Localized Significance Thresholds (pounds/day)

	NO_x	CO	PM_{10}	$PM_{2.5}$
Maximum On-Site Operational Emissions[a]				
Year 2020	9	13	2.8	0.8
Comparison to SCAQMD LSTs[b]				
Allowable Emissions	*270*	*1,577*	*4*	*2*
Threshold exceeded?	**No**	**No**	**No**	**No**
Comparison to 1-hour NO_2 NAAQS[c]				
Allowable Emissions	*150*	—	—	—
Threshold exceeded?	**No**	—	—	—

Notes: NO_x = oxides of nitrogen; CO = carbon monoxide; PM_{10} = particulate matter with an aerodynamic diameter equal to or less than 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter equal to or less than 2.5 microns; SCAQMD = South Coast Air Quality Management District; LST = localized significance threshold; NO_2 = nitrogen dioxide; NAAQS = National Ambient Air Quality Standards; — = no threshold available.
See Appendix C for complete results.

[a] Project emissions include on-site area, energy, and mobile source emissions for calendar year 2020. Area source and energy emissions were estimated using California Emissions Estimator Model (CalEEMod) 2016.3.2. Mobile source emissions were calculated using EMFAC2017. On-site mobile emissions were estimated using a one-way trip length of 0.6 miles. The operational schedule shown here is one year later than that analyzed in the CalEEMod analysis. This is a conservative assumption for the operational emissions analysis since the CalEEMod model has decreasing emission factors for later years.

[b] Using the SCAQMD LSTs, 'Allowable Emissions' are the maximum emissions that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard. Metropolitan Riverside County LSTs shown are for a 5-acre site at a 25-meter distance, and are assumed to be conservative thresholds for larger project sites.

[c] An approximated LST was estimated to evaluate the federal 1-hour NO_2 standard, as the SCAQMD significance threshold has not been updated to reflect this standard. Calculated by scaling the Metropolitan Riverside County NO_2 LST for a 5-acre site at a 25-meter distance, by the ratio of the 1-hour NO_2 standards (federal/state).

As shown in Table 4.2-10, operation of the Project is not anticipated to result in an exceedance of the interpolated SCAQMD LSTs or of the approximated LST for the 1-hour NO_2 NAAQS. Localized ambient air quality impacts would be **less than significant**. Since the screening analysis shows that on-site operational emissions are below the mass-rate LSTs, further air dispersion modeling was not required.

Carbon Monoxide Hotspots

Based on the comparative analysis presented in Appendix C and summarized below, a quantitative CO hotspots analysis was not needed to determine whether the change in the LOS of an intersection by the Project would have the potential to result in exceedances of the CAAQS or NAAQS. CO attainment was thoroughly analyzed as part of the SCAQMD's 2003 AQMP and the 1992 CO Plan. As discussed in Appendix C, peak CO concentrations in the SCAB are due to unusual meteorological and topographical considerations, and not due to the impact of particular intersections. Considering the region's unique meteorological conditions and the increasingly stringent CO emissions standards, CO modeling was performed as part of the 1992 CO Plan and subsequent plan updates and AQMPs.

Appendix C includes a comparison of CO hotspot analysis included in the 1992 CO Plan, which assessed CO concentrations for four busy intersections in Los Angeles at the peak morning and afternoon time periods, to intersections affected by Project traffic volumes. The busiest intersection evaluated in the 1992 CO Plan was Wilshire Boulevard/Veteran Avenue, which had a daily traffic volume of about 100,000 vehicles per day and did not result in a CO standard violation. The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm, which indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 400,000 vehicles per day, based on the ratio of the CO standard (20.0 ppm) and the modeled value (4.6 ppm). At buildout of the Project, the highest average daily trips at an intersection would be approximately 228,500 at the Trautwein Road/Alessandro Boulevard intersection, which is below the daily traffic volumes that would be expected to generate CO exceedances as evaluated in the 2003 AQMP. This daily trip estimate is based on the average daily traffic rate conditions of the intersection. Even at this level of traffic and including the SCAQMD projected background concentrations of CO in 2020 at the Rubidoux monitoring station (5.1 ppm), the standard would not be exceeded. There is no reason unique to SCAB meteorology to conclude that the CO concentrations at the Trautwein Road/Alessandro Boulevard intersection would exceed the 1-hour CO standard if modeled in detail, based on the studies undertaken for the 2003 AQMP. Based on the above considerations, localized CO impacts would be **less than significant**.

Health Risk Assessment

According to CARB's *Air Quality and Land Use Handbook: A Community Health Perspective* (CARB 2005b), living close to distribution centers or warehouse facilities may lead to adverse health effects beyond those associated with regional air pollution in urban areas. The activities associated with delivering, storing, and loading freight produces DPM emissions. In addition to on-site emissions, truck exhaust from travel in and out of distribution centers contributes to the local pollution impact. DPM has been identified as a TAC and represents 70% of the known potential cancer risk from air toxics in California. DPM is an important contributor to particulate matter air pollution. CARB and SCAQMD analyses indicate that providing a separation of 1,000 feet would substantially reduce DPM concentrations and public exposure downwind of a distribution center. Therefore, CARB recommends a separation of 1,000 feet based on the combination of risk analysis done for Transportation Refrigeration Units and the decrease in exposure predicted within SCAQMD modeling (CARB 2005b).

In order to evaluate health impacts to off-site receptors, the geographic scope of this assessment was extended to a one-quarter mile radius or 1,320 feet from the modeled Project sources. The HRA is consistent with OEHHA guidance (OEHHA 2015), where risks were estimated at the location of the maximally exposed individual resident (MEIR) and included evaluation of the maximally exposed individual sensitive receptor (MEISR). The MEIR and MEISR are defined as the off-site

receptor locations where residents and other sensitive individuals may reside or be present, respectively, with the potential highest cancer risk or chronic HI. Additionally, the 2015 OEHHA guidance includes an exposure duration of 30 years for the residences, as well as applicable age sensitivity factors and daily breathing rates. A detailed description of the 2015 OEHHA guideline assumptions is included in Appendix C.

In summary, the incremental increase in lifetime cancer risk and chronic HI for a resident at the off-site location due to operational emissions would be 1.3 in a million and 0.004, respectively, which would not exceed the applicable SCAQMD cancer and non-cancer risk thresholds. For this analysis, the MEIR was identified as a sensitive receptor and thus determined to be the MEISR.[8] Health risk impacts associated with long-term operations of the Project would be **less than significant**. While DPM emissions will also be emitted during Project construction, the short-term duration of the Project construction and the lower level of on-site construction DPM emissions compared to operational emissions suggests that it is unlikely for construction emissions to substantially change the findings and results reported for the operational emissions.

Threshold AQ-4. Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source, the wind speeds and direction, and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying and cause distress among the public, and generate citizen complaints. Odor impacts associated with Project construction and operations are discussed below.

Odors would be potentially generated from vehicles and equipment exhaust emissions during construction of the Project. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment. Such odors are temporary and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered **less than significant**.

According to the SCAQMD, land uses and industrial operations typically associated with odor complaints include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project does not include any uses identified by the SCAQMD as commonly associated with odors. Therefore, Project operations would result in an odor impact that would be **less than significant**.

[8] The MEIR may also be considered the MEISR if the health risk values at the MEIR are the maximum of off-site receptors.

4.2.6 Mitigation Measures

CEQA Guidelines Section 15126.4 requires EIRs to describe feasible measures that can minimize significant adverse impacts. The following mitigation measures have been evaluated for feasibility and are incorporated in order to reduce potentially significant impacts related to criteria air pollutant emissions. These mitigation measures were quantified: **MM-AQ-1** and **MM-AQ-2**. All others were conservatively not quantified.

MM-AQ-1 **Construction Equipment Emissions Standards.** During Project construction, the construction contractor, with oversight by March JPA, shall ensure that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the U.S. Environmental Protection Agency (EPA). In addition, the construction contractor shall utilize 50% Tier 4 Final construction equipment, based on number of pieces of construction equipment.

MM-AQ-2 **Low-VOC Architectural Coatings.** The construction contractor shall be required to utilize Super-Compliant volatile organic compound (VOC) interior and exterior paints, which are defined by the South Coast Air Quality Management District (SCAQMD) as meeting the "super-compliant" VOC standard of 10 grams per liter, during construction and long-term operations (SCAQMD n.d.b).

MM-AQ-3 **Construction Relations Officer.** The Project will provide a construction relations officer to act as a community liaison to oversee on-site construction activity and all emissions and congestion related matters. A phone number and email contact information for the construction relations officer shall be posted on signage at construction site entrance points.

MM-AQ-4 **Improved Energy Efficiency and Water Reduction.** The Project applicant shall incorporate the following measures into the Project design:

- The Project will install approximately 4.5 megawatts of solar photovoltaic electricity generation.
- The Project will install Energy Star certified light bulb and lighting fixtures.
- The Project will install duct insulation to a minimum level of R-6 and modestly enhanced window insulation as required by 2016 Title 24 and consistent with the Riverside County Climate Action Plan criteria.
- Consistent with the Riverside County Climate Action Plan criteria, the Project will include the following design elements: Construction of modest cool roof,

defined as Cool Roof Rating Council (CRRC) Rated 0.15 aged solar reflectance and 0.75 thermal emittance; Use of heating, ventilation, and air conditioning equipment with a Seasonal Energy Efficiency Ratio (SEER) of 14 or higher; Installation of water heaters with an energy factor of 0.92 or higher; All rooms will have some form of daylighting (e.g., skylights or windows); At least 50% of artificial lighting unit fixtures will be high efficacy; Waterless urinals and high efficiency toilets will be used throughout the Project; and water efficient faucets will be used throughout the Project.

- The Project will provide electrical outlets at building exterior areas.
- The Project landscape non-potable water system will meet "purple" pipe standards.
- The Project will exceed the Riverside County Climate Action Plan requirement for water efficient landscaping by having no turf and only drought tolerant plants and introducing additional water efficient irrigation controls such as smart irrigation controllers.
- The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle charging stations and fifty-four off-site electric vehicle charging stations.

MM-AQ-5 **Commute Trip Reduction .** The Project applicant shall incorporate the following measures in order to encourage alternative modes of transportation and reduce commute trips.

- Five percent (5%) of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools.
- Tenants with more than 10,000 square feet of office space shall provide video conferencing facilities. Tenant spaces below 10,000 square feet of office space may pursue video conferencing as feasible.
- The Project will provide short- and long-term bicycle parking facilities to meet peak season maximum demand (one bike rack space per 20 vehicle/employee parking spaces).
- The Project will provide "end-of-trip" facilities including showers, lockers, and changing space (four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).
- Each tenant will provide on-site food vending machines or refrigerator, microwave oven and mail facilities (i.e., drop box) at the Project site. Each

tenant with over 5,000 square feet of office space shall provide an on-site computer, internet connection, and other services for personal employee use. Projects will consider the provision of an ATM as feasible.

MM-AQ-6 **Truck Requirements.** In order to minimize on-road mobile source criteria air pollutant emissions, March Joint Powers Authority (JPA) shall require the following measures for the Project.

- For any warehouse use, the loading docks shall be designed to accommodate SmartWay trucks. The March JPA will require evidence of compliance prior to issuance of a certificate of occupancy for any warehouse use.

4.2.7 Level of Significance After Mitigation

With implementation of Mitigation measures **MM-AQ-1** and **MM-AQ-2** during Project construction, NO_x and VOC emissions would be reduced to a level that is **less than significant**. Project emissions would exceed the SCAQMD operational thresholds for NO_x which is attributed to the vehicular source emissions from trucks traveling to and from the Project site. **MM-AQ-4** would apply to energy and water use reductions, which are primarily sources of greenhouse gases and minimal sources of criteria air pollutants and, therefore, not quantified herein. **MM-AQ-5**[9] and **MM-AQ-6**[10] would be required to reduce mobile source emissions; however, due to the lack of clarity on the quantity of reductions associated with these mitigation measures these measures are conservatively not quantified for this analysis (Appendix C). While CAPCOA guidance provides some guidance to estimate reductions for commute trips, the information is in the form of a range of potential reductions, and it is reasonable to conservatively not include a specific reduction relative to MM-AQ-5. Therefore, impacts would be considered **significant and unavoidable** for Project operational emissions. The Project operations would conflict with Consistency Criterion No. 1 of the SCAQMD *CEQA Air Quality Handbook*, therefore the impact remains **significant and unavoidable** impact. Also, since the SCAQMD considers an impact cumulatively considerable contribution to nonattainment status in the SCAB if a project's emissions would exceed the SCAQMD significance thresholds, the Project would also have a cumulatively considerable **significant and unavoidable** impact to air quality after mitigation.

[9] While CAPCOA guidance provides some guidance to estimate reductions for commute trips, the information is in the form of a range of potential reductions, and it is reasonable to conservatively not include a specific reduction relative to MM-AQ-5.

[10] MM-AQ-6 will allow and encourage SmartWay trucks to use the K4 warehouse. SmartWay trucks have improved efficiency over non-SmartWay trucks. However, it is reasonable to conservatively not quantify the benefit of MM-AQ-6 due to minimal information available to estimate emission reductions if such trucks are incorporated into the fleet.

Project Health Impacts

While EIRs have long evaluated the health impacts of air toxic pollutants, such as diesel particulate matter, EIRs have not historically evaluated the specific health impacts of the increase in criteria pollutants[11] other than to note the general effect of criteria air pollutants on health without tying those general impacts to the project. This analysis estimates the health impacts of criteria pollutants, specifically those that are evaluated by the USEPA in rulemaking: NO_X, VOC, O_3, $PM_{2.5}$, and SO_X. However, the Project only exceeded the SCAQMD significance thresholds for NO_X emissions during operation.

In order to estimate the health impacts of criteria pollutants from the Project, a photochemical grid model (PGM), Comprehensive Air-quality Model with extensions (CAMx),[12] was utilized to estimate the small increases in concentrations of O_3 and $PM_{2.5}$ in the region as a result of the emissions of criteria pollutants from the Project. The Benefits Mapping and Analysis Program (BenMAP) (EPA 2018b) was then applied to estimate the resulting health impacts from the small increases in concentration.

The first step in the process is to run the PGM with appropriate information to assess the small increases in ambient air concentrations that the Project may cause. PGMs require a database of information including the spatial allocation of emissions in the area to be modeled. This includes both baseline emissions and Project mitigated emissions. The latest publicly available PGM database for Southern California, which contains baseline emissions, was developed by the SCAQMD in support of the 2016 AQMP (SCAQMD 2017) and was adapted for this analysis. This PGM database is tailored for Southern California using California-specific input tools (e.g., the EMFAC (CARB 2018) mobile source emissions model) and uses a high-resolution 4-km horizontal grid to better simulate meteorology and air quality in the complex terrain and coastal environment of California.

EPA's air quality modeling guidelines (Appendix W of 40 CFR) and O_3 and $PM_{2.5}$ modeling guidance (EPA 2018c) recommends using a PGM to estimate O_3 and secondary $PM_{2.5}$ concentrations. EPA's modeling guidance does not recommend specific PGMs but provides procedures for determining an appropriate PGM on a case-by-case basis. EPA's air quality modeling guidelines and guidance notes that both the CAMx and the Community Multiscale Air Quality (CMAQ) PGMs have been used extensively in the past and would be acceptable PGMs.

[11] Criteria pollutants are those pollutants with an air pollution standard or pollutants which are precursors to those with a standard. Pollutants with an air pollution standard include nitrogen dioxide, sulfur dioxide, ozone, carbon monoxide, particulate matter smaller than 2.5 microns and 10 microns and ozone. Precursor pollutants to criteria pollutants include oxides of nitrogen, oxides of sulfur, and volatile organic chemicals.

[12] Comprehensive Air Quality Model with Extensions.

EPA has prepared a Memorandum documenting the suitability for using CAMx and CMAQ for O_3 and secondary $PM_{2.5}$ modeling of single-sources or group of sources (EPA 2017).

To estimate the potential air quality health impacts, the Project's emissions were added to the CAMx 4-km annual PGM modeling database. Operational emissions from the Project were estimated as described in the Section 4.2.5, Impacts Analysis, and Appendix C. For use in PGMs, each Project emissions source must be spatially distributed across the modeling grid cells so that they can be incorporated into the gridded emission inventory. The total mitigated emission inventory for the Project was used in the analysis. This includes area, energy and mobile source emissions. The energy and area source emissions are located on site and were therefore allocated to the grid cell representing the Project. The mobile source category includes both passenger vehicles and trucks, with the majority of the emissions resulting from truck traffic serving the site. The mobile sources are spatially distributed in the site's grid cell and other grid cells representing travel routes consistent with the Traffic Impact Analysis. Annual emission estimates were spatially gridded, temporally allocated, and chemically speciated to be used for photochemical grid modelling using the Sparse Matrix Operating Kernel Emissions (SMOKE) emissions modelling system supported by the USEPA.

The SCAQMD 2016 AQMP modeling database for Southern California was used for this Project. The Southern California 4-km CAMx modeling databases is based on a 2012 base meteorological year and includes future year emission scenarios. The 2023 future year projections were used for this analysis. The Project's emissions were tagged for treatment by the source apportionment tools in CAMx to obtain the incremental O_3 and $PM_{2.5}$ concentration impacts due to the Project's emissions.

EPA's BenMAP (EPA 2018b) program was used to estimate the health impacts of the Project's contribution to O_3 and $PM_{2.5}$ concentration produced by the CAMx source apportionment modeling. BenMAP uses the concentration estimates along with population and health effect concentration-response (C-R) functions to estimate various health effects of the concentration increases. BenMAP has a wide history of applications by EPA and others, including for local-scale analysis (EPA n.d.) as needed for assessing the health impacts of a Project's emissions. The health effects that we used for $PM_{2.5}$ include mortality (all causes), hospital admissions (respiratory, asthma, cardiovascular), emergency room visits (asthma), and acute myocardial infarction (non-fatal). For O_3, the endpoints are mortality, emergency room visits (respiratory) and hospital admissions (respiratory).

$PM_{2.5}$-related health outcomes included less than one additional incidence of asthma-related emergency room visits, asthma-related hospital admissions, all cardiovascular-related hospital admissions (not including myocardial infarctions), all respiratory-related hospital admissions, mortality, and nonfatal acute myocardial infarction. O_3-related health outcomes included less than one additional incidence of all respiratory-related hospital admissions, mortality, and asthma-

related emergency room visits for any age range. For all these health endpoints, the number of estimated incidences is less than 0.0042% of the baseline number of incidences. The "baseline incidence" is the actual incidence of health effects as measured in the local population in the absence of additional emissions from the Project.

There is a degree of uncertainty in these results from a combination of the uncertainty of the increase in concentration resulting from the PGM and the uncertainty of the application of the C-R increase. All simulations of physical processes, whether ambient air concentrations, or health impacts from air pollution, have a level of uncertainty associated with them, due to simplifying assumptions. The overall uncertainty is a combination of the uncertainty associated with each piece of the modeling study, in this case, the PGM, and BenMAP. While these results reflect a level of uncertainty, regulatory agencies, including the USEPA have judged that, even with the uncertainty in the results, the results provide sufficient information to the public to allow them to understand the health effects of increases or decreases in air pollution. In addition, the health impacts estimation using this method presumes that impacts seen at large concentration differences can be linearly scaled down to small increases in concentration. This methodology of linearly scaling impacts is broadly accepted for use in regulatory evaluations and is considered as being health protective (EPA 2010). These health impacts are conservatively estimated, and the actual impacts may be zero.

4.3 BIOLOGICAL RESOURCES

This section provides an analysis of the potential impacts to biological resources from the implementation of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). The following discussion and analysis is based on information presented in the biological technical report, *K4 Warehouse and Cactus Channel Improvements Project Biological Resources Report* (Appendix E), and the jurisdictional delineation, *K4 Warehouse and Cactus Channel Improvements Project Jurisdictional Delineation Report* (Appendix F), prepared by Rocks Biological Consulting for the proposed Project. This section analyzes the potential adverse impacts to special-status biological resources defined as follows: (1) species that have been given special recognition by federal, state, or local resource agencies and environmental organizations due to limited, declining, or threatened population sizes; (2) species and habitat types recognized by local and regional resource agencies as special-status; (3) habitat areas or vegetation communities that are unique, are of relatively limited distribution, or are of particular value to wildlife; (4) wildlife corridors and habitat linkages; and (5) U.S. Army Corps of Engineers (ACOE) jurisdictional waters of the United States (including wetlands), California Department of Fish Wildlife (CDFW) jurisdictional streams, and waters of the state subject to the permitting authority of the Los Angeles Regional Water Quality Control Board (RWQCB). Regulated biological resources may or may not be considered special-status, but are regulated under local, state, and/or federal laws.

As discussed in Chapter 2, Project Description, of the Environmental Impact Report (EIR), Meridian Park K4 LLC is proposing the development of an approximately 718,000-square-foot industrial warehouse with 289 automobile parking stalls and 317 truck trailer parking stalls on the K4 Parcel and the conversion of the existing Cactus Avenue Drainage Channel (Cactus Channel)) from an open-air earthen channel into an underground concrete culvert for approximately 7,900 linear feet between Elsworth Street on the west and Heacock Street and Heacock Channel on the east on the Cactus Channel improvements site. The K4 Parcel is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The Project includes the following components:

- **General Plan Amendment:** The K4 Parcel has a current land use designation of Business Park within the existing March Joint Powers Authority (JPA) General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.

- **Plot Plan:** A Plot Plan approval is requested to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailed parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into one 35.4-acre K4 Parcel.

4.3.1 Existing Conditions

Project Description

The approximately 42.4-acre Project site includes the 35.4-acre K4 Parcel and 7.0-acre Cactus Channel improvements site; thus, the term "Project site" in this section includes both the "K4 Parcel" and "Cactus Channel improvements site" defined further below.

K4 Parcel

The proposed Project includes development of a 718,000-square-foot building equipped with 105 loading docks, 289 automobile parking stalls, 317 truck trailer parking stalls, and new driveways on the approximate 35.4-acre K4 Parcel. Vehicles would access the K4 Parcel via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. These new access driveways are proposed to cross Cactus Channel and are necessary to provide ingress/egress to the proposed K4 Warehouse site; thus, is included in the K4 Parcel.

Cactus Channel Improvements

The Project also includes converting an existing open-air drainage channel (Cactus Channel) on the south side of Cactus Avenue into a box culvert and would include implementing regional improvements to the Cactus Channel drainage ditch. This portion of the Project is referred to as the "Cactus Channel Improvements Site" in this section.

Project Location

The approximately 35.4-acre K4 Parcel is located north of March Air Reserve Base (ARB), south of Cactus Avenue, and extends east-to-west from the Veterans Way and Cactus Avenue intersection to Chanute Avenue. The approximately 7.0-acre Cactus Channel improvements site runs along the south side of Cactus Avenue (north of the 35.4-acre K4 Parcel), east of Elsworth Street and west of Heacock Street and Heacock Channel. Interstate (I) 215 is located approximately 0.8 miles west of the Project site. The Project site is located within the March JPA jurisdiction in unincorporated Riverside County, California and is comprised of five parcels designated as Assessor's Parcel Numbers 2971-500-068, 2971-500-079, 2971-500-387, 2971-600-058, and 2972-000-040 (Figure 2-1, Project Location).

Access to the Project is from Cactus Avenue to the north, where the new access driveways are proposed to be constructed across Cactus Channel.

Physical Setting and Land Uses

The site is a relatively flat parcel that supports several upland vegetation communities, primarily dominated by goldenbush scrub/non-native grassland and developed/disturbed land. Surrounding land uses include industrial and commercial development, residential development, and military development. The Project site is within the jurisdiction of March JPA, but outside of (adjacent to) the Meridian Specific Plan area. Therefore, the Project requires separate land use approvals. Reuse of the March ARB, including the Project site, was planned under the March JPA General Plan (March JPA 1999a). The March JPA General Plan and Master EIR were prepared and adopted/certified in 1999 for the JPA Planning area (March JPA 1999b; SCH No. 97071095). Additionally, the Project occurs within the 'Northeast Planning Subarea' area identified for future development within the "Disposal and Reuse of March Air Force Base" Project (U.S. Air Force 1996).

The proposed improvements to the Cactus Channel are being proposed by and for the District as part of the District's Master Plan; and thus, is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert is being permitted by the District and it would either be constructed contemporaneously with the Project or built separately depending on permitting and timing. The Cactus Channel would function as part of the District's Master Plan, and these agencies are party to the Western Riverside County (WRC) Multiple Species Habitat Conservation Plan (MSHCP). Thus, improvements to the Cactus Channel may require compliance with the MSHCP. Currently it is anticipated that there would be some utility relocations for existing crossings in record plans as well as removal of some existing roadway culverts and extending existing storm drain connections to the earth swale.

Background

The Project was part of the larger 'Disposal and Reuse of March Air Force Base' and occurs within the 'Northeast Planning Subarea' area identified for future development under that process. Reuse of the entire base was planned under the *March AFB Master Reuse Plan*, and that document served as the basis for the *March Joint Powers Authority (JPA) General Plan* (March JPA 1999a). Environmental review of the general plan was performed in 1999 under the *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA 1999b; SCH No. 97071095).

As part of that process, a Section 7 Consultation with the U.S. Fish and Wildlife Service (USFWS) was pursued for Stephens' kangaroo rat (SKR) (*Dipodomys stephensi*), least Bell's vireo (*Vireo bellii pusillus*), mountain plover (*Charadrius montanus*), coastal California gnatcatcher (*Polioptila californica californica*), Quino checkerspot butterfly (*Euphydryas editha quino*), southwestern willow flycatcher (*Empidonax traillii extimus*), and Riverside fairy shrimp (*Streptocephalus woottoni*).

Through formal Section 7 Consultation (Biological Opinion (BO) 1-6-99-F-13), USFWS concurred that the proposed action was not likely to adversely affect coastal California gnatcatcher, Quino checkerspot butterfly, southwestern willow flycatcher, Riverside fairy shrimp, and mountain plover, and any future effects to these species would need to be addressed through separate Section 7 Consultation. Additionally, the Section 7 BO 1-6-99-F-13 addressed effects on SKR and least Bell's vireo within occupied areas located west of I-215 within the West March Planning subarea. No occupied SKR habitat or occupied least Bell's vireo habitat was identified east of I-215 (USFWS 1999; March JPA 1999b).

The Long-Term SKR Habitat Conservation Plan (HCP), adopted in 1996, designated portions of the March Air Force Base as the Sycamore Canyon-March Air Force Base Core Reserve, which is located outside of the Project site (west of I-215). Core Reserves were designated to be managed for the conservancy and recovery of SKR. However, in accordance with Section 5(C)(1)(e) of the Long-Term SKR HCP, SKR Management Areas and open space areas are allowed to be sold or traded to secure other habitat that support similar biological function and value as the core reserve areas designated in the SKR HCP. Thus, BO 1-6-99-F-13 outlined conservation measures to minimize effects to SKR, including the consideration of suitable trade criteria for the proposed development areas that would affect the function and value of the Sycamore Canyon-March Air Force Base Core Reserve area. As such, the USFWS supported the release of 1,178 acres of SKR Management Area/March Air Force Base West Campus for development as long as suitable replacement habitat with similar biological value compared with the area to be traded was exchanged. Additionally, the California Department of Fish and Game[1] (CDFG) issued a consistency determination to BO 1-6-99-F-13 on January 12, 2000, pursuant to the California Endangered Species Act (CESA).

Both the USFWS and CDFG authorized the acquisition and conservation of the Potrero site in exchange for the former 1,178-acre March Air Force Base (now March ARB) SKR Management Area. The Potrero site was determined to better address the "overall conservation needs of the SKR," and would meet the completion needs of the SKR Core Reserves expansion as required by the SKR HCP. Thus, USFWS and CDFG authorized the release of the 1,178-acre SKR Management Area of the former March Air Force Base for development. This was provided in a series of three letters written by USFWS and cosigned by CDFG (also referred to as a joint wildlife agency letter) dated December 29, 2003 (FWS-WRIV-883.2), October 29, 2004, and May 22, 2006 (FWS/CDFG-WRIV-3259.5).

As a result of the release of the 1,178-acre SKR Management Area for development, the Center for Biological Diversity and the San Bernardino Valley Audubon Society jointly filed a lawsuit

[1] As of January 2013, the CDFG changed its name to the California Department of Fish and Wildlife (CDFW). Where referring to documents/guidance published before the official name change, CDFG is used in this document; for all references after 2012, CDFW is used.

against the USFWS and the Secretary of the Interior in 2009 for failure to prepare a new BO under the federal Endangered Species Act (FESA), failure to conduct environmental analysis under National Environmental Policy Act, and a failure to properly amend the SKR HCP. Ultimately these parties, March JPA and LNR Riverside LLC through a Cy Pres motion, entered into a Settlement Agreement (*Center for Biological Diversity v. Jim Bartel, et al.* 2012), dated September 12, 2012. Pursuant to the Settlement Agreement, specific areas in the March SKR Management Area/March Air Force Base West Campus were set aside as permanent open space and other areas were identified as developable areas. As such, 649 acres of the former March SKR Management Area lands were re-instated as SKR management area (i.e., lands to the west and south of the Project site) and SKR restriction were removed from the 'West Campus' Project site lands. Additionally, 15 acres of the former March SKR Management Area lands resulted in the establishment of Water Quality Open Space Area for least Bell's vireo conservation. The BO (1-6-99-F-13) and subsequent Settlement Agreement have been incorporated into this EIR, where applicable, as many of the habitats that were set aside as permanent open space provide suitable habitat with higher function and value compared with similar habitats within the Project site.

The Project also occurs within the WRC MSHCP plan area. The WRC MSHCP is a comprehensive, multijurisdictional HCP focusing on conservation of species and their associated habitats in WRC. The MSHCP is one of several large, multijurisdictional habitat-planning efforts in Southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The goal of such regional biological planning efforts is to preserve sufficient contiguous blocks of native habitats, such that special-status species are also conserved. The March JPA is the lead agency for the Project and is not a signatory to the MSHCP. As such, the Project is not subject to MSHCP regulations nor does it receive take authority granted under the MSHCP. However, if proposed Project implementation is anticipated to impact (would have a take) Covered Species addressed within the MSHCP, the March JPA may choose to participate in the MSHCP. Additionally, the Cactus Channel improvements are being permitted by the Riverside County Flood Control District and Water Conservation District (District) and would function as part of the District's Master Plan. Since the District is party to the MSHCP, improvements to the Cactus Channel may require compliance with the MSHCP. In either case, the Project mitigation will be pursued in a manner consistent with the MSHCP, further offsetting potential minor impacts on special-status species that could occur with Project implementation.

Biological Resources Surveys

RBC biologists conducted vegetation mapping, a habitat assessment, general biological surveys, a preliminary jurisdictional wetland/waters delineation, and summer special-status plant surveys at the Project site on July 17 and 25, 2018 (Appendices E and F). Protocol-level presence/absence surveys for SKR were conducted between October 21 and October 26, 2018. Additionally, large branchiopod surveys are currently underway and survey results will be shared with the USFWS pursuant to survey

protocol. General biological surveys, vegetation mapping, and wildlife surveys were conducted within the 42.4-acre Project site (i.e., the 35.4-acre K4 Parcel and 7.0-acre Cactus Channel improvements site) and within 50 feet of the Project site (collectively referred to as the Biological Survey Area (BSA)). However, only the Project site information is included in report calculations and tables, while the 50-foot buffer is illustrated within the figures of the biological report for informational purposes and edge effects analysis (Appendix E). Site visits confirmed the Project site primarily consists of upland vegetation communities dominated by goldenbush/non-native grassland and developed/disturbed land. The Cactus Channel occurs within the Project's boundary, and supports sparse riparian vegetation along the border of the site to the north at Cactus Avenue.

Topography and Soils

The Project site is relatively flat with elevations ranging from approximately 1,540 feet above mean sea level (amsl) to 1,550 feet amsl. Soils mapped on site are primarily Greenfield sandy loams, ranging from moderately coarse to coarse sandy loam to coarse textured alluvium (Appendices E and F).

4.3.1.1 Vegetation Communities

The Project site supports seven vegetation communities and land covers, as classified in accordance with *Preliminary Descriptions of the Terrestrial Natural Communities of California* (Holland 1986). Vegetation within the Project site is predominantly comprised of goldenbush scrub/non-native grassland, developed/disturbed land covers (i.e., roads and industrial areas), and non-native grassland (Figure 4.3-1, Biological Resources; Appendix E). Additionally, primarily small patches of riparian plants were observed within the Cactus Channel. Vegetation communities were then crosswalked with *The Manual of California Vegetation* (MCV2) (Sawyer et al. 2009), which is adopted as the standard for vegetation classification and description recognized by state and federal agencies. Table 4.3-1 provides a summary of vegetation acreages for the Project site, which is crosswalked from Holland (1986) to MCV2 (Sawyer et al. 2009) and separated by Project area (K4 Parcel and Cactus Channel Improvements Project Site). Vegetation descriptions throughout this section refer to MCV2 (Sawyer et al. 2009) as crosswalked from Holland (1986).

Notes: — = no data available.

1 Vegetation communities recognized by Holland (1986; Appendix E).

2 Vegetation communities from Holland (1986) crosswalked to *The Manual of California Vegetation* (Sawyer et al. 2009).

3 Considered special-status by Holland (1986), California Department of Fish and Wildlife (CDFW 2018a), and/or are riparian vegetation communities within the jurisdictional limits of California Department of Fish and Wildlife, Regional Water Quality Control Board, and/or U.S. Army Corps of Engineers.

4 Acreage may not total due to rounding.

Three of the seven vegetation communities and land covers identified within the Project site (i.e., the K4 Parcel and Cactus Channel improvements site) are riparian vegetation communities (i.e., cattail marshes, sandbar willow, Fremont cottonwood individuals), which are considered sensitive for the purposes of this analysis because they are likely within the jurisdictional limits of CDFW, ACOE, and/or RWQCB. Additionally, Fremont cottonwood alliance is considered a sensitive vegetation community by CDFW (2018a). One upland vegetation community (disturbed Palmer's goldenbush scrub) observed on site is recognized as a sensitive vegetation community by CDFW (2018a). The disturbed Palmer's goldenbush scrub vegetation community present on site is sparse and heavily intermixed with non-native grassland. It is not comprised of the rare goldenbush species for which this community is likely considered sensitive. The goldenbush on site is thick-bracted goldenbush (*Ericameria palmeri* var. *pachylepis*; no California Rare Plan Rank (CRPR) or other listing), whereas the Palmer's goldenbush (*Ericameria palmeri* var. *palmeri*) that is rare and is a CRPR 1B.1 species. As such, this vegetation community provides low quality function and value, particularly compared with similar undisturbed vegetation communities west of the

Project site. As per the base realignment, USFWS consultation, and subsequent negotiations, 664 acres of native habitat west of the Project site were set aside for conservation in consideration of development within the base re-use area. These conservation areas include upland habitats similar to those that occur on site. As such, impacts on upland habitats are considered adequately mitigated under previous agency consultation and are considered less than significant.

Upland Vegetation Communities

Disturbed Palmer's Goldenbush Scrub Alliance

The Palmer's goldenbush scrub alliance (*Ericameria palmeri* provisional shrubland alliance) includes Palmer's goldenbush as the dominant shrub in the shrub canopy. Palmer's goldenbush scrub alliance has an open canopy less than 1.5 meters (4.9 feet) in height (Sawyer et al. 2009).

Species associated with Palmer's goldenbush scrub alliance includes California buckwheat (*Eriogonum fasciculatum*), California matchweed (*Gutierrezia californica*), and sawtooth goldenbush (*Hazardia squarrosa*). The herbaceous layer within this alliance is typically is continuous (Sawyer et al. 2009). Disturbed Palmer's goldenbush scrub, which has at least 50% cover of non-native species such as red brome (*Bromus madritensis* ssp. *rubens*), poverty brome (*Bromus sterilis*), and Bermuda grass (*Cynodon dactylon*), occurs within the western two-thirds of the Project site.

The disturbed Palmer's goldenbush scrub alliance on site occurs within the western two-thirds of the K4 Parcel and is also referred to as goldenbush scrub/non-native grassland habitat within the biological report prepared for the Project (Appendix E). Disturbed Palmer's goldenbush scrub within the K4 Parcel totals approximately 22.16 acres and supports scattered stands of goldenbush (*Ericameria palmeri* var. *pachylepis*) amongst primarily non-native grasses (*Bromus madritensis* ssp. r*ubens*, *Bromus sterilis*, *Cynodon dactylon*, etc.). The K4 Parcel is frequently disked, which keeps non-native grasses fairly low to the ground. No disturbed Palmer's goldenbush scrub occurs within the Cactus Channel Improvement Site.

The Palmer's goldenbush scrub alliance has a CRPR rank of G3 and a provisional rank of S3 meaning it is considered vulnerable and at modern risk (also considered rare and of high priority) globally and provisionally within California. Although this vegetation community is a sensitive plant community based on the above rankings, the Palmer's goldenbush scrub mapped within the Project site is highly disturbed by non-native species and frequent mechanical perturbation (i.e., disking); thus, provides low quality habitat.

Mediterranean California Naturalized Annual and Perennial Grassland (Non-Native Grassland)

The Mediterranean California naturalized annual and perennial grassland (herein referred to as non-native grasslands) includes a sparse to dense cover of annual grasses that is typically 0.2 meters (0.7 feet) to 0.5 meters (1.6 feet) tall and can be up to 1 meter (3 feet) tall. Grasses that occur in non-native grassland include wild oats (*Avena* spp.), bromes (*Bromus* spp.), fescue (*Vulpia* spp.), and Italian ryegrass (*Festuca perennis*). Forbs that occur with these grasses include California poppy (*Eschscholzia californica*), stork's bill (*Erodium* ssp.), goldfields (*Lasthenia* spp.), phacelias (*Phacelia* ssp.), gilias (*Gilia* spp.), and baby blue eyes (*Nemophila menziesii*) (Holland 1986). Non-native grassland also includes land that is used as pasture for grazing purposes. Grasses such as barley (*Hordeum* spp.) and wild oats may grow in these areas. This land has very few native species.

Non-native grassland (totaling approximately 8.66 acres within the Project site) occurs predominantly within the Cactus Channel on the Project site. Approximately 0.26 acres of non-native grassland habitat occurs within the K4 Parcel and 8.40 acres occurs within the Cactus Channel improvements site. Non-native grassland generally occurs on fine-textured loam or clay soils that are moist during the winter rainy season and very dry during the summer and fall (Holland 1986). Non-native grassland within the BSA is largely dominated by common brome (*Bromus madritensis* ssp. *rubens*). Areas mapped as non-native grassland within the Cactus Channel also support Dallis grass (*Paspalum dilatatum*) and Bermuda grass (*Cynodon dactylon*). This habitat includes portions of the Cactus Channel that either did not qualify as freshwater marsh or were too small to map separately. All jurisdictional resources were delineated and mapped as part of the Project. Details regarding aquatic resources are provided in the jurisdictional delineation report prepared for the Project (Appendix F).

Mediterranean California naturalized annual and perennial grassland (non-native grassland) were mapped to the general habitat type because the CDFW does not consider any of the semi-natural stands[2] as special-status biological resources under California Environmental Quality Act (CEQA) (CDFW 2018a).

Native Riparian Vegetation Communities

Cattail Marshes Alliance

The cattail marshes alliance (*Typha* (*angustifolia, domingensis, latifolia*) alliance) includes cattails as the dominant or co-dominant herb in the herbaceous layer. Cattail marshes alliance has a continuous to intermittent canopy less than 1.5 meters (4.9 feet) in height (Sawyer et al. 2009).

[2] Semi-natural stands are invasive naturalized plant groups where "plants are sufficiently dominant to have replaced most of the natives, and, in many situations, the associates are themselves non-native species" (Sawyer et al. 2009).

Species associated with the cattail marshes alliance includes creeping bentgrass (*Agrostis stolonifera*), flatsedge (*Cyperus* spp.), salt grass (*Distichlis spicata*), barnyardgrass (*Echinochloa crus-galli*), pale spike rush (*Eleocharis macrostachya*), (*Juncus* spp.), perennial pepper weed *(Lepidium latifolium*), water-parsley (*Oenanthe sarmentosa*), smartweed (*Persicaria lapathifolia),* dotted smartweed *(Persicaria punctata*), common reed (*Phragmites australis*), American bulrush (*Schoenoplectus americanus*), California bulrush (*Schoenoplectus californicus*), and cocklebur (*Xanthium strumarium*). Emergent trees may be present at low cover, including willows (*Salix* spp.) (Sawyer et al. 2009).

Cattail marshes within the Project site supports hydrophytic species including broadleaf cattail (*Typha latifolia*), pondweed (*Potamogeton* sp.), and tall flat sedge (*Cyperus eragrostis*) and is also referred to as freshwater marsh within the biological report prepared for the Project (Appendix E). Cattail marshes vegetation occurs within inundated portions of the Cactus Channel and this vegetation community occurs in patches along the northwestern portion of the Cactus Channel. Approximately 0.41 acres of cattail marshes vegetation community occurs within the Project site, including 0.04 acres within the K4 Parcel and 0.37 acres within the Cactus Channel improvements site.

The cattail marshes alliance has a rank of G5S5 in CDFW (2018a) meaning it is globally secure and secure in the state. Therefore, cattail marshes are not considered special-status under CDFW (2018a); however, this is a riparian community and Section IV, Appendix G (Environmental Checklist Form) of the CEQA Guidelines (14 CCR 15000 et seq.) requires an evaluation of impacts to "any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFG or the USFWS; therefore, this community is considered special-status under CEQA.

Sandbar Willow Thickets Alliance

The sandbar willow thickets (*Salix exigua*) alliance includes sandbar willow as the dominant or co-dominant shrub in the tree canopy. The sandbar willow thickets alliance has an intermittent to continuous shrub canopy less than 7 meters (23 feet) in height with a variable ground cover layer and low cover of emergent trees (Sawyer et al. 2009).

Species associated within the sandbar willow thickets alliance include baccharis species (*Baccharis* ssp.), California brickellbush (*Brickellia californica*), California rose (*Rosa californica*), Himalayan black berry (*Rubus armeniacus*), California blackberry (*R. ursinus*), and arroyo willow (*Salix lasiolepis*) (Sawyer et al. 2009).

Sandbar willow thickets alliance (also referred to as southern willow scrub within the biological report prepared for the Project; Appendix E) occurs within small patches throughout the Cactus Channel, and totals approximately 0.04 acres within the Project site. Approximately 0.02 acres of sandbar willow thickets vegetation community occurs within the K4 Parcel and 0.04 acres occurs within the Cactus

Channel improvements site. Sandbar willow thickets alliance is characteristically dominated by dense stands of willows (*Salix* spp.). The on-site sandbar willow thickets contain limited stands of Gooding's black willow (*Salix gooddingii*; four individuals) and sandbar willow (*Salix exigua* var. *exigua*; 60 small individuals).

Sandbar willow thickets alliance is ranked by CDFW (2018a) as a G5S4 alliance meaning it is meaning it is globally secure and considered apparently secure in the state. Sandbar willow thickets are therefore not considered special-status under CDFW; however, this is a riparian community and Section IV, Appendix G (Environmental Checklist Form) of the CEQA Guidelines (14 CCR 15000 et seq.) requires an evaluation of impacts to "any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFG or the USFWS; therefore, this community is considered special-status under CEQA.

Fremont Cottonwood Individuals

The Fremont cottonwood forest alliance (*Populus fremontii* alliance) includes Fremont cottonwood as the dominant or co-dominant tree in the canopy. Fremont cottonwood forest has a continuous to open canopy less than 25 meters (82 feet) in height with a variable ground layer (Sawyer et al. 2009).

Species associated with the Fremont cottonwood forest alliance include box elder, Oregon ash (*Fraxinus latifolia*), California sycamores, coast live oak, sandbar willow, black willow (*Salix gooddingii*), red willow (*Salix laevigata*), arroyo willow, and yellow willow (*Salix lutea*) (Sawyer et al. 2009). A small population of young Fremont cottonwood (11 individuals) are located within the eastern portion of the Cactus Channel.

A small population of young Fremont cottonwood (*Populus fremontii*) occurs within the Cactus Channel. Within the Project site, a total of 0.02 acres of Fremont cottonwood individuals occur within the Cactus Channel improvements site. Fremont cottonwood individuals do not occur within the K4 Parcel on site. Fremont cottonwood is a riparian tree species, which grows near streams, rivers, and wetlands in the southwestern United States. Fremont cottonwood are typically associated with riparian forests, however the on-site population of this species is limited to 11 individuals.

The Fremont cottonwood forest alliance is ranked by CDFW (2018a) as a G3S3 alliance. This ranking indicates that globally and within California the alliance is considered vulnerable and at modern risk, and is also considered rare and of high priority; therefore, is considered special-status under CEQA. Although this vegetation community is a sensitive plant community based on the above rankings, the Fremont cottonwood forest mapped within the Project site is highly disturbed, small (totaling 0.02 acres), and isolated; thus, providing low quality habitat.

Land Covers

Developed/Disturbed

Developed/disturbed areas within the Project site totals approximately 11.01 acres, including 10.16 acres within the K4 Parcel and 0.85 acres within the Cactus Channel improvements site. Developed/disturbed land support little to no native vegetation and are comprised of human-made disturbances (agriculture, construction, or other land-clearing activities) or structures such as buildings and roads. The high level of soil disturbance allows only sparse ruderal (weedy) plant species to occur. Major developed areas within the Project boundary are concentrated on the eastern third of the site and include a soil stockpile area and areas disturbed by grading and former concrete pads on the site. Areas mapped as developed/disturbed on the Project site are overwhelmingly comprised of disturbed areas within only a few small developed areas in the form of concrete bridges and paved roads.

Developed/disturbed land is not recognized by CDFW (2018a); therefore, it is not considered special-status under CEQA.

Ornamental

Ornamental vegetation within the Project site totals approximately 0.05 acres, which occurs within the Cactus Channel improvements site. Ornamental vegetation does not occur within the K4 Parcel. Ornamental vegetation supports non-native tree and grass species including tree of heaven (*Ailanthus altissima*) and Bermuda grass. Ornamental vegetation within the Project area is located along the Cactus Channel and at the far west end of the Cactus Channel.

Ornamental vegetation is not recognized by CDFW (2018a); therefore, it is not considered special-status under CEQA.

4.3.1.2 Special-Status Plants and Wildlife

Endangered, rare, or threatened species, as defined in CEQA Guideline 15380(b) (14 CCR 15000 et seq.), are referred to as "special-status species" in this analysis and include (1) endangered or threatened species recognized in the context of CESA and FESA; (2) plant species with a CRPR 1 or 2 (CDFW 2016; CNPS 2016); (3) CDFW Species of Special Concern and Watch List (WL) species, as designated by the CDFW (2016); (4) mammals and birds that are Fully Protected species, as described in Fish and Game Code, Sections 4700 and 3511; and (5) Birds of Conservation Concern, as designated by the USFWS (2008). Species of CRPR 3 or 4 may, but generally do not, qualify for protection under this provision. Species of CRPR 3 and 4 are those that require more information to determine status and plants of limited distribution; and thus, are also discussed.

Plants

The California Natural Diversity Database (CDFW 2018b; Figure 4.3-2, CDFW and USFWS Occurrences) was queried for a radius of 3 miles around the Project site (i.e., K4 Parcel and Cactus Channel improvements site). Additionally, a California Native Plant Society Inventory of Rare, Threatened, and Endangered Plants of California (CDFW 2018b) search was conducted for the U.S. Geological Survey 7.5-minute Riverside East and Sunnymead quadrangles and the surrounding topographic quadrangles (i.e., Steele Peak and Perris) with an elevation range of 1,500 to 1,600 feet amsl. Potential for special-status species occurrence was refined by considering the habitat affinities for each species, the results of field habitat assessments, vegetation mapping, and knowledge of local biological resources. The potential for the Project area to support special-status plant species was assessed during the site visits and vegetation mapping; analysis of California Natural Diversity Database (Figure 4.3-2) and California Native Plant Society data; and knowledge of the habitat affinities and biogeography of special-status plants in Southern California. Special-status plant species with potential to occur on the Project site are provided in Table 4.3-2.

Table 4.3-2
Special-Status Plants with Potential to Occur within the Project Site

Scientific Name	Common Name	Status (Federal/ State/ CRPR)	Habitat Description	Potential to Occur
Abronia villosa var. *aurita*	Chaparral sand-verbena	None/None/ 1B.1	Annual herb. Blooms January–September. Sandy chaparral, coastal scrub and desert dunes. Elevation 245–5,250 feet	Very low potential to occur. Suitable sandy habitat not present.
Allium munzii	Munz's onion	FE/ST/1B.1	Perennial bulbiferous herb. Blooms March–May. Chaparral, Cismontane woodland, Coastal scrub, Pinyon and juniper woodland, Valley and foothill grassland. Elevation 970–3,510 feet	Very low potential to occur. No undisturbed native vegetation communities on site. No clay soils mapped prior to site disturbance (mapped soil is a sandy loam) and no clay soil observed during site visit.
Asplenium vespertinum	western spleenwort	None/None/ 4.2	Perennial rhizomatous herb. Blooms February–June. Chaparral, Cismontane woodland, Coastal scrub. Elevation 590–3,280 feet	Low potential to occur. No undisturbed native vegetation communities on site. Additionally, visible year-round and not observed during site visit.
Atriplex coronata var. *notatior*	San Jacinto Valley crownscale	FE/None/ 1B.1	Annual herb. Blooms April–August. Playas, mesic valley/foothill grasslands, and vernal pools within alkaline habitat. Elevation 456–1,640 feet	Very low potential to occur. No suitable alkaline habitat present.

Table 4.3-2
Special-Status Plants with Potential to Occur within the Project Site

Scientific Name	Common Name	Status (Federal/ State/ CRPR)	Habitat Description	Potential to Occur
Atriplex parishii	Parish's brittlescale	None/None/ 1B.1	Annual herb. Blooms June–October. Chenopod scrub, playas, and vernal pools within alkaline habitat. Elevation 82–6,233 feet	Very low potential to occur. No suitable alkaline habitat present.
Berberis nevinii	Nevin's barberry	FE/SE/1B.1	Perennial evergreen shrub. Blooms February–June. Chaparral, cismontane woodland, coastal scrub, and riparian scrub. Elevation 230–2,705 feet	No potential to occur. Species is visible year-round and was not detected during summer plant surveys.
Brodiaea filifolia	thread-leaved brodiaea	FT/SE/1B.1	Perennial bulbiferous herb. Blooms March–June. Chaparral, cismontane woodlands, coastal scrub, playas, valley/foothill grasslands, vernal pools. Elevation 82–3,675 feet	Low potential to occur. Not known from region and no suitable habitat present.
Calochortus plummerae	Plummer's mariposa lily	None/None/ 4.2	Perennial bulbiferous herb. Blooms May–July. Chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, valley and foothill grassland. Elevation 330–5,580 feet	Very low potential to occur. No suitable habitats present on site. Species not observed during summer plant surveys, and no dried Calochortus fruit observed on site.
Caulanthus simulans	Payson's jewelflower	None/None/ 4.2	Annual herb. Blooms February–June. Chaparral and coastal scrub. Elevation 295–7,218 feet	Very low potential to occur. No suitable habitat on site.
Centromadia pungens ssp. laevis	smooth tarplant	None/None/ 1B.1	Annual herb. Blooms April–September. Chenopod scrub, meadows and seeps, playa, riparian woodland, valley and foothill grassland. Elevation 0–2,100 feet	Present. This species is common on the K4 warehouse site with a population of 525-550 individuals occupying 0.15 acre.
Chorizanthe leptotheca	Peninsular spineflower	None/None/ 4.2	Annual herb. Blooms May–August. Chaparral, coastal scrub, lower montane coniferous forest. Elevation 984–6,233 feet	Low potential to occur. Limited suitable habitat present and not detected during summer plant survey.

Table 4.3-2
Special-Status Plants with Potential to Occur within the Project Site

Scientific Name	Common Name	Status (Federal/ State/ CRPR)	Habitat Description	Potential to Occur
Chorizanthe parryi var. *parryi*	Parry's spineflower	None/None/ 1B.1	Annual herb. Blooms April–June. Chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland. Elevation 900–4,000 feet	Low potential to occur. Limited suitable habitat present and not detected during plant survey.
Chorizanthe polygonoides var. *longispina*	long-spined spineflower	None/None/ 1B.2	Annual herb. Blooms April–July. Chaparral, coastal scrub, meadows and seeps, valley/foothill grassland, and vernal pools. Elevation 98–5,020 feet	Low potential to occur. Limited suitable habitat present and not detected during summer plant survey.
Convolvulus simulans	small-flowered morning-glory	None/None/ 4.2	Annual herb. Blooms March–July. Chaparral, coastal scrub, valley and foothill grasslands. Elevation 98–2,296 feet	Low potential to occur. Limited suitable habitat present.
Deinandra paniculata	paniculate tarplant	None/None/ 4.2	Annual herb. Blooms April–November. Coastal scrub, valley/foothill grassland, vernal pools. Elevation 82–3,084 feet	Low potential to occur. Although there is suitable habitat for this species and this species is known to occur in the general area, this species was not observed during the summer rare plant survey conducted in July 2018 during the blooming period for this species.
Dodecahema leptoceras	slender-horned spineflower	FE/SE/1B.1	Annual herb. Blooms April–June. Chaparral, cismontane woodland, alluvial fan coastal scrub. Elevation 655–2,490 feet	Very low potential to occur. No suitable habitat present.
Dudleya multicaulis	many-stemmed dudleya	None/None/ 1B.2	Perennial herb. Blooms April–July. Chaparral, coastal scrub, and valley/foothill grasslands. Elevation 50–2,590 feet	Very low potential to occur. No suitable habitat present.
Eriastrum densifolium ssp. *sanctorum*	Santa Ana River woollystar	FE/SE/1B.1	Perennial herb. Blooms April–September. Chaparral and coastal alluvial fan scrub. Elevation 298–2,000 feet	Very low potential to occur. No chaparral or coastal alluvial fan scrub present.
Harpagonella palmeri	Palmer's grapplinghook	None/None/ 4.2	Annual herb. Blooms March–May. Chaparral, coastal scrub, and valley/foothill grasslands. Elevation 65–3,133 feet	Very low potential to occur. No clay soils or suitable habitats present on site.

Table 4.3-2
Special-Status Plants with Potential to Occur within the Project Site

Scientific Name	Common Name	Status (Federal/ State/ CRPR)	Habitat Description	Potential to Occur
Hordeum intercedens	vernal barley	None/None/ 3.2	Annual herb. Blooms March–June. Coastal dunes, coastal scrub, valley/foothill grassland saline flats and depressions, and vernal pools. Elevation 16–3,280 feet	Very low potential to occur. Not known from the vicinity; not observed during summer plant survey. On-site disturbance and lack of saline habitat would likely preclude species.
Horkelia cuneata var. *puberula*	mesa horkelia	None/None/ 1B.1	Perennial herb. Blooms February–September. Maritime chaparral, cismontane woodland, and coastal scrub. Elevation 230–2,657 feet	Very low potential to occur. No suitable habitat present.
Imperata brevifolia	California satintail	None/None/ 2B.1	Perennial rhizomatous herb. Blooms September–May. Chaparral, coastal scrub, Mojavean desert scrub, alkali meadows and seeps, and riparian scrub. Elevation 0–3,986 feet	Very low potential to occur. No suitable habitat present; not observed during summer plant surveys.
Lasthenia glabrata ssp. *coulteri*	Coulter's goldfields	None/None/ 1B.1	Annual herb. Blooms February–June. Coastal salt marshes and swamps, playas, vernal pools. Elevation 3–4,002 feet	Very low potential to occur. No suitable coastal salt marsh, swamp, or playa habitat present on site.
Lepidium virginicum var. *robinsonii*	Robinson's pepper-grass	None/None/ 4.3	Annual herb. Blooms January–July. Chaparral and coastal sage scrub. Elevation 3–2,905 feet	Very low potential to occur. No suitable habitat on site.
Microseris douglasii ssp. *platycarpha*	small-flowered microseris	None/None/ 4.2	Annual herb. Blooms March–May. Cismontane woodlands, coastal scrub, valley/foothill grasslands, and vernal pools. Elevation 50–3,510 feet	Low potential to occur. No undisturbed native vegetation communities on site. This species can be found in non-native grassland but high site disturbance likely precludes it.
Myosurus minimus ssp. *apus*	little mousetail	None/None/ 3.1	Annual herb. Blooms March–June. Valley/foothill grasslands and alkaline vernal pools. Elevation 65–2,100 feet	Low potential to occur. Areas that may pond are highly disturbed and unlikely to support native vernal pool species.

Table 4.3-2
Special-Status Plants with Potential to Occur within the Project Site

Scientific Name	Common Name	Status (Federal/ State/ CRPR)	Habitat Description	Potential to Occur
Navarretia fossalis	spreading navarretia	FT/None/ 1B.1	Annual herb. Blooms April–June. Chenopod scrub, shallow freshwater marshes and swamps, playas, and vernal pools. Elevation 98–2,150 feet	Low potential to occur. Not reported from area and not observed during surveys; potentially ponded areas on site are highly disturbed and unlikely to support native species.
Pseudognaphaliu m leucocephalum	white rabbit-tobacco	None/None/ 2B.2	Perennial herb. Blooms (July) August–November (December). Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland. Elevation 0–6,890 feet	Very low potential to occur. No suitable habitat on site; not observed during summer rare plant survey.
Romneya coulteri	Coulter's matilija poppy	None/None/ 4.2	Perennial rhizomatous herb. Blooms March–July. Chaparral and coastal scrubs. Elevation 65–3,937 feet	Low potential to occur. Not observed during summer plant surveys.
Senecio aphanactis	chaparral ragwort	None/None/ 2B.2	Annual herb. Blooms January–April. Chaparral, cismontane woodland, and coastal scrub. Elevation 50–2,625 feet	Very low potential to occur. No chaparral, cismontane woodland, or coastal scrub habitat present on site.
Sidalcea neomexicana	salt spring checkerbloom	None/None/ 2B.2	Perennial herb. Blooms March–June. Chaparral, coastal scrub, lower montane coniferous forests, Mojavean desert scrub, and playas. Elevation 50–5,020 feet	Very low potential to occur. No suitable alkaline habitat present.
Sphenopholis obtusata	prairie wedge grass	None/None/ 2B.2	Perennial herb. Blooms April–July. Cismontane woodland, meadows and seeps. Elevation 984–6,561 feet	Very low potential to occur. No woodlands, meadows, or seeps present.
Symphyotrichum defoliatum	San Bernardino aster	None/None/ 1B.2	Perennial rhizomatous herb. Blooms July–November. Cismontane woodlands, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, and vernally mesic valley/foothill grasslands. Elevation 7–6,690 feet	Very low potential to occur. No associated habitats present on site. No suitable mesic habitat present on site.

Table 4.3-2
Special-Status Plants with Potential to Occur within the Project Site

Scientific Name	Common Name	Status (Federal/ State/ CRPR)	Habitat Description	Potential to Occur
Texosporium sancti-jacobi	woven-spored lichen	None/None/ 3	Crustose lichen. Appears on soil, small mammal pellets, dead twigs, and on Selaginella spp., as well as chaparral openings. Elevation 950–2,165 feet	Very low potential to occur. Continuous site disturbance would disrupt the establishment of this species.

Notes: CRPR = California Rare Plant Rank.
Status Legend:
FE: Federally listed as endangered
FT: Federally listed as threatened
SE: State listed as endangered
ST: State listed as threatened
CRPR 1A: Plants Presumed Extirpated in California and Either Rare or Extinct Elsewhere
CRPR 1B: Plants Rare, Threatened, or Endangered in California and Elsewhere
CRPR 2A: Plants Presumed Extirpated in California, But More Common Elsewhere
CRPR 2B: Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere
CRPR 3: Plants About Which More Information is Needed - A Review List
CRPR 4: Plants of Limited Distribution - A Watch List
.1 Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
.2 Moderately threatened in California (20%–80% occurrences threatened / moderate degree and immediacy of threat)
.3 Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

No federally or state listed plants were observed during the general field surveys or summer rare plant surveys, and none have a moderate or high potential to occur on the site based on the disturbed nature of the site and lack of suitable habitats (Table 4.3-2, which is based on Table 4 in Appendix E). The only special-status plant species identified on site during the focused summer rare plant surveys conducted in July 2018 was smooth tarplant (*Centromadia pungens* ssp. l*aevis*); a California Native Plant Society CRPR 1B.1 and State Rank S2. The CRPR rank of 1B.1 listing means it's a plant of rare, threatened, or endangered in California and elsewhere, and seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat); its state rank S2 means that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province (CNPS 2018; Appendix E). Smooth tarplant is an annual herb in the sunflower family (*Asteraceae*) that blooms from April to September. Smooth tarplant is found in a wide range of habitats ranging from open, poorly drained flats, grassland, and disturbed sites to riparian woodland, meadows and seeps. Smooth tarplant was observed in the eastern third of the K4 Parcel in disturbed/developed communities, and in the central portion of the Cactus Avenue Channel within non-native grassland vegetation communities. The total on-site population is approximately 525–550 individuals covering an area of 0.15 acres (Figure 4.3-1).

No federally or state threatened or endangered plants were observed during the general field survey or focused special-status plant survey. The majority of the Project site is continually disturbed. Additionally, the Project site lacks suitable soils (i.e., clay and alkaline soils) to support listed plant species known from the Project vicinity. Soils on site are primarily Greenfield sandy loams, ranging from moderately coarse to coarse sandy loam to coarse textured alluvium (Appendix E). Thus, state and/or federally listed plants are not likely to occur on site or within the BSA.

Wildlife

Special-status wildlife species are defined as species that meet one or more of the following criteria:

- Species designated as either rare, threatened, or endangered by CDFW or the USFWS and are protected under either the CESA (California Fish and Game Code (CFGC), section 2050 et seq.) or FESA (16 U.S.C. 1531 et seq.), or meet the CEQA definition for endangered, rare, or threatened (14 CCR 15380(b) and (d)).
- Candidate species being considered or proposed for listing under these same acts.
- Species fully protected by the CFGC sections 3511, 4700, 5050, or 5515.
- Species of expressed concern to resource/regulatory agencies or local jurisdictions. This includes wildlife that are considered a state SSC, CDFW WL species, USFWS Birds of Conservation Concern, and CDFW Special Animal species.

A California Natural Diversity Database (CDFW 2018b; Figure 4.3-2) query was conducted for a radius of 3 miles around the Project site. Potential for special-status species occurrence was refined by considering the habitat affinities for each species, the results of field habitat assessments, vegetation mapping, and knowledge of local biological resources. Additionally, the base re-alignment BO and supporting information was reviewed as part of this assessment (Appendix E). Special-status wildlife species with potential to occur on the Project site are provided in Table 4.3-3.

Table 4.3-3
Special-Status Wildlife with Potential to Occur within the Project Site

Species Name	Common Name	Status (Federal/ State)	Habitat Description	Potential to Occur
Invertebrates				
Branchinecta lynchi	vernal pool fairy shrimp	FT/None	Natural vernal pools or other seasonal pools.	Low to moderate potential to occur. Potential ponding features observed on site may be suitable for this species, which is typically found in deep, naturally occurring vernal pools. This species also has a minor potential to occur in the Cactus Channel as it supports temporarily ponded areas.
Streptocephalus woottoni	Riverside fairy shrimp	FE/None	Vernal pools or other seasonal pools with a depth greater than 30 centimeters.	Moderate potential to occur. Limited ponding features observed during Project surveys that appear to be deep enough for this species, which typically occurs in pools greater than 30 centimeters depth; moderate potential to occur in the Cactus Channel as it supports temporarily ponded areas that may be deep enough for this species.
Amphibians				
Spea hammondii	western spadefoot	None/SSC	Temporary ponds, vernal pools, and backwaters of flowing creeks. Also adjacent upland habitats such as grasslands and coastal sage scrub for burrowing.	Moderate potential to occur. Though the site is fairly disturbed, low areas occur on the site that would be suitable for this species if they hold water. Additionally, the Cactus Channel has suitable habitat to support this species.
Reptiles				
Aspidoscelis hyperythra	orange-throated whiptail	None/WL	A variety of habitats including sage scrub, chaparral, and coniferous and broadleaf woodlands. Found on sandy or friable soils with open scrub.	Moderate potential to occur. Suitable habitat is present, but this species not observed during field surveys.
Aspidoscelis tigris stejnegeri	San Diegan tiger whiptail	None/SSC	A variety of rocky, sandy, dry habitats including sage scrub, chaparral, woodlands on friable loose soil.	Low potential to occur. Suitable habitat is present; this species is more common near the coast.

Table 4.3-3
Special-Status Wildlife with Potential to Occur within the Project Site

Species Name	Common Name	Status (Federal/ State)	Habitat Description	Potential to Occur
Crotalus ruber	red diamondback rattlesnake	None/SSC	Chaparral, coastal sage scrub, along creek banks, and in rock outcrops or piles of debris. Often associated with dense vegetation in rocky areas.	Low potential to occur. Suitable rocky habitat is not present.
Phrynosoma blainvillii	Blainville's horned lizard	None/SSC	A variety of habitats including sage scrub, chaparral, and coniferous and broadleaf woodlands. Found on sandy or friable soils with open scrub. Requires open areas, bushes, and fine loose soil.	Low potential to occur. Suitable habitat is present; however, species is more common near the coast.
			Birds	
Accipiter cooperii (nesting)	Cooper's hawk	None/WL	Usually in oak woodlands but occasionally in willow or eucalyptus woodlands.	Low potential to occur. Although not observed during Project surveys, this species is known to occur in the area. Limited nesting habitat present on site. No large willows, oaks, or eucalyptus trees present on site.
Athene cunicularia (burrow sites and some wintering sites)	burrowing owl	BCC/SSC	Found in grasslands and open scrub from the coast to foothills. Strongly associated with California ground squirrel (*Otospermophilus beecheyi*) and other fossorial mammal burrows.	Moderate to high potential to occur. Suitable but unoccupied burrows observed on site. Burrowing owls known to occur within 1.25 miles of site.
Charadrius montanus (nesting)	mountain plover	BCC/SSC	Inhabits annual grasslands and agricultural fields.	Low potential to occur. Suitable foraging habitat not present.
Eremophila alpestris actia	California horned lark	None/WL	Found from coastal deserts and grasslands to alpine dwarf-shrub habitat above treeline. Also seen in coniferous or chaparral habitats.	Low to moderate potential to occur. Suitable habitat not present; however, species known to occasionally occupy disturbed grasslands. Nearest documented occurrence approximately 3.5 miles southwest.
Lanius ludovicianus (nesting)	loggerhead shrike	BCC/SSC	Found within grassland, chaparral, desert, and desert edge scrub, particularly near dense vegetation used for nesting.	Low potential to occur. Suitable foraging habitat is present, but dense nesting habitat is not present.

Table 4.3-3
Special-Status Wildlife with Potential to Occur within the Project Site

Species Name	Common Name	Status (Federal/ State)	Habitat Description	Potential to Occur
Vireo bellii pusillus (nesting)	least Bell's vireo	FE/SE	Riparian woodland with understory of dense young willows or mulefat and willow canopy. Nests often placed along internal or external edges of riparian thickets.	Low potential to occur. Suitable riparian habitat is not present.
			Mammals	
Chaetodipus fallax fallax	northwestern San Diego pocket mouse	None/SSC	Inhabits coastal sage scrub, sage scrub/grassland ecotones, and chaparral communities.	Low to moderate potential to occur. Suitable habitat on site and burrows observed that are consistent with pocket mouse size; however, repeated disturbance of the site would likely preclude this species.
Dipodomys stephensi	Stephens' kangaroo rat	FE/ST	Habitats include annual grassland and coastal sage scrub with sparse shrub cover. Commonly in association with *Eriogonum fasciculatum*, *Artemisia californica*, and *Erodium cicutarium*, in areas with loose, friable, well-drained soil, and flat or gently rolling terrain.	None. No individuals or sign observed during focused Stephens' kangaroo rat surveys.
Eumops perotis californicus	western mastiff bat	None/SSC	Chaparral, live oaks, and arid, rocky regions. Requires downward opening crevices.	Low potential to occur. Suitable roosting crevices not present.
Lasiurus xanthinus	western yellow bat	None/SSC	Occupies a range of habitats in arid and dry areas. Inhabits secluded woodlands, agricultural lands, and sometimes even residential areas.	Low potential to occur. Suitable roosting habitat not present.
Lepus californicus bennettii	San Diego black-tailed jackrabbit	None/SSC	Habitats include early stages of chaparral, open coastal sage scrub, and grasslands near the edges of brush. Uses open land but requires some shrubs for cover.	Present. Although the site is fairly disturbed, suitable foraging habitat is present for this species.
Nyctinomops femorosaccus	pocketed free-tailed bat	None/SSC	Rugged cliffs, rocky outcrops, and slopes in desert shrub and pine oak forests.	Low potential to occur. Rocky outcrops not present.

Table 4.3-3
Special-Status Wildlife with Potential to Occur within the Project Site

Species Name	Common Name	Status (Federal/ State)	Habitat Description	Potential to Occur
Onychomys torridus ramona	southern grasshopper mouse	None/SSC	Low open and semi-open scrub habitats including sparse coastal scrub, mixed chaparral, low sagebrush, riparian scrub, and annual grassland with scattered shrubs.	Low potential to occur. Suitable desert habitat with friable soils lacking on site. Repeated disturbance of the site would likely preclude this species.
Perognathus longimembris brevinasus	Los Angeles pocket mouse	None/SSC	Found in low elevation grassland, alluvial sage scrub, and coastal sage scrub.	Low to moderate potential to occur. Alluvial sage scrub and coastal sage scrub not present, however grassland present. Repeated disturbance of the site would likely preclude this species.

Notes:
FT: Federally listed as threatened
FE: Federally listed as endangered
SSC: Species of Special Concern
WL: Watch List
BCC: Birds of Conservation Concern
SE: State listed as endangered
ST: State listed as threatened

No federally and/or state listed species were observed within or adjacent to the Project site during the field surveys conducted in July 2018. Two federally listed species have a low to moderate or moderate potential to occur within or adjacent to the Project site (i.e., the K4 Parcel and Cactus Channel improvements site) (protocol-level presence/absence surveys for large branchiopods are currently underway for the 2018 wet season; however, no fairy shrimp have been observed to date):

- Riverside fairy shrimp (*Streptocephalus woottoni*; federally endangered (FE)); and
- Vernal pool fairy shrimp (*Branchinecta lynchi*; federally threatened (FT)).

Based on negative results of protocol-level presence/absence surveys conducted for SKR in 2018, potential for this federally and state listed species to occur on site was modified from a moderate to no potential to occur; and is discussed below:

- Stephens' kangaroo rat (*Dipodomys stephensi*; FE/state threatened (ST)).

Seven non-listed special-status wildlife species were observed or have a low to moderate or moderate to high potential to occur within and/or immediately adjacent to the BSA:

- Burrowing owl (*Athene cunicularia*; CDFW Species of Special Concern (SSC));

- California horned lark (*Eremophila alpestris actia*; CDFW WL);
- Los Angeles pocket mouse (*Perognathus longimembris brevinasus*; SSC)
- northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*; SSC);
- orange-throated whiptail (*Aspidoscelis hyperythra*; WL);
- San Diego black-tailed jackrabbit (*Lepus californicus bennettii*; SSC); and
- western spadefoot (*Spea hammondii*; SSC).

Federally and State Listed Species

Riverside Fairy Shrimp (*Streptocephalus woottoni*)

The Riverside fairy shrimp (FE) is considered to have one of the most limited distributions among west coast-endemic fairy shrimps. The species is found in Ventura, Orange, Riverside, and San Diego Counties in California, and is also known to occur in Baja California, Mexico. The extent of the Riverside fairy shrimp range in California spans 163 miles north-south and all populations, with the exception of the Riverside population, occur within 15 miles of the coast (USFWS 2011). This species is the biotic foundation of the food web for a diverse range of aquatic and terrestrial predators. Riverside fairy shrimp have adapted and evolved to endure dry seasons, when vernal pools are not inundated with water by lying dormant in cysts (dormant eggs) until environmental conditions are optimal for the Riverside fairy shrimp life cycle. Hatching and observation periods are variable based on annual and seasonal precipitation levels. Riverside fairy shrimp hatch and mature within 48 to 56 days, dependent on environmental variables such as water temperature. Since the Riverside fairy shrimp matures slowly (as compared to seven to 14 days for San Diego fairy shrimp), it is generally restricted to the cooler water temperatures of deep (greater than 12 inches or 30 centimeters) vernal pools (USFWS 2011). The closest documentation of this species is approximately 0.5 and 1.5 miles south of the Project site; however, these occurrence are extirpated or possibly extirpated (CDFW 2018b). The closest extant occurrence for this species is located approximately 16 miles southeast of the Project site (CDFW 2018b).

Suitable habitat for Riverside fairy shrimp has been documented within the Project site (i.e., K4 Parcel and Cactus Channel improvements site). Riverside fairy shrimp has a moderate potential to occur within the low areas that may pond within the K4 Parcel during rain events. Additionally, Riverside fairy shrimp has a moderate potential to occur within portions of the Cactus Channel that support features likely to remain inundated for periods greater than 120 days in the Cactus Channel improvements site (Appendix E). Thus, federally listed branchiopod (i.e., fairy shrimp) protocol-level presence/absence surveys are currently underway. The results of these surveys will be submitted to the USFWS in accordance with species protocol, and the exact acreage of potentially suitable habitat would need to be verified based on inundation during the first significant rain event.

*Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)*

The vernal pool fairy shrimp (FT) is known to occur from Jackson County near Medford, Oregon, throughout the Central Valley in California, and west to the central Coast Ranges. Isolated southern populations occur on the Santa Rosa Plateau and near Rancho California in Riverside County (Eng et al. 1990). This species is more typical of natural vernal pools, not riverine or other systems. Within its southernmost range (e.g., Riverside County) this species tends to occur in pools that pond for long periods of time (USFWS 2007). Since this species requires a long ponding period it generally occurs in deeper pools, such as Santa Rosa Plateau, which has pools up to 16 inches deep (Chester 2007). The closest documented occurrence for this species is approximately 17 miles southwest of the Project site (CDFW 2018b).

Vernal pool fairy shrimp has a low to moderate potential to occur within the low areas that may pond within the parcel area during rain events, as well within portions of the Cactus Channel that support features likely to remain inundated for periods greater than 120 days (Appendix E). Although this species has not been recorded in the immediate Project area, suitable habitat occurs within the on-site ponding features (CDFW 2018b). Thus, federally listed branchiopod (i.e., fairy shrimp) protocol-level presence/absence surveys are currently underway. The results of these surveys will be submitted to the USFWS in accordance with species protocol, and the exact acreage of potentially suitable habitat would need to be verified based on inundation during the first significant rain event.

*Stephens' Kangaroo Rat (*Dipodomys stephensi*)*

SKR (FE/ST) populations occur within three distinct regions within Riverside and San Diego Counties: WRC, western San Diego County, and central San Diego County. Habitat for SKR includes open grasslands, fallow agricultural fields, and sparse coastal sage scrub vegetation types in areas with penetrable soils and flat to fairly steep sloping topography, with elevations ranging from 180 to 4,100 feet amsl (USFWS 1997). Suitable habitat for SKR varies in composition and density based on location and season; however, areas with dense grass cover are typically not suitable for this species. This species is known to occur approximately 1 mile west of the Project site and I-215, and 1.5 miles south of the Project site (i.e., the K4 Parcel and Cactus Channel improvements site) (CDFW 2018b).

Although suitable habitat to support SKR (i.e., grassland, limited coastal scrub, and disturbed habitat) was identified within the Project site (i.e., K4 Parcel and Cactus Channel improvements site), protocol-level presence/absence surveys were conducted between October 21 and 26, 2018 for this species with negative findings. No SKR were trapped during the protocol-level survey effort and no SKR sign (i.e., tracks, scats, tail-drags, seed caches) were observed within the study area. The complete survey results are provided in Appendix E. These findings are consistent with the Master Environmental Impact Analysis for the March JPA General Plan, which states that all occupied acreage of SKR occur west of I-215 and no occupied SKR habitat was documented east of I-215 (March JPA 1999b). Thus, SKR

are not expected to occur within the Project site. Additionally, the Project does not occur within a SKR Core Area as recognized by the SKR HCP Plan Area and/or MSHCP Plan Area (RCHCA 1996; County of Riverside 2003). While SKR is widespread throughout the MSHCP Plan Area, the largest and key populations of occupied SKR are known, concentrated in several Core Areas requiring conservation. The closest SKR Core Area is Sycamore Canyon Core Reserve located approximately 1.7 miles northwest of the Project site; thus, impacts to Core Areas for SKR would not occur.

Other Special-Status Species

Burrowing Owl (*Athene cunicularia*)

Burrowing owl (SSC) inhabit open areas such as grasslands, pastures, coastal dunes, desert scrub, and the edges of agriculture fields (Unitt 1984). This species may also occur in agricultural areas, ruderal grassy fields, vacant lots, and pastures containing suitable vegetation structure and useable burrows with foraging in proximity (Gervais et al. 2008). In California, suitable habitat for burrowing owl is generally characterized by short, sparse vegetation with few shrubs, level to gentle topography, and well-drained soils (Haug et al. 1993). Burrowing owl populations in California usually use burrows created by California ground squirrel (*Spermophilus (Otospermophilus) beecheyi*) or other fossorial species including badger (*Taxidea taxus*), coyote (*Canis latrans*), and/or foxes. Burrowing owl also frequently use natural rock cavities, debris piles, culverts, and pipes for nesting and roosting (Rosenberg et al. 1998) and have been documented using artificial burrows for nesting and cover (Smith and Belthoff 2001).

Suitable foraging and nesting habitat occurs within the Project site (i.e., the K4 Parcel and the Cactus Channel improvements site), as well as areas adjacent to the Project site. Although focused burrowing owl surveys have not been conducted for the Project, suitable burrowing owl habitat occurs within the Project site. Burrowing owls or sign (i.e., active burrow, white-wash, pellets, etc.) were not observed during the July 2018 field surveys; however, a wintering burrowing owl was documented by RBC approximately 1.5 miles west of the Project site (west of I-215), near the Meridian West Campus site on December 23, 2015 (Appendix E). This species has a moderate to high potential to occur within the non-native grassland habitat, goldenbush scrub/non-native grassland, and disturbed land (totaling approximately 41.83 acres) throughout the Project site, including approximately 32.58 acres within the K4 Parcel and 9.25 acres within the Cactus Channel improvements site.

California Horned Lark (*Eremophila alpestris actia*)

California horned lark (SSC) is found from coastal deserts and grasslands to alpine dwarf-shrub habitat above tree line and in coniferous or chaparral habitats. It is a common to abundant resident in a variety of habitats where trees and large shrubs are absent. Within Southern California, California horned lark nest on the ground in open fields, grasslands, and rangelands. In California, this species breeds from March through July, with a peak in activity in May. California horned

larks forage in areas with low-growing vegetation and feed primarily on grains and other seeds, relying on mostly insects during the summer months. This species has a low to moderate potential to occur within the non-native grassland and goldenbush scrub/non-native grassland habitats (totaling approximately 30.82 acres) throughout the Project site, including approximately 22.42 acres within the K4 Parcel and 8.40 acres within the Cactus Channel improvements site.

Los Angeles Pocket Mouse (*Perognathus longimembris brevinasus*)

Los Angeles pocket mouse (California Species of Special Concern) occurs in coastal basins of Southern California, from Los Angeles east to Cabazon, south to Temecula (Bolster 1998). This species is uncommon to rare throughout its range and inhabits low elevation (550 to 2,650 feet) grasslands, alluvial sage scrub, and coastal sage scrub. This species hibernates from October through February and primarily feeds on seeds and forbs, and infrequently arthropods and larva (Bolster 1998).

The closest documented occurrence for this species is approximately 0.5 miles south of the Project site (CDFW 2018b). This species was not observed on site; however, there are approximately 30.82 acres of suitable foraging habitat (i.e., non-native grassland and goldenbush scrub/non-native grassland habitats) for Los Angeles pocket mouse within the Project site, including approximately 22.42 acres within the K4 Parcel and 8.40 acres within the Cactus Channel improvements site. Thus, there is a low to moderate potential for this species to occur within the Project site.

Northwestern San Diego Pocket Mouse (*Chaetodipus fallax fallax*)

Northwestern San Diego Pocket Mouse (SSC) occurs in coastal sage scrub, sage scrub/grassland ecotomes, and chaparral communities generally associated with rocky and gravelly substrates. In San Diego County, northwestern San Diego pocket mouse is typically associated with shrub cover greater than 50% (Bolger et al. 1997). This species is one of six subspecies of San Diego pocket mouse (Williams et al. 1993) and is primarily a granivore (seed-eater). Northwestern San Diego pocket mouse are nocturnal and spend their days in burrows. A study by Bolger et al. (1997) suggests that isolated habitat patches must be at least 62 to 198 acres to sustain native rodent populations. The repeated disturbance evident on site would likely preclude this species; however, based on the presence of suitable habitat and burrows consistent with pocket mouse size observed within the general biological surveys there is a low to moderate probability for northwestern San Diego pocket mouse to occur on the Project site. The closest documented occurrence for this species is approximately 1.3 miles west of the Project site, west of I-215. There are approximately 30.82 acres of suitable habitat (i.e., non-native grassland, goldenbush scrub/non-native grassland) for northwestern San Diego pocket mouse within the Project site, including 22.42 acres within the K4 Parcel and 8.40 acres within the Cactus Channel improvements site.

*Orange-Throated Whiptail (*Aspidoscelis hyperythra*)*

Orange-throated whiptail (WL) is known to occur within chaparral, non-native grassland, coastal sage scrub, juniper woodland, and oak woodland in southwestern California and Baja California from sea level to 3,400 feet amsl. Its diet consists primarily of termites (*Reticulitermes hesperus*); thus, it is primarily associated with perennial vegetation (Bostic 1966), including California buckwheat (McGurty 1981). Orange-throated whiptail are diurnal, but spend the hottest part of the day in the shade (Pianka 1986). Although this species was not observed during field surveys conducted in July 2018, the Project site provides suitable habitat (i.e., non-native grassland and goldenbush scrub/non-native grassland habitat) to support this species. Thus, there is a moderate potential for this species to occur within the Project site and the closest documented occurrence for this species is approximately 2.3 miles southwest of the Project site, west of I-215 (CDFW 2018b). There are approximately 30.82 acres of suitable habitat (i.e., non-native grassland and goldenbush scrub/non-native grasslands) for orange-throated whiptail within the Project site, including 22.42 acres within the K4 Parcel and 8.40 acres within the Cactus Channel improvements site.

*San Diego Black-Tailed Jackrabbit (*Lepus californicus*)*

San Diego black-tailed jackrabbit (SSC) inhabits open land, but require some shrubs for cover, and primarily occurs in early stages of chaparral, open coastal sage scrub, and grasslands near the edges of brush. This species is currently considered vulnerable due to a restricted range and small number of populations. San Diego black-tailed jackrabbit occur from the coast to the western slope of the coastal mountains at elevations below 6,000 feet. Suitable habitat to support San Diego black-tailed jackrabbit occurs throughout the Project site and adjacent areas. One individual was observed within the Project site during surveys conducted in July 2018; thus, this species occurs on site. There are approximately 42.35 acres of suitable habitat (all habitats excluding developed land) for San Diego black-tailed jackrabbit within the Project site, including 32.64 acres within the K4 Parcel and 9.71 acres within the Cactus Channel improvements site.

*Western Spadefoot (*Spea hammondii*)*

Western spadefoot (SSC) is an amphibian species that is almost completely terrestrial, requiring upland areas for foraging and overwintering, and adjacent wetland areas for breeding and reproduction (USFWS 2005). Spadefoot toads are known to construct and occupy burrows that may be up to one meter in depth during the dry periods (Stebbins 1972). Adults emerge with the onset of rainfall events to breed (Stebbins 1972). This species requires temporary rain pools or water sources (lacking predators) with at least three weeks of inundation. The potential vernal pools within the K4 Parcel, as well as the Cactus Channel on the south side of Cactus Avenue have the potential to support this species during breeding. Additionally, the Project site provides suitable upland habitat (i.e., non-native grassland and goldenbush scrub/non-native grassland habitat) to

support this species. The closest documented occurrence for this species is approximately 0.6 miles west of the Project site, west of I-215, and 0.9 miles northwest of the Project site (CDFW 2018b); thus, there is a moderate potential for this species to occur within the Project site. Additionally, a SKR management report notes the observation of this species within a ponded area at the north end of the Meridian West Campus Project site in 2011, approximately 1.55 miles northwest of the Project site. There are approximately 30.82 acres of suitable upland habitat (i.e., non-native grassland and goldenbush scrub/non-native grasslands) for western spadefoot within the Project site, including 22.42 acres within the K4 Parcel and 8.40 acres within the Cactus Channel improvements site. Additionally, there are approximately 0.47 acres of suitable breeding habitat (i.e., freshwater marsh, southern willow scrub, and Fremont's cottonwood), including 0.06 acres within the K4 Parcel and 0.41 acres within the Cactus Channel improvements site.

4.3.1.3 Critical Habitat

No USFWS-designated critical habitat or proposed critical habitat occurs within 5 miles of the proposed Project site; thus, no impacts to critical habitat are expected to occur during implementation of the proposed Project (Figure 4.3-2).

4.3.1.4 Wildlife Corridors

Wildlife corridors are linear features that connect larger patches of natural open space and provide avenues for the migration of animals. Wildlife corridors contribute to population viability by assuming continual exchange of genes between populations, providing access to adjacent habitat areas for foraging and mating, and providing routes for recolonization of habitat after local extirpation or ecological catastrophes (e.g., fires). Habitat linkages are small patches of habitat that join larger blocks of habitat and help reduce adverse effects of habitat fragmentation. Habitat linkages are also important in maintaining gene flow and long-term dispersal of plants and animals and may also serve as primary habitat for smaller animals, such as reptiles and amphibians. Habitat linkages may be continuous habitat or discrete habitat islands that function as stepping stones for dispersal.

The Project site occurs in Riverside County, within the boundaries of the WRC MSHCP (Figure 4.3-3, MSHCP Overview). The MSHCP Conservation Area is comprised of a variety of existing and proposed cores and linkages, including Cores, Extensions of Existing Cores, Linkages, Constrained Linkage, and Non-contiguous Habitat Blocks (County of Riverside 2003). The Project site does not occur within any existing or proposed cores and/or linkage areas recognized within the MSHCP Conservation Area (County of Riverside 2003; Figure 4.3-3). Additionally, the Project site does not occur within any MSHCP designed Criteria Cells, Public/Quasi Public Conserved Land areas, existing conserved Additional Reserve Land, or land described for conservation (County of Riverside 2003; Figure 4.3-3). The closest designated core and/or linkage area to the Project site is existing Core D, which is located approximately 1.1 miles west of the Project site

(west of I-215), followed by Non-contiguous Habitat Block A, which is located approximately 2.6 miles north of the Project site (north of State Route (SR) 60). The closest designated linkage area is proposed Constrained Linkage 7, which connects the northern habitat block of Core D (immediately north of Sycamore Canyon Wilderness Park) with Box Springs Mountain Reserve (Non-contiguous Habitat Block A) north of Sycamore Canyon Wilderness Park, located over 4 miles northwest of the Project site.

While the Project site is primarily undeveloped, it is dominated by routinely disturbed non-native grasses and disturbed land that provide lower quality habitat and minimal cover to support most wildlife movement through the area. Additionally, the areas surrounding the site are substantially developed, and do not support direct linkage to better quality habitat. Furthermore, the Project site is located approximately 0.50 miles east of I-215 and approximately 2.1 miles south of SR-60, which likely provides a barrier to wildlife traveling east–west and north–south. As a result, the Project site does not serve as a wildlife corridor.

4.3.1.5 Preliminary Jurisdictional Areas

The Project supports an west–east, earthen-lined and vegetated drainage ditch, which is referred to as the Cactus Channel (Figure 4.3-4, Preliminary Jurisdictional Determination; Appendix F). The Cactus Channel runs parallel to Cactus Avenue from just east of Elsworth Street to Hancock Street, within the northern portion of the Project site, and receives flows from several culverts along Cactus Avenue. This is the only aquatic resource observed within the study area. This feature originates within the Project survey area from a culvert along Cactus Avenue, east of the intersection of Elsworth Street, and flows east approximately 1.5-miles until being diverted south into a drainage ditch along Heacock Street. The channel supports both wetland and non-wetland features.

A majority of the Cactus Channel within the survey area met all three parameters per the Arid West Supplement and would therefore be considered potentially jurisdictional wetlands per the ACOE, RWQCB, and CDFW. These wetland areas were disturbed by regular mowing of the channel; thus, the presence or absence of wetland boundaries was largely defined by observation of hydric soil indicators (i.e., presence and prominence/abundance of redox features). Wetland areas also occur within the bed and banks of potentially jurisdictional CDFW streambed.

Non-wetland waters (determined by the presence of an ordinary high water mark (OHWM) and bed and bank) were present within the Cactus Channel from just west of Riverside Drive to Heacock Street. These waters are considered potential non-wetland, ephemeral waters of the United States/state and are likely to be jurisdictional under the ACOE, RWQCB, and ephemeral streambed jurisdictional by the CDFW. Some areas of the Cactus Channel supported small patches of riparian vegetation (i.e., sandbar willow, Fremont's cottonwood, and Goodding's black willow), which is also likely to be considered potentially jurisdictional CDFW riparian areas; however,

these riparian areas did not meet the federal wetland parameters; thus, unlikely to be jurisdictional by the ACOE and RWQCB. The trapezoidal nature of the channel and associated wide banks account for the increase in CDFW estimated jurisdiction, which extends beyond the delineated ACOE/RWQCB/CDFW wetland and non-wetland areas in most areas throughout the channel.

No vernal pools were observed during the 2018 Project biological surveys; however, depressions with cracked soils were observed on site during the July 2018 general biological surveys. As such, these areas may pond during the rainy season and protocol listed branchiopod surveys are currently being undertaken to determine presence/absence on site.

Tables 4.3-4 and 4.3-5 provide the approximate acreages of potential jurisdictional resources, per regulatory agency, delineated within the Project survey area and related information. Table 4.3-6 provides vegetation community acreages with the Project site (Figure 4.3-4; Appendix F).

Table 4.3-4
The Project Site (K4 Parcel and Cactus Channel Improvements site)

ACOE and RWQCB Jurisdictional Waters	Acreage	Linear Feet	Presence of OHWM	Wetland Presence	Dominant Vegetation	Location (lat/long)
Cactus Channel Wetland	1.39	4,790	No	Yes	Freshwater Marsh	33.90994442, -117.2615647
Cactus Channel Non-Wetland Waters of the United States/State	0.42	2,876	Yes	No	Unvegetated; Non-Native Grassland	33.909960615, -117.2509659
Total	**1.81**	**7,666**	—	—	—	—

4.3.2 Relevant Plans, Policies, and Ordinances

Federal

Federal Endangered Species Act

FESA of 1973 (16 U.S.C. 1531 et seq.), as amended provides for listing of endangered and threatened species of plants and animals and designation of critical habitat for listed animal species. FESA regulates the "taking" of any endangered fish or wildlife species, per Section 9 of the Act. As development is proposed, the responsible agency or individual landowner is required to consult with the USFWS to assess potential impacts to listed species (including plants) or its critical habitat, pursuant to Sections 7 and 10 of the act. USFWS is required to make a determination as to the extent of impact to a particular species a project would have. If it is determined that potential impacts to a species would likely occur, measures to avoid or reduce such impacts must be identified. USFWS may issue an incidental take statement, following consultation and the issuance of a BO. This allows for take of the species that is incidental to another authorized activity, provided that the action will not adversely affect the existence of the species. Section 10 of the FESA provides for issuance of incidental take permits to non-federal parties with the development of a HCP; Section 7 of the act provides for permitting of federal projects.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA; 16 U.S.C. 703 et seq.) was originally passed in 1918 as four bilateral treaties, or conventions, for the protection of a shared migratory bird resource. The MBTA is a federal statute that implements treaties with several countries on the conservation and protection of migratory birds. The number of bird species covered by the MBTA is extensive and is listed at 50 CFR 10.13. The MBTA is enforced by USFWS and prohibits "by any means or in

any manner, to pursue, hunt, take, capture, [or] kill" any migratory bird, or attempt such actions, except as permitted by regulation.

Rivers and Harbors Act of 1899

The Rivers and Harbors Act of 1899 prohibit discharge of any material into navigable waters, or tributaries thereof, of the United States without a permit. The act also makes it a misdemeanor to excavate, fill, or alter the course, condition, or capacity of any port, harbor, or channel; or to dam navigable streams without a permit.

Many activities originally covered by the Rivers and Harbors Act are now regulated under the Clean Water Act (CWA) of 1972, discussed below. However, the 1899 Act retains relevance and created the structure under which the ACOE oversees CWA 404 permitting.

Clean Water Act

Pursuant to Section 404 of the CWA, the ACOE is authorized to regulate any activity that would result in the discharge of dredged or fill material into waters of the U.S. The term "wetlands" (a subset of waters) is defined in 33 Code of Federal Regulations 328.3(b) as "those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." In the absence of wetlands, the limits of ACOE jurisdiction in non-tidal waters, such as intermittent streams, extend to the OHWM, as defined in 33 Code of Federal Regulations 328.3(e). The ACOE, with oversight from the U.S. Environmental Protection Agency, has the principal authority to issue CWA Section 404 Permits. The ACOE would require a Standard Individual Permit for more than minimal impacts to waters of the U.S. as determined by the ACOE. Projects with minimal individual and cumulative adverse effects on the environment may meet the conditions of an existing Nationwide Permit. Pursuant to Section 10 of the Rivers and Harbors Act of 1899, ACOE regulates any potential obstruction or alteration of any navigable water of the United States.

A water quality certification or waiver pursuant to Section 401 of the CWA is required for all Section 404 permitted actions. The RWQCB, a division of the State Water Resources Control Board, provides oversight of the 401 permit process in California. The RWQCB is required to provide "certification that there is reasonable assurance that an activity that may result in the discharge to waters of the United States will not violate water quality standards." Water Quality Certification must be based on the finding that proposed discharge will comply with applicable water quality standards.

The NPDES is the permitting program for discharge of pollutants into surface waters of the U.S. under Section 402 of the CWA. Substantial impacts to wetlands may require an Individual Permit. Projects that only minimally affect wetlands may meet the conditions of one of the existing Nationwide Permits.

Clean Water Rule

Issued in 2015, the Clean Water Rule (also referred to as the Waters of the U.S. Rule or WOTUS Rule) was published by the U.S. Environmental Protection Agency and the ACOE under a provision of the CWA to clarify water resource management in the United States. The regulation defined the scope of federal water protection in a more consistent manner, particularly as regulations oversee streams and wetlands that have a significant hydrologic and ecological connection to traditional navigable waters, interstate waters, and territorial seas. The Clean Water Rule clarifies the scope of coverage of the CWA in an effort to save time and avoid costs and confusion in future implementation of the act. More than 100 parties have filed lawsuits since the Clean Water Rule was issued which were consolidated in the Sixth Circuit and halted the implementation of the Clean Water Rule for the duration of the litigation. However, in January 2018, the Supreme Court ruled that the Sixth Circuit did not have jurisdiction over the case, and in February 2018, the Sixth Circuit dismissed the case and dissolved the stay. On February 6, 2018, the U.S. Environmental Protection Agency and ACOE published a final rule titled "Definition of 'Waters of the United States'—Addition of an Applicability Date to 2015 Clean Water Rule," in which the agencies delayed implementation of the 2015 Clean Water Rule until 2020. Nine environmental groups challenged the rule in the United States District Court and the District Court called the final rule the "Suspension Rule" since it suspended the implementation of the 2015 Clean Water Rule until 2020. The Suspension Rule is one of a series of steps intended to repeal and replace the rule.

The 2015 Clean Water Rule is in effect in 22 states, the District of Columbia, and the U.S. territories. With this final rule, the Environmental Protection Agency and the Department of the Army intend to provide greater certainty about the jurisdictional extent of the Clean Water Act and to maintain the legal status quo by adding an applicability date to the 2015 Clean Water Rule while they continue to work to consider possible revisions to the 2015 rule.

State

California Environmental Quality Act

The CEQA was established in 1970 as California's counterpart to the National Environmental Policy Act. It is a statute that requires state and local agencies to identify significant environmental impacts of their actions and to avoid or mitigate those impacts, where feasible.

CEQA applies to certain activities of state and local public agencies. A public agency must comply with CEQA when it undertakes an activity defined by CEQA as a project. A project is an activity undertaken by a public agency or a private activity, which must receive some discretionary approval (meaning that the agency has the authority to deny the requested permit or approval) from a government agency that may cause either a direct physical change in the environment or a reasonably foreseeable indirect change in the environment.

California Endangered Species Act and Natural Community Conservation Planning Act

The CESA (CFGC, Section 2050 et seq.) provides protection and prohibits the take of plant, fish, and wildlife species listed by the State of California. Unlike FESA, state-listed plants have the same degree of protection as wildlife, but insects and other invertebrates may not be listed. Take is defined similarly to FESA and is prohibited for both listed and candidate species. Take authorization may be obtained by the project applicant from the CDFW under the CESA Section 2081, which allows take of a listed species for educational, scientific, or management purposes. In this case, private developers consult with CDFW to develop a set of measures and standards for managing the listed species, including full mitigation for impacts, funding of implementation, and monitoring of mitigation measures.

CESA of 1984, in combination with the California Native Plant Protection Act of 1977, regulates the listing and take of plant and animal species designated as endangered, threatened, or rare within the state. California also lists SSC based on limited distribution, declining populations, diminishing habitat, or unusual scientific, recreational, or educational value. The CDFW is responsible for assessing development projects for their potential to impact listed species and their habits. State-listed special-status species are addressed through the issuance of a 2081 permit (Memorandum of Understanding).

In 1991, the California Natural Community Conservation Plan (NCCP) Act was approved and the NCCP Coastal Sage Scrub program was initiated in Southern California. California law (Section 2800 et seq. of the CFGC) established the NCCP program "to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development and growth." The NCCP Act encourages preparation of subarea plans that address habitat conservation and management on an ecosystem basis rather than one species or habitat at a time.

California Fish and Game Code Sections 1600-1602

Pursuant to Division 2, Chapter 6, Section 1602 of the CFGC, CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream or lake that supports fish or wildlife. A Lake or Streambed Alteration Agreement Application must be submitted to CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." CDFW has jurisdiction over riparian habitats associated with watercourses. Jurisdictional waters are

delineated by the outer edge of riparian vegetation or at the top of the bank of streams or lakes, whichever is wider. CDFW jurisdiction does not include tidal areas or isolated resources. CDFW reviews the proposed actions and, if necessary, submits (to the applicant) a proposal that includes measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and the applicant is the Lake or Streambed Alteration Agreement.

California Fish and Game Code Sections 3503, 3511, 3513, 3801, 4700, 5050, and 5515

Within California, fish, wildlife, and native plant resources are protected and managed by CDFW. The California Fish and Game and Commission and/or CDFW are responsible for issuing permit for the take or possession of protected species. The following sections of the CFGC address protected species: Section 3511 (birds), Section 4700 (mammals), Section 5050 (reptiles and amphibians), and Section 5515 (fish). In addition, the protection of birds of prey is provided for in Sections 3503, 3513, and 3800 of the CFGC.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Water Code Section 13000 et seq.) provides for statewide coordination of water quality regulations. The state Water Resources Control Board was established as the statewide authority and nine separate RWQCBs were developed to oversee water quality on a day-to-day basis.

