P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This large two-story reinforced concrete office building was constructed in 1926. Several features of the building, including its intersecting gable roof covered in terra cotta tiles, stucco-clad walls, arched windows and Churrigueresque style door surround, are stylistic attributes of the Spanish Colonial Revival style. The east elevation functions as the building's entrance façade. The linearity of the elevation is relieved by slightly projecting elements at the north and south ends of the façade. The recessed entrance is through a Churrigueresque style cast stone portal, located at the south end of the elevation. The portal embellishes an eight-sided tower that is capped by a domed cupola. The linear element of the façade is comprised of three large arched windows that are capped by tripartite windows on the second floor. At the north end of the elevation the projecting part of the elevation is capped by a front gable roof. The remaining fenestration of the façade is comprised of a number of small multi-light wood frame windows. The south elevation, with the exception of a slight projection at its east end, is essentially linear in configuration. Its fenestration is comprised of series of rectangular multi-light windows on both the first and second floors. The west elevation is u-shaped in configuration *(Continued pg. 2)*

B5. Architectural Style: *Spanish Colonial Revival*

B6. Construction History: (Construction date, alterations, and date of alterations)

Built in 1926 to house the administrative staff of the County Farm. The building continued to function in this capacity until the late 1970s. Subsequently renovated to operate in its present capacity as the Office of Public Safety.

B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:

B8. Related Features: *Once part of a larger complex of buildings that formed an integral component of the Los Angeles County Farm and sitll later as the Rancho Los Amigos Hospital.*

B9a. Architect: *unknown* b. Builder: *County of Los Angeles*

B10. Significance: Theme: *Public Health* Area:

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The former administrative building has retained its original ornamental cast stone embellishments, wrought iron work, roofing type, and most of its original fenestration. Sometime after 1931, the exterior configuration was altered when the north elevation's arcaded portico was removed. With the exception of this one modification, the exterior configuration has remained substantially intact. The building is in excellent physical condition, having been rehabilitated in the late 1980s. Therefore, the building has retained sufficient integrity to represent its architectural style and period of historic significance and qualifies under Criterion c.

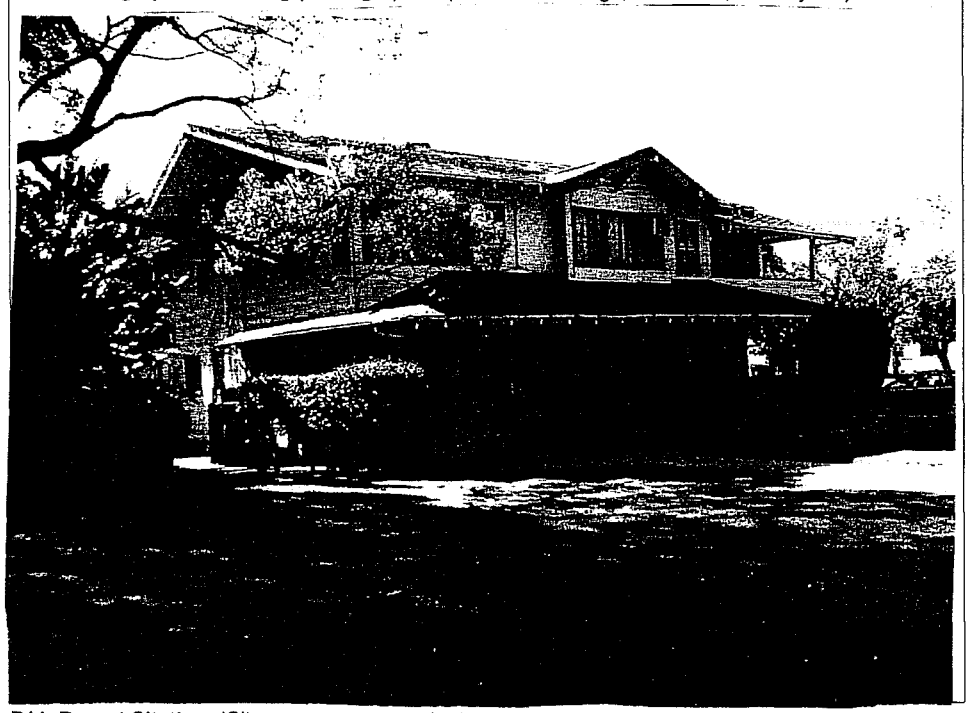
P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)



The Superintendent's house was built in 1915 to serve as the residence of the Superintendent of the County Farm. The two-story house is designed in the Craftsman Style, which enjoyed widespread popularity in the United States between circa 1900 and the mid-1920s. The wood frame house exhibits several character-defining elements of the style, including its informal plan, use of natu materials, such as wood and brick, horizontal wood siding, exposed rafter tails, overhanging eaves with triangular brackets, sleepin porches and lack of formal architectural embellishments.

The north elevation functions as the house's façade. Its most notable element is the one-story porch that runs the length of the elevation. Four brick piers support the porch's hipped roof. A set of brick stairs, set at the east end of the elevation, provides acce to the porch from the front lawn. The steps lead to a Craftsman style front door that is flanked by oversized wood sash windows, o of which is set into a slightly projecting bay. The second floor is capped by a side gable roof with a small cross gable set over the projecting bay. A second floor sleeping porch, supported by brick piers, projects from the west end of the façade *(Continued pg. 2,*

P3. Description

The fenestration of the second floor is comprised of a number of large and small casement and sash windows. The west elevation is asymmetrical in its massing. At the north end of the elevation a two-story projection, capped by a cross gable roof, has a sleeping porch on its second floor and a porte-cochere on the first floor. A set of brick stairs leads from the porte-cochere to the house's front porch. The port-cochere is flanked on its south side by a slightly projecting bay capped by shed roof. Brick piers support the small projecting wing at the south end of the elevation. The fenestration of this elevation is an asymmetrical arrangement of wood sash and casement windows. The south elevation functions as the building's rear elevation, which is u-shaped in configuration. The eaves of the two-story wings are capped by cross gable roofs that are supported by triangular brackets. The wing on the east side of the elevation has an enclosed porch, capped by a hipped roof. Once again the fenestration is an asymmetrical arrangement of wood sash and sliding windows. The east elevation is linear in configuration. It is capped by a complex gable roof. At the south end of the elevation a concrete stoop leads to a service door that is capped a shed-style metal awning . The door is flanked on its north side by a one-story projecting bay capped by an extension of the north elevation's porch roof. Its fenestration is comprised of wood sash windows.

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The Superintendent's house (Harriman House) is an excellent example of Craftsman architecture built in the early decades of the twentieth century. The building exhibits a number of the attributes that identifies it with the Craftsman aesthetic, including its clapboard siding, moderately pitched roof, deep eaves and exposed rafter tails. Like many structures constructed in this style the design was predicated, in large measure, on the artistic tenets of the mid-nineteenth century English Arts and Crafts Movement. Promoted by such men as John Ruskin and William Morris and later, Gustave Stickley, in America, adherents of the Craftsman movement rejected what they perceived as the overly elaborated, machine-made decorative motifs of late nineteenth century High Victorian design and ornamentation. Instead, they favored simpler compositions based on an open plan, horizontal massing, integration with the landscape, smooth, unadorned wood surfaces and understated decorative schemes. The Superintendent's house, which possesses all of these features, is an excellent example of the Craftsman style, a style popular from circa 1900 to the mid-1920s. Therefore, the Superintendent's House possess sufficient architectural significance to qualify under Criterion c, at the local level, and for nomination to the National Register of Historic Places.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Located near the intersection of Hawthorn and Flores Streets this wood-frame, single-story vernacular building is one of two survi examples of staff housing at Rancho Los Amigos. The rectangular building is supported by a concrete slab foundation. Its cross-gabled roof is covered in a combination of rolled asphalt and composition shingles. Triangular wood brackets support the rc projecting eaves. The wood frame cottage is clad in horizontal lapped wood siding. Its wood-frame windows are one-over-one sir hung sash type. The building once formed part of an enclave of residential buildings that housed Rancho Los Amigos staff memb Over the last 40 years, with the exception of two cottages, all of the buildings in this residential complex has been demolished.

Period of Significance: *1923-1950* **Property Type:** *Public* **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The cottage is a vernacular style building whose original context has been significantly diminished by the demolition of other staff residences. The building does not have the type of historic associations or architectural significance that would make it eligible for nomination to the National Register of Historic Places on an individual level. In addition, it is not part of a distinguishable entity that would make it eligible for nomination as a contributing element to a historic district.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Located near the intersection of Hawthorn and Flores Streets, just west of Building #1121, this wood-frame, single-story vernacular building is one of two surviving examples of staff housing at Rancho Los Amigos (the other is Building #1121). The rectangular building is supported by a concrete slab foundation. Its cross-gabled roof is covered in a combination of rolled asphalt and composition shingles. Triangular wood brackets support the roof's projecting eaves. The wood frame cottage is clad in horizontal lapped wood siding. Its wood-frame windows are one-over-one single hung sash type. The east elevation of the cottage functions as the building's rear elevation. It has two separate entries located at the top of a five-step concrete stoop placed in the center of the elevation. The west elevation is the cottage's primary elevation. Its entrance is embellished with a decorative gable-end. The extended eave shelters a projecting stoop capped by a shed roof. A wood single-leaf door is the primary entry. The stoop has metal pipe railings. The north elevation faces toward Flores Street. A centrally placed doorway placed at the top of a concrete stoop provides access to the cottage's interior. The south elevation is linear in configuration. Its fenestration is comprised of an asymmetrical arrangement of wood sash windows.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Built in 1907, this wood frame vernacular style cottage is located just east of the metal tanks, near Bonita Street. The wood frame house is capped by a side gable roof, and is clad in horizontal wood siding. Its fenestration is primarily comprised of wood sash windows. The west elevation is the cottage's façade; its most distinguishing feature is the projecting porch that runs along most c elevation. Square wood posts set on a solid wood parapet support the porch's shed roof. The north end of the porch has been enclosed with wood frame windows. A solid wood Craftsman Style front door is located at the north end of the porch. It is flanke its south side by large wood frame window. The south elevation of the cottage is linear in configuration. Its fenestration is compri of a symmetrical arrangement of two wood sash windows. A louvered vent is located just below the peak of the side gable roof. projecting element at the north end of the elevation is the cottage's kitchen. The fenestration of this side of the building is compri of an asymmetrical arrangement of the wood sash windows. The north side of the building is linear in configuration. Its fenestrati consists of a symmetrical arrangement of wood sash windows. A rectangular wood louver is located just under the eave line.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The wood frame garage is located across an asphalt driveway and parking area from the Superintendent's house. The Craftsman style garage was built in 1917. Many architectural details of the garage, including its wood siding, projecting side gable roof, and window types, mimic those of the Superintendent's house. The north elevation faces toward the house. Two large garage door bays fitted with sliding wood doors take up most of its length. A shed-roofed carport is attached to the west end of the elevation. A shed-roofed carport is attached to the north elevation. Both the south and east elevations are linear in configuration and unbroken by fenestration or doorways.

B3. Original Use: *garage* B4. Present Use: *vacant*

B5. Architectural Style: *Vernacular*

B6. Construction History: (Construction date, alterations, and date of alterations)

Built in 1917, the garage served as the Superintendent's garage until the early 1960s. Within the last 30 years a carport was added off the garage's west elevation.

B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:

B8. Related Features: *Once part of a larger complex of buildings that formed an integral element of the Los Angeles County Poor Farm (later the County Farm and still later the RAncho Los Amigos Hospital).*

B9a. Architect: *unknown* b. Builder: *County of Los Angeles*

B10. Significance: Theme: *Public Health* Area:

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The garage has retained its original exterior configuration and details, roofing type, and most of its original fenestration. The building is in fair physical condition. Post-construction modifications to the garage's exterior include the addition of a carport off of the west elevation. This alteration has somewhat diminished the integrity of the building. In other respects the garage's exterior has not been significantly altered since its construction. The garage's exterior has not suffered from significant deterioration or vandalism. The building has retained sufficient integrity to represent its architectural style and period of historic significance and therefore qualifies under Criterion c as a contributing element to the Superintendent's house (the Harriman House).

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The five general ward buildings share a similar design scheme. Each building is designed as a two-story rectangular masonry building, whose facade face toward Erickson Avenue. Each building's flat roof is hidden from view by a solid brick parapet. At the base of the parapet a brick cornices projects from the top of the wall plate. All four elevations are embellished with blind arcades inset with rectangular wood sash windows. All five buildings are sheathed in stucco. Originally, the east and west elevations had screened porches, which were later glazed. The east elevation of each ward is divided into two arcades. At the east end of the elevation an exterior staircase leads to the second floor. A sealed door is located just north of the façade's central pier. The second floor of each building is recessed behind a second floor loggia; two doors set into the second floor provide access to second floor. The north elevation of each ward is linear in configuration with wall surfaces divided into an arcade by eight flattened arches. Sets of paired wood sash windows, on the first and second floors, fill the blind arcades. Several of the original sets of pair windows have been altered, removed or replaced by doors. Doors reached via a concrete ramp are placed at the base of the second and fourth arcades (Continued pg. 2).

P3. Description

The west elevation of each ward is the rear of the building. On the first floor the fenestration is comprised of two sets of pair sash windows flanked on their south side by a sealed window. The second floor fenestration is comprised of a series of what appear to be double casement windows (the windows have been covered with wood sheeting making precise identification difficult). Originally the second floor was a screened porch. The rear elevation of Buildings #1184, #1185 and #1186 are joined by one-story hyphens. A one story arched bridge join Buildings #1184 and #1185 to Building #1162. The south elevation of each ward references the design of the north elevation. Its wall surface is divided into an arcade by ten flattened arches. Sets of paired wood sash windows, on the first and second floors, fill blind arcades. Several of the original sets of pair windows have been altered, removed or replaced by doors. A staircase is set into a recessed entry at the west end of the elevation.

Utilitarian in design the General Ward Buildings represent fairly common examples of early twentieth century institutional buildinç that eschewed explicit references to a particular architectural style. As an individual structures none of these buildings have th type of historic associations or architectural significance that would make them eligible for nomination to the National Register · Historic Places on an individual level. In addition, none of the individual buildings are part of a distinguishable entity that wou make them eligible for nomination as contributing elements to a historic district.

Nine freestanding one-story wood frame buildings (wards)are linked by a continuous portico on the south side of each building. Eacl ward is capped by a modestly pitched, composition shingle roof. Skylights have been inserted in some of the ward's roofs. Recesse doorways are located on the north and south elevations. Each ward is capped by hipped roofs and is clad in horizontal wood siding. The fenestration of the west elevation is comprised of a linear arrangement of wood sash windows. The east elevation's fenestratior is comprised of a linear arrangement of multi-light wood windows. The interior of each ward is comprised of two large rectangular wards, flanked at their south end by smaller rooms that were used for staff room, a small kitchen and bathrooms. At the east end of the building a rectangular room acted as a vestibule to the main ward.

Period of Significance: *1887-1950* **Property Type:** *Public* **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Post-construction alteration to the ward buildings' interiors and exteriors, which include the stuccoing of some of the elevations, the replacement of part of the fenestration, and the insertion of a number of small additions have diminished the integrity of the buildings. The buildings represent a common type of construction that was prevalent in the early part of the twentieth century. While in fair condition, the buildings do not have the type of historic associations or architectural significance that would make tany of them eligible for nomination to the National Register of Historic Places on an individual level. In addition, they are not part of a distinguishable entity that would make them eligible for nomination as a contributing element to a historic district.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

In 1916 construction began on a building to house female psychopathic patients. The one-story brick building (Building #1203) was u-shaped in configuration and its primary façade faced toward Erickson Avenue. In 1924-25 the women's wards were expanded through the construction of another u-shaped building, Building #1202, placed to the east of Building #1203. After the completion of Building #1202 the Women's Psychopathic Wards consisted of a quadrangle with a central courtyard that contained three freestanding building housing toilets and a linen room. The courtyard was landscaped with pathways and plantings for the use of the ward's inmates. In their design, materials and architectural scheme, the women's wards recapitulate the Men's Psychopathic Wards on Flores Street. The vernacular style one-story buildings are constructed of brick masonry, and are capped by complex hipped roofs covered in composition shingles. Both buildings' fenestration is comprised of wood frame sash windows set into arched window openings. The main exterior entrances are located at the center of the north elevation of Building #1203 and the south elevation of Building #1202. The west elevation (street facade) of Building #1203 is comprised of a recessed central block, flanked on either side by projecting wings *(Continued pg. 2).*

P3. Description

It is entirely clad in metal siding. A hipped roof caps the centrally placed entrance porch. A set of double metal and glass doors provides access to the interior. Secondary entrances are located at the end of the projecting wings. The entrance porch is flanked on either side by a series of metal framed windows. The north elevation is comprised of the side wings of Building #1202 and Building #1203. The elevation is linear in configuration with the exception of small projections at its east and west ends. At the building's centerpoint a small brick building, capped by a gable roof, fills the gap between the north elevation's two wings. Fenestration is comprised of a series of rectangular windows that provide light to the interior. The east elevation of Building #1202 mirrors the west elevation's configuration and design scheme. However, unlike the west elevation, it has not been clad in metal siding and retains its original multi-light wood sash windows. The south elevation of Buildings #1202 and #1203 recapitulate the configuration and design scheme of the west elevation. At its centerpoint a masonry wall links the side wings of Building #1202 and Building #1203.

Interior Courtyard of Building #1202/1203

The interior of the Women's Psychopathic Wards recapitulate, on a smaller scale, the design scheme of the adjacent Men's Psychopathic Wards (Building #1204 and Building #1205). It is configured as a large courtyard that houses a symmetrical arrangement of four small buildings and ancillary structures. The courtyard's west elevation is comprised of recessed wings that flank a centrally placed projecting porch (later enclosed). The fenestration of the projecting block is comprised of large, rectangular wood sash windows that flank a centrally placed doorway. The fenestration of the recessed wings is comprised of a symmetrical arrangement of arched and rectangular wood sash windows. The north elevation, with the exception of small projections at its east and west ends, is linear in configuration. It is comprised of the side wings of Building #1202 and Building #1203. This elevation's fenestration is primarily wood sash windows placed in arched or rectangular window openings. At the centerpoint of the interior elevation Building #1240 fills the gap between the building's freestanding wings. The south interior elevation, with its series of wood sash windows, essentially recapitulates the scheme of the north elevation. At the elevation's centerpoint a masonry wall fills the gap between the side wings of Building #1202 and Building #1203.

(Continued pg. 3)

P3. Description

Buildings and Structures within the Central Courtyard

Four small buildings and structures are located within the courtyard of Building #1203 and Building #1204. Three of the buildings are brick construction and one is prefabricated metal.

Building #1239

Built in 1924-1925, this small, rectangular vernacular style brick building is set on an elevated foundation. It is axially aligned with Building #1202. The building is capped by hipped roof and its fenestration is comprised of wood sash windows. Concrete ramps lead to doorways on the east and west elevations that provide access to toilet rooms. The building was constructed to house toilet facilities for inmates of the psychopathic wards.

Building #1240

This rectangular shelter building is placed at the center of the quadrangle's courtyard. Available documentation suggests that it was built in 1930. It replaced an earlier wood canopy that is depicted on the 1929 Fire Insurance Map of Rancho Los Amigos. The structure was built to provide shade for the inmates of the psychopathic ward.

Building #1241

Built in 1924-25, this small, rectangular vernacular style brick building is set on an elevated foundation. It is placed in the gap at the center of the north elevation. The building is capped by hipped roof and its fenestration is comprised of wood sash windows. Concrete ramps lead to doorway on the north elevation. The building was constructed as a linen storeroom. It was later used as a women's gymnasium.

Building #1242

Built in circa 1919-1925, this small, rectangular vernacular style brick building is set on an elevated foundation. It is axially aligned with Building #1203. The building is capped by hipped roof and its fenestration is comprised of wood sash windows. Concrete ramps lead to doorways on the east and west elevations that provide access to toilet rooms. The building was constructed to house toilet facilities for inmates of the psychopathic wards.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building #1204/1205 was constructed over a 17 year period, between 1907 and 1924, to house wards for male psychopathic patien Designed around a central courtyard, the brick building is composed of two u-shaped buildings that form a quadrangle. Within the building's central courtyard are ten accessory buildings and structures that housed restrooms, linen rooms, and outdoor shelters for the patients. The west elevation is the building's street façade. It is comprised of a central projection (with a modified front gable roof) flanked by recessed wings that are capped by a modified hipped roof with triangular vents. The building's street façade is clad metal siding that simulates the appearance of wood siding. At the center of the façade a porch shelters the building's main entranc The fenestration of the recessed wing is comprised of sliding metal windows. The north elevation is linear in configuration. It is comprised of two wings that are linked by a concrete masonry wall. The eastern wing is part of Building #1205 and the western win is part of Building #1204. Each of the wings is linear in configuration, with a two-story, flat-roofed block at its midpoint. The fenestration of both wings is essentially symmetrical, with a balanced arrangement of rectangular or arched windows (Continued pg 2).

P3. Description

The west wing is sheathed in the same type of metal cladding that is found on the building's street façade. The windows are the same type of metal sliders that are found on the façade. The east wing has the same configuration as the west wing. However, the wing's original brick walls have not been sheathed in metal siding and the original wood sash windows, placed in arched or rectangular openings, are still in place. In its configuration and design, the east elevation of Building #1204 references the west elevation of Building #1205. The wing at the center of the façade has a projecting porch that shelters the wing's primary entrance. The recessed wings on either side of the porch are linear in configuration. Their fenestration is comprised of a symmetrical arrangement of rectangular wood sash windows. The south elevation of the Men's Psychopathic Ward recapitulates the appearance and configuration of the building's north elevation. However, the building's two wings are not linked by a wall, as is the case with the north elevation. Instead, a small freestanding building, capped by a front gable roof, fills the gap between the two wings. The west wing is sheathed in the same type of metal siding that is found on the building's west elevation. The fenestration of the west wing of the building is comprised of an essentially symmetrical arrangement of arched and rectangular windows. At the east end of Building #1205 is a small front gable building (Building #3820) that is placed on an elevated platform. The east side of Building #3820 is flanked by the south elevation of Building #1204. The fenestration of this wing recapitulates the south elevation of Building #1205. The interior of the Men's Psychopathic Ward Building is a large courtyard that houses a symmetrical arrangement of ten small buildings and ancillary structures. The courtyard's west elevation is comprised of recessed wings that flank a centrally placed projecting element. At either end of the elevation are two wood frame sunrooms, whose fenestration is comprised of a series of wood frame sash windows. The fenestration of the projecting block is comprised of large, rectangular wood sash windows that flank a centrally placed doorway. The fenestration of the recessed wings is comprised of a symmetrical arrangement of arched and rectangular wood sash windows. The north elevation is linear in configuration. It is comprised of the side wings of Building #1204/1205. Its fenestration is primarily wood sash windows placed in arched or rectangular window openings. At the centerpoint of the interior elevation a stucco-covered cinderblock wall links the building's freestanding wings. The south interior elevation recapitulates the appearance of the north elevation. At the elevation's centerpoint a small front gable building (Building #3820) fills the gap between the side wings of Building #1204 and Building #1205. Eleven small buildings and structures are located within the courtyard of Building #1204/1205. Three of the buildings are brick construction, four are prefabricated metal, one is wood frame and the remaining three are free standing metal canopy shelters.

Eleven small buildings and structures are located within the courtyard of Building #1204/1205. Three of the buildings are brick construction, four are prefabricated metal, one is wood frame and the remaining three are free standing metal canopy shelters.

Aviary (no number)

The aviary is a small rectangular structure capped by a gable roof. Its walls are primarily comprised of screening. Built in the late nineteenth century the aviary was originally located adjacent to the 1889 office building.

LACO#1243 (Canopy Shelter)

This narrow, rectangular prefabricated metal canopy shelter is located at the north end of the courtyard. It is capped by shallow metal shed roof. The structure was erected sometime between the early 1960s and the mid-1970s (the building is depicted on a 1974 map of the facility). It replaced an earlier canopy shelter depicted on a 1929 site plan of Rancho Los Amigos.

LACO#1244

This small, rectangular brick building is set on an elevated foundation. It is axially aligned with Building #1205. The building is capped by hipped roof and its fenestration is comprised of wood sash windows. Doorways on the east and west elevations provide access to the toilet facilities. The building was constructed in 1916 to house toilet facilities for the inmates of the psychopathic wards.

(Continued pg. 3)

P3. Description

LACO#1245

This small, rectangular brick building is set on an elevated foundation. It is placed at the center of the courtyard and is axially aligned wi the gap between Building #1204 and Building #1205. The building is capped by hipped roof and its fenestration is comprised of wood sash windows. Doorways on the east and west elevations provide access to the interior. The building was constructed sometime between 1917 and 1925 as a linen room for the Men's Psychopathic Wards.

LACO #1246

Building #1246 is axially aligned with the center of Building #1204 (Figure 51). This aluminum canopy shelter is comprised of metal pole. supporting a slightly pitched metal roof. The shelter was erected sometime between the early 1960s and the mid-1970s (the shelter is depicted on a 1974 map of the facility; however, it does not appear on the Sanborn Fire Insurance maps of the Rancho.

LACO #1249

This small, rectangular brick building is set on an elevated foundation (Figure 52). It is axially aligned with Building #1204. The building i capped by hipped roof and its fenestration is comprised of wood sash windows. Doorways on the east and west elevations provide access to the toilet facilities. The building was constructed to house toilet facilities for the inmates of the psychopathic wards.

LACO #1251

This narrow, rectangular prefabricated metal canopy shelter, supported by metal poles, is located in the northwest quadrant of the courtyard (Figure 53). The shelter was erected sometime in the late 1950s or early 1960s (the shelter is depicted on a 1974 map of the facility; however, it does not appear on the Sanborn Fire Insurance maps of the facility.

LACO #2434

Building #2434 is located in the southwest quadrant of the courtyard. This prefabricated metal building has a rectangular footprint and is capped by a shallow front gable roof. Doorways to the interior are located in the north and south elevations. Its fenestration is comprisec of multi-light metal frame windows. This building was erected in 1949. The original function of this structure is unknown. In later years it was used as a gymnasium.

LACO #2435

Building #2435 is located in the northwest quadrant of the courtyard. This prefabricated metal building has a rectangular footprint and is capped by a shallow front gable roof. Doorways to the interior are located in the north and south elevations. Its fenestration is comprised of multi-light metal frame windows. This building was erected in 1949. The original function of the structure is unknown.

LACO #2436

Building #2436 is located in the northeast quadrant of the courtyard. This prefabricated metal building has a rectangular footprint and is capped by a shallow front gable roof. Doorways to the interior are located in the north and south elevations. Its fenestration is comprised of multi-light metal frame windows. The building was erected in 1949. The original function of this structure is unknown.

LACO #2437

Building #2436 is located in the southeast quadrant of the courtyard. Like Building #2436, this prefabricated metal building has a rectangular footprint and is capped by a shallow front gable roof. Doorways to the interior are located in the north and south elevations. Its fenestration is comprised of multi-light metal frame windows. The building was erected in 1949. The original function of this structure is unknown.

LACO #3820

This small, stucco clad, rectangular building is placed in the center of the south elevation, in the gap between the wings of Building #1204 and Building #1205. It is placed on an elevated platform that allows its south elevation to function as a loading dock for trucks. The north elevation is accessed via a concrete ramp that leads to a centrally placed doorway. Small windows are placed on the east and west elevations. The building was constructed in 1954.

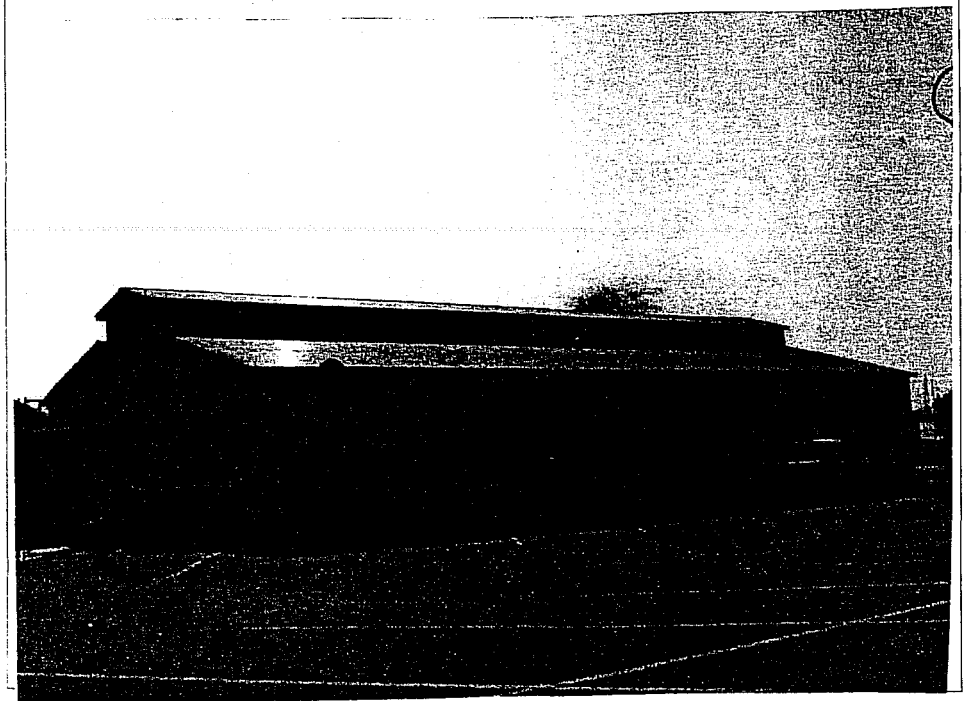
P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)



The Work Preparation Center (Building #1207), built in circa 1915-1925, faces toward Laurel Street. It is a barn style building cappe by a monitor style roof . The rectangular building's roof and walls are clad in corrugated metal siding. Its fenestration is comprised o rectangular wood frame windows. The façade is linear in configuration. At the center of the façade a wood panel and glass door provides access to the interior. It is flanked on either side by sliding wood panel and glass doors that have been fixed in place. Rectangularly shaped windows flank the doors. At the apex of the elevation a set of double doors that once provided access to the loft has been sealed over. The north elevation is linear in configuration. Its first floor's fenestration is comprised of a linear arrangement of rectangular wood frame windows.

The east elevation recapitulates the configuration and detailing of the west elevation. A canopy links this elevation with Building #1259. The south elevation largely recapitulates the configuration and detailing of the north elevation.

resembles a monitor style barn depicted on the 1922 aerial photograph of the Rancho. At that time it was located behind Building 1259. In the mid-1920s the building was converted into a general ward building (Ward 104). While this was supposed to be a temporary measure, it appears to have remained a ward until World War II. During the war the barn housed a war effort scheme that was staffed by hospital inmates. After the war the building became the Work Preparation Center #2.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Casa Consuelo is a two-story, h-shaped reinforced concrete and tile building located near the intersection of Dahlia and Consuelo Streets. It is set in an expanse of lawn and is surrounded by foundation shrubs. Large fan tail palms delineate the perimeter of the building. The building was completed in 1930 as a women's residential ward. Capped by end gable roofs, covered in c-shaped terra cotta tiles, and embellished with arcades and wrought-iron balconies and staircases, Casa Consuelo was designed in the Spanish Colonial Revival style. The west elevation is comprised of a number of projections and recessions. Its first floor and second floor fenestration consists of a balanced arrangement of wood casement windows. At the south end of the elevation an iron staircase provides access from the second floor to the ground level. The south elevation (facing toward Consuelo Street) is comprised of a recessed courtyard flanked on either side by linear wings. The courtyard is embellished with an arcuated portico capped by a solid parapet. On either side of the arcade flat-roofed towers, embellished with wrought-iron balconies on the second floor, rise above the eave line. The towers are flanked by linear wings whose fenestration is comprised of a double row of rectangular wood casement windows. Double French doors are placed in the tower's second floor and at the end of each wing. The east elevation (street facade) is u-shaped in configuration. The elevation's projecting wings are linked by an arcuated portico. At the center of the façade a set of double doors provides access to the buildings interior (cont. on page 2)

B3. Original Use: *women's patient ward* B4. Present Use: *vacant*

B5. Architectural Style: *Spanish Colonial Revival*

B6. Construction History: (Construction date, alterations, and date of alterations)

The two-story H-shaped women's residential ward was completed in 1930 in order to help allivate overcrowded conditions in the existing women's patient wards. Rather than large wards, Casa Consuelo housed patients in small single- to two occupancy residential rooms.

B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:

B8. Related Features: *Once part of a larger complex of patient wards that formed an integral component of the County Farm and later the Rancho Los Amigos Hospital.*

B9a. Architect: *unknown* b. Builder: *County of Los Angeles*

B10. Significance: Theme: *Public Health* Area:

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Casa Consuelo is an excellent example of the Spanish Colonial Revival style applied to a large institutional building. The building has several character-defining features of the Spanish Colonial Revival style, including its arcuated porticos, moderately pitched roof covered in c-shaped Spanish style tiles, wrought iron embellishments, u-shaped courtyards, and the primacy of the wall surface. The building's symmetrical massing, while somewhat uncharacteristic of the style, is a characteristic feature of institutional architecture, which often necessitated the used of rational floor plans. Because the building is an excellent example of the Spanish Colonial Revival style as applied to public institutional architecture it is eligible for designation to the National Register of Historic Places under Criterion c.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The former chapel is located just southwest of the Women's Psychopathic Ward building. Built in 1907, the L-shaped wood frame building is capped by an intersection front gable roof with boxed eaves. The building is clad in metal siding. The west elevation (street facade) is comprised of a projecting wing that is flanked on its south side by a recessed wing. The projecting wing, which once functioned as the chapel for Rancho Los Amigos, has an elevated front porch capped by a hipped roof. The porch shelters the building's main doorway and is flanked on either side by metal frame windows set into rectangular openings. A doorway, accessed via a concrete ramp, is placed at the north end of the recessed wing. The north elevation is linear in configuration. Its fenestration is comprised of a series of five metal windows set into rectangular openings. The east elevation is linear in configuration. It is comprised of the rear elevation of the chapel and the side elevation of the attached wing. Its fenestration is comprised of a series of rectangular metal frame windows. The south elevation is comprised of a recessed wing flanked on the east by a projecting wing. The fenestration of the projecting wing is comprised of two aluminum sliders. The fenestration of the former chapel is a series of four metal frame windows. A concrete ramp, leading to a door, flanks the entire length of the chapel's side elevation.

The former chapel building is not at its original location. Beginning in the postwar period it has undergone a fairly extensive series of alterations, including the addition of a side wing, the addition of metal siding, and the replacement of the original wood windows with metal windows. Because of these alterations the building as a low level of integrity in regard to its design and location. Because of these alterations the building does not retain sufficient integrity for further evaluation.

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The Wheelchair Repair Building has undergone a series of alterations and modifications. The loggia that projected off of the east elevation was enclosed and an addition was made to the south elevation. Many of the existing metal frame windows have been replace within the last 35 years. A number of these alterations occurred during the building's period of significance. However the scope of these modifications has so altered the building that it no longer represents the original vernacular style of the building. Therefore, it does not retain sufficient physical integrity to represent its architectural type and period of historic significance.

B-6

Sometime in the 1930s or 1940s an addition was built off of the south elevation that enclosed the loggia. The building eventually housed the wheelchair repair and sign shops, as well as a small locker room.

P3. Description

The second floor fenestration is comprised of a series of what appear to be double casement windows windows (the windows have been covered with wood sheeting making precise identification difficult). Originally, the second floor was a screened porch. The south elevation essentially mimics the design of the north elevation. Its wall surface is divided into an arcade by eight flattened arches. Sets of paired wood sash windows, on the first and second floors, fill blind arcades. Several of the original sets of pair windows have been altered, removed or replaced by doors. A staircase is set into a recessed entry at the west end of the elevation.

Buildings #1184, #1185, and #1185, which were built in 1914. Later in its history the bathhouse was used as the linen mending room. Ir the late 1950s the building was transformed into a storage facility. Over the years the building has undergone a number of alterations, including the replacement of doors and windows, others of which were sealed over. Sometime after 1930 the screened-in porch on the second floor was remodeled into an interior space.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Auditorium (Building #1261) is located across a narrow walkway from the Bathhouse building. The flat-roofed, stucco clad, two-story masonry building, built in 1928, represents a reductive example of the Art Deco style. The east elevation is linear in configuration. At the center of the building a pylon-shaped entrance projects from the building's facade. Within the pylon three pair doors are flanked on either side by masonry piers. Multi-light windows set into deep reveals flank either side of the projecting pylon The second floor fenestration consists of a symmetrical arrangement of three narrow, rectangular windows placed above the entrance. The south elevation is linear in configuration. Its fenestration is confined to a number of small rectangular windows set a the west end of the elevation. The west elevation is linear in configuration. A sealed doorway is located at the west end of the doorway. The doorway, which is not set at ground level, is missing its access ramp or stairway. The north elevation is linear in configuration. Its fenestration is confined to a number of small rectangular windows set at the west end of the elevation. The building's interior contains an Art Deco style proscenium arch.

B6. Construction History: (Construction date, alterations, and date of alterations)

The Auditorium was built in 1928 on the site of the 1888 Refectory Building which was demolished shortly before the Auditorium was built. The Auditorium is the only Art Deco style building at Rancho Los Amigos (Continued pg. 4).

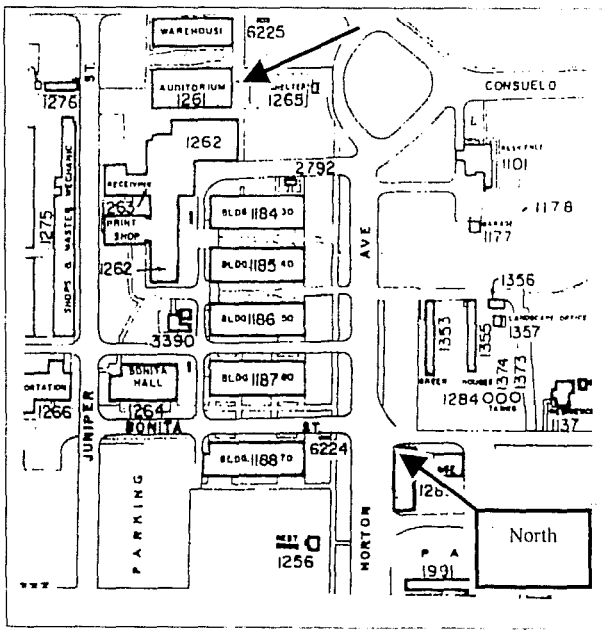
B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:

B8. Related Features: *Once a part of a larger complex of buildings that formed an integral component of the County Farm and still later, the Rancho Los Amigos Hospital.*

B9a. Architect: *unknown* b. Builder: *County of Los Angeles*

B10. Significance: Theme: *Public Health* Area:

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**



(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The Auditorium building has undergone several alterations and modifications since its construction. Sometime in the past the building's brick exterior was covered in stucco. The original front doors have been replaced and some of the Art Deco detailing of the interior has been removed or destroyed. These alterations have diminished somewhat the integrity of the building. However, despite these changes the building retains sufficient physical integrity to represent its architectural type and period of historic significance. As the only example of Art Deco design in the Rancho Los Amigos complex the Auditorium is an unique example of the institution's use of this style. Therefore, the building, which has retained sufficient integrity to represent its architectural style and period of historic significance, qualifies under Criterion c.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building #1262/1263, which contained the dining, kitchen, commissary and staff rooms, flanks the south side of the Auditorium. Bui between 1910 and 1921, the two-story, vernacular style brick building is made up of a series of interlocking rectangular volumes. T first floor of the building contained staff and patient dining rooms, a kitchen, a reading room, and the commissary store. The secon floor contained staff rooms. While the building was constructed in several phases, its different wings share several design motifs, including arched windows, decorative stringcourses, flat roofs, and solid parapets. The east elevation is comprised of a number of projections and recessions. At the north end of the elevation is a two-story tall projecting wing. Its fenestration is comprised a serie of arched windows and two large bay doors on the first floor. Brick cornices delineate division between the first and second floors. The second floor fenestration is comprised of a series of arched windows. A projecting brick cornice that is capped by a solid parap delineates the base of the wall plate. This wing's first floor once housed staff and patient dining rooms, and a reading room. Its second floor housed staff rooms. A recessed one-story wing attached to the southwest corner of the dining room wing housed the main kitchen (Continued pg. 2).

P3. Description

Its fenestration is comprised of an asymmetrical arrangement of four square windows. At the south corner of the elevation metal stairs lead to the flat roof. Near the center of the roof a glass and metal skylight provided light to the kitchen. The kitchen wing of the building is flanked on its south side by a two-story block that contained additional dining rooms on the first floor and rooms for staff on the second floor. The fenestration of both its first and second floors is comprised of a series of arched windows. At the elevation's center point an arched bridge links the building's second floor with the general wards located just east of Building #1262. The bridge shelter's the wing's main entrance. The south elevation is essentially L-shaped in configuration. The recessed element of the elevation is U-shaped in configuration and is two-stories in height. Its fenestration is comprised of a symmetrical arrangement of rectangular windows. The projecting wing of the elevation is linear in configuration. Its fenestration is comprised of series of arched windows on the first and second floors. The west elevation is comprised of a complex series of projections and recessions that form a centrally placed u-shaped courtyard flanked by projecting wings. The fenestration is primarily comprised of sash windows set into arched openings. A metal canopy runs the length of the recessed wing at the south end of the elevation. This wing was originally a freestanding building (Building #1263) that was later joined to Building #1262 by a one-story hyphen. At the north end of the elevation a metal canopy shelters the building's primary main loading bay. The north elevation is comprised of a number of projections and recessions. Its fenestration is comprised of arched door and window openings.

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Unlike many of the other vernacular buildings on the South Campus of Rancho Los Amigos the exterior of the Building #1262/1263, which has retained its integrity, represents an excellent example of an early twentieth century vernacular building. While utilitarian in design, the building's brick walls, arched windows and simple cubic volumes are representative of a type of industrial/vernacular design that was a common feature of Los Angeles' urban buildings during the early twentieth century. Therefore, the building does have the type of architectural significance to qualify under Criterion c, at the local level, for nomination to the National Register of Historic Places.

(Building #1262) was built to house the kitchen and main dining rooms. Between circa 1914 and 1920, a one-story kitchen wing was added to the southwest corner of the building and later a two-story wing to the south elevation of the kitchen wing. Finally, in 1921, a one-story wing was built to link the kitchen wing to the commissary. The second floor of the building housed staff residential rooms. Several modifications have been made to the building since its last large-scale expansion in 1921. Since that time the building's exterior has been painted and modifications have been made to its interior. Within the last ten years arson and vandalism have damaged the building's interior.

Bonita Hall, built in 1932, is located at the intersection of Juniper and Bonita Streets. It is one-story building capped by a composition shingle, monitor style roof. An arcade, which has largely been filled in, runs the length of the south elevation. The south elevation is linear in configuration. An arcade, capped by a shed roof and supported by square masonry piers, runs the length of the elevation. Three of the arcade's six bays have been infilled with masonry. Metal framed slider windows are set into the infilled walls. The main entrance is set into the elevation's third bay. At the west end of the elevation a shed roofed wing projects from the side of the building. The west elevation is comprised of a one-story shed-roofed wing. Its fenestration is comprised of two rectangular windows set at either end of the elevation. At the north end of the elevation a pre-fabricated metal structure has been added to the building. The north elevation is linear in configuration. Rectangular windows flank a doorway near the east end of the elevation. A series of seven windows, placed just above the top of the shed roof, provide light to the building's interior. The east elevation consists of a central element capped by front gable roof that is flanked by lower, shed roofed aisles. Its fenestration consists of a large, arched, multi-light window.

P3. Description

Occupational Therapy Building to Building #1267 still exist at the south end of the elevation.
A shed roof porch shelters the east end of the elevation. The porch's posts are supported by masonry piers. The porch looks out on an elaborate series of garden beds that are surrounded by a masonry wall. A series of double French doors comprise the fenestration of this part of the elevation. The porch is flanked on its west side by a projection. This part of the building has been, to a large extent, stripped down to the studs. Most of the original windows and the exterior cladding have been removed.

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)
The former Descanso Hall (Occupational Therapy Building) has undergone a significant number of alterations and modifications since its construction in 1928. A landscaped courtyard, porch, and a series of French doors have been added to the south side of the building. The façade's front entrance has been replaced by a window. Sometime in the last 15 years the rear of the building was gutted. This resulted in the removal of wall cladding and many of the building's windows. Because of these alterations the building has a low level of integrity and is in poor physical condition. Therefore, the building does not retain sufficient design integrity or physical integrity to represent its architectural type and period of significance.

B-6

In the 1980s the building was renovated and a landscaped courtyard was added to the south side of the building. The renovation also removed the façade's front entrance and added a porch and a series of French doors to the south elevation. Sometime in the last 15 years the rear of the building was gutted. This resulted in the removal of wall cladding and many of the building's windows.

The Occupational Therapy Building Addition (Building #1267) is a vernacular style building that was once attached to the rear of the main Occupational Therapy Building by a one-story hyphen. Today it is a freestanding building. It is a one-story, wood frame building capped by a hipped roof covered in composition shingles. Each of the four elevations has an asymmetrical arrangement of multi-light sash windows and flush panel doors. All doors are accessed via concrete ramps. A shed roof porch projects from the we elevation.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Workshop Building i(Building #1275) is a long narrow building that is approximately 160 feet in length. The brick building, portions of which were built between 1917 and circa 1945, is capped brick parapet that hides the flat roof from view. A decorative cornice delineates the base of the parapet from the wall plate. The east elevation is linear in configuration. Its façade is compriseo a series of rectangular windows that alternate with doors that open into the individual shop spaces. This elevation is the short side the building. Its fenestration is comprised of two multi-light wood frame windows. At the west end of the elevation a wood frame addition capped by a front gable roof links Building #1276 with the nearby garage building (Building #1277). The additions central sliding wood plank and multi-light doors are flanked by sets of multi-light wood frame windows. The west elevation forms the east a west sides of u-shaped courtyard (the west side of the courtyard is formed by the east elevation of Building #1277). This elevation comprised of a series of rectangular windows that alternate with doors that open into the individual shop spaces *(Continued pg. 2)*

P3. Description

The south end of the elevation is comprised of the gable end of the wood frame wing that links Building #1275 with Building #1277. The fenestration of this wing consists of a pair of sliding wood plank and multi-light doors that are flanked by sets of multi-light wood frame windows. The north elevation is linear in configuration. The elevation's entrance is sheltered by a projecting shed roof.

By circa 1930 the building housed the carpentry and paint shops at its south end and a series of seven storerooms at the north end of the building. Sometime after circa 1945 a wood frame wing linking the workshops to Building #1277 was added. Like several other post World War II buildings it may have been built of materials salvaged from demolished buildings.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Lock Shop (Building #1276), built in 1913, is located just north of Building #1275. It is a one-story brick building with a flat roo With its brick parapet and cornice the building is similar to other vernacular style brick buildings erected at Rancho Los Amigos between 1910 and 1925. The façade of the building faces toward Juniper Street. The façade's central doorway is flanked on eith side by metal frame windows. A rectangular addition was added to the rear of the building sometime in the mid- to-late 1920s. Th addition lacks the ornamental cornice found on the building's original wing.

It later served as a lock shop. The building is in fair condition. However, alterations to the building, such the replacement of original door and windows, the painting of the exterior and the construction of an addition off of the building's west elevation, have diminished the buildings architectural integrity. Therefore, the building only retains a fair level of architectural integrity.

NRHP Status Code 6Z

Resource Name or #: (Assigned by recorder) *LACO #1278*

B1. Historic Name:

B2. Common Name: *Garage*

B3. Original Use: *automotive garage* B4. Present Use: *storage*

B5. Architectural Style: *Vernacular style*

B6. Construction History: (Construction date, alterations, and date of alterations)

According to available documentation the building was constructed in 1924 as an automobile garage. Since that time it has also been used as a storage building. It appears to have undergone few alterations since its construction.

B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:

B8. Related Features: *Once part of a larger complex of buildings that formed an integral component of the Los Angeles County Farm and still later, the Rancho Los Amigos Hospital.*

B9a. Architect: *unknown* b. Builder: *County of Los Angeles*

B10. Significance: Theme: *Public Health* Area:

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Utilitarian in design the garage represents a fairly common example of an early twentieth century industrial style building that eschewed explicit references to a particular architectural style. As an individual structure the building does not have the type of historic associations or architectural significance that would make it eligible for nomination to the National Register of Historic Places on an individual level. In addition, it is not part of a distinguishable entity that would make it eligible for nomination as a contributing element to a historic district.

The former stable is an L-shaped, one-story brick building built in 1913. The building, located at the corner of Erickson Avenue Bonita Street, is capped by a flat roof that is hidden by a solid parapet. Fenestration is primarily comprised of double hung sas windows. The west elevation is linear in configuration, its most notable feature, is an arched entrance near the north end. Pair arcuated windows flank the arched entrance on either side. Near the elevation's center point a rectangular window has been s a sealed doorway. The doorway is flanked on its south side by for small arcuated windows. The north elevation is linear in configuration. Its fenestration is comprised of a linear arrangement of wood sash windows of varying size. The rear elevation i L-shaped in configuration. An arched opening is set at the center of the elevation's projecting wing. A pre-fabricated addition, capped by a shed roof, runs the length of the recessed wing. The south elevation is L-shaped in configuration. A metal canop shelters the doorway in the elevation's projecting wing. A pre-fabricated addition, capped by a shed roof, runs the length of the elevation's projecting wing. The same addition encapsulates the west end of the recessed wing. A metal canopy, supported by poles, shelters the remainder of the wing.

B1. Historic Name: *Stable*
B2. Common Name: *Trunk Building*
B3. Original Use: *stable* B4. Present Use: *storage*

B5. Architectural Style: *Vernacular*

B6. Construction History: (Construction date, alterations, and date of alterations)

Built as a stable in 1913 less than a decade later its second floor was converted to a patient ward. After the 1933 earthquake it was used for storing patient luggage. Prefabricated additions have been added within the last 25 years.

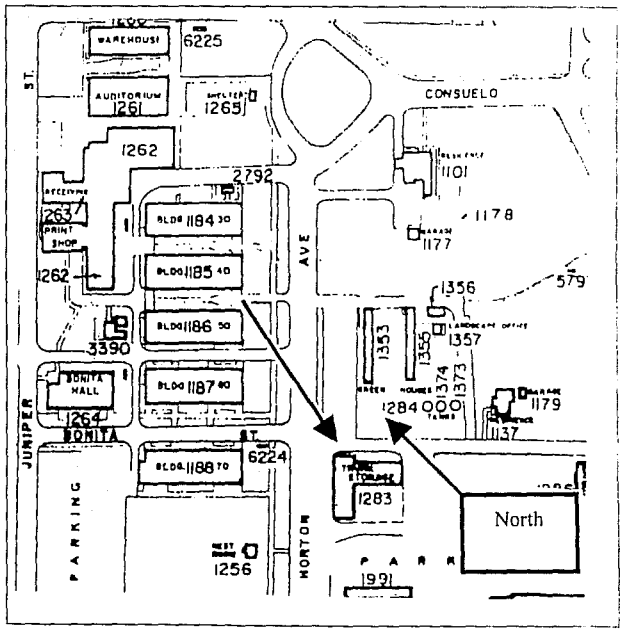
B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:

B8. Related Features: *Once part of a complex of buildings that formed an integral component of Los Angeles County Poor Farm and still later the County Farm and Rancho Los Amigos Hospital.*

B9a. Architect: *George Low* b. Builder: *County of Los Angeles*

B10. Significance: Theme: *Public Health* Area:

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**



(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Post-construction modifications to the stable's exterior include the removal of the building's second floor shortly after it was damaged by the 1933 Long Beach earthquake. More recently, prefabricated additions have been added to the rear elevation. The building's physical condition is good. However the loss of the original second floor and the non-contextual additions to the rear elevation, have significantly diminished the ability of the building to represent its architectural type and period of historic significance. Therefore, the building does not retain sufficient design and physical integrity to communicate its period of significance.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Shelter Building (Building #1290), built between 1920 and 1930, is located near the intersection of Descanso and Laurel Streets. The vernacular style wood frame shelter is capped by a gable roof. The roof is supported by wood posts with triangular braces. The long rectangular building is open on all sides with the exception of the far west end of building, which is enclosed.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This one-story, flat-roofed, concrete building is an example of Stripped Classicism, a style that enjoyed widespread popularity for public works projects from the late 1920s through the 1930s. The building's footprint consists of an irregular rectangle with projecting elements on the east and west elevations. At the top of the wall plate a projecting cornice delineates the base of the solid parapet that hides the flat roof from view. The building's fenestration is comprised of a linear arrangement of multi-light casement windows. The east elevation functions as the building's primary façade . It has two entrances placed on the north and south sides of a projecting wing. The doors are double-leaf, with single lights and transoms. A six-step concrete stoop leads to the left door and a wheelchair ramp allows universal access to the right door. Both entries have metal pipe handrails. At the left end of the building is a concrete loading dock with a metal roll-up freight door. The north elevation is comprised of a projecting wing flanked on its east side by a slightly recessed wing. A loading dock is inset into this elevation. Metal stairs lead to the roof

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Located at the northwest corner of the intersection of Erickson and Descanso Streets, the Power Plant building is comprised of th one-to-three story brick and concrete wings flanked by a freestanding water tower and concrete chimney. The Power Plant (Build #1300) was built over three separate building campaigns. In 1909 a one-story brick building was constructed to house the facility steam powered power plant. In 1926 a more monumental wing, with classically inspired embellishments was built along Erickson Avenue. Later, the building underwent further expansion when a one-story wing (Building #1302) was built off the southwest corn of the 1909 wing. Designed with a minimum of ornamental embellishments, the building is an example of the type of utilitarian des common to many early twentieth century institutional buildings. The building has poured-in-place concrete walls that support a ste truss roof. Facing toward Erickson Avenue the building's street façade (east elevation) is linear in configuration. The Classical st tripartite façade is comprised of a centrally placed temple façade flanked on either side by flat-roofed wings. The temple façade is comprised of four Tuscan style pilasters that support a projecting cornice that delineates the base of a solid parapet that hides the building's flat roof *(continued pg. 2)*

P3. Description

The cornice supports a triangular pediment. A centrally placed doorway is flanked on either side by multi-light metal frame windows. The flanking wings are linear in configuration, and are capped by a continuous cornice that runs the length of the elevation. Their fenestration consists of a series of symmetrically arranged, multi-light metal windows that provide light to the building's two-story tall power room. The power room was built to house four steam driven turbines that provided power and heat to the Rancho campus. The south elevation consists of three wings built over a period of 19 years. A projecting wing of Building #1300 forms the east end of the elevation. The wing's centrally placed doorway is flanked on either side by oversized rectangular windows that rise to a height of two stories. A massive cornice, capped by a stepped parapet, caps this end of the power plant. A recessed, one story brick wing flanks the power plant. Capped by a wood truss roof, this wing of the brick building was constructed in 1909 to house the Rancho's first power plant. It later housed the facilities ice house and machine shop. The icehouse's large wood cooling tower, added sometime between 1933 and 1936 is located at the southwest corner of the roof. The wing's fenestration is comprised of a series of large metal frame windows. The west end of the recessed wing is flanked by a projecting one-story brick wing. Built in 1911 this one-story brick wing was built to house Rancho laundry. The west elevation is L-shaped in configuration. The fenestration of the projecting wing at the south end of the elevation is comprised of an asymmetrical arrangement of arched and square windows. The recessed section of the building is comprised of the rear elevation of Building #1300. ilts most notable feature is a freestanding, circular chimney that rises to a height of 125 feet. Built in 1927, the tower's fluting references the classical design of the 1926 Power Plant. the chimney is flanked by a 125-foot tall ater tower that supports a 100,00 gallon water tank. The north elevation, which faces toward Esperanza Street, is L-shaped in configuration. At the east end of the elevation the 1926 power plant forms a projecting wing that is flanked on its west side by the one-story wing built in 1909. At the far west end of the elevation is the slightly recessed 1909 wing that once housed the Rancho's laundry facility. The fenestration of the 1909 and 1926 wings are comprised of an asymmetrical arrangement of arched windows. The north elevation of the 1926 Power Plant is comprised of a symmetrical arrangement of oversized metal frame windows that flank a central entrance.

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The Power House complex, with its chimney and water tower, represents an important example of early twentieth century industrial design. The complex's water tower and chimney have been visually prominent features of the viewscape of Downey since 1913 (water tower) and 1926 (chimney). The 1926 wing of the building, with its classical style façade and large over-scaled windows, represents a regionally important example of the application of classical imagery to an industrial building. This was a not uncommon phenomenon during the early twentieth century, a period when Classical Revival style architecture enjoyed widespread popularity for public works projects. Examples of this style in Los Angeles County can be seen in such buildings and engineering works as the Department of Water and Power Distributing Station #2 (1916), the Hall of Justice (1925), the Fourth and Lorena Streets Bridge (Boyle Heights 1928), and the Macy Street Viaduct (1926). The vernacular brick wings of the Power House building still contain many of the working features that communicate its original use as a power/ice plant, including the steel water tower, concrete chimney and wood evaporating tower. Because the building retains both its vernacular and high style architectural elements it is eligible for designation to the National Register under Criterion c. It also should be noted that the building has formed an integral and important element of the skyline of the nearby communities of Downey and Southgate for 77 years, and may derive historic significance from this fact.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Located just south of the tool house, Building #1357 is a vernacular style, rectangular board-and-batten structure capped by a shed roof. An elevated porch capped by a shed roof, projects from the building's east elevation. The building's fenestration is comprised of aluminum slider windows of varying dimension. The primary entrance is located on the east elevation, where a flush panel wood door, located at the north end of the elevation provides access to the interior.

B1. Historic Name: *Landscape Office*
B2. Common Name:
B3. Original Use: *landscaping office* B4. Present Use: *storage*
B5. Architectural Style: *Vernacular*
B6. Construction History: (Construction date, alterations, and date of alterations)
Built in 1938, aluminum framed windows have replaced the orignial wood framed windows. Original door also have been replaced.

B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:
B8. Related Features: *Once part of complex of buildings that formed an integral component of the Los Angeles County Farm and still later Rancho Los Amigos Hospital.*

B9a. Architect: *unknown* b. Builder: *County of Los Angeles*
B10. Significance: Theme: *Public Health* Area:
Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)
The Landscape Office has retained its original exterior configuration and cladding. Post-construction modifications to the house's exterior include the addition of aluminum frame windows, and the replacement of the original doors. These alterations have significantly diminished the ability of the building to represent its architectural style and period of historic significance. Therefore, the building does not retain sufficient design and physical integrity to communicate its period of significance.

B1. Historic Name:

B2. Common Name: *Garage*

B3. Original Use: *Automotive garage* B4. Present Use: *Vacant*

B5. Architectural Style: *Vernacular style*

B6. Construction History: (Construction date, alterations, and date of alterations)

Building #1379/4121 was a garage for the Rancho's fleet of trucks and cars. Its precise construction date could not be ascertained. It was built on the site of the poultry yards, which were in place as late as 1930-1932 *(Continued pg. 3)*

B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:

B8. Related Features: *Once part of a larger complex of buildings that formed an integral component of the Los Angeles County Farm and still later, the Rancho Los Amigos Hospital.*

B9a. Architect: *unknown* b. Builder: *County of Los Angeles*

B10. Significance: Theme: *Public Health* Area:

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Utilitarian in design the garage represents a fairly common example of an early twentieth century industrial style building that eschewed explicit references to a particular architectural style. As an individual structure the garage does not have the type of historic associations or architectural significance that would make it eligible for nomination to the National Register of Historic Places on an individual level. In addition, it is not part of a distinguishable entity that would make it eligible for nomination as a contributing element to a historic district.

B11. Additional Resource Attributes: (List attributes and codes) *HP41 - Hospital*

Date of Evaluation: *10/27/2003*

(This space reserved for official comments.)

B-6

This suggests that the garage was not built until sometime after 1932. Based on its design, the building would appear to date somewhere between 1933 and the mid-1940s. The building has been unused since the early 1990s.

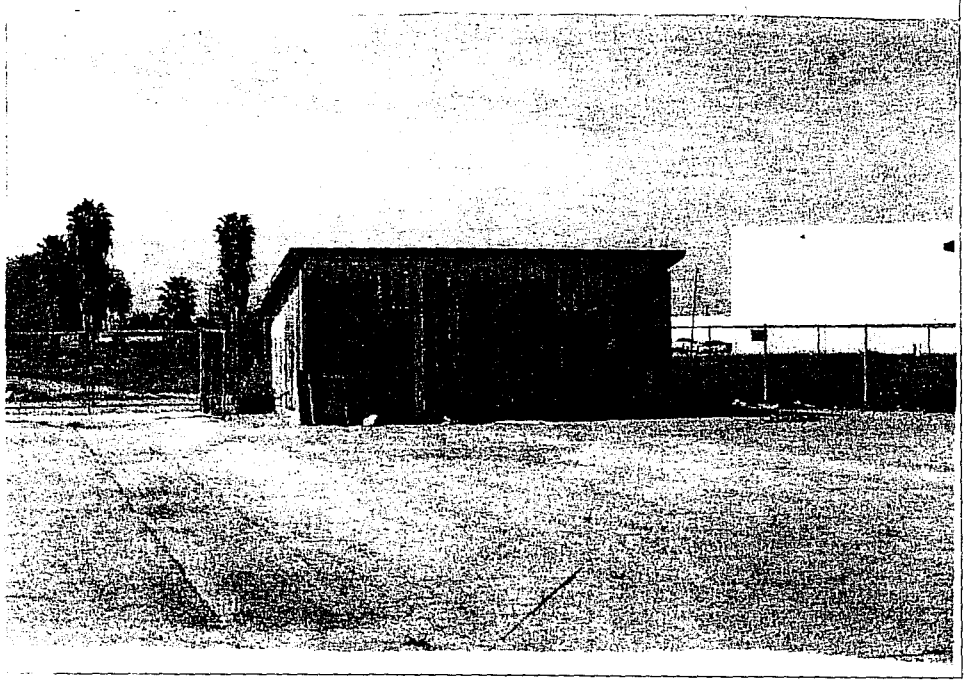
e. Other Locational Data (Enter Parcel #, legal description, directions to resource, elevation, etc., as appropriate)

Parcel No.