The RWQCB is the primary agency responsible for protecting water quality in California. As discussed above, the RWQCB regulates discharges to surface waters under the federal CWA. In addition, the RWQCB is responsible for administering the California Porter-Cologne Water Quality Control Act.

Pursuant to the Porter-Cologne Water Quality Control Act, the state is given authority to regulate waters of the state, which are defined as any surface water or groundwater, including saline waters. As such, any persons proposing to discharge waste into a water body that could affect its water quality must first file a Report of Water Discharge if Section 404 is not required for the activity. "Waste" is partially defined as any waste substance associated with human habitation, including fill material discharged into water bodies.

Regional and Local Plans

Stephens' Kangaroo Rat Habitat Conservation Plan

The March JPA Planning Area is located within the SKR HCP area for the endangered SKR, which was implemented by the Riverside County Habitat Conservation Agency and allows for incidental take of SKR for qualifying projects located within the HCP area. The SKR HCP mitigates impacts to SKR from development by establishing a network of Core Reserves for conservation of SKR

and the ecosystems upon which it depends. The SKR HCP also established a system for managing and monitoring these Core Reserves. The SKR HCP designated the Sycamore Canyon Park and the March Air Force Base SKR Management Area as a Core Reserve in 1996. No portion of the Project site is located within this designated SKR Management Area. The original March Air Force Base SKR Management Area consisting of 1,178 acres of grassland, located in the northern and western portions of the West March Planning Subarea (west of the Project site and I-215) was exchanged for acquisition of the Potrero site, which was determined to better address the overall conservation needs of SKR. The Potrero site provides a larger, contiguous block of occupied SKR habitat, is adjacent to federal lands, and provides connection to core population reserves for this species; thus, better complies with the objectives and requirements of the Long-term SKR HCP. The acquisition and conservation of the Potrero site allowed for other developable areas identified within the SKR Management Area of the former March Air Force Base (west of I-215) to be released for development. As such, the 1,178 acres of grassland within the West March Planning Subarea was released as a Core Reserve and is no longer part of the Riverside County Habitat Conservation Agency. However, the proposed Project is located outside of (east of) the West March Planning Subarea.

Under the SKR HCP development within the Plan boundaries, but outside the Core Reserves, is deemed to have fully mitigated for any impacts to SKR through compliance with the HCP and the payment of a fee. March JPA is not a Permittee to the SKR HCP. However, if the proposed Project is anticipated to impact (would have a take) SKR, the March JPA may choose to participate in the SKR HCP. The SKR HCP establishes suitable habitat areas where incidental take is permitted through a fee process and core reserve areas in occupied habitat where development projects are required to obtain individual permits. The Project site (i.e., K4 Parcel and Cactus Channel improvements site) is located within the SKR HCP fee area; thus, if impacts to SKR are anticipated, the March JPA may choose to pay a per-acre fee to participate in the SKR HCP to allow for take. Alternatively, March JPA may choose to acquire an individual Stephens kangaroo rat incidental take permit from the USFWS through Section 7 of the FESA.

Western Riverside County MSHCP

The Project occurs within the boundaries of the WRC MSHCP, a comprehensive, multijurisdictional HCP focusing on conservation of species and their associated habitats in WRC. The MSHCP is one of several large, multijurisdictional habitat-planning efforts in Southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP allows Riverside County and its Cities to better control local land-use decisions and maintain a strong economic climate in the region, while addressing the requirements of CESA and FESA. The MSHCP serves as a HCP pursuant to Section 10(a)(1)(b) of FESA of 1973, as well as a NCCP under the NCCP Act of 2001; and allows the participating jurisdictions to authorize "take" of plant and wildlife species identified within the plan area.

Projects where the lead agency is a signatory to the MSHCP are covered under the MSHCP. However, the March JPA is the lead agency for the Project and is not a signatory to the MSHCP. As such, the Project is not subject to MSHCP regulations nor does it receive take authority granted under the MSHCP. However, if proposed Project implementation is anticipated to impact (would have a take) Covered Species addressed within the MSHCP, the March JPA may choose to participate in the MSHCP instead of acquiring a separate federal take permit from the USFWS under Section 7 of the FESA for covered special-status species. Pursuant to the MSHCP, the WRC Regional Conservation Authority was created to oversee the goals of the MSHCP. The Regional Conservation Authority may grant permission to public agencies and regional service providers who were not part of the original agreement to construct projects within the area covered by the MSHCP. As such, the March JPA could apply for status as a Participating Special Entity (which includes payment of a fee), and the Project can use the "take" permits granted under the MSHCP instead of having to obtain their own separate permits or negotiate with the federal and state wildlife agencies. Participation in the MSHCP is a voluntary action typically taken only when incidental take permit is required from USFWS. However, all projects are required to be consistent with the terms and conditions of the MSHCP.

March JPA General Plan

The March JPA General Plan serves as the primary document for the regulation of the physical development of the planning area. The Resource Management Element of the March JPA General Plan includes policies related to biological resources. The following policies are from the March JPA General Plan that applies to the Project. Consistency with these policies are discussed in Section 4.9, Land Use and Planning.

Policy 5.1: Where practical, conserve important plant communities and habitats such as riparian areas, wetlands, significant tree stands, and species by using buffers, creative site planning, revegetation and open space easements/dedications.

Policy 5.2: Encourage the planting of native species of trees and other drought tolerant vegetation.

Policy 5.4: In areas that may contain important plant and animal communities, require development to prepare biological assessments identifying species types and locations and develop measures to preserve recognized sensitive species, as appropriate.

Policy 5.5: Where practical, allow development to remove only the minimum natural vegetation and encourage the revegetation of graded areas with native plant species.

Policy 5.6: Work with state, federal and local agencies in the preservation and/or mitigation of recognized sensitive vegetation and wildlife in March JPA Planning Area.

Policy 9.1: Encourage a "link" system of open space land to intermix with development providing both visual buffers and relief, as well as preservation and connectivity of the natural environment.

Policy 9.6: Establish an open space conservation program that identifies areas of open space retention based upon capital costs, operations and maintenance costs, accessibility, needs, resource preservation, ability to complete or enhance the existing open space linkage system and natural environment.

Riverside County Ordinance Nos. 499-559 (Tree Removal)

Chapter 12.08 of the Riverside County Code of Ordinances provides regulations regarding roadside tree removal and trimming activities (County of Riverside 2016). In accordance with Unincorporated Riverside County Ordinance No. 499 (as amended through 499.11), a permit must be obtained from the County Transportation Director prior to removing trees or trimming any tree planted in the right of way of a County highway. If such tree removals are proposed, conditions may be imposed by the County Transportation Director such as requirements for use of a qualified tree surgeon or trimmer, and for bond, insurance, or security to protect from damage, as well as relocation and/or replacement by one or more trees.

Chapter 12.24 of the Riverside County Code of Ordinances also includes regulations related to the tree removal (County of Riverside 2016). According to the Unincorporated Riverside County Ordinance No. 559 (as amended through 559.7), the removal of living native trees on parcels or property greater than 0.5 acre in size, located in the unincorporated Riverside County, and above 5,000 feet in elevation requires a permit.

Riverside County Oak Tree Management Guidelines address oak woodlands in areas where zoning and/or general plan density restrictions will allow the effective use of clustering (County of Riverside 1999). A biological study is required for properties that support oak tree son a lot size of 2.5 acres or greater. Protected oaks include any individual tree larger than 2 inches in diameter at breast height or the sum of the diameters of multiple trunks at diameter at breast height. Protected species include *Quercus agrifolia*, *Q. chrysolepis*, *Q. Engelmann*, *Q. kelloggii*, *Q. morehus*, and *Q. wislizenii* (County of Riverside 1999).

4.3.3 Thresholds of Significance

March JPA uses the CEQA Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the Initial Study prepared for the Project (Appendix A, Initial Study and Notice of Preparation) and the newly adopted CEQA

Guidelines Appendix G (December 2018), the Project could have a significant impact related to biological resources if the Project would:

- **BIO-1:** Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
- **BIO-2:** Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
- **BIO-3:** Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- **BIO-4:** Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
- **BIO-5:** Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
- **BIO-6:** Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

4.3.4 Impacts Analysis

Threshold BIO-1. ***Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?***

The *Biological Technical Report* outlines the special-status species that could be potentially affected by the Project (Appendix E). The entire approximate 42.4-acre Project site (including the 35.4-acre K4 Parcel and 7.0-acre Cactus Channel improvements site) is proposed to be impacted by the proposed Project (Figure 4.3-5, Proposed K4 Project Impacts).

Special-Status Plants

The Project site does not provide suitable habitat for federally or state threatened or endangered plants based on the disturbed nature of the site, lack of suitable soils to support listed plant species

in the vicinity, and results of focused summer special-status plant surveys conducted in July 2018 (Appendix E). Smooth tarplant (*Centromadia pungens* ssp. *laevis*; CRPR 1B.1 and State Rank S2) was the only plant species observed on site during the focused rare plant survey conducted in July 2018 (Appendix E; Figure 4.3-5). No other special-status plant species has a moderate or high potential to occur within the Project site (Table 4.3-2; Appendix E).

All plants constituting CRPR 1B meet the definitions of Section 1901, Chapter 10 (Native Plant Protection Act), or Section 2062 and 2067 (CESA) of the CFGC and are eligible for state listing. Thus, it is mandatory that impacts to these species or their habitat be analyzed during preparation of environmental documents pertaining to CEQA. Approximately 525 to 550 smooth tarplant individuals were observed and mapped within 0.15 acres of predominantly disturbed land and minimal grassland habitat throughout the Project site during the focused special-status plant surveys conducted in July of 2018, and individuals would be directly impacted by the Project (i.e., grading, clearing, grubbing, trampling, etc.) (Figure 4.3-5). The entire 42.4 acre Project site (i.e., K4 Parcel and Cactus Channel improvements site) is proposed to be permanently impacted during the proposed Project activities. Potential short-term indirect impacts to smooth tarplant would primarily result from the generation of fugitive dust, increased human activity, and the introduction of chemical pollutants during vegetation removal and grading/filling activities associated with Project construction. Potential long-term indirect impacts to smooth tarplant populations in the Project area would primarily result from potential altered hydrology, non-native invasive species, chemical pollutants, increased human presence, and alteration of the natural fire regime. Project impacts to special-status plants are discussed below for each Project area (i.e., the K4 Parcel and Cactus Channel improvements site).

K4 Parcel

Approximately 532 smooth tarplant individuals were observed and mapped within 0.15 acres of disturbed land in the southeastern portion of the K4 Parcel during the focused special-status plant surveys conducted in July of 2018, and these individuals would be permanently impacted by the Project (i.e., grading, clearing, grubbing, trampling, etc.) (Figure 4.3-5). Direct temporary impacts to smooth tarplant could occur from removal or trampling of vegetation outside of the designated work zones. Construction would result in direct permanent impacts to smooth tarplant, which would be potentially significant absent mitigation. MM-BIO-1 would be implemented requiring focused surveys be conducted during the appropriate season prior to construction, demarcation of construction limits adjacent to occupied smooth tarplant habitat outside of the construction areas, preparation of a Smooth Tarplant Mitigation Plan including measures to salvage seedbanks from occupied habitat, when feasible, timing of planting or seeding activities, success criteria requirements, and compensatory mitigation requirements for impacts (minimum replacement value of 1:1 for permanent impacts) to occupied smooth plant habitat.

In accordance with the March Air Force Base closure process, 664 acres of native habitat (i.e., non-native grassland habitat) was placed into conservation easement to offset species and habitat losses associated with base redevelopment, including development of the Project site. Planned conservation areas occur approximately 1 mile west of the Project site (west of I-215), and provides similar habitats to those that will be impacted by the Project (March JPA 1999b; Appendix E). At least one population of 50 smooth tarplant individuals was observed during a brief survey of the conservation areas conducted in 2018. Given the habitats present within the conserved areas, it is also likely that there are additional populations of smooth tarplant within the conserved areas. As such, many habitat and species loses have already been addressed through conservation of the site, including smooth tarplant and other CRPR species. As a result, it is likely that this habitat could be counted toward the overall compensatory mitigation requirements addressed in **MM-BIO-1**, as applicable.

Short-term and long-term indirect impacts to smooth tarplant could be significant, and would be reduced through implementation of **MM-BIO-1**, requiring focused surveys be conducted during the appropriate season prior to construction, preparation of a Smooth Tarplant Mitigation Plan should impacts to the species be unavoidable, demarcation of construction limits adjacent to occupied smooth tarplant habitat outside of the construction areas for avoidance, and weekly monitoring to assure avoidance. Additionally, implementation of **MM-BIO-2** requiring an environmental awareness training be conducted, clearly marking work limits, routine monitoring to ensure implementation of best management practices (BMPs), requiring vehicle speeds under 15 mph on unpaved roads to control dust, and preparation and implementation of a landscape plan with appropriate provisions to avoid the spread of non-native invasive species would further reduce potential indirect impacts to smooth tarplant. Implementation of **MM-BIO-1** and **MM-BIO-2** would reduce direct and/or indirect impacts to special-status plants to **less than significant**.

Cactus Channel Improvements

Approximately 11 smooth tarplant individuals were observed and mapped in non-native grassland habitat within the Cactus Channel improvements site during the focused special-status plant surveys conducted in July of 2018 (Figure 4.3-5). All of these individuals would be directly impacted by the Project (i.e., grading, clearing, grubbing, trampling, etc.). Direct temporary impacts to smooth tarplant could occur from removal or trampling of vegetation outside of the designated work zones. Direct impacts to smooth tarplant would be potentially significant absent mitigation. **MM-BIO-1** would be implemented requiring focused surveys be conducted during the appropriate season prior to construction, demarcation of construction limits adjacent to occupied smooth tarplant habitat outside of the construction areas, preparation of a Smooth Tarplant Mitigation Plan including measures to salvage seedbanks from occupied habitat, when feasible, timing of planting or seeding activities, success criteria requirements, and compensatory mitigation requirements for impacts (minimum replacement value of 1:1 for permanent impacts) to occupied smooth plant habitat.

In accordance with the March Air Force Base closure process, 664 acres of native habitat (i.e., non-native grassland habitat) was placed into conservation easement to offset species and habitat losses associated with base redevelopment, including development of the Project site. Planned conservation areas occur approximately 1 mile west of the Project site (west of I-215), and provides similar habitats to those that will be impacted by the Project (March JPA 1999b; Appendix E). At least one population of 50 smooth tarplant individuals was observed during a brief survey of the conservation areas conducted in 2018. Given the habitats present within the conserved areas, it is also likely that there are additional populations of smooth tarplant within the conserved areas. As such, many habitat and species loses have already been addressed through conservation of the site, including smooth tarplant and other CRPR species. As a result, it is likely this habitat could be counted toward the overall compensatory mitigation requirements addressed in **MM-BIO-1**, as applicable.

Short-term and long-term indirect impacts to smooth tarplant could be significant, and would be reduced through implementation of **MM-BIO-1**, requiring focused surveys be conducted during the appropriate season prior to construction, preparation of a Smooth Tarplant Mitigation Plan should impacts to the species be unavoidable, demarcation of construction limits adjacent to occupied smooth tarplant habitat outside of the construction areas for avoidance, and weekly monitoring to assure avoidance. Additionally, implementation of **MM-BIO-2** requiring an environmental awareness training be conducted, clearly marking work limits, routine monitoring to ensure implementation of BMPs, requiring vehicle speeds under 15 mph on unpaved roads to control dust, and preparation and implementation of a landscape plan with appropriate provisions to avoid the spread of non-native invasive species would further reduce potential indirect impacts to smooth tarplant. Implementation of **MM-BIO-1** and **MM-BIO-2** would reduce direct and/or indirect impacts to special-status plants to **less than significant**.

Special-Status Wildlife

Federally and State-Listed Wildlife Species

Riverside Fairy Shrimp and Vernal Pool Fairy Shrimp

Riverside fairy shrimp is federally listed as endangered and vernal pool fairy shrimp is federally listed as threatened. Riverside fairy shrimp and vernal pool fairy shrimp have a low to moderate and moderate potential to occur (respectively) within the Project site based on the presence of potentially suitable habitat for these species. Protocol-level branchiopod presence/absence surveys are currently underway and results of these surveys will be submitted to the USFWS in accordance with species protocol. Impacts to Riverside fairy shrimp and vernal pool fairy shrimp could occur should the results of the ongoing focused surveys be positive. However, if the results of the listed branchiopod focused surveys are negative, no direct and/or indirect impacts would occur to these species and mitigation would not be required.

If present, direct impacts to federally listed fairy shrimp could result from ground-disturbing activities (i.e., clearing, grubbing, grading, etc.), and would be considered significant absent mitigation. Indirect short-term impacts to fairy shrimp include vibration, changes to hydrology, chemical pollution, fugitive dust, and increased human presence, and substantial long-term impacts include hydrology alterations, chemical pollution, and increased human presence. Indirect short-term and long-term impacts to federally listed vernal pool branchiopods would also be considered significant absent mitigation. Project impacts to federally listed fairy shrimp are further discussed below for each Project area (i.e., K4 Parcel and Cactus Channel improvements site).

K4 Parcel

The low areas within the K4 Parcel may pond during rain events, and may support features likely to remain inundated for periods greater than 120 days. As discussed above, direct impacts to federally listed fairy shrimp could result from ground-disturbing activities (i.e., clearing, grubbing, grading, etc.). Additionally, short-term and long-term indirect impacts to federally listed fairy shrimp could result from impacts due to vibration, changes to hydrology, chemical pollution, fugitive dust, and increased human presence. Indirect long-term impacts include changes to hydrology, chemical pollution, and increased human presence. Direct and/or indirect impacts would be considered significant absent mitigation.

Direct and/or indirect impacts to occupied listed vernal pool branchiopod habitat would be reduced by implementation of **MM-BIO-3**, which requires focused surveys be conducted prior to construction, demarcation of construction limits adjacent to occupied vernal pool branchiopod habitat outside of the construction areas, monitoring for avoidance within 500 feet of occupied or assumed occupied vernal pool habitat, avoidance of fueling, vehicle maintenance, and staging areas within 100 feet of vernal pool or aquatic habitat, as well as mitigation (i.e., minimum replacement value of 1:1 for temporary impacts and 2:1 for permanent impacts), preparation and implementation of a mitigation, monitoring, and management plan, and creation, restoration, and/or enhancement of suitable vernal pool habitat or compensation to a USFWS-approved mitigation bank for listed branchiopods if impacts to occupied vernal pool branchiopod habitat cannot be avoided. Additionally, implementation of **MM-BIO-2** requiring attendance of an environmental awareness training, clearly marking work limits, routine monitoring to ensure implementation of BMPs, requiring vehicle speeds under 15 mph on unpaved roads to control dust, and preparation and implementation of a landscape plan with appropriate provisions to avoid the spread of non-native invasive species would further reduce potential indirect impacts to listed vernal pool branchiopod species. Implementation of **MM-BIO-2 and MM-BIO-3** would reduce direct and/or indirect impacts to listed vernal pool branchiopods to **less than significant**, and no additional mitigation is required.

Cactus Channel Improvements Site

The Cactus Channel supports features that likely remain inundated for long periods, and therefore may be suitable for Riverside fairy shrimp and vernal pool fairy shrimp. As discussed above, direct impacts to federally listed fairy shrimp could result from ground-disturbing activities (i.e., clearing, grubbing, grading, etc.). Additionally, short-term and long-term indirect impacts to federally listed fairy shrimp could result from impacts due to vibration, changes to hydrology, chemical pollution, fugitive dust, and increased human presence. Indirect long-term impacts include changes to hydrology, chemical pollution, and increased human presence. Direct and/or indirect impacts would be considered significant absent mitigation.

Direct and/or indirect impacts to occupied listed vernal pool branchiopod habitat would be reduced by implementation of **MM-BIO-3**, which requires focused surveys be conducted prior to construction, demarcation of construction limits adjacent to occupied vernal pool branchiopod habitat outside of the construction areas, monitoring for avoidance within 500 feet of occupied or assumed occupied vernal pool habitat, avoidance of fueling, vehicle maintenance, and staging areas within 100 feet of vernal pool or aquatic habitat, as well as mitigation (i.e., minimum replacement value of 1:1 for temporary impacts and 2:1 for permanent impacts), preparation and implementation of a mitigation, monitoring, and management plan, and creation, restoration, and/or enhancement of suitable vernal pool habitat or compensation to a USFWS-approved mitigation bank for listed branchiopods if impacts to occupied vernal pool branchiopod habitat cannot be avoided. Additionally, implementation of **MM-BIO-2** requiring attendance of an environmental awareness training, clearly marking work limits, routine monitoring to ensure implementation of BMPs, requiring vehicle speeds under 15 mph on unpaved roads to control dust, and preparation and implementation of a landscape plan with appropriate provisions to avoid the spread of non-native invasive species would further reduce potential indirect impacts to listed vernal pool branchiopod species. Implementation of **MM-BIO-2 and MM-BIO-3** would reduce direct and/or indirect impacts to listed vernal pool branchiopods to **less than significant**, and no additional mitigation is required.

Stephens' Kangaroo Rat

This species of kangaroo rat is federally listed as endangered and state listed as threatened. There are approximately 41.83 acres of potentially suitable habitat (i.e., goldenbush scrub/non-native grassland, non-native grassland, and developed/disturbed land) within the Project site. Protocol-level presence/absence surveys were conducted for SKR within the study area (i.e., the K4 Parcel and Cactus Channel improvements site) in 2018 with negative results. No SKR or SKR sign (i.e., tracks, scat, tail drags, or seed caches) were documented during the protocol survey effort conducted between October 21 and 26, 2018. Additionally, the March JPA Planning Area EIR did not identify SKR records and/or occupied habitat within the Project site (east of I-215) based on previous focused survey efforts conducted for this species in this area (March JPA 1999b).

Therefore, no direct and/or indirect impacts to this species are expected to occur during Project implementation. Nevertheless, direct and/or indirect impacts to this species, if present, would be considered significant. Thus, Project impacts to federally listed SKR are further discussed below for each Project area (i.e., K4 Parcel and Cactus Channel improvements site).

K4 Parcel

Potentially suitable habitat for SKR occurs within the K4 Parcel and this species has documented occurrences within 1 mile of the Project site (CDFW 2018b). Although the species was determined to be absent during protocol-level surveys conducted in 2018, there are approximately 32.58 acres of suitable habitat for this species (i.e., goldenbush scrub/non-native grassland, non-native grassland, and developed/disturbed land) within the K4 Parcel and direct and/or indirect impacts to this species would be significant. Potential impacts include direct impacts to 32.58 acres of occupied habitat (i.e., non-native grassland, goldenbush scrub/non-native grassland, and disturbed lands), potential for mortality, injury, and/or harassment, and indirect impacts due to construction-related noise, vibration, lighting, potential vehicle strike, and increased human presence could occur. As such, construction activities have the potential to result in significant impacts to SKR individuals and/or occupied habitat if present on site and in the immediate vicinity of the Project site.

Direct and/or indirect impacts to occupied SKR habitat would be further reduced by implementation of **MM-BIO-4**, which requires focused surveys be conducted prior to construction, development and implementation of a trapping/relocation program in coordination with the resource agencies, demarcation of construction limits adjacent to occupied SKR burrows outside of the construction areas, monitoring for avoidance within 500 feet of occupied SKR habitat, as well as take authorization requirements and mitigation (i.e., minimum replacement value of 1:1 for impacts). Additionally, implementation of **MM-BIO-2** requiring attendance of an environmental awareness training, clearly marking work limits, routine monitoring to ensure implementation of BMPs, requiring vehicle speeds under 15 mph on unpaved roads to control dust, lighting restrictions, and preparation and implementation of a landscape plan with appropriate provisions to avoid the spread of non-native invasive species would further reduce potential indirect impacts to SKR individuals and habitat. Implementation of **MM-BIO-2 and MM-BIO-4** would reduce direct and/or indirect impacts to listed SKR to **less than significant**, and no additional mitigation is required.

Cactus Channel Improvements Site

Potentially suitable habitat for SKR occurs within the Cactus Channel improvements site and this species has documented occurrences within 1 mile of the Project site (CDFW 2018b). Although the species was determined to be absent during protocol-level surveys conducted in 2018, there are approximately 9.25 acres of suitable habitat for this species (i.e., non-native grassland, and

developed/disturbed land) within the Cactus Channel Improvements, and any direct and/or indirect impacts to this species would be significant. Potential impacts include direct impacts to 9.25 acres of occupied habitat (i.e., non-native grassland and disturbed lands), potential for mortality, injury, and/or harassment, and indirect impacts due to construction-related noise, vibration, lighting, potential vehicle strike, and increased human presence could occur. As such, construction activities have the potential to result in significant impacts to SKR individuals and/or occupied habitat if present on site and in the immediate vicinity of the Project site.

Direct and/or indirect impacts to occupied SKR habitat would be further reduced by implementation of **MM-BIO-4**, which requires focused surveys be conducted prior to construction, development and implementation of a trapping/relocation program in coordination with the resource agencies, demarcation of construction limits adjacent to occupied SKR burrows outside of the construction areas, monitoring for avoidance within 500 feet of occupied SKR habitat, as well as take authorization requirements and mitigation (i.e., minimum replacement value of 1:1 for impacts). Additionally, implementation of **MM-BIO-2** requiring attendance of an environmental awareness training, clearly marking work limits, routine monitoring to ensure implementation of BMPs, requiring vehicle speeds under 15 mph on unpaved roads to control dust, lighting restrictions, and preparation and implementation of a landscape plan with appropriate provisions to avoid the spread of non-native invasive species would further reduce potential indirect impacts to SKR individuals and habitat. Implementation of **MM-BIO-2** and **MM-BIO-4** would reduce direct and/or indirect impacts to listed SKR to **less than significant**, and no additional mitigation is required.

Other Non-Listed Special-Status Wildlife Species

Birds

Burrowing Owl

Burrowing owl is a CDFW SSC species. Although focused burrowing owl surveys have not been conducted for the Project site, suitable foraging and nesting habitat for this species occurs on site. Burrowing owl individuals and/or sign (i.e., active burrows, whitewash, pellets, etc.) were not identified within the Project site during general biological surveys conducted in July 2018. However, the Project site is within this species range and approximately 41.83 acres of suitable foraging and nesting habitat (i.e., non-native grassland habitat and disturbed lands with burrows of potentially suitable size for burrowing owl) occurs on site. Thus, burrowing owls may occur within or adjacent to the Project site.

Burrowing owl was also identified in the *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA 1999b). In accordance with the USFWS consultation of the March ARB realignment, 664 acres of native habitat (i.e., 649 acres of upland habitat) were set aside for conservation to offset species and habitat losses associated with March

ARB redevelopment, including development of the Project site. This planned conservation area occurs approximately 1 mile west of the Project site, and provides similar habitats to those that will be impacted by the Project. As such, many habitat and species losses, including suitable burrowing owl foraging habitat, have already been addressed through the planned conservation of this area and are considered adequately mitigated for under previous agency consultation. Project impacts to suitable foraging habitat would not represent a significant adverse impact to this species, conditional upon satisfaction of previous mitigation requirements within the BO (BO-1-6-99-F-13), subsequent Settlement Agreement (S.D. Cal. No. 09-cv-1854-JAH-POR), and consistency determination (2080-1999-56-6).

Burrowing owl has the potential to occur on site or within the vicinity of the Project during the proposed construction activities. Impacts would include direct impacts to 41.83 acres of suitable foraging and nesting habitat (i.e., non-native grassland habitat and disturbed lands) and indirect impacts due to construction-related noise, vibration, lighting, vehicle strike, and increased human presence could occur. As such, construction activities have the potential to result in significant impacts to burrowing owl individuals present on site and in the immediate vicinity of the Project site. Thus, implementation of **MM-BIO-5**, which would require preconstruction surveys for burrowing owl within 30 days of ground-disturbing activities, avoidance and minimization measures if burrowing owl is found, and potential preparation of a burrowing owl Relocation Plan (i.e., compensatory mitigation requirements), would reduce potential direct impacts to burrowing owl. Conservation areas west of I-215 provide suitable habitat for burrowing owl and could be counted toward the overall compensatory mitigation requirements addressed in **MM-BIO-5**, as applicable. Additionally, potential indirect impacts to burrowing owl would be reduced through the implementation of **MM-BIO-2**, which requires attendance of an environmental awareness training, clearly marking work limits, restricts vehicle speed limits to 15 mph or less to minimize the generation of fugitive dust, provides pet restrictions, provides measures to ensure that trash and debris are disposed of properly to minimize short-term impacts of increased human activities; and incorporation of native, non-invasive landscaping be incorporated to minimize the spread of non-native invasive plant and animal species. With implementation of **MM-BIO-5** and **MM-BIO-2**, direct and/or indirect impacts to burrowing owls would be **less than significant** with Project implementation, and no additional mitigation is required.

Amphibians

Western Spadefoot

Western spadefoot is a CDFW SSC species. Although this species has not been recorded within the immediate Project area, suitable breeding (i.e., potential vernal pools and Cactus Channel) and upland habitat (i.e., goldenbush scrub/non-native grassland and non-native

grassland habitat) for this species occurs on site. Thus, western spadefoot has a moderate potential to occur within the Project site.

There are approximately 0.47 acres of suitable breeding habitat (i.e., freshwater marsh, southern willow scrub, and Fremont's cottonwood) and 30.82 acres of suitable upland habitat (i.e., non-native grassland and goldenbush scrub/non-native grasslands) for western spadefoot within the Project site (i.e., K4 Parcel and Cactus Channel improvements site). If western spadefoot are present, Project construction could result in direct impacts to this species and/or suitable habitat to support this species (i.e., the grassland, disturbed coastal scrub, and riparian habitats present on site). Vegetation- and ground-disturbing activities associated with construction have the potential to impact suitable habitat for this species. Western spadefoot are also vulnerable to mortality or injury during vegetation and grading activities because they tend to be cryptic, slow moving, and belowground or under rocks or debris during cooler periods. Project impacts to western spadefoot are further discussed below for each Project area (i.e., K4 Parcel and Cactus Channel improvements site).

K4 Parcel

There are approximately 0.06 acres of suitable breeding habitat (i.e., freshwater marsh and southwestern willow scrub) and 22.42 acres of suitable upland habitat (i.e., non-native grassland and goldenbush/non-native grasslands) within the K4 Parcel. Thus, direct impacts to western spadefoot could occur during proposed K4 Parcel activities. Direct impacts to western spadefoot are considered less than significant with implementation of **MM-BIO-3**, requiring focused surveys for breeding western spadefoot, and if observed, establishing environmentally sensitive areas (ESAs), monitoring avoided occupied pools, BMPs, and development and implementation of a Mitigation, Monitoring, and Management Plan, as well as **MM-BIO-7** requiring development of a relocation plan to identify monitoring and relocation efforts if adult western spadefoots are identified. Potential indirect impacts would be considered less than significant with implementation of **MM-BIO-2**, which requires attendance of an environmental awareness training, regular monitoring, flushing special-status species immediately prior to vegetation removal activities, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, covering trenches to prevent trapping wildlife, lighting restrictions, and replanting with native and/or non-invasive species. Additionally, the conservation of 649-acres of adjacent open space areas, impacts to western spadefoot would be further reduced to **less than significant**. Thus, implementation of **MM-BIO-2, MM-BIO-3,** and **MM-BIO-7** would reduce potential direct and/or indirect impacts to **less than significant**, and no additional mitigation is required.

Cactus Channel Improvements Site

There are approximately 0.47 acres of suitable breeding habitat (i.e., freshwater marsh, southwestern willow scrub, and Fremont's cottonwood) and 8.40 acres of suitable upland habitat (i.e., non-native grassland) within the K4 Parcel. Thus, direct impacts are considered less than significant with implementation of **MM-BIO-3**, requiring focused surveys for breeding western spadefoot, and if observed, establishing ESAs, monitoring avoided occupied pools, BMPs, and development and implementation of a Mitigation, Monitoring, and Management Plan, as well as **MM-BIO-7** requiring development of a relocation plan to identify monitoring and relocation efforts if adult western spadefoots are identified. Potential indirect impacts would be considered less than significant with implementation of **MM-BIO-2**, which requires attendance of an environmental awareness training, regular monitoring, flushing special-status species immediately prior to vegetation removal activities, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, covering trenches to prevent trapping wildlife, lighting restrictions, and replanting with native and/or non-invasive species. Additionally, the conservation of 649-acres of adjacent open space areas, impacts to western spadefoot would be further reduced to **less than significant**. Thus, implementation of **MM-BIO-2, MM-BIO-3,** and **MM-BIO-7** would reduce potential direct and/or indirect impacts to **less than significant**, and no additional mitigation is required.

Reptiles

Orange-Throated Whiptail

Orange-throated whiptail, a CDFW WL species, was the only special-status reptile with moderate potential to occur within the Project site (i.e., the K4 Parcel and Cactus Channel improvements site). Although not observed during field surveys conducted within Project site in 2018, orange-throated whiptail could occur within the shrub dominated habitats and grassland habitats (i.e., goldenbush scrub/non-native grassland and non-native grassland habitat) on site, totaling approximately 30.77 acres. There are approximately 22.42 acres of suitable habitat (i.e., goldenbush scrub/non-native grassland and non-native grassland habitat) for this species within the K4 Parcel and 8.40 acres of suitable habitat (i.e., non-native grassland habitat) for this species within the Cactus Channel improvements site. Given orange-throated whiptails status as a low-level WL species, due to its abundance on a regional level, as well as the conservation of 649-acres of adjacent open space areas, impacts to orange-throated whiptail would be considered **less than significant** with Project implementation, and no additional mitigation is required. Additionally, **MM-BIO-2** which requires regular biological monitoring, biologists to flush special-status species from the Project site, implementation of speed limits, and covering open trenches would further reduce potential impacts to this species. No additional mitigation is required.

Mammals

San Diego Black-Tailed Jackrabbit

San Diego black-tailed jackrabbit is a CDFW SSC species. One individual San Diego black-tailed jackrabbit was observed within the developed/disturbed habitat on site during general biological surveys conducted in July 2018 (Appendix E). The proposed Project would impact 42.35 acres of goldenbush/non-native grassland, developed/disturbed, non-native grassland, freshwater marsh, ornamental, southern willow scrub, and a small patch Fremont cottonwood habitats. Construction activities have the potential to directly impact a small number of individuals of these species, including mortality and injury of individuals in burrows. Also, any individuals that are flushed from burrows by construction activities would be highly vulnerable to stress and predation. Project impacts to San Diego black-tailed jackrabbit are further discussed below for each Project area (i.e., 32.6-acre K4 Parcel and 9.7-acre Cactus Channel improvements site).

K4 Parcel

There are approximately 32.64 acres of suitable habitat (i.e., all habitats excluding developed lands) for San Diego black-tailed jackrabbit within the K4 Parcel. Direct impacts to San Diego black-tailed jackrabbit are considered less than significant with implementation of **MM-BIO-8**, requiring a pre-construction survey for San Diego black-tailed jackrabbit thirty days prior to construction, flushing of non-breeding jackrabbits prior to construction, flagging and avoiding dens, depressions, nests, or burrows occupied by pups during the pup-rearing season, as well as monitoring and reporting requirements.

Potential indirect short-term and long-term impacts could occur due to generation of fugitive dust, increased noise levels, chemical pollutants, increased human activity, and non-native invasive plant and animal species introduction. Indirect impacts to non-listed special-status wildlife species would be significant, absent mitigation. Potential indirect impacts to San Diego black-tailed jackrabbit would be considered less than significant with implementation of **MM-BIO-2**, which requires attendance of an environmental awareness training, regular monitoring, flushing special-status species immediately prior to vegetation removal activities, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, covering trenches to prevent trapping wildlife, lighting restrictions, and replanting with native and/or non-invasive species.

Additionally, the conservation of 649-acres of adjacent open space areas west of I-215, impacts to San Diego black-tailed jackrabbit would be further reduced to **less than significant**. Thus, implementation of **MM-BIO-2** and **MM-BIO-8** would reduce potential direct and/or indirect impacts to **less than significant**, and no additional mitigation is required.

Cactus Channel Improvements Site

There are approximately 9.71 acres of suitable habitat (i.e., all habitats excluding developed lands) for San Diego black-tailed jackrabbit within the Cactus Channel improvements site. Direct impacts to San Diego black-tailed jackrabbit are considered less than significant with implementation of **MM-BIO-8**, requiring a pre-construction survey for San Diego black-tailed jackrabbit thirty days prior to construction, flushing of non-breeding jackrabbits prior to construction, flagging and avoiding dens, depressions, nests, or burrows occupied by pups during the pup-rearing season, as well as monitoring and reporting requirements.

Potential indirect short-term and long-term impacts could occur due to generation of fugitive dust, increased noise levels, chemical pollutants, increased human activity, and non-native invasive plant and animal species introduction. Indirect impacts to non-listed special-status wildlife species would be significant, absent mitigation. Potential indirect impacts to San Diego black-tailed jackrabbit would be considered less than significant with implementation of **MM-BIO-2**, which requires attendance of an environmental awareness training, regular monitoring, flushing special-status species immediately prior to vegetation removal activities, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, covering trenches to prevent trapping wildlife, lighting restrictions, and replanting with native and/or non-invasive species.

Additionally, the conservation of 649-acres of adjacent open space areas west of I-215, impacts to San Diego black-tailed jackrabbit would be further reduced to **less than significant**. Thus, implementation of **MM-BIO-2** and **MM-BIO-8** would reduce potential direct and/or indirect impacts to **less than significant**, and no additional mitigation is required.

Northwestern San Diego Pocket Mouse and Los Angeles Pocket Mouse

Northwestern San Diego pocket mouse and Los Angeles pocket mouse are CDFW SSC species. There is a low to moderate potential for northwestern San Diego pocket mouse and Los Angeles pocket mouse to occur within the approximate 30.82 acres of non-native grassland and goldenbush scrub/non-native grassland habitat present throughout the Project site (i.e., the K4 Parcel and Cactus Channel improvements site) based on the presence of suitable habitat and burrows consistent with pocket mouse size observed during field surveys conducted in July 2018.

Construction activities have the potential to directly impact a small number of individuals of these species, including mortality and injury of individuals in burrows. Also, any individuals that are flushed from burrows by construction activities would be highly vulnerable to stress and predation. Potential indirect short-term and long-term impacts could occur due to generation of fugitive dust, increased noise levels, chemical pollutants, increased human activity, and non-native invasive plant and animal species introduction. Indirect impacts to non-listed special-status wildlife species would be significant, absent mitigation. Project impacts to northwestern San

Diego pocket mouse and Los Angeles pocket mouse are further discussed below for each Project area (i.e., 32.6-acre K4 Parcel and 9.7-acre Cactus Channel improvements site).

K4 Parcel

There are approximately 22.42 acres of suitable Northwestern San Diego pocket mouse and Los Angeles pocket mouse habitat (i.e., non-native grassland, goldenbush scrub/non-native grassland) within the K4 Parcel. Direct impacts to these species are considered less than significant with implementation of **MM-BIO-4**, requiring focused special-status small mammal surveys prior to construction, avoidance of active burrows, to the extent feasible, and/or preparation and implementation of an agency approved trapping/relocation program if active burrows are not avoidable (i.e., methods for trapping and relocating to other suitable habitats within the Project vicinity). Potential indirect impacts to Northwestern San Diego pocket mouse and/or Los Angeles pocket mouse would be considered less than significant with implementation of **MM-BIO-2**, which requires attendance of an environmental awareness training, regular monitoring, flushing special-status species immediately prior to vegetation removal activities, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, covering trenches to prevent trapping wildlife, lighting restrictions, and replanting with native and/or non-invasive species.

Additionally, the conservation of 649-acres of adjacent open space areas west of I-215, impacts to northwestern San Diego pocket mouse and Los Angeles pocket mouse would be further reduced to **less than significant**. Thus, implementation of **MM-BIO-2** and **MM-BIO-4** would reduce potential direct and/or indirect impacts to **less than significant**, and no additional mitigation is required.

Cactus Channel Improvements Site

There are approximately 8.40 acres of suitable northwestern San Diego pocket mouse and Los Angeles pocket mouse habitat (i.e., non-native grassland habitat) within the Cactus Channel improvements site. Direct impacts to these species are considered less than significant with implementation of **MM-BIO-4**, requiring focused special-status small mammal surveys prior to construction, avoidance of active burrows, to the extent feasible, and/or preparation and implementation of an agency approved trapping/relocation program if active burrows are not avoidable (i.e., methods for trapping and relocating to other suitable habitats within the Project vicinity). Potential indirect impacts to Northwestern San Diego pocket mouse and/or Los Angeles pocket mouse would be considered less than significant with implementation of **MM-BIO-2**, which requires attendance of an environmental awareness training, regular monitoring, flushing special-status species immediately prior to vegetation removal activities, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, covering trenches to prevent trapping wildlife, lighting restrictions, and replanting with native and/or non-invasive species.

Additionally, the conservation of 649-acres of adjacent open space areas west of I-215, impacts to northwestern San Diego pocket mouse and Los Angeles pocket mouse would be further reduced to **less than significant**. Thus, implementation of **MM-BIO-2** and **MM-BIO-4** would reduce potential direct and/or indirect impacts to **less than significant**, and no additional mitigation is required.

Threshold BIO-2. Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Special-Status Riparian Vegetation Communities

Biological resource surveys, vegetation mapping, and a preliminary jurisdictional wetland/waters delineation, including documentation of riparian habitats, were conducted on the Project site (i.e., K4 Parcel and Cactus Channel improvements site) and within 50 feet of the Project site (BSA) in July 2018 (Figure 4.3-4; Appendices E and F). One east–west, earth-lined channel (also referred to as the Cactus Channel) occurs along the northern portion of the Project site, south of Cactus Avenue. The Cactus Channel supports 0.47 acres of riparian vegetation communities, including: freshwater marsh, southern willow scrub, and a small patch of Fremont cottonwood habitat (Tables 4.3-1 and 4.3-6). These riparian vegetation communities are potentially jurisdictional under CDFW CFGC Section 1602; thus, this habitat is considered to be a sensitive habitat community. A Streambed Alteration Agreement or clearance would be required from CDFW to ensure compliance with CDFG Code Section 1602. One CDFW recognized upland sensitive vegetation community occurs within the Project site: disturbed Palmer's goldenbush scrub alliance (G3S3; CDFW 2018b). The disturbed Palmer's goldenbush scrub vegetation community on site totals approximately 22.16 acres within the K4 Parcel and is highly disturbed; thus, providing low quality habitat. Palmer's goldenbush scrub vegetation community does not occur within the Cactus Channel improvements site. Other upland vegetation communities within the Project site include developed/disturbed land, non-native grassland, and ornamental vegetation, none of which are considered sensitive vegetation communities. Project impacts to riparian habitat are further discussed below for each Project area (i.e., K4 Parcel and Cactus Channel improvements site).

K4 Parcel

The K4 Parcel access driveways are proposed to cross over Cactus Channel to provide ingress/egress to the site from Cactus Avenue. These driveway crossings would permanently impact all potentially jurisdictional CDFW riparian vegetation communities' on site (totaling approximately 0.06 acres) including 0.04 acres of freshwater marsh and 0.02 acres of southern willow scrub, which would result in potential significant impacts to riparian habitat. CDFW has jurisdiction over streambeds and/or riparian habitats associated with watercourses; therefore, a

Streambed Alteration Agreement or clearance would be required from CDFW to ensure compliance with CDFG Code Section 1602 prior to impacts. Additionally, if vernal pools are identified within the low areas of the K4 Parcel, the vernal pools are likely to be considered a sensitive vegetation community, and is likely to be significant. Potential indirect short-term impacts could also occur due to generation of fugitive dust, chemical pollutants, increased human activity, non-native invasive plant and animal species introduction, and changes in hydrology/hydraulics. **MM-BIO-9** would be implemented, which requires demarcation of jurisdictional features (i.e., jurisdictional riparian habitats) that will not be impacted by proposed Project activities; implementation of BMPs, including vehicle and equipment restrictions within ponding or flowing water, measures to reduce impacts to water quality (i.e., spoil and debris placement), and fueling and chemical pollutant restriction adjacent to jurisdictional waters (i.e., riparian habitat); consultation with the ACOE, RWQCB, and CDFW to determine appropriate replacement ratios for impacts to sensitive riparian habitat, requiring a minimum of 1:1 replacement ratio for impacts to sensitive riparian vegetation communities. Additionally, implementation of **MM-BIO-2** would reduce potential indirect impacts to sensitive riparian vegetation communities, which requires regular monitoring, attendance of an environmental awareness training, demarcation of construction limits, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, and replanting with native and/or non-invasive species. With implementation of **MM-BIO-2** and **MM-BIO-9**, direct and indirect impacts to sensitive riparian vegetation would be **less than significant**.

Additionally, the K4 Parcel would permanently impact approximately 22.16 acres of disturbed Palmer's goldenbush scrub, which is a sensitive upland vegetation community by CDFW (2018b). The disturbed Palmer's goldenbush scrub vegetation community present on site is sparse and heavily intermixed with non-native grassland; thus, this vegetation community provides low quality function and value, particularly compared with similar undisturbed vegetation communities west of the Project site. As per the base realignment, USFWS consultation, and subsequent negotiations, 664 acres of native habitat west of the Project site were set aside for conservation in consideration of development within the base re-use area. These conservation areas include upland habitats similar to those that occur on site. As such, impacts on upland habitats are considered adequately mitigated under previous agency consultation and are considered less than significant.

Cactus Channel Improvements Site

The proposed Cactus Channel Improvements would permanently impact all potentially jurisdictional CDFW riparian vegetation communities on site (totaling approximately 0.41 acres) including 0.37 acres of freshwater marsh, 0.02 acres of Fremont's cottonwood, and 0.02 acres of southern willow scrub habitat, which would result in potential significant impacts. CDFW has jurisdiction over streambeds and/or riparian habitats associated with watercourses; therefore, a Streambed Alteration Agreement or clearance would be required from CDFW to ensure

compliance with CDFG Code Section 1602 prior to impacts. Potential indirect short-term impacts could also occur due to generation of fugitive dust, chemical pollutants, increased human activity, non-native invasive plant and animal species introduction, and changes in hydrology/hydraulics. **MM-BIO-9** would be implemented to minimize potential direct and/or indirect impacts to less than significant. **MM-BIO-9**, which requires demarcation of jurisdictional features (i.e., jurisdictional riparian habitats) that will not be impacted by proposed Project activities; implementation of BMPs, including vehicle and equipment restrictions within ponding or flowing water, measures to reduce impacts to water quality (i.e., spoil and debris placement), and fueling and chemical pollutant restriction adjacent to jurisdictional waters (i.e., riparian habitat); consultation with the ACOE, RWQCB, and CDFW to determine appropriate replacement ratios for impacts to sensitive riparian habitat, requiring a minimum of 1:1 replacement ratio for impacts to sensitive riparian vegetation communities. Additionally, implementation of **MM-BIO-2** would reduce potential indirect impacts to sensitive riparian vegetation communities, which requires regular monitoring, attendance of an environmental awareness training, demarcation of construction limits, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, and replanting with native and/or non-invasive species. With implementation of **MM-BIO-2** and **MM-BIO-9**, direct and indirect impacts to sensitive riparian vegetation would be **less than significant**.

Threshold BIO-3. ***Would the Project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?***

As discussed in Section 4.3.2, Relevant Plans, Policies, and Ordinances, the RWQCB is a division of the State Water Resources Control Board, provides oversight of the 401 permit (required by the CWA) process in California. The 42.4-acre Project area includes a west–east, earthen-lined and vegetated drainage ditch (also known as the Cactus Channel). Thus, a preliminary jurisdictional wetland/waters delineation was conducted for the Project site (i.e., the K4 Parcel and Cactus Channel improvements site) and within areas 50 feet of the Project site (BSA) in July 2018 (Figure 4.3-4; Appendices E and F). As concluded in the jurisdictional delineation, a majority of the Cactus Channel within the survey area met all three parameters per the Arid West Supplement and would therefore be considered potentially jurisdictional wetlands per the ACOE and RWQCB. The drainage and other waters of the US will also require permitting through the RWQCB under the CWA Section 401. As shown in Table 4.3-4 (Appendices E and F; Figures 4.3-4 and 4.3-5), the proposed Project would permanently impact approximately 1.39 acres (4,790 linear feet) of potential ACOE and RWQCB wetland waters of the United States/state (the entire portion of this drainage that occurs within the Project site). The Project would also impact 0.42 acres (2,876 linear feet) of non-wetland, ephemeral ACOE/RWQCB waters of the United States/state (Table 4.3-4). Approximately 2.99 acres (7,666 linear feet) of potentially jurisdictional CDFW streambed (wetland

and non-wetland) and/or associated riparian habitat within the Cactus Channel would be impacted with the proposed Project (Table 4.3-5). Waters under the jurisdiction of RWQCB pursuant to Section 401 of the CWA and Section 13260 of the California Water Code (the Porter-Cologne Water Quality Act) is equal to that of the ACOE and CDFW streambed jurisdiction on the Project site. To ensure compliance with Section 404 of the CWA, a permit or clearance would be required from ACOE. Similarly, a Water Quality Certification or clearance from the RWQCB would be required to ensure compliance with Section 401 of the CWA and the Porter-Cologne Water Quality Act. Finally, as also discussed above, a Streambed Alteration Agreement or clearance would be required from CDFW to ensure compliance with CFGC Section 1602. Thus, impacts to jurisdictional features would be significant and would require consultation with ACOE, RWQCB, and CDFW.

K4 Parcel

The K4 Parcel access driveways are proposed to cross over Cactus Channel to provide ingress/egress to the site from Cactus Avenue. These crossings would permanently impact approximately 0.06 acres (131 linear feet) of potential ACOE and RWQCB wetland waters of the United States/state (Table 4.3-7). No non-wetland, ephemeral ACOE and RWQCB waters of the United States/state would be impacted during development of the K4 Parcel. The CDFW takes jurisdiction over riparian vegetation associated with the streambed; and thus, has a slightly more expansive jurisdiction than the ACOE and/or RWQCB. In total, approximately 0.08 acres (131 linear feet) of potentially jurisdictional CDFW streambed (wetland and non-wetland) areas would be impacted during the implementation of the K4 Parcel development (including all ACOE and RWQCB potentially jurisdictional areas and an additional 0.02 acres of CDFW potentially jurisdictional riparian habitat) (Table 4.3-7). K4 Parcel impacts to the jurisdictional areas would potentially require permitting from the ACOE under Section 404 of the CWA, RWQCB pursuant to Section 401 of the CWA and/or Porter Cologne Act, and CDFW Streambed Alteration Agreement pursuant to Fish and Game Code Section 1602. The proposed K4 Parcel impacts to ACOE jurisdiction would be minimal (less than 0.5 acres and below the 300 linear foot limitation); thus, is likely to qualify for Nationwide Permit No. 39.

Table 4.3-7
U.S. Army Corps of Engineers, Regional Water Quality Control Board, and/or California Department of Fish and Wildlife Potentially Jurisdictional Waters within the K4 Parcel

Agency Jurisdiction	Acreage	Linear Feet
Potentially Jurisdictional ACOE and RWQCB Disturbed Wetland Waters of the United States/State	0.06	131
Potentially Jurisdictional CDFW Streambed (Wetland and Non-Wetland)	0.08	131

Source: Appendices E and F.
Notes; ACOE = U.S. Army Corps of Engineers; RWQCB = Regional Water Quality Control Board; CDFW = California Department of Fish and Wildlife.

Compensatory mitigation would be based upon resource agency direction; however, mitigation to address impacts to these drainages must, at a minimum include the following types of measures: off-site restoration or enhancement through either acquisition or work on another site already conserved, and/or through a local In-Lieu Fee Program or mitigation bank, including replacement of the disturbed jurisdictional features at a minimum of 1:1. The exact mitigation would be decided through consultation with the permitting agencies after completion of the CEQA process. **MM-BIO-9** would ensure that appropriate mitigation to replace state and/or federally jurisdictional waters and/or wetlands proposed to be impacted during Project activities maintains compliance with Sections 404 and 401 of the CWA, and CFGC Section 1602, and has been approved and implemented prior to site disturbance. **MM-BIO-9** also incorporates measures to minimize indirect impacts to jurisdictional waters not proposed to be impacted through the implementation of BMPs, including; vehicle and equipment restrictions adjacent to flowing water, minimization of impacts to water quality, and measures for work areas adjacent to jurisdictional waters, including wetlands and riparian areas, and has been included to ensure impacts are mitigated accordingly and regulatory permits are obtained based on impacts to jurisdictional resources. Therefore, with incorporation of **MM-BIO-9**, the K4 Parcel would have a **less than significant direct impact** related to jurisdictional resources.

Potential indirect short-term and long-term impacts could also occur due to generation of fugitive dust, chemical pollutants, increased human activity, non-native invasive plant and animal species introduction, altered fire regime, and changes in hydrology/hydraulics. Potential indirect impacts to jurisdictional wetlands and/or waters would be reduced with implementation of **MM-BIO-2**, requiring attendance of an environmental awareness training, demarcation of construction limits, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, removal of cut vegetation from drainage channels, and storage/staging area restrictions adjacent to jurisdictional features. Therefore, with incorporation of **MM-BIO-2**, the K4 Parcel would have a **less than significant indirect impact** related to jurisdictional resources.

Cactus Channel Improvements Site

The proposed Cactus Channel Improvements would permanently impact approximately 1.34 acres (4,659 linear feet) of potential ACOE and RWQCB wetland waters of the United States/state and approximately 0.42 acres (2,876 linear feet) of non-wetland, ephemeral ACOE and RWQCB waters of the United States/state during the construction of a box culvert along the Cactus Channel (Table 4.3-8). The proposed Cactus Channel Improvements would impact approximately 2.90 acres (7,535 linear feet) of potentially jurisdictional CDFW streambed (wetland and non-wetland) and/or associated riparian habitat within the Cactus Channel (Table 4.3-8). The 2.90 acres of CDFW impacts include 2.5 acres of non-native grassland, 0.37 acres of freshwater marsh, 0.02 acres of Fremont's cottonwood, and 0.02 acres of southern willow scrub habitat. The Cactus Channel Improvements proposed impacts

to the jurisdictional areas would require permitting from the ACOE[3] under Section 404 of the CWA, RWQCB pursuant to Section 401 of the CWA and/or Porter Cologne Act, and CDFW Lake or Streambed Alteration Agreement pursuant to Fish and Game Code Section 1602. Impacts to jurisdictional areas from the Cactus Channel Improvements are likely to be significant and would require consultation with the ACOE, RWQCB, and CDFW. Impacts to ACOE jurisdictional areas are unlikely to qualify for a Nationwide Permit; and thus, is likely to require an individual permit under the ACOE.

Table 4.3-8
U.S. Army Corps of Engineers, Regional Water Quality Control Board, and/or California Department Fish and Wildlife Potentially Jurisdictional Waters within the Cactus Channel Improvements

Agency Jurisdiction	Acreage	Linear Feet
Potentially Jurisdictional ACOE and RWQCB Disturbed Wetland Waters	1.34	4,659
Potentially Jurisdictional ACOE and RWQCB Non-Wetland Waters, Ephemeral Waters of the United States/state	0.42	2,876
Total Potential ACOE/RWQCB Impacts	**1.76**	**7,535**
Potentially Jurisdictional CDFW Streambed (Wetland and Non-Wetland)	2.9	7,535

Source: Appendices E and F.
Notes: ACOE = U.S. Army Corps of Engineers; RWQCB = Regional Water Quality Control Board; CDFW = California Department of Fish and Wildlife. ACOE/RWQCB jurisdictional areas are the same as (within) CDFW jurisdictional areas; acreages do not represent separate lands.

Compensatory mitigation would be based upon resource agency direction; however, mitigation to address impacts to these drainages must, at a minimum include the following types of measures: off-site restoration or enhancement through either acquisition or work on another site already conserved, and/or through a local In-Lieu Fee Program or mitigation bank, including replacement of the disturbed jurisdictional features at a minimum of 1:1. The exact mitigation would be decided through consultation with the permitting agencies after completion of the CEQA process. **MM-BIO-9** would ensure that appropriate mitigation to replace state and/or federally jurisdictional waters and/or wetlands proposed to be impacted during Project activities maintains compliance with Sections 404 and 401 of the CWA, and CFGC Section 1602, and has been approved and implemented prior to site disturbance. **MM-BIO-9** also incorporates measures to minimize indirect impacts to jurisdictional waters not proposed to be impacted through the implementation of BMPs, including; vehicle and equipment restrictions adjacent to flowing water, minimization of impacts to water quality, and measures for work areas adjacent to jurisdictional waters, including wetlands and riparian areas, and has been included to ensure impacts are mitigated accordingly and regulatory permits are obtained based on impacts to jurisdictional resources.

[3] The ACOE may evaluate the Cactus Avenue Channel culvert project under a Standard Individual Permit, which would require an analysis of alternatives pursuant to the Section 404(b)(1) Guidelines. Additionally, the ACOE, RWQCB, and/or CDFQ may require a functional assessment to quantitatively estimate the stream/wetland condition for the evaluation of the proposed project.

Therefore, with incorporation of **MM-BIO-9**, the Cactus Channel Improvements would have a **less than significant direct impact** related to jurisdictional resources.

Potential indirect short-term and long-term impacts could also occur due to generation of fugitive dust, chemical pollutants, increased human activity, non-native invasive plant and animal species introduction, altered fire regime, and changes in hydrology/hydraulics. Potential indirect impacts to jurisdictional wetlands and/or waters would be reduced with implementation of **MM-BIO-2**, requiring attendance of an environmental awareness training, demarcation of construction limits, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, removal of cut vegetation from drainage channels, and storage/staging area restrictions adjacent to jurisdictional features. Therefore, with incorporation of **MM-BIO-2**, the Cactus Channel Improvements would have a **less than significant indirect impact** related to jurisdictional resources.

Threshold BIO-4. Would the Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

The trees and shrubs within the Project site and adjacent area have the potential to support nesting birds protected under the MBTA (16 USC 703–712) and CFGC Sections 3503.5, 3503, and 3513. Thus, Project construction would have the potential to result in significant impacts to birds and raptors, in the event that such species were to be nesting, foraging, or reproducing within the biological resources study area. Implementation of **MM-BIO-6**, which requires pre-construction nesting bird surveys be conducted and impacts to protected nesting birds be avoided, has been included to avoid potential impacts to native nesting birds. With implementation of **MM-BIO-6**, impacts to native nesting birds would be **less than significant**.

The Project site is located on March JPA land within the March JPA Planning Area identified within the March JPA General Plan (March JPA 1999a). The Project site also occurs in Riverside County, within the boundaries of the WRC MSHCP. However, the Project does not occur within any conservation areas identified in the March JPA General Plan or MSHCP existing and proposed cores (i.e., Cores, Extensions of Existing Cores, Linkages, Constrained Linkage, and Non-contiguous Habitat Blocks) (Figure 4.3-3). Additionally, the Project site does not occur within any MSHCP designed Criteria Cells, Public/Quasi Public Conserved Land areas, existing conserved Additional Reserve Land, or land described for conservation (Figure 4.3-3). The closest designated core and/or linkage areas include existing Core D (located approximately 1.1 miles west of the Project site, west of I-215), Non-contiguous Habitat Block A (located approximately 2.6 miles north of the Project site, north of SR-60), and Constrained Linkage 7 (which connects the northern habitat block of Core D, north of Sycamore Canyon Wilderness park with Box Springs Mountain Reserve also known as Non-contiguous Habitat Block A, west of I-215). The Project site is dominated by non-native grassland

habitat and disturbed land and is surrounded by development. I-215 is located 0.5 miles west of the Project site and SR-60 is located approximately 2.1 miles north of the Project site and likely provides a barrier for most wildlife traveling east–west and north–south in the area. As a result, the Project is unlikely to serve as a wildlife corridor or habitat linkage, and **no impact** is anticipated.

Cactus Channel is an ephemeral drainage and the only water source within the Project site. Thus, the Project site and adjacent areas lack habitats that support native migratory fish. The Project site is within an urbanized environment and provides minimal water sources to provide suitable habitat for important nesting, feeding, and resting ground for migratory, resident, and wintering bird species. As a result, the Project provides minimal habitat to support resident and migratory birds and bats. The closest water feature is Perris Reservoir approximately 4.2 miles southeast of the Project site, and would not be impacted during the proposed Project activities. As a result, the Project would not interfere substantially with the moment of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. No direct or indirect impacts to native migratory fish or wildlife species are anticipated, and the proposed Project would not impede on the use of native wildlife nursery sites; thus, **no impact** is anticipated.

Threshold BIO-5. Would the Project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The Riverside County Oak Tree Management Guidelines protect native oaks. No oaks protected under the Riverside County Oak Tree Management Guidelines occur within the Project site and/or adjacent areas; therefore, the proposed Project (i.e., K4 Parcel and Cactus Channel improvements site) would not conflict with the County's Oak Tree Management Guidelines.

Pursuant to unincorporated Riverside County Ordinance No. 499 (as amended through 499.11), "No person, firm, corporation, public district, public agency or political subdivision shall remove or severely trim any tree planted in the right of way of any County highway without first obtaining a permit from the County Transportation Director to do so." The only trees that occur near roadways are a few small willows associated with on-site drainages (there are no street tree plantings). Since no street tree plantings occur on the Project site, no impacts to trees protected under Ordinance No. 499.11 would occur with Project implementation.

Chapter 12.24 of the Riverside County Code of Ordinances also includes regulations related to tree removal (County of Riverside 2016). According to the Unincorporated Riverside County Ordinance No. 559 (as amended through 559.7), the removal of living native trees on parcels or property greater than 0.5 acres in size, located in the Unincorporated Riverside County, and above 5,000 feet in elevation requires a permit. The Project site elevation is below 5,000 acres; thus, the proposed Project would not conflict with the Unincorporated Riverside County Ordinance No. 559. The proposed

Project would not conflict with any local policies or ordinance protecting biological resources. **No impact** would occur.

Threshold BIO-6. Would the Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The 42.4-acre Project site (i.e., K4 Parcel and Cactus Channel improvements site) is located within the boundaries of the WRC MSHCP. The March JPA is not a permittee to the MSHCP, and thus, does not have to comply with the Reserve Assembly goals of the MSHCP or any other MSHCP requirements. The Project site is not located in an area subject to Cell Criteria, Public/Quasi-Public Conserved Land areas, existing conserved Additional Reserve Land, or land described for conservation under the MSHCP, and therefore the Project's development would not interfere or conflict with the ability of the MSHCP goals and objectives to be implemented (Figure 4.3-3). Although Riparian/Riverine habitat occurs on site, these areas would be mitigated to a level of less than significant in compliance with the MSHCP through implementation of **MM-BIO-2** (i.e., regular monitoring, attendance of an environmental awareness training, demarcation of construction limits, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, and replanting with native and/or non-invasive species) and **MM-BIO-9** (i.e., demarcation of jurisdictional features, implementation of BMPs, and consultation with the ACOE, RWQCB, and CDFW to determine appropriate replacement ratios for impacts to sensitive riparian habitat with a minimum of 1:1 replacement ratio). Additionally, vernal pool branchiopod surveys are ongoing. If identified, impacts to vernal pool fairy shrimp would be reduced by implementation **MM-BIO-2** (i.e., attendance of an environmental awareness training, clearly marking work limits, routine monitoring to ensure implementation of BMPs, maintaining vehicle speed limits of 15 mph on adjacent dirt roads, preparation and implementation of a landscape plan, and replanting with native and/or non-invasive species) and **MM-BIO-3** (i.e., focused listed branchiopod surveys be conducted prior to construction, demarcation of construction limits adjacent to occupied vernal pool branchiopod habitat outside of construction areas, monitoring for avoidance within 500 feet of occupied or assumed occupied vernal pool habitat, avoidance of fueling, vehicle maintenance, and staging areas within 100 feet of vernal pool or aquatic habitat, as well as mitigation (i.e., minimum replacement value of 1:1 for temporary impacts and 2:1 for permanent impacts), preparation and implementation of a mitigation, monitoring, and management plan, and creation, restoration, and/or enhancement of suitable vernal pool habitat or compensation to a USFWS-approved mitigation bank for listed branchiopods, which would be consistent with the WRC MSHCP.

The Project site is located within an identified burrowing owl survey area within the MSHCP. Although no burrowing owl individuals and/or sign were observed during general biological surveys conducted within the Project site in July 2018, focused burrowing owl surveys were not conducted and suitable burrowing owl habitat occurs on site and in adjacent areas immediately south of the Project site. Thus, additional burrowing owl measures within **MM-BIO-5** including,

but not limited to preconstruction surveys for BUOW within 30 days of ground-disturbing activities, avoidance and minimization measures if found, potential preparation of a burrowing owl Relocation Plan, and potential compensatory mitigation, would ensure consistency with the MSHCP. As such, the development of the Project would not interfere or conflict with the ability of the MSHCP goals and objectives to be implemented. Conflicts with the MSHCP would be **less than significant** with Project implementation, and no additional mitigation is required.

Additionally, the Project is consistent with other MSHCP and SKR HCP requirements. Although suitable SKR habitat was identified within the Project site (i.e., K4 Parcel and Cactus Channel improvements site), focused surveys were conducted for SKR in 2018 with negative results. Additionally, the Project site is not located within a SKR Core Area designated by the SKR HCP and MSHCP. The closest SKR Core Area is Sycamore Canyon Core Reserve Area located approximately 1.7 miles northwest of the Project site. Thus, impacts to designated SKR Core Areas would not occur as a result of the proposed Project. Given this species has not been identified within the Project site during previous survey efforts, and the negative findings for this species in 2018 during focused surveys, SKR are not expected to occur within the Project site and impacts to this species are anticipated to be **less than significant**, and further reduced by implementation of **MM-BIO-4** (presence/absence surveys if burrows cannot be avoided, installation of one-way doors, if present, development of a trapping/relocation plan, and mitigation requirements). Federally listed large branchiopod protocol-level surveys are currently underway, and results of these surveys will be provided to USFWS as per the survey requirements. If this species is identified to be present on site, then additional fairy shrimp measures within **MM-BIO-3**, including, but not limited to conducting focused surveys, establishing ESAs within 250 feet of occupied features, biological monitoring, establishment of BMPs, preparation of a Mitigation, Monitoring, and Management Plan, and mitigation requirements (i.e., minimum of 1:1 mitigation for temporary impacts and 2:1 mitigation for permanent impacts). Impacts to state and/or federally jurisdictional waters would be less than significant with implementation of **MM-BIO-9**, which requires that state and/or federal permits be acquired prior to impacts, establishment of BMPs, biological monitoring, and mitigation requirements (i.e., minimum of 1:1 mitigation for temporary impacts and 2:1 mitigation for permanent impacts). Conflicts with the MSHCP would be **less than significant** with Project implementation, and no additional mitigation is required.

4.3.5 Cumulative Impacts

The Project would result in impacts on riparian areas and special-status plant and wildlife species. These impacts are adverse, however, riparian impacts would be fully mitigated through creation and/or preservation of similar habitats in close proximity to the Project area. Special-status plant and wildlife impacts will be fully mitigated in accordance with previous larger planning efforts and in consultation with state and federal wildlife agencies, as well as through implementation of additional avoidance and minimization measures. Project impacts were considered in connection with the larger March AFB re-

use, and this area is included in the regional MSHCP plan. The MSHCP is a regional effort to offset significant cumulative biological impacts, and all development in the region that is permitted through the County of Riverside must comply with the MSHCP. Because of this regional biological planning, cumulative biological impacts are avoided for development in the western Riverside region when developments are pursued in compliance with the plan. Though the JPA is an independent agency and therefore not a participant under the MSHCP, Project mitigation will be pursued in a manner consistent with the MSHCP and all special-status species impacts and jurisdictional resource impacts will be permitted through state and federal agencies. The channel is constructed and any impacts would not contribute to a significant regional loss of such habitats. As such, cumulative impacts are considered **less than significant**.

4.3.6 Mitigation Measures

CEQA Guidelines Section 15126.4 requires EIRs to describe feasible measures that can minimize significant adverse impacts. The following mitigation measures have been evaluated for feasibility and are incorporated in order to reduce potentially significant impacts related to smooth tarplant, listed vernal pool branchiopods (fairy shrimp), burrowing owls, nesting birds, western spadefoot, special-status small mammals, burrowing owl, San Diego black-tailed jackrabbit, and jurisdictional areas.

MM-BIO-1 **Smooth Tarplant Mitigation and Monitoring Plan.** Surveys shall be conducted for smooth tarplant the season prior to each phase of construction. Surveys shall occur within the Project site and include suitable habitat within a 100-foot buffer (access permitting), at the appropriate time to capture the characteristics necessary to identify the taxon. Surveys shall be conducted consistent with California Department of Fish and Wildlife (CDFW) protocols and by a qualified botanist knowledgeable of the local flora. Since annual variation in weather may result in fewer specimens being observed, the locations of plants considered will be cumulative (i.e., all known plant locations over the course of the various surveys, will be noted). The full extent of the occurrence within the survey area shall be recorded using GPS.

The location of smooth tarplant shall be mapped and number of individuals for each occurrence documented. The outer extent of each occurrence shall be flagged at the time of the survey and the following avoidance measures implemented:

1. **Establish Environmentally Sensitive Areas (ESAs)**. Prior to the start of any ground- or vegetation-disturbing activities, a qualified biologist shall establish ESAs to protect and avoid special-status plants that occur outside of the Project disturbance areas and within 100 feet of Project disturbance areas. The locations

of ESAs shall be clearly depicted on construction drawings, which shall also include all avoidance and minimization measures on the margins of the construction plans. ESAs shall be clearly delineated in the field (e.g., with temporary construction fencing) to ensure that avoided plants are not inadvertently harmed during construction.

2. **Monitoring.** A qualified biologist shall conduct weekly monitoring of the ESAs that protect special-status plant occurrences. The monitor shall have the authority to stop construction activities in the vicinity (within 100 feet) of an ESA if it is determined as a result of monitoring that corrective actions are necessary to avoid and protect the ESA.

3. **Smooth Tarplant Mitigation Plan.** If impacts to smooth tarplant cannot be avoided a Smooth Tarplant Mitigation Plan shall be submitted to CDFW for review and approval prior to ground disturbance to occupied habitat. Upon approval, the plan will be implemented by the applicant or its designee. The plan will demonstrate the feasibility of enhancing or restoring smooth tarplant habitat in areas to be managed as natural open space (i.e., within the designated conservation areas west of Interstate 215) without conflicting with other resource management objectives. Habitat enhancement replacement will be at a 1:1 ratio (acres enhanced or restored:acres impacted).

   The plan shall include at minimum: (a) collection/salvage measures for plants or seed banks, to retain intact soil conditions and maximize success likelihood; (b) details regarding storage of plants or seed banks; (c) location of the proposed recipient site, and detailed site preparation and plant introduction techniques details for top soil storage, as applicable; (d) time of year that the salvage and replanting or seeding will occur and the methodology of the replanting; (e) a description of the irrigation, if used; (f) success criteria; and (g) a detailed monitoring program, commensurate with the plan's goals.

MM-BIO-2 **Best Management Practices (BMPs).** To prevent inadvertent disturbance to areas outside the limits of the proposed Project construction limits, the following monitoring requirements and BMPs shall be implemented. A biologist shall be contracted to perform regular random checks (at minimum once a month) to ensure implementation with the following monitoring requirements and BMPs. Monitoring reports and a post-construction monitoring report will be prepared to document compliance with these requirements.

1. **Workers Environmental Awareness Training.** All construction personnel must attend an environmental awareness training to educate personnel about special-status species that may potentially occur on site, their protective status,

avoidance and minimization measures to be implemented by all personnel, flagging/fencing of any exclusion areas, permit requirements, the boundaries within which the Project construction shall occur, trash and debris collection and disposal, spill avoidance and clean-up, and other environmental issues;

2. **Demarcate Construction Limits.** To prevent inadvertent disturbance to areas outside the limits of work, the construction limits shall be clearly demarcated (e.g., installation of flagging or temporary visibility construction fence) prior to ground disturbance activities and all construction activities, including, equipment staging and maintenance shall be conducted within the marked disturbance limits. The work limit delineation will be maintained throughout Project construction.
3. **Flush Special-Status Species.** Biologist will flush special-status species (i.e., avian or other mobile species) from suitable habitat areas to the maximum extent practicable immediately prior to initial vegetation removal activities.
4. **Speed Limit.** Construction vehicles shall not exceed 15 mph or unpaved roads adjacent to the Project site or the right-of-way accessing the site.
5. **Trash and Debris.** If trash and debris need to be stored overnight during the maintenance activities, fully covered trash receptacles that are animal-proof and weather-proof will be used by the maintenance contractor to contain all food, food scraps, food wrappers, beverage containers, and other miscellaneous trash. Alternatively, standard trash receptacles may be used during the day, but must be removed each night.
6. **Open Trenches.** At the end of each workday, check that all potential wildlife pitfalls (trenches, bores, and other excavations) have been backfilled, covered, or sloped to allow wildlife egress. Should wildlife become trapped, a qualified biologist shall remove and relocate it.
7. **Vegetation Removal.** Cut vegetation must be hauled out of the channel and stored, if necessary, where it cannot be washed by rainfall or runoff into the channel. When maintenance activities are completed, any excess materials or debris will be removed from the Project site.
8. **Staging/Storage.** Temporary structures and staging/storage of construction equipment and materials will not be located in or within 100 feet of jurisdictional waters, including wetlands and riparian areas.
9. **Pets.** Pets on or adjacent to construction sites will not be permitted by the operator.
10. **Construction Lighting.** Construction activities will be limited to daylight hours to the extent feasible. If nighttime work is necessary, lighting will be

shielded away from surrounding natural areas. Fixtures will be shielded to downcast below the horizontal plane of the fixture height and mounted as low as possible.

11. **Permanent Lighting.** Permanent lighting will be shielded away from surrounding natural areas. Fixtures will be shielded to downcast below the horizontal plane of the fixture height and mounted as low as possible.

12. **Landscaping Guidelines.** As per the Landscaping Guidelines of the Resource Management Element of the March Joint Powers Authority (JPA) General Plan (1999a), drought tolerant vegetation and native vegetation will be used to the extent feasible, consistent with March JPA Landscape Water Efficiency Ordinance No. JPA 16-03, with the purpose of preserving existing mature trees and native vegetation. Landscape plans shall be reviewed by a qualified botanist to recommend appropriate provisions to minimize the spread of invasive plant species as defined by the County of Riverside, and listed by the California Invasive Plant Council (www.cal-ipc.org) and California Native Plant Society (www.cnps.org) within the Project area. Provision may include: a) installation of container plants and/or hydro-seeding areas adjacent to existing, undisturbed native vegetation areas with native plant species common within temporary impact areas; and (b) review and screening of proposed plants to identify and avoid potential invasive species and weed removal during the initial planting of landscaped.

MM-BIO-3 **Listed Vernal Pool Branchiopods and Western Spadefoot.** Focused surveys shall be conducted for federally listed large branchiopods and sensitive western spadefoot prior to initiation of construction related activities within suitable habitat present within the Project site (i.e., the K4 Parcel and Cactus Channel Improvement site). Surveys for federally listed branchiopods shall be conducted according to the current U.S. Fish and Wildlife Service (USFWS) *Survey Guidelines for the Listed Large Branchiopods* (USFWS 2015), which describes a complete survey for branchiopods as one wet season and one dry season survey conducted according to the new guidelines and within a 3-year period. Additionally, pre-construction surveys for western spadefoot shall be conducted during a time of year when the species can be detected (i.e., when the vernal pool and/or drainage channel on the south side of Cactus Avenue is inundated). Surveys shall be initiated at least one year prior to the initiation of construction related activities to allow sufficient time to complete one wet season and one dry season survey within the Project site, including suitable habitat within a 250-foot buffer. If focused surveys are negative, no additional mitigation is required.

If focused surveys are positive, the full extent of listed branchiopod and/or western spadefoot occurrence within the survey area shall be recorded using GPS. The location of occupied features shall be mapped and number of individuals for each occurrence documented. The outer extent of each occupied listed branchiopod and/or western spadefoot feature shall be flagged at the time of the survey. Consultation with USFWS shall occur and/or take authorization may be obtained from the USFWS through Section 7 Consultation for impacts to federally listed branchiopods. Alternatively, the applicant may choose to mitigate for impacts through the Western Riverside County (WRC) Multiple Species Habitat Conservation Plan (MSHCP) as a participating special entity. Occupied listed branchiopod habitat shall be mitigated at a minimum 1:1 ratio for temporary impacts, 2:1 ratio for permanent impacts, as specified by the resources agencies (e.g., within take authorization), or as per the requirements within the WRC MSHCP. Occupied western spadefoot habitat shall be mitigated at a minimum 1:1 ratio. Avoidance and minimization measures shall be implemented in accordance with provisions of the take authorization and shall include, at a minimum:

1. **Establish Environmentally Sensitive Areas (ESAs)**. Prior to the start of any ground- or vegetation-disturbing activities, a qualified biologist shall establish ESAs to protect and avoid occupied federally listed branchiopod and/or western spadefoot breeding habitat that occur outside of the Project disturbance areas and within 250 feet of Project disturbance areas. The locations of ESAs shall be clearly delineated through brightly colored fencing or other highly visible means and include a designated avoidance buffer developed in consultation with the USFWS to prevent construction from affecting the pool and its associated watershed. Construction crews will be directed not to encroach beyond the limits of construction.
2. **Monitoring.** A qualified biologist shall be present during construction within 300 feet of occupied or assumed occupied vernal pool habitat(s) to conduct daily monitoring of the ESAs that protect occupied federally listed branchiopod and/or western spadefoot habitat. The monitor shall have the authority to stop construction activities in the vicinity (within 250 feet) of an ESA if it is determined as a result of monitoring that corrective actions are necessary to avoid and protect the ESA.
3. **Best Management Practices (BMPs).** All fueling and maintenance of vehicles and other equipment and staging areas shall occur at least 100 feet from vernal pool or aquatic habitat.

4. **Mitigation, Monitoring, and Management Plan.** Prior to construction within 500 feet of occupied or assumed occupied vernal pool habitat, the Project applicant shall develop and implement a mitigation, monitoring, and management plan, with input from regulatory agencies that outlines long-term management strategies and performance standards to be attained to compensate for habitat losses resulting from the Project. At a minimum, the plan shall include standards for mitigation site selection and construction specifications for mitigation sites, a description of site conditions including aerial maps, an analysis of local vernal pool habitat, and performance criteria by which site quality can be assessed over time (e.g., size, vegetation communities and plant species present, date of initial ponding, ponding duration, and wildlife usage). The mitigation, monitoring and management plan shall provide species-specific conservation objectives for covered species and habitats; success criteria for meeting conservation objectives for covered species and habitats; success criteria for meeting conservation objectives; and methods for remediating restoration/enhancement sites that do not achieve the success criteria. A monitoring program shall be established to track the development of habitat conductions that are conducive to the establishment of vernal pool wildlife species.

5. **Creation/Restoration/Enhancement of Suitable Vernal Pool Habitat.** If impacts to occupied listed vernal pool branchiopod habitat cannot be avoided, then creation, restoration, and/or enhancement of suitable vernal pool habitat suitable for vernal pool fairy shrimp and/or Riverside fairy shrimp shall be required, as applicable (specific to the species impacted and habitat requirements). The creation, restoration, and/or enhancement effort would incorporate measures to salvage these species from on-site ponds and relocate them into created, restored, and/or enhanced pools within designated open space easement, upon coordination with the necessary regulatory agencies (i.e., USFWS and/or U.S. Army Corps of Engineers (ACOE)). The created, restored, and/or enhanced habitat would be monitored for fairy shrimp at intervals specified in the mitigation, monitoring, and management plan. Quarterly reports would be prepared by a qualified restoration specialist for the first year and annual reports thereafter. If the success criteria listed in the mitigation, monitoring, and management plan are not met at the end of a given year, remedial action would be taken, pursuant to the direction and approval from the regulatory agencies (i.e., USFWS and ACOE).

Alternatively, impacts to occupied listed branchiopod habitat may be mitigated by purchasing mitigation credits at a USFWS-approved mitigation bank for listed branchiopods.

MM-BIO-4 **Special-Status Small Mammals.** Potentially suitable habitat to support special-status small mammals (i.e., Stephens' kangaroo rat, Northwestern San Diego pocket mouse, and Los Angeles pocket mouse) occurs within the Project site and areas adjacent to the Project site. If potential burrows may be impacted by the proposed Project activities in areas of suitable habitat for these species, a qualified permitted biologist shall conduct focused small mammal surveys for Stephens' kangaroo rat, Northwestern San Diego pocket mouse, and/or Los Angeles pocket mouse to determine presence/absence of these species on the Project site and within 200 feet of the Project site (access permitting) prior to the initiation of construction activities. The survey shall consist of a habitat assessment, followed by five consecutive nights of trapping using Sherman live trapping within suitable habitat as determined by a permitted small mammal trapping individual. If special-status species are not found, no further action is required.

If special-status individuals are identified during focused surveys, potentially active special-status small mammal burrows shall be avoided to the extent feasible. If avoidance of active burrows is not possible, a trapping/relocation program shall be implemented and conducted by qualified biologists in consultation with the appropriate regulatory agencies (i.e., U.S. Fish and Wildlife Service (USFWS) and/or California Department of Fish and Wildlife (CDFW)). In accordance with the trapping/relocation program, special-status small mammal individuals shall be relocated to adjacent suitable habitat areas or preserves (including within the conservation area west of Project site), and/or measures shall be provided to ensure exclusion during construction activities, including trenching. Occupied habitat for special-status mammals shall be mitigated at a minimum 1:1 ratio. The trapping/relocation program shall include submitting a plan for regulatory agency approval, with the following elements included at a minimum:

1. Allow for at least one night without disturbance to the burrow and surrounding area to allow the individuals to vacate the burrow. Remaining individuals shall be live-trapped and relocated out of impacted areas into adjacent occupied areas or into unoccupied areas within the same habitat.
2. Methods (e.g., one-way doors) shall be used to prevent reentry to any burrows not destroyed by construction until construction is complete in these areas.

3. At least 45 days before the start of construction within 200 feet of an active burrow, a trapping/relocation plan shall be submitted to the USFWS and/or CDFW for approval. The plan shall include but not be limited to the following: the methods for capturing animals, the procedures for evaluating health of the animals, the location and methods for storing live animals the methods for release (i.e., fencing), the location of release, on-site habitat restoration and methods for restoring temporarily destroyed burrows where appropriate, and remedial actions for injured or lost animals.

MM-BIO-5 **Burrowing Owl Habitat.** Prior to the initiation of construction activities, a qualified biologist shall conduct preconstruction surveys for burrowing owl to determine presence/absence of the species. The survey shall be conducted in accordance with the most current and applicable California Department of Fish and Wildlife (CDFW) protocol within 30 days of site disturbance to determine whether the burrowing owl is present at the site. Preconstruction surveys shall include suitable burrowing owl habitat within the Project footprint and within 500 feet of the Project footprint (or within an appropriate buffer as required in the most recent guidelines and where legal access to conduct the survey exists). If burrowing owls are not detected during the clearance survey, no additional mitigation is required.

1. If burrowing owl is located, occupied burrowing owl burrows shall not be disturbed during the nesting season (February 1 through August 31) unless a qualified biologist approved by CDFW verifies through non-invasive methods that either the birds have not begun egg-laying and incubation or that juveniles from the occurred burrows are foraging independently and capable of independent survival. A 500-foot non-disturbance buffer (where no work activities may be conducted) will be maintained between Project activities and nesting burrowing owls during the nesting season, unless otherwise authorized by CDFW.
2. If burrowing owl is detected during the non-breeding season (September 1 through January 31) or confirmed to not be nesting, a 160-foot buffer non-disturbance buffer will be maintained between the Project activities and occupied burrow. Alternatively, a Burrowing Owl Relocation and Mitigation Plan may be prepared and submitted for approval by CDFW. Once approved, the Plan would be implemented to relocate non-breeding burrowing owls from the Project site. The Plan will detail methods and guidance for passive relocation of burrowing owls from the Project site, provide monitoring and management of the replacement burrow sites, reporting requirements, and ensure that a minimum of two suitable, unoccupied burrows are available off site for every burrowing owl or pair of

burrowing owls to be passively relocated. Compensatory mitigation of habitat would be required if occupied burrows or territories occur within the permanent impact footprint. Ratios typically include a minimum of 19.5 acres per nesting burrow lost; however, habitat compensation will be approved by CDFW and detailed in the Burrowing Owl Relocation and Mitigation Plan. Suitable burrowing owl habitat conserved pursuant to the Settlement Agreement may be counted toward mitigation for impacts to burrowing owl habitat and would be based upon regulatory agency approval.

3. Construction work may proceed after owls have been excluded from the site following accepted protocol and approval of CDFW, and as approved by March Joint Powers Authority (JPA). Results of the surveys and relocation efforts shall be provided to CDFW.

MM-BIO-6 **Suitable Habitat for Nesting Birds.** The Migratory Bird Treaty Act (MBTA) of 1918 (50 CFR Section 10.13) and similar provisions under the CDFG Code (Sections 3503, 3503.5, and 3513) prohibit the "Take" of any native bird. March Joint Powers Authority (JPA) shall ensure that vegetation clearing on the Project site would be conducted outside of the nesting season (February 1 through September 15). If avoidance of the nesting season is not feasible, then a qualified biologist shall conduct a nesting bird survey within three days prior to any disturbance of the site, including disking, demolition activities, and grading. If active nests of native species are identified, the biologist shall establish suitable buffers around the nests, and the buffer areas shall be avoided until the nests are no longer occupied and the juvenile birds can survive independently from the nests. Typically, established buffers are greater for raptors than songbirds and depend on the species, the nesting stage, and type of construction activity proposed. The buffer should be no less than 300 feet for raptors and no less than 150 feet for songbirds, unless specifically determined by a qualified biologist familiar with the nesting phenology of the nesting species. In some cases, the buffer may need to be larger. There are no specific protocols for nesting bird surveys or for buffers once nests are found. The key is to ensure that no direct mortality of a native bird, which when nesting includes eggs and young. Implementation of this measure would ensure the Project is not in violation of the MBTA and California Fish and Game Code (CFGC). Alternatively, the Project shall comply with survey requirements imposed by U.S. Fish and Wildlife Service (USFWS) and/or California Department of Fish and Wildlife (CDFW).

MM-BIO-7 **Western Spadefoot.** Prior to construction, the applicant shall develop a relocation plan for adult western spadefoot. The plan should include, but not be limited to the

timing and location of the surveys conducted for western spadefoot, identify the habitats and conditions in the proposed relocation site(s); methods used for trapping and relocating the species, and documentation/recordation of the species and number of the animals relocated. The plan shall be provided to California Department of Fish and Wildlife (CDFW) for approval 30 days prior to any ground-disturbing activities within potentially occupied habitat. A qualified biologist will be present during ground-disturbing activities immediately adjacent to or within the grassland or coastal scrub habitat that could support populations of western spadefoot. The qualified biologist shall possess an appropriate California scientific collecting permit to handle special-status species likely to occur in the Project area. If special-status amphibian and/or reptile species (i.e., western spadefoot) are detected in the work area during pre-construction surveys and/or monitoring, the authorized biologist will capture and relocate individuals to nearby undisturbed areas with suitable habitat outside of the construction area, but as close to their origin as possible (i.e., within designated conservation areas west of Interstate 215). All wildlife moved during Project activities will be documented by the biologist on site and provided in the plan, which will be submitted to CDFW quarterly.

MM-BIO-8 **San Diego Black-Tailed Jackrabbit.** Thirty days prior to construction a qualified biologist shall conduct a survey within the proposed construction disturbance zone and within 200 feet of the disturbance zone for San Diego black-tailed jackrabbit. If San Diego black-tailed jackrabbits are present, non-breeding rabbits shall be flushed from areas to be disturbed. Dens, depressions, nests, or burrows occupied by pups shall be flagged and ground-disturbing activities avoided within a minimum of 200 feet during the pup-rearing season (February 15 through July 1). This buffer may be reduced based on the location of the den upon consultation with California Department of Fish and Wildlife (CDFW). Occupied maternity dens, depressions, nests, or burrows shall be flagged for avoidance, and a biological monitor shall be present during construction. If unattended young are discovered, they shall be relocated to suitable habitat by a qualified biologist. The applicant shall document all San Diego black-tailed jackrabbit identified, avoided, or moved and provide a written report to CDFW within 72 hours. Collection and relocation of animals shall only occur with the proper scientific collection and handling permits.

MM-BIO-9 **Jurisdictional Features.** In order to mitigate Project impacts to jurisdictional features under the jurisdiction of the U.S. Army Corps of Engineers (ACOE), California Department of Fish and Wildlife (CDFW), and Regional Water Quality Control Board (RWQCB), the Project applicant shall implement mitigation required by the regulatory agencies. March Joint Powers Authority (JPA) shall require proof that the applicable Section 404, 401, and 1600 permits and/or

clearances have been obtained or verification that they are not required shall be obtained prior to any disturbance of the jurisdictional features on site. All mitigation measures and conditions contained within the permits shall be implemented. At a minimum, the following shall be completed for mitigation for impacts to waters of the United States and jurisdictional streambeds. Mitigation options include on-site, off-site, in lieu fee mitigation, or a combination of mitigation strategies, to replace the disturbed jurisdictional features, including sensitive riparian vegetation communities, at a minimum of 1:1 ratio for temporary impacts and 2:1 for permanent impacts, or as otherwise required by the respective permits. Avoided jurisdictional waters shall be fenced or flagged for avoidance.

Best management practices (BMPs) shall be implemented to avoid indirect impacts to jurisdictional waters, including the following:

1. A biologist will conduct daily site visits during the removal of riparian vegetation.
2. Vehicles and equipment will not be operated in ponded or flowing water except as described in permits.
3. Water containing mud, silt, or other pollutants from grading or other activities will not be allowed to enter jurisdictional waters or be placed in locations that may be subjected to high storm flows.
4. Spoil sites will not be located within 30 feet from the boundaries of jurisdictional waters or in locations that may be subject to high storm flows, where spoils might be washed back into drainages.
5. Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil, or other petroleum products, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from Project-related activities, will be prevented from contaminating the soil and/or entering avoided jurisdictional waters.
6. No equipment maintenance will be performed within 100-feet of jurisdictional waters, including wetlands and riparian areas, where petroleum products or other pollutants from the equipment may enter these areas. Fueling of equipment will not occur on the Project site.

4.3.7 Level of Significance after Mitigation

Impacts to biological resources on the Project site can be mitigated to less than significant levels by incorporating mitigation measures as described in the EIR. No significant adverse impacts would remain after mitigation.

INTENTIONALLY LEFT BLANK

4.4 CULTURAL RESOURCES

This section provides an analysis of the potential impacts to cultural resources from the implementation of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). Meridian Park K4 LLC is proposing the development of an approximately 718,000-square-foot industrial warehouse on the K4 Parcel and the conversion of the existing Cactus Avenue Drainage Channel (Cactus Channel) from an open-air earthen channel into an underground concrete culvert for approximately 7,900 linear feet. This analysis is based on a review of two separate technical studies prepared by CRM TECH in support of the proposed Project. These studies include the following reports: *Identification and Evaluation of Historic Properties K4 Parcel Project* and the *Identification and Evaluation of Historic Properties Cactus Avenue Drainage Channel Improvement Project*, both prepared in August 2018 and revised in April 2019 (Appendices G and H, respectively, of this Environmental Impact Report (EIR)).

Both studies (Appendices G and H) were prepared in compliance with the California Environmental Quality Act (CEQA) and Section 106 of the National Historic Preservation Act (NHPA); however, only the Cactus Channel Improvements include a federal nexus. The Cactus Channel Improvements are subject to federal review by the U.S. Army Corps of Engineers as a responsible agency under Section 106. Furthermore, this analysis includes the review of existing cultural resources; technical data; and applicable laws, regulations, and guidelines from each study to adequately assess the potential impacts to cultural resources.

As discussed in Chapter 2, Project Description, of the EIR, the proposed Project includes the development of an approximately 718,000-square-foot industrial warehouse with 598 automobile parking stalls and 242 truck trailer parking stalls on the K4 Parcel and the conversion of the existing Cactus Channel from an open-air earthen channel into an underground concrete culvert for approximately 7,900 linear feet between Elsworth Street on the west and Heacock Street and Heacock Channel on the east. The K4 Parcel is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The proposed Project includes the following components:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March Joint Powers Authority (JPA) General Plan. The proposed Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.

- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

4.4.1 Existing Conditions

The K4 Parcel is located within the March JPA jurisdiction, which is within unincorporated Riverside County, California (Figure 2-1, Project Location). The Interstate 215 is located approximately 0.8 miles east of the K4 Parcel. The K4 Parcel is comprised of five parcels designated as Assessor's Parcel Numbers 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The Cactus Channel runs along the south side of Cactus Avenue until it reaches Heacock Street and connects with the Heacock Channel.

The Project area of potential effect (APE), which collectively consists of the K4 Parcel and the Cactus Channel, is located on the south side of Cactus Avenue and immediately north of March Air Reserve Base (ARB). The five parcels within the K4 Parcel consists of undeveloped land situated along the northern perimeter of the March ARB. In addition, the Cactus Channel runs approximately 7,900 linear feet along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the K4 Parcel frontage, and ending at the Heacock Channel.

Appendices G and H of this EIR document the results of a California Historical Resources Information System (CHRIS) search conducted at the Eastern Information Center (EIC), and a search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF).

Eastern Information Center Records Search

CRM TECH completed a CHRIS search at the EIC for the Project APE and surrounding 1-mile radius on May 15, 2018, for the K4 Parcel Project (Appendix G) and July 19, 2018, for the Cactus Channel Project (Appendix H). This search included mapped prehistoric, historical, and built-environment resources; Department of Parks and Recreation site records; technical reports; properties designated as California Historical Landmarks, Points of Historical Interest, or Riverside County Landmarks. Additional consulted sources included the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), and the California Historical Resources Inventory.

Records Search Results

The EIC records for the K4 Parcel Project indicate that 35 technical studies have been previously conducted within 1 mile of the Project APE between the mid-1990s and 2002. Of these, four studies partially or entirely overlap the Project APE (see Figure 5, Previous cultural resources

studies, in Appendix G of this EIR). Approximately 60% of the Project APE and 1-mile records search buffer has been previously surveyed. Moreover, the records search for the K4 Parcel Project indicates that 258 cultural resources comprised of historical and/or archaeological sites and one isolate have been previously recorded within 1 mile of the Project APE. All 258 previously recorded resources are historical in age and consist of the Atchison, Topeka and Santa Fe Railway, a drainage channel unrelated to the Project APE, structural remains from Camp Haan, and the remaining resources are comprised of historic built environment resources. Based on the records search, the majority of the buildings were located in the March Field Historic District within March ARB, a National Register-listed property lying roughly 0.5 miles to the south of the Project APE. None of these resources were identified within the Project APE.

The EIC records for the Cactus Channel component of the Project indicate that 46 technical studies have been previously conducted within 1 mile of the Project APE between 1991 and 2014. Of these, six studies partially or entirely overlap the Project APE. The entirety of the Project APE has been previously investigated (see Figure 5, Previous cultural resources studies, in Appendix H of this EIR). In addition, the records search for the Cactus Channel component of the Project indicates that 246 cultural resources comprised of historical and/or archaeological sites and one isolate have been previously recorded within 1-mile of the Project APE. All 246 previously recorded resources are historical in age and consist of the Atchison, Topeka and Santa Fe Railway, a drainage channel unrelated to the Project APE, structural remains from Camp Haan, and the remaining resources are comprised of historic built environment resources. The majority of the buildings were located in the March Field Historic District within March ARB, a National Register-listed property lying roughly 0.5 miles to the south of the Project APE. None of these resources were identified within the Project APE.

The isolate identified in both the K4 Parcel and Cactus Channel reports is a prehistoric resource comprised of a bifacial mano discovered on the surface approximately 0.75 miles southeast of the K4 Parcel and approximately 0.5 miles south of the eastern portion of the Cactus Channel.

Geoarchaeological Analysis

CRM TECH conducted a geoarchaeological analysis to assess the K4 Parcel and Cactus Channel's potential for the deposition and preservation of cultural deposits subsurface. Sources consulted for this analysis included primary topographic, geologic, and soil maps of the Project APE and vicinity (Appendix I1, Geotechnical Exploration Proposed Industrial Warehouse Site K4 Cactus Avenue; Morton and Cox 1994; Morton et al. 2001). The results of the geoarchaeological analysis (Appendix G and Appendix H) and paleontological field survey (Appendix I3) determined that the Project APE has been heavily disturbed by construction activities as a result of March ARB, Cactus Avenue, and Cactus Channel development. Disturbance was noted throughout the APE during geoarchaeological assessment, but predominantly in the eastern portion. In addition, the Cactus Channel portion of the

APE was observed to be extensively disturbed during the intensive pedestrian survey (Appendix H). Utility lines occur both above and below the ground surface, adding to subsurface disturbance. Moreover, the surface geology of the APE consists of exposures of locally formed alluvium of Pleistocene and Holocene age (Appendix I3) with soils near the ground surface identified as primarily artificial fill and, at depth, the soils are characterized as early Pleistocene alluvial fan deposits that would be expected to be sterile for cultural materials.[1] The artificial fill was noted mostly along Cactus Avenue and in the soil stockpiles, while the older alluvium was noted in all borings, at least below the surface (Appendix G).

Native American Coordination

Sacred Lands File Search and Tribal Outreach

CRM TECH requested a search of the SLF from the California NAHC for the K4 Parcel on May 14, 2018, and later deemed adequate for the Cactus Channel Improvement Site. The NAHC responded in a letter dated May 17, 2018, stating that the results of the SLF search failed to indicate the presence of Native American cultural resources within the Project APE, though the NAHC did note that the Project APE was sensitive for Native American cultural resources. The NAHC also provided a list of Native American groups and/or individuals who may have knowledge of cultural resources in the Project APE. In addition to or in lieu of some of the individuals recommended by the NAHC, CRM TECH also contacted other spokespersons for the tribes provided by the NAHC. Twelve responses were received as a result of the tribal outreach letters and are summarized in Table 4.4-1.

Table 4.4-1
Native American Tribal Communications

Native American Tribes	Response Received
San Manuel Band of Mission Indians	Stated that the Project APE is outside of tribe's ancestral territory and declined consulting party status.
Santa Rosa Band of Cahuilla Indians	No concerns regarding the proposed Project.
Agua Caliente Band of Cahuilla Indians	Requested all documentation associated with the cultural study for tribal review.
Morongo Band of Mission Indians	Requested all documentation associated with the cultural study for tribal review.
Augustine Band of Cahuilla Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the proposed Project. The tribe recommended further consultation with other tribes in the vicinity, to be notified of the discovery of any Native American cultural resources, and monitoring of ground-disturbing work in the Project APE.

[1] The early Pleistocene (circa 2.6-0.8 million years ago) alluvial fan deposits well predate human habitation in California and would not be expected to contain deeply buried cultural materials.

Table 4.4-1
Native American Tribal Communications

Native American Tribes	Response Received
Cabazon Band of Mission Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the proposed Project
Cahuilla Band of Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the proposed Project. However, the tribe requested to be informed on the progress of the Project.
Pauma Band of Luiseno Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the proposed Project. However, the tribe requested to be informed on the progress of the Project.
Rincon Band of Luiseno Indians	Stated that they did not have any information regarding Native American cultural resources within the Project APE that may be impacted by the implementation of the proposed Project
Serrano Nation of Indians	The tribe requested to be notified if any Native American cultural resources are encountered during the implementation of the proposed Project.
Pechanga Band of Luiseno Indians	The tribe participated in the survey of the Project APE and found the Project vicinity to be culturally sensitive and requested further consultation with March JPA. Furthermore, the tribe requested that a representative from their tribe and monitor for all earth-moving work associated with the proposed Project along with an archaeological monitor.
Soboba Band of Luiseno Indians	The tribe participated in the survey of the Project APE and found the Project vicinity to be culturally sensitive and requested further consultation with March JPA. Furthermore, the tribe requested that a representative from their tribe monitor for all earth-moving work associated with the proposed Project.

Notes: APE = area of potential effect; JPA = Joint Powers Authority.

The results of the tribal outreach process conducted for both the K4 Parcel and Cactus Channel, are available as Appendix 2 in both Cultural Resources Studies prepared by CRM TECH, which are included as Appendices G and H of this EIR. This outreach was conducted for informational purposes only and did not constitute formal government-to-government consultation as specified by Assembly Bill 52.

Historical Research

CRM TECH reviewed published literature, archival records, U.S. General Land Office land survey plat map, U.S. Geological Survey topographic maps, and aerial photographs to understand development of the Project APE and vicinity. The historical research did not identify any evidence of settlement or development within the Project APE during the historic period. The only historic-

era resource identified was a human-made feature located in the vicinity of the Project APE, to the west and is identified as the "Wagon Road to Timicula" in the U.S. General Land Office 1855 map.

In 1941, the Project APE became a part of the March Army Air Field, which was renamed March Army Air Base in 1942. In the 1939 U.S. Geological Survey topographic map, the Project APE did not depict any development; however, by the early 1950s a drainage channel in the northern portion of the Project APE is visible. Based on this time frame, it is likely that the channel was constructed when the APE was acquired by the military in 1941-1942.

Aerial photographs from the 1950s and 1960s depicted present-day Chanute Avenue as extending into the eastern portion of the APE and the mid-1960s, Cactus Avenue was shown extending across the Project vicinity, beyond the APE's northern boundary (NETR Online 1966). Sometime between the 1978 and 1994 aerials, the substation adjacent to the APE was constructed (NETR Online 1978, 1994) and images reviewed from Google Earth show the soil stockpiles within the APE in 2006–2008 (Google Earth 2018). Stockpiles of imported soil are found in the eastern portion of the APE, near the substation. Other than these and the various dirt roads, no additional features have appeared within or immediately adjacent to the APE (Appendix G).

Cultural Resources Survey

CRM TECH conducted a pedestrian survey on June 1, 2018, for the K4 Parcel and on July 27, 2018, for the Cactus Channel. The methods and results for the surveys conducted for each project are provided below.

The K4 Parcel survey was completed by walking a series of parallel north-south transects at 15-meter (approximately 50-foot) intervals by one CRM TECH archaeologist and two Native American monitors with one representing the Pechanga Band of Luiseno Indians and the second representing the Soboba Band of Luiseno Indians. The surveyors systematically surveyed for any evidence of archaeological resources, including both prehistoric and historical resources. Ground visibility was nearly 100%. Several power transmission lines and stockpiles of imported soil were surveyed in the eastern portion of the APE, near the substation. In addition, a small segment of Chanute Avenue was identified by surveyors in the southeastern corner of the Project APE. Chanute Avenue dates to the 1950s and 1960s and was maintained and used for accessing a nearby substation up until around 2006, when it was abandoned. CRM TECH determined that the Chanute Avenue was not a historical resource under CEQA and therefore it was not formally recorded.

The Cactus Channel survey resulted in the identification and recordation of the historical Cactus Channel (see Appendix 3 of Appendix H of this EIR), situated across the northernmost portion of the Project APE. This resource consists of an earthen, open-air drainage channel that was recorded during a recent study as site P-33-028200 (CA-RIV-12712) (see Appendix 3 in

Appendix G of this EIR). The Cactus Channel survey was conducted by walking a transect on each side of the existing channel for the entire length of the linear channel by one CRM TECH archaeologist and one Native American monitor representing the Soboba Band of Luiseno Indians. The surveyors systematically surveyed for any evidence of archaeological resources, including both prehistoric and historical resources. Ground visibility varied between 80% along the top of Cactus Channel, to approximately less than 5% along the bottom of the channel, due to dense vegetation growth and surface refuse obscuring any possible visible exposed ground surface. The survey resulted in the recordation of the Cactus Channel for submission into the CHRIS records (see Appendix 3 in Appendix H of this EIR). The resource was designated by the EIC as site P-33-028200. In addition, surveyors identified several streets including Riverside Dive, Fourth Street, and Cactus Avenue, adjacent to the channel that are historical in age; however, these streets appear to have undergone modifications over time and as such, are not considered historical resources under CEQA and therefore were not formally recorded.

In summary, no cultural or historic-era resources were identified within the Project APE as a result of the CHRIS records search, Native American outreach, or intensive pedestrian survey, with exception to the Cactus Channel. However, further analysis of the Cactus Channel concluded that the Cactus Channel is not considered a historical resource.

4.4.2 Relevant Plans, Policies, and Ordinances

Federal

The National Register of Historic Places

The NRHP is the United States' official list of districts, sites, buildings, structures, and objects worthy of preservation. Overseen by the National Park Service, under the U.S. Department of the Interior, the NRHP was authorized under the National Historic Preservation Act of 1966, as amended (16 USC 470 et seq.). Its listings encompass all National Historic Landmarks, as well as historic areas administered by the National Park Service.

NRHP guidelines for the evaluation of historic significance were developed to be flexible and to recognize the accomplishments of all who have made significant contributions to the nation's history and heritage. Its criteria are designed to guide state and local governments, federal agencies, and others in evaluating potential entries in the NRHP. For a property to be listed in or determined eligible for listing, it must be demonstrated to possess integrity and to meet at least one of the following criteria:

> The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and

> objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:
>
> A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
>
> B. That are associated with the lives of persons significant in our past; or
>
> C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
>
> D. That have yielded, or may be likely to yield, information important in prehistory or history.

Integrity is defined in NRHP guidance, *How to Apply the National Register Criteria,* as "the ability of a property to convey its significance. To be listed in the NRHP, a property must not only be shown to be significant under the NRHP criteria, but it also must have integrity" (NPS 1990). Historic properties either retain integrity (convey their significance) or they do not. Within the concept of integrity, the National Register criteria recognizes seven aspects or qualities that define integrity. The seven aspects of integrity are locations, setting, design, materials, workmanship, feeling and association. In order to retain historic integrity "a property will always possess several, and usually most, of the aspects" (Andrus and Shrimpton 2002).

NRHP guidance further asserts that properties be completed at least 50 years ago to be considered for eligibility. Properties completed fewer than 50 years before evaluation must be proven to be "exceptionally important" (criteria consideration G) to be considered for listing.

Under Section 106 of the National Historic Preservation Act, a historic property is defined as any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the NRHP maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the NRHP criteria (36 CFR Part 800.16(i)(1)).

Effects on historic properties under Section 106 of the National Historic Preservation Act are defined in the assessment of adverse effects in 36 CFR Part 800.5(a)(1):

> An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of

the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the National Register. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative.

Adverse effects on historic properties are clearly defined and include, but are not limited to:

(i) Physical destruction of or damage to all or part of the property;

(ii) Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation and provision of handicapped access, that is not consistent with the Secretary's Standards for the Treatment of Historic Properties (36 CFR Part 68) and applicable guidelines;

(iii) Removal of the property from its historic location;

(iv) Change of the character of the property's use or of physical features within the property's setting that contributes to its historic significance;

(v) Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features;

(vi) Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization; and

(vii) Transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance (36 CFR 800.5 (2)).

To comply with Section 106, the criteria of adverse effect are applied to historic properties, if any exist in the Project APE, pursuant to 36 CFR Part 800.5(a)(1). If no historic properties are identified in the APE, a finding of "no historic properties affected" will be made for the proposed Project. If there are historic properties in the APE, application of the criteria of adverse effect will result in Project-related findings of either "no adverse effect" or of "adverse effect," as previously described. A finding of no adverse effect may be appropriate when the undertaking's effects do not meet the thresholds in criteria of adverse effect 36 CFR Part 800.5(a)(1), in certain cases when the undertaking is modified to avoid or lessen effects, or if conditions were imposed to ensure

review of rehabilitation plans for conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties (codified in 36 CFR Part 68).

If adverse effects findings were expected to result from the proposed Project, mitigation would be required, as feasible, and resolution of those adverse effects by consultation may occur to avoid, minimize, or mitigate adverse effects on historic properties pursuant to 36 CFR Part 800.6(a).

State

The California Register of Historical Resources

In California, the term "historical resource" includes, but is not limited to, "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (PRC Section 5020.1(j)). In 1992, the California legislature established the CRHR "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated as follows. According to Public Resources Code (PRC) Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity" and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

(2) Is associated with the lives of persons important in our past.

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

(4) Has yielded, or may be likely to yield, information important in prehistory or history.

To understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic-era resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in

the CRHR, as are the California Historical Landmarks from No. 770 onward, California Points of Historical Interest designated after January 1998, and resources recommended by the State Historical Resources Commission (SHRC). The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

California Environmental Quality Act

As described further, the following CEQA Statute (PRC Section 21000 et seq.) and Guidelines (14 CCR 15000 et seq.) are of relevance to the analysis of historical and archaeological resources and human remains.

- PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) defines "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource," it also defines the circumstances when a project would materially impair the significance of a historical resource.
- PRC Section 21083.2(g) defines "unique archaeological resource."
- PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- PRC Sections 21083.2(b) and 21083.2(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic-era resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (PRC Section 21084.1; 14 CCR 15064.5(b)). If a resource is listed or eligible for listing in the CRHR, included in a local register of historic resources, or identified as significant in a historical resources survey (meeting the requirements of PRC Section 5024.1(q)), it is an "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (PRC Section 21084.1; 14 CCR 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (PRC Section 21084.1; 14 CCR 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would

be materially impaired" (14 CCR 15064.5(b)(1); PRC Section 5020.1(q)). In turn, the significance of a historical resource is materially impaired when a project does any of the following:

(1) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

(2) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

(3) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA (14 CCR 15064.5(b)(2)).

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2(a)–(c)).

Section 21083.2(g) defines a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

(1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

(2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.

(3) Is directly associated with a scientifically recognized important prehistoric or historic event or person (PRC Section 21083.2(g)).

Impacts on non-unique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); 14 CCR 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as a tribal cultural resource (PRC Sections 21074(c) and 21083.2(h)), further consideration of significant impacts is required (refer to Section 4.12, Tribal Cultural Resources).

CEQA Guidelines Section 15064.5(d) and (e) assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. Described as follows, these procedures are detailed in California Health and Safety Code Section 7050.5 and PRC Section 5097.98.

California Health and Safety Code Section 7050.5

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code Section 7050.5 requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains can occur until the county coroner has examined the remains (Health and Safety Code Section 7050.5(b)). PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (Health and Safety Code Section 7050.5(c)). The NAHC will notify the most likely descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 48 hours from being granted access to the site. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

Local

County of Riverside General Plan

The County of Riverside's General Plan recognizes the CEQA Guidelines Section 15064.5 as a threshold for the identification and protection of historic resources, archaeological and paleontological resources as well as the determination of significant impacts on those resources. In addition, the County's General Plan includes several Open Space policies to reduce or minimize the effects of development on historic, archaeological and paleontological resources.

Historical Resources

The County Board of Supervisors of Riverside County established a Riverside County Historical Commission on May 6, 1968. The Commission advises the Board of Supervisors in order to

discover and identify persons, events, and places of historical importance within Riverside County and to make recommendations relating to the preservation of historic sites and structures.

The Riverside County Historical Commission has adopted a set of criteria and procedures for nominating and recognizing Historic Landmarks. Individuals, organizations, or governmental agencies may apply for a County Landmark to the County's Historic Preservation Officer (HPO) at the Riverside County Regional Park and Open Space District. The HPO assesses applications and advises the County Regional Park and Open Space District General Manager, who forwards nominations to the Historical Commission for consideration and recommendation. The Historical Commission may recommend a nomination to the County Board of Supervisors. A nomination approved by the County Board of Supervisors will be officially listed as a Riverside County Historic Landmark.

Historical resources that may be considered by nomination include those found eligible for local, state, or national landmark status during CEQA cultural review or a historic resource survey, or historic resources that are already designated under a municipal or county preservation or landmark ordinance. Nominations for historic resources that do not already have some level of landmark designation, or that are found to be eligible for such, will be reviewed under County criteria. The Commission may deem a resource eligible for designation but will not officially landmark the property without owner consent.

Cultural Resources

Cultural Resources are evidence of past human activity that become important for scientific, historic, and/or religious reasons to communities, descendant groups, and individuals. They may include objects, buildings, structures, sites (particularly archaeological sites), areas, places, records, or manuscripts associated with history. The following policies are intended to ensure that cultural resources are appropriately considered:

OS 19.3: Review proposed development for the possibility of cultural resources and for compliance with the cultural resources program.

OS 19.4: To the extent feasible, designate as open space and allocate resources and/or tax credits to prioritize the protection of cultural resources preserved in place or left in an undisturbed state.

OS 19.5: Exercise sensitivity and respect for human remains from both prehistoric and historic time periods and comply with all applicable laws concerning such remains.

4.4.3 Thresholds of Significance

March JPA uses the CEQA Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the IS prepared for the Project (Appendix A) and the newly adopted CEQA Guidelines Appendix G (December 2018), a significant impact related to cultural resources would occur if the project would:

- **CUL-1**: Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5.
- **CUL-2**: Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5.
- **CUL-3**: Disturb any human remains, including those interred outside of dedicated cemeteries.

4.4.4 Impacts Analysis

Threshold CUL-1. Would the Project cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5?

The proposed Project involves the development of an approximately 718,000-square-foot industrial warehouse and the conversion of the existing Cactus Channel from an open-air earthen channel into an underground concrete culvert. CRM TECH completed a CHRIS records search and conducted pedestrian surveys of the Project APE on June 1, 2018 for the K4 Parcel and on July 27, 2018 for the Cactus Channel, for historic built-environment resources. As a result of the study, only one resources was identified in the Project APE. The Cactus Channel (33-028200/CA-RIV-12721), constructed between 1941 and 1953, was found ineligible under all NRHP and CRHR designation criteria. Cactus Channel is a peripheral feature associated with the WWII-era military base, but does not demonstrate a unique or particularly close association with that event or with any other events (Criterion A/1) or persons (Criterion B/2) of recognized historic significance. Additionally, the channel does not stand out as an important example of any style, type, period, region, or method of construction, nor is it known to represent the work of a prominent architect, designer, engineer, or builder (Criterion C/3). Finally, as a late-historic-period infrastructure feature of standard construction, it demonstrates little potential for any important historical/archaeological information (Criterion D/4; Appendix H). The channel is not considered a historical resource for the purposes of CEQA. As such, the Project would result in **no impact** on historical resources.

Threshold CUL-2. Would the Project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5?

The proposed Project involves development of an approximately 718,000-square-foot industrial warehouse and the conversion of the existing Cactus Channel from an open-air earthen channel into

an underground concrete culvert. CRM TECH conducted pedestrian surveys of the Project APE on June 1, 2018 for the K4 Parcel and on July 27, 2018 for the Cactus Channel, for archaeological resources. Additionally, a CHRIS records search was conducted for the Project APE and within 1-mile buffer around the APE, and an NAHC SLF search and tribal outreach were conducted. No archaeological resources were identified within the Project APE as a result of the CHRIS records search, Native American outreach, or intensive pedestrian survey.

Geoarchaeological analysis was conducted to assess the Project APE's potential for the deposition and preservation of cultural deposits subsurface. The results of the geoarchaeological analysis determined that the Project APE has been heavily disturbed by construction activities as a result of March ARB, Cactus Avenue, and Cactus Channel development. Moreover, the soils near the ground surface are primarily engineered fill and, at depth, the soils are characterized as early Pleistocene alluvial fan deposits and would be expected to be sterile for cultural materials.

It is always possible that unanticipated discoveries could be encountered during ground-disturbing activities associated with the proposed Project. If such unanticipated discoveries were encountered, impacts to encountered resources could be potentially significant. However, with implementation of mitigation measure **MM-CUL-1**, which requires that all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, can evaluate the significance of the find, potentially significant impacts to archaeological resources would be reduced to **less than significant** levels.

Threshold CUL-3 Would the Project disturb any human remains, including those interred outside of dedicated cemeteries?

No prehistoric or historic burials were identified within the Project APE as a result of the CHRIS and SLF records search, tribal outreach, and pedestrian survey. Although the likelihood of encountering human remains as a result of Project implementation is low to non-existent, mitigation measure **MM-CUL-2** is provided to ensure impacts would be considered **less than significant** in the unexpected event that human remains are unearthed during construction activities within the proposed Project APE. The discovery of human remains would require handling in accordance with PRC 5097.98, which states that in the event that human remains are discovered during construction, construction activity shall be halted and the area shall be protected until consultation and treatment can occur as prescribed by law.

4.4.5 Mitigation Measures

The following mitigation measures would reduce potentially significant impacts to archaeological resources and human remains to a less-than-significant level.

MM-CUL-1 **Inadvertent Discovery of Archaeological Resources.** In the event that archaeological resources are inadvertently unearthed during excavation and grading activities for the Project and no monitors are present, the contractor shall cease all earth-disturbing activities within a 100-foot radius of the area of the discovery, March Joint Powers Authority (JPA) shall be notified, and a qualified archaeologist meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology shall evaluate the significance of the find and determine the appropriate course of action. Depending upon the significance of the find under the California Environmental Quality Act (CEQA) (14 CCR 15064.5(f); PRC, Section 21082), the archaeologist may simply record the find and allow work to continue.

If the resource is a Native American cultural resource or is prehistoric, the appropriate tribe(s) shall weigh in on the evaluation of the resource and the appropriate course of action.

Pursuant to California Public Resources Code Section 21083.2(b) and CEQA Guidelines Section 15126.4, avoidance is the preferred method of preservation for archaeological resources. If avoidance of the resources is not feasible, salvage operation requirements pursuant to Section 15064.5 of the CEQA Guidelines shall be followed and shall take in to account tribal preferences and sensitivity concerns. If potentially significant features or sites are discovered, an Evaluation and Treatment Plan shall be developed by the qualified archaeologist and the Native American representative and shall contain, at a minimum, a research design and field methodology designed to address the criterion outlined in the CRHR. If a site is determined to be significant, data recovery excavations may be necessary unless the resource is avoided and preserved/protected in place. The qualified archaeologist shall also be required to curate specimens in a repository with permanent retrievable storage and submit a written report to March JPA for review and approval. Once artifact analysis is completed, a final written report detailing the results of all research procedures and interpretation of the site shall be submitted to March JPA for review and approval. Evaluation and treatment shall be supervised by an individual or individuals that meet the Secretary of the Interior's Professional Qualification Standards.

After the find has been appropriately avoided or mitigated and cleared by March JPA, the qualified archaeologist and, if applicable, the Native American representative, work in the area may resume. Resources shall be documented on Department of Parks and Recreation 523 series forms and shall be submitted to the Eastern Information Center (EIC) along with the final written report for inclusion in the California Historical Resources Information System (CHRIS).

MM-CUL-2 **Inadvertent Discovery of Human Remains.** In accordance with Section 7050.5 of the California Health and Safety Code, if human remains are found, the Riverside County Coroner shall be immediately notified of the discovery. No further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains shall occur until the County Coroner has determined, within 2 working days of notification of the discovery, the appropriate treatment and disposition of the human remains. If the County Coroner determines that the remains are, or are believed to be, Native American, he or she shall notify the Native American Heritage Commission (NAHC) within 24 hours. In accordance with California Public Resources Code, Section 5097.98, the NAHC must immediately notify those persons it believes to be the most likely descendant (MLD) from the deceased Native American. The MLD shall complete their inspection within 48 hours of being granted access to the site. The MLD representative would then determine, in consultation with the property owner, the disposition of the human remains.

4.4.6 Level of Significance After Mitigation

With adherence to mitigation measures **MM-CUL-1** and **MM-CUL-2**, no significant impacts to cultural resources would occur as a result of the proposed Project.

INTENTIONALLY LEFT BLANK

4.5 GEOLOGY AND SOILS

This section analyzes the potential impacts of the proposed K4 Warehouse and Cactus Channel Improvement Project (proposed Project or Project) related to exposing people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking and seismic-related ground failure, unique paleontological resources and sites, and additional geological hazards.

The Initial Study (Appendix A, Initial Study and Notice of Preparation) concluded that potential impacts related to exposing people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault or landslides would be less than significant. The Initial Study also concluded that the Project would have no impact with respect to the potential for the proposed Project to have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. Therefore, these issues are not discussed further in this Environmental Impact Report (EIR).

The following resources were used in the preparation of this section of the EIR:

- *Geotechnical Exploration Proposed Industrial Warehouse Site K4 Cactus Avenue* (Appendix I1)
- *Geotechnical Addendum Report K4 Moreno Valley Storm Drain Cactus Avenue* (Appendix I2)
- *Paleontological Resources Assessment Report* (Appendix I3)
- *Phase I and Limited Phase II Environmental Site Assessment Proposed Industrial Warehouse Site K4* (Appendix K)
- *General Plan of the March Joint Powers Authority (JPA)* (March JPA 1999a)
- *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA 1999b)

As mentioned in Chapter 2, Project Description, of this EIR, the Project includes the development of the five parcels on approximately 35.4-acre site (K4 Parcel) with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Drainage Channel (Cactus Channel) that runs along the south side of Cactus Avenue, commencing just east

of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel (Channel Improvement Site). The proposed Project includes the following components:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The proposed Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

4.5.1 Existing Conditions

The K4 Parcel and Cactus Channel are located on the south side of Cactus Avenue and extends from the terminus of Veterans Way at Cactus Avenue on the west to the terminus of Frederick Street at Cactus Avenue on the east. The K4 Parcel is located within the March JPA jurisdiction, which is within unincorporated Riverside County, California. The K4 Parcel is located within the former boundaries of the March Air Force Base (now known as the March Air Reserve Base (ARB)), in the northern area.

The surrounding area consists of vacant land, commercial and industrial properties and the March ARB. Adjacent to the north of the K4 Parcel and Cactus Channel, across Cactus Avenue, is an industrial and commercial center. To the east, the K4 Parcel is bounded by vacant land and an electrical substation. To the south, the K4 Parcel is bordered by March ARB and to the west the K4 Parcel is bordered by a vacant lot and March ARB. Harvest Time Christian School is located at 14420 Elsworth Street, Moreno Valley, CA 92553, and approximately 0.2 miles northwest of the Cactus Channel component of the proposed Project site.

Topographically, the K4 Parcel is relatively flat, draining gently in a southeastern direction. The K4 Parcel is currently undeveloped and vacant land covered with small vegetative growth and seasonal weeds. The K4 Parcel is underlain by localized undocumented artificial fill and older (Appendix I1). There is an approximately 152,000-square-foot area with stockpiled soil in the southern portion of the K4 Parcel, adjacent to the transformer station. No buildings or structures are located on site; the southeastern perimeter of the K4 Parcel wraps around an electrical substation that is not included as part of the subject site. The substation has two paved entrances on the east that are accessible by

Chanute Avenue, these entrances and Chanute Avenue are part of the K4 Parcel. The Cactus Channel is earthen and flows within the channel drain to the east.

Surrounding Land Uses

Adjacent to the north of the proposed K4 Parcel, across Cactus Avenue, are commercial, office, and industrial uses. Beyond these initial uses to the north, are other office, commercial, and industrial uses within the City of Moreno Valley, such as the Riverside County Waste Management Department, and commercial concrete facility. To the east, the proposed K4 Parcel is bounded by vacant land and an electrical substation. Further east is the March ARB, which previously the March Air Force Base. To the south, the proposed K4 Parcel is bordered by March ARB, including the March ARB runway. Lastly, to the west, the proposed K4 Parcel is bordered by a vacant lot and March ARB. Interstate 215 is approximately 0.7 miles west of the K4 Parcel, which intersects the March ARB. Further west is the City of Riverside, along with unincorporated areas of Riverside County.

The Cactus Channel portion of the proposed Project runs along the south side of Cactus Avenue, passing a variety of uses along the Cactus Avenue corridor, primarily consisting of March ARB, Industrial Warehouse, and commercial uses.

Geologic Setting and Soils

The site located in the March JPA Planning Area, which is part of the eroded Cretaceous and older crystalline basement rock (Perris Erosional Surface) and the alluvial filled valley (Perris Plain). The Perris Plain alluvial deposits are composed of alternating layers of varying amounts of clay, silt, sand, and gravel. The thickness of the Perris Plain varies from a few feet to greater than 800 feet. On-site soils are generally suitable for reuse as compacted fill, provided they are free of debris and organic matter (Appendix I1). Groundwater was encountered at the Project site, at a depth of approximately 19 feet below ground surface and 23 feet below ground surface.

The site is located in the natural geomorphic province in southwestern California known as the Peninsular Ranges. The province is characterized by steep, elongated, mountains and valleys that trend northwestward. The site is located in the Perris Block, which is approximately 20 by 50 miles and is bounded by the San Jacinto Fault Zone to the northeast and the Elsinore Fault Zone to the southwest. The Perris Block is characterized by vertical land movements of several thousand feet in response to movement

The Project vicinity is primarily located within Quaternary-age very old fan deposits. More specifically, the K4 Parcel is underlain by localized artificial fill and older alluvium. The undocumented artificial fill is generally associated with existing Cactus Avenue and a large stockpile. The older alluvium soils encountered in all borings, generally consist of medium dense to very dense

silty to clayey sand and localized layers of sandy silty to sandy clay. This older alluvium is expected to generally possess a low expansion potential and slight collapse potential (<1%) (Appendix I1).

Based on the results of the geotechnical report (Appendix I2), the alignment of the proposed storm drain (Cactus Channel) is likely underlain by the recent sediments/young alluvium and older alluvium. Recent sediments/young alluvium is likely generated during past cycles of flooding within this earthen channel. Based on visual observations during field exploration performed for the Project, recent sediments/young alluvium generally consist of fine sands and silt and are expected to be loose and possess low expansion (EI<51). The older alluvium deposits are expected to consist of medium dense to very dense silty to clayey sand (SM/SC) and localized layers of sandy silty to sandy clay (ML/CL). This older alluvium is expected to generally possess a low expansion potential (EI<51) and slight collapse potential (<1%).

Topography

Both the K4 Parcel and the Cactus Channel are relatively flat, draining gently in a southeastern direction. The K4 Parcel is currently undeveloped and vacant land.

Faults and Seismicity

The proposed Project site, similarly to the planning area and the Southern California region, is a located in a seismically active region, as it is located between the North American and Pacific tectonic plates. The Project site is located between two major fault zones: the Elsinore-Whittier fault, approximately 13 miles to the southeast, and the San Jacinto fault, approximately 7 miles to the northeast. The area between the two faults is known as the Perris Block or Perris Plain. The primary source of seismic activity on the site is the tectonic boundary condition which is expressed by the predominant northwest trending faults.

Ground Shaking

Strong ground shaking can be expected at the site during moderate to severe earthquakes in the general Southern California region. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (i.e., soil type) characteristics.

Liquefaction/Lateral Spreading

Liquefaction is a process in which loose sand and silt that is saturated with water can behave like a liquid when shaken by an earthquake (USGS 2018a). According to the Riverside County Geologic Hazards maps, the K4 Parcel and the Cactus Channel are located in a zone of high liquefaction potential. However, liquefaction-induced ground settlement is not expected to be a significant hazard at the site due to the absence of near-surface saturated sand layers and

underlying dense older alluvium. The dynamic settlement due to ground shaking, based on a peak ground acceleration of 0.5g (percent of gravity), with a moment magnitude of 7.2, is estimated to be less than 1 inch. This settlement is expected to be generally global and over a large area. As such, the seismic differential settlement is not expected to exceed 0.5 inch in a 40-foot horizontal distance within this site (Appendix I1).

Lateral spreading is the finite, lateral movement of gently to sloping, saturated soils deposits, caused by earthquake-induced liquefaction. Based on the low potential for liquefaction, in combination with the relatively flat topography, the potential for lateral spreading is low.

Landslides

Due to the relatively flat site topography, the potential for landslides at the Project site is very low.

Collapsible Soils

Laboratory testing indicates that on-site soils (older alluvium) are expected to possess a slight collapse potential (<1%) (Appendix I2).

Subsidence

Land subsidence is a settling or sudden sinking of a geological surface owing to subsurface movement of earth materials. The principal causes in Southern California are aquifer-system compaction, drainage and decomposition of organic soils, and oil and gas extraction. Effects of land subsidence include damage to buildings and infrastructure such as roads and canals, increased flood risk in low-lying areas, and lasting damage to groundwater aquifers and aquatic ecosystems (USGS 2017). Based on a review of a United States Geological Survey subsidence map, the Project site is not located in an area subject to subsidence (USGS 2018b).

Expansive Soils

Expansive soils contain significant amounts of clay particles that swell considerably when wetted and shrink when dried. Foundations constructed on these soils are subject to large uplifting forces caused by the volumetric changes over time. Without proper measures taken, heaving and cracking of building foundations and slabs-on-grade could result. According to laboratory testing of on-site soils performed for the proposed Project geotechnical report (Appendix I2), it was indicated that the soils on site possess an expansion potential of EI<51, which is considered to be low.

Paleontological Setting

March ARB is located in a valley floor area in the northern portion of the Peninsular Ranges Geomorphic Province, which is bounded on the north by the Transverse Ranges province, on the

northeast by the Colorado Desert province, and on the west by the Pacific Ocean (Appendix I3). The Project area lies on the edge of a high portion of the Perris Block, which was defined as a region between the San Jacinto and Elsinore-Chino fault zones and consisting of a series of tectonically controlled valleys and ridges (Appendix I3). The structural blocks are considered to have been active since Pliocene (~ 5.3 million years ago [mya] – 2.6 mya) time. The Pliocene- and Pleistocene (~ 2.6 mya – 11,700 years ago)-age non-marine sedimentary rocks found filling the valley areas have produced vertebrate fossils, as well as plant and invertebrate fossil remains (Appendix I3). The ground surface in the Project vicinity has been disturbed extensively in the past and appears to have been cleared of much of the vegetation recently, except in the Cactus Channel.

There is disagreement regarding the 1:24,000 scale, surficial geological mapping of the Project area. According to surficial geological mapping by Morton and Cox (1994), the western Project area is underlain by Pleistocene older alluvium (map unit Qoa); whereas, Morton et al. (2002a; 2002b) mapped the entire Project area as early Pleistocene (~ 2.6 mya – 781,000 years ago) very old alluvial fan deposits (map unit $Qvof_a$). Morton (1978) mapped the surficial geology of the eastern Project area as underlain by Holocene (< 11,700 years ago) younger alluvium (map unit Qya) and Dibblee and Minch (2003a; 2003b) mapped the entire Project area as Holocene alluvium (map unit Qa). Geotechnical borings indicated the Project area to be underlain by Pleistocene alluvial deposits (Leighton Consulting Inc. 2018a; Leighton Consulting Inc. 2019b). Pleistocene alluvial deposits have high paleontological sensitivity, and Holocene alluvial deposits have low paleontological sensitivity on the surface that increases with depth.

CRM TECH (2019) requested a paleontological records search of the Project area and a one-mile radius buffer through the Western Science Center (WSC) in Hemet and conducted field surveys on June 1 and July 27, 2018, in which no evidence of any paleontological resources was observed on the ground surface throughout the Project area. The field observations confirmed that the surface sediments in and near the Project area had been extensively disturbed in the past, especially along the drainage channel and the various roadways nearby (Appendix I3). While no paleontological resource localities were reported by the WSC within the Project area or the one-mile radius buffer, the WSC reported 100's of fossil localities from outside the one-mile buffer recovered from sediments similar to those underlying the Project area. The WSC concluded the Project has a high potential to impact scientifically significant paleontological resources (CRM TECH 2019).

4.5.2 Relevant Plans, Policies, and Ordinances

Federal

Occupational Safety and Health Administration Regulations

Excavation and trenching are among the most hazardous construction operations. OSHA Excavation and Trenching Standard, Title 29 of the Code of Federal Regulations, Part 1926.650, covers requirements for excavation and trenching operations. OSHA requires that all excavations in which employees could potentially be exposed to cave-ins be protected by sloping or benching the sides of the excavation, supporting the sides of the excavation, or placing a shield between the side of the excavation and the work area. In California, California OSHA (Cal/OSHA) has responsibility for implementing federal rules relevant to worker safety, including slope protection during construction excavations. Cal/OSHA's requirements are more restrictive and protective than federal OSHA standards.

State

The statewide minimum public safety standard for mitigation of earthquake hazards (as established through the California Building Code (CBC)), Alquist–Priolo Earthquake Fault Zoning Act, and Seismic Hazards Mapping Act) is that the minimum level of mitigation for a proposed Project should reduce the risk of ground failure during an earthquake to a level that does not cause the collapse of buildings for human occupancy,[1] but in most cases, is not required to prevent or avoid the ground failure itself. It is not feasible to design all structures to completely avoid damage in worst-case earthquake scenarios. Accordingly, regulatory agencies have generally defined an "acceptable level" of risk as that which provides reasonable protection of the public safety, although it does not necessarily ensure continued structural integrity and functionality of a proposed Project (14 CCR 3721(a)). Nothing in these acts, however, precludes lead agencies from enacting more stringent requirements, requiring a higher level of performance, or applying these requirements to developments other than those that meet the acts' definitions of "proposed Project."

CEQA

CEQA requires lead agencies to consider the potential effects of a project on unique paleontological resources. CEQA requires an assessment of impacts associated with the direct or indirect destruction of unique paleontological resources or sites that are of value to the region or state. This study satisfies project requirements in accordance with CEQA (Pub. Resources Code, § 2100 et seq.) and Public

[1] A "structure for human occupancy" is any structure used or intended for supporting or sheltering any use or occupancy that is expected to have a human occupancy rate of more than 2,000 person-hours per year.

Resources Code Section 5097.5 (Stats 1965, c 1136, p. 2792). This analysis also complies with guidelines and significance criteria specified by the Society of Vertebrate Paleontology ([SVP] 2010).

Paleontological resources are explicitly addressed by CEQA, specifically in Section VII(f) of CEQA Guidelines Appendix G, the "Environmental Checklist Form," which addresses the potential for adverse impacts to "unique paleontological resource[s] or site[s] or … unique geological feature[s]." This provision covers scientifically significant fossils of signal importance – remains of species or genera new to science, for example, or fossils exhibiting features not previously recognized for a given animal group – as well as localities that yield fossils significant in their abundance, diversity, preservation, and so forth. The Public Resources Code, sections 5097.5 and 30244, also regulate removal of paleontological resources from state lands, define unauthorized removal of fossil resources as a misdemeanor, and require mitigation of disturbed sites.

California Building Code

The CBC has been codified in the California Code of Regulations as Title 24, Part 2. Title 24 is administered by the California Building Standards Commission, which is responsible for coordinating all building standards. Under state law, all building standards must be centralized in Title 24 or they are not enforceable. The purpose of the CBC is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all building and structures within its jurisdiction. The CBC is based on the International Building Code published by the International Code Conference. The CBC contains California amendments based on the American Society of Civil Engineers Minimum Design Standards 7-16, which provides requirements for general structural design and includes means for determining earthquake loads and other loads (such as wind loads) for inclusion into building codes. The provisions of the CBC apply to the construction, alteration, movement, replacement, and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures throughout California.

State Earthquake Protection Law

The State Earthquake Protection Law (California Health and Safety Code, Section 19100 et seq.) requires that structures be designed to resist stresses produced by lateral forces caused by wind and earthquakes. Specific minimum seismic safety and structural design requirements are set forth in Chapter 16 of the CBC. The CBC requires a site-specific geotechnical study to address seismic issues and identifies seismic factors that must be considered in structural design.

California Occupational Safety and Health Administration Regulations

Excavation and trenching are among the most hazardous construction operations. In California, the Cal/OSHA has responsibility for implementing state standards that have been determined to be "as effective as" federal rules relevant to worker safety, including slope protection during construction excavations. Cal/OSHA's requirements are more restrictive and protective than federal OSHA standards.

Local

March JPA General Plan Safety Element

The Safety/Risk Management Element of the March JPA General Plan identifies and establishes goals and policies related to strong seismic shaking and seismic related ground failure including liquefaction that will be applied to the proposed Project. The following goals and policies form the March JPA General Plan apply to the proposed Project. Consistency with these goals and policies is discussed in Section 4.9, Land Use and Planning.

Goal 1: Minimize injury and loss of life, property damage, and other impacts caused by seismic shaking, fault rupture, ground failure, and landslides.

Policy 1.1: Require geological and geotechnical investigations in areas of potential seismic or geologic hazards as part of the environmental development review process. Require mitigation of seismic of geologic hazards to the satisfaction of the responsibility.

Policy 1.2: Ensure all grading plans comply with the Uniform Building Code (UBC) and California Building Code including, if necessary, requiring preliminary investigations of development sites by a State-registered geotechnical engineers and certified engineering geologists.

Policy 1.3: If necessary, require liquefaction assessment studies in any area identified as having moderate to high liquefaction susceptibility.

4.5.3 Thresholds of Significance

March JPA uses the California Environmental Quality Act Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the Initial Study prepared for the Project (Appendix A) and the newly adopted California Environmental Quality Act Guidelines Appendix G (December 2018), the proposed Project could have a significant impact on geology and soils if the proposed Project would:

- **GEO-1**: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking and/or liquefaction.

- **GEO-2**: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.
- **GEO-3**: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.
- **GEO-4**: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

4.5.4 Impacts Analysis

Threshold GEO-1. Would the Project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking and/or liquefaction?

The Project site is located between two major fault zones: the Elsinore-Whittier fault, approximately 13 miles to the southeast, and the San Jacinto fault, approximately 7 miles to the northeast. Along with the San Andreas fault, these faults are the primary seismic sources in the area. Similar to most of Southern California, strong ground shaking can be expected at the site during moderate to severe earthquakes. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (i.e., soil type) characteristics. Construction of the proposed Cactus Channel improvements would include trenching. As discussed in the Geotechnical Report (Appendix I2), excavation shall be performed in accordance with the Project plans, "Standard Specifications for Public Works Construction" (Public Works Standard Inc. 2018), applicable Riverside County Flood Control and Water Conservation District requirements, applicable OSHA requirements, and the recommendations included in the Geotechnical Explorations (Appendices I1 and I2). Implementation or the recommendations within Appendix I1 and Appendix I2 are ensured through MM-GEO-1. As included as a recommendation in Appendix I2, the contractor shall be consulted for the proper excavation method, equipment, and production rate based on the findings of Appendix I2. OSHA requires that all excavations in which employees could potentially be exposed to cave-ins be protected by sloping or benching the sides of the excavation, supporting the sides of the excavation, or placing a shield between the side of the excavation and the work area. Other earthwork recommendations are included in the Geotechnical Report that would reduce potential risk from earthwork activities during construction.

Based on Riverside County Geologic Hazards maps, the K4 Parcel and the Cactus Channel are located in a zone of high liquefaction potential. However, liquefaction-induced ground settlement is not expected to be a significant hazard at the site due to the absence of near-surface saturated sand layers and underlying dense older alluvium (Appendix I1).

The proposed Project would be designed to current CBC seismic design standards to anticipate the effects associated with direct or indirect effects of potential seismic ground shaking and liquefaction. As part of its plan check process, the March JPA reviews project plans to ensure compliance with the existing and regularly amended seismic design provisions of the CBC or UBC, whichever is more restrictive. The March JPA's building plan check process would review the Project with consideration of the following (March JPA 1999a):

- Symmetrical, concrete, and steel-framed buildings are particularly earthquake resistant forms of non-residential construction and shall be encouraged.
- Irregularly shaped buildings are more difficult to design to withstand strong ground motions, and are therefore, more susceptible to damage during an earthquake. Irregularly shaped buildings shall be discouraged.
- Buildings with adverse discontinuities in strength between major structural elements are susceptible to earthquake damage and shall be discouraged.
- Nonstructural elements must not block exit routes and constrain rescue operations if damaged or overturned during a tremor.
- Non-residential, precast tilt-up construction must have adequate diaphragms (horizontal bracing system that transmits horizontal forces to vertical resisting components) and adequate tie-ins or connections between structural components to prevent roof collapse.
- Stairways and elevators shall be adequately strengthened, and nonstructural components such as emergency generators, computers, and cabinets shall be anchored.

March JPA-designated building inspectors would review proposed Project plans to ensure compliance with the existing and regularly amended seismic design provisions of the CBC, in order to reduce potential impacts from seismic ground shaking, including liquefaction. In addition, the Project would be constructed in compliance with recommendations of the Project-specific geotechnical investigations as required by **MM-GEO-1**, included within Appendix I2 of this EIR, thus minimizing exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking and/or liquefaction. As a result, with implementation of **MM-GEO-1**, impacts would be **less than significant**.

Threshold GEO-2. Would the Project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Based on Project-specific geotechnical investigations (Appendix I1), the potential for liquefaction and lateral spreading is low. Regarding landslide potential, landslides and rock falls occur most often on

steep or compromised slopes. Factors controlling the stability of slopes include (1) slope height and steepness, (2) engineering characteristics of the earth materials comprising the slope, and (3) intensity of ground shaking (County of Riverside 2016). Considering the site is generally level without significant slopes, and the site is underlain by recent sediments/young alluvium and dense, older alluvium, the site is not considered susceptible to static slope instability or seismically induced landslides. Laboratory testing indicates that on-site soils (older alluvium) are expected to possess a slight collapse potential (<1%). However, based on the remedial grading recommendations to remove and compact the near surface soils, this geologic hazard on the site is considered very low. Based on a review of a United States Geological Survey subsidence map, the Project site is not located in an area subject to subsidence.

All structures associated with the proposed Project would be designed to the CBC standards to anticipate impacts associated with ground failure, including soil collapse. March JPA-designated building inspectors would review proposed Project plans to ensure compliance with the existing and regularly amended provisions of the CBC, in order to reduce potential impacts from ground failure. In addition, the Project would be constructed in compliance with recommendations of the Project-specific geotechnical investigations, included as Appendix I2, as required by MM-GEO-1. Specifically, recommendations from the Geotechnical Report related to reducing the potential risks associated with landslide, lateral spreading, subsidence, liquefaction, and collapse within the geotechnical explorations include recommendations 4.2.1, 4.2.2, 4.2.5, and 4.3.2 for the proposed warehouse building on the K4 Parcel and recommendations 3.2.2 and 3.4.1 for the proposed Cactus Channel improvements (Appendix I2). As such, with implementation of **MM-GEO-1**, impacts would be **less than significant**.

Threshold GEO-3. Would the Project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Soil test results indicated that on-site soils generally possess a low expansion potential of (EI<51). Based on these results, the on-site soils are not anticipated to have a variable expansion potential. Nonetheless, to reduce potential impacts associated with expansive soils, mitigation measure **MM-GEO-1**, which requires compliance with the recommendations included within the geotechnical investigations prepared for the proposed Project, would be implemented. With implementation of **MM-GEO-1**, soil expansion related impacts would be **less than significant**.

Threshold GEO-4. Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

As stated in Section 4.5.1, Existing Conditions, no evidence of any paleontological resources was observed on the ground surface throughout the Project area (Appendix I3). The surface geology at the

Project location consists of exposures of locally formed Pleistocene alluvium. While not indicated within the geotechnical borings for the Project, Holocene alluvium (if present within the Project area) has a low potential for containing nonrenewable paleontological resources, but these surface sediments rest atop older, Pleistocene-age sediments that have a high potential for such resources (Appendix I3). The results of the records searches, literature research, and field survey demonstrate that the proposed Projects' potential to impact paleontological resources appears to be low in the surface soils but high in the undisturbed subsurface deposits of older Quaternary age. However, **MM-GEO-2**, would further prevent potential impacts. As such, with implementation of **MM-GEO-2**, impacts to nonrenewable paleontological would be less than significant.

4.5.5 Mitigation Measures

To ensure that the Project is designed and constructed in a manner that reduces the potential for impacts associated with geology and soils, the following mitigation measure is required:

MM-GEO-1 **Geotechnical Exploration Recommendations.** The recommendations included within both the Geotechnical Exploration for the Proposed Industrial Warehouse Site K-4 and Geotechnical Addendum Report for the K4 Moreno Valley Storm Drain, prepared by Leighton Consulting Inc. shall be implemented throughout Project design and construction (Leighton Consulting Inc. 2018a, 2018b). Prior to the issuance of building permits, the March Joint Powers Authority (JPA)-designated plan reviewer shall ensure that design recommendations are incorporated into the K4 Warehouse and Cactus Channel improvements designs.

MM-GEO-2 **Paleontological Resources.** In accordance with the provisions of the California Environmental Quality Act and the proposed guidelines of SVP (2010) and the Paleontological Resources Assessment Report prepared by CRM TECH, the proposed Project shall implement the following actions:

- Prior to the commencement of any grading activity, the applicant shall retain a qualified paleontologist to ensure the implementation of a paleontological monitoring program. The qualified paleontologist shall obtain a repository agreement from an accredited paleontological repository such as the WSC prior to the initiation of ground disturbing activities associated with the Project. The Society of Vertebrate Paleontology (SVP 2010) defines a qualified paleontologist as having:

  "1. A graduate degree in paleontology or geology, and/or a publication record in peer reviewed journals; and demonstrated competence in field techniques, preparation, identification, curation, and reporting in the state

or geologic province in which the project occurs. An advanced degree is less important than demonstrated competence and regional experience.

2. At least two full years professional experience as assistant to a Project Paleontologist with administration and project management experience; supported by a list of projects and referral contacts.
3. Proficiency in recognizing fossils in the field and determining significance.
4. Expertise in local geology, stratigraphy, and biostratigraphy.
5. Experience collecting vertebrate fossils in the field."

- The qualified paleontologist should attend any preconstruction meetings; present a worker environmental training to construction personnel outlining pertinent laws protecting paleontological resources, typical fossils recovered from the geological units onsite, and the steps to take if paleontological resources are discovered during project implementation; and manage the paleontological monitor(s) if he or she is not doing the monitoring. A paleontological monitor should be on-site during all excavations below the depth of previously disturbed sediments. Specifically, all earth-moving operations above the depth of three feet shall be monitored periodically to identify the sediments being impacted, and any earth-moving operations reaching beyond the depth of three feet will require continuous monitoring for potential paleontological remains. The SVP (2010) defines a qualified paleontological monitor as having:

"1. BS or BA degree in geology or paleontology and one year experience monitoring in the state or geologic province of the specific project. An associate degree and/or demonstrated experience showing ability to recognize fossils in a biostratigraphic context and recover vertebrate fossils in the field may be substituted for a degree. An undergraduate degree in geology or paleontology is preferable, but is less important than documented experience performing paleontological monitoring, or
2. AS or AA in geology, paleontology, or biology and demonstrated two years experience collecting and salvaging fossil materials in the state or geologic province of the specific project, or
3. Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and two years of monitoring experience in the state or geologic province of the specific project.
4. Monitors must demonstrate proficiency in recognizing various types of fossils, in collection methods, and in other paleontological field techniques."

- The monitor shall be prepared to quickly salvage fossils, if they are unearthed, to avoid construction delays, but must have the power to temporarily halt or divert construction equipment to allow for removal of abundant or large specimens. In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor will temporarily halt and/or divert grading activity to allow evaluation and potential recovery of paleontological resources by the qualified paleontologist. The area of discovery will be roped off with a 50-foot radius buffer. Once documentation and collection of the find is completed, the monitor will remove the rope and allow grading to recommence in the area of the find.
- If appropriate sedimentological indicators, as outlined in the SVP (2010) guidelines, are observed, sediment samples shall be collected and processed to recover small fossil remains following SVP (2010) guidelines for collection and processing of sediment samples. The amount of sediment collected and processsed shall be consistent with SVP (2010) or determined by the qualified paleontologist.
- Recovered specimens shall be identified to the lowest taxonomic and curated at a repository with permanent retrievable storage that allows for further research in the future, such as the WSC.
- If during the paleontological monitoring program, half the Project excavations have occurred with no fossil recovery, monitoring can be reduced or terminated, as determined by the qualified paleontologist.
- A report of findings, including an itemized inventory of recovered specimens and a discussion of their significance when appropriate, shall be prepared upon completion of the research procedures outlined above. The report should summarize the monitoring program and include geological observations and any paleontological resources recovered during paleontological monitoring for the proposed project. The approval of the report and the inventory by the March Joint Powers Authority shall signify completion of the mitigation program.

4.5.6 Level of Significance After Mitigation

With implementation of **MM-GEO-1** and **MM-GEO-2**, impacts would be less than significant.

INTENTIONALLY LEFT BLANK

4.6 GREENHOUSE GAS EMISSIONS

This section analyzes the potential impacts associated with the generation of greenhouse gas (GHG) emissions resulting from construction and operation of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project). The focus of the following analysis per the Initial Study and Notice of Preparation (Appendix A) is related to the direct or indirect impacts of the generation of GHG emissions and consistency with an applicable plan, policy, or regulation adopted for the purpose of reducing GHGs. This analysis is based on emission calculations and California Emissions Estimator Model (CalEEMod) outputs presented in the *Greenhouse Gas Technical Report* (Appendix J).

As mentioned in Chapter 2, Project Description, of this Environmental Impact Report (EIR), the Project includes the development of the five parcels on approximately 35.4-acre site ("K4 Parcel") with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. The maximum exterior building height would be 46 feet at the parapet. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the K4 Parcel via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the K4 Parcel. Once constructed, the e-commerce/fulfillment center use occupying the K4 Parcel could potentially be used up to 7 days per week and 24 hours per day. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Drainage Channel (Cactus Channel) drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. This portion of the Project is being proposed by Riverside County Flood Control and Water Conservation District as part of the District's Master Plan, which would convert the existing Cactus Channel drainage ditch into a box culvert, which would either be constructed contemporaneously with the Project or built separately depending on permitting and timing.

4.6.1 Existing Conditions

4.6.1.1 Greenhouse Effect and Greenhouse Gases

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind, lasting for an extended period (decades or longer). Gases that trap heat in the atmosphere are often called GHGs. The greenhouse effect traps heat in the troposphere through a threefold process: short-wave radiation emitted by the Sun is absorbed by the Earth; the Earth emits a portion of this energy in the form of long-wave radiation; and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and back toward the Earth. This

trapping of the long-wave (thermal) radiation emitted back toward the Earth is the underlying process of the greenhouse effect.

Principal GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), ozone, and water vapor. Some GHGs, such as CO_2, CH_4, and N_2O, can occur naturally and are emitted into the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Emissions of CO_2 are largely byproducts of fossil-fuel combustion, whereas CH_4 results mostly from off-gassing associated with agricultural practices and landfills. Human-caused GHGs, which are produced by certain industrial products and processes, have a much greater heat-absorption potential than CO_2. They include fluorinated gases, such as hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and nitrogen trifluoride (NF_3) (CAT 2006).

The greenhouse effect is a natural process that contributes to regulating the Earth's temperature. Without it, the average temperature of the Earth would be about 0°F (−18°C) instead of its current 57°F (14°C). Global climate change concerns are focused on whether human activities are leading to an enhancement of the greenhouse effect.

The effect each GHG has on climate change is measured as a combination of the mass of its emissions and the potential of the gas or aerosol to trap heat in the atmosphere, known as its global warming potential (GWP). The GWP varies between GHGs; for example, CO_2 is the reference GHG and has a GWP of 1. CH_4 and N_2O are substantially more potent than CO_2, with GWPs of 25 and 298, respectively.[1] Total GHG emissions are expressed as a function of how much warming would be caused by the same mass of CO_2. Thus, GHG gas emissions are typically measured in terms of tons or metric tons (MT) of CO_2 equivalent (CO_2e).

4.6.1.2 Contributions to Greenhouse Gas Emissions

Per the U.S. Environmental Protection Agency's (EPA's) Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2016, total United States GHG emissions were approximately 6,511 million metric tons (MMT) of CO_2e in 2016 (EPA 2018). The primary GHG emitted by human activities in the United States was CO_2, which represented approximately 81% of total GHG emissions (5,313 MMT CO_2e). The largest source of CO_2, and of overall GHG emissions, was fossil-fuel combustion, which accounted for approximately 94% of CO_2 emissions in 2016 (4,966 MMT CO_2e). Relative to 1990, gross United States GHG emissions in 2016 are higher by 5%; down from a high of 16% above 1990 levels in 2007. GHG emissions decreased from 2015 to 2016 by 2% (83 MMT CO_2e), and overall, net emissions in 2016 were 12% below 2005 levels (EPA 2018).

[1] In the Scoping Plan Update published by CARB in 2014, the GWPs for CH4 and N2O were updated from 21 to 25 and from 310 to 298, respectively. This analysis relies upon these updated GWPs.

According to California's 2000–2016 GHG emissions inventory (2018 edition), California emitted 429 MMT CO_2e in 2016, including emissions resulting from out-of-state electrical generation (CARB 2017a). The sources of GHG emissions in California include transportation, industry, electric power production from both in-state and out-of-state sources, residential and commercial activities, agriculture, high GWP substances, and recycling and waste. The California GHG emission source categories and their relative contributions in 2016 are presented in Table 4.6-1.

Table 4.6-1
Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total*
Transportation	176.1	41%
Industrial	98.8	23%
Electricity (in state)	42.9	10%
Electricity (imports)	25.8	6%
Agriculture	34.4	8%
Residential	30.1	7%
Commercial	21.5	5%
Total	**429.4**	**100%**

Source: CARB 2017a.
Notes: MMT CO_2e = million metric tons of carbon dioxide equivalent.
* Column may not add due to rounding.

4.6.1.3 Potential Effects to the Environment and Human Health Due to Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The 2014 *Intergovernmental Panel on Climate Change Synthesis Report* indicated that warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. Signs that global climate change has occurred include warming of the atmosphere and ocean, diminished amounts of snow and ice, and rising sea levels (IPCC 2014).

In California, climate change impacts have the potential to affect sea level rise, agriculture, snowpack and water supply, forestry, wildfire, public health, and electricity demand and supply (CCCC 2006). The primary effect of global climate change has been a 0.2°C rise in average global tropospheric temperature per decade, determined from meteorological measurements worldwide between 1990 and 2005. Scientific modeling predicts that continued emissions of GHGs at or above current rates could induce more extreme climate changes during the twenty-first century than were observed during the twentieth century.

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The average temperatures in California have increased leading to more extreme hot days and fewer cold nights. Shifts in the water cycle have been observed with less winter precipitation falling as snow and both snowmelt and rainwater running off earlier in the year. Sea levels have risen. Wildland fires are becoming more frequent and intense due to dry seasons that start earlier and end later (CAT 2010a).

Observed changes over the last several decades across the western United States reveal clear signals of climate change. Statewide average temperatures increased by about 1.7°F from 1895 to 2011 and warming in the Sierra Nevada area has been the greatest (CCCC 2012). By 2050, California is projected to warm by approximately 2.7°F above 2000 averages, a threefold increase in the rate of warming over the last century. By 2100, average temperatures could increase by 4.1°F to 8.6°F, depending on emissions levels. Springtime warming—a critical influence on snowmelt—will be particularly pronounced. Summer temperatures would rise more than winter temperatures, and the increases would be greater in inland California, compared to the coast. Heat waves will be more frequent, hotter, and longer. There would be fewer extremely cold nights (CCCC 2012). A decline of Sierra snowpack, which accounts for approximately half of the surface water storage in California, by 30% to as much as 90% is predicted over the next 100 years (CAT 2006).

Model projections for precipitation over California continue to show the Mediterranean pattern of wet winters and dry summers with seasonal, year-to-year, and decade-to-decade variability. For the first time, however, several of the improved climate models shift toward drier conditions by the mid-to-late 21st century in Central and, most notably, Southern California. By late-century, all projections show drying, and half of them suggest 30-year average precipitation would decline by more than 10% below the historical average (CCCC 2012).

Wildfire risk in California will increase as a result of climate change. Earlier snowmelt, higher temperatures and longer dry periods over a longer fire season would directly increase wildfire risk. Indirectly, wildfire risk will also be influenced by potential climate-related changes in vegetation and ignition potential from lightning. However, human activities will continue to be the biggest factor in ignition risk. It is estimated that the long-term increase in fire occurrence associated with a higher emissions scenario is substantial, with increases in the number of large fires statewide ranging from 58% to 128% above historical levels by 2085. Under the same emissions scenario, estimated burned area will increase by 57% to 169%, depending on location (CCCC 2012).

Reduction in the suitability of agricultural lands for traditional crop types may occur. However, adaptation could allow farmers and ranchers to minimize potential negative effects on agricultural outcomes through adjusting timing of plantings or harvesting and changing crop types. Public health-related effects of increased temperatures and prolonged temperature extremes, including heat stroke,

heat exhaustion, and exacerbation of existing medical conditions, could be particular problems for the elderly, infants, and those who lack access to air conditioning or cooled spaces (CNRA 2009a).

4.6.2 Relevant Plans, Policies, and Ordinances

International Treaties and Other Developments

The Kyoto Protocol is an international agreement linked to the United Nations Framework Convention on Climate Change. It was adopted in Kyoto, Japan, on December 11, 1997, and entered into force on February 16, 2005. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing GHG emissions. The targets amount to an average of 5% reduction against 1990 levels over the 5-year period 2008–2012. The major distinction between the Protocol and the Convention is that while the Convention encouraged industrialized countries to stabilize GHG emissions, the Protocol commits them to do so. Recognizing that developed countries are principally responsible for the current high levels of GHG emissions in the atmosphere as a result of more than 150 years of industrial activity, the Protocol places a heavier burden on developed nations under the principle of "common but differentiated responsibilities" (United Nations 1998).

Negotiations after Kyoto have continued in an attempt to address the period after the first "commitment period" of the Kyoto Protocol, concluded at the end of 2012. In Durban, South Africa in 2011, parties to the protocol agreed in principle to negotiate a new comprehensive and legally binding climate agreement by 2015 and to enter it into force for all parties starting from 2020. However, significant divisions remain in determining the parameters of any such new protocol, including its enforcement mechanisms and the degree to which developing economies will begin to be subject to binding emissions targets.

During the Paris Climate Conference (21st Conference of the Parties or COP) on December 12, 2015, parties to the United Nations Framework Convention on Climate Change reached "a landmark agreement to combat climate change and to accelerate and intensify the actions and investments needed for a sustainable low carbon future." The Paris Agreement aims to limit global warming to "well below 2 degrees Celsius above pre-industrial levels" (United Nations 2015). On August 4, 2017 President Trump's administration delivered an official notice for the United States of America to withdraw from the Paris Agreement (United Nations 2017a). Under Article 28 of the Agreement, the United States of America is required to stay in the pact until at least 2019 (United Nations 2017b).

Federal

Massachusetts v. U.S. Environmental Protection Agency

On April 2, 2007, in *Massachusetts v. U.S. Environmental Protection Agency*, the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In making these decisions, the EPA administrator is required to follow the language of Section 202(a) of the Clean Air Act. On December 7, 2009, the administrator signed a final rule with two distinct findings regarding GHGs under Section 202(a) of the Clean Air Act:

- The elevated concentrations of GHGs—CO_2, CH_4, N_2O, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride—in the atmosphere threaten the public health and welfare of current and future generations. This is referred to as the "endangerment finding."
- The combined emissions of GHGs—CO_2, CH_4, N_2O, and hydrofluorocarbons—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is referred to as the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act.

It was expected that Congress would enact GHG legislation, primarily for a cap-and-trade system. However, proposals circulated in both the House of Representative and Senate were controversial and it may be some time before Congress adopts major climate change legislation. Under the Consolidated Appropriations Act of 2008 (HR 2764), Congress has established mandatory GHG reporting requirements for some emitters of GHGs. In addition, on September 22, 2009, the EPA issued the Final Mandatory Reporting of Greenhouse Gases Rule. The rule requires annual reporting to the EPA of GHG emissions from large sources and suppliers of GHGs, including facilities that emit 25,000 MT or more a year of GHGs.

Heavy-Duty Engines and Vehicles Fuel Efficiency Standards

In addition to the regulations applicable to cars and light-duty trucks, on August 9, 2011, the EPA and the National Highway Traffic Safety Administration (NHTSA) announced fuel economy and GHG standards for medium- and heavy-duty trucks, which applies to vehicles from model years 2014–2018 (EPA 2016a). EPA and NHTSA have adopted Phase 1 standards for CO_2 emissions and fuel consumption, respectively, tailored to each of three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to EPA, this program will reduce GHG emissions and fuel consumption for affected vehicles by 9% to 23%. In August 2016, EPA and NHTSA announced adoption of Phase 2 standards, affecting model years

2021–2027 for semi-trucks, large pickup trucks, vans and all types of sizes of buses and work trucks, and expected to reduce GHG emissions beyond the first phase by 16%–25%. The second round of regulation introduces an additional vehicle category, trailers. Commitments for trailers are voluntary from 2018–2021 and mandatory after 2021, and are projected to reduce GHG emissions up to 9%. The final rule was adopted on August 16, 2016.

In August 2018, the EPA and NHTSA released a notice of proposed rulemaking called Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks (SAFE Vehicles Rule). This rule would modify the existing Corporate Average Fuel Economy standards and tailpipe CO_2 emissions standards for passenger cars and light trucks and establish new standards covering model years 2021 through 2026. SAFE standards are expected to uphold model year 2020 standards through 2026 (NHTSA 2018).

Energy Independence and Security Act

On December 19, 2007, President George W. Bush signed the Energy Independence and Security Act of 2007. Among other key measures, the act would do the following to aid in the reduction of national GHG emissions:

1. Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel by 2022.
2. Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
3. Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

EPA and National Highway Traffic Safety Administration Joint Final Rule for Vehicle Standards

The EPA and NHTSA announced a joint final rule to establish a national program consisting of new standards for light-duty vehicles model years 2012 through 2016 (April 2010) that is intended to reduce GHG emissions and improve fuel economy. The EPA approved the first-ever national GHG emissions standards under the Clean Air Act, and NHTSA approved Corporate Average Fuel Economy standards under the Energy Policy and Conservation Act (75 FR 25324–25728), which became effective on July 6, 2010 (75 FR 25324–25728).

American Recovery and Reinvestment Act

On February 17, 2009, President Obama signed the American Recovery and Reinvestment Act of 2009. The act was passed in response to the economic crisis of the late 2000s, with the primary purpose to maintain existing jobs and create new jobs. Among the secondary objectives of the American Recovery and Reinvestment Act was investment in "green" energy programs, including funding the following through grants, loans, or other funding; private companies developing renewable energy technologies; local and state governments implementing energy efficiency and clean energy programs; research in renewable energy, biofuels, and carbon capture; and development of high efficiency or electric vehicles (EPA 2016a).

Multi-State

The Western Regional Climate Action Initiative (WCI)

The Western Regional Climate Action Initiative (WCI) is a partnership among seven states including California and four Canadian provinces to implement a regional, economy-wide cap-and-trade system to reduce global warming pollution. The WCI will cap GHG emissions from the region's electricity, industrial, and transportation sectors with the goal to reduce the heat trapping emissions that cause global warming to 15% below 2005 levels by 2020 When the WCI adopted this goal in 2007, it estimated this would require 2007 levels to be reduced worldwide between 50% and 85% by 2050. California is working closely with the other states and provinces to design a regional GHG reduction program that includes a cap-and-trade approach. The California Air Resources Board's (CARB's) planned Cap-and-Trade Program is also intended to link California and the other member states and provinces. The cap-and-trade regulation, which is a key element of California's climate plan, took effect in January 2012 and compliance obligation began in January 2013. The cap-and-trade program sets a statewide limit on sources responsible for 85% of California's GHG emissions and establishes a price signal needed to drive long-term investment in cleaner fuels and more efficient use of energy. As of January 1, 2014, California's Cap-and-Trade Program is linked to Quebec's pursuant to the Agreement Between the CARB and the Gouvernement du Québec Concerning the Harmonization and Integration of Cap-and-Trade Programs Reducing Greenhouse Gas Emissions, in accordance with the direction in CARB Board Resolution 13-7 (CARB 2013). As of January 1, 2018, California's Cap-and-Trade Program along with Québec's Program linked with Ontario's Cap-and-Trade Program (Ontario Program). However, on July 3, 2018 the Ontario government revoked its cap-and-trade regulation. With Ontario's withdrawal from the linked program, California and Québec will work together to ensure environmental integrity and stringency of the Cap-and-Trade program/market is sustained (CARB 2018). The program is designed to provide covered entities the flexibility to seek out and implement the lowest-cost options to reduce emissions. The first phase of the cap-and-trade regulation included electricity generated in and imported into California, large combustion sources

(i.e., generally those emitting more than 25,000 MT CO_2e per year), and certain industrial sectors. The second phase added providers of transportation fuels and other combustion fuels (e.g., natural gas, propane) to the cap-and-trade program. The regulation requires that emissions generated by these facilities and combustion of fuels be reduced over time under a declining "cap." Appendix F of the CAP includes additional detail on the cap-and-trade program.

Pacific Coast Action Plan on Climate and Energy

On October 28, 2013, the Governors of California, Oregon, and Washington and the Premier of British Columbia signed a clean energy pact, known as the Pacific Coast Action Plan on Climate and Energy (Pacific Coast Action Plan). Although the Action Plan does not impose legally enforceable obligations and lacks a specific schedule for implementation, the pact sets out a number of goals and aspirational measures. The Action Plan calls upon each of the parties to undertake a number of measures to address the use of carbon-based fuels in the transportation sector, including the adoption or maintenance of low-carbon fuel standards, the development of targets and action plans in order to encourage public and private investment in low-carbon commercial fleets that use alternative fields, and the expansion of the sale of zero-emissions vehicles to a goal of 10% of new vehicle purchases by 2016.

State

California Code of Regulations, Title 20

Title 20 Public Utilities and Energy, of the California Code of Regulations, was most recently updated in 2017. Title 20 provides regulations to supplement the Warren-Alquist State Energy Resources Conservation and Development Act, including energy conservation, environmental protection, solar energy policies, appliance energy efficiency standards, and other energy and development standards and regulations.

California Code of Regulations, Title 24

Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. While not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically establishes energy efficiency standards for residential and non-residential buildings constructed in the State of California to reduce energy demand and consumption. The Title 24, Part 6 standards are updated every three years. The most recent amendments to Title 24, Part 6, referred to as the 2016 standards, will become effective on January 1, 2017.

Title 24 also includes Part 11, known as California's Green Building Standards. California's Green Building Standards, which initially took effect in January 2011, were updated effective January 1, 2014, and instituted mandatory minimum environmental performance standards for all ground-up,

new construction of commercial, low-rise residential, and state-owned buildings, as well as schools and hospitals. The standards were further revised with the 2016 Building Energy Efficiency Standards. For non-residential buildings, the most substantial efficiency improvement is alignment with the ASHRAE 90.1 2013 national standards. The non-residential standards include new efficiency requirements for elevators, escalators, and moving walkways and direct digital controls and requirement revisions for building envelope, lighting, and mechanical and electrical systems. The California Energy Commission's (CEC's) 2016 Building Energy Efficiency Standards (2016 Building Standards), which become on effective January 1, 2017, are the most current version of these standards.

Assembly Bill 1493

In response to the transportation sector accounting for more than half of California's CO_2 emissions, Assembly Bill (AB) 1493 (Pavley) was enacted on July 22, 2002. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles whose primary use is noncommercial personal transportation in the state. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. Compared to the 2009 fleet, the near-term (2009–2012) standards resulted in a reduction of about 22% in GHG emission rates from passenger vehicles and the mid-term (2013–2016) standards will result in a reduction of about 30% (CARB 2017b).

Executive Order S-3-05

Executive Order S-3-05 (June 2005) established California's GHG emissions reduction targets. The executive order established the following goals: GHG emissions should be reduced to 2000 levels by 2010, GHG emissions should be reduced to 1990 levels by 2020, and GHG emissions should be reduced to 80% below 1990 levels by 2050. Under the executive order, the California EPA is directed to report biannually on progress made toward meeting the GHG targets and the impacts to California due to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry. The Climate Action Team was formed, which subsequently issued the 2006 Climate Action Team Report to Governor Schwarzenegger and the Legislature (CAT 2006).

The 2009 Climate Action Team Biennial Report (CAT 2010b) expands on the policy outlined in the 2006 assessment. The 2009 report identifies the need for additional research in several different aspects that affect climate change in order to support effective climate change strategies. Subsequently, the 2010 Climate Action Team Report to Governor Schwarzenegger and the California Legislature (CAT 2010a) reviews past climate action milestones including voluntary reporting programs, GHG standards for passenger vehicles, the Low Carbon Fuel Standard (LCFS), a statewide renewable energy standard, and the cap-and-trade program.

The extent to which GHG emissions from traffic at the Project will change in the future depends on the quantity (e.g., number of vehicles, average daily mileage) and quality (i.e., carbon content) of fuel that will be available and required to meet both regulatory standards and residents' needs. As discussed above, renewable power requirements, the LCFS, and vehicle emissions standards will all decrease GHG emissions per unit of energy delivered or per vehicle mile traveled. Future regulated fuel decarbonization will reduce the carbon emissions from the vehicular emissions for the proposed Project.

The CEC published "State Alternative Fuels Plan" (CEC 2007) in which it noted the existence of "challenging but plausible ways to meet 2050 [transportation] goals." The main finding from this analysis is that reducing today's average per capita driving miles by about 5% (or back to 1990 levels), in addition to the decarbonization strategies listed below, would achieve S-03-05 goals of 80% below 1990 levels. The approach described below is directly (CEC 2007) from the CEC report and similar to CARB's anticipated path (CARB 2008).

An 80% reduction in GHG emissions associated with personal transportation can be achieved even though population grows to 55 million, an increase of 50%. The following set of measures could be combined to produce this result:

- Lowering the energy needed for personal transportation by tripling the energy efficiency of on-road vehicles in 2050 with:
    - Conventional gas, diesel, and flexible fuel vehicles averaging more than 40 miles per gallon.
    - Hybrid gas, diesel, and flexible fuel vehicles averaging almost 60 miles per gallon.
    - All electric and plug-in hybrid electric vehicles averaging well over 100 miles per gallon (on a GHG equivalents basis) on the electricity cycle.
    - Fuel cell vehicles averaging over 80 miles per gallon (on a GHG equivalents basis).
- Moderating growth in per capita driving, reducing today's average per capita driving miles by about 5% or back to 1990 levels.
- Changing the energy sources for transportation fuels from the current 96% petroleum based to approximately:
    - 30% from gasoline and diesel from traditional petroleum sources or lower GHG emission fossil fuels such as natural gas.
    - 30% from transportation biofuels.
    - 40% from a mix of electricity and hydrogen.

- Producing transportation biofuels, electricity, and hydrogen from renewable or very low carbon-emitting technologies that result in, on average, at least 80% lower life cycle GHG emissions than conventional fuels.
- Encouraging more efficient land uses and greater use of mass transit, public transportation, and other means of moving goods and people.

Studies have shown that in order to meet the 2050 target, aggressive technologies in the transportation and energy sectors, such as electrification and maturation of technologies such as advanced batteries and more efficient biofuels will be required (LBL 2011).

Due to the wholesale shifts in energy technology required and more aggressive regulations needed both of which are not currently in place, analyzing a Project's impacts relative to the 2050 target are speculative for purposes of the California Environmental Quality Act (CEQA). As a result, this report does not analyze the Project's consistency with the 2050 target.

Assembly Bill 32

In furtherance of the goals established in Executive Order S-3-05, the legislature enacted AB 32 (Núñez and Pavley), the California Global Warming Solutions Act of 2006, which Governor Schwarzenegger signed in September 2006. The GHG emissions limit is equivalent to the 1990 levels, which are to be achieved by 2020.

CARB was assigned to carry out and develop the programs and requirements necessary to achieve the goals of AB 32. Under AB 32, CARB must adopt regulations requiring the reporting and verification of statewide GHG emissions. This program will be used to monitor and enforce compliance with the established standards. CARB is also required to adopt rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions. AB 32 allows CARB to adopt market-based compliance mechanisms to meet the specified requirements. Finally, CARB is ultimately responsible for monitoring compliance and enforcing any rule, regulation, order, emission limitation, emission reduction measure, or market-based compliance mechanism adopted.

The first action under AB 32 resulted in the adoption of a report listing early action GHG emissions reduction measures in June 2007.

In December 2008, CARB approved the *Climate Change Proposed Scoping Plan: A Framework for Change* (Scoping Plan) (CARB 2008) to achieve the goals of AB 32. An update to the Scoping Plan (First Scoping Plan Update) was adopted in May 2014 (CARB 2014). In November 2017, CARB published California's 2017 Climate Change Scoping Plan (Second Scoping Plan Update) (CARB 2017c). The 2017 Climate Change Scoping Plan was adopted by CARB on December 14, 2017.

The Second Scoping Plan Update outlines CARB's strategy for achieving the state's 2030 GHG target as established in Senate Bill (SB) 32, including continuation of the Cap-and-Trade Program through 2030, and incorporation of a Mobile Source Strategy that includes strategies targeted to increase zero emission vehicle fleet penetration and a more stringent target for the LCF by 2030. The Second Scoping Plan Update also incorporates approaches to cutting short-lived climate pollutants under the Short-Lived Climate Pollutant Reduction Strategy (a planning document that was adopted by CARB in March 2017) and acknowledges the need for reducing emissions in agriculture and highlights the work underway to ensure that California's natural and working lands increasingly sequester carbon.

With regard to project-level GHG emissions reduction actions and thresholds, the Second Scoping Plan Update states "[a]chieving net zero increases in GHG emissions, resulting in no contribution to GHG impacts, may not be feasible or appropriate for every project, however, and the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA."

Senate Bill 1368

In September 2006, Governor Schwarzenegger signed SB 1368, which requires the CEC to develop and adopt regulations for GHG emissions performance standards for the long-term procurement of electricity by local publicly owned utilities. These standards must be consistent with the standards adopted by the California Public Utilities Commission. This effort will help protect energy customers from financial risks associated with investments in carbon-intensive generation by allowing new capital investments in power plants whose GHG emissions are as low as or lower than new combined-cycle natural gas plants by requiring imported electricity to meet GHG performance standards in California and by requiring that the standards be developed and adopted in a public process.

Executive Order S-1-07

Issued on January 18, 2007, Executive Order S-1-07 sets a declining LCFS for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The target of the LCFS is to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020. The LCFS is anticipated to lead to the replacement of 20% of the fuel used in motor vehicles with alternative fuels by 2020.

Senate Bill 375

In August 2008, the legislature passed, and in September 2008, Governor Schwarzenegger signed SB 375 (Steinberg), which addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. By September 30, 2010, CARB was

required to assign regional GHG reduction targets for the automobile and light truck sector for 2020 and 2035. Regional metropolitan planning organizations will be responsible for preparing a Sustainable Communities Strategy (SCS) within the Regional Transportation Plan (RTP). The goal of the SCS is to establish a development plan for the region that, after considering transportation measures and policies, will achieve the GHG reduction targets. SB 375 provides incentives for streamlining CEQA requirements by substantially reducing the requirements for "transit priority projects," as specified in SB 375, and eliminating the analysis of the impacts of certain residential projects on global warming and the growth-inducing impacts of those projects when the projects are consistent with the SCS or Alternative Planning Strategy. In September 2010, CARB adopted the SB 375 targets for the regional metropolitan planning organizations.

On April 7, 2016, the Southern California Association of Governments (SCAG) adopted the 2016-2040 RTP/SCS which looks to build on the success of the 2012-2035 RTP/SCS. Targets for the SCAG region in the updated plan includes an 8% per capita reduction in GHG emissions from automobiles and light trucks by 2020, an 18% reduction by 2035, and a 21% reduction by 2040 compared with 2005 levels (SCAG 2016).

Supreme Court Ruling in Center for Biological Diversity. v. California Fish and Wildlife

In its 2015 decision, *Center for Biological Diversity v. Department of Fish and Wildlife*, S217763 (Newhall),[2] the California Supreme Court evaluated the California Department of Fish and Wildlife's analysis of potential impacts caused by GHG emissions contained in the EIR for the proposed land development called Newhall Ranch. In the EIR, the California Department of Fish and Wildlife analyzed GHG emissions under AB 32, using the business-as-usual comparison as its sole criterion of significance.

In Newhall, the California Supreme Court concluded that a finding of consistency with meeting statewide emission reduction goals is a legally permissible criterion of significance when analyzing potential impacts of GHG emissions under CEQA. However, the Court found that the EIR's conclusion that the project's emissions would be less than significant under that criterion was not supported by substantial evidence, and remanded back to the appellate court the narrow issue of whether substantial evidence supported the application of AB 32 statewide GHG reduction goal of 29% to new land use projects.

[2] The Newhall decision is available at https://caselaw.findlaw.com/ca-supreme-court/1719578.html (accessed November 2018).

The Court then identified "potential options" for lead agencies evaluating cumulative significance of a proposed land use development's GHG emissions in future CEQA documents:

1. Business-As-Usual Model: While the Court cautioned that the Scoping Plan may not be appropriate at the project-level, the business-as-usual model might be used to determine what level of reduction from business as usual a new land use development at the proposed location must contribute in order to comply with statewide goals pursuant to AB 32.
2. Compliance With Regulatory Programs Designed To Reduce Greenhouse Gas Emissions: The Court suggests that a lead agency could rely on a showing of compliance with regulatory programs designed to reduce GHG emissions. The Court clarifies that a significance analysis based on compliance with such statewide regulations only goes to impacts within the area governed by the regulations.
3. Local Climate Action Plan (CAP) Or Other "Geographically Specific Greenhouse Gas Emission Reduction Plans": The Court points out that these plans may provide a basis for the tiering or streamlining of project-level CEQA analysis, so long as the plan is "sufficiently detailed and adequately supported." Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
4. Regional Sustainable Community Strategy (SCS): The Court also articulates that a lead agency need not additionally analyze GHG emissions from cars and light trucks in CEQA documents for certain residential, mixed use and transit priority projects that are consistent with an applicable SCS adopted pursuant to SB 375.
5. Numerical GHG Significance Thresholds: Although noting that use of such thresholds are GHG significance thresholds, which are based on compliance with AB 32, and use a "service population" GHG ratio threshold for land use projects and a 10,000-ton annual GHG emission threshold for industrial projects. The Court remanded for further consideration the application of the 29% overall Scoping Plan metric, which is used by several Air Districts and, like the favorably-cited Bay Area Air Quality Management District metric, is based on AB 32.

Citing to Executive Order Nos. S-3-05 and B-30-15, the Court cautioned that those EIRs taking a goal-consistency approach to CEQA significance may in the future need to consider the project's effects on meeting emissions reduction targets beyond 2020.

Renewable Portfolio Standards (SB 1078, SB 107, SBX1-2, and SB 100)

As most recently amended by SB 350, California's Renewables Portfolio Standard Program requires retail sellers of electric services and local publicly-owned electric utilities to increase procurement from eligible renewable energy resources to 33% of total retail sales by 2020, 40% of total retail sales by 2024, 45% of total retail sales by 2027, and 50% of total retail sales by 2030. On September 10, 2018

the goals of this standard were revised to a 50% renewable resources target by December 21, 2026, and to a 60% target by December 31, 2030.

Senate Bill 350

Governor Jerry Brown signed SB 350 on October 7, 2015, which expands the Renewable Portfolio Standard by establishing a goal of 50% of the total electricity sold to retail customers in California per year by December 31, 2030. In addition, SB 350 includes the goal to double the energy efficiency savings in electricity and natural gas final end uses (such as heating, cooling, lighting, or class of energy uses upon which an energy efficiency program is focused) of retail customers through energy conservation and efficiency.

Executive Order B-30-15

On April 29, 2015, Governor Jerry Brown issued an executive order that identified an interim GHG reduction target in support of targets previously identified under S-3-05 and AB 32. Executive Order B-30-15 set an interim target goal of reducing GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050, as set forth in Executive Order S-3-05. To facilitate achievement of this goal, Executive Order B-30-15 calls for an update to CARB's Scoping Plan to express the 2030 target in terms of MMT CO_2e. The executive order also calls for state agencies to continue to develop and implement GHG emission reduction programs in support of the reduction targets.

Senate Bill 32 and Assembly Bill 197

Enacted by the Legislature in August 2016, SB 32 and AB 197 are companion bills that will extend GHG reduction targets and make changes to CARB membership; increase legislative oversight of CARB climate change activities; and expand dissemination of GHG, criteria air pollutant, and toxic air contaminant (TAC) emissions data to enhance transparency and accountability. SB 32 requires CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies consisting of at least three members of the Senate and three members of the Assembly in order to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to CARB as nonvoting members, requires CARB to make available and update at least annually via its website emissions of GHGs, criteria air pollutants, and TACs from reporting facilities, and requires CARB to identify specific information for GHG emissions reduction measures when updating the scoping plan.

Assembly Bill 1613 (Waste Heat and Carbon Emissions Reduction Act)

AB 1613 directed the CEC, the California Public Utilities Commission, and CARB to implement the Waste Heat and Carbon Emissions Reduction Act, which is designed to encourage development of new combined heat and power systems in California with a generating capacity of not more than 20 megawatts.

A January 2011 decision by an administrative law judge determined that the pilot program will not be established due to lack of customer interest and difficulties in instituting a program that meets California Department of Corporations requirements (CPUC 2011).

Assembly Bill 341

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source reduced, recycled, or composted by the year 2020, and annually thereafter (California Public Resources Code Section 41780.01(a)). In addition, AB 341 required the California Department of Resources Recycling and Recovery to develop strategies to achieve the state's policy goal (California Public Resources Code Section 41780.02).

Senate Bill X7-7(Water Conservation Act of 2009)

The Water Conservation Act of 2009 sets an overall goal of reducing per-capita urban water use by 20% by December 31, 2020. The state was required to make incremental progress toward this goal by reducing per-capita water use by at least 10% by December 31, 2015. Reduction in water consumption directly reduces the energy necessary and the associated emissions to convene, treat, and distribute the water; it also reduces emissions from wastewater treatment.

Executive Order B-55-18

On September 10, 2018, Governor Brown signed EO B-55-18, to achieve carbon neutrality by moving the state of California to 100% clean energy by 2045. This Executive Order also includes specific measures to reduce GHG emissions via clean transportation, energy efficient buildings, directing cap-and-trade funds to disadvantaged communities, and better management of state's forest land.

California Air Pollution Control Officers Association

The California Air Pollution Control Officers Association (CAPCOA) is the association of air pollution control officers representing all 35 air quality agencies throughout California. CAPCOA is not a regulatory body, but it has been an active organization in providing guidance in addressing the CEQA significance of GHG emissions and climate change as well as other air quality issues. The GHG analysis set forth in this EIR has been informed, in part, by the expertise and methodologies

described in the following documents published by CAPCOA: (1) *CEQA & Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act* (CAPCOA 2008) and (2) *Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emission Reductions from Greenhouse Gas Mitigation Measures* (CAPCOA 2010).

Regional

South Coast Air Quality Management District

CEQA Guidelines and Proposed GHG Thresholds. The South Coast Air Quality Management District **(**SCAQMD) is principally responsible for comprehensive air pollution control in the Basin, which includes Los Angeles, Orange, and the urbanized portions of Riverside and San Bernardino Counties, including the Project site. SCAQMD works directly with SCAG, County transportation commissions, and local governments and cooperates actively with all federal and state government agencies to regulate air quality.

In April 2008, SCAQMD convened a Working Group to develop GHG significance thresholds. On December 5, 2008, the SCAQMD Governing Board adopted its staff proposal for an interim CEQA GHG significance threshold for projects where the SCAQMD is the lead agency. As to all other projects, where the SCAQMD is not the lead agency, the Board has, to date, only adopted an interim threshold of 10,000 MT CO_2e per year for industrial stationary source projects (SCAQMD 2008a).

For all other projects, SCAQMD staff proposed a multiple tier analysis to determine the appropriate threshold to be used. The draft proposal suggests the following tiers: Tier 1 is any applicable CEQA exemptions, Tier 2 is consistency with a GHG reduction plan, Tier 3 is a screening value or bright line, Tier 4 is a performance based standard, and Tier 5 is GHG mitigation offsets (SCAQMD 2008a).

According to the presentation given at the September 28, 2010, Working Group meeting, SCAQMD staff reviewed the tiered significance threshold approach (SCAQMD 2010a). The proposed tiers are as follows:

- Tier 1: Determine if CEQA categorical exemptions are applicable. If not move to Tier 2;
- Tier 2: Consider whether or not the proposed project is consistent with a locally adopted GHG reduction plan (i.e., CAP) that has gone through public hearings and CEQA review, which has an approved inventory that includes monitoring, etc. If not move to Tier 3;
- Tier 3: For all land use types, if projects are less than 3,000 MT/year of CO_2e, the project is presumed to be less than significant for GHGs. If the project exceeds 3,000 MT CO_2e per year (MT CO_2e/yr); move to Tier 4. More specific screening thresholds were also provided, which include 1,400 MT CO_2e/yr for commercial projects and 3,500 MT CO_2e/yr

for residential projects. These thresholds were based on a review of the Office of Planning and Research database which included 711 CEQA projects using a 90% capture approach;

- Tier 4: The proposed performance standards include three options:
  1. Percent Emission Reduction Target (no further recommendation
  2. Early Implementation of Applicable AB 32 Scoping Plan Measures (incorporated into option 3)
  3. SCAQMD Efficiency Target

For option 3, there are targets for 2020 and 2035, using an approach similar to the Bay Area Air Quality Management District Thresholds. The proposed 2020 target is:

- 4.8 MT/year CO_2e per service population for project level threshold (land use employment only)
- 6.6 MT/year CO_2e per service population for plan level threshold

The proposed 2035 target is:

- 3.0 MT/year CO_2e per service population for project level threshold
- 4.1 MT/year CO_2e per service population for plan level threshold
- Incorporate Sustainable Communities and Climate Protection Act of 2008 or SB 375 regional targets.
- Tier 5: Off-site mitigation for life of project (30 years), if this threshold is to be used, GHG emissions must be mitigated to less than the Tier 3 screening significance threshold. The SCAQMD clarified that offsets should have a 30-year project life, should be real, quantifiable, verifiable, and surplus and will be considered in the following prioritized manner:
  - Project design feature/on-site reduction measures;
  - Off site within neighborhood;
  - Off site within district;
  - Off site within state;
  - Off site out of state; and
  - Substitution allowed via enforceable commitment (e.g., when an offset project ends prematurely).

If the Project cannot meet any of the Tiers, it is presumed to be significant for GHG emissions.

The Tier 4 percent emissions reduction target is based on a percent reduction target that is based on consistency with AB 32. This is because the Tier 4 percent emissions reduction target is based on the same numeric reductions calculated in the Scoping Plan to reach 1990 levels by 2020.

The Working Group has not convened since the fall of 2010. As of April 2017, the proposal has not been considered or approved for use by the SCAQMD Board. In the meantime, no GHG significance thresholds are approved for use in the Basin.

Criteria Pollutant Regulations. The SCAQMD administers a plethora of air quality regulations that control the emission of criteria pollutants and maintain or seek to achieve air quality standards for criteria pollutant and TACs set by the federal and state Clean Air Acts. The goal of reducing criteria and TAC pollutants can sometimes have the co-benefit of reducing GHG emissions, for example through zero emission technologies. However, some methods of reducing criteria and TAC pollutants may in fact increase the amount of GHG emissions because the technologies increase energy use. The SCAQMD is the regional agency who weighs and balances the sometimes competing interests and makes the policy decisions as to prioritizing air quality reductions.

Local

Riverside County General Plan and Climate Action Plan

The current Riverside County General Plan was adopted in October 2003 and includes a number of policies regarding the reduction of GHG impacts. An update to the County's General Plan was adopted in 2008. In addition to the 2008 General Plan Update, the County prepared a CAP, adopted in December 2015, which sets County-wide GHG emissions targets consistent with state reduction goals in AB 32. The CAP is not part of the General Plan per se; rather, it is a separate document that provides another implementation tool of the General Plan to guide development in the County. The CAP identifies actions necessary to reduce GHGs across a variety of sectors, and includes:

- An analysis of GHG emissions and sources attributable to Riverside County.
- Estimates on how those emissions are expected to increase.
- Recommended policies and actions that can reduce GHG emissions to meet state, federal, and international targets.
- A timeline of implementation.
- A defined tracking and reporting mechanism that will measure progress toward the goals.

The CAP establishes that community-wide GHG emissions for the County in 2008 were approximately 7,012,938 MT CO_2e. In order for the County to meet the reduction goals of AB 32, they established a reduction target of 15% below 2008 levels by 2020. The County is expected to

reduce its GHG emissions to 5,534,113 MT CO_2e, which is below the 5,960,998 MT CO_2e level, thus meeting their reduction target after implementation of reduction measures.

The County released the CAP, General Plan Amendment No. 960 incorporating the CAP into the General Plan, and a Draft EIR analyzing the impact of adopting the CAP in February 2015 (County of Riverside 2015a). Public comments were received and responses prepared by the County. The Board of Supervisors formally adopted the CAP on December 8, 2015.

The CAP includes screening tables which provide guidance in measuring the reduction of GHG emissions attributable to certain design and construction measures incorporated into development projects. The CAP screening tables assign points for each option incorporated into a project as mitigation or a project design feature. Projects that garner at least 100 points will be consistent with the reduction quantities anticipated in the County's GHG Technical Report. As such, those projects that garner a total of 100 points or greater would not require quantification of project specific GHG emissions. Consistent with CEQA Guidelines, such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions.

March JPA General Plan

The Noise/Air Quality Element of the adopted March JPA General Plan (1999) includes goals and policies that will be applied to the Project related to GHG emissions. The following goals and policies from the March JPA General Plan apply to the Project. Consistency with these goals and policies are discussed in Section 4.9, Land Use and Planning.

Goal 3: Reduce air pollution through proper land use, transportation, and energy use planning.

Policy 3.4: Encourage ride share programs.

Goal 6: Reduce emissions associated with vehicle/engine use.

Policy 6.1: Reduce idling emissions by increasing traffic flow through synchronized traffic signals.

Policy 6.2: Work with Riverside Transit Agency (RTA) to develop a local transit system and facilitate connections of the local transit system with regional transit systems.

Policy 6.3: Encourage diversion of peak hour truck traffic, whenever feasible, to off-peak periods to reduce roadway congestion and associated emissions.

Policy 6.4: Work with Caltrans [California Department of Transportation] and traffic engineers to ensure that roadways and freeway on-ramps that are heavily utilized by trucks are designed to safely accommodate trucks.

Policy 6.5: Encourage trucks operating within March JPA Planning Area to maintain safety equipment and operate at safe speeds so as to reduce the potential for accidents which create congestion and related emissions.

Policy 6.6: Reduce vehicle emissions through improved parking design and management that provide for safe pedestrian access to and from various facilities.

Policy 6.8: Encourage the use of compressed natural gas, clean diesel and/or alternative fuels in engines.

Goal 7: Reduce emissions associated with energy consumption.

Policy 7.1: Support the use of energy-efficient equipment and design in the March JPA Planning Area for facilities and infrastructure.

Policy 7.2: Encourage incorporation of energy conservation features in development.

Policy 7.3: Support passive solar design in new construction.

Policy 7.4: Support recycling programs which reduce emissions associated with manufacturing and waste disposal.

Policy 7.5: Support drought-resistant vegetation in landscaping areas to reduce energy needed to pump water.

4.6.3 Thresholds of Significance

The Office of Planning and Research's Technical Advisory titled *CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review* (2008) states that "public agencies are encouraged but not required to adopt thresholds of significance for environmental impacts. Even in the absence of clearly defined thresholds for GHG emissions, the law requires that such emissions from CEQA projects must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to "a significant, cumulative climate change impact." Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice" (OPR 2008).

The CNRA adopted amendments to the CEQA Guidelines on December 30, 2009, which became effective on March 18, 2010. With respect to GHG emissions, the amended CEQA Guidelines state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines

note that an agency may identify emissions by either selecting a "model or methodology" to quantify the emissions or by relying on "qualitative analysis or other performance based standards" (14 CCR 15000 et seq.). Section 15064.4(b) provides that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment:

- The extent a project may increase or reduce GHG emissions as compared to the existing environmental setting.
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4(b)).

In addition, Section 15064.7(c) of the CEQA Guidelines specifies that "[w]hen adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence" (14 CCR 15064.7(c)). Similarly, the revisions to Appendix G, Environmental Checklist Form, which is often used as a basis for lead agencies' selection of significance thresholds, do not prescribe specific thresholds. Section 15064.4 (b) of the CEQA Guidelines specifies that "[a] lead agency should consider the following factors, among others, when assessing the significance of impacts from greenhouse gas emissions on the environment: ….(3) The extent to which the project complies with regulations or requirements adopted to implement a…local plan for the reduction or mitigation of greenhouse gases. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions." As discussed above, the County of Riverside's CAP is an applicable local plan developed specifically for the reduction of GHGs, adopted through a public review process.

March JPA's 2015 Local CEQA Guidelines Form J provides guidance for evaluating whether a development project may result in significant impacts. Based on the IS prepared for the Project (Appendix A) and March JPA's 2015 Local CEQA Guidelines Form J, the Project could have a significant impact on GHGs if the Project would:

- **GHG-1**: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
- **GHG-2**: Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Notably, global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. There are currently no established thresholds for assessing whether the GHG emissions of a project in the South Coast Air Basin, such as the proposed Project, would be considered a cumulatively considerable contribution to global climate change; however, all reasonable efforts should be made to minimize a project's contribution to global climate change.

While the Project would result in emissions of GHGs during construction and operation, , it is generally believed that an individual project is of insufficient magnitude by itself to influence climate change or result in a substantial contribution to the global GHG inventory since scientific uncertainty regarding the significance of a project's individual and cumulative effects on global climate change remains.

Thus, GHG impacts are recognized exclusively as cumulative impacts; there are no noncumulative GHG emission impacts from a climate change perspective (CAPCOA 2008). This approach is consistent with that recommended by the CNRA, which noted the impact of GHG emissions should be considered in the context of a cumulative impact rather than a project-level impact (CNRA 2009b). Similarly, the *Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB 97* (CNRA 2009b) confirm that an EIR or other environmental document must analyze the incremental contribution of a project to GHG levels and determine whether those emissions are cumulatively considerable.

Riverside County Climate Action Plan

The Riverside County CAP includes a series of implementation measures that may be used by new development proposals to demonstrate consistency with the CAP, and by extension, with AB 32 (County of Riverside 2015b). A Riverside County GHG Screening Table containing a menu of GHG reduction options which projects can implement is included as Appendix F to the CAP. If a project can obtain 100 points from the screening tables, the mitigated project will implement pertinent reduction measures to meet the CAP GHG reduction goals, and a "less than significant" finding can be made under CEQA (County of Riverside 2015b).

4.6.4 Approach and Methodology

Significance of GHG impacts included in this analysis is based on three different methodologies, with each approach a separate and independent ground for the significance conclusion:

1. Consistency with AB 32 was assessed through evaluating the Project's consistency and compliance with applicable statewide and local regulatory programs designed to reduce GHG emissions consistent with AB 32.

2. The County of Riverside CAP was developed using AB 32 so this analysis also assesses if the Project is consistent with the CAP as an AB 32 compliance pathway (County of Riverside 2015b), using the CAP screening tables.
3. The Project's consistency with SB 375 was evaluated based on the growth assumptions of SCAG 2016 RTP/SCS.

Threshold GHG-1 Analysis Methodology

The determination of whether the Project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment (Threshold GHG-1) is based on the following evaluations: (a) Project compliance with the CAP screening tables. The quantification of GHG emissions is presented for informational purposes only.

Project Compliance with CAP. A Riverside County GHG Screening Table containing a menu of GHG reduction options which projects can implement is included as Appendix F to the CAP. This screening table is required to be used if Project's exceed 3,000 MT CO_2e per year. Projects that meet or exceed a total of 100 points after incorporating a variety of GHG reduction measures (as mitigation or project features) would be determined to have a less than significant impact for GHG emissions. This assessment is included in Section 4.6.5, Impacts Analysis, in the analysis and discussion for Threshold GHG-1.

- **Construction:** Construction emissions were based on the Project construction assumptions described in Section 4.2.4, Approach and Methodology, in Section 4.2, Air Quality, and Appendix F of the CAP.
- **Area Sources:** Includes emissions from operation of landscape maintenance equipment, based on default CalEEMod assumptions for emissions estimation, such as OFFROAD2011 equipment emission factors and usage hours.
- **Energy Use:** Emissions reductions associated with implementing 33% Renewable Portfolio Standard were quantified for Project 2020. Energy mitigation also includes incorporation of Energy Star lighting, solar PV, and on- and off-site EV charging stations.
- **Water Supply, Treatment, and Distribution (Title 24):** The Project assumes water usage with the 20% reduction in indoor and outdoor water usage due to the California Green Building Code requirements and that the GHG emissions related to the water and wastewater conveyance are based on utility emission factors consistent 33% Renewable Portfolio Standard.
- **Mobile Sources:** Emissions associated with daily traffic were estimated for the Project scenario using trip-generation rates and vehicle fleet mixes from the Traffic Impact Analysis (TIA) report (Appendix R). According to the TIA report, the Project would

generate 5,873 average daily trips. Default CalEEMod trip lengths were used with the exception of commercial-nonwork (C-NW) for haul trucks, which was assumed to be 60 miles based on an anticipated haul truck usage similar to recent distribution centers in the region (Appendix J). For the fleet mix detailed in Appendix J, default CalEEMod assumptions were used for the unrefrigerated warehouse land use fleet mix was calculated based on the vehicle trip rates provided in Appendix R. The mobile source emissions analysis for the Project includes reductions from regulatory programs including LCFS and the Advanced Clean Cars program. EMFAC2017's default emission factors include benefits from ACC and CARB's HDV GHG Emissions Reduction Measure Regulation.

- **Vegetation Changes:** The current site is vacant and has little to no vegetation. The sequestration of CO_2 from planting trees on site was quantified and included.

Threshold GHG-2 Analysis Methodology

The determination of whether the Project would conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs (Threshold GHG-2) is based on the following evaluations: (a) consistency with AB 32 through evaluating the Project's consistency and compliance with applicable statewide and local regulatory programs designed to reduce GHG emissions consistent with AB 32, (b) the Project's consistency with SB 375, and (c) Project compliance with the CAP screening tables.

4.6.5 Impacts Analysis

Threshold GHG-1. Would the Project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction

As discussed in the GHG Technical Report (Appendix J), on-site construction of the K4 Parcel is anticipated to occur across five phases in 2019 and 2020. Construction for the Cactus Channel improvements would occur contemporaneously with the K4 Parcel or separately depending on permitting and timing, however it is conservatively assumed that construction associated with Cactus Channel would occur at the same time as the K4 Parcel construction in 2019 and 2020. The total emissions from construction are summarized in Table 4.6-2. Total GHG emissions from all proposed Project construction phases for off-road and on-road emissions are 458 and 1,656 MT CO_2e, respectively. Total GHG emissions from the construction activities are 2,114 MT CO_2e. When amortized over 30-year project lifetime, the construction GHG emissions are 70 MT CO_2e/year (Appendix J).