P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Property Warehouse is located south of the former stable building. It is a narrow, rectangular prefabricated metal building capped by shallow front gable roof. The north and south elevations are linear in configuration. Fenestration is comprised of a series of nine rectangular windows that have been covered by wood planks. Two rectangular windows flank a single panel door located on the east elevation. The west elevation mimics the arrangement of the east elevation. The Property Warehouse (Building #1991) was probably erected in the late 1940s or early 1950s (several other prefabricated metal buildings of the same type are located in the quadrangle of the former Men's' Psychopathic Wards). It is possible that the building was originally sited somewhere else on South Campus and was moved to its current location in the mid-1950s, a time when the former complex of farm buildings were being demolished to make way for the new laundry building.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Located near the intersection of Gardendale Street and Erickson Avenue, the Steam Lauandry (Building #2637), is a rectangular metal frame industrial style building. Built in 1951, the building is clad in corrugated metal and is capped by a monitor style roof. A series of ten vents lines the roof's ridgeline. It fenestration is comprised primarily of multi-light metal frame hopper style windows. The west elevation faces toward Erickson Avenue. At the south end of the elevation a set of sliding doors, flanked by hopper style windows, provides access to the building's interior. A concrete loading dock, flanked by a hopper window, is located at the north en of the elevation. At the second floor level a series of hopper windows provides light to the interior. The north elevation is essentiall linear in configuration. A series of doors and hopper windows run the length of the first floor elevation. A linear series of hopper windows runs the length of the upper story. A number of small metal clad additions have been added to the west end of the elevation. The east elevation mimics the window arrangement of the west elevation. The south elevation is essentially linear in configuration. It largely mimics the appearance of the building's north elevation.

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

The Steam Laundry was built in 1951. The building post-dates the South Campus' period of significance. The building represents a fairly standard type of industrial design dating from the early 1950s. As an individual structure the building does not embody the level of craftsmanship, design or historical association that would make it eligible for nomination to the National Register of Historic Places on the individual level. Because the building lacks individual distinction it would only be eligible for designation under Criterion c, a criterion that the South Campus of Rancho Los Amigos does not meet. In addition, it is not part of a distinguishable entity that would make it eligible for nomination as a contributing element to a historic district.

Rancho Los Amigos' complex of farm buildings. The laundry building was one of the last large-scale industrial buildings constructed on the South Campus. In 1983 the Rancho contracted out its laundry service and the laundry building was shut down. The building has been unused since that time.

The post office is located just southeast of Building #1100. It was moved onto the campus in 1949. The one-story wood frame building is capped by a front gable roof and is clad in asbestos type shingles. Its fenestration is primarily multi-light wood sash windows. The east elevation functions as the building's street façade. Two flush panel doors provide access to the building's interior. The north and south elevation are linear in configuration. Their fenestration is comprised of a series of rectangular multi-lig sash windows. The west elevation is linear in configuration. Its fenestration is comprised of two multi-light wood sash windows.

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Utilitarian in design the Decontamination Building represents a fairly common example of a mid-twentieth century, vernacular style institutional building that eschewed explicit references to a particular architectural style. As an individual structure the building does not have the type of historic association or architectural significance that would make it eligible for nomination to the National Register of Historic Places on an individual level. In addition, it is not part of a distinguishable entity that would make it eligible for nomination as a contributing element to a historic district.

Building #3592 was constructed in 1955 to replace a smaller chapel built in 1907 (Building #1254). It is comprised of two chapels s at right angles to each other. The Protestant/Jewish chapel and Catholic chapel are joined at the rear which creates an L-shaped configuration. The roof is front-gabled with an intersecting gable at the north end. Roof materials are composition shingles and the wall cladding is stucco. Fenestration is primarily three-light, metal casement type. The west elevation is comprised of the projectin wing that forms the Roman Catholic chapel and side elevation of the Protestant/Jewish chapel. The facade of the Roman Catholic chapel is capped by a front gable roof. A one-story tall shed-roofed porch shelters the centrally placed double entrance doors. A quatrefoil window is placed below the peak of the slightly projecting roof. A Mission Style bell tower is placed at the peak of the roo The side elevation of the Protestant/Jewish chapel is linear and comprised of lower aisles flanking a taller nave. The fenestration o the nave and aisles is comprised of a symmetrical arrangement of multi-light, metal hopper windows. At the south end of the Protestant/Jewish chapel a one-story porch shelters the door leading to the chapel's vestibule (cont. pg 2)

P3. Description

The south elevation is comprised of the façade of the Protestant/Jewish chapel and the side elevation of the south of the Roman Catholic chapel. A Mission Revival style bell tower (similar to that of Mission San Gabriel) stands on the west end of the façade of the Protestant/Jewish chapel. This bell tower has three arched openings for bells. A centrally placed round window is above the shed roofed entrance porch of the Protestant/Jewish chapel. The porch roof is supported with square piers. Two porches, capped with side-gabled roofs and supported with piers, project from the ends of the Protestant/Jewish chapel. The fenestration of this elevation of the Roman Catholic chapel is linear in configuration. This elevation of the Roman Catholic chapel is linear and comprised of a lower aisle flanking a taller nave. The fenestration of the nave and aisles is comprised of a symmetrical arrangement of multi-light, metal hopper windows. The east elevation is comprised of the nave of the Protestant/Jewish chapel and the rear elevation of the Roman Catholic chapel. Fenestration is a symmetrical arrangement of metal casement windows. A one-story wing that projects from the sanctuary of the Roman Catholic chapel is attached to the rear of the Roman Catholic chapel. The north elevation is comprised of the nave of the Roman Catholic chapel and the rear elevation of the Sanctuary of the Protestant/Jewish chapel. The fenestration of the nave is a symmetrical arrangement of metal casement windows. A one-story wing that projects from the Protestant /Jewish chapel's sanctuary is attached to the rear of the Roman Catholic chapel.

BUILDING, STRUCTURE, AND OBJECT RECORD

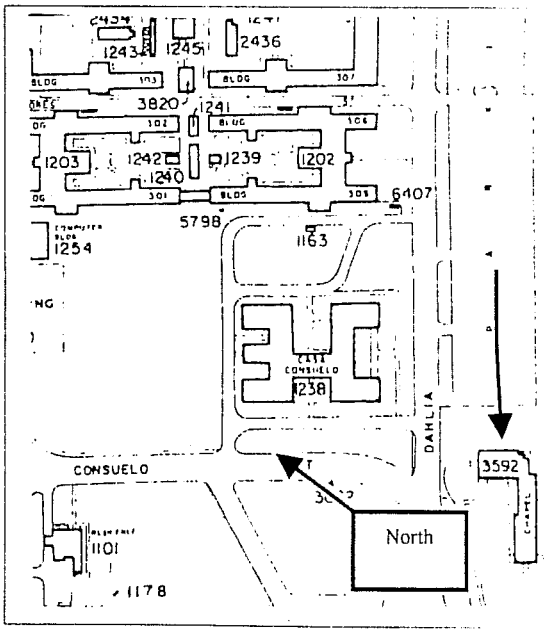
NRHP Status Code 6Z

Resource Name or #: (Assigned by recorder) *LACO #3592*

B1. Historic Name: *Chapel*
B2. Common Name: *Chapel*
B3. Original Use: *Chapel* B4. Present Use: *vacant*
B5. Architectural Style: *Mediterranean Revival*
B6. Construction History: (Construction date, alterations, and date of alterations)
Built in 1955 to replace an earlier chapel on the Rancho Los Amigos, South Campus. The building has been vacent for at least the last 15 years.

B7. Moved? ☒ No ☐ Yes ☐ Unknown Date : Original Location:
B8. Related Features: *Part of the South Campus or Rancho Los Amigos*

B9a. Architect: b. Builder:
B10. Significance: Theme: Area:
Period of Significance: *1887-1950* **Property Type:** *public* **Applicable Criteria:**
(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)
The chapel building is less than 50 years of age. Therefore, it is not eligble for the National Register of Historic Places.



B11. Additional Resource Attributes: (List attributes and codes) *HP41 - Hospital* *HP16 - Religious building*

Period of Significance: *1887-1950* **Property Type:** **Applicable Criteria:**

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

Utilitarian in design the garage represents a fairly common example of an early twentieth century industrial style building tha eschewed explicit references to a particular architectural style. As an individual structure the building does not have the type c historic associations or architectural significance that would make it eligible for nomination to the National Register of Histori Places on an individual level. In addition, it is not part of a distinguishable entity that would make it eligible for nomination as contributing element to a historic district.

(This space reserved for official comments.)

B-6

or on site plan of the Rancho prepared in circa 1932. This suggests that the garage was not built until sometime after 1932. Based on its design, the building would appear to date somewhere between 1933 and the mid-1940s. The building has been unused since the early 1990s.

Parcel No.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This one-story t-shaped building replaced the one-story patient wards located at the intersection of Descanso and Hawthorn Streets. Capped with a flat roof, and clad in a combination of brick and stucco, the building is an example of Second Modernism, the dominant architectural style for corporate and institutional buildings from the mid-1940s through the late 1960s.

SECTION ES
EXECUTIVE SUMMARY

This Historic District Update Report presents the results of an intensive survey update of the Rancho Los Amigos Historic District (District), located on the South Campus of the Rancho Los Amigos in the City of Downey, County of Los Angeles, California. The survey was conducted by Sapphos Environmental, Inc. from 2007 to 2010 on behalf of the County of Los Angeles (County). The survey update was undertaken to assist the County with preparation of a master plan for the Rancho Los Amigos National Rehabilitation Center and to provide information necessary to determine the feasibility of rehabilitation and adaptive reuse of District contributors. The survey update also was intended to resolve contradictory results from two previous historic resources surveys. In 1995, a survey conducted by Historic Resources Group (HRG) documented a total of 103 buildings, structures, and features on the South Campus, 78 of which were determined to be contributing elements to a historic district eligible for listing in the National Register of Historic Places (NRHP).[1] In 2004, pursuant to a contract with the County, Post/Hazeltine Associates completed the Intensive Historic Structures/Sites Survey for the South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California,[2] indicating that 11 of 78 buildings, structures, and features inventoried were individually eligible for listing in the NRHP, 10 of which had been previously identified as contributing features of the District by HRG. As a result of the 1995 survey, the Rancho Los Amigos Historic District was officially determined eligible for listing in the NRHP on September 30, 1996, and subsequently listed in the California Register of Historical Resources (CRHR).

The current (2007–2010) investigation of 129 buildings, structures, and features resulted in the determination that there are 68 extant contributors to the District. Of the 78 original contributing resources identified in the 1995 survey,

- 6 buildings, structures, and features are no longer extant.[3] These include Patient Wards 212 and 214 (LACO Nos. 1200 and 1201), which were removed circa 2001; the 1930 shed and 1931 shed (LACO Nos. 1272 and 1333); the Vivarium (LACO No. 1334); and the Train Station (LACO No. 1352).
- 4 no longer contribute to the significance of the District: 3 because of loss of integrity (LACO Nos. 1243, 1251, and 1279) and 1 because of a date of construction that postdates the period of significance (LACO No. 4118).
- 1 additional building (LACO No. 1242) has been identified as a potential contributor to the District.
- 1 structure (the Smoke Stack) was addressed as a separate resource in 1995, when it should have been included as part of the Power Plant (LACO No. 1300).

In addition, the 2007–2010 survey update revised the evaluation of 1 of the 11 resources found individually significant in 2004. The Superintendent's Shed (LACO No. 1178) was identified during

[1] Historic Resources Group. 26 July 1995. *1994 Northridge Earthquake Project Review: Survey of Earthquake Damaged Properties for Purposes of Section 106 Review*. Rancho Los Amigos Medical Center District Record. Rancho Los Amigos Medical Center, Downey, CA.

[2] Post/Hazeltine Associates. 19 March 2004. *Intensive Historic Structures/Sites Survey for the South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California*. Santa Barbara, CA. Prepared for: County of Los Angeles.

[3] It is unknown exactly why the buildings were demolished, as none of the documentation collected in support of the 2007–2010 Historic District analysis indicated why or when the buildings were removed from the property.

the 2004 survey as being potentially eligible for the CRHR; however, during the 2007–2008 survey, it was found to lack sufficient historic merit to be characterized as a contributing resource to the District. Because the building was not evaluated as part of the 1995 survey and is not listed as one of the 78 original contributors to the District, this conclusion does not change the total number of extant contributors within the District.

The remaining extant buildings, structures, and features on the South Campus were identified as noncontributors to the Historic District, either because they were previously determined to be noncontributors or because they lack sufficient age, historic association, and/or architectural character to be a part of the District.

The District was determined eligible for the NRHP and listed in the CRHR under Criterion A/1, association with events that have a made a significant contribution to the broad patterns of history. The 1995 survey that resulted in the determination of eligibility of the Rancho Los Amigos Historic District stated that the District is significant under NRHP Criterion A "for its association with the turn-of-the-century health care of Los Angeles County's indigent population and for its later treatment of those in Los Angeles County with chronic illnesses, both mental and physical."[4] The 2007–2010 survey update confirmed the importance of the role of Rancho Los Amigos in evolution of the County welfare and health care systems.

These conclusions were reached as a result of records searches, extensive archival research and literature reviews, and field surveys. Integrity was assessed through physical inspections and utilized the results of architectural and structural conditions assessments and measured drawings prepared in support of a concurrent rehabilitation and adaptive reuse feasibility study. Evaluations of significance utilized the criteria of significance for the NRHP and CRHR. The historic context for the development of the District was developed to provide a framework for the evaluations of significance. As a result of the historic context, a District period of significance of 1888–1945 was recommended.

SECTION 1.0
INTRODUCTION

1.1 PURPOSE OF THE HISTORIC DISTRICT UPDATE

This Historic District Update Report presents the results of an intensive survey update of the Rancho Los Amigos Historic District (District), located on the South Campus of the Rancho Los Amigos in the City of Downey, County of Los Angeles, California. The survey was undertaken to assist the County of Los Angeles (County) with the development of the Rancho Los Amigos Campus Plan and Specific Plan. The Campus Plan incorporates development standards and design guidelines to accommodate redevelopment of portions of the former Rancho Los Amigos National Rehabilitation Center. The corresponding Specific Plan would be adopted by the City of Downey to update zoning to reflect the Campus Plan. The survey update was also undertaken to resolve conflicts between two existing historic resources surveys of the South Campus. In 1995, a survey conducted by Historic Resources Group (HRG) documented a total of 103 buildings, structures, and features on the South Campus, 78 of which were determined to be contributing elements to a historic district eligible for listing in the National Register of Historic Places (NRHP).[5] In 2004, pursuant to a contract with the County, Post/Hazeltine Associates completed the Intensive Historic Structures/Sites Survey for the South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California,[6] indicating that 11 of 78 buildings, structures, and features inventoried were individually eligible for listing in the NRHP, 10 of which had been previously identified as contributing features of the District by HRG. In 2006, the County retained Sapphos Environmental, Inc. to update the survey and to assess the feasibility of rehabilitation and adaptive reuse of the historic buildings, structures, and features within the District. The objectives of the survey update were to examine the existing district boundaries, the historic context and period of significance, and to re-evaluate the significance and integrity of the district as a whole as well as individual buildings and structures.

1.2 HISTORIC DISTRICT LOCATION

The Rancho Los Amigos National Rehabilitation Center is composed of 212 acres owned by the County, in the western portion of the City of Downey, County of Los Angeles, California (Figure 1.2-1, *Regional Vicinity*). It is bisected by Imperial Highway, creating two campuses: the North Campus, 48 acres north of Imperial Highway; and the South Campus, 164 acres south of Imperial Highway (Figure 1.2-2, *Local Vicinity*). The 52.2-acre Historic District is located within the South Campus of the Rancho Los Amigos National Rehabilitation Center (Figure 1.2-3, *Historic District*). The Historic District is approximately 1 mile north of U.S. Interstate 105, 3.3 miles northeast of U.S. Interstate 5, 1 mile east of U.S. Interstate 710, and 3.25 miles west of U.S. Interstate 605. The site is roughly bounded by Flores Street and Golondrinas Street to the north, Dahlia Avenue to the east, Gardendale Street to the south, and Laurel Street to the west. The Historic District appears on the U.S. Geological Survey (USGS) 7.5-minute series South Gate, California, topographic

quadrangle, within the southwestern portion of the Santa Gertrudes (McFarland and Downey) Land Grant Boundary.[7]

1.3 PREVIOUS INVESTIGATIONS

The two previous historic resources surveys of the Rancho Los Amigos South Campus are summarized in this section. Specific results of these surveys are itemized in Section 5, Results, and compared to the results of the current survey.

1.3.1 1995 Survey

In 1995, the first historic resources evaluation of the Rancho Los Amigos South Campus was conducted within the context of a survey of earthquake-damaged properties in compliance with Section 106 of the National Historic Preservation Act.[8] Section 106 of the National Historic Preservation Act requires federal agencies to take into account the effects of their undertakings on historic properties. The survey of the Rancho Los Amigos South Campus was apparently triggered by the involvement of the Federal Emergency Management Agency (FEMA) in the wake of the 1994 Northridge Earthquake. The Rancho Los Amigos South Campus was recorded on a State of California Department of Parks and Recreation Primary Record (DPR 523A) and evaluated on a District Record (DPR 523F), both of which are dated July 26, 1995. The survey and evaluation were performed by Christy Johnson McAvoy of HRG, who was designated as Acting State Historic Preservation Officer for undertakings related to the 1994 Northridge Earthquake.

As a result of the 1995 survey, the Rancho Los Amigos South Campus was officially determined to be eligible for listing in the NRHP as a district. The DPR forms prepared in support of the 1995 survey indicated that 103 buildings, structures, and features were identified within the boundaries of the District. Of the 103, 78 were found to be contributors to the District, 22 were identified as noncontributors, 2 were not surveyed, and 1 was no longer extant at the time of the survey[9,10] (Figure 1.3.1-1, *1995 Historic District Survey Results*). As a result of the 1995 survey, on September 30, 1996, the Rancho Los Amigos Medical Center Historic District was officially determined to be eligible for listing in the NRHP under Criterion A, association with events that have made a significant contribution to the broad patterns of history, with a period of significance of 1888 through 1945. As a result of the determination of NRHP eligibility, the District and its contributing buildings, structures, and features were automatically listed in the California Register of Historical Resources (CRHR).[11]

[9] Historic Resources Group. 26 July 1995. *1994 Northridge Earthquake Project Review: Survey of Earthquake Damaged Properties for Purposes of Section 106 Review*. Rancho Los Amigos Medical Center District Record. Rancho Los Amigos Medical Center, Downey, CA.

[10] The DPR specified that 102 buildings were surveyed, of which, 76 were contributors to the District, 23 were noncontributors to the District, 2 were not surveyed, and 1 was demolished. Upon examination of the document, Sapphos Environmental, Inc. found discrepancies with these numbers and recounted, resulting in the totals specified in this document.

FIGURE 1.3.1-1
1995 Historic District Survey Results

1.3.2 2004 Survey

In 2004, Post/Hazeltine Associates resurveyed the Rancho Los Amigos South Campus and presented its findings in its report, *Intensive Historic Structures/Sites Survey for the South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California*.[12] The Post/Hazeltine Associates report concluded that the previously identified District, as well as many of its contributors, did not retain sufficient integrity to be eligible for listing in either the NRHP or the CRHR. The study identified 11 buildings, structures, and features as being potentially eligible for individual listing in both registers under Criterion C (NRHP) and Criterion 3 (CRHR), for embodiment of the distinctive characteristics of a type, period, or method of construction, with a period of significance of 1887 through 1950[13] (Figure 1.3.2-1, *2004 Survey Results*).

Despite the contradictory results found in the 2004 survey, the 1995 survey was a formal, determination of eligibility that was based on consensus between the Office of Historic Preservation and FEMA. A reversal or change of determination requires official applications to the State Historical Resources Commission and to the Keeper of the National Register, National Park Service. The 2004 Post/Hazeltine Associates report was never finalized, and no action has been undertaken to amend or withdraw the CRHR listing of the District. Therefore, the District and the associated buildings, structures, and features identified as contributors to the District are considered to be historic properties pursuant to the NHPA and historical resources pursuant to the California Environmental Quality Act (CEQA).

[12] Post/Hazeltine Associates. 19 March 2004. *Intensive Historic Structures/Sites Survey for the South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California*. Santa Barbara, CA. Prepared for: County of Los Angeles.

[13] Conclusions for the 2004 Post/Hazeltine Associates report were taken from the DPR forms attached to the report and not from the survey report, which contains numerous inconsistencies.

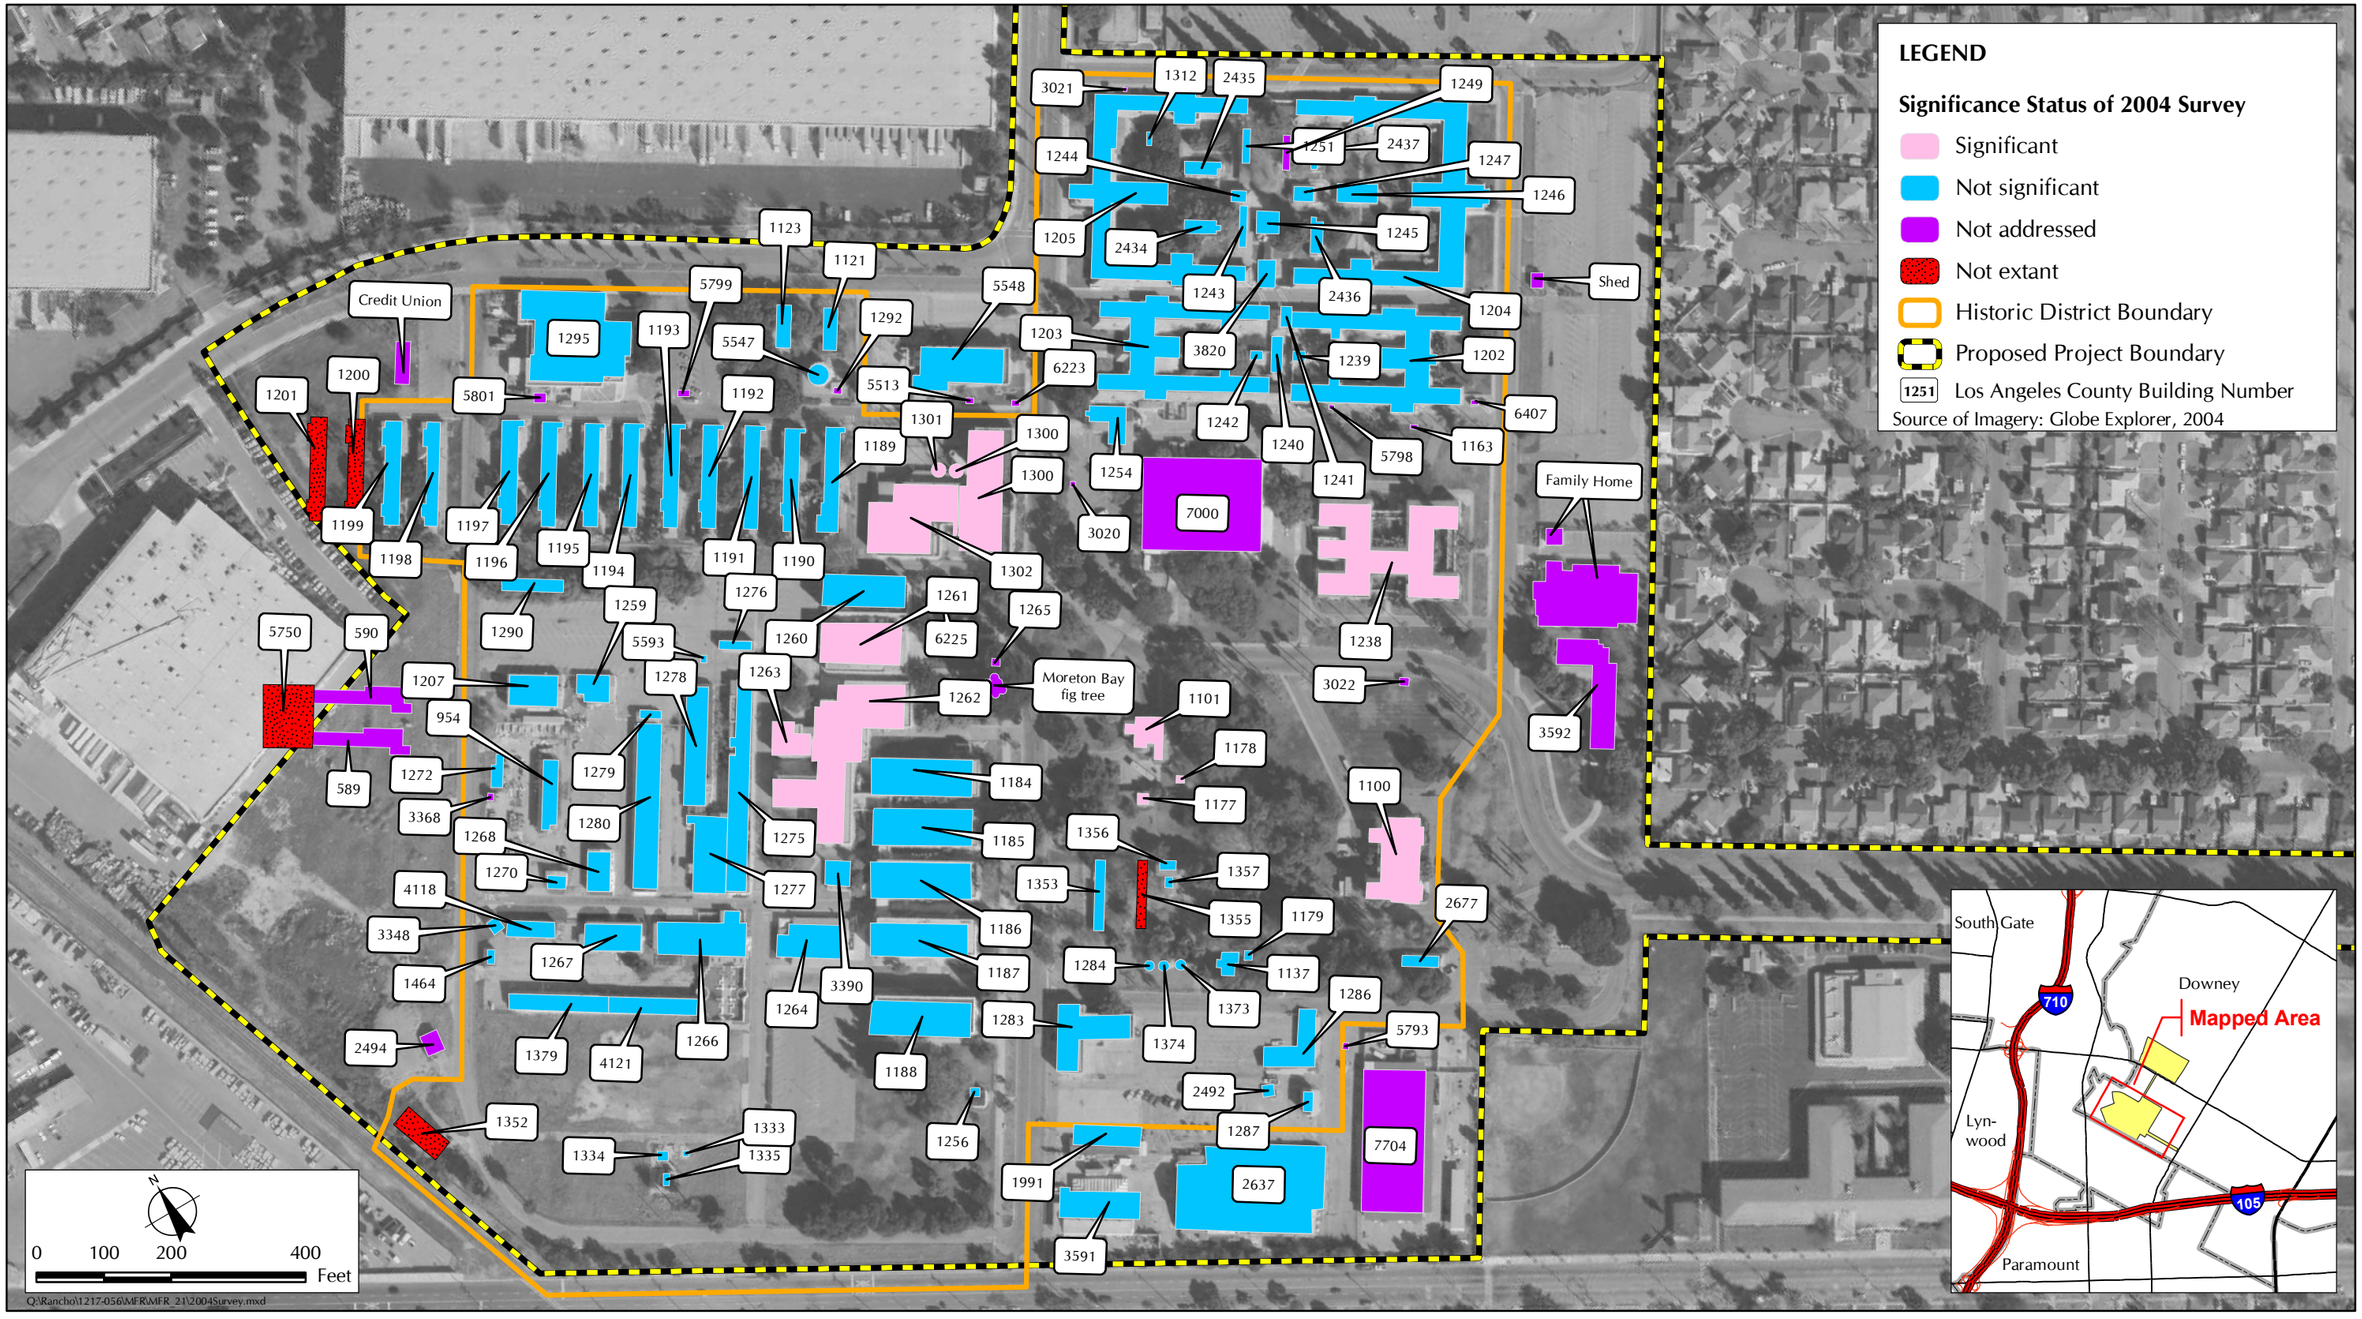

FIGURE 1.3.2-1
2004 Survey Results

SECTION 2.0
SURVEY METHODOLOGY

This section of the Historic District Update Report describes the methods employed in the characterization and evaluation of historic resources at the proposed project site. The study methods were designed to conform to accepted historic resources survey practices and protocols, specifically:

- Secretary of the Interior's Standards for Preservation Planning
- National Register Bulletin (No. 24): Guidelines for Local Surveys: A Basis for Preservation Planning
- National Register Bulletin (No. 15): How to Apply the National Register Criteria for Evaluation
- Office of Historic Preservation, Instructions for Recording Historical Resources
- Office of Historic Preservation, Technical Assistance Bulleting #8, User's Guide to the California Historical Resources Status Codes

2.1 RECORD SEARCH, LITERATURE REVIEW, AND RESEARCH

Preparation of this report began with a thorough review of the two previous studies described in Section 1, Introduction, and consultation with the Office of Historic Preservation (OHP) to confirm the official status of the District.[14] In addition, a record search was performed at the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton, one of the 11 independent centers operated under contract to OHP for the purpose of maintaining records associated with the federally and state-mandated California Historic Resources Inventory (HRI). This search included a review of all known relevant cultural resource surveys and reports and examination of the 2009 editions of the HRI,[15] including listings in the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), California Historical Landmarks (CHL), and California Points of Historical Interest (CPHI). The narrative history of the Rancho Los Amigos National Rehabilitation Center prepared by Colleen Adair Fliedner *Centennial, Rancho Los Amigos Medical Center, 1888–1988*, provided the most complete account of the development of Rancho Los Amigos.

Archival research was completed between August 2007 and December 2010. Research in primary resources included extensive use of the Papers of the Rancho Los Amigos Hospital, part of the California Social Welfare Archives, housed at the Doheny Library, University of Southern California. Materials examined included narrative histories, historic photographs, aerial photographs, blueprints, historic maps, and annual reports. It was also determined that full and partial sets of as-designed or as-built drawings were on file at the County of Los Angeles Rancho Los Amigos Facilities Management Department for 30 buildings (the Patient Wards [LACO Nos. 1189, 1190, 1191, 1192, 1193, 1194, 1195, 1196, 1197, 1198, and 1199]; the Kitchen and Dining Building [LACO No. 1295]; the Power Plant [LACO No. 1300]; the Water Tower [LACO No. 1301]; the Shop, Laundry and Ice Plant [LACO No. 1302]; the Administration/Safety Police Building [LACO No. 1100]; Casa Consuelo [LACO No. 1238]; Auditorium [LACO No. 1261];

[14] California Office of Historic Preservation. 24 February 2006. Historic Property File Single Property Printout, Rancho Los Amigos Medical Center. On file at Sapphos Environmental, Inc., Pasadena, CA.

[15] California Office of Historic Preservation. 2007. *California Historical Resources Inventory, 2004*. Fullerton, CA: California State University, Department of Anthropology, South Central Coastal Information Center.

Dining Room, Kitchen, and Staff Room [LACO No. 1262]; the Commissary and Receiving Room [LACO No. 1263]; the General Wards [LACO Nos. 1184, 1185, 1186, 1187, and 1188]; the Women's Psychiatric Wards [LACO Nos. 1202 and 1203]; and the Men's Psychiatric Wards [LACO Nos. 1204 and 1205]).

Other sources consulted included historic issues of the *Los Angeles Times* and *Downey Livewire* newspapers, accessed online through the ProQuest newspaper database; historical aerial maps and photographs at Rancho Los Amigos; and the collections of the Los Angeles and Downey Public Libraries and the Downey History Center. Materials compiled in support of a concurrent investigation by Sapphos Environmental, Inc., the *Rancho Los Amigos Historic District Feasibility Study* (Sapphos Environmental, Inc., September 16, 2009) including current measured drawings and architectural and structural conditions assessments, also were used. Sources of relevant information are cited in footnotes and compiled in the References section of this document.

Using the information obtained through the research effort, a historic overview and context was prepared (Section 4, Historic Overview and Context). The purpose of the narrative was to clarify the history of the District and identify the important historical themes that it represents. The context provided a framework for reconsidering the period of significance associated with the District and assessing the current significance of individual District contributors.

2.2 FIELD SURVEY

A pedestrian survey of the District was performed between December 2006 and October 2007 to update the two previous historic resources surveys of the Rancho Los Amigos South Campus. Specifically, the goals of the field survey were to photograph the current condition and assess the integrity of District contributors; document character-defining features; and confirm the boundaries of the District. The field survey included both exterior and interior inspections. In addition, buildings and structures within the District boundaries that had not been previously surveyed were addressed. Updated resource descriptions were prepared and entered on State of California Department of Parks and Recreation Historic Resources Inventory update forms (form DPR 523L, Continuation Sheet).

2.3 EVALUATION

Using the results of the research, field inspection, and historic context theme identification, buildings, structures, and features within the District were studied to determine if re-evaluation was warranted. Particular attention was paid to identifying resources whose historic integrity had changed in the years following the official determination of eligibility. NRHP and CRHR criteria of significance (see Section 3, Regulatory Framework) were considered. The City of Downey does not have codified criteria of significance to evaluate potential historical resources.

Although all resources formally determined eligible for inclusion in the NRHP and listed in the CRHR are treated equally under applicable statutes and regulations, for purposes of comparative analysis to determine feasibility for rehabilitation, a historical ranking system was developed. The rankings indicate how critical each building or structure is to the identity and significance of the Rancho Los Amigos Historic District. "Highest" rankings reflect buildings and structures that appear to be eligible for the NRHP individually, as well as being formally identified as contributors to the District. "Key" rankings reflect buildings and structures that, while not appearing individually eligible, are substantive district contributors. "Medium" rankings reflect a District contributor of lesser interest and prominence. "Low" rankings reflect buildings and structures that while

contributing to the District by virtue of their age, location, and original function are generally support structures of utilitarian appearance. The rankings reflect consideration of six factors:

- Historic associations and functions of the building or structure and its relevance to the mission of Rancho Los Amigos as it evolved over time
- Architectural character and quality
- Uniqueness
- Date of construction and period of significance
- Integrity of design
- Location and visual prominence

2.4 PERSONNEL

Sapphos Environmental, Inc. historic resources manager, Ms. Leslie Heumann, supervised the work effort. Ms. Shannon Carmack and Ms. Rebecca Silva prepared the architectural history and historical resources sections of this report. Ms. Deborah Howell-Ardila assisted with research and project coordination. Ms. Laura Carias and Ms. Marlise Fratinardo prepared the Historic Resources Inventory forms. All members of the project team meet the Secretary of the Interior's Professional Qualification Standards for Architectural History.

SECTION 3.0
CRITERIA FOR EVALUATION

Historic resources at Rancho Los Amigos were evaluated under two established sets of criteria of significance, corresponding to federal and state designation programs. To be eligible for inclusion in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR), a property must satisfy one or more of the appropriate registration criteria. In addition, the property must retain sufficient integrity to convey the reasons for its significance. This section of the Historic District Update Report presents the criteria of significance for each program and compares the respective integrity requirements. A brief discussion of other designation programs is also included. Neither the County of Los Angeles nor the City of Downey has mechanisms with associated criteria for designation of historic resources.

3.1 NATIONAL REGISTER OF HISTORIC PLACES

The NRHP was established by the National Historic Preservation Act (NHPA) of 1966 as "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[16] The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance also must possess integrity of location, design, setting, materials, workmanship, feeling, and association. A property is eligible for the NRHP if it is significant under one or more of four established criteria:[17]

Criterion A: It is associated with events that have made a significant contribution to the broad patterns of our history;

Criterion B: It is associated with the lives of persons who are significant in our past;

Criterion C: It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; and/or

Criterion D: It has yielded, or may likely yield, information important in prehistory or history.

Ordinarily, cemeteries, birthplaces, or graves of historic figures; properties owned by religious institutions or used for religious purposes; structures that have been moved from their original locations; reconstructed historic buildings; properties that are primarily commemorative in nature; and properties that have achieved significance within the past 50 years are not considered to be

[16] U.S. Government Printing Office. "Effects of Listing under Federal Law." *Code of Federal Regulations*, Title 36, Part 60.2. Washington, DC.

[17] U.S. Government Printing Office. "Criteria for Evaluation." *Code of Federal Regulations*. Title 36, Part 60.4. Washington, DC.

eligible for the NRHP. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:[18]

Criteria Consideration A:	A religious property deriving primary significance from architectural or artistic distinction or historical importance; or
Criteria Consideration B:	A building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event; or
Criteria Consideration C:	A birthplace or grave of a historical figure of outstanding importance if there is no other appropriate site or building directly associated with his or her productive life; or
Criteria Consideration D:	A cemetery that derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or
Criteria Consideration E:	A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or
Criteria Consideration F:	A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own historical significance; or
Criteria Consideration G:	A property achieving significance within the past 50 years if it is of exceptional importance.

For purposes of NRHP nomination, definitions of the types of significant properties that may be listed have been developed[19] and have been generally accepted for many designation programs at all levels of government:

- A **building**, such as a house, barn, church, hotel, or similar construction, is created principally to shelter any form of human activity.

- **Structure** is used to distinguish from buildings those functional constructions made usually for purposes other than creating human shelter (e.g., aviary, bridge, fence, gazebo, windmill).

[18] U.S. Government Printing Office. "Criteria for Evaluation." *Code of Federal Regulations*. Title 36, Part 60.4. Washington, DC.

[19] U.S. Department of the Interior National Park Service. 1990; revised 1997. *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation*.

- **Object** is used to distinguish from buildings and structures those constructions that are primarily artistic in nature or are relatively small in scale and simply constructed. Although it may be, by nature or design, movable, an object is associated with a specific setting or environment. Examples include fountains, monuments, boundary markers, and sculptures.

- A **site** is the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historic, cultural, or archaeological value regardless of the value of any existing structure. Examples of prehistoric sites include ceremonial sites, habitation sites, petroglyphs, and so on. Examples of historic sites in battlefields, ruins of building or structure, or cemeteries significant for information potential or historic association.

- A **district** possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development. A district derives its importance from being a unified entity, even though it is often composed of a wide variety of resources. The identity of a district results from the interrelationship of its resources, which can convey a visual sense of the overall historic environment or be an arrangement of historically or functionally related properties.

Most buildings, structures, objects, non-archaeological sites, and historic era districts are evaluated under Criteria A through C, while Criterion D is applied generally to archaeological resources.

3.2 CALIFORNIA REGISTER OF HISTORICAL RESOURCES

Created in 1992 and implemented in 1998, CRHR is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change."[20] Certain properties, including those listed in or formally determined eligible for listing in the NRHP and California Historical Landmarks numbered 770 and higher, are automatically included in the CRHR. Other properties recognized under the California Points of Historical Interest program, identified as significant in historical resources surveys or designated by local landmarks programs, may be nominated for inclusion in the CRHR. A resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:[21]

Criterion 1: It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

Criterion 2: It is associated with the lives of persons important in our past.

Criterion 3: It embodies the distinctive characteristics of a type, period, region, or method of construction; represents the work of an important creative individual; or possesses high artistic values.

[20] *California Public Resources Code*, Division 5, Chapter 1, Article 2, Historical Resources, Section 5024.1(a).

[21] *California Public Resources Code*, Division 5, Chapter 1, Article 2, Historical Resources, Section 5024.1(c).

Criterion 4: It has yielded, or may be likely yield, information important in history or prehistory.

Resources nominated to the CRHR must retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance.[22] It is possible that a resource whose integrity does not satisfy NRHP criteria still may be eligible for listing in the CRHR. Similarly, resources that have achieved significance within the past 50 years may be eligible for inclusion in the CRHR if enough time has lapsed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance.

Similar to the NRHP criteria, most buildings, structures, objects, nonarchaeological sites, and districts are evaluated under Criteria 1 through 3, while Criterion 4 is generally applied to archaeological resources.

3.3 INTEGRITY

Historic properties either retain integrity (i.e., convey their significance) or not. To retain historic integrity, a property must always possess several, and usually most, of the seven aspects of integrity described below. The retention of specific aspects of integrity is paramount for a property to convey its significance. Determining which of these aspects are most important to a particular property requires knowing why, where, and when the property is significant.

3.3.1 National Register of Historic Places

The NRHP defines integrity as "the ability of a property to convey its significance."[23] For a property to be listed in the NRHP, it must not only qualify under at least one of the appropriate evaluation criteria but also retain integrity. Understanding a property type's character-defining features and their relationship to its significance is paramount when evaluating a resource's integrity.

There are seven aspects of integrity:

1. **Location** is the place where the historic property was constructed or the place where the historic event occurred. The actual location of a historic property, complemented by its setting, is particularly important in recapturing the sense of historic events and persons.

2. **Design** is the combination of elements that create the form, plan, space, structure, and style of a property. The design results from decisions made during the original conception and planning of a property (or its significant alteration) and applies to activities as diverse as community planning, engineering, architecture, and landscape architecture.

[22] California Office of Historic Preservation. 14 March 2006. "California Register and National Register: A Comparison (for Purposes of Determining Eligibility for the California Register)." *Technical Assistance Series*, No. 6. Sacramento, CA. Available at: http://ohp.parks.ca.gov/pages/1056/files/06CalReg&NatReg_090606.pdf

[23] U.S. Department of the Interior, National Park Service. Revised 2002. "How to Apply the National Register Criteria for Evaluation." *National Register Bulletin*, No. 15. Washington, DC, p. 44.

3. **Setting** is the physical environment of a historic property. It refers to the character of the place in which the property played its historic role. It involves how, not just where, the property is situated and its relationship to surrounding features and open space.

4. **Materials** are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

5. **Workmanship** is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

6. **Feeling** is a property's expression of the aesthetic or historic sense of a particular period of time. It results from the presence of physical features that, taken together, convey the property's historic character. Because feeling and association depend on individual perceptions, their retention alone is never sufficient to support eligibility of a property for the NRHP.

7. **Association** is the direct link between an important historic event or person and a historic property. A property retains association if it is the place where the event or activity occurred and is sufficiently intact to convey that relationship to an observer. Like feeling, association requires the presence of physical features that convey a property's historic character. Because feeling and association depend on individual perceptions, their retention alone is never sufficient to support eligibility of a property for the NRHP.

Certain aspects of integrity may be more or less important in evaluating a property, depending on the specific criterion of significance. For example, a property that is significant under criterion C for its exemplification of the distinctive characteristics of an architectural style needs to retain a high degree of integrity of design, setting, materials, workmanship, and feeling. On the other hand, a property significant for its association with an important person may not emphasize integrity of design as much as association.

3.3.2 California Register of Historical Resources

The CRHR defines integrity as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance."[24] For a property to be listed in the CRHR, it must not only meet one of the appropriate evaluation criteria but also retain enough of its historic character or appearance to be recognizable as a historical resource and to convey the reasons for its significance.

As with the NRHP, the CRHR evaluates integrity with regard to the seven aspects of location, design, setting, materials, workmanship, feeling, and association. For listing in the CRHR, integrity must also be judged with reference to the particular criteria under which a resource is proposed for eligibility. Historical resources that have been rehabilitated or restored may be evaluated for listing.

[24] California Office of Historic Preservation. 14 March 2006. "California Register and National Register: A Comparison (for Purposes of Determining Eligibility for the California Register)." *Technical Assistance Series*, No. 6. Sacramento, CA. Available at: http://ohp.parks.ca.gov/pages/1056/files/06CalReg&NatReg_090606.pdf

Alterations over time to a resource or historic changes in its use may themselves have historical, cultural, or architectural significance.

3.4 OTHER STATE DESIGNATION PROGRAMS

3.4.1 California Historical Landmarks[25]

California Historical Landmarks are buildings, structures, sites, or places that have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value and that have been determined to have statewide historical significance by meeting at least one of the criteria listed below. The resource also must be approved for designation by the County Board of Supervisors or be recommended by the State Historical Resources Commission, and be officially designated by the Director of California State Parks. The specific standards now in use first were applied in the designation of CHL 770. CHLs 770 and above are automatically listed in the CRHR.

To be eligible for designation as a *landmark*, a resource must meet at least one of the following criteria:

- Be the first, last, only, or most significant of its type in the state or within a large geographic region (Northern, Central, or Southern California)
- Be associated with an individual or group having a profound influence on the history of California
- Be a prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or be one of the more notable works or the best surviving work in a region of a pioneer architect, designer, or master builder

3.4.2 California Points of Historical Interest[26]

California Points of Historical Interest are sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. Points of Historical Interest designated after December 1997 and recommended by the State Historical Resources Commission also are listed in the CRHR. No historical resource may be designated as both a landmark and a point. If a point is subsequently granted status as a landmark, the point designation will be retired.

To be eligible for designation as a Point of Historical Interest, a resource must meet at least one of the following criteria:

- Be the first, last, only, or most significant of its type within the local geographic region (city or county)

[25] Office of Historic Preservation. Accessed 17 July 2006. "California Historical Landmarks Registration Program." Available at: http://ohp.parks.ca.gov

- Be associated with an individual or group having a profound influence on the history of the local area

- Be a prototype of, or an outstanding example of, a period, style, architectural movement, or construction, or be one of the more notable works or the best surviving work in the local region of a pioneer architect, designer, or master builder

SECTION 4.0
HISTORIC OVERVIEW AND CONTEXT

4.1 CHRONOLOGICAL HISTORY

4.1.1 Regional Early History

The historic period in California as a whole began with the arrival of Spanish navigator Juan Rodriguez Cabrillo and his party, who anchored in San Diego Bay on September 28, 1542. The area comprising present-day Los Angeles County was first explored by Europeans in 1769 when Gaspar de Portola and a group of missionaries camped on what are now the banks of the Los Angeles River. They named the area "Nuestra Senora de Los Angeles de la Porciuncula" (Our Lady the Queen of the Angels of Porciuncula). The first settlement was established in 1771 with the founding of Mission San Gabriel Arcangel by Father Junipero Serra and a party of Spaniards. Ten years later, the Pobladores, a group of 11 families recruited from Mexico by Captain Rivera y Moncada, traveled from the San Gabriel Mission to a spot selected by Alta California Governor Felipe de Neve to establish a new pueblo. The settlement was named El Pueblo de la Reina de Los Angeles (The Pueblo of the Queen of the Angels. Over time, the area became known as the Ciudad de Los Angeles, "City of Angels."[27]

During Spanish rule, from 1781 to 1824, two dozen land grants were made, primarily as compensation to soldiers upon their retirement. In 1784, the Spanish granted 300,000 acres of land (later reduced to 150,000), stretching from the San Gabriel River to the Santa Ana River and encompassing the area later developed as the Los Angeles County Poor Farm, to Jose Manuel Nieto. A former soldier who had served at the San Diego presidio, Nieto was a member of the 1769 Serra-Portola expedition, led by military leader Gaspar de Portola and Franciscan priest Junipero Serra meant to establish the mission system (and with it Christianity) in Alta California. After his death, Nieto's land holdings were divided into smaller ranchos among his heirs, becoming Rancho Los Alamitos, Las Bolsas, Los Cerritos, Los Coyotes, and Santa Gertrudes. In 1821, Mexico gained independence from Spain and subsequently assumed rule over Alta California. The 1834 secularization of the mission system and distribution of its holdings dramatically shifted the character of land ownership in Southern California. Mission secularization in 1833 and the beginning of a highly profitable trade in cattle hide and tallow exports opened the way for an increase in the number of commercially driven farms. During Mexican rule of California, from 1821 to 1848, land owned by the Spanish crown and clergy was distributed in over 800 land grants, passing mostly to Mexican settlers born in California, or *Californios*.[28]

With the signing of the Treaty of Guadalupe Hidalgo in 1848, the U.S.–Mexican War formally ended. California was annexed to the United States. After gaining statehood in 1850, California's legal and political system was transformed, setting in motion a series of changes that began to erode the rancho system. The introduction of property taxes proved onerous for many Southern California ranchers, given the size of their holdings.[29] In addition, the 1851 creation of the U.S. Land Commission required that property owners prove the validity of their property titles, many of which had been granted relatively informally and without the benefit of formal survey. Because

appeals were allowed (but were usually prolonged affairs), property ownership disputes were resolved via expensive litigation proceedings. Ranchers often paid legal debts with portions—or all—of their ranchos; during this period, 40 percent of rancho-held lands in the County of Los Angeles passed to the U.S. government.[30],31 However some ranchos, such as Rancho Santa Gertrudes, were purchased by private individuals who understood that the Rancho era had come to an end, and purchased a large rancho property for the purpose of dividing into smaller farm sites.

4.1.2 Rancho Santa Gertrudes and the City of Downey

Originally, Rancho Santa Gertrudes, which included the present-day cities of Downey and Santa Fe Springs, was awarded to Antonio María Nieto following the death of Jose Manuel Nieto. In 1834, Nieto's claim to Rancho Santa Gertrudes (by then in the hands of his widow Josefa Cota de Nieto) was confirmed by the Mexican government. Nieto's widow subsequently sold the rancho to Kentuckian Lemuel Carpenter, a soap maker who had married her niece, Maria de los Angeles Dominguez.[32] For four years, Carpenter and his wife and family enjoyed the lifestyle of a large land-holding Don. After the signing of the Treaty of Guadalupe Hidalgo in 1848, Carpenter's loyalty to the United States and his land holdings were questioned. When his attempt to maintain his property by seeking credit was unsuccessful, he sold a portion of his land holdings to José Ramirez in 1855, as well as to other individuals, realizing it was becoming too difficult to repay his creditors.[33] In 1859, apparently due to overwhelming debts, Carpenter committed suicide causing Rancho Santa Gertrudes to be auctioned off by the local sheriff. The property was purchased for $60,000 by successful Los Angeles drug store owner and a founder of the Los Angeles Farmers and Merchants Bank, John Gately Downey, and his partner James P. McFarland.[34] Downey was elected Lieutenant-Governor of California in 1859, but ending up becoming governor instead in January 1860. He placed any plans for the rancho on hold until after his term as governor ended in 1862. He allowed the Carpenter heirs to live on the land for many years.[35]

Downey and McFarland eventually subdivided Rancho Santa Gertrudes and sold plots of land, most of which were developed for agricultural uses. A section of the land located between the Rio Hondo and the San Gabriel River was named after Downey, and established as a town in 1873. The property was called the "Tract of the Downey Land Association" according to tax assessor records. This land, consisting of 96 acres, was valued at $2,940 with improvements of $330.[36] Located approximately 10 miles east of the Pacific Ocean and just southeast of downtown Los Angeles, Downey quickly became an important settlement within the County of Los Angeles.

[36] City of Downey. Available at: http://www.downeyca.org/city_about.php#railroad

In 1888, a depot was constructed and soon the Southern Pacific Railroad began bringing settlers and visitors to the new community. Much of the city's pattern of development was determined by the railroad. The construction of the Christian Church on the corner of Fourth and New Streets marked the beginning of Downey's downtown. As the town began to grow over the next decade, 300 homes were constructed as well as a courthouse, post office, schools, churches, and businesses.[37]

By the 1900s, Downey was an established community featuring a variety of profitable business such as a Sunkist packing plant, a department store, banks, restaurants and mercantile shops. Downey also established its own grammar and high schools. In the following decades, Downey continued to flourish, with the addition of businesses in several important industries, including agriculture and aviation. Residential development expanded continuously throughout the 20th century, particularly in the period following World War II. In 1956, the City of Downey was incorporated.[38]

4.1.3 County of Los Angeles

On February 18, 1850, the year California was admitted to the Union, the County of Los Angeles was established as one of the 27 original counties of the soon-to-be thirty-first state. The people of Los Angeles County elected a three-man Court of Sessions as their first governing body on April 1, 1850. A total of 377 votes were cast in this election. In 1852 the Legislature dissolved the Court of Sessions and created a five-member Board of Supervisors.[39]

After the Civil War ended, there was a large immigration into the Los Angeles area. Several large Mexican ranches were divided into many small farms, and cities such as Compton, Norwalk, San Fernando, Santa Monica, Pasadena, and Downey were founded. Los Angeles also experienced a large boom in population and development with the completion of the Southern Pacific Railroad route from San Francisco in 1876 and its subsequent links to the southeast, followed by the arrival of the Santa Fe Railroad, which reached Los Angeles 1n 1887. Tourism was promoted and new towns were planned to attract investors, to raise land values, and to increase the value of railroad shipments and holdings. The Southern California citrus industry flourished at this time, able to reach national markets quickly due to the availability of the rail lines. The Los Angeles population increased from approximately 11,000 in 1880 to approximately 60,000 in 1890.[40]

4.1.4 County Poor Farm Beginnings: 1887/1888–1907

Begun in 1887/1888 as the new County Poor Farm, Rancho Los Amigos upon its inception was an agricultural facility that provided work, housing, and medical care for the indigent. The original purchase of 124.4 acres in the vicinity of the town of Downey was graded for roads and supplied with water from an artesian well. In addition, the Los Angeles County Board of Supervisors reviewed plans from architects for the first buildings planned for the campus. In 1888, the Board of Supervisors awarded the contract to design the layout of the new Poor Farm to the preeminent Los Angeles architectural firm of the time, Kysor, Morgan, and Walls.[41] Ezra F. Kysor (1835–1907),

Octavius Morgan (1850–1922), and John A. Walls (1858–1922) were individually and collectively responsible for the architecture of many of the most notable buildings constructed in the Los Angeles area in the late–19th century, including Pico House in the El Pueblo Historic District (Kysor, 1869/1870), the former St. Vibiana's Cathedral (Kysor, 1871/1876), Hollenbeck Home for the Aged (Morgan and Walls, 1896), and Widney Hall at the University of Southern California (Kysor and Morgan, 1880).[42]

The firm envisioned a U-shaped configuration, with a central courtyard defined by the North (Female) and South (Male) Wards and a central Dining Hall (Refectory) *(*Figure 4.1.4-1*, Original U-Shaped Configuration by Kysor, Morgan, and Walls)*. While the commissions for the two wards were given to Kysor, Morgan, and Walls, the job of designing the Refectory fell to another local architect, Jacob Friedlander. The central courtyard was landscaped with lawns and flower beds. A year later, in 1889, Morgan designed the fourth building on the campus, which was to serve as an office, residence for the physician and superintendent, and laboratory.[43] The completed set of buildings was situated on what is now known as the South Campus, just south of the intersection of today's Erickson Avenue and Descanso Street at the west terminus of Consuelo Street. Three of the buildings were designed in a brick Victorian-era institutional style, were two-stories in height, and measured 45′ × 75′ *(*Figure 4.1.4-2*, Original Administration Building and North and South Wards)*. The fourth building was constructed at a cost of $9,000, and was a simple wood-framed building with Victorian-era detailing.[44] A continuous veranda connected the buildings, and framed a garden courtyard, featuring lawns, a rose garden, and an aviary (Figure 4.1.4-3, *View of Original Courtyard Designed by Kysor, Morgan, and Walls*). The aviary remains the oldest surviving building on the hospital campus and is now located in the northwest section of the interior courtyard of the Men's Psychiatric Ward Complex. The remaining buildings from the original poor farm plan are no longer extant.

By December 1888, the first patients had been transported by wagon to the new facility, and the Board of Supervisors had established the rules and regulations governing the operation of the Los Angeles County Poor Farm.[45,46] The following February, Missouri native and physician Edwin L. Burdick was appointed superintendent and resident physician. Burdick and his wife, Ellen, had relocated to Los Nietos Valley from Kansas City in 1876 in order to enjoy what they regarded to be the more healthful climes of California. Upon his arrival at the Poor Farm, Superintendent Burdick and his family moved into the second floor residential area of the newly constructed Administration Building.

From the beginning, the County's goal was to make the Poor Farm as self-sufficient as possible through the planting of crops and the raising of dairy cows, chickens, and pigs. The inmates at the Poor Farm largely provided the labor for the agricultural efforts, with the assistance of several farm supervisors. Inmates also tended to the numerous trees, lawns, and gardens that decorated the

farm's landscape. The agricultural program at the Poor Farm became highly successful; throughout the first half of the 20th century, it was nationally recognized in the fields of cultivation and scientific breeding as a successful producer of prized crops and livestock.

During the 1890s, the inmate population of the Poor Farm nearly doubled, from approximately 125 to nearly 200 patients, most of whom were over 60 years of age. Many of those seeking care were manual laborers, originally from other states or countries, who had fallen ill or were injured and lacked a safety net provided by family or financial resources. During this period, the facilities expanded to accommodate the growing patient population and staff. The Refectory was enlarged, and new buildings were constructed, including a bathhouse and laundry building, outdoor toilet facilities, a bunkhouse, barns, and various outbuildings. A freight and passenger depot, operated by the Terminal Railroad Company, was also constructed in the 1890s, with the County paying the Terminal Railroad Company approximately $14 a month to ship milk from the County Farm to the County Hospital in Los Angeles.[47] (Figure 4.1.4-4*, County Poor Farm Depot Operated by the Terminal Railroad Company [No Longer Extant]*). In 1897, a new two-story, 40-bed Women's Ward was constructed adjacent to the Administration Building.

Burdick's tenure as superintendent lasted for 12 years until 1901, when he was forced to resign for health reasons.[48] The expansion and development carried out under Burdick's leadership established the Poor Farm's reputation as an important agricultural producer and haven for the destitute and ill. By 1902, the institution had grown to 227 acres with a total value of $92,046, and the annual net value of agricultural products $5,176.[49,50] After Burdick's departure, the dual roles he held as superintendent and resident physician were split into two separate posts. T.F. Simpson, the Poor Farm steward and bookkeeper became superintendent, and the position of resident physician went to Dr. F.L. Norton, a graduate of the University of Southern California's College of Medicine and Burdick's assistant physician and druggist.

As the Poor Farm continued to expand and develop, the residents and community leaders of Los Angeles County became aware of the farm's achievements. This high profile also brought a greater degree of public scrutiny and comment on facility operations. Initially in the 1900s this public comment was positive. In May 1902, a delegation from the General Federation of Women's Clubs, convening in Southern California, arrived to inspect the County Poor Farm in order to learn about the successful mix of commerce and social welfare services. After a tour of the facilities led by Superintendent Simpson and chairman of the County Board of Supervisors, E.S. Field, the women were quoted commenting on the Poor Farm's combination of "charity and industry . . . in such a manner as to afford recreation and exercise for the inmates, as well as to return more than half the cost of maintenance to the county."[51,52]

(No Longer Extant)

However, one year later in 1903, newspapers began reporting on problems at the Poor Farm, including overcrowding of the wards, poor sanitation and maintenance, too few "suitable and sufficient" toilet facilities, and poor oversight of the agricultural operations (which were nonetheless found to be in "good condition" overall).[53] In April 1903, the County Hospital and Farm had a new superintendent and resident physician. After having served only two years, Superintendent Simpson left the post and was replaced by George S. Clarke, who remained as superintendent until January 1907. The resident physician, Norton, left and was replaced by Marshall E. Price.

4.1.5 Poor Farm Faces Problems: 1903–1907

Marshal E. Price was a graduate of Chicago Medical College in Illinois and moved to Los Angeles in the 1890s where he began his private practice. Price was appointed as physician of the Poor Farm on April 1, 1903. At that time, he and his family moved into the third floor of the Administration building. Prior to his arrival, nurses were inmate assistants. Price made the decision to hire a professionally trained nurse, Mr. H.S. Readon, for the day shift and kept the inmate assistants to work as night nurses.[54]

Although early reports about the County Farm praised the institution as pleasant and relaxing, by 1903 inspectors from the State Board of Charities and Corrections stated in their report that the facility was overcrowded, furniture had to be replaced, and that the use of tallow candles for light was a fire hazard. The report also criticized the outdated water closets for their drainage problems (the male patients could only use outdoor toilets) as well as the lack of electricity on the Farm.[55] In spite of the negative publicity, progress continued at the Poor Farm. In 1905, a much-needed water pump was installed. To the relief of the Supervisors, the pump provided more water then needed, allowing the Poor Farm to sell the excess water to neighboring cities rather than pay the excess of $600 to $700 a year in water fees.[56]

By the following year, negativity surrounding the institution resurfaced. Overcrowding at both the County Poor Farm and County Hospital was largely blamed on men that came from outside Los Angeles County to the Farm and Hospital during the winter months looking for relief. These men stayed at the expense of Los Angeles taxpayer's money and were difficult to send away. To alleviate the Poor Farm's financial crisis, a bond issue, which would allocate $70,000 for improvements, was placed on the November 1906 ballot. Although two well-known physicians, Drs. Webster and Cook, tried to help pass the bond by visiting the Poor Farm and writing newspaper articles in support of the issue, it failed. A grand jury visited the institution and urged the County Board of Supervisors to designate funds for the remodeling of the existing wards and the construction of additional ward buildings, as well as a new dining room, kitchen, laundry facility, bathing facilities and modern toilets. The board abided by the jury's suggestion and made necessary upgrades.[57]

4.1.6 Expansion and Progress: 1907–1915

Following the departure of Clarke in 1907, Donald Chick was temporarily appointed superintendent of the County Farm. Superintendent Chick's brief tenure resulted in several important accomplishments, which had lasting effects at the County Poor Farm. He established the landscaping department, constructed the Poor Farm's first chapel, and built the original Psychopathic (now Psychiatric) ward, the first purpose-built hospital building to be erected at the institution.[58]

Constructed in 1907, the original psychiatric ward (LACO No. 1205) housed both male and female mentally impaired patients, who were transferred from the overcrowded Los Angeles County Hospital. The single-story brick building located at the intersection of Erickson Avenue and Golondrinas Street was organized into rows of rooms, each with a window, on either side of a central corridor. The men's section was on the north side of the corridor and the women's was on the south side. The windows were barred and had heavy wire screens, and the doors were kept padlocked. The patients were locked outside of their rooms a few hours each day to get fresh air and sunshine by sitting under shade trees in a fenced yard.