Table 4.6-2
Construction Greenhouse Gas Emissions

Construction Phase	MT CO_2e Emissions[a]		
	Equipment	*Vehicles*	*Total*
Project Site	289	1,373	1,661
Cactus Channel	170	283	453
Total	**458**	**1,656**	**2,114**
		30-year Amortized[b]	**70**

Notes: MT = metric tons; CO_2e = carbon dioxide equivalent.
See Appendix J for detailed results.
[a] Emissions estimated with California Emissions Estimator Model (CalEEMod) version 2016.3.2.
[b] One-time emissions from construction were amortized over a 30-year period.

Operations

Operational emissions are emissions that would occur after build-out of the Project. This analysis identifies operational emissions for source categories including direct emissions from area and mobile sources and indirect emissions from energy use, water/wastewater, and waste management. Vehicle miles traveled (VMT) is the unit used to measure Project emission estimates for mobile sources presented in the air quality and GHG inventories account for truck trips to and from the facility. Refer to Table 15 in the Greenhouse Gas Technical Report (Appendix J) for Project-related passenger car and truck VMT estimates.

There is no operational activity associated with the Cactus Channel, hence operational emissions are zero. As explained in Section 4.6.2, Relevant Plans, Policies, and Ordinances, the determination of whether the Project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment is also based on Project compliance with the County of Riverside CAP.

Project Compliance with CAP

As shown in Appendix J's Table C-1 Screening Table for GHG Implementation Measures for Commercial Development and Public Facilities, the Project's operational GHG emissions exceed 3,000 MT CO_2e per year and thus the screening tables apply. A project that would implement a total of 100 points worth of reduction measures in the Riverside County GHG Screening Table would assist in achieving attainment of the CAP's goals for the region as a whole and therefore would not conflict with the CAP. The completed Riverside County GHG Screening Table for the Project is included in Appendix J to this EIR. The Project's points are shown in Table 4.6-3, which shows that the Project would earn 656 points based on implementing the following GHG reduction measures:

- **Insulation:** Walls will have a minimum of R-13 insulation and the roof will have R-38 insulation for all office space associated with the Project, as required by 2016 Title 24. (0 points)

- **Windows:** All windows will have modestly enhanced window insulation. (0 points)
- **Cool Roofs:** Modest cool roof will be constructed (12 points).
- **Space Heating/Cooling Equipment:** Those areas that are cooled and heated will have HVAC equipment of 14 Seasonal Energy Efficiency Ratio or higher (7 points).
- **Water Heaters:** The water heaters installed will be of 0.92 energy factor or higher (19 points).
- **Daylighting:** All rooms will have some form of daylighting be it skylights or windows (5 points).
- **Artificial Lighting:** 50% of in unit fixtures will be high efficacy (12 points).
- **Photovoltaic:** 2016 Title 24 requires that nonresidential solar ready requirements apply to hotel/motel occupancies with 10 habitable stories or fewer, high-rise multifamily buildings with 10 stories or fewer, and all other nonresidential buildings with three habitable stories or fewer. In addition to meeting this requirement, the Project will install solar photovoltaic panels to generate electricity equal to 100% of the power needs of the project (62 points).
- **Water Efficient Landscaping:** No turf; only drought tolerant plants (4 points).
- **Water Efficient Irrigation Systems:** Smart irrigation controllers only (5 points).
- **Signal Improvements:** At least one traffic signal along a nearby arterial will be synchronized (3 points).
- **Sidewalks:** Sidewalks are on both sides of the street (1 point).
- **Employee Bicycle/Pedestrian Programs:** The Project will provide plentiful short- and long-term bicycle parking facilities to meet peak season maximum demand (one bile rack space per 20 vehicle/employee parking spaces) and "end-of-trip" facilities including showers, lockers, and charging stations (3 points).
- **Parking:** 5% of vehicle/employee parking spaces shall be reserved for preferential spaces for carpools and vanpools (1 point)
- **Electric Vehicle Recharging:** 2013 CALGreen (Title 24, Part 11) requires circuit and capacity for electric vehicle charging in non-residential areas where the total number of parking spaces is >50. The Project will additionally install 11 on-site and 54 off-site EV charging stations (520 points).
- **Commercial Vehicle Idling Restriction:** All commercial vehicles are restricted to 5-minutes or less per trip on site and at loading docks (2 points).

Table 4.6-3
Screening Table Points for K4 Parcel Scenario

Questionnaire Points	Number of Points
Commercial	656
Total	**656**
Threshold Requirements	100
Meets Requirement?	**Yes**

Since the Project's reduction strategies would garner 656 points, in excess of the minimum 100 points required to demonstrate consistency with the County's CAP, the Project's GHG emissions and associated impacts are considered **less than significant**.

Threshold GHG-2. Would the Project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

As explained in Section 4.6.4, Approach and Methodology, the determination of whether the Project would conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs is based on the following evaluations:

a. Project consistency with AB 32 through evaluating the Project's consistency and compliance with applicable statewide and local regulatory programs designed to reduce GHG emissions consistent with AB 32,

b. Project consistency with SB 375, and

c. Project compliance with the CAP screening tables.

The SCAQMD has not adopted any GHG reduction measures that would apply to the GHG emissions associated with the Project. The Air Quality Element of the General Plan of the March JPA (March JPA 1999) establishes goals and policies related to the reduction of GHG emissions. Consistency with these goals and policies is discussed in Section 4.9. The following analyses summarize the GHG impact discussions detailed in Appendix J, based on the methodologies described in Section 4.6.4.

Consistency with AB 32 and the March JPA General Plan Noise/Air Quality Element Regulatory Programs

The Project is consistent and compliant with applicable statewide regulatory programs designed to reduce GHG emissions consistent with AB 32, as described in Table 4.6-4.

Table 4.6-4
Consistency with Assembly Bill 32 Regulatory Programs

Regulatory Program	Project Level Evaluation
Construction	
CARB In-Use Off-Road Regulation	Off-road equipment used for construction of the Project will utilize Tier 3 or Tier 4 certified engines.
Mobile Sources	
California Assembly Bill 1493 (Pavley Standards)	This regulatory program applies to vehicle manufacturers, and not directly to land use development. That being said, the vehicles operated by future occupants of and visitors to the Project would benefit from and be consistent with this regulatory program in the form of reduced GHG emissions from the vehicle fleet for model years 2017 through 2025.
Advanced Clean Cars Program	This regulatory program applies to vehicle manufacturers, and not directly to land use development. That being said, the vehicles operated by future occupants of and visitors to the Project would benefit from and be consistent with this regulatory program in the form of reduced GHG emissions from the vehicle fleet for model years 2017 through 2025.
Low Carbon Fuel Standard Regulation	This regulatory program applies to fuel suppliers, and not directly to land use development. That being said, the vehicles operated by future occupants of and visitors to the Project would benefit from and be consistent with this regulatory program in the form of reduced GHG emissions from the vehicle fleet.
Heavy-Duty Vehicle GHG Emission Reduction Regulation	This regulatory program is intended to reduce fuel use and GHG emissions from medium- and heavy-duty vehicles, semi-trucks, pickup trucks and vans, and all types and sizes of work trucks and buses in between. The Project construction and operational analysis includes the benefit of reductions from these programs.
CARB In-Use On-Road Heavy-Duty Diesel Vehicles Regulation	This regulatory program applies to vehicle manufacturers, and not directly to land use development. That being said, the vehicles operated during Project construction and operations would benefit from and be consistent with this regulatory program in the form of reduced GHG emissions from the vehicle fleet.
Energy Use	
California Title 20 Standards Appliance Energy Efficiency Standards	The Project would result in new land use development that would be outfitted with appliances that accord to the CEC's Title 20 standards to the extent required by law.
California Title 24, Part 6 Standards Building Energy Efficiency Standards	The Project will design and construct buildings that accord to the CEC's 2016 Title 24 standards to the extent required by law.
California Title 24, Part 11 Standards Green Building Standards Code	The development facilitated by the Project would comply with CALGreen as a matter of law.
California Senate Bill X1-2 Renewable Portfolio Standards	This regulatory program applies to investor-owned utilities, electric service providers and community choice aggregators, and not directly to land use development. That being said, the Project would benefit from and be consistent with this regulatory program in the form of reduced GHG emissions from building energy consumption. The Project will purchase electricity from Southern California Edison, which is required to procure 20% and 33% of retail sales from renewable energy resources by 2013 and 2020, respectively.

Table 4.6-4
Consistency with Assembly Bill 32 Regulatory Programs

Regulatory Program	Project Level Evaluation
Water Supply, Treatment and Distribution	
Senate Bill X7-7 Water Use Efficiency Program	This regulatory program is implemented through the California Department of Water Resources and urban water suppliers, not land use developers. The Project would accord to water conservation objectives through use of the latest water-efficiency technologies, including those relating to water-conserving plumbing fixtures, weather-sensitive irrigation controls, drought-tolerant landscaping palettes, and the use of recycled water for irrigation purposes.
Executive Order B-29-15	Mandatory water reductions are implemented via Executive Order B-29-15 and a regulatory framework developed by the State Water Resources Control Board. These regulatory programs apply to urban water suppliers, not land use developers. The Project would accord to water conservation objectives through use of the latest water-efficiency technologies, including those relating to water-conserving plumbing fixtures, weather-sensitive irrigation controls, drought-tolerant landscaping palettes, and the use of recycled water for irrigation purposes.
California Title 24, Part 11 Standards Green Building Standards Code	The Project would comply with CALGreen as a matter of law. The use of water saving design elements (such as water-efficient toilets/urinals and faucets) will allow the Project to comply with required 20% reduction in indoor potable water use.
County of Riverside Ordinance No. 859	The Project will incorporate drought tolerant landscaping, smart irrigation controls, and a non-potable water system that meets "purple pipe" standards and provides the entirety of outdoor water demand.
Solid Waste	
California Assembly Bill 341 Mandatory Commercial Recycling	This regulatory program applies to commercial businesses and local land use jurisdictions, not land use developers. That being said, any businesses located in the Project would be required to comply with the program to the extent required by law; the Project would not hinder implementation of the program.
General	
California Cap-and-Trade Regulation	This regulatory program does not classify land use development as a covered entity. That being said, implementation of the regulatory program serves to reduce emissions at sources that are indirectly related to land use development (e.g., transportation fuel refineries).

Source: Appendix J.
Notes: CARB = California Air Resources Board; GHG = greenhouse gas; CEC = California Energy Commission; CALGreen = California Green Building Standards.

The Project is also consistent and compliant with applicable local regulatory programs, specifically the March JPA General Plan Noise/Air Quality Element policies designed to reduce GHG emissions, as described in Table 4.6-5.

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Goal 3	Reduce air pollution through proper land use, transportation, and energy use planning.	The Project would be constructed on approximately 35.4 acres located immediately adjacent to existing industrial and warehouse development. The uses would be concentrated with similar land uses, and the major roadways connecting the Project site to the existing roadway network are, for the most part, already constructed. Additionally, the Project would include solar panels to result in energy efficiency.	The Project would be consistent with this goal.
Policy 3.1	Locate ancillary uses within businesses and employment centers to reduce the number of vehicle trips and lessen vehicle miles traveled.	The Project site is located in the Business Park zone (refer to Figure 2-2, March JPA General Plan Land Use Designations, in Chapter 2, Project Description). Adjacent to the north of the proposed site, across Cactus Avenue, is an industrial and commercial center. To the east, the proposed warehouse site is bounded by vacant land and an electrical substation. To the south, the proposed warehouse site is bordered by March Air Reserve Base and to the west the proposed warehouse site is bordered by a vacant lot and March Air Reserve Base.	Given the site's location within the Business Park zone, there are limitations in the types of uses that can be located on the Project site, thereby limiting the ability to collocate ancillary uses on the Project site in an effort to minimize vehicle miles traveled by employees. However, the Project is located close to a commercial center which would provide ancillary services within a close proximity. The Project would be consistent with this policy.
Policy 3.4	Encourage ride share programs.	As required by mitigation measure **MM-AQ-5**: Commute Trip Reduction, 5% of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools to encourage ride share programs.	The Project would be consistent with this policy.
Goal 4	Pursue reduced emissions for stationary and mobile sources through the use and implementation of new and advancing technologies.	The following Project Design Features (included in Appendix B, K4 Warehouse Rendering) would reduce energy consumption associated with Project facilities: • The Project will install duct installation to a minimum level of R-6 and modestly enhanced window insulation; as required by 2016 Title 24 (conservatively not quantified).	The Project would be consistent with this goal with incorporation of project design features and implementation of **MM-AQ-1** through **MM-AQ-6**.

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		• For any warehouse use, the loading docks shall be designed to accommodate SmartWay trucks (EPA 2016b) (conservatively not quantified). • The Project will use Energy Star certified light bulb and lighting fixtures (conservatively not quantified). • The Project will include the following design elements: construction of modest cool roof; defined as CRRC Rated 0.15 aged solar reflectance and 0.75 thermal emittance, use of HVAC equipment with a Seasonal Energy Efficiency Ratio rating of 14 or higher; installation of water heaters with an energy factor of 0.92 or higher; all rooms will have some form of daylighting (i.e., skylights or windows); at least 50% of artificial lighting fixtures will be high efficiency; waterless urinals and high efficiency toilets will be used throughout the Project; water efficient faucets will be used throughout the Project (conservatively not quantified). The Project will exceed the Riverside County Climate Action Plan requirement for water efficient landscaping by having no turf and only drought tolerant plants and introducing additional water efficient irrigation controls such as smart irrigation controllers (included in emissions analysis). Additionally, as required by mitigation measures **MM-AQ-1** through **MM-AQ-6**, and detailed in Section 4.2, Air Quality, further	

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		requirements imposed on the Project would reduce emissions for stationary and mobile sources through the use and implementation of new and advancing technologies.	
Policy 4.1	Pursue the use of equipment with reduced or zero emissions for stationary and mobile source equipment.	See Goal 4 for Project consistency analysis.	The Project would be consistent with this policy with incorporation of project design features and implementation of **MM-AQ-1** through **MM-AQ-6**.
Policy 4.4	Promote for all development and encourage end-users to employ emission reducing or zero source equipment and processes.	See Goal 4 for Project consistency analysis.	The Project would be consistent with this policy with implementation of **MM-AQ-1** through **MM-AQ-6**.
Policy 5.5	Review development project to determine potential air quality impacts and provide appropriate mitigation, where necessary.	A comprehensive air quality analysis for the proposed Project is included within Section 4.2, Air Quality, of the EIR, and applicable mitigation measures can be found in the Executive Summary and in Section 4.2.6 Mitigation Measures, of the EIR.	The Project would be consistent with this policy.
Goal 6	Reduce emissions associated with vehicle/engine use.	The existing bus routes provided within the Project area by RTA are shown on Exhibit 3-11 in the TIA (refer to Appendix R). RTA Route 11 could potentially serve the Project, as it currently operates along Cactus to the north of the Project site. In addition, the following Project Design Features (included in Appendix J) would reduce energy consumption associated with Project facilities: • For any warehouse use, the loading docks shall be designed to accommodate SmartWay trucks (EPA 2016c). Additionally, per **MM-AQ-1**, during the Project construction, all off-road diesel-powered construction equipment greater than 50 horsepower, shall	The Project would be consistent with this goal with implementation of **MM-AQ-1, MM-AQ-5** and **MM-AQ-6.**

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the U.S. Environmental Protection Agency (EPA). The Project is committed to utilize up to 50% Tier 4 construction equipment. Per **MM-AQ-5**, the Project shall incorporate measures to encourage alternative modes of transportation and reduce commute trips. Per **MM-AQ-6**, the Project shall incorporate measures to minimize on-road mobile source criteria air pollutant emissions. Refer to Section 4.2, Air Quality, for further discussions.	
Policy 6.1	Reduce idling emissions by increasing traffic flow through synchronized traffic signals.	The Project Applicant shall participate in the funding of off-site improvements, including traffic signals that are needed to serve cumulative traffic conditions through the payment of transportation uniform mitigation fee in accordance with County Policy C 2.5. These fees shall be collected by the March JPA, with the proceeds solely used as part of a funding mechanism aimed at ensuring that regional highways and arterial expansions keep pace with the projected population increases. The Project would identify opportunities to modify streets to better serve the safety and needs of pedestrians and cyclists. Street modifications would serve to slow or reduce automobile traffic and make walking and cycling more safe and viable, reducing idling emissions. These may include adequate sidewalk width, pedestrian crossing time, “count down” signals, and universal access signal features at all signalized crosswalks.	The Project would be consistent with this policy.

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 6.2	Work with Riverside Transit Agency (RTA) to develop a local transit system and facilitate connections.	The existing bus routes provided within the Project area by RTA are shown on Exhibit 3-11 in the TIA (refer to Appendix R). RTA Route 11 could potentially serve the Project, as it currently operates along Cactus to the north of the Project site.	The Project would be consistent with this policy.
Policy 6.3	Encourage diversion of peak hour truck traffic, whenever feasible, to off-peak periods to reduce roadway congestion and associated emissions.	The Project Applicant shall pay all the necessary development and fair share fees associated with development of the Project. While payment of fees would be completed as part of Project approval, the use of these fees to implement programs and street system improvements cannot be guaranteed by the Project itself.	The Project would be consistent with this policy; however, implementation of these fees to fund the infrastructure improvements necessary to mitigate Project impacts cannot be guaranteed.
Policy 6.4	Work with Caltrans and traffic engineers to insure that roadways and freeway on-ramps that are heavily utilized by trucks are designed to safely accommodate trucks.	The freeway on-ramps and roadways already exist and are designed to safely accommodate trucks. The extension of Cactus Avenue and the construction of a new cul-de-sac roadway immediately south of the mixed use area would be reviewed by March JPA to ensure that the roadway is designed to safely accommodate trucks.	The Project would be consistent with this policy.
Policy 6.5	Encourage trucks operating within March JPA Planning Area to maintain safety equipment and operate at safe speeds so as to reduce the potential for accidents which create congestion and related emissions.	All trucks operating within the March JPA Planning Area are to maintain safety equipment and operate at safe speeds. The Project is designed to minimize potential conflicts between truck and vehicular traffic, and reduce the potential for accidents.	The Project would be consistent with this policy.
Policy 6.6	Reduce vehicle emissions through improved parking design and management that provide for safe pedestrian access to and from various facilities.	See Goal 6 for Project consistency analysis.	The Project would be consistent with this policy.
Policy 6.8	Encourage the use of compressed natural gas, clean diesel, and/or alternative fuels in engines.	Per **MM-AQ-1**, during the Project construction, all off-road diesel-powered construction equipment greater than 50 horsepower, shall	The Project would be consistent with this policy with implementation of **MM-AQ-1,**

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the EPA. In addition, the Project is committed to utilize 50% Tier 4 construction equipment, based on the number of pieces of construction equipment. With implementation of **MM-AQ-4**, the Project will include improved energy efficiency by providing circuitry and capacity for installation of electric vehicle charging stations consistent with the Climate Action Plan criteria. The Project will provide electrical outlets at building exterior areas. The project shall develop 11 on-site and 26 off-site electric vehicle charging stations. Per **MM-AQ-5**, the Project shall incorporate measures to encourage alternative modes of transportation and reduce commute trips including preferential parking spaces to be offered to car pools and van pools. Per **MM-AQ-6**, the Project shall incorporate measures to minimize on-road mobile source criteria air pollutant emissions. Refer to Section 4.2, Air Quality, for further discussions. In addition, the following Project Design Features (included in Appendix J) would reduce energy consumption associated with Project facilities: • For any warehouse use, the loading docks shall be designed to accommodate SmartWay trucks (EPA 2016c).	**MM-AQ-4, MM-AQ-5,** and **MM-AQ-6**.

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Goal 7	Reduce emissions associated with energy consumption.	See Policy 6.8 for Project consistency analysis.	The Project would be consistent with this goal with implementation of **MM-AQ-**1, **MM-AQ-4**, **MM-AQ-5**, and **MM-AQ-6**.
Policy 7.1	Support the use of energy-efficient equipment and design in the March JPA Planning Area for facilities and infrastructure.	See Policy 6.8 for Project consistency analysis.	The Project would be consistent with this policy with implementation **MM-AQ-1**, **MM-AQ-4**, **MM-AQ-5**, and **MM-AQ-6**.
Policy 7.2	Encourage incorporation of energy conservation features in development.	See Policy 6.8 for Project consistency analysis.	The Project would be consistent with this policy with implementation of **MM-AQ-1**, **MM-AQ-4**, **MM-AQ-5**, and **MM-AQ-6**.
Policy 7.3	Support passive solar design in new construction.	The Project will include the following design elements: construction of modest cool roof; defined as CRRC Rated 0.15 aged solar reflectance and 0.75 thermal emittance, use of HVAC equipment with a Seasonal Energy Efficiency Ratio rating of 14 or higher; installation of water heaters with an energy factor of 0.92 or higher; all rooms will have some form of daylighting (i.e., skylights or windows); at least 50% of artificial lighting fixtures will be high efficiency; waterless urinals and high efficiency toilets will be used throughout the Project; water efficient faucets will be used throughout the Project (conservatively not quantified).	The Project would be consistent with this policy.
Policy 7.4	Support recycling programs which reduce emissions associated with manufacturing and waste disposal.	As discussed in Section 4.13, Utilities and Service Systems, of the EIR, **MM-UTL-2** and **MM-UTL-3** would ensure the preparation of a waste recycling plan and approval from the Riverside County Waste Management Department. The plan would specify where and how the recyclable materials will be stored on the site.	The Project would be consistent with this policy with implementation of **MM-UTL-2** and **MM-UTL-3**.

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 7.5	Support drought-resistant vegetation in landscaping areas to reduce energy needed to pump water.	The Project would be designed to comply with March JPA's policy on drought-tolerant landscaping.	The Project would be consistent with this policy.
Goal 8	Reduce air pollution emissions and impacts through siting and building design.	See Policy 6.8 for Project consistency analysis.	The Project would be consistent with this goal with implementation of **MM-AQ-**1, **MM-AQ-4**, **MM-AQ-5**, and **MM-AQ-6**.
Policy 8.1	Support the use of low polluting construction materials and coatings.	See Policy 6.8 for Project consistency analysis.	The Project would be consistent with this policy with implementation of **MM-AQ-1 through MM-AQ-6** and compliance with SCAQMD Rule 403 and Rule 1113.
Policy 8.2	Encourage the separation of sensitive receptors, such as schools and hospitals, from sources of toxic emissions.	At buildout of the Project, the highest average daily trips at an intersection would be approximately 228,500 at the Trautwein Road/Alessandro Boulevard intersection, which is below the daily traffic volumes that would be expected to generate carbon monoxide (CO) exceedances as evaluated in the 2003 Air Quality Management Plan. This daily trip estimate is based on the average daily traffic rate conditions of the intersection. There is no reason unique to the South Coast Air Basin meteorology to conclude that the CO concentrations at the Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard intersection would exceed the 1-hour CO standard if modeled in detail, based on the studies undertaken for the 2003 Air Quality Management Plan. As such, localized CO impacts would be less than significant. As analyzed in Section 4.2.5, Impact Analysis, of the EIR, the excess lifetime cancer risk and chronic HI for a resident at the off-site maximally exposed individual resident location	The Project would be consistent with this policy.

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		due to operational emissions would be 1.3 in a million and 0.004, respectively, which would not exceed the applicable SCAQMD cancer and noncancer risk thresholds. Health risk impacts associated with long-term operations of the Project would be less than significant. Refer to Section 4.2, Air Quality, for further discussions.	
Policy 8.3	Encourage the separation of sensitive receptors from potential carbon monoxide hotspots.	See Policy 8.2 for Project consistency analysis.	The Project would be consistent with this policy.
Goal 9	Reduce fugitive dust and particulate matter emissions.	To account for dust control measures to comply with SCAQMD Rule 403 in the calculations, it was assumed that the active sites would be watered twice times daily, or as needed depending on weather conditions, resulting in a 55% reduction in fugitive dust as implemented by the CalEEMod.	The Project would be consistent with this goal.
Policy 9.1	Require all feasible fugitive dust reduction techniques to be utilized during construction activities.	Standard construction practices that would be employed to reduce fugitive dust emissions include watering the active sites twice times daily, as needed, depending on weather conditions.	The Project would be consistent with this policy.
Policy 9.3	Support land division design which minimizes grading and maintains the natural topography to the maximum extent feasible.	Recommendations included within the Project's Geotechnical Investigation are incorporated via **MM-GEO-1** to ensure that site preparation; over-excavation and recompaction; fill placement and compaction; import and export of fill soil; rippability and over-sized material; alluvium soil removal; temporary excavations; and trench backfill are completed where the site is prepared for the development of the Project components while maintaining the natural topography to the maximum extent feasible.	The Project would be consistent with this policy with implementation of **MM-GEO-1**.

Table 4.6-5
Consistency with March Joint Powers Authority General Plan
Noise/Air Quality Element

Applicable Goal or Policy/ Recommendation Number	Applicable Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		Prior to construction, a licensed geotechnical engineer shall review the site and grading plans when available and comment further on the geotechnical aspects of the Project. Geotechnical observation and testing shall be conducted during excavation and all phases of grading operations.	

Notes: EIR = environmental impact report; RTA =Riverside Transportation Authority; TIA = Traffic Impact Analysis; Caltrans = California Department of Transportation; JPA = Joint Powers Authority; CRRC = Cool Roof Rating Council; CalEEMod = California Emissions Estimator Model.

In summary, since the Project would comply with statewide and local regulatory programs designed to reduce GHG emissions consistent with AB 32, this impact would be **less than significant**.

Consistency Evaluation with SB 375 (SCAG RTP/SCS)

SCAG's 2016 RTP/SCS is a regional growth-management strategy that targets per capita GHG reduction from passenger vehicles and light-duty trucks in the Southern California region. The SCS will integrate land use and transportation strategies that will achieve GHG emissions reduction targets that are forecasted to achieve reduction in GHG emissions to achieve the state's 2035 and 2040 GHG reduction goals.

The Project lies entirely within Traffic Analysis Zone 43268200. The 2016 RTP/SCS projects that within Traffic Analysis Zone 43268200, there will be a total of 8,755 jobs by 2020 and 22,196 by 2045.[3] As of 2016, there are 4,531 jobs in the March JPA jurisdiction. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Adding jobs consistent with 2016 RTP/SCS projections supports SCAG's achievement of Air Reserve Base emissions reductions targets.

The SCS also indicates that this is a jobs poor area so providing more jobs will actually reduce GHG emissions and reduce VMT as it will provide local jobs to achieve a more favorable jobs-housing balance.

[3] Jobs data provided by March JPA.

Additionally, the March JPA Draft General Plan (March JPA 1999) discusses the need to create more jobs, including the following examples:

- March JPA has a stated goal of providing 38,000 jobs, through development of its Planning Area, to the western Riverside County area thereby creating a much-needed job center. The creation of a job center is important to reduce the existing jobs/housing imbalance that exists in this region such that it can help reduce traffic congestion, pollution, fossil fuel dependence and improve the overall quality of life for the residents of western Riverside County. (p. 1–11)
- March JPA has a mission to replace regional economic benefit that was lost with the realignment of the active duty March Air Force Base into a Reserve Base in April 1996. The quantified benefits are the creation of at least 38,000 jobs, and more than $500 million annual economic contribution to the Riverside County region. (p. 5–4)

The Project is expected to generate 900 jobs. This is approximately 21% of the projected job growth in Traffic Analysis Zone 43268300 in 2020 as compared to 2016, and approximately 5.1% of projected job growth in 2045 as compared to 2016. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Since the jobs created by the Project are within the job growth projections in the 2016 RTP/SCS, will not impair the region's ability to achieve the GHG reductions from Project related mobile sources as required by SB 375 because the land use development pattern proposed by the Project results in jobs within the total number of jobs projected by SCAG's 2016 RTP/SCS, and is consistent with the underlying assumptions upon which SCAG's 2016 RTP/SCS was based. Thus, the Project is consistent with the principles of the 2016 RTP/SCS and the Project would have a **less than significant** impact.

Consistency with County of Riverside CAP

The County's CAP identifies a series of GHG reduction measures which projects could implement in order to reduce GHG emissions if the projects' GHG emissions exceed 3,000 MT CO_2e per year. The point values for each GHG reduction measure correspond to the minimum emissions reduction expected from each feature. Possible features within the screening table allow maximum flexibility and options for how projects can implement the GHG reduction measures. A project that would implement a total of 100 points worth of reduction measures would assist in achieving attainment of the CAP's goals for the region as a whole and therefore would not conflict with the CAP. Most of the reduction measures focus on energy efficiency, renewable energy, water use and waste reduction, and transportation. As previously discussed under Threshold GHG-1, the Project would implement GHG-reducing elements garnering 656-points from the CAP's screening tables. Therefore, the Project would not conflict with the County's CAP and this impact would be **less than significant**.

4.6.6 Mitigation Measures

CEQA Guidelines Section 15126.4 requires EIRs to describe feasible measures that can minimize significant adverse impacts. Although no significant impact was identified in Section 4.6.5, the following mitigation measures identified in Section 4.2 have been evaluated for feasibility and are incorporated herein to reduce potentially significant impacts related to GHG emissions.

MM-GHG-1 Air Quality Mitigation Measures. The applicant shall incorporate MM-AQ-1 (Construction Equipment Emissions Standards), MM-AQ-3 (Construction Relations Officer), MM-AQ-4 (Improved Energy Efficiency and Water Reduction), MM-AQ-5 (Commute Trip Reduction), and MM-AQ-6 (Haul Truck Requirements).

Notably, the mitigation measure discussed above reflects the requirements from the Riverside CAP screening analysis. As a conservative approach, the reductions from MM-AQ-3, MM-AQ-5, MM-AQ-6 and MM-AQ-7 were not quantified. As discussed in Appendix J, a portion of MM-AQ-4 was quantified. Incorporating GHG reductions from these mitigation measures would further reduce the Project's emissions.

4.6.7 Level of Significance After Mitigation

As the Project had a less than significant impact prior to mitigation, it would also have a less than significant impact with mitigation.

4.6.8 Informational Analysis of Updated Scoping Plan (Service Population)

The SCAQMD has not adopted recommended numeric CEQA significance thresholds for GHG emissions for lead agencies to use in assessing GHG impacts of non-industrial projects. In October 2008, SCAQMD presented to the Governing Board the *Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold* (SCAQMD 2008b). The guidance document was not adopted or approved by the Governing Board. This document, which builds on the previous guidance prepared by CAPCOA (discussed previously), explored various approaches for establishing a significance threshold for GHG emissions.

For informational purposes, an additional comparison to a service population target is provided, because no numeric threshold for determining the significance of construction or operational GHG emissions from a residential/commercial development project has been adopted by the lead agency or by SCAQMD. The SCAQMD's draft 2020 target for project-level analysis is 4.8 $MTCO_2e$ per year per service population (land use employment only). The Tier 4 efficiency metric is based on a percent reduction target that is based on consistency with AB 32. This is because the Tier 4

percent emission reduction target is based on the same numeric reductions calculated in the Scoping Plan to reach 1990 levels by 2020.

The service population estimate for the Project is 900 employees on an annual average basis. Non-peak period service population is estimated to be two-thirds of the peak period based on Project specific estimates.

Project-Generated Construction Emissions. Construction of the Project would result in GHG emissions that are primarily associated with use of off-road construction equipment and on-road construction and worker vehicles. CalEEMod was used to calculate the annual GHG emissions based on the construction scenario described in Section 4.2.4 in Section 4.2 and Appendix J. SCAQMD methodology recommends that "construction emissions be amortized over a 30-year project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies" (SCAQMD 2008b). On-site sources of GHG emissions include off-road equipment. Off-site sources include hauling and vendor (delivery) trucks and worker vehicles. Emissions from on-site and off-site sources are combined for the purposes of this analysis. A breakdown of emissions by source is provided in Appendix J. Table 4.6-2 presents the Project-generated construction emissions.

As shown in Table 4.6-2, the estimated total GHG emissions during Project construction would be approximately 2,114 MT CO_2e, which equates to 70 MT CO_2e when amortized over 30 years. Because GHG emissions are cumulative in nature, amortized construction GHG emissions were added to operational emissions in Table 4.6-6 in order to present total annual emissions. Additional details regarding these calculations are provided in Appendix J.

Project-Generated Operational Emissions. Operation of the Project would result in GHG emissions through energy use (natural gas and generation of electricity consumed by the Project); motor vehicle trips to and from the Project; generation of electricity associated with water supply, treatment, and distribution and wastewater treatment; and solid waste disposal. Annual GHG emissions from these sources were estimated using CalEEMod for the year 2020. The Project would primarily generate GHG emissions through vehicular traffic generated by employees and delivery trucks. Table 4.6-6 presents estimated GHG emissions from area sources, energy sources, motor vehicles, solid waste generation, water consumption, and wastewater treatment. Emissions reductions from measures incorporated as part of County CAP compliance were not quantified or included in the Unmitigated Project 2020 scenario. Table 4.6-6 presents estimated GHG emissions from area sources, energy sources, motor vehicles, solid waste generation, water consumption, and wastewater treatment. Emissions reductions from measures incorporated as part of County CAP compliance were not quantified or included in the Unmitigated Project 2020 scenario.

Where it was possible to quantify emissions reductions from CAP compliance, those measures were incorporated as mitigation. For several measures, substantial evidence to support quantification was not available and thus emissions reductions were excluded from the analysis. Additional details regarding these calculations are provided in Appendix J.

Table 4.6-6
Summary of Greenhouse Gas Emissions

Category	Unmitigated Project 2020	Mitigated Project 2020
	MT CO_2e/year	
Area	0.04	0.04
Energy (natural gas and electricity)	497	-1,342
Water supply and wastewater	18	18
Solid waste	123	123
On-road Traffic (with trucks)	17,298	16,856
On-road Traffic (without trucks)	6,992	6,551
Construction (amortized over 30 years)	70	70
Vegetation	0	-5
Total (with trucks)	**18,007**	**15,721**
Total (without trucks)	**7,701**	**5,416**
Service Population	**900**	
Total Emissions per Service Population with trucks (MT CO_2e/SP/yr)	**20.0**	**17.5**
Total Emissions per Service Population without trucks (MT CO_2e/SP/yr)	**8.56**	**6.02**

Notes: MT = metric tons; CO_2e = carbon dioxide equivalent; SP = Service Population; yr = year.
See Appendix J for detailed results. The Unmitigated Project 2020 scenarios both include greenhouse gas (GHG) reductions due to improvements in Renewable Portfolio Standards, Title 24 building energy standards, solid waste disposal rates, water conservation, and mobile source tailpipe emissions. The Mitigated Project 2020 scenario includes application of mitigation measure MM-GHG-1.

The Project's unmitigated efficiency metric is estimated to be 20.0 MT CO_2e per year per service population (18,007 MT CO_2e per year / 900 people), which is above the draft threshold. The Project's mitigated efficiency metric is estimated to be 17.5 MT CO_2e per year per service population (15,721 MT CO_2e per year / 900 people), which is also above the draft threshold, however, this is based on a comparison that does not fairly compare the Project emissions inventory to the associated service population. In this case, the trucks associated with Project operation are the predominant emissions source, however, those drivers are not considered in the SCAQMD's service population since they are not included in the employment for the Project land use (SCAQMD 2010b). With the analysis in Appendix J, the emissions from these trucks are included in the total emissions, but the drivers are excluded from the service population.

Further, this analysis also evaluates the Project's GHG emissions utilizing a modified emissions inventory to compare against the efficiency target because the District's draft definition of "service population" leads to a negative bias for projects with emissions not related to the residents or workers of the project. The modified emissions inventory used in this analysis evaluates the emissions associated with the defined service population – the workers at the project site and not the truck workers and the truck emissions; as such, mobile source emissions associated with the operational trucks are excluded from the emissions total. In this analysis, shown in Appendix J, the Project's mitigated efficiency metric without truck emissions is estimated to be 6.02 MT CO_2e per year per service population, which is above the draft threshold. This analysis is included for informational purposes only.

4.7 HAZARDS AND HAZARDOUS MATERIALS

This section describes the existing hazardous materials within the vicinity of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) site, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the Project. The Initial Study (Appendix A, Initial Study and Notice of Preparation) concluded that potential impacts related to creating a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials; creating a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment; emitting hazardous emissions within one-quarter of an existing school; locating the Project on a site listed as a hazardous materials site creating a significant hazard to the public or environment; and being located within an airport land use plan or within two miles of a public airport were found to be potentially significant and are therefore discussed further in this Environmental Impact Report (EIR).

In addition to other documents listed in Section 4.7.7, References, the following resources were used in the preparation of this section of the EIR:

- Phase I and Limited Phase II Environmental Site Assessment Proposed Industrial Warehouse Site K4 (Appendix K)
- Phase I Environmental Site Assessment Former March Air Force Base K4 Parcel and Cactus Channel (Appendix L)
- Geotechnical Exploration Proposed Industrial Warehouse Site K4 Cactus Avenue (Appendix I1)
- Geotechnical Addendum Report K4 Moreno Valley Storm Drain Cactus Avenue (Appendix I2)

As mentioned in Chapter 2, Project Description, of this EIR, the proposed Project involves the development of the K4 Parcel with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use, and improvements to the Cactus Avenue Drainage Channel (Cactus Channel) at the Cactus Channel Improvement Site. The Project includes the following components for Project approval:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March Joint Powers Authority (JPA) General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.

- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

4.7.1 Existing Conditions

The proposed Project collectively consists of a proposed warehouse building on the K4 Parcel and improvements within the Cactus Channel. The approximately 35.4-acre K4 Parcel is located on the south side of Cactus Avenue and extends from the terminus of Veterans Way at Cactus Avenue on the west to the terminus of Frederick Street at Cactus Avenue on the east. The K4 Parcel is located within the March JPA jurisdiction, which is within unincorporated Riverside County, California (Figure 2-1, Project Location). The K4 Parcel is located within the former boundaries of the March Air Force Base (AFB) (now known as the March Air Reserve Base (ARB)), in the northern area.

The surrounding area consists of vacant land, commercial and industrial properties and the March ARB. Adjacent to the north of the K4 Parcel and Cactus Channel, across Cactus Avenue, is an industrial and commercial center. To the east, the K4 Parcel is bounded by vacant land and an electrical substation. To the south, the K4 Parcel is bordered by March ARB and to the west the K4 Parcel is bordered by a vacant lot and March ARB. The Cactus Channel component of the Project, is located within proximity of Harvest Time Christian School, located at 14420 Elsworth Street, Moreno Valley, California 92553, and is approximately 0.2 miles northwest of the Cactus Channel component of the Project site.

Topographically, the K4 Parcel is relatively flat, draining gently in a southeastern direction. The K4 Parcel is currently undeveloped and vacant land covered with small vegetative growth and seasonal weeds. The K4 Parcel consists of Quaternary age alluvial soils and surface soils in the vicinity of the K4 Parcel consist of younger aged alluvium consisting of sand, gravel and clay of valley areas covered with soil (Appendix I1). There is an approximately 152,000-square-foot area with stockpiled soil in the southern portion of the site, adjacent to the transformer station. No buildings or structures are located on site; the southeastern perimeter of the K4 Parcel wraps around an electrical substation that is not included as part of the subject site. The substation has two paved entrances on the east that are accessible by Chanute Avenue, these entrances and Chanute Avenue are part of the K4 Parcel. The Cactus Channel is earthen and flows within the channel drain to the east.

Hazardous Materials

K4 Parcel

According to the Phase I Environmental Site Assessment (ESA) prepared for the proposed Project, a review of historic aerial photographs show that the K4 Parcel has been vacant since 1901; prior to 1901 it is unknown whether or not the K4 Parcel was developed. The Phase I ESA Report also states that no hazardous substances, chemical containers, or aboveground and underground storage tanks were observed on the K4 Parcel. Evidence of pesticide use was not observed on the K4 Parcel. One pad-mounted transformer was observed on the eastern portion of the K4 Parcel, adjacent to the large, off-site electrical substation located near the eastern boundary of the K4 Parcel. The transformer appeared in good condition with no evidence of staining or leakage was observed. The soils appeared to be clean and locally derived (Appendix K).

The K4 Parcel is located in the northern area of the former boundaries of the March AFB, which was reported on various hazard-identifying databases. According to the Environmental Data Resources (EDR) radius map report the former March AFB was originally used to train pilots during World War I, and by 1938, it became the central location for west-coast bombing and gunnery training. Due to the facility's purpose in national defense, there was a wide variety of operations that involved the use, storage, and disposal of hazardous materials and waste such as fuel, solvents and waste oil. As a result, 30 different areas of soil and groundwater contamination have been identified on the base. By November 1989, March AFB was added to the National Priorities List (NPL) due to the contamination of the groundwater. According to the EDR radius map report, the March ARB, formerly March AFB, facilities status is "currently on the Final NPL." There were numerous contaminants of concern detected in the groundwater at the operational units, including trichloroethylene, perchloroethylene, vinyl chloride, and fuel. The area that required groundwater remediation includes the southern and eastern boundary of March ARB and extends 1,500 feet south of the March ARB, and does not include the K4 Parcel or Cactus Channel boundary.

Based on the results of Phase I ESA, organochlorine pesticides (OCPs) and arsenic were not detected in the undocumented soil at concentrations exceeding the U.S. Environmental Protection Agency (EPA) residential Regional Screening Levels or the Department of Toxic Substance Control (DTSC) Human Health Risk Assessment Note 3 screening levels for OCPs, or the DTSC recognized Southern California background arsenic concentration of 12 mg/kg. Additionally, based on the past use of the K4 Parcel as part of a military base for over 50 years, future development of the K4 Parcel, including grading activities have the potential to encounter subsurface hazardous materials and/or wastes, buried trash and debris, unexploded ordnance (UXO), and contaminated media, including soil, soil vapor/gas, and or groundwater (Appendix L).

Cactus Channel

According to research conducted for the Phase I ESA, historic U.S. Army Corps of Engineers maps from 1943 and 1944 indicate that a levee was located along the northern portion of March AFB, suggesting the presence of a storm drain channel along the present day Cactus Channel. The Cactus Channel, which appeared as an earthen storm drain channel, was first evident in historical aerial photographs from the late 1940s and is similar to conditions in the present day. Per the Phase I ESA, a few empty one-quart motor oil containers were observed along the north side of the Cactus Channel and south side of Cactus Avenue, with no other containers of hazardous materials or wastes observed.

Airport Land Use Plan

March ARB prepared the Air Installation Compatible Use Zone (AICUZ) Study evaluating the aircraft noise and accident potential related to Air Force flying operations and is designed to aid in the development of local planning mechanisms which will protect the public safety and health, as well as preserve the operational capabilities of March ARB. The March ARB AICUZ identifies Accident Potential Zones (APZs) and defines noise contours around the air base. Neither the K4 Parcel nor the Cactus Channel Improvement Site are located within a designated Accident Potential Zone.

The K4 Parcel component of the proposed Project is located within the March ARB Land Use Plan (Mead & Hunt 2014), in the C1 Primary Approach/Departure Zone and would ultimately require approval from the ALUC due to the site's proximity to the March Inland Port Airport (approximately 4,500 feet from the north end of the runway). The C1 zone is subject to moderate to high noise and moderate accidental potential risk (Mead & Hunt 2014). Uses prohibited within Zone C1 include children's schools, day care centers, libraries, hospitals, congregate care facilities, places of assembly, noise-sensitive outdoor nonresidential uses, and hazards to flight.

4.7.2 Relevant Plans, Policies, and Ordinances

Federal

Federal Aviation Administration

The Federal Aviation Administration (FAA) requires that any structure that is located within proximity to an airport or other criteria per Code of Federal Regulations Title 14, Part 77.9, file with the FAA (FAA 2014). Because the Project is located in close proximity to the March ARB/IP, and specifically within one mile of the airport, the Project applicant has filed Form FAA 7460-1, Notice of Proposed Construction or Alteration, with the FAA.

FAA Advisory Circular 150/5200-33B

In 2007, FAA issued an Advisory Circular (AC) No. 150/5200-33B (FAA 2007) providing guidance on certain land uses that have the potential to attract hazardous wildlife on or near public-use airports. The AC also discusses airport development projects, including airport construction, expansion and renovation, affecting aircraft movement near hazardous wildlife attractants. Hazardous wildlife is defined as any species of wildlife (birds, mammals, reptiles), including feral animals and domesticated animals not under control, that are associated with aircraft strike problems, are capable of causing structural damage to airport facilities, or act as attractants to other wildlife that pose a strike hazard. Included within the AC are minimum separation criteria for land-use practices that attract hazardous wildlife to the vicinity of airports. Separation distances are based on flight patterns, altitude at which most strikes happen, and National Transportation Safety Board recommendations. Land use practices discussed within the AC associated with wildlife hazards directly applicable to the proposed Project include the placement and design of new stormwater management facilities, which must drain within 48 hours after a storm event.

Department of Defense

The Department of Defense has developed the AICUZ program to ensure that development is compatible with aviation operations in areas on and adjacent to military airfields. The AICUZ land use recommendations are based on land use compatibility with exposure to aircraft noise, and safety considerations. Recommended compatible land uses are derived from data on noise contours (noise zones) and safety zones (clear zones and accident potential zones).

Federal Toxic Substances Control Act and Resource Conservation and Recovery Act

The Federal Toxic Substances Control Act of 1976 (15 USC 2601 et seq.) and the Resource Conservation and Recovery Act (RCRA) of 1976 (42 USC 6901 et seq.) established a program administered by the EPA for regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. The RCRA was amended in 1984 by the Hazardous and Solid Waste Act (PL 98-616), which affirmed and extended the "cradle-to-grave" system of regulating hazardous wastes. The use of certain techniques for the disposal of some hazardous wastes was specifically prohibited by the Hazardous and Solid Waste Act. Under the authority of RCRA, the regulatory framework for managing hazardous waste, including requirements for entities that generate, store, transport, treat, and dispose of hazardous waste, is found in Title 40 of the Code of Federal Regulations, Parts 260–299.

Hazardous Materials Transportation Act

The U.S. Department of Transportation regulates hazardous materials transportation under Title 49 of the United States Code. State agencies with primary responsibility for enforcing federal and

state regulations and responding to hazardous materials transportation emergencies are the California Highway Patrol and the California Department of Transportation. These agencies also govern permitting for hazardous materials transportation. Title 49 of the Code of Federal Regulations, part 100 et seq., reflects laws passed by Congress as of January 2, 2006.

Comprehensive Environmental Response, Compensation, and Liability Act

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) (42 USC 9601 et seq.), commonly known as "Superfund," was enacted by Congress on December 11, 1980. This law provided broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA established requirements concerning closed and abandoned hazardous waste sites, provided for liability of persons responsible for releases of hazardous waste at these sites, and established a trust fund to provide for cleanup when no responsible party could be identified. CERCLA also enabled the revision of the National Contingency Plan. The National Contingency Plan provided the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, or contaminants.

State

California Occupational Safety and Health Administration

California OSHA is the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. California OSHA standards are generally more stringent than federal regulations. The employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR 330 et seq.). The regulations specify requirements for employee training, availability of safety equipment, accident prevention programs, and hazardous substance exposure warnings.

California Hazardous Waste Control Act

The California DTSC is responsible for the enforcement of the Hazardous Waste Control Act (California Health and Safety Code, Section 25100 et seq.), which creates the framework under which hazardous wastes are managed in California. The law provides for the development of a state hazardous waste program that administers and implements the provisions of the federal RCRA cradle-to-grave waste management system in California. It also provides for the designation of California-only hazardous waste and development of standards that are equal to or, in some cases, more stringent than federal requirements. Although the Hazardous Waste Control Act is generally more stringent than RCRA, until EPA approves the California hazardous waste control program (which is charged with regulating the generation, treatment, storage, and disposal of hazardous waste), both the state and federal laws apply in California. The Hazardous Waste

Control Act lists 791 chemicals and approximately 300 common materials that may be hazardous; establishes criteria for identifying, packaging, and labeling hazardous wastes; prescribes management controls; establishes permit requirements for treatment, storage, disposal, and transportation; and identifies some wastes that cannot be disposed of in landfills.

According to 22 CCR 66261 et seq., substances having a characteristic of toxicity, ignitability, corrosivity, or reactivity are considered hazardous waste. Hazardous wastes are hazardous substances that no longer have a practical use, such as material that has been abandoned, discarded, spilled, or contaminated, or that is being stored prior to proper disposal.

Toxic substances may cause short-term or long-lasting health effects ranging from temporary effects to permanent disability or death. For example, toxic substances can cause eye or skin irritation, disorientation, headache, nausea, allergic reactions, acute poisoning, chronic illness, or other adverse health effects if human exposure exceeds certain levels (the level depends on the substance involved). Carcinogens (substances known to cause cancer) are a special class of toxic substances. Examples of toxic substances include most heavy metals, pesticides, and benzene (a carcinogenic component of gasoline). Ignitable substances (e.g., gasoline, hexane, and natural gas) are hazardous because of their flammable properties. Corrosive substances (e.g., strong acids and bases such as sulfuric (battery) acid or lye) are chemically active and can damage other materials or cause severe burns upon contact. Reactive substances (e.g., explosives, pressurized canisters, and pure sodium metal, which react violently with water) may cause explosions or generate gases or fumes.

California State Aeronautics Act

The purpose of the California State Aeronautics Act pursuant to Public Utilities Code (PUC) Section 21001 et seq., administered by the California Department of Transportation, Division of Aeronautics, is "to protect the public interest in aeronautics and aeronautical progress." Under State Aeronautics Act, Airport Land Use Commissions are required, per Article 3.5 of PUC Sections 21670-21679.5, and airports must create Airport Land Use Compatibility Plans, pursuant to Article 3.5 of PUC Sections 21674.5 and 21674.7. Consistent with these provisions, Riverside County Airport Land Use Commission has been assigned airport land use authority for all public and military airports in the County, including March ARB/ IP, and the airport has created an Airport Land Use Compatibility Plan. Each of these are discussed in greater detail under applicable local regulations.

California Accidental Release Prevention Program

Similar to the EPA Risk Management Program, the California Accidental Release Prevention (CalARP) Program (19 CCR 2735.1 et seq.) regulates facilities that use or store regulated substances, such as toxic or flammable chemicals, in quantities that exceed established thresholds. The overall purpose of the CalARP Program is to prevent accidental releases of regulated

substances and reduce the severity of releases that may occur. The CalARP Program meets the requirements of the EPA Risk Management Program, which was established pursuant to the Clean Air Act Amendments.

California Government Code Section 51014.6

Section 51014.6 of the California Government Code states, "(a) Effective January 1, 1987, no person, other than the pipeline operator, shall do any of the following with respect to any pipeline easement: (1) Build, erect, or create a structure or improvement within the pipeline easement or permit the building, erection, or creation thereof. (2) Build, erect, or create a structure, fence, wall, or obstruction adjacent to any pipeline easement which would prevent complete and unimpaired surface access to the easement, or permit the building, erection, or creation thereof. (3) No shrubbery or shielding shall be installed on the pipeline easement which would impair aerial observation of the pipeline easement. This subdivision does not prevent the revegetation of any landscape disturbed within a pipeline easement as a result of constructing the pipeline and does not prevent the holder of the underlying fee interest or the holder's tenant from planting and harvesting seasonal agricultural crops on a pipeline easement. (4) This section does not prohibit a pipeline operator from performing any necessary activities within a pipeline easement, including, but not limited to, the construction, replacement, relocation, repair, or operation of the pipeline.

It is the position of the State Fire Marshal that nothing shall encroach into or upon the pipeline easement, which would impede the pipeline operator from complete and unobstructed surface access along the pipeline right-of-way. Nor shall there be any obstructions, which would shield the pipeline right-of-way from observation. In the interest of public safety and the protection of the environment, it is imperative that the pipeline operator visually assesses the conditions along the easement to ensure the integrity of the pipeline.

It is the responsibility of the pipeline operator to ensure they have unimpeded surface access and to be able to physically observe all portions of their pipeline rights-of-way. In cases where this is not possible, the pipeline operator shall inform the State Fire Marshal. The State Fire Marshal shall, in collaboration with the pipeline operator, resolve the issue.

California Health and Safety Code

In California, the handling and storage of hazardous materials is regulated by Division 20, Chapter 6.95, of the California Health and Safety Code (Section 25500 et seq.). Under Sections 25500–25543.3, facilities handling hazardous materials are required to prepare a hazardous materials business plan. Hazardous materials business plans contain basic information about the location, type, quantity, and health risks of hazardous materials stored, used, or disposed of in the state.

Chapter 6.95 of the California Health and Safety Code establishes minimum statewide standards for Hazardous Materials Business Plans. Each business shall prepare a Hazardous Materials Business Plan if that business uses, handles, or stores a hazardous material (including hazardous waste) or an extremely hazardous material in disclosable quantities greater than or equal to the following:

- 500 pounds of a solid substance
- 55 gallons of a liquid
- 200 cubic feet of compressed gas
- A hazardous compressed gas in any amount (highly toxic with a Threshold Limit Value of 10 parts per million or less)
- Extremely hazardous substances in threshold planning quantities (California Health and Safety Code, Section 25503.5)

In addition, in the event that a facility stores quantities of specific acutely hazardous materials above the thresholds set forth by California code, facilities are also required to prepare a risk management plan consistent with the CalARP program. The risk management plan provides information about the potential impact zone of a worst-case release, and require plans and programs designed to minimize the probability of a release and to mitigate potential impacts.

Local

March ARB AICUZ

In February 2018, March ARB released an update of the March ARB AICUZ Study dated 2005. This update was initiated because of the bed-down of new aircraft, operational changes and the introduction of new flight tracks. It is a reevaluation of aircraft noise and accident potential related to Air Force flying operations and is designed to aid in the development of local planning mechanisms which will protect the public safety and health, as well as preserve the operational capabilities of March ARB. The AICUZ program is a means to protect public health, safety, and general welfare in areas surrounding base while seeking development compatible with the defense flying mission. The Project site is not located within any AICUZ noise zones, as identified in Figure 4-2 of the March ARB AICUZ.

Riverside County Airport Land Use Commission

In accordance with provisions of the California State Aeronautics Act (PUC Section 21670 et seq.) as discussed above, the Riverside County ALUC has been assigned lead responsibility for airport land use compatibility planning around each of the public-use and military airports in Riverside County. The Project site is located within the March ARB/IP airport influence area within unincorporated Riverside County and therefore is subject to review and approval by the Riverside County ALUC.

March ARB/IP ALUCP

The March ARB/IP ALUCP was prepared for and adopted by the Riverside County ALUC on November 13, 2014. The March ARB/Inland Port Airport is located approximately 0.7 miles southwest of the Project site. The purpose of the March ARB/Inland Port ALUCP is to promote compatibility between the March ARB/Inland Port and the land uses that surround the joint-use airport, to the extent such areas are not already devoted to incompatible uses. The March ARB/Inland Port ALUCP regulates future development of new residential dwellings, commercial structures, and other noise- or risk-sensitive uses within the Airport Influence Area based on factors enumerated in the ALUCP, including but not limited to noise, overflight, safety, and airspace protection. The Riverside County ALUCP Policy Document includes the policies for determining the land use compatibility of the Project since it is located within 2 miles of an airport runway. As mentioned above, the Project site is located in Zone C1 (Mead & Hunt 2014). Zone C1 encompasses areas of moderate to high noise impact and moderate accident potential beneath or adjacent to low altitude overflight corridors.

Policy 4.1.5, Noise Exposure for Other Land Uses of the Riverside County ALUCP requires that land uses, such as the Industrial land use of the Project site, demonstrate compatibility with the acceptable noise levels as shown on Table 4.7-1. Table 4.7-1 indicates that clearly compatible business park land uses experience exterior noise levels below 55 A-weighted decibels (dBA) Community Noise Equivalent Level (CNEL), which industrial land uses experience clearly compatible exterior noise levels below 60 dBA CNEL. Normally acceptable noise levels for Industrial land uses range from 60 to 65 dBA CNEL. Marginally acceptable noise levels at Industrial land uses range from 65 to 70 dBA CNEL. For marginally acceptable noise levels, the indicated noise exposure will cause moderate interference with outdoor activities and with indoor activities when windows are open. The land use is acceptable on the conditions that outdoor activities are minimal and construction features which provide sufficient noise attenuation are used (e.g., installation of air conditioning so that windows can be kept closed). Under other circumstances, the land use should be discouraged.

Table 4.7-1
Riverside County Airport Land Use Compatibility Criteria: Noise

Land Use Category	CNEL (dB) 50–55	55–60	60–65	65–70	70–75
Residential *					
single-family, nursing homes, mobile homes	++	o	–	– –	– –
multi-family, apartments, condominiums	++	+	o	– –	– –
Public					
schools, libraries, hospitals	+	o	–	– –	– –
churches, auditoriums, concert halls	+	o	o	–	– –
transportation, parking, cemeteries	++	++	++	+	o
Commercial and Industrial					
offices, retail trade	++	+	o	o	–
service commercial, wholesale trade, warehousing, light industrial	++	++	+	o	o
general manufacturing, utilities, extractive industry	++	++	++	+	+
Agricultural and Recreational					
cropland	++	++	++	++	+
livestock breeding	++	+	o	o	–
parks, playgrounds, zoos	++	+	+	o	–
golf courses, riding stables, water recreation	++	++	+	o	o
outdoor spectator sports	++	+	+	o	–
amphitheaters	+	o	–	– –	– –

Land Use Acceptability		Interpretation/Comments
++	*Clearly Acceptable*	The activities associated with the specified land use can be carried out with essentially no interference from the noise exposure.
+	*Normally Acceptable*	Noise is a factor to be considered in that slight interference with outdoor activities may occur. Conventional construction methods will eliminate most noise intrusions upon indoor activities.
o	*Marginally Acceptable*	The indicated noise exposure will cause moderate interference with outdoor activities and with indoor activities when windows are open. The land use is acceptable on the conditions that outdoor activities are minimal and construction features which provide sufficient noise attenuation are used (e.g., installation of air conditioning so that windows can be kept closed). Under other circumstances, the land use should be discouraged.
–	*Normally Unacceptable*	Noise will create substantial interference with both outdoor and indoor activities. Noise intrusion upon indoor activities can be mitigated by requiring special noise insulation construction. Land uses which have conventionally constructed structures and/or involve outdoor activities which would be disrupted by noise should generally be avoided.
– –	*Clearly Unacceptable*	Unacceptable noise intrusion upon land use activities will occur. Adequate structural noise insulation is not practical under most circumstances. The indicated land use should be avoided unless strong overriding factors prevail and it should be prohibited if outdoor activities are involved.

* Subtract 5 dB for low-activity outlying airports (Chiriaco Summit and Desert Center)

Source: County of Riverside 2015.

March JPA General Plan

The Land Use Element and Safety/Risk Management Element of the March JPA General Plan (March JPA 1999) include policies related to safety risks for people residing or working in the Project area that will be applied to the Project. The following policies from the March JPA General Plan apply to the Project. Consistency with these policies is discussed in Section 4.9, Land Use and Planning.

Land Use Element

Policy 1.9: Plan for compatible land uses within the aircraft noise impact contours depicted in the Air Installation AICUZ Report for the airfield use.

Policy 6.2: Plan for compatible land uses within the Clear one, Accident Potential Zones I and II, as depicted in the AICUZ Report for the airfield use.

Policy 6.4: Ensure that plans and development do no conflict with the long term needs of the Air Force Reserve in terms of encroachment, noise, accident zone, constraints, etc.

Policy 7.2: Ensure development and use of property within the vicinity of the airfield complies with appropriate building standards and codes, including height restrictions, restrictions on use, setbacks, population densities, insulation and materials, as contained within an approved Comprehensive Land Use Plan and appropriate AICUZ.

Safety and Risk Management Element

Goal 5: Reduce the potential for hazardous material exposure or contamination in the Planning Area

Policy 5.1: Comply with the enforcement of disclosure laws that require all users, producers, and transporters of hazardous materials and wastes to clearly identify such materials at the site, and to notify the appropriate County, State and/or Federal agencies in the event of a violation.

Policy 5.3: Ensure the storage, use and transportation of any hazardous material complies with the standards set forth within the errata sheets published for each substance.

4.7.3 Thresholds of Significance

March JPA uses the California Environmental Quality Act Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the Initial Study prepared for the Project (Appendix A) and the newly adopted California Environmental Quality Act Guidelines

Appendix G (December 2018), the Project could have a significant impact on hazards and hazardous materials if:

- **HAZ-1**: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.
- **HAZ-2**: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
- **HAZ-3**: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.
- **HAZ-4**: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as result, would it create a significant hazard to the public or the environment.
- **HAZ-5**: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.

The Initial Study prepared for the proposed Project determined that impacts related to vicinity to a private air strip, interference with an adopted emergency response and/or evacuation plan, and risk from wildland fires would either result in no impacts or less than significant impacts. For further details, please see the Initial Study included Appendix A. As such, these thresholds are not included in the following impact analysis.

4.7.4 Impacts Analysis

Threshold HAZ-1. Would the Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction

The proposed Project would include construction of a 718,000-square-foot building on an approximately 35.4-acre site (K4 Parcel). Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Channel drainage ditch that runs along the Cactus Channel Improvement Site. A variety of hazardous materials would be transported to, stored, and used during construction activities. These would include fuels for equipment and vehicles, new and used motor oils, cleaning solvents, paints, and storage containers and applicators containing such materials. If not transported, used, or disposed of in a safe manner, hazardous materials used during construction could represent a potential threat to the public and the

environment. However, these materials would be transported, used, and disposed of in accordance with all federal, state, and local laws regulating the management and use of hazardous materials. For example, hazardous materials would not be disposed of or released onto the ground or into the underlying groundwater or any surface water during construction of the proposed Project, and completely enclosed containment would be provided for all refuse generated in the planning area. Additionally, all construction waste, including trash, litter, garbage, solid waste, petroleum products, and any other potentially hazardous materials, would be removed and transported to a permitted waste facility for treatment, storage, or disposal. Use of these materials during construction for their intended purpose would not pose a significant risk to the public or the environment. Consistent with federal, state, and local requirements, transport, removal, and disposal of hazardous materials would be conducted by a permitted and licensed service provider. Any handling, transport, use, or disposal would comply with all applicable federal, state, and local agencies and regulations, including the EPA, the California DTSC, the California Occupational Safety and Health Administration, California Department of Transportation, the RCRA, and the Department of Environmental Health (the Certified Unified Program Agency (CUPA) for Riverside County). Further, during construction, if aggregate aboveground oil/fuel storage capacity is greater than 1,320 gallons (or completely buried 42,000 gallons) and there is a reasonable expectation of an oil discharge into or upon navigable waters of the United States or adjoining shorelines a Spill Prevention, Control and Countermeasure (SPCC) plan would be required (or, for smaller quantities, a spill prevention and response plan).

Given the former uses within the Project vicinity, site conditions observed, and the findings reported in the Phase I ESA, there is a possibility that soil on the K4 Parcel could be potentially impacted by hazardous materials. Other subsurface areas of the site may be impacted by hazardous materials and/or wastes (such as asbestos-containing pipe), buried trash and debris, UXO, and utilities (including high pressure gas lines). As such, construction activities have the potential to result in significant impacts through the transport, use, or disposal of hazardous materials, and mitigation measures are required.

In order to reduce potentially significant impacts associated with accidental release of chemicals from the Project site during construction, **MM-HAZ-1,** which requires the development of a SPCC plan, shall be implemented. Additionally, as required by **MM-HAZ-2**, implementation of a Hazardous Materials Contingency Plan during construction shall be required to address any unexpected hazardous materials encountered throughout Project construction. While it is unlikely that UXOs are present on the K4 Parcel, in an abundance of caution, a UXO survey shall be performed prior to construction activities, as detailed in **MM-HAZ-3**. With implementation of mitigation measures **MM-HAZ-1** through **MM-HAZ-3**, potentially significant hazards and hazardous materials impacts associated with Project construction would be reduced to **less than significant** levels.

Operation

The proposed Project would include a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use on the K4 Parcel and improvements to the existing Cactus Channel. Depending on the activities involved with the proposed warehouse and industrial uses, hazardous materials could be used. The March ARB/IP Land Use Compatibility Plan (Mead & Hunt 2014) imposes restrictions and limitations on the types and quantities of uses and hazardous materials that can be stored on Project sites.

Within the C1 zone, the following restrictions apply:

- A maximum of three dwelling units per acre are permitted.
- An average of 100 people per acre and 250 people in the most concentrated acre can occupy the Project site.
- Prohibited uses include children's school, day care centers, libraries, hospitals, congregate care facilities, and places of assembly.
- In Zones B2 and C1, aboveground storage of more than 6,000 gallons of hazardous or flammable materials per tank is discouraged.
- Noise sensitive outdoor nonresidential uses are prohibited, examples of which include major spectator-oriented sports stadiums, amphitheaters, concert halls and drive-in theaters. Caution should be exercised with respect to uses such as poultry farms and nature preserves.
- Hazards to flight, which include physical (e.g., tall objects), visual, and electronic forms of interference with the safety of aircraft operations, land use development that may cause the attraction of birds are prohibited. Man-made features must be designed to avoid heightened attraction of birds. In Zones A, B1, and B2, flood control facilities should be designed to hold water for no more than 48 hours following a storm and be completely dry between storms (see FAA AC 150/5200-33B). Additionally, certain farm crops and farming practices that tend to attract birds are strongly discouraged. These include: certain crops (e.g., rice, barley, oats, wheat – particularly durum – corn, sunflower, clover, berries, cherries, grapes, and apples); farming activities (e.g., tilling and harvesting); confined livestock operations (i.e., feedlots, dairy operations, hog or chicken production facilities, or egg-laying operations); and various farming practices (e.g., livestock feed, water, and manure). Fish production (i.e., catfish, trout) conducted outside of fully enclosed buildings may require mitigation measures (e.g., netting of outdoor ponds, providing covered structures) to prevent bird attraction.

Despite restrictions put in place on the Project site due to proximity to the March ARB/IP, Project operations do have the potential to result in significant hazards and hazardous materials impacts

through the routine transport, use, or disposal of hazardous materials. However, with implementation of mitigation, and specifically, **MM-HAZ-1**, which requires preparation of a SPCC plan or spill prevention and response plan, and **MM-HAZ-4** which requires preparation and submittal of a Hazardous Materials Business Plan within 30 days of K4 Parcel operations, potentially significant impacts can be reduced to **less than significant** levels.

Threshold HAZ-2. Would the Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction

The proposed Project would include construction of a 718,000-square-foot building on an approximately 35.4-acre K4 Parcel and improvements to the existing Cactus Channel. As discussed in the Phase I ESA prepared for the proposed Project, no recognized environmental conditions (RECs), controlled RECs or historical RECs were identified for the collective proposed Project site. Additionally, no off-site RECs, controlled RECs or historical RECs were identified that would negatively impact the Project site. However, given the proximity to the March ARB and based on the past use of the K4 Parcel as part of a military base for over 50 years, future development of the K4 Parcel, including grading activities have the potential to encounter subsurface hazardous materials and/or wastes, buried trash and debris, UXO, and contaminated media, including soil, soil vapor/gas, and/or groundwater. As such, further observation may be necessary to identify possible contamination such as, but not limited to, the presence of underground facilities, buried debris, waste drums, and tanks, stained soil or odorous soils. With implementation of a Hazardous Materials Contingency Plan during construction, as required by mitigation measure **MM-HAZ-2**, and development and implementation of a plan to manage UXO as required by mitigation measure **MM-HAZ-3**, potentially significant hazards impacts during construction could be mitigated to **less than significant** levels.

Operation

Operation of the K4 Parcel would include industrial uses, specifically an e-commerce/fulfillment center. Depending on the activities involved with the proposed warehouse and industrial uses, hazardous materials could be used. Within the C1 zone (imposed by the March ARB/IP Land Use Compatibility Plan), aboveground storage of more than 6,000 gallons of hazardous or flammable materials per tank is discouraged. Additionally, Senate Bill 483 amended the California Health and Safety Code to require businesses that use 55 gallons (liquid) or 500 pounds (solid) of hazardous materials to submit a Hazardous Materials Business Plan within 30 days of beginning operations. Any handling, transport, use, or disposal would comply with all applicable federal, state, and local agencies and regulations, including the EPA, the California DTSC, the California

Occupational Safety and Health Administration, California Department of Transportation, the RCRA, and the Department of Environmental Health (the CUPA for Riverside County). If aggregate aboveground oil/fuel storage capacity is greater than 1,320 gallons (or completely buried 42,000 gallons) and there is a reasonable expectation of an oil discharge into or upon navigable waters of the United States or adjoining shorelines a SPCC plan would be required (or, for smaller quantities, a spill prevention and response plan). Also, if necessary, the K4 Parcel may need to register with the State of California as a hazardous waste generator and implement requirements for management of hazardous wastes pursuant to Title 22 CCR Section 66260. In order to further reduce potentially significant impacts associated with accidental release of chemicals from the K4 Parcel during operation, **MM-HAZ-1,** which requires the development of a SPCC plan, shall be implemented. The SPCC plan (or spill prevention and response plan) shall identify best management practices (BMPs) for spill and release prevention and provide procedures for cleaning up and disposing of any spills or releases. Additionally, if operations of the K4 Parcel use 55 gallons (liquid) or 500 pounds (solid) of hazardous materials **MM-HAZ-4** would be implemented; requiring the preparation and submittal of a Hazardous Materials Business Plan within 30 days of Project operations. Operation or the Cactus Channel would not result in a potential foreseeable upset and accident release of hazardous materials. Therefore, with compliance with local, state, and federal regulations, along with implementation of **MM-HAZ-1** and **MM-HAZ-4** operations of the proposed Project would not create a significant hazard to the public or the environment through the reasonably foreseeable upset and accident conditions involving the release of hazardous materials. With implementation of mitigation measures, impacts would be **less than significant**.

Threshold HAZ-3. Would the Project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction

The proposed Project include the construction of a 718,000-square-foot building on an approximately 35.4-acre site known as the K4 Parcel, located south of Cactus Avenue, east and north of portions of the March ARB, and west of vacant land formerly part of the March ARB. Additionally, the Project involves improvements within the existing Cactus Channel. There is the potential for proposed Project construction activities, to handle hazardous materials within one-quarter mile of one elementary school, Harvest Time Christian School, located approximately 0.2 mile northwest of the proposed Project site.

According to research conducted for the Phase I ESA, historic US Army Corps of Engineers maps from 1943 and 1944 indicate that a levee was located along the northern portion of March AFB, suggesting the presence of a storm drain channel along the present day Cactus Channel.

The Cactus Channel, which appeared as an earthen storm drain channel, was first evident in historical aerial photographs from the late 1940s and is similar to conditions in the present day. Per the Phase I ESA, a few empty one-quart motor oil containers were observed along the north side of the Cactus Channel and south side of Cactus Avenue, with no other containers of hazardous materials or wastes observed.

As discussed in Section 4.7.2, Relevant Plan, Policies, and Ordinances, regulations such as the Federal Toxic Substances Control Act of 1976 (15 USC 2601 et seq.) and the RCRA, Hazardous Material Transportation Act, and the March JPA General Plan are in place regarding the handling of hazardous materials. These regulations would require the use of certain techniques for the disposal and transport of hazardous wastes. Adherence to the construction specifications included in these federal and local regulations regarding hazardous materials and hazardous waste, including disposal, would reduce hazards to the public or the environment. However, to further minimize potential significant impacts resulting from hazardous emissions or handling of hazardous materials from Project construction, **MM-HAZ-1** through **MM-HAZ-3** would be implemented. Therefore, with implementation of mitigation measures, Project construction would result in a **less than significant impact** relative to hazardous emissions or hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Operation

Operation of the Cactus Channel would not include the use, transport, or disposal of hazardous or acutely hazardous materials, substances, or waste because the Cactus Channel would operate as an underground box culvert that transports stormwater runoff to the Heacock Channel as part of the Riverside County Flood Control and Water Conservation District's services. Surface flows drain to the northeast into an existing stormwater collection basin that connects to an existing storm drain pipe. Conflicts with water quality standards are addressed in Section 4.8, Hydrology and Water Quality. Therefore the Cactus Channel improvements would not result in a significant impact related to hazardous materials within a quarter mile of an existing or proposed school. As previously discussed, upon completion of construction the proposed Project would involve operation of the proposed an e-commerce/fulfillment center on the K4 Parcel. Operation of the K4 Parcel will comply with the enforcement of disclosure laws that require all users, producers, and transporters of hazardous materials and wastes to clearly identify such materials at the site, and to notify the appropriate county, state and/or federal agencies in the event of a violation. As such, any handling, transport, use, or disposal of hazardous materials, which would be limited given the C1 zone, would comply with all applicable federal, state, and local agencies and regulations, including the EPA, the California DTSC, the California Occupational Safety and Health Administration, California Department of Transportation, the RCRA, and the Department of Environmental Health (the CUPA for Riverside County). **MM-HAZ-4** would require the preparation and submittal of a Hazardous Materials Business Plan within 30 days of Project

operations. Therefore, with compliance with local, state, and federal regulations, along with implementation of **MM-HAZ-4** operations of the proposed Project would result in a **less than significant impact** related to hazardous emissions or hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Threshold HAZ-4. Would the Project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as result, would it create a significant hazard to the public or the environment?

California Government Code Section 65962.5 combines several regulatory lists of sites that have the potential to pose a hazard related to known hazardous materials or substances. The DTSC's EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. As discussed in Section 4.7.1, Existing Conditions, a search of selected government databases was conducted by Leighton using the EDR Radius Report environmental database report system (Appendix K). According to the EDR radius map report, March ARB was reported on various hazard-identifying databases. The former March AFB was originally used to train pilots during World War I, and by 1938, it became the central location for west-coast bombing and gunnery training. Due to the facility's purpose in national defense, there was a wide variety of operations that involved the use, storage, and disposal of hazardous materials and waste such as fuel, solvents and waste oil. As a result, 30 different areas of soil and groundwater contamination have been identified on the base. By November 1989, March AFB was added to the NPL due to the contamination of the groundwater. According to the EDR radius map report, the March ARB facilities status is "currently on the Final NPL."

Based on the past use of the K4 Parcel as part of a military base for over 50 years, the subsurface soils on site may contain hazardous materials and/or wastes, buried trash and debris, UXO, and contaminated medial, including soil, soil vapor/gas, and or groundwater. Operations of the K4 Parcel and the Cactus Channel improvements would not include activities such as trenching or grading that would potentially encounter any potential subsurface hazardous materials. Construction activities such as grading and trenching associated with the K4 Parcel and Cactus Channel improvements would have the potential to encounter hazardous materials and thus create a hazard to the environment. However, according to the Phase I ESA, there were no RECs, controlled RECs or historical RECs identified for the Project site. Additionally, no off-site RECs, controlled RECs or historical RECs were identified in the Project vicinity that would negatively impact the Project site. OCPs and arsenic were not detected in the undocumented soil at concentrations exceeding the EPA residential Regional Screening Level or the DTSC Human Health Risk Assessment Note 3 screening levels for OCPs, or the DTSC recognized Southern California background arsenic concentration of 12 mg/kg (Appendix K). Because no RECs, controlled RECs, or historical RECs were identified on or near the Project site, the potential for

impacts associated with past use of the K4 Parcel is unlikely. With implementation of a Hazardous Materials Contingency Plan during construction, as required by mitigation measure **MM-HAZ-2**, and development and implementation of a plan to manage UXO as required by mitigation measure **MM-HAZ-3**, potentially significant hazards impacts during construction could be mitigated to **less than significant** levels.

Threshold HAZ-5. ***For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?***

The Project site is located approximately 4,500 feet from the March ARB/IP Airport and is included as part of the March ARB/IP Airport ALUCP and the 2018 March ARB AICUZ Study area. As depicted in the March ARB/Inland Port Airport JLUS and March ARB/Inland Port Airport ALUCP, the Project site is located within the C1 compatibility zone (Mead & Hunt 2014). Land use restrictions within the C1 zone are described above under the analysis within Threshold HAZ-1. In order to further minimize safety hazards for people residing or working in the Project area, in addition to the above restrictions in place for the portions of the Project site within zone C1, the following additional conditions would apply. Per the Riverside County Airport Land Use Plan (Mead & Hunt 2014), conditions imposed within the C1 zone include:

- Critical community infrastructure facilities are discouraged, including power plants, electrical substations, and public communications facilities. These uses would generally not be permitted unless no other feasible alternatives are available.
- Aboveground bulk storage of more than 6,000 gallons of hazardous or flammable materials per tank is discouraged and would generally not be permitted unless no feasible alternatives are available.
- Sound attenuation shall be incorporated, as necessary, to meet interior noise level criteria. All new residences, schools, libraries, museums, hotels and motels, hospitals and nursing homes, places of worship, and other noise-sensitive uses must have sound attenuation features incorporated into the structures sufficient to reduce interior noise levels from exterior aviation-related sources to no more than CNEL 40 dB. This requirement is intended to reduce the disruptiveness of loud individual aircraft noise events upon uses in this zone and represents a higher standard than the CNEL 45 dB standard set by state and local regulations and countywide ALUC policy. Office space must have sound attenuation features sufficient to reduce the exterior aviation-related noise level to no more than CNEL 45 dB. To ensure compliance with these criteria, an acoustical study shall be required to be completed for any development proposed to be situated where the aviation-related noise exposure is more than 20 dB above the interior standard (e.g., within the CNEL 60 dB contour where the interior

standard is CNEL 40 dB). Standard building construction is presumed to provide adequate sound attenuation where the difference between the exterior noise exposure and the interior standard is 20 dB or less. See Section 4.10, Noise, for additional discussion and evaluation regarding the potential noise impacts associated with the Project.

- Generally, an airspace review required for objects greater than 70 feet in height. Airspace review requirements are determined on a site-specific basis in accordance with Part 77 of the Federal Aviation Regulations. Shorter objects normally will not be airspace obstructions unless situated at a ground elevation well above that of the airport. Taller objects may be acceptable if determined not to be obstructions. The FAA or California Department of Transportation Division of Aeronautics may require marking and/or lighting of certain objects.
- March ARB must be notified of any land use having an electromagnetic radiation component to assess whether a potential conflict with Air Base radio communications could result. Sources of electromagnetic radiation include microwave transmission in conjunction with a cellular tower, radio wave transmission in conjunction with remote equipment inclusive of irrigation controllers and other similar EMR emissions.

The proposed Project also may include a solar photovoltaic (PV) system on the building rooftop. Solar, or PV panels are known to create glare and potentially hazardous reflections into pilots' eyes, and within immediate proximity of an airport and within the flight path of air traffic, this glare could result in potentially significant safety impacts. Minimization of glare from PV systems can be obtained through the use of non-reflective components on PV system panels. Emerging technologies shall be used, such as diffusion coatings and nanotechnological innovations to effectively reduce the refractive index of solar cells and protective glass. These technological advances are intended to make the solar panels more efficient with respect to converting incident sunlight into electrical power, but have the tertiary effect of reducing the amount of light that escapes into the atmosphere in the form of reflected light, a potential source of glare and spectral highlighting. As such, with implementation of **MM-HAZ-5**, requiring the use of non-reflective materials on all PV panels at the Project site, impacts associated with glare from solar panels could be reduced to less than significant.

Similar to potential sight obstructions to pilots caused by PV panels, smoke and steam emitted into the atmosphere from buildings and taller stacks can also obstruct line of sight for pilots. In the event that end user proposes to construct stacks and/or a building that would emit smoke or steam, there would be the potential for significant safety impacts. With implementation of **MM-HAZ-6**, requiring written approval from March ARB and March Inland Port Airport officials, impacts associated with visual obstruction from smoke and/or steam could be reduced to less than significant.

Given the Project site's proximity to an active runway, there is the potential that standing water, including detention basins, could be an attractant to animals, and in particular birds, which could pose a safety risk to aircraft in flight. If standing water associated with the Project were to attract birds, this would result in a potentially significant safety impact. However, with the placement of Cactus Channel, which is currently open and earthen, within a box culvert, this would reduce the potential for standing water within the Channel. Nonetheless, for any planned detention basins associated with the Project, these would be located underground so as to minimize the attraction of water fowl. As such, with implementation of **MM-HAZ-7**, which requires compliance with FAA AC 150/5200-33B and that all standing water, including within detention basins, shall drain within 48 hours following a storm event, this potentially significant impact could be reduced to a less than significant level.

In addition to the potential for ponding water to attract birds, tall trees with masts and trees that are used for roosting also pose as potential safety hazards to the adjacent airport. As such, in order to minimize the potential to attract birds to the Project site, mitigation measure **MM-HAZ-8** restricting the planting of tree species that have masts and/or provide for roosting shall be implemented.

As discussed in Section 4.7.2, Policy 4.1.5 of the Riverside County ALUCP requires that land uses, such as the industrial land use of the proposed Project, demonstrate compatibility with the acceptable noise levels shown in Table 4.7-1. The Project site is partially located within the 60 to 65 dBA CNEL noise level contour boundaries of March ARB/IPA. Based on the Riverside County ALUCP noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the Riverside County ALUCP compatibility criteria, and no noise mitigation is required with typical building construction. Therefore, construction and operational noise impacts associated with exposing people residing or working within the vicinity of a public airport would be considered less than significant.

With the aforementioned development restrictions in place, and with implementation of the required mitigation measures and conditions as outlined above, all of which are intended to avoid safety hazards for people residing or working in the vicinity of an active airport, Project implementation would not result in significant safety hazards, excessive noise, or impacts for people residing or working in the Project area. Impacts would be **less than significant** with implementation of mitigation.

4.7.5 Mitigation Measures

California Environmental Quality Act Guidelines Section 15126.4 requires EIRs to describe feasible measures that can minimize significant adverse impacts. The following mitigation measures have been evaluated for feasibility and are incorporated in order to reduce potentially significant impacts related to hazards and hazardous materials for people working at the Project site.

MM-HAZ-1 **Hazardous Materials Transport.** Aboveground bulk storage of more than 6,000 gallons of hazardous or flammable materials per tank is discouraged in Zone C1, and would generally not be permitted unless no feasible alternatives are available. Any aggregate aboveground oil/fuel storage containers in Zone C1 greater than 1,320 gallons (or completely buried 42,000 gallons) shall include preparation and implementation of a Spill Prevention, Control and Containment (SPCC) plan pursuant to 40 C.F.R. 112 (or, for small quantities, a spill prevention and response plan) during construction, and if applicable, during site operations. The SPCC plan (or spill prevention and response plan) shall identify best management practices for spill and release prevention and provide procedures for cleaning up and disposing of any spills or releases.

MM-HAZ-2 **Hazardous Materials Contingency Plan.** A Hazardous Materials Contingency Plan shall be prepared by a qualified environmental consultant and implemented during demolition, excavation, and construction activities for the Project. The Hazardous Materials Contingency Plan shall include, at a minimum, the following:

- Identification of known areas with hazardous waste and hazardous materials of concern
- Procedures for temporary cessation of construction activity and evaluation of the level of environmental concern
- Procedures for limiting access for properly trained personnel to the contaminated area
- Procedures for notification and reporting, including internal management and local agencies (e.g., local fire department, county Certified Unified Program Agency (CUPA)), as needed
- Health and safety measures for removal and excavation of contaminated soil
- Procedures for characterizing and managing excavated soils
- Procedures for certification of completion of remediation

The Hazardous Materials Contingency Plan shall be submitted to March JPA for approval no less than 30 days prior to the initiation of construction activities at the site.

MM-HAZ-3 **UXO Identification, Training, and Reporting Plan.** Prior to commencement of construction activities, a UXO Identification, Training, and Reporting Plan to properly train all site workers in the recognition, avoidance, and reporting of

military waste debris and ordnance shall be prepared by a qualified environmental consultant. The plan shall contain, at a minimum, the following:

- A description of the training program outline and materials, and the qualifications of the trainers;
- Identification of available trained experts that will respond to notification of discovery of any suspected ordnance (unexploded or not);
- Procedures to stop work immediately in the vicinity of suspected UXO and to notify the Riverside County Sherriff's Department, Certified Unified Program Agency (CUPA) and the U.S. Army Corps of Engineers;
- A work plan to recover and remove discovered ordnance, and complete additional field screening, possibly including geophysical surveys to investigate adjacent areas for surface, near-surface or buried ordnance in all proposed land disturbance areas;
- Documentation of all surveys and investigations performed to evaluate and remove discovered ordnance.

The UXO Identification, Training, and Reporting Plan shall be submitted to March JPA for approval no less than 30 days prior to the initiation of construction activities at the site. The results of geophysical surveys shall be submitted to March JPA within 30 days of completion of the surveys.

MM-HAZ-4 **Hazardous Materials Business Plan.** Businesses that use 55 gallons (liquid) or 500 pounds (solid) of hazardous materials are required to submit a Hazardous Materials Business Plan (pursuant to California Health and Safety Code Section 25500) within 30 days of beginning operations. The Hazardous Materials Business Plan shall contain information on hazardous materials inventory, inspections, training, record keeping, and reporting. The Hazardous Materials Business Plan shall be submitted online through the California Environmental Reporting System website. Further information can be found on the County of Riverside Department of Environmental Health website (http://www.rivcoeh.org/HazMat/hmbp).

MM-HAZ-5 **Solar Voltaic System Approval.** In the event the Project Applicant chooses to include solar photovoltaic system(s) as part of the Project, the system shall be reviewed and approved by the Air Force prior to the issuance of building permits. The Project Applicant shall demonstrate that the solar panels and hardware are designed to minimize glare and spectral highlighting. Emerging technologies shall

be used, such as diffusion coatings and nanotechnological innovations to effectively reduce the refractive index of the solar cells and protective glass.

MM-HAZ-6 **Emittance of Steam/Smoke.** In the event the Project Applicant decides to include system(s) that would result in the emittance of steam and/or smoke as part of the Project, written approval shall be granted by March Air Reserve Base and March Inland Port airport officials prior to the issuance of building permits.

MM-HAZ-7 **Compliance with FAA Advisory Circular 150/5200-33B.** In order to ensure proper functioning of the Project drain system to avoid potential hazards to March Air Reserve Base flights, an additional best management practice (BMP) shall be added to the Project Water Quality Management Plan, which shall require that the applicant enter into a covenant and agreement with the March Joint Powers Authority (JPA) similar to the Water Quality Management Plan and Urban Runoff Best Management Practice Transfer, Access and Maintenance Agreement between March JPA and Sun Life Assurance Company of Canada (Document No. 2014-0030862), which shall be recorded prior to issuance of a certificate of occupancy. A copy of the recorded agreement and BMP shall be provided to the Riverside County Airport Land Use Commission. The BMP shall include the following:

a. The property owner or its designated representative shall monitor the conditions of the detention basins and promptly inspect such basins following completion of each "significant" rain event and the 48-hour period thereafter.

b. The Project includes an underground stormwater detention design so as to minimize the attraction of birds. However, if any standing water remains in a basin that is not beneath a rock, gravel, or other layer following the completion of the "significant" rain event and the 48-hour period thereafter, the property owner or its designated representative shall arrange to have such standing water either removed or covered within the next 2 business days following the conclusion of the 48-hour period.

c. In the event that the standing water situation recurs on a regular basis following the 48-hour detention period, the detention basin may no longer be draining as originally designed to prevent standing water from rising above a rock, gravel, or other layer (for example, due to a rise in groundwater levels or other circumstance beyond the property owner's ability to control). In that situation, the property owner or its designated representative shall promptly engage a licensed civil engineer to prepare a design plan to ensure that such condition does not persist for more than 48 hours following the conclusion of a "significant" rain event. The required engineering design solution shall be implemented promptly, but no later

than 180 days following its approval by all applicable authorities, providing that, until such time as the engineered design solution is implemented, the property owner or its designated representative will maintain the detention basins such that after 48 hours following a significant rain event, the water levels are below a rock, gravel, or other layer.

MM-HAZ-8 **Tree Planting Restrictions.** Trees species with masts and tree species that are suitable for roosting shall not be planted on the Project site. Prior to issuance of a grading permit, the plant palette for the proposed Project shall be reviewed and approved by the March Joint Powers Authority.

4.7.6 Level of Significance After Mitigation

Impacts related to hazards and hazardous materials can be mitigated to less-than-significant levels through the incorporation of mitigation measures **MM-HAZ-1** through **MM-HAZ-8**, as described in Section 4.7.5, Mitigation Measures, into the Project. Therefore, no significant adverse impacts would remain after implementation of mitigation.

4.8 HYDROLOGY AND WATER QUALITY

This section describes the existing hydrology and water quality of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) site, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. The Initial Study concluded that potential impacts related to placing housing or structures within a 100-year flood hazard area; exposing people or structures to a significant risk of loss, injury, or death involving flooding; and inundation by seiche, tsunami, or mudflow would either have no impact or less-than-significant impact and are therefore not discussed further in this Environmental Impact Report (EIR) (Appendix A, Initial Study and Notice of Preparation). The information in this section is based on the following reports:

- *K4 Warehouse and Cactus Channel Improvements Project Jurisdictional Delineation Report* (Appendix F)
- *Geotechnical Exploration Proposed Industrial Warehouse Site K4 Cactus Avenue* (Appendix I1)
- *Geotechnical Addendum Report K4 Moreno Valley Storm Drain Cactus Avenue* (Appendix I2)
- *Hydrology Study for Cactus Avenue K-4 Parcel Industrial* (Appendix M)
- *Hydrology Study for Cactus Avenue Channel* (Appendix N)
- *Project Specific Water Quality Management Plan* (Appendix O)
- *Water Supply Assessment K4 Industrial Project* (Appendix P)

As mentioned in Chapter 2, Project Description, of this EIR, the proposed Project involves the development of the K4 Parcel with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use, and improvements to the Cactus Avenue Drainage Channel (Cactus Channel) between Elsworth Street on the west and Heacock Street on the east. The Project includes the following components for Project approval:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.

- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into one 35.4-acre parcel.

4.8.1 Existing Conditions

Hydrology

The proposed Project site, collectively consisting of the K4 Parcel and the Cactus Channel, is generally located within the March JPA Planning Area within an unincorporated area of the County of Riverside. The Project site is within the San Jacinto Hydrologic Unit Code (HUC) 8(18070202), the Lower San Jacinto River HUC 10(1807020203), and the Perris Reservoir HUC 12(180702020305), as shown on Figure 4.8-1, Watershed Map. The proposed Project site is primarily flat with a west-east trending channel that runs parallel to Cactus Avenue (Cactus Channel). The Project site is underlain by dense older alluvium with surficial and local younger/recent sediments, with low expansion potential (Appendix I2). The Cactus Channel collects flows discharging from the storm drains along Elsworth Street, Frederick Street, and Graham Street. Cactus Channel also receives relatively small runoff from Cactus Avenue via public catch basins that discharge at various locations downstream along the channel. Known hydrologic sources for the Cactus Channel include several culverted storm drain outlets (which collect and convey runoff from the commercial area north of the channel) sheet flows from the adjacent March Air Reserve Base, and direct precipitation. The Cactus Channel flows east until the intersection of Cactus Avenue and Heacock Street where flows are diverted south into a drainage ditch along Heacock Street which drains into the Perris Valley storm drain system. Flows continue into the San Jacinto River and ultimately Lake Elsinore. On-site delineations prepared by Rocks Biological Consulting identified that sections of the Cactus Channel meet the parameters for jurisdictional wetland hydrology (Appendix F). As shown on Figure 4.8-2, FEMA Flood Map, the proposed Project site is located in Zone D, which indicates that flood hazards are undetermined, but possible.

The K4 Parcel contains approximately 35.4 acres of natural open brush. Generally, surface flows on the K4 Parcel drain in a southeast direction, onto the March Air Reserve Base, eventually entering the Heacock Channel, located approximately 1.5 miles to the southeast (Appendix M). Table 4.8-1, Existing Average and Annual Precipitation describes the estimated monthly total and average precipitation for the Project area between 2007 and 2018.

Table 4.8-1
Existing Average and Annual Precipitation

Monthly Total Precipitation (inches) for March AFB, CA (NOAA)

Note: trace precipitation/snowfall/snow depth amounts are treated as zero in sums, means, and frequency counts. Annual average temperatures are the average of the twelve-monthly values. Values of 'M' indicate missing data and 'T' indicates a trace."
Source: Appendix F.

Groundwater

As shown in Figure 4.8-3, Regional Geology Map, the site is underlain by Quaternary Older Alluvial deposits consisting primarily of medium dense to very dense silty to clayey sand. Neither surface water nor groundwater were observed on site during field exploration conducted by DRC Engineering (Appendix O). However, geotechnical exploration identified groundwater at a depth of approximately 19 feet below ground surface (bgs) and 23 feet bgs. Historic groundwater data, as reported by Department of Water Resource data for Well 338995N1171958W001 located approximately 5 miles east of the Project site, reflect a groundwater elevation of 1,470 feet (about 82 feet bgs) in April 2017 (Appendix O). Leighton Consulting conducted a geotechnical investigation for the Project site in 2018; groundwater was encountered at approximately 19 to 23 bgs (Appendix K, Phase I and Limited Phase II Environmental Site Assessment, Proposed Industrial Warehouse Site K4). Due to the soil type and density within the Project site, infiltration is relatively impermeable due to the geologic formation within the depth explored (Appendix O).

Water Quality

Water quality is affected by sedimentation caused by erosion, runoff carrying contaminants, and direct discharge of pollutants (point-source pollution). As land is developed, the new impervious surfaces can send an increased volume of runoff containing oils, heavy metals, pesticides, fertilizers, and other contaminants (non-point-source pollution) into adjacent watersheds.

Stormwater that accumulates on impervious surfaces, such as parking lots, rooftops, and streets drains directly and indirectly to waters of the United States. As identified in the Preliminary Water Quality Management Plan (WQMP) (Appendix O), the Project's primary pollutants of concern include metals, nutrients, trash and debris, and oil and grease. Construction-related pollutants typically include sediments, concrete, paints and solvents, and hazardous materials associated with operation and maintenance of heavy equipment such as fuels and oils.

Surface water quality on the Project site is regulated by the Santa Ana Regional Water Quality Control Board (RWQCB) (Region 8). The Santa Ana RWQCB Basin Plan establishes water quality standards for all the groundwater and surface water in the region. The Santa Ana Region includes the upper and lower Santa Ana River watersheds, the San Jacinto watershed, and several other small drainage areas.

Under Section 303(d) and 305(b) of the Clean Water Act (CWA), the State Water Resources Control Board (SWRCB) is required to develop a list of water quality limited segments for jurisdictional waters of the United States and prepare an integrated report on the current statewide status of water quality every two years. The waters on the list do not meet water quality standards, and therefore, the RWQCB was required to establish priority rankings and develop action plans, called Total Maximum Daily Loads, to improve water quality. The U.S. Environmental Protection Agency (EPA) approved the Santa Ana RWQCB's 303(d)/305(b) integrated report on water quality in July 2015 (SWRCB 2016). The list includes pollutants causing impairment to receiving waters or, in some cases, the condition leading to impairment. As previously stated, surface flows from the Project site are discharged through the municipal stormwater drainage system to the San Jacinto River. The terminal reservoirs for the San Jacinto River (i.e., Lake Elsinore) have CWA Section 303(d) impairment listings for nutrients and pathogens (SWRCB 2016).

4.8.2 Relevant Plans, Policies, and Ordinances

Federal

Clean Water Act

The CWA (33 USC 1251 et seq.), as amended by the Water Quality Act of 1987, is the major federal legislation governing water quality. The objective of the CWA is "to restore and

maintain the chemical, physical, and biological integrity of the Nation's waters." Key sections of the act are as follows:

- Sections 303 and 304 provide for water quality standards, criteria, and guidelines. Under Section 303(d) of the CWA, the State of California is required to develop a list of impaired water bodies that do not meet water quality standards and objectives and establish TMDLs for each pollutant/stressor. The water quality impairments relevant to the Project are discussed above in the Setting.
- Section 401 (Water Quality Certification) requires an applicant for any federal permit that proposes an activity which may result in a discharge to waters of the United States, to obtain certification from the state that the discharge will comply with other provisions of the act. The Project area supports jurisdictional wetlands and non-wetland waters of the United States/State and will require a Section 401 water quality certification. Effects of the Project on jurisdictional waters are addressed in Section 4.3, Biological Resources.
- Section 402 establishes the National Pollutant Discharge Elimination System (NPDES), a permitting system for the discharge of any pollutant (except for dredged or fill material) into waters of the United States. This permit program is administered by the SWRCB and the nine RWQCBs, who have several programs that implement individual and general permits related to construction activities, stormwater runoff quality, and various kinds of non-stormwater discharges. The Project will be in compliance with CWA Section 402, as discussed in the impact analysis below.
- Section 404 establishes a permit program for the discharge of dredged or fill material into waters of the United States. This permit program is jointly administered by the U.S. Army Corps of Engineers and the EPA. Effects of the Project on jurisdictional waters are addressed in Section 4.3.

Numerous agencies have responsibilities for administration and enforcement of the CWA. At the federal level this includes the EPA and the U.S. Army Corps of Engineers. At the state level, with the exception of tribal lands, the California EPA and its sub-agencies, including the SWRCB, have been delegated primary responsibility for administering and enforcing the CWA in California.

State

Porter–Cologne Water Quality Control Act

The Porter–Cologne Act (codified in the California Water Code, Section 13000 et seq.) is the primary water quality control law for California. Whereas the CWA applies to all waters of the United States,

the Porter–Cologne Act applies to waters of the state,[1] which includes isolated wetlands and groundwater in addition to federal waters. It is implemented by the SWRCB and the nine RWQCBs. In addition to other regulatory responsibilities, the RWQCBs have the authority to conduct, order, and oversee investigation and cleanup where discharges or threatened discharges of waste to waters of the state could cause pollution or nuisance, including impacts to public health and the environment.

The act requires a "Report of Waste Discharge" for any discharge of waste (liquid, solid, or otherwise) to land or surface waters that may impair a beneficial use of surface or groundwater of the state. California Water Code Section 13260 subdivision (a) requires that any person discharging waste or proposing to discharge waste, other than to a community sewer system, that could affect the quality of the waters of the state, to file a Report of Waste Discharge with the applicable RWQCB. For discharges directly to surface water (waters of the United States), an NPDES permit is required, which is issued under both state and federal law; for other types of discharges, such as waste discharges to land (e.g., spoils disposal and storage), erosion from soil disturbance, or discharges to waters of the state (such as groundwater and isolated wetlands), Waste Discharge Requirements (WDRs) are required and are issued exclusively under state law. WDRs typically require many of the same best management practices (BMPs) and pollution control technologies as required by NPDES-derived permits.

Basin Planning

The nine RWQCBs throughout California adopt and implement Basin Plans that recognize the unique characteristics of each region with regard to natural water quality, actual and potential beneficial uses, and water quality problems. The Santa Ana RWQCB is responsible for the protection of the beneficial uses of waters within the watershed of the Santa Ana River, including the Project area.

The *Water Quality Control Plan for the Santa Ana River Basin* designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan (California Water Code Sections 13240–13247) (Santa Ana RWQCB 2016). The Santa Ana RWQCB basin plan must conform to the policies set forth in the Porter-Cologne Act as established by the SWRCB in its state water policy. The Porter-Cologne Act also provides the RWQCBs with authority to include within their basin plan water discharge prohibitions applicable to particular conditions, areas, or types of waste. The Water Quality Control Plan for the Santa Ana River Basin is continually being updated to include amendments related to implementation of TMDLs, revisions of programs and policies within the Santa Ana RWQCB region, and changes to beneficial use designations and associate water quality objectives.

[1] "Waters of the state" are defined in the Porter–Cologne Act as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code, Section 13050(e)).

NPDES and WDR Permits

The NPDES and WDR programs regulate construction, municipal, and industrial stormwater and non-stormwater discharges under the requirements of the CWA and the Porter–Cologne Water Quality Control Act. The industrial and construction stormwater programs are administered by the SWRCB, while the municipal stormwater program and other WDRs are administered by the Santa Ana RWQCB. Relevant permits are discussed below.

Construction General Permit (SWRCB Order 2012-0006-DWQ, as amended)

For stormwater discharges associated with construction activity in the State of California, the SWRCB has adopted the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit) to avoid and minimize water quality impacts attributable to such activities (SWRCB 2012). The Construction General Permit applies to all projects in which construction activity disturbs 1 acre or more of soil. Construction activity subject to this permit includes clearing, grading, and disturbances to the ground, such as stockpiling and excavation. The Construction General Permit requires the development and implementation of a stormwater pollution prevention plan (SWPPP), which would include and specify water quality BMPs designed to prevent pollutants from contacting stormwater and keep all products of erosion from moving off site into receiving waters. Routine inspection of all BMPs is required under the provisions of the Construction General Permit, and the SWPPP must be prepared and implemented by qualified individuals as defined by the SWRCB.

Industrial General Permit (SWRCB Order No. 2014-0057-DWQ, as Amended)

Depending on the type of facility constructed on the site, compliance with the *NPDES General Permit for Stormwater Discharges Associated with Industrial Activities* (i.e., the Industrial General Permit, or IGP) could be required. Warehouse distribution facilities are not a type of facility currently required to obtain coverage under the IGP, however, the end user has not yet been identified. Ultimately, it is possible that another facility consistent with the zoning designation of Industrial and subject to the IGP (e.g., warehouse with fuel dispensing facilities or vehicle maintenance facilities, food processing use or manufacturing use) could be constructed. Should the Project include a facility covered under the IGP, the Project Applicant would be required to implement management measures that would achieve the performance standard of best available technology economically achievable and best conventional pollutant control technology.

The IGP requires stormwater dischargers to eliminate unauthorized non-stormwater discharges; develop and implement an industrial SWPPP; implement feasible and effective BMPs; conduct monitoring; compare monitoring results to numeric action levels; perform appropriate exceedance response actions when numeric action levels are exceeded; and certify and submit all permit registration documents electronically via the SWRCB's Storm Water Multiple Application and Report Tracking System.

General Waste Discharge Requirements for Recycled Water Use (SWRCB Order No. 2014-0090-DWQ)

The SWRCB adopted general WDRs for non-potable uses of recycled water. The general WDRs are intended to conserve availability of local potable water supplies by streamlining permitting for recycled water use that typically presents a relatively low threat to water quality. It relieves new recycled water end users from the requirements to apply for individual WDRs, and provides coverage for recycled water uses not otherwise covered by general orders or existing permits. Uses that may be covered under this general permit include irrigation, impoundments, cooling/industrial uses, and construction uses such as dust control and soil hydration. Recycled water purveyors must submit a water recycling program for review and approval by the RWQCB, a Title 22 engineering report to Division of Drinking Water, and other submittals as specified in the order to have coverage under this permit. The water purveyor for the proposed Project is Western Municipal Water District (WMWD), which has recycled water available and is authorized by the SWRCB to provide recycled water for non-potable uses to its customers.

Local

NPDES – New Development & Redevelopment Guidelines for Projects Under the March JPA

The NPDES – New Development & Redevelopment Guidelines for Projects Under the March JPA (March JPA 2008) is a document prepared to provide March JPA with guidance, procedures, and a format to implement the regional NPDES land development requirements (hereafter referred to as the March JPA NDPES Guidelines). Additionally, this document is intended to help March JPA establish consistency with other agencies (e.g., the U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, Santa Ana RWQCB, Riverside County) that all help protect natural resources. The March JPA is not a co-permittee of the Riverside County Municipal Separate Storm Sewer System (MS4) Permit but has the legal authority and responsibility to control the quality of stormwater system discharges under NPDES land development regulations. The March JPA has chosen to meet the intent of the Riverside County MS4 Permit concerning new development and redevelopment by establishing submittal requirements, including design guidelines for BMPs and WQMPs, for projects under its authority. Approval of a project-specific Preliminary WQMP requires that the WQMP include site design BMPs, applicable source control BMPs, and treatment control BMPs. It is required under the NPDES, that implementation of a new development project shall conform with all recommendations in the associated WQMP and WQMP Conditions of Approval.

The reduction of pollutants in urban stormwater discharge to the maximum extent practicable through the use of structural and nonstructural BMPs is one of the primary objectives of the water quality regulations for MS4s. BMPs typically used to manage runoff water quality include controlling roadway and parking lot contaminants by installing filters with oil and grease

absorbents at storm drain inlets, cleaning parking lots on a regular basis, incorporating peak-flow reduction and infiltration features (such as grass swales, infiltration trenches, and grass filter strips) into landscaping, and implementing educational programs.

The March JPA has the authority to ministerially withhold certificates or permits if BMPs or specifically designed features needed to properly manage potential pollutants are not implemented into a complete project. The March JPA uses the most recent guidance, handbooks and templates adopted by the Riverside County Flood Control and Water Conservation District (and other MS4 co-permittees) as the standard for adequacy when reviewing WQMPs for projects under its authority.

Landscape Ordinances

Jurisdictional authorities that have established landscape ordinances are the County of Riverside Water Efficient Landscape Requirements (Ordinance No. 859), and March JPA *Water Efficient Landscape Ordinance (Ordinance No. JPA 16-03).* The Project Applicant will be required to plan and install water-efficient devices and landscaping in accordance with applicable ordinances. The subject Project may be served by WMWD's existing recycled water distribution infrastructure. Accordingly, landscaped areas for the Project including all piping, controls, and related appurtenances must be designed and installed to accommodate potential recycled water use.

March JPA General Plan

The Safety and Risk Management Element of the March JPA General Plan includes goals and policies related to flood hazards and stormwater runoff that would be applied to the Project (March JPA 1999). The following policies from the March JPA General Plan apply to the Project. Consistency with these policies is discussed in Section 4.9, Land Use and Planning.

Goal 3: Minimize injury, loss of life, property damage, and economic and social disruption caused by flood hazards.

Policy 3.3: Ensure all development within identified flood hazard areas complies with Floodplain Management Regulations.

Policy 3.4: Ensure that development does not divert storm water runoff onto adjacent properties, or cause alterations of natural drainage courses that cannot be adequately handled by existing drainage facilities or the flood control improvements proposed with the development.

Policy 3.5: Require the installation and maintenance of storm drains by property owners.

Policy 3.6: Assess potential environmental drainage impacts of new construction, including the necessity and impact of District drains and privately-owned and operated storm drains adjacent to slopes and stream-bed areas.

Policy 3.7: Utilize and support storm drain maintenance efforts to prevent localized flooding and mud and debris flows from overtaxed storm drains during strong storms.

4.8.3 Thresholds of Significance

March JPA uses the California Environmental Quality Act Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the Initial Study prepared for the Project (Appendix A) and the newly adopted California Environmental Quality Act Guidelines Appendix G (December 2018), the Project could have a significant impact on hydrology and water quality if the Project would:

- **HYD-1**: Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.
- **HYD-2**: Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.
- **HYD-3**: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
    - result in substantial erosion or siltation on or off site;
    - substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;
    - create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
    - impede or redirect flood flows.

4.8.4 Impacts Analysis

Threshold HYD-1. Would the Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

Construction

The proposed Project would collectively include construction of a 718,000-square-foot building on the approximately 35.4-acre K4 Parcel and the conversion of the existing drainage ditch into a box culvert within the Cactus Channel. In addition to the proposed building, a total of 598 automobile parking stalls, 242 truck trailer parking stalls, and 105 loading dock positions would be provided on the K4 Parcel. Vehicles would access the site via new driveways aligned with the termination of Veterans Way on the west end of the K4 Parcel and the terminus of Frederick Street towards the eastern end of the Project site. An additional designated truck route would provide truck access to the K4 Parcel. The Project would also include improvements to the Cactus Channel drainage that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. A box culvert would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box.

During construction of the Project, grading would occur, bare soils would be exposed, and soil and material stockpiles would be established. Fuels, lubricants, and solid and liquid wastes would be stored within active construction areas. If the construction areas are not properly managed to contain loose soils and liquid and solid contaminants, short-term water quality impacts could occur due to sediment and contaminant runoff from the construction zone. Potential impacts to water quality could also result from the improper handling and disposal of construction waste materials and oil and grease leakage from vehicles and equipment.

Because the Project is greater than one acre in size, the Project Applicant and/or its qualified contractor would be required to submit a Notice of Intent to the SWRCB in order to obtain approval to carry out construction activities under the NPDES Construction General Permit. This permit would include a number of design, management, and monitoring requirements for the protection of water quality and the reduction of construction phase impacts related to stormwater (and some non-stormwater) discharges. Compliance with the Construction General Permit requires a SWPPP be developed and implemented by qualified individuals with appropriate credentials and training (i.e., qualified SWPPP developer/qualified SWPPP practitioner), as defined by the SWRCB. The SWPPP includes BMPs for preventing water quality degradation, identification of stormwater collection and discharge points, general topography both before and after construction, and drainage patterns across the Project site. The BMPs ensure that water quality standards are met

and that stormwater runoff from the construction work areas does not cause degradation of water quality in receiving water bodies.

The exact type and location of construction site BMPs in the SWPPP would be based on site-specific conditions and receiving water risk. However, minimum BMPs include erosion controls (e.g., mulches, soil binders, erosion control blankets/mats, outlet projection/energy dissipation devices), sediment controls (e.g., silt fences, fiber rolls, gravel bags), tracking controls (e.g., stabilized construction entrance/exit, entrance/outlet tire wash), wind erosion controls, non-stormwater management, and materials and water management (cleanup and containment of trash and debris, stockpile management, spill prevention and control, hazardous waste management). Other examples of BMPs that could be used during Project construction include, but are not limited to, sandbag barriers, geotextiles, storm drain inlet protection, sediment traps, riprap, and soil stabilizers/hydro seeding. Implementation of these BMPs included in the SWPPP would minimize effects on water quality from construction-induced erosion and sedimentation on the Project site. The SWPPP would also include hazardous materials BMPs necessary to prevent or contain spills or leaks associated with construction equipment and materials.

Although construction activities have the potential to adversely affect water quality, required coverage under the Statewide General Construction Permit would be adequate to ensure potential construction-related impacts on water quality are avoided or substantially minimized, and do not violate any SWRCB/RWQCB water quality standards or WDRs. For these reasons, the Project's construction-phase would not violate water quality standards or WDRs and would result in a **less than significant** impact.

Operations

The proposed Project would result in the development and operations of a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. The proposed Project would also include paved parking areas, drive aisles, storm drains, utilities, and associated landscaping areas. The Project site would drain to three separate underground detention systems. The Project would also include improvements to the Cactus Channel drainage which would install an undergrounded box culvert that would run approximately 7,900 linear feet parallel to Cactus Avenue. An increase in pollutant levels in the runoff conveyed to the storm drain system, if uncontrolled, could violate water quality standards. The Project's primary pollutants of concern include metals, nutrients, trash and debris, and oil and grease (Appendix O). These pollutants may be sourced from fertilizers used on landscaped areas; vehicular fluids, including antifreeze, motor oil, brake fluid, gasoline, and transmission fluid emanating from paved areas and parking areas on the site. An increase in pollutant levels in the runoff conveyed to the storm drain system, if uncontrolled, could violate water quality standards and the WDR of the CWA or the Porter-Cologne Water Quality Control Act. As previously discussed, the Preliminary Project Specific WQMP (Appendix O) describes and illustrates, in broad outline, how the drainage for the entire Project will comply with the WQMP requirements. Source control BMPs would be incorporated into the Project design. These BMPs may include structural

features such as roofs over and berms around trash and recycling areas, and operational features such as regular sweeping of the site by the site's occupant or user (Appendix O). Compliance with the March JPA NPDES Guidelines requires that pollutants of concern be treated by a California Stormwater Quality Association-approved treatment BMP with medium to high removal rates. In order to minimize pollutant levels in the runoff conveyed to the storm drain system, several permanent water quality BMPs have been proposed in the WQMP to address the proposed access roadways for each parcel. Operational source control BMPs may include but are not limited to the following:

- Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."
- Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions.
- Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Water from loading dock areas shall be drained to the sanitary sewer, or diverted and collected for ultimate discharge to the sanitary sewer.
- Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.
- Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris.
- Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.

Based on geotechnical testing and soil reports, the proposed Project site has poor percolation test results (less than 0.01 inches per hour) and therefore is not suitable for on-site infiltration (Appendix I2). In addition, there are not enough adjacent pervious areas to disperse runoff from rest of the proposed development area. Therefore, all stormwater will be treated by two proposed Modular Wetland Biofiltration Systems (MWSs) prior to leaving the K4 Parcel. MWSs are stormwater systems that utilize horizontal biofiltration, replicating the natural processes to remove pollutants from stormwater runoff. Pervious surface area is proposed to the maximum extent practicable while still allowing for other impervious site design requirements (i.e., amount of parking stalls) (Appendix O).

As stated in Section 4.8.2, Relevant Plans, Policies, and Ordinances, the March JPA has chosen to meet the intent of the Riverside County MS4 Permit concerning new development and redevelopment by establishing submittal requirements, including design guidelines for BMPs and WQMPs, for projects under its authority. The NPDES – New Development & Redevelopment Guidelines for Projects Under the March JPA (NPDES) is a document prepared to provide March JPA with guidance, procedures, and a format to implement the regional NPDES land development requirements. As such, the March JPA requires the approval of the WQMP (Appendix O) by the March JPA Engineer.

As stated earlier in this section, approval of a project-specific Preliminary WQMP requires that the WQMP include site design BMPs, applicable source control BMPs, and treatment control BMPs. It is required under the NPDES, that implementation of a new development project shall conform with all recommendations in the associated WQMP and WQMP Conditions of Approval. The WQMP shall meet the March JPA minimum standards in order to be approved by the March JPA. Once the Final WQMP is approved, the Project is required to implement all BMPs and conditions of approval identified in the WQMP. The implementation of current BMP requirements would result in an improvement to water quality on and off site compared to existing conditions because of the more stringent requirements for development in place today. Considering the Project site is underlain with dense older alluvium soils that have slow infiltration rates, the existing site conditions have poor percolation and is not suitable for on-site infiltration. In addition the proposed Project would implement BMP requirements that result in water quality improvements, thus Project-related water quality impacts would be **less than significant**.

Threshold HYD-2. Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

As stated in Section 4.8.1, Existing Conditions, neither surface water nor groundwater were observed on site; however, geotechnical exploration identified groundwater at a depth of approximately 19 to 23 feet bgs. On the K4 Parcel, construction activities would include rough grading, utility relocation/installation, and building construction. Rough grading and utility installation would last approximately 25 days, and building construction, including pad/site-specific grading activities, would occur over approximately 11 months. Construction activities on the K4 Parcel are not anticipated to require dewatering of groundwater due to the depth of the groundwater, and any dust control actions would utilize water imported via water trucks. Construction activities for the Cactus Channel improvements component of the proposed Project are also not anticipated to include dewatering of groundwater, as the depth of the groundwater exceeds any proposed excavations, and any dust control actions would utilize water imported via water trucks. As identified in Appendix O, under proposed Project conditions, the total proposed impervious footprint would be 1,389,000 square feet. The proposed Project design maximizes pervious areas to the maximum extent practicable while still allowing for other impervious site design requirements (i.e., amount of parking stalls). The increase in impervious area contributes to larger quantities of runoff. However, the proposed Project is required by the Riverside Santa Ana Region Municipal MS4 Permit to include low impact development and infiltration BMPs, such as stormwater design features and biotreatment (Appendix O). The proposed Project also includes pervious areas in the southeastern and northwestern corners of the site which would encourage on-site infiltration of stormwater runoff which would provide groundwater recharge. However, because there are not enough adjacent pervious areas to disperse runoff from rest of the proposed development area, stormwater would eventually be treated by two proposed MWSs to prior leaving the Project site.

Under proposed Project conditions, the drainage pattern for the both the K4 Parcel and the Cactus Channel would be consistent with the existing drainage pattern. The existing K4 Parcel is approximately 35.4 acres of mass graded land with surface flows draining in the northeast direction into an existing stormwater collection basin that connect to an existing storm drain pipe (Appendix O). The proposed Project would include the operations of a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. The proposed Project would also include paved parking areas, drive aisles, storm drains, utilities, and associated landscaping areas. No wells or direct connections to the underlying aquifers are proposed under Project conditions. Potable water would be supplied by WMWD. WMWD relies on three existing water sources: groundwater, imported water, and recycled water to meet its wholesale and retail demands, with imported water sources being the primary water source. WMWD purchases both Colorado River and the State Water Project, but also receives recycled water and supplemental water obtained from the cities of Corona and Riverside and other local projects (Appendix P). WMWD is able to convey groundwater obtained from Elsinore Valley Municipal Water District's groundwater rights which is delivered via Riverside Public Utilities via the existing Mockingbird Canyon Pump Station and Whitegates Reservoir. WMWD instead utilizes up to 4,208 acre-feet per year of Elsinore Valley Municipal Water District's groundwater rights produced from the Bunker Hill Basin and the Colton and Riverside Basins (WMWD 2016). Total groundwater storage capacity for the Bunker Hill Basin is approximately 5,976,000 acre-feet. Because those water supplies will be from adjudicated and highly managed groundwater basins, the amounts are categorized as reliable sources in normal, single-dry year, and multiple-dry year conditions (Appendix P).

Considering construction and operation of the proposed Project would not directly draw groundwater from the underlying aquifer, and that WMWD receives approximately 9% of their water supply from groundwater, the proposed Project would not substantially effect water demand from WMWD that appreciably deplete their overall groundwater supplies (WMWD 2016). Additionally, the proposed Project would use recycled water for non-potable uses (Appendix O). For these reasons, the Project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level. As such, impacts to groundwater and groundwater recharge would be **less than significant**.

Threshold HYD-3. Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

(i) result in substantial erosion or siltation on or off site;

(ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;

(iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

(iv) impede or redirect flood flows.

As discussed in Section 4.8.1, the proposed K4 Parcel is primarily flat with Cactus Channel located north of the site and running west to east, parallel to and south of Cactus Avenue. Surface flows on the K4 Parcel drain in a southeast direction, onto the March Air Reserve Base, eventually entering the Heacock Channel, located approximately 1.5 miles to the southeast. The existing K4 Parcel is approximately 35.4 acres of mass graded land with surface flows draining in the northeast direction into an existing storm water collection basin that connect to an existing storm drain pipe (Appendix O). The site is underlain by Quaternary Older Alluvial deposits consisting primarily of medium dense to very dense silty to clayey sand, which causes site infiltration to be relatively impermeable (Appendix O).

Construction

Construction of the proposed Project would include the development of a 718,000-square-foot building, paved parking areas, drive aisles, storm drains, utilities, and associated landscaping areas on the approximately 35.4-acre K4 Parcel. Construction activities on the K4 Parcel would include rough grading, utility relocation/installation, and building construction. These activities would have the potential to generate water-borne pollutants such as silt, debris, chemicals, paints, and other solvents with the potential to affect water quality. In the absence of protective and avoidance measures construction of the Project has the potential to result in short-term impacts to water quality. The Cactus Channel improvements include the installation of a box culvert which would require trenching through the existing swale, relocation of some utilities, and removal of some existing roadway culverts and extending storm drain connections to the earth swale. Similarly, these construction activities would have the potential to generate water-borne pollutants with the potential to affect water quality.

Pursuant to the requirements of the Santa Ana RWQCB, prior to commencement of construction activities, the proposed Project (collectively, the K4 Warehouse and Cactus Channel improvements) would be required to obtain coverage under the State of California NPDES General Construction Permit. The NPDES permit is required for all projects that include construction activities, such as clearing, soil stockpiling, grading, and/or excavation that disturb at least 1 acre of total land area. Compliance with the NPDES permit involves the preparation and implementation of a SWPPP for construction related activities. The SWPPP will specify the BMPs that the Project would be required to implement during construction activities to ensure that all potential pollutants of concern, including sediment, are prevented, minimized, and/or otherwise appropriately treated prior to being discharged from the property. Examples of BMPs that could be used during Project construction include, but are not limited to, sandbag barriers, geotextiles, storm drain inlet protection, sediment traps, riprap, and soil stabilizers/hydro seeding. Mandatory compliance with the SWPPP would ensure that the Project does not result in substantial erosion or siltation on site or off site during short-term construction activities. Thus, water quality impacts associated with short-term construction activities would be **less than significant** and no mitigation would be required. Mandatory compliance with the SWPPP would ensure that the Project does not result in substantial erosion or flooding on site or off site during short-term construction activities.

Operations

To meet the requirements of the County's NPDES permit and in accordance with the Riverside County Ordinance No. 754, the Project is required to prepare and implement a WQMP. The WQMP is a site specific, post-construction water quality management program designed to minimize the release of potential waterborne pollutants, including pollutants of concern for downstream receiving waters, under long-term conditions with BMPs. Implementation of the WQMP ensures on-going, long-term protection of the watershed basin. Compliance with the WQMP would be required as a condition of approval for the Project including long-term maintenance of on-site water quality features to ensure their long-term effectiveness. A Preliminary Project Specific WQMP has been prepared for the Project (Appendix O). The Preliminary Project Specific WQMP describes and illustrates how the drainage for the entire Project would comply with the WQMP requirements. As stated earlier in this section, approval of a project-specific Preliminary WQMP requires that the WQMP include site design BMPs, applicable source control BMPs, and treatment control BMPs. It is required under the NPDES, that implementation of a new development project shall conform with all recommendations in the associated WQMP and WQMP Conditions of Approval. The WQMP shall meet the March JPA minimum standards in order to be approved by the March JPA. Once the Final WQMP is approved, the Project is required to implement all BMPs and conditions of approval identified in the WQMP.

Under proposed Project conditions, the drainage pattern for the K4 Parcel would be consistent with the existing drainage pattern. As previously discussed, the proposed Project site has poor percolation test results (less than 0.01 inches per hour) and therefore is not suitable for on-site infiltration. Therefore,

BMPs such as biotreatment were selected as the most appropriate treatment BMPs. The site would drain to three separate underground detention systems. The westerly 14.8 acres of the K4 Parcel would drain to underground detention system 'A'. The central 15.37 acres of the K4 Parcel would drain to underground detention system 'B'. The easterly 2.47 acres of the K4 Parcel would drain to underground detention system 'C'. The proposed improvements to the Cactus Channel would maintain flows in their current west-east orientation. The existing hydrology of the Cactus Channel is considered the same as the future condition for Cactus Channel, based on the fact that the watershed is almost fully developed and most flood control facilities upstream and downstream of Cactus Avenue have been developed (Appendix N). Since few areas are still in the process of being developed, all assumptions in the development of the hydrologic model assumed full development. The proposed design for Cactus Channel features underground reinforced concrete boxes that would carry flow to Heacock Channel at a slope of 0.18%. The proposed Cactus Channel improvements were designed to take the place of the existing earthen Cactus Channel and carry the cumulative maximum flow relative to the junctions upstream. The design also includes a proposed 30-foot easement for Riverside County Flood Control District. Cactus Channel Improvement Plans are included in Appendix N.

Under proposed Project conditions, the drainage pattern for the Project site (collectively the K4 Parcel and Cactus Channel) would be consistent with the existing drainage pattern. The southeasterly off-site flows would be intercepted and conveyed through three separate underground detention systems. The two-year storm flow rates were calculated, as shown in Appendix M, using the Riverside County unit hydrograph dividing the K4 Parcel roughly into three portions. For the two-year storm event, the flow rate increases in the proposed conditions from 0.76 cfs to 6.23 cfs. Under the proposed Project, three underground detention systems consisting of a series of parallel 42-inch storm drain pipes would be constructed that would reduce the peak discharge rate under this storm event. The 100-year storm flow rates increase from 14.85 cfs to 16.37 cfs. The three underground detention systems, consisting of a series of parallel 42-inch storm drain pipes, would reduce the peak discharge rate under the 100-year storm event. The Cactus Channel improvements would include installation of a box culvert, in replacement of the existing earthen channel. Additionally, the Project would contain low impact development and preventative measures (i.e., overflow containment structures and dead-end sumps) to control the peak flows to ensure there would be no adverse effect on downstream facilities (Appendix O). Therefore, the existing hydrology of the Cactus Channel is considered the same as future conditions, however, designed to carry the cumulative maximum flow relative to the junctions upstream.

As discussed under above, the proposed design for Cactus Channel would include an underground reinforced concrete box carrying flows to Heacock Channel at a slope of 0.18%. The proposed Cactus Channel improvements would take the place of the existing earthen channel and carry the cumulative maximum flow relative to the junctions upstream. The three underground detention systems would reduce the peak discharge rate under the 100-year storm event. The Project would contain low impact development and preventative measures to control the peak flows to ensure

there would be no adverse effect on downstream facilities (Appendix M). Because there are not enough adjacent pervious areas to disperse runoff from rest of the proposed development area, stormwater would eventually be treated by two proposed MWSs to prior leaving the Project site.

Mandatory compliance with the Preliminary Site Specific WQMP and the Final Site Specific WQMP[2] would ensure that the Project does not result in additional sources of polluted runoff, substantial erosion, or siltation on site or off site during long-term operations. Thus, impacts associated with stormwater drainage capacity, and erosion and siltation on site or off site would be **less than significant**, and no mitigation would be required. In addition, considering the proposed Project would not substantially alter the existing drainage pattern of the K4 Parcel, that the installed box culvert within the existing Cactus Channel would continue to convey the same flows, and compliance with the SWPPP would ensure that the Project does not result in substantial erosion or flooding on site, construction and operations impacts associated with flooding on or off site would be **less than significant**.

4.8.5 Mitigation Measures

The proposed Project would result in less than significant impacts to drainage, hydrology, and water quality with implementation of required SWPPP and WQMPs. As a result, no mitigation measures are required.

4.8.6 Level of Significance After Mitigation

The proposed Project would have less than significant impacts related to drainage, hydrology, and water quality with compliance with existing regulations and mitigation measures are not required.

INTENTIONALLY LEFT BLANK

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

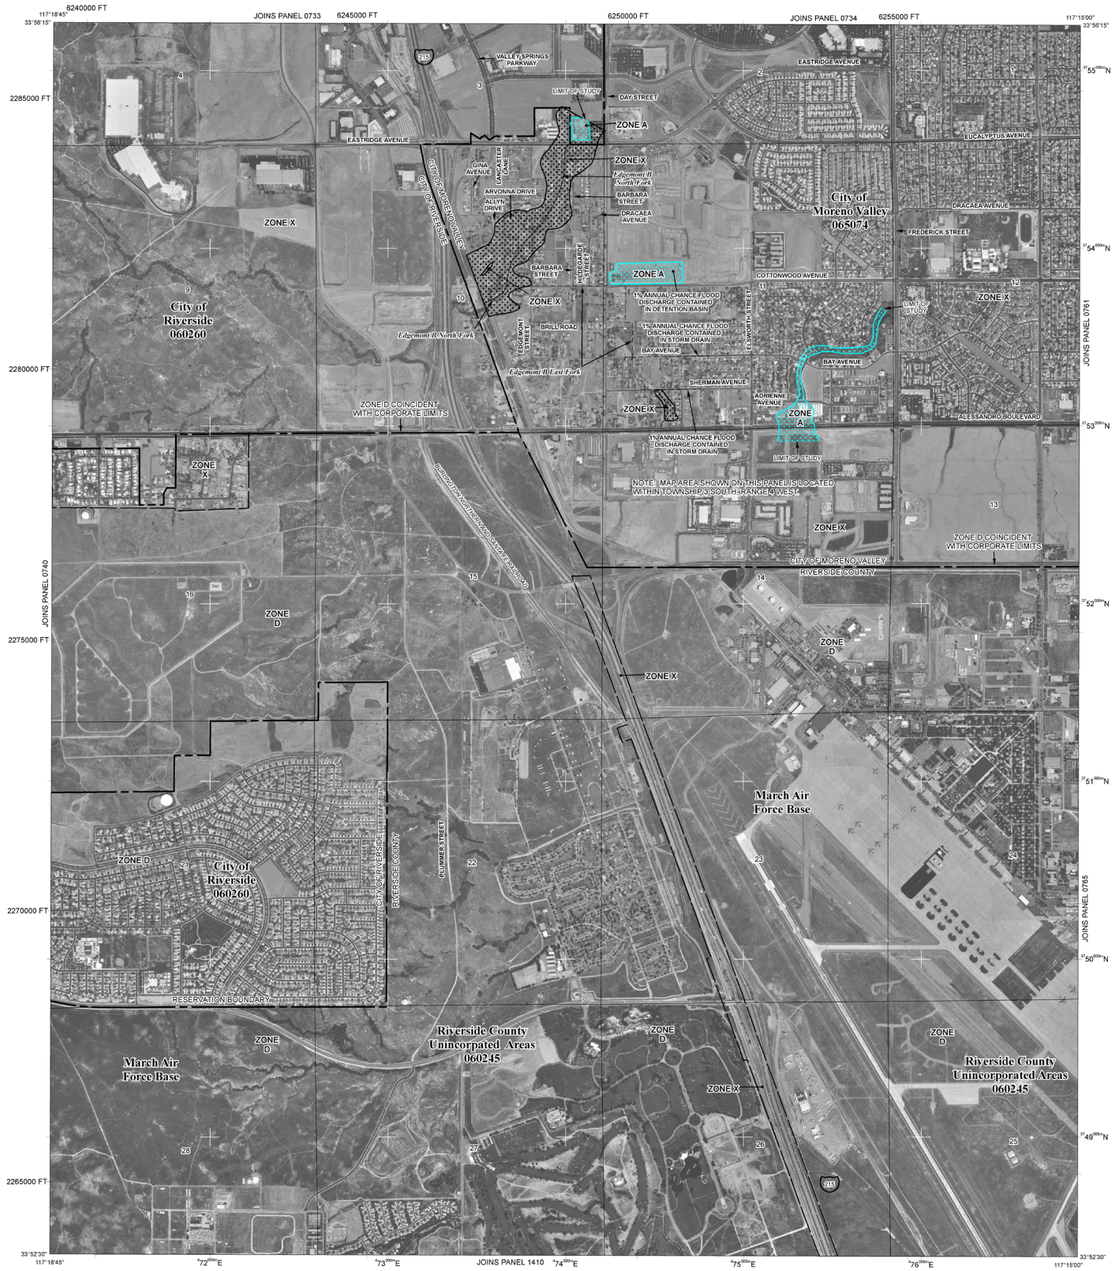
The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11. The **horizontal datum was** NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was derived from U.S. Geological Survey Digital Orthophoto Quadrangles produced at a scale of 1:12,000 from photography dated 1994 or later.



This map may reflect more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.

LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

	1% annual chance floodplain boundary
	0.2% annual chance floodplain boundary

4.9 LAND USE AND PLANNING

This section describes the existing land use and planning setting of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) site, identifies associated regulatory requirements, evaluates potential impacts, and identifies mitigation measures related to implementation of the proposed Project. This section analyzes the potential impacts of the proposed Project relative to potential conflicts with an applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including, but not limited to the General Plan and/or Zoning Code) resulting from implementation of the proposed Project. In addition to other documents, the following references were used in the preparation of this section of the EIR:

- *General Plan of the March Joint Powers Authority* (JPA) (March JPA 1999a)
- *Master Environmental Impact Report for the General Plan of the March Joint Powers Authority* (March JPA 1999b)

As mentioned in Chapter 2 of this EIR, the Project includes the development of the five parcels on approximately 35.4-acre site (K4 Parcel) with a 718,000-square-foot building conservatively assumed to be occupied by e-commerce/fulfillment center use. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Drainage Channel (Cactus Channel) that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel (Cactus Channel Improvement Site). The proposed Project includes the following components:

- **General Plan Amendment:** The K4 Parcel has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the K4 Parcel has not previously been given a zoning designation, the proposed Project is pursuing a zoning designation of Industrial for the 35.4-acre site in order to be consistent with the requested General Plan land use designation of Industrial.
- **Plot Plan:** A plot plan approval is required to construct the 718,000-square-foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Parcel Merger:** A parcel merger is required to merge the five separate parcels on the K4 Parcel into a 35.4-acre parcel.

4.9.1 Existing Conditions

The proposed K4 Warehouse component of the Project would be located on approximately 35.4-acres located on the south side of Cactus Avenue extending from where Veterans Way terminates at Cactus Avenue on the west to where Fredrick Street terminates at Cactus Avenue on the east. The proposed Cactus Channel improvements would be located within Cactus Channel extending from Elsworth Street on the west to Heacock Channel on the east. The Project site is located within the March JPA jurisdiction, which is within unincorporated Riverside County, California (Figure 2-1, Project Location).

General Plan and Zoning

According to the March JPA General Plan Land Use Plan, the K4 Parcel's land use designation is Business Park, as shown in Figure 2-2, March JPA General Plan Land Use Designations. The K4 Parcel has not previously been given a zoning designation per the official March JPA Zoning Map, as shown in Figure 2-3, March JPA Zoning Designations.

Previous On-Site Land Uses

According to the August 2018 Phase I and Limited Phase II Environmental Site Assessment (ESA) (Appendix K), prepared by Leighton Consulting Inc., the Project site where the warehouse is proposed was observed to be the northern portion of March Air Force Base (AFB) in 1949. In 1967, the site consisted of vacant land, cleared of the previously observed structures and vehicles. The northern adjacent property was observed to be vacant land. The western adjacent property was observed to contain three large aboveground storage tanks. In 1994, additional structures were observed within the southern adjacent property. After 1994, significant land use changes were not observed on the site, with the exception of a larger commercial building observed in the northern adjacent property. The Cactus Channel, located along the southern side of Cactus Avenue, has been utilized as a drainage channel since the late 1940s (Appendix L, Phase I Environmental Site Assessment Former March Air Force Base K4 Parcel and Cactus Channel).

Current On-Site Land Uses

The K4 Parcel, where the warehouse is proposed, is currently vacant with the exception of an area with soil piles on the eastern portion of the site. No buildings or structures are located on site; the southeastern perimeter of the subject site wraps around an electrical substation that is not included as part of the subject site. The substation has two paved entrances on the east that are accessible by Chanute Avenue, these entrances and Chanute Avenue are part of the subject site. The Cactus Channel is currently a depressed, natural earthen drainage channel running along the south side of Cactus Avenue from the southeast corner of the intersection of Cactus Avenue and the March Air

Reserve Base (ARB) driveway across from Elsworth Street, to the southwest corner of the Cactus Avenue and Heacock Street, where the drainage turns south along Heacock Street.

Surrounding Land Uses

Adjacent to the north of the proposed K4 Parcel warehouse site, across Cactus Avenue, is an industrial and commercial center. To the east, the proposed warehouse site is bounded by vacant land and an electrical substation. To the south, the proposed warehouse site is bordered by March ARB and to the west the proposed warehouse site is bordered by a vacant lot and March ARB.

At a regional level, the City of Moreno Valley is to the north and east of the proposed Project. To the south and west of the Project site is the March ARB, which previously the March AFB. The March AFB was realigned as the March ARB in 1993, along with the substantial reduction in its military use. The March ARB currently has a presence of reservists, guardsmen, and active duty from all branches of the military. The March ARB contains a runway, approximately 0.7 mile southwest of the Project site. The uses nearest to the Project site include warehousing, internal services, and housing. Interstate (I) 215 is approximately 0.7 miles west of the Project site, which intersects the March ARB. Further west is the City of Riverside, along with unincorporated areas of Riverside County.

4.9.2 Relevant Plans, Policies, and Ordinances

Federal

Federal Aviation Administration

The Federal Aviation Administration (FAA) requires that any structure that is located within proximity to an airport or other criteria per Code of Federal Regulations Title 14, Part 77.9, requires filing with the FAA. Because the Project is located within proximity to the March ARB, which may impact the assurance of navigation signal reception, the Project Applicant will file Form FAA 7460-1, Notice of Proposed Construction or Alteration, with the FAA.

FAA Advisory Circular 150/5200-33B

In 2007, FAA issued an Advisory Circular (AC) No. 150/5200-33B (FAA 2007) providing guidance on certain land uses that have the potential to attract hazardous wildlife on or near public-use airports. The AC also discusses airport development projects, including airport construction, expansion and renovation, affecting aircraft movement near hazardous wildlife attractants. Hazardous wildlife is defined as any species of wildlife (birds, mammals, reptiles), including feral animals and domesticated animals not under control, that are associated with aircraft strike problems, are capable of causing structural damage to airport facilities, or act as attractants to other

wildlife that pose a strike hazard. Included within the AC are minimum separation criteria for land-use practices that attract hazardous wildlife to the vicinity of airports. Separation distances are based on flight patterns, altitude at which most strikes happen, and National Transportation Safety Board recommendations. Land use practices discussed within the AC associated with wildlife hazards directly applicable to the proposed Project include the placement and design of new stormwater management facilities, which must drain within 48 hours after a storm event.

Department of Defense

The Department of Defense has developed the Air Installation Compatible Use Zone (AICUZ) program to minimize development that is incompatible with aviation operations in areas on and adjacent to military airfields. The AICUZ land use recommendations are based on (1) land use compatibility with exposure to aircraft noise and (2) safety considerations. Recommended compatible land uses are derived from data on noise contours (noise zones) and safety zones (clear zones and accident potential zones). An AICUZ was prepared for March ARB (described below) that describes height limitations for airspace protection, accident potential zones, and noise.

State

There are no land use and planning state regulations applicable to the Project.

Local

March ARB AICUZ

The 2018 March ARB AICUZ Study is an update of the AICUZ study dated 2005. The update is a reevaluation of aircraft noise and accident potential related to Air Force flying operations and is designed to aid in the development of local planning mechanisms which will protect the public safety and health, as well as preserve the operational capabilities of March ARB. The update also provides noise contours based upon the Community Noise Equivalent Level metric and utilizes a planning noise contour. The Project site is not located within a Noise Contour Level, (Figure 4-2 of the March ARB 2018 AICUZ). The Project site is located within the Primary Approach/Departure Zone (Figure 6-2 of the March ARB 2018 AICUZ). Within this zone, the slope of the approach/departure clearance surface is 50:1 until it reaches an elevation of 500 feet above the established airfield elevation.

Riverside County Airport Land Use Commission

In accordance with provisions of the California State Aeronautics Act (Public Utilities Code Section 21670 et seq.), the Riverside County Airport Land Use Commission (ALUC) has been assigned the lead responsibility for airport land use compatibility planning around each of the public-use and military

airports in Riverside County. The Project site is located within the March ARB airport influence area in unincorporated Riverside County and therefore is subject to review and approval by the Riverside County ALUC. A Riverside County ALUC public hearing will be held for the Project. At the Riverside County ALUC public hearing, Project approval, subject to conditional consistency, will be considered.

March ARB/Inland Port Airport Land Use Compatibility Plan

The March ARB/Inland Port Airport Land Use Compatibility Plan (ALUCP) was prepared for and adopted by the Riverside County ALUC on November 13, 2014. The purpose of the March ARB/Inland Port ALUCP is to promote compatibility between March ARB/Inland Port and the land uses that surround the joint-use airport, to the extent such areas are not already devoted to incompatible uses. The March ARB/Inland Port ALUCP regulates future development of new residential dwellings, commercial structures, and other noise- or risk-sensitive uses within the Airport Influence Area based on factors enumerated in the ALUCP, including but not limited to noise, overflight, safety, and airspace protection. The Project site is located in Zone C1. Zone C1 represents the Primary Approach/Departure Zone. Zone C1 allows up to 100 people per acre, and does not allow places of assembly, noise-sensitive outdoor nonresidential uses, and hazards to flight. Within the C1 zone, the following restrictions apply (Riverside County ALUC 2014):

- A maximum of three dwelling units per acre are permitted.
- An average of 100 people per acre can occupy the Project site and the most concentrated acre may accommodate up to 250 individuals.
- Prohibited uses include children's school, day care centers, libraries, hospitals, congregate care facilities, and places of assembly.
- In Zones B2 and C1, aboveground storage of more than 6,000 gallons of hazardous or flammable materials per tank is discouraged.
- Noise sensitive outdoor nonresidential uses are prohibited, examples of which include major spectator-oriented sports stadiums, amphitheaters, concert halls and drive-in theaters. Caution should be exercised with respect to uses such as poultry farms and nature preserves.
- Hazards to flight, which include physical (e.g., tall objects), visual, and electronic forms of interference with the safety of aircraft operations, land use development that may cause the attraction of birds are prohibited. Built features must be designed to avoid heightened attraction of birds.

March JPA General Plan

The March JPA General Plan is a long-range comprehensive plan designed to outline and delineate use and development of an area known formerly as March AFB, prior to the base realignment in April 1996

to the March ARB. The March AFB was first established as a military installation in 1918, and has operated almost continually since that time. In July 1993, March AFB was selected to be realigned, and subsequently converted from an active duty base to a Reserve Base, effective April 1, 1996. With the announcement of base realignment at March AFB, the adjacent jurisdictions immediately formed a JPA, known as March JPA. March JPA is a public entity, created for the purpose of addressing the use, reuse, and joint use of realigned the March AFB. The four individual public entities that cooperatively formed the JPA are the cities of Perris, Moreno Valley, and Riverside, and the County of Riverside. The JPA was created by separate resolutions of the four jurisdictions in September 1993 (March JPA 2018). The March JPA defines reuse and development opportunities of the area, while preserving the environmental quality. The March JPA General Plan is designed to implement the March AFB Master Reuse Plan, which includes the disposal and redevelopment of approximately 4,400 acres of the 6,500-acre former March ARB. The March JPA General Plan establishes goals and policies to reach long-term objectives, and establishes long-term policies for day-to-day decisions, based upon those objectives (March JPA 1999a). The March JPA certified the General Plan in 1999 and has published the Draft Vision 2030: March JPA General Plan. Because the 2030 March JPA General Plan is in draft form, the proposed Project shall be evaluated for consistency with the 1999 March JPA General Plan. The goals and policies relevant to the Project are contained within the March JPA General Plan Land Use Element, Transportation Element, Air Quality Element, Resource Management Element, and Safety/Risk Management Element, as described below.

Land Use Element

The Land Use Element is based upon the March AFB Master Reuse Plan preferred land use pattern. This element delineates the general location and distribution of land uses, extent of existing and proposed land uses for March JPA, and development criteria for development intensity. The goals and policies contained within the Land Use Element address the capitalization of the opportunities within the Planning Area, and the reuse and revitalization of existing facilities. The goals and policies contained in the Land Use Element focus on maintaining a balance between commerce, industry, and aviation uses, while promoting high quality development and minimizing land use conflicts. As previously mentioned, the Project includes a General Plan amendment that would change the existing Business Park land use designation to Industrial. The Project would comply with the 2018 March AICUZ Study and the March ARB/Inland Port ALUCP.

Circulation Element

The Circulation Element determines the way in which land use is ultimately distributed throughout the Planning Area and the subsequent resulting physical environment. The location, classification, capacity, and mode type play an important role in shaping air quality, noise impacts, natural habitat, development types, and general appearance of the Planning Area. The Transportation Plan includes a Truck Route Plan (as adopted by Resolution No. JPA 03-02), with truck restrictions prohibiting truck movements on westbound Alessandro and westbound Van Buren. Vehicles

would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. The extent of necessary facilities, adequacy of service levels, and transportation demand management measures, along with general location and infrastructure facilities, are described within this element of the General Plan.

Air Quality Element

The Air Quality Element addresses air quality due to the nexus of generators and significance to the General Plan and region. The Air Quality Element contains a discussion of local and regional air quality, stationary and mobile emission sources, and programs to reduce pollutant emissions generated.

Resource Management Element

The Resource Management Element provides for the conservation, development, and use of natural, historical, and cultural resources. The Resource Management Element also details plans and measures for the preservation of open space designed to promote the management of natural resources, outdoor recreation and public health and safety.

Safety and Risk Management Element

The Safety and Risk Management Element identifies and establishes standards and plans for the protection of the Planning Area from a variety of hazards including earthquakes, flooding, fire, geological, and airport compatibility conditions.

March JPA Development Code

The primary implementation mechanism for the Land Use Element is the March JPA Development Code, which provides for parcel-specific zone designations for all land within its jurisdiction and subdivision regulations. Title 9 of the March JPA's Municipal Code contains the Development Code for the March JPA, and includes regulations for site planning and development.

As previously mentioned, the K4 Parcel is currently unzoned within the March JPA Zoning Map. The proposed Project is pursuing a zoning designation of Industrial to the K4 Parcel, consistent with the General Plan designation of Industrial. The Project would be subject to Chapter 9.05, Industrial Districts of the March JPA Development Code.

Western Riverside Multiple Species Habitat Conservation Plan

The K4 Parcel and Cactus Channel improvement site occur within the boundaries of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP), a comprehensive,

multijurisdictional habitat conservation plan focusing on conservation of species and their associated habitats in Western Riverside County. The MSHCP is one of several large, multijurisdictional habitat-planning efforts in Southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP allows Riverside County and its Cities to better control local land-use decisions and maintain a strong economic climate in the region, while addressing the requirements of the state and federal Endangered Species Acts (CESA and FESA, respectively). The MSHCP serves as a habitat conservation plan pursuant to Section 10(a)(1)(b) of the FESA of 1973, as well as a Natural Communities Conservation Plan under the Natural Communities Conservation Plan Act of 2001; and allows the participating jurisdictions to authorize "take" of plant and wildlife species identified within the plan area.

Projects where the lead agency is a signatory to the MSHCP are covered under the MSHCP. However, the March JPA is the lead agency for the Project and is not a signatory to the MSHCP. As such, the Project is not subject to MSHCP regulations nor does it receive take authority granted under the MSHCP. However, if proposed Project implementation is anticipated to impact (would have a take) Covered Species addressed within the MSHCP, the March JPA may choose to participate in the MSHCP.

4.9.3 Thresholds of Significance

March JPA uses the California Environmental Quality Act Guidelines Appendix G for evaluating whether a development project may result in significant impacts. Based on the IS prepared for the Project (Appendix A, Initial Study and Notice of Preparation) and the newly adopted California Environmental Quality Act Guidelines Appendix G (December 2018), the Project could have a significant impact on land use and planning if the Project would:

- **LU-1**: Cause a significant environmental impact due to a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.
- **LU-2**: Conflict with any applicable habitat conservation plan or natural community conservation plan.

4.9.4 Impacts Analysis

Threshold LU-1. ***Would the Project cause a significant environmental impact due to a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?***

The Project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project, including the March JPA General Plan, Development Code, March ARB/Inland Port Airport Joint Land Use Study, March ARB AICUZ, and the March ARB/Inland Port ALUCP.

As shown on Figure 2-2, the site's current land use designation is Business Park. The site is not yet zoned per the March JPA Zoning Map, as shown in Figure 2-3. The proposed Project would include the construction of a 718,000-square-foot warehouse building on the approximately 35.4-acre site. The site would also include automobile and truck trailer parking, loading dock positions, and improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue between Elsworth Street to the west and Heacock Channel to the east. To facilitate Project approval, a General Plan Amendment would be required to change the existing Business Park land use designation to Industrial on the K4 Parcel. In addition, because the K4 Parcel is not yet zoned, a Zone Designation would be required to allow for an Industrial zoning designation for the K4 Parcel.

The proposed Project is located in the C1 Primary Approach/Departure Zone for the March ARB. The C1 Zone is subject to a moderate to high noise impact, which may be disruptive to noise-sensitive land use activities. Zone C1 allows up to 100 people per acre, and does not allow places of assembly, noise-sensitive outdoor nonresidential uses, and hazards to flight. Within the C1 Zone, critical community infrastructure facilities and aboveground bulk storage of hazardous materials is discouraged. Sound attenuation shall be used as necessary to meet interior noise level criteria. Lastly, airspace review is required for objects greater than 70 feet tall. The constructed warehouse building would have a maximum building height of 46 feet and the maximum number of employees that would be located within the proposed warehouse on the K4 Parcel would be 900 employees, which is fewer than 100 people per acre given that the K4 Parcel is 35.4 acres in size. As such, an airspace review would not be required (Riverside County ALUC 2014). Therefore, the proposed Project is designed consistent with the applicable March ARB AICUZ and the March ARB/Inland Port ALUCP.

The 1999 March JPA General Plan is a long-range comprehensive plan designed to outline and delineate use and development of an area known formerly as March AFB, prior to the base realignment in April 1996 to the March ARB. The March JPA General Plan establishes goals and policies to reach long-term objectives, and establishes long-term policy for day-to-day decisions, based upon those objectives (March JPA 1999a). Table 4.9-1 demonstrates how the Project promotes consistency with the applicable goals and policies of the March JPA General Plan.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Land Use Element			
Goal 1	Land Use Plan provides for a balanced mix of land uses that contribute to the regional setting, and capitalize on the assets of the Planning Area, while insuring compatibility throughout the Planning Area and with regional plans.	The K4 Parcel is proposed to be developed with an industrial warehouse building that would be consistent with the GP land use designation of Industrial (IND) with the approval of the proposed GP Amendment and Zoning Designation of Industrial (IND) to Assessor Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The K4 Parcel would develop a vacant, disturbed site and provide temporary jobs during short-term construction and up to 900 new permanent jobs during Project operations, thus contributing jobs to the region. The Cactus Channel improvements would occur within the existing Cactus Channel.	The Project would be consistent with this goal, assuming the approval of the proposed GP Amendment and Zoning Designation to Industrial (IND) to the Project site.
Policy 1.1	Provide for a mix of land uses which implement the Base Master Reuse Plan for March AFB; offer a variety of employment opportunities; and capitalizes, enhances and expands upon existing physical and economic assets of the Planning Area.	The proposed Project would include an industrial warehouse that would provide automobile and truck trailer parking, loading dock positions, and improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue. Additionally, the new development would be occupied by an e-commerce fulfillment center and would likely provide temporary jobs during short-term construction and up to 900 new permanent jobs during Project operations.	The Project would be consistent with this policy as it would create job opportunities and enhance the physical and economic assets of the Planning Area.
Policy 1.2	Develop and maintain a system of land use designations and zoning districts which will provide locations for commercial, business park, manufacturing, aviation, public, and open space uses, and which actuates compatible and synergistic land uses.	The Project proposes an industrial warehouse in a location that does not yet have a zoning designation. The Project proposes a land use designation change and General Plan Amendment to change the existing land use from Business Park to Industrial and would be compatible for industrial with the approval of the proposed zoning designation and GP Amendment. The proposed Project would include the operation of an e-commerce fulfillment center, which would be compatible with the surrounding commercial and industrial uses in the Project vicinity.	The Project would be consistent with this policy with the approval of the proposed GP Amendment and Zoning Designation from Business Park to Industrial (IND) for the Project site.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 1.3	Provide for patterns of land use which can be supported by existing and planned circulation, public facilities, and infrastructure system improvements in a manner that will preserve the March JPA's fiscal capacity.	The Project would be constructed along an existing roadway (Cactus Avenue), which is currently developed on the north side with industrial warehouse buildings and would then be developed on the south side through Project implementation. The Project would include roadway improvements that take into consideration all modes of transportation. New roadways and improvements to existing roadways would provide improved mobility and accessibility to regional destinations. The Project would also include improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. Public services such as fire and police protection, which are provided to the neighboring industrial and business park and adjacent business, would be extended to serve the Project site and as part of standard development practices, Project plans would be reviewed by the appropriate public agencies to ensure facility capacity.	The Project would be consistent with this policy.
Policy 1.5	Provide for a variety of industrial uses, including heavy manufacturing, light manufacturing, warehousing, and distribution, transportation-related, and research and development.	The proposed Project includes a GP Amendment and Zoning Designation to APNs (297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0) to allow development of an approximately 718,000 square feet of industrial e-commerce/fulfillment center and the creation of 289 automobile parking stalls, 317 truck trailer parking, and 105 loading dock positions for trucks. While an end user has not yet been identified, it is assumed that the end use will be e-commerce/fulfilment center.	The Project would be consistent with this policy with the approval of the proposed GP Amendment and Zoning Designation to Industrial (IND).
Policy 1.6	Locate and group commercial and industrial uses which are oriented toward regional service/market areas to promote	The Project proposes an approximately 718,000 square feet of industrial e-commerce/fulfillment center and the creation of 289 automobile parking stalls, 317 truck trailer parking, and	The Project would be consistent with this policy with the approval of the proposed GP

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
	utilization of regional transportation facilities and development-supporting infrastructure.	105 loading dock positions for trucks with close proximity to the I-215 Freeway, a regional transportation facility. Existing commercial/service uses are located north of the Project site. Utilities are available to support the proposed Project and Project plans include enhancements to utilities yet no up-sizing of facilities would be required.	Amendment, Zoning Designation, Parcel Map and Master Plot Plan.
Policy 1.9	Plan for compatible land uses within the aircraft noise impact contours depicted in the Air Installation Compatible Use Zones (AICUZ) Report for the airfield use.	The Project site would be directly north of March ARB. Based on the Riverside County Airport Land Use Compatibility Plan (ALUCP) noise level contours of the March ARB/Inland Port Authority, the Project is partially located in the C1 Primary Approach/Departure Zone, which represents areas of moderate to high noise and moderate accidental potential risk. The Project site is partially located within the 60 to 65 dBA CNEL noise level contour boundaries of March ARB/IPA. Based on the Riverside County Airport Land Use Compatibility Plan Policy Document (RC ALUCP) noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the RC ALUCP compatibility criteria. Outdoor activities at the industrial land use within the Project site are expected to be minimal and include employees traveling to and from their vehicles to the industrial warehouse building. Additionally, the March JPA would review and approve plans and specifications of the proposed Project. Therefore, the Project would satisfy these Riverside County ALUCP compatibility criteria based on the noise level contour boundaries.	The Project would be consistent with this policy.
Goal 2	Locate land uses to minimize land use conflict or creating competing land uses, and achieve maximum land use compatibility while improving or maintaining the desired integrity of the Planning Area and subregion.	The Project proposes an approximately 718,000 square feet of industrial e-commerce/fulfillment center and the creation of 289 automobile parking stalls, 317 truck trailer parking, and 105 loading dock positions for trucks within close proximity to the I-215 Freeway, a regional transportation facility. Existing commercial and industrial	The Project would be consistent with this goal with the approval of the proposed GP Amendment and Zoning Designation of Industrial (IND) for the Project site.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		uses are located north of the Project site. The Project includes a GP Amendment and Zoning Designation of Industrial (IND) for APNs 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The Project is planned adjacent to existing business park and industrial warehouse development, thereby continuing an existing development to the south.	
Policy 2.1	Avoid conflicts and incompatibilities between land uses through the use of landscaped setbacks and buffers, site design, site orientation, architectural features, walls or fences, density/intensity reductions, reduced hours of operation for commercial and industrial uses, shielding of lighting, and the like.	The Project would be developed in accordance with the March JPA Development Code that would ensure the Project meets the setback requirements, height restrictions, site and building design, and site orientation. Through the March JPA Development Code process, the Project would be compatible with adjacent and surrounding land uses. Furthermore, the proposed Project would be subject to compliance with Section 9.08.100, Lighting; light and glare performance standards established in Section 9.10.110, Light and Glare; and Chapter, 9.13, Landscape Requirements, of the March JPA Development Code.	The Project would be consistent with this policy.
Policy 2.2	Encourage and facilitate the transition of facility reuse and land uses to conforming land uses.	The Project proposes an approximately 718,000 square feet of industrial e-commerce/fulfillment center. The Project site is adjacent to existing commercial and industrial uses. The Project would contribute to the industrial warehouse visual character of existing development along Cactus Avenue and the I-215 corridor with the construction of similar uses displaying comparable bulk and scale. With the approval of a GP Amendment and Zoning Designation of Industrial (IND), the Project would be consistent with the existing March JPA GP. The Project site is bordered to the north by Cactus Avenue and an industrial and commercial center. To the east, the subject site is bounded by vacant	The Project would be consistent with this policy with the approval of the proposed GP Amendment and Zoning Designation of Industrial (IND) for the Project site.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		land and an electrical substation. To the south and west, the subject site is bordered by March ARB. The Project would thereby continue an existing development pattern.	
Policy 2.3	Support land uses that provide a balanced land use pattern of the Planning Area, and discourage land uses that conflict or compete with the services and/or plans of adjoining jurisdictions.	See Policy 2.2.	The Project would be consistent with this policy with the approval of the proposed GP Amendment and Zoning Designation of Industrial (IND) for the Project site.
Policy 2.4	Protect the interests of, and existing commitments to adjacent residents, property owners, and local jurisdictions in planning land uses.	There are no residential developments immediately adjacent to the Project site. The nearest residence is located 0.5 miles north of the Project site.The Project site is bordered to the north by Cactus Avenue and an industrial and commercial center. To the east, the subject site is bounded by vacant land and an electrical substation. To the south and west, the subject site is bordered by March ARB.The proposed Project, including the architectural renderings, would undergo staff review with the March JPA to ensure that the massing, height, siting, and design of the industrial development and landscape comply with the March JPA Development Code and building and construction code, and compatible with the surrounding area. The proposed Project would undergo staff review with the March JPA to ensure that the massing, height, siting, and design of the industrial warehouse development and landscape comply with the March JPA Development Code and building and construction code, and compatible with the surrounding area.	The Project would be consistent with this policy.
Goal 3	Manage growth and development to avoid adverse environmental and fiscal effects.	The Project would be developed in accordance with the March JPA Development Code, consistent with the anticipated buildout of the existing March JPA GP, which would be amended to include a GP Amendment for this site and designate an industrial use instead of business park use on the Project site.	The Project would be consistent with this goal with the approval of the proposed GP Amendment and Zoning Designation of Industrial (IND) for the Project site.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 3.1	Manage growth so that its rate does not exceed the ability of March JPA or service districts to provide for an acceptable level of public facilities and services.	Public facilities and services are available to the Project site, and the Project would neither burden nor exceed the capacity of the service providers, as discussed in the Initial Study (Appendix A) and Section 4.13, Utilities and Service Systems. No upsizing of facilities would be required to serve the Project.	The Project would be consistent with this policy.
Policy 3.3	Use finance mechanisms such as benefit assessment districts, development fees, and maintenance districts to ensure new development within the Planning Area constructs the public facilities and fiscally supports the public services necessitated by the development.	The Project Applicant shall pay all the necessary development and fair share fees associated with development of the Project, including the appropriate development impacts fee (DIF). While payment of fees would be completed as part of Project approval, the use of these fees to implement programs and street system improvements cannot be guaranteed by the Project itself.	The Project would be consistent with this policy; however, implementation of these fees to fund the infrastructure improvements necessary to mitigate Project impacts cannot be guaranteed.
Goal 4	Develop an identity and foster quality development within the Planning Area.	The Project is planned immediately south of and adjacent to existing commercial and industrial warehouse developments, thereby continuing an existing development pattern to the south. Project implementation would be consistent with this existing character.	The Project would be consistent with this goal.
Policy 4.1	Develop and maintain a land use plan for the Planning Area which proposes compatible land uses to create distinct, identifiable historic, commercial, industrial, public, and aviation areas.	See Policy 2.2.	The Project would be consistent with this policy with the approval of the proposed GP Amendment and Zoning Designation of Industrial (IND) for the Project site.
Policy 4.4	Develop a distinctive community identity for commercial, business park and industrial developments that reflect the character and atmosphere of March JPA Planning Area through the use of good planning and design principals, and sound development practices which	The proposed Project, including the architectural renderings, would undergo staff review with the March JPA to ensure that the massing, height, siting, and design of the industrial warehouse development and landscape comply with the March JPA Development Code and building and construction code, and compatible with the surrounding area.	The Project would be consistent with this policy with compliance with the March JPA Development Code and building and construction code.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
	serve as guidelines for building materials, colors, site design and orientation, and landscaping.		
Policy 4.6	Encourage the use of master plans and design guidelines to permit the clustering of development and creating campus-like setting of large tracts of land, while capitalizing on areas with unique assets and opportunities.	The Project entails a GP Amendment, Zoning Designation, Parcel Map, and a Master Plot Plan. As such, the Project would result in the approval of a comprehensive development plan for the 35.4-acre K4 Parcel.	The Project would be consistent with this policy with the approval of the proposed GP Amendment, Zoning Designation, Parcel Map and Master Plot Plan.
Policy 4.7	Develop and enhance the economic climate and create a balanced business community to serve the work force, commerce, and industry of the region.	The Project would provide industrial warehouse buildings and industrial facilities whose ultimate use would create up to 900 new permanent jobs and help serve the goods movement needs of the region.	The Project would be consistent with this policy.
Goal 5	Maximize and enhance the tax base and generation of jobs through new, reuse, and joint use opportunities.	Development of the Project would increase the property value of the site and would provide temporary jobs during short-term construction and up to 900 permanent jobs during Project operations.	The Project would be consistent with this goal.
Policy 5.1	Support the development and establishment of new employment centers and economic development activities that contribute to an improved tax base.	See Goal 5.	The Project would be consistent with this policy.
Policy 5.5	Encourage the development of commercial, business park and industrial centers to expand the employment and fiscal base of the March JPA Planning Area and the western Riverside County Subregion.	See Goal 5.	The Project would be consistent with this policy.
Policy 5.6	Encourage employers in the March JPA Planning Area to hire from the local communities when seeking to fill employment positions.	Implementation of the proposed Project would not require installation of new roadways, public services, or utilities; the site is currently served by existing roadways, utilities, and services, and these services would be maintained as	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		part of the proposed Project. Therefore, the proposed Project would not induce substantial unplanned population growth and the additional 900 employment opportunities resulting from the Project would be assumed to be filled by the existing residential population in the greater Riverside County area.	
Goal 6	Support the continued Military Mission of March Air Reserve Base, and preservation of the airfield from incompatible land use encroachment.	The Project site is not located within a designated APZ I or APZ II, and instead lies outside of all APZs. The Project is located in C1 or Primary Approach/Departure Zone which limits projects to no more than 100 people per acre. The proposed land use on the K4 Parcel, which is 35.4 acres, would employ approximately 900 people, which is below the 100 people per acre threshold. As such, this Project would be compatible with this zone. The proposed Cactus Channel improvements would result in the installation of a box culvert within an existing earthen channel, thereby reducing the potential for bird attractants within the Channel, which would serve as a safety benefit to the airfield.	The Project would be consistent with this goal.
Policy 6.2	Plan for compatible land uses within the Clear Zone, APZ I and APZ II, as depicted in the Air Installation Compatible Use Zones (AICUZ) Report for the airfield use.	See Goal 6.	The Project would be consistent with this policy.
Policy 6.3	Ensure that plans and development do not interfere, conflict, or degrade the military mission of March ARB.	See Goal 6.	The Project would be consistent with this policy.
Policy 6.4	Ensure that plans and development do not conflict with the long-term needs of the Air Force Reserve in terms of encroachment, noise, accident zone, constraints, etc.	The Project is located in Zone C1, which allows for the uses proposed by the Project. The K4 Parcel is not located within a designated APZ I or APZ II, and instead lies outside of all APZs. Within the C1 Zone which limits projects to no more than 100 people per acre. The proposed land use on the K4	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		Parcel, which is 35.4 acres, would employ approximately 900 people, which is below the 100 people per acre threshold. As such, this Project would be compatible with this zone. The Project would be developed in accordance with the March JPA Development Code that would ensure the Project meets the setback requirements, height restrictions, site and building design, site orientation, etc. that would be compatible with adjacent and surrounding land uses. The Project would comply with the March ARB/Inland Port ALUCP, which would ensure that development does not conflict with the long-term needs of the Air Force Reserve.	
Policy 6.5	Ensure that plans and development conform to the draft Comprehensive Land Use Plan for March AFB/March Inland Port.	The Project would conform to the March ARB/Inland Port ALUCP, as described throughout this section of the EIR.	Given than none of the uses restricted in the Zone C1 would be constructed as part of the Project, the Project would be consistent with this policy.
Policy 6.6	Ensure that sensitive land uses (i.e., schools, high occupancy land uses, etc.) are discouraged from locating and operating in areas determined to be incompatibly with airport operations.	The Project would not introduce any new sensitive land uses such as schools or high occupancy land uses that would present an incompatibility. Instead the Project would result in the construction of a new industrial warehouse and improvements within the existing Cactus Channel.	The Project would be consistent with this policy.
Policy 6.7	Ensure that land uses adhere to floor area ratios applicable under California Department of Transportation (Caltrans) guidelines for airports.	The Project conforms to the floor area ratios as adopted in the March ARB/Inland Port ALUCP, which are more restrictive than the Caltrans guidelines for airports.	The Project would be consistent with this policy.
Policy 6.8	Ensure that land uses adhere to both military and civilian Part 77 conical surface criteria, relative to height restrictions.	The Project Applicant will submit an FAA 7460-1 application through ALUC to ensure compatibility. Within 5 days after construction of the Project reaches its greatest height, a FAA Form 7460-2 shall be completed by the Project Applicant or his/her designee and e-filed with the FAA.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 7.6	Plan for compatible land uses within the aviation area.	The Project is located in Zone C1, which allows for the uses proposed by the Project. The Project site is not located within a designated APZ I or APZ II, and instead lies outside of all APZs. Within the C1 Zone which limits projects to no more than 100 people per acre. The proposed land use on the K4 Parcel, which is 35.4 acres, would employ approximately 900 people, which is below the 100 people per acre threshold. As such, this Project would be compatible with this zone. The Project would be developed in accordance with the March JPA Development Code that would ensure the Project meets the setback requirements, height restrictions, site and building design, site orientation, etc. that would be compatible with adjacent and surrounding land uses. Outdoor activities at the industrial land use within the Project site are expected to be minimal and include employees traveling to and from their vehicles. Additionally, the March JPA would review and approve the plans and specifications of the proposed Project to ensure compliance with the provisions of the CBC and Title 24, which regulates building standards. Title 24 is administered by the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Additionally, the Project would comply with the Inland Port ALUCP, which would ensure that development does not conflict with the March ARB. Furthermore, the Project Applicant will submit an FAA 7460-1 application through ALUC to ensure compatibility. Within 5 days after construction of the Project reaches its greatest height, an FAA Form 7460-2 shall be completed by the Project Applicant or his/her designee and e-filed with the FAA.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 8.2	Sensitive biological resources and habitats, cultural resources, view shed areas shall be protected where practical.	The Project would be constructed on undeveloped lands. As discussed in the Initial Study prepared for the Project (Appendix A), no view sheds would be obstructed through Project implementation. While the K4 Parcel is currently vacant, as discussed in Section 4.3, Biological Resources, impacts can be mitigated to less than significant levels through the incorporation of **MM-BIO-1** through **MM-BIO-9**. Additionally, with implementation of **MM-CUL-1** through **MM-CUL-2** outlined in Section 4.4, Cultural Resources, impacts the Project would not affect valued cultural resources.	The Project would be consistent with this policy with implementation mitigation measures outlined in Section 4.3, Biological Resources, and 4.4, Cultural Resources, of the EIR.
Policy 8.4	Implement federal, state, regional, and local requirements that apply to water and air quality, wetlands, endangered species, and other environmental considerations.	The Project would be constructed in a manner that minimizes, to the extent feasible, impacts to water quality, air quality, wetlands, endangered species, and other environmental considerations, as detailed within this EIR. Where required, mitigation measures shall be implemented to reduce potentially significant environmental impacts throughout construction and operation. Therefore, the Project would continue to implement and comply with federal, state, regional and local requirements.	The Project would be consistent with this policy with implementation of mitigation measures.
Goal 10	Avoid undue burdening of infrastructure, public facilities, and services by requiring new development to contribute to the improvement and development of the March JPA Planning Area.	The Project is located adjacent to an area where infrastructure, public facilities, and services already exist. Development of the Project would contribute to the improvement and development of the March JPA Planning Area by completing off-site infrastructure and by providing the required Development Impact Fees (DIF), which would contribute to those facilities and services. The Project is located adjacent to an area surrounded by existing development immediately to the north, south and east.	The Project would be consistent with this goal.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 10.1	Require new construction to pay its "fair share" of the cost of providing adequate public services, infrastructure, and facilities for the development.	The Project Applicant shall pay all the necessary development (DIF) and fair share fees associated with development of the Project. While payment of fees would be completed as part of Project approval, the use of these fees to implement programs and street system improvements cannot be guaranteed by the Project itself.	The Project would be consistent with this policy; however, implementation of these fees to fund the infrastructure improvements necessary to mitigate Project impacts cannot be guaranteed.
Policy 10.2	Require new construction to provide adequate infrastructure to serve the development (i.e., curbs and gutters, sidewalks, street lights, water service, sewer service, or septic systems, etc.) prior to initiation of use.	The K4 Parcel is currently undeveloped and would be required to install curbs and gutters, sidewalks, streetlights, water service connections, and sewer service connections prior to occupancy. Additionally, the Project proposes regional improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, proposed by Riverside County Flood Control and Water Conservation District as part of the District's Master Plan. The proposed improvements include constructing an underground box culvert within the existing earthen channel.	The Project would be consistent with this policy.
Policy 10.3	Locate commercial and industrial development in areas where street rights-of-way and capacity are available, as well as sufficient infrastructure and public services.	The Project is located in an area where infrastructure, public facilities and services are available to support the Project. The Project would require the construction on new water and wastewater connections in order to connect to the WMWD water and wastewater collection and treatment. Also, the proposed proposes regional improvements to Cactus Channel proposed by Riverside County Flood Control and Water Conservation District as part of the District's master Plan Additionally, the Project is adjacent to existing commercial and industrial facilities already served by public services.	The Project would be consistent with this policy.
Policy 10.4	Facilitate the provision of public services, (i.e., sewer, water, streets, and public safety) to be provided in an efficient and cost-effective manner.	See Policy 10.3.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Goal 11	Plan for the location of convenient and adequate public services to serve the existing and future development of March JPA Planning Area.	See Policy 10.3.	The Project would be consistent with this goal.
Policy 11.2	Provide and maintain existing infrastructure and enhance service levels to meet the needs of March JPA Planning Area.	See Policy 10.3.	The Project would be consistent with this policy.
Goal 12	Ensure, plan, and provide adequate infrastructure for all facility reuse and new development, including but not limited to, integrated infrastructure planning, financing, and implementation.	The K4 Parcel is currently undeveloped yet located where infrastructure, public facilities and services would be available to support the Project. The Project would require the construction of new water and wastewater connections in order to connect to the WMWD water and wastewater collection and treatment. Also, the Project includes regional improvements to enhance drainage infrastructure along Cactus Avenue as part of Project development, proposed by Riverside County Flood Control and Water Conservation District as part of the District's master Plan. Additionally, the Project site is adjacent to existing commercial and industrial facilities already served by public services, and development of the Project would provide development impact fees (DIF) that would contribute to those facilities and services.	The Project would be consistent with this goal.
Policy 12.1	Coordinate the provision of all public utilities and services to ensure a consistent, complete and efficient system of service to development.	The Project site is located adjacent to an area where public facilities and services exist already. Development of the Project would contribute to the improvement and development of the March JPA Planning Area by completing off-site infrastructure and by providing impact fees which would contribute to those facilities and services. The Project is located adjacent to an area surrounded by existing development immediately to the east, south, and north.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 12.2	Require new construction to pay its "fair share" for the regional infrastructure system by providing appropriate dedications, improvements, and/or fee assessment districts or other financing mechanisms.	The Project Applicant shall pay all the necessary development (DIF) and fair share fees associated with development of the Project. While payment of fees would be completed as part of Project approval, the use of these fees to implement programs and street system improvements cannot be guaranteed by the Project itself.	The Project would be consistent with this policy.
Policy 12.3	Require new development projects to provide for the extension of infrastructure to serve the development, including over-sizing facilities for future needs.	The K4 Parcel is currently undeveloped and not connected to water or wastewater infrastructure. As such, Project implementation would require the construction of new water and wastewater connections in order to connect to WMWD water and wastewater collection and treatment systems. Additionally, the Project would include regional improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, proposed by Riverside County Flood Control and Water Conservation District as part of the District's master Plan. The proposed improvements include undergrounding a box culvert. Existing utilities not being abandoned or improved would be extended to provide water, sewer, electricity, and other utility services, as discussed in Section 4.13, Utilities and Service Systems. While the development would require improvement and enhancement of existing infrastructure, it does not rely on the extension or up-sizing of facilities by other new development projects.	The Project would be consistent with this policy.
Goal 13	Secure adequate water supply system capable of meeting normal and emergency demands for existing and future land uses.	As part of the proposed Project, a Water Supply Assessment (WSA) has been prepared and approved by the WMWD to provide an analysis as to whether WMWD has sufficient water supplies available to serve the Project. As discussed in Section 4.13, Utilities and Service Systems, WMWD has determined that adequate water supplies do exist to serve the proposed Project.	The Project would be consistent with this goal.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 13.1	Only approve development which can demonstrate an adequate and secure water supply for the proposed use.	See Goal 13.	The Project would be consistent with this policy.
Policy 13.2	Enhance local groundwater supplies through development designs which promote an on-site recharge and minimize impermeable ground coverage with landscaped areas, open space, or recreation areas.	As discussed in Section 4.8, Hydrology and Water Quality, Project implementation would not affect groundwater supplies, and with Project design features, water would be allowed to percolate into the groundwater.	The Project would be consistent with this policy.
Policy 14.1	Require all development to adequately collect, treat, and dispose of wastewater in accordance with the Santa Ana Regional Water Quality Control Board requirements.	The Project would treat and dispose of wastewater in conformance with the requirements of the Santa Ana Regional Water Quality Control Board.	The Project would be consistent with this policy.
Policy 14.2	Require connection to the sewer system for any development occurring on land formerly part of March AFB.	The Project site is located on the Northeast Planning Subarea of land that was formerly part of March AFB. Project implementation would require wastewater connections to connect to the WMWD water and wastewater collection and treatment systems.	The Project would be consistent with this policy.
Policy 14.3	Encourage the reuse of reclaimed and treated non-potable water for irrigation and maintenance of recreation areas, landscaping and open space preservation.	See Policy 13.2.	The Project would be consistent with this policy.
Goal 15	In compliance with state law, ensure solid waste collection, siting and construction of transfer and/or disposal facilities, operation of waste reduction and recycling programs, and household hazardous waste disposal programs and education are consistent with the County Solid Waste Management Plan.	Solid waste collection for the Project would be consistent with the County Solid Waste Management Plan.	The Project would be consistent with this goal.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 15.1	Ensure all hazardous materials are stored, treated, and disposed in accordance with state and federal law.	The Project site is located within Zone C1. The March ARB/Inland Port Airport Land Use Compatibility Plan (Mead & Hunt 2014) imposes restrictions and limitations on the types and quantities of uses and hazardous materials that can be stored on Project sites within the C1 zone. The Project would not contain any aboveground bulk storage of hazardous materials, as recommended by the March ARB/Inland Port Airport Land Use Compatibility Plan (Mead & Hunt 2014). As discussed in Section 4.7, Hazards and Hazardous Materials, any hazardous materials used on site would be stored, treated, and disposed of in accordance with state and federal law.**MM-HAZ-1** through **MM-HAZ-8** shall also be implemented to ensure hazardous materials would be properly stored, treated, and disposed of.	The Project would be consistent with this policy.
Goal 17	Adequate flood control facilities shall be provided prior to, or concurrent with, development in order to protect the lives and property within the March JPA Planning Area.	The Project site is currently undeveloped and not connected to any stormwater or flood infrastructure or facilities. However, the Cactus Channel does run along the northern property boundary. The Project would retain all post development flow on site; however, the Riverside County Flood Control District may allow minimal drainage into the regional improvements to the existing open Cactus Channel drainage that are proposed by Riverside County Flood Control and Water Conservation District as part of the District's master Plan. The Project would be required to comply with all rules, regulations, and other requirements of the March JPA for use of stormwater facilities and flood control.	The Project would be consistent with this goal.
Policy 17.1	Provide for the adequate drainage of storm runoff to protect the lives and property within the Planning Area.	See Goal 17.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 17.3	Require new development to construct new or upgrade existing drainage facilities to accommodate the additional storm runoff caused by the development.	See Goal 17.	The Project would be consistent with this policy.
Policy 17.4	Require all storm drain and flood control facilities to be approved and operational prior to the issuance of certificates of occupancy for the associated development.	Prior to issuance of certificates of occupancy, the required storm drain and flood control facilities would be inspected and approved.	The Project would be consistent with this policy.
Policy 17.7	Seek to preserve drainage courses in their natural condition, while providing adequate safety and protection of property.	Appropriate permit(s) from the federal, state, regional, and local permitting agencies would be obtained to address the on-site drainage and protect persons and property.	The Project would be consistent with this policy.
Noise/Air Quality Element			
Policy 2.3	Noise sensitive land uses shall not be located in areas influenced by noise generating land uses, in particular the noise contours associated with the joint use airfield, unless appropriate mitigation is utilized.	See Policy 1.2.	The Project would be consistent with this policy.
Policy 3.1	Include mitigating measures such as landscaping, berming, and site orientation, in the design of projects located near noise generating sources such as arterial roadways.	The Project design includes a screening wall and landscaping that would provide sound mitigation.	The Project would be consistent with this policy.
Policy 3.6	Regulate the use of local streets by trucks, trailers, and construction vehicles, to the extent possible.	Regional access to the Project is provided via I-215, with local access for trucks, trailers, and construction vehicles provided via Cactus Avenue. Vehicular access points and circulation outside/inside the Project site, including the Project's parking lots, would be reviewed and approved by	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		the March JPA's planning and engineering staff. Additionally, Project construction would comply March JPA Development Code Sections 9.10.140 and 9.10.030.	
Policy 3.7	Limit trucking operations to appropriate routes, times and speeds.	See Policy 3.6.	The Project would be consistent with this policy.
Policy 3.8	Appropriate muffling systems for construction equipment and operations shall be required, as necessary.	During all Project construction, pursuant to March JPA General Plan Noise Element Policy 2(e), the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractors shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the Project site.	The Project would be consistent with this policy.
Goal 3	Reduce air pollution through proper land use, transportation, and energy use planning.	The proposed warehouse component of the Project would be constructed on approximately 35.4 acres located just south of existing industrial and warehouse development. The use would be similar to surrounding land uses, and the existing roadway network provides access to the K4 Parcel. Potential air impacts associated with the Project would be reduced to the maximum extent feasible through implementation of **MM-AQ-1** through **MM-AQ-6**; however, even with implementation of mitigation, operational air impacts associated with NO_x from truck trips would exceed established thresholds. However, the Project site is located far enough from sensitive land uses (i.e., schools, residences, etc.) that air impacts would not result in health hazards to individuals, and as explained in Section 4.2, Air Quality, and Section 4.6, Greenhouse Gas Emissions, the Project is consistent with the RTP/SCS.	The Project would be consistent with this goal to the maximum extent feasible, with implementation of mitigation measures **MM-AQ-1** through **MM-AQ-6**.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 3.4	Encourage ride share programs.	As required by mitigation measure **MM-AQ-5** Commute Trip Reduction, 5% of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools to encourage ride share programs.	The Project would be consistent with this policy.
Goal 4	Pursue reduced emissions for stationary and mobile sources through the use and implementation of new and advancing technologies.	As required by **MM-AQ-1**, Construction Equipment Emissions Standards, and **MM-AQ-4**, Improved Energy Efficiency and Water District, the Project shall commit to the following: During Project construction, the construction contractor, with oversight by March JPA, shall ensure that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the United States Environmental Protection Agency (USEPA). In addition, the construction contractor shall utilize 50% Tier 4 Final construction equipment, based on number of pieces of construction equipment. • The Project will install approximately 4.5 MW of solar photovoltaic electricity generation. • The Project will install Energy Star certified light bulb and lighting fixtures. • The Project will install duct insulation to a minimum level of R-6 and modestly enhanced window insulation as required by 2016 Title 24 and consistent with the Riverside County Climate Action Plan criteria. • Consistent with the Riverside County Climate Action Plan criteria, the Project will include the following design elements: Construction of modest cool roof, defined as CRRC Rated 0.15 aged solar reflectance and 0.75 thermal emittance; Use of HVAC equipment	The Project would be consistent with this goal with implementation of **MM-AQ-1** and **MM-AQ-4.**

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		with a SEER of 14 or higher; Installation of water heaters with an energy factor of .92 or higher; All rooms will have some form of daylighting (e.g., skylights or windows); At least 50% of artificial lighting unit fixtures will be high efficacy; Waterless urinals and high efficiency toilets will be used throughout the Project; and water efficient faucets will be used throughout the Project. • The Project will provide electrical outlets at building exterior areas. • The Project landscape non-potable water system will meet "purple" pipe standards. • The Project will exceed the Riverside County Climate Action Plan requirement for water efficient landscaping by having no turf and only drought tolerant plants and introducing additional water efficient irrigation controls such as smart irrigation controllers. • The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle (EV) charging stations and fifty-four off-site EV charging stations.	
Policy 4.1	Pursue the use of equipment with reduced or zero emissions for stationary and mobile source equipment.	See Goal 4.	The Project would be consistent with this goal with implementation of **MM-AQ-1** and **MM-AQ-4.**
Policy 4.4	Promote for all development and encourage end-users to employ emission reducing or zero source equipment and processes.	See Goal 4.	The Project would be consistent with this goal with implementation of **MM-AQ-1** and **MM-AQ-4.**

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 5.5	Review development project to determine potential air quality impacts and provide appropriate mitigation, where necessary.	A comprehensive air quality analysis for the proposed Project is included within Section 4.2, Air Quality of the EIR, and applicable mitigation measures can be found in both the Executive Summary and in Section 4.2.7 of the EIR.	The Project would be consistent with this policy.
Goal 6	Reduce emissions associated with vehicle/engine use.	The Riverside Transit Agency (RTA) provides bus service within the March JPA (RTA 2019). The nearest bus stop is located at the northeast intersection of Fredrick Street and Cactus Avenue. There is an existing Class II bike lane along Cactus Avenue. Bicycle racks would be included as part of the proposed Project and would be reviewed as part of March JPA's design review process. Additionally, **MM-AQ-5** is required for the proposed Project and would entail: • 5% of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools. • Tenants with more than 10,000 square feet of office space shall provide video conferencing facilities. Tenant spaces below 10,000 square feet of office space may pursue video conferencing as feasible. • The Project will provide short- and long- term bicycle parking facilities to meet peak season maximum demand (one bike rack space per 20 vehicle/employee parking spaces). • The Project will provide "end-of-trip" facilities including showers, lockers, and changing space (four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).	The Project would be consistent with this goal with implementation of **MM-AQ-5.**

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		• Each tenant will provide on-site food vending machines or refrigerator, microwave oven and mail facilities (i.e., drop box) at the Project site. Each tenant with over 5,000 square feet of office space shall provide an on-site computer, internet connection, and other services for personal employee use. Projects will consider the provision of an ATM as feasible.	
Policy 6.1	Reduce idling emissions by increasing traffic flow through synchronized traffic signals.	The Project Applicant shall participate in the funding of off-site improvements, including traffic signals that are needed to serve cumulative traffic conditions through the payment of transportation uniform mitigation fee (TUMF). These fees shall be collected by the March JPA, with the proceeds solely used as part of a funding mechanism aimed at ensuring that signals are synchronized to reduce idling emissions along roadways in the vicinity of the Project.	The Project would be consistent with this policy with implementation of **MM-TRAF-1**, **MM-TRAF-2**, **MM-TRAF-4**, **MM-TRAF-7**, **MM-TRAF-8**, **MM-TRAF-13**, **MM-TRAF-15** and **MM-TRAF-18**.
Policy 6.2	Work with Riverside Transit Agency (RTA) to develop a local transit system and facilitate connections.	RTA Route 11 currently operates along Cactus Avenue and could potentially serve the Project. The Project Applicant and March JPA will continue to work with RTA during throughout Project design to ensure transit access to the Project site.	The Project would be consistent with this policy.
Policy 6.3	Encourage diversion of peak hour truck traffic, whenever feasible, to off-peak periods to reduce roadway congestion and associated emissions.	With implementation of **MM-AQ-5**, the Project would encourage diversion of peak hour traffic (see Goal 6, above for **MM-AQ-5** language).	The Project would be consistent with this policy with implementation of **MM-AQ-5**.
Policy 6.4	Work with Caltrans and traffic engineers to insure that roadways and freeway on-ramps that are heavily utilized by trucks are designed to safely accommodate trucks.	The freeway on-ramps and roadways already exist and are designed to safely accommodate trucks. Any infrastructure or street enhancements related to the Project would be reviewed by March JPA to ensure that the roadway is designed to safely accommodate trucks.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 6.5	Encourage trucks operating within March JPA Planning Area to maintain safety equipment and operate at safe speeds so as to reduce the potential for accidents which create congestion and related emissions.	All trucks operating within the March JPA Planning Area are required to maintain safety equipment and operate at safe speeds. The Project is designed to minimize potential conflicts between truck and vehicular traffic, and reduce the potential for accidents. Additionally, as required by **MM-AQ-1**, during Project construction, the construction contractor, with oversight by March JPA, shall ensure that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the United States Environmental Protection Agency (USEPA). In addition, the construction contractor shall utilize 50% Tier 4 Final construction equipment, based on number of pieces of construction equipment	The Project would be consistent with this policy with implementation of **MM-AQ-1**.
Policy 6.6	Reduce vehicle emissions through improved parking design and management that provide for safe pedestrian access to and from various facilities.	See Goal 6.	The Project would be consistent with this goal with implementation of **MM-AQ-5.**
Policy 6.8	Encourage the use of compressed natural gas, clean diesel, and/or alternative fuels in engines.	See Goal 6.	The Project would be consistent with this goal with implementation of **MM-AQ-5.**
Goal 7	Reduce emissions associated with energy consumption.	As required in **MM-AQ-4**, the Project applicant shall incorporate the following measures into the Project design: • The Project will install approximately 4.5 MW of solar photovoltaic electricity generation. • The Project will install Energy Star certified light bulb and lighting fixtures. • The Project will install duct insulation to a minimum level of R-6 and modestly enhanced window insulation	The Project would be consistent with this goal with implementation **MM-AQ-4**.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		as required by 2016 Title 24 and consistent with the Riverside County Climate Action Plan criteria. • Consistent with the Riverside County Climate Action Plan criteria, the Project will include the following design elements: Construction of modest cool roof, defined as CRRC Rated 0.15 aged solar reflectance and 0.75 thermal emittance; Use of HVAC equipment with a SEER of 14 or higher; Installation of water heaters with an energy factor of .92 or higher; All rooms will have some form of daylighting (e.g., skylights or windows); At least 50% of artificial lighting unit fixtures will be high efficacy; Waterless urinals and high efficiency toilets will be used throughout the Project; and water efficient faucets will be used throughout the Project. • The Project will provide electrical outlets at building exterior areas. • The Project landscape non-potable water system will meet "purple" pipe standards. • The Project will exceed the Riverside County Climate Action Plan requirement for water efficient landscaping by having no turf and only drought tolerant plants and introducing additional water efficient irrigation controls such as smart irrigation controllers. • The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle (EV) charging stations and fifty-four off-site EV charging stations.	

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 7.1	Support the use of energy-efficient equipment and design in the March JPA Planning Area for facilities and infrastructure.	See Goal 7.	The Project would be consistent with this policy with implementation of **MM-AQ-4**.
Policy 7.2	Encourage incorporation of energy conservation features in development.	See Goal 7.	The Project would be consistent with this policy with implementation of **MM-AQ-4**.
Policy 7.3	Support passive solar design in new construction.	The Project would include solar panels that are recessed into the building elevation or screened by a decorative wall or landscaping.	The Project would be consistent with this policy.
Policy 7.4	Support recycling programs which reduce emissions associated with manufacturing and waste disposal.	As discussed in Section 4.13, Utilities, the Project would be required to prepare a waste recycling plan to be approved by the Riverside County Waste Management Department. The plan would specify where and how the recyclable materials would be stored on the site.	The Project would be consistent with this policy.
Policy 7.5	Support drought-resistant vegetation in landscaping areas to reduce energy needed to pump water.	Drought-resistant vegetation would be installed on the Project site, thereby reducing the amount of potable water needing to be pumped to the Project site.	The Project would be consistent with this policy.
Goal 8	Reduce air pollution emissions and impacts through siting and building design.	See Goal 6.	The Project would be consistent with this goal with implementation of **MM-AQ-5**.
Policy 8.1	Support the use of low polluting construction materials and coatings.	The Project would be subject to the following with implementation of **MM-AQ-1** and **MM-AQ-2**: • During Project construction, the construction contractor, with oversight by March JPA, shall ensure that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the United States Environmental Protection Agency (USEPA). In	The Project would be consistent with this policy with implementation of **MM-AQ-1** and **MM-AQ-2**.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		addition, the construction contractor shall utilize 50% Tier 4 Final construction equipment, based on number of pieces of construction equipment. • The construction contractor shall be required to utilize Super-Compliant VOC interior and exterior paints, which are defined by SCAQMD as meeting the "super-compliant" VOC standard of 10 grams per liter (g/L), during construction and long-term operations.	
Policy 8.2	Encourage the separation of sensitive receptors, such as schools and hospitals, from sources of toxic emissions.	The Project is not located in the vicinity of sensitive receptors such as schools, hospitals and residences.	The Project would be consistent with this policy.
Policy 8.3	Encourage the separation of sensitive receptors from potential carbon monoxide hotspots.	See Policy 8.2.	The Project would be consistent with this policy.
Goal 9	Reduce fugitive dust and particulate matter emissions.	To account for dust control measures to comply with SCAQMD Rule 403 in the calculations, it was assumed that the active sites would be watered twice times daily, or as needed depending on weather conditions, resulting in a 55% reduction in fugitive dust as implemented by the CalEEMod.	The Project would be consistent with this goal.
Policy 9.1	Require all feasible fugitive dust reduction techniques to be utilized during construction activities.	Standard construction practices that would be employed to reduce fugitive dust emissions include watering the active sites twice times daily, as needed, depending on weather conditions.	The Project would be consistent with this policy.
Policy 9.3	Support land division design which minimizes grading and maintains the natural topography to the maximum extent feasible.	The K4 Parcel is relatively flat and would require minimal grading at the outset of Project construction. As detailed in Section 4.5, Geology and Soils, recommendations included within the Geotechnical Explorations prepared for the Project would be incorporated during Project design and construction, as required by **MM-GEO-1**.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Resource Management Element			
Policy 1.1	Where possible, retain local drainage courses, channels and creeks in their natural condition.	The Project site currently drains to the south and west and also connects to the existing Cactus Channel north of the K4 Parcel. Flows within the Cactus Channel drain from west to east, where they then connect with the Heacock Channel and drain to the south. Project implementation would retain existing flows both on the Project site and within the Cactus Channel. While the existing earthen Cactus Channel would be converted to an underground box culvert, this improvement would minimize bird strike hazards within the vicinity of the March ARB airstrip.	The Project would be consistent with this policy.
Policy 1.2	Protect groundwater and surface water resources from depletion and sources of pollution.	Potable water would be supplied by WMWD. Water sources from WMWD primarily depend on imported water resources. WMWD purchases both Colorado River and State Water Project water from Metropolitan Water District of Southern California. The Project would not directly draw groundwater from the underlying aquifer, would not result in a water demand from WMWD that appreciably deplete their overall groundwater supplies, and the Project would use water-efficient devices and landscaping to reduce water consumption. The development under the proposed Project would include LID stormwater design features such as bioretention best management practices (BMPs) which encourage on-site infiltration of stormwater runoff which would provide groundwater recharge. The Project would also use recycled water for non-potable uses. For these reasons, the Project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 1.4	Require development to conserve water resources, including the use of water-efficient plumbing fixtures and irrigation systems.	Low water-use plumbing fixtures and irrigation systems would be installed as part of the proposed Project.	The Project would be consistent with this policy.
Policy 1.5	Conserve imported water by requiring water conservation techniques, water-conserving and recycling processes, drought-resistant landscaping, and reclaimed water for irrigation, when available and appropriate.	Drought-resistant landscaping would be used at the Project site, and low water-use plumbing fixtures and irrigation systems would be installed so as to minimize water use and encourage water conservation.	The Project would be consistent with this policy.
Policy 1.6	Promote the use of drought tolerant landscaping in development, and encourage the use of reclaimed water for irrigation, when available and appropriate.	See Policy 1.5.	The Project would be consistent with this policy.
Goal 4	Conserve energy resources through use of availability energy technology and conservation practices.	See Noise/Air Quality Element Goal 7. The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle (EV) charging stations and fifty-four off-site EV charging stations.	The Project would be consistent with this goal with implementation **MM-AQ-4**.
Policy 4.1	Implement energy performance requirements established under the California Administration Code Title 24 Energy Conservation and Insulation Regulations.	See Goal 4.	The Project would be consistent with this goal with implementation **MM-AQ-4**.
Policy 4.3	Encourage the use and development of alternative and innovative energy resources and energy conservation techniques, where practical.	See Goal 4.	The Project would be consistent with this goal with implementation **MM-AQ-4**.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Goal 5	Conserve and protect significant stands of mature trees, native vegetation, and habitat within the planning area.	The Project site does not provide suitable habitat for federally or state threatened or endangered plants based on the disturbed nature of the site, lack of suitable soils to support listed plant species in the vicinity, and results of focused summer special-status plant surveys.	The Project would be consistent with this policy.
Policy 5.1	Where practical, conserve important plant communities and habitats such as riparian areas, wetlands, significant tree stands, and species by using buffers, creative site planning, revegetation and open space easements/dedications.	See Goal 5.	The Project would be consistent with this policy.
Policy 5.2	Encourage the planting of native species of trees and other drought-tolerant vegetation.	Native and drought-resistant landscaping would be used at the Project site, and low water-use plumbing fixtures and irrigation systems would be installed so as to minimize water use and encourage water conservation.	The Project would be consistent with this policy.
Policy 5.4	In areas that may contain important plant and animal communities, require development to prepare biological assessments identifying species types and locations and develop measures to preserve recognized sensitive species, as appropriate.	As discussed in Section 4.3, Biological Resources, the Project would incorporate **MM-BIO-1** through **MM-BIO-9.**	The Project would be consistent with this policy with implementation of **MM-BIO-1** through **MM-BIO-9.**
Policy 7.5	Require development proposals that are located on or near archaeological or paleontological resources to provide a cultural resources study that assesses potential impacts to the resource as a result of the proposed development. The report will include measures to avoid destruction of any significant cultural resources.	While no archeological or paleontological resources are anticipated to be encountered during Project construction, in the event of unanticipated discoveries, implementation of **MM-CUL-1** through **MM-CUL-2** would reduce impacts to such resources.	The Project would be consistent with this policy with implementation of **MM-CUL-1** through **MM-CUL-2**.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 7.6	Require the preservation of identified cultural resources to the extent possible, prior to development, through dedication, removal, transfer, reuse, or other means.	See Policy 7.5.	The Project would be consistent with this policy with implementation of **MM-CUL-1** through **MM-CUL-2**.
Safety/Risk Management Element			
Goal 1	Minimize injury and loss of life, property damage, and other impacts caused by seismic shaking, fault rupture, ground failure, and landslides.	The K4 Parcel is relatively flat and would require minimal grading at the outset of Project construction. As detailed in Section 4.5, Geology and Soils, recommendations included within the Geotechnical Explorations prepared for the Project would be incorporated during Project design and construction, as required by **MM-GEO-1**.	The Project would be consistent with this goal.
Policy 1.1	Require geological and geotechnical investigations in areas of potential seismic or geologic hazards as part of the environmental and development review process. Require mitigation of seismic or geologic hazards to the satisfaction of the responsible agencies.	See Goal 1.	The Project would be consistent with this policy.
Policy 1.2	Ensure all grading plans comply with the Uniform Building Code and California Building Code including, if necessary, requiring preliminary investigations of development sites by a State-registered geotechnical engineers and certified engineering geologists.	See Goal 1.	The Project would be consistent with this policy.
Policy 1.3	If necessary, require liquefaction assessment studies in any area identified as having moderate to high liquefaction susceptibility.	See Goal 1.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Goal 3	Minimize injury, loss of life, property damage, and economic and social disruption caused by flood hazards.	Implementation of (1) the SWPPP in conformance with the Construction General Permit, (2) the WQMP in compliance with the "New Development & Redevelopment Guidelines for Projects Under the March JPA," and (3) proposed drainage design according to the *Riverside County Flood Control & Water Conservation District Hydrology Manual* collectively ensure that Project impacts on hydrology and water quality would be less than significant.	The Project would be consistent with this goal.
Policy 3.3	Ensure all development within identified flood hazard areas complies with Floodplain Management Regulations.	See Goal 3.	The Project would be consistent with this policy.
Policy 3.4	Ensure that development does not divert stormwater runoff onto adjacent properties, or cause alterations of natural drainage courses that cannot be adequately handled by existing drainage facilities or the flood control improvements proposed with the development.	See Goal 3.	The Project would be consistent with this policy.
Policy 3.5	Require the installation and maintenance of storm drains by property owners.	See Goal 3.	The Project would be consistent with this policy.
Policy 3.6	Assess potential environmental drainage impacts of new construction, including the necessity and impact of Riverside County Flood Control and Water Conservation District drains and privately-owned and operated storm drains adjacent to slopes and stream-bed areas.	The Project is designed to provide adequate drainage of anticipated storm runoff. The Project is designed to provide for adequate drainage of anticipated storm runoff. Additionally, see Policy 3.4 for Project consistency analysis.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 3.7	Utilize and support storm drain maintenance efforts to prevent localized flooding and mud and debris flows from overtaxed storm drains during strong storms.	See Goal 3.	The Project would be consistent with this policy.
Policy 4.1	Ensure that law enforcement and fire services, such as fire equipment and response time, are adequate and able to respond to a major disaster.	With the nearby services of Station 65 – Moreno Valley Station as well as other nearby City of Moreno Valley and Riverside County fire stations, the Project would be served by sufficient fire protection services. The Riverside County Fire Department ensures that new development complies with the California Fire Code (24 CCR, Part 9). Buildings would be required to install fire prevention devices, such as fire alarms and sprinklers, in order to improve emergency-related problems for the proposed development. Zoned sprinkler systems would be installed throughout the building. Per discussions with the City of Moreno Valley Police Department, the development of the industrial use may result in additional enforcement calls and emergency responses, incrementally increasing demand for additional law enforcement personnel and services in the City of Moreno Valley and surrounding area. None of these increases, however, would trigger the need for new or improved facilities in order to meet the additional demand as no new population is expected per City of Moreno Valley Police Department. Any additional personnel (officers, supervisors, or support staff), equipment, and vehicles necessary could be accommodated at existing facilities. The proposed Project would also pay the criminal justice public facilities DIFs.	The Project would be consistent with this policy.
Policy 4.5	Ensure that new access roads have adequate widths and turning radius for fire and emergency vehicles.	All areas of the Project site would be accessible to emergency responders during both Project construction and operation. Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. These access points, along with the internal drive aisles and other on-site circulation design features, would provide emergency responders access to the entirety of the site.	
Policy 4.6	Coordinate with the Riverside County Fire Department to support the development of adequate water supplies for emergency fire flow needs in an emergency, including on-site supplies of water, supplementary gravity-fed 1 water tanks, and auxiliary water distribution systems.	As part of standard development practices, prior to construction, Project plans would be reviewed by the Riverside County Fire Department, and the Project would be required to incorporate the County Fire Department's recommendations into the final Project design. The Project would coordinate with the Riverside County Fire Department to support the development of adequate water supplies for emergency fire flow during an emergency.	The Project would be consistent with this policy.
Policy 7.2	Ensure development and use of property within the vicinity of the airfield complies with appropriate building standards and codes, including height restrictions, restrictions on use, setbacks, population densities, insulation and materials, as contained within an approved Comprehensive Land use Plan and appropriate AICUZ.	The Project site is located in Zone C1, which allows for the uses proposed by the Project. The Project site is not located within a designated Accident Potential Zone (APZ) I or APZ II, and instead lies outside of all APZs. Within the C1 Zone which limits projects to no more than 100 people per acre. The proposed land use on the K4 Parcel, which is 35.4 acres, would employ approximately 900 people, which is below the 100 people per acre threshold. As such, this Project would be compatible with this zone. The Project would comply with 2005 Air Installation Compatible Use Zone Study and the March ARB/Inland Port ALUCP. The Project would be developed in accordance with the March JPA Development Code that would ensure the Project meets the setback requirements, height restrictions,	The Project would be consistent with this policy, as discussed above.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		site and building design, site orientation, etc. that would be compatible with adjacent and surrounding land uses. The Project will submit an FAA 7460-1 application through ALUC to ensure compatibility. Within 5 days after construction of the Project reaches its greatest height, an FAA Form 7460-2 shall be completed by the Project proponent or his/her designee and e-filed with the FAA.	
Policy 8.8	Encourage private businesses to develop disaster preparedness plans for their employees.	Future tenants of the Project would provide identification of the exit routes and signage to their employees, as required by law.	The Project would be consistent with this policy.
Transportation Element			
Policy 3.5	Driveway Entrances onto surrounding arterial highways, major and minor arterials streets should be redistricted when practical, and through traffic on interior streets should be minimized.	Driveway entrances onto surrounding arterial highways, major, and minor arterials would be redistricted when practical. Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. Driveways would be provided, each of which would be designed and constructed according to March JPA standards and under the direction of a licensed and qualified civil engineer.	The Project would be consistent with this policy.
Policy 4.3	Arterial roads should carry both local and through traffic and be planned and improved to maintain a Level of Service "D" or better with limiting circumstances of Level of Service "E" to occur.	Improvement strategies (**MM-TRAF-1** through **MM-TRAF-20**) would be required to improve on-site, site-adjacent, and off-site circulation; payment of TUMF fees; fair share fees to the City of Riverside, County of Riverside, City of Moreno Valley, and Caltrans. Refer to Section 4.11, Transportation for detail discussion.	The Project would be consistent with this policy with implementation of **MM-TRAF-1** through **MM-TRAF-20**; however, implementation of these fees to fund the infrastructure improvements necessary to mitigate Project impacts cannot be guaranteed.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 4.4	Through traffic planning, measures should be implemented to alleviate direct impacts to adjoining jurisdictions which decrease roadway function Level of Service below the jurisdiction's adopted accepted Level of Service, as appropriate.	The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project.	The Project would be consistent with this policy.
Policy 4.5	Require the dedication and improvement of arterial roadways prior to the issuance of certificates of occupancy.	Improvement strategies (**MM-TRAF-1** through **MM-TRAF-20**) would be required to improve on-site, site-adjacent, and off-site circulation; payment of TUMF fees; fair share fees to the City of Riverside, County of Riverside, City of Moreno Valley, and Caltrans. Refer to Section 4.12, Transportation for detail discussion.	The Project would be consistent with this policy with implementation of **MM-TRAF-** through **MM-TRAF-20**; however, implementation of these fees to fund the infrastructure improvements necessary to mitigate Project impacts cannot be guaranteed.
Goal 6	Establish vehicular access control policies in order to maintain and insure the effectiveness and capacity of arterial roadways.	See Policy 4.5.	The Project would be consistent with this policy with implementation of **MM-TRAF-** through **MM-TRAF-20**; however, implementation of these fees to fund the infrastructure improvements necessary to mitigate Project impacts cannot be guaranteed.
Policy 6.1	To the extent possible, access shall be provided on local or collector streets where the frontage is available on both local and arterials streets.	Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. Driveways would be designed and constructed according to March JPA standards and under the direction of a licensed and qualified civil engineer. Similarly, the internal drive aisles, and loading and parking areas would be designed to comply with March JPA width, clearance, and turning radius requirements.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 6.2	Access to an arterial road shall be limited to one point for every 300 feet of frontage or one point for parcels with less than 300 feet of frontage.	Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. These access-points would provide access to the Project site with over 300 feet spacing between the cul-de-sacs.	The Project would be consistent with this policy.
Policy 7.2	Require major employers to prepare Transportation Management Plans with provisions for carpooling and vanpooling, flexible work hours or other techniques.	Project design shall include a designated bicycle route connecting all units, on-site bicycle parking facilities, off-site bicycle facilities, site entrances, and primary building entrances to existing Class I or Class II bike lane(s) within one-half mile. Bicycle route connects to all streets contiguous with Project site. Additionally, as required within **MM-AQ-5**, the following would be included for the proposed Project: • 5% of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools. • Tenants with more than 10,000 square feet of office space shall provide video conferencing facilities. Tenant spaces below 10,000 square feet of office space may pursue video conferencing as feasible. • The Project will provide short- and long- term bicycle parking facilities to meet peak season maximum demand (one bike rack space per 20 vehicle/employee parking spaces). • The Project will provide "end-of-trip" facilities including showers, lockers, and changing space (four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).	The Project would be consistent with this policy with implementation of **MM-AQ-5**.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		• Each tenant will provide on-site food vending machines or refrigerator, microwave oven and mail facilities (i.e., drop box) at the Project site. Each tenant with over 5,000 square feet of office space shall provide an on-site computer, internet connection, and other services for personal employee use. Projects will consider the provision of an ATM machine as feasible.	
Goal 9	Develop measures which will reduce the number of vehicle-miles travelled during peak travel periods.	Project design shall include a designated bicycle route connecting all units, on-site bicycle parking facilities, off-site bicycle facilities, site entrances, and primary building entrances to existing Class I or Class II bike lane(s) within one-half mile. Bicycle route connects to all streets contiguous with Project site. Additionally, as required within **MM-AQ-5**, the following would be included for the proposed Project: • 5% of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools. • Tenants with more than 10,000 square feet of office space shall provide video conferencing facilities. Tenant spaces below 10,000 square feet of office space may pursue video conferencing as feasible. • The Project will provide short- and long- term bicycle parking facilities to meet peak season maximum demand (one bike rack space per 20 vehicle/employee parking spaces). • The Project will provide "end-of-trip" facilities including showers, lockers, and changing space (four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).	The Project would be consistent with this goal with implementation of **MM-AQ-5**.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
		• Each tenant will provide on-site food vending machines or refrigerator, microwave oven and mail facilities (i.e., drop box) at the Project site. Each tenant with over 5,000 square feet of office space shall provide an on-site computer, internet connection, and other services for personal employee use. Projects will consider the provision of an ATM machine as feasible.	
Policy 9.2	Provide preferential parking for carpools and vanpools, where appropriate.	See Goal 9.	The Project would be consistent with this policy with implementation of **MM-AQ-5**.
Goal 10	Regulate the travel of trucks on March JPA Planning Area streets.	Trucks would access and leave the Project site solely via Cactus Avenue and I-215.	The Project would be consistent with this goal.
Policy 10.1	Establish a truck route system which designates truck commercial vehicle routes and provides adequately sized and designated roadways to meet the needs of trucks and commercial vehicles. This will eliminate truck and commercial vehicle traffic through inappropriate areas of the March JPA Planning Area.	See Goal 10.	The Project would be consistent with this policy.
Goal 11	Adequate off-street parking for all land uses shall be provided which requires adequate on-site parking to prevent spill over on the adjacent street system.	Parking requirements require 260 stalls for the proposed Project. Parking for employees and non-employee vehicles would be accommodated by 289 automobile parking stalls, and 317 truck trailer parking stalls on site. The on-site parking would prevent spill over on the adjacent street system.	The Project would be consistent with this goal.
Policy 11.1	Provide for adequate parking facilities for all uses.	See Goal 11.	The Project would be consistent with this policy.
Policy 11.4	Require all new development to provide adequate off-street parking based on expected parking needs.	See Goal 11.	The Project would be consistent with this policy.