The Psychiatric ward building was enlarged several times, beginning in 1909. The original single-story, rectangular shaped building was expanded to form a U-shape enclosing a courtyard area by the addition of two parallel wings on its north and south elevations. These wings were elongated in 1916 for additional ward space, and a partial second story was added to house the resident attendants. Also at this time, a projecting cafeteria wing was constructed along the center of the east (rear) elevation of the original 1907 building.

After eight months of temporary management under Chick, Superintendent Andrew Wade arrived at the Poor Farm in September 1907. Under Wade's management, conditions at the farm continued to improve. By 1908, the institution had grown to 333 acres, with a value of approximately $200,000. The staff expanded; including nurses, interns and other laborers; and an average of 210 patients remained on the Farm monthly.[59]

Andrew Wade served as the first Postmaster at the Poor Farm in 1908. The Farm at the time had over 200 patients and over 20 staff members and the Postal Service thought the Farm had enough mail to warrant its own post office. Wade received the mail in the Administration Building, sorted it, and made it available for staff and patients to come in and pick it up. Superintendents were generally elected postmasters until 1933 when the amount of mail received required a full-time postmaster to attend to the Poor Farm's post office.[60]

More construction occurred in 1909 under Wade's supervision. Employee housing was added, and the first Power House (LACO 1302) was constructed. The Power House, located on the corner of Hawthorn and Descanso Streets, housed the power plant, new telephone system, ice house, brine

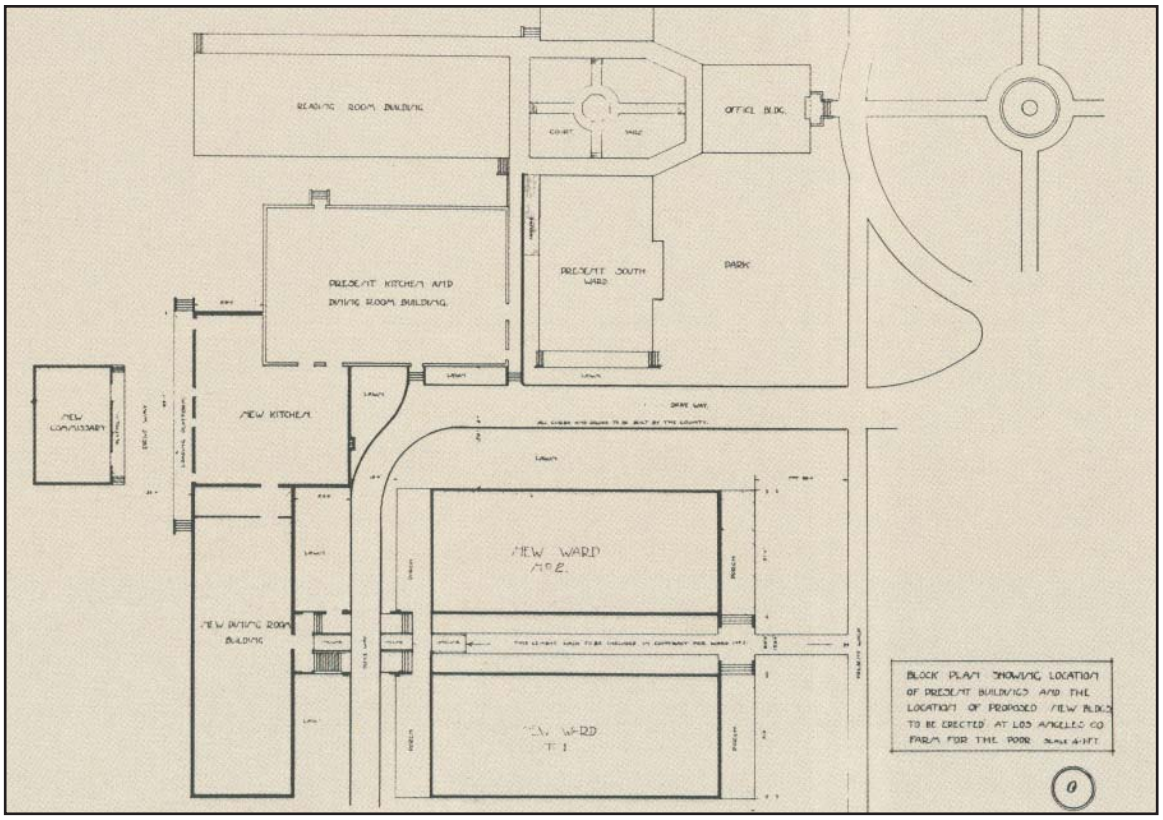
room, and laundry. The Power House facilities consisted of a boiler room with three boilers and pump pit. A fourth boiler and shallow trenches with pipes were added later.[61]

The Poor Farm began to make a profit off their crops in 1909. One of their most notable and high paying crops were oranges. In April of that year, the Semi-Tropical Fruit Exchange paid over $10,000 for 33 cars of navel oranges, which constituted approximately one-half of the total crop.[62] In May, another $5,000 worth of oranges were sold. Due to its value, the crop was protected from thieves by a high fence. Estimates calculate that this fence saved the County from approximately two carloads worth of stolen oranges that year.[63]

In addition to operating a successful agricultural enterprise, the Poor Farm gradually expanded its role as a County medical facility. By the 1910s, an increasing number of inmates with chronic medical disorders were being admitted to the Poor Farm, prompting administrators to employ a staff of physicians and nurses to treat them. This surge in patients and employees created the impetus to expand the Poor Farm. The resulting development program reflected a critical shift in the mission of the Poor Farm, and marked the early stages of the transition from a rehabilitative care facility for indigents into a hospital to house long-term invalid patients. Also at this time, a Milk House was also added to provide a place to pasteurize the milk produced on the farm.



Wade left the Poor Farm in January 1911 and was immediately replaced by Charles C. Manning. Under the management of Superintendent Manning (1911 to 1915), expansion of the County Farm accelerated in response to a dramatic upswing in admittance under his tenure. Between 1911 and 1914, the inmate population increased 280 percent, from 198 to 479. In 1912, Manning requested plans for the first two General Ward Buildings, later called Buildings 30 and 40 (LACO Nos. 1184 and 1185), to be constructed along the west side of Erickson Avenue south of the original Administration Building (no longer extant) (Figure 4.1.6-1*, 1912 Block Plan Depicting Location of the First Two General Ward Buildings [Known as Buildings 30 and 40]*). The buildings were to be connected on their west (or rear) elevations by a one-story hyphen addition that provided a covered walkway and handicapped access between the two buildings. It was necessary to demolish the original pump house building and water tower for the construction of Building 30. A recording device was installed under the new building to continue to record the local water table for the water district (Figure 4.1.6-2*, Northeastern View of the General Ward Buildings Constructed in 1913*).[64] A new large steel water tower and tank (LACO No. 1301) was constructed to the rear of the original powerhouse (LACO No. 1302). Building 30 also housed the first receiving ward for the campus and became known as the Medical Offices and Pharmacy Building. Once the first two General Ward Buildings were completed in 1913, the old North Ward (no longer extant) reverted from a hospital ward back to its original use as a General Ward for male patients. The series of General Ward Buildings that were begun under Manning's direction in 1912 were completed under Harriman's in the late 1920s. Manning left the County Farm in June 1915 and was briefly succeeded by Carl P. Talle.

4.1.7 Harriman Era: 1915–1952

In June 1915, William Ruddy Harriman was appointed the new Superintendent at the County Poor Farm. Harriman promptly moved his family into the new Craftsman residence that had been constructed by Manning at the center of the property (Figure 4.1.7-1*, The Superintendent's House [Also Known as the Harriman House], Constructed in 1915*).[65] When he took over management of the institution, the Poor Farm was providing care to 500 indigent men and women with a staff of 45. With Harriman came a significant change in the direction of the Poor Farm; he is credited with rebuilding the Poor Farm after the damage caused by a devastating flood in 1914. In addition, Harriman drastically improved the property, constructing new buildings, installing an irrigation system, upgrading the utilities, organizing administration duties, and developing the park-like landscape that is still apparent today These improvements were largely accomplished in the wake of a financial surge that followed World War I.

Harriman's first major building effort was the construction of additional General Ward buildings. By 1917, the patient population had reached a new high of over 600, prompting Harriman to construct Building 50, the third General Ward Building (LACO No. 1186), directly south of Building 40. The influx of new patients at the Poor Farm provided the impetus for the expansion of services and facilities needed, resulting in the construction of a number of the extant significant buildings at the property (Figure 4.1.7-2*, 1917 Plot Plan for Los Angeles County Poor Farm*).

At this time, the Psychiatric Wards were enlarged by the addition of two wings, including a partial upper story containing rooms for the attending staff (Figure 4.1.7-3*, Men's Psychiatric Wards, Constructed in 1907 and Enlarged in 1924*).[66] By 1918, the "insane" population had risen to more than 160 patients, and Superintendent Harriman was forced to seek funding for a separate building to house the female psychiatric patients. The new ward was constructed in 1919 and was located directly south of the Men's Psychiatric Ward Building. It was designed in an H shape and accommodated centrally located matron's and administrative rooms; a wing to house the kitchen and dining room; a wing for the patient rooms; and a fenced inner courtyard with a lawn, trees, and flowers.

The numbers of insane patients continued to rise each year, reaching 257 in 1924.[67] Plans were initiated by Harriman to begin the construction of two new ward buildings for 156 men and 98 women, respectively, to be built directly east of the existing psychiatric ward buildings. The new men's ward opened in late 1924, followed by the new women's ward in the summer of 1925. Both buildings mirrored the design and configuration of the original wards. New one-story wall hyphens connected the two men's ward buildings and the two women's ward buildings on the north and south elevations. These wall connectors created an enclosed courtyard space which allowed the patients to roam in a confined area. Over the next several years, additional, freestanding, mostly brick vernacular style buildings (LACO Nos. 1239, 1240, 1241, 1243, 1244, 1245, 1249, and 1251) were constructed within the courtyard areas of the two psychiatric ward complexes. These buildings served several functions, including linen rooms, toilet buildings, and open shelters. In 1931, the Aviary, the sole remnant of the 19th-century Poor Farm, was moved to the courtyard of the Men's Psychiatric Ward complex in hopes of bringing a sense of calmness to the patients.

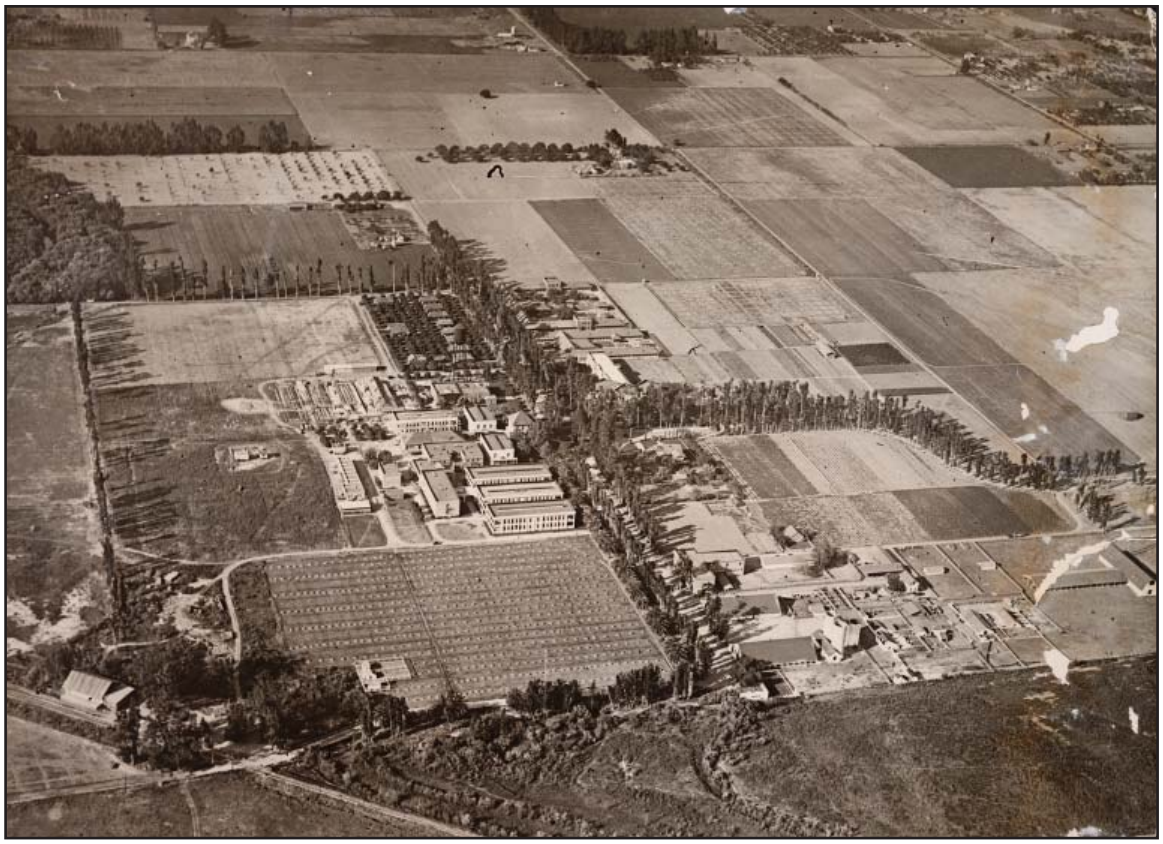
Throughout the 1920s, as residency continued to increase, Harriman expanded and improved the facilities, including a number of large building projects. (Figure 4.1.7-4*, 1922 Aerial Photograph of the Los Angeles County Poor Farm*) Understanding the need to house additional patients, Harriman began the construction of four Patient Ward buildings in 1922 followed by an additional four wards soon after. This project signaled the full-fledged transition of the farm from a rehabilitative care facility for indigents into a hospital to house long-term invalid patients. By 1922, the institution had a staff of approximately 175 employees to care for the needs of the 1,500 ambulatory patients living at Rancho Los Amigos (Figure 4.1.7-5*, Staff Cottages Located on Flores Street, Constructed in 1921*).[68] By late 1925, an additional five infirmary (Patient) wards had been constructed (Figure 4.1.7-6*, Northwestern View of Infirmary Wards circa 1929 and Floor Plan*). Even with the new facilities, there was a lack of beds in the wards, forcing many patients to reside on the sleeping porches. When administrators realized that this temporary fix was going to become permanent, they enclosed the porches circa 1936.[69]



Substantial buildings continued to be erected through the 1920s (Figure 4.1.7-7*, 1926 Aerial Photograph of the Los Angeles County Poor Farm*). The old Administration Building constructed in 1889 was in dire need of repair and was replaced by a new building in 1926 (Figure 4.1.7-8*, The New Administration Building, Constructed in 1926*). The old Administration Building was demolished in 1929 and replaced with a fish pond, and an 18′ × 12′ wrought iron shelter was constructed mark the location of the former building. A new kitchen and service building (LACO 1295) was constructed for employees of the nearby infirmary ward and general ward buildings (Figure 4.1.7-9*, The New Kitchen and Employee Dining Room Constructed in 1929*). The old brick refectory building was razed and replaced with an 850-seat Spanish Colonial Revival Auditorium, which provided much needed diversions to the ailing patients and staff (Figure 4.1.7-10*, The Spanish Colonial Revival Style Auditorium, Constructed in 1928*). Movies were screened weekly in the Auditorium and other musical types of entertainment were offered as well. A radio and reading room was located in the rear of the building. A new Woman's Ward, Casa Consuelo (LACO No. 1238), also featured Spanish Colonial Revival styling, and was able to accommodate 188 female patients in bright and cheery rooms, all with an exterior view (Figure 4.1.7-11*, Casa Consuelo, Constructed in 1930*).[70] Harriman's wife, Elinor, is credited with having influenced the design of the building.

In addition to the physical changes that occurred under Harriman's leadership, there were also philosophical changes at the Poor Farm. Harriman subscribed to the idea that the physical condition of an individual could be improved through occupational and physical activities and by the character of their surroundings. Harriman's philosophy for self-improvement soon encompassed all aspects of life at the Poor Farm. Harriman insisted that the patient's needs and comfort be addressed through the development of amenities at the Poor Farm. He insisted that the patients work towards their own physical improvement, through active rehabilitation. Patients were assigned to work on the farm or in the greenhouse, based on their physical capabilities and individual talents. These occupational therapy activities were also intended as physical therapy, by providing the patients with fresh air, sunshine and independence.

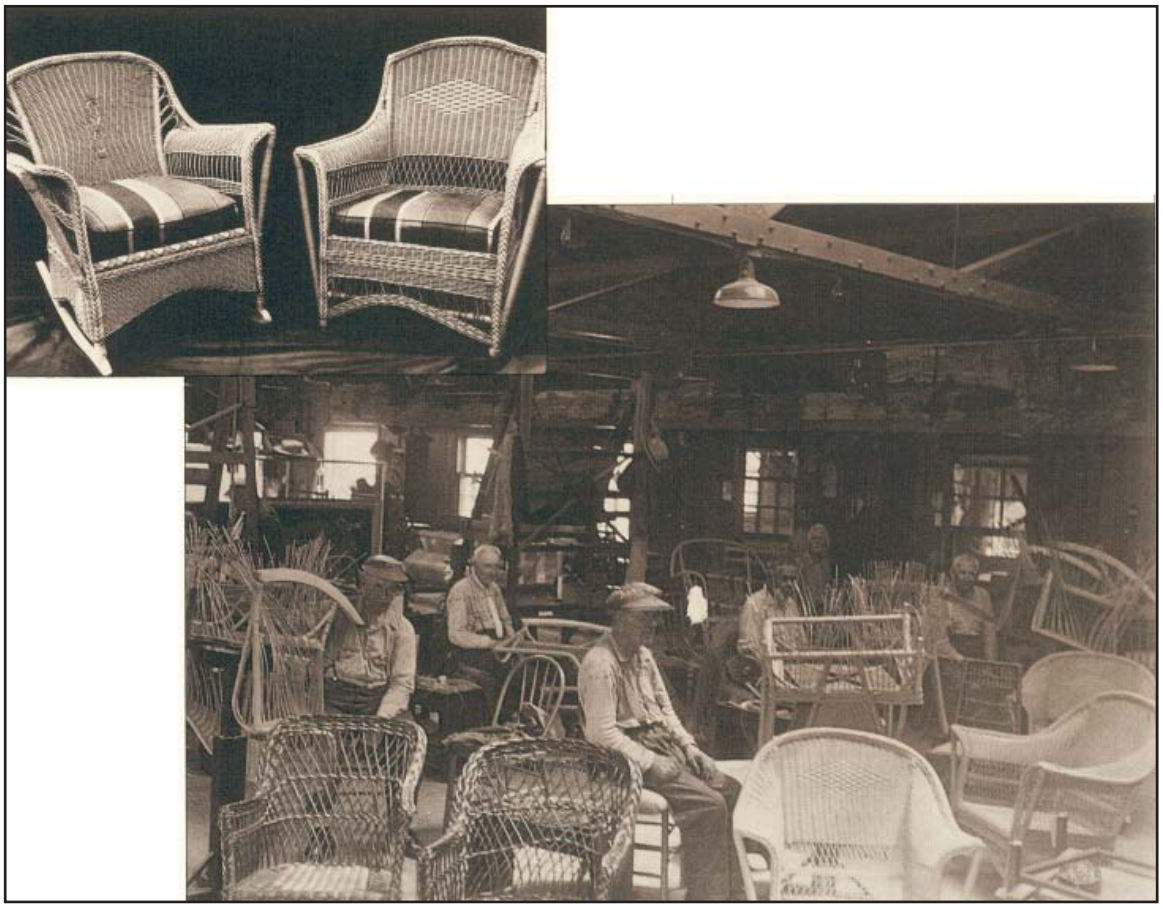
The Occupational Therapy Department was established in 1926, and was integral to the improvement in lifestyle at the Poor Farm. Eighteen types of craft and handiwork were taught through the department, ranging from rug making and basket weaving to leather work. The Occupational Therapy Department allowed the institution to increase its self-sufficiency and generate income. Patients were employed to make everything necessary for every day life, as well as stock a showroom of items for sale, including equipment, furniture, linens, food, shelters, repairs, and printed matter (Figure 4.1.7-12*, Patients Creating Wicker Furniture at the Occupational Therapy Shop*). In 1929, a new building was constructed on Bonita Street to house the occupational therapy shops.[71]

By the end of the 1920s, the Poor Farm comprised an impressive 540 acres of farmland and buildings, with a property value of $2 million dollars. The property produced three annual crop yields, and real estate improvements included one mile of paved roads, an additional one and one-fourth miles of decomposing granite roads, miles of sewer mains connected to the County sanitation system, hundreds of acres of new lawns, gardens, and trees and numerous buildings serving a variety of purposes[72] (Figure 4.1.7-13*, 1928 Aerial Photograph of the Los Angeles County Poor Farm*).

The stock market crash of 1929 and ensuing Depression created a challenge for the Poor Farm. Not only did admittance at the County Farm rise due to the increased number of indigents within the County health care system, but also funding was significantly reduced. By 1934, a shift in patient demographics served had become apparent, with an increased number of patients from the professional, or white-collar, sector of society. Patient records from the period document attorneys, physicians, professors, and accountants among the County Farm residents.[73]

Despite the reduced budget, Harriman was still able to implement several upgrades to the facility, including the erection of new buildings. Improvements during this period primarily consisted of maintenance to existing buildings including making all building ramps nonslip and providing patients in wheelchairs improved access throughout the Rancho. Several significant buildings were erected, including the Harriman Building in 1933 (not located within the boundaries of the Historic District), (Figure 4.1.7-14*, Harriman Building under Construction in 1930*), which became the first modern medical facility on the property grounds.[74] (The Poor Farm managed to maintain all of its existing services and features, including its landscaping department, thanks to the supply of labor provided by the increasing number of admitted inmates (Figure 4.1.7-15*, 1930 Aerial Photograph of the Los Angeles County Poor Farm*).



In 1932 Harriman petitioned the County of Los Angeles to change the official name of the institution from County Poor Farm to "Rancho Los Amigos," or "Ranch of the Friends." This name change served as public notice of the evolving medical mission of the facility, as well as helping to shed the stigma associated with the title of "Poor Farm." Los Amigos reported that the institution's beds were occupied at 97-percent capacity, averaging 2,976 beds by mid-year.[75] Rancho continued to take in patients who were physically disabled or over the age of 65. The Depression-era budget precluded the addition of more infirmary wards, so Harriman converted buildings—the cow barn became the men's General Ward—and added extra beds in hallways and porches of the other General Wards to accommodate the swelling numbers of patients.[76]

Before the stock market crash of 1929, money was set aside for the construction of a patient recreation hall. Bonita Hall opened in 1932 to serve the recreational needs of the patients (Figure 4.1.7-16, *Bonita Hall, Constructed in 1932)*. Designed in the Spanish Colonial Revival Style, the single story building featured a large assembly room for male patients, as well as several rooms which housed utilities, employment offices and the patients' canteen.[77]

The 1933 Long Beach Earthquake provided the catalyst for much-needed improvements to the institution's infrastructure (Figure 4.1.7-17*, Impact of 1933 Long Beach Earthquake*). Utilities in particular were upgraded. Equipment was installed to ensure a back-up power source in the event of another disaster, and a contract was secured with Southern California Edison to provide power to the new buildings situated north of Imperial Highway, as well as a back-up power on an as-needed basis. In addition, improvements were made to many of the unreinforced masonry buildings damaged during the earthquake. Employees quickly went to work bracing the weakened walls and making repairs to various buildings. Four buildings were condemned and razed following the earthquake, including the original women and men's wards.

By late 1937, Rancho Los Amigos was treating close to 3,000 patients annually. The average patient age had been dramatically reduced due to the 1933 enactment of the National Social Security Act, which gave individuals over the age of 65 a $35 monthly allowance. This enabled older inmates to leave institutional care and provide for themselves. Their departure freed space for chronically ill children to be admitted to the new medical center.[78] This shift in types of patients propelled Rancho Los Amigos into becoming an exclusively hospital facility. The majority of patients could no longer contribute to the production of the farm, which increased the cost of patient care and caused the gradual phasing out of the farming operations. This was confirmed in an April 14, 1941, *Los Angeles Times* article, which stated, "For several years the institution has been more of a convalescent hospital than a county farm, therefore the persons cared for there are designated as patients rather than inmates."[79] (Figure 4.1.7-18*, 1938 Aerial Photograph of Rancho Los Amigos*).

By the end of World War II, the patient population at Rancho Los Amigos had more than doubled from 2,500 to 5,579. A significant portion of this patient increase resulted from the wide-spread polio outbreak which began in 1945. In 1950, General Ward 40 (LACO No. 1185) was remodeled to accommodate polio patients.[80] In the late 1940s, immediately after World War II,

Superintendent Harriman began construction of four ward buildings adjacent to the Medical Building (Harriman Building). This was the first large-scale construction project to take place at Rancho Los Amigos in a number of years, and it initiated a large-scale building program on the portion of the property located north of Imperial Highway. Harriman also planned a convalescent home for the growing number of children, physiotherapy and hydrotherapy building, a larger chapel, warehouses, and garages.[81] He added the departments of pediatrics and speech and hearing. He also opened a Rehabilitation Shop where patients handicapped by illness or injuries could be trained in wood and leather working, watch making, ceramics, and other crafts.[82]

The most important shift in the development of Rancho Los Amigos in the post World War II years was the response to the mass outbreak of polio in Los Angeles County. As the epidemic continued for several years, Rancho Los Amigos became a well-known polio rehabilitation center.[83] Many of the existing buildings underwent first-floor improvements to accommodate polio patients.[84] Most of the polio ward staff became polio treatment experts who taught their methods to other medical professionals all over the country.

4.1.8 Post-Harriman Years: 1952–Present Day

In 1952, Superintendent Harriman retired, and Robert Thomas assumed the duties of superintendent. Under his guidance, a Respiratory Center was constructed in 1952 in the expanding facility north of Imperial Highway (Figure 4.1.8-1*, 1954 Aerial Photograph Rancho Los Amigos*). Thomas reorganized the staff into the Professional Services Department, the Nursing Department, and the Dietary Department, to better coordinate the various services of Rancho Los Amigos. New departments and programs initiated under Thomas' watch included a Home Care Department, an Orthopedic Department, a pilot rehabilitation program, and Social Services Department. Although Thomas left after only four years in 1956, Rancho Los Amigos continued to expand its medical services for polio patients and develop an innovative rehabilitative program.

With the waning of the polio epidemic after the development of vaccines in the mid-1950s, Rancho Los Amigos made its transition to rehabilitative care through the development of its progressive rehabilitation program (Figure 4.1.8-2*, Polio Patients Receiving Rehabilitative Care at Rancho Los Amigos National Rehabilitation Center in the 1950s*). In 1958, the hospital sought accreditation, which was granted in May 1959. By the end of the decade, Rancho Los Amigos was recognized as a quality medical facility and the farming facilities of the old Poor Farm were completely abandoned.[85]

Rancho Los Amigos continued to grow throughout the late–20th century and to develop into a state-of-the art medical facility. As the emphasis for expansion and development occurred north of Imperial Highway, the existing buildings from the County Farm era were vacated and used for office space, storage, or were abandoned. Today, Rancho Los Amigos Medical Center remains one

4.2 SIGNIFICANT HISTORICAL THEMES

4.2.1 Rancho Los Amigos Role in the County Health and Welfare Systems

Rancho Los Amigos is significant as one of the historic lynch pins of the public services provided by the County of Los Angeles, initially as a poor farm and subsequently as a hospital whose mission evolved into one of rehabilitation. The Los Angeles County Poor Farm was founded on the basic principles of the poorhouse system developed during the Industrial Revolution in England to provide care to the poor, disabled and elderly. It was not unusual for the dual goals of welfare for the indigent and medical care for the impoverished to overlap.

Prior to the concept of a county hospital system, many American general care facilities were administered through federal aid. This type of funding became available in 1798 to both governmental and private hospitals that served as marine hospitals under the terms of legislation for the "relief of sick and disabled men."[86] Government funding seemed to be an incentive for various private groups across the country to open their own hospitals. According to H.S. Mustard in *Government in Public Health*, the financial appropriation for a hospital in the 1800s was, "a favorite mode of starting a new town in the West, if it was anywhere on a stream or on a good size puddle."[87]

During this time, states were somewhat involved with subsidizing hospitals through the issuing of grants; however, such grants were not intended to serve as substitutes for government hospital provision. States tended not to be involved in the provision of general hospital care and preferred funding psychiatric hospitals. Usually, states that provided funds for general hospitals did so on a selective, ad hoc, case-by-case basis, responding to specific requests from individual local groups.[88] One exception to this was the state of California, which in 1851 established a short-lived state accident hospital in the gold-mining areas of Stockton and Sacramento.[89] Later, Pennsylvania and West Virginia followed California's lead and established their own accident hospitals. Some states also provided welfare medical care through the hospitals of the state university system.

Local governments were also involved in early medical care; this consisted mainly of provision of infectious disease and isolation hospitals in major cities and seaports, and had the intention of quelling the recurring epidemics of smallpox, cholera, typhoid, and diarrhea. Counties and cities also provided a substantial amount of hospital care in almshouses, or County Poor Farms, for the destitute and impoverished.[90] Sometimes, local governments supported general care hospitals by providing land. The beginnings of today's welfare medical system were evident in the grants provided to hospitals for the care of indigents. According to Rosemary Stevens,

> Similarly, in cities with large immigrant populations, such as New York City, government payments to voluntary hospitals supplemented the governmental hospital system. Where government aid existed, its form was determined by a combination of local political conditions, commonsense, the strength of local interest groups, and the taxing structures which obtained in different states.[91]

As previously noted, California's hospital system began in the mid-1800s, as a result of the Gold Rush. Approximately 250,000 "49-ers" entered California during the Gold Rush, significantly increasing the state population. The majority of emigrants settled in Northern California. Poor sanitation in gold fields and newly formed mining settlements resulted in a variety of health problems and diseases for miners, many of whom ended up in the state's cities destitute and in bad health, resulting in mass outbreaks of scurvy, rheumatism, dysentery, and fevers. In response to public outcries, the state legislature passed a bill to provide funding for a much-needed state Marine Hospital in San Francisco.

Due to the overcrowded conditions in Northern California, many of the emigrants drifted south, causing a concern over sanitary conditions in Los Angeles County. At this time, Los Angeles, still a growing frontier town with little infrastructure, was unequipped to handle the large influx of impoverished and ill settlers. Smallpox epidemics broke out, periodically killing hundreds of residents.[92] Medical treatment was available from eight local County-funded doctors or was left to the responsibility of the individual or his family.

Public care for the poor officially began in 1850, when the California state legislature enacted a requirement that the court of session should, "perform all acts necessary to the county welfare." Following the creation of a Board of Supervisors in 1852 for each county, the task of caring for the aged and needy became a local venture. Consequently, in 1855, the California state legislature passed a bill known as the "Poor Law of 1855," which transferred responsibility for providing medical care for the indigent ill from the state to the county boards of supervisors: [93]

> The board of supervisors of each county has the duty to construct or lease, officer, and maintain hospitals and almshouses, or, at their discretion, to provide otherwise for the indigent sick or dependent poor of the county, and for such purposes may levy the necessary tax.[94]

In response to this legislation, in July 1855 the County of Los Angeles appointed two prominent residents, Abel Stearns and John G. Downey, to spearhead efforts to establish the county's first public hospital. On May 29, 1858, the new hospital was officially opened in a house owned by a Los Angeles resident named Cristobal Aguilar; the publication *Southern Vineyard,* stated that the facility was located "north of the church."[95] It was operated by the Sisters of Charity and overseen

by the county physicians. The new hospital consisted of two wards: a ward for paying patients and a ward for charity patients.

In 1860, the state Legislature passed a law requiring county hospitals to provide care for all indigent persons, despite their health condition or income level. Due to this new responsibility put on the County Hospital, the Los Angeles County Board of Supervisors saw no alternative but to move the facility to larger accommodations. The hospital was relocated to a building on a nine-acre lot on Naud Street between North Main and San Fernando Streets. In addition to the building, the nine acres of grounds consisted of scenic landscaping of orange groves, pepper and walnut trees, and a vegetable garden.[96]

By 1869, conditions at the County Hospital had again become overcrowded. The situation had worsened by the mid-1870s due to the influx of settlers that arrived in Los Angeles following its connection with the Southern Pacific Railroad network. Public outcry demanded the construction of a hospital facility with an adjoining Poor Farm that offered destitute but able-bodied indigents a way to offset the costs of their food and care.

Poor Farms or Poorhouses had first appeared in the United States during the early 1800s. Intended to be the least expensive option for caring for the indigent, the poorhouse or almshouse system was designed to be tax-supported, and offered long-term care to the poor, disabled and elderly. Early poorhouses were the seeds of the modern American welfare system and followed the English tradition of care, jointly serving as a rehabilitation center and correctional institution. These establishments did not distinguish between individuals suffering from poverty and criminal behavior, as evidenced by the use of "inmate" to refer to the patients at the poorhouse or poor farm.[97] This system was widely supported, as it was believed that such housing could reform people and heal them of the bad behavior, which caused the "afflictions" of poverty and criminality.

By the mid-1800s, the poor farm emerged out of the poorhouse system. Although the poor farm was essentially a poorhouse with farming capabilities, it served to advance the public goal of offering the least-expensive indigent care possible, as the costs of care could be subsidized through the farming activities of the inmates. The poor farms generally were staffed by farmhands who directed the work and were aided by the able-bodied inmates. These farming operations proved highly successful; most became self-sustaining, and some even became profitable. Many poor farms went beyond merely serving the needs of the community's indigent, playing an integral role in the lives of residents who benefited from the poor farm's use as an agricultural center, economic hub, and charity supplier.[98]

In 1878, the County of Los Angeles opened a new Hospital and Poor Farm on a 30-acre lot approximately 1 mile from downtown Los Angeles on Mission Road with funds raised through a hospital bond campaign. The new facility offered 106 beds and was the first hospital to be completely owned and operated by the County.[99]

The 1880s witnessed another population boom in Los Angeles County, this one triggered by rate wars between two competing railroads serving Los Angeles. The influx of new residents caused overcrowding at the County Hospital once again. To manage the growing hospital demands, the County Board of Supervisors voted in January of 1887 to create the Office of the Superintendent of the County Hospital to oversee the hospital operations, medical supplies, and the duties of the County Physician.[100] Although the hospital operations had improved substantially, the facility could still not accommodate the new wave of settlers to the area. A decision was made to sell the farmland (which by then also included a dairy) and relocate the farm facility to a larger area outside of the city of Los Angeles, which could accommodate a larger facility and more patients. In the tradition of poorhouses or almshouses, the County Board of Supervisors proposed a County Farm where patients would receive shelter, food, and an opportunity to earn a paycheck if contributing to farm production. The County hoped this type of facility not only would be cost sustaining but also would rehabilitate its patients to return to society by creating an atmosphere of work opportunity and community service.

In 1887, the Board of Supervisors decided to purchase a 124.4 parcel of land a few miles from the city of Downey in an area known for its agricultural successes. Ward buildings were immediately constructed to accommodate ambulatory indigents, freeing-up the County Hospital to offer more room for bedridden patients. In November of 1888, the first patients were transferred from the County Hospital to the new County Poor Farm. Over the next three months, patients continued to be transferred as the buildings were completed, the kitchen was stocked, and the farm began its operations. In 1889, a general superintendent was hired to oversee the Poor Farm and also serve as the resident physician.[101]

It was the intention of the County to provide complete medical care by the county physician to the patients of the County Poor Farm; however, the County Hospital was to remain the dominant medical facility. In the Poor Farm's early history, the primary emphasis of the institution was on the farming operations and the rehabilitative care of the indigent patients. Over the years, the Poor Farm began giving care to an increasing number of bedridden and terminal patients due to the continuing overcrowding conditions at the County Hospital. By the mid-1920s, the County Farm had begun to transition into a facility focusing on hospital care rather than on agricultural operations.

The early inmates at the County Farm were mainly destitute foreign and American immigrants. Additional inmates included blue-collar workers, such as miners, laborers, carpenters, wagon makers, brick masons, farmers, and teamsters. Many laborers came to the County Farm to recover from injuries, such as sore arms, injured ankles, or broken legs, which prevented them from working at their occupations. The Poor Farm provided shelter and food until they were well enough to return to work.[102]

For many years, the County Hospital continued to transfer indigent patients to the County Farm whenever they had a large number of admissions. This news was not always met with enthusiasm by the patients who had come to view the Poor Farm as a place for destitute individuals and

[101] *Los Angeles Times*. 20 February 1889. "An Ordinance," p. 7.

[102] Fliedner, Colleen Adair. 1990. Rancho Los Amigos Medical Center Centennial, 1888–1988. Downey, CA: Rancho Los Amigos Medical Center, p. 43.

oftentimes represented, "a place of lost hopes and shattered dreams."[103] This sentiment was confirmed by a report given by the County Hospital Physician in 1891:

> During the first of the month, the number of admissions was large, and the hospital was very much overcrowded, the average number of patients being 142. On the 12th and 19th 11 patients were sent to the county farm, and it was surprising then how many patients discovered that they had friends who could care for them. In a week, the men had dropped from 119 to 92.[104]

Public perceptions notwithstanding, the County Farm did become self-sustaining through agricultural growth and prosperity. Agricultural operations not only met the daily food supply needs of the Poor Farm, but also provided the daily supply of milk and fresh produce to the County Hospital. It was stated in a 1907 *Los Angeles Times* article that much of the food at the time was being traded for coffins made in the hospital basement workshop.[105] Trades between the County Farm and Hospital saved the County of Los Angeles thousands of dollars each year. By 1911, it was reported that the Poor Farm was supplying the County Hospital with over $13,000 worth of produce and milk, in addition to providing laundry services.[106] And by 1917, the Poor Farm was supplying the hospital with some 167,269 gallons of milk per year. The Poor Farm continued to provide the County Hospital with milk and produce for many years until its farming operations ceased in the 1950s.

Another strong early connection between the County Hospital and the Poor Farm was the shared responsibility for the treatment of mentally ill patients. At the beginning of the 20th century, the state mental institutions were extremely crowded, and patients were sent to county hospitals for care. Los Angeles County created a psychiatric Ward at the County Hospital to provide treatment for these individuals. Once the patients had completed their treatment and had been deemed "harmlessly insane," they were sent to the County Farm where they would be visited regularly by parole officers and a representative of the Lunacy Council. In 1907, the first psychiatric ward (previously known as the Insane Ward or Psychopathic Ward) was constructed at the Poor Farm.[107] Additional psychiatric wards were constructed at the Poor Farm through the early 1920s. If the individual could not afford to pay for their treatment and stay once they were transferred to the Poor Farm, the County assumed the cost. Los Angeles County was the only county in the United States at the time to assume the expense of caring for these individuals once they left the psychiatric ward at the County Hospital.[108]

By 1918, the County Farm had taken on more chronically sick and insane patients than the institution was equipped to handle. The County Hospital had continued to be overcrowded for many years, resulting in the transfer of patients who needed extended medical care to County Farm. In response, Superintendent William R. Harriman requested funding from the County to construct the first infirmary wards (also known as patient wards) at the Poor Farm. An April 29, 1923, *Los Angeles Times* article stated:

[108] *Los Angeles Times*. 18 January 1920. "New High Mark in Mind-Healing," p. 119.

> The point of distress at the farm is the great overcrowding. Extra beds are on porches, in corridors and storerooms and in the loft of the work-stock stable. In all these places, the beds are crowded, often to the extent of being down the aisles. We are receiving daily applications and are unable to admit many worthy applicants. Further, because of the severe congestion at the hospital, there are being housed at the farm many persons of a type for which the present construction at that institution is not designed. There are 100 inmates of the general wards who must receive food-tray service, whereas the farm is equipped only for those able to go to the dining rooms. Seventy-five men are now housed in the work-stock stable loft.[109]

The first four infirmary wards were completed in 1923, and housed some 130 bedridden patients who had been transferred from the County Hospital.[110] Dozens of additional employees had to be hired, including physicians, nurses, orderlies, porters, and cleaners. Additional kitchen and living facilities were constructed. A total of 13 wards had been constructed by 1927 and were providing care for hundreds of chronically ill patients. According to Colleen Fliedner in *Centennial, Rancho Los Amigos Medical Center, 1888–1988*:

> Mr. Harriman, who seems to have relished statistics, pointed out that "the cost of a single bed at County General Hospital will build and equip five to eight beds at the Farm." Every bed vacated at the hospital was used for an average of 18 acute patients; thus, in 1924, more than 4,000 patients received care at County Hospital due to the fact that the Infirmary Wards had relieved the hospital of 260 patients.
>
> Furthermore, the cost of one bed per day at County Hospital was $3.75, while the net cost in the Infirmary Wards was $1.58 per patient per day. Mr. Harriman estimated that based on these figures $257,000 had been saved in one year alone by having these patients at the County Farm. "This is sufficient to pay for the entire group of buildings and equipment every eight months, as the cost per bed of buildings and equipment is only about one-seventh of that at the General Hospital [County Hospital was called General Hospital in 1925]."[111]

The construction of the infirmary wards signaled a new era for the Poor Farm as it metamorphosed into an institution primarily focused on hospital care. The medical staff was expanded to include not only additional general health physicians but also specialists in fields such as eye, ear, nose, and throat; urology; orthopedic; hydrotherapy; physiotherapy; dental care; psychiatry; and dietetics. New medical offices and a pharmacy were created in one of the General Ward Buildings (LACO No. 1184), and state-of-the-art medical equipment, including an X-ray machine, was purchased. Also at this time, an Occupational Therapy Department was opened to rehabilitate patients by instructing them in the creation of crafts such as baskets, brushes, pottery, leather, woven articles, needlework, metal work, and crepe-paper novelties.[112] This type of therapy also was offered in the wards for those patients who were less mobile.

[112] *Los Angeles Times*. 27 September 1937. "Handicaps Forgotten in Therapy Work," p. A16.

In 1930, Superintendent Harriman constructed a modern medical building (now known as the Harriman Building) north of the original buildings, on what is now known as the Rancho Los Amigos North Campus. This building was filled with the latest equipment, laboratories, and surgery facilities, and also provided separate rooms to isolate patients of varying illnesses. Two months after the completion of the building, the medical department, laboratories, dental services, various treatment rooms, X-ray, and the new surgical unit moved into the building, as well as over 200 patients. Although the County Farm had not yet been identified as an official hospital, major surgery was performed in the new building beginning in late 1931. Over fourteen operations of seven different classifications were carried out the first year, saving the County the amount of money it would take to transport the patients to the County Hospital.[113] To mark this new direction of modern medicine, Harriman petitioned in 1931 to change the name of the institution from the antiquated County Farm to Rancho Los Amigos. The name was officially adopted in 1932.[114]

Over the years, Rancho Los Amigos treated many serious illnesses. A few tuberculosis patients were transferred during the institution's early days. Either the County Hospital did not diagnose their condition prior to transferring them or the overcrowding conditions forced their transfer despite the possibility of spreading the highly contagious disease. As knowledge of the disease was gained, tubercular patients were isolated from the rest of the inmates. Another serious disease treated was syphilis. The institution served as a facility for syphilis research between 1922 and 1928. Some 120 treatments were given to approximately 60 patients each week.[115] In 1944, Rancho Los Amigos began treating polio patients during the mass outbreak in Los Angeles County. Rancho's success in rehabilitating polio patients and its advanced physical therapy methods led to its role as a polio rehabilitation center and reputation as the leading post-polio respiratory center in the world.[116] Polio wards were created in the Medical (Harriman) Building, as well as on the first floors of many of other buildings.

By 1951, the role of Rancho Los Amigos within the County health system according to Fliedner was to be

> One of the five hospitals operated by the county with the primary mission of providing geriatric, medical, and nursing care, as well as care for those suffering from chronic diseases or convalescing from medical or surgical conditions. Rancho also provided the necessary medical, surgical, and ancillary care for the largest concentration of respirator-dependent poliomyelitis patients in history.[117]

Today, Rancho Los Amigos continues to be one of four hospitals operated by the County of Los Angeles.

4.2.2 Campus Design

4.2.2.1 Setting and Landscape

The historic character of the Rancho Los Amigos Historic District has been shaped by its design, including the physical layout, which evolved over the facility's approximately 120-year history into the campus apparent today. Although the landscaping department of the County Poor Farm was not officially established until 1907, landscaping was always an integral component of the design and activities of the institution. This concern was evident from the initial work on the property to create the Poor Farm. Local laborers were employed to clear the land, grade the roadways, and plant eucalyptus saplings along planned walkways and roads, as well as along much of the property's periphery. The eucalyptus trees provided a supply of hard wood for use in building fence posts, and created a shaded, lush setting for the grounds. Along the north-south running entrance of Main Drive, date palms lined one side of a walkway with eucalyptus trees on the other side.[118] Groupings of native willows and sycamores were left in place around the property and dozens of small areas were prepared for plantings of roses and various flowers. According to Fleidner, "By the end of February, 1888, the Board of Supervisors noted that the task of planting the shade and ornamental trees had been completed, and everything was ready for the buildings to be constructed."[119]

The original 1887/1888 design for the County Poor Farm, by the Los Angeles architecture firm of Kysor, Morgan and Wells, included plans for immediate construction of buildings (the Men's and Women's Wards), as well as future buildings which would be erected as necessity and funding allowed. In addition, the architects included plans for landscaping and infrastructure improvements to the property. So confident in the design, original architect Octavius Morgan proclaimed,

> When all of the buildings are completed and the orchards and gardens are in good trim the poor farm will be one of the prettiest spots on the face of the globe. The farm is beautifully situated, and if the plans are carried out the poor will have a home that cannot be surpassed in the United States.[120]

The plan envisioned a U-shaped configuration of the buildings, with a central courtyard defined by the North (Female) and South (Male) Wards and a central Dining Hall (Refectory). While the commissions for the two wards were given to Kysor, Morgan, and Walls, the job of designing the Dining Hall fell to another local architect, Jacob Friedlander. The central courtyard was landscaped with lawns and flower beds. A year later, in 1889, Morgan designed the fourth building on the campus (the Administration Building), which was to serve as an office, residence for the physician and superintendent, and laboratory.[121] During the 1890s, fountains were built in front of the Men's and Women's Wards. Trees, lawns, and gardens with flower beds were planted and cultivated throughout the property.

---

[118] Fliedner, Colleen Adair. 1990. Rancho Los Amigos Medical Center Centennial, 1888–1988. Downey, CA: Rancho Los Amigos Medical Center, p. 23.

[119] Fliedner, Colleen Adair. 1990. Rancho Los Amigos Medical Center Centennial, 1888–1988. Downey, CA: Rancho Los Amigos Medical Center, pp. 23–24.

[120] *Los Angeles Times*. 5 August 1888. "For Indigents. Something about the County's Poor Farm Near Downey," p. 5.

[121] *Los Angeles Times*. 27 February 1889. "The Supervisors," p. 2.

In 1891, the Poor Farm was visited by a group of benevolent women from Los Angeles, as well as two women representing the *Los Angeles Times*. They were given a guided tour and are quoted as describing the landscaping characteristics of the property in the following way:

> There are three of the main buildings, all built of brick and connected by wide verandas. . . . The space between them is a lovely court with a green and well-kept lawn, playing fountains and beds of flowers. Around this space upon three sides the covered verandas extend, and here the inmates may sit listening to the tinkling of the flashing water which falls in diamond-like drops upon the greensward or into the bed of the pool. Birds sing their songs here, and flowers blossom all year, and there is northing but beauty and quiet everywhere in this spot. Between the buildings the vista opens upon a wide expanse of tree and orchard-crowned plains. In another direction are the harvest and alfalfa fields of green and gold.
>
> It is surprising to see the results of the two and a half years during which the farm has been occupied. Substantial frame out-buildings have been completed; 32,000 orange trees have been planted with 800 other varieties—apples, apricots, pears and figs. There are four miles of eucalyptus trees; twenty acres sown to alfalfa; ten to barley, and about the same number to corn, and there are two acres devoted to vegetables.[122]

The group's enthusiastic response to the Poor Farm's park-like setting was noted by the County Board of Supervisors. Soon mention of the property's beauty and tranquility was a regular feature in the *Los Angeles Times*. This publicity influenced the Board of Supervisors to "beautify" the County Hospital in 1900. Under the supervision of one of the inmates, a gardener by trade, a hothouse was erected and plantings from many local conservatories and parks were relocated to the hospital grounds.[123]

A 1902 map of the Poor Farm depicted the curved east-west roadway entrance (currently known as Consuelo Street) as the main entrance into the property, leading west towards the center of the farm where a circular drive enclosed the core of the original four buildings. To the south of the farm driveway the map indicated the location of the livestock pens, where the hogs, poultry and cows were kept. To the west of the circular driveway and buildings, the remaining acreage of the Farm was planted in orange and lemon orchards (Figure 4.2.2.1-1, *1902 Map of the Los Angeles County Poor Farm*).

To maintain the extensive gardens of the Poor Farm, Superintendent Chick established a Landscape Department in 1907. Mr. O.D. Pond was hired as the first full-time gardener, with a monthly salary of $50. Pond was responsible for directing the landscaping efforts at the Poor Farm, primarily through the use of inmate labor to maintain the expanses of lawns, trees and gardens.[124] By 1917, the farm included a separate area with ancillary buildings and tools specifically for the landscaping operations.[125]

FIGURE 4.2.2.1-1
1902 Map of the Los Angeles County Poor Farm

Over the years, the maintenance of the grounds of County Farm continued to be supplemented by the patients. The able-bodied general ward patients kept steady jobs and supplied much of the man power needed to keep the South Campus operating smoothly. In addition to working at the farm and dairy, approximately 125 patients worked on the landscaping crews, keeping specific areas of the South Campus landscape manicured and clean of debris.[126]

The maintenance of the grounds was made a priority by Superintendent Harriman in the 1920s when he reserved a significant portion of the annual budget to maintain and improve the landscape, through the purchase of trees, shrubs and irrigation systems. Believing that the setting offered patients beneficial healing powers, Harriman insisted that the landscape of the property be maintained at the same level of excellence as that reflected in the newer buildings at the County Farm. As Harriman explained in the Rancho Los Amigos Annual Report of 1928:

> We believe that the surroundings are far more pleasant and the actual feeling of "home" more evident than in many smaller institutions. The buildings are well lighted and ventilated, and all are provided with steam heat, hot and cold water service and facilities of every kind. They are located in a park-like setting of flowers and shrubbery, with drives bordered by magnificent 45-year old eucalyptus trees. The Farm employees are constantly on the alert to improve the comfort and happiness of the sick and unfortunate in their care with a sincere and helpful spirit.[127]

During the 1920s, the east-west running entrance into the Poor Farm gained prominence with the construction of the new Administration Building in 1926 (LACO No. 1100). The street was given the name Administration Drive (later named Consuelo Street) and officially became the primary entranceway into the intuition. Administration Drive was distinguished by a recognizable bow, which began east near the entrance to the Administration Building and bent northwest around the east and north elevations of the building. Two circular driveways landscaped with mature trees and lawns filled the space created by the curvature of Consuelo Street. This organized lawn setting created a distinct separation between the public Administration Building and the private inmate and support buildings located farther west on Consuelo Street toward the center of South Campus. These characteristics are still visible today.

In 1929, an ornamental courtyard was created in the center of South Campus after the original Administration Building was demolished. At this time, a fifty-one foot-long fish pond was built near the front of the Auditorium (LACO No. 1264) where two cast iron tiered fountains were located. This area was further enhanced by an 18′ × 12′ wrought-iron gazebo (LACO No. 1265) which was added to the space circa 1933. Large flower beds were planted, and the walkways were paved with flagstone slabs.[128] A sundial was also positioned to the rear of the gazebo. These amenities must have complemented the impressive roots and branches of the Moreton Bay fig tree planted in the same area around the turn-of-the-century. This new, public green space was enjoyed by the inmates, their visitors, and staff, and created a focal point for the historic traffic circle at the intersection of Erickson Avenue and Consuelo Street. The curvature of these streets around the

traffic circle has remained generally in the same configuration to the present day, except for a slight alteration to the western edge of the traffic circle when Erickson Avenue (then Horton) was widened circa 1950.

By the end of the 1920s, landscape improvements at the farm included one mile of paved roads, one and one-fourth miles of decomposed granite roads, cast-iron sewer piping, and hundreds of acres of new lawns, gardens, trees, curbs, walkways and fencing.[129,130] Despite the lull in building construction caused by the Depression, improvements to the landscape at the Farm continued throughout the early 1930s. Acres of new lawn were planted throughout the property and an automatic sprinkler system was installed. Street lights were erected along Golondrinas Street and Dahlia Avenues, illuminating the newly constructed Psychiatric Ward Buildings (LACO Nos. 1202 and 1204) and Casa Consuelo (LACO No. 1238).[131]

Superintendent Harriman took great pleasure in the expansion and development of the landscape at the Farm, proudly stating in his 1932–1933 Annual Report:

> As a further step toward mental and physical welfare of the patients, the grounds surrounding their homes are beautifully landscaped and maintained in perfect order and cleanliness at all times. Acres of flower gardens provide cut flowers in abundance and these are used in decorating the wards through the year. Many patients assist trained crews of gardeners in the general care of the lawns and gardens and the propagation of plants, trees and shrubs in the operation of the greenhouse. Around the grounds, numerous benches are placed in the shade of the magnificent eucalyptus trees that have bordered the drives for nearly fifty years. . . . The drab colors so common at many institutions have no place at the Rancho as furniture, interior finishes and trim are decorated in pleasing colors conductive cheerfulness and rest.[132]

Harriman continued to emphasize the importance of the landscaping at Rancho Los Amigos. In 1934, Harriman reported that the eucalyptus trees were maintained at 75 feet tall. The buildings were surrounded in landscaping with lawn and shrubbery and large flower gardens which supplied the various offices and wards with bouquets. The work of landscaping was largely controlled by landscape supervisors with patient labor.[133] By 1935, the landscaping department employed some 24 men.

However, by 1950, the Landscaping Department had been reduced to a full-time staff of 17, who were assisted by 46 patient "helpers." Each day the landscaping team cleaned six miles of streets, hauled away garbage and maintained 56 acres of lawns, flower beds and trees. Thousands of fresh-cut flowers grown in Rancho greenhouses were supplied for special bouquets which were placed

within buildings.[134] Many of the trees that are still present today had been planted by this time, including: Avocado; Bottle Tree; Bunya Bunya; Camphor; Carob; Coast Live Oak; Date Palm; Laurel Fig; Mexican Fan Palm; Morton Bay Fig; Primrose Tree; Queensland Pittosporum; Redwood; and Southern Magnolia.[135] The Moreton Bay fig tree (located on Erickson Avenue in the ornamental lawn in front of the Auditorium) and redwood trees were identified in 1988 as Landmark trees by the City of Downey.[136]

By 1960, the eucalyptus trees that lined Erickson Avenue had been removed and the landscaping efforts diminished as the focus of the institution began to be centered on the new medical buildings constructed north of Imperial Highway in the area now called North Campus. By the 1980s, many of the buildings located in South Campus were being abandoned and the surrounding landscape began to deteriorate, leaving only vestiges of the original park-like environment.

4.2.2.2 Architectural Character

From the founding of the Los Angeles County Poor Farm in 1887/1888, the institution's built environment has consistently evolved. During the farm's early history, there were few buildings, allowing the majority of the property to be devoted to farming activities. As the patient population increased, a demand for administrative offices, additional ward space, dining facilities, and staff housing initiated several periods of growth and expansion. The largest period of construction occurred from the 1920s through the early 1930s when the "poor farm" was transitioning from a rehabilitative care facility for indigents into a hospital to house long-term invalid patients known as Rancho Los Amigos Medical Center.

The first buildings constructed at the Poor Farm in 1887/1888 were designed by the preeminent Los Angeles architectural firm of the time, Kysor, Morgan, and Walls and lesser-known architect Jacob Friedlander.[137] The first four buildings were the North and South Wards, Dining Hall (Refectory), and the office, residence for the physician and superintendent, and laboratory (Administration Building).[138] Three of the buildings were designed in a brick Victorian-era institutional style, and the fourth was a simple wood-framed building with Victorian-era detailing.[139] A continuous veranda connected the buildings, and framed a garden courtyard, featuring lawns, rose garden, and aviary. Out of these four initial buildings, only the aviary (LACO No. 1312) survives today, albeit in an altered condition, and remains the oldest surviving structure on the Rancho Los Amigos campus. It is now located in the northwest section of the interior courtyard of the Men's Psychiatric Ward Complex (LACO Nos. 1204 and 1205).

As the farm expanded and additional buildings were constructed, particularly during the first three decades of the 20th century, distinct architectural styles began to emerge, defining the visual character of the campus and identifying the function of the various buildings. Buildings dating from

this era substantially shape the current architectural landscape of the area of seventy-six buildings identified as the Rancho Los Amigos Historic District. A few appear to have been designed by the office of the County Architect, which was headed by Karl Muck during much of the 1920s and 1930s. However, a few of the original plans for the buildings list only that they were constructed under the supervision of the Los Angeles County Mechanical Department, while many other buildings have no existing plans.

The contributing buildings and structures of the Rancho Los Amigos Historic District are primarily vernacular in character and represent five general architectural styles or types: Craftsman and Wood Vernacular, Classical Influence, Spanish Colonial Revival, Brick Vernacular, and Utilitarian. These five styles were typical of the first part of the 20th century and were constructed throughout Southern California architecture.

4.2.2.2.1 Craftsman and Wood Vernacular

The Craftsman style dominated residential architecture in southern California from circa 1902 through the mid 1920s. Rooted in the principles of the late-19th-century Arts and Crafts movement in England, the Craftsman aesthetic and ideals were developed and promoted in the United States by furniture maker Gustav Stickley and his 1901 magazine *The Craftsman*. Stickley envisioned residences for people of moderate means designed as a unified whole, including furniture and fittings. He discounted the ornamentation of the Victorian-era and preferred a much more simplified style that accented the beauty of natural materials such as wood and stone. He stated in the first issue of *The Craftsman*, "Beauty does not imply elaboration or ornament."[140] Drawing inspiration from English architect and designer William Morris, Stickley published plans and construction drawings in *The Craftsman* that epitomized his philosophy. The dissemination of his drawings exerted a strong influence on the development of the Craftsman Style.

Craftsman architectural design reached its apogee with the work of two brothers, Charles S. Greene and Henry M. Greene, who practiced together in Pasadena from 1893 to 1914 and with the work of a handful of other architects primarily located in the vicinity of the Arroyo Seco and the San Francisco Bay Area. The Greene brothers created an architectural style that combined elements of Stickley's influence, the Stick Style, the English Arts and Crafts Movement, and, especially, Japanese techniques of joinery.[141] The concurrent work of Frank Lloyd Wright also is said to have been an influence. Advocates of total design and craftsmanship, the Greenes also lavished attention on interior finishes and details and furniture. Some of the Greene's most notable commissions include the Gamble House, the Blacker House, and the Duncan-Irwin House, all located in Pasadena.

The work of the Greene brothers and other Craftsman style architects was widely published in both professional and popular journals. This exposure fueled the popularity of the Craftsman style, which spread quickly throughout the country. Craftsman house plans became easily accessible to the middle-class through pattern books and mail-order houses such as Sears, Roebuck & Company, and Montgomery Ward's. Affordable and easily constructed from locally available materials, one-to-one and a half-story Craftsman homes became known as bungalows and dominated middle-class residential design during the first quarter of the 20th century. Although some Craftsman homes were two stories in height, large-scale versions of Craftsman houses were rare except in

[141] Roth, Leland M. 1980. *A Concise History of American Architecture*. New York: Harper & Row, p. 211.

California.[142] A limited number of commercial and public buildings also reflect Craftsman influences.

Craftsman buildings utilize materials such as wood, stone, and brick in a natural-appearing state. Structural features were left exposed and exploited for their decorative qualities. Earth tones were favored, integrating the building with the surrounding landscape. Horizontality was emphasized through low, ground-hugging massing, employment of broadly pitched, overhanging roofs, and utilization of wood siding and flat trim laid in continuous bands. Often, the lower portion of the exterior walls or porch supports was battered or tapered so as to be heavier at ground level. Capacious front porches were nearly ubiquitous features, often overlooked by generous expanses of windows clustered in groups. A combination of window types was used, with casement windows and fixed windows commonly appearing on the facade and double-hung sash on the sides and rear. Entries typically were characterized by oversized, heavy, wood-paneled doors. Craftsman interiors were distinguished by built-in features such as bookshelves, cabinets and hutches with leaded glass doors, and seating nooks and by the use of wood for picture rails, continuous header moldings, window and door casings, and doors.

Vernacular architecture is defined as "a mode of building based on regional forms and materials."[143] Commonly, a wood vernacular building would be constructed to reflect the design trends of the region in which it was located. In Southern California, a common 20th-century treatment for wood houses was to add modest Craftsman details, such as exposed rafters and beams, wide window and door trim, and a Craftsman front door. The character-defining features of a Wood Vernacular style building include wood framing and cladding, one or two story height, low- to moderate-pitched roof, and a partial- or full-width porch.

4.2.2.2.2 Classical Influence

Numerous architectural styles throughout Western history have been influenced by the temples, villas, and other buildings of ancient Greece and Rome, as reinterpreted by the Renaissance. Classicism has played a central role in American architecture as well, contributing to many of the dominant architectural styles throughout the nation's history. According to Poppeliers, Chambers, and Schwartz in *What Style is it? A Guide to American Architecture*, the mass appeal of Classicism when America was a young country "undoubtedly was the often expressed sentiment that America, with its democratic ideals, was the spiritual successor of ancient Greece, a feeling evident not only in the architecture but also in the very names of newly established towns—Athens, Sparta, Ithaca—from Georgia to Maine and throughout the Midwest."[144] Political decision makers and architects agreed that the Greek ideals of democracy, beauty, and simplicity were considered fitting for many buildings in the new nation. Classical architecture quickly became the prevalent style for churches, banks, civic buildings, and residences.