Table 4.9-1
Project Consistency with March Joint Powers Authority General Plan

Goal or Policy/ Recommendation Number	Goal or Policy/Recommendation	Project	Project Consistency/ Inconsistency
Policy 11.5	Provide adequate loading areas within off-street parking areas for all commercial and manufacturing land uses.	The internal drive aisles, and loading and parking areas would be designed to comply with March JPA width, clearance, and turning radius requirements.	The Project would be consistent with this policy.
Goal 15	In accordance with state and federal law, promote and provide mobility for the disabled.	The Project shall comply with all applicable ADA requirements as required by state and federal law.	The Project would be consistent with this goal.
Policy 15.1	Require that all development comply with the requirements of the state and federal law for the disabled. Requirements may include ramps at street corners, access to public buildings, traffic signal timing and the like.	See Goal 15.	The Project would be consistent with this policy.

Notes: GP = General Plan; AFB = Air Force Base; JPA = Joint Powers Authority; APN = Assessor's Parcel Number; ARB = Air Reserve Base; dBA = A-weighted decibel; CNEL = Community Noise Equivalent Level; APZ = Accident Potential Zone; FAA = Federal Aviation Administration; EIR = environmental impact report; WMWD = Western Municipal Water District; RTP = Regional Transportation Plan; SCS = Sustainable Communities Strategy; MW = megawatt; HVAC = heating, ventilation, and air conditioning; SEER = Seasonal Energy Efficiency Ratio; SCAQMD = South Coast Air Quality Management District; CalEEMod = California Emissions Estimator Model; LID = low impact development.

As outlined in Table 4.9-1, the Project would be consistent with the goals and policies presented in the March JPA General Plan. Impacts are considered **less than significant with mitigation incorporated.**

The Project site is also subject to compliance with the *2005 Air Installation Compatible Use Zone (AICUZ) Study* (March ARB 2005) and the *March ARB/Inland Port ALUCP* (Mead & Hunt 2014).

March JPA General Plan and Development Code

As previously mentioned, the Project would require a General Plan amendment that would re-designate the Project site from Business Park to Industrial. Additionally, the Project would include a zoning designation of Industrial, consistent with the requested General Plan designation of Industrial. Table 4.9-2 demonstrates the Project's compliance with the March JPA's Development Code.

Table 4.9-2
Project's Compliance with the March Joint Powers Authority's Development Standards

Development Standards	Required/Permitted	Project Provided
Site Area	35.4 acres	35.4 acres
Lot Dimensions Lot Width Lot Depth	600 feet 600 feet	~2,000 feet ~700 feet
Building Height	80 feet maximum	46 feet
Building Setbacks		
Front Side (Interior) Side (Street Side) Rear	20 feet 3 feet 20 feet 3 feet	240 feet 79 feet 79 feet 41 feet
Parking Requirements		
Warehouse		
0–50,000 sf – 1/1,000 50,000 sf – 200,000 sf 500,000 sf +	50 50 100	289 automobile spaces
Office		
18,000 sf	60	
Total Spaces Required	**260 spaces**	**289 spaces** **105 loading docks**

Notes: sf = square feet.

As shown in Table 4.9-2, the Project would be in compliance with the March JPA Development Code Standards. Therefore, the Project would be consistent with the March JPA Development Code, and impacts would be **less than significant**.

Threshold LU-2. Would the Project conflict with any applicable habitat conservation plan or natural community conservation plan?

As discussed in Section 4.3 Biological Resources, the Cactus Channel would function as part of the District's Master Plan, and these agencies are party to the Western Riverside County MSHCP area. The K4 Parcel is also located within the boundaries of the MSHCP. The March JPA is not a permittee to the MSHCP, and thus, does not have to comply with the Reserve Assembly goals of the MSHCP or any other MSHCP requirements. The Project site is not located in an area subject to Cell Criteria, Public/Quasi-Public Conserved Land areas, existing conserved Additional Reserve Land, or land described for conservation under the MSHCP, and therefore the Project's development would not interfere or conflict with the ability of the MSHCP goals and objectives to be implemented (Figure 4.3-3, MSHCP Overview, of Appendix E).

The Project site is located within an identified burrowing owl survey area within the MSHCP. Although burrowing owl individuals and/or sign were observed during general biological surveys conducted within the Project site in July 2018, focused burrowing owl surveys were not conducted and suitable burrowing owl habitat occurs on site and in adjacent areas immediately south of the Project site. Thus, additional burrowing owl measures within **MM-BIO-5** including, but not limited to preconstruction surveys for burrowing owl within 30 days of ground-disturbing activities, avoidance and minimization measures if found, potential preparation of a burrowing owl Relocation Plan, and potential compensatory mitigation, would ensure consistency with the MSHCP. As such, the development of the Project would not interfere or conflict with the ability of the MSHCP goals and objectives to be implemented. Conflicts with the MSHCP would be **less than significant** with Project implementation, and no additional mitigation is required.

Although suitable Stephens' kangaroo rat habitat was identified within the Project site (i.e., K4 Parcel and Cactus Channel improvements area), focused surveys were conducted for Stephens' kangaroo rat in 2018 with negative results. Provided that this species has not been identified within the Project site, and the negative findings for this species, Stephens' kangaroo rat are not expected to occur within the Project site and impacts to this species are anticipated to be **less than significant**, and further reduced by implementation of **MM-BIO-4** (presence/absence surveys if burrows cannot be avoided, installation of one-way doors, if present, development of a trapping/relocation plan, and mitigation requirements). Federally listed large branchiopod protocol-level surveys are currently underway, and results of these surveys will be provided to USFWS as per the survey requirements. If this species is identified to be present on site, then additional fairy shrimp measures within **MM-BIO-3** including, but not limited to conducting focused surveys, establishing Environmentally Sensitive Areas within 250 feet of occupied features, biological monitoring, establishment of BMPs, preparation of a Mitigation, Monitoring, and Management Plan, and mitigation requirements (i.e., minimum of 1:1 mitigation for temporary impacts and 2:1 mitigation for permanent impacts). Impacts to state and/or federally jurisdictional

waters would be less than significant with implementation of **MM-BIO-9**, which requires that state and/or federal permits be acquired prior to impacts, establishment of BMPs, biological monitoring, and mitigation requirements (i.e., minimum of 1:1 mitigation for temporary impacts and 2:1 mitigation for permanent impacts). Conflicts with the MSHCP would be **less than significant** with Project implementation, and no additional mitigation is required.

4.9.5 Mitigation Measures

The proposed Project is required to implement the following mitigation measures to reduce potentially significant Land Use and Planning impacts:

- **MM-AQ-1** through **MM-AQ-6**
- **MM-BIO-1** through **MM-BIO-9**
- **MM-CUL-1** through **MM-CUL-2**
- **MM-GEO-1**
- **MM-HAZ-1** through **MM-HAZ-8**
- **MM-TRAF-1** through **MM-TRAF-20**

4.9.6 Level of Significance After Mitigation

Impacts to land use and planning can be mitigated to less than significant levels by incorporating mitigation measures as described in Section 4.9.5 above. Therefore, no significant adverse impacts would remain after mitigation; impacts to land use and planning would be less than significant.

CHAPTER 5
MANDATORY CEQA TOPICS

5.1 INTRODUCTION

Section 15128 of the California Environmental Quality Act (CEQA) guidelines requires that an environmental impact report (EIR) briefly describe potential environmental effects that were determined not to be significant and therefore were not discussed in detail in the EIR. The environmental issues discussed in the following sections are not considered significant, and the reasons for the conclusion of non-significance are discussed below.

The following is a guide to where most of these issues are discussed in this EIR:

- Significant Environmental Effects – throughout Chapter 4
- Mitigation Measures – Executive Summary and throughout Chapter 4
- Alternatives – Chapter 7
- Growth-Inducing Impacts – Chapter 8

Because the above issues are discussed in other sections of this EIR, this chapter will only address the significant unavoidable and irreversible impacts from implementation of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project).

5.1.1 Significant Unavoidable Environmental Effects

CEQA Guidelines Section 15126.2(b) further directs EIRs to address impacts from a project that will result in significant impacts, including those that cannot be mitigated below a level of significance. A summary of all the environmental issue areas and the resultant significance and listing of mitigation measures is found in the Executive Summary of this document. To summarize, the following issue areas would result in significant impacts even after mitigation measures have been incorporated, thus resulting in unavoidable impacts:

- Air Quality – oxides of nitrogen emissions during construction
- Transportation

5.1.2 Significant Irreversible Changes

CEQA Guidelines mandate that the EIR must address any significant irreversible environmental changes that would be involved in the proposed action should it be implemented (14 CCR 15126(c)). An impact would fall into this category if:

- The project would involve a large commitment of nonrenewable resources
- The primary and secondary impacts of the project would generally commit future generations of people to similar uses

- The project involves uses in which irreversible damage could result from any potential environmental incidents associated with the project
- The proposed consumption of resources is not justified (e.g., the project results in wasteful use of energy)

Determining whether the proposed Project may result in significant irreversible effects requires a determination of whether key resources would be degraded or destroyed in such a way that there would be little possibility of restoring them. Construction of each of the Project components would result in the use of nonrenewable resources and energy sources, including fossil fuels, natural gas, and electricity, as discussed in Section 4.14, Energy, of this EIR. Fossil fuels would be used to power construction equipment and delivery and construction employee vehicles. Construction equipment would also use electricity and natural gas. Use of these energy sources would be considered a permanent commitment of resources. However, Project impacts related to consumption of nonrenewable resources are considered to be less than significant because the Project would not use unusual or wasteful amounts of energy or construction materials. Because the proposed Project would not consume an unusual or wasteful amount of energy or materials, and would comply with California Building Energy Efficiency Standards (24 CCR Part 6), potential impacts associated with non-renewable energy consumption would be less than significant. In addition, a variety of resource materials would be used during the construction process, including steel, wood, concrete, and fabricated materials. Once these materials and fuels are used for purposes of construction, the commitment of such materials and fuels would be considered irreversible. These construction materials and fuels would likely be committed to other similar projects in the region if not used for this Project. Resources used for the Project would be typical of similar industrial projects in the region. Therefore, although irretrievable commitments of resources would result from the proposed Project, such changes would be less than significant. Provision of utilities and energy use are discussed in Section 4.13, Utilities and Service Systems, and Section 4.14.

Once operational, the Project components would consume more energy on a daily basis than is currently consumed on the Project site, given that the Project site is currently undeveloped. A portion of the energy used would be provided by nonrenewable sources. Once constructed, it is reasonable to assume that the industrial facilities would use nonrenewable energy resources, which would be an irreversible commitment of such resources. Additionally, the Project is a relatively minor energy consumer compared to other local and regional users.

The utilities that service the Project, and the design of the proposed Project are all subject to regulations that are working to reduce the amount of nonrenewable resources from development projects. Irreversible changes may also occur from environmental damage, such as spill or release of hazardous material, flooding due to failure of human-made structure for channeling, or accidental fire resulting from mechanical or industrial failure. While there are many other types of accidents possible, those listed above represent the key sources for irreversible damage that can be associated

with the types of future development. However, it is assumed that all new uses of hazardous materials would occur pursuant to applicable laws and regulations. That is, industrial use involving hazardous materials would obtain and comply with a valid materials license specifying the requisite safety measures for the use, handling, storage, transportation and disposal of these materials. Additionally, all drainage improvements would all be subject to the extensive local, state, and federal regulations, building codes and geotechnical standards enacted to ensure that such uses do not result in a geotechnical, soil, or slope hazard. Therefore, this would not be considered a significant irreversible environmental effect or cause irreversible environmental damage.

INTENTIONALLY LEFT BLANK

CHAPTER 6
CUMULATIVE EFFECTS

6.1 INTRODUCTION

The California Environmental Quality Act (CEQA) requires that an environmental impact report (EIR) examine the cumulative impacts associated with a project, in addition to project-specific impacts. The discussion of cumulative impacts must reflect the severity of the impacts and the likelihood of their occurrence; however, the discussion need not be as detailed as the discussion of environmental impacts attributable to the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) alone (14 CCR 15130(b)).

As stated in the CEQA Guidelines, an EIR "shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable" (14 CCR 15130(a)). "Cumulatively considerable" means that "the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects as defined in Section 15130" (14 CCR 15065(c)). Section 15355 of the CEQA Guidelines states that cumulative impacts occur from "the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time."

A cumulative impact is not considered significant if the impact can be mitigated to below the level of significance through mitigation, including providing improvements and/or contributing funds through fee-payment programs. The EIR must examine "reasonable options for mitigating or avoiding any significant cumulative effects of a proposed project" (14 CCR 15130(a)(3) and 15130(b)(5)).

6.2 CUMULATIVE ANALYSIS SETTING

The proposed Project consists of two components: the K4 Parcel Warehouse and the Cactus Channel improvements. For the purposes of this cumulative analysis, the analysis will refer to the combined two components as the proposed Project, unless separate analysis of the two components is justified. Where such separate analysis is provided, the discussion will clearly indicate which Project component is being discussed. The cumulative impact analysis for the proposed Project is based on information contained in the *General Plan of the March Joint Powers Authority (JPA)* (March JPA 1999) and the *March Air Reserve Base (ARB)/Inland Port Airport Land Use Compatibility Plan* (ALUCP) (Mead & Hunt 2014), since the Project site is located within the March JPA Planning Area and within these land use plan and study areas. All the above-mentioned documents are incorporated in this chapter by reference.

6.3 CUMULATIVE FORECASTING METHODOLOGY

Section 15130(b)(1)(A) of the CEQA Guidelines allows for the preparation of a list of past, present, and reasonably anticipated future projects as a viable method of determining cumulative impacts. This discussion uses the following approach: an initial list and description of all related projects is presented, followed by a discussion of the effects that the Project may have on each environmental category of concern. Consistent with CEQA (California Public Resources Code, Section 21000 et seq.), this discussion is guided by the standards of practicality and reasonableness.

6.3.1 Related Projects

This section provides a list of past, present, and reasonably foreseeable future projects based on the information that was provided in the Traffic Impact Analysis prepared for the proposed Project (Appendix R). The cumulative project list was developed for the purposes of this analysis through consultation with planning and engineering staff from the City of Riverside, City of Moreno Valley, and County of Riverside to include key projects in their respective jurisdictions.

Table 6-1 presents the cumulative projects generally within a 20-mile radius of the Project site that captures the March JPA Planning Areas as well as the surrounding areas. The projects listed in Table 6-1 serve as the foundation on which the cumulative analysis approach has been based. Figure 6-1, Cumulative Projects, shows geographically where the projects listed in Table 6-1 are located. As shown in Figure 6-1, the nearest project listed in Table 6-1 is the Cactus Commerce Center Drive Project, located approximately 0.3 miles west of the proposed Project. However, the geographic extent for cumulative analysis varies depending on each environmental issue area. For example, air quality impacts need to consider the entire South Coast Air Basin (SCAB), whereas noise impacts would be limited to the area more immediately surrounding the proposed Project. The geographic extent for cumulative analysis of each environmental issue are is described below.

Table 6-1
Cumulative Projects

ID	Project Name	Land Use	Density	Location	Status
March JPA					
MJPA1	Meridian Business Park (West Campus)	Industrial Park	2,278,852 sf	West of the MARB and the I-215	Approved

6.4 ASSESSMENT OF CUMULATIVE IMPACTS

6.4.1 Aesthetics

The geographic extent for this cumulative impact analysis includes the March JPA Planning Area jurisdiction as well as portions of the City of Moreno Valley and Riverside County visibility accessible to the Project site. The Project site is located in an urbanized area within the County of Riverside, with commercial, industrial, residential, and federal uses in the Project vicinity. The K4 Parcel is currently undeveloped, yet previously disturbed land with perimeter fencing adjacent to existing industrial warehouse and office development. Mount Russel is visible from the K4 Parcel and Cactus Channel Improvement Site when facing east, however, according to the March JPA General Plan, this view is not designated as a scenic vista (Exhibit 5-5 in March JPA 1999). Additionally, according to the City of Moreno Valley General Plan Conservation Element, and the City of Riverside General Plan Open Space and Conservation Element, there are no designated scenic view or vista in the Project area (City of Moreno Valley 2006; City of Riverside 2012).

As described in Chapter 2, Project Description, of this EIR, the development on the K4 Parcel would cover approximately 35.4 acres and would consist of an industrial warehouse building and underground improvements to the existing Cactus Avenue Drainage Channel (Cactus Channel). The area surrounding the K4 Parcel generally includes commercial, office, and industrial uses, and the Interstate 215 (I-215) freeway.

Visual Character of Public Views

The K4 Parcel primarily consists of upland vegetation communities dominated by disturbed goldenbush/non-native grassland and developed/disturbed land. While implementation of the K4 Warehouse and Cactus Channel Improvements would change the immediate area's visual character, the new warehouse on the K4 Parcel would be generally consistent and compatible with the visual character along the Cactus Avenue corridor and the underground box culvert would be relatively non-visible and concealed through irrigated landscaping. Additionally, the larger visual context north, west and south of the Project site is predominantly industrial, commercial, and March ARB development. The proposed Cactus Channel improvements would result in noticeable visual changes to nearby receptors due to the removal of existing in-channel vegetation and replacement with a closed, yet depressed, box culvert. These changes would also affect the expectation of nearby casual observers that are accustomed to views of natural-appearing and unmaintained in-channel vegetation. However, the proposed approximately 7,900 linear-foot underground box culvert would be concealed through irrigated landscaping contoured mounds. The nearest cumulative project is the Cactus Commerce Center Drive Project, located approximately 0.3 mile west of the proposed Project, which would develop a vacant parcel into commercial and retail uses with a drive-thru. The Cactus Commerce Center Drive Project would be consistent with the visual character along the Cactus Avenue corridor, thus the nearby receptors would

not be significantly affected by this project in combination with the proposed Project. All other cumulative projects are not in close enough proximity to impact the visual character in combination with the proposed Project. As such, implementation of the K4 Parcel and Cactus Channel improvements in addition to the identified projects in Table 6-1, would not result in cumulatively considerable impacts to visual character.

Light and Glare

Implementation of the K4 Parcel warehouse building would introduce new sources of lighting in an area of March JPA that is currently undeveloped. However, as discussed in Section 4.1, Aesthetics, there is existing lighting in the surrounding area consisting of street lights on Cactus Avenue, and interior and exterior lighting from commercial and office land uses. Structures in the surrounding area are constructed with low reflective building materials. Lighting associated with the proposed Project would be of a similar nature to the daytime and nighttime illumination currently generated by surrounding commercial, and industrial developments, as well as existing light associated vehicle traffic. All lighting proposed for the Project would be subject to compliance with the provisions of March JPA Development Code, which would ensure proper design, installation, and operation of all exterior lighting, thereby reducing the potential for glare effects and light spillover onto adjacent properties. There would be no lighting associated with the Cactus Channel improvements. As such, given the commercial/industrial context of the surrounding area, implementation of the K4 Parcel and the Cactus Channel improvements would not result in or contribute to cumulatively significant lighting or impacts.

6.4.2 Air Quality

The geographic extent for the analysis of cumulative impacts related to air quality includes the SCAB (all cumulative projects in Table 6-1 are located within the Basin). In analyzing cumulative impacts from the K4 Parcel and Cactus Channel improvements, the analysis must specifically evaluate a project's contribution to the cumulative increase in pollutants for which the SCAB is designated as nonattainment for selected air pollutants under the California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS). If a project's emissions would exceed the South Coast Air Quality Management District (SCAQMD) significance thresholds, it would be considered to have a cumulatively considerable contribution to nonattainment status in the SCAB. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant (SCAQMD 2015).

The SCAB has been designated as federal nonattainment area for ozone (O_3) and particulate matter with an aerodynamic diameter equal to or less than 2.5 microns ($PM_{2.5}$) and a state nonattainment area for O_3, particulate matter with an aerodynamic diameter equal to or less than 10 microns (PM_{10}), and $PM_{2.5}$. PM_{10} and $PM_{2.5}$ emissions associated with construction generally result in

localized impacts. The nonattainment status is the result of cumulative emissions from all sources of these air pollutants and their precursors within the SCAB. As discussed in Section 4.2, Air Quality, of this EIR, the oxides of nitrogen (NO_x) and volatile organic compounds (VOC) emissions during K4 Parcel construction would be above the significance threshold without mitigation. Construction activities required for the implementation of the K4 Parcel Project component would be considered typical of a warehouse facility.

Cumulative localized impacts would potentially occur if a construction project were to occur concurrently with another off-site project. Construction schedules for potential future projects near the Project site are currently unknown; therefore, potential construction impacts associated with two simultaneous projects would be considered speculative. The CEQA Guidelines state that if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145). This analysis is nonetheless provided in an effort to show good faith analysis and comply with CEQA's information disclosure requirements.

Construction of the proposed Project would generate VOC and NO_x emissions (which are precursors to O_3) that would exceed the SCAQMD's emission-based significance threshold. Mitigation measure **MM-AQ-1** and **MM-AQ-2** (see Section 4.2.7, Level of Significance After Mitigation, of this EIR) would reduce NO_x and VOC emissions, respectively, to **less than significant** levels. Thus, the proposed Project would not have a cumulatively considerable increase in emissions due to construction.

In terms of localized air pollutant concentrations of nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), PM_{10}, and $PM_{2.5}$, construction and operation of the Project would have a less than significant impact. According to the SCAQMD guidance, the Project's contribution to cumulative localized air quality concentrations of these pollutants would not be cumulatively considerable, and therefore, impacts would be **less than significant**.

There is no operational activity associated with the Cactus Channel improvements, hence operational emissions are zero (Appendix C, Air Quality Technical Report). Operational emissions generated by the proposed K4 Parcel Warehouse would exceed the SCAQMD operational threshold for NO_x (precursor to O_3) which is attributed to the vehicular source emissions from trucks traveling to and from the Project site. Mitigation Measures **MM-AQ-5** and **MM-AQ-6** would reduce mobile source emissions, but not to a level of less than significant. **MM-AQ-4** would apply to energy and water use, which are minimal sources of criteria air pollutants. Additionally, Mitigation Measures **MM AQ-5** and **MM-AQ-6** are conservatively not quantified for this analysis. For the reasons identified above, there is no feasible mitigation to reduce operational NO_x impacts to a less-than-significant level. As described above, if a Project's emissions exceed the SCAQMD significance thresholds for a pollutant or a precursor to a pollutant the SCAB is in nonattainment of under the CAAQS and/or NAAQS, it would have a cumulatively considerable contribution to

the SCAB's nonattainment status of that pollutant. Therefore, operation of the proposed K4 Parcel Warehouse component of the Project would contribute to the SCAB's O_3 nonattainment designation, and impacts would be **significant and unavoidable**.

With regard to cumulative impacts associated with nonattainment pollutants, in general, if a Project is consistent with the community and general plans, it has been accounted for in the attainment demonstration contained within the State Implementation Plan and would therefore not result in a cumulatively significant impact on the ambient air quality. The proposed Project would be consistent with the population and growth projections of the Southern California Association of Governments (SCAG). The proposed Project would indirectly stimulate population growth through the addition of new employees/staff. However, the growth would be consistent with employment growth envisioned in local and regional land use plans and in projections made by the March JPA. Since the proposed Project would be consistent with the SCAG *2016–2045 Regional Transportation Plan/Sustainable Communities Strategy*, the proposed Project would also be consistent with the SCAQMD Air Quality Management Plan (AQMP), because demographic growth forecasts for various socioeconomic categories (e.g., population, housing, employment by industry) developed by SCAG for their 2016 RTP/SCS were used to estimate future emissions in the 2016 AQMP. However, because operation of the K4 Parcel Warehouse could result in a cumulatively considerable increase in emissions of NOx, which are precursors to O_3, the K4 Parcel Warehouse component of the proposed Project would conflict with implementation of the applicable air quality plan. Thus, implementation of the K4 Parcel Warehouse would result in a **significant cumulative impact** to O_3 levels in the SCAB**.**

6.4.3 Biological Resources

The geographic extent for this cumulative impact analysis includes the jurisdiction of the March JPA Planning Area. This accounts for development projects within the nearby vicinity that may provide habitat for the same species as the proposed Project site.

Special-Status Plants and Wildlife

As discussed in Section 4.3, Biological Resources, the following species were identified as having a moderate or high potential to occur on site: smooth tarplant, Riverside fairy shrimp, vernal pool fairy shrimp, Stephen's kangaroo rat, burrowing owl, western spadefoot, California horned lark, nesting native birds, San Diego black-tailed jackrabbit, northwestern San Diego pocket mouse, and Los Angeles pocket mouse. Focused surveys were not conducted for all species listed in this section. Special-status plants and wildlife have potential to occur on both the K4 Parcel and Cactus Channel Improvement Site. To reduce potential impacts to these species associated with both the Project components, mitigation measures **MM-BIO-1** through **MM-BIO-8** are required to reduce potential direct and/or indirect impacts to **less than significant.** Given that Project-specific impacts

to sensitive plant and animal species are less than significant with mitigation incorporated, the proposed Project (both the K4 Parcel and Cactus Channel components) would not create or contribute to a significant cumulative impact.

Special-Status Riparian Vegetation Communities

The K4 Parcel access driveways are proposed to cross over Cactus Channel to provide ingress/egress to the site from Cactus Avenue. These driveway crossings would permanently impact all potentially jurisdictional CDFW riparian vegetation communities on site (totaling approximately 0.06 acres) including 0.04 acres of freshwater marsh and 0.02 acres of southern willow scrub, which would result in potential significant impacts to riparian habitat. Potential indirect short-term impacts could also occur due to generation of fugitive dust, chemical pollutants, increased human activity, non-native invasive plant and animal species introduction, and changes in hydrology/hydraulics. **MM-BIO-2** and **MM-BIO-9** would be implemented to reduce potential indirect impacts to sensitive riparian vegetation communities.

The Cactus Channel improvements would permanently impact all potentially jurisdictional CDFW riparian vegetation communities on site (totaling approximately 0.48 acres), which would result in potential significant impacts. Riparian Potential indirect short-term impacts could also occur due to generation of fugitive dust, chemical pollutants, increased human activity, non-native invasive plant and animal species introduction, and changes in hydrology/hydraulics. With implementation of **MM-BIO-2** and **MM-BIO-9**, direct and indirect impacts to sensitive riparian vegetation would be **less than significant**. Given that Project-specific impacts to special-status riparian vegetation communities within the Cactus Channel are less than significant with mitigation incorporated, the collective proposed Project would not create or contribute to a significant cumulative impact.

Federally and State-Protected Wetlands

As discussed in Section 4.3.2, Relevant Plans, Policies, and Ordinances, the RWQCB is a division of the State Water Resources Control Board, provides oversight of the 401 permit (required by the Clean Water Act) process in California. The K4 Parcel access driveways are proposed to cross over Cactus Channel to provide ingress/egress to the site from Cactus Avenue. These crossings would permanently impact approximately 0.06 acres (131 linear feet) of potential Corps and RWQCB wetland waters of the United States/state. As concluded in the jurisdictional delineation, a majority of the Cactus Channel within the survey area met all three parameters per the Arid West Supplement and would therefore be considered potentially jurisdictional wetlands per the USACE and RWQCB. With incorporation of **MM-BIO-9**, the K4 Parcel would have a less than significant direct impact related to jurisdictional resources.

The proposed Cactus Channel Improvements would permanently impact approximately 1.34 acres (4,659 linear feet) of potential Corps and RWQCB wetland waters of the United States/state and

approximately 0.42 acres (2,876 linear feet) of non-wetland, ephemeral Corps and RWQCB waters of the United States/state during the construction of a box culvert along the Cactus Channel. The proposed Cactus Channel improvements would impact approximately 2.90 acres (7,535 linear feet) of potentially jurisdictional CDFW streambed (wetland and non-wetland) and/or associated riparian habitat within the Cactus Channel. With incorporation of **MM-BIO-2** and **MM-BIO-9**, the K4 Parcel would have a less than significant direct impact related to jurisdictional resources. Cumulative projects listed in Table 6-1 would also be subject to consistency with the CWA, therefore, in combination with related cumulative projects, the K4 Parcel and Cactus Channel improvements would not result in or contribute to cumulatively significant impacts.

Migratory Fish or Wildlife Species

Construction of both the K4 Parcel Warehouse and the Cactus Channel improvements would have the potential to result in significant impacts to birds and raptors, in the event that such species were to be nesting, foraging, or reproducing within the biological resources study area. Implementation of **MM-BIO-7**, which requires pre-construction nesting bird surveys be conducted and impacts to protected nesting birds be avoided, has been included to avoid potential impacts to native nesting birds. With implementation of **MM-BIO-7**, impacts to native nesting birds would be **less than significant.** Given that Project-specific impacts to migratory fish and wildlife species are less than significant with mitigation incorporated, neither the K4 Parcel nor the Cactus Channel improvements would create or contributed to a significant cumulative impact.

Policies or Ordinances Protecting Biological Resources

No native oaks protected under the Riverside County Oak Tree Management Guidelines occur within the K4 Parcel or Cactus Channel Improvement Site and/or adjacent areas; therefore, the neither Project component would conflict with the County's Oak Tree Management Guidelines. Additionally, the K4 Parcel and Cactus Channel improvements would not conflict with the Unincorporated Riverside County Ordinance No. 559, which requires a permit for the removal of living native trees on parcels or property greater than 0.5 acres in size, located in the Unincorporated Riverside County, and above 5,000 feet in elevation. In addition, County of Riverside Ordinance 499 (as amended through 499.11) provides regulations on encroachments in County Highways and tree removal in the right or way of any County highway. Since no street tree plantings occur on the Project site, no impacts to trees protected under Ordinance No. 499.11 would occur with Project implementation. As discussed in Section 4.3, no impact would occur in relation to policies or ordinances protecting biological resources, therefore the K4 Parcel and Cactus Channel improvements would not create of contribute to a cumulatively significant impact.

Habitat Conservation Plan

The March JPA is not a permittee to the MSHCP, and thus, does not have to comply with the Reserve Assembly goals of the MSHCP or any other MSHCP requirements. The Project site is not located in an area subject to Cell Criteria, Public/Quasi-Public Conserved Land areas, existing conserved Additional Reserve Land, or land described for conservation under the MSHCP, and therefore the Project's development would not interfere or conflict with the ability of the MSHCP goals and objectives to be implemented. However, the Project site is located within an identified burrowing owl (BUOW) survey area within the MSHCP. Stephens' kangaroo rat are not expected to occur within the Project site and impacts to this species are anticipated to be **less than significant**, and further reduced by implementation of **MM-BIO-4.** Federally listed large branchiopod protocol-level surveys are currently underway. If this species is identified to be present on site, then additional fairy shrimp measures within **MM-BIO-3** would be implemented. As such, the development of the K4 Parcel and Cactus Channel improvements would not interfere or conflict with the ability of the MSHCP goals and objectives to be implemented. Conflicts with the MSHCP would be **less than significant** with implementation of both Project components, and no additional mitigation is required. As such, the K4 Parcel and Cactus Channel improvements, in combination with related projects within the March JPA Planning Area, would not result in or contribute to cumulatively significant impacts.

6.4.4 Cultural Resources

The geographic extent for this cumulative impact analysis includes the March JPA Planning Area. The collective proposed Project site (K4 Parcel and Cactus Channel Improvement Site) was surveyed for cultural resources relative to archaeological resources, and the March JPA General Plan concluded that no sites or artifacts are eligible for inclusion within the National Register of Historic Places (NRHP). As discussed in Section 4.4, Cultural Resources, of this EIR, a pedestrian field survey for the Cactus Channel and the K4 Parcel were conducted. As a result of the historic significance evaluation, the Cactus Channel (33-028200/CA-RIV-12721), constructed between 1941 and 1953, was found ineligible under all NRHP and CRHR designation criteria. No other potential "historic properties" or "historical resources" were identified throughout the various avenues of research.

Historical Resources

According to CEQA, the importance of cultural resources comes from the research value and the information that they contain. Therefore, the issue that must be explored in a cumulative analysis is the potential cumulative loss of that information. No historical resources were found eligible on the K4 Parcel. The Cactus Channel (33-028200/CA-RIV-12721), constructed between 1941 and 1953, was found ineligible under all NRHP and CRHR designation criteria. Moreover, no other

potential "historic properties" or "historical resources" of prehistoric or historical origin were identified within the Project APE. As such, the proposed Project would result in **no impact** on historical resources. When considering cumulative impacts to a cultural viewshed, there must be clearly identified resources to which a viewshed is a contributing element to the resources' CRHR eligibility. There have been no resources to which a viewshed has been identified as a contributing element to CRHR eligibility.

A cumulative impact, in terms of historical resources, refers to the collective potential effect upon historical resources due to modern or recent historical land use, that result from human activity. Considering the proposed Project would have no impact on historical resources, it cannot contribute to a cumulative impact.

Archeological Resources

No archaeological resources were observed on the K4 Parcel and the Cactus Channel Improvement Site. In the unlikely event that unanticipated archaeological resources are encountered during ground-disturbing activities for either Project component, mitigation **MM-CUL-1** requires that all construction work occurring within 100 feet of the find shall immediately stop until a qualified archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for Archaeology, can evaluate the significance of the find, which would reduce potentially significant impacts to archaeological resources to less-than-significant levels.

The cumulative projects listed in Table 6-1 have the potential to result in discovery of unknown or subsurface archaeological resources of unknown significance, similar to the proposed Project. Cumulative projects located within fully developed areas would likely have a low chance of accidental discoveries of unknown archaeological resources due to previous grading and development likely removing, preserving, or destroying archaeological resources that previously existed within the sites. However, because the K4 Parcel, the Cactus Channel improvements, and those projects identified within the cumulative impact study area are primarily mitigated by the collection and curation of information and the preservation of the most important resources, adequate mitigation has occurred for in situ appreciation of and access to information regarding those sites for future generations. This reduces the potential for cumulative effects, and the K4 Parcel and the Cactus Channel improvements would not contribute to a cumulatively significant impact to archaeological resources.

Human Remains

Similar to archaeological resources, cumulative impacts to human remains would result from an aggregate of disturbance and loss of Native American remains. Projects located in the cumulative projects area would have the potential to result in an impact associated with human remains from grading, excavation, or other ground-disturbing activities. Each of the cumulative projects would

be required to comply with applicable laws for the proper handling of human remains, and a potential significant cumulative impact would therefore not occur. The proposed Project is also subject to regulations addressing discovery of human remains. Therefore, the proposed Project would not contribute considerably to a potential significant cumulative impact.

6.4.5 Geology and Soils

The geographic extent for this cumulative impact analysis includes the March JPA Planning Area, however, most geology and soil hazards associated with development on surrounding projects would be site-specific and can be mitigated on a project-by-project basis.

The K4 Parcel Warehouse building and the Cactus Channel improvements would be designed to the applicable California Building Code or Uniform Building Code standards, whichever is more restrictive, to anticipate impacts associated with seismic ground shaking. Mitigation measure **MM-GEO-1** would ensure the K4 Parcel Warehouse and Cactus Channel improvements are constructed in compliance with recommendations of the Project-specific geotechnical investigations, included in Appendices I1 and I2, thus minimizing direct and indirect potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking and liquefaction. Therefore, with incorporation of **MM-GEO-1**, impacts from the K4 Parcel and Cactus Channel related to seismic ground shaking would be reduced to **less than significant** levels.

As shown in Figure 6-1, there are multiple projects located within proximity to the Project site. The geology and soils impacts for each project are specific to its site and users, and would not be in common or contribute to (or be shared with, in an additive sense) the impacts on other project sites. In addition, each cumulative project would be required to adhere to required building engineering design per the most recent California Building Code in order to ensure the safety of building occupants and avoid a cumulative geologic hazard. Additionally, as needed, projects would incorporate individual mitigation or geotechnical requirements for site-specific geologic hazards present on each individual cumulative project site. Therefore, a potential cumulative impact related to site-specific geologic hazards such as landslides, liquefaction, soil stability characteristics, seismic hazards, and erosion would not occur. Therefore, the K4 Parcel and Cactus Channel improvements would not create or contribute to a significant cumulative impact.

Paleontological Resources

As described in Section 4.5.1, Existing Conditions, the Project area lies on the edge of a high portion of the Pleistocene-age Perris Block, which has a high potential for paleontological resources. Therefore, **MM-GEO-2** would be implemented to prevent potential impacts to paleontological resources. All current and future development resulting in earthwork into high sensitivity formations would be required to implement similar preservation measures. Potential impacts to paleontological resources would largely be limited to the Project site, as paleontological

resources impacts from the proposed Project would not have a substantial effect on adjacent properties. Where such resources exist, implementation of cumulative development in the region would represent an incremental adverse impact on paleontological resources. However, each cumulative project would be required by CEQA to implement appropriate mitigation measures that would minimize or avoid impacts to paleontological resources to the extent feasible. Furthermore, the proposed Project would implement **MM-GEO-2** to help reduce potential impacts to paleontological resources through monitoring and proper treatment of any discovered resources. Therefore, the proposed Project would not have a cumulatively considerable contribution to a cumulative impact on paleontological resources.

6.4.6 Greenhouse Gas Emissions

As explained earlier, the analysis of a project's greenhouse gas (GHG) emissions is inherently a cumulative analysis because climate change is a global issue and the emissions from individual projects are negligible in a global context. Accordingly, the analysis included within Section 4.6, Greenhouse Gas Emissions, demonstrations that GHG impacts would be less than significant and takes into account the potential for the proposed Project to contribute to a cumulative impact of global climate change.

The analysis shows that the proposed Project is consistent with the 2016 RTP/SCS goals to reduce regional GHG emissions from the land use and transportation sectors by 2020 and 2035. The proposed Project is also consistent with CARB's Scoping Plan, particularly its emphasis on the identification of emission reduction opportunities that promote economic growth while achieving greater energy efficiency and accelerating the transition to a low-carbon economy. Given the proposed Project's consistency with statewide and regional plans adopted for the purpose of reducing GHG emissions, it is concluded that the proposed Project's incremental contribution to greenhouse gas emissions and their effects on climate change would not be cumulatively considerable. For these reasons, the proposed Project's cumulative contribution to global climate change is less than significant.

6.4.7 Hazards and Hazardous Materials

Hazardous Materials

As discussed in Section 4.7, Hazards and Hazardous Materials, of the EIR, given both Project components' locations are within the C1 Zone, restrictions exist as to the materials, and quantities of each material, that can be stored on the proposed Project site, and specifically the K4 Parcel. In order to reduce potentially significant impacts associated with accidental release of chemicals during construction of the K4 Parcel and Cactus Channel improvements **MM-HAZ-1** through **MM-HAZ-3** would reduce potentially significant hazards and hazardous materials impacts to less than significant levels.

All handling, transport, use, and disposal would comply with applicable federal, state, and local agencies and regulations. Despite restrictions put in place on the Project site due to proximity to the March ARB/IP, K4 Parcel operations do have the potential to result in significant hazards and hazardous materials impacts through the routine transport, use, or disposal of hazardous materials. Operations associated with the Cactus Channel improvements would not have the potential to result in significant hazards and hazardous materials impacts. With implementation of **MM-HAZ-1** and **MM-HAZ-4**, potentially significant impacts from the K4 Parcel operations can be reduced to **less than significant** levels.

Cumulative impacts related to hazards and hazardous materials would result from projects that collectively increase exposure to hazards and hazardous materials. Risks associated with hazardous soils, underground storage tanks, and other existing sources of hazardous materials are generally site-specific and localized. Some of the identified cumulative projects are industrial uses and would therefore have the potential to increase exposure or the chance of the release of hazardous materials. The nearest cumulative project within Table 6-1 is the Meridian South Campus Project, located approximately 2 miles southwest of the proposed Project. Given this distance, the geographic extent for cumulative analysis is limited to the K4 Parcel and Cactus Channel site. Furthermore, all of the cumulative projects would be required to comply with federal, state, and local standards regarding the handling, use, transport, storage, and disposal of hazardous materials, which are intended to minimize risk to public health and the environment. In addition to these standards, the cumulative projects would be required to minimize erosion and any pollution discharges through compliance with the Regional Water Quality Control Board (RWQCB) through implementation of project-specific best management practices and stormwater pollution prevention practices (or equivalent, per project). Because regulations directing clean up and rehabilitation of hazardous materials sites are mandatory, and because such occurrences are tied to specific localized sources, they are not expected to combine with potential effects from other projects. Project-related potential cumulative impacts associated with hazardous emissions and materials would be reduced to less than significant levels and not cumulatively considerable.

Upset or Accident Conditions

Construction activities would include the use of fuels for equipment and vehicles, new and used motor oils, cleaning solvents, paints, and storage containers and applicators containing such materials. Given the proximity to the March ARB and based on the past use of the K4 Parcel as part of a military base for over 50 years, future development of the K4 Parcel and Cactus Channel improvements, including grading activities have the potential to encounter subsurface hazardous materials and/or wastes, buried trash and debris, UXO, and contaminated media, including soil, soil vapor/gas, and/or groundwater. In order to further reduce potentially significant impacts associated with accidental release of chemicals during construction of both the K4 Parcel and

Cactus Channel components **MM-HAZ-2** and **MM-HAZ-3** would be implemented to mitigate levels to less than significant levels.

Operations associated with the Cactus Channel improvements would not have to potential to result in significant hazards and hazardous materials impacts. Depending on the activities involved with the proposed warehouse and industrial uses, hazardous materials could be used. Therefore, with compliance with local, state, and federal regulations, along with implementation of **MM-HAZ-1** and **MM-HAZ-4** operations of the K4 Parcel would not create a significant hazard to the public or the environment through the reasonably foreseeable upset and accident conditions involving the release of hazardous materials. With implementation of mitigation measures **MM-HAZ-1** through **MM-HAZ-4**, impacts would be **less than significant**.

As previously discussed, some of the cumulative projects are industrial uses and would therefore have the potential to increase exposure or the chance of the release of hazardous materials. However, all of the cumulative projects would be required to comply with federal, state, and local standards regarding the handling, use, transport, storage, and disposal of hazardous materials, which are intended to minimize risk to public health and the environment. As such, implementation of the K4 Parcel and Cactus Channel improvements in combination with the cumulative projects would not create or contributed to a significant cumulative impact associated with upset or accident conditions.

Proximity to School

There is the potential for construction activities associated with both the K4 Parcel and Cactus Channel improvements to handle hazardous materials within one-quarter mile of one elementary school, Harvest Time Christian School, located approximately 0.2 mile northwest of both components of the proposed Project site. Regulations are in place regarding the handling of hazardous materials. **MM-HAZ-1** through **MM-HAZ-3** would further minimize potential significant impacts resulting from hazardous emissions or handling of hazardous materials from K4 Parcel and Cactus Channel construction. Therefore, with implementation of mitigation measures, K4 Parcel and Cactus Channel construction would result in a **less than significant impact** relative to hazardous emissions or hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Cactus Channel improvement operations would not include the use of hazardous materials. Depending on the operational activities involved with the proposed K4 Parcel Warehouse, hazardous materials could be used. **MM-HAZ-4** would require the preparation and submittal of a Hazardous Materials Business Plan within 30 days of K4 Parcel Warehouse operations. Therefore, with compliance with local, state, and federal regulations, along with implementation of **MM-HAZ-4** operations of the K4 Parcel would result in a **less than significant impact.**

Cumulative impacts related to hazards in proximity to schools is generally site specific and addressed on a project-by-project basis. All other cumulative projects in the area would be required to comply with the federal, state, and local regulations in place for handling of hazardous materials. As such, the K4 Parcel and Cactus Channel improvements would not create or contributed to a significant cumulative impact associated with hazardous emission or materials, substances, or waste within one-quarter mile of an existing or proposed school.

List of Hazardous Materials Sites

Based on the past use of the K4 Parcel as part of a military base for over 50 years, grading activities for both the K4 Parcel and Cactus Channel improvements have the potential to encounter subsurface hazardous materials and/or wastes, buried trash and debris, UXO, and contaminated medial, including soil, soil vapor/gas, and or groundwater. With implementation of a Hazardous Materials Contingency Plan during construction of both Project components, as required by mitigation measure **MM-HAZ-2**, and development and implementation of a plan to manage UXO as required by mitigation measure **MM-HAZ-3**, potentially significant hazards impacts during construction could be mitigated to **less than significant** levels. Cumulative impacts related to hazards in proximity to schools is generally site specific and addressed on a project-by-project basis. All other cumulative projects in the area would be required to comply with the federal, state, and local regulations in place for handling of hazardous materials. Because regulations directing clean up and rehabilitation of hazardous materials sites are mandatory, and because such occurrences are tied to specific localized sources, they are not expected to combine with potential effects from other projects. Project-related potential cumulative impacts associated with hazardous materials sites would be less than significant and not cumulatively considerable.

Proximity to Airport

The K4 Parcel and Cactus Channel Project components are located approximately 4,500 feet from the March ARB and is also within the March ARB/Inland Port ALUCP. As depicted in the March ARB/Inland Port ALUCP, the proposed K4 Parcel and portions of the Cactus Channel are located within the Zone C1 (Mead & Hunt 2014). With the restrictions in place in this zone, potential impacts associated with proximity to the airfield are less than significant. Additionally, with implementation of mitigation measures **MM-HAZ-5**, requiring the use of non-reflective materials on all PV panels at the K4 Parcel, impacts associated with glare from solar panels could be reduced to less than significant. No PV panels would be associated with the proposed Cactus Channel improvements. Similar to potential sight obstructions to pilots caused by PV panels, smoke and steam emitted into the atmosphere from buildings and taller stacks can also obstruct line of sight for pilots. In the event that implementation of the K4 Parcel would construct stacks and/or a building that would emit smoke or steam, there would be the potential for significant safety impacts. With implementation of **MM-HAZ-6**, requiring written approval from March ARB and March Inland Port Airport officials,

impacts associated with visual obstruction on the K4 Parcel from smoke and/or steam would be reduced to less than significant. The Cactus Channel improvements would have the potential to attract birds, resulting in a potentially significant safety impact, given the Cactus Channel's proximity to an active runway. As such, with implementation of **MM-HAZ-7** and **MM-HAZ-8** would reduce this potentially significant impact to a less than significant level.

As discussed in Section 4.7, the Project site is partially located within the 60 to 65 dBA CNEL noise level contour boundaries of March ARB/IPA. Based on the Riverside County ALUCP noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the Riverside County ALUCP compatibility criteria, and no noise mitigation is required with typical building construction. A cumulative impact to airport hazards would result if cumulative projects are located in the March ARB/Inland Port ALUCP. However, all other projects within the March ARB/Inland Port ALUCP would be required to comply with the restrictions included in the March ARB/Inland Port ALUCP that provide restrictions with each of the zones. Given that K4 Parcel- and Cactus Channel-specific impacts would be mitigated to a less than significant level, the K4 Parcel and Cactus Channel improvements would not create or contributed to a significant cumulative impact associated with proximity to an airport.

6.4.8 Hydrology and Water Quality

The geographic scope of cumulative effects on surface water hydrology and water quality is typically watershed based, whereby projects contributing flow to the same water bodies as both the K4 Parcel and Cactus Channel Project components. The largest watershed applicable to the proposed Project site is the Santa Ana Watershed, approximately equivalent to the area covered by the Santa Ana RWQCB. The geographic scope of cumulative effects on groundwater quality is consists of the San Jacinto Groundwater Basin. Therefore, all projects listed in Table 6-1 are potential contributors to cumulative impacts on hydrology and water quality and are thus taken into consideration for this cumulative analysis. Cumulative projects listed in Table 6-1 include the construction of residential, commercial, industrial, transportation related facilities, and medical-related land which could potentially result in impacts to drainage patterns, erosion, or siltation on or off site if not properly managed.

Water Quality

Water quality problems in the receiving waters from both the K4 Parcel and the Cactus Channel improvements, which include both the Santa Ana River and the San Jacinto River, are the cumulative result of past and present urban and agricultural land uses within each watershed. For example, CWA Section 303(d) impairments within these waters include metals (copper and lead), pathogens and nutrients. To the extent of the K4 Parcel, Cactus Channel improvements, and

projects in Table 6-1, exacerbate these impairments or cumulatively result in new impairments, a cumulative impact could occur.

The analysis in Section 4.8, Hydrology and Water Quality, concludes that with implementation of the water quality BMPs and LID features required under the SWRCB Construction General Permit, and under the combined K4 Parcel- and Cactus Channel-specific Water Quality Management Plan (WQMP) per March JPA standards, water quality impacts would be less than significant. These water quality standards are implemented through permit programs administered by the SWRCB, the Santa Ana RWQCB, March JPA and applicable local jurisdictions. Other projects would be required to implement the same or similar set of BMPs necessary to meet performance standards in the Construction General Permit, regional MS4 Permits, and/or waste discharge requirements.

Operations of the Cactus Channel would not result in a substantial effect on water quality. Operations of the proposed K4 Warehouse would introduce pollutants of concern including metals, nutrients, trash and debris, and oil and grease. An increase in pollutant levels in the runoff conveyed to the storm drain system, if uncontrolled, could violate water quality standards and the waste discharge requirements of the Clean Water Act or the Porter-Cologne Water Quality Control Act. Implementation of operational source control BMPs for the K4 Parcel provided within the approved WQMP would result in an improvement to water quality on and off site compared to existing conditions because of the more stringent requirements for development in place today, and K-4 operational impacts would be less than significant.

Cumulative water quality impacts can result from projects that combine to either pollute or increase the turbidity of water. In the absence of regulatory controls, the primary potential cumulative effect would be to alter the natural hydrology of the region through increases in the area covered by impervious surfaces and to increase the potential for the release of non-point-source pollutants (i.e., motor fuels, trash, and sediment). Each of the cumulative projects would be required to comply with RWQCB standards for water discharge during construction and operation phases. Each cumulative project would employ site design features, treatment control, and source control best management practices, as necessary, to control for erosion and stormwater pollution. For projects that would be located on vacant land, proposed surface conditions would mimic existing patterns to the extent feasible, and adherence to a RWQCB Regional Municipal Separate Storm Sewer System Permit would be required to minimize adverse effects to hydrology and water quality. As such, a potential cumulative impact to water quality would not occur.

A cumulative impact to groundwater resources would result from cumulative projects drawing from a common groundwater source such that, in combination, the resources were depleted to unsustainable levels. Assessment for groundwater resources would occur on a project-by-project basis due to site-specific conditions. Each of the cumulative projects in the area would have water supplied by existing water supplies and distribution pipelines from the Western Municipal Water

District (WMWD). Furthermore, the cumulative projects identified in Table 6-1 would be similarly mandated to meet federal, state and local regulatory standards. Due to expected non-reliance on groundwater resources, cumulative projects would not result in the substantial depletion of known groundwater resources. The analysis in Section 4.8 concluded that the two components of the proposed Project, the K4 Parcel Warehouse and the Cactus Channel improvements, would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level. As a result, the proposed Project's potential cumulative impacts to groundwater would be less than significant and not cumulatively considerable.

Drainage/Flooding

Cumulative hydrology impacts also result from projects that collectively alter the course of surface water flow or increase flood hazards in a particular area, either through diverting floodways or constructing structures within the floodways. Each of the cumulative projects would be required to comply with RWQCB standards for water discharge during construction and operation phases. Each cumulative project would employ site design features, treatment control, and source control best management practices, as necessary, to control for drainage. For projects that would be located on vacant land, proposed surface conditions would mimic existing patterns to the extent feasible, and adherence to a RWQCB Regional Municipal Separate Storm Sewer System Permit would be required to minimize adverse effects to hydrology and water quality. With regard to drainage and flooding, projects within the area serviced by regional detention basins are relevant to the cumulative impact analysis. The analysis in Section 4.8 concluded that the K4 Parcel and the Cactus Channel improvements would not result in substantial erosion or siltation on site or off site during short-term construction activities. Since the proposed Project would result in no increase in runoff, it would not contribute to existing or future cumulative effects with regard to flooding or downstream drainage capacity. Therefore, the proposed Project would not contribute considerably to a potential significant cumulative impact.

6.4.9 Land Use and Planning

While land use impacts tend to be localized in nature, and specific impacts are tied either directly or indirectly to the specific action, the proposed Project, specifically the K4 Parcel, may have the potential to work in concert with other past, present, or future projects to either cause unintended land use impacts such as reducing available open space or accommodate increased growth that may result in more intensive land uses. Therefore, the geographic extent for cumulative analysis tends toward larger policy areas.

The proposed Cactus Channel improvements would not conflict with any applicable land use plan, policy, or regulation. However, in order for the K4 Parcel component to be consistent with the

March JPA General Plan land use and zoning designations, the Project applicant has filed for a General Plan Amendment, Zoning Designation, Parcel Merger, and Plot Plan as discussed in Section 4.9, Land Use and Planning, of the EIR. The K4 Parcel's consistency with applicable land use plans, policies, or regulations is demonstrated in Table 4.9-1 in Section 4.9. The land use consistency analysis takes several factors into consideration. Overall, as shown in the consistency tables, with implementation of mitigation measures and approval of the proposed General Plan Amendment and Zoning Designation, the K4 Parcel would be consistent with or implement many of the pertinent goals, policies, guidelines, and recommendations.

The March JPA is not a permittee to the MSHCP, and thus, does not have to comply with the Reserve Assembly goals of the MSHCP or any other MSHCP requirements. However, the Project site is located within an identified burrowing owl (BUOW) survey area within the MSHCP, and burrowing owl measures within **MM-BIO-5** would ensure consistency with the MSHCP. Therefore, given that Project impacts would be limited to the K4 Parcel, that development of the proposed K4 Parcel has been envisioned in planning documents, and that impacts can be reduced to **less than significant** levels through implementation of mitigation referenced throughout the EIR, the K4 Parcel and Cactus Channel improvements would not create or contributed to a significant cumulative impact related to existing land use plans, designations, and policies.

Significant cumulative land use impacts would result from projects that contribute to development that is inconsistent with applicable land use plans or policies or are incompatible with existing or planned uses. All cumulative projects listed in Table 6-1 would be subject to similar plan consistency criteria as the proposed Project, which would ensure compliance with existing applicable land use plans with jurisdiction over the Project area. Any cumulative projects that propose amendments to the general plan or zoning ordinance, or require a specific plan, would be required to show that proposed uses would be consistent with applicable policies. Cumulative projects that exist outside the March JPA's jurisdiction, would be required to show consistency with relevant and applicable planning documents that govern each respective jurisdiction. Therefore, potentially significant cumulative conflicts with land use plans, policies, and ordinances are not anticipated.

6.4.10 Noise

Construction Noise Impacts

Section 4.10.4, Impacts Analysis, of the EIR states that construction noise impacts associated with the K4 Parcel and Cactus Channel improvements are expected to create temporarily high noise levels at the nearby receiver locations. However, the unmitigated K4 Parcel- and Cactus Channel-related construction noise levels would satisfy the less restrictive 90 dBA L_{eq} 8-hour continuous noise level limit identified in the City of Moreno Valley Municipal Code. Therefore, the construction of

the K4 Parcel and Cactus Channel would result in a less than significant noise impact at the nearby sensitive receiver locations during peak construction activity. The nearest cumulative project is located 0.3 miles away, therefore, it is unlikely construction noise from the two Project components would combine for a significant impact at nearby off-site receptors.

Operational on-site noise-generating activities associated with proposed Project would include: idling trucks, delivery truck activities, backup alarms, as well as loading and unloading of dry goods, roof-top air conditioning units, and parking lot vehicle movements. The off-site Project-related traffic noise level increase is considered a less than significant impact under Opening Year 2023 conditions. The off-site Project-related traffic noise level increase is considered a less than significant impact under Horizon Year 2040 conditions.

Noise levels tend to diminish quickly with distance from a source; therefore, the geographic scope for the analysis of cumulative impacts related to noise would be limited to projects within approximately 0.25 miles of the proposed Project site and access routes. At distances greater than 0.25 miles, construction noise would be briefly audible and steady construction noise from the proposed Project would generally dissipate into background noise levels. The temporal scope for cumulative impacts associated with noise would include the construction and operation phases of the proposed Project. The baseline for assessing cumulative noise impacts includes the noise sources associated with other projects within 0.25 miles of the proposed Project that could be constructed and/or operated at the same time as the proposed Project. No cumulative projects are located within a 0.25-mile vicinity of the proposed Project. Therefore, the proposed Project's contribution of noise from construction activities would not be cumulatively considerable.

Operational Noise Impacts

The Cactus Channel improvements are not anticipated to include operational noise sources requiring analysis. The K4 Parcel-related operational noise levels would satisfy the March JPA and City of Moreno Valley exterior noise level standards at all nearby sensitive receiver locations. The K4 Parcel operational noise levels would satisfy the City of Moreno Valley Municipal Code 65 dBA L_{eq} daytime and 60 dBA L_{eq} nighttime exterior noise level standards at 200 feet from the source land use. The K4 Parcel is expected to generate an exterior traffic-related noise level increase of up to 0.2 dBA CNEL at adjacent land uses, which is not a significant increase and would not contribute considerably to a cumulative increase in traffic or associated traffic noise levels. Appendix Q, K4 Parcel Noise Impact Analysis, assesses operational traffic noise level impacts for the K4 Parcel combined under multiple scenarios which include cumulative projects.

Although all of the projects in the cumulative projects list could result in significant noise impacts related to construction and/or operations, none of the cumulative projects are located within a 0.25-mile vicinity of the proposed Project. In addition, the cumulative projects would be required

to comply with the same regulations as the proposed Project pertaining to noise levels and exposure to noise and vibration during construction and operation. These regulations would ensure that noise impacts would remain below a level of significance. Lastly, as discussed in Section 4.10, Noise, the K4 Parcel's traffic generation would not result in cumulative noise impacts on the surrounding roadway network. Therefore, the proposed Project's contribution of noise from long-term operations would not be cumulatively considerable

Ground-borne Vibration or Noise Levels

It is expected that ground-borne vibration from construction activities may occur from the K4 Parcel Warehouse and Cactus Channel improvements. Ground-borne vibration levels from the K4 Parcel and Cactus Channel improvements were estimated to remain below the FTA 80 VdB threshold at all sensitive receiver locations Therefore, the K4 Parcel and Cactus Channel construction vibrations would be considered a less than significant impact; no mitigation is required.

The Cactus Channel improvements would not result in substantial operational vibration levels. Typical vibration levels for K4 Parcel operational heavy trucks at normal traffic speeds do not exceed 65 VdB, and therefore, the K4 Parcel component would result in a less than significant impact as vibration levels would remain below the FTA vibration threshold of 80 VdB at nearby receiver locations. No mitigation is required; operational impacts would be less than significant. It is unlikely that substantial construction vibration from the nearest cumulative project could combine for a significant impact at nearby off-site receptors, as construction vibration would attenuate with distance. Therefore, the K4 Parcel and Cactus Channel improvements would not contribute to a significant impact related to ground-borne vibrations.

Proximity with Airport Land Use Plan

The Project site is not within the vicinity of a private airstrip. Based on the analysis provided in Section 4.10.4 of the EIR, both the K4 Parcel and Cactus Channel improvements represent normally acceptable land uses based on the RC ALUCP compatibility criteria, and no noise mitigation is required with typical building construction. Therefore, construction and operational noise impacts associated with exposing people residing or working within the vicinity of a public airport would be considered **less than significant**.

Cumulative projects within the March JPA planning area listed in Table 6-1 include the construction of residential, commercial, industrial, transportation related facilities and medical-related land uses that could potentially result in noise impacts. Considering the K4 Parcel or Cactus Channel improvements would not result in any significant impacts related to noise, the collective proposed Project would not contribute substantially to cumulatively significant traffic noise level increases.

6.4.11 Transportation

The CEQA Guidelines require that other reasonably foreseeable development projects which are either approved or being processed concurrently in the study area also be included as part of a cumulative analysis scenario. As discussed in Section 4.11, Transportation, of this EIR, the traffic generated by individual cumulative projects has been manually added to the study area network to generate Opening Year Cumulative (2023) forecasts. In other words, this comprehensive list of cumulative development projects, as listed in Table 6-1, above, has been reviewed to determine which projects would likely contribute measurable traffic through the study area intersections (e.g., those cumulative projects in close proximity to the proposed Project).

Construction Traffic

Construction of the K4 Parcel and Cactus Channel Project components may potentially result in short-term traffic deficiencies related to construction employees, export of materials, and import of construction materials, etc. It is anticipated that the following construction-related activities would generate traffic and may potentially result in temporary construction-related traffic deficiencies:

- Construction employee commutes;
- Import of construction materials and soils; and
- Transport and use of heavy construction equipment.

To minimize the impact of the Cactus Channel improvements and K4 Parcel construction activities, the applicant would be required to develop and implement a March JPA-approved Construction Traffic Management Plan addressing potential construction-related traffic detours and disruptions. In general, the Construction Traffic Management Plan would ensure that to the extent practical, construction traffic would access the proposed Project site during off-peak hours; and that construction traffic would be routed to avoid travel through, or proximate to, sensitive land uses. With the incorporation of **MM-TRAF-20**, short term construction impacts would be **less than significant**.

Intersection Operations Analysis

The Cactus Channel improvements would not result in any operational vehicle trips, with exception to minimal as-needed maintenance trips. Operational traffic would occur as a result of the K4 Parcel development. LOS calculations were conducted for the study intersections to evaluate their operations under Opening Year Cumulative Conditions. The study area intersections are anticipated to operate at an acceptable LOS for Opening Year Cumulative without Project Conditions, with the exception of the following locations:

- Overlook Parkway – Canyon Crest Drive/Alessandro Boulevard – LOS F AM and PM peak hours

- Mission Grove Parkway/Alessandro Boulevard – LOS F AM peak hour
- Sycamore Canyon Boulevard/Alessandro Boulevard – LOS F AM and PM peak hours
- Meridian Parkway/Cactus Avenue – LOS E AM peak hour
- Meridian Parkway/Van Buren Boulevard – LOS F AM and PM peak hours
- Innovation Drive/Cactus Avenue – LOS F PM peak hour
- Old 215 Frontage Road – I-215 northbound ramps/Cactus Avenue – LOS F AM peak hour
- Elsworth Street/Cactus Avenue – LOS F AM and PM peak hours
- Heacock Street/Cactus Avenue – LOS F AM peak hour; LOS E PM peak hour

In addition to implementing mitigation measures **MM-TRAF-1** though **MM-TRAF-4**, the incorporation of mitigation measures **MM-TRAF-5** through **MM-TRAF-8** would reduce off-site impacts associated with the development of the K4 Parcel to less than significant levels for Opening Year Cumulative with Project condition.

Traffic Signal Warrants Analysis

Traffic signal warrants were prepared for the only unsignalized intersection in the study area, Meridian Parkway/Innovation Drive. Based on the warrant analysis, Meridian Parkway/ Innovation Drive would not warrant a traffic signal in the Opening Year Cumulative with Project condition. There are no additional traffic signals anticipated to meet traffic signal warrants under Opening Year Cumulative with Project Conditions.

Freeway Analysis

Off-Ramp Queuing

A queuing analysis was performed for the off-ramps to I-215 at the I-215/Cactus Avenue interchange to assess vehicle queues that may potentially result in deficient peak-hour operations at intersections and cause "spill back" onto the I-215 mainline. There are no queuing issues anticipated for Opening Year Cumulative Conditions.

Freeway Segments

Opening Year Cumulative mainline directional volumes for the weekday AM and PM peak hours without and with the K4 Parcel component of the Project were determined. The study area freeway segments are anticipated to operate at an acceptable LOS during the peak hours with and without the K4 Parcel component of the proposed Project.

Freeway Merge/Diverge

Ramp merge and diverge operations were also evaluated for Opening Year Cumulative Conditions. most of the study area freeway ramp merge/diverge ramp junctions are forecast to operate with satisfactory LOS (LOS D or better), with exception of the I-215 northbound off-ramp (diverge) at Cactus Avenue, which is forecast to operate at LOS F in the AM peak hour in both, without and with, Project conditions. While the addition of the K4 Parcel component of the proposed Project traffic is not anticipated to result in an LOS letter grade change to this deficient ramp diverge junction, it would contribute to its deficiency.

Freeway Impacts Analysis

As described above, there are no identified significant operational K4 Parcel impacts to the study area off-ramp queues at I-215/Cactus Avenue, and the I-215 mainline segments with implementation of the K4 Parcel. However, the ramp (diverge) junction at the northbound I-215 off-ramp at Cactus Avenue is forecast to continue to operate with unsatisfactory LOS under Opening Year Cumulative with Project conditions. At this time, Caltrans has no fee programs or other improvement programs in place to address the deficiencies caused by development projects in the March JPA (or other neighboring jurisdictions) on State Highway System (SHS) roadway segments. The Cactus Avenue overcrossing is the subject of a Project Study Report prepared by the City of Moreno Valley in conjunction with Caltrans. The Western Riverside Council of Governments (WRCOG's) Transportation Uniform Mitigation Fee (TUMF) Program identifies this interchange, inclusive of on/off-ramps as a transportation mitigation project on the Regional System of Highways and Arterials. However, there are also no known near-term planned improvements along I-215. Additionally, the March JPA cannot guarantee the timing or implementation of such improvements as the facilities are under the jurisdiction of Caltrans. As such, the K4 Parcel's contribution to the deficiency is considered **cumulatively considerable**.

Summary of Cumulative Impacts

The Cactus Channel improvements would not result in any operational vehicle trips, with exception to minimal as-needed maintenance trips. Operational traffic would occur as a result of the K4 Parcel development. Cumulative traffic impacts are deficiencies that are not directly caused by the K4 Parcel, but occur as a result of regional growth combined with that or other nearby cumulative development projects or if the Project is anticipated to contribute traffic to a deficient intersection under pre-Project conditions. The K4 Parcel's contribution to a particular cumulative transportation deficiency is deemed cumulatively considerable if the K4 Parcel adds significant traffic to the forecasted deficiency.

Based on the applicable jurisdiction's significance criteria, the following study area intersections were found to be significantly impacted by the Project for Opening Year Cumulative (2023) traffic conditions:

- Old 215 Frontage Rd./I-215 NB Ramps and Cactus Avenue (No.16)
- Elsworth St. and Cactus Avenue (No.19)
- Heacock St. and Cactus Avenue (No. 25)

Based on the March JPA's significance criteria, the K4 Parcel is anticipated to have potentially significant and **cumulatively considerable** impact at the identified freeway mainline segments and merge/diverge ramp junctions, however no mitigation measures have been identified as no other improvements beyond those planned by the I-215 North Project have been evaluated. Neither Caltrans nor the state have adopted a fee program that can ensure that locally contributed impact fees will be tied to improvements to freeway mainlines, and only Caltrans has the jurisdiction over mainline improvements. Because Caltrans has exclusive control over state highway improvements, ensuring that fair share contributions to mainline improvements are actually part of a program tied to implementation is within the jurisdiction of Caltrans. As such, the impacts are considered **significant and unavoidable**.

6.4.12 Tribal Cultural Resources

The geographic extent for this cumulative impact analysis includes the March JPA Planning Area. A Sacred Lands File search and a California Historical Resources Information System search were conducted on the collective proposed Project site (K4 Parcel and Cactus Channel Improvement Site), and outreach under AB 52 and SB 18 was completed. As discussed in Section 4.12, Tribal Cultural Resources, of this EIR, no tribal cultural resources (TCRs) were identified on the K4 Parcel and the Cactus Channel Improvement Site or identified by tribes through the AB 52 and SB 18 consultation process. In the unlikely event that unanticipated a TCR is encountered during ground-disturbing activities for either Project component, mitigation MM-TCR-1 requires that all construction work occurring within 100 feet of the find shall immediately stop until the find can be evaluated; as such, potentially significant impacts to TCRs would be reduced to less than significant levels.

The cumulative projects listed in Table 6-1 have the potential to result in the discovery of unknown or subsurface TCRs of unknown significance, similar to the proposed Project. It is anticipated that TCRs that are potentially affected by related projects would also be subject to the same requirements of CEQA as the proposed Project and any impacts would be mitigated, as applicable. At this time, it is not known whether and to what extent these related projects would result in impacts to TCRs, or whether such impacts can be mitigated to less than significant. As such, these determinations would be made on a case-by-case basis, by employing Tribal consultation according to AB 52 and if applicable, SB 18, for each proposed project, and the effects of

cumulative development on TCRs would be mitigated to the extent feasible in accordance with CEQA and other applicable legal requirements. This reduces the potential for cumulative effects, and the K4 Parcel and the Cactus Channel improvements would not contribute to a cumulatively significant impact to TCRs.

6.4.13 Utilities and Service Systems

Wastewater

The Cactus Channel improvements would not result in an increase in demand of wastewater facilities. The K4 Parcel lies within the service area of Western Municipal Water District (WMWD). Upon implementation, the K4 Parcel's wastewater flows would be treated at the Riverside Water Quality Control Plant, which is a wastewater treatment plant that is currently being expanded to handle a capacity of 46 million gallons per day. The Riverside Water Quality Control Plant is subject to the waste discharge requirements set forth in RWQCB Order No R8-2015-0013 (NPDES No CA8000316), which expires July 31, 2020. Since the K4 Parcel would be served by the existing Riverside Water Quality Control Plant, which operates in compliance with the treatment and discharge requirements of the Santa Ana RWQCB, impacts would be less than significant.

Cumulative projects identified in Table 6-1 also receiving wastewater treatment services by WMWD would be accommodated by the recently expanded Riverside Water Quality Control Plant. Given that the K4 Parcel would be adequately served by WMWD and that the wastewater plant recently underwent expansion, K4 Parcel-related impacts would be less than significant and would not create or contribute to cumulative wastewater impacts.

Water

The Cactus Channel improvements would not result in an increase in demand of water facilities. Water service to the K4 Parcel would be provided by WMWD. As such, the geographic context for this cumulative analysis is projects that would also use water provided by WMWD. Upon implementation, the K4 Parcel would add demand for water services within the service area of WMWD. Since the K4 Parcel consists of an industrial development exceeding 650,000 square feet in floor area, in accordance with SB 610, a Water Supply Assessment was prepared by WMWD (Appendix P). The Water Supply Assessment evaluated the total projected water supplies available to WMWD during normal, single-dry, and multiple-dry water years during a 20-year project and whether WMWD's total projected supplies are sufficient to meet the projected water demand associated with the Project, in addition to existing and planned future uses. As discussed in the Water Supply Assessment, the ability for WMWD to meet water demands is, in part, dependent in part upon the available supply of water that can be purchased from MWD each year and completion of several water supply projects, including the Arlington Desalter and the Chino II Desalter Expansion, as well as the Riverside Wheeling and Purchase Agreement. WMWD has sufficient

supplies in all analyzed scenarios to serve the K4 Parcel demands, in addition to existing and planned future uses over the 20-year projection. Therefore, WMWD can be relied upon as a source of water for the K4 Parcel Project component. Given that WMWD has determined that adequate water supplies exist to serve the K4 Parcel, and also demonstrated that they have a surplus of water supplies, the K4 Parcel Project component would not result in or contribute to a cumulatively significant water impact.

Stormwater

The K4 Parcel will be divided into three Drainage Management Areas (DMAs), each served by a separate primary detention basin and a secondary basin. On-site runoff would be conveyed to the proposed on-site detention basins via proposed on-site catch basins and storm drains. The proposed basins will be located along the northern boundary of the site, separated into Detention Basin 'A', Detention Basin 'B', and Detention Basin 'C'. The Cactus Channel improvements component of the Project consists of channel improvements that would provide increased flood protection and contain 100-year storm flows. Considering the collective proposed Project would provide increased flood protection and contain 100-year storm flows, and would not have a negative impact on downstream facilities, the proposed stormwater drainage facilities would not cause significant environmental effects; therefore would have a **less than significant** impact. Collectively, implementation of the K4 Parcel and Cactus Channel improvements would not result in or contribute to cumulatively significant impacts.

Solid Waste

The Cactus Channel improvements would not result in an increase in demand of solid waste facilities. The K4 Parcel would be served by Waste Management for solid waste pickup and removal. In the future, Waste Management or another waste hauling company is expected to collect solid waste generated on the site and be brought to any of the County's landfill facilities. As discussed in Section 4.13, Utilities and Service Systems, of this EIR, collectively the six active landfills have a maximum capacity of 183.3 cubic yards. According to the County's 2017 Annual Report Summary, based on the best available estimates of current and future total County disposal, the County has 20 year of disposal capacity left. As such the County landfill facilities have capacity to service the proposed K4 Parcel Warehouse and the projects listed in Table 6-1 within the County's jurisdiction. Therefore, implementation of the K4 Parcel and Cactus Channel improvements would not result in or contribute to cumulatively significant impacts.

Electric Power, Natural Gas, or Telecommunications

Long-term energy consumption associated with the Project includes electricity consumption by employees, energy from water conveyance, and long-term vehicle operations by employees. Although electricity consumption would increase due to the implementation of the Project, the

building envelope, HVAC, lighting, and other systems, such as electric motor equipment, shall be designed to maximize energy performance.

Natural gas consumption during operation would be required for various purposes, including, but not limited to, building heating and cooling. The Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code.

No specific telecommunication system upgrades are proposed with the proposed Project, and the location and extent of future facilities is not known at this time.

As such, the existing utility infrastructure for electricity, natural gas, and telecommunications has capacity to service the proposed K4 Parcel Warehouse and the projects listed in Table 6-1. County's jurisdiction. No relocation or construction of new or expanded facilities would be required as a result of the Project. All other projects listed in Table 6-1 would be required to comply with the state regulations in place to minimize the use of these resources. Therefore, implementation of the K4 Parcel and Cactus Channel improvements would not result in or contribute to cumulatively significant impacts.

6.4.14 Energy

Cumulative impacts to energy would result when projects combine to increase inefficient consumption or increased demand for energy, adversely affecting energy resources. The cumulative projects would result in an increase in energy consumption and demand. However, since the cumulative developments represent a modest increase in development, and since each new development is required to be compliant with the latest Title 24 building requirements that include substantially more efficient fittings for energy, there would not be a cumulatively significant increase in inefficient use of energy; in fact, the converse would result. The cumulative analysis for energy conservation considers the projects listed in Table 6-1 and assesses the K4 Parcel's and Cactus Channel's compliance with the electricity, natural gas, and petroleum demands and supplies available. The K4 Parcel component is not expected to exceed energy resource demands as projected for Southern California Edison (SCE) and Southern California Gas Company (SoCal Gas), as discussed in Section 4.14, Energy, of this EIR. Although electricity and natural gas consumption would increase due to the implementation of the K4 Parcel, the building envelope, HVAC, lighting, and other systems, such as electric motor equipment, shall be designed to maximize energy performance. The K4 Parcel component is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Prior to Project approval, March JPA would ensure that the K4 Parcel component would meet Title 24 standards for 2016, as required by state regulations through their plan review process. Electricity and natural

gas consumed by the K4 Parcel are also subject to the cap-and-trade regulation. For these reasons, the electricity and natural gas consumption of the K4 Parcel would not be considered inefficient or wasteful, and impacts would be less than significant.

Although electricity consumption would increase due to the implementation of the K4 Parcel component, the building envelope, HVAC, lighting, and other systems, such as electric motor equipment, shall be designed to maximize energy performance. The K4 Parcel component is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. As with electricity demand, natural gas demand calculation for the Project assumes compliance with Title 24 standards for 2016. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. Prior to Project approval, March JPA would ensure that the K4 Parcel component would meet Title 24 requirements applicable at that time, as required by state regulations through their plan review process. For these reasons, the electricity and natural gas consumption of the K4 Parcel component would not be considered inefficient or wasteful, and impacts would be less than significant.

The K4 Parcel and other cumulative projects are required to meet the mandatory energy standards, current CCR Title 24, Part 6 California Energy Code, and Part 11 California Green Building Standards. Also, incorporation of Project design features, compliance with state and local regulations, and mitigation measures (**MM-AQ-4** through **MM-AQ-7**) from the Air Quality section of the EIR would further reduce Project's energy consumption. Compliance with these policies and other energy reduction strategies would ensure that energy use as a result of development would not be wasteful, inefficient, or unnecessary, and **no significant cumulative impacts would occur.**

Cumulative Projects

K4 Warehouse and Cactus Channel Improvements Project EIR

INTENTIONALLY LEFT BLANK

CHAPTER 7
ALTERNATIVES

7.1 INTRODUCTION

Pursuant to the California Environmental Quality Act (CEQA) Guidelines, an Environmental Impact Report (EIR) is required to "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives" (14 CCR 15126.6(a)). An EIR "must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation" (14 CCR 15126.6(a)). This alternatives discussion is required even if these alternatives "would impede to some degree the attainment of the project objectives, or would be more costly" (14 CCR 15126.6(b)).

The inclusion of an alternative in an EIR does not constitute definitive evidence that the alternative is in fact "feasible." The final decision regarding the feasibility of alternatives lies with the decision maker for a given project, who must make the necessary findings addressing the potential feasibility of an alternative, including whether it meets most of the basic project objectives or reduces the severity of significant environmental effects pursuant to CEQA (California Public Resources Code, Section 21081; see also 14 CCR 15091).

7.2 PROJECT OBJECTIVES

In developing the alternatives to be addressed in this chapter, consideration was given to the ability to meet the basic objectives of the K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) and eliminate or substantially reduce the identified significant environmental impacts. As stated in Chapter 2, Project Description, of this EIR, the Project objectives against which the alternatives were analyzed include the following:

- Provide appropriate land use intensities to comply with the parameters of the March Air Reserve Base/Inland Port Airport Compatibility Plan.
- Implement the goals, objectives and policies of the March JPA General Plan at the K4 Parcel, specifically encouraging the development of industrial uses to expand the employment and financial base of the March JPA Planning Area in a manner that is compatible with the nearby airbase and adjacent industrial uses.
- Provide increased job opportunities for local residents through the provision of employment-generating businesses.

- Establish a land use and facility plan that ensures project viability in consideration of existing and anticipated economic conditions.
- Develop the property with land uses that are compatible with the March AFB Reuse program.
- Encourage the use of alternative modes of transportation through the provision of a pedestrian and bicycle circulation system that is both safe and comfortable.
- Provide a range of job types for the community's residents.
- Provide a circulation system that facilitates movement and access needs of automobiles, pedestrians and bicyclists.
- Minimize impacts from construction of the development to sensitive biological resources.
- Minimize water wildlife attractants, which are hazards to aircraft flights, associated with the naturalized open-air Cactus Avenue Drainage Channel (Cactus Channel) by undergrounding the drainage channel.

Pursuant to the CEQA Guidelines stated above, as well as the Project objectives, a range of alternatives to the Project are considered and evaluated in this EIR. To summarize these Project alternatives, as suggested in CEQA Section 15126.6(d), a matrix was prepared to summarize and compare the impacts of each Project alternative (see Table 7-1).

Table 7-1
Comparison of Project and Alternatives Impacts

Environmental Issue Area	Proposed Project	Alternative 1 No Project	Alternative 2 Reduced Size General Warehouse	Alternative 3 High-Cube Short-Term Storage Warehouse	Alternative 4 High-Cube Parcel Hub Warehouse
Aesthetics	**LTS**	▼	▼	—	—
Air Quality	**SU**	▼	▼	▼	▲
Biological Resources	**LTS-MM**	▼	▼	—	—
Cultural Resources	**LTS-MM**	▼	▼	—	—
Geology and Soils	**LTS**	▼	▼	—	—

Table 7-1
Comparison of Project and Alternatives Impacts

Environmental Issue Area	Proposed Project	Alternative 1 No Project	Alternative 2 Reduced Size General Warehouse	Alternative 3 High-Cube Short-Term Storage Warehouse	Alternative 4 High-Cube Parcel Hub Warehouse
Energy	LTS	▼	▼	—	—
Meets Project Objectives?	Yes	No	Partially	Yes	Yes

— Alternative is likely to result in similar impacts to issue when compared to Project.
▼ Alternative is likely to result in reduced impacts to issue when compared to Project.
▲ Alternative is likely to result in greater impacts to issue when compared to Project.
LTS = less than significant impact; LTS-MM= less than significant impact with mitigation; SU = significant, unavoidable impact

7.3 ALTERNATIVES CONSIDERED BUT REJECTED

The following discussion presents information on alternatives to the Project that were considered but rejected. These alternative are not discussed in further detail and has been eliminated from further consideration.

Alternative Site Location

In accordance with CEQA Guidelines, Section 15126.6(f)(2), the March JPA attempted to identify a feasible alternative off-site location within the Project area that could be available for the development of the Project. Pursuant to CEQA Guidelines, Section 15126.6(f)(2)(A), the key question and first step in analysis of the off-site location is whether any of the significant effects of the Project would be avoided or substantially lessened by moving the Project to another location.

After a review of available open spaces of approximately 35 acres (similar to the K4 Parcel) within the Project vicinity, no large-scale additional sites that could accommodate the proposed Project exist. Additionally, the Project Applicant does not have ownership of 35 acres elsewhere within the Project vicinity such that the Project could be developed on an alternate site. Therefore, off-site locations capable of accommodating the entire Project are considered infeasible, and no off-site location alternatives were carried forward in this analysis.

Alternative Uses

The Project site is located approximately 0.8 mile northeast of the March Air Reserve Base (ARB) runway. The March ARB/Inland Port Land Use Compatibility Plan (Mead & Hunt 2014) and the March ARB Air Installation Compatible Use Zone (AICUZ) Study (March ARB 2005), impose restrictions and limitations on the types and quantities of uses that can exist on project sites within

specific zones in proximity to the airport. The Project site is located in the C1 zone. Within the C1 zone, the following restrictions apply:

- A maximum of three dwelling units per acre are permitted. A total of 35.4 acres of the Project site are within the C1 zone; as such, a total of 106 dwelling units could be constructed on this portion of the Project site. However, the proximity of these housing units to the March ARB and warehouse and industrial uses in the vicinity of the Project site, would be relatively incompatible. Furthermore, though low density residential is not prohibited by the airport compatibility plan, the proximity of this site to the airport flight paths and noise contours would result in an incompatible land use. As such, residential development on this portion of the Project site has been eliminated from further consideration.
- An average of 100 people per acre can occupy the 35.4-acre portion of the Project site within Zone C1. As such, no more than 3,540 employees can be present on the 35.4-acre portion of the Project site within Zone C1.
- Prohibited uses include children's school, day care centers, libraries, hospitals, congregate care facilities, hotels/motels, restaurants, and places of assembly. As such, development of these uses on the Project site has been eliminated from further consideration.
- Noise sensitive outdoor nonresidential uses are prohibited, examples of which include major spectator-oriented sports stadiums, amphitheaters, concert halls and drive-in theaters. Caution should be exercised with respect to uses such as poultry farms and nature preserves. As such, development of these uses on the Project site have been eliminated from further consideration.
- Hazards to flight, which include physical (e.g., tall objects), visual, and electronic forms of interference with the safety of aircraft operations, land use development that may cause the attraction of birds are prohibited. Human-made features must be designed to avoid heightened attraction of birds. Though not located within Zones A, B1, and B2, flood control facilities should be designed to hold water for no more than 48 hours following a storm and be completely dry between storms (see FAA Advisory Circular 150/5200-33B). Additionally, certain farm crops and farming practices that tend to attract birds are strongly discouraged. These include: certain crops (e.g., rice, barley, oats, wheat – particularly durum – corn, sunflower, clover, berries, cherries, grapes, and apples); farming activities (e.g., tilling and harvesting); confined livestock operations (i.e., feedlots, dairy operations, hog or chicken production facilities, or egg-laying operations); and various farming practices (e.g., livestock feed, water, and manure). Fish production (i.e., catfish, trout) conducted outside of fully enclosed buildings may require mitigation measures (e.g., netting of outdoor ponds, providing covered structures) to prevent bird attraction. As such, uses that would generate hazards to flight have been eliminated from further consideration.

Given the land use restrictions in place for the proposed Project site, there are limited opportunities to introduce types of land uses other than those included within the proposed Project. As such, evaluating alternatives that include any part or combination of the above-listed uses were eliminated from further consideration.

7.4 ALTERNATIVES UNDER CONSIDERATION

This section discusses the alternatives to the Project, including the No Project Alternative, under consideration. However, the range of alternatives analyzed is greatly limited, as discussed above, based upon the Project site's location in the areas of the March ARB Zone C1 and proximity to the March ARB airstrip. As discussed in more detail in Section 4.9, Land Use and Planning, of the EIR, the Project site's designation prohibits numerous uses, requires low occupancy, and has strict height limits. The No Project (No Development) Alternative, which is a required element of an EIR pursuant to Section 15126.6(e) of the CEQA Guidelines, examines the environmental effects that would occur if the Project were not to proceed and no development activities were to occur. The other alternatives are discussed as part of the "reasonable range of alternatives" selected by the lead agency. The alternatives addressed in this section are listed below, followed by a more detailed discussion of each:

- Alternative 1 – No Project
- Alternative 2 – Reduced Size General Warehouse
- Alternative 3 – High-Cube Short-Term Storage Warehouse
- Alternative 4 – High-Cube Parcel Hub Warehouse

7.4.1 Alternative 1 – No Project

Under Alternative 1, development of the Project would not occur as discussed in Chapter 2 of this EIR. The Project site would remain unchanged, and no development activity would occur. As a result, the proposed General Plan Amendment, Zoning Designation, Master Plot Plan, Parcel Merger, and all other applicable pending approvals associated with the Project would not be necessary, as no new development would occur on the Project site that would trigger such actions.

No Project Alternative Environmental Impact Analysis

Aesthetics

As discussed in Section 4.1, Aesthetics, the Project would have less-than-significant impacts associated with changes to existing visual character and quality of the Project site and light and glare.

Under Alternative 1, the K4 Parcel and the Cactus Channel would remain in their current condition, and no development or improvements to the Channel would occur. The visual character of the K4

Parcel from the site would remain unchanged, and no new lighting would be introduced to the K4 Parcel. Therefore, because no development would occur as a result of Alternative 1, there would be no impacts compared to the proposed Project.

Air Quality

As discussed in Section 4.2, Air Quality, daily construction emissions would not exceed the SCAQMD's significance thresholds for CO, SOx, PM_{10}, or $PM_{2.5}$ during construction of the Project in any of the construction years. The Project would exceed daily construction emissions thresholds for NOx and VOCs; however, implementation of mitigation would reduce NO_x and VOC emissions and impacts during Project construction would be less than significant**.** The Project's operational emissions would not exceed the SCAQMD's significance threshold for VOCs, CO, SOx, PM_{10}, and $PM_{2.5}$. The Project, however, would exceed operational emissions thresholds for NOx even with implementation of mitigation due to emissions and exhaust from internal combustion engines used by construction equipment, therefore resulting in a significant and unavoidable operational impact.

The LST analysis included in Section 4.2 shows that the Project construction and operational emissions would not exceed the CAAQS for NO_2, CO, PM_{10}, and $PM_{2.5}$ or the 1-hour NO_2 NAAQS. Additionally, the Project would not result in on-road traffic volumes at affected intersections that would result in a CO hotspot. The cancer risk and noncancer risk at the nearby residents would not exceed the SCAQMD threshold of 10 in 1 million or chronic HI of 1.0, respectively, and impacts would also be less than significant.

Under Alternative 1, the K4 Parcel would remain in its current condition, and no development would occur. The K4 Parcel would continue to remain vacant and the Cactus Channel would continue to remain an open-air earthen drainage channel. Therefore, because no new construction or operational emissions would occur under Alternative 1, there would be no impacts compared to the Project.

Biological Resources

As discussed in Section 4.3, Biological Resources, both the K4 Parcel and Cactus Channel Improvement Site provide suitable habitat for federal and state special-status plant and animal species. However, with implementation of mitigation, potentially significant impacts to smooth tarplant, Riverside fairy shrimp, vernal pool fairy shrimp, Stephen's Kangaroo Rat, burrowing owl, western spadefoot, orange-throated whiptail, San Diego black-tailed jackrabbit, northwestern San Diego pocket mouse, and Los Angeles pocket mouse can be reduced to less than significant levels. Additionally, there is the potential for the Project to affect special-status riparian vegetation communities and protected wetland communities; however, with implementation of mitigation, potential impacts can be reduced to less than significant levels.

Finally, there is the potential for the Project to affect implementation of the MSCHP; however, with implementation of mitigation, all potential conflicts with the MSCHP would be reduced to less than significant impacts.

Under Alternative 1, the new warehouse building would not be constructed on the K4 Parcel and the Cactus Channel improvements would not be implemented. The K4 Parcel would remain undeveloped and the Cactus Channel would remain as an open-air earthen drainage ditch. As such, all potential impacts to biological resources would be avoided when compared to the proposed Project, and no impacts would occur.

Cultural Resources

As discussed in Section 4.4, Cultural Resources, with the incorporation of mitigation, the Project would have less-than-significant impacts associated with historical resources, archaeological resources, unique geologic features, and human remains. Impacts to cultural resources can be mitigated to less-than-significant levels by incorporating mitigation measures, and no significant adverse impacts would remain after mitigation.

Alternative 1 would not result in any direct impacts related to cultural resources because no construction or site disturbance would occur. No construction or development activities would take place that could impact potential historical, paleontological, unique archaeological resources, tribal cultural resources, or human remains; therefore, the Alternative 1 would have no impacts compared to the Project.

Geology and Soils

As discussed in Section 4.5, Geology and Soils, the implementation of the Project would not conflict with any applicable plan, policy, or regulation adopted for the purposes of mitigating hazards associated with geology and soils. The Project would have a less-than-significant impact associated with strong seismic ground shaking and seismic-related ground failure with incorporation of mitigation. Lastly, the proposed Project would result in less than significant impacts to unique paleontological resources with mitigation incorporated.

Alternative 1 would not result in any direct impacts related to geology and soils because no construction or site disturbance would occur. No construction or operational activities would take place that could expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking or seismic related ground failure; therefore, Alternative 1 would have no impacts compared to the Project.

Greenhouse Gas Emissions

As discussed in Section 4.6, Greenhouse Gas Emissions, the proposed Project would result in greenhouse gas (GHG) emissions that are primarily associated with use of off-road equipment and on-road construction and worker vehicles during construction. Operation of the proposed Project would result in GHG emissions through energy use; motor vehicle trips to and from the proposed Project; generation of electricity associated with water supply, treatment, and distribution and wastewater treatment; and solid waste disposal. The Project would result in a less-than-significant impact associated with GHG emissions.

Under Alternative 1, the K4 Parcel would remain in its current condition, and no development would occur. The K4 Parcel would continue to remain vacant and the Cactus Channel would continue to remain an open-air earthen drainage channel. Alternative 1 would not have GHG emissions so it would be considered less than significant in accordance with the Riverside County CAP. With respect to consistency with AB 32, Alternative 1 would not conflict with any of the GHG reduction measures provided in AB 32 as there would be no action. However, it would also not support any of the measures within AB 32. Similarly, Alternative 1 would not conflict with the March JPA General Plan Noise/Air Quality Element (March JPA 1999) or support any goals or policies within it. With respect to consistency with SB 375, Alternative 1 would not create jobs and therefore would not support the SCAG 2016 RTP/SCS goal of improving the Project area, which is considered a jobs poor area. Impacts would be less than significant.