The sense of order implied by Classicism appealed to many early architects who felt it was important to study classical forms to understand and practice architecture as a discipline. The identifying characteristics commonly associated with the Classicism of antiquity include the following: a temple-style porch supported by large columns, symmetrical facade, a low-pitched roof, a heavy cornice and frieze under the eaves, and decorative column capitals. Rediscovered

[142] McAlester, Virginia, and Lee McAlester. 1994. *A Field Guide to American Houses*. New York: Alfred Knopf, p. 454.

[143] Harris, Cyril M. 1993. *Dictionary of Architecture and Construction*. 2nd ed. New York: McGraw Hill, p. 884.

[144] Poppeliers, John C., Chambers, S. Allen Jr., and Schwartz, Nancy B. 1983. *What Style Is It? A Guide to American Architecture*. Washington, DC: Preservation Press, p. 36.

and reinterpreted during the Renaissance, the Classical vocabulary that was inherited by American architects also included balanced, symmetrical facades; horizontal division of buildings corresponding to base, shaft, and capital; vertical divisions articulated by piers or pilasters; decorative details such as pedimented doors and windows, dentils, quoins, and pilasters; and occasionally colonnaded one-story (and less commonly, two-story) entrance porches. Numerous architectural styles throughout American history have reflected this legacy, from the literal Classical Revival of Thomas Jefferson's Virginia State Capitol to the simple, ubiquitous Colonial Revival bungalow of the early 1920s.

With the mass industrialization of the late-19th-century, large-scale commercial and industrial buildings were constructed featuring Classical detailing. This new trend carried over into the 20th century. Architects and contractors gave industrial and commercial buildings a clear sense of order and unity by employing the Classical styles, especially those that emphasized balance, symmetry, and restraint. This also allowed a uniformed style to develop for buildings associated with a distinct usage or company affiliation. Classicism lost its popularity in the mid–20th century, when historicism was rejected in favor of the new International Style. By the 1960s, however, some contemporary designers embraced the symmetry, clarity of hierarchy, and geometrically pure massing of the Classical, producing buildings in the New Formalism style.[145] In the 1970s, architects such as Michael Graves and Philip Johnson led a new revival of interest in Classicism.

The character-defining features of a Classical building include the following: a symmetrical facade; a low-pitched gabled or hipped roof or a flat roof; pediments and parapets at the roof line; wide cornice and a frieze under the roof eaves; temple-style front with columns; decorative column capitals; symmetrical fenestration of windows (commonly double-hung); pedimented and/or segmental arched doors and windows; paneled wood doors, occasionally with decorative glazing and trim; and decorative details such as dentils, quoins, pilasters, belt courses, and blind arcades. Vernacular interpretations of Classicism often pared these features down to a mere suggestion but retained the essential balance and form of the more high style examples.

4.2.2.2.3 Spanish Colonial Revival

From the 17th century until 1821, the southwestern portion of the United States was Spanish territory. The domestic dwellings constructed during the Spanish period exhibited few decorative or stylistic details and were built out of necessity rather than luxury. The dwellings were commonly one-story, with a low-pitched roof covered in thatch or flat roof with parapet, and thick masonry walls of adobe brick or rubble stone covered in protective stucco. There were usually multiple exterior door openings which opened onto long, narrow porches, and a minimal number of small window openings protected by shutters. It wasn't until the United States opened their trade routes in 1823 that prosperity reached the inhabitants of these dwellings and Anglo immigrants began altering the simple buildings with wood decorative details such as carved posts (particularly from the Greek Revival Style), double-hung windows, and the addition of a framed, shingled roof.[146,147] This style continued until the 1880s when the spread of the railroad provided easy access to milled lumber, and the adobe building style declined in favor of wood-framed houses.

[145] Gebhard, David, and Robert Winter. January 1977. *A Guide to Architecture in Los Angeles and Southern California*. Salt Lake City, UT: Gibbs Smith, pp. 706–707.

[146] McAlester, Virginia, and Lee McAlester. 1994. *A Field Guide to American Houses*. New York: Alfred Knopf, p. 454.

[147] Harris, Cyril M. 1993. *Dictionary of Architecture and Construction*. 2nd ed. New York: McGraw Hill, pp. 129–130.

In 1915, architect Bertram Goodhue designed the Panama-California Exposition in San Diego, California. Goodhue was an influential proponent of Spanish Colonial architecture adapted to the 20th century. He felt that the climate and cultural heritage of the Southwest was well suited to the style. Goodhue is considered instrumental in bringing the newly created Spanish Colonial Revival Style to California, Arizona, Texas, and in Florida, all regions where original Spanish Colonial building occurred and continued into the 19th century.[148] Due to the popularity of his exhibit, other influential architects began looking directly to Spain for inspiration.

The Spanish Colonial Revival style was popular from the early 1920s until the 1940s. Although the style was prevalent in the southwest and Florida, vernacular examples were located throughout the country. The style was particularly utilized in California, where the idea of Spanish heritage was embraced by many cities who named their streets and communities after Spanish antecedents. In the 1920s when communities were developing planned housing developments to create a uniform appearance, older California cities, such as Santa Barbara and Ojai, "passed ordinances requiring that new downtown buildings conform to the Spanish Colonial Revival style in order to build a tourist trade based on the aristocratic grandee aspects of their Hispanic heritage."[149]

A Spanish Colonial Revival building borrows decorative details from the entire history of Spanish architecture, rather than just the simple dwellings erected during the Spanish period here in the United States. According to McAlester in *A Field Guide to American Houses*, "These may be of Moorish, Byzantine, Gothic, or Renaissance inspiration, an unusually rich and varied series of decorative precedents."[150,151] A Spanish Colonial Revival building was generally asymmetrical in appearance with a round or square tower. The exterior wall surface was almost always stucco, and the roof was a low-pitched gabled roof with little or no overhang sheathed in either Mission tiles or Spanish tiles, or a flat roof with parapet wall. Heavy carved doors were often emphasized by spiral columns, pilaster, carved stonework, or patterned tiles. Many times there was one focal arched fixed window or a grouping of them. Casement windows were also commonly used. Exterior gardens, patios and balconies were a strong feature, as well as arcaded walkways. Additional features include tiled chimney tops, fountains, and brick or tile vents.[152,153]

The character-defining features of the Spanish Colonial Revival style include: exterior wall surface covered in stucco; asymmetrical appearance; round or square towers and cupolas; low-pitched gabled roof with little or no overhang sheathed in Mission or Spanish tiles or flat roof with parapet wall; heavy wood door, commonly carved or paneled, emphasized by spiral columns, pilaster, carved stonework, or patterned tiles; arched focal windows and casement windows; exterior balconies with wrought-iron railings; exterior gardens and patios; arcaded walkways; tiled chimney tops; brick or tile vents; and fountains.

4.2.2.2.4 Brick Vernacular

The technique of using masonry materials to construct buildings was brought by European immigrants to America close to 300 years ago. From the time of its introduction into this country,

[148] Roth, Leland M. 1980. *A Concise History of American Architecture*. New York: Harper & Row, p. 250.

[151] Harris, Cyril M. 1993. *Dictionary of Architecture and Construction*. 2nd ed. New York: McGraw Hill, p. 417.

[152] McAlester, Virginia, and Lee McAlester. 1994. *A Field Guide to American Houses*. New York: Alfred Knopf, p. 454.

[153] Harris, Cyril M. 1993. *Dictionary of Architecture and Construction*. 2nd ed. New York: McGraw Hill, pp. 417–418.

brick has consistently been one of the most popular building materials and has played a large role in the evolution of American architecture. Brick provided a much stronger and more fire-resistant alternative to wood, as well as offered additional insulation against the weather. It has been used in conjunction with various architectural styles in most parts of the country for all types of buildings, from elaborate residences and commercial edifices, to modest houses, Main Street commercial buildings, and vernacular farm and industrial buildings.

One of the most common uses for brick in the late 19th and early twentieth centuries was the application of the material to large-scale commercial, institutional, and industrial buildings. Due to the development of the steel frame in the mid-1800s, architects were able to rethink the idea of building height and scale.[154] In this new age of industrial advancement, buildings were constructed to serve the growing uses of the business, industrial, and medical industries. "Brick Vernacular" was used to describe these brick buildings that were designed to support their function rather than make an architectural style statement.

The overall appearance of a Brick Vernacular building tended to be very simple and largely devoid of decorative ornamentation. The character-defining features include the following: brick exterior walls, often with "face" brick utilized for the public facade, and rougher, more random brick for the sides and rear; one to three stories in height; flat roof with parapet; windows arranged in a linear fenestration pattern; segmental arched window and door openings with double- or triple-header brick rows above; wood-paneled doors; and limited classical detailing such as cornices, friezes, piers, quoins, or stringcourses, sometimes highlighted by the use of glazed or colored brick.

4.2.2.2.5 Utilitarian

"Utilitarian" is not really a style at all; it is an approach to construction predicated on function rather than appearance and as such cannot not be described in terms of a standard set of character-defining features. Utilitarian buildings and structures utilize materials and structure appropriate to the intended use. Although often undistinguished and unremarkable, at its best, the utilitarian building or structure may be an honest and even an elegant expression of function and engineering.

[154] Roth, Leland M. 1980. *A Concise History of American Architecture*. New York: Harper & Row, p. 173.

SECTION 5.0
RESULTS

This section of the Historic District Update Report presents the results of the 2007–2010 Rancho Los Amigos Historic District intensive-level survey update, including evaluation by Sapphos Environmental, Inc. of the extant buildings, structures, and features previously determined to be contributors to the District. The section opens with a summary of the current survey results and comparison with the results of previous surveys. The subsequent discussion characterizes the District in terms of applicable criteria and historic context, period of significance, and integrity. The section concludes with the results of updated evaluations of individual District contributors and noncontributors.

5.1 SUMMARY OF SURVEY RESULTS

As explained in Section 1, Introduction, this historic district update is the third historic resources survey of the Rancho Los Amigos South Campus. The first survey was conducted by Historic Resources Group (HRG) and resulted in the determination of National Register of Historic Places (NRHP) eligibility, and consequent California Register of Historical Resources (CRHR) listing, of the Rancho Los Amigos Historic District.[155] The 1995 survey evaluated a total of 103 buildings, structures and features, and found 78 to be contributors to the significance of the District. The second survey was performed in 2004 by Post/Hazeltine Associates; it resulted in a recommendation of individual eligibility for 11 of the 78 resources evaluated as contributors by HRG and argued that the historic district lacked sufficient integrity to be eligible for listing. Of the 11 resources recommended eligible by Post/Hazeltine Associates, 10 had been previously evaluated by HRG. The current (2007–2010) investigation of 129 buildings, structures, and features determined that there are 68 extant contributors to the District. Table 5.1-1, *Comparison of Historic Resources Survey Results*, itemizes the resources evaluated in support of each of the three surveys.

[155] The Office of Historic Preservation has assigned a California Historical Resource status code of 2S2 to the Rancho Los Amigos Historic District in the California Historical Resources Information System Historic Resources Inventory database. A 2S2 status code is defined as an individual property determined eligible for the NRHP by a consensus through a Section 106 process and listed in the CRHR. Districts are categorized as individual properties (hence the "S"), although district contributors are categorized as contributors and given a "D" status code.

KEY: n/a = not applicable; N/A = survey data not available.

NOTE:

a. Names used in this table to identify contributing resources are based on the results of the current survey and correlate with the buildings' historic use and name and may contradict previously used resource names. However, the LACO numbers have not changed.

b. Construction dates used in this table are based on the results of the current survey and were estimated using historical aerials, maps, and historical narratives. The year constructed dates may contradict previously estimated construction years.

c. The 1995 survey identifies the Smoke Stack (with no LACO No.) as a separate individual resource. The 2004 and 2007 survey lists the Power Plant and Smoke Stack as a single resource, under one LACO number (LACO No. 1300). This difference results in a discrepancy of one in the total number of buildings within the Historic District.

d. The 1995 survey identifies the Smoke Stack (with no LACO No.) as a separate individual resource. The 2004 survey lists the Power Plant and Smoke Stack as a single resource, under one LACO number (LACO No. 1300). This difference results in a discrepancy of one in the total number of buildings within the Historic District.

e. The 1995 survey identifies the Smoke Stack (with no LACO No.) as a separate individual resource. The 2007 survey lists the Power Plant and Smoke Stack as a single resource, under one LACO number (LACO No. 1300). This difference results in a discrepancy of one in the total number of buildings within the Historic District.

5.1.1 1995 Survey

During the review of the 1995 survey records, it was noted that the documentation contains slight discrepancies between the reported total number of contributing resources and the actual number of District contributors. The Historic Resources Inventory forms prepared in support of the 1995 survey stated that 102 buildings, structures, and features were identified within the boundaries of the District. Of the 102, 76 were found to be contributors to the District, 23 were identified as noncontributors, 2 were not surveyed,[156] and 1 was no longer extant at the time of the survey. In actuality, the 1995 survey results indicate that 103 buildings, structures, and features were identified within the District: 78 were identified as district contributors, 22 were identified as noncontributors, 2 were not surveyed,[157] and 1 was determined to be no longer extant.

The additional discrepancy of 1 contributor is the result of a reporting error in the original 1995 survey, which listed the Smoke Stack as a separate resource. Subsequent research prepared as part of the 2007–2010 District analysis revealed that this structure, although freestanding, is not a separate resource but is actually part of the Power Plant (LACO No. 1300) constructed in 1925. Therefore, the 2004 and 2007–2010 survey data and reports count the Smoke Stack as part of the Power Plant (LACO No. 1300) and not as a separate resource. Table 5.1-1 and Figure 1.3.1-1 itemize and map the contributors and noncontributors listed in the 1995 survey, identified by LACO numbers.

5.1.2 2004 Survey

A review of the 2004 Post/Hazeltine Associates report found that of the 11 buildings, structures, and features identified as being potentially individually eligible for listing in the NRHP, 1 was not identified in the 1995 survey. The 2004 survey listed the Superintendent's Shed (LACO No. 1178) as being potentially eligible for listing in the NRHP on an individual basis; however, the building was not surveyed in 1995 and was never listed in the CRHR as a contributor to the District. Table 5.1-1 and Figure 1.3.2-1 itemize and map the contributors and noncontributors listed in the 2004 survey, identified by LACO numbers.

5.1.3 2007–2010 Intensive-Level Survey Update

The 2007–2010 survey update concluded that there are 68 extant Historic District contributors (Table 5.1-1 and Figure 5.1.3-1, *2007–2010 Survey Results*). Of the 78 original contributing resources identified in the 1995 survey,

- 6 buildings, structures, and features are no longer extant.[158] These include Patient Wards 212 and 214 (LACO Nos. 1200 and 1201), which were removed circa 2001; the 1930 shed and 1931 shed (LACO Nos. 1272 and 1333); the Vivarium (LACO No. 1334); and the Train Station (LACO No. 1352).

[156] The 1995 survey identified 2 out of 102 buildings as not surveyed: the Greenhouse (LACO No. 1353) and an unknown building (LACO No. 1242).

[157] The 1995 survey identified 2 out of 102 buildings as not surveyed: the Greenhouse (LACO No. 1353) and an unknown building (LACO No. 1242). However, the 2007–2010 survey identified a total of 129 extant buildings, structures, and features on the South Campus, indicating that at least 26 additional buildings, structures, and features on the South Campus were not surveyed and not discussed in the 1995 survey.

[158] It is unknown exactly why the buildings were demolished, as none of the documentation collected in support of the 2007–2010 Historic District analysis indicated why or when the buildings were removed from the property.

FIGURE 5.1.3-1
2007- 2010 Survey Results

- 4 no longer contribute to the significance of the District, three because of loss of integrity (LACO Nos. 1243, 1251, and 1279) and one because of a date of construction that post-dates the period of significance (LACO No. 4118).
- 1 additional building (LACO No. 1242) has been identified as a potential contributor to the District.
- 1 structure (the Smoke Stack) was addressed as a separate resource in 1995, when it should have been included as part of the Power Plant (LACO No. 1300).

In addition, the 2007–2010 survey update revised the evaluation of one of the 11 resources found individually significant in 2004. The Superintendent's Shed (LACO No. 1178) was identified during the 2004 survey as being potentially eligible for the CRHR; however, during the 2007–2008 survey, it was found to lack sufficient historic merit to be characterized as a contributing resource to the District. Because the building was not evaluated as part of the 1995 survey and is not listed as one of the 78 original contributors to the District, this conclusion does not change the total number of extant contributors within the District.

The remaining extant buildings, structures, and features on the South Campus were identified as noncontributors to the Historic District, either because they were previously determined to be noncontributors or because they lack sufficient age, historic association, and/or architectural character to be a part of the District.

5.2 CHARACTERIZATION OF THE HISTORIC DISTRICT

The 1995 survey that resulted in the determination of eligibility of the Rancho Los Amigos Historic District stated that the District is significant under NRHP Criterion A "for its association with the turn-of-the-century health care of Los Angeles County's indigent population and for its later treatment of those in Los Angeles County with chronic illnesses, both mental and physical."[159] The 2007–2010 survey update confirmed the importance of the role of Rancho Los Amigos in evolution of the County welfare and health care systems. In its early years, Rancho Los Amigos, as the Poor Farm, was a response to the homeless problem of the period, housing the poverty-stricken in the most cost-effective manner by making the institution self-sufficient. The Poor Farm was established during a period in American history when the public was increasingly aware of its responsibility towards those less fortunate and as the Progressive Movement gained support; it is no coincidence that Jane Addams Hull House in Chicago was established around the same time, in 1889. With one of its original goals of relieving the existing County hospital of the burden of caring for the indigent, the Poor Farm operated in tandem with the developing County health care system, which had opened its first hospital in 1878. Increasingly, as patients with long-term illnesses were directed to the Poor Farm, the institution became an integral part of that system. The niche that Rancho Los Amigos filled was that of long term care and rehabilitation, particularly for those afflicted with mental illness and later, the victims of the mid-20th-century outbreaks of polio. As one of the historic cornerstones of the County of Los Angeles health care system, Rancho Los Amigos has been critical to the development of what is now the second largest health care system in the nation.

Concurrent with the evolving mission of the institution, its physical plant also grew and changed. The Historic District today retains aspects of each period of Rancho Los Amigo's history. From its

[159] Historic Resources Group. 26 July 1995. *1994 Northridge Earthquake Project Review: Survey of Earthquake Damaged Properties for Purposes of Section 106 Review*. Rancho Los Amigos Medical Center District Record. Rancho Los Amigos Medical Center, Downey, CA.

founding in the late 19th century, the District incorporates the distinctive curvilinear street plan still evident in the central east part of the campus and the Aviary (LACO No. 1312). A handful of buildings remain that reference the institution's agricultural and livestock operations, including a former stable and hay barn (LACO No. 1283), the farmhouse-like Oil and Storage Building (LACO No. 1287), the Dairyman's House (LACO No. 1137) ,and the Brooder House / Vivarium Annex (LACO No. 1335). Several buildings from the World War I and earlier era are reminders of the self-contained, residential nature of the facility and its growing focus on the treatment of long term illness, including the Superintendent's House (LACO No. 1101), the older wings of the Dining Room, Kitchen, and Staff Room (LACO No. 1262), Commissary (LACO No. 1263), Workshop (LACO No. 1275), the first wing of the Men's Psychiatric Wards (LACO No. 1205), the first Power Plant (LACO No. 1302), the first Chapel (LACO No. 1254), and the first General Wards (LACO Nos. 1184, 1185, and 1186). The growth of the medical campus and is appurtenant support facilities is extensively represented, most prominently by the later General Wards and the Patient Wards (LACO Nos. 1187–1199), Men's and Women's Psychiatric Ward complexes (LACO Nos. 1202–1205 and 1239–1247), Power Plant (LACO No. 1300), Kitchen and Dining Building (LACO No. 1295), Bathhouse and Ward building (LACO No. 1260), Auditorium (LACO No. 1261), Administration Building (LACO 1100), and Casa Consuelo (LACO No. 1238). Although no agricultural fields are still extant, the nearby train tracks are a reminder of the essential proximity of transportation. The importance of landscape design to the concept of the County Farm can still be discerned from the remaining ornamental trees, most prominently a Moreton Bay fig tree, and the ample green space that flanks buildings in the central campus.

Although it is certainly true that numerous buildings have been demolished over the course of the history of Rancho Los Amigos and that a few incompatible buildings have been constructed within the District boundaries (for example, the Butler Building, LACO No. 7000), the Historic District still possesses the physical features necessary to convey its historical importance under Criterion A/1. Containing a range of property types linked by historical and physical development, the District retains sufficient integrity to provide a sense of historic and architectural cohesiveness, particularly with respect to its setting, design, materials, association, and feeling. The 1995 document characterized the District as an intact collection of structures used for health care and social services from 1888–1950, but defined the period of significance as 1888–1945, perhaps in deference to the 50-year requirement of the NRHP. Based on the history of Rancho Los Amigos, and the pivotal role of Superintendent William R. Harriman for most of the first half of the 20th century, extension of the period of significance to 1952, when Harriman stepped down, is suggested.

The 2007–2010 survey also resulted in the conclusion that a small number of buildings at Rancho Los Amigos also appear to be individually eligible for listing in the NRHP/CRHR under Criterion C/3 for architectural merit (LACO Nos. 1100, 1101/1177, 1238, 1262/1263, and 1300–1302.

5.3 DISTRICT CONTRIBUTORS AND NONCONTRIBUTORS

This subsection briefly discusses each of the 129 buildings, structures, and features that were evaluated and provides any new or updated information. Detailed descriptions and statements of significance are incorporated into Appendix A, *Historic Resources Inventory Forms*. Architectural terms used in the descriptions are defined in Appendix B, *Glossary of Terms*.

Moreton Bay Fig Tree

The survey update concluded that the Moreton Bay Fig Tree is a District contributor and has a California Historical Resources (CHR) status code of 2D2.[160] For purposes of the survey update, it was ranked as Key due to its species, visual prominence, age, and representation of the importance of landscape in the design of the County Farm.

Estimated to have been planted circa 1900, the Moreton Bay Fig Tree (*ficus macraphylla*) was measured in 2007 at 10.2 meters in height, with a diameter at breast height of 3.25 meters and a canopy of 36.6 meters. An Australian import, Moreton Bay fig trees were popular as ornamental trees in Southern California from the last quarter of the 19th century through the first quarter of the 20th century. Notable for their impressive size and above ground root system, individual Moreton Bay fig trees have been designated as landmarks in several Southern California communities, including Los Angeles, Santa Monica, Santa Barbara, and San Diego. The City of Downey has recognized this Moreton Bay Fig Tree in the significant tree list incorporated into its General Plan, Downey Vision 2025.

Vocational Training 215 (LACO No. 589)

The survey update concluded that this building, constructed in 1941 and identified as a District noncontributor and excluded from the District boundaries by HRG in 1995, is no longer extant.

Vocational Training 216 (LACO No. 590)

The survey update concluded that this building, constructed in 1941 and identified as a District noncontributor and excluded from the District boundaries by HRG in 1995, is no longer extant.

Lumber Shed (LACO No. 954)

The survey update concluded that the Lumber Shed, constructed in 1942, is a District contributor and has a CHR status code of 2D2. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, secondary support function, and relatively late date of construction.

Administration / Safety Police Building (LACO No. 1100)

The survey update concluded that the Administration / Safety Police Building, constructed in 1926, is a District contributor and has a CHR status code of 2D2. For purposes of the survey update, it was ranked as Highest, for its importance to the evolution of the County Farm into a medical facility. It is also noteworthy for its association with William Ruddy Harriman, the Superintendent most extensively associated with Rancho Los Amigos, and for its evident architectural ambitions as an example of the Spanish Colonial Revival style. Although the 2004 survey characterized the building as individually eligible to the NRHP under Criterion C (architecture), the replacement of the primary windows on the facade has somewhat compromised its integrity in this regard.

[160] The Office of Historic Preservation defines a 2D2 status code as a contributor to a district determined eligible for the NRHP by consensus through a Section 106 process and listed in the CRHR.

Harriman / Superintendent's House (LACO No. 1101)

The survey update concluded that the Harriman / Superintendent's House, constructed in 1915, is a District contributor and has a CHR status code of 2D2. For purposes of the survey update it was ranked as Highest, for its integrity and historic role in history of Rancho Los Amigos. It is also noteworthy for its association with William Ruddy Harriman, who lived in the house during his extensive tenure as Superintendent. The 2004 survey characterized the building as "an excellent example of the Craftsman style" and therefore individually eligible to the NRHP under Criterion C (architecture). Although the design may not merit the label of "excellent," the house does illustrate several of the distinctive characteristics of the Craftsman style, including horizontal massing, gabled roof configuration, exposed structural elements, incorporation of several capacious porches, and fenestration with generous bands of windows. Given its setting within the County Farm and the City of Downey, the property does appear to also be eligible to the NRHP and CRHR under Criterion C/3.

Staff Cottage (LACO No. 1121)

The survey update concluded that the Staff Cottage, constructed in 1921, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Medium, due to its support function, modest appearance, and relatively hidden location.

Staff Cottage (LACO No. 1123)

The survey update concluded that the Staff Cottage, constructed in 1924, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Medium, due to its support function, modest appearance, and relatively hidden location.

Dairyman's House (LACO No. 1137)

The survey update concluded that the Dairyman's House, constructed in 1907, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Medium, due to its age and association with the agricultural character of the County Farm.

Generator House (LACO No. 1163)

The survey update concluded that this utilitarian structure, estimated to have been constructed after the period of significance and not evaluated in 1995, is not a District contributor. A CHR status code of 6Z is recommended.[161]

[161] The Office of Historic Preservation defines a 6Z CHR status code as found ineligible for NRHP, CRHR, or local designation through survey evaluation.

Superintendent's Garage (LACO No. 1177)

The survey update concluded that the Superintendent's Garage, constructed in 1917, is a District Contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Highest, as a component of the Harriman / Superintendent's House complex.

Superintendent's Shed (LACO No. 1178)

The survey update concluded that the Superintendent's Shed, estimated to have been constructed between 1917 and 1922, is not a District contributor and has a CHR status code of 6Z. The 1995 survey did not evaluate this building. The current study did not discover any information regarding the historic role of the Shed in the evolution of Rancho Los Amigos. Although the 2004 survey recommended the Shed as eligible for the NRHP as a component of the Harriman / Superintendent's House complex under Criterion C, the building has no architectural qualities that would satisfy this criterion.

Dairyman's Garage (LACO No. 1179)

The survey update concluded that the Dairyman's Garage, constructed in 1926, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Low, due to its utilitarian quality and character and secondary association with agricultural activities of the County Farm.

General Ward 30 (LACO No. 1184)

The survey update concluded that General Ward 30, constructed in 1913, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the early years of the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of five nearly identical wards lined up along Erickson Avenue; and its architecture as an example of stripped Classicism.

General Ward 40 (LACO No. 1185)

The survey update concluded that General Ward 30, constructed in 1913, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the early years of the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of five nearly identical wards lined up along Erickson Avenue; and its architecture as an example of stripped Classicism.

General Ward 50 (LACO No. 1186)

The survey update concluded that General Ward 30, constructed in 1916, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the early years of the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of five nearly identical wards lined up along Erickson Avenue; and its architecture as an example of stripped Classicism.

General Ward 60 (LACO No. 1187)

The survey update concluded that General Ward 30, constructed in 1926, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of five nearly identical wards lined up along Erickson Avenue; and its architecture as an example of stripped Classicism.

General Ward 70 (LACO No. 1188)

The survey update concluded that General Ward 30, constructed in 1928, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of five nearly identical wards lined up along Erickson Avenue; and its architecture as an example of stripped Classicism.

Patient Ward 201 (LACO No. 1189)

The survey update concluded that Patient Ward 201, constructed in 1923, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 202 (LACO No. 1190)

The survey update concluded that Patient Ward 202, constructed in 1923, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and

its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 203 (LACO No. 1191)

The survey update concluded that Patient Ward 203, constructed in 1923, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 204 (LACO No. 1192)

The survey update concluded that Patient Ward 204, constructed in 1923, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 205 (LACO No. 1193)

The survey update concluded that Patient Ward 205, constructed in 1926, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 206 (LACO No. 1194)

The survey update concluded that Patient Ward 206, constructed in 1926, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 207 (LACO No. 1195)

The survey update concluded that Patient Ward 207, constructed in 1926, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 208 (LACO No. 1196)

The survey update concluded that Patient Ward 208, constructed in 1928, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 209 (LACO No. 1197)

The survey update concluded that Patient Ward 209, constructed in 1928, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 210 (LACO No. 1198)

The survey update concluded that Patient Ward 210, constructed in 1928, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 211 (LACO No. 1199)

The survey update concluded that Patient Ward 211, constructed in 1928, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the

transition from County Farm into hospital for the treatment of long-term illnesses; its visual prominence as one of a row of eleven nearly identical wards lined up along Descanso Avenue; and its barracks-like appearance as an early 20th-century wood-framed, vernacular building linked to its neighbors by a continuous veranda.

Patient Ward 212 (LACO No. 1200)

The survey update concluded that Patient Ward 212, constructed in 1926 and determined to be a District contributor in 1996, is no longer extant.

Patient Ward 214 (LACO No. 1201)

The survey update concluded that Patient Ward 214, constructed in 1926 and determined to be a District contributor in 1996, is no longer extant.

Women's Psychiatric Ward (LACO No. 1202)

The survey update concluded that the Women's Psychiatric Ward, constructed in 1924, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for chronic illnesses, including mental illnesses; its courtyard plan which was reflective of how the building was used; its visual prominence as one of two large complexes devoted to psychiatric care; and its use of brick vernacular architecture.

Women's Psychiatric Ward (LACO No. 1203)

The survey update concluded that the Women's Psychiatric Ward, constructed in 1919, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for chronic illnesses, including mental illnesses; its courtyard plan which was reflective of how the building was used; its visual prominence as one of two large complexes devoted to psychiatric care; and its use of brick vernacular architecture.

Men's Psychiatric Ward (LACO No. 1204)

The survey update concluded that the Men's Psychiatric Ward, constructed in 1924, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for chronic illnesses, including mental illnesses; its courtyard plan which was reflective of how the building was used; its visual prominence as one of two large complexes devoted to psychiatric care; and its use of brick vernacular architecture.

Men's Psychiatric Ward (LACO No. 1205)

The survey update concluded that the Men's Psychiatric Ward, constructed in 1907, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its direct association with the transition from County Farm into hospital for chronic illnesses, including mental illnesses; its courtyard plan which was reflective of how the building was used; its visual prominence as one of two large complexes devoted to psychiatric care; and its use of brick vernacular architecture.

Work Preparation Center No. 2 (LACO No. 1207)

The survey update concluded that the Work Preparation Center No. 2, constructed in 1925, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Medium, due to its support function at the County Farm and utilitarian, barn-like appearance.

Casa Consuelo (LACO No. 1238)

The survey update concluded that Casa Consuelo, constructed in 1930 as the new Women's Ward, is a District contributor and has a CHR status code of 2D2. For purposes of the survey update, it was ranked as Highest due to its importance to the evolution of the County Farm into a medical facility; its function as a patient care building; and its embodiment of new trends in women's medical care. It also appears eligible for NRHP/CRHR individual listing under Criterion C/3 as a good example of the Spanish Colonial Revival style.

Toilet Building (LACO No. 1239)

The survey update concluded that the Toilet Building, constructed in 1930 within the courtyard of the Women's Psychiatric Wards (LACO Nos. 1202 and 1203), is a District contributor and has a CHR status code of 2D2. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, secondary support function, and location.

Shelter (LACO No. 1240)

The survey update concluded that the Shelter, constructed in 1930 within the courtyard of the Women's Psychiatric Wards (LACO Nos. 1202 and 1203), is a District contributor and has a CHR status code of 2D2. Although deteriorated, the structure retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, support function, and location.

Linen Room (LACO No. 1241)

The survey update concluded that the Linen Room, constructed in 1932 within the courtyard of the Women's Psychiatric Wards (LACO Nos. 1202 and 1203), is a District contributor and has a CHR status code of 2D2. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey

update, it was ranked as Low, due to its utilitarian appearance, secondary support function, and location.

Toilet Building (LACO No. 1242)

The survey update concluded that the Toilet Building, constructed in 1930 within the courtyard of the Women's Psychiatric Wards (LACO Nos. 1202 and 1203), is a District contributor and has a CHR status code of 3D. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, secondary support function, and location. As noted above, this building was not evaluated in either the 1995 or 2004 surveys.[162] However, it is comparable in history, function, and integrity as well as location, setting, design, materials, workmanship, feeling, and association, with other toilet buildings within the psychiatric ward complexes that have been determined eligible for the NRHP and listed in the CRHR.

Open Shelter (LACO No. 1243)

The survey update concluded that the Open Shelter, constructed in 1916 within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205), determined eligible for the NRHP in 1996 and listed in the CRHR as a District contributor, has lost integrity and can no longer be identified as a significant resource. It is missing 50 percent of one of its two character-defining features, the canopy. A revised CHR status code of 6Z is recommended.

Toilet Room (LACO No. 1244)

The survey update concluded that the Toilet Room, constructed in 1916 within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205), is a District contributor and has a CHR status code of 2D2. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, secondary support function, and location.

Linen Room / Snack Bar No. 3 (LACO No. 1245)

The survey update concluded that the Linen Room / Snack Bar No. 3, constructed in 1932 within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205), is a District contributor and has a CHR status code of 2D2. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, secondary support function, and location.

Canopy (LACO No. 1246)

The survey update concluded that the Canopy, constructed in 1930 within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205), is a District contributor and has a CHR status code of 2D2. Although deteriorated, the structure retains sufficient integrity to continue to

[162] This appears to have been an unintentional oversight in the 1995 survey itemization of contributors, since the building is illustrated in one of the accompanying photographs, identified, and labeled "contributing."

contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, support function, and location.

Toilet Building (LACO No. 1247)

The survey update concluded that the Toilet Building, constructed in 1925 within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205), is a District contributor and has a CHR status code of 2D2. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance, secondary support function, and location.

Pump House (LACO No. 1249)

The survey update concluded that this resource, which was mistakenly described in the 2004 survey as a building, is actually an installation of large pipes that run underground within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205) and is not a contributor to the Historic District. A CHR status code of 6Z is recommended.

Open Shelter (LACO No. 1251)

The survey update concluded that the Open Shelter, which the 1995 survey estimated had been constructed in 1916, was apparently partially or completely replaced in circa 1960, and therefore no longer has sufficient integrity to contribute to the significance of the District. A revised CHR status code of 6Z is recommended.

Chapel / Computer Center (LACO No. 1254)

The survey update concluded that the Chapel / Computer Center, which was constructed in 1907 and added to sometime after World War II, is a District contributor and has a CHR status code of 2D2. Although altered and moved a short distance to its present location in 1919, the original wing of the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Medium, due to its important role as the original, purpose-built chapel at Rancho Los Amigos.

Toilet Building (LACO No. 1256)

The survey update concluded that the Toilet Building, constructed in 1925, is a District contributor and has a CHR status code of 2D2. Although somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked Low, due to its secondary support function and utilitarian appearance.

Wheelchair Repair (LACO No. 1259)

The survey update concluded that the Wheelchair Repair building, constructed in 1932, is a District contributor and has a CHR status code of 2D2. Although deteriorated and somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked Low, due to its support function and utilitarian appearance.

Bathhouse and Ward (LACO No. 1260)

The survey update concluded that the Bathhouse and Ward, constructed in 1922, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Key, due to its importance to the mission of the facility; its role as a patient services building; the stripped classicism of its design, which mirrors that of the nearby General Wards; and its prominent location in the center of the District.

Auditorium (LACO No. 1261)

The survey update concluded that the Auditorium, constructed in 1928, is a District contributor and has a CHR status code of 2D2. Although altered from its original Spanish Colonial Revival styling, the building retains a number of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. However, it does not appear to retain the requisite integrity of design that would be required for individual listing in the NRHP under Criterion C, as was argued by the 2004 survey. For purposes of the survey update it was ranked as Highest, due to its importance to the mission of the facility; its role as a patient services building; and its prominent location in the center of the District.

Dining Room, Kitchen, Staff Room (LACO Nos. 1262 and 1263)

The survey update concluded that the Dining Room, Kitchen, Staff Room, constructed in stages from circa 1912 to 1926, is a District contributor and has a CHR status code of 2D2. Although deteriorated and damaged by fire, the building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Highest, due to its importance to the mission of the facility; role as a patient and staff services building; age; brick vernacular architecture; and prominent location in the center of the District. It is also one of the only buildings in the District that can be associated with a known architect. The Los Angeles firm of Hudson and Munsell drew the plans for the 1913 Dining Room and Kitchen (LACO No. 1263). The building also appears eligible for listing in the NRHP and CRHR under Criterion C/3 as an example of this architectural firm's interpretation of brick vernacular design.

Bonita Hall (LACO No. 1264)

The survey update concluded that Bonita Hall, constructed in 1932, is a District contributor and has a CHR status code of 2D2. Although a substantial rehabilitation in 1975 removed many of its original Spanish Colonial Revival character-defining features, the building does retain other aspects of integrity. However, due to the alterations, for purposes of the survey update, it was ranked Low, despite its importance as one of the few new buildings erected during the Depression and its important role as a recreational patient support facility.

Shelter (LACO No. 1265)

The survey update concluded that the Shelter, constructed circa 1933, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Medium, due to its association with the landscaping theme that informed much of the development of the District and its prominent location on Erickson Avenue.

Amigos Hall (LACO No. 1266)

The survey update confirmed that Amigos Hall, constructed in 1928 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. The building has lost the majority of its character-defining features through alterations. A CHR status code of 6Y is assumed.[163]

Transportation Office (LACO No. 1267)

The survey update confirmed that the Transportation Office, constructed in 1930 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Storage (LACO No. 1268)

The survey update concluded that the Storage building, constructed in 1932, is a District contributor and has a CHR status code of 2D2. Although somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked Low, due to its secondary support function and utilitarian appearance.

Garage (LACO No. 1270)

The survey update concluded that the Garage, constructed in 1932, is a District contributor and has a CHR status code of 2D2. Although somewhat altered, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked Low, due to its secondary support function and utilitarian appearance.

Shed (LACO No. 1272)

The survey update concluded that the Shed, constructed in 1930 and identified as a District contributor in 1995, is no longer extant. A concrete slab foundation and paving is all that remains of this building.

[163] The Office of Historic Preservation defines a 6Y CHR status code as determined ineligible for NRHP listing through Section 106 process. Noncontributors are not currently individually listed in the California Historical Resources Information System Historic Resources Inventory database; therefore, the status code is assumed. A 6Z status code would otherwise apply.

Workshop (LACO No. 1275)

The survey update concluded that the Workshop, constructed in 1917, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Medium, due to its support function, age, and architectural character.

Lock Shop (LACO No. 1276)

The survey update concluded that the Lock Shop, constructed in 1913, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Low, due to its secondary support function and utilitarian appearance.

Garage (LACO No. 1277)

The survey update concluded that the Garage, constructed in 1925, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains the majority of its character-defining features and sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as Medium, due to its support function and architectural character.

Garage and Storage (LACO No. 1278)

The survey update concluded that the Garage and Storage building, constructed in 1924, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its support function and utilitarian appearance.

Garage (LACO No. 1279)

The survey update concluded that the Garage, constructed in 1925 and determined eligible for the NRHP in 1996 and listed in the CRHR as a District contributor, has lost integrity and can no longer be identified as a significant resource. A simple, utilitarian building with plywood walls and a corrugated metal roof, it has lost its original window and door on the primary (west) elevation. Since these features occupy most of the facade, the original appearance of the building is substantially altered. A revised CHR status code of 6Z is recommended.

Garage Storage (LACO No. 1280)

The survey update concluded that the Garage Storage building, constructed in 1928, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its support function and utilitarian appearance.

Trunk Storage (LACO No. 1283)

The survey update concluded that the Trunk Storage building, originally constructed as a horse stable and hay barn, is a District contributor and has a CHR status code of 2D2. Although somewhat altered, its original function is apparent in its appearance. Removal of an original upper story was done following the Long Beach earthquake in 1933 and therefore is considered to be an alteration that has acquired significance in its own right. Thus, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Medium, due to its association with the former livestock operations at the County Farm and its architectural character.

Water Tanks (LACO No. 1284

The survey update confirmed the water tanks, installed at an unknown date and identified as a District noncontributor in 1995, do not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Garage / Storage (LACO No. 1286)

The survey update concluded that the Garage / Storage building, constructed in 1920, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its support function and utilitarian appearance.

Oil and Storage (LACO No. 1287)

The survey update confirmed that the Oil and Storage building, constructed in 1909 as in connection with dairy operations at the County Farm, is a District contributor and has a CHR status code of 2D2. Although somewhat altered, it continues to resemble an early 20th-century farmhouse. The building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Medium, due to association with the former dairy at the County Farm; its age; and its architectural character.

Shelter (LACO No. 1290)

The survey update confirmed the shelter, constructed in 1952 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Pump House (LACO No. 1292)

The survey update confirmed the Pump House, constructed in 1932 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Kitchen and Dining Building (LACO No. 1295)

The survey update confirmed that the Kitchen and Dining Building, constructed in 1927, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update it was ranked as "Key," due to its importance to the functioning of Rancho Los Amigos as it transitioned into a full-time medical facility and the stripped classicism of its design, which echoes the General Wards and Bathhouse and Ward building.

Power Plant and Smoke Stack (LACO No. 1300)

The survey update confirmed that the Power Plant, constructed in 1925, is a District contributor and has a CHR status code of 2D2. The Power Plant retains the majority of its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Highest for several reasons:

- Its critical support function during the evolution, expansion, and consolidation of the County Farm as it transitioned into a medical facility
- Its architectural quality as an embodiment of the distinctive features of the industrial use of the Classical Revival style during the 1920s
- Its prominent location at the northwest corner of Erickson and Descanso Avenues
- Its visual integration with the other components of the historic power plant complex the Water Tower (LACO No. 1301) and the Shop, Laundry, and Ice Plant (LACO No. 1302)
- Its associated vertical element, the freestanding chimney, which, combined with the water cooling tower on the roof of LACO No. 1302 and the Water Tower (LACO No. 1301) provides a distinctive vertical dimension to the Historic District

The Power Plant also appears eligible for NRHP/CRHR individual listing under Criterion C/3 for its industrial interpretation of the Classical Revival style.

Water Tower (LACO No. 1301)

The survey update confirmed that the Water Tower, constructed in 1913, is a District contributor and has a CHR status code of 2D2. The Water Tower retains its character-defining features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Highest, due to its height and visual prominence, which have made it a landmark and symbol of Rancho Los Amigos both to campus users and the surrounding neighborhood; its important support function; its age; and its visual integration with the other components of the historic power plant complex (LACO Nos. 1300 and 1302). As part of the historic power plant complex, the Water Tower also appears eligible for individual listing in the NRHP/CRHR under Criterion C.

Shop, Laundry, and Ice Plant (LACO No. 1302)

The survey update confirmed that the Shop, Laundry, and Ice Plant, constructed in increments between 1909 and 1911 as the original power plant for the County Farm, is a District contributor and has a CHR status code of 2D2. The building retains the majority of its character-defining

features and displays sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Highest for several reasons:

- Its critical support role in the operation, expansion, and evolution of the County Farm
- Its age
- Its exemplification of the brick vernacular style influenced by the Classical Revival
- Its visual integration with the other components of the historic Power Plant complex (LACO Nos. 1300 and 1301)
- Its prominent location at the intersection of Erickson and Descanso Avenues
- The water cooling tower on the roof of the 1911 addition, which is one of three visually significant vertical elements of the historic power plant complex (the other two being the freestanding chimney, part of LACO No. 1300 and the Water Tower, LACO No. 1301)

As part of the historic power plant complex, the Water Tower also appears eligible for individual listing in the NRHP/CRHR under Criterion C.

Aviary (LACO No. 1312)

The survey update confirmed that the Aviary, constructed in 1888 and moved to its present site within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205) sometime after 1924, is a District contributor and has a CHR status code of 2D2. Although moved (albeit during the District's period of significance), the structure retains sufficient integrity to convey its historic association and feeling as the oldest improvement, other than the site plan itself, in the Historic District. For purposes of the survey update, it was ranked as Medium, for its age and association.

Shed (LACO No. 1333)

The survey update concluded that the Shed, constructed in 1931 and identified as a District contributor in 1995, is no longer extant. A concrete slab foundation is all that remains of this building.

Vivarium (LACO No. 1334)

The survey update concluded that the Vivarium, constructed in 1926 and identified as a District contributor in 1995, is no longer extant. A concrete slab foundation and paving is all that remains of this building.

Brooder House / Vivarium Annex (LACO No. 1335)

The survey update concluded that the Brooder House / Vivarium Annex, constructed in 1929, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Medium due to its association with the agricultural operations at the County Farm and its architectural character as an example of brick vernacular design.

Train Station (LACO No. 1352)

The survey update concluded that the Train Station, constructed in 1907 and identified as a District contributor in 1995, is no longer extant.

Greenhouse (LACO No. 1353)

The survey update concluded that the Greenhouse, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Greenhouse (LACO No. 1355)

The survey update concluded that the Greenhouse, constructed in 1926 and not evaluated in 1995, is no longer extant.

Tool House (LACO No. 1356)

The survey update concluded that the Tool House, constructed in 1926, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its support function and utilitarian appearance.

Landscape Office (LACO No. 1357)

The survey update concluded that the Landscape Office, constructed in 1938, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its utilitarian appearance.

Grain Tank (LACO No. 1373)

The survey update concluded that the Grain Tank, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Grain Tank (LACO No. 1374)

The survey update concluded that the Grain Tank, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Garage (LACO Nos. 1379 and 4121)

The survey update concluded that the Garage, constructed in 1929, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its support function and utilitarian appearance.

Shed (LACO No. 1464)

The survey update confirmed that the Shed, constructed in 1945 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Shed (LACO No. 1991)

The survey update concluded that the Shed, constructed at an unknown date outside the District boundaries and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Shed, Men's Gymnasium (LACO No. 2434)

The survey update confirmed that the Shed, Mens's Gymnasium constructed in 1949 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Patient Recreation Shed (LACO No. 2435)

The survey update confirmed that the Patient Recreation Shed, constructed in 1949 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Classroom Hut / Shed (LACO No. 2436)

The survey update confirmed that the Classroom Hut / Shed, constructed in 1949 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Metal Shed (LACO No. 2437)

The survey update confirmed that the Metal Shed, constructed in 1949 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Toilet Room (LACO No. 2492)

The survey update confirmed that the Toilet Room, constructed in 1948 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Shed (LACO No. 2494)

The survey update concluded that the Shed, constructed at an unknown date outside the District boundaries and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Old Laundry (LACO No. 2637)

The survey update concluded that the Old Laundry, constructed at an unknown date outside of the District boundaries and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Post Office (LACO No. 2677)

The survey update confirmed that the Post Office, constructed in 1949 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Bus Stop (LACO No. 3020)

The survey update concluded that the Bus Stop, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Bus Stop (LACO No. 3021)

The survey update concluded that the Bus Stop, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Bus Stop (LACO No. 3022)

The survey update concluded that the Bus Stop, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Garbage Can Room (LACO No. 3348)

The survey update confirmed that the Garbage Can Room, constructed in 1948 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Shed (LACO No. 3368)

The survey update concluded that the Shed, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Prosthetic Shop (LACO No. 3390)

The survey update confirmed that the Prosthetic Shop, constructed in 1953 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Warehouse (LACO No. 3591)

The survey update concluded that the Warehouse, constructed at an unknown date outside the District boundaries and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Chapel (LACO No. 3592)

The survey update concluded that the Chapel, constructed in 1955 and not evaluated in the 1995 survey, does not contribute to the significance of the District. Although it is an intact example of the Spanish Colonial Revival style and served an important function at the facility following closure of the 1907 chapel (LACO No. 1254), it is located on the east side of Dahlia Street outside of the District boundaries and was built after the District's period of significance. A CHR status code of 6Z is recommended.

Loading Dock (LACO No. 3820)

The survey update confirmed that the Loading Dock, constructed in 1954 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Garage (LACO No. 4118)

The survey update concluded that the garage, which was identified as a District contributor in 1995 based on a 1929 construction date, was actually not built until after 1965. It therefore post-dates the District's period of significance. A revised CHR status code of 6Z is recommended.

Garage (LACO Nos. 1379 and 4121)

The survey update concluded that this portion of the Garage, constructed in 1926, is a District contributor and has a CHR status code of 2D2. Although somewhat altered and deteriorated, the building retains sufficient integrity to continue to contribute to the significance of the District. For purposes of the survey update, it was ranked as Low, due to its support function and utilitarian appearance.

Station 18 (LACO No. 5513)

The survey update concluded that Station 18, constructed at an unknown date outside the District boundaries and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

200,000 Gallon Tank (LACO No. 5547)

The survey update confirmed that the 200,000 Gallon Tank, constructed in 1966 and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Steam Plant (LACO No. 5548)

The survey update confirmed that the Steam Plant, constructed in 1966 outside the District boundaries and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Time Clock Shelter (LACO No. 5593)

The survey update concluded that the Time Clock Shelter, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Work Preparation Center No. 1 (LACO No. 5750)

The survey update confirmed that the Work Preparation Center No. 1, constructed at an unknown date and identified as a District noncontributor in 1995, is no longer extant.

Electrical Distribution Panel (LACO No. 5793)

The survey update concluded that the Electrical Distribution Panel, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Electrical Station 16 (LACO No. 5798)

The survey update concluded that Electrical Station 16, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Electrical Station 4C (LACO No. 5799)

The survey update concluded that Electrical Station 4C, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Generator House (LACO No. 5801)

The survey update concluded that the Generator House, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Electrical Station (LACO No. 6223)

The survey update concluded that the Electrical Station, constructed at an unknown date outside the District boundaries and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Electrical Station (LACO No. 6225)

The survey update concluded that the Electrical Station, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Unknown (LACO No. 6407)

The survey update concluded that LACO No. 6407, constructed at an unknown date and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Butler Building (LACO No. 7000)

The survey update confirmed that the Butler Building, constructed at an unknown date (presumed to be after the period of significance) and identified as a District noncontributor in 1995, does not contribute to the significance of the District. A CHR status code of 6Y is assumed.

Facilities Management Metal Building (LACO No. 7704)

The survey update concluded that the Facilities Management Metal Building, constructed in 1992 outside of the District boundaries and not evaluated in the 1995 survey, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Credit Union (LACO No. unavailable)

The survey update confirmed that the Credit Union, constructed at an unknown date and identified as a District noncontributor in 1995, is no longer extant.

Family Home (LACO No. unavailable)

The survey update confirmed that the Family Home, one of two constructed at an unknown date on the east side of Dahlia Street outside of the District boundaries, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Family Home (LACO No. unavailable)

The survey update confirmed that the Family Home, one of two constructed at an unknown date on the east side of Dahlia Street outside of the District boundaries, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

Shed (LACO No. unavailable)

The survey update confirmed that the Shed, constructed at an unknown date on the east side of Dahlia Street outside of the District boundaries, does not contribute to the significance of the District. A CHR status code of 6Z is recommended.

5.4 CONCLUSION

One of the purposes of the 2007–2010 survey update was to reconsider the 1995 findings of eligibility in light of the differing conclusions of the 2004 study. Since the 1996 determination of eligibility was a formal process and resulted in the listing of the Historic District in the CRHR, official action would be required for any changes to be made. Formal delisting from the CRHR requires a public hearing and satisfaction of one of two criteria:[164]

- The historical resource, through demolition, alteration, or loss of integrity has lost its historical qualities or potential to yield information
- New information or analysis shows that the historical resource was not eligible at the time of its listing

The results of the 2007–2010 survey update indicate that, with the exceptions of the recommended modifications to the CHR status codes of 10 of the 1996 District contributors, these criteria have not been met. Changes to the Historic District since the 1996 determination of eligibility have not resulted in the loss of the District's historical qualities. In addition, extensive historical research has confirmed that reasons for the Historic District's significance were, and continue to be, valid.

APPENDIX A
HISTORIC RESOURCES INVENTORY FORMS

***NRHP Status Code:** *2S2*

***Resource Name or #** (Assigned by recorder)**:** *Rancho Los Amigos Historic District*

D1. Historic Name: *Los Angeles County Poor Farm* **D2. Common Name:** *Rancho Los Amigos National Rehabilitation Center*

This district evaluation is an update to two previous surveys: *1) McAvoy, Christy J. 1994 Northridge Earthquake Project Review: Rancho Los Amigos Medical Center: Survey of Earthquake Damaged Properties for Purposes of Section 106 Review. Historic Resources Group. 26 July 1995. 2) Post/Hazeltine Associates. Intensive Historic Structures/Sites Survey for The South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California. 19 March 2004.*

***D3. Detailed Description** (Discuss overall coherence of the district, its setting, visual characteristics, and minor features. List all elements of district.): *The Rancho Los Amigos Historic District (District) consists of buildings, structures, and features occupying 52 acres located in the western portion of the City of Downey, County of Los Angeles, California. Constructed as the Los Angeles County Poor Farm, the District represents the evolution of the property from an institution originally intended to serve Los Angeles County's indigent into a medical hospital specializing in the rehabilitative care of persons with physical disabilities. Contributing resources to the District include hospital wards, infirmaries, residential units, an administration building, a power plant, and support buildings, including mechanical shops, kitchen and dining quarters, storage structures, laundry and toilet buildings, and a bathhouse.*

(See Continuation Sheet 2 of 6.)

***D4. Boundary Description** (Describe limits of district and attach map showing boundary and district elements.): *The District boundaries represent a subset of the historic boundaries of the Los Angeles County Poor Farm / Rancho Los Amigos during its period of significance and enclose the group of contributing features on the South Campus of Rancho Los Amigos dating from the period of significance that are extant. The period of significance begins with the establishment of the Los Angeles County Poor Farm in 1888 and ends with the 1952 retirement of the institution's most influential superintendent, William R. Harriman, who guided the transition from poor farm into medical hospital during the first half of the twentieth century.*

(See Continuation Sheet 4 of 6.)

***D5. Boundary Justification:** *The District boundaries contain a significant concentration of buildings, structures, and features that are united historically by plan and physical development. All the buildings, structures, and features constructed within the period of significance, 1888–1952, on the South Campus of Rancho Los Amigos lie within the boundaries. As defined, the District conveys a distinct sense of time and place associated with the evolution of the Los Angeles County Poor Farm into Rancho Los Amigos National Rehabilitation Center.*

***D6. Significance: Theme:** *Public Poor Farm, Public Hospital* **Area:** *Los Angeles County*
Period of Significance: *1888 - 1952* **Applicable Criteria:** *A* (Discuss district's importance in terms of its historical context as defined by theme, period of significance, and geographic scope. Also address the integrity of the district as a whole.)

The District was determined eligible for listing in the National Register of Historic Places (NRHP) under Criterion A on September 30, 1996. It is therefore also listed in the California Register of Historical Resources (CRHR) under Criterion 1. The current study upheld the significance of the District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The intensive-level survey update confirmed that the majority of the District contributors are extant and retain sufficient integrity to continue to contribute to the significance of the District and that the District exhibits sufficient integrity to maintain its significance under Criterion A/1 for its important role in the public welfare and health care history of the County of Los Angeles.

(See Continuation Sheet 4 of 6.)

***D7. References** (Give full citations including the names and addresses of any informants, where possible.):
(See Continuation Sheet 6 of 6.)

***D8. Evaluator:** *Leslie J. Heumann and Rebecca L. Silva* **Date:** *June 2, 2008*

Affiliation and Address: *Sapphos Environmental, Inc., 430 North Halstead Street, Pasadena, CA 91107*

***D3. Detailed Description (continued from page 1):**

The District also contains site plan and landscaping elements that contribute to the property's park-like historic character, including the distinctive street pattern anchored by the east-west running Consuelo Street and north-south Erickson Avenue; mature trees (Moreton Bay Fig, Bottle, Bunya bunya, Camphor, Coast Live Oak, Laurel Fig, Primrose, Queensland Pittosporum, Redwood, and southern Magnolia[1]); and vestiges of ornamental landscaping, such as lawns, shrubs, and fruit trees. The contributing buildings of the District represent five general architectural styles or types: Craftsman and wood vernacular, Classical influence, Spanish Colonial Revival, brick vernacular, and utilitarian. Craftsman and wood vernacular styling was favored for residential buildings, most notably the Harriman House (LACO No. 1101), but also for staff cottages (LACO Nos. 1121 and 1123) and the 1920s Infirmary Wards (LACO Nos. 1189–1199). The Classical Revival and Spanish Colonial Revival styles were selected for some of the most visibly prominent buildings of the District, the 1925 Power Plant (LACO No. 1300), the Administration Building (LACO No. 1100), and Casa Consuelo (LACO No. 1238). Classical Revival influence is also apparent in several of the buildings erected in the second and third decades of the 20th century, including the General Wards (LACO Nos. 1184–1188), Bathhouse and Ward (LACO No. 1260), and Kitchen and Dining Building (LACO No. 1295). Brick vernacular design characterized many buildings from the first quarter of the 20th century, including the original Power Plant (LACO No. 1302), the Psychiatric Wards (LACO Nos. 1202–1205), Kitchen, Dining, and Staff Room (LACO No. 1262), and Commissary and Receiving building (LACO No. 1263). Utilitarian buildings reflected their particular purpose, be they related to agricultural functions (Brooder House / Vivarium Annex, LACO No. 1335; the former horse barn, LACO No. 1283; or former hay barn, LACO No. 1207) or other operations and maintenance (Garage, LACO No. 1277). All five architectural genres were typical of the first half of the 20th century in Southern California. The oldest extant building in the District is the 1888 Aviary (LACO. No. 1312), which was moved circa 1930 from its location in the original central courtyard (now the open space east of the Auditorium, LACO No. 1261) to its current location in the interior courtyard of the Men's Psychiatric Ward (LACO No. 1205). The most recent building constructed in the District is the 1942 Lumber Shed (LACO No. 954).

The historic resources survey conducted in 1995 that resulted in the 1996 determination of eligibility documented a total of 103 buildings, structures, and features on the South Campus of Rancho Los Amigos, 78 of which were determined to be contributing elements to the District.[2] The current investigation of 129 buildings, structures, and features determined that there are 68 extant contributors to the District. Results of this intensive-level survey update indicate that, of the 78 original contributing resources identified in the 1995 survey,

- 6 buildings, structures, and features are no longer extant.[3] These include Patient Wards 212 and 214 (LACO Nos. 1200 and 1201), which were removed circa 2001; the 1930 shed and 1931 shed (LACO Nos. 1272 and 1333); the Vivarium (LACO No. 1334); and the Train Station (LACO No. 1352).

- 4 no longer contribute to the significance of the District: 3 because of loss of integrity (LACO Nos. 1243, 1251, and 1279) and 1 because of a date of construction that postdates the period of significance (LACO No. 4118).

- 1 additional building (LACO No. 1242) has been identified as a potential contributor to the District.

-1 structure (the Smoke Stack) was addressed as a separate resource in 1995, when it should have been included as part of the Power Plant (LACO No. 1300).

The remaining extant 45 buildings, structures, and features on the South Campus were identified as noncontributors to the District, either because they were previously determined to be noncontributors or because they lack sufficient age, historic association, and/or architectural character to be a part of the District.

All buildings and structures are listed in chronological order by construction date and are accompanied by their assigned Los Angeles County Number. Updated descriptions are provided in the attached DPR 523A Primary Records. The corresponding map illustrates the locations of the contributors, noncontributors, and demolished features within the District boundaries.
(See Continuation Sheet 3 of 6.)

***D4. Boundary Description (continued)**

The boundary has been slightly adjusted on the northwest from that described in the previous (1995) District Record, to eliminate two buildings (LACO Nos. 1200 and 1201, both Patient / Infirmary Wards) that were demolished after the 1996 determination of NRHP eligibility and subsequent CRHR listing.

On the north, the boundaries roughly follow Flores Street and Golondrinas Street and deviate from the historical north boundaries because of the intervening construction of a business park south of East Imperial Highway. The boundary on the east generally follows Dahlia Street and the historic eastern limits of the County Poor Farm; the boundary excludes the curve of Consuelo Street and the 1955 new Chapel, constructed on the east side of Dahlia Street. The southern boundary runs along Aliso Street, the historic edge of the facility, but curve northwards to exclude four noncontributing buildings. The west boundary follows the railroad tracks, then generally tracks Laurel Street, with a bump out to accommodate the two westernmost, extant Patient / Infirmary Wards; this line also acknowledges newer construction within the western section of the former County Poor Farm boundaries.

***D6. Significance (continued from page 1):**

The 1995 survey that resulted in the determination of eligibility of the District stated that the District is significant under NRHP Criterion A "for its association with the turn-of-the-century health care of Los Angeles County's indigent population and for its later treatment of those in Los Angeles County with chronic illnesses, both mental and physical."[4]

(See Continuation Sheet 5 of 6.)

[4] Historic Resources Group. 26 July 1995. *1994 Northridge Earthquake Project Review: Survey of Earthquake Damaged Properties for Purposes of Section 106 Review*. Rancho Los Amigos Medical Center District Record. Rancho Los Amigos Medical Center, Downey, CA.

***D6. Significance (continued from page 4):**

The 2007–2010 survey update confirmed the importance of the role of Rancho Los Amigos in evolution of the County welfare and health care systems. In its early years, Rancho Los Amigos, as the Poor Farm, was a response to the homeless problem of the period, housing the poverty stricken in the most cost-effective manner by making the institution self-sufficient. The Poor Farm was established during a period in American history when the public was increasingly aware of its responsibility toward those less fortunate and as the Progressive Movement gained support; it is no coincidence that Jane Addams Hull House in Chicago was established around the same time, in 1889. With one of its original goals of relieving the existing County hospital of the burden of caring for the indigent, the Poor Farm operated in tandem with the developing County health care system, which had opened its first hospital in 1878. Increasingly, as patients with long-term illnesses were directed to the Poor Farm, the institution became an integral part of that system. The niche that Rancho Los Amigos filled was that of long-term care and rehabilitation, particularly for those afflicted with mental illness, and later the victims of the mid-20th-century outbreaks of polio. As one of the historic cornerstones of the County of Los Angeles health care system, Rancho Los Amigos has been critical to the development of what is now the second largest health care system in the nation.

Concurrent with the evolving mission of the institution, its physical plant also grew and changed. The District today retains aspects of each period of Rancho Los Amigo's history. From its founding in the late 19th century, the District incorporates the distinctive curvilinear street plan still evident in the central east part of the campus and the Aviary (LACO No. 1312). A handful of buildings remain that reference the institution's agricultural and livestock operations, including a former stable and hay barn (LACO No. 1283), the farmhouse-like Oil and Storage Building (LACO No. 1287), the Dairyman's House (LACO No. 1137), and the Brooder House / Vivarium Annex (LACO No. 1335). Several buildings from the World War I and earlier era are reminders of the self-contained, residential nature of the facility and its growing focus on the treatment of long-term illness, including the Superintendent's House (LACO No. 1101); the older wings of the Dining Room, Kitchen, and Staff Room (LACO No. 1262); Commissary (LACO No. 1263); Workshop (LACO No. 1275); the first wing of the Men's Psychiatric Wards (LACO No. 1205); the first Power Plant (LACO No. 1302); the first Chapel (LACO No. 1254); and the first General Wards (LACO Nos. 1184, 1185, and 1186). The growth of the medical campus and its appurtenant support facilities is extensively represented, most prominently by the later General Wards and the Patient Wards (LACO Nos. 1187–1199), Men's and Women's Psychiatric Ward complexes (LACO Nos. 1202–1205 and 1239–1247), Power Plant (LACO No. 1300), Kitchen and Dining Building (LACO No. 1295), Bathhouse and Ward building (LACO No. 1260), Auditorium (LACO No. 1261), Administration Building (LACO 1100), and Casa Consuelo (LACO No. 1238). Although no agricultural fields are still extant, the nearby train tracks are a reminder of the essential proximity of transportation. The importance of landscape design to the concept of the County Farm can still be discerned from the remaining ornamental trees, most prominently a Moreton Bay fig tree, and the ample green space that flanks buildings in the central campus.

Although it is certainly true that numerous buildings have been demolished over the course of the history of Rancho Los Amigos and that a few incompatible buildings have been constructed within the District boundaries (e.g., the Butler Building, LACO No. 7000), the District still possesses the physical features necessary to convey its historical importance under Criterion A/1. Containing a range of property types linked by historical and physical development, the District retains sufficient integrity to provide a sense of historic and architectural cohesiveness, particularly with respect to its setting, design, materials, association, and feeling. The 1995 document characterized the District as an intact collection of structures used for health care and social services from 1888–1950 but defined the period of significance as 1888–1945, perhaps in deference to the 50-year requirement of the NRHP. Based on the history of Rancho Los Amigos, and the pivotal role of Superintendent William R. Harriman for most of the first half of the 20th century, extension of the period of significance to 1952, when Harriman stepped down, is suggested.

The 2007–2010 survey also resulted in the conclusion that a small number of buildings at Rancho Los Amigos also appear to be individually eligible for listing in the NRHP/CRHR under Criterion C/3 for architectural merit (LACO Nos. 1100, 1101/1177, 1238, 1262/1263, and 1300–1302).

Additional information regarding the history of the Los Angeles County Poor Farm can be found in the attached Building, Structure, and Object Records and in the report, Rancho Los Amigos Historic District Update Report (Sapphos Environmental, Inc., June 2011).

***P3a. Updated Description:**

The Moreton Bay Fig Tree was planted at the Los Angeles County Poor Farm (in circa 1900). It is located in the ornamental courtyard area in the center of the area now known as South Campus east of the Dining Room/Staff Rooms/Kitchen/Commissary Complex (LACO Nos. 1262 & 1263) and Auditorium (LACO No. 1261). The tree sits directly west of Erickson Avenue. Of impressive size, the tree was measured in 2007 at 10.2 meters in height, with a diameter at breast height of 3.25 meters and a canopy of 36.6 meters. The tree appears to be healthy. Notable both for its size and its above-ground root system, the tree serves as a marker for the center of the South Campus area.

***B10. Updated Significance:**

This resource was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Moreton Bay Fig Tree as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The tree was planted in circa 1900 as a central landscaping feature for the County Poor Farm. A significant component of the Poor Farm from the beginning, landscaping created a scenic, lush, and inviting environment for the patients, staff, and visitors.

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

An Australian import, Moreton Bay fig trees were popular as ornamental trees in Southern California from the last quarter of the 19th century through the first quarter of the 20th century. Individual Moreton Bay fig trees have been designated as landmarks in several Southern California communities, including Los Angeles, Santa Monica, Santa Barbara, and San Diego. The City of Downey has recognized this Moreton Bay Fig Tree in the significant tree list incorporated into its General Plan, Downey Vision 2025.

***P3a. Updated Description:**

The Lumber Shed (LACO No. 954) is located northeast of the intersection of Laurel and Bonita Streets. The Lumber Shed is one-story, asymmetrical in appearance and rectangular in plan. The wood-framed vernacular building is capped by a medium-pitched, front-gabled roof with slightly overhanging eaves and exposed rafters, and is covered by composition shingles. The building is clad in a combination of vertical and horizontal wood siding, possibly indicating use of salvaged materials. A series of original wood sliding doors are located on the east and west elevations and provide access to individual storage areas. Original extant wood-framed, one-over-one, double-hung sash windows are located on the north elevation of the building. An attached, front-gabled screen porch is located on the south façade. The building is sited directly on concrete pavement which surrounds the building. Character-defining features include: horizontal massing and rectangular plan, medium-pitched front gabled roof, original wood-framed windows (where extant), original wood sliding doors (where extant), and screened porch. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations include the replacement of original roofing material, and the removal of original windows and doors.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Lumber Shed (LACO No. 954) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1942 to serve as a support building for the general construction operations of the institution. It stored lumber needed for the upkeep of existing buildings on the South Campus, as well as providing building materials for the new construction taking place on the North Campus. The building continued to be used for lumber storage for many years until it was abandoned in the late twentieth-century.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. An example wood-framed utilitarian construction, the building retains integrity of location, feeling, association, design, materials, and workmanship. It has retained most of its character-defining features: simplicity of design and lack of ornamentation; horizontal massing and rectangular plan; wood framing and exterior building materials; original windows and doors (where extant); and attached front-gabled porch. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. ***P3a. Updated Description:**

The Administration/Safety Police Building (LACO No. 1100) is located in the southeast section of the Rancho Los Amigos Historic District, facing the original Consuelo Street entrance to the campus. The two-story building is rectangular in plan and features horizontal massing beneath a complex gabled roof. Designed in the Spanish Colonial Revival style, the building is constructed of reinforced concrete, with smooth stucco exterior walls and a red-clay tile roof. It sits on a concrete foundation. At the south end of the east-facing façade, an eight-sided tower capped by a domed cupola marks the raised entry bay. A front-gabled bay at the north end of the façade echoes the projection. In between the end bays, three interior bays are defined by tall, round-arched, multi-pane windows on the lower story and tripartite casement windows on the second story. Elevated seven steps above ground level, the Baroque style cast stone portal consists of a double, glazed door, flanked by sidelights and topped by transoms, recessed into a rusticated surround accented by engaged, fluted columns. The columns support a balconet with a wrought iron railing, behind which a tripartite window is set into a cast stone surround topped by a three-lobed arch pediment. Finials adorn the pediment and the wall surface above the columns. A curved parapet repeats the shape of the pediment immediately below it. On the tympanum, the year of construction, "1926," has been incised.

(See Continuation Sheet 2 of 3.)

***P3a. Updated Description (continued from page 1):**

The north and south elevations are also asymmetrically organized, with front gabled wings on the east ends and side-gabled wings extending to the west. Both elevations are fenestrated predominantly with double casement windows. On the north, a four-bay arcade projects from the lower story. On the south, a small balcony is defined by a two-bay arcade. The central portion of the rear elevation contains a second story terrace with a slightly crenellated railing.

Park-like lawns punctuated by mature trees, shrubs and grass provide the setting for the Administration Building, which is encircled by driveways. Character-defining features include: horizontal-massing and U-shaped plan; projecting and receding wall planes on the façade; smooth stucco walls; cross-gabled roof with tower and domed cupola and red-clay tile covering; decorative façade entrance bay consisting of Baroque style cast stone portal and recessed entry; use of arched openings, including windows and arcade; and incorporation of patio spaces. The property is in excellent condition, but has been altered by the removal of an arcaded extension of the north elevation to the west, replacement of many of the original windows and doors (within the original openings and recreating the original division of window lights), and repair and replacement of the original stucco. Despite these changes, the building retains sufficient integrity to convey its period of significance.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations and alteration dates as they appear from original architectural drawings and historic photographs include: replacement stucco; replacement windows; the replacement of all wood doors (except for the main entrance door) with metal doors; and the removal of an original arcade extension on the north elevation after the 1933 Long Beach earthquake.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Administration /Safety Police Building (LACO No. 1100) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. Erected in 1926, it was the second Administration Building at Rancho Los Amigos, and housed the administrative offices, the superintendent's office, and the post office as well as additional patient ward space. It was prominently sited at the main entrance to South Campus on Dahlia Street facing east towards the east-west axis of Consuelo Street. It was intended by this location and placement to be the first building seen by visitors to the campus, and thereby became not only the most accessible building but also symbolic of the facility. The open park-like setting surrounding the building created a separation between the building and the private hospital buildings located further west on Consuelo Street toward the center of South Campus. Today, the building is still sited within this open space, and it retains the same spatial relationships to the hospital buildings on the south campus. It still functions as an office building, and presently houses the Los Angeles County Office of Public Safety.

Although the building has been somewhat altered by its 1980 rehabilitation, its exterior appearance still reflects its period of construction. An example of the Spanish Colonial Revival style, the building retains integrity of location, feeling, association, design, and to some degree, materials and workmanship. The building has retained most of its character-defining features: horizontal-massing and rectangular plan; asymmetrical projecting and receding wall planes on the façade; smooth stucco walls; cross-gabled roof with tower and domed cupola and red-clay tile covering; and decorative façade entrance bay consisting of a Baroque style cast stone portal and recessed entry. The building's position as the focal point of the primary entrance to the County Farm was altered when the main entrance was relocated to the north-south axis of Erickson Avenue and the functions of South Campus were closed or relocated to the North Campus.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

In 1923, Superintendent William R. Harriman commissioned the design a new building to house the administrative offices of the growing campus. He felt the original 1889 administrative offices, a three-story building once located directly west of Erickson Avenue and directly in front of the original Rectory Building (now the Auditorium), had become inadequate for the growing needs of himself, the patients, and his staff. A new Spanish Colonial Revival style building was under construction by July of 1926, sited in an area he considered a "more convenient location close to the main entrance of the Farm," off of Consuelo Street.[1] The new building was in use by 1927, and Harriman hired additional secretaries, bookkeepers, typists, and clerks. In 1933, the rear portion of the north elevation arcade projection was removed due to structural damage caused by the 1933 Long Beach earthquake. The building was rehabilitated in the 1980s.

***P3a. Updated Description:**

The Superintendent's House (LACO No. 1101) is located in the central grassy area of the Rancho Los Amigos Historic District, bounded by Consuelo Street and Erickson Avenue, slightly southeast of the Erickson Avenue traffic circle. The two-story building is rectangular in plan with horizontal massing and an asymmetrical appearance beneath a complex cross-gabled roof. Designed in the Craftsman style, the building is constructed of simple (or drop) wood siding laid in alternating tall and short bands and a low-pitched, wood-shingle roof with wide over-hanging eaves and rafter tails. The building sits on a brick foundation. The first floor of the façade has a wrapping front porch constructed of red brick that is topped by a pent hipped roof. The primary entrance is located in the east bay of the porch and consists of a broadly proportioned doorway with a door and frame of unpainted wood. A large, rectangular window occupies the upper half of the door, set off by a ledge and a band of corbels beneath its lower edge, and two large vertical panels on its lower half. Extending west from the house, a red brick porte cochère topped by a sleeping porch is covered by a side gable at a slightly lower height than that of the main roof. A façade front gable surmounts a slightly projecting bay and is trimmed by a plain barge board and supported by triangular, solid braces.

***P3a. Updated Description (continued):**

Multiple gables face the east, west, and south elevations, all of which have gable ends with latticework attic vents, supported by triangular braces and rafters in the eaves. A capped interior chimney is located south of the ridgeline of the main side gable. Notched beams project between the first and second-story of the building. The windows are arranged asymmetrically on each elevation primarily in bands or pairs, and include one-over-one-light double-hung sash, casements, and fixed pane, all of which are wood framed and flat-headed. Window trim consists of flat wood boards with slightly projecting sills.

Mature trees, shrubs, grass and vestiges of the original landscaping, including orange trees, provide the setting for the Superintendent's House. Concrete sidewalks surround the house on all elevations, and a concrete driveway is located on the building's west elevation and runs under the porte cochère. The property is in good condition, but has been altered by the removal of a Craftsman style wood-framed screen door that was originally mounted in front of the door and is currently stored within the house. Non-original metal doors are also present on the building. Despite these changes, the building retains sufficient integrity to convey its period of significance. Character-defining features include: horizontal massing articulated by low-pitched roof; horizontal siding; bands of windows; exposed structural features such as rafters, beams, braces, and piers; use of wood and brick; integration of interior and exterior through incorporation of porches and provision of multiple windows.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this building. Alterations as they appear from historic photographs include the replacement of original wood doors with metal doors; enclosure of the second-story south elevation (rear) sleeping porches with bands of louvered windows; and the enclosure of the first-story south elevation (rear) west projecting brick porch with plywood.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Harriman / Superintendent's House (LACO No. 1101) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. In addition, the house illustrates several of the distinctive characteristics of the Craftsman style, including horizontal massing, gabled roof configuration, exposed structural elements, incorporation of several capacious porches, and fenestration with generous bands of windows. Given its setting within the County Farm and the City of Downey, the property also appears to be eligible to the National Register of Historic Places and California Register of Historical Resources under Criterion C/3. The building was erected in 1915 as the residence for the superintendent of the County Poor Farm. Although it was commissioned by Superintendent Charles C. Manning, who oversaw the operations at the County Farm from 1911 to 1915, Superintendent William R. Harriman and his family became the building's first residents. After Harriman's resignation in 1952, the house was converted into an assisted living facility and offices. It currently is used for storage by the Los Angeles County Office of Public Safety.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction, retaining integrity of location, feeling, association, design, materials, and workmanship. Most of its character-defining features are intact: horizontal massing articulated by low-pitched roof; horizontal siding; and bands of windows; exposed structural features such as rafters, beams, braces, and piers; use of wood and brick; integration of interior and exterior through incorporation of porches and provision of multiple windows. Its setting has been somewhat degraded through the deterioration of the surrounding landscape.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

The construction of the Superintendent's House was planned by Superintendent Charles C. Manning in 1911 after moving his wife and four children into the cramped second-story quarters of the original Administration Building. He saw the need for a grand residence to be constructed at the County Farm that would reflect the leadership role of the Superintendent. The 5,000-square-foot, four-bedroom building was designed in the Craftsman style, which was a popular style for residences during the period of 1905 until the early 1920s. The Craftsman style had been influenced by the aesthetics of the mid-19th-century Arts and Crafts Movement but essentially originated in Southern California and quickly spread through the country by pattern books and popular magazines. Craftsman style homes were known for open plans, horizontal massing, unadorned wood surfaces, and integration with the surrounding landscape.

The Superintendent's House was not completed until 1915, after Manning had resigned and his position filled by William Ruddy Harriman. The construction had been delayed somewhat after the flood of 1914, when lumber being stored for the house was damaged. Superintendent Harriman and his family became the new building's first residents, and the house became known as the Harriman House. Two years later, Harriman had a two-car garage (LACO No. 1177) constructed at the rear of the house in a matching Craftsman style. Also during this period or a few years later, a gardener's shed (LACO No. 1178) was constructed at the rear of the house close to the garage.

***P3a. Updated Description:**

One of two nearly identical buildings, the Staff Cottage (LACO No. 1121) is located on the northeast corner of Hawthorn and Flores Streets and positioned directly east of the second cottage. The Staff Cottage is a one-story building, asymmetrical in appearance, and rectangular in plan. Although displaying some influence of the Craftsman bungalow style, the building is vernacular in design. The wood-framed building is capped by a low-pitched, cross-gabled roof with rafters and knee braces exposed in the overhanging eaves. Rolled asphalt and composition shingles cover the roof. Vents composed of horizontal louvers fill the upper portions of the gable ends. The building sits on a concrete slab foundation and is clad in horizontal lapped wood siding. Fenestration on all elevations consists primarily of a linear arrangement of variously sized wood-framed, one-over-one, double-hung sash windows, whose plain wood casings are characterized by slightly extended lintels. The primary entrance (east façade) is offset slightly to the north in the slightly raised center bay and is sheltered by a shed roof that projects from the front gable end. False beams support the shed roof. Plain wood trim with extended lintels frames the entry, whose original door has been replaced by a non-original metal door.

***P3a. Updated Description (continued from page 1):**

Three additional entries on the east façade, two to the south of the gabled projection and one to the north, are similarly framed and have been enclosed with plywood. A non-original, sloped concrete ramp with iron pipe railings provides access to the main entrance. Each of the four entries is flanked to each side by single windows. A secondary entrance, accessed by four steps, is located on the rear elevation; the rear door is also a metal replacement. A non-original small shed has been attached the north elevation. Existing landscaping surrounding the Staff Cottage consists of mature trees, shrubs, grass and vestiges of original flower beds defined by timbers. Original concrete pathways to building, shown on historic aerial photographs, have been covered or removed. Character-defining features include: cross-gabled roof, exposed braces and overhanging eaves, double-hung sash windows, and original wood clapboard siding. The property is in deteriorated condition and its windows have been boarded over.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this building. Alterations as they appear from historic photographs include: the removal of four sets of stairs leading to the east entries, boarding over three entrances on the east façade, and the addition of a concrete ramp to the east façade between circa 1960 and 1990; replacement metal doors circa 1990; and a one-story shed addition to the north elevation circa 1960.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Staff Cottage (LACO No. 1121) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1921 during a large building initiative in the 1920s under the Los Angeles County Poor Farm's most influential superintendent, William Ruddy Harriman (1915-1931; 1933-1952). Containing four residential units, the staff cottages housed the additional staff hired to work in the patient ward buildings, which were built nearby during the same time period. This cottage is one of two extant examples of this property type in the Historic District. Historic photographs indicate that several rows of similar cottages and dormitories had been built immediately to the north by 1930.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. A vernacular interpretation of the Craftsman bungalow style, the building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features, which reflect the influence of the Craftsman style: horizontal massing and rectangular plan; low-pitched cross-gabled roof; horizontal wood siding; wide window and door casings; and exposed structural features such as rafters, braces, and false beams. Its setting has been altered through the loss of the other staff housing to the north and east (circa 1990) and the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

In the 1920s, Superintendent William R. Harriman began expanding the County Farm. Much of the new construction resulted from the demand for additional services occasioned by the opening of the first four Infirmary Wards (LACO Nos. 1189–1192) in 1923 and the plan to construct nine additional ward buildings (LACO Nos. 1192–1199). The construction of these buildings affected every department of South Campus. A new power plant was planned to generate more heat and power (LACO No. 1300); there was a great need for additional kitchen and dining facilities (LACO No. 1295); and the laundry facilities had to expand to accommodate the sizable linen needs. Also, dozens of new employees had to be hired to staff the new ward buildings, creating a need for additional staff housing. A two-story dormitory was constructed (no longer extant), as well as additional married staff cottages. By 1926, four married staff cottages had been built in an open grassy area at the northwest intersection of Esperanza and Hawthorn Streets. Although there were various types of staff cottages constructed throughout the years in South Campus, it appears from historic aerials that there were only four of this type of cottage constructed. The cottages shared the same Craftsman style and basic appearance featured on other staff cottages of the South Campus; however, they varied somewhat in their floor plans. Over the years, the staff cottages were used for multiple purposes such as office and storage. Today, only the southernmost two of the four cottages are still extant.

***P3a. Updated Description:**

The Dairyman's House (LACO No. 1137) is located in an open grassy area bounded by Consuelo Street to the north, Erickson Avenue to the west, Bonita Street to the south, and Dahlia Avenue to the east. The Dairyman's House is a one-story building, asymmetrical in appearance and rectangular in plan. The wood-framed Wood Vernacular style building is capped by a medium-pitched side-gabled roof, sheathed in split-wood shingles. Rectangular louvered vents are visible in the eaves on the north and south elevations. A brick chimney is attached to the south side of the east elevation and projects mid-way up the roof. The building sits on a concrete slab foundation and is clad in horizontal wood siding trimmed with end boards. Fenestration on all elevations consist primarily of wood-framed windows, including (where extant) two-over-two double-hung sash windows and single fixed windows. The primary entrance is located on the west façade and consists of a Craftsman style wood door. A secondary entrance is located on the east elevation attached kitchen. On the west façade, an attached, partial-width, front porch covered by a shed roof, supported by square posts and enclosed by a solid railing is accessed by a two-step concrete stoop. A partial-width attached kitchen wing projects from the north side of the east elevation. Existing landscaping surrounding the Dairyman's House consists of mature grass, trees and shrubs. A concrete walkway leads to the primary entrance of the building from Bonita Street. The wood vernacular style of the building is characterized by the horizontal massing and rectangular plan; (now partially enclosed) porch with squared wood posts; medium-pitched side-gabled roof; linear bands of windows; and screened porch. The property is in deteriorated condition.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Dairyman's House (LACO No. 1137) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1907 as a staff residence at the County Poor Farm. The building was originally occupied from 1907-1911 by Fred Wyman, a gardener. In 1911, L.R. Manning, head dairyman and brother of then Superintendent, Charles C. Manning, took occupancy of the building until 1915. From 1919-1945 Billy Payne, a nursing aide, lived in the house, and from 1949-1970 it was occupied by Azalea Barton, of whom little is known. In 1970, the building was given to the landscaping department for storage. The building is currently abandoned, and is one of three staff residences (not including the Harriman / Superintendent's House) still extant in the Historic District. It is also one of the oldest extant buildings at Rancho Los Amigos.
Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. A vernacular, wood-framed cottage, the building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: simplicity of design and lack of ornamentation; wood construction; horizontal wood siding trimmed with end boards; attached, partial-width, front porch with shed roof supported by square posts and enclosed by solid railing; and original wood-framed windows. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

***P3a. Updated Description:**

The Superintendent's Garage (LACO No. 1177), an outbuilding associated with the Superintendent's House (LACO No. 1101), is located slightly southwest of the house in a central open grassy area directly east of Erickson Avenue. The one-story building is square in plan and capped by a side-gabled roof. The building sits on a concrete foundation. Designed in the Craftsman style to match the Superintendent's House, the garage is constructed of simple (or drop) wood siding laid in alternating tall and short bands topped by a moderately low-pitched wood shingle roof with plain bargeboards, exposed rafters and shallow overhanging eaves. Attic vents in the gable ends are filled with wooden horizontal slats. A centered, front-gabled roof dormer accents the north facade. A pair of original garage doors placed side-by-side are located on the north façade. Each set of double doors has an "X-panel" in the lower half and a six-light window in the upper half (boarded over). A three-light hopper window is located in the central roof dormer. Wide window and door casings trim the openings.

Intensive Survey Update

***P11. Report Citation:** (Cite survey report and other sources, or enter "none.") *Sapphos Environmental, Inc., June 2010. Rancho Los Amigos Historic District Update Report, Prepared for the County of Los Angeles*.

***P3a. Updated Description (continued):**

Mature trees, shrubs, grass, and vestiges of the original landscaping, including orange trees, provide the setting for the Superintendent's Garage. A concrete driveway is located at the building's north façade. The property is in deteriorated condition and has been altered by a non-original carport extension that has been attached to the west elevation. The building retains sufficient integrity to convey its period of significance.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this building. Historic photographs make evident one alteration, an attached carport extension on the west elevation.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Patient Ward 201 (LACO No. 1189) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1917, two years after the adjacent Superintendent's House, to house the Superintendent's automobile. Its appearance reflects the Craftsman style of the residence. The first user of the garage was the most well-known and influential superintendent in the history of the County Poor Farm, William R. Harriman. Superintendent Harriman used the building for its original purpose until the end his tenure in 1952. The building is now used as storage space.

The building has only minor alterations, and still reflects its period of construction. The building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features, which reflect the influence of the Craftsman style: horizontal-massing and rectangular plan; low-pitched gable roof; and horizontal wood siding. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

***P3a. Updated Description:**

An outbuilding of the Harriman House, the Superintendent's Shed (LACO No. 1178) is located slightly southwest of the house in a central open grassy area directly off of Erickson Avenue. The Harriman Shed is a small, one-story, one-room building, symmetrical in appearance and square in plan. Its vernacular appearance is characterized by a steeply angled shed roof, exposed rafters, and board and batten walls. The entrance is located on the northwest façade and consists of a single door opening with plain wood trim. There are remnants of the original wood paneled door. Single wood-framed, one-over-one, double-hung sash windows are located centrally on both the southwest and northeast elevations. The windows are surrounded by a plain wood trim and have slightly projecting wood sills. Existing landscaping surrounding the Shed consists of a paved path mature trees, shrubs, and grass. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this building. According to historic photographs, there have been no alterations to the building.

***B10. Updated Significance:**

Although within the boundaries of the Rancho Los Amigos Historic District, which was determined eligible for listing in the National Register of Historic Places under Criterion A on September 30, 1996, the Superintendent's Shed does not contribute to the significance of the District. It was not determined eligible as a District contributor in 1996. The building was constructed circa 1917 to 1922, based on historic aerial photographs. No information regarding its function has been discovered to link it to the historic evolution and mission of the District, other than its date of construction (Criterion A/1. Similarly, no information suggesting an important association with Superintendent William R. Harriman other than the fact of its construction during his residency, has been found (Criterion B/2). It is a utilitarian building and does not possess any architectural merit (Criterion C/3). The recommended California Historical Resources Status Code is 6Z.

***P3a. Updated Description:**

One of five nearly identical buildings, General Ward 30 (LACO No. 1184) is located on the west side of Erickson Avenue and is the northern anchor of a row of four General Ward buildings that are sited northwest of the intersection of Erickson Avenue and Bonita Street. One additional building is located south of Bonita Street. Reflecting a stripped Classical Revival design, General Ward 30 is two-stories in height with a rectangular plan and a symmetrical east-facing façade. The building sits on a concrete foundation and has reinforced concrete exterior walls covered in painted, textured stucco. The flat roof is surmounted by a flat, monitor roof projection wrapped in a continuous linear band of metal, louver vents. The western section of the roof exhibits fire damage. At the top of the wall plate, a crown molding is topped by a plain, projecting cornice. A continuous blind arcade divides the east (primary) and west (rear) elevations into two bays, each bay containing two groups of four windows on each level. The blind arcade defines ten bays on the north and south elevations. Fenestration on these elevations is mostly single windows, two per bay. Windows are primarily wood-framed, one-over-one, double-hung sash topped by hopper type transoms. At the west end of the building, a one-story bridge connects General Ward 30 to General Ward 40 (LACO No. 1185) to the south and to the Dining Room/Staff Rooms/Kitchen/Commissary Complex (LACO Nos. 1262 and 1263 to the west). Primary entrances are located at the east and west ends of the north and south elevations and are accessed by concrete ramps edged by pipe railings.

Sapphos Environmental, Inc., June 2010. Rancho Los Amigos Historic District Update Report, Prepared for the County of Los Angeles.

***P3a. Updated Description (continued):**

Secondary entrances are located centrally on the north, south, and west elevations. Both original, single and double wood doors and metal replacement doors are present. Existing landscaping surrounding the building consists of a sparse amount of mature shrubs and grass. Concrete sidewalks surround the building. The property is in deteriorated condition and its doors and windows have been boarded over.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include the enclosing of original screened porch areas with wood-framed double-hung windows, the replacement of metal doors, and fire damage to the roof.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of General Ward 30 (LACO No. 1184) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1913 to house patients of the County Poor Farm and was converted into a medical and pharmacy building in the 1930s. It continued to function as a medical building and ward until it was converted into office and storage space in the late 20th century. The building is currently abandoned.

Although the building has been somewhat altered, it exterior appearance still reflects its period of construction. An example of stripped Classicism, the building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: the vertical division of the exterior walls into two-story segmentally arched bays by plain raised piers, and the horizontal division of the exterior into three parts by a simple cornice topped by a parapet and raised wall base. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

The General Ward Buildings were begun under Superintendent Charles C. Manning's direction in 1912 and completed under Superintendent William R. Harriman's in the late 1920s. In 1912, Manning requested the plans drawn for the first two General Ward Buildings, later called Buildings 30 and 40 (LACO Nos. 1184 and 1185), to be constructed along the west side of Erickson Avenue south of the original Administration Building (no longer extant). The buildings were to be connected on their west (or rear) elevations by a one-story hyphen addition that provided a covered walkway and handicapped access between the two buildings. It was necessary to demolish the original pump house building and water tower for the construction of Building 30; a recording device was installed under the building to continue to record the local water table for the water district.[1] *A new large steel water tower and tank were constructed to the rear of the original powerhouse (LACO No. 1302). Building 30 also housed the first receiving ward for the campus and became known as the Medical Offices and Pharmacy Building. Once the first two General Ward Buildings were completed in 1913, the old North Ward (no longer extant) reverted from a hospital ward back to its original use as a General Ward for male patients.*

By 1917, the patient population had reached a new high of over 600, prompting Harriman to construct Building 50, the third General Ward Building (LACO No. 1186), directly south of Building 40.[2] *To facilitate additional dining room space for the growing patient population created by these new ward buildings, as well as to provide additional employee housing, a dining room extension (south wing of LACO No. 1262) was constructed to the west (rear) of the General Ward Buildings and to the south of the Kitchen Wing circa 1920. A pedestrian bridge providing handicapped accessibility was constructed to connect the new Dining Room Wing to the rear of Buildings 30 and 40.*

A fourth General Ward Building, known as Building 60 (LACO No. 1187), was constructed in the mid-1920s directly south of Building 50. The fifth and final General Ward Building, known as Building 70 (LACO No. 1188), was constructed circa 1928 south of Building 60. Building 70 was slightly separated from the first four buildings by Bonita Street. The five General Ward Buildings were positioned in a linear row facing Erickson Avenue, and the first four were connected by bridges. In later years, the use of the buildings changed from hospital wards to storage and general office space. Currently, the buildings are vacant, and in circa 2006, Building 30 (LACO No. 1184) suffered extensive fire damage to its second floor.

***P3a. Updated Description (continued):**

Primary entrances are located at the east and west ends of the north and south elevations and are accessed by concrete ramps edged by pipe railings. Secondary entrances are located centrally on the north, south, and rear elevations. Both original, single and double wood doors and metal replacement doors are present. Existing landscaping surrounding the building consists of a sparse amount of mature shrubs and grass. Concrete sidewalks surround the building. The property is in deteriorated condition and its doors and windows have been boarded over.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include: the enclosing of the original screened porch areas with wood-framed double-hung windows, replacement metal doors, and the addition of a one-story rear projection.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of General Ward 40 (LACO No. 1185) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1913 to house patients of the County Poor Farm The building also housed the wheelchair repair shop for many years. The building continued to function as a ward building and wheelchair repair shop until its use changed in the late twentieth-century to office and storage space. The building is currently abandoned.

Although the building has been somewhat altered, it exterior appearance still reflects its period of construction. An example of stripped Classicism, the building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: the vertical division of the exterior walls into two-story segmentally arched bays by plain raised piers, and the horizontal division of the exterior into three parts by a simple cornice topped by a parapet and raised wall base. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

The General Ward Buildings were begun under Superintendent Charles C. Manning's direction in 1912 and completed under Superintendent William R. Harriman's in the late 1920s. In 1912, Manning requested the plans drawn for the first two General Ward Buildings, later called Buildings 30 and 40 (LACO Nos. 1184 and 1185), to be constructed along the west side of Erickson Avenue south of the original Administration Building (no longer extant). The buildings were to be connected on their west (or rear) elevations by a one-story hyphen addition that provided a covered walkway and handicapped access between the two buildings. It was necessary to demolish the original pump house building and water tower for the construction of Building 30; a recording device was installed under the building to continue to record the local water table for the water district.[1] A new large steel water tower and tank were constructed to the rear of the original powerhouse (LACO No. 1302). Building 30 also housed the first receiving ward for the campus and became known as the Medical Offices and Pharmacy Building. Once the first two General Ward Buildings were completed in 1913, the old North Ward (no longer extant) reverted from a hospital ward back to its original use as a General Ward for male patients.

By 1917, the patient population had reached a new high of over 600, prompting Harriman to construct Building 50, the third General Ward Building (LACO No. 1186), directly south of Building 40.[2] To facilitate additional dining room space for the growing patient population created by these new ward buildings, as well as to provide additional employee housing, a dining room extension (south wing of LACO No. 1262) was constructed to the west (rear) of the General Ward Buildings and to the south of the Kitchen Wing circa 1920. A pedestrian bridge providing handicapped accessibility was constructed to connect the new Dining Room Wing to the rear of Buildings 30 and 40.

A fourth General Ward Building, known as Building 60 (LACO No. 1187), was constructed in the mid-1920s directly south of Building 50. The fifth and final General Ward Building, known as Building 70 (LACO No. 1188), was constructed circa 1928 south of Building 60. Building 70 was slightly separated from the first four buildings by Bonita Street. The five General Ward Buildings were positioned in a linear row facing Erickson Avenue, and the first four were connected by bridges. In later years, the use of the buildings changed from hospital wards to storage and general office space. Currently, the buildings are vacant, and in circa 2006, Building 30 (LACO No. 1184) suffered extensive fire damage to its second floor.

***P3a. Updated Description:**

One of five nearly identical buildings, General Ward 50 (LACO No. 1186) is located on the west side of Erickson Avenue and is positioned centrally in a row of four General Ward Buildings that are sited northwest of the intersection of Erickson Avenue and Bonita Street. One additional building is located south of Bonita Street. Reflecting a stripped Classical Revival design, General Ward 50 is two-stories in height with a rectangular plan and a symmetrical east-facing façade. The building sits on a concrete foundation and has reinforced concrete exterior walls covered in painted, textured stucco. The flat roof is surmounted by a flat, monitor roof projection wrapped in a continuous linear band of metal, louver vents. At the top of the wall plate, a crown molding is topped by a plain, projecting cornice. A continuous blind arcade divides the east (primary) and west (rear) elevations into two bays, each bay containing two groups of four windows on each level. The blind arcade defines ten bays on the north and south elevations. Fenestration on these elevations is mostly single windows, two per bay. Windows are primarily wood-framed, one-over-one, double-hung sash topped by hopper type transoms. One-story hypens connect the west end of the building to General Ward 40 (LACO No.1185) to the north and General Ward 60 (LACO No. 1187) to the south. Entrances are located on the north, south, and west elevations and in the hypens and are accessed by concrete ramps edged by pipe railings. Both original, single and double wood doors and metal replacement doors are present. Existing landscaping surrounding the building consists of a sparse amount of mature shrubs and grass. Concrete sidewalks surround the building. The property is in deteriorated condition and its doors and windows have been boarded over.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include the enclosing of the original screened porch areas with wood-framed double-hung windows, replacement metal doors, and the addition of a one-story projection with a shed roof on the south side of the west elevation (rear).

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of General Ward 50 (LACO No. 1186) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1926 to serve as a ward building to house patients of the County Poor Farm. In later years, an addition to the west elevation functioned as a bakery. The building continued to function as a ward building and bakery until its use changed in the late twentieth-century to office and storage space. The building is currently abandoned.

Although the building has been somewhat altered, it exterior appearance still reflects its period of construction. An example of stripped Classicism, the building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: the vertical division of the exterior walls into two-story segmentally arched bays by plain raised piers, and the horizontal division of the exterior into three parts by a simple cornice topped by a parapet and raised wall base. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

The General Ward Buildings were begun under Superintendent Charles C. Manning's direction in 1912 and completed under Superintendent William R. Harriman's in the late 1920s. In 1912, Manning requested the plans drawn for the first two General Ward Buildings, later called Buildings 30 and 40 (LACO Nos. 1184 and 1185), to be constructed along the west side of Erickson Avenue south of the original Administration Building (no longer extant). The buildings were to be connected on their west (or rear) elevations by a one-story hyphen addition that provided a covered walkway and handicapped access between the two buildings. It was necessary to demolish the original pump house building and water tower for the construction of Building 30; a recording device was installed under the building to continue to record the local water table for the water district.[1] A new large steel water tower and tank were constructed to the rear of the original powerhouse (LACO No. 1302). Building 30 also housed the first receiving ward for the campus and became known as the Medical Offices and Pharmacy Building. Once the first two General Ward Buildings were completed in 1913, the old North Ward (no longer extant) reverted from a hospital ward back to its original use as a General Ward for male patients.

By 1917, the patient population had reached a new high of over 600, prompting Harriman to construct Building 50, the third General Ward Building (LACO No. 1186), directly south of Building 40.[2] To facilitate additional dining room space for the growing patient population created by these new ward buildings, as well as to provide additional employee housing, a dining room extension (south wing of LACO No. 1262) was constructed to the west (rear) of the General Ward Buildings and to the south of the Kitchen Wing circa 1920. A pedestrian bridge providing handicapped accessibility was constructed to connect the new Dining Room Wing to the rear of Buildings 30 and 40.

A fourth General Ward Building, known as Building 60 (LACO No. 1187), was constructed in the mid-1920s directly south of Building 50. The fifth and final General Ward Building, known as Building 70 (LACO No. 1188), was constructed circa 1928 south of Building 60. Building 70 was slightly separated from the first four buildings by Bonita Street. The five General Ward Buildings were positioned in a linear row facing Erickson Avenue, and the first four were connected by bridges. In later years, the use of the buildings changed from hospital wards to storage and general office space. Currently, the buildings are vacant, and in circa 2006, Building 30 (LACO No. 1184) suffered extensive fire damage to its second floor.

The building has retained most of its character-defining features: the vertical division of the exterior walls into two-story segmentally arched bays by plain raised piers, and the horizontal division of the exterior into three parts by a simple cornice topped by a parapet and raised wall base. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

The General Ward Buildings were begun under Superintendent Charles C. Manning's direction in 1912 and completed under Superintendent William R. Harriman's in the late 1920s. In 1912, Manning requested the plans drawn for the first two General Ward Buildings, later called Buildings 30 and 40 (LACO Nos. 1184 and 1185), to be constructed along the west side of Erickson Avenue south of the original Administration Building (no longer extant). The buildings were to be connected on their west (or rear) elevations by a one-story hyphen addition that provided a covered walkway and handicapped access between the two buildings. It was necessary to demolish the original pump house building and water tower for the construction of Building 30; a recording device was installed under the building to continue to record the local water table for the water district.[1] A new large steel water tower and tank were constructed to the rear of the original powerhouse (LACO No. 1302). Building 30 also housed the first receiving ward for the campus and became known as the Medical Offices and Pharmacy Building. Once the first two General Ward Buildings were completed in 1913, the old North Ward (no longer extant) reverted from a hospital ward back to its original use as a General Ward for male patients.

By 1917, the patient population had reached a new high of over 600, prompting Harriman to construct Building 50, the third General Ward Building (LACO No. 1186), directly south of Building 40.[2] To facilitate additional dining room space for the growing patient population created by these new ward buildings, as well as to provide additional employee housing, a dining room extension (south wing of LACO No. 1262) was constructed to the west (rear) of the General Ward Buildings and to the south of the Kitchen Wing circa 1920. A pedestrian bridge providing handicapped accessibility was constructed to connect the new Dining Room Wing to the rear of Buildings 30 and 40.

A fourth General Ward Building, known as Building 60 (LACO No. 1187), was constructed in the mid-1920s directly south of Building 50. The fifth and final General Ward Building, known as Building 70 (LACO No. 1188), was constructed circa 1928 south of Building 60. Building 70 was slightly separated from the first four buildings by Bonita Street. The five General Ward Buildings were positioned in a linear row facing Erickson Avenue, and the first four were connected by bridges. In later years, the use of the buildings changed from hospital wards to storage and general office space. Currently, the buildings are vacant, and in circa 2006, Building 30 (LACO No. 1184) suffered extensive fire damage to its second floor.

***P3a. Updated Description:**

One of eleven nearly identical buildings, Patient Ward 201 (LACO No. 1189) is located on the northwest corner of Descanso Street and Hawthorn Street and is the eastern anchor of a row of nine patient wards that spans the block between Hawthorn Street and Laurel Street. A continuous veranda along the Descanso Street elevations is the focal point of the grouping. Two additional patient wards are located west of Laurel Street. Patient Ward 201 is one-story, asymmetrical in appearance, and vernacular in design. It is rectangular in plan and substantially longer than it is wide. The wood-framed building is capped by a high-pitched, front-gable-on-hip roof with moderately over-hanging eaves, exposed rafter tails, and triangular brace supports. Composition shingles cover the roof. A gable projection is located at the south end of the west elevation roof. Vents composed of horizontal louvers fill the upper portions of the gable ends. Triangular dormer vents and skylights are located on the east and west elevations. The building sits on a concrete slab foundation, and the exterior walls are reinforced concrete covered in smooth stucco. The primary entrance faces south onto the veranda, which is characterized by a raised concrete foundation, a shed roof with exposed beams and trusses, square wood posts, and iron pipe railings.

***P3a. Updated Description (continued):**

Plain wood trim with extended lintels frames the entry, whose original door has been replaced by a non-original metal door. A full-length, wood-framed, screened porch on the east elevation, capped by a shed roof projection, was enclosed to provide additional ward space. A secondary entrance, accessed by a concrete stoop, is located on the rear elevation; the rear door is also a metal replacement. Original fenestration on all elevations can generally be described as bands of original wood-frame, one-over-one, double-hung sash windows with transoms, irregularly arranged, whose plain wood casings are characterized by slightly extended lintels. Also present are wood-frame one-light hopper windows with transoms and double-casement windows. Wood slat awnings have been added to west-facing windows. Concrete ramps and staircases with iron pipe railings provide access to the building. Existing landscape features include mature trees, shrubs, grass and vestiges of the original flower gardens. Character-defining features include: horizontal massing and rectangular plan, continuous veranda on the south-facing façade, medium-pitched complex roof consisting of gable and hipped projections, linear bands of windows, and projecting screened porches. The property is in deteriorated condition and its windows and doors have been covered with boards.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include: the removal of some original windows; the replacement of original wood doors with metal doors; the replacement of original screens with boards; a one-story connecting addition added centrally to the west elevation connecting the building to Patient Ward/Building No. 202 (LACO No. 1190); and added stucco to the screened porch located on the north (rear) elevation.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Patient Ward 201 (LACO No. 1189) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1923 during a large building initiative in the 1920s under the Los Angeles County Poor Farm's most influential superintendent, William Ruddy Harriman (1915-1931; 1933-1952). Thirteen patient wards were constructed between 1923 and 1928 to treat chronically ill patients, marking the evolution of the mission of the County Farm from the housing and care of indigents to a long-term hospital facility. This building is one of the eleven extant examples of this property type in the Historic District.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. A vernacular style building, it retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: horizontal-massing and rectangular plan; continuous veranda on a raised foundation; high-pitched complex roof consisting of gable and hipped projections; linear bands of windows; and projecting screened porches. Its setting has been altered through the loss of westernmost two of the original ward buildings in the late 1990s, and the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

In 1922, Superintendent William R. Harriman began the construction of four Infirmary Ward buildings at the County Poor Farm. By 1923, the first four wards had been completed and an additional four were under construction. Approximately 130 bedridden patients were transported by ambulance from County Hospital to be housed in the new wards.[1] By 1926, 8 wards had been completed and a ninth ward was under construction. A total of 260 invalid patients were housed in the wards, with additional patients continuing to transferring from the County Hospital to the new wards at a steady rate.[2] By 1928, 13 wards had been completed, and all were filled to capacity with a waiting list of some 200 patients. In 1936, the sleeping porches on the wards were permanently enclosed and equipped to handle the care of 15 additional patients.

Although the Infirmary Wards were constructed over a period of several years, they adhered to a common design and thus display similar materials and character-defining features. Historic architectural plans for the buildings reveal two different ward styles, referred to in the plans as Type A and Type B, which varied slightly in appearance, floor plan, and roof configuration.3 Concurrent with the construction of the Infirmary Wards, a new road was laid out between the Power Plant (LACO No. 1300) and the Bathhouse/Ward Building (LACO No. 1260). Originally known as Infirmary Drive and now called Descanso Street, this east-west-running road served as a western continuation of Consuelo Street. An elevated, continuous veranda linked the south facades of the Infirmary Wards, facing the new road, and provided the fresh air and views for the patients that was believed to assist with their recovery and relieve their ailments. In addition, the gardens were planted around and between the buildings to provide a pleasant calming atmosphere for the patients, in keeping with the historic park-like landscape of the District.

During the 1930s, Harriman applied for additional funding from the Progressive Works Administration (PWA) to construct additional ward buildings. Harriman envisioned that the new wards would be located by the new Administration Building (LACO No. 1100). He wrote the following excerpt in the publication The Story of Rancho in 1934:

"Applications are now pending for Federal funds to erect a series of smaller ward buildings on this tract, as there is a very urgent need for additional accommodations for infirmary patients. These buildings are to be only one story high, of reinforced concrete, housing 50 to 60 persons each, and connected by means of a covered arcade with the Administration Building for the group. The construction of additional ward buildings in the infirmary group would permit a very considerable saving to the County as there are 524 persons who have qualified for entrance but are now maintained in private institutions all over the County because of lack of accommodations at the Rancho. The cost of care at these outside homes is higher than the cost here where facilities are so much better for care of the sick; also their wide distribution in rest homes makes supervision and control if they were concentrated at a County institution."[4]

According to a 1933 Los Angeles Times article, Harriman had applied for $300,000 to fund the new Infirmary Wards.[5] Construction bids for the new buildings began August 13, 1934; however, the additional ward buildings were never constructed, presumably due to the lack of allotment of PWA funding.[6]

An elevated, continuous veranda linked the south facades of the Infirmary Wards, facing the new road, and provided the fresh air and views for the patients that was believed to assist with their recovery and relieve their ailments. In addition, the gardens were planted around and between the buildings to provide a pleasant calming atmosphere for the patients, in keeping with the historic park-like landscape of the District.

During the 1930s, Harriman applied for additional funding from the Progressive Works Administration (PWA) to construct additional ward buildings. Harriman envisioned that the new wards would be located by the new Administration Building (LACO No. 1100). He wrote the following excerpt in the publication The Story of Rancho in 1934:

"Applications are now pending for Federal funds to erect a series of smaller ward buildings on this tract, as there is a very urgent need for additional accommodations for infirmary patients. These buildings are to be only one story high, of reinforced concrete, housing 50 to 60 persons each, and connected by means of a covered arcade with the Administration Building for the group. The construction of additional ward buildings in the infirmary group would permit a very considerable saving to the County as there are 524 persons who have qualified for entrance but are now maintained in private institutions all over the County because of lack of accommodations at the Rancho. The cost of care at these outside homes is higher than the cost here where facilities are so much better for care of the sick; also their wide distribution in rest homes makes supervision and control if they were concentrated at a County institution."[4]

According to a 1933 Los Angeles Times article, Harriman had applied for $300,000 to fund the new Infirmary Wards.[5] Construction bids for the new buildings began August 13, 1934; however, the additional ward buildings were never constructed, presumably due to the lack of allotment of PWA funding.[6]

***P3a. Updated Description:**

One of eleven nearly identical buildings, Patient Ward 204 (LACO No. 1192) is located in the east half of a row of nine patient wards that spans the block of Descanso Street between Hawthorn Street and Laurel Street. A continuous veranda along the Descanso Street elevations is the focal point of the grouping. Two additional patient wards are located west of Laurel Street. Patient Ward 204 is one-story, asymmetrical in appearance, and vernacular in design. It is rectangular in plan and substantially longer than it is wide. The wood-framed building is capped by a high-pitched, front-gable-on-hip roof with moderately over-hanging eaves, exposed rafter tails, and triangular brace supports. Composition shingles cover the roof. A gable projection is located at the south end of the west elevation roof. Vents composed of horizontal louvers fill the upper portions of the gable ends. Triangular dormer vents and skylights are located on the east and west elevations. The building sits on a concrete slab foundation, and the exterior walls are reinforced concrete covered in smooth stucco. The primary entrance faces south onto the veranda, which is characterized by a raised concrete foundation, a shed roof with exposed beams and trusses, square wood posts, and iron pipe railings. Plain wood trim with extended lintels frames the entry, whose original door has been replaced by a non-original metal door.

***P3a. Updated Description (continued):**

A full-length, wood-framed, screened porch on the east elevation, capped by a shed roof projection, was enclosed to provide additional ward space. A secondary entrance, accessed by a concrete stoop, is located on the rear elevation; the rear door is also a metal replacement. Original fenestration on all elevations can generally be described as bands of original wood-frame, one-over-one, double-hung sash windows with transoms, irregularly arranged, whose plain wood casings are characterized by slightly extended lintels. Also present are wood-framed, one-light hopper windows with transoms and double-casement windows. Wood slat awnings have been added to west-facing windows. Concrete ramps and staircases with iron pipe railings provide access to the building. Existing landscape features include mature trees, shrubs, grass and vestiges of the original flower gardens. Character-defining features include: horizontal massing and rectangular plan, continuous veranda on the south-facing façade, medium-pitched complex roof consisting of gable and hipped projections, linear bands of windows, and projecting screened porches. The property is in deteriorated condition and its windows and doors have been covered with boards.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include: the removal of some original windows; the replacement of original wood doors with metal doors; the replacement of original screens with boards; the addition of stucco to the screened porch located on the north (rear) elevation; and a one-story addition connecting this building centrally on its east elevation to Patient Ward 203 (LACO No. 1191).

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Patient Ward 204 (LACO No. 1192) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1923 during a large building initiative in the 1920s under the Los Angeles County Poor Farm's most influential superintendent, William Ruddy Harriman (1915-1931; 1933-1952). Thirteen patient wards were constructed between 1923 and 1928 to treat chronically ill patients, marking the evolution of the mission of the County Farm from the housing and care of indigents to a long-term hospital facility. This building is one of the eleven extant examples of this property type in the Historic District.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. A vernacular style building, it retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: horizontal-massing and rectangular plan; continuous veranda on a raised foundation; high-pitched complex roof consisting of gable and hipped projections; linear bands of windows; and projecting screened porches. Its setting has been altered through the loss of westernmost two of the original ward buildings in the late 1990s, and the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

In 1922, Superintendent William R. Harriman began the construction of four Infirmary Ward buildings at the County Poor Farm. By 1923, the first four wards had been completed and an additional four were under construction. Approximately 130 bedridden patients were transported by ambulance from County Hospital to be housed in the new wards.[1] By 1926, 8 wards had been completed and a ninth ward was under construction. A total of 260 invalid patients were housed in the wards, with additional patients continuing to transferring from the County Hospital to the new wards at a steady rate.[2] By 1928, 13 wards had been completed, and all were filled to capacity with a waiting list of some 200 patients. In 1936, the sleeping porches on the wards were permanently enclosed and equipped to handle the care of 15 additional patients.

Although the Infirmary Wards were constructed over a period of several years, they adhered to a common design and thus display similar materials and character-defining features. Historic architectural plans for the buildings reveal two different ward styles, referred to in the plans as Type A and Type B, which varied slightly in appearance, floor plan, and roof configuration.3 Concurrent with the construction of the Infirmary Wards, a new road was laid out between the Power Plant (LACO No. 1300) and the Bathhouse/Ward Building (LACO No. 1260). Originally known as Infirmary Drive and now called Descanso Street, this east-west-running road served as a western continuation of Consuelo Street. An elevated, continuous veranda linked the south facades of the Infirmary Wards, facing the new road, and provided the fresh air and views for the patients that was believed to assist with their recovery and relieve their ailments. In addition, the gardens were planted around and between the buildings to provide a pleasant calming atmosphere for the patients, in keeping with the historic park-like landscape of the District.

During the 1930s, Harriman applied for additional funding from the Progressive Works Administration (PWA) to construct additional ward buildings. Harriman envisioned that the new wards would be located by the new Administration Building (LACO No. 1100). He wrote the following excerpt in the publication The Story of Rancho in 1934:

"Applications are now pending for Federal funds to erect a series of smaller ward buildings on this tract, as there is a very urgent need for additional accommodations for infirmary patients. These buildings are to be only one story high, of reinforced concrete, housing 50 to 60 persons each, and connected by means of a covered arcade with the Administration Building for the group. The construction of additional ward buildings in the infirmary group would permit a very considerable saving to the County as there are 524 persons who have qualified for entrance but are now maintained in private institutions all over the County because of lack of accommodations at the Rancho. The cost of care at these outside homes is higher than the cost here where facilities are so much better for care of the sick; also their wide distribution in rest homes makes supervision and control if they were concentrated at a County institution."[4]

According to a 1933 Los Angeles Times article, Harriman had applied for $300,000 to fund the new Infirmary Wards.[5] Construction bids for the new buildings began August 13, 1934; however, the additional ward buildings were never constructed, presumably due to the lack of allotment of PWA funding.[6]

A vernacular style building, it retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: horizontal-massing and rectangular plan; continuous veranda on a raised foundation; high-pitched complex roof consisting of gable and hipped projections; linear bands of windows; and projecting screened porches. Its setting has been altered through the loss of westernmost two of the original ward buildings in the late 1990s, and the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

In 1922, Superintendent William R. Harriman began the construction of four Infirmary Ward buildings at the County Poor Farm. By 1923, the first four wards had been completed and an additional four were under construction. Approximately 130 bedridden patients were transported by ambulance from County Hospital to be housed in the new wards.[1] By 1926, 8 wards had been completed and a ninth ward was under construction. A total of 260 invalid patients were housed in the wards, with additional patients continuing to transferring from the County Hospital to the new wards at a steady rate.[2] By 1928, 13 wards had been completed, and all were filled to capacity with a waiting list of some 200 patients. In 1936, the sleeping porches on the wards were permanently enclosed and equipped to handle the care of 15 additional patients.

Although the Infirmary Wards were constructed over a period of several years, they adhered to a common design and thus display similar materials and character-defining features. Historic architectural plans for the buildings reveal two different ward styles, referred to in the plans as Type A and Type B, which varied slightly in appearance, floor plan, and roof configuration.3 Concurrent with the construction of the Infirmary Wards, a new road was laid out between the Power Plant (LACO No. 1300) and the Bathhouse/Ward Building (LACO No. 1260). Originally known as Infirmary Drive and now called Descanso Street, this east-west-running road served as a western continuation of Consuelo Street. An elevated, continuous veranda linked the south facades of the Infirmary Wards, facing the new road, and provided the fresh air and views for the patients that was believed to assist with their recovery and relieve their ailments. In addition, the gardens were planted around and between the buildings to provide a pleasant calming atmosphere for the patients, in keeping with the historic park-like landscape of the District.

During the 1930s, Harriman applied for additional funding from the Progressive Works Administration (PWA) to construct additional ward buildings. Harriman envisioned that the new wards would be located by the new Administration Building (LACO No. 1100). He wrote the following excerpt in the publication The Story of Rancho in 1934:

"Applications are now pending for Federal funds to erect a series of smaller ward buildings on this tract, as there is a very urgent need for additional accommodations for infirmary patients. These buildings are to be only one story high, of reinforced concrete, housing 50 to 60 persons each, and connected by means of a covered arcade with the Administration Building for the group. The construction of additional ward buildings in the infirmary group would permit a very considerable saving to the County as there are 524 persons who have qualified for entrance but are now maintained in private institutions all over the County because of lack of accommodations at the Rancho. The cost of care at these outside homes is higher than the cost here where facilities are so much better for care of the sick; also their wide distribution in rest homes makes supervision and control if they were concentrated at a County institution."[4]

According to a 1933 Los Angeles Times article, Harriman had applied for $300,000 to fund the new Infirmary Wards.[5] Construction bids for the new buildings began August 13, 1934; however, the additional ward buildings were never constructed, presumably due to the lack of allotment of PWA funding.[6]

***P3a. Updated Description:**

One of eleven nearly identical buildings, Patient Ward 207 (LACO No. 1195) is located in the west half of a row of nine patient wards that spans the block of Descanso Street between Hawthorn Street and Laurel Street. A continuous veranda along the Descanso Street elevations is the focal point of the grouping. Two additional patient wards are located west of Laurel Street. Patient Ward 207 is one-story, asymmetrical in appearance, and vernacular in design. It is rectangular in plan and substantially longer than it is wide. The wood-framed building is capped by a high-pitched, front-gable-on-hip roof with moderately over-hanging eaves, exposed rafter tails, and triangular brace supports. Composition shingles cover the roof. A gable projection is located at the south end of the west elevation roof. Vents composed of horizontal louvers fill the upper portions of the gable ends. Triangular dormer vents and skylights are located on the east and west elevations. The building sits on a concrete slab foundation, and the exterior walls are reinforced concrete covered in smooth stucco. The primary entrance faces south onto the veranda, which is characterized by a raised concrete foundation, a shed roof with exposed beams and trusses, square wood posts, and iron pipe railings. Plain wood trim with extended lintels frames the entry, whose original door has been replaced by a non-original metal door.

***P3a. Updated Description (continued):**

A full-length, wood-framed, screened porch on the east elevation, capped by a shed roof projection, was enclosed to provide additional ward space. A secondary entrance, accessed by a concrete stoop, is located on the rear elevation; the rear door is also a metal replacement. Original fenestration on all elevations can generally be described as bands of original wood-frame, one-over-one, double-hung sash windows with transoms, irregularly arranged, whose plain wood casings are characterized by slightly extended lintels. Also present are wood-frame one-light hopper windows with transoms and double-casement windows. Wood slat awnings have been added to west-facing windows. Concrete ramps and staircases with iron pipe railings provide access to the building. Existing landscape features include mature trees, shrubs, grass and vestiges of the original flower gardens. Character-defining features include: horizontal massing and rectangular plan, continuous veranda on the south-facing façade, medium-pitched complex roof consisting of gable and hipped projections, linear bands of windows, and projecting screened porches. The property is in deteriorated condition and its windows and doors have been covered with boards.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include: the removal of some original windows; the replacement of original wood doors with metal doors; the replacement of original screens with boards; and added stucco to the screened porch located on the north (rear) elevation.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Patient Ward 207 (LACO No. 1195) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1926 during a large building initiative in the 1920s under the Los Angeles County Poor Farm's most influential superintendent, William Ruddy Harriman (1915-1931; 1933-1952). Thirteen patient wards were constructed between 1923 and 1928 to treat chronically ill patients, marking the evolution of the mission of the County Farm from the housing and care of indigents to a long-term hospital facility. This building is one of the eleven extant examples of this property type in the Historic District.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. A vernacular style building, it retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: horizontal-massing and rectangular plan; continuous veranda on a raised foundation; high-pitched complex roof consisting of gable and hipped projections; linear bands of windows; and projecting screened porches. Its setting has been altered through the loss of westernmost two of the original ward buildings in the late 1990s, and the deterioration of the surrounding landscape.

A full-length, wood-framed, screened porch on the east elevation, capped by a shed roof projection, was enclosed to provide additional ward space. A secondary entrance, accessed by a concrete stoop, is located on the rear elevation; the rear door is also a metal replacement. Original fenestration on all elevations can generally be described as bands of original wood-frame, one-over-one, double-hung sash windows with transoms, irregularly arranged, whose plain wood casings are characterized by slightly extended lintels. Also present are wood-frame one-light hopper windows with transoms and double-casement windows. Wood slat awnings have been added to west-facing windows. Concrete ramps and staircases with iron pipe railings provide access to the building. Existing landscape features include mature trees, shrubs, grass and vestiges of the original flower gardens. Character-defining features include: horizontal massing and rectangular plan, continuous veranda on the south-facing façade, medium-pitched complex roof consisting of gable and hipped projections, linear bands of windows, and projecting screened porches. The property is in deteriorated condition and its windows and doors have been covered with boards.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include: the removal of some original windows; the replacement of original wood doors with metal doors; the replacement of original screens with boards; and added stucco to the screened porch located on the north (rear) elevation.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Patient Ward 209 (LACO No. 1197) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1928 during a large building initiative in the 1920s under the Los Angeles County Poor Farm's most influential superintendent, William Ruddy Harriman (1915-1931; 1933-1952). Thirteen patient wards were constructed between 1923 and 1928 to treat chronically ill patients, marking the evolution of the mission of the County Farm from the housing and care of indigents to a long-term hospital facility. This building is one of the eleven extant examples of this property type in the Historic District.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. A vernacular style building, it retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features: horizontal-massing and rectangular plan; continuous veranda on a raised foundation; high-pitched complex roof consisting of gable and hipped projections; linear bands of windows; and projecting screened porches. Its setting has been altered through the loss of westernmost two of the original ward buildings in the late 1990s, and the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

In 1922, Superintendent William R. Harriman began the construction of four Infirmary Ward buildings at the County Poor Farm. By 1923, the first four wards had been completed and an additional four were under construction. Approximately 130 bedridden patients were transported by ambulance from County Hospital to be housed in the new wards.[1] By 1926, 8 wards had been completed and a ninth ward was under construction. A total of 260 invalid patients were housed in the wards, with additional patients continuing to transferring from the County Hospital to the new wards at a steady rate.[2] By 1928, 13 wards had been completed, and all were filled to capacity with a waiting list of some 200 patients. In 1936, the sleeping porches on the wards were permanently enclosed and equipped to handle the care of 15 additional patients.

Although the Infirmary Wards were constructed over a period of several years, they adhered to a common design and thus display similar materials and character-defining features. Historic architectural plans for the buildings reveal two different ward styles, referred to in the plans as Type A and Type B, which varied slightly in appearance, floor plan, and roof configuration.3 Concurrent with the construction of the Infirmary Wards, a new road was laid out between the Power Plant (LACO No. 1300) and the Bathhouse/Ward Building (LACO No. 1260). Originally known as Infirmary Drive and now called Descanso Street, this east-west-running road served as a western continuation of Consuelo Street. An elevated, continuous veranda linked the south facades of the Infirmary Wards, facing the new road, and provided the fresh air and views for the patients that was believed to assist with their recovery and relieve their ailments. In addition, the gardens were planted around and between the buildings to provide a pleasant calming atmosphere for the patients, in keeping with the historic park-like landscape of the District.