Hazards and Hazardous Materials

As discussed in Section 4.7, Hazards and Hazardous Materials, with the implementation of mitigation, impacts to hazards related to air traffic and proximity to the March ARB Airport as a result of the Project can be mitigated to less-than-significant levels. The Project would be in compliance with the *Citizen's Brochure for the 452d Air Mobility Wing AICUZ Study*, *March ARB AICUZ*, and the *March ARB/Inland Port ALUCP*, and impacts would be less than significant. Therefore, no adverse significant impacts would remain after mitigation. Additionally, based on the Riverside County ALUCP noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the Riverside County ALUCP compatibility criteria, and no noise mitigation is required with typical building construction.

Alternative 1 would not result in any potential increase in hazards or hazardous materials used during construction, because no construction would occur. Similarly, the No Project Alternative would not introduce a greater number of employees, and visitors to potential hazards from the airport at March ARB during construction or operation because nothing would be built as a result of Alternative 1. Additionally, no relocation of underground petroleum or natural gas lines would occur. Therefore, Alternative 1 would have no impacts on hazards and hazardous materials compared to the Project.

Hydrology/Water Quality

As discussed in Section 4.8, Hydrology and Water Quality, the Project would have less-than-significant impacts associated with water quality standards, waste discharge requirements, increased runoff of pollutants, decrease of groundwater supplies, interference of groundwater recharge, altering existing drainage patterns, or degrading water quality. The Project would be in compliance with all applicable federal, state, and local rules and regulations regarding water quality and hydrology. In addition, implementation of (1) the Storm Water Pollution Prevention Plan (SWPPP) in conformance with the Construction General Permit, (2) the Water Quality Management Plan (WQMP) in compliance with the New Development & Redevelopment Guidelines for Projects Under the March JPA, and (3) proposed drainage design according to the *Riverside County Flood Control and Water Quality District Hydrology Manual* collectively ensure Project impacts on hydrology and water quality would be less than significant.

Alternative 1 would not result in any direct impacts related to hydrology and water quality because no construction would occur, and there would be no increase in runoff from the site. No construction or development activities would take place that could generate an increase in potential pollutants in stormwater, nor would there be changes to groundwater recharge and drainage patterns; therefore, Alternative 1 would have no impacts compared to the Project.

Land Use and Planning

As described in Section 4.9, the K4 Parcel is currently designated Business Park (BP) within the March JPA General Plan Land Use Map (March JPA 2012). Under the proposed Project, the K4 Parcel would be re-designated as Industrial (IND) under the proposed General Plan amendment. Additionally, the K4 Parcel is not yet zoned and as part of the Project, the zoning designations of Industrial (IND) would be applied to the parcel. The proposed Project would also include the processing of a master plot plan and parcel merger. The Project would not cause a significant environmental impact due to a conflict with the goals and policies outlined in the March JPA General Plan, and impacts would be considered less than significant with mitigation incorporated. The Project is also in compliance with the March JPA Development Standards and impacts would be less than significant.

Under Alternative 1, the March JPA General Plan amendment and zoning designation would not be implemented and the Project site would not be incorporated into the March JPA Land Use Authority. Under Alternative 1, existing March JPA General Plan land use and zoning designations would remain and Project objectives would not be met. Therefore, the Project would have no impacts compared to Alternative 1 related to Land Use and Planning.

Noise

As discussed in Section 4.10, Noise, the Project would result in less-than-significant impacts relative to temporary or permanent noise levels. Alternative 1 would not result in any construction or introduce any new land uses or vehicle trips with the potential to generate noise. The existing noise conditions at the Project site and in the vicinity of the Project site would remain unchanged. Therefore, even though noise impacts associated with the proposed Project would be less than significant, Alternative 1 would have no impacts compared to the Project.

Transportation

As discussed in Section 4.11, Transportation, construction of the proposed Project would result in less-than-significant traffic impacts following implementation of mitigation requiring the preparation of a Construction Traffic Management Plan. While Project implementation has the potential to result in several traffic-related impacts, all traffic impacts can be reduced to less than significant levels with the exception of the following:

- **Overlook Parkway/Canyon Crest/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the south leg of the Overlook Parkway/Canyon Crest/Alessandro Boulevard, increasing intersection operations to LOS D and reducing Project impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard**. The Project shall pay its fair share towards the restriping of lanes and the modification of the traffic signal at the intersection of Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the southbound approach at the intersection of Sycamore Canyon Boulevard/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of City and County of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards the traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The intersection of Sycamore Canyon Boulevard/Alessandro Boulevard is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **I-215 Southbound Ramps/Cactus Avenue**. The intersection of I-215 southbound ramps/Cactus Avenue is anticipated to operate at LOS A during the AM peak hour and at LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **I-215 Northbound Ramps/Alessandro Boulevard**. The intersection of I-215 northbound ramps/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/Alessandro Boulevard**. The intersection of Old 215 Frontage Road/Alessandro Boulevard is anticipated to operate at LOS C with fair share contributions towards lane modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of Moreno Valley and the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 northbound ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the

Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **Elsworth Street/Alessandro Boulevard**. The intersection of Elsworth Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Frederick Street/Alessandro Boulevard**. The intersection of Frederick Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

Since the above required improvements are within the jurisdiction of another public agency and not the lead agency, impacts associated with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, as well as impacts related to an applicable congestion management program, would be considered significant and unavoidable following the incorporation of mitigation measures.

Alternative 1 would not result in any direct or indirect impacts related to the roadway network because the Project would not be constructed and no new vehicle trips would be introduced to the Project area. As such, Alternative 1 would have no impacts compared to the Project.

Tribal Cultural Resources

As discussed in Section 4.12, Tribal Cultural Resources, Project implementation could have the potential to affect tribal cultural resources; however, with implementation of mitigation, potential impacts to tribal cultural resources would be reduced to less than significant levels. Alternative 1 would not result in any construction activities, and as such, Alternative 1 would not have the potential to affect tribal cultural resources. Alternative 1 would have no impacts compared to the Project.

Utilities

As discussed in Section 4.13, Utilities and Service Systems, the Project would result in less-than-significant impacts associated with water, wastewater, solid waste, and electric power, natural gas,

and telecommunication services. Alternative 1 would not result in any direct impacts related to water, wastewater, solid waste, and electric power, natural gas, and telecommunication services because nothing would be built as a result of Alternative 1, and a larger number of employees would not be introduced to the area. No construction or development activities would take place that could generate an increase in needed water, wastewater, solid waste, and electric power, natural gas, and telecommunication services; therefore, Alternative 1 would have no impacts compared to the Project.

Energy

As concluded in Section 4.14, Energy, there would be an increase in the amount of electricity, natural gas, and petroleum used during construction and operation of the Project; however, the Project includes features such as alternative modes of transportation that would help reduce the number of vehicle miles traveled generated by the Project operation. Additionally, bike racks would be installed so that employees can use biking as a mode of transportation, thus, reducing the amount of gasoline that would be consumed by Project operation. In addition, the Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. The Project would not contribute to inefficient or wasteful consumption of electricity, natural gas or petroleum, and impacts related to conflicts with existing energy standards would be less than significant. Further, the Project would not place significant demand on local or regional energy supplies or require a substantial amount of additional capacity. Therefore, impacts related to energy supplies and capacity would be less than significant.

Since Alternative 1 would not increase the use of energy, natural gas, or petroleum or require additional energy supplies because no construction would occur under this alternative, there would be no impacts compared to the Project.

Relationship to Project Objectives and Feasibility

Under Alternative 1, the land on the Project site would remain vacant, and no new construction would be developed on the Project site. Table 7-2 provides a list of the Project objectives and whether Alternative 1 meets each objective.

Table 7-2
Summary of Alternative 1 Success at Meeting Project Objectives

Project Objective	Alternative Meets Objective?
1. Provide appropriate land use intensities to comply with the parameters of the March Air Reserve Base/Inland Port Airport Compatibility Plan.	**No.** Alternative 1 would continue to provide vacant land on the K4 Parcel and would not result in the conversion of the Cactus Channel to an underground box culvert, thereby reducing wildlife attractants which can be hazards to aircraft flight.
2. Implement the goals, objectives and policies of the March JPA General Plan at the K4 Parcel.	**No.** Alternative 1 would continue to provide vacant land on the K4 Parcel and would not implement any of the goals, objectives or policies of the March JPA General Plan.
3. Provide increased job opportunities for local residents through the provision of employment-generating businesses.	**No.** Alternative 1 would not result in construction or permanent employment opportunities, as the K4 Parcel would remain undeveloped.
4. Establish a land use and facility plan that ensures project viability in consideration of existing and anticipated economic conditions.	**No.** Alternative 1 would continue to provide vacant land on the K4 Parcel and would not provide any new construction or permanent employment opportunities.
5. Develop the property with land uses that are compatible with the March ARB Reuse program.	**No.** Alternative 1 would continue to provide vacant land on the K4 Parcel and would not develop available land consistent with the March ARB Reuse program.
6. Encourage the use of alternative modes of transportation through the provision of a pedestrian and bicycle circulation system that is both safe and comfortable.	**No.** Alternative 1 would continue to provide vacant land on the K4 Parcel, and no improvements to Cactus Avenue along the K4 Parcel frontage would occur. Additionally, no new employees would be accessing the K4 Parcel. As such, Alternative 1 would not encourage the use of alternative modes of transportation.
7. Provide a range of job types for the community's residents.	**No.** Alternative 1 would not result in construction or permanent employment opportunities, as the K4 Parcel would remain undeveloped.
8. Provide a circulation system that facilitates movement and access needs of automobiles, pedestrians, and bicyclists.	**No.** Alternative 1 would continue to provide vacant land on the K4 Parcel, and no improvements to Cactus Avenue along the K4 Parcel frontage would occur. Additionally, no new employees would be accessing the K4 Parcel. As such, Alternative 1 would not enhance the circulation system to facilitate movement and access for automobiles, pedestrians, or bicyclists.
9. Minimize impacts from construction of the development to sensitive biological resources.	**Yes.** Alternative 1 would not result in any construction activities or changes in operations. As such, no changes to sensitive biological resources would occur.
10. Minimize hazards to flight associated with the naturalized Cactus Channel drainage channel by undergrounding the drainage channel.	**No.** Alternative 1 would not include the proposed Cactus Channel improvements. As such, the open-air earthen channel would continue to attract wildlife and pose hazards to flight.

7.4.2 Alternative 2 – Reduced Size General Warehouse

Under Alternative 2 – Reduced Size General Warehouse, a smaller version, approximately 700,000 square feet, of the Project shell would be constructed on the K4 Parcel, and rather than operating as a High-Cube Fulfillment Center, which is characterized by a significant storage function and direct distribution of ecommerce product to end uses, the building on the K4 Parcel would operate

as a general warehouse. As a general warehouse, Alternative 2 would be primarily devoted to the storage of materials with minimal space devoted to office and maintenance areas. Alternative 2 would require the same proposed General Plan Amendment, Zoning Designation, Master Plot Plan, Parcel Merger, and all other applicable pending approvals associated with the Project would not be necessary, as no new development would occur on the Project site that would trigger such actions. Under Alternative 2, access to the Project site would be via two clear span bridges would be constructed over the Cactus Avenue Drainage Channel (Cactus Channel), and no improvements or installation of an underground box culvert would be completed within the Cactus Channel.

Reduced Size General Warehouse Alternative Environmental Impact Analysis

Aesthetics

As discussed in Section 4.1, the Project would have less-than-significant impacts associated with changes to existing visual character and quality of the Project site and light and glare.

Under Alternative 2, the K4 Parcel would still be developed with a new, yet smaller, warehouse building. The visual character of the K4 Parcel would be similar as under the proposed Project. Access to the Project site would be via two bridges constructed over the Cactus Channel, and no improvements to the Cactus Channel would be made. Therefore, because the building on the K4 Parcel would be the similar, yet smaller, under Alternative 2 as the proposed Project, impacts would be similar to those of the proposed Project and remain less than significant.

Air Quality

As discussed in Section 4.2, daily construction emissions would not exceed the SCAQMD's significance thresholds for CO, SOx, PM_{10}, or $PM_{2.5}$ during construction of the Project in any of the construction years. The Project would exceed daily construction emissions thresholds for NOx and VOCs; however, implementation of mitigation would reduce NO_x and VOC emissions and impacts during Project construction would be less than significant**.** The Project's operational emissions would not exceed the SCAQMD's significance threshold for VOCs, CO, SOx, PM_{10}, and $PM_{2.5}$**.** The Project, however, would exceed operational emissions thresholds for NOx even with implementation of mitigation due to emissions and exhaust from internal combustion engines used by construction equipment, therefore resulting in a significant and unavoidable operational impact.

The localized significance threshold (LST) analysis included in Section 4.2 shows that the Project construction and operational emissions would not exceed the CAAQS for NO_2, CO, PM_{10}, and $PM_{2.5}$ or the 1-hour NO_2 NAAQS. Additionally, the Project would not result in on-road traffic volumes at affected intersections that would result in a CO hotspot. The cancer risk and noncancer risk at the nearby residents would not exceed the SCAQMD threshold of 10 in 1 million or chronic HI of 1.0, respectively, and impacts would also be less than significant.

Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel, and no Cactus Channel improvements would be implemented. Construction under Alternative 2 would therefore result in the fewer impacts as the proposed Project because no construction activities would be performed along the alignment of the Cactus Channel. Nonetheless, Alternative 2 construction would still exceed daily construction emissions thresholds for NOx and VOCs; however, implementation of mitigation would reduce NO_x and VOC emissions and impacts during Project construction would be less than significant**.**

Under Alternative 2, the new 700,000 warehouse building on the K4 Parcel would be operated as a general warehouse, thereby resulting in fewer operational vehicle trips when compared to the proposed Project. Table 7-3 summarizes unmitigated and mitigated emissions associated with operation of Alternative 2.

Table 7-3
Alternative 2 Estimated Maximum Daily Operational Emissions
(pounds per day unmitigated)

	VOC [1]	NO_x	CO	SO_x	PM_{10} [2]	$PM_{2.5}$ [2]
Unmitigated Emissions						
Area source emissions [3]	16.3	< 0.1	0.1	< 0.1	< 0.1	< 0.1
Energy source emissions [3]	< 0.1	0.4	0.3	< 0.1	< 0.1	< 0.1
Mobile source emissions [4]	11.0	208	66	0.8	39	13.1
Combined total emissions	**27.4**	**208**	**67**	**0.8**	**39**	**13.1**
SCAQMD Pollutant threshold [5]	*55*	*55*	*550*	*150*	*150*	*55*
Threshold exceeded? [6]	**No**	**Yes**	**No**	**No**	**No**	**No**
Mitigated Emissions						
Area source emissions [3]	14.7	< 0.1	0.1	< 0.1	< 0.1	< 0.1
Energy source emissions [3]	< 0.1	0.4	0.3	< 0.1	< 0.1	< 0.1

Source: Ramboll 2019.
Notes:
1 For purposes of this analysis VOC emissions are assumed to be equal to ROG.
2 PM emissions for mobile sources are estimated as a sum of exhaust emissions, tire wear, brake wear, and entrained road dust.
3 Emissions estimated using CalEEMod®. Refer to Appendix C for CalEEMod® outputs.
4 Emissions were estimated emission factors from EMFAC2017 along with Project-specific vehicle trip rates prepared by Urban Crossroads in the K4 Parcel Alternatives Trip Generation Evaluation dated December 14, 2018.
5 SCAQMD Air Quality Significance Thresholds. Available at http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2. Accessed: August 2018.
6 Comparison of mitigated operational emissions against SCAQMD significance thresholds. Quantified mitigation measure includes the use of Super Compliant coatings with a VOC content less than 10 g/L VOC for architectural coatings.

Under Alternative 2, operational activities would be less intense than those associated with the proposed Project, thereby resulting in fewer vehicle trips and associated air emission reductions and energy emissions. However, under Alternative 2, emissions related to NO_x would remain at significant and unavoidable even with implementation of mitigation measures due to emissions and exhaust from internal combustion engines used by construction equipment. Therefore, operational emissions would be significant and unavoidable but slightly reduced when compared to the proposed Project.

Biological Resources

As discussed in Section 4.3, both the K4 Parcel and Cactus Channel Improvement Site provide suitable habitat for federal and state special-status plant and animal species. However, with implementation of mitigation, potentially significant impacts to smooth tarplant, Riverside fairy shrimp, vernal pool fairy shrimp, Stephen's Kangaroo Rat, burrowing owl, western spadefoot, orange-throated whiptail, San Diego black-tailed jackrabbit, northwestern San Diego pocket mouse, and Los Angeles pocket mouse can be reduced to less than significant levels. Additionally, there is the potential for the Project to affect special-status riparian vegetation communities and protected wetland communities; however, with implementation of mitigation, potential impacts can be reduced to less than significant levels. Finally, there is the potential for the Project to affect implementation of the Multiple Species Habitat Conservation Plan (MSHCP); however, with implementation of mitigation, all potential conflicts with the MSHCP would be reduced to less than significant impacts.

Under Alternative 2, a new 700,000-square-foot warehouse building would be constructed on the K4 Parcel; no improvements would be constructed within the Cactus Channel and instead two clear span bridges would be constructed over the Cactus Channel thereby removing any potential impacts to biological resources within the Cactus Channel. The same construction footprint would occur on the K4 Parcel; however, no construction activities would occur within the Cactus Channel. As with the proposed Project, with implementation of mitigation, all impacts to biological resources under Alternative 2 would be reduced to less than significant levels; however, under Alternative 2, impacts would be reduced because no impacts would occur within the Cactus Channel. Additionally, without the Cactus component of the Project, the Project would not affect implementation of the MSHCP. Impacts to biological resources associated with Alternative 2 would be reduced in comparison to the proposed Project.

Cultural Resources

As discussed in Section 4.4, with the incorporation of mitigation, the Project would have less-than-significant impacts associated with historical resources, archaeological resources, unique geologic features, and human remains. Impacts to cultural resources can be mitigated to less-than-

significant levels by incorporating mitigation measures, and no significant adverse impacts would remain after mitigation.

Alternative 2 would result in the same impacts related to cultural resources on the K4 Parcel because a comparable, yet smaller, warehouse building would be constructed. However, no improvements would occur within the Cactus Channel. As such, the same potential as the proposed Project exists to impact potential historical, paleontological, unique archaeological resources, or human remains on the K4 Parcel; however, no potential impacts would occur within the Cactus Channel. As with the proposed Project, implementation of mitigation measures for Alternative 2 would reduce potentially significant impacts to a less than significant level on the K4 Parcel; however, because no impacts would occur within the Cactus Channel, Alternative 2 would result in reduced potential impacts to cultural resources when compared to the proposed Project.

Geology and Soils

As discussed in Section 4.5, the implementation of the Project would not conflict with any applicable plan, policy, or regulation adopted for the purposes of mitigating hazards associated with geology and soils. The Project would have a less-than-significant impact associated with strong seismic ground shaking and seismic-related ground failure with incorporation of mitigation. Lastly, the proposed Project would result in less than significant impacts to unique paleontological resources with mitigation incorporated.

Alternative 2 would result in comparable impacts related to geology and soils because a similar, yet smaller, warehouse building would be constructed on the K4 Parcel. However, under Alternative 2, the proposed Cactus Channel improvements would not be implemented. With incorporation of the recommendations included in the Geotechnical Exploration prepared for the Project (Appendix I1 and Appendix I2), which would also apply to the warehouse building constructed under Alternative 2, impacts related to risk of loss, injury, or death involving strong seismic ground shaking or seismic related ground failure would be less than significant and the same as those identified for the proposed Project. However, because no impacts would occur within the Cactus Channel, Alternative 2 would result in reduced potential impacts when compared to the proposed Project.

Greenhouse Gas Emissions

As discussed in Section 4.6, the proposed Project would result in greenhouse gas (GHG) emissions that are primarily associated with use of off-road equipment and on-road construction and worker vehicles during construction. Operation of the proposed Project would result in GHG emissions through energy use; motor vehicle trips to and from the proposed Project; generation of electricity associated with water supply, treatment, and distribution and wastewater treatment; and solid waste disposal. The Project would result in a less than significant impact associated with GHG emissions.

As provided in Appendix J, Greenhouse Gas Technical Report, Alternative 2's total unmitigated and mitigated GHG emissions (including construction) would not exceed 3,000 MT carbon dioxide equivalent per year and thus would be considered less than significant in accordance with the Riverside County CAP. Furthermore, Alternative 2 would not need to complete the Riverside County's CAPs screening table. As Alternative 2 would only reduce the size of the project and not reduce any of the sustainable features of the proposed Project, Alternative 2 would be consistent with AB 32 as shown in detail in Table 4.6-4. Similar to the proposed Project, Alternative 2 would also be consistent with the March JPA General Plan Noise/Air Quality Element as provided in Table 4.6-5. Alternative 2 would also be consistent with SB 375 as it would add jobs consistent with the SCAG 2016 RTP/SCS projections in accordance with ARB's emissions reduction targets. Impacts would be less than significant.

Hazards and Hazardous Materials

As discussed in Section 4.7, with the implementation of mitigation, impacts to hazards related to air traffic and proximity to the March ARB Airport as a result of the Project can be mitigated to less-than-significant levels. The Project would be in compliance with the *Citizen's Brochure for the 452d Air Mobility Wing AICUZ Study*, *March ARB AICUZ*, and the *March ARB/Inland Port ALUCP*, and impacts would be less than significant. Therefore, no adverse significant impacts would remain after mitigation. Additionally, based on the Riverside County ALUCP noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the Riverside County ALUCP compatibility criteria, and no noise mitigation is required with typical building construction.

Under Alternative 2, the proposed warehouse building on the K4 Parcel would still be constructed, yet would be smaller in size at 700,000 square feet, and new employees would be introduced to a site within proximity of the March ARB. There would also still be the potential to encounter unexploded ordinance during construction on the K4 Parcel. However, under Alternative 2, the Cactus Channel improvements would not be implemented. The mitigation measures included for the proposed Project would remain applicable to Alternative 2, and as such, all potentially significant impacts could be reduced to less-than-significant levels. Given that the potential for Alternative 2 to result in similar hazards and hazardous materials impacts on the K4 Parcel as the proposed Project yet reduced for the Cactus Channel improvements component of the proposed Project, Alternative 2 would be result in reduced impacts compared to the proposed Project with respect to hazards and hazardous materials.

Hydrology/Water Quality

As discussed in Section 4.8, the Project would have less-than-significant impacts associated with water quality standards, waste discharge requirements, increased runoff of pollutants, depletion of

groundwater supplies, interference of groundwater recharge, altering existing drainage patterns, or degrading water quality. The Project would be in compliance with all applicable federal, state, and local rules and regulations regarding water quality and hydrology. In addition, implementation of (1) the SWPPP in conformance with the Construction General Permit, (2) the WQMP in compliance with the New Development & Redevelopment Guidelines for Projects Under the March JPA, and (3) proposed drainage design according to the *Riverside County Flood Control and Water Quality District Hydrology Manual* collectively ensure Project impacts on hydrology and water quality would be less than significant.

Under Alternative 2, a smaller warehouse building would be constructed on the K4 Parcel, and the proposed Cactus Channel improvements would not be implemented. As such, with implementation of a similar, yet smaller, building hydrology and water quality impacts for the K4 Parcel would be similar to those of the proposed Project. However, given that the Cactus Channel improvements component of the Project would not be implemented, Alternative 2 would result in reduced hydrology and water quality impacts compared to the proposed Project.

Land Use and Planning

As described in Section 4.9, the K4 Parcel is currently designated Business Park (BP) within the March JPA General Plan Land Use Map (March JPA 2012). Under the proposed Project, the K4 Parcel would be re-designated as Industrial (IND) under the proposed General Plan amendment. Additionally, the K4 Parcel is not yet zoned and as part of the Project, the zoning designations of Industrial (IND) would be applied to the parcel. The proposed Project would also include the processing of a master plot plan and parcel merger. The Project would be consistent with the goals and policies outlined in the March JPA General Plan, and impacts would not cause a significant environmental impact due to a conflict less than significant with mitigation incorporated. The Project is also in compliance with the March JPA Development Standards and impacts would be less than significant.

Under Alternative 2, the K4 Parcel would be developed with an industrial warehouse building that is smaller than the proposed Project. This alternative would still require the processing of a General Plan amendment to designate the site as Industrial (IND), assign zoning of IND, approval of a master plot plan, and approval of a parcel merger. As such, given that the same land use entitlements would be required under Alternative 2 as the proposed Project, land use impacts under Alternative 2 would be comparable to those of the proposed Project and less than significant with the incorporation of mitigation measures.

Noise

As discussed in Section 4.10, the Project would result in less-than-significant impacts relative to temporary or permanent noise levels. Alternative 2 would result in the construction and operation of

a 700,000-square-foot industrial warehouse building on the K4 Parcel. Alternative 2 would not result in implementation of the Cactus Channel improvements. As such, given that Alternative 2 would not include construction impacts along the Cactus Channel alignment, construction noise impacts would be less than the proposed Project. Additionally, during operation of Alternative 2, given the smaller building, fewer trucks and vehicles would be accessing the K4 Parcel. As such, noise impacts under Alternative 2 would be reduced in comparison to those of the proposed Project.

Transportation

As discussed in Section 4.11, construction of the proposed Project would result in less-than-significant traffic impacts following implementation of mitigation requiring the preparation of a Construction Traffic Management Plan. While Project implementation has the potential to result in several traffic-related impacts, all traffic impacts can be reduced to less than significant levels with the exception of the following:

- **Overlook Parkway/Canyon Crest/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the south leg of the Overlook Parkway/Canyon Crest/Alessandro Boulevard, increasing intersection operations to LOS D and reducing Project impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard**. The Project shall pay its fair share towards the restriping of lanes and the modification of the traffic signal at the intersection of Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the southbound approach at the intersection of Sycamore Canyon Boulevard/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of City and County of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue is anticipated to operate

at LOS D with fair share contributions towards the traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The intersection of Sycamore Canyon Boulevard/Alessandro Boulevard is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **I-215 Southbound Ramps/Cactus Avenue**. The intersection of I-215 southbound ramps/Cactus Avenue is anticipated to operate at LOS A during the AM peak hour and at LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **I-215 Northbound Ramps/Alessandro Boulevard**. The intersection of I-215 northbound ramps/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/Alessandro Boulevard**. The intersection of Old 215 Frontage Road/Alessandro Boulevard is anticipated to operate at LOS C with fair share contributions towards lane modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of Moreno Valley and the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 northbound ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the

improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **Elsworth Street/Alessandro Boulevard**. The intersection of Elsworth Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Frederick Street/Alessandro Boulevard**. The intersection of Frederick Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

Under Alternative 2, the K4 Parcel would be developed with a new, yet smaller, warehouse building that would be approximately 700,000 square feet. The Cactus Channel improvements would not be implemented under Alternative 2. As such, construction traffic under Alternative 2 would be reduced when compared to the proposed Project. The new building constructed on the K4 Parcel would be utilized as a general warehouse under Alternative 2, compared to an e-commerce/fulfillment center under the proposed Project. Additionally, the warehouse building itself would be smaller in size, at 700,000 square feet instead of 718,000 square feet. Table 7-4 presents the overall vehicle trips under Alternative 2, and provides the difference and percent reductions when compared to the proposed Project.

Table 7-4
Alternative 2 Trip Generation Comparison and Summary

Land Use	Quantity	Units[1]	AM Peak Hour			PM Peak Hour			Daily
			In	*Out*	*Total*	*In*	*Out*	*Total*	
General Warehouse	700.000	TSF							
Passenger Cars			64	19	83	28	76	104	770
Truck Trip									
2-axle:			5	1	6	1	4	5	75
3-axle:			6	1	7	1	4	5	93
4+-axle:			18	6	23	5	13	18	281
- Net Truck Trips (Actual)[2]			28	7	36	7	22	28	448
Alternative 2 Total Net Trips (Actual)[3]			*92*	*26*	*119*	*35*	*98*	*133*	*1,219*

Table 7-4
Alternative 2 Trip Generation Comparison and Summary

Land Use	Quantity	Units[1]	AM Peak Hour			PM Peak Hour			Daily
			In	*Out*	*Total*	*In*	*Out*	*Total*	
Project Net Trips (PCE)[3]			*327*	*98*	*425*	*275*	*708*	*983*	*5,873*
Variance (Alternative 2-Project)			**-235**	**-72**	**-306**	**-240**	**-610**	**-850**	**-4,654**

Source: Urban Crossroads 2019.
Notes:
1 Trip Generation Source: ITE 2017.
2 TSF = Thousand Square Feet
3 TOTAL NET TRIPS (Actual Vehicles) = Passenger Cars + Net Truck Trips (Actual Trucks).

Under Alternative 2, a total of 4,654 fewer actual vehicle trips would occur when compared to the proposed Project. During the AM and PM peak hours, trips would also all be reduced when compared to the proposed Project, with a total of 306 fewer AM peak hour trips and a total of 850 fewer PM peak hour trips.

However, as with the proposed Project, since the required improvements to the street network are within the jurisdiction of another public agency and not the lead agency, impacts under Alternative 2 would be reduced when compared to the proposed Project but still remain significant and unavoidable.

Tribal Cultural Resources

As discussed in Section 4.12, Project implementation could have the potential to affect tribal cultural resources; however, with implementation of mitigation, potential impacts to tribal cultural resources would be reduced to less than significant levels. Alternative 2 would result in the construction of a comparable, yet smaller, industrial warehouse building on the K4 Parcel. The Cactus Channel improvements component of the Project would not be implemented. As such, the same potential to affect tribal cultural resources could occur on the K4 Parcel under Alternative 2. However, the potential to affect tribal cultural resources within the Cactus Channel would be reduced since no construction activities would occur within the Channel. As such, Alternative 2 would result in fewer potential impacts to tribal cultural resources than the proposed Project.

Utilities

As discussed in Section 4.13, the Project would result in less-than-significant impacts associated for water, wastewater, solid waste, and electric power, natural gas, and telecommunication services resulting in no need to develop new or improve existing facilities. Under Alternative 2, the K4 Parcel would be developed with a smaller industrial warehouse building; the proposed Cactus Channel improvements would not be implemented. As such, given that the new warehouse

building under Alternative 2 would be smaller than the warehouse building under the proposed Project, operational activities would be reduced where compared with the proposed Project.

Energy

As concluded in Section 4.14, there would be an increase in the amount of electricity, natural gas, and petroleum used during construction and operation of the Project; however, the Project includes features such as alternative modes of transportation that would help reduce the number of vehicle miles traveled generated by the Project operation. Additionally, bike racks would be installed so that employees can utilize biking as a mode of transportation, thus, reducing the amount of gasoline that would be consumed by Project operation. In addition, the Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. The Project would not contribute to inefficient or wasteful consumption of electricity, natural gas or petroleum, and impacts related to conflicts with existing energy standards would be less than significant. Further, the Project would not place significant demand on local or regional energy supplies or require a substantial amount of additional capacity. Therefore, impacts related to energy supplies and capacity would be less than significant.

Under Alternative 2, the construction schedule would be similar to that of the proposed Project and a comparable, yet smaller industrial warehouse building would be constructed on the K4 Parcel. However, no Cactus Channel improvements would be implemented under Alternative 2. As such, Alternative 2 would result in less energy consumption when compared to the proposed Project, and as such, fewer energy impacts than the proposed Project.

Relationship to Project Objectives and Feasibility

Under Alternative 2, a comparable, yet smaller, industrial warehouse building would be constructed on the K4 Parcel and no Cactus Channel improvements would be implemented. Table 7-5 provides a list of the Project objectives and whether Alternative 2 meets each objective.

Table 7-5
Summary of Alternative 2 Success at Meeting Project Objectives

Project Objective	Alternative Meets Objective?
1. Provide appropriate land use intensities to comply with the parameters of the March Air Reserve Base/Inland Port Airport Compatibility Plan.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel. The general warehouse use is consistent with the C1 Zone of the K4 Parcel and Alternative 2 would continue to provide fewer than 100 persons per acre as building occupants.

Table 7-5
Summary of Alternative 2 Success at Meeting Project Objectives

Project Objective	Alternative Meets Objective?
2. Implement the goals, objectives and policies of the March JPA General Plan at the K4 Parcel.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel. The general warehouse use is consistent with, and would implement the goals, objectives and policies of the March JPA General Plan.
3. Provide increased job opportunities for local residents through the provision of employment-generating businesses.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel and would provide both temporary jobs during construction and permanent jobs during operations. However, under this alternative, fewer new permanent jobs would be provided when compared to the proposed Project.
4. Establish a land use and facility plan that ensures project viability in consideration of existing and anticipated economic conditions.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel. The flexibility associated with the general warehouse use would allow for Project viability both in the short- and long-term.
5. Develop the property with land uses that are compatible with the March ARB Reuse program.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel. This use would be consistent and compatible with the March ARB Reuse program.
6. Encourage the use of alternative modes of transportation through the provision of a pedestrian and bicycle circulation system that is both safe and comfortable.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel. As part of the Alternative 2, roadway improvements on Cactus Avenue along the K4 Parcel frontage would be implemented, bicycle parking would be provided at the site, and a connection to the local transit system would be provided.
7. Provide a range of job types for the community's residents.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel and would provide both temporary jobs during construction and permanent jobs during operations. However, under this alternative, fewer new permanent jobs would be provided when compared to the proposed Project.
8. Provide a circulation system that facilitates movement and access needs of automobiles, pedestrians, and bicyclists.	**Yes.** Under Alternative 2, a 700,000-square-foot general warehouse building would be constructed on the K4 Parcel. As part of the Alternative 2, roadway improvements on Cactus Avenue along the K4 Parcel frontage would be implemented, bicycle parking would be provided at the site, and a connection to the local transit system would be provided.
9. Minimize impacts from construction of the development to sensitive biological resources.	**Yes.** While Alternative 2 would result in the implementation of a new warehouse building on the K4 Parcel, as with the proposed Project, mitigation would be implemented to minimize impacts to sensitive biological resources.
10. Minimize hazards to flight associated with the naturalized Cactus Channel drainage channel by undergrounding the drainage channel.	**No.** Under Alternative 2 the Cactus Channel improvements would not be implemented and the existing hazards to flight associated with the open-air drainage channel would remain.

7.4.3 Alternative 3 – High-Cube Short-Term Storage Warehouse

Under Alternative 3 – High-Cube Short-Term Storage Warehouse, the Project shell would be constructed on the K4 Parcel, and rather than operating as a High-Cube Fulfillment Center, which is characterized by a significant storage function and direct distribution of ecommerce product to end uses, the building on the K4 Parcel would operate as a high-cube warehouse (HCW) building. A HCW is a building that typically has at least 200,000 gross square feet of floor area, has a ceiling height of 24 feet or more, and is used primarily for the storage and/or consolidation of manufactured goods (and to a lesser extent, raw materials) prior to their distribution to retail locations or other warehouses. A typical HCW has a high level of on-site automation and logistics management. The automation and logistics enable highly efficient processing of goods through the HCW. The HCWs included in this land use include transload and short-term facilities. Transload facilities have a primary function of consolidation and distribution of pallet loads (or larger) for manufacturers, wholesalers, or retailers. They typically have little storage duration, high throughput, and are high-efficiency facilities. Short-term HCWs are high-efficiency distribution facilities often with custom/special features built into structure for movement of large volumes of freight with only short-term storage of products. Alternative 3 would require the same proposed General Plan Amendment, Zoning Designation, Master Plot Plan, Parcel Merger, and all other applicable pending approvals associated with the Project would not be necessary, as no new development would occur on the Project site that would trigger such actions. Under Alternative 3, improvements to the Cactus Avenue Drainage Channel (Cactus Channel) would also be completed.

High-Cube Short-Term Storage Warehouse Alternative Environmental Impact Analysis

Aesthetics

As discussed in Section 4.1, the Project would have less-than-significant impacts associated with changes to existing visual character and quality of the Project site and light and glare.

Under Alternative 3, the K4 Parcel would still be developed with a new warehouse building of comparable size, and the Cactus Channel improvements would be constructed underground within the existing depressed Channel. The visual character of the K4 Parcel would be the same as under the proposed Project, and as with the Project's proposed Cactus Channel improvements, the improvements would not be visible. Therefore, because the building on the K4 Parcel would be the same under Alternative 3 as the proposed Project, impacts would be comparable to those of the proposed Project and remain less than significant.

Air Quality

As discussed in Section 4.2, daily construction emissions would not exceed the SCAQMD's significance thresholds for CO, SOx, PM_{10}, or $PM_{2.5}$ during construction of the Project in any of the

construction years. The Project would exceed daily construction emissions thresholds for NOx and VOCs; however, implementation of mitigation would reduce NO_x and VOC emissions and impacts during Project construction would be less than significant**.** The Project's operational emissions would not exceed the SCAQMD's significance threshold for VOCs, CO, SOx, PM_{10}, and $PM_{2.5}$. The Project, however, would exceed operational emissions thresholds for NOx even with implementation of mitigation due to emissions and exhaust from internal combustion engines used by construction equipment, therefore resulting in a significant and unavoidable operational impact.

The LST analysis included in Section 4.2 shows that the Project construction and operational emissions would not exceed the CAAQS for NO_2, CO, PM_{10}, and $PM_{2.5}$ or the 1-hour NO_2 NAAQS. Additionally, the Project would not result in on-road traffic volumes at affected intersections that would result in a CO hotspot. The cancer risk and noncancer risk at the nearby residents would not exceed the SCAQMD threshold of 10 in 1 million or chronic HI of 1.0, respectively, and impacts would also be less than significant.

Under Alternative 3, a new warehouse building comparable to the one under the proposed Project would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. Construction under Alternative 3 would therefore result in the same impacts as the proposed Project. Alternative 3 construction would exceed daily construction emissions thresholds for NOx and VOCs; however, implementation of mitigation would reduce NO_x and VOC emissions and impacts during Project construction would be less than significant**.**

Under Alternative 3, the new warehouse building on the K4 Parcel would be operated as a HCW, thereby resulting in fewer operational vehicle trips when compared to the proposed Project. Table 7-6 summarizes unmitigated and mitigated emissions associated with operation of Alternative 3.

Table 7-6
Alternative 3 Estimated Maximum Daily Operational Emissions
(pounds per day unmitigated)

	VOC [1]	NO_x	CO	SO_x	PM_{10} [2]	$PM_{2.5}$ [2]
Unmitigated Emissions						
Area source emissions [3]	16.3	< 0.1	0.1	< 0.1	< 0.1	< 0.1
Energy source emissions [3]	< 0.1	0.4	0.3	< 0.1	< 0.1	< 0.1
Mobile source emissions [4]	8.4	150	52	0.6	29	9.9
Combined total emissions	**24.7**	**151**	**53**	**0.6**	**29**	**9.9**
SCAQMD Pollutant threshold [5]	*55*	*55*	*550*	*150*	*150*	*55*
Threshold exceeded? [6]	**No**	**Yes**	**No**	**No**	**No**	**No**

	VOC [1]	NO_x	CO	SO_x	PM_{10} [2]	$PM_{2.5}$ [2]
Mitigated Emissions						
Area source emissions [3]	14.7	< 0.1	0.1	< 0.1	< 0.1	< 0.1
Energy source emissions [3]	< 0.1	0.4	0.3	< 0.1	< 0.1	< 0.1
Mobile source emissions [4]	8.4	150	52	0.6	29	9.9
SCAQMD Pollutant threshold [5]	**23.0**	**151**	**53**	**0.6**	**29**	**9.9**
Threshold exceeded? [6]	*55*	*55*	*550*	*150*	*150*	*55*
Threshold exceeded?	**No**	**Yes**	**No**	**No**	**No**	**No**

Source: Ramboll 2018a.
Notes:
1 For purposes of this analysis VOC emissions are assumed to be equal to ROG.
2 PM emissions for mobile sources are estimated as a sum of exhaust emissions, tire wear, brake wear, and entrained road dust.
3 Emissions estimated using CalEEMod®. Refer to Appendix C for CalEEMod® outputs.
4 Emissions were estimated emission factors from EMFAC2017 along with Project-specific vehicle trip rates prepared by Urban Crossroads in the K4 Parcel Alternatives Trip Generation Evaluation dated December 14, 2018.
5 SCAQMD Air Quality Significance Thresholds. Available at http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2. Accessed: August 2018.
6 Comparison of mitigated operational emissions against SCAQMD significance thresholds. Quantified mitigation measure includes the use of Super Compliant coatings with a VOC content less than 10 g/L VOC for architectural coatings.

Under Alternative 3, operational activities would be less intense than those associated with the proposed Project, thereby resulting in few vehicle trips and associated air emission reductions and energy emissions. However, under Alternative 3, emissions related to NO_x would remain at significant and unavoidable even with implementation of mitigation measures due to emissions and exhaust from internal combustion engines used by construction equipment. Therefore, operational emissions would be significant and unavoidable but slightly reduced when compared to the proposed Project.

Biological Resources

As discussed in Section 4.3, both the K4 Parcel and Cactus Channel Improvement Site provide suitable habitat for federal and state special-status plant and animal species. However, with implementation of mitigation, potentially significant impacts to smooth tarplant, Riverside fairy shrimp, vernal pool fairy shrimp, Stephen's Kangaroo Rat, burrowing owl, western spadefoot, orange-throated whiptail, San Diego black-tailed jackrabbit, northwestern San Diego pocket mouse, and Los Angeles pocket mouse can be reduced to less than significant levels. Additionally, there is the potential for the Project to affect special-status riparian vegetation communities and protected wetland communities; however, with implementation of mitigation, potential impacts can be reduced to less than significant levels. Finally, there is the potential for the Project to affect implementation of the MSCHP; however, with implementation of mitigation, all potential conflicts with the MSCHP would be reduced to less than significant impacts.

Under Alternative 3, the new warehouse building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented in the same manner as the proposed Project. As such, because construction would occur within the same footprint and operational activities

would be similar to those of the proposed Project, Alternative 3 would result in the same impacts as the proposed Project. As with the proposed Project, with implementation of mitigation, all impacts to biological resources under Alternative 3 would be reduced to less than significant levels.

Cultural Resources

As discussed in Section 4.4, with the incorporation of mitigation, the Project would have less-than-significant impacts associated with historical resources, archaeological resources, unique geologic features, and human remains. Impacts to cultural resources can be mitigated to less-than-significant levels by incorporating mitigation measures, and no significant adverse impacts would remain after mitigation.

Alternative 3 would result in the same impacts related to cultural resources because a comparable warehouse building would be constructed on the K4 Parcel, and the Cactus Channel improvements included within the proposed Project would still be implemented. As such, the same potential as the proposed Project exists to impact potential historical, paleontological, unique archaeological resources, or human remains. As with the proposed Project, implementation of mitigation measures for Alternative 3 would reduce potentially significant impacts to a less than significant level.

Geology and Soils

As discussed in Section 4.5, the implementation of the Project would not conflict with any applicable plan, policy, or regulation adopted for the purposes of mitigating hazards associated with geology and soils. The Project would have a less-than-significant impact associated with strong seismic ground shaking and seismic-related ground failure with incorporation of mitigation. Lastly, the proposed Project would result in less than significant impacts to unique paleontological resources with mitigation incorporated.

Alternative 3 would result in comparable impacts related to geology and soils because a similar warehouse building would be constructed on the K4 Parcel. Additionally, under Alternative 3, the proposed Cactus Channel improvements would be implemented. With incorporation of the recommendations included in the Geotechnical Exploration prepared for the Project (Appendix I1 and Appendix I2), which would also apply to the warehouse building constructed under Alternative 3, impacts related to risk of loss, injury, or death involving strong seismic ground shaking or seismic related ground failure would be less than significant and the same as those identified for the proposed Project.

Greenhouse Gas Emissions

As discussed in Section 4.6, the proposed Project would result in greenhouse gas (GHG) emissions that are primarily associated with use of off-road equipment and on-road construction and worker

vehicles during construction. Operation of the proposed Project would result in GHG emissions through energy use; motor vehicle trips to and from the proposed Project; generation of electricity associated with water supply, treatment, and distribution and wastewater treatment; and solid waste disposal. The Project would result in a less than significant impact associated with GHG emissions.

As provided in Appendix J, Alternative 3's total unmitigated and mitigated GHG emissions (including construction) would not exceed 3,000 MT carbon dioxide equivalent per year and thus would be considered less than significant in accordance with the Riverside County CAP. Furthermore, Alternative 3 would not need to complete the Riverside County's CAPs screening table. As Alternative 3 would only reduce the size of the project and not reduce any of the sustainable features of the proposed Project, Alternative 3 would be consistent with AB 32 as shown in detail in Table 4.6-4. Similar to the proposed Project, Alternative 3 would also be consistent with the March JPA General Plan Noise/Air Quality Element as provided in Table 4.6-5. Alternative 3 would also be consistent with SB 375 as it would add jobs consistent with the SCAG 2016 RTP/SCS projections in accordance with ARB's emissions reduction targets. Impacts would be less than significant.

Hazards and Hazardous Materials

As discussed in Section 4.7, with the implementation of mitigation, impacts to hazards related to air traffic and proximity to the March ARB Airport as a result of the Project can be mitigated to less-than-significant levels. The Project would be in compliance with the *Citizen's Brochure for the 452d Air Mobility Wing AICUZ Study*, *March ARB AICUZ*, and the *March ARB/Inland Port ALUCP*, and impacts would be less than significant. Therefore, no adverse significant impacts would remain after mitigation. Additionally, based on the Riverside County ALUCP noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the Riverside County ALUCP compatibility criteria, and no noise mitigation is required with typical building construction.

Under Alternative 3, the proposed warehouse building on the K4 Parcel would still be constructed, new employees would be introduced to a site within proximity of the March ARB, and there would still be the potential to encounter unexploded ordinance. Additionally, the Cactus Channel improvements would still be implemented under Alternative 3. The mitigation measures included for the proposed Project would remain applicable to Alternative 3, and as such, all potentially significant impacts could be reduced to less-than-significant levels. Given that the potential for Alternative 3 to result in similar hazards and hazardous materials impacts as the proposed Project, Alternative 3 would be comparable to the proposed Project with respect to impacts associated with hazards and hazardous materials.

Hydrology/Water Quality

As discussed in Section 4.8, the Project would have less-than-significant impacts associated with water quality standards, waste discharge requirements, increased runoff of pollutants, depletion of groundwater supplies, interference of groundwater recharge, altering existing drainage patterns, or degrading water quality. The Project would be in compliance with all applicable federal, state, and local rules and regulations regarding water quality and hydrology. In addition, implementation of (1) the SWPPP in conformance with the Construction General Permit, (2) the WQMP in compliance with the New Development & Redevelopment Guidelines for Projects Under the March JPA, and (3) proposed drainage design according to the *Riverside County Flood Control and Water Quality District Hydrology Manual* collectively ensure Project impacts on hydrology and water quality would be less than significant.

Under Alternative 3, a comparable warehouse building would be constructed on the K4 Parcel, and the proposed Cactus Channel improvements would still be implemented. As such, with implementation of the same building and Channel improvements, impacts associated with Alternative 3 would be the same as the proposed Project and would be less than significant.

Land Use and Planning

As described in Section 4.9, the K4 Parcel is currently designated Business Park (BP) within the March JPA General Plan Land Use Map (March JPA 2012). Under the proposed Project, the K4 Parcel would be re-designated as Industrial (IND) under the proposed General Plan amendment. Additionally, the K4 Parcel is not yet zoned and as part of the Project, the zoning designations of Industrial (IND) would be applied to the parcel. The proposed Project would also include the processing of a master plot plan and parcel merger. The Project would not cause a significant environmental impact due to a conflict with the goals and policies outlined in the March JPA General Plan, and impacts would be considered less than significant with mitigation incorporated. The Project is also in compliance with the March JPA Development Standards and impacts would be less than significant.

Under Alternative 3, the K4 Parcel would be developed with a comparable industrial warehouse building. This alternative would still require the processing of a General Plan amendment to designate the site as Industrial (IND), assign zoning of IND, approval of a master plot plan, and approval of a parcel merger. As such, given that the same land use entitlements would be required under Alternative 3 as the proposed Project, land use impacts under Alternative 3 would be comparable to those of the proposed Project and less than significant with the incorporation of mitigation measures.

Noise

As discussed in Section 4.10, the Project would result in less-than-significant impacts relative to temporary or permanent noise levels. Alternative 3 would result in the construction and operation of a comparable industrial warehouse building on the K4 Parcel and implementation of the Cactus Channel improvements. As such, Alternative 3 would result in the same noise impacts as the proposed Project and would continue to be less than significant.

Transportation

As discussed in Section 4.11, construction of the proposed Project would result in less-than-significant traffic impacts following implementation of mitigation requiring the preparation of a Construction Traffic Management Plan. While Project implementation has the potential to result in several traffic-related impacts, all traffic impacts can be reduced to less than significant levels with the exception of the following:

- **Overlook Parkway/Canyon Crest/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the south leg of the Overlook Parkway/Canyon Crest/Alessandro Boulevard, increasing intersection operations to LOS D and reducing Project impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard**. The Project shall pay its fair share towards the restriping of lanes and the modification of the traffic signal at the intersection of Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the southbound approach at the intersection of Sycamore Canyon Boulevard/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of City and County of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards the traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The intersection of Sycamore Canyon Boulevard/Alessandro Boulevard is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **I-215 Southbound Ramps/Cactus Avenue**. The intersection of I-215 southbound ramps/Cactus Avenue is anticipated to operate at LOS A during the AM peak hour and at LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **I-215 Northbound Ramps/Alessandro Boulevard**. The intersection of I-215 northbound ramps/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/Alessandro Boulevard**. The intersection of Old 215 Frontage Road/Alessandro Boulevard is anticipated to operate at LOS C with fair share contributions towards lane modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of Moreno Valley and the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 northbound ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal

modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **Elsworth Street/Alessandro Boulevard**. The intersection of Elsworth Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Frederick Street/Alessandro Boulevard**. The intersection of Frederick Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

Under Alternative 3, the K4 Parcel would be developed with a new warehouse building that would be the same size as the proposed Project and the same Cactus Channel improvements would be implemented. As such, construction traffic under Alternative 3 would be the same as the proposed Project. However, the new building constructed on the K4 Parcel would be utilized as a high-cube short-term storage warehouse under Alternative 3, compared to an e-commerce/fulfillment center under the proposed Project. Table 7-7 presents the overall vehicle trips under Alternative 3, and provides the difference and percent reductions when compared to the proposed Project.

Table 7-7
Alternative 3 Trip Generation Comparison and Summary

Land Use	Quantity	Units[1]	AM Peak Hour			PM Peak Hour			Daily
			In	*Out*	*Total*	*In*	*Out*	*Total*	
High-Cube Short-Term Warehouse	718.000	TSF							
Passenger Cars			31	9	40	16	40	56	682
Truck Trip									
2-axle:			2	1	3	1	2	3	54
3-axle:			3	1	4	1	2	3	67
4+-axle:			9	3	12	3	7	10	203
- Net Truck Trips (Actual)[2]			*14*	*5*	*19*	*5*	*11*	*16*	*324*
Alternative 2 Total Net Trips (Actual)[3]			*44*	*14*	*58*	*21*	*51*	*72*	*1,005*

Table 7-7
Alternative 3 Trip Generation Comparison and Summary

Land Use	Quantity	Units[1]	AM Peak Hour			PM Peak Hour			Daily
			In	*Out*	*Total*	*In*	*Out*	*Total*	
Project Net Trips (PCE)[3]			*327*	*98*	*425*	*275*	*708*	*983*	*5,873*
Variance (Alternative 2-Project)			**-283**	**-84**	**-367**	**-254**	**-657**	**-911**	**-4,868**

Source: Urban Crossroads 2018a.
Notes:
1 Trip Generation Source: ITE 2017.
2 TSF = Thousand Square Feet
3 TOTAL NET TRIPS (Actual Vehicles) = Passenger Cars + Net Truck Trips (Actual Trucks).

Under Alternative 3, a total of 4,868 fewer actual vehicle trips would occur when compared to the proposed Project. During the AM and PM peak hours, trips would also all be reduced when compared to the proposed Project, with a total of 367 fewer AM peak hour trips and a total of 911 fewer PM peak hour trips.

However, as with the proposed Project, since the required improvements to the street network are within the jurisdiction of another public agency and not the lead agency, impacts under Alternative 3 would be reduced when compared to the proposed Project but still remain significant and unavoidable.

Tribal Cultural Resources

As discussed in Section 4.12, Project implementation could have the potential to affect tribal cultural resources; however, with implementation of mitigation, potential impacts to tribal cultural resources would be reduced to less than significant levels. Alternative 3 would result in the construction of a comparable industrial warehouse building on the K4 Parcel and implementation of the Cactus Channel improvements. As such, the same potential to affect tribal cultural resources could occur under Alternative 3. However, as with the proposed Project, implementation of mitigation would reduce potentially significant impacts to tribal cultural resources. Alternative 3 would have the same impacts as the Project.

Utilities

As discussed in Section 4.13, the Project would result in less-than-significant impacts associated for water, wastewater, solid waste, and electric power, natural gas, and telecommunication services resulting in no need to develop new or improve existing facilities. Under Alternative 3, the K4 Parcel would be developed with a comparable industrial warehouse building and the proposed Cactus Channel improvements would be implemented. As such, operational activities would be comparable to those associated with the proposed Project.

Energy

As concluded in Section 4.14, there would be an increase in the amount of electricity, natural gas, and petroleum used during construction and operation of the Project; however, the Project includes features such as alternative modes of transportation that would help reduce the number of vehicle miles traveled generated by the Project operation. Additionally, bike racks would be installed so that employees can utilize biking as a mode of transportation, thus, reducing the amount of gasoline that would be consumed by Project operation. In addition, the Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. The Project would not contribute to inefficient or wasteful consumption of electricity, natural gas or petroleum, and impacts related to conflicts with existing energy standards would be less than significant. Further, the Project would not place significant demand on local or regional energy supplies or require a substantial amount of additional capacity. Therefore, impacts related to energy supplies and capacity would be less than significant.

Under Alternative 3, the construction schedule would be similar to that of the proposed Project and a comparable industrial warehouse building would be constructed on the K4 Parcel. Additionally, the same Cactus Channel improvements would be implemented under Alternative 3. As such, Alternative 3 would result in similar energy consumption to the proposed Project, and as such, similar energy impacts as the proposed Project.

Relationship to Project Objectives and Feasibility

Under Alternative 3, a comparable industrial warehouse building would be constructed on the K4 Parcel and the same Cactus Channel improvements would be implemented. Table 7-8 provides a list of the Project objectives and whether Alternative 3 meets each objective.

Table 7-8
Summary of Alternative 3 Success at Meeting Project Objectives

Project Objective	Alternative Meets Objective?
1. Provide appropriate land use intensities to comply with the parameters of the March Air Reserve Base/Inland Port Airport Compatibility Plan.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. The HCW warehouse use is consistent with the C1 Zone of the K4 Parcel and Alternative 3 would continue to provide fewer than 100 persons per acre as building occupants.
2. Implement the goals, objectives and policies of the March JPA General Plan at the K4 Parcel.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. The HCW use is consistent with, and would implement the goals, objectives and policies of the March JPA General Plan.

Table 7-8
Summary of Alternative 3 Success at Meeting Project Objectives

Project Objective	Alternative Meets Objective?
3. Provide increased job opportunities for local residents through the provision of employment-generating businesses.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel and would provide both temporary jobs during construction and permanent jobs during operations. However, under this alternative, fewer new permanent jobs would be provided when compared to the proposed Project.
4. Establish a land use and facility plan that ensures project viability in consideration of existing and anticipated economic conditions.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel. The flexibility associated with the HCW use would allow for Project viability both in the short- and long-term.
5. Develop the property with land uses that are compatible with the March ARB Reuse program.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. These would be consistent and compatible with the March ARB Reuse program.
6. Encourage the use of alternative modes of transportation through the provision of a pedestrian and bicycle circulation system that is both safe and comfortable.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. As part of the Alternative 3, roadway improvements on Cactus Avenue along the K4 Parcel frontage would be implemented, bicycle parking would be provided at the site, and a connection to the local transit system would be provided.
7. Provide a range of job types for the community's residents.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel and would provide both temporary jobs during construction and permanent jobs during operations. However, under this alternative, fewer new permanent jobs would be provided when compared to the proposed Project.
8. Provide a circulation system that facilitates movement and access needs of automobiles, pedestrians, and bicyclists.	**Yes.** Under Alternative 3, a HCW building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. As part of the Alternative 3, roadway improvements on Cactus Avenue along the K4 Parcel frontage would be implemented, bicycle parking would be provided at the site, and a connection to the local transit system would be provided.
9. Minimize impacts from construction of the development to sensitive biological resources.	**Yes.** While Alternative 3 would result in the implementation of a new HCW building on the K4 Parcel and the installation of an underground box culvert within the existing Cactus Channel, as with the proposed Project, mitigation would be implemented to minimize impacts to sensitive biological resources.
10. Minimize hazards to flight associated with the naturalized Cactus Channel drainage channel by undergrounding the drainage channel.	**Yes.** Under Alternative 3 the Cactus Channel improvements would be implemented thereby undergrounding the drainage channel and minimizing hazards to flight by reducing wildlife attractants.

7.4.4 Alternative 4 – High-Cube Parcel Hub Warehouse

Under Alternative 4 – High-Cube Parcel Hub Warehouse, the Project shell would be constructed on the K4 Parcel, and rather than operating as a High-Cube Fulfillment Center, which is characterized by a significant storage function and direct distribution of ecommerce product to end

uses, the building on the K4 Parcel would operate as a high-cube parcel hub warehouse. A high-cube parcel hub warehouse typically serves as a regional and local freight forwarder facility for time-sensitive shipments via airfreight and ground carriers. These sites also often include truck maintenance, wash and fueling facilities. Alternative 4 would require the same proposed General Plan Amendment, Zoning Designation, Master Plot Plan, Parcel Merger, and all other applicable pending approvals associated with the Project would not be necessary, as no new development would occur on the Project site that would trigger such actions. Under Alternative 4, improvements to the Cactus Avenue Drainage Channel (Cactus Channel) would also be completed.

High-Cube Parcel Hub Warehouse Alternative Environmental Impact Analysis

Aesthetics

As discussed in Section 4.1, the Project would have less-than-significant impacts associated with changes to existing visual character and quality of the Project site and light and glare.

Under Alternative 4, the K4 Parcel would still be developed with a new warehouse building of comparable size, and the Cactus Channel improvements would be constructed underground within the existing depressed Channel. The visual character of the K4 Parcel would be the same as under the proposed Project, and as with the Project's proposed Cactus Channel improvements, the improvements would not be visible. Therefore, because the building on the K4 Parcel would be the same under Alternative 4 as the proposed Project, impacts would be comparable to those of the proposed Project and remain less than significant.

Air Quality

As discussed in Section 4.2, daily construction emissions would not exceed the SCAQMD's significance thresholds for CO, SOx, PM_{10}, or $PM_{2.5}$ during construction of the Project in any of the construction years. The Project would exceed daily construction emissions thresholds for NOx and VOCs; however, implementation of mitigation would reduce NO_x and VOC emissions and impacts during Project construction would be less than significant**.** The Project's operational emissions would not exceed the SCAQMD's significance threshold for VOCs, CO, SOx, PM_{10}, and $PM_{2.5}$. The Project, however, would exceed operational emissions thresholds for NOx even with implementation of mitigation due to emissions and exhaust from internal combustion engines used by construction equipment, therefore resulting in a significant and unavoidable operational impact.

The LST analysis included in Section 4.2 shows that the Project construction and operational emissions would not exceed the CAAQS for NO_2, CO, PM_{10}, and $PM_{2.5}$ or the 1-hour NO_2 NAAQS. Additionally, the Project would not result in on-road traffic volumes at affected intersections that would result in a CO hotspot. The cancer risk and noncancer risk at the nearby

residents would not exceed the SCAQMD threshold of 10 in 1 million or chronic HI of 1.0, respectively, and impacts would also be less than significant.

Under Alternative 4, a new warehouse building comparable to the one under the proposed Project would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. Construction under Alternative 4 would therefore result in the same impacts as the proposed Project. Alternative 4 construction would exceed daily construction emissions thresholds for NOx and VOCs; however, implementation of mitigation would reduce NO_x and Under Alternative 4, the new warehouse building on the K4 Parcel would be operated as a high-cube parcel hub warehouse, thereby resulting in more operational vehicle trips when compared to the proposed Project. Table 7-9 summarizes unmitigated and mitigated emissions associated with operation of Alternative 4.

Table 7-9
Alternative 4 Estimated Maximum Daily Operational Emissions
(pounds per day unmitigated)

	VOC [1]	NO_x	CO	SO_x	PM_{10} [2]	$PM_{2.5}$ [2]
Unmitigated Emissions						
Area source emissions [3]	16.3	< 0.1	0.1	< 0.1	< 0.1	< 0.1
Energy source emissions [3]	< 0.1	0.4	0.3	< 0.1	< 0.1	< 0.1
Mobile source emissions [4]	51.2	970	304	3.5	174	60.7
Combined total emissions	**67.6**	**970**	**305**	**3.5**	**174**	**60.7**
SCAQMD Pollutant threshold [5]	*55*	*55*	*550*	*150*	*150*	*55*
Threshold exceeded? [6]	**Yes**	**Yes**	**No**	**No**	**Yes**	**Yes**
Mitigated Emissions						
Area source emissions [3]	14.7	< 0.1	0.1	< 0.1	< 0.1	< 0.1

Source: Ramboll 2018b.
Note:
1 For purposes of this analysis VOC emissions are assumed to be equal to ROG.
2 PM emissions for mobile sources are estimated as a sum of exhaust emissions, tire wear, brake wear, and entrained road dust.
3 Emissions estimated using CalEEMod®. Refer to Appendix C for CalEEMod® outputs.
4 Emissions were estimated emission factors from EMFAC2017 along with Project-specific vehicle trip rates prepared by Urban Crossroads in the K4 Parcel Alternatives Trip Generation Evaluation dated December 14, 2018.
5 SCAQMD Air Quality Significance Thresholds. Available at http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2. Accessed: August 2018.
6 Comparison of mitigated operational emissions against SCAQMD significance thresholds. Quantified mitigation measure includes the use of Super Compliant coatings with a VOC content less than 10 g/L VOC for architectural coatings.

Under Alternative 4, operational activities would be more intense than those associated with the proposed Project, thereby resulting in more vehicle trips and associated air emissions and energy

emissions. Under Alternative 4, emissions related to VOCs, NO_x, PM_{10} and $PM_{2.5}$would remain at significant and unavoidable even with implementation of mitigation measures due to emissions and exhaust from internal combustion engines used by construction equipment. Therefore, operational emissions would be significant and unavoidable and increased when compared to the proposed Project.

Biological Resources

As discussed in Section 4.3, both the K4 Parcel and Cactus Channel Improvement Site provide suitable habitat for federal and state special-status plant and animal species. However, with implementation of mitigation, potentially significant impacts to smooth tarplant, Riverside fairy shrimp, vernal pool fairy shrimp, Stephen's Kangaroo Rat, burrowing owl, western spadefoot, orange-throated whiptail, San Diego black-tailed jackrabbit, northwestern San Diego pocket mouse, and Los Angeles pocket mouse can be reduced to less than significant levels. Additionally, there is the potential for the Project to affect special-status riparian vegetation communities and protected wetland communities; however, with implementation of mitigation, potential impacts can be reduced to less than significant levels. Finally, there is the potential for the Project to affect implementation of the MSCHP; however, with implementation of mitigation, all potential conflicts with the MSCHP would be reduced to less than significant impacts.

Under Alternative 4, the new warehouse building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented in the same manner as the proposed Project. As such, because construction would occur within the same footprint and operational activities would be similar to those of the proposed Project, Alternative 4 would result in the same impacts as the proposed Project. As with the proposed Project, with implementation of mitigation, all impacts to biological resources under Alternative 4 would be reduced to less than significant levels.

Cultural Resources

As discussed in Section 4.4, with the incorporation of mitigation, the Project would have less-than-significant impacts associated with historical resources, archaeological resources, unique geologic features, and human remains. Impacts to cultural resources can be mitigated to less-than-significant levels by incorporating mitigation measures, and no significant adverse impacts would remain after mitigation.

Alternative 4 would result in the same impacts related to cultural resources because a comparable warehouse building would be constructed on the K4 Parcel, and the Cactus Channel improvements included within the proposed Project would still be implemented. As such, the same potential as the proposed Project exists to impact potential historical, paleontological, unique archaeological resources, or human remains. As with the proposed Project, implementation of mitigation measures for Alternative 4 would reduce potentially significant impacts to a less than significant level.

Geology and Soils

As discussed in Section 4.5, the implementation of the Project would not conflict with any applicable plan, policy, or regulation adopted for the purposes of mitigating hazards associated with geology and soils. The Project would have a less-than-significant impact associated with strong seismic ground shaking and seismic-related ground failure with incorporation of mitigation. Lastly, the proposed Project would result in less than significant impacts to unique paleontological resources with mitigation incorporated.

Alternative 4 would result in comparable impacts related to geology and soils because a similar warehouse building would be constructed on the K4 Parcel. Additionally, under Alternative 4, the proposed Cactus Channel improvements would be implemented. With incorporation of the recommendations included in the Geotechnical Exploration prepared for the Project (Appendix I1 and Appendix I2), which would also apply to the warehouse building constructed under Alternative 4, impacts related to risk of loss, injury, or death involving strong seismic ground shaking or seismic related ground failure would be less than significant and the same as those identified for the proposed Project.

Greenhouse Gas Emissions

As discussed in Section 4.6, the proposed Project would result in GHG emissions that are primarily associated with use of off-road equipment and on-road construction and worker vehicles during construction. Operation of the proposed Project would result in GHG emissions through energy use; motor vehicle trips to and from the proposed Project; generation of electricity associated with water supply, treatment, and distribution and wastewater treatment; and solid waste disposal. The Project would result in a less-than-significant impact associated with GHG emissions.

As provided in Appendix J, Alternative 4's total unmitigated GHG emissions (including construction) would exceed 3,000 MT carbon dioxide equivalent per year and thus would be required to complete the Riverside County's CAPs screening table. All sustainable design features outlined in Section 4.6 for the proposed Project would remain for Alternative 4. Therefore, Alternative 4 would exceed the 100-point minimum using the CAP screening tables and would be consistent with the CAP. As Alternative 4 would only reduce the size of the project and not reduce any of the sustainable features of the proposed Project, Alternative 4 would be consistent with AB 32 as shown in detail in Table 4.6-4. Similar to the proposed Project, Alternative 4 would also be consistent with the March JPA General Plan Noise/Air Quality Element as provided in Table 4.6-5. Alternative 4 would also be consistent with SB 375 as it would add jobs consistent with the SCAG 2016 RTP/SCS projections in accordance with ARB's emissions reduction targets. Impacts would be less than significant.

Hazards and Hazardous Materials

As discussed in Section 4.7, with the implementation of mitigation, impacts to hazards related to air traffic and proximity to the March ARB Airport as a result of the Project can be mitigated to less-than-significant levels. The Project would be in compliance with the *Citizen's Brochure for the 452d AICUZ Study*, *March ARB AICUZ*, and the *March ARB/Inland Port ALUCP*, and impacts would be less than significant. Therefore, no adverse significant impacts would remain after mitigation. Additionally, based on the Riverside County ALUCP noise level contours for the March ARB/IPA, the Project represents a normally acceptable land use based on the Riverside County ALUCP compatibility criteria, and no noise mitigation is required with typical building construction.

Under Alternative 4, the proposed warehouse building on the K4 Parcel would still be constructed, new employees would be introduced to a site within proximity of the March ARB, and there would still be the potential to encounter unexploded ordinance. Additionally, the Cactus Channel improvements would still be implemented under Alternative 4.

There is the potential that within Alternative 4, there could be a truck maintenance facility. While certain chemicals and materials could be utilized at a truck maintenance facility that are different than those previously considered under the proposed use of the site, use of these chemicals would be regulated and material health, safety and protocol plans, as legally required, would be established. Section 9.08.090 of the March JPA Development Code requires that commercial and industrial uses which receive, utilize, store, transport, or dispose of hazardous waste in quantities exceeding 500 pounds at one time, shall have access to sewer and freeways, and shall keep such materials at least 2,000 feet from residential areas. In addition, the Applicant would be required to provide the Fire Department with a list of hazardous materials to be used at the site, a description of where and how each is stored, and how each react in a fire. Placards or other appropriate signage shall be placed on all buildings which have hazardous materials or wastes stored. March JPA prohibits discharge of hazardous wastes into the air, land, or into water resources within March JPA Planning Area and requires the preparation of a hazardous materials and waste management plan for any commercial and industrial uses which create, utilize, store, or treat hazardous materials or waste. The plan shall be subject to approval by the March JPA Planning Director, review by the Police Department and shall outline source reduction, treatment, handling, transportation, disposal, emergency response, and employee training methods. Further, uses which involve hazardous waste, shall implement the best available technology for on-site pre-treatment and reduction of hazardous wastes, whenever feasible (March JPA 2016). Additionally, the County of Riverside Ordinance 651.4 requires disclosure where businesses handle hazardous materials and the acquisition of a permit issued by the Department of Environmental Health for any owner or operator of a business where hazardous materials are handled. The Project Applicant would ensure compliance with the regulations set forth by March JPA and the County of Riverside. As such, no

new or more severe hazardous impacts would occur than those previously evaluated in past environmental documents prepared for the March Business Center Specific Plan.

Therefore, through compliance with the same mitigation measures imposed on the proposed Project as well as compliance with existing regulations, all potentially significant impacts associated with Alternative 4 could be reduced to less-than-significant levels. Given that the potential for Alternative 4 to result in similar hazards and hazardous materials impacts as the proposed Project, Alternative 4 would be comparable to the proposed Project with respect to impacts associated with hazards and hazardous materials.

Hydrology/Water Quality

As discussed in Section 4.8, the Project would have less-than-significant impacts associated with water quality standards, waste discharge requirements, increased runoff of pollutants, depletion of groundwater supplies, interference of groundwater recharge, altering existing drainage patterns, or degrading water quality. The Project would be in compliance with all applicable federal, state, and local rules and regulations regarding water quality and hydrology. In addition, implementation of (1) the SWPPP in conformance with the Construction General Permit, (2) the WQMP in compliance with the New Development & Redevelopment Guidelines for Projects Under the March JPA, and (3) proposed drainage design according to the *Riverside County Flood Control and Water Quality District Hydrology Manual* collectively ensure Project impacts on hydrology and water quality would be less than significant.

Under Alternative 4, a comparable warehouse building would be constructed on the K4 Parcel, and the proposed Cactus Channel improvements would still be implemented. There is the potential that as a part of Alternative 4, a truck maintenance area could be included in the alternative. According to Section 402 of the Clean Water Act (CWA), a National Pollutant Discharge Elimination System (NPDES) permit is required for the discharge of any pollutant (except for dredged or fill material) into waters of the United States. This permit program is administered by the State Water Resources Control Board with assistance and local oversight from the nine Regional Water Quality Control Boards, who have several programs that implement individual and general permits related to construction activities, stormwater runoff quality, and various kinds of non-stormwater discharges. Alternative 4 would be constructed and operated in compliance with CWA Section 402. Further, and in compliance with NPDES – New Development & Redevelopment Guidelines for Projects under the March JPA and the Riverside County Municipal Separate Storm Sewer System (MS4), the Applicant would ensure the reduction of pollutants in urban stormwater discharge to the maximum extent practicable through the use of structural and nonstructural BMPs to manage runoff water. In compliance with the March JPA General Plan, Alternative 4 would ensure that stormwater runoff is not diverted onto adjacent properties, or cause

alterations of natural drainage courses that cannot be adequately handled by existing drainage facilities or the flood control improvements proposed with the development.

As such, with implementation of the same building and Channel improvements and compliance with existing regulations, impacts associated with Alternative 4 would be the same as the proposed Project and would be less than significant.

Land Use and Planning

As described in Section 4.9, the K4 Parcel is currently designated Business Park (BP) within the March JPA General Plan Land Use Map (March JPA 2012). Under the proposed Project, the K4 Parcel would be re-designated as Industrial (IND) under the proposed General Plan amendment. Additionally, the K4 Parcel is not yet zoned and as part of the Project, the zoning designations of Industrial (IND) would be applied to the parcel. The proposed Project would also include the processing of a master plot plan and parcel merger. The Project would not cause a significant environmental impact due to a conflict with the goals and policies outlined in the March JPA General Plan, and impacts would be considered less than significant with mitigation incorporated. The Project is also in compliance with the March JPA Development Standards and impacts would be less than significant.

Under Alternative 4, the K4 Parcel would be developed with a comparable industrial warehouse building. This alternative would still require the processing of a General Plan amendment to designate the site as Industrial (IND), assign zoning of IND, approval of a master plot plan, and approval of a parcel merger. As such, given that the same land use entitlements would be required under Alternative 4 as the proposed Project, land use impacts under Alternative 4 would be comparable to those of the proposed Project and less than significant with the incorporation of mitigation measures.

Noise

As discussed in Section 4.10, the Project would result in less-than-significant impacts relative to temporary or permanent noise levels. Alternative 4 would result in the construction and operation of a comparable industrial warehouse building on the K4 Parcel and implementation of the Cactus Channel improvements. As such, Alternative 4 would result in the same noise impacts as the proposed Project and would continue to be less than significant.

Transportation

As discussed in Section 4.11, construction of the proposed Project would result in less-than-significant traffic impacts following implementation of mitigation requiring the preparation of a Construction Traffic Management Plan. While Project implementation has the potential to result

in several traffic-related impacts, all traffic impacts can be reduced to less than significant levels with the exception of the following:

- **Overlook Parkway/Canyon Crest/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the south leg of the Overlook Parkway/Canyon Crest/Alessandro Boulevard, increasing intersection operations to LOS D and reducing Project impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard**. The Project shall pay its fair share towards the restriping of lanes and the modification of the traffic signal at the intersection of Overlook Parkway/Canyon Crest Drive/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The Project shall pay its fair share towards the elimination of the pedestrian crosswalk on the southbound approach at the intersection of Sycamore Canyon Boulevard/Alessandro Boulevard, increasing intersection operations to LOS D and reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of City and County of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards the traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Sycamore Canyon Boulevard/Alessandro Boulevard**. The intersection of Sycamore Canyon Boulevard/Alessandro Boulevard is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impacts to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction

of the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **I-215 Southbound Ramps/Cactus Avenue**. The intersection of I-215 southbound ramps/Cactus Avenue is anticipated to operate at LOS A during the AM peak hour and at LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **I-215 Northbound Ramps/Alessandro Boulevard**. The intersection of I-215 northbound ramps/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS B during the PM peak hour, thus reducing the Project's contribution to cumulative impact to less than significant. These improvements are included in the TUMF program. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/Alessandro Boulevard**. The intersection of Old 215 Frontage Road/Alessandro Boulevard is anticipated to operate at LOS C with fair share contributions towards lane modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdictions of Moreno Valley and the City of Riverside, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Old 215 Frontage Road/I-215 Northbound Ramps/Cactus Avenue**. The intersection of Old 215 Frontage Road/I-215 northbound ramps/Cactus Avenue is anticipated to operate at LOS D with fair share contributions towards lane and traffic signal modifications, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of Caltrans, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.
- **Elsworth Street/Alessandro Boulevard**. The intersection of Elsworth Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

- **Frederick Street/Alessandro Boulevard**. The intersection of Frederick Street/Alessandro Boulevard is anticipated to operate at LOS C during the AM peak hour and LOS D during the PM peak hour with fair share contributions towards lane improvements, thus reducing the Project's contribution to cumulative impact to less than significant. However, since the improvement is within the jurisdiction of the City of Moreno Valley, and March JPA does not have the authority to implement the mitigation, the impact is considered significant and unavoidable.

Under Alternative 4, the K4 Parcel would be developed with a new warehouse building that would be the same size as the proposed Project and the same Cactus Channel improvements would be implemented. As such, construction traffic under Alternative 4 would be the same as the proposed Project. However, the new building constructed on the K4 Parcel would be utilized as a high-cube parcel hub warehouse under Alternative 4, compared to an e-commerce/fulfillment center under the proposed Project. Table 7-10 presents the overall vehicle trips under Alternative 4, and provides the difference and percent reductions when compared to the proposed Project.

Table 7-10
Alternative 4 Trip Generation Comparison and Summary

Land Use	Quantity	Units[1]	AM Peak Hour			PM Peak Hour			Daily
			In	*Out*	*Total*	*In*	*Out*	*Total*	
High-Cube Short-Term Warehouse	718.000	TSF							
Passenger Cars			126	126	252	221	104	325	3,467
Truck Trip									
2-axle:			21	21	42	15	7	22	350
3-axle:			26	26	52	19	9	28	434
4+-axle:			78	78	156	57	27	84	1,313
- Net Truck Trips (Actual)[2]			*125*	*125*	*250*	*91*	*43*	*134*	*2,098*
Alternative 2 Total Net Trips (Actual)[3]			*251*	*251*	*502*	*312*	*147*	*459*	*5,565*
Project Net Trips (PCE)[3]			*327*	*98*	*425*	*275*	*708*	*983*	*5,873*
Variance (Alternative 2-Project)			**-76**	**153**	**77**	**37**	**-561**	**-524**	**-309**

Source: Urban Crossroads 2018b.
Notes:
1 Trip Generation Source: ITE 2017.
2 TSF = Thousand Square Feet
3 TOTAL NET TRIPS (Actual Vehicles) = Passenger Cars + Net Truck Trips (Actual Trucks).

Under Alternative 4, a total of 309 fewer actual vehicle trips would occur when compared to the proposed Project. However, during the AM peak hour, trips would be increased when compared to the proposed Project. A total of 77 more AM peak our trips would occur under Alternative 4. During the PM peak hour, however, a total of 524 fewer trips would occur under Alternative 4 when compared to the proposed Project.

However, as with the proposed Project, since the required improvements to the street network are within the jurisdiction of another public agency and not the lead agency, impacts under Alternative 4 would be reduced when compared to the proposed Project but still remain significant and unavoidable.

Tribal Cultural Resources

As discussed in Section 4.12, Project implementation could have the potential to affect tribal cultural resources; however, with implementation of mitigation, potential impacts to tribal cultural resources would be reduced to less than significant levels. Alternative 4 would result in the construction of a comparable industrial warehouse building on the K4 Parcel and implementation of the Cactus Channel improvements. As such, the same potential to affect tribal cultural resources could occur under Alternative 4. However, as with the proposed Project, implementation of mitigation would reduce potentially significant impacts to tribal cultural resources. Alternative 4 would have the same impacts as the Project.

Utilities

As discussed in Section 4.13, the Project would result in less-than-significant impacts associated for water, wastewater, solid waste, and electric power, natural gas, and telecommunication services resulting in no need to develop new or improve existing facilities. Under Alternative 4, the K4 Parcel would be developed with a comparable industrial warehouse building and the proposed Cactus Channel improvements would be implemented. As such, operational activities would be comparable to those associated with the proposed Project.

Energy

As concluded in Section 4.14, there would be an increase in the amount of electricity, natural gas, and petroleum used during construction and operation of the Project; however, the Project includes features such as alternative modes of transportation that would help reduce the number of vehicle miles traveled generated by the Project operation. Additionally, bike racks would be installed so that employees can utilize biking as a mode of transportation, thus, reducing the amount of gasoline that would be consumed by Project operation. In addition, the Project is subject to statewide mandatory energy requirements as outlined in Title 24, Part 6, of the California Code of Regulations. Title 24, Part 11, contains voluntary energy measures that are applicable to Project under the California Green Building Standards Code. The Project would not contribute to inefficient or wasteful consumption of electricity, natural gas or petroleum, and impacts related to conflicts with existing energy standards would be less than significant. Further, the Project would not place significant demand on local or regional energy supplies or require a substantial amount of additional capacity. Therefore, impacts related to energy supplies and capacity would be less than significant.

Under Alternative 4, the construction schedule would be similar to that of the proposed Project and a comparable industrial warehouse building would be constructed on the K4 Parcel. Additionally, the same Cactus Channel improvements would be implemented under Alternative 4. As such, Alternative 4 would result in similar energy consumption to the proposed Project, and as such, similar energy impacts as the proposed Project.

Relationship to Project Objectives and Feasibility

Under Alternative 4, a comparable industrial warehouse building would be constructed on the K4 Parcel and the same Cactus Channel improvements would be implemented. Table 7-11 provides a list of the Project objectives and whether Alternative 4 meets each objective.

Table 7-11
Summary of Alternative 4 Success at Meeting Project Objectives

Project Objective	Alternative Meets Objective?
1. Provide appropriate land use intensities to comply with the parameters of the March Air Reserve Base/Inland Port Airport Compatibility Plan.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. The HCW warehouse use is consistent with the C1 Zone of the K4 Parcel and Alternative 4 would continue to provide fewer than 100 persons per acre as building occupants.
2. Implement the goals, objectives and policies of the March JPA General Plan at the K4 Parcel.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. The high-cube warehouse parcel hub use is consistent with, and would implement the goals, objectives and policies of the March JPA General Plan.
3. Provide increased job opportunities for local residents through the provision of employment-generating businesses.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel and would provide both temporary jobs during construction and permanent jobs during operations. However, under this alternative, fewer new permanent jobs would be provided when compared to the proposed Project.
4. Establish a land use and facility plan that ensures project viability in consideration of existing and anticipated economic conditions.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel. The flexibility associated with the high-cube warehouse parcel hub use would allow for Project viability both in the short- and long-term.
5. Develop the property with land uses that are compatible with the March ARB Reuse program.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. These would be consistent and compatible with the March ARB Reuse program.
6. Encourage the use of alternative modes of transportation through the provision of a pedestrian and bicycle circulation system that is both safe and comfortable.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. As part of the Alternative 4, roadway improvements on Cactus Avenue along the K4 Parcel frontage would be implemented, bicycle parking would be provided at the site, and a connection to the local transit system would be provided.

Table 7-11
Summary of Alternative 4 Success at Meeting Project Objectives

Project Objective	Alternative Meets Objective?
7. Provide a range of job types for the community's residents.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel and would provide both temporary jobs during construction and permanent jobs during operations. However, under this alternative, fewer new permanent jobs would be provided when compared to the proposed Project.
8. Provide a circulation system that facilitates movement and access needs of automobiles, pedestrians, and bicyclists.	**Yes.** Under Alternative 4, a high-cube warehouse parcel hub building would be constructed on the K4 Parcel and the Cactus Channel improvements would be implemented. As part of the Alternative 4, roadway improvements on Cactus Avenue along the K4 Parcel frontage would be implemented, bicycle parking would be provided at the site, and a connection to the local transit system would be provided.
9. Minimize impacts from construction of the development to sensitive biological resources.	**Yes.** While Alternative 4 would result in the implementation of a new high-cube warehouse parcel hub building on the K4 Parcel and the installation of an underground box culvert within the existing Cactus Channel, as with the proposed Project, mitigation would be implemented to minimize impacts to sensitive biological resources.
10. Minimize hazards to flight associated with the naturalized Cactus Channel drainage channel by undergrounding the drainage channel.	**Yes.** Under Alternative 4 the Cactus Channel improvements would be implemented thereby undergrounding the drainage channel and minimizing hazards to flight by reducing wildlife attractants.

7.5 EVALUATION OF ALTERNATIVES

In accordance with the CEQA Guidelines Section 15126.6(d), the discussion of the environmental effects of the alternatives may be less detailed than the discussion of the impacts of the Project. Table 7-1, above, provides a summary of the comparison of the impacts of the alternatives with the Project; an analysis of the Environmentally Superior Alternative is provided in Section 7.6, below.

7.6 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

As indicated in Table 7-1, above, Alternative 1, the No Project Alternative, would result in the least environmental impacts, and therefore would be considered the Environmentally Superior Alternative. However, Section 15126.6(e)(2) of the CEQA Guidelines states that if the Environmentally Superior Alternative is the No Project Alternative, the EIR shall also identify an Environmentally Superior Alternative among the other alternatives.

Of the alternatives evaluated above, Alternative 2 was found to be environmentally superior over the Project (see Table 7-1) because it had the most reductions in impacts from the Project. Alternative 2 was found to have fewer environmental impacts for each environmental issue area, with the exception of land use and planning, when compared to the proposed Project. Additionally, Alternative 2 achieves most of the Project objectives, as outlined in detail in Table 7-5. However,

as with the proposed Project, identified significant and unavoidable impacts associated with air quality and transportation would remain under Alternative 2.

CHAPTER 8
GROWTH-INDUCING IMPACTS

8.1 GROWTH-INDUCING IMPACTS

Section 15126.2(d) of the California Environmental Quality Act (CEQA) Guidelines requires a discussion of how the potential growth-inducing impacts of the proposed K4 Warehouse and Cactus Channel Improvements Project (proposed Project or Project) could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Induced growth is distinguished from the direct employment, population, or housing growth of a project (14 CCR 15000 et seq.). If a project has characteristics that "may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively," then these aspects of the project must be discussed as well. Induced growth is any growth that exceeds planned growth and results from new development that would not have taken place in the absence of that project. Typically, the growth-inducing potential of a project is considered significant if it stimulates population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities, such as the Southern California Association of Governments (SCAG).

The CEQA Guidelines also indicate that growth should not be assumed to be either beneficial or detrimental (14 CCR 15126.2(d)). According to Section 15126.2(d) of the CEQA Guidelines, a project may foster economic or population growth, or additional housing, either indirectly or directly, in a geographical area if it meets any one of the following criteria:

- The project would remove obstacles to population growth.
- Increases in the population may tax existing community service facilities, causing significant environmental effects.
- The project would encourage and facilitate other activities that could significantly affect the environment.

The Project would involve the construction of an approximately 718,000-square-foot warehouse development for future e-commerce/fulfillment center use on an approximately 35.4-acre site. Additionally, the Project would involve the undergrounding of the existing Cactus Avenue Drainage Channel (Cactus Channel) which runs along the south side of Cactus Avenue between Elsworth Street to the west and the Heacock Channel to the east. The Project site is surrounded by a mix of commercial, industrial, air reserve base, and vacant lands. The Project would not involve the development of additional housing. However, the Project would require the hire of temporary construction workers during construction activities and part-time/full-time employees during Project operations.

At the time this Environmental Impact Report (EIR) was prepared, the future tenant(s) of the proposed e-commerce/fulfillment center warehouse building had not yet been identified. For the purposes of CEQA and to ensure full disclosure on all potential allowable uses within the proposed Industrial (IND) lots, this assessment assumes a total of 900 jobs would result with implementation of the Project. Because the tenant is not yet known, the number of jobs that the Project would generate is based off the Institute of Transportation Engineers *Trip Generation Manual* (ITE 2017) and the Institute of Transportation Engineers trip generation rates for the Project in order to be consistent with the traffic impact analysis.

According to the SCAG Growth Forecast (Appendix to the *2016–2040 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS); SCAG 2016a), employment is anticipated to grow from 70,500 in 2012 to 156,600 in 2040 in unincorporated Riverside County (SCAG 2016a). The Project lies entirely within Traffic Analysis Zone (TAZ) 43268200. The 2016 RTP/SCS projects that within TAZ 43268200, there will be a total of 8,755 jobs by 2020 and 22,196 by 20451. As of 2016, there are 4,531 jobs in the March JPA jurisdiction. This allows the creation of 4,224 jobs between 2016 and 2020, and 17,665 jobs between 2016 and 2045. Adding jobs consistent with 2016 RTP/SCS projections supports SCAG's achievement of March Air Reserve Base emissions reductions targets.

The SCS also indicates that this is a jobs poor area so providing more jobs will actually reduce greenhouse gas emissions and reduce vehicle miles traveled as it will provide local jobs to achieve a more favorable jobs housing balance. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities.

Indirect growth can also occur by a Project installing infrastructure that can support further growth. The Project site is served by existing public services and utilities, and no new off-site utility systems would be needed in order to serve the Project. Regional improvements to Cactus Channel are a minor infrastructure improvement that would function as part of the existing Riverside County Flood Control and Water Conservation District's Master Plan. Therefore, indirect growth inducement as a result of the extension of these facilities into a new area would not occur.

Overall, the Project would indirectly stimulate population growth through the addition of new employees. However, the growth would be consistent with employment growth envisioned in local and regional land use plans and in projections made by regional planning authorities, since the planned growth of the Project and its land use intensity have been factored into the underlying growth projections of the SCAG 2016–2040 RTP/SCS.

[1] Jobs data provided by March JPA.

8.2 SCAG'S 2016–2040 RTP/SCS CONSISTENCY ANALYSIS

SCAG's Regional Council recently adopted the 2016–2040 RTP/SCS in April 2016 (SCAG 2016b). The 2016–2040 RTP/SCS links the goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption, promoting transportation-friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic, and commercial limitations. The goals in SCAG's RTP/SCS are meant to provide guidance for considering the Project within the context of regional goals and policies. Table 8-1 provides an assessment of the Project's relationship to SCAG's RTP/SCS goals.

Table 8-1
Consistency with SCAG's 2016–2040 RTP/SCS Goals

RTP/SCS Goal	Project's Consistency
RTP/SCS G1: Align the plan investments and policies with improving regional economic development and competiveness.	**Consistent**: Development of the Project would increase the property value of the site and would provide temporary jobs during short-term construction and permanent jobs during Project operations. Development of the Project may also provide goods distribution to and from the ports and regional area.
RTP/SCS G2: Maximize mobility and accessibility for all people and goods in the region.	**Consistent**: The Project would locate an industrial warehouse building within proximity to the Interstate (I) 215 and would also include circulation improvements, including vehicular (e.g., cul-de-sac), pedestrian (e.g., sidewalks) and bicycle (e.g., bicycle lane) infrastructure which would foster the efficient movement of people and goods throughout the Project area and the region as a whole.
RTP/SCS G3: Ensure travel safety and reliability for all people and goods in the region.	**Consistent:** The Project would include traffic improvements (e.g., cul-de-sac), pedestrian (e.g., sidewalks), and bicycle (e.g., bicycle lane) infrastructure that would be designed and constructed to meet applicable safety requirements and design standards as required by applicable jurisdiction (e.g., County of Riverside, California Department of Transportation), which would ensure the travel safety and reliability are maximized.
RTP/SCS G4: Preserve and ensure a sustainable regional transportation system.	**Consistent:** The Project would be required to construct on-site and off-site traffic system improvements and pay applicable fair-share contributions to local and regional off-site improvements in order to mitigate Project-related traffic impacts. As such, with implementation of applicable improvements, the Project would not hinder the preservation or sustainability of the regional transportation system.
RTP/SCS G5: Maximize the productivity of our transportation system.	**Consistent:** As noted above, the Project would either construct traffic improvements or pay applicable fair-share contributions to help fund additional improvements, which would reduce the Project's impact on, and maximize the productivity of, the region's transportation system.
RTP/SCS G6: Protect the environment and health for our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking).	**Consistent:** The Project area includes a network of commuter rail, pedestrian and bicycle-related facilities and bus transit that offer non-vehicular transportation options within the Project area.

Table 8-1
Consistency with SCAG's 2016–2040 RTP/SCS Goals

RTP/SCS Goal	Project's Consistency
RTP/SCS G7: Actively encourage and create incentives for energy efficiency, where possible.	**Consistent:** The Project would include eleven on-site electric vehicle (EV) charging stations and 54 off-site EV charging stations for at least 5% of all vehicle parking spaces.
RTP/SCS G8: Encourage land use and growth patterns that facilitate transit and active transportation.	**Consistent:** The Project would include on-site and off-site traffic improvements (e.g., cul-de-sac); pedestrian (e.g., sidewalks) and bicycle (e.g., bicycle lane) infrastructure; and would pay applicable fair-share contributions to local and regional off-site improvements in order to mitigate Project-related traffic impacts.
RTP/SCS G9: Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.	**Not applicable**: This goal relates to SCAG's ongoing efforts to maintain security within the regional transportation system, which would not be affected by the Project.

Source: SCAG 2016b.
Notes: RTP = Regional Transportation Plan; SCS = Sustainable Communities Strategy; SCAG = Southern California Association of Governments.

The analysis in Table 8-1 concludes that the Project would be consistent with the applicable RTP/SCS goals. Therefore, implementation of the Project would not result in significant impacts related to relevant RTP/SCS goals which are designed to manage growth on a regional basis.

Notice of Preparation of a Draft Environmental Impact Report

Notice of Public Scoping Meeting

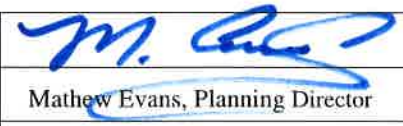
TO:	Responsible Agencies, Trustee Agencies and Interested Parties	FROM:	March Joint Powers Authority 14205 Meridian Parkway, Suite 140 Riverside, CA 925 1 8 (951) 656-7000

The March Joint Powers Authority (JPA) will be the Lead Agency and will prepare an environmental impact report (EIR) for the Project identified below. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed Project. Your agency will need to use the EIR prepared by our agency when considering your permit or other approval for the Project.

The Project description, location, and the probable environmental effects are contained in the attached materials. An Initial Study has been prepared for the Project. The Initial Study document outlines the issues that March JPA has determined will be addressed in the forthcoming EIR.

☒	A copy of the Initial Study IS attached.
☐	A copy of the Initial Study IS NOT attached, but can be downloaded at www.marchjpa.com (link: K4 Warehouse and Cactus Channel Improvements Project NOP)
☒	The proposed project IS considered a project of statewide, regional or areawide significance.
☐	The proposed project IS NOT considered a project of statewide, regional or areawide significance.
☒	The proposed project WILL affect highways or other facilities under the jurisdiction of the State Department of Transportation.
☐	The proposed project WILL NOT affect highways or other facilities under the jurisdiction of the State Department of Transportation.
☒	A scoping meeting WILL be held by the lead agency.
☐	A scoping meeting WI LL NOT be held by the lead agency.

The Project meets the criteria requiring a scoping meeting, and as such, the Lead Agency will hold the meeting at the following date, time and location:



Date: December 3, 2018	**Time**: 6:00 - 7:00 PM	**Location**:	March Joint Powers Authority Meridian Conference Room 14205 Meridian Parkway, Suite 140 Riverside, CA 92518

Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice.

Please send your response to Mathew Evans, Planning Director, at the address shown above by Wednesday, December 19, 2018. We will need the name of a contact person in your agency.

Project Title:	K4 Warehouse and Cactus Channel Improvements Project
Project Location – Specific: Identify street address and cross street or attach a map showing project site (preferably a U.S.G.S. 15' or 7 ½' topographical map identified by quadrangle name):	The approximately 35.4-acre Project site is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The Project site is located within the March Joint Powers Authority (JPA) jurisdiction, which is within unincorporated Riverside County, California (Figure 1, Project Location). The Interstate 215 Freeway (I-215) is located approximately 0.8 mile east of the Project site. The Project site is currently undeveloped and comprised of five parcels designated as Assessor's Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0. The latitude and longitude of the approximate center of the site is 33°909101 North and 117°263507 West. The Project site sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey.
Project Description:	The proposed Project collectively involves the development of the five (5) parcels on approximately 35.4-acre site with 718,000 square foot building and the installation of a box culvert within the Cactus Channel. The proposed site plan for development on the K4 Parcel with a proposed e-commerce/fulfillment center, which is the most intense use that could operate on the Project site is shown in Figure 4, K4 Warehouse Site Plan. The maximum exterior building height would be 46 feet at the parapet. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. Once constructed, the e-commerce/fulfillment center use occupying the Project site could potentially be used up to 7 days per week and 24 hours per day. Use of the building would entail storage of smaller products and packages for direct distribution of e-commerce product to end users. Additionally, the Project would include improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. The current drainage ditch is proposed to be undergrounded in a box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). This portion of the Project is being discussed with Riverside County Flood Control and Water Conservation District, the City of Moreno Valley, the United States Department of Agriculture (USDA), the Western Riverside County Regional Conservation Authority, and other agencies and

	landowners that control the land necessary to implement the length of the improvement. The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) because portions of the work would be done within jurisdictions that are permittees to the MSHCP. The following approvals may be required for the proposed Project: • **General Plan Amendment:** The Project site has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change. • **Zoning Designation:** As the Project site has not previously been given a zoning designation, to be consistent with the requested General Plan land use designations of Industrial, the proposed Project is pursuing a zoning designation of Industrial (IND) for the 35.4-acre site. • **Plot Plan:** A plot plan approval is required to construct the 718,000 square foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls. • **Tentative Parcel Map:** A tentative parcel map is required to merge the five separate parcels on the Project site into one 35.4-acre parcel.

1 INTRODUCTION

1.1 Project Background

In 1993, the federal government mandated the realignment of March Air Force Base (AFB) and a substantial reduction in its military use. In April 1996, March AFB was re-designated an Air Reserve Base (ARB). Approximately 4,400 acres of land that had historically supported March AFB was no longer needed to support the ARB. The cities of Moreno Valley, Perris, and Riverside, and the County of Riverside formed the March JPA to oversee the dispensation and management of the surplus land. A General Plan (GP) and Master Environmental Impact Report (EIR) were prepared and adopted/certified in 1999 for the JPA planning area, which includes the March ARB.

Concurrent with the U.S. Air Force's preparation of the EIS, the March JPA and the March Joint Powers Redevelopment Agency prepared an EIR for the proposed March ARB Redevelopment Project. The project evaluated in this EIR considered the development of approximately 7,250 acres. The area evaluated including 6,782 acres comprising the boundaries of March ARB, of which approximately 4,524 acres would fall under the authority of March JPA. The remaining 2,258 acres would remain under the control of the military. Additionally, 467 acres within the City of Moreno Valley were included in the EIR evaluation.

Upon approval by the federal government for the realignment of March ARB and the transfer of excess property from March ARB to March JPA, March JPA prepared a General Plan and certified a Master EIR for the General Plan in 1999 (SCH#97071095). The proposed Project site was grouped in the Northeast Planning Subarea and assigned a land use designation of Business Park (BP).

Meridian Park K4, LLC is now pursuing development of the K4 Parcel Project site as well as the proposal to convert the existing Cactus open-air channel into a box culvert. The focus of this Initial Study is specifically on the proposed Project. While the Project site was previously conceptually considered for development in the Disposal of Portions of March AFB EIS, the March AFB Redevelopment Project EIR, and the Master EIR for March JPA, with a specific development plan identified, the analysis in this Initial Study addresses the proposed build-out of the Project site.

1.2 Project Overview

1.2.1 Project Location

The approximately 35.4-acre Project site is located on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The Project site is located within the March Joint Powers Authority (JPA) jurisdiction, which is within unincorporated Riverside County, California (Figure 1, Project Location). The Interstate 215 Freeway (I-215) is located approximately 0.8 mile east of

the Project site. The Project site is currently undeveloped and comprised of five parcels designated as Assessor's Parcel Numbers (APNs) 297-150-006-8, 297-150-007-9, 297-150-038-7, 297-160-005-8, and 297-200-004-0.

The latitude and longitude of the approximate center of the site is 33°909101 North and 117°263507 West. The Project site sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey.

According to the March JPA General Plan (GP) Land Use Plan, the site's land use designation is Business Park (BP), as shown in Figure 2, General Plan Land Use Designations. The site has not previously been given a zoning designation per the official March JPA Zoning Map, as shown in Figure 3, March JPA Zoning Designations.

Currently, the Project site is undeveloped and surrounded by March ARB to the south, east and west, and the City of Moreno Valley and business park and industrial land uses to the north. Along the Cactus Avenue corridor, on which the Project site is located, are a variety of industrial and business park warehouse uses mixed with supporting commercial uses such as fueling stations, convenience stores and restaurants.

1.2.2 Project Components

The proposed Project collectively involves the development of the five (5) parcels on approximately 35.4-acre site with 718,000 square foot building and the installation of a box culvert within the Cactus Channel. The proposed site plan for development on the K4 Parcel with a proposed e-commerce/fulfillment center, which is the most intense use that could operate on the Project site is shown in Figure 4, K4 Warehouse Site Plan. The maximum exterior building height would be 46 feet at the parapet. A total of 289 automobile parking stalls and 317 truck trailer parking stalls would be provided. The building would include a total of 105 loading dock positions for trucks. Vehicles would access the Project site via Cactus Avenue, a designated truck route, and new driveways aligned with the termination of Veterans Way on the west end of the Project site and the terminus of Frederick Street towards the eastern end of the Project site. Once constructed, the e-commerce/fulfillment center use occupying the Project site could potentially be used up to 7 days per week and 24 hours per day. Use of the building would entail storage of smaller products and packages for direct distribution of e-commerce product to end users.

Additionally, the Project would include improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. The current drainage ditch is proposed to be undergrounded in a box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width).

This portion of the Project is being discussed with Riverside County Flood Control and Water Conservation District, the City of Moreno Valley, the United States Department of Agriculture (USDA), the Western Riverside County Regional Conservation Authority, and other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert would be jointly constructed with the Riverside County Flood Control District and Water Conservation District and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) because portions of the work would be done within jurisdictions that are permittees to the MSHCP.

Project construction would occur over a 12-month period of time, commencing in Quarter 1 of 2020 and completing in Quarter 1 of 2021. Generally, Project construction would include site grading, utility relocation/installation, and building construction. Rough grading and utility installation would last approximately 25 days, and building construction, including pad/site-specific grading activities, would occur over approximately 11 months. Heavy equipment to be used on site during construction include flat beds, dozers, scrapers, graders, track hoes, dump trucks, forklifts, cranes, cement trucks, pavers, rollers, water trucks, rolling container trucks, and bobcats. Heavy equipment will be delivered and removed from the site throughout the construction phase. As most heavy equipment is typically not authorized to be driven on a public roadway, most of the equipment will be delivered and removed from the site via large flatbed trucks. It is anticipated that delivery of heavy equipment would not occur on a daily basis, but rather periodically throughout the construction phase based on need. During summer months, concrete pours could begin as early as 3:00 a.m.; during the remainder of the year, concrete pours would occur after 4:00 a.m. All other deliveries would occur at any time during the day. Any early morning concrete pours would comply with existing noise limitations identified in March JPA Development Code Sections 9.10.140 and 9.10.030.

The delivery and removal of heavy equipment would occur outside of the morning and evening peak hours (7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m.) to minimize impacts to traffic and circulation near the vicinity of the Project.

The installation of the box culvert would require trenching through the existing swale behind the Cactus right-of-way. A conceptual plan for the proposed Cactus Channel box culvert is shown in Figure 5, Cactus Channel Overview. Currently it is anticipated that there would be some utility relocations for existing crossings in record plans as well as removal of some existing roadway culverts and extending existing storm drain connections to the earth swale.

1.2.3 Requested Approvals and Entitlements

To facilitate Project approval, the following would be required:

- **General Plan Amendment:** The Project site has a land use designation of Business Park within the existing March JPA General Plan. The Project proposes to change the existing Business Park land use designation to Industrial; as such, a General Plan Amendment is required for this change.
- **Zoning Designation:** As the Project site has not previously been given a zoning designation, to be consistent with the requested General Plan land use designations of Industrial, the proposed Project is pursuing a zoning designation of Industrial (IND) for the 35.4-acre site.
- **Plot Plan:** A plot plan approval is required to construct the 718,000 square foot building, 289 automobile parking stalls, and 317 truck trailer parking stalls.
- **Tentative Parcel Map:** A tentative parcel map is required to merge the five separate parcels on the Project site into one 35.4-acre parcel.

1.3 California Environmental Quality Act Compliance

The baseline for a project is typically the physical environmental condition that exists in the vicinity of a project when the Notice of Preparation (NOP) is published (14 California Code of Regulations, Section 15125(a)). The NOP for the Project was published on November 19, 2018, which will thus be the environmental baseline for the Project. Currently the site is flat land that is vacant and undeveloped.

1.4 Discretionary Actions

The following additional permits, approvals and discretionary actions will be necessary as part of Project approval.

a. United States Army Corps of Engineers (USACE) – A Jurisdictional Determination (JD) will be required to identify and locate the boundaries of jurisdictional Waters of the United States on the Project site, and if found, will be regulated by USACE under Section 404 of the Clean Water Act.

b. State Water Resources Control Board (SWRCB) – A National Pollutant Discharge Elimination System (NPDES) Construction General Permit will need to be obtained from the SWRCB. Permit registration documents include a Stormwater Pollution Prevention Plan (SWPPP).

c. SWRCB – A NPDES Industrial General Permit may need to be obtained from the SWRCB, depending on the type of facility ultimately built, consistent with the requested General Plan land use designations of Industrial (IND).

d. Regional Water Quality Control Board (RWQCB), Santa Ana Region – 401 Water Quality Certification – A Waste Discharge Requirement Permit will need to be obtained from the RWQCB.

e. South Coast Air Quality Management District (SCAQMD) – A Dust Control Plan will need to be approved by the SCAQMD.

f. Federal Aviation Administration (FAA) – A Form 7460-1 will need to be approved by the FAA.

g. Riverside County Airport Land Use Commission (ALUC) – A consistency finding with Riverside County Land Use Plan will be required by Riverside County Airport Land Use Commission.

h. Western Riverside County Regional Conservation Authority

1.5 Public Review Process

Once the lead agency releases the Notice of Preparation (NOP) and the Initial Study (IS), the public has 30 days to provide the lead agency with comments on the Project. During this time, a scoping meeting will be held Thursday, November 15, 2018. The comments received on the NOP during the public comment period and scoping meeting will be considered and included in the Draft EIR.

INTENTIONALLY LEFT BLANK

2 ENVIRONMENTAL CHECKLIST FORM

1. **Project Title:**

   K4 and Cactus Channel Improvements Project

2. **Lead Agency Name and Address:**

   March Joint Powers Authority
   14205 Meridian Parkway, Suite 140
   Riverside, California 92518

3. **Contact Person and Phone Number:**

   Mathew Evans: (951) 656-7000

4. **Project Location:**

   The approximately 35.4-acre Project site is located on the south side of Cactus Avenue and extends from the terminus of Veterans Way at Cactus Avenue to the west to the terminus of Frederick Street at Cactus Avenue to the east. The Project site is located within the March Joint Powers Authority (JPA) jurisdiction which is within unincorporated Riverside County, California (Figure 1, Project Location).

   The latitude and longitude of the approximate center of the site is 33°909101 North and 117°263507 West. The Project site sits on Township 3 South, Range 4 West, including Sections 13 and 14 within the Riverside East 7.5-minute quadrangle, as mapped by the U.S. Geological Survey.

5. **Project Sponsor's Name and Address:**

   Meridian Park K4, LLC
   Attn: Timothy Reeves
   1156 N. Mountain Avenue
   Upland, California 91786

6. **General Plan Designation:**

   Existing: Business Park
   Proposed: Industrial

7. **Zoning:**

   Existing: None
   Proposed: Industrial

8. **Description of Project:**

   See Section 1.2 above.

9. **Surrounding Land Uses and Setting:** (Briefly describe the project's surroundings.)

   The proposed Project site is currently undeveloped and is surrounded by existing development to the north, south and west. These surrounding uses include commercial, industrial and military land uses in the local vicinity. Parcels located to the east of the Project site are designated as Public Facility, and to the south is designated as March Air Reserve Base. The proposed Project is on the south side of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. Interstate 215 (I-215) is located approximately 0.8 mile east of the Project site.

10. **Other public agencies whose approval is required** (e.g., permits, financing approval, or participation agreement):

    The following additional permits, approvals and discretionary actions will be necessary as part of Project approval.

    a. USACE – A JD will be required to identify and locate the boundaries of jurisdictional Waters of the United States on the Project site, and if found, will be regulated by USACE under Section 404 of the Clean Water Act.

    b. SWRCB – A NPDES Construction General Permit will need to be obtained from the SWRCB. Permit registration documents include a SWPPP.

    c. SWRCB – A NPDES Industrial General Permit may need to be obtained from the SWRCB, depending on the type of facility ultimately built, consistent with the requested General Plan land use designations of Industrial (IND).

    d. RWQCB, Santa Ana Region – 401 Water Quality Certification – A Waste Discharge Requirement Permit will need to be obtained from the RWQCB.

    e. SCAQMD – A Dust Control Plan will need to be approved by the SCAQMD.

    f. FAA – A Form 7460-1 will need to be approved by the FAA.

    g. Riverside County ALUC – A consistency finding with Riverside County Land Use Plan will be required by Riverside County Airport Land Use Commission.

    h. Western Riverside County Regional Conservation Authority

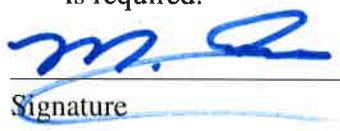
11. **SB-18/AB-52 Tribal Consultations:** Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, has consultation begun?

    Consultation with tribes has been initiated, and the results of the consultation process will be included in the EIR prepared for the proposed Project.

INTENTIONALLY LEFT BLANK

3 ENVIRONMENTAL DETERMINATION

On the basis of this initial evaluation:



☐ I find that the proposed Project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed Project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the Project have been made by or agreed to by the Project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed Project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed Project MAY have a "potentially significant" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed Project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed Project, nothing further is required.

4 INITIAL STUDY CHECKLIST

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

☒ Aesthetics	☐ Agriculture/ Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Geology/Soils
☒ Greenhouse Gas Emissions	☒ Hazards and Hazardous Materials	☒ Hydrology/Water Quality
☒ Land Use/Planning	☐ Mineral Resources	☒ Noise
☐ Population/Housing	☐ Public Services	☐ Recreation
☒ Transportation/Traffic	☒ Tribal Cultural Resources	☒ Utilities/Service Systems
☒ Mandatory Findings of Significance		

EVALUATION OF ENVIRONMENTAL IMPACTS:

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an Environmental Impact Report (EIR) is required.
4. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).
5. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
    a. Earlier Analysis Used. Identify and state where they are available for review.
    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
    c. Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or

refined from the earlier document and the extent to which they address site-specific conditions for the project.

6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
9. The explanation of each issue should identify:
   a. The significance criteria or threshold, if any, used to evaluate each question; and
   b. The mitigation measure identified, if any, to reduce the impact to less than significance.

4.1 Aesthetics

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
AESTHETICS – Would the project**:**				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b) Substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	☒	☐	☐	☐
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☒	☐	☐	☐

a) Would the project have a substantial adverse effect on a scenic vista?

Less Than Significant Impact. The March JPA's GP designates the area looking east and northeast of the March JPA Planning Area toward the Box Springs Mountains and San Jacinto Mountains as a scenic vista (Exhibit 5-5, Scenic & View Shed Areas, March JPA 1999).

While distant scenic vistas of the Box Springs Mountains and San Jacinto Mountains are visible from the Project site, north and northeast of the Project site are existing warehouse developments within the City of Moreno Valley. Viewers to the south and west of the Project site would be people located on the March ARB. The construction of a new 46-foot tall warehouse building on this site would introduce a new warehouse building closer to the ARB, but given that there are existing warehouse developments immediately north and northeast of the Project site, the introduction of this new warehouse building would not significantly obstruct distant views of the Box Springs Mountains and San Jacinto Mountains. Additionally, according to the City of Moreno Valley General Plan Conservation Element, no corridors within the western portion of the city boundary (which abuts the Project site to the north) are designated as scenic view areas (Moreno Valley 2006). Installation of the proposed box culvert within the Cactus Channel would require the placement of the culvert below grade and as such, the improvements within the Channel would not be visible or affect scenic vistas. As such, impacts to scenic vista would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

b) Would the project substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact. The Project site is located on vacant, previously disturbed land. There are no state scenic highways near the Project site as identified by the California Scenic Highway Mapping System (Caltrans 2011). The Project site does not contain substantial shrubbery or canopy. As such, Project implementation would not damage any scenic resources within a state scenic highway; no impacts would occur. This issue will not be further evaluated in the EIR prepared for the proposed Project.

c) Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Potentially Significant Impact. The proposed Project would result in the construction of a 718,000 square-foot building, with 289 automobile parking stalls, 317 truck trailer parking stalls, and 105 loading dock positions for trucks. The maximum exterior building height would be 46 feet at the parapet. Additionally, the Project would include improvements to the drainage ditch that runs along the south side of Cactus Avenue from just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. The drainage improvements are proposed to be an underground box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). Implementation of these proposed improvements would require coordination between the

Project Applicant, Riverside County Flood Control District, March JPA, March ARB, USDA, March Life Care, and the City of Moreno Valley.

The Project site is currently vacant; however, the site was previously disturbed with buildings and unpaved roads utilized as part of the former March Air Force Base. The properties to the north across Cactus Avenue are located in the City of Moreno Valley. These properties are commercial and industrial in nature. To the west and south the subject site is surrounded by the March ARB. To the east, the Project site is bordered by vacant land that was formerly part of the March Air Reserve Base and is currently owned by the USDA (Leighton 2018). As such, the visual character of the site would change compared to its existing undeveloped nature. As such, there is the potential for the Project to degrade the visual character of the site. This issue will be analyzed further in the EIR prepared for the proposed Project.

d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Potentially Significant Impact. The proposed Project would result in the construction a 718,000 square-foot, 46-foot tall warehouse building with minimal window coverage. During construction, nighttime lighting would exist on the Project site for security purposes, and during the early-morning concrete pours, lighting would be required for construction workers to complete tasks. However, the Project site is located along the Cactus Avenue corridor, which includes nighttime street lighting and contains warehouse and business park buildings with similar nighttime lighting.

Once operational, the proposed Project would introduce similar lighting and glare from security and perimeter lighting as the warehouse buildings in the vicinity. However, as part of the Project, solar panels would likely be constructed on the roof, if approved by ALUC, thereby introducing a new potential source of glare for aircraft landing and departing from the adjacent March ARB. As such, there is the potential for the Project to introduce a new source of glare that would adversely affect day or nighttime views in the area. This issue will be further evaluated in the EIR prepared for the proposed Project.

4.2 Agriculture and Forestry Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
AGRICULTURE AND FORESTRY RESOURCES – In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

a) Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. The Project site is located in an area designated as Urban and Built-Up Land, not Prime Farmland, Unique Farmland, or Farmland of Statewide Importance by the California Department of Conservation (DOC) Farmland Mapping and Monitoring Program (DOC 2016). Additionally, the Project site is not utilized for agricultural purposes. As such, the proposed Project would not convert Prime Farmland, Unique Farmland, or

Farmland of Statewide Importance. No impact would occur. This issue will not be further evaluated in the EIR prepared for the proposed Project.

b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. The proposed Project site is located in an area designated as Urban and Built-Up Land, under the Williamson Act. Therefore, the proposed Project would not conflict with zoning for agricultural use. No impact would occur. This issue will not be further evaluated in the EIR prepared for the proposed Project.

c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. The proposed Project site is not currently zoned and is not utilized for forest land, timberland, or within a designated Timberland Production area. The proposed Project would change the Project site's General Plan land use designation from Business Park to Industrial use and would similarly assign an Industrial zoning designation to the site. As such, the proposed Project would not conflict with zoning of forest land, timberland, or timberland production. No impacts would occur. This issue will not be further evaluated in the EIR prepared for the proposed Project.

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

No Impact. The proposed Project is located on vacant previously disturbed land with no forest resources. The proposed Project is identified as Urban and Built-Up Land. As such, Project implementation would not convert forest land to non-forest use. No impact would occur. This issue will not be further evaluated in the EIR prepared for the proposed Project.

e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

No Impact. Neither the Project site nor surrounding land uses are located in an area designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (DOC 2016), nor is the site utilized for agricultural purposes. As such, the proposed Project would not result in conversion of Farmland. No impact would occur. This issue will not be further evaluated in the EIR prepared for the proposed Project.

4.3 Air Quality

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
AIR QUALITY – Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☒	☐	☐	☐
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☒	☐	☐	☐
d) Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
e) Create objectionable odors affecting a substantial number of people?	☐	☐	☒	☐

a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

Potentially Significant Impact. The Project site is located within the South Coast Air Basin (SCAB), under the jurisdiction of the SCAQMD, which is principally responsible for air pollution control. The SCAQMD has adopted a series of Air Quality Management Plans (AQMPs) to meet the state and federal ambient air quality standards. Construction of the proposed Project could result in a temporary addition of pollutants to the local airshed caused by soil disturbance, fugitive dust emissions, and combustion pollutants from on-site construction equipment, as well as from off-site trucks hauling construction materials. The California Emissions Estimation Model (CalEEMod) land use and air emissions model will be used to estimate emissions associated with the construction and operation of the proposed Project. The analysis of air quality impacts, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant. This topic will be analyzed further in the EIR prepared for the proposed Project.

b) Would the project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Potentially Significant Impact. Project construction could result in a temporary addition of pollutants to the local airshed caused by soil disturbance, fugitive dust emissions, and combustion pollutants from on-site construction equipment, as well as from off-site trucks hauling construction materials. Project operations could introduce additional truck trips and employee vehicle trips with the potential to add pollutants to the local airshed. Thus, the proposed Project could potentially violate an air quality standard or contribute substantially to an existing or projected air quality violation. Impacts would be potentially significant. As such, this topic will be analyzed further in the EIR prepared for the proposed Project.

c) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Potentially Significant Impact. Project construction could result in a temporary addition of pollutants to the local airshed caused by soil disturbance, fugitive dust emissions, and combustion pollutants from on-site construction equipment, as well as from off-site trucks hauling construction materials. Construction emissions can vary substantially day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions. During operations, the Project could introduce new sources of vehicle emissions. Thus, the proposed Project has the potential to result in a cumulatively considerable net increase of a criteria pollutant for which the region is non-attainment under federal or state ambient air quality standard. Impacts are potentially significant. As such, this topic will be analyzed further in the EIR prepared for the proposed Project.

d) Would the project expose sensitive receptors to substantial pollutant concentrations?

Potentially Significant Impact. The proposed Project has the potential to create air emissions in quantities that could violate air quality standards. Exposure of nearby sensitive receptors (e.g., neighboring residents) to substantial pollutant concentrations will be evaluated as part of the air quality assessment prepared for the Project. The SCAQMD localized significance thresholds (LSTs) will be evaluated to determine whether the proposed Project would cause or contribute to exceedances of ambient air quality standards at sensitive receptors near the Project site. Additionally, a health risk assessment (HRA) will be performed to evaluate diesel particulate matter emissions associated with the proposed Project and potential cancer risk to existing sensitive receptors within an approximately 1,000-foot radius. The analysis of air quality and SCAQMD CEQA

Regional Significance Thresholds, the LSTs, HRA, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR. Therefore, the EIR prepared for the proposed Project will include an air quality assessment that addresses whether the proposed Project would expose sensitive receptors to substantial pollutant concentrations.

e) Would the project create objectionable odors affecting a substantial number of people?

Less Than Significant Impact. Odors would be generated from vehicles and/or equipment exhaust emissions during construction of the Project. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment and to architectural coatings associated with building painting during construction. Most of the people within the Project area that could be subject to odors would include employees and visitors at nearby Business Park and Industrial uses. The land uses most proximate to the Project site, which include Business Park, Industrial, and March ARB uses, do not encourage people to be outdoors for long periods of time where they would be exposed to construction odors. Therefore, impacts associated with odors during construction would be less than significant.

Land uses and industrial operations that are typically associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding. The Project entails construction of a new industrial building to be occupied by an e-commerce/fulfillment center use. Fulfillment centers are not a use typically associated with generating odor or odor compliances. As such, Project operations would not have the potential to result in significant odor impacts. This issue will not be further evaluated in the EIR prepared for the proposed Project.

4.4 Biological Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
BIOLOGICAL RESOURCES – Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☒	☐	☐	☐
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☒	☐	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☒	☐	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☒	☐	☐	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☒	☐	☐	☐

a) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Potentially Significant Impact. A biological technical report is being prepared for the Project, and the results of this report will be included within the EIR. It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. As such, the potential for the Project to adversely affect species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (formerly California Department of Fish and Game) or U.S. Fish and Wildlife Service is considered significant. The analysis of biological resources, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore

is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Potentially Significant Impact. A biological technical report is being prepared that would address if the proposed Project would affect riparian habitat or sensitive communities, as there are several drainage features that traverse the Project site, including the existing Cactus Channel. It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. The analysis of biological resources, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

c) Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Potentially Significant Impact. The Project site itself is relatively flat. A portion of the Project would potentially involve channelizing the existing Cactus Channel into a box culvert. It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. As such, the Project does have the potential to affect waters protected under Section 404 of the Clean Water Act. The biological technical report and jurisdictional delineation report prepared for the Project will address if these drainage features are subject to Section 404 permitting. The analysis of resources, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Potentially Significant Impact. The proposed Project site is currently undeveloped and is surrounded by existing development to the west, north, and south. The March JPA General Plan does not designate the Project area or adjacent properties as open space areas (March

JPA 2010). The Project site is generally surrounded by existing development and existing infrastructure. However, because the Project site is vacant and undeveloped, the analysis of biological resources, along with the potential for feasible mitigation measures, requires additional study and analysis, and therefore is considered potentially significant. It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. The EIR prepared for the Project will include a biological technical report that will address whether the proposed Project would interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. As such, this issue will be evaluated in the EIR prepared for the proposed Project.

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Potentially Significant Impact. A biological technical report is being prepared that addresses whether or not the proposed Project would conflict with any local policies or ordinances protecting biological resources. It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. The analysis of whether the proposed Project would conflict with any local policies or ordinances protecting biological resources, along with the potential for feasible mitigation measures, requires additional study and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Potentially Significant Impact. The proposed Project site is located within the Western Riverside County MSHCP. However, the March JPA is not a permittee to the MSHCP and would be required to comply with the Reserve Assembly goals of the MSHCP or other MSHCP requirements (County of Riverside 2003). However, the Cactus Channel, which is currently open but is proposed to be converted to a box culvert as part of Project development, may be subject to actions by Riverside County Flood Control District and the City of Moreno Valley which are signatories to the MSHCP. As such, the EIR prepared for the Project will discuss impacts and mitigation if needed. The analysis as to whether or not the Project conflicts with the MSHCP, along with the potential for feasible mitigation measures, requires additional study and analysis. Therefore, this impact is considered potentially significant and will be analyzed fully in the EIR prepared for the proposed Project.

4.5 Cultural Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
CULTURAL RESOURCES – Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	☒	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☒	☐	☐	☐
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☒	☐	☐	☐
d) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☒	☐

a) Would the project cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

Potentially Significant Impact. A cultural resources technical report is being prepared for the proposed Project that will identify potential impacts to historical resources/properties under both CEQA and Section 106 of the National Historic Preservation Act. A California Historical Resources Information Systems (CHRIS) records search of the Project area and a 1-mile radius at the Eastern Information Center (EIC) will be conducted to identify any previously recorded cultural resources that may be located within the Project area. The California Native American Heritage Commission (NAHC) will also be contacted for a review of its Sacred Lands File. Additionally, an intensive-level pedestrian survey of the proposed Project area will be conducted to identify any observed cultural resources (including both prehistoric and historic archaeological resources and potential historic built environment resources, such as culverts). T It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. he analysis of impacts to historical resources, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Potentially Significant Impact. A cultural resources technical report is being prepared for the Project that will identify potential impacts to archaeological resources. A CHRIS records search of the Project area and a 1-mile radius at the EIC will be conducted to identify any Archaeological Determinations of Eligibility. An intensive-level pedestrian survey of the proposed Project area will be conducted to identify any observed cultural resources (including both prehistoric and historic archaeological resources and potential historic built environment resources, such as culverts). The Senate Bill (SB) 18 consultation process will be initiated by the March JPA with the NAHC-listed tribes for the Project provided by the NAHC response. Additionally, in accordance with Assembly Bill (AB) 52, agency-to-agency consultation by the March JPA will be conducted by sending a formal notice to inform California Native American tribes that have requested such notice of a Project application within a geographic area with which the tribe is traditionally and culturally affiliated. It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. The analysis of impacts to archaeological resources, consultation with tribes, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

c) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Potentially Significant Impact. According to the Map My County – Riverside County database (County of Riverside 2018), the Project site is located within an area designated as high paleontological sensitivity. Although the proposed Project does not anticipate destroying any paleontological resource or unique geologic feature, a cultural resources technical report is being prepared for the EIR that will identify potential impacts to paleontological resources. It should be noted that all construction and fencing would be within the property line along the eastern, southern and western edges of the K4 site, and potential edge effects within the Cactus Channel will be evaluated. The analysis of paleontological resources, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

d) Would the project disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant Impact. Based on records searches completed for the proposed Project, as discussed above, the Project site is not known to be an informal or formal cemetery. The Project site is currently undeveloped. In the unlikely event that human remains are discovered, state and local laws require that the County Coroner be notified. California Public Resources Code Section 5097.98 addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction; establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a Project; and establishes the NAHC to resolve disputes regarding the disposition of such remains. The proposed Project will be required to comply with California Public Resources Code Section 5097.98 should any unknown human remains be discovered during site disturbance. Additionally, Sections 7050.5, 7051, 7052, and 7054 of the California Health and Safety Code collectively address the illegality of interference with human burial remains, as well as the disposition of Native America burials in archaeological sites. The law protects such remains from disturbance, vandalism, or inadvertent destruction and establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a Project, including the treatment of remains prior to, during, and after evaluation, and reburial procedures. As such, through the inclusion of appropriate mitigation measures and through compliance with state and local laws in the event human remains are discovered, impacts would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

4.6 Geology and Soils

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
GEOLOGY AND SOILS – Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☒	☐
ii) Strong seismic ground shaking?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
iii) Seismic-related ground failure, including liquefaction?	☒	☐	☐	☐
iv) Landslides?	☐	☐	☒	☐
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☒	☐	☐	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	☒	☐	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒

a) Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. According to the most recent Alquist-Priolo Earthquake Fault Zoning Map, the Project area is not located within an Alquist-Priolo fault zone. The nearest fault zone, the San Jacinto fault zone, is located approximately 9 miles east (DOC 2015) of the Project site. Construction of the Project would be required to meet California Building Code (CBC) standards. Additionally, the March JPA would review and approve the plans and specifications of the proposed Project to ensure compliance with the provisions of the CBC and Title 24, which regulates building standards. Title 24 is administered by the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Under State law, all building standards must be centralized in Title 24 or they are not enforceable. Because the Project site is not within an Alquist-Priolo Earthquake Fault Zone, pursuant to the Department of Conservation's Fault Activity Map of California,

and given that the Project is required to comply with the provisions of the CBC and Title 24, the potential for exposing people or structures to potential substantial adverse effects, including risk of loss, injury, or death involving rupture of a known Alquist-Priolo earthquake fault is low. Therefore, a less than significant impact is expected and this issue will not be further addressed in the EIR prepared for the proposed Project.

ii) Strong seismic ground shaking?

Potentially Significant Impact. According to the Geotechnical Exploration, prepared by Leighton and included as Appendix A to this Initial Study, strong ground shaking can be expected at the site during moderate to severe earthquakes in this general Southern California region (Leighton 2018a). This is common to virtually all of Southern California. Intensity of ground shaking at a given location depends primarily upon earthquake magnitude, site distance from the source, and site response (soil type) characteristics. The site-specific seismic coefficients identify the Project site as a Class D. A Class D site is characterized by high seismic vulnerability that is expected to experience severe and destructive ground shaking. Given the potential for the Project to be subject to strong seismic ground shaking, impacts are potentially significant and this issue will be further evaluated in the EIR prepared for the proposed Project.

iii) Seismic-related ground failure, including liquefaction?

Potentially Significant Impact. According to the Map My County – Riverside County database (County of Riverside 2018), the Project site contains a high liquefaction susceptibility, as well as susceptible to subsidence. However, according to the Geotechnical Exploration prepared by Leighton (Appendix A), liquefaction-induced or dynamic dry settlement is not expected to be a significant hazard at this site due to the absence of near surface saturated sand layers and underlying dense older alluvium (Leighton 2018a). Nonetheless, because this geotechnical exploration does not address the Cactus Channel, this issue will be further evaluated in the EIR prepared for the proposed Project.

iv) Landslides?

Less Than Significant Impact. The proposed Project site is relatively flat, varying in grade up to approximately 6 feet across the entire site 35.4-acre site. The nearest hilly terrain to the Project site, which has the potential to cause landslides, is located approximately 1.5 miles to the west of the Project site, on the western side of I-215

andnd March ARB. Therefore, due to the flat topography of the Project area, the proposed Project site itself, and the Cactus Channel, the Project site would not be susceptible to landslides. Additionally, the proposed Project would undergo staff review with the March JPA to ensure that Project grading activities would not be subject to, or result in, landslides. As such, the proposed Project would not expose people to the risk of landslides. This issue will not be further evaluated in the EIR prepared for the proposed Project.

b) Would the project result in substantial soil erosion or the loss of topsoil?

Less Than Significant Impact. The proposed Project would result in the construction of a 718,000 square-foot warehouse building, 289 automobile parking stalls, 317 truck trailer parking stalls, and 105 loading dock positions for trucks. Additionally, the Project includes proposed improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue. The drainage improvements are proposed to be undergrounded in a box culvert that would run approximately 7,900 linear feet and would vary in width from an 11-foot wide box to a 9-foot wide double box (approximately 19 feet in width). Short-term erosion effects during construction of the Project would be prevented through implementation of a SWPPP as required in compliance with the NPDES program and through incorporation of best management practices intended to reduce soil erosion. The SWPPP would include standard construction methods such as temporary detention basins to control on-site and off-site erosion. The SWPPP is required by the March JPA during plan review and approval of Project improvement plans. Upon completion of Project construction, the warehouse portion of the Project site would be completely paved, thereby preventing any soil erosion or loss of topsoil from occurring. The box culvert within the Cactus Channel would control flowing water through the Channel such that the potential for erosion would also be reduced and limited. As such, impacts related to soil erosion or the loss of topsoil would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Potentially Significant Impact. The Project site is not located within an earthquake fault zone or in an area with steep slopes having the potential to result in landslides. According to Riverside County's Map My County, the Project site is however, located on areas of high liquefaction potential, as well as susceptible to subsidence (County of Riverside 2018). However, according to the Geotechnical Exploration (Appendix A), laboratory testing indicates that the on-site soils (older alluvium) are expected to possess a slight

collapse potential (<1%). Based on the remedial grading recommendations to remove and compact the near surface soils (Leighton 2018a) on the warehouse site, this geologic hazard on this site is considered very low. However, the geotechnical exploration did not address the Cactus Channel. As such, this issue will be further evaluated in the EIR prepared for the proposed Project.

d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Potentially Significant Impact. According to the U.S. Department of Agriculture Natural Resources Conservation Services Web Soil Survey, the soil underlain the proposed Project area is comprised of Monserate sandy loam, which has low water storage ability, naturally drains well, and has a low capacity of transmitting water, thus a low expansive potential (USDA 2017). According to the Geotechnical Exploration, limited laboratory testing indicated that on-site soils generally possess a low expansion potential. The Geotechnical Exploration includes recommendations related to the geologic hazard of expansive soils. However, the geotechnical exploration did not address the Cactus Channel. As such, this issue will be further evaluated in the EIR prepared for the proposed Project.

e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

No Impact. Use of septic tanks or other alternative wastewater disposal systems would not be a part of the proposed Project. The Project would be connected to the existing sewer system. Therefore, no impacts would occur, and this issue will not be further evaluated in the EIR prepared for the proposed Project.

4.7 Greenhouse Gas Emissions

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
GREENHOUSE GAS EMISSIONS – Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐

a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Potentially Significant Impact. The proposed Project has the potential to generate greenhouse gas emissions that may have a significant impact on the environment, both during construction and operation of the Project. The analysis of greenhouse gas emissions, along with the potential for feasible mitigation measures, requires additional study and therefore is considered potentially significant until it can be analyzed fully in the EIR. Therefore, the EIR prepared for the proposed Project will include an assessment of the Project in relation to the potential impacts on global climate change.

b) Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Potentially Significant Impact. See response a) above. The proposed Project has the potential to generate greenhouse gas emissions that may have a significant impact on the environment, both during construction and operation of the proposed Project. Therefore, the EIR prepared for the proposed Project will identify how the proposed Project would relate to any plan, policy, or regulation adopted to address greenhouse gas emissions.

4.8 Hazards and Hazardous Materials

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
HAZARDS AND HAZARDOUS MATERIALS – Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☒	☐	☐	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☒	☐	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☒	☐	☐	☐
d) Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	☒	☐	☐	☐
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☐	☐	☒	☐

a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Potentially Significant Impact. According to the Phase I Environmental Site Assessment (ESA) Report, prepared by Leighton, and included as Appendix B to this Initial Study, the subject site is located in the northern area within the former boundaries of the March ARB (Leighton 2018). Due to the facility's purpose in national defense, there were a wide variety of operations that involved the use, storage, and disposal of hazardous materials and waste such as fuel, solvents and waste oil when the ARB was in operation. As such, this issue will be further evaluated in the EIR prepared for the proposed Project.

b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Potentially Significant Impact. According to the Phase I ESA Report (Appendix B), a review of historic aerial photographs show that the Project site has been vacant since 1901; prior to 1901 it is unknown whether or not the Project site was developed. The Phase I ESA Report also stated that no hazardous substances, chemical containers, or aboveground and underground storage tanks were observed on the Project site. Evidence of pesticide use was not observed on the Project site. One pad mounted transformer was observed on the eastern portion of the Project site, adjacent to the large, off-site electrical substation located near the eastern boundary of the Project site. The transformer appeared in good condition and

no evidence of staining or leakage was observed. The soils appeared to be clean and locally derived (Leighton 2018).

The Project site is located in the northern area of the former boundaries of the March ARB. Due to the facility's purpose in national defense, there was a wide variety of operations that involved the use, storage, and disposal of hazardous materials and waste such as fuel, solvents and waste oil. As a result, 30 different areas of soil and groundwater contamination have been identified on the base. Additionally, there is the potential for unexploded ordnance to be located on the Project site. As such, this issue will be further evaluated in the EIR prepared for the proposed Project.

c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Potentially Significant Impact. The Cactus Channel component of the Project is located within proximity of several schools. As such, there is the potential for hazardous materials to be handled within one-quarter mile of an existing school. This issue will be further evaluated in the EIR prepared for the proposed Project.

d) Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Potentially Significant Impact. California Government Code Section 65962.5 combines several regulatory lists of sites that may pose a hazard related to hazardous materials or substances. The Department of Toxic Substances Control's (DTSC's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. A review of the Envirostor database has revealed that there are three cleanup sites within approximately 1 mile of the Project site. The nearest cleanup site is located at 14420 Elsworth Street, located approximately 0.12 miles northwest from the Project site. This site is identified as an evaluation site. The next site is located approximately 0.3 mile south of the Project site, at 14310 Frederick Street. This site is within the March ARB, and is listed as "Military Evaluation" (DTSC 2018). The next furthest site is located approximately 0.6 mile south of the Project site, also at 14130 Fredrick Street, within the March Air Reserve Base, and also listed as "Military Evaluation."

According to the Environmental Data Resource (EDR) Radius Report included in Appendix B, March ARB was reported on multiple hazardous waste sites databases. The

former March Air Force Base was historically used to train pilots during World War I, and by 1938, it became the central location for west-coast bombing and gunnery training. Due to the facility's purpose in national defense, there was a wide variety of operations that involved the use, storage, and disposal of hazardous materials and waste such as fuel, solvents and waste oil. As a result, 30 different areas of soil and groundwater contamination have been identified on the base. By November 1989, March Air Force Base was added to the National Priorities List (NPL) due to the contamination of the groundwater. According to the EDR radius map report the facilities status is "currently on the Final NPL." Operational Units (OU) were identified on the facility based on the groundwater plumes. There were numerous contaminants of concern (COCs) detected in the groundwater at the OUs including trichloroethylene (TCE), perchloroethylene (PCE), vinyl chloride, and fuel. The OU areas that require groundwater remediation include the southern and eastern boundary of March Air Force Base and extend 1,500 feet south of the base property, and does not include the current subject site boundary (Appendix B; Geotracker, 2018). However, this does encompass areas where planned improvements to the Cactus Channel are located. As such, this issue requires further evaluation in the EIR prepared for the proposed Project.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Potentially Significant Impact. The proposed Project is located within the March ARB Land Use Plan, in the C1 Primary Approach/Departure Zone and would ultimately require approval from the ALUC due to the site's proximity to the March Inland Port Airport (approximately 4,500 feet from the north end of the runway). The C1 zone is subject to moderate to high noise and moderate accidental potential risk (Riverside County ALUC 2014). Uses prohibited within Zone C1 include children's schools, day care centers, libraries, hospitals, congregate care facilities, places of assembly, noise-sensitive outdoor nonresidential uses, and hazards to flight. The proposed Project is intended to serve e-commerce/fulfillment center uses, which does have the potential to expose people to safety hazards. As such, this issue will be evaluated further in the EIR prepared for the proposed Project.

f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

No Impact. The proposed Project site is not located within the vicinity of a private airstrip but is located in close proximity to the March Inland Port Airport (approximately 4,500 feet from the north end of the runway), as discussed above. The Project site is located

within the March ARB Land Use Plan, in the C1 Primary Approach/Departure Zone, as discussed above. However, given that the Project site is not located within the vicinity of a private airstrip, no impacts would occur and this issue will not be further evaluated in the EIR prepared for the proposed Project.

g) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The Project site is located within the March JPA Planning Area emergency response plan. The proposed Project is located along Cactus Avenue, approximately 0.7 mile east of Interstate 215 (I-215). Access driveways would be provided on Cactus Avenue. According to the March GPA General Plan's Circulation Plan and Roadway Classifications, Cactus Avenue is considered an Arterial/Urban Arterial Highway which allows access to I-215, an Arterial Highway to the west, and Heacock Street a Secondary Highway to the east (March JPA 2010). Additionally, the proposed site plan, including the access driveways, would be reviewed and approved by the March JPA, police, and fire department during plan review to ensure emergency access would be provided at all times. During construction of the proposed Project, no lane closures are anticipated. As such, adequate emergency access during construction and operation of the proposed Project would be maintained, and the Project would not physically interfere with an adopted emergency response plan or emergency evacuation plan. Impacts would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

h) Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Less Than Significant Impact. According to the Map My County – Riverside County database (County of Riverside 2018), the Project site is not within a designated fire hazard area. Additionally, the Project site is surrounded by development to the north, west, and south. Therefore, the risk of a large, high-intensity wildland fire impacting the site is low. Impacts would be less than significant, and this issue will not be further evaluated in the EIR prepared for the proposed Project.

4.9 Hydrology and Water Quality

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
HYDROLOGY AND WATER QUALITY – Would the project:				
a) Violate any water quality standards or waste discharge requirements?	☒	☐	☐	☐
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	☒	☐	☐	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	☒	☐	☐	☐
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	☒	☐	☐	☐
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☒	☐	☐	☐
f) Otherwise substantially degrade water quality?	☒	☐	☐	☐
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☐	☒
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☒	☐	☐	☐
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	☒	☐
j) Inundation by seiche, tsunami, or mudflow?	☐	☐	☒	☐

a) Would the project violate any water quality standards or waste discharge requirements?

Potentially Significant Impact. The proposed Project involves the construction of a warehouse building. Additionally, the Project would include improvements to the Cactus

Channel drainage ditch that runs along the south side of Cactus Avenue. The proposed improvements include undergrounding a box culvert that would vary in width. A hydrology study and water quality management plan (WQMP) will be prepared for the Project. It is not presumed that Project implementation would have a substantial impact on water quality standards or waste discharge requirements; however, this issue will be analyzed and discussed further in the EIR prepared for the Project. In the event that impacts are identified, feasible mitigation measures from the hydrology study and WQMP will be identified. This issue is considered potentially significant until it can be fully analyzed in the EIR prepared for the proposed Project.

b) Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (i.e., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)?

Potentially Significant Impact. The proposed Project involves the construction of an approximately 718,000-square foot warehouse building and the installation of a new box culvert within the existing earthen Cactus Channel. The EIR will analyze the potential source(s) of water for the site and address whether or not groundwater resources could be depleted as a result of the Project implementation on the undeveloped Project site. This issue will also be addressed in the WQMP and Water Supply Assessment (WSA) prepared for the Project. The analysis of groundwater resources, along with the potential for feasible mitigation measures, requires additional study and therefore, is considered potentially significant until it can be fully analyzed in the EIR prepared for the proposed Project.

c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Potentially Significant Impact. The proposed Project would result in the construction of an approximately 718,000-square foot warehouse building. Additionally, the Project would include improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue. The proposed Project has the potential to modify the existing drainage pattern of the site by constructing a new warehouse building and undergrounding a box culvert that would run approximately 7,900 linear feet and would vary in width on the Project site where no structures are located currently. Although the Project site is relatively flat, a hydrology study and WQMP is being prepared, and results and any identified mitigation will be included within the EIR prepared for the Project. The analysis of the drainage patterns, along with the potential for feasible mitigation measures, requires

additional study and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

d) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Potentially Significant Impact. See response c) above.

e) Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Potentially Significant Impact. The analysis of the proposed Project's potential to contribute runoff and create an additional source of polluted runoff, along with the potential for feasible mitigation measures, requires additional study and therefore is considered potentially significant until it can be analyzed fully in the EIR. A hydrology study and WQMP is being prepared for the Project, and the findings and recommendations will be incorporated into the EIR prepared for the proposed Project.

f) Would the project otherwise substantially degrade water quality?

Potentially Significant Impact. See responses a) through e) above. This issue will be evaluated in the EIR prepared for the proposed Project.

g) Would the project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

No Impact. Implementation of the proposed Project would not result in the development of housing. Additionally, the Project site is not located within a 100-year flood hazard area (FEMA 2008). Therefore, no housing would be placed within a 100-year flood hazard area. No impact would result, and this issue will not be further evaluated in the EIR prepared for the proposed Project.

h) Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Potentially Significant Impact. The Project site is not located within a 100-year flood hazard area (FEMA 2008). However, the proposed Project would not place structures

within an existing drainage channel and would have the potential to alter flood flows. As such, impacts to flood flows are potentially significant, and this issue will be further evaluated in the EIR prepared for the proposed Project.

i) Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam or inundation by seiche, tsunami or mudflow?

Less Than Significant Impact. According to the Geotechnical Exploration prepared for the proposed Project (Appendix A), due to the site location and lack of nearby open bodies of water, the potential for seiches or tsunami is considered very low. The Perris Reservoir Dam is located approximately 4.9 miles southeast of the Project site as well as downstream; therefore, the Project site would not be subject to inundation by dam failure at Perris Reservoir. Therefore, the potential for inundation at the site as a result of an earthquake-induced dam for levee failure is considered low. Impacts related to exposure of people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of a failure of a levee or dam, is considered less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

4.10 Land Use and Planning

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
LAND USE AND PLANNING – Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☒	☐	☐	☐
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	☒	☐	☐	☐

a) Would the project physically divide an established community?

No Impact. The Project site is located on an approximately 35.4-acre site within the northern portion of the jurisdiction of March JPA. Cactus Avenue and north of Cactus Avenue are development within the City of Moreno Valley. This development primarily consists of warehouse and commercial development. West and south of the Project site is

March ARB, which includes military uses and an active airfield. East of the Project site is an undeveloped parcel owned by the USDA. The Cactus Channel drainage ditch fronts the northern boundary of the Project site. Build-out of the proposed warehouse on this vacant parcel as well as installation of a box culvert within the Cactus Channel abutting March ARB, the City of Moreno Valley, and vacant land owned by USDA would not physically divide an established community given that the site is adjacent to a variety of uses and jurisdictions. As such, no impacts would occur and this issue will not be further evaluated in the EIR prepared for the proposed Project.

b) Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Potentially Significant Impact. As shown on Figure 2, General Plan Land Use Designations, the site's land use designation is Business Park (BP). The site is not yet zoned per the March JPA Zoning Map, as shown in Figure 3, March JPA Zoning Designations. The proposed Project would include the construction of a 718,000 square foot building on the approximately 35.4-acre site as well as the installation of a box culvert within the Cactus Channel. The site would also include automobile and truck trailer parking, loading dock positions, and improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue. To facilitate Project approval, a General Plan Amendment would be required to change the existing Business Park land use designation to Industrial. In addition, because the Project site is not yet zoned, a Change of Zone to allow for an Industrial land use would need to be approved for the site.

The proposed Project is located in the C1 Primary Approach/Departure Zone for the March Air Reserve Base. The C1 zone is subject to a moderate to high noise impact, which may be disruptive to noise-sensitive land use activities. The constructed warehouse building would have a maximum building height of 46 feet. The installation of the box culvert within the Cactus Channel would not introduce any above-ground structures with the potential to affect airspace or result in land use conflicts. However, an airspace review would be required for the proposed building (Riverside County Airport Land Use Commission 2014). Given that numerous approval actions are required, impacts are considered potentially significant until this issue can be further evaluated in the EIR prepared for the proposed Project.

c) Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Potentially Significant Impact. As discussed in Section 3.4 Biological Resources, the proposed Project site is located within the Western Riverside County MSHCP. However, the March JPA is not a permittee to the MSHCP and would not be required to comply with the Reserve Assembly goals of the MSHCP or other MSHCP requirements (County of Riverside 2003). However, the Cactus Channel, which is currently open but is proposed to be converted to a box culvert as part of the Project, may be located within jurisdictions of Riverside County Flood Control District and the City of Moreno Valley, who are subject to the MSHCP. As such, the EIR prepared for the Project will discuss impacts and mitigation if needed. The analysis whether or not the Project conflicts with the MSHCP, along with the potential for feasible mitigation measures, requires additional study and analysis. Therefore, this impact is considered potentially significant and will be analyzed fully in the EIR prepared for the proposed Project.

4.11 Mineral Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
MINERAL RESOURCES – Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☒	☐
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒

a) Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Less Than Significant Impact.

As previously stated in Section 3.10, the site's land use designation is Business Park and is proposed as Industrial under the Project. These land use designations do not allow for mining activities (March JPA 2016). Additionally, the Project site is surrounded by commercial, industrial and military land uses in the local vicinity that would be incompatible with a mining operation on the Project site. Therefore, impacts to known

mineral resources would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

b) Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

No Impact. As previously stated, the site's land use designation is Business Park and is proposed as Industrial under the Project. These land use designations do not allow for mining activities (March JPA 2016). Additionally, the Project site is surrounded by commercial, industrial and military land uses in the local vicinity that would be incompatible with a mining operation on the project site. Therefore, the proposed Project would not result in the loss of availability of a locally important mineral resource recovery site. No impact would occur, and this issue will not be further evaluated in the EIR prepared for the proposed Project.

4.12 Noise

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
NOISE – Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☒	☐	☐	☐
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

a) Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Potentially Significant Impact. There are no sensitive receptors such as homes, schools, or daycare facilities located immediately adjacent to the warehouse site; however, sensitive receptors may be located adjacent to the Cactus Channel portion of the Project. Noise levels are regulated by the March JPA's Development Code and March ARB's Air Installation Compatible Use Zone. During Project construction activities, the proposed Project would result in a temporary increase in noise levels due to the use of construction equipment. The Project would also generate additional traffic on local streets generally from employees, trucks delivering or transporting goods, and the public. The additional traffic may impact the existing noise level of the area. A noise impact analysis will be prepared for the Project to analyze the potential impacts from construction and operation of the proposed Project on neighboring land uses. The analysis of noise levels, along with the potential for feasible mitigation measures, requires additional study and, therefore, is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

b) Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Potentially Significant Impact. The proposed Project would involve earthwork to produce finish grades and provide proper recompacting, resulting in temporary groundborne vibration and noise levels. A noise impact analysis is being prepared and will analyze level of vibration and groundborne noise associated with Project construction activities. Once completed, operation of the Project would not expose persons to or generate groundborne vibration or groundborne noise. The analysis of groundborne noise levels, along with the potential for feasible mitigation measures outlined in the noise impact analysis, requires additional study and, therefore, is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

c) Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Potentially Significant Impact. The Project would involve the introduction of a noise source associated with an increase in traffic on the Project site and adjacent roadways, thereby potentially changing the ambient noise levels in the Project vicinity such that significant noise impacts could occur. The noise impact analysis will evaluate the extent of this increase and level of impact. The analysis of ambient noise levels, changes in ambient conditions, and the potential for noise impacts requires additional study and, therefore, is

considered potentially significant. This issue will be evaluated further in the EIR prepared for the proposed Project.

d) Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Potentially Significant Impact. The proposed Project has the potential to temporarily increase ambient noise levels during construction. A noise impact analysis is being prepared for the Project. The analysis of ambient noise levels, changes in ambient conditions, and the potential for noise impacts, is being further evaluated and will be discussed in the EIR prepared for the proposed Project.

e) Would the project be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Potentially Significant Impact. The Project site is located immediately adjacent to the March ARB and is also within the March ARB land use plan area. Specifically, the Project site is located within the C1 compatibility zone, as depicted in the March ARB/Inland Port Airport Land Use Compatibility Plan (Mead & Hunt 2014). Zone C1, Primary Approach/Departure Zone, encompasses areas of moderate to high noise and moderate accidental potential risk. Locating residential uses within these zones is not permitted; therefore, no individuals will be residing in the Project site. However, Project implementation does have the potential to expose people working in the Project area to excessive noise levels. Impacts are potentially significant, and this issue will be further evaluated and discussed in the EIR prepared for the proposed Project.

f) Would the project be within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

No Impact. The Project site is not within the vicinity of a private airstrip. March Inland Port Airport is considered a joint-use airport utilized for both commercial and military purposes. As such, no impacts associated with exposing people residing or working within the vicinity of a private airstrip to excessive noise levels would result from Project implementation. This issue will not be further evaluated in the EIR prepared for the proposed Project.

4.13 Population and Housing

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
POPULATION AND HOUSING – Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

a) Would the project induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less Than Significant Impact. The proposed Project involves the construction of a 718,000 square-foot warehouse building to be occupied by e-commerce/fulfillment center use. No housing is being proposed with this Project; therefore, the Project would not directly generate substantial population growth. The Project would enhance the jobs/housing balance of the March JPA Planning Area and adjacent jurisdictions at full buildout. While the end tenant for the proposed warehouse building is not yet known, it is assumed that the proposed Project would generate a maximum number of 900 jobs during operations. Because the tenant is not yet known, the number of jobs that the Project would generate is based off the *Institute of Transportation Engineers (ITE) Trip Generation Manual* and the ITE trip generation rates for the Project in order to be consistent with the traffic impact analysis.

According to the SCAG Growth Forecast (Appendix to the *2016–2040 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS); SCAG 2016), employment is anticipated to grow from 70,500 in 2012 to 156,600 in 2040 in unincorporated Riverside County (SCAG 2016a, p. 28). Total employees/staff for the Project is estimated to be 900, which would be less than 1% of the total employment in SCAG's Growth Forecast in 2040. The increase in employment would be minimal in comparison to the anticipated increase of the SCAG Growth Forecast. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. As such, it is anticipated that these new jobs would be filled by the existing residential population in the greater Riverside County area. Therefore, the proposed Project

would not generate substantial population growth. Infrastructure improvements would include the improvements to the Cactus Channel drainage ditch that runs along the south side of Cactus Avenue, connections to existing utilities serving areas surrounding the Project site. The infrastructure improvements implemented by the proposed Project would not encourage population growth, as they would be limited to just the Project site and flows within the existing Cactus Channel. Based on the above, no adverse impacts related to population growth would result from the Project; impacts would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

b) Would the project displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

No Impact. The Project site is undeveloped and does not currently support any housing; therefore, substantial numbers of existing housing would not be displaced and the construction of replacement housing elsewhere would not be necessary as a result of the proposed Project. No impact would occur, and this issue will not be further evaluated in the EIR prepared for the proposed Project.

c) Would the project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

No Impact. The Project site is undeveloped does not currently support any housing or population; therefore, substantial numbers of people would not be displaced, necessitating the construction of replacement housing elsewhere, as a result of the proposed Project. Therefore, no impacts would occur, and this issue will not be further addressed in the EIR prepared for the proposed Project.

4.14 Public Services

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
Fire protection?	☐	☐	☒	☐
Police protection?	☐	☐	☒	☐
Schools?	☐	☐	☒	☐
Parks?	☐	☐	☒	☐
Other public facilities?	☐	☐	☒	☐

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

Fire protection?

Less Than Significant Impact. The Project would be served by the Riverside County Fire Department. The closest fire station to the Project site is Station 65 Moreno Valley Station (15111 Indian Street, Moreno Valley), which is approximately 2 miles to the south and east of the Project site. As part of standard development practices, prior to construction, Project plans would be reviewed by the Riverside County Fire Department, and the Project would be required to incorporate the Riverside County Fire Department's recommendations into the final Project design. The Riverside County Fire Department review and approval of plans would ensure that the Project complies with the California Fire Code (24 CCR, Part 9). The Project applicant would be required to install fire safety devices, such as fire alarms and sprinklers, in order to improve emergency-related problems for the proposed development. Zoned fire sprinkler systems would be installed throughout the building.

The Project is subject to the payment of a development impact fee (DIF) related to fire protection. The Project DIF amount for fire protection facility fees is determined based on Ordinance No. JPA 15-01(March JPA 2015). The payment of these fees would provide funding for capital improvements such as land, equipment purchases, and fire station construction. Operations of the proposed warehouse would generate approximately 900 jobs, which would be less than 1% of the total employment in SCAG's Growth Forecast in 2040. The increase in employment would be minimal in comparison to the anticipated increase of the SCAG Growth Forecast. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Therefore, it is anticipated that these new jobs would be filled by the existing residential population in the greater Riverside County area. Therefore, Project employment would not result in substantial population growth within the fire station jurisdictions as it is expected that jobs would be filled by the existing residential population in the greater Riverside County area. The proposed Project would comply with applicable fire codes, is consistent with the land use types and activities envisioned, and would pay the required DIF fees; therefore, the Project would not result in the need for new or expanded fire protection facilities, and impacts would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

Police protection?

Less Than Significant Impact. The Project would be served by the Riverside County Sheriff's Department. The closest police station to the Project site is the Riverside Sheriff's Department (22850 Calle San Juan De Los Lagos, Moreno Valley, California 92553), located approximately 0.3 mile north of the Project site. The proposed industrial development would bring an additional 900 employees, which would be less than 1% of the total employment in SCAG's Growth Forecast in 2040. The increase in employment would be minimal in comparison to the anticipated increase of the SCAG Growth Forecast. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Therefore, it is anticipated that these jobs would be filled by existing residential population in the greater Riverside County area. Project implementation could result in additional enforcement calls and emergency responses to this location but is not anticipated to increase the overall demand for law enforcement personnel and services in the Project area such that new or improved facilities would be required. Any additional personnel (officers, supervisors, or support staff), equipment, and vehicles necessary to service calls to the new industrial use could be accommodated at existing facilities. The proposed Project would also be required to pay the criminal justice public facilities DIF. Therefore, with payment of fees, impacts to police protection services as a result of Project implementation would be less than significant. This issue will not be further evaluated in the EIR prepared for the proposed Project.

Schools?

Less Than Significant Impact. The Project would result in the construction of a 718,000 square-foot warehouse building. No housing is being proposed with this Project; therefore, the Project would not generate substantial population growth. The proposed industrial development would bring an additional 900 employees, which would be less than 1% of the total employment in SCAG's Growth Forecast in 2040. The increase in employment would be minimal in comparison to the anticipated increase of the SCAG Growth Forecast. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Therefore, it is anticipated that these new jobs could be filled by the existing residential population in the greater Riverside County area. As such, the proposed Project would not generate substantial population growth, thus there would be no substantial impact to school facilities in the area. This issue will not be further evaluated in the EIR prepared for the proposed Project.

Parks?

Less Than Significant Impact. The Project would result in the construction of a 718,000 square-foot warehouse building. No housing is being proposed with this Project; therefore, the Project would not generate substantial population growth. The Project would enhance the jobs/housing balance of the March JPA Planning Area and adjacent jurisdictions at full buildout. It is anticipated that these new jobs could be filled by the existing residential population in the greater Riverside County area. Therefore, the proposed Project would not generate substantial population growth, thus there would be no substantial impact to park facilities in the area. This issue will not be further evaluated in the EIR prepared for the proposed Project.

Other public facilities?

Less Than Significant Impact. No housing is being proposed with this Project; therefore, the Project would not generate substantial population growth. The Project would enhance the jobs/housing balance of the March JPA Planning Area and adjacent jurisdictions at full buildout. It is anticipated that these new jobs could be filled by the existing residential population in the greater Riverside County area. Therefore, the proposed Project would not generate substantial population growth, thus there would be no substantial impact to library or other public facilities in the area. This issue will not be further evaluated in the EIR prepared for the proposed Project.

4.15 Recreation

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☒	☐

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less Than Significant Impact. The March JPA General Plan does not designate the Project area or adjacent properties as open space areas (March JPA 1999). The proposed Project involves the development of a warehouse building, and improvements to the drainage ditch that runs along the south side of Cactus Avenue. No housing is being proposed with this Project, and the proposed industrial development would bring an additional 900 employees, which would be less than 1% of the total employment in SCAG's Growth Forecast in 2040. The increase in employment would be minimal in comparison to the anticipated increase of the SCAG Growth Forecast. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Therefore, Project implementation would not directly or indirectly increase the use of existing parks or recreational facilities, and thus no deterioration of existing facilities would occur. There would not be an increase in use of the parks and recreational facilities from this Project, and thus no deterioration of existing facilities. Therefore, no signification impacts would occur. This issue will not be further evaluated in the EIR prepared for the proposed Project.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

Less Than Significant Impact. The proposed Project involves the development of a warehouse building and improvements to the drainage ditch that runs along the south side of Cactus Avenue. No housing is being proposed with this Project; therefore, the Project would not generate substantial population growth. The Project would enhance the jobs/housing balance of the March JPA Planning Area and adjacent jurisdictions at full buildout. The proposed Project would generate a maximum number of 900 jobs during operations, which would be less than 1% of the total employment in SCAG's Growth Forecast in 2040. The increase in employment would be minimal in comparison to the anticipated increase of the SCAG Growth Forecast. Therefore, the Project would not stimulate population growth or a population concentration above what is assumed in local and regional land use plans, or in projections made by regional planning authorities. Therefore, it is anticipated that these new jobs would be filled by the existing residential population in the greater Riverside County area. Therefore, the proposed Project would not require the construction or expansion of recreational facilities, and impacts would be less than significant. This issue will not be further discussed in the EIR prepared for the proposed Project.

4.16 Transportation and Traffic

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
TRANSPORTATION/TRAFFIC – Would the project:				
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	☒	☐	☐	☐
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	☒	☐	☐	☐
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☒	☐	☐	☐
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
e) Result in inadequate emergency access?	☐	☐	☒	☐
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	☒	☐	☐	☐

a) Would the project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Potentially Significant Impact. A traffic impact analysis is being prepared for the Project that will identify any potential impacts associated with consistency with the March JPA's traffic and circulation policies. The traffic impact analysis will evaluate the circulation system with the development of the proposed Project. The analysis of the circulation system, potential impacts associated with the Project, and potential feasible mitigation

measures will be identified in the traffic impact analysis and incorporated into the EIR. As such, traffic impacts are considered potentially significant and will be further evaluated in the EIR prepared for the proposed Project.

b) Would the project conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Potentially Significant Impact. A traffic impact analysis is being prepared for the Project that will identify the potential for congestion as a result of Project implementation. The proposed Project would generate a maximum number of 900 jobs during operations, thus bringing in more vehicle trips to the Project area from the greater Riverside County area. The analysis of the congestion management plan, with the potential for feasible mitigation measures outlined in the traffic impact analysis, requires additional study and therefore would be considered potentially significant until it can be analyzed fully in the EIR. As such, the EIR prepared for the Project will include a traffic impact analysis that identifies congestion impacts associated with the development of the proposed Project.

c) Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Potentially Significant Impact. The Project site is located within the March ARB land use plan area. Specifically, the Project site is located within the C1 compatibility zone. Zone C1, Primary Approach/Departure Zone, encompasses areas subject to moderate to high noise and moderate accidental potential risk. Generally, uses prohibited within Zone C1 include children's schools, day care centers, libraries, hospitals, congregate care facilities, places of assembly, noise-sensitive outdoor nonresidential uses, and hazards to flight. The Project's compliance with the March ARB/Inland Port Airport Land Use Compatibility Plan will be addressed in the Hazards and Hazardous Materials section in the EIR prepared for the proposed Project, as the intent of the compatibly plan is to protect people and the environment from impacts due to proximity to the airport. As such, this threshold will be further evaluated in the EIR prepared for the proposed Project.

d) Would the project substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant Impact. Regional access to the Project site is provided via I-215, with local access via Cactus Avenue. Vehicular access points and circulation outside/inside the Project site, including the Project's parking lots, would be reviewed and approved by the March JPA's planning and engineering staff. The Project does not

include any non-standard design features, nor does it have any hazardous elements. Impacts would be less than significant, and this issue will not be further evaluated in the EIR prepared for the proposed Project.

e) Would the project result in inadequate emergency access?

Less Than Significant Impact. The proposed Project would result in the development of a currently undeveloped site, including the development of site access roadways. Access to the Project site would be provided via two driveways located along Cactus Avenue. Access to the Project site would be designed according to March JPA standards and all applicable emergency access standards. Additionally, through March JPA's site plan review, March JPA would ensure that the proposed industrial warehouse building and the improvements to the drainage ditch that runs along the south side of Cactus Avenue meet code requirements related to emergency access. Impacts would be less than significant, and this issue will not be further evaluated in the EIR prepared for the proposed Project.

f) Would the project conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Potentially Significant Impact. The Riverside Transit Agency (RTA) provides bus service within the March JPA (RTA 2014). The nearest bus stop is located at the northeast intersection of Fredrick Street and Cactus Avenue. There is an existing Class II bike lane along Cactus Avenue. Bicycle racks would be included as part of the proposed Project and would be reviewed as part of March JPA's design review process. A traffic impact analysis is being prepared that will address consistency with adopted policies, plans, or programs regarding public transit and bicycle and pedestrian facilities. The analysis of the alternate modes of transportation, including public transit and bicycle and pedestrian facilities requires additional study and therefore is considered potentially significant until it can be analyzed fully in the EIR. This issue will be further evaluated in the EIR prepared for the proposed Project.

4.17 Tribal Cultural Resources

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
TRIBAL CULTURAL RESOURCES				
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☒	☐	☐	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	☒	☐	☐	☐

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

Potentially Significant Impact. A cultural resources technical report is being prepared for the proposed Project that will identify potential impacts to tribal resources/properties under both CEQA and Public Resources Code (PRC) 5020.1(k). The analysis of tribal resources, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR prepared for the proposed Project.

ii) ***A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?***

Potentially Significant Impact. March JPA has initiated consultation efforts with California Native American tribes. Through consultation efforts, March JPA and Native American tribes will determine the Project's potential to affect tribal cultural resources. This issue will be evaluated further in the EIR prepared for the proposed Project.

4.18 Utilities and Service Systems

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
UTILITIES AND SERVICE SYSTEMS – Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☒	☐	☐	☐
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed? In making this determination, the Authority shall consider whether the project is subject to the water supply assessment requirements of Water Code Section 10910, et. seq. (SB 610), and the requirements of Government Code Section 664737 (SB 221).	☒	☐	☐	☐
e) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☒	☐	☐	☐
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	☒	☐	☐	☐
g) Comply with federal, state, and local statutes and regulations related to solid waste?	☒	☐	☐	☐

a) Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Potentially Significant Impact. The Project site is currently undeveloped and not connected to water or wastewater infrastructure. As such, Project implementation would require the construction of new water and wastewater connections in order to connect to Western Municipal Water District (WMWD0 water and wastewater collection and treatment systems. The proposed Project would generate a maximum of 900 jobs during operations. Due to the size of the Project and the potential for the Project to require water and generate wastewater in quantities beyond those currently handled by WMWD's service infrastructure, potentially significant impacts could result. As such, this issue will be further evaluated in the EIR prepared for the proposed Project..

b) Would the project require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Potentially Significant Impact. The Project site is currently undeveloped and not connected to water or wastewater infrastructure. As such, Project implementation would require the construction of new water and wastewater connections in order to connect to WMWD water and wastewater collection and treatment systems. The proposed Project would generate a maximum of 900 jobs during operations. Due to the size of the Project and the potential for the Project to require water and generate wastewater in quantities beyond those currently handled by WMWD's service infrastructure, potentially significant impacts could result. As such, this issue will be further evaluated in the EIR prepared for the proposed Project.

c) Would the project require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Potentially Significant Impact. The Project site is currently undeveloped and not connected to any stormwater infrastructure or facilities. The Project would retain all post development flow on site; however, the Riverside County Flood Control District may allow minimal drainage into the proposed improvements to the existing open Cactus Channel drainage. The Project would be required to comply with all rules, regulations, and other requirements of the March JPA for use of stormwater facilities. A WQMP will be prepared for the Project, and the impacts and mitigation identified within the WQMP will be incorporated into the EIR prepared for the Project. While no significant stormwater drainage facility impacts are anticipated, further detailed analysis will be performed to confirm whether or not significant impacts would result from Project implementation. As such, this issue will be evaluated further in the EIR prepared for the Project.

d) Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Potentially Significant Impact. The Project site is located within the WMWD service area. The proposed Project would generate a maximum number of 900 jobs during operations. A Water Supply Assessment (WSA) will be prepared and approved by WMWD to provide an analysis as to whether WMWD will have sufficient water supplies available to serve the Project in normal, dry, or multiple dry years. The analysis in the WSA may result in the need for mitigation measures. This issue requires additional analysis and is therefore considered potentially significant until it can be analyzed fully in the EIR. This issue will be further evaluated in the EIR prepared for the proposed Project.

e) Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Potentially Significant Impact. See discussion b) above. The Project site is located within WMWD's service area. Prior to Project approval, a will-serve letter must be obtained by WMWD to determine whether WMWD can serve the Project. Wastewater generated would be discharged to the City of Riverside's Wastewater Treatment Plant located at the Regional Water Quality Control Plant. This topic requires additional analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR. This issue will be further evaluated in the EIR prepared for the proposed Project.

f) Would the project be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Potentially Significant Impact. The amount of solid waste generated during construction would be limited to excess construction debris, as the site is currently undeveloped. However, during operation, a maximum of 900 employees would be on site. Therefore, solid waste quantities would exceed the amount being generated currently on site. As such, impacts to solid waste are potentially significant, and this issue will be further evaluated in the EIR prepared for the proposed Project.

g) Would the project comply with federal, state, and local statutes and regulations related to solid waste?

Potentially Significant Impact. The analysis of the federal, state, and local statues and regulations related to solid waste, with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR. Therefore, the EIR prepared for the proposed

Project will identify the solid waste provider and discuss how that provider complies with federal, state, and location statutes regarding solid waste.

4.19 Mandatory Findings of Significance

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☒	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

Potentially Significant Impact. The Project site is currently undeveloped. A biological technical report is being prepared to identify whether the proposed Project would substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or reduce the number or restrict the range of a rare or an endangered plant or animal. A cultural resources report is also being prepared to evaluate whether the proposed Project would result in adverse impacts to cultural, archaeological, or paleontological resources. The analysis of the proposed Project's potential for environmental effects related

to biological and cultural resources, along with the potential for feasible mitigation measures, requires additional study and analysis and therefore is considered potentially significant until it can be analyzed fully in the EIR. These issues will be further evaluated in the EIR prepared for the proposed Project.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Potentially Significant Impact. The proposed Project has the potential to result in significant impacts, and as such has the potential to result in and/or contribute to cumulatively significant impacts. As such, this issue will be further evaluated in the EIR prepared for the proposed Project.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Potentially Significant Impact. Based on the analysis above, Project implementation could result in potentially significant adverse effects on human beings. The analysis of the proposed Project's potential for environmental effects that can cause substantial adverse effects on human beings requires additional study and therefore is considered potentially significant until it can be analyzed fully in the EIR. As such, this issue will be further evaluated in the EIR prepared for the proposed Project.

WESTERN MUNICIPAL WATER DISTRICT

Securing Your Water Supply

December 3, 2018

Matthew Evans
Planning Director
March Joint Powers Authority
14205 Meridian Parkway, Suite 140
Riverside, CA 92518

CONDITIONS OF APPROVAL FOR K4 WAREHOUSE AND CACTUS CHANNEL IMPROVEMENTS PROJECT

Thank you for giving Western Municipal Water District (Western) the opportunity to review the initial study for K4 and Cactus Channel Improvements project. We have completed our review and have the following conditional approval for the K4 project:

1. Compliance with water efficient landscape requirements per the March Joint Powers Authority Ordinance is required.

2. All applicable Added Facilities Charges (for water facilities), Sewer Connection Fees, and Meter Installation Fees must be paid as well as Cross Connection Testing, and regulatory compliance approved prior to the installation of any water meter.

3. Proposed facilities for water and sewer must be designed by a registered Civil Engineer, and reviewed and approved by Western. Deposit for Plan Check must be received prior to plan submittal and Deposit for Inspection must be submitted to Western prior to approval of the plans.

4. Western, as a member agency of Metropolitan Water District of Southern California (MWD) will enforce MWD's Plan for Water Use Efficiency Guideline requirements for water conservation.

5. The project site is currently undeveloped and it is not connected to a water and sewer system. As such, project implementation would require the construction of new water and sewer pipelines from Riverside Avenue along Cactus Avenue to provide adequate capacity to serve the K4 warehouse development. A water and sewer study needs to be prepared by the developer to address on-site and off-site improvements. In addition the interconnection between Western and Eastern

Municipal Water District (EMWD) must be constructed prior to connecting the system to the water pipeline. Water service to K4 will be via Western pipes extended to the parcel by off-site developer paid design and construction.

6. The Channel Improvements shall be made in such a way to avoid conflicts with the approved plans for the construction of interconnection PRV vale and appurtenances between EMWD and Western. The Channel box culvert or pipe must be designed and constructed such that it is not an obstacle to existing or planned sanitary sewer or potable water service laterals.

7. Prior to issuance of will-serve letter, water and sewer study shall be completed. A water supply assessment shall also be completed and approved by Western.

8. Developer shall submit a detailed engineer's construction cost estimate to Western for review and approval. Once approved, developer shall make a deposit for plan checking services for Water, Sewer and/or Recycled Water Improvement Plans.

9. Water, Sewer and/or Recycled Water Improvement Plans shall be designed per Western's Standard Specifications. Please review Western's Developer Handbook for submittal formats and requirements online at:

   http://www.wmwd.com/162/Developer-Handbook

10. Water, Sewer and Recycled Water Commercial Plans for connections only shall be designed per Western's Standards and Specifications. Please review Western's Commercial Plan Check Package for submittal formats and requirements online at:

    http://www.wmwd.com/DocumentCenter/Home/View/237

11. Developer shall submit grading plans for Western's review and approval before a grading permit is issued.

12. Water, Sewer and/or Recycled Water Improvement Plans or Commercial Plans shall not be approved until all items mentioned above are received and approved by Western.

13. The developer is responsible for installing, paying all costs, and obtaining an encroachment permit from the local jurisdiction having authority over installation of water, sewer and/or recycled water facilities including laterals in the public right-of-way. If the customer chooses to cross private property then the customer is responsible to obtain private easements from adjacent property owners. Proof of an officially recorded private easement must be provided to Western prior to plan approval.

14. For water, sewer and/or recycled water service by Western, the developer shall comply with the "Standard Conditions," and all applicable Rules, Regulations, and General Policies of Western at the time of construction.

15. Modify Section 4.18, Paragraph e, page 59 of the draft initial study to read, wastewater generated would be treated by Western.

16. Contact Western's Development Services Department at (951) 571-7100 for further information.

Thank you for giving Western the opportunity to submit these items as part of the study.

Notice of Preparation of a Draft Environmental Impact Report for the K4 and Cactus Channel Improvements Project[1]

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. SCAQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Environmental Impact Report (EIR). Please send SCAQMD a copy of the Draft EIR upon its completion. Note that copies of the Draft EIR that are submitted to the State Clearinghouse are not forwarded to SCAQMD. Please forward a copy of the Draft EIR directly to SCAQMD at the address shown in the letterhead. **In addition, please send with the Draft EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files**[2]**. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, SCAQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from SCAQMD's Subscription Services Department by calling (909) 396-3720. More guidance developed since this Handbook is also available on SCAQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). SCAQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

SCAQMD has also developed both regional and localized significance thresholds. SCAQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results to

[1] The Proposed Project would include construction of a 718,000-square-foot warehouse on 35.4 acres.
[2] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

SCAQMD's CEQA regional pollutant emissions significance thresholds to determine air quality impacts. SCAQMD's CEQA regional pollutant emissions significance thresholds can be found here: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In addition to analyzing regional air quality impacts, SCAQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by SCAQMD staff or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses (such as placing homes near freeways) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance[3] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

SCAQMD Staff's Recommendation for Truck Trip Rates for High Cube Warehouse Projects

SCAQMD staff recommends the use of truck trip rates from the Institute of Transportation Engineers (ITE) for high cube warehouse projects located in SCAQMD (i.e. 1.68 average daily vehicle trips per 1,000 square feet and 0.64 average daily truck trips per 1,000 square feet). Consistent with CEQA Guidelines, the Draft EIR for the Proposed Project may use a non-default trip rate if there is substantial evidence supporting another rate is more appropriate for the air quality analysis.

[3] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

For high cube warehouse projects, SCAQMD staff has been working on a Warehouse Truck Trip Study to better quantify trip rates associated with local warehouse and distribution projects, as truck emission represent more than 90 percent of air quality impacts from these projects. Details regarding this study can be found online here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/high-cube-warehouse.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project, including:

- Chapter 11 of SCAQMD's CEQA Air Quality Handbook
- SCAQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- SCAQMD's Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Additional mitigation measures for operational air quality impacts from mobile sources that the Lead Agency should consider in the Draft EIR may include the following:

- Require zero-emissions or near-zero emission trucks, if and when feasible. Consider measures such as incentives, phase-in schedules for clean trucks, etc. At a minimum, require that the operator commit to using 2010 model year and newer trucks (e.g., material delivery trucks and soil import/export)[4].
- Have truck routes clearly marked with trailblazer signs, so that trucks will not enter residential areas.
- Limit the daily number of trucks allowed at the Proposed Project to levels analyzed in the CEQA document. If higher daily truck volumes are anticipated to visit the site, the Lead Agency should commit to re-evaluating the Proposed Project through CEQA prior to allowing this land use or higher activity level.
- Provide electric vehicle (EV) Charging Stations (see the discussion below regarding EV charging stations).
- Should the Proposed Project generate significant regional emissions, the Lead Agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including Class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final CEQA document, the Lead

[4] Based on a review of the California Air Resources Board's diesel truck regulations, 2010 model year diesel haul trucks should have already been available and can be obtained in a successful manner for the project construction California Air Resources Board. March 2016. Available at: http://www.truckload.org/tca/files/ccLibraryFiles/Filename/000000003422/California-Clean-Truck-and-Trailer-Update.pdf (See slide #23).

Agency should require a phase-in schedule for these cleaner operating trucks to reduce any significant adverse air quality impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the Lead Agency.

- Trucks that can operate at least partially on electricity have the ability to substantially reduce the significant NOx impacts from this project. Further, trucks that run at least partially on electricity are projected to become available during the life of the project as discussed in the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS)[5]. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing building. Therefore, SCAQMD staff recommends the Lead Agency require the Proposed Project and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in. Similar to the City of Los Angeles requirements for all new projects, SCAQMD staff recommends that the Lead Agency require at least 5% of all vehicle parking spaces (including for trucks) include EV charging stations[6]. Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in any onboard auxiliary equipment. At a minimum, electrical panels should be appropriately sized to allow for future expanded use.
- Design the industrial building such that entrances and exits are such that trucks are not traversing past neighbors or other sensitive receptors.
- Design the industrial building such that any check-in point for trucks is well inside the Proposed Project site to ensure that there are no trucks queuing outside of the facility.
- Design the industrial building to ensure that truck traffic within the Proposed Project site is located away from the property line(s) closest to its residential or sensitive receptor neighbors.
- Restrict overnight parking in residential areas.
- Establish overnight parking within the industrial building where trucks can rest overnight.
- Establish area(s) within the Proposed Project site for repair needs.
- Develop, adopt and enforce truck routes both in and out of city, and in and out of facilities.
- Create a buffer zone of at least 300 meters (roughly 1,000 feet), which can be office space, employee parking, greenbelt, etc. between the Proposed Project and sensitive receptors.

Additional mitigation measures for operational air quality impacts from other area sources that the Lead Agency should consider in the Draft EIR may include the following:

- Maximize use of solar energy including solar panels; installing the maximum possible number of solar energy arrays on the building roofs and/or on the Project site to generate solar energy for the facility.
- Maximize the planting of trees in landscaping and parking lots.
- Use light colored paving and roofing materials.
- Utilize only Energy Star heating, cooling, and lighting devices, and appliances.
- Install light colored "cool" roofs and cool pavements.
- Require use of electric or alternatively fueled sweepers with HEPA filters.
- Use of water-based or low VOC cleaning products.

[6] City of Los Angeles. Accessed at: http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf.

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the Draft EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.

Permits

In the event that the Proposed Project requires a permit from SCAQMD, SCAQMD should be identified as Responsible Agency for the Proposed Project in the Draft EIR. For more information on permits, please visit SCAQMD webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to SCAQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available at SCAQMD's webpage at: http://www.aqmd.gov.

SCAQMD staff is available to work with the Lead Agency to ensure that project air quality impacts are accurately evaluated and any significant impacts are mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov or call me at (909) 396-3308.

Sincerely,

Lijin Sun

Subject: FW: "K4 and Cactus Channel Improvements Project - EIR"

FYI – Comments (late) from Moreno Valley.

From: Claudia Manrique <claudiam@moval.org>
Sent: Tuesday, January 15, 2019 9:20 AM
To: Mathew Evans <evans@marchjpa.com>
Subject: "K4 and Cactus Channel Improvements Project - EIR"

Dear Mr. Evans:

The City of Moreno Valley appreciates the opportunity to comment on the Notice of Preparation of a Draft Environmental Impact Report (DEIR) for the proposed industrial warehouse project. The notice describes the proposal as the development of 718,000 square feet of industrial/warehouse buildings on approximately 35 acres along with improvements to the neighboring Cactus Channel drainage ditch. The proposed project's close proximity to Moreno Valley gives us keen interest in the project to ensure it is successful without causing adverse impacts to Moreno Valley.

In reviewing the Notice of Preparation of a DEIR and related Initial Study, we have the following comments for your consideration:

- The City of Moreno Valley is concerned that the proposed zone change to allow for a 718,000 square foot industrial building is more intensive than the current land use designation of Business Park. The land use change and the corresponding development would likely create increased intensity and environmental concern, including increased truck traffic and air quality impacts to the area and adjacent City of Moreno Valley roadways; these impacts should be addressed in the environmental document.

- Cumulative impacts of the project shall be considered along with other recently approved industrial projects and other projects under consideration in the vicinity, including the approximately 700,000 square foot logistics warehouse building proposed southwesterly of Alessandro Boulevard and the Old 215 Frontage Road within the March Joint Powers Authority area.

- The City of Moreno Valley requests that project plans be provided for review when complete. A full set of project plans including the site plan and building elevations should be provided in both hard copy and electronic format for ease of review and distribution to other City staff.

- The City of Moreno has concerns regarding existing drainage and infrastructure on Cactus Avenue adjacent to the project site. Include information in the DEIR and corresponding Drainage Study demonstrating that the project would not further be impacting drainage for the area, including properties to the south of the project site located in the City of Moreno Valley.

- General transportation impacts would need to be reviewed in the future environmental document. A traffic study should be prepared that analyzes project access and traffic operations at adjacent and nearby intersections. Information shall include the number of trucks/vehicles generated by the project, any proposed bicycle lanes and bus or shuttle connections provided to service the Metrolink Station located westerly of Interstate 215. The City of Moreno Valley requests an opportunity to review the draft traffic study when complete.

- With the proposed project's close proximity to the City of Moreno Valley and prominent location close to a major entry point into the City of Moreno Valley, it is important that the project is compatible with surrounding land uses and design along Cactus Avenue. All four sides of the project building elevations should be addressed, and color elevations that depict actual paint selection colors for all proposed buildings should be provided for review.

- The project and associated DEIR should address roof top equipment screening from the Cactus Avenue right of way and the adjacent City of Moreno Valley.

- With the location of the proposed project adjacent to the City, project landscaping must be compatible with the aesthetic character of the area. Landscapes and streetscapes shall be compatible to developments adjacent in the City of Moreno Valley. The City has designated the African Sumac/*Rhus lancea* as the street tree for Cactus Avenue. Conceptual landscape plans would be necessary to determine the type of landscape and street trees provided. The City of Moreno Valley would encourage coordination with your staff on the landscape plan to ensure a unified streetscape.

- Site Plan details are not specifically provided with the NOP submittal. Project details should include decorative screen walls for all loading areas adjacent to Cactus Avenue, with details providing information including height, design and color. A sight line distance exhibit should be provided to determine the height of the walls provided for full screening of any truck loading and trailer storage areas from the right of way and the City of Moreno Valley. Consistent with the City of Moreno Valley Municipal Code, decorative screening walls with pilasters equal in height to or exceeding a truck trailer and compatible with design/colors of the proposed buildings would be recommended. The City of Moreno Valley would encourage coordination with City staff on all proposed screening walls to ensure a unified streetscape.

- It is recommended that project conditions of approval identify the need to ensure that graffiti abatement will occur on any exposed perimeter walls.

- Initial Study Page 40, Sections 4.9 g, h, i shows no impact due to flooding. Per FEMA FIRM 06065C0745G dated 8/28/08, the project site falls within Zone D (flood hazards undetermined, but possible). As part of the project development, the base flood elevation should be determined and a CLOMR/LOMR should be submitted to FEMA for review and approval.

- Initial Study Figure 5 shows Cactus Channel as a proposed rectangular channel. Per the project description, Cactus Channel is proposed as a box culvert. Documents within the EIR should be consistent on what is being proposed for the channel. Furthermore, the study area limits of the EIR should extend to cover the entire reach of the proposed Cactus Channel improvements, not just limited to the project's frontage along Cactus Avenue.

- The City of Moreno Valley Noise Ordinance should be addressed in the Noise analysis in addition to MJPA Noise regulations.

- The project and associated DEIR should address required street lighting on the south side of Cactus Ave.

- The project and associated DEIR should address requirements to repair any damage made to existing landscape areas maintained by the City.

- The project and associated DEIR should address bringing existing median(s) up to current City Standards.

- The project and associated DEIR should address the need to enter into an agreement to fund the ongoing operation and maintenance for its share of street lighting costs and median landscape maintenance.

The City of Moreno Valley looks forward to working with the March Joint Powers Authority team as this project progresses through the environmental review process and prior to the public hearing. We respectfully request that the City of Moreno Valley receive copies of the appropriate environmental documents and all related technical studies when available. The City of Moreno Valley would also request early coordination and review of the site plan and other project components noted in this letter prior to public review. Please include the City on any future mailing lists regarding the DEIR documents as well as for future notification of meetings and public hearings associated with the project.

Thank you again for the opportunity to provide comments on the NOP. We look forward to working with you as the DEIR is being finalized and reviewing all environmental documents when complete.

Sincerely,

Claudia Manrique

DRAFT

EXECUTIVE SUMMARY

K4 and Cactus Channel Improvement Project proposes a warehouse for industrial use in Riverside County, California, known as the K4 Parcel Project (the Project). The Project is an approximately 718,000 square feet building on an approximately 35.4-acre site that includes surface parking areas for automobiles and truck trailers, and a 7.0-acre drainage channel (Cactus Avenue Channel) bordering the parcel to the north (south side of Cactus Avenue). The warehouse development will be used up to 7 days per week and 24 hours per day. Currently, the site is vacant land. The Project site is located south of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 0.8 miles west of the Project site.

The Project will result in emissions of criteria air pollutants, such as nitrogen oxides (NO_X), carbon monoxide (CO), volatile organic compounds (VOCs), sulfur oxides (SO_X), and particulate matter (PM) of aerodynamic radius less than 10 micrometers (PM_{10}) or less than 2.5 micrometers ($PM_{2.5}$). This report provides an inventory surveying the emissions that would result from the Project.

This analysis primarily utilized the California Emission Estimator Model version 2016.3.2 (CalEEMod®)[1] to assist in quantifying the criteria air pollutant emissions for both construction and operation of the Project. CalEEMod® incorporates EMFAC2014 to calculate mobile source emissions. EMFAC2014 has been superseded by EMFAC2017.[2] In order to allow for a more accurate representation of mobile source operational emissions associated with the Project, mobile source emission factors were estimated using EMFAC2017. These emissions factors were then used to estimate mobile source operational emissions based on CalEEMod® methodology along with Project-specific values where available. The maximum daily emissions are estimated for the criteria air pollutants. The localized criteria air pollutant concentrations were evaluated using the mass-based Localized Significance Thresholds (LSTs) to evaluate ambient air impacts associated with construction and operation of the Project.

For construction, the maximum daily unmitigated criteria air pollutant emissions (lbs/day) are less than the South Coast Air Quality Air Management District (SCAQMD) CEQA significance thresholds for CO, SO_x, PM_{10} and $PM_{2.5}$, and greater than the significance thresholds for VOC and NO_X as shown in **Table ES-1**. The unmitigated NO_X emissions are estimated to exceed the significance threshold during construction due to a combination of haul truck activities and the operation of on-site construction equipment during the grading phase. The unmitigated VOC emissions are estimated to exceed the significance threshold during construction primarily due to the use of architectural coatings. The Project will comply with SCAQMD Rule 403 to minimize fugitive dust during construction.[3] The Project will mitigate the VOC emissions by utilizing Super Compliant coatings with a VOC content less than 10

[1] California Air Pollution Control Officers Association (CAPCOA). 2017. California Emissions Estimator Model. Available at: http://www.CalEEMod.com/. Accessed: August 2018.

[2] EMFAC2017 was initially released by the California Air Resources Board (CARB), which establishes California's air quality regulations, on December 22, 2017 and then updated on March 1, 2017. USEPA is currently reviewing this model to determine if it can be used in State Implementation Plans and conformity modeling. Since this report has been prepared for CEQA purposes, and CEQA is a state regulation, EMFAC2017 (the most current version of the model released by CARB) was used.

[3] SCAQMD. 2005. Rule 403. Fugitive Dust. Available at: http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf. Accessed: August 2018.

DRAFT

grams per liter (g/L) VOC[4] to reduce VOC emissions to below the applicable significance threshold as shown in **Table ES-1**. The Project has also committed to use 50% Tier 3 construction equipment and 50% Tier 4 equipment, based on number of pieces of construction equipment. This mitigation measure will reduce NO_X emissions to below the applicable significance threshold as shown in **Table ES-1**.

For operational emissions, the maximum daily criteria air pollutant emissions for the Project are estimated to be less than the significance thresholds for CO, SO_X, PM_{10}, $PM_{2.5}$, and VOC, and greater than the significance thresholds for NO_X as shown in **Tables ES-2**. The primary source of the operational emissions is the traffic related mobile sources. While the emissions from mobile sources are expected to decline in the future as vehicles are required to become more fuel efficient due to existing regulations (i.e., EPA and NHTSA Phase 1 and Phase 2 greenhouse gas emissions and fuel efficiency standards), this analysis conservatively does not incorporate reductions from these regulatory changes as the emission factors from EMFAC2017 do not account for the benefits from these regulatory programs for criteria pollutants. The Project will not exceed the CO hotspots significance thresholds at any intersection affected by the Project.

Localized air quality impacts of Project construction and operational activities were evaluated using SCAQMD's LST methodology. As shown in **Tables ES-3 and Table ES-4,** Project related emissions from on-site construction and operation would not result in an exceedance of SCAQMD LSTs for nitrogen dioxide (NO_2), CO, PM_{10}, and $PM_{2.5}$. Emissions from both the construction and operational activities were estimated based on conservative assumptions to represent the maximum level of activity that may occur on the Project Site. Furthermore, the LST analysis assumes that the maximum daily emissions would occur during the worst-case meteorological conditions, which is not likely.

DRAFT

[4] SCAQMD. 2018. Super-Compliant Coating Manufacturers. Available at: http://www.aqmd.gov/docs/default-source/planning/architectural-coatings/super-compliant-manf-list.pdf?sfvrsn=19. Accessed: August 2018.

1. INTRODUCTION

The purpose of this technical report is to present the quantitative analyses that were used to evaluate the Project's air quality impacts. Emissions during both construction and operations of the Project were quantified and compared to the South Coast Air Quality (SCAQMD) daily mass significance thresholds. In addition, on-site construction and operational emission estimates were used to evaluate ambient air impacts of the Project on the residences and sensitive receptors located in the vicinity of the Project.

1.1 Project Description

K4 and Cactus Channel Improvement Project (the Project) proposes an industrial use warehouse development in Riverside County, California. The Project is a building consisting of approximately 718,000 square feet on an approximately 35.4-acre site that includes surface parking areas for automobiles and truck trailers. The warehouse development will be used up to 7 days per week and 24 hours per day. Additionally, the Project would include implementing regional improvements to the 7-acre Cactus Avenue Channel drainage ditch that runs along the south side of Cactus Avenue, commencing just east of Elsworth Street, then along the Project frontage, and further to the east ending at the Heacock Channel. This portion of the Project is being proposed by Riverside County Flood Control and Water Conservation District as part of the District's Master Plan and is being discussed with the other agencies and landowners that control the land necessary to implement the length of the improvement. The box culvert is being permitted by the Riverside County Flood Control District and Water Conservation District ("District") and it would either be constructed contemporaneously with the project or built separately depending on permitting and timing. The channel would function as part of the District's Master Plan and it would function as part of the District's Master Plan and may require compliance with the Western Riverside County Multiple Species Habitat Conservation Plan. Currently, the site is vacant land. The Project site is located south of Cactus Avenue and extends from where Veterans Way terminates at Cactus Avenue on the west to where Frederick Street terminates at Cactus Avenue on the east. The project site is located within the March joint Powers Authority (JPA) jurisdiction in unincorporated Riverside County, California. Interstate 215 (I-215) is located approximately 0.8 miles west of the Project site. The closest residential land uses are located approximately 0.5 miles to the north and southeast of the Project Site. The proposed Project area is shown in **Figure 1** and the land use summary is presented in **Table 1.**

Analysis of the Project's criteria air pollutant (CAP) emissions incorporates the following regulatory measures and mitigation measures.

Regulatory Measures

Construction

- Compliance with SCAQMD Rule 403 regarding fugitive dust. The analysis quantifies the emission reductions associated with of watering active construction areas at least twice daily to minimize fugitive dust emissions;[5]

[5] Note that the control efficiency of watering is dependent on numerous variables such as soil/ground conditions, temperature, and vehicle travel specifics. For unpaved roads, increased frequency and/or water amounts are expected to improve the control efficiency.

DRAFT

– Compliance with SCAQMD Rule 1113 regarding Architectural Coatings. This rule limits the VOC content of architectural coatings used in the SCAQMD. The rule provides various standards for the coating category;[6]

Operational

– Compliance with the California Energy Commission's (CEC) 2016 Building Energy Efficiency Standards (Title 24) are included in the energy use and emissions estimate for the Project.

Mitigation Measures

This Section provides a list of mitigation measures MM-AQ-1 through MM-AQ-8 that would help reduce CAP and greenhouse gas (GHG) emissions associated with the Project construction and operation. As a conservative approach, the reductions from MM-AQ-3, MM-AQ-4, MM-AQ-5, and MM-AQ-6 were not quantified due to the lack of clarity on the quantity of reductions associated with these mitigation measures.

MM-AQ-1 (Construction Equipment Emission Standards): During Project construction, the construction contractor, with oversight by March JPA, shall ensure that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet, at a minimum, the Tier 3 emission standards for non-road diesel engines promulgated by the United States Environmental Protection Agency (USEPA). In addition, the construction contractor shall utilize 50% Tier 4 Final construction equipment, based on number of pieces of construction equipment.

MM-AQ-2 (Low-VOC Architectural Coatings): The construction contractor shall be required to utilize Super-Compliant VOC interior and exterior paints, which are defined by SCAQMD as meeting the "super-compliant" VOC standard of 10 grams per liter (g/L), during construction and long-term operations.[7]

MM-AQ-3 (Construction Relations Officer): The Project will provide a construction relations officer to act as a community liaison to oversee on-site construction activity and all emissions and congestion related matters. A phone number and email contact information for the construction relations officer shall be posted on signage at construction site entrance points.

MM-AQ-4 (Improved Energy Efficiency and Water Reduction):

- The Project will install approximately 4.5 MW of solar photovoltaic electricity generation.
- The Project will install Energy Star certified light bulb and lighting fixtures.
- The Project will install duct insulation to a minimum level of R-6 and modestly enhanced window insulation as required by 2016 Title 24 and consistent with the Riverside County Climate Action Plan criteria.
- Consistent with the Riverside County Climate Action Plan criteria, the Project will include the following design elements: Construction of modest cool roof, defined as CRRC Rated 0.15 aged solar reflectance and 0.75 thermal emittance; Use of HVAC equipment with a

[6] Available at: http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/r1113.pdf. Accessed: August 2018.

[7] SCAQMD. Super-Compliant Architectural Coatings. Available at: http://www.aqmd.gov/home/programs/business/business-detail?title=super-compliant-coatings. Accessed: August 2018.

DRAFT

SEER of 14 or higher; Installation of water heaters with an energy factor of .92 or higher; All rooms will have some form of daylighting (e.g., skylights or windows); At least 50% of artificial lighting unit fixtures will be high efficacy; Waterless urinals and high efficiency toilets will be used throughout the Project; and water efficient faucets will be used throughout the Project.

- The Project will provide electrical outlets at building exterior areas.
- The Project landscape non-potable water system will meet "purple" pipe standards.
- The Project will exceed the Riverside County Climate Action Plan requirement for water efficient landscaping by having no turf and only drought tolerant plants and introducing additional water efficient irrigation controls such as smart irrigation controllers.
- The Project will provide circuitry and capacity for installation of electric vehicle charging stations consistent with the Riverside County Climate Action Plan criteria. The Project shall develop eleven on-site electric vehicle (EV) charging stations and fifty-four off-site EV charging stations.

MM-AQ-5 (Commute Trip Reduction):

- Five percent (5%) of vehicle/employee parking spaces shall be reserved for preferential spaces for car pools and van pools.
- Tenants with more than 10,000 square feet of office space shall provide video conferencing facilities. Tenant spaces below 10,000 square feet may pursue video conferencing as feasible.
- The Project will provide plentiful short- and long- term bicycle parking facilities to meet peak season maximum demand (one bike rack space per 20 vehicle/employee parking spaces).
- The Project will provide "end-of-trip" facilities including showers, lockers, and changing space (four clothes lockers and one shower provided for every 80-employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).
- Each tenant will provide on-site food vending machines or refrigerator, microwave oven, and mail facilities (i.e., drop box) at the Project site. Each tenant with over 5,000 square feet of office space shall provide an on-site computer, internet connection, and other services for personal employee use. Projects will also consider the provision of an ATM machine as feasible.

MM-AQ-6 (Truck Requirements):

- For any warehouse use, the loading docks shall be designed to accommodate SmartWay trucks.[8] The March JPA will require evidence of compliance prior to issuance of a certificate of occupancy for any warehouse use.

Regulatory Measures – Non-quantified Reductions

A few regulations adopted on the federal and/or state level were not incorporated due to the difficulty in quantifying the CAP reductions. They are:

- Phase 1 of the Heavy-duty Engines and Vehicles Fuel Efficiency Standards adopted by the United States Environmental Protection Agency (USEPA) and the National Highway Traffic Safety Administration (NHTSA) for model year 2014-2018.
- Phase 2 of the Heavy-duty Engines and Vehicles Fuel Efficiency Standards adopted by the USEPA and the NHTSA for model year 2018-2027.

Incorporating these regulations would further reduce the Project's emissions.

1.2 Existing Conditions

As noted above, the Project site is currently vacant land. The plot of land is located with a United States Air Force base to the south and an industrial area to the north.

DRAFT

2. SIGNIFICANCE THRESHOLDS

The Project is located in Riverside County and is; therefore, required to comply with the policies in the Riverside General Plan. The Riverside General Plan requires compliance with SCAQMD regulations and thresholds.[9] The SCAQMD has established significance thresholds[10] to assess the impacts of project-related construction and operational emissions on regional and local ambient air quality. **Table 2** shows the mass daily thresholds for construction and operations as adopted by the SCAQMD for criteria air pollutant emissions. The analysis summarized in this report estimates project-related construction and operational mass emissions and compares the emissions to these mass daily significance thresholds. This report also evaluates the localized ambient air quality impacts from on-site construction and operation activities for NO_2, CO, PM_{10}, and $PM_{2.5}$ emissions using SCAQMD's LST methodology.[11] If emission estimates for the proposed project activities are below the LST emission levels found in the LST mass look-up tables, the proposed construction or operational activity is not significant for air quality. The LST emission levels are presented in **Table 2**.

3. CRITERIA AIR POLLUTANT EMISSION INVENTORIES

This section describes the methodology that Ramboll US Corporation (Ramboll) used to develop the criteria air pollutant emissions inventories associated with the Project, which include construction emissions and operational emissions. Sub-categories of the operational emissions include: area sources, energy use, and mobile sources.

3.1 Methodology for Calculating Mass Emissions

This analysis focuses on the potential change in air quality due to implementation of the Project. The Project would result in criteria air pollutant emissions from construction and operational sources. Construction activities would generate emissions at the site from on-site construction equipment, and on roadways resulting from construction-related truck hauling, vendor deliveries, and worker commuting. Operational activities would also generate emissions from both on-site and off-site sources, including worker commuting, truck traffic, truck idling, and area sources, such as architectural coating and landscaping.

To estimate the criteria air pollutant emissions from the Project, Ramboll directly or indirectly relied primarily on emissions estimation guidance from government-sponsored organizations, Project specific resource management studies (e.g., Traffic Impact Analysis), and emission estimation software.

CalEEMod®

Ramboll primarily utilized the California Emission Estimator Model version 2016.3.2 (CalEEMod®)[12] to assist in quantifying the criteria air pollutant emissions in the inventories presented in this report for the Project. CalEEMod® is a state-wide program designed to calculate both criteria and greenhouse gas (GHG) emissions from development projects in California.

CalEEMod® is based upon California Air Resources Board (ARB) approved Off-Road and On-Road Mobile-Source Emission Factor models (OFFROAD and EMFAC, respectively), and is designed to estimate construction and operational emissions for land use development projects and allows for the input of project specific information. OFFROAD2011[13] is an emissions factor model used in CalEEMod® to calculate emission rates from off-road mobile sources (e.g., construction equipment, agricultural equipment). EMFAC2014[14] is the emissions factor model used in CalEEMod® to calculate emissions rates from on-road vehicles (e.g., passenger vehicles, haul trucks). EMFAC2014 has been superseded by EMFAC2017. In order to allow for a more accurate representation of mobile source operational emissions associated with the Project, operational mobile source emission factors were estimated using EMFAC2017. These emissions factors were then used to estimate mobile source operational emissions based on CalEEMod® methodology and defaults along with Project specific values where available.