During the 1930s, Harriman applied for additional funding from the Progressive Works Administration (PWA) to construct additional ward buildings. Harriman envisioned that the new wards would be located by the new Administration Building (LACO No. 1100). He wrote the following excerpt in the publication The Story of Rancho in 1934:

"Applications are now pending for Federal funds to erect a series of smaller ward buildings on this tract, as there is a very urgent need for additional accommodations for infirmary patients. These buildings are to be only one story high, of reinforced concrete, housing 50 to 60 persons each, and connected by means of a covered arcade with the Administration Building for the group. The construction of additional ward buildings in the infirmary group would permit a very considerable saving to the County as there are 524 persons who have qualified for entrance but are now maintained in private institutions all over the County because of lack of accommodations at the Rancho. The cost of care at these outside homes is higher than the cost here where facilities are so much better for care of the sick; also their wide distribution in rest homes makes supervision and control if they were concentrated at a County institution."[4]

According to a 1933 Los Angeles Times article, Harriman had applied for $300,000 to fund the new Infirmary Wards.[5] Construction bids for the new buildings began August 13, 1934; however, the additional ward buildings were never constructed, presumably due to the lack of allotment of PWA funding.[6]

***P3a. Updated Description:**

One of eleven nearly identical buildings, Patient Ward 210 (LACO No. 1198) is located on the northwest corner of Descanso Street and Laurel Street, and is one of two patient wards which are positioned directly northwest of a row of nine patient wards situated to the east of Laurel Street. A continuous veranda along the Descanso Street elevations is the focal point of the two buildings. Patient Ward 210 is one-story, asymmetrical in appearance, and vernacular in design. It is rectangular in plan and substantially longer than it is wide. The wood-framed building is capped by a high-pitched, front-gable-on-hip roof with moderately over-hanging eaves, exposed rafter tails, and triangular brace supports. Composition shingles cover the roof. A gable projection is located at the south and north end of the west elevation roof. Vents composed of horizontal louvers fill the upper portions of the gable ends. Triangular dormer vents and skylights are located on the east and west elevations. The building sits on a concrete slab foundation, and the exterior walls are reinforced concrete covered in smooth stucco. The primary entrance faces south onto the veranda, which is characterized by a raised concrete foundations, a shed roof with exposed beams and trusses, square wood posts, and iron pipe railings. Plain wood trim with extended lintels frames the entry, whose original door has been replaced by a non-original metal door. A full-length, wood-framed, screened porch on the east elevation, capped by a shed roof projection, was enclosed to provide additional war space. A secondary entrance, accessed by a concrete stoop, is located on the rear elevation; the rear door is also a metal replacement.

2. **Resource Identifier:** *LACO #1200* **NR Status Code:** *Not Addressed*
Post/Hazeltine Associates. Intensive Historic Structures/Sites Survey for the South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California. 19 March 2004.

***P3a. Updated Description:**

Patient Ward 212 (LACO No. 1200) was originally located west of Laurel Street between Descanso and Esperanza Streets. Nearly identical in appearance to the eleven remaining Patient Wards to the east (LACO Nos. 1189-1199), the building was demolished some time in the late 20th century. Nothing remains of this building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos south Campus Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources (CRHR) (under Criterion 1). The current study confirmed that Patient Ward 212 (LACO No. 1200) is no longer a contributor to the Historic District under Criterion 1 due to its demolition.

***P3a. Updated Description:**

Consisting of two buildings, the Women's Psychiatric Ward complex is located centrally in the block bounded by Golondrinas Street to the north, Erickson Avenue to the west, Dahila Avenue to the east, and Consuelo Street to the south. The complex consists of two one-story brick vernacular style buildings and was constructed in two stages; the first ward (LACO No. 1203) in 1919 and the second ward (LACO No. 1202) in 1924. The two buildings enclose a large, interior courtyard. Grassy setbacks flank the east and west sides of the complex. The overall quadrangle plan consists of two "H-shaped" ward buildings connected by one-story concrete block wall hyphens. The complex is symmetrical in appearance with horizontal massing. Projecting one-story wings are located on the north and south ends of the west-facing façade and east elevation (rear). One-story square projecting bathroom wings surmounted by a hipped roof are located on the north and south elevations, and partial-width enclosed porches project from interior courtyard elevations. The exterior walls of both buildings in the complex are clad in painted brick laid in common bond pattern, with the exception of the west and north elevation of LACO No. 1203, which has replacement horizontal metal siding over the original brick walls. The roof configuration incorporates multiple medium-pitched hips and gables-on-hips with overhanging eaves. It is sheathed in composition shingles. Exposed rafters and beams are visible underneath the eaves.

***P3a. Updated Description (continued):**

Gabled dormers with louvered vents project from the roof, and triangular vents are located in the gable ends. Galvanized iron skylights with wire glass are located just below the ridgeline on the north and south bathroom projections. Corbelled brick courses define the wall base and a cornice and frieze on the bathroom wings. All windows are set in segmental arched window openings with lintels of double and triple bands of header bricks. Original windows (where extant) include: four-over-four double-hung sash windows; one-over-one light double-hung sash windows; one-light fixed windows; and four-over-four fixed windows. All windows are flat-headed and trimmed by slightly projecting header brick window sills. The primary entrance is located centrally on the west façade and is defined by a partial-width porch with vertical posts supporting a front gabled roof and a raised concrete stoop. Additional entrances are located on all exterior elevations, and also on each interior courtyard elevation, accessed by raised concrete walkways. Entrances are defined by segmental arched door openings with triple header bands and flat-headed door openings trimmed by wide door moldings. Original wood doors include (where extant) paneled and glazed doors with and without transom. Replacement metal doors are located throughout the building. Existing landscaping consists of mature grass, shrubs, and trees. A series of outbuildings are located within the courtyard. Concrete sidewalks and ramps surround the building. The property is in good condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations as they appear from historic photographs include the addition of metal horizontal siding to the west façade and north and south elevations of LACO No. 1203, the replacement of the original split-wood shingled roof with composition shingles, and the replacing of original wood doors with metal doors.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Women's Psychiatric Wards (LACO Nos. 1202 and 1203) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The buildings were erected in 1919 and 1924 to house the mentally unstable female patients sent to the County Poor Farm by the Los Angeles County Hospital. The complex was built was during a large building imitative in the 1920s directed by the Poor Farm's most influential superintendent, William R. Harriman (1915-1931; 1933-1952). The first psychiatric facility at the Poor Farm was the Psychiatric Ward building, constructed in 1907 (now the Men's Psychiatric Ward (LACO No. 1205). This facility housed both males and females. The first ward exclusively for women mental patients was completed directly south of the men's ward in 1919. A second women's ward was completed in 1924, mirroring the original ward and enclosing a courtyard. The Women's Psychiatric Ward Complex was converted to office and storage space in the late-twentieth century. The buildings are no longer occupied but continue to be used for storage.

Although the buildings have been somewhat altered, their exterior appearance still reflects its period of construction. An example of brick vernacular construction, the Women's Psychiatric Ward complex retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features, which include: one-story height, horizontal massing and double H-shaped, courtyard plan; medium-pitched, complex roof consisting of hipped and gable-on-hip sections, punctuated by gabled roof vents; rafters with rounded tails exposed in overhanging eaves; concrete foundation regularly pierced by vents; brick (painted) exterior walls laid in common bond; sill above the foundation composed of three raised brick courses; regular fenestration pattern of evenly spaced window openings with segmental arched heads; segmental arch door openings; attached porches at the entries on the west (primary) and east facades; projecting (enclosed) porch spaces facing the interior courtyard; and interior brick chimney on the east (rear).

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

Beginning in the early 1900s, one of the most pressing issues for the County of Los Angeles was how to care for the growing numbers of mentally unstable patients. By 1901, the California state mental hospitals were suffering from overcrowding, resulting in many patients being sent to county hospitals. By 1905, Los Angeles County Hospital had exceeded its patient capacity and began calling upon the County Poor Farm to help with the patient overflow, including those with mental conditions.[1]

Until 1907, patients labeled as "harmlessly insane" were housed in the General Wards (no longer extant) with the other campus patients. When funds were made available for a dedicated facility, the original psychiatric ward at Rancho Los Amigos was constructed under the direction of Superintendent Clarke in 1907. It was a single-story brick building located at the intersection of Erickson Avenue and Golondrinas Street. In plan, the building consisted of two rows of rooms, each with a window, on either side of a central corridor. The men's section was on the north side of the corridor, and the women's was on the south side. The windows were barred and had heavy wire screens, and the doors were kept padlocked. The patients were locked outside of their rooms for a few hours each day to sit under shaded trees in a fenced yard to get fresh air and sunshine.

The psychiatric ward building (LACO No. 1205) was enlarged several times, beginning in 1909. The original single-story, bar shaped building was expanded to form a U shape enclosing a courtyard area by the addition of two parallel wings on its north and south elevations. These wings were elongated in 1916 for additional ward space, and a partial second story was added to house the resident attendants. Also at this time, a projecting cafeteria wing was constructed along the center of the east (rear) elevation of the original 1907 building.

By 1918, the Rancho Los Amigos insane population had risen to more than 160 patients, and Superintendent Harriman was forced to seek funding for a separate building to house the women psychiatric patients. The new ward (LACO No. 1203) was constructed in 1919 and was located directly south of the Men's Psychiatric Ward Building. It was designed in an H shape and accommodated centrally located matron's and administrative rooms; a wing to house the kitchen and dining room; a wing for the patient rooms; and a fenced inner courtyard with a lawn, trees, and flowers.

The numbers of insane patients continued to rise each year, reaching 257 in 1924.[2] *Plans were initiated by Harriman to begin the construction of two new ward buildings, for 156 men and 98 women, respectively, to be built directly east of the existing psychiatric ward buildings. The new men's ward (LACO No. 1204) opened in late 1924, followed by the new women's ward (LACO No. 1202) in the summer of 1925. Both buildings basically mirrored the design and configuration of the original wards. New, one-story wall hyphens connected the two men's ward buildings and the two women's ward buildings, each at their north and south elevations. These wall connectors created an enclosed courtyard space, which allowed the patients to roam in a confined area. Over the next several years, additional, freestanding, mostly brick vernacular style buildings (LACO Nos. 1239, 1240, 1241, 1243, 1244, 1245, 1249, and 1251) were constructed within the courtyard areas of the two psychiatric ward complexes. These buildings served several functions, including linen rooms, toilet buildings, and open shelters. In 1931, the Aviary, the sole remnant of the 19th-century Poor Farm, was moved to the courtyard of the Men's Psychiatric Ward Complex in hopes of bringing a sense of calmness to the patients.*

***P3a. Updated Description:**

Consisting of two "U-shaped" buildings that enclose a rectangular, central courtyard, the Men's Psychiatric Ward Complex (LACO No. 1204 & 1205)occupies the north half of the block bounded by Golondrinas Street to the north, Dahlia Avenue to the east, Consuelo Street to the south, and Erickson Avenue to the west. Mostly one-story in height, the wards present a nearly symmetrical appearance on their primary, west and east elevations. A medium-pitched, hipped and hip-on-gable roof, punctuated by front-gabled vents, caps the building. Rafters are exposed in the overhanging eaves. Galvanized iron skylights with wire glass and interior chimneys are located just below and on the roof ridgeline. Two-story, flat-roofed pavilions are offset to the west on the north and south elevations. The exterior walls are brick, laid in common bond pattern and painted. Horizontal metal siding has been installed over the brick on the west half of the complex. Attached, hip-roofed porches project towards the street on the west and east elevations and contain the primary entrances. Window and door openings are defined by segmental arch heads articulated by triple courses of header bricks. Original windows, where extant, are wood-framed and include: four-over-four double-hung sash windows; one-over-one double-hung sash windows; one-light fixed windows; and four-over-four fixed windows.

***P3a. Updated Description (continued):**

All windows are flat-headed and trimmed by slightly raised header sills. Both original wood doors and replacement metal doors are present. Additional entrances are located within the interior courtyard. Courtyard projections contain sunrooms. Elevated concrete walkways and ramps provide access to the secondary and courtyard building entries. Segmental arched door openings with triple header bands frame extant original wood doors and replacement metal doors. Grassy set-backs are located at the east and west street frontage. The interior courtyard is characterized by trees and overgrown landscaping, and contains a number of accessory buildings. The complex is in fair condition and its windows and doors have been boarded over.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for these buildings. Alterations as they appear from historic photographs include the replacement of the original split-wood shingled roof with composition shingles, the replacement of original wood doors with metal doors, and the addition of metal horizontal siding on the west façade, and north and south elevations of LACO No. 1205.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The Men's Psychiatric Ward Complex was erected in several stages from 1907 to 1924. The oldest part of the complex, LACO No. 1205 on the west, initially housed both male and female "psychopathic wards." Initially constructed to house mentally unstable patients transferred from the County Hospital, the facility eventually was considered one of the outstanding psychiatric ward faculties in the State of California. It provided ward space and medical care for hundreds of Los Angeles County patients for many years until the facility was closed in the late twentieth-century, and the buildings converted to offices and storage. The buildings are currently abandoned.

Although the complex has been somewhat altered, its exterior appearance still reflects its period of construction. An example of brick vernacular styling, the building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features, including: horizontal massing and overall symmetry of design; courtyard plan; one- and two-story height; brick exterior walls; hipped and gable-on-hip roof; segmental arched window and door openings with triple header bands; raised and corbelled brick courses defining belt courses; and attached entry porches. Its setting has been altered through the deterioration of the surrounding landscape.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. ***P3a. Updated Description:**

Work Preparation Center No. 2 (LACO No. 1207) is located in the block bounded by Descanso Street to the north, Juniper Street to the east, Bonita Street to the south, and Laurel Street to the west. Exhibiting a monitor roof, or raised roof, barn design, the rectangular building sits on a concrete foundation. Exterior walls are clad in panels of corrugated, metal siding. Windows are unevenly spaced around the exterior and consist of a series of original multi-light windows trimmed by raised wood sills. The west-facing façade is nearly symmetrical with a central entrance containing a wood paneled and glazed door flanked on either side by large, wood, sliding doors with X-patterned paneling. Hayloft doors are centered over the ground level entry. A secondary entrance is located on the east elevation (rear) and consists of a set of double wooden and glazed doors. Hayloft doors at the roof apex are also located on this elevation. A non-original open shed is attached to the north end of the east elevation, and a corrugated metal canopy links the east elevation to LACO No. 1259. The existing landscaping surrounding Work Preparation Center No. 2 consists of weeds and mature shrubs at the building's west facade. Concrete sidewalks and driveways flank the building to the north, east, and south. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations include the addition of an open shed, and attached corrugated canopy and awnings to the building's east elevation.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Work Preparation Center No. 2 (LACO No. 1207) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1925, presumably in association with the agricultural activities at the Poor Farm. A 1930 aerial photograph of Rancho Los Amigos illustrates a monitor barn a little to the west of, and perpendicular to, LACO No. 1207's current location, raising the possibility that this building was either moved or resembled another barn that was subsequently removed.[1] During the Depression, this building had been converted into an ambulatory ward (Fliedner, p. 211). A World War II era photograph shows this building with signs indicating that it functioned both as Ward 104 and as a the Warco production office (Fliedner, pp. 200-201). Warco was an association of Rancho patients who contracted for piece work in the aircraft industry. Following the war, the building was taken over by the Rancho Crafters, patients who had learned crafts under the occupational therapy program who began making products for sale. Eventually the building became known as the Rehabilitation Center or Rehab Shop. In the last quarter of the 20th century, the building was used for steam fitting and the refrigeration shops. It is currently vacant.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. Utilitarian in style, the building retains integrity of feeling, association, design, materials, and workmanship. The building has retained most of its character-defining features, including monitor barn design, sliding x-paneled barn doors, and hayloft doors. Its setting has been altered through the deterioration of the surrounding landscape and its location may have been shifted slightly.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

***P3a. Updated Description:**

Casa Consuelo (LACO No. 1238) is located directly north of Consuelo Street at the intersection of Consuelo Street and Dahlia Avenue and faces the broad lawn located to the southwest of Consuelo Street. Designed in the Spanish Colonial Revival style, the two-story building has an irregular H-shaped plan with projecting wings and features. It horizontally massed beneath a complex hipped and gabled roof covered in red clay tiles. Casa Consuelo is constructed of board-form concrete painted white and sits on a concrete foundation. A stringcourse wraps the exterior walls beneath the second story. Courtyards set behind arcades are located on the south (primary), north and east elevations. Square, flat-roofed towers abut the arcade on either side on the south. A decoratively scalloped, wooden frieze board wraps the walls beneath shallow eaves, except in the courtyards where carved brackets support overhanging eaves. Scalloped parapets top each arcade. Impost moldings trim the piers. The east and west bays of the south arcade are blind and pierced by vents composed of twelve small square openings. Attic vents in the gable ends are small, rectangular openings filled with a zigzag design of clay tiles. Wrought iron balconies in the towers, end and middle bays, and courtyards are variously designed, with corbelled supports or wrought iron brackets; some are shaded by hoods that extend from the roof on wrought iron brackets.

(See Continuation Sheet 2 of 3.)

***Recorded by:** *Rebecca L. Silva, Sapphos Environmental, Inc.* ***Date:** *June 2, 2008* ☐ **Continuation** ☒ **Update**

***P3a. Updated Description (continued from page 1):**

Fenestration consists of wood-framed, flat-headed single and double casement windows recessed into the window openings with slightly projecting concrete sills. The primary south entrance and secondary east entrance are set within flattened arch recesses and contain paneled and glazed double doors and sidelights adorned with spindle grilles and topped by transoms. Additional entrances are located on both the north and west elevations and contain non-original double metal doors. At least one original wrought iron pendant light illuminates one entry.

Mature trees, shrubs, grass, and vestiges of the original Mediterranean landscaping provide the setting for Casa Consuelo. Concrete sidewalks surround the building and concrete driveways are located on north and west elevations. The property is in deteriorated condition and its windows and doors are covered with boards. The building retains sufficient integrity to convey its period of significance.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include: replacement of some original doors and windows.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Casa Consuelo (LACO No. 1238) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. In addition, the building illustrates several of the distinctive characteristics of the Spanish Colonial Revival style, including its red clay tile roof, decorative use of wood and wrought iron, and incorporation of arcades, courtyards, and balconies into its design. Resembling a women's dormitory more than a hospital building, the Casa Consuelo also appears to be eligible to the National Register of Historic Places and California Register of Historical Resources under Criterion C/3. The building was erected in 1930 as the second women's ward for the County Poor Farm. Casa Consuelo provided a private and separate area for the women patients of the Poor Farm in a planned setting more conducive to their needs and comfort. The building served in this capacity until it was later converted to office and storage space. It is currently abandoned.

Although the building has suffered minor alterations, its exterior appearance still reflects its period of construction. An example of the Spanish Colonial Revival style, the building retains integrity of location, feeling, association, design, materials, and workmanship. The building has retained its Spanish Colonial Revival style character-defining features: horizontal massing; white-washed board form concrete exterior walls; arcades; courtyards; red-clay tile roof; decorative wooden frieze board and roof brackets; second-floor balconies with wrought iron railings; and architectural details, such as stringcourses and impost moldings. Its setting has been altered by the deterioration of the surrounding landscape.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

In 1929, one of the most substantial constructions at the County Poor Farm was the Casa Consuelo Building (officially named in circa 1940), which opened to residents March 11, 1930, to serve as the new Women's Ward. The original 1897 Women's Ward located on the northeast corner of Consuelo Street and Main Drive, was converted to house ambulatory men, and later demolished. Superintendent William R. Harriman's wife, Elinor, was reportedly very involved in the design of the new Women's Ward.[1] According to the Los Amigos Rancho Annual Report of 1928-29, "The new building was planned to house approximately 200 women patients, with one-half of its rooms planned to accommodate two patients. . . . All of these are outside rooms well lighted and ventilated with steam heat and both hot and cold water in every room. There are three courtyards and sun porches on the second floor. Instead of attempting to provide a single large day room for these patients there are six parlor rooms on each floor."

***P3a. Updated Description:**

The Toilet Building (LACO No. 1239) is one of several small support buildings located within the courtyard of the Women's Psychiatric Wards (LACO Nos. 1202 and 1203), which are located centrally within the block bounded by Golondrinas Street to the north, Dahlia Avenue to the east, Consuelo Street to the south, and Erickson Avenue to the west. The Toilet Building is one-story, symmetrical in appearance and square in plan. Of brick vernacular design, the building is capped by a medium-pitched hipped roof with overhanging eaves. The roof is covered by composition shingles. Exposed rafters are visible under the eaves. It sits on a raised concrete foundation. Exterior walls are brick laid in common bond and have been painted. Fenestration on all elevations consists of segmental arched openings with lintels composed of double rows of header bricks containing original, flat-headed, wood-framed, one-over-one, double-hung sash windows. The windows are trimmed by slightly projecting window sills of header bricks. The primary entrance to the building is located on the east-facing façade, with a secondary entrance on the north elevation. Both entrances contain original wood and glazed doors and are accessed by concrete ramps with iron railings. A concrete block hyphen wall is attached to both the north and south elevations of the building. The existing landscaping surrounding the Toilet Building consists of a weeds, and mature grass and shrubs. Concrete paving surrounds the building. Windows have been boarded over. The property is in fair condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No permits or original architectural drawings could be found for this building. Other than general deterioration, boarding over of windows, and replacement roofing, no exterior elevations are apparent.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Toilet Building (LACO No. 1239) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1930 as a restroom serving patients using the interior courtyard of the Women's Psychiatric Wards. The patients were taken outside of their rooms for a few hours each day to sit under shade trees in a fenced yard to get fresh air and sunshine. The building is currently abandoned.

Substantially unaltered, the building still reflects its period of construction and retains integrity of location, feeling, association, design, materials, and workmanship. Intact character-defining features include: brick walls in common bond pattern; corbelled brick courses defining brick belt course that wraps around building at the wall base; segmental arched door openings with double header brick bands; and hipped roof. Its setting has been altered through the deterioration of the surrounding landscape.

***P3a. Updated Description:**

One of several small service buildings located in the interior courtyard of the Women's Psychiatric Ward complex (LACO Nos. 1202 and 1203) east of Erickson Avenue and west of Dahlia Street, the Linen Room (LACO No. 1241) is one-story, simple in volume, and square in plan, with an asymmetrical east-facing façade. The brick vernacular building sits on a concrete foundation. Exterior walls are brick laid in common bond and have been painted. The building is capped by a medium-pitched, gable-on-hip roof with overhanging eaves sheathed in composition shingles. Exposed rafters are visible under the eaves. Window openings are located on the east and west elevations, and consist of flat-headed openings trimmed by slightly projecting sills of header bricks. All extant windows are original wood-framed, one-over-one, double-hung sash. The primary entrance to the building is located on the south façade and contains an original wood paneled door. A secondary entrance containing a non-original metal door is on the north (rear) elevation. A concrete block connector wall is attached to the east elevation of the building, and the roof canopy of the Shelter (LACO No. 1240) extends over the building's primary entrance. Existing landscaping surrounding the Linen Room consists of weeds and mature grass. Concrete walkways and sidewalks surround the building. The property is in fair condition.

No building permits or original architectural drawings were found for this building. Alterations include the replacement of the original wood doors with metal doors.

***B10. Updated Significance:**

This property is identical to, and similarly located as LACO 1239, which determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996 and also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed that Toilet Building (LACO No. 1242) should be considered to be a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history, with a recommended CHR status code of 3D. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1920 as a restroom serving patients using the interior courtyard of the Women's Psychiatric Wards. The patients were taken outside of their rooms for a few hours each day to sit under shaded trees in a fenced yard to get fresh air and sunshine. The building is currently abandoned.

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities. By the late 20th century, the facility was known as the Rancho Los Amigos National Rehabilitation Center.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction and retains integrity of location, feeling, association, design, materials, and workmanship. Most of its character-defining features are intact: brick walls in laid common bond pattern; segmental arched window and door openings with lintels of double header brick bands; slightly projecting window sills of header bricks, and hipped roof. Its setting has been altered through the deterioration of the surrounding landscape.

***P3a. Updated Description:**

The Open Shelter (LACO No. 1243) is a one-story open structure located in the courtyard of the Women's Psychiatric Wards (LACO Nos. 1202 and 1203). Rectangular in plan, the structure consists of a flat roof supported by metal pipe columns. A scalloped fascia board trims the canopy. Exposed beams with tapered ends run lengthwise under the canopy. The shelter is paved with concrete. Immediate setting within the courtyard includes weeds, grass, and concrete walkways. A fire has destroyed at least half of the roof. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this structure. The structure suffered a major alteration with the loss of much of the roof due to fire damage.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The survey update concluded that the Open Shelter (LACO No. 1243), constructed in 1916 within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205)has lost integrity and can no longer be identified as a significant resource. It is missing 50 percent of one of its two character-defining features, the roof. Due to this extensive fire damage, the structure no longer reflects its period of construction. The structure no longer retains integrity of setting, design, materials, workmanship, and feeling. A revised CHR status code of 6Z is recommended.

***P3a. Updated Description:**

The Toilet Room (LACO No. 1244) is one of several small support buildings located within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205), which occupy the north half of the block bounded by Golondrinas Street to the north, Dahlia Avenue to the east, Consuelo Street to the south, and Erickson Avenue to the west. The Toilet Building is one-story, symmetrical in appearance and square in plan. Of brick vernacular design, the building is capped by a medium-pitched hipped roof with overhanging eaves. The roof is covered by composition shingles. Rafters are visible in the eaves. The building sits on a concrete slab foundation. Exterior walls are brick laid in common bond and have been painted. Fenestration on the north and south elevations consists of segmental arched openings with lintels composed of double rows of header bricks containing original, flat-headed, wood-framed, one-over-one, double-hung sash windows. The windows are trimmed by slightly projecting window sills of header bricks. Two entrances, accessed by concrete ramps with pipe railings, occupy most of the west façade. Secondary entrances are located on the north and south elevations and are characterized by segmental arched openings with lintels of double header brick bands. The north entrance still retains its original wood paneled door. Replacement metal doors are present on the west façade. Existing landscaping surrounding the Toilet Room consists of a weeds, and mature grass. Concrete paving surrounds the building bands, corbelled brick course defining brick belt course at the wall base, and slightly projecting windows sills of header bricks. The property is in deteriorated condition.

***P3a. Updated Description:**

One of several small service buildings located in the interior courtyard of the Men's Psychiatric Ward Complex (LACO Nos. 1204 and 1205), the Linen Room / Snack Bar No. 3 (LACO No. 1245) is one-story, asymmetrical in appearance and rectangular in plan. The brick vernacular building is capped by a medium-pitched, gable-on-hip roof with overhanging eaves, which is covered with rolled composition shingles. Non-original metal air handlers are visible on the south elevation of the roof. The building is sits on a concrete foundation. Exterior walls are brick in laid in common bond and painted. Fenestration on all elevations consists of flat-headed windows trimmed by slightly projecting sills of header brick bands. All extant windows are original wood-framed, one-over-one, double-hung sash. The primary entrance to the building is on the north façade, with a secondary entrance on the south (rear) elevation. Both entrances contain replacement metal doors. An addition attached to the east elevation appears to be an enclosed porch. It is topped by a nearly flat shed roof and clad with board and batten. The existing landscaping surrounding the Linen Room / Snack Bar No. 3 consists of weeds and mature grass. Concrete walkways surround the structure. The property is in deteriorated condition.

***P11. Report Citation:** (Cite survey report and other sources, or enter "none.") *Sapphos Environmental, Inc., June 2010. Rancho Los Amigos Historic District Update Report, Prepared for the County of Los Angeles.*

***Recorded by:** *Rebecca L. Silva, Sapphos Environmental, Inc.* ***Date:** *June 2, 2008* ☐ **Continuation** ☒ **Update**

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this structure.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The survey update concluded that the Shelter (LACO No. 1251), constructed in 1916 within the courtyard of the Men's Psychiatric Wards (LACO Nos. 1204 and 1205)has lost integrity and can no longer be identified as a significant resource. It was apparently partially or completely replaced circa 1960. The structure no longer reflects its period of construction and no longer retains integrity of setting, design, materials, workmanship, and feeling. A revised CHR status code of 6Z is recommended.

***P3a. Updated Description:**

The Chapel / Computer Center (LACO No. 1254) is located east of Erickson Avenue and directly southeast of the Women's Psychiatric Ward (LACO No. 1203). L-shaped in plan, the one-story building consists of an original north wing and a post-1955 recessed south wing. The wood-framed building is capped by a medium-pitched, cross-gabled roof. Exposed beams and rafters visible in older photographs of the north wing, which imparted a Craftsman influence, have been removed. The front-gabled north wing is symmetrical in design. Centered on its façade, an attached porch is elevated five steps above ground level and capped by a hipped roof. Square piers support the porch roof. A horizontal louver vent is centered in the gable end above the porch roof. Single windows to either side of the porch were originally round-headed; they appear to have been replaced. Widely spaced single windows define six bays on the north elevation, with a seventh bay containing a secondary entrance. Four bays remain on the south elevation, west of the attached newer wing. The building sits on a concrete slab foundation and is clad in non-original horizontal metal siding. The side-gabled south wing has fewer openings and its south and east elevations are sheathed with stucco. Existing landscaping surrounding the Chapel / Computer Center consists of mature grass, shrubs, and trees. Concrete ramps with metal handrails lead to the building's entrances. A paved parking lot is located to the south and east. The property is in fair condition and its windows and doors have been boarded over.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations include a south wing addition; replacement of the original roof with composition shingles; removal of exposed beams and rafters and substitution of boxed eaves; removal of original window openings on the façade; and replacement of the original wood siding with metal siding. A rose window over the pulpit at the east end of the building and a belfry, described in historic accounts, have also been removed.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Chapel / Computer Center (LACO No. 1254) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1907 and was the first chapel constructed at the County Poor Farm. The building is currently abandoned.

Although the building has been altered, its exterior appearance still recalls its original function. Extant character-defining features include: horizontal massing, medium-pitched gabled roof with overhanging eaves, original wood cladding in situ under later metal siding, attached elevated entry porch with hipped roof and square porch supports, and original wood paneled and glazed doors.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

Prior to 1907, religious services were held in the inmate dining room. The chapel seated 125 people in wooden pews. In 1919, the building was moved south 88 feet from its original location immediately south of the original Psychopathic Ward (the Men's Psychiatric Ward, LACO No. 1205) to accommodate the construction of the new Women's Psychiatric Ward (LACO No. 1203). The building served the religious needs of the institution until 1955, when a new chapel was constructed on Dahlia Street. The 1907 building was converted into a library for several years and the south wing was added. By 1988, the building housed the Building Crafts Planning Division. Sometime in the late 20th century the building was converted into a computer center.

***P3a. Updated Description:**

Toilet Building (LACO No. 1256) is located directly west of Erickson Avenue, northwest of the intersection of Erickson Avenue and Aliso Street. The Toilet Building is one-story, flat-roofed, symmetrical in appearance and square in plan. The building sits on a concrete foundation, and its exterior walls are concrete covered in stucco. The east façade contains the two primary entrances, which are unevenly sized and located at either end with two windows set between the doors. Transom windows top the doors. The remaining elevations are divided into three bays primarily by the fenestration. Three evenly spaced windows are located on the north and south elevations while a shallow central projection on the west elevation contains a secondary entrance with a wood-paneled door. Fenestration consists of wood-framed four-light pivot windows. Existing landscaping surrounding the Toilet Building consists of mature grass, shrubs and trees. Concrete walkways are located to the east and west of the building. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this building. There appear to be no alterations to the exterior of the building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Toilet Building (LACO No. 1256) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1925 as an outdoor restroom facility for the staff and working patients of the County Poor Farm. The building served in this capacity until the late twentieth-century with the institution officially moved their operations to the North Campus area and the farm no longer existed. The building is currently abandoned.

The building's exterior appearance still reflects its period of construction. As an example of a simple utilitarian building, it retains integrity of location, feeling, association, design, materials and workmanship. The building has retained most of its character-defining features: simplicity in design and materials; flat roof; and concrete exterior walls covered in stucco. Its setting has been altered through the deterioration of the surrounding landscape.

***P3a. Updated Description:**

The Wheelchair Repair (LACO No. 1259) is located in the block bounded by Descanso Street to the north, Juniper Street to the east, Laurel Street to the west, and Bonita Street to the south. The Wheelchair Repair is one-story, asymmetrical in appearance and rectangular in plan. The vernacular style building is wood-framed and capped by a low-pitched side-gabled roof with slightly overhanging eaves which is sheathed in composition shingles. A horizontal louver vent is located beneath the gable on the west elevation. Board-and-batten siding covers the exterior walls. Fenestration on all elevations consists of a combination of aluminum sash sliding windows and wood sash hopper windows; several window openings have been boarded over with plywood. The primary entrance (south façade) is offset slightly to the east where an iron security door has been added. Two additional entries are located on the north and west elevations and they consist of wood doors. The area surrounding the building is paved with asphalt paving. Character-defining features include: wood-framed structural system; board-and-batten siding; exposed rafter tails; and wood-framed windows. The property is in deteriorated condition.

***P3a. Updated Description:**

The Bathhouse and Ward (LACO No. 1260) is located on the south side of Descanso Street between Erickson Avenue and Juniper Street, at the southern terminus of Hawthorne Avenue. Reflecting the influence of the Classical Revival, the Bathhouse and Ward is two stories, regular if not symmetrical in appearance and rectangular in plan. A flat roof caps the building. The roof is hidden by a parapet, which rises from a slightly projecting cornice. The building sits on a concrete slab foundation and its exterior walls are reinforced concrete covered in textured, painted stucco. A blind arcade defines two bays on the east and west elevations and eight bays on the north and south elevations. Fenestration generally consists of two windows in each bay on each level on the north and south elevations. The east façade is distinguished by a covered balcony accessed by a lateral staircase. The corresponding balcony on the west elevation was enclosed by windows at an early date. Window types include original one-over-one, double-hung sash with and without transoms and non-original metal casements. Some window openings have been enclosed and an air conditioning unit installed. Due to the interior spatial divisions of the Bathhouse and Ward, there is no defined primary entrance. Instead, entrances are located on the north and south elevations and are accessed by a raised concrete ramp with metal pipe railings. Original wood doors include (where extant): single veneered, glazed doors with and without transoms and double veneered and glazed doors with and without transoms. Replacement metal doors are located throughout the building. The existing landscaping surrounding the Bathhouse and Ward consists of a grassy setback punctuated by mature trees, shrubs and grass directly east of the building's facade. The property is in deteriorated condition with its doors and windows boarded over.

***Recorded by:** *Rebecca L. Silva, Sapphos Environmental, Inc.* ***Date:** *June 2, 2007* ☐ **Continuation** ☒ **Update**

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from original architectural drawings and historic photographs include: the sealing-up of window and door openings; the replacement of wood doors with metal doors; and the replacement of original window screens with wood-framed double-hung windows.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Bathhouse and Ward 30 (LACO No. 1260) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1922 during a large building initiative in the 1920s under the Poor Farm's most influential superintendent, William Ruddy Harriman (1915-1931; 1933-1952). Constructed as a bathhouse and restroom facility for the male patients at the County Poor Farm, the building was converted to storage for the Los Angeles County Material Management Department in the late 20th century.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. An example of stripped Classicism, the building retains integrity of location, feeling, association, design, materials, and workmanship. Most of its character-defining features are intact, including the vertical division of the exterior walls into two-story, segmental arched bays by plain raised piers and the horizontal division of the exterior into three parts by a simple cornice topped by a parapet and raised wall base. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

Among the first of the buildings to be constructed by Superintendent William R. Harriman in the 1920s was the Bath and Ward for male ambulatory patients. The male patients were required to take at least one bath per week and were issued a bath card, which had to be punched each time a bath was taken. Those who failed to have their card punched had certain privileges revoked. The first floor consisted of 22 bath areas with tubs, a restroom area with eight toilets and three sinks, a barber shop for a full-time barber, and a laundry distributing room or linen room. The second floor contained an additional four wards of 11 beds each for ambulatory male patients, locker rooms, and two additional restrooms with toilets and sinks. A sewing room was added later to mend issued clothing.[1]

***P3a. Updated Description:**

The Auditorium (LACO No. 1261) faces Erickson Avenue, southwest of the intersection with Descanso Street, and is the visual terminus of Consuelo Street to the east. A deep grassy setback separates the building from Erickson Avenue. Originally a Spanish Colonial Revival design with Art Deco influences, the two-story building is rectangular in plan. The flat roof was originally surmounted by a hipped clay tile roof that extended across the facade (east) with partial returns on the north and south elevations. A plain metal coping marks the roofline currently. The building is constructed of unreinforced masonry with smooth painted stucco exterior walls and a composition roof. It sits on a concrete foundation. The east-facing façade is organized into three equally sized bays. A raised center bay contains the main entrance, consisting of three pairs of slightly recessed non-original doors topped by transoms. Pyramid-capped piers flank the entrance opening. An over-scaled voussoir tops the entrance, with a lintel below it containing the word "AUDITORIUM" in metal letters. The piers and voussoir create a "pinched arch" opening. The ground floor side bays each feature a single window opening with a pair of six-light, steel-framed pivot sash windows set below a wood lintel within a pinched arch opening. Three equally spaced, identical six-light, steel-framed original pivot windows are centered on the second floor above the entry. Wrought iron grilles over these windows, illustrated in historic photographs, have been removed.

(See Continuation Sheet 2 of 2.)

***P3a. Updated Description (continued from page 1):**

Fenestration on the north, south, and west (rear) elevations is sparse and includes original steel-framed sash windows; some of the openings are also characterized by pinched arches. Secondary entrances open off of each of these elevations, as well. One door on the north elevation also has a pinched arch cap; another, at the top of an attached staircase, contains a pair of original, wood-paneled doors. The staircase is supported by heavy concrete brackets and edged by a wrought-iron railing. The west entry has been enclosed. Concrete ramps circle the building. Mature trees, shrubs and grass complement the façade, while the rear overlooks a paved area. The property is in deteriorated condition and many of its windows and doors are covered with boards.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. By the mid-1950s, the exposed brick walls of the Spanish style building had been whitewashed, according to a photograph taken at the time. Subsequent modifications made in 1972 had the effect of changing the Spanish Colonial Revival appearance of the building to a style influenced by the Art Deco, which was experiencing a new appreciation during the period. Alterations as they appear from original building plans and historic photographs include: painted stucco applied to the building's once exposed brick exterior walls and over the concrete lintels of the first-floor windows and doors; the removal of the tile roof; and the removal of original wrought-iron grilles attached to the three windows on the second-story façade.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Auditorium (LACO No. 1261) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1928 Superintendent William R. Harriman as an entertainment venue for the patients and staff. It continued to be used for special events even towards the end of the 20th century. It was subsequently converted to storage space.

Although the building's exterior has been altered, the building still overall reflects the District's period of significance. While somewhat compromised by removal of the tile roof and other Spanish Colonial Revival features, the building retains some integrity of design, materials, and workmanship, and substantial integrity of location, feeling, and association. It setting was altered during the period of significance by the removal of the original North and South Wards, which framed it, and the reflecting pool and courtyard, which fronted it. Intact character-defining features include: symmetrical, three-bay façade composition whose slightly projecting central bay has a battered profile; pinched arch over the entry, side doors, and some windows; pyramid-topped piers flanking the entry; and voussoirs that define the entry arch.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

In 1928, Superintendent William R. Harriman constructed an 850-seat Auditorium, to provide a place of recreation and entertainment for the expanding patient population. After years of planning, Harriman selected the site of the old Refectory Building, which was demolished to make way for an Auditorium designed in the Spanish Colonial Revival style. In addition to the Auditorium space, which was used to screen movies and mount programs of music and other entertainments sponsored by various county civic organizations, the building also housed the County Farm branch of the Los Angeles County Library and a small smoking room equipped with games and a radio. It was equipped with a movie projector and sound equipment in 1929 and was in use on a weekly basis for the next 30 years.

***P3a. Updated Description:**

Comprised of six attached building wings and additions, the Dining Room, Kitchen, Staff Room / Commissary and Receiving Room (Complex) is set back from Erickson Avenue by a grassy area, north and west of the General Wards (LACO Nos. 1184-1188). The rear (west) of the Complex faces Juniper Street. Constructed in stages between 1912 and 1926, the Complex is a large, asymmetrically massed building whose L-shaped floor plan resembles a pistol. The brick vernacular Complex consists of the two-story circa 1912 Commissary and Receiving Building (LACO No. 1263); the two-story 1913 Dining, Game, and Staff Building; the one-story circa 1917 Kitchen Wing; the two-story circa 1920 Dining Room Wing; the two-story 1924 Dining Room Expansion Wing; and the one-story circa 1926 Wing linking the Kitchen Wing to the Commissary Building (the later five wings collectively referred to as LACO No. 1262). A bridge extends east over a walkway and connects the Complex to General Wards 30 and 40 (LACO Nos. 1184 and 1185).

Above a concrete foundation, the exterior walls of the complex are unreinforced brick laid in common bond and currently painted. The flat roof is hidden by a parapet; the roof of the Kitchen Wings is distinguished by a large skylight.

Sapphos Environmental, Inc., June 2010. Rancho Los Amigos Historic District Update Report, Prepared for the County of Los Angeles.

***P3a. Updated Description (continued from page 1):**

Corbelled and raised brick courses wrap the building and define the cornice and frieze, separate the first and second stories, and delineate the base of the wall plate. Brick dentils accent the frieze on the Commissary building. The fenestration can generally be described as rows of large, evenly spaced, segmentally arched openings containing wood-framed, one-over-one, double-hung sash windows. Triple courses of header bricks define the arches. Windows are flat-headed; some are topped with transoms. Raised brick sills are provided when the windows do not sit directly on the sbringcourses atop the wall base or separating the levels. Numerous entries, located on nearly all elevations, provide access to the building, including some second story entrances reached via attached metal staircases. A receiving dock is located on the west. Some original wood doors, both single- and double-leaved, are in situ.

Mature trees, shrubs, and a large grassy set-back area provide the setting for the Complex on the northeast and trees, shrubs, grass and a paved parking area are on the west; the other elevations are hemmed in by the General Wards on the east and the Auditorium (LACO No. 1261) on the north. Concrete ramps with pipe railings surround much of the building. The complex is in deteriorated condition and its windows and doors are covered with boards. A fire in 2005 extensively damaged the northeast wing of the building, destroying the roof and the interior of the second story.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Architectural drawings for the 1913 additions and alterations are on file with the County of Los Angeles and were drawn by Hudson and Munsell, Architects, Los Angeles. Alterations as they appear from historic photographs include: fire damage to the second floor and roof of the 1913 Dining, Game, and Staff Building and the removal of some original wood-framed windows and doors.

B9a. Architect: *Hudson and Munsell (1913 additions and alterations)*

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Dining Room, Kitchen, Staff Room / Commissary and Receiving Room Complex (LACO Nos. 1262 & 1263) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected from 1912 to 1926 as the primary dining room and kitchen for the County Poor Farm. By the mid 1920s, growth of the County Farm prompted the construction of "Kitchen #2" (now the Kitchen and Dining Building, LACO No. 1295) to relieve the burden on this earlier facility. The Complex continued to be used for food preparation and dining, as well as for housing and other functions, until Rancho Los Amigos began relocating all medical activities to the North Campus area across East Imperial Highway. The Complex is currently abandoned.

Although the building has suffered minor alterations and fire damage, its exterior appearance still reflects its extended period of construction. The Complex retains substantial integrity of location, setting, design, materials, workmanship, feeling, and association. Extant character-defining features include: brick exterior walls; flat roofs; and architectural detailing such as cornices, frieze, stringcourses, brick dentils, base moldings, and arched window and door openings.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance:**

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

The Dining Room, Kitchen, Staff Room / Commissary and Receiving Room complex evolved over a period of approximately 14 years in response to the expanding capacity and functions of the County Farm. The earliest portion of the Complex, the Commissary Building (LACO No. 1263), was built circa 1912 and was among the first buildings constructed at the institution during Superintendent Charles C. Manning's tenure. Known as the Old Rancho Store, the building later was used for shipping and receiving. In 1913, the north wing of the Complex (LACO No. 1262) was constructed to house dining, game, and staff rooms (sometime later, the first-floor dining room was converted into a reading room). In the following years, Superintendent William R. Harriman made several additions to the complex, including the addition of a one-story Kitchen Wing (circa 1917) to the southwest corner of the 1913 building and a two-story Dining Room Wing (circa 1920) south of the new Kitchen Wing. In 1924, dining room space was expanded by a two-story addition to the west elevation of the circa 1920 Dining Room Wing (in later years, this building was used as the Print Shop for the campus). The last addition to the Complex occurred circa 1926, when a one-story extension linked the Kitchen Wing to the Commissary Building. At least one of the additions to the complex, the 1913 north wing, was designed by the prominent Los Angeles architectural firm, Hudson and Munsell, according to the original architectural drawings. The kitchen and dining room served both staff and ambulatory patients, and was known as the "dormitory kitchen" because of its proximity to the General Wards. In addition, meals were prepared for patients in the psychiatric wards and delivered by cart. Diet had been emphasized as a critical component of health, recovery, and well-being at the County Farm since its beginnings, and in 1924 a professional dietitian was added to the staff.

***P3a. Updated Description:**

Bonita Hall (LACO No. 1264) is located on the northeast corner of Juniper and Bonita Streets, west of the General Ward buildings. It is one-story in height, originally symmetrical in appearance with a basilica-like rectangular plan. Constructed of brick, the building has been partially stuccoed. A low-pitched, side gable roof with exposed brackets in overhanging eaves tops the building. Spanning most of the south (primary) elevation, a covered loggia, now partially enclosed, is topped by a shed roof attached to the south wall. A corresponding shed roof tops a lower one-story wing that extends the length of the north elevation. Another shed roofed wing is attached to the west elevation. Rolled asphalt and gravel cover the roof, which was originally tiled. Square vents adorned with wrought iron grilles are located in the gable ends. Rows of small, clerestory-level windows are located above the shed roofs and below the eaves on the north and south elevations. Centered on the east elevation, a large, multi-light window features a segmental arch head. A smaller opening, also topped by a segmental arch, is located at the east end of the south elevation. Some original wood casement windows are extant. A window in the east end of the north wing is adorned with a wrought iron grille. Entrances to the building are located along the south and north elevations and generally consist of doors with half glazing. Mexican sautillo tiles pave the loggia area and the walkway leading to it. No original landscaping is extant. The property is in deteriorated condition and its doors and windows have been boarded over.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this building. Alterations as they appear from historic photographs include: removal of the tile roof; enclosure of window and door openings; partial enclosure of the loggia and addition of stucco walls; replacement of wood doors with metal doors; and addition of a metal shed to the northwest corner of the building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Bonita Hall (LACO No. 1264) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1932 to serve as a recreational venue for the County Poor Farm. The building was originally constructed in the Spanish Colonial Revival style, but underwent alterations when it was converted to office space in the 1970s. The building is currently abandoned.

Although the building's exterior has been altered, the building still overall reflects the District's period of significance. While somewhat compromised by removal of the tile roof and modification of the loggia, the building retains some integrity of design, materials, and workmanship, and substantial integrity of location, feeling, and association. Intact character-defining features include: basilica like plan incorporating a loggia; prominent east window defined by segmental arched opening; low-pitched side-gabled roof with moderately overhanging eaves and exposed brackets; and tile pavement. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

One of the few buildings constructed at the County Poor Farm during the Depression Era of the 1930s was Bonita Hall. Harriman had set aside funds for the construction of this recreational building before the 1929 stock market crash.[1] The opening of Bonita Hall in 1932 provided the patients and staff with much-needed entertainment and socialization. Patients could purchase food in the canteen area of the building and enjoy games and live music in the recreation hall. A utility office and the patients' employment office were located on the west end of Bonita Hall. An area to the south of the building provided space for the patients and staff to pitch horseshoes and play croquet.

In later years, Bonita Hall became part of the Receiving Department, and it was renovated substantially in 1975. Period photographs indicate that at this time, the original Spanish red clay tile roof was removed, the east-facing facade was covered in stucco, concrete and stucco was in-filled between some of the south elevation gallery piers to create enclosed spaces, original wooden doors were replaced with metal doors, and metal-framed sliding windows were placed in the infilled sections.

***P3a. Updated Description:**

Shelter (LACO No. 1265) is located directly west of the Erickson Avenue traffic circle in an ornamental grassy courtyard area. The Shelter is an 18' by 12' wrought-iron metal canopy designed in a Regency-influenced style. The structure consists of a bellcast, hipped roof with prominent ridges, and flared eaves which is supported by four decorative wrought-iron posts. The posts have starbursts and oval designs. A molded and scalloped cornice wraps the eaves. Set into the concrete pavement, the structure is flanked by sidewalks and lawns. The boughs of the nearby Moreton Bay fig tree shade the area. . The Shelter is in good condition.

No building permits or original architectural drawings were found for this building. There are no alterations.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Shelter (LACO No. 1265) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The structure, which at the time of its construction served a commemorative function associated with the 1933 Long Beach earthquake, was erected in circa 1933.

The structure has suffered no alterations and its exterior appearance still reflects its period of construction. Influenced by the Regency style, the structure retains integrity of location, feeling, association, design, materials, and workmanship. The structure has retained its character-defining features including: low-pitched, bell cast, hipped metal roof with prominent ridges; lacy, wrought-iron construction; four L-shaped corner supports with slender posts and geometric motifs; and molded and scalloped cornice. Its setting has been altered through the deterioration of the surrounding landscape.
History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

The structure was erected in 1933 when the original Administration Building for the County Poor Farm was demolished after the Long Beach earthquake. At this time, an ornamental courtyard was created between the original North and South Wards which extended out to Erickson Avenue. A large 51 foot long fishpond was put in at the same time as this 18 foot by twelve foot wrought iron gazebo. The structure lost its ceremonial significance as a marker of the original Administration Building when the surrounding buildings were abandoned in the late twentieth-century and the ornamental courtyard deteriorated.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Storage (LACO No. 1268) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1932 as a storage and service building for the County Poor Farm. It served in this capacity until the late 20th century when the operations of the institution relocated to the North Campus area. The building is currently abandoned.

The building's exterior appearance still reflects the District's period of significance. As an example of a simple utilitarian building, it retains integrity of location, feeling, association, design, materials and workmanship. The building has retained most of its character-defining features that reflect simplicity of design and materials and lack of ornamentation, use of corrugated metal, and wood-framed structure. Its setting has been altered through the deterioration of the surrounding landscape.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Garage (LACO No. 1270) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1932 as a storage area for the large vehicles servicing the County Poor Farm. The building continued to be used as a general storage and service building until it was abandoned in the late twentieth-century.

The building's exterior appearance still reflects its period of construction. As an example of a simple utilitarian building, it retains integrity of location, feeling, association, design, materials and workmanship. The building has retained most of its character-defining features: a large, open bay on north façade; shed roof of corrugated metal; and corrugated metal siding. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

***P3a. Updated Description:**

The Shed (LACO No. 1272) was originally located directly east of Laurel Street, south of Descanso Street and north of Bonita Street, in the area initially designated for farming buildings. The building was demolished sometime in the late 20th century. Concrete slab foundation and paving is all that remains of this building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos south Campus Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources (CRHR) (under Criterion 1). The current study confirmed the demolition of Shed (LACO NO. 1272) and its loss of significance and integrity. Therefore, the building is no longer a contributor to the Historic District under Criterion 1.

***P3a. Updated Description:**

Workshop (LACO No. 1275) is occupies the northwest corner of the intersection of Juniper and Bonita Streets. A long, narrow building, it extends north along the west side of Juniper Street two-thirds of the block. The one-story, brick vernacular Workshop is capped by a flat roof screened by stepped brick parapet with coping of header bricks. The building sits on concrete slab foundation and has common bond brick exterior walls. Linear fenestration of original wood-framed, primarily four-over-four, double-hung windows, recessed with slightly projecting sills of header bricks and heavy, flushed, concrete lintels, line all four elevations. Metal awnings are located above the two windows on the east elevation. The façade (east) has several storefront-like entrances containing wood paneled and glazed doors topped by transoms. Each of the three storefronts on the south end of the east façade is flanked by a pair of wood-framed, four-over-four, double-hung sash windows. A shed-roofed leanto is attached to the north elevation. Alterations include a flat-roofed, stucco-clad addition and a corrugated metal canopy at the north end of the west elevation and the enclosure of some openings on the east. Metal awnings have been added to the pair of windows that occupy the south elevation. The building is bordered by sidewalk on the east, shrubbery on the south and asphalt paving on the north and west. The Garage (LACO No. 1277) is attached to the south end of the west elevation. The property is in fair condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations to this building include additions on the west elevation and the replacement or enclosure of some original wood doors and windows.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Workshop (LACO No. 1275) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1917 to serve as a work service building for the farm and construction programs of the County Poor Farm and functioned in this capacity until the late 20th century. The building is currently abandoned.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. It retains integrity of location, setting, design, materials, workmanship, feeling, and association. The building has retained most of its character-defining features, including: flat roof screened by stepped parapet with coping of header bricks; brick exterior walls; corbelled brick cornice which separates the parapet from the wall plate; repetitive "storefront" composition of central entries flanked by paired windows in south three bays of east elevation; double-hung windows recessed with slightly projecting sills of header bricks and heavy, flush concrete lintels; and original wood-paneled and glazed doors with transoms.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District .

The Workshop, dating to 1917, played an important role in the self-sufficiency that characterized the County Poor Farm. A 1917 plot plan simply labels the building "General Utility." It first appears on Sanborn maps of the institution in 1924, when individual rooms were labeled, south to north: Carpenter, Paints, Repair Shop, Storage, Painting, Storage, Cobbler, Storage, and Furnishing.

***P3a. Updated Description:**

The Lock Shop (LACO No. 1276) is located directly southwest of the intersection of Descanso and Juniper Streets. The Lock Shop is one-story, symmetrical is appearance, and rectangular in plan. The brick vernacular building is capped by a flat roof screened by a brick parapet with raised coping. The building sits on a concrete foundation and its exterior walls are brick laid in common bond. A stucco-clad addition was made to the west (rear) elevation of the original building. All windows have been boarded over except for those on the façade which consist of three-light fixed sash. The windows have slightly projecting window sills of header bricks and heavy, flush, concrete lintels. The primary entrance is located centrally on the façade and is topped by a transom window. Both the door and window have been boarded over. Secondary entrances are found on the western section of the south and north elevations and they consist of wood doors; the door on the north elevation is glazed and has been boarded over. The area immediately surrounding the Lock Shop is paved in asphalt. Character-defining features include: flat roof screened by brick parapet with raised coping; brick exterior walls in common bond pattern; corbelled brick cornice which separates parapet from wall plate; and slightly projecting window sills of header bricks. The property is in fair condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations as they appear from historic photographs include the rear stucco addition.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Lock Shop (LACO No. 1276) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1913 as a gas station. Underground gas tanks were located to the north of the building. The rear room served as paint and fuel oil storage. The rear room was also used to store pipe fittings, and eventually was converted into a lock shop. In later years, the lock shop was replaced by master mechanic offices. The building is currently abandoned.

The building's exterior appearance still reflects its period of construction. As an example of a simple utilitarian building, it retains integrity of location, feeling, association, design, materials and workmanship. The building has retained most of its character-defining features: flat roof screened by brick parapet with raised coping; brick exterior walls in common bond pattern; corbelled brick cornice which separates the parapet from the wall plate; and slightly projecting window sills of header bricks. Its setting has been altered through deterioration of the surrounding landscape.

***P3a. Updated Description:**

The Garage (LACO No. 1277) is located on the north side of Bonita Street, immediately west of and attached to the south end of the Workshop (LACO No. 1275). One-story and rectangular in plan, the building consists of a symmetrical, front-gabled, main section on the east and a shed-roofed, leanto attached to west elevation. Of utilitarian design, the wood-framed building is clad in corrugated metal sheets. Composite shingles cover the roof. Vents composed of horizontal louvers are located in the gable ends. The building sits on a concrete slab foundation. Both the façade (south) and north elevation are nearly completely glazed, with a continuous band of multi-light windows flanking a central entry containing a pair of similarly fenestrated sliding doors. The openings on the façade have been boarded over. A row of square, awning windows are located clerestory level on the west elevation of the main section of the building. The west wing is an irregular assemblage of spaces, some of which have windows, while others are storage areas enclosed by hinged doors. This wing appears to be constructed of recycled materials. A cement driveway provides access to the building on the south and paved areas are located on the west and north. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The survey update concluded that the Garage (LACO No. 1279), determined eligible for the NRHP in 1996 and listed in the CRHR as a District contributor, has lost integrity and can no longer be identified as a significant resource. The building was erected in 1925 to serve as a paint spray booth and storage area for the County Poor Farm. The building continued to serve as a service building for the operations of the institution until it was abandoned in the late twentieth century.

Due to many alterations over the years, including the loss of its original window and door on the primary (west) elevation, the building's exterior appearance no longer reflects its period of construction. A revised CHR status code of 6Z is recommended.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

***P3a. Updated Description:**

The Garage Storage building (LACO No. 1280) is located within the block bounded by Descanso Street to the north, Laurel Street to the west, Juniper Street to the east, and Bonita Street to the south. It is one-story, asymmetrical in appearance and rectangular in plan. The wood-framed utilitarian building is capped by a low-pitched side-gabled roof covered in rolled composition sheets with overhanging eaves and exposed rafters. The building sits directly on concrete pavement and its exterior walls consist of corrugated metal sheets. A series of large double doors made of corrugated metal are located along the east, west, and south elevations. The building is surrounded by asphalt paving. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. There are no alterations to the building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Garage Storage building (LACO No. 1280) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1928 to serve as a service and storage area for the general operations of the County Poor Farm. For many years the building housed small equipment and supplies. The building was abandoned in the late twentieth-century when the operations of South Campus were officially closed.

The exterior appearance of this building still reflects the District's period of significance. Character-defining features include side-gabled roof, corrugated metal sheet siding, and bands of doors faced with corrugated metal on the east, west, and south elevations.

***P3a. Updated Description:**

The Trunk Storage building (LACO No. 1283) is located on the east side of Erickson Avenue, opposite General Ward 70 (LACO No. 1188). The building is one-story, asymmetrical in appearance, with an L-shaped plan. The brick vernacular building is capped by a flat roof with a parapet that is flush with the exterior walls. The building sits on a concrete slab foundation and its exterior walls are brick laid in common bond and painted. The northern two-thirds of the façade (west) consists of five bays and is symmetrically arranged. A large, semi-circular archway in the center bay is flanked by single windows in the penultimate bays and double windows in the end bays. Five rows of header bricks outline the arch. Deeply recessed within a vestibule behind the arch, the primary entry is a wide, wood door with glazing. Other entrances, which contain metal roll-up doors set within segmental arched openings, are located on the south and east elevations. Fenestration on all elevations consists primarily of a linear arrangement of multi-light, flat-headed windows (six-over-six and four-over-four) located within segmental arched window openings. A flat-roofed metal-sided room addition is attached to the east elevation and a flat-roofed metal canopy projects from the south elevation. The building is mostly surrounded by asphalt, with a remnant of a garden bed on the north. It is in fair condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations as they appear from historic photographs include the removal of a second-story after the 1933 Long Beach earthquake.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Trunk Storage building (LACO No. 1283) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. Originally two stories in height, the building was erected in 1923 as a horse stable and hay barn. After an outbreak of hoof and mouth disease in 1924 decimated the livestock at the County Farm, the building was re-purposed for storage of patient belongings (or trunks) on the first floor and a male patient ward on the second floor. After the 1933 Long Beach earthquake extensively damaged the upper story, it was removed. Other uses of the building included a barber shop, and a room for scale house records located off the main entrance. In 1984, the building was converted to offices for medical equipment repairs and some workshop space. The building was abandoned by the end of the 20th century.

Although the building has been somewhat altered, its exterior appearance today still reflects its appearance after 1933 and still conveys its original function as a horse barn. The building retains integrity of location, design, materials, workmanship, feeling, and association. Extant character-defining features include: brick exterior walls laid in common bond; segmental arched window and door openings; use of multiple rows of header bricks to define arched openings; slightly projecting window sills of header bricks; broad arched entries clearly intended to accommodate horses; fenestration pattern that suggests former stable divisions; and original windows. Its setting has been altered through the deterioration of the surrounding landscape.

***P3a. Updated Description:**

The Garage / Storage building (LACO No. 1286) is located in an open area directly south of Bonita Street and east of Erickson Avenue. It is one-story, asymmetrical in appearance and L-shaped in plan. The wood-framed, utilitarian building is capped by a low-pitched, cross-gabled roof covered in rolled asphalt sheets, with rafters exposed in overhanging eaves. The building sits on a concrete slab foundation and is clad in a combination of board-and batten, horizontal wood siding and corrugated, metal siding. Fenestration on all elevations consists of a linear arrangement of variously sized aluminum sash sliding windows and wood sash, two-over-two casement windows with wide wood surrounds. Vehicular garage doors are located on the west elevation and on the west and north elevations of the projecting wing. A chain-link fence is located along the east elevation of the garage and an asphalt parking lot extends out along the west elevation. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this building. Alterations include replacement roofing material and plywood sheeting on exterior walls.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Garage / Storage building (LACO No. 1286) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1920 as a service building for dairy operations of the County Farm. The building originally housed a blacksmith shop in its central portion, and the north portion was used as a bus garage. For many years the southeast section was used by pest control operations, and a lawnmower repair shop was also located in the building. The building continued to be used as a service building for the County Farm until farming operations ceased by the end of the 1950s. The building was subsequently used for various storage and service uses. The building is currently abandoned.

Although the building has been somewhat altered, its exterior appearance still reflects the District's period of significance. The building has retained most of its character-defining features: wood-framed structural system; board-and-batten siding; and minimal ornamentation.

***P3a. Updated Description:**

The Oil and Storage building (LACO No. 1287) is located in the block bounded by Bonita Street to the north, Erickson Avenue to the west, and Gardendale Street to the south. Resembling a farmhouse in appearance, it is two stories, asymmetrical in appearance and rectangular in plan. The wood-framed vernacular building sits on a brick foundation and is clad in horizontal lapped wood siding. A steeply-pitched, front-gabled roof with overhanging eaves and exposed rafters hidden by a molded fascia caps the building. The façade contains a large entrance offset to the east, a single, one-over-one double-hung sash window on the west, and an identical double-hung sash centered in the upper story gable end. Three similar windows, unevenly spaced, are located on each level of the side elevations; the lower story windows are taller than those on the upper story. Plain wood casings with slightly projecting sills frame the openings. Concrete steps and a landing bordered by iron pipe railings provide access to the front entrance. A small shed for the water heater has been attached to the south elevation. Asphalt paving surrounds the building. The property is in deteriorated condition and its windows and doors have been boarded over.

The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1909 as a support building for the County Farm dairy operations. After the outbreak of hoof and mouth disease in 1924, the building was used by the pest control operations. For a time in the 1950s and 1960s the upstairs was used by the Downey Radio Club a few evenings a month. The building continued to be used as the headquarters for the pest control operations until 1979 when the supervisor retired. After that time, the building was used for general storage and service needs until it was abandoned in the late twentieth-century.

Although the building has experienced minor alterations, its exterior appearance still reflects its period of construction. It retains integrity of location, design, materials, workmanship, feeling, and association. Its character-defining features include: steeply pitched, front-gabled roof with overhanging eaves; wood-framed structural system; narrow clapboard siding; fenestration of original, wood-framed, one-over-one double-hung sash windows; and wide window and door casings with slightly projecting wooden sills. Its setting has been altered through the deterioration of the surrounding landscape.

***P3a. Updated Description:**

The Kitchen and Dining Room (LACO NO. 1295) is located in the western section of the block bounded by Flores Street to the north, Hawthorne Avenue to the east, Esperanza Street to the south, and Laurel Street to the west. The one-story building has a central roof projection, and is asymmetrical in appearance and irregular in plan. Of reinforced concrete construction, the building displays the influence of classical revival styling. A flat, steel truss roof of composition material is shielded from view by concrete parapet walls. A central, one-story projection over the kitchen is surmounted by a flat roof covered in composition panels with a slight slope on its north and south elevations below the ridgeline, and projecting parapets on its east and west elevations.

***P3a. Updated Description (continued):**

The building sits on a concrete foundation and the exterior walls are clad in stucco. A raised concrete Tuscan-style cornice wraps the building below the roof parapet and above a concrete plain frieze and architrave. Small rectangular screened vents punctuate the frieze of the building. Concrete stringcourses band the building above the windows. Fenestration on all elevations consists primarily of a linear arrangement of original wood-framed three-over-three double-hung sash windows with transoms and slightly projecting sills. Additional windows include: three-light hopper windows; three-over-three double-hung sash windows without transoms; and large, steel sash three-over-three pivot windows. Non-original metal sliding windows are located on the north elevation. The primary east façade entrance and secondary north elevation entrance are characterized by partial-width porches sheltered by projecting flat concrete hoods suspended by steel cables. Paired glazed and paneled one-over-one wood-paneled doors topped by two, two-light transoms are recessed within the entries. The entrances are accessed by concrete steps with ramps and metal pipe handrails. A loading dock and metal roll-up loading doors are located on the west elevation, and non-original metal sheds on a raised concrete deck are located on the south elevation. Existing landscaping surrounding the Kitchen and Dining Room consists of mature trees, shrubs and grass. A concrete parking lot lies to the east and another parking lot to the west. Concrete sidewalks and ramps surround the building. The property is in fair condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits were found for this building. Alterations as they appear from historic architectural drawings and photographs include: the replacement of original double-hung windows with metal sliding windows on the north elevation, and the addition of a metal shed to both the building's west and south elevations.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Kitchen and Dining Building (LACO No. 1295)as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1927 during a large building initiative in the 1920s under the Los Angeles County Poor Farm's most influential superintendent, William Ruddy Harriman (1915-1931; 1933-1952). The building was constructed as a secondary kitchen and dining hall to support the additional staff hired to work in the patient ward buildings, which were built nearby during the same time period. The Kitchen and Dining Building also supported the dining needs of a large grouping of staff residential buildings, which included staff cottages, small bungalows, and dormitory buildings. All of these residences except for two staff cottages were demolished in the early 1990s when Flores Street was constructed.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction and retains integrity of location, feeling, association, design, materials, and workmanship. Most of its character-defining features are intact: regular fenestration, flat roof; and spare classical detailing including cornices, frieze, stringcourses, and base moldings. Its setting has been altered by the loss of the residential buildings that the building provided support for and the overall deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District. Still in use, the Kitchen and Dining Building is one of the few exceptions to the abandonment of the South Campus of Rancho Los Amigos.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**

The construction of the Kitchen and Employee Dining Room was a result of Superintendent William R. Harriman's effort to improve the dietetics program of the expanding County Poor Farm. He was aware of the growing popularity of the science of dietetics in the 1920s and saw the value of proper nutrition planning for the patients. In 1923, Harriman hired the farm's first dietitian, Otto Jardon, to oversee the kitchen and dietary needs of the campus patients.[1] Otto supervised the second kitchen constructed for the campus located in the Dining Room/Staff Rooms/Kitchen/Commissary Complex (LACO Nos. 1262 and 1263), which served the substantial needs of the General Ward Buildings (LACO Nos. 1184–1188), as well as the rest of the campus. The first campus kitchen and dining room had been located in the Rectory Building, which was demolished in 1927 for the construction of the Auditorium.

After the opening and expansion of the Infirmary Wards in 1926, the number of campus employees had increased to over 500, creating a need for additional kitchen and dining space. In 1927, plans were drawn for a new Kitchen and Employee Dining Building (originally called Kitchen No. 2 or the Service Building) to be located close to the Infirmary Wards for easy access by the employees. The building was designed to have two kitchens and six dining areas, which included a dining area for campus guests and one for the cooks. Harriman wrote the following description of the building in 1934 in the publication The Story of the Rancho: The new Service Building provides one of the finest kitchens in the state—spacious, light and airy under all conditions. Even on the hottest summer day this buildings is cool and comfortable to work in because of a row of 6-foot steel sash around three sides of the top of the wall. This sash may be swung to any position by chain controls from the kitchen floor. Electrically operated meat slicers and mixing equipment, automatic toasters, and other economy and labor saving devices are in constant use.[2] Over the years, the building has been altered to meet the needs of the campus. The Kitchen and Employee Dining Room was one of the few buildings to continue to be used for its original purpose well after the rest of the buildings on South Campus had been closed.

***P3a. Updated Description:**

An assemblage of three connected buildings, the Historic Power Plant (LACO Nos. 1300 & 1302) is located on the northwest corner of Erickson Avenue and Descanso Street. The building is composed of three cubic volumes (1909 Shop, Laundry, Ice Plant, the 1911 Addition, and 1925 Power Plant), which loosely define an L-shaped plan. The 1909 Shop, Laundry, Ice Plant and 1911 Addition, both one-story in height and designed in the Brick Vernacular style, comprise the longer, western leg of the "L." The 1925 Power Plant building, the equivalent of two-stories in height and designed in the Classical Revival style, forms the shorter leg. All three buildings are constructed of brick, which is currently painted. A freestanding concrete chimney, constructed in association with the 1925 Power Plant, is located within the courtyard formed by the L. Rising 140 feet, the chimney tapers toward the top and is finished with vertical fluting. Also in the courtyard, a steel water tower (LACO No. 1301) is documented on separate inventory form.

Flat roofs hidden by parapets top the 1909 and 1911 buildings. Steel-framed skylights illuminate the interior of each space. A circa 1933 wooden water cooling tower sits on the roof of the 1909 Shop, Laundry, Ice Plant.

(See Continuation Sheet 2 of 3.)

***P3a. Updated Description (continued):**

Both the parapets and a frieze are defined by raised and corbelled brick courses. Fenestration on these two buildings consists primarily of single and paired, wood- framed, six-over-six double hung sash windows. Flat-headed, the windows are set into segmental arched openings, with lintels defined by three rows of header bricks and sills by single rows of raised bricks. Original entries located on the south elevation also have segmented arched heads and contain single and double wood doors topped by transoms. A flat-headed metal rollup door on the south elevation of the 1909 wing does not appear to be original. The secondary north elevation of these two buildings are spanned by an attached canopy that shades a band of windows. On the northwest corner, a non-original steel shed has been attached to the complex.

Symmetry characterizes the Classical Revival design of the 1925 Power Plant, with nearly identical three-bay facades facing north and south and thirteen bays spanning the east (Erickson Avenue) elevation. Wrapped by a continuous parapet, the flat roof is bisected by a monitor roof wrapped in a continuous band of steel-framed multi-light windows. Stepped parapets terminate the north and south ends of the monitor. Beneath the parapets, a projecting and tops a molded frieze. The central three bays of the east elevation are given a temple-front treatment, with four raised pilasters carrying a pediment whose tympanum is incised with the year of construction, 1925. Double-door entries are located in the central bays on the east, north and south elevations. The remaining bays are occupied by large, flat-headed, multi-light industrial sash windows. The west elevation is partially adjoined by the 1909 Shop, Laundry, Ice Plant; openings on this elevation are limited to four large, steel-framed multi-light windows that appear at the northern end of the wing, an additional window set high-up at the south end of the wing, and two double doors onto the courtyard.

Vestiges of landscaping remain along the east elevation and include strategically placed palm trees. The other street elevations are set directly on the sidewalk, with no planting areas. Weeds and bushes, by design or by accident, are located near the base of the water tower in the paved courtyard. The property is in deteriorated condition.

B6. Updated Construction History: (Construction date, alterations, and date of alterations)

No building permits were found for this building. Only the architectural drawings for the 1925 Power Plant building were located. Alterations and alteration dates as they can be derived from examination of historic photographs and architectural drawings include: the removal or breakage of original windows; the replacement of original wood doors with metal doors; the addition of a metal clad enclosure on the northwest corner of the 1911 Addition; and the addition of an awning attached to the north elevation (rear) of the 1909 Shop, Laundry, Ice Plant.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of Historic Power Plant (LACO Nos. 1300 and 1302) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The buildings were erected from 1909 to 1925 to provide power for the medical and agricultural activities of the Los Angeles County Poor Farm. The original 1909 Shop, Laundry, Ice Plant was an extension of the City of Downey Power Plant and was constructed and opened at the same time. The evolution and expansion of the facility are indicative of the growth of the Los Angeles County Poor Farm over time and its increased need for more self-sustaining power.

Exterior alterations to the buildings are relatively minor. An interpretation of the Brick Vernacular and Classical Revival Styles, the Historic Power Plant retains integrity of location, feeling, association, design, materials, and workmanship. Most of its character-defining features are intact, including: brick construction and architectural trim; flat roofs with encircling parapets; segmental arched openings; Classical Revival treatment of the north, south, and east elevations of the 1925 building; rooftop features including skylights, cooling tower, and monitor; original double-hung and industrial sash windows; original wood doors and transoms (where extant); and freestanding chimney.

(See Continuation Sheet 3 of 3.)

***B10. Updated Significance (continued):**.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

Several buildings on the South Campus as it exists today date back to the first decade of the 20th century. The first portion of the Power Plant Complex, built in 1909, was among the numerous buildings constructed during that period. A one-story brick building displaying the utilitarian vernacular typical of commercial and industrial architecture of the time, the original powerhouse comprises the east wing of LACO No. 1300. Two years later, in 1911, a one-story addition in the same brick vernacular style was constructed west of the original powerhouse; this is the west wing of LACO No. 1302. The addition housed the campus laundry. A freestanding Water Tower (LACO No. 1301) was erected north of the building in 1913; the tower and tank of are of steel construction and have a capacity of 100,000 gallons.

The County Poor Farm continued to expand, with new buildings that marked a shift in its mission from poor farm to hospital, during the 1910s and 1920s. By 1925, additional power generation capabilities were needed, and a new, larger power plant was built to accommodate expected growth over the next quarter century. Two-stories in height, with monumental Classical Revival detailing, the new building was attached to the east end of the 1909 Original Building, which then was converted into an ice house and machine shop. The freestanding Chimney, located next to the Water Tower, was built concurrently with the new power plant. Sometime between 1933 and 1936, a large wooden Water Cooling Tower was built on the roof of the ice house. In 1966, the steam transfer building (LACO No. 5548) was constructed north of the Complex, which, as in most buildings on the South Campus by that time, was relegated to a secondary role of support facility and storage.

***P3a. Updated Description:**

One of three vertical projections that characterize the Historic Power Plant complex, the Water Tower (LACO No.1301) is located in the courtyard formed by the 1909-1911 Shop, Laundry, and Ice Plant (LACO No. 1302) and the 1925 Power Plant (LACO No. 1300). The Water Tower is a freestanding steel trellis structure, standing 125 feet tall and crowned by a 100,000-gallon capacity, bullet shaped, metal holding tank. Currently not in use, the structure is in fair condition.

(See Continuation Sheet 2 of 2.)

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or architectural drawings were found for this structure. Comparison of historic photographs with the current appearance of the Water Tower suggest that there have not been any alterations to the structure.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Water Tower (LACO No. 1301) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The structure was erected in 1933 to provide a water holding tank for the Power Plant of the Los Angeles County Poor Farm. The structure continued to serve in that capacity until the Power Plant was no longer operating. Visible from the surrounding community, the Water Tower also serves a placemarker in the urban landscape.

The Water Tower has no alterations and still reflects its period of construction. It retains integrity of location, feeling, association, design, materials, and workmanship. The structure has retained the character-defining features of a water holding tank, which include the bullet-shaped tank and freestanding steel trellis support structure. Its setting has been altered through the deterioration of the Historic Power Plant and the surrounding landscape.

***P3a. Updated Description:**

The Aviary (LACO No. 1312) is located in the courtyard of the Men's Psychiatric Wards. The small structure is one-story in height and symmetrical in appearance. A rectangular structure that is longer than it is wide, it sits on a raised circular concrete slab foundation. The wood-framed structure consists of a central, enclosed space with screened-in spaces at each end. A front-gabled roof with moderately overhanging eaves caps the structure. Composition shingles cover the roof and plywood sheets cover the exterior walls. Two screen gates in succession, creating an entry cage, are located at the south end of the structure. Existing landscaping surrounding the Aviary consists of mature shrubs, trees and grass. The resource is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations as they appear from historic photographs include: replacement roofing material and plywood sheeting.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Aviary (LACO No. 1312) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The structure was erected in 1888 in the central court of the original buildings at the County Poor Farm. This courtyard was located in the grassy setback that now occupies the space between the Auditorium (LACO No. 1261) and Erickson Avenue. Consistent with the institution's emphasis on the benefits of exposing inmates of the Poor Farm to nature and the outdoors, the aviary was thought to have a therapeutic effect. In 1929, when the original Administration Building was demolished, the Aviary was replaced by a reflecting pond in the courtyard. By 1932, the Aviary was apparently located on the corner of Consuelo and Erickson, where it briefly became the home of two monkeys. When additional animals were purchased and a small zoo created, new cages were required. Sometime afterwards, the Aviary was moved to its present location in the interior courtyard area of the 1907 Psychiatric Ward Building (LACO No. 1205). It was thought to provide a calming influence for the patients. The structure is currently unoccupied.

Although altered by relocation and reconstruction, the structure reflects the District's period of significance. Intact character-defining features include; medium-pitched roof, screened viewing areas, and utilitarian appearance.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. ***P3a. Updated Description:**

The Brooder House/Vivarium Annex (LACO No. 1335) is located in an open area west of Juniper Street and north of Aliso Street. Utilitarian in style, the Brooder House is one story, symmetrical in appearance and rectangular in plan. It is capped by a low-pitched front gabled roof with slightly overhanging eaves. Rolled asphalt sheets cover the roof. The building sits on a concrete slab foundation and its exterior walls consist of painted unreinforced brick masonry. A band of concrete at the top of the wall plate forms a sort of frieze. The primary entrance is centered on the east façade and consists of a wide wood door set between two boarded up, half-sized sidelights and beneath a boarded up transom. The triangular head of this "surround" echoes the pitch of the roof. Rectangular screened vent openings are located in a linear arrangement high up on the side and rear elevations below the eaves. A series of large, rectangular openings set nearly at ground level on the side elevations indicate that they were intended for the building's original occupants, hens. A shed is located directly north of the structure and it has a concrete block structural system and wood paneled doors. The areas immediately north and west of the structure are paved with concrete. The property is in deteriorated condition and has shows evidence of fire damage.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings could be found for this building. Alterations to this building appear to be limited to replacement roofing material and enclosure of some original openings .

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Brooder House / Vivarium Annex (LACO No. 1335) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1929 as a chicken coop and to house the egg incubator for the County Farm poultry yard. The building continued to be used in that capacity until the farming operations were phased out in the late 1950s. The building is currently abandoned.

Although the building has been somewhat altered, its exterior appearance still reflects its period of construction. It retains integrity of location, design, materials, workmanship, feeling, and association. Extant character-defining features include: front-gabled roof, masonry construction, distinctive primary entrance configuration, and fenestration indicative of its function. Its setting has been altered through the modification of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. ***Recorded by:** *Rebecca L. Silva, Sapphos Environmental, Inc.* ***Date:** *June 2, 2008* ☐ **Continuation** ☒ **Update**

This is an update to two previous surveys:

1 **Resource Identifier:** *Rancho Los Amigos Medical Center* **CHR Status Code:** *2D2*
McAvoy, Christy J. 1994 Northridge Earthquake Project Review: Rancho Los Amigos Medical Center: Survey of Earthquake Damaged Properties for Purposes of Section 106 Review. Historic Resources Group. 26 July 1995

2. **Resource Identifier:** *LACO #1352* **NR Status Code:** *6Z*
Post/Hazeltine Associates. Intensive Historic Structures/Sites Survey for the South Campus of Rancho Los Amigos Rehabilitation Center, Los Angeles County, California. 19 March 2004.

***P3a. Updated Description:**

The Train Station, Warehouse (LACO No. 1352) was originally located west of Laurel Street at its southern curve into Aliso Street. The Train Station, Warehouse has been demolished. Nothing exists of the building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos South Campus Historic District on September 30, 1996. It is therefore also listed in the California register of Historical Resources (CRHR) (under Criterion 1). The current study confirmed that the Train Station, Warehouse (LACO No. 1352) is no longer a contributor to the Historic District under Criterion 1 due to its demolition.

***P3a. Updated Description:**

Tool House (LACO No. 1356) is located almost centrally in the block bounded by Consuelo Street to the north and east, Erickson Avenue to the west, and Bonita Street to the south. It is one-story, nearly symmetrical in appearance and rectangular in plan. The wood-framed, vernacular building is capped by a low-pitched, front-gabled roof with exposed rafters underneath the overhanging eaves. Small square vents with wide wood casings are located in the gable ends. The building sits on a concrete slab foundation and is clad in board-and-batten siding. Fenestration on all elevations consists of two-over-one wood-framed double-hung windows. The primary entrance is offset to the north on the west façade and contains a wide, wood slab door. Both windows and front door are defined by plain wood surrounds. A shed has been attached to the south elevation. The area surrounding the property is paved in concrete and asphalt.. The property is in deteriorated condition.

Sapphos Environmental, Inc., June 2010. Rancho Los Amigos Historic District Update Report, Prepared for the County of Los Angeles.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. There do not appear to be any alterations to the building.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Tool House (LACO No. 1356) as a contributor to the Historic District under Criterion A/1,association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1926 as a service and support building for the operations of the County Farm. The building continued to be used as a tool storage area until it was abandoned in the late 20th century.

The exterior appearance of the building still reflects the District's period of significance. The building retains integrity of location, feeling, association, design, materials, and workmanship. Character-defining features include: low-pitched, front-gabled roof with slightly projecting eaves; wood-framing and board-and-batten siding; exposed rafters; wood sash windows; and wide window and door surrounds with slightly projecting wooden sills. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. Beginning in 1907 with the construction of the psychiatric wards, the County Poor Farm began to transition away from the provision of indigent care and focus instead on the treatment of patients with chronic medical and/or psychiatric conditions. By 1952, the former County Poor Farm, renamed Rancho Los Amigos in 1932, had evolved into a medical hospital that specialized in the rehabilitative care of persons with physical disabilities, and was especially associated with the treatment of polio. By the end of 20th century, the Historic District had been largely vacated (except for storage), in favor of newer hospital buildings built north of the Historic District.

***P3a. Updated Description:**

The Landscape Office (LACO No. 1357) is located in the southwest portion of a large, open, grassy area bounded by Consuelo Street to the north, Erickson Avenue to the east, Bonita Street to the south, and Dahlia Street to the west. A one-story, vernacular building, the Landscape Office is asymmetrical in appearance and rectangular in plan. A shed roof that slopes down towards the west tops the building, while a full-width, attached porch is covered by a lower shed roof which slopes the opposite direction. Composition shingles cover the roofs. Both the exterior walls and the foundation skirting are sheathed with board-and-batten siding. The porch is elevated a few steps above ground level. Wood posts support the porch roof. No railing encloses the porch space. The entry is located at the north end of the façade (east); the only other opening on this elevation is a small window at the south end. Fenestration on the remaining elevations is similarly sparse and consists of variously sized aluminum sash sliders. Two detached wood sheds nearly abut the west (rear) elevation. Existing landscaping surrounding the Landscape Office consists of mature trees and patchy grass. The property is in deteriorated condition.

***B6. Updated Construction History:** (Construction date, alterations, and date of alterations)

No building permits or original architectural drawings were found for this building. Alterations include the replacement of the original wood framed windows with metal sliding windows and the replacement of the roofing material with rolled composition shingles.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. The current study confirmed the significance of the Landscape Office (LACO No. 1357) as a contributor to the Historic District under Criterion A/1, association with events that have made a significant contribution to the broad patterns of local or regional history. The property is significant for its association with the development of the Los Angeles County Poor Farm, which had a period of significance from 1888 to 1952. The building was erected in 1938 to serve as the landscaping office for the grounds supervisor of the County Poor Farm. Landscaping had been integral to the overall design of the Poor Farm since its founding in 1888. The landscaping was carefully crafted over the years to create a beautiful, lush welcoming environment for the patients, staff, and visitors. This building served as the landscaping administrative office for many years until the deterioration of the grounds in the late 20th century. The building is currently abandoned.

Although the building has been somewhat altered, its exterior appearance still reflects the District's period of significance. It retains integrity of location, feeling, association, design, materials, and workmanship. Extant character-defining features include: shed roof, full-width porch with wooden floors and posts, wood structural system, and board-and-batten siding. Its setting has been altered through the deterioration of the surrounding landscape.

History:

Established in 1888, the Los Angeles County Poor Farm is an important institution in the public welfare and health care history of the County of Los Angeles. The County Poor Farm was built to provide a publicly-funded facility to house indigents with the Los Angeles County hospital system. In its role as a farm, the County Poor Farm supplied agricultural products to other Los Angeles County institutional facilities during the first half of the 20th century. ***P3a. Updated Description:**

Composed of two attached buildings, the Garage (LACO Nos. 1379 and 4121) is located in an open area directly southeast of the intersection of Laurel and Bonita Streets and west of Juniper Street. The Garage is one-story, with a central roof projection, asymmetrical in appearance and rectangular in plan. Long and linear, the wood-framed, utilitarian building is capped by a shed roof with a front overhang and shallow eaves. The building sits on a concrete slab foundation. Both the roof and the exterior walls are covered with corrugated metal sheets. Windows are located on the south and west elevation of LACO No. 1379 only and Include two windows that have been boarded up and one wood sash two-over-two casement window with safety glass. The north façade consists of an open loggia supported by wood posts. The ground north of the garage is paved with asphalt whereas the area south of the building is dirt with patchy grass and weeds. The property is in deteriorated condition.

***B10. Updated Significance:**

This property was determined eligible for listing in the National Register of Historic Places under Criterion A as a contributor to the Rancho Los Amigos Historic District on September 30, 1996. It is therefore also listed in the California Register of Historical Resources under Criterion 1. However, the current study confirmed that Garage, Shed (LACO No. 4118) is no longer a contributor to the significance of the Historic District due to a date of construction that post-dates the 1888-1952 period of significance of the Historic District. According to historic aerials, the building was erected in circa 1965. A revised CHR status code of 6Z is recommended.

APPENDIX B
GLOSSARY OF TERMS

GLOSSARY OF TERMS

This glossary provides definitions of architectural terms used in various environmental documentation produced in support of the Rancho Los Amigos Historic District. These definitions were obtained from recognized literature in the field of historic resources. A list of reviewed literature is provided in the References section below.

Arcade: A series of arches supported by columns or pillars; a covered passageway.

Architrave: An ornamental molding or decorative band around or above an opening, such as a door or window or around a panel. In Classical orders, it is the lowest member of entablature, which is the beam that spans from column to column, resting directly on the capitals of the columns.

Art Deco: A decorative style stimulated by the Paris Exposition International des Arts Decoratifs et Industrielles Modernes of 1925, and widely used in the architecture of the 1930s, including skyscrapers designs such as the Chrysler Building in New York; characterized by sharp angular or zigzag surface forms and ornaments. Also referred to as Style Moderne.

Battered: To incline from the vertical. When a wall or pier is thicker at the bottom than it is at the top.

Baroque: A European style of architecture and decoration that developed in the 17th century in Italy from late Renaissance and Mannerist forms and culminated in the churches, monasteries, and places of southern Germany and Austria in the early 18th century. It is characterized by interpenetration of oval spaces, curved surfaces, and conspicuous use of decoration, sculpture, and color.

Barrel vault: A masonry vault of plain, semicircular cross section, supported by parallel walls or arcades and adapted to longitudinal areas.

Bay: Within a structure, a regularly repeated spatial element defined by beams or ribs and their supports.

Board-and-batten: A type of wall cladding for wood-frame houses; closely spaced, applied boards or sheets of plywood, the joints of which are covered by narrow wood strips.

Bracket: Any overhanging member projecting from a wall or other body to support a weight, such as a cornice, acting outside the wall.

Art Deco: A decorative style stimulated by the Paris Exposition International des Arts Decoratifs et Insustrielles Modernes of 1925, widely used in the architecture of the 1930s, including skyscraper designs such as the Chrysler Building in New York; characterized by sharp angular or zigzag surface forms and ornaments. Also referred to as Style Moderne.

Brick Vernacular: A vernacular building using brick as its structural system.

Building code: Law setting forth minimum standards for the construction and use of buildings to protect the public health and safety.

Casement window: A window sash that swings open along its entire length, usually on hinges fixed to the sides of the opening into which it is fitted.

Character-defining feature: *Character* refers to all those visual aspects and physical features that make up the appearance of every historic building. Character-defining elements include the overall shape of the building, its materials, craftsmanship, decorative details, interior spaces, and features, and the various aspects of its site and environment.

Classical Revival style: A style of American architecture, based primarily on the use of Roman forms and classical antiquity, typically symmetrical in form and sometimes similar to a classical temple.

Contributor: A site, building, or structure in a historic district that generally has historic, architectural, cultural, or archaeological significance.

Coping: A protective cap, top, or cover of wall, parapet, pilaster, or chimney; often of stone, terracotta, concrete, metal, or wood. May be flat, but commonly sloping, double-beveled, or curved to shed water so as to protect masonry below from penetration of water from above. Most effective if extended beyond wall face and cut with a drip.

Corbel: In masonry, a projection or one of a series of projections, each stepped progressively farther forward with height; anchored in a wall, story, column, or chimney; used to support an overhanging member above or, if continuous, to support overhanging courses; may support an ornament of similar appearance.

Corbel brick course: A masonry course acting as a corbel, or an ornament of similar appearance.

Cornice: Any molded horizontal projection that crowns or finishes the top of a wall where it meets the edge of the roof; sometimes ornamented. The exterior trim of a structure where the wall and roof meet. The third or uppermost division of an entablature, resting on the frieze. An ornamental molding that forms the top member of a door or window frame, usually of wood or plaster. An ornamental molding that usually extends around the walls of a room just below the ceiling.

Craftsman style: A style of house most popular from about 1900 to 1920, greatly influenced by the Arts and Crafts movement and popularized by Gustav Stickley in *The Craftsman*. Stickley also made construction drawings of such houses, in many sizes and configurations, available at a reasonable price. Complete precut components for the houses were available for purchase by catalogue from mail-order companies and were shipped by railroad to destinations throughout the nation. As a result, this style of house became the most popular small dwelling in the nation. The interior typically featured a high wainscot that was integrated with the decor and windows as part of the structural decoration. The stairway from the living room to the floor was often an important feature.

Crown molding: Any molding serving as a corona or otherwise forming the crowning or finishing member of a structure.

Cupola: A domical roof on a circular base often set on the ride of a roof.

Dentil: One of a band of small, square, toothlike blocks forming part of the characteristic ornamentation of the Iconic, Corinthian, and Composite orders, and sometimes the Doric.

Dormer: A structure projecting from a sloping roof usually housing a window or ventilating louver.

Elevation: A drawing showing the vertical elements of a building, either exterior or interior, as a direct projection onto a vertical plane. The vertical distance above or below some established reference level.

Eligible property: Property that meets the criteria for inclusion in the National Register of Historic Places but is not formally listed.

Entablature: In Classical architecture and its derivatives, an elaborate horizontal band and molding supported by columns; horizontally divided into three basic elements: architrave, frieze, and cornice. The proportions and detailing of an entablature are different for each order and are strictly prescribed. Any similar construction that crowns a wall, window, or doorway.

Facade: The exterior face of a building that is considered to be the architectural front, sometimes distinguished from the other faces by more elaborate architectural and/or ornamental details.

Fenestration: The design and arrangement of windows in a building.

Flute: A lengthwise groove or channel, especially one of many such parallel grooves, used decoratively, as along the shaft of a column.

Freestanding: A term descriptive of a structural element that is fixed at its lower end but not constrained throughout its vertical height.

Frieze: In Classical architecture and derivatives, the middle horizontal member of three main divisions of an entablature; it is above the architrave and below the cornice. A decorative band at or near the top of an interior wall below the cornice. In house construction, a horizontal member connecting the top row of the siding with the underside of the cornice.

Gable: The vertical triangular portion of the end of a building having a double-sloping roof, from the level of the cornice or eaves to the ridge of the roof.

Gargoyles: A waterspout projecting from the roof gutter of a building, often carved grotesquely.

Guidelines: A reference to *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring & Reconstructing Historic Buildings* (Guidelines). The Guidelines have been prepared to assist in applying the Secretary of the Interior's Standards to all project work; consequently, they are not meant to give case-specific advice or address exceptions or rare instances. Therefore, it is recommended that the advice of qualified historic preservation professionals be obtained early in the planning stage of the project. Such professionals may include architects, architectural historians, historians, historical engineers, archaeologists, and others who have experience in working with historic buildings. The Guidelines pertain to both exterior and interior work on historic buildings of all sizes, materials, and types.

Historic district: An area that generally includes within its boundaries a significant concentration of properties linked by architectural style, historical development, or a past event.

Integrity: The authenticity of physical characteristics from which properties obtain their significance.

Lintel: A horizontal structural member that spans the top of an opening such as a window; supports the weight of the wall directly above it.

Massing: The overall bulk, size, physical volume, or magnitude of a structure.

Monitor: A superstructure that straddles the ridge of a roof or that crowns a roof or dome; may be glazed to provide light below or may be louvered to provide ventilation below.

National Register of Historic Places: The National Register of Historic Places is the nation's official list of cultural resources worthy of preservation. Authorized under the National Historic Preservation Act of 1966, the National Register is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect the nation's historic and archaeological resources. Properties listed in the National Register include districts, sites, buildings, structures, and objects that are significant in American history, architecture, archaeology, engineering, and culture. The National Register is administered by the National Park Service, which is part of the U.S. Department of the Interior.

Noncontributor: A feature consisting of a site, building, or structure located within a historic district that is not recognized as contributing to the historic, architectural, cultural, or archaeological significance of the district.

Order: In Classical architecture, a particular style of column having a prescribed entablature and standardized details, including its capital and base. The term often is limited to a single shaft of a column with its associated appurtenances; the distinction between one order and another is marked by the details of one such unit of a colonnade. The Greeks developed the Doric order, Ionic order, and Corinthian order; the Romans added the Composite order and Tuscan order. For each order, the height and spacing of the columns were established in terms of a specified number of diameters of the lower part of the columns, and the design of the base also was prescribed; the height of the entablatures was determined by the height of the columns. Often used in Classical Revival style, Greek Revival style, and Neoclassical style buildings in America before the 20th century.

Ornament: In architecture, a detail of shape, texture, and/or color—such as an embellishment or decoration—that is deliberately exploited to attract the attention of an observer.

Parapet: A low-guarding wall at any point of sudden drip, as at the edge of a terrance, roof, battlement, balcony, etc. In an exterior wall, fire wall, or party wall, the part entirely above the roof.

Pediment: In Classical architecture and its derivatives, a low triangular gable usually having a horizontal cornice enclosing a tympanum, with raked cornices on each side, surmounting or crowning a portico or another major division of a facade, end wall, or a colonnade. A gable above or over a door, window, or hood; usually has a horizontal cornice, crowned with slanting sides forming a triangle but also may be crowned with other configurations, such as curved or broken sides.

Pent roof: A roof formed like an inclined plane, the slope being all on one side.

Period of significance: The span of time during which significant events and activities occurred. Events and associations with historic properties are finite; most properties have a clearly definable period of significance.

Picture rail: Any of numerous types of moldings or other such devices formed so as to support picture hooks at or near the ceiling.

Pier: A column designed to support concentrated load. Also known as a member, usually in the form of a thickened section, which forms an integral part of a wall; usually placed at intervals along the wall to provide lateral support or to take concentrated vertical loads.

Pivot window: A window having a sash (ventilator) that rotates about fixed vertical or horizontal pivots, located at or toward the center, in contrast to one hung on hinges along an edge.

Porte-cochère: A door-way large enough to let a vehicle pass from street to parking area. Also known as a carriage porch.

Preservation: The act or process of applying measures necessary to sustain the existing form, integrity, and materials of a historic property. Work, including preliminary measures to protect and stabilize the property, generally focuses on the ongoing maintenance and repair of historic materials and features rather than on extensive replacement and new construction. New exterior additions are not within the scope of this treatment; however, the limited and sensitive upgrading of mechanical, electrical, and plumbing systems and other code-required work to make properties functional is appropriate within a preservation project.

Proscenium arch: An arch or any equivalent opening in the proscenium wall through which the state is seen by the audience.

Reconstruction: The act or process of depicting, by means of new construction, the form, features, and detailing of a nonsurviving site, landscape, building, structure, or object for the purpose of replicating its appearance at a specific period of time and in its historic location.

Rehabilitation: The act or process of making possible a compatible use for a property through repair, alterations, and additions while preserving those portions or features that convey its historical, cultural, or architectural values.

Restoration: The act or process of accurately depicting the form, features, and character of a property as it appeared at a particular period of time by means of the removal of features from other periods in its history and reconstruction of missing features from the restoration period. The limited and sensitive upgrading of mechanical, electrical, and plumbing systems and other code-required work to make properties functional is appropriate within a restoration project.

Segmental arch: A circular arch in which the intrados is less than a semicircle.

Skylight: In a roof, an opening that is glazed with a transparent or translucent material; used to provide light to the space below it.

Sleeping porch: A porch, or a room lined with windows, used for sleeping; often located in an extension to a house, above another porch, or above a porte cochère.

Spanish Colonial Revival: An architectural style best known by the simple adobe to imposing Baroque inspired missions of the Southwest. Domestic architecture characterized by: single-story structures with flat or low pitched roof, stucco covered stone or adobe brick walls, multiple doors and sometimes verandas as well as courtyards (patios) with corridors (interior verandas).

Standards: Refers to *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, & Reconstructing Historic Buildings* (Standards). The Standards makes recommendations for maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations; as such, the Standards cannot, in and of itself, be used to make essential decisions about which features of a historic property should be saved and which might be changed. But once an appropriate treatment is selected, the Standards provides philosophical consistency to the work. There are Standards for four distinct, but interrelated, approaches to the treatment of historic properties: preservation, rehabilitation, restoration, and reconstruction.

Steel-frame construction: Construction in which the structural supporting elements consist of some combination of steel beams, steel girders, and/or steel columns that are rigidly joined at their intersections.

Stringcourse: A continuous horizontal band of brick, stone, or wood on the exterior wall of a building; used for decorative purposes, or as a means of breaking up a large expanse of wall surface.

Terrazzo: Marble-aggregate concrete that is cast in place or precast and ground smooth; used as a decorative surfacing on floors and walls.

Transom window: A small window or series of panes above a door, or above a casement or double-hung window.

Tripartite window: A window having three sashes of the same height and in the same plane; there is a wide rectangular sash at its center and a narrower sash on each side; essentially the same as a Palladian window with the rounded head of the center sash lopped off at the top.

Truss: A combination of structural members, usually in some form of triangular arrangement, that provides a rigid framework for supporting roofs, floors, and the like.

Tuscan order: One of the five Classical orders; a simplified version of the Roman Doric order to which it is similar but has fewer and bolder moldings, unfluted columns, a plain frieze, and no triglyphs; its only decorative details are moldings.

Vernacular architecture: Architecture that makes use of common regional forms and materials at a particular place and time; sometimes includes strong ethnic influences of an immigrant population. Usually modest, unassuming, and unpretentious, and often a mixture of traditional and more modern styles or a hybrid of several styles. Houses were often owner-built by people familiar with local materials, regional climatic conditions, and local building customs and techniques, as described under folk literature. In contrast, industrial vernacular architecture has been the work of

architects as well as by owner-builders; their designs often have been based on examples from pattern books, using readily available manufactured components described in catalogs.

Voussoir: A wedge-shaped masonry unit in an arch or vault whose converging sides are cut as radii of one of the centers of the arch or vault.

Construction Energy Analysis

Fuel Consumption Summary

Category	Value
Diesel fuel for heavy-duty construction equipment	252,165
Diesel fuel for Haul Trucks	47,230
Diesel fuel for Vendor Trucks	125,609
Gasoline fuel for workers	191,724
Total Diesel Consumption	425,004
Total Gasoline Consumption	191,724
Construction Phase Duration (years)	2.5
Annual Average Gallons Diesel	**169,167**
Annual Average Gallons Gasoline	**76,313**

Fuel saved with ATCM

10,660

Source	Diesel	Gas
Off-Road Equipment	252,165	-
Haul/Vendor	172,839	-
Worker	-	191,724
Total Project Fuel Consumption	**425,004**	**191,724**
Annual Average Gallons Diesel	**169,167**	
Annual Average Gallons Gasoline		**76,313**

	Los Angeles County Fuel Consumption		State Fuel Consumption	
	Diesel	**Gas**	**Diesel**	**Gas**
	590,196,078	3,659,000,000	3,798,039,216	15,584,000,000
Annual Project % of Consumption	0.029%	0.0021%	0.0045%	0.0005%

1. California Energy Commission, California Retail Fuel Outlet Annual Reporting (CEC-A15) Results, 2017
https://www.energy.ca.gov/almanac/transportation_data/gasoline/2010-2017_A15_Results.xlsx
Diesel is adjusted to account for retail (51%) and non-retail (49%) diesel sales.

Greenhouse Gas Emissions Documentation

ESA

Rancho Los Amigos
GHG Tech Report
Greenhouse Gases - Operational Emissions

Summary of Estimated Unmitigated Annual GHG Emissions (CEQA Analysis)

Source	GHG Emissions MTCO2e
Project	
Construction	
Amortized Construction[1]	212
Stationary (Emergency Generators)	237
Area	0.1
Energy - Natural Gas	363
Energy - Electricity	2,635
Waste	304
Water	816
Mobile	7,622
Total	**12,189**

Project Emissions (MTCO2e)		12,189
Significance Indicator		3,000
Exceeds Significance Indicator?	YES	

Notes:

1. Total construction-related GHG emissions amortized over 30 years, per SCAQMD guidance.

a Totals may not add up exactly due to rounding in the modeling calculations.

metric tons/yr	**235.00**	**237.117812938906**

Notes:

1. Emission factors for VOC and NOX: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
2. Emission factors for CO, PM10, and PM2.5: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
3. Emission factor for SO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1. Emission Factor for SO2 is based on 15 ppm (0.0015%) S1 from the EPA Nonroad Diesel Fuel Program, and assumes complete conversion to SO2.
1. Emission factor for CO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1. Emissions of GHGs assume 99.11% of the CO2e emissions occur as CO2, which is typical for off-road diesel engines.

TRAFFIC NOISE ANALYSIS TOOL

Project Name: Rancho Los Amigos South Campus
Project Number: D170230
Analysis Scenario: Grading and Excavation (Remediation)
Source of Traffic Volumes: County

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)	Noise Level dBA CNEL
			Auto	MT	HT	Auto	MT	HT		
Imperial Highway between I-710 and Erickson	Hard	50	35	35	35	0	0	77	65.0	65.3

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

1.0 INTRODUCTION

This traffic analysis has been conducted to identify and evaluate the potential traffic impacts generated by the proposed Rancho Los Amigos South Campus project located on land owned by the County of Los Angeles (County) in the City of Downey. The project applicant proposes to construct three new County administrative uses serving up to 3,000 employees: the Internal Services Department (ISD) Headquarters, Probation Department Headquarters, and a County Office Building. The project site is bound by Flores Street and Golondrinas Street to the north, Gardendale Street to the south, Laurel Street to the west, the Union Pacific Railroad to the southwest, Rives Avenue and Dahlia Avenue to the east, and a strip that runs east along Consuelo Street to Paramount Boulevard. The project site location and general vicinity are shown in ***Figure 1–1***.

The traffic analysis follows Los Angeles County Department of Public Works (LACDPW) traffic study guidelines[1] and is consistent with traffic impact assessment guidelines set forth in the Los Angeles County Congestion Management Program[2]. This traffic analysis evaluates potential project-related impacts at 27 key intersections in the vicinity of the project site, which were identified as those intersections that could potentially be most affected by traffic generated by the proposed project. The study intersections were determined in consultation with LACDPW Traffic and Lighting Division staff, as well as transportation staff at the City of Downey, City of South Gate, City of Paramount, and City of Lynwood. The Intersection Capacity Utilization (ICU) method was used to determine Volume-to-Capacity (*v/c*) ratios and corresponding Levels of Service (LOS) for the signalized study intersections located within the City of Downey, City of South Gate, City of Paramount, and the County of Los Angeles. The Highway Capacity Manual (HCM) method was used to determine Control Delays and corresponding Levels of Service (LOS) for the unsignalized study intersections. The Critical Movement Analysis (CMA) method was used to determine Volume-to-Capacity (*v/c*) ratios and corresponding Levels of Service (LOS) for the study intersection located within the City of Lynwood. A review was also conducted of Los Angeles County Metropolitan Transportation Authority freeway and intersection monitoring stations to determine if a Congestion Management Program (CMP) transportation impact assessment analysis is required for the proposed project.

This study (i) presents existing traffic volumes, (ii) includes existing traffic volumes with the forecast net new traffic volumes from the proposed project, (iii) forecasts future cumulative traffic volumes with and without the proposed project, (iv) recommends mitigation measures, where feasible to address significant impacts, and (v) provides an assessment of construction-related traffic impacts.

1.1 Study Area

Upon coordination with LACDPW Traffic and Lighting staff, as well as consultation with nearby cities, 27 study intersections have been identified for evaluation during the weekday morning and afternoon peak hours. The 27 study intersections provide local access to the study area and define the extent of the boundaries for this traffic impact analysis. Further discussion of the existing street system and study area is provided in Section 4.0.

The general location of the project in relation to the study intersection locations and surrounding street system is presented in *Figure 1–1*. The traffic analysis study area is generally comprised of those locations which have the potential to experience significant traffic impacts due to the proposed project. In the traffic engineering practice, the study area generally includes those intersections that are:

a. Immediately adjacent or in close proximity to the project site;

b. In the vicinity of the project site that are documented to have current or projected future operational issues; and

c. In the vicinity of the project site that are forecast to experience a relatively greater percentage of project-related vehicular turning movements (e.g., at freeway ramp intersections).

The locations selected for analysis were based on the above criteria, the forecast Rancho Los Amigos South Campus project peak hour vehicle trip generation, consultation with staff from the LACDPW Traffic and Lighting Division and adjacent cities, the anticipated distribution of project vehicular trips, and existing intersection/corridor operations.

2.0 PROJECT DESCRIPTION

2.1 Site Location

The site of the proposed Rancho Los Amigos South Campus project is located on the south side of Flores Street on 74 acres of County-owned land in the City of Downey, California. The project site is bound by Flores Street and Golondrinas Street to the north, Gardendale Street to the south, Laurel Street to the west, the Union Pacific Railroad to the southwest, Rives Avenue and Dahlia Avenue to the east, and a strip that runs east along Consuelo Street to Paramount Boulevard. The area in which new County buildings and infrastructure are proposed (the Development Area; 28 acres) is bound by Flores Street and Golondrinas Street to the north, the parking lot adjacent to Dahlia Street and the Assistance League of Downey to the east, a mid-block between Descanso Street and Bonita Street to the south, and Laurel Avenue to the west. The project site location and general vicinity are shown in *Figure 1–1*.

2.2 Existing Project Site

The existing project site contains approximately 107 County-owned buildings and structures, as well as two other features, including a Moreton Bay Fig Tree and the Ranch Los Amigos Site Plan, resulting in approximately 109 total features on the project site, many of which are varying in degrees of abandonment and deterioration. Many of the buildings on the existing project site have been boarded-up since roughly 1991. The project site is currently unoccupied with the exception of LACO No. 1100, Administration/Safety Police Building that currently houses the County Office of Public Safety including approximately 50 employees, and LACO No. 3591, which houses the City of Downey's Rose Float Association operations (minimal seasonal staff). These uses would continue in their current operation. Some other buildings are used for maintenance and storage (LACO Nos. 7000 and 1286). Access to the interior of the project site is not available to the public, as an eight-foot chain link fence surrounds the perimeter of the project site.

2.3 Proposed Project Description

The Rancho Los Amigos South Campus project proposes to develop three new County administrative buildings on the existing project site. The ISD Headquarters (up to 315,000 square feet), Probation Department Headquarters (up to 168,000 square feet), and the County Office Building (up to 167,000 square feet) and associated parking and infrastructure would be constructed within the 35-acre Development Area, in the northern part of the project site. In total, up to 650,000 square feet of net new building floor area is proposed to be developed, accommodating up to 3,000 County employees (not including the existing uses). Construction and occupancy of the proposed project is anticipated to be completed by the year 2021. Nearly all buildings and landscape features would be demolished, except for three buildings and the Moreton Bay Fig Tree which would remain on the project site. One building is the County Office of Public Safety building, which will remain in its current use. The two other buildings are currently closed and vacant, and there is no proposal to occupy these buildings in the future. The proposed site plan for the proposed project is illustrated in ***Figure 2–1***.

RANCHO LOS AMIGOS SOUTH CAMPUS

o:\0354\dwg\f2-1.dwg 07/08/2019 14:30:27 jshender llg exhibits color.ctb

Vehicular access would be provided via Erickson Avenue and Flores Street. Further discussion of the project site access and circulation schemes is provided in Section 3.0.

County staff proposed to be accommodated at the new buildings currently work at existing facilities, many of which are in proximity to the project site. ***Table 2–1*** provides a summary of the staff anticipated to be relocated to the new buildings on the site in conjunction with the project. Some of the existing staffing sites are located two or more miles away from the project site. There is the potential for other County departments to backfill the existing buildings to be vacated as a part of this project, or for some of the existing County-owned buildings to be sold; however, it is speculative at this time to anticipate the long-term use of these buildings. Nevertheless, this traffic study conservatively assumes that all relocated County workers would generate "new" vehicle trips that would be added to traffic volumes on the local street system.

Table 2-1
LOS ANGELES COUNTY DEPARTMENTS AFFECTED BY THE PROPOSED PROJECT [1]

07-Mar-19

DEPARTMENT NAME	NUMBER OF STAFF TO BE RELOCATED	COUNTY OWNED OR LEASED	APPROXIMATE DISTANCE FROM PROJECT SITE
Probation Department Staff Relocated to Rancho South Campus			
9150 E. Imperial Highway, Downey (Probation HQ/ISD HQ - County-Owned)	688	County-Owned	2.0 Miles East
9525 E. Imperial Highway, Downey (Probation Lease)	109	Probation Lease	3.0 Miles East

[1] Sources: County of Los Angeles Department of Public Works, 2019

3.0 SITE ACCESS AND CIRCULATION

A proposed site access plan for the Rancho Los Amigos project is displayed in *Figure 2–1*. A description of proposed site access and circulation is provided in the following subsections.

3.1 Existing Vehicular Site Access

Vehicular access to the project site from the general public is not permitted, as the project site is currently gated. However, historically, Erickson Avenue served as the primary access into the project site (from Imperial Avenue to the north and Gardendale to the south), as well as access from the east from Consuelo Street. The existing 50 employees at the County Office of Public Safety use these access points.

3.2 Vehicular Project Site Access

A secured Level 1 (ground floor) public entrance to the project site would be provided from Golondrinas Street, which is currently gated and does not allow for regular vehicle access. A dedicated entrance from the secured parking area to the ISD and Probation Department Headquarters buildings would also be provided. Off-campus visitors would arrive on campus through a new parking structure. The parking structure would contain a minimum of two vehicular entry/exit locations from either the extended Rives Avenue and/or Golondrinas Street, as well as two pedestrian access points. Loading docks for the ISD and Probation Department Headquarters buildings are proposed to be located along Rives Avenue. The loading docks are proposed to be integrated into the building façade and be fully screened.

The County Office Building and associated parking structure would be accessed from vehicular entry/exit points from Flores Avenue and Laurel Street, and will be fully contained within the security wall with controlled access through ingress and egress gates. The primary access point for the County Office Building would be set back from the street and may include a covered entry.

As described in Section 7.2, while the vehicular access points for the parking structures serving the ISD and Probation Department Headquarters buildings and County Office Building have not been finalized, the actual driveways will not affect the assumed assignment of project-related trips to the analyzed study intersections.

4.0 EXISTING STREET SYSTEM

4.1 Regional Highway System

Primary regional access is provided by the I-105 (Century) Freeway and I-710 (Long Beach) Freeway, as shown in *Figure 1-1*. A brief description of the I-105 and I-710 freeways are provided in the following paragraphs.

I-105 (Century) Freeway is an east-west freeway that extends from El Segundo to Norwalk. In the project vicinity, one HOV lane and three to four mixed-flow travel lanes are provided in each direction. Eastbound and westbound ramps are provided on the I-105 Freeway at Garfield Avenue and Paramount Boulevard in the project vicinity.

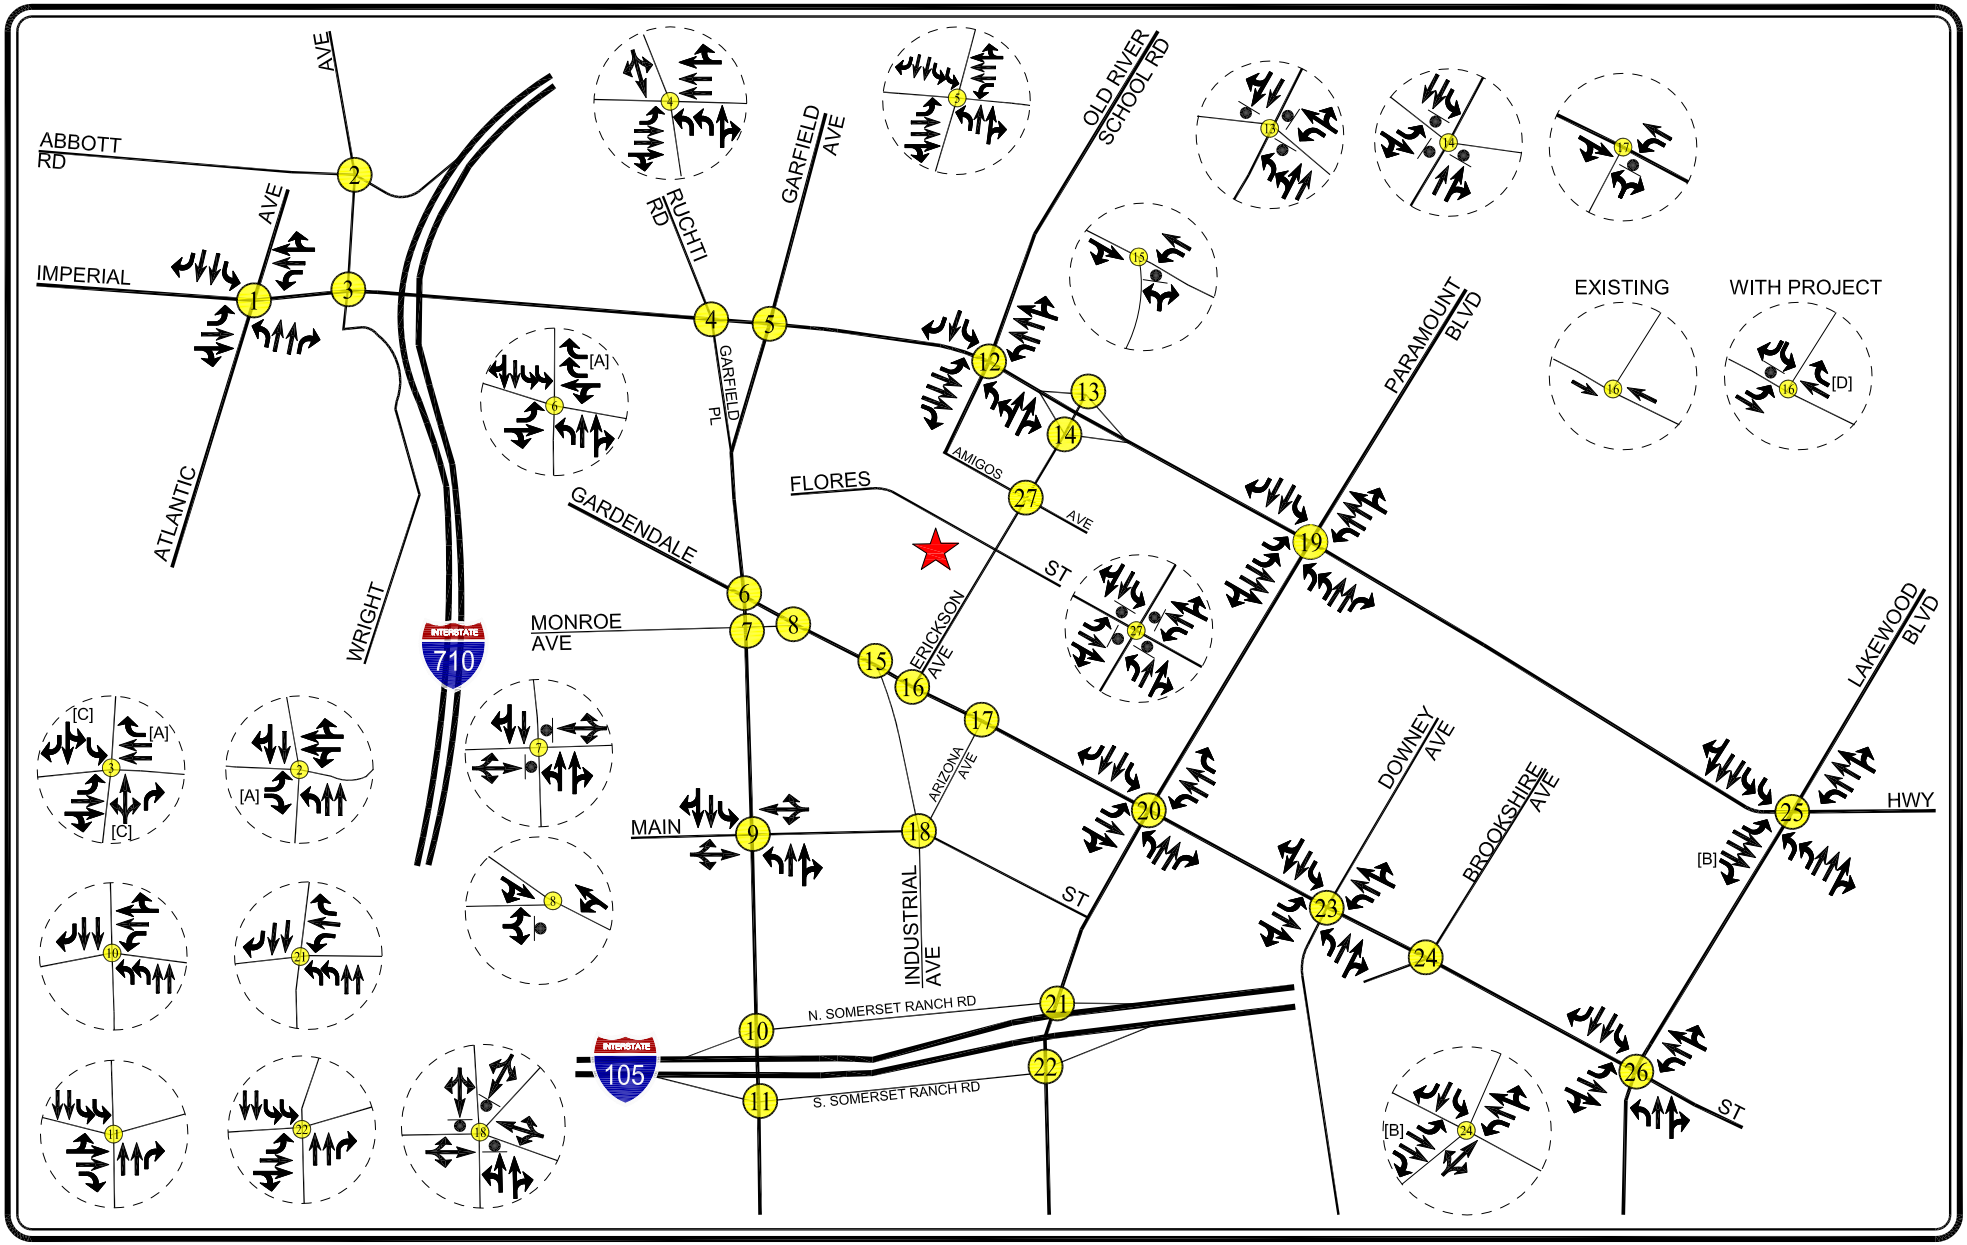
I-710 (Long Beach) Freeway is a north-south freeway that extends from Alhambra to Long Beach. In the project vicinity, four mixed-flow travel lanes are provided in each direction on the I-710 Freeway. Northbound and southbound ramps are provided on the I-710 Freeway at Imperial Highway in the project vicinity.

4.2 Local Street System

The following intersections (and their jurisdictional authority were selected in consultation with LACDPW Traffic and Lighting Division staff (as well as staff from adjacent cities) for analysis of potential traffic impacts due to the proposed project:

1. Atlantic Avenue / Imperial Highway (City of Lynwood)
2. Wright Road / Abbott Road – I-710 Southbound Off-Ramp (City of South Gate)
3. Wright Road / Imperial Highway (City of Lynwood / City of South Gate)
4. Ruchti Road-Garfield Place / Imperial Highway (City of South Gate)
5. Garfield Avenue / Imperial Highway (City of South Gate)
6. Garfield Avenue / Gardendale Street (City of Downey / City of South Gate)
7. Garfield Avenue / Monroe Avenue (City of South Gate) [Unsignalized]
8. Gardendale Street / Monroe Avenue (City of South Gate) [Unsignalized]
9. Garfield Avenue / Main Street (City of South Gate)
10. Garfield Avenue / N. Somerset Ranch Road (City of Paramount)
11. Garfield Avenue / S. Somerset Ranch Road (City of Paramount)
12. Old River School Road / Imperial Highway (City of Downey)
13. Erickson Avenue / W. Imperial Highway (City of Downey / County of Los Angeles) [Unsignalized]
14. Erickson Avenue / E. Imperial Highway (City of Downey / County of Los Angeles) [Unsignalized]

15. Industrial Avenue / Gardendale Street (City of Downey / City of South Gate) [Unsignalized]
16. Erickson Avenue / Gardendale Street (City of Downey / City of South Gate / County of Los Angeles) [Unsignalized]
17. Arizona Avenue / Gardendale Street (City of Downey / City of South Gate) [Unsignalized]
18. Industrial Avenue – Arizona Avenue / Gardendale Street (City of South Gate) [Unsignalized]
19. Paramount Boulevard / Imperial Highway (City of Downey)
20. Paramount Boulevard / Gardendale Street (City of Downey / City of South Gate / City of Paramount)
21. Paramount Boulevard / N. Somerset Ranch Road (City of South Gate)
22. Paramount Boulevard / S. Somerset Ranch Road (City of South Gate)
23. Downey Avenue / Gardendale Street (City of Downey / City of Paramount)
24. Brookshire Avenue – N. Somerset Ranch Road / Gardendale Street (City of Downey)
25. Lakewood Boulevard / Imperial Highway (City of Downey)
26. Lakewood Boulevard / Gardendale Street (City of Downey)
27. Erickson Avenue / Amigos Avenue (City of Downey / County of Los Angeles) [Unsignalized]



Eighteen of the 27 study intersections selected for analysis are presently controlled by traffic signals, while nine of the intersections are stop-controlled. The existing lane configurations at the study intersections are displayed in ***Figure 4–1.***

4.3 Roadway Descriptions

A brief description of the roadways in the project vicinity is provided in the following paragraphs.

Atlantic Avenue is a north-south oriented roadway located west of the project site. In the project vicinity, Atlantic Avenue is designated as an Arterial Street in the City of Lynwood General Plan. Two through travel lanes are provided in each direction on Atlantic Avenue within the project vicinity. Separate exclusive left-turn and right-turn lanes are provided on Atlantic Avenue at the Imperial Highway intersection. Atlantic Avenue is posted for a 35 miles per hour speed limit in the project vicinity.

Wright Road is a north-south oriented roadway located west of the project site. In the project vicinity, Wright Road is designated as a Collector Street in the City of Lynwood General Plan and as a Collector Street in the City of South Gate Mobility Element. One through travel lane is

FIGURE 4-1
EXISTING LANE CONFIGURATIONS

RANCHO LOS AMIGOS SOUTH CAMPUS

LINSCOTT, LAW & GREENSPAN, engineers

c:\0354\dwg\f4-1.dwg 10/04/2018 13:56:38 jshender llg exhibits color.ctb

provided in each direction on Wright Road within the project vicinity. Separate exclusive left-turn lanes are provided on Wright Road at the I-710 Southbound Off-Ramp-Abbott Road intersection, as well as in the southbound direction at the Imperial Highway intersection. Wright Road is posted for a 35 miles per hour speed limit north of Imperial Highway, and for a 25 miles per hour speed limit south of Imperial Highway in the project vicinity.

Ruchti Road is a north-south oriented roadway located west of the project site. In the project vicinity, Ruchti Road is designated as a Collector Street in the City of South Gate Mobility Element. One through travel lane is provided in each direction on Ruchti Road within the project vicinity. South of Imperial Highway, Ruchti Road becomes Garfield Place. There is no speed limit posted on Ruchti Road, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Garfield Place is a north-south oriented roadway located west of the project site. In the project vicinity, Garfield Place is designated as a Collector Street in the City of South Gate Mobility Element. Two through travel lanes are provided in each direction on Garfield Place within the project vicinity. Separate exclusive left-turn lanes are provided on Garfield Place in the northbound direction at the Imperial Highway intersection. North of Imperial Highway, Garfield Place becomes Ruchti Road. Garfield Place is posted for a 35 miles per hour speed limit in the project vicinity.

Garfield Avenue is a north-south oriented roadway located west of the project site. In the project vicinity, Garfield Avenue is designated as a Primary Arterial in the City of South Gate Mobility Element, as a Primary Arterial in the City of Downey Circulation Plan, and as a Major Arterial in the City of Paramount General Plan. Two through travel lanes are provided in each direction on Garfield Avenue within the project vicinity. Separate exclusive left-turn lanes are provided at major intersections along Garfield Avenue in the project vicinity. Separate exclusive right-turn lanes are provided on Garfield Avenue in the southbound direction at the Gardendale Street intersection, in the southbound direction at the N. Somerset Ranch Road intersection, and in the northbound direction at the S. Somerset Ranch Road intersection. Garfield Avenue is posted for a 35 miles per hour speed limit in the project vicinity.

Old River School Road is a north-south oriented roadway located west of the project site. In the project vicinity, Old River School Road is designated as a Primary Arterial in the City of Downey Circulation Plan. Two through travel lanes are provided in each direction on Old River School Road within the project vicinity. Separate exclusive left-turn lanes are provided on Old River School Road at the Imperial Highway intersection, and separate exclusive right-turn lanes are provided in the southbound direction on Old River School Road at the Imperial Highway intersection. Old River School Road is posted for a 40 miles per hour speed limit in the project vicinity.

Erickson Avenue is a north-south oriented roadway that provides immediate access to the project site. In the project vicinity, Erickson Avenue is designated as a Collector Street in the City of Downey Circulation Plan. Two through travel lanes are provided in each direction on Erickson Avenue within the project vicinity. Separate exclusive left-turn and right-turn lanes are provided

at major intersections along Erickson Avenue in the project vicinity. Under existing conditions, Erickson Avenue is gated at the Gardendale Street intersection. The gate would be removed to allow access to Erickson Avenue from Gardendale Street as part of the project. There is no speed limit posted on Erickson Avenue, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Laurel Avenue is a north-south oriented roadway that provides immediate access to the project site. In the project vicinity, Laurel Avenue is designated as a Collector Street in the City of Downey Circulation Plan. One through travel lane is provided in each direction on Laurel Avenue within the project vicinity. Under existing conditions, Laurel Avenue is gated off at the Flores Street intersection. The gate would be removed to allow access to Laurel Avenue from Flores Street as part of the project. There is no speed limit posted on Laurel Avenue, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Juniper Street is a north-south oriented roadway that provides immediate access to the project site. In the project vicinity, Juniper Street is designated as a Collector Street in the City of Downey Circulation Plan. One through travel lane is provided in each direction on Juniper Street within the project vicinity. Under existing conditions, Juniper Street is located within the gated-off area surrounding the project site. The gate would be removed to allow access to Juniper Street from Descanso Street as part of the project. There is no speed limit posted on Juniper Street, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Dahlia Avenue is a north-south oriented roadway that provides immediate access to the project site. In the project vicinity, Dahlia Avenue is designated as a Collector Street in the City of Downey Circulation Plan. One through travel lane is provided in each direction on Dahlia Avenue within the project vicinity. There is no speed limit posted on Dahlia Avenue, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code. Dahlia Avenue would be rerouted as part of the project to serve the easternmost portion of the project site.

Industrial Avenue is a north-south oriented roadway located south of the project site. In the project vicinity, Industrial Avenue is designated as a Collector Street in the City of South Gate Mobility Element. One through travel lane is provided in each direction on Industrial Avenue within the project vicinity. There is no speed limit posted on Industrial Avenue, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Arizona Avenue is a north-south oriented roadway located south of the project site. In the project vicinity, Arizona Avenue is designated as a Collector Street in the City of South Gate Mobility Element. One through travel lane is provided in each direction on Arizona Avenue within the project vicinity. There is no speed limit posted on Arizona Avenue, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Paramount Boulevard is a north-south oriented roadway located east of the project site. In the project vicinity, Paramount Boulevard is designated as a Major Arterial in the City of Downey Circulation Plan, as a Major Arterial in the City of Paramount General Plan, and as a Primary Arterial in the City of South Gate Mobility Element. Two through travel lanes are provided in each direction on Paramount Boulevard within the project vicinity. Separate exclusive left-turn and right-turn lanes are provided along Paramount Boulevard at major intersections in the project vicinity. Paramount Boulevard is posted for a 35-40 miles per hour speed limit in the project vicinity.

Downey Avenue is a north-south oriented roadway located east of the project site. In the project vicinity, Downey Avenue is designated as a Primary Arterial in the City of Downey Circulation Plan, and as a Secondary Arterial in the City of Paramount General Plan. Two through travel lanes are provided in each direction on Downey Avenue within the project vicinity. Separate exclusive left-turn lanes are provided along Downey Avenue at major intersections in the project vicinity. Downey Avenue is posted for a 40 miles per hour speed limit in the project vicinity.

Brookshire Avenue is a north-south oriented roadway located east of the project site. In the project vicinity, Brookshire Avenue is designated as a Primary Arterial in the City of Downey Circulation Plan. Two through travel lanes are provided in each direction on Brookshire Avenue within the project vicinity. Separate exclusive left-turn and right turn lanes are provided on Brookshire Avenue at the Gardendale Street intersection in the project vicinity. South of Gardendale Street, Brookshire Avenue becomes N. Somerset Ranch Road. Brookshire Avenue is posted for a 40 miles per hour speed limit in the project vicinity.

Lakewood Boulevard is a north-south oriented roadway located east of the project site. In the project vicinity, Lakewood Boulevard is designated as a Major Arterial in the City of Downey Circulation Plan. Two to three through travel lanes are provided in each direction on Lakewood Boulevard within the project vicinity. Separate exclusive left-turn lanes are provided along Lakewood Boulevard at major intersections in the project vicinity. Separate exclusive right-turn lanes are provided on Lakewood Boulevard in the southbound direction at the Gardendale Street intersection. Lakewood Boulevard is posted for a 40 miles per hour speed limit in the project vicinity.

Imperial Highway is an east-west oriented roadway located north of the project site. In the project vicinity, Imperial Highway is designated as an Arterial Street in the City of Lynwood General Plan, as a Primary Arterial in the City of South Gate Mobility Element, and as a Major Arterial in the City of Downey Circulation Plan. Two to three through travel lanes are provided in each direction on Imperial Highway within the project vicinity. Separate exclusive left-turn lanes are provided at major intersections along Imperial Highway in the project vicinity. Separate exclusive right-turn lanes are provided on Imperial Highway in the westbound direction at the Wright Road intersection, and in the eastbound direction at the Old River School Road and Lakewood Boulevard intersections. Imperial Highway is posted for a 40 miles per hour speed limit in the project vicinity.

Abbott Road is an east-west oriented roadway that is located west of the project site. Within the project vicinity, Abbott Road is designated as a Collector Street in the City of Lynwood General Plan. Two through travel lanes are provided in each direction on Abbott Road within the project vicinity. Separate exclusive left-turn and right-turn lanes are provided on Abbott Road at the Wright Road intersection. Abbott Road is posted for a 35 miles per hour speed limit in the project vicinity.

Gardendale Street is an east-west oriented roadway located south of the project site. In the project vicinity, Gardendale Street is designated as a Secondary Arterial in the City of South Gate Mobility Plan, and as a Secondary Arterial in the City of Downey Circulation Plan. One through travel lane is provided in each direction on Gardendale Street within the project vicinity. Separate exclusive left-turn lanes are provided along Gardendale Street at major intersections in the project vicinity. Separate exclusive right-turn lanes are provided in the westbound direction on Gardendale Street at the Garfield Avenue intersection. Gardendale Street is posted for a 35 miles per hour speed limit in the project vicinity.

Amigos Avenue is an east-west oriented roadway that provides immediate access to the project site. In the project vicinity, Amigos Avenue is designated as a Collector Street in the City of Downey Circulation Plan. Two through travel lanes are provided in each direction on Esperanza Street within the project vicinity. There is no speed limit posted on Amigos Avenue, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Flores Street is an east-west oriented roadway that provides immediate access to the project site. In the project vicinity, Flores Street is designated as a Collector Street in the City of Downey Circulation Plan. Two through travel lanes are provided in each direction on Flores Street within the project vicinity. There is no speed limit posted on Flores Street, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Esperanza Street is an east-west oriented roadway that provides immediate access to the project site. In the project vicinity, Esperanza Street is designated as a Collector Street in the City of Downey Circulation Plan. One through travel lane is provided in each direction on Esperanza Street within the project vicinity. Under existing conditions, Esperanza Street is gated off at the Erickson Avenue intersection. The gate would be removed to allow access to Esperanza Street from Erickson Avenue as part of the project. There is no speed limit posted on Esperanza Street, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Descanso Street is an east-west oriented roadway that provides immediate access to the project site. In the project vicinity, Descanso Street is designated as a Collector Street in the City of Downey Circulation Plan. One through travel lane is provided in each direction on Descanso Street within the project vicinity. Under existing conditions, Descanso Street is gated off at the Erickson Avenue intersection. The gate would be removed to allow access to Descanso Street from Erickson Avenue as part of the project. There is no speed limit posted on Descanso Street,

thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Bonita Street is an east-west oriented roadway that provides immediate access to the project site. In the project vicinity, Bonita Street is designated as a Collector Street in the City of Downey Circulation Plan. One through travel lane is provided in each direction on Bonita Street within the project vicinity. Under existing conditions, Bonita Street is located within the gated-off area surrounding the project site. The gate would be removed to allow access to Bonita Street as part of the project. There is no speed limit posted on Bonita Street, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Monroe Avenue is an east-west oriented roadway located south of the project site. In the project vicinity, Monroe Avenue is designated as a Collector Street in the City of South Gate Mobility Element. One through travel lane is provided in each direction on Monroe Avenue within the project vicinity. There is no speed limit posted on Monroe Avenue, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code.

Main Street is an east-west oriented roadway located south of the project site. In the project vicinity, Main Street is designated as a Collector Street in the City of South Gate Mobility Element. One through travel lane is provided in each direction on Main Street within the project vicinity. Main Street is posted for a 35 miles per hour speed limit in the project vicinity.

N. Somerset Ranch Road is a westbound one-way street located south of the project site. In the project vicinity, N. Somerset Ranch Road is designated as a Collector Street in the City of South Gate Mobility Element, and as a Collector Street in the City of Paramount General Plan. Two through travel lanes are provided on N. Somerset Ranch Road within the project vicinity. Separate exclusive left-turn lanes are provided along N. Somerset Ranch Road at major intersections in the project vicinity. Separate exclusive right-turn lanes are provided on N. Somerset Ranch Road at the Paramount Boulevard intersection. N. Somerset Ranch Road is posted for a 40 miles per hour speed limit in the project vicinity.

S. Somerset Ranch Road is an eastbound one-way street located south of the project site. In the project vicinity, S. Somerset Ranch Road is designated as a Collector Street in the City of South Gate Mobility Element, and as a Collector Street in the City of Paramount General Plan. Two through travel lanes are provided on S. Somerset Ranch Road within the project vicinity. Separate exclusive left-turn lanes are provided along S. Somerset Ranch Road at major intersections in the project vicinity. S. Somerset Ranch Road is posted for a 40 miles per hour speed limit in the project vicinity.

4.4 Public Transit Services

Public transit services within the project study area are currently provided by the Los Angeles County Metropolitan Transit Authority (Metro), DowneyLink Transit, City of South Gate Transit, and City of Lynwood Trolley/Breeze. A summary of the existing transit service, including the transit routes servicing the project vicinity, destinations, and peak hour headways is presented in ***Table 4–1***. As shown in *Table 4–1*, the following bus lines serve the project study area: Metro 117, Metro 120, Metro 258, Metro 265, Metro 266, Metro Rapid 762, DowneyLink Southwest, DowneyLink Southeast, G.A.T.E. Eastside, and Lynwood Trolley/Breeze Route B. Additionally, the Metro Green Line light rail line serves the project study area. The existing public transit routes in the project study area are shown in ***Figure 4–2***.

In addition to these existing routes, Metro is currently in the planning and environmental review phase for the West Santa Ana Branch Line, which would include a transit station at Gardendale Street, in proximity to the project site. Per Measure M, the project would break ground in 2022 with an opening date of 2041. Metro is advancing the project as a Public Private Partnership that may potentially accelerate the project opening earlier than 2041.

4.5 Bicycle and Pedestrian Facilities

Bicycle and pedestrian facilities are provided within the project study area, and offer additional options for travel to and from the project site. Gardendale Street, which borders the project site to the south, provides on-street bicycle lanes in each direction. The Rio Hondo, Los Angeles River, and San Gabriel River Multi-Use Trails provide walking and bicycling facilities for regional travel to and from the project site. Additionally, sidewalks are provided on all streets within the project study area.

5.0 TRAFFIC COUNTS

Manual traffic counts of vehicular turning movements were conducted at each of the 27 study intersections during the weekday morning and afternoon commuter period to determine the peak hour traffic volume. The manual traffic counts at the study intersections were conducted from 7:00 AM to 9:00 AM to determine the AM peak commuter hour and from 4:00 to 6:00 PM to determine the PM peak commuter hour. The traffic counts were conducted on Wednesday, October 11, 2017 at 26 of the 27 study intersections. Traffic counts were conducted on Wednesday, August 15, 2018 at the Erickson Avenue / Amigos Avenue intersection (Int. No. 27) Per LACDPW Traffic and Lighting Division direction, the intersection traffic counts were conducted during a mid-week weekday while local schools were in session.

The weekday AM and PM peak period manual counts of vehicle movements at the study intersections are summarized in ***Table 5–1***. The existing traffic volumes at the study intersections during the AM and PM peak hours are shown in ***Figures 5–1 and 5–2***, respectively. Summary data worksheets of the manual traffic counts at the study intersections are contained in ***Appendix A***.

6.0 CUMULATIVE DEVELOPMENT PROJECTS

The forecast of future baseline traffic conditions was prepared in accordance to procedures outlined in Section 15130 of the CEQA Guidelines. Specifically, the CEQA Guidelines provide two options for developing the future traffic volume forecast:

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
>
> (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency."

The traffic analysis utilizes options "A" and "B" outlined in CEQA Guidelines for purposes of developing the future cumulative traffic volume forecast. This combined approach is considered conservative.

6.1 Related Projects

A forecast of cumulative traffic conditions with occupancy of the proposed project was prepared by incorporating the potential trips associated with other known development projects (related projects) in the project study area. With this information, the potential impact of the proposed project can be evaluated within the context of the cumulative impact of all ongoing development. The related projects research was based on information on file at the County of Los Angeles Department of Regional Planning, City of Downey Community Development Department, City of South Gate Community Development Department, and the City of Lynwood Building, Safety and Planning Division. The list of related projects that was determined by LLG to be applicable in the project site area is presented in ***Table 6–1***. The location of the related projects is shown in ***Figure 6–1***.

Traffic volumes expected to be generated by the related projects were calculated using rates provided in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*[3]. The related projects' respective traffic generation for the weekday AM and PM peak hours, as well as on a daily basis for a typical weekday, is summarized in *Table 6–1*. Related projects traffic volumes have been distributed and assigned to the adjacent street system based on considerations similar to the methodology used for the proposed project's traffic distribution and assignment as described in Section 7.2. The distribution of the related projects traffic volumes to the study

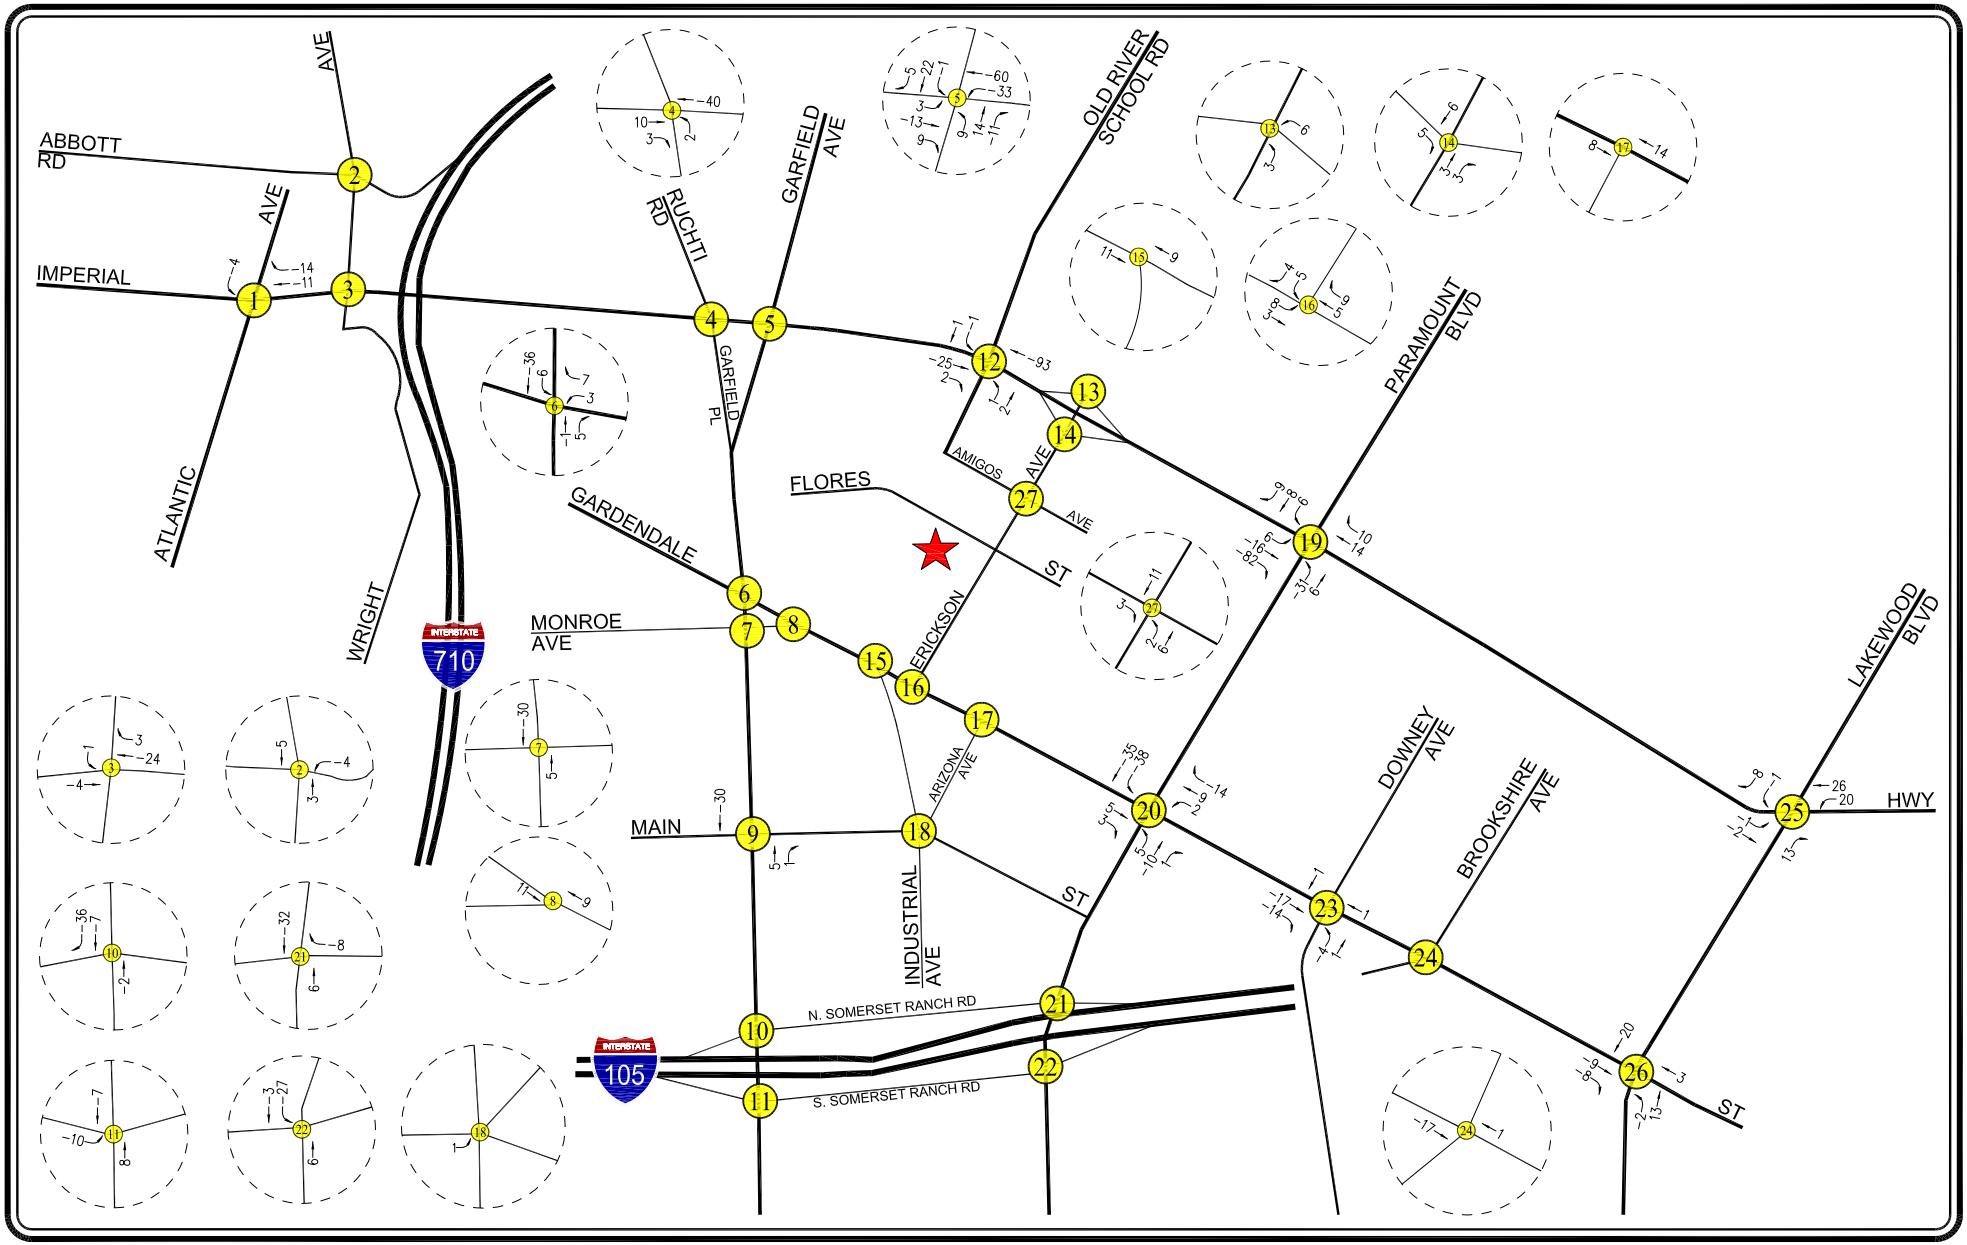
intersections during the weekday AM and PM peak hours are displayed in ***Figures 6–2*** and ***6–3***, respectively.

6.2 Ambient Traffic Growth Factor



In order to reflect the effects of overall regional growth both in and outside of the transportation study area, the existing traffic volumes at the 27 intersections were increased at an annual rate of 1.0 percent (1.0%) per year to the year 2021 (i.e., the anticipated year of project build-out). The ambient growth factor was based on general traffic growth factors provided in the *2010 Congestion Management Program for Los Angeles County*[4] (the "CMP manual") and determined in consultation with LACDPW staff. It is noted that based on review of the general traffic growth factors provided in the CMP manual for the project study area (i.e., RSA 22, Downey) it is anticipated that the existing traffic volumes are expected to increase at an annual rate of approximately 0.61% per year between the years 2015 and 2025[5]. Thus, application of an annual growth factor of the 1.0% annual growth rate provides a conservative, worst-case forecast of future traffic volumes in the area as it substantially exceeds the annual traffic growth rate published in the CMP manual. Further, it is noted that the CMP manual's traffic growth rate is intended to anticipate future traffic generated by development projects in the project vicinity. Thus, the inclusion in this traffic analysis of both a forecast of traffic generated by known related projects plus the use of an ambient growth traffic factor based on CMP traffic model data results in a conservative estimate of future traffic volumes at the study intersections.

[4] The LA County Congestion Management Program is available online at: http://media.metro.net/docs/cmp_final_2010.pdf

[5] From a 2010 baseline, the CMP estimates total growth in RSA 22 of 1.052 % to 2015 and 1.116% to 2025. Therefore, ((1.116-1.052)/1.052)/10 years = 0.61% growth per year

7.0 TRAFFIC FORECASTING METHODOLOGY

In order to estimate the traffic characteristics of the proposed project, a multi-step process has been utilized. The first step is trip generation, which estimates the total arriving and departing traffic volumes on a peak hour and daily basis. The traffic generation potential is forecast by applying the appropriate vehicle trip generation equations or rates to the project.

The second step of the forecasting process is trip distribution, which identifies the origins and destinations of inbound and outbound project traffic volumes. These origins and destinations are typically based on demographics and existing/anticipated travel patterns in the study area. Residential zip code data related to current County employees anticipated to work at the project site was also utilized for purposes of forecasting origins and destinations of project-related trips.

The third step is traffic assignment, which involves the allocation of project traffic to the study area streets and intersections. Traffic assignment is typically based on minimization of travel time, which may or may not involve the shortest route, depending on prevailing operating conditions and travel speeds. Consequently, the trip distribution considers traffic congestion in the area. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersection turning movements throughout the study area.

7.1 Project Traffic Generation

Traffic volumes expected to be generated by the proposed project during the weekday AM and PM peak hours, as well as on a daily basis, were estimated using rates published in the ITE *Trip Generation* manual. The following trip generation rates were used to forecast the traffic volumes expected to be generated by the project land use component:

- County Administrative Buildings: ITE Land Use Code 710 (General Office Building) trip generation equation rates were used to forecast the traffic volumes expected to be generated by the proposed Rancho Los Amigos South Campus project.

The daily and peak hour trip generation forecast for the proposed project was submitted for review and approval by LACDPW Traffic and Lighting Division. As presented in ***Table 7–1***, the proposed project (i.e., new County administrative buildings serving up to 3,000 employees) is expected to generate 1,038 vehicle trips (913 inbound trips and 125 outbound trips) during the AM peak hour. During the PM peak hour, the proposed project is expected to generate 884 vehicle trips (150 inbound trips and 734 outbound trips). Over a 24-hour period, the proposed project is forecast to generate an increase of 7,443 daily trip ends (approximately 3,722 inbound trips and 3,721 outbound trips) during a typical weekday.

As stated above, the trip generation forecast provided in *Table 7–1* utilizes the proposed number of County employees (i.e., 3,000 employees) as the independent variable for purposes of calculating the number of vehicle trips that may be generated by the project. It is noted that the ITE *Trip Generation Manual* also provides trip rates under Land Use Code 710 based on the

Table 7-1

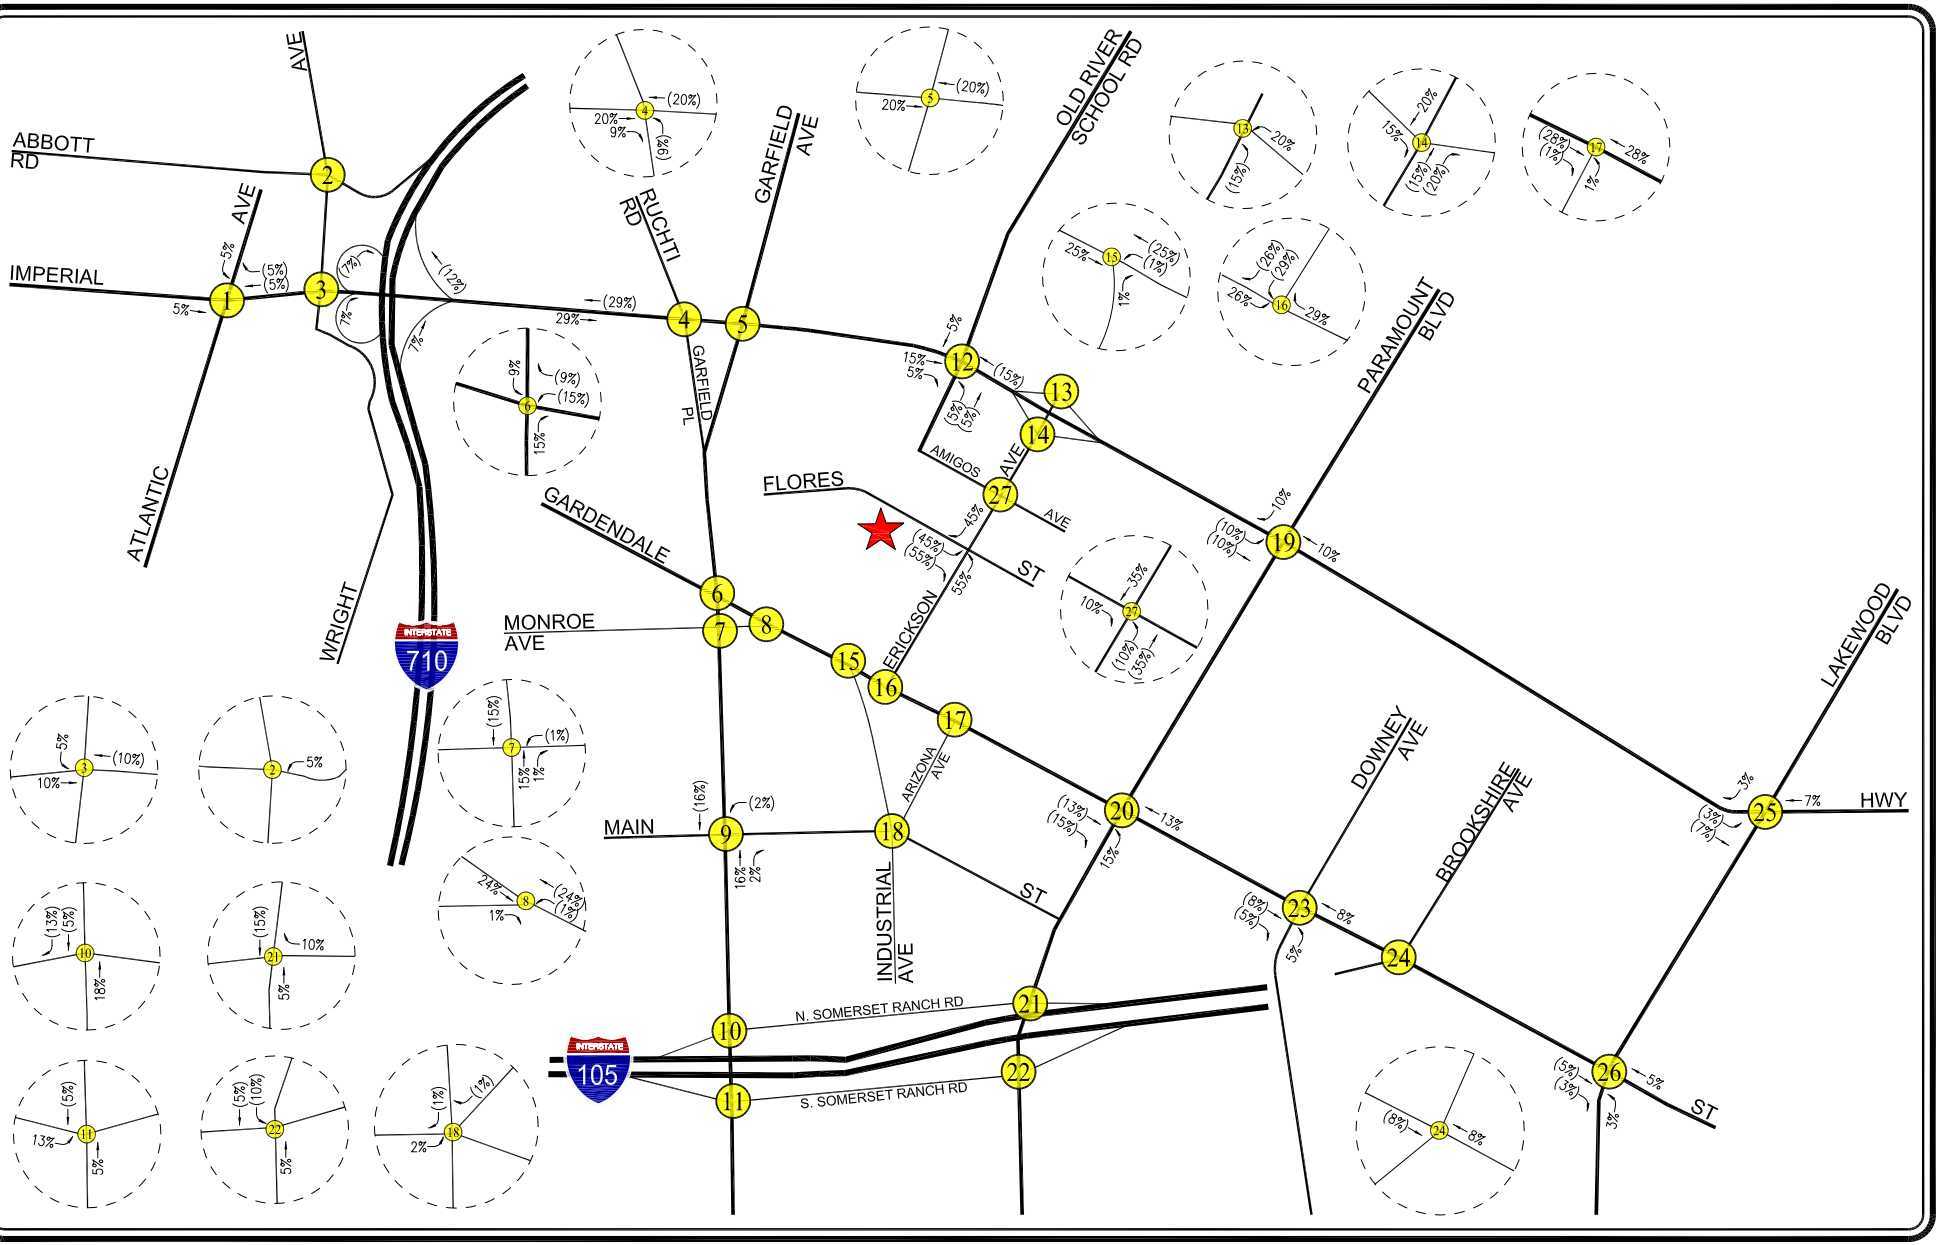
[1] Source: ITE "Trip Generation Manual", 10th Edition, 2017.
[2] Trips are one-way traffic movements, entering or leaving.
[3] ITE Land Use Code 710 (General Office Building) trip generation equation rates rates.
- Daily Trip Rate: Ln(T) = 0.80*Ln(X) + 2.51 ; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: Ln(T) = 0.79*Ln(X) + 0.62 ; 88% inbound/12% outbound
- PM Peak Hour Trip Rate: Ln(T) = 0.73*Ln(X) + 0.94 ; 17% inbound/83% outbound

amount of building floor area as the independent variable. If the ITE trip rates using the project floor area (650,000 square feet) as the independent variable were utilized, it would result in a forecast of 637 AM peak hour vehicle trips and 674 PM peak hour trips. As these floor area-based forecasts would result in fewer vehicle trips related to the project as compared to the forecasts based on the proposed number of employees (1,038 AM peak hour trips and 884 PM peak hour trips), LACDPW Traffic and Lighting Division staff directed that the forecasts using the employee-based trip rates be utilized so as to provide a conservative ("worst case") assessment of the potential traffic impacts due to the project.



The *Trip Generation Manual* states that the driveway traffic count data used by ITE for purposes of establishing the trip generation rates was generally collected at suburban sites with little or no transit services and potential for trips made by other modes such as walking and bicycling. As previously described in Section 4.4, the site is well-served by public transit services. In addition, bicycle trips to and from the project may be facilitated by the current bike lanes provided on Gardendale Street adjacent to site. However, to provide a conservative, worst-case analysis of the potential vehicular traffic impacts related to the project, no reductions were made to the project trip generation forecast provided in *Table 7–1* related to potential trips that may be made by public transit, bicycling or other modes in lieu of the private automobile.

7.2 Project Traffic Distribution and Assignment

Project traffic volumes both entering and exiting the site have been distributed and assigned to the adjacent street system based on the following considerations:

- The site's proximity to major traffic corridors (i.e., Imperial Highway, Gardendale Street, Paramount Boulevard, I-105 Freeway, I-710 Freeway, etc.);
- Expected localized traffic flow patterns based on adjacent roadway channelization and presence of traffic signals;
- Existing intersection traffic volumes (i.e. existing congestion);
- Ingress/egress availability at the project site assuming the site access and circulation scheme described in Section 3.0;
- The residential zip code data related to current County employees anticipated to work at the project site;
- Nearby population and employment centers as well as adjacent residential neighborhoods; and
- Input from LACDPW Traffic and Lighting staff.

The directional traffic distribution patterns for the proposed project are presented in ***Figure 7–1***. The forecast net new weekday AM and PM peak hour project traffic volumes at the study intersections associated with the proposed project are presented in ***Figures 7–2*** and ***7–3***, respectively. The traffic volume assignments presented in *Figures 7–2* and *7–3* reflect the traffic distribution characteristics shown in *Figure 7–1* and the project traffic generation forecast presented in *Table 7–1*.

8.0 TRAFFIC IMPACT ANALYSIS METHODOLOGY

Operations at the signalized study intersections located in the Cities of Downey, South Gate, and Paramount, as well as under the jurisdiction of the County of Los Angeles were evaluated using the Intersection Capacity Utilization (ICU) method of analysis based on the direction from the respective jurisdictions. Specifically, the ICU method was used to determine Volume-to-Capacity (*v/c*) ratios. The ICU calculations uses a lane capacity of 1,600 vehicles per hour (vph) for left-turn, through, and right-turn lanes. The overall intersection *v/c* ratio is subsequently assigned a LOS value to describe intersection operations.

The stop-controlled study intersections were evaluated using the Highway Capacity Manual (HCM) method of analysis based on guidelines provided by the Cities of Downey and South Gate and to determine the delay (in seconds) and corresponding LOS.

Operations at the study intersections located in the City of Lynwood were evaluated using the Critical Movement Analysis (CMA) method that determines (*v/c*) ratios on a critical lane basis in the City of Lynwood

The LOS under the different methodologies vary from LOS A (free flow) to LOS F (congested condition). A description of the ICU method and corresponding LOS for the Cities of Downey, South Gate, Paramount, and the County of Los Angeles are provided in ***Appendix B***, ***C***, ***D***, ***and E***, respectively. A description of the HCM and CMA methods and corresponding LOS are provided in ***Appendix F***, and ***G***, respectively.

8.1 Impact Criteria and Thresholds

The relative impact of the added project traffic volumes that would be generated by the proposed project during the AM and PM peak hours was evaluated based on analysis of existing and future cumulative operating conditions at the study intersections, with the proposed project. The previously discussed capacity analysis procedures were utilized to evaluate the existing and future *v/c* relationships and service level characteristics at each study intersection.

The significance of the potential impacts of project generated operational traffic was identified using the transportation impact criteria provided by the Cities of Downey, South Gate, Paramount, and Lynwood, as well as the County of Los Angeles. The transportation impact thresholds of significance for Downey, South Gate, Paramount, Los Angeles County, and Lynwood are provided in ***Tables 8–1***, ***8–2***, ***8–3***, ***8–4***, and ***8–5***, respectively.

8.2 Traffic Impact Analysis Scenarios

8.2.1 *City of Downey Traffic Impact Analysis Scenarios*

Pursuant to direction from Staff at the City of Downey, LOS calculations have been prepared for the following scenarios for the study intersections located within the City of Downey:

(a) Existing (2017) conditions.

(b) Condition (a) with completion and occupancy of the project.

(c) Condition (b) with implementation of project mitigation measures where necessary.

(d) Condition (a) plus ambient traffic growth through year 2021 and with completion and occupancy of the related projects (i.e., future cumulative without project)

(e) Condition (d) with completion and occupancy of the project.

(f) Condition (e) with implementation of project mitigation measures where necessary.

8.2.2 *City of South Gate Traffic Impact Analysis Scenarios*

Pursuant to direction from Staff at the City of South Gate, LOS calculations have been prepared for the following scenarios for the study intersections located within the City of South Gate:

(a) Existing (2017) conditions.

(b) Condition (a) with completion and occupancy of the project.

(c) Condition (b) with implementation of project mitigation measures where necessary.

(d) Condition (a) ambient traffic growth through year 2021 and with completion and occupancy of the related projects (i.e., future cumulative without project)

(e) Condition (d) with completion and occupancy of the project.

[10] Source for City of Lynwood operational threshold criteria: Email correspondence with City of Lynwood Staff, November 21, 2017.

(f) Condition (e) with implementation of project mitigation measures where necessary.

8.2.3 *City of Paramount Traffic Impact Analysis Scenarios*

Pursuant to direction from Staff at the City of Paramount, LOS calculations have been prepared for the following scenarios for the study intersections located within the City of Paramount:

(a) Existing (2017) conditions.

(b) Existing (2017) conditions with completion and occupancy of the project.

(c) Condition (b) with implementation of project traffic mitigation measures, where necessary.

(d) Future (2021) conditions with completion and occupancy of the project and related projects.

(e) Condition (d) with implementation of regional traffic mitigation measures, where necessary.

8.2.4 *County of Los Angeles Traffic Impact Analysis Scenarios*

Pursuant to direction from LACDPW's traffic study, LOS calculations have been prepared for the following scenarios for the study intersections located within the County of Los Angeles:

(a) Existing (2017) conditions.

(b) Existing (2017) conditions with completion and occupancy of the project.

(c) Condition (b) with implementation of project traffic mitigation measures, where necessary.

(d) Future (2021) conditions with completion and occupancy of the project and related projects.

(e) Condition (d) with implementation of regional traffic mitigation measures, where necessary.

8.2.5 *City of Lynwood Traffic Impact Analysis Scenarios*

Pursuant to direction from Staff at the City of Lynwood, LOS calculations have been prepared for the following scenarios for the study intersections located within the City of Lynwood:

(a) Existing conditions.

(b) Condition (a) with completion and occupancy of the project.

(c) Condition (b) with implementation of project mitigation measures where necessary.

(d) Condition (a) plus ambient traffic growth through year 2021 and with completion and occupancy of the related projects (i.e., future cumulative without project)

(e) Condition (d) with completion and occupancy of the project.

(f) Condition (e) with implementation of project mitigation measures where necessary.

The traffic volumes for each new condition were added to the volumes in the prior condition to determine the change in capacity utilization at the study intersections.

9.0 CITY OF DOWNEY TRAFFIC ANALYSIS

The traffic impact analysis prepared for the 14 study intersections located within the City of Downey using the ICU methodology for signalized intersections and HCM methodology for unsignalized intersections, and application of the City of Downey significant traffic impact criteria is summarized in ***Table 9–1***. The ICU and HCM data worksheets for the 14 analyzed intersections are contained in *Appendix B* and *F*, respectively.

9.1 Existing Conditions

9.1.1 *Existing Conditions*

As indicated in column [1] of *Table 9–1*, 13 of the 14 study intersections located in the City of Downey are presently operating at LOS D or better during the weekday AM and PM peak hours under existing conditions. The following unsignalized intersection currently operates at LOS E or worse during the peak hour shown below under existing conditions:

- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour: *v/c* = 0.684, Delay = 37.4 seconds, LOS E

The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 5–1* and *5–2*, respectively.

9.1.2 *Existing With Project Conditions*

As shown in column [2] of *Table 9–1,* application of the City's threshold criteria to the "Existing With Project" scenario indicates that the proposed project is not expected to create significant impacts at 12 of the 14 study intersections located in the City of Downey. As indicated in *Table 9–1*, a significant transportation impact is expected at the following two unsignalized intersections during the peak hours shown below under existing with project conditions:

- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.025
- Int. No. 16: Erickson Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.170, PM Peak Hour *v/c* increased 0.134

Incremental, but not significant, impacts are noted at the other 12 study intersections due to the project. The existing with project traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in ***Figures 9–1*** and ***9–2***, respectively.

9.2 Future Cumulative Conditions

9.2.1 *Future Cumulative Without Project Conditions*

The future cumulative without project conditions were forecast based on the addition of the traffic generated by cumulative growth rates and the completion and occupancy of the other related projects. The *v/c* ratios and delay value at the study intersections are incrementally increased with the addition of traffic generated by cumulative growth and the related projects

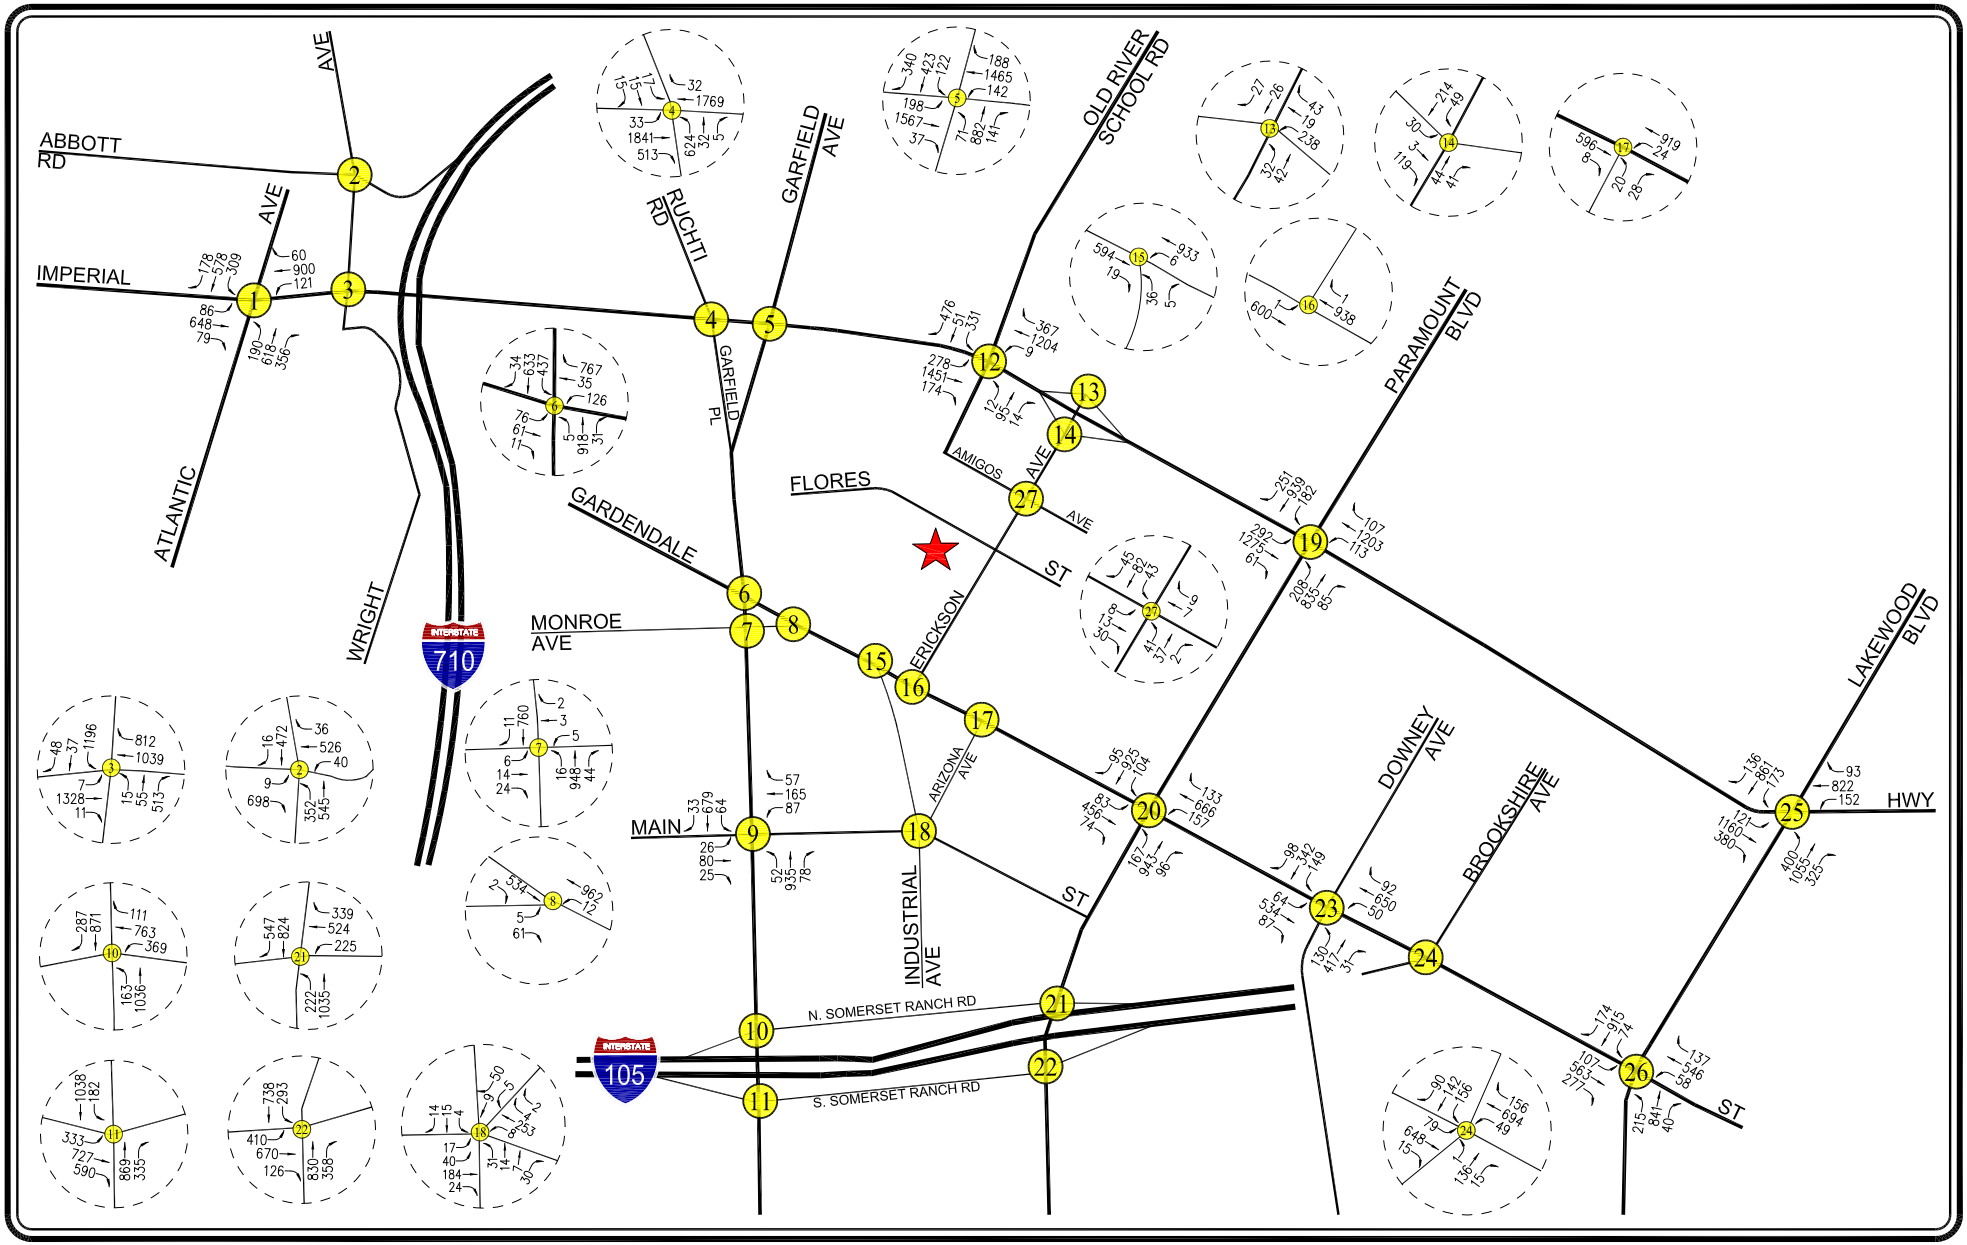
(including the project) listed in *Table 6–1*. As indicated in *Table 9–1*, incremental changes in *v/c* ratios are noted at the all of the study intersections due to the cumulative developments in the project vicinity.

As presented in column [3] of *Table 9–1*, 12 of the 14 study intersections are expected to operate at LOS D or better during the weekday AM and PM peak hours with the addition of growth in ambient traffic and related project traffic under the future cumulative without project conditions. The following two intersections, one signalized and one unsignalized, are expected to operate at LOS E or worse during the peak hour shown below under future cumulative without project conditions:

- Int. No. 12: Old River School Road / Imperial Highway — AM Peak Hour: *v/c* = 0.906, LOS E
- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour: *v/c* = 0.709
Delay = 42.3 seconds, LOS E



The future cumulative without project traffic volumes at the study intersections during the AM and PM peak hours are illustrated in ***Figures 9–3*** and ***9–4***, respectively.

9.2.2 *Future Cumulative With Project Conditions*

The future cumulative with project conditions were forecast based on the addition of traffic generated by the project plus annual ambient growth rates, plus completion and occupancy of other related projects. As shown in column [4] of *Table 9–1,* application of the City's threshold criteria to the "Future With Project" scenario as compared to the "Future Cumulative Without Project" scenario indicates that the proposed project is not expected to create a significant impact at 11 of the 14 study intersections located in the City of Downey. As indicated in *Table 9–1*, a significant transportation impact is expected at the following three unsignalized intersections during the peak hours shown below under future cumulative with project conditions:

- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.025
- Int. No. 16: Erickson Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.171
PM Peak Hour *v/c* increased 0.133
- Int. No. 17: Arizona Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.166

Incremental, but not significant, impacts are noted at the other 11 study intersections due to the project. The future cumulative with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in ***Figures 9–5* and *9–6***, respectively.

10.0 CITY OF SOUTH GATE TRAFFIC ANALYSIS

The traffic impact analysis prepared for the 16 study intersections located within the City of South Gate using the ICU methodology for signalized intersections and HCM methodology for unsignalized intersections, and application of the City of South Gate significant traffic impact criteria is summarized in ***Table 10–1***. The ICU and HCM data worksheets for the 16 analyzed intersections are contained in *Appendix C* and *F*, respectively.

10.1 Existing Conditions

10.1.1 *Existing Conditions*

As indicated in column [1] of *Table 10–1*, 13 of the 16 study intersections located in the City of South Gate are presently operating at LOS D or better during the weekday AM and PM peak hours under existing conditions. The following three intersections, one signalized and two unsignalized, are currently operating at LOS E or worse during the peak hour shown below under existing conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour: *v/c* = 1.048, LOS F; PM Peak Hour: *v/c* = 0.904, LOS E
- Int. No. 7: Garfield Avenue / Monroe Avenue — AM Peak Hour: *v/c* = 0.443; Delay = 44.6 seconds, LOS E
- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour: *v/c* = 0.684; Delay = 37.4 seconds, LOS E

The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 5–1* and *5–2*, respectively.

10.1.2 *Existing With Project Conditions*

As shown in column [2] of *Table 10–1*, application of the City's threshold criteria to the "Existing With Project" scenario indicates that the proposed project is not expected to create significant impacts at 11 of the 16 study intersections located in the City of South Gate. As indicated in *Table 10–1*, a significant transportation impact is expected at the following five intersections, one signalized and four unsignalized, during the peak hours shown below under existing with project conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour *v/c* increases 0.043
- Int. No. 7: Garfield Avenue / Monroe Avenue — AM Peak Hour *v/c* increases 0.046; PM Peak Hour *v/c* increased 0.039
- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.025

[a] According to the City of South Gate, a transportation impact is considered significant if the final volume-to-capacity ratio (v/c) equals or exceeds the thresholds shown below:

Level of Service	Final V/C	Project-Related Increase in V/C
E,F	> 0.900	equal to or greater than 0.02

[b] Two-Way Stop-Controlled Intersection. Reported values represent the delays associated with the most constrained approach of the intersection.

- Int. No. 16: Erickson Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.170; PM Peak Hour *v/c* increased 0.134
- Int. No. 17: Arizona Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.166

Incremental, but not significant, impacts are noted at the other 11 study intersections due to the project. The existing with project traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in *Figures 9–1* and *9–2*, respectively.

10.2 Future Cumulative Conditions

10.2.1 *Future Cumulative Without Project Conditions*

The future cumulative without project conditions were forecast based on the addition of the traffic generated by ambient annual growth rates and the completion and occupancy of the other related projects. The *v/c* ratios and delay value at the study intersections are incrementally increased with the addition of traffic generated by cumulative growth and the other related projects (including the project) listed in *Table 6–1*. As indicated in *Table 10–1*, incremental changes in *v/c* ratios are noted at the all of the study intersections due to the cumulative developments in the project vicinity.

As presented in column [3] of *Table 10–1*, 11 of the 16 study intersections are expected to operate at LOS D or better during the weekday AM and PM peak hours with the addition of growth in ambient traffic and related project traffic under the future cumulative without project conditions. The following five intersections, three signalized and two unsignalized, are expected to operate at LOS E or worse during the peak hour shown below under future cumulative without project conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour: *v/c* = 1.075, LOS F; PM Peak Hour: *v/c* = 0.936, LOS E
- Int. No. 5: Garfield Avenue / Imperial Highway — AM Peak Hour: *v/c* = 0.926, LOS E
- Int. No. 7: Garfield Avenue / Monroe Avenue — AM Peak Hour: *v/c* = 0.445; Delay = 46.9 seconds, LOS E; PM Peak Hour: *v/c* = 0.398; Delay = 34.8 seconds, LOS E
- Int. No. 12: Old River School Road / Imperial Highway — AM Peak Hour: *v/c* = 0.906, LOS E
- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour: *v/c* = 0.709; Delay = 42.3 seconds, LOS E

The future cumulative without project traffic volumes at the study intersections during the AM and PM peak hours are illustrated in *Figures 9–3* and *9–4*, respectively.

10.2.2 *Future Cumulative With Project Conditions*

The future cumulative with project conditions were forecast based on the addition of traffic generated by the project plus ambient annual growth rates, plus completion and occupancy of other related projects. As shown in column [4] of *Table 10–1*, application of the City's threshold criteria to the "Future With Project" scenario as compared to the "Future Without Project" scenario indicates that the proposed project is not expected to create a significant impact at 11 of the 16 study intersections located in the City of South Gate. As indicated in *Table 10–1*, a significant transportation impact is expected at the following five intersections, one signalized and four unsignalized, during the peak hours shown below under future cumulative with project conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour *v/c* increases 0.042
- Int. No. 7: Garfield Avenue / Monroe Avenue — AM Peak Hour *v/c* increases 0.047; PM Peak Hour *v/c* increased 0.039
- Int. No. 15: Industrial Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.025
- Int. No. 16: Erickson Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.171; PM Peak Hour *v/c* increased 0.133
- Int. No. 17: Arizona Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.166

Incremental, but not significant, impacts are noted at the other 11 study intersections due to the project. The future cumulative with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in *Figures 9–5* and *9–6*, respectively.

11.0 CITY OF PARAMOUNT TRAFFIC ANALYSIS

The traffic impact analysis prepared for the four study intersections located within the City of Paramount using the ICU methodology and application of the City of Paramount significant traffic impact criteria is summarized in ***Table 11–1***. The ICU data worksheets for the four analyzed intersections are contained in *Appendix D*.

11.1 Existing Conditions

As indicated in column [1] of *Table 11–1*, the four study intersections (all signalized) located in the City of Paramount are presently operating at LOS D or better during the weekday AM and PM peak hours under existing conditions. The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 5–1* and *5–2*, respectively.

11.2 Existing With Project Conditions

As shown in column [2] of *Table 11–1,* application of the City's threshold criteria to the "Existing With Project" scenario indicates that the proposed project is not expected to create significant impacts at three of the four study intersections located in the City of Paramount. As indicated in *Table 11–1*, a significant transportation impact is expected at the following intersections during the peak hours shown below under existing with project conditions:

- Int. No. 20: Paramount Boulevard / Gardendale Street — AM Peak Hour *v/c* increases 0.121; PM Peak Hour *v/c* increased 0.064

Incremental, but not significant, impacts are noted at the other three study intersections due to the project. The existing with project traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in *Figures 9–1* and *9–2*, respectively**.**

11.3 Future Cumulative With Project Conditions

The *v/c* ratios at all the City of Paramount study intersections are incrementally increased with the addition of traffic generated cumulative growth rates and the completion and operation of other related projects (including the project) listed in *Table 6–1*. As indicated in column [3] of *Table 11–1,* the proposed project contributes to a significant traffic impact at the following intersection during the peak hours shown below under future cumulative with project conditions:

- Int. No. 20: Paramount Boulevard / Gardendale Street — AM Peak Hour v/c increases 0.144; PM Peak Hour v/c increases 0.067

Incremental, but not significant changes in v/c ratios are noted at the remaining study intersection due to the cumulative developments in the project vicinity. The future cumulative with project (existing, proposed project, and related projects) traffic volumes at the study intersections during the AM and PM peak hours are illustrated in *Figures 9–5* and *9–6,* respectively.

[a] According to the City of Paramount, a transportation impact on an intersection shall be deemed significant in accordance with the following table:

Pre-Project V/C	LOS	Project Related Increase in V/C
0.701 - 0.800	C	equal to or greater than 0.040
0.801 - 0.900	D	equal to or greater than 0.020
> 0.901	E,F	equal to or greater than 0.010

12.0 COUNTY OF LOS ANGELES TRAFFIC ANALYSIS

The traffic impact analysis prepared for the four study intersections located within the City of Paramount using ICU and HCM methodologies and application of the County of Los Angeles significant traffic impact criteria is summarized in ***Table 12–1***. The ICU and HCM data worksheets for the four analyzed intersections are contained in *Appendix E* and *F*, respectively.

12.1 Existing Conditions

As indicated in column [1] of *Table 12–1*, the four study intersections (all unsignalized) located in the County of Los Angeles are presently operating at LOS D or better during the weekday AM and PM peak hours under existing conditions. The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 5–1* and *5–2*, respectively.

12.2 Existing With Project Conditions

As shown in column [2] of *Table 12–1*, application of the County's threshold criteria to the "Existing With Project" scenario indicates that the proposed project is not expected to create significant impacts at three of the four study intersections located in the County of Los Angeles. As indicated in *Table 12–1*, a significant transportation impact is expected at the following intersections during the peak hours shown below under existing with project conditions:

- Int. No. 16: Erickson Avenue / Gardendale Street — AM Peak Hour *v/c* increases 0.170; PM Peak Hour *v/c* increased 0.134

Incremental, but not significant, impacts are noted at the other three study intersections due to the project. The existing with project traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in *Figures 9–1* and *9–2*, respectively**.**

12.3 Future Cumulative With Project Conditions

The *v/c* ratios and delay values at all the County of Los Angeles study intersections are incrementally increased with the addition of traffic generated cumulative growth rates and the completion and operation of other related projects (including the project) listed in *Table 6–1*. As indicated in column [3] of *Table 12–1*, the proposed project contributes to a significant traffic impact at the following intersection during the peak hours shown below under future cumulative with project conditions:

- Int. No. 16: Erickson Avenue / Gardendale Street — AM Peak Hour v/c increases 0.195; PM Peak Hour v/c increases 0.153

Incremental, but not significant changes in v/c ratios are noted at the remaining study intersection due to the cumulative developments in the project vicinity. The future cumulative with project (existing, proposed project, and related projects) traffic volumes at the study intersections during the AM and PM peak hours are illustrated in *Figures 9–5* and *9–6*, respectively.

[a] According to Los Angeles County Department of Public Works "Traffic Impact Analysis Report Guidelines, " January 1997, a transportation impact on an intersection shall be deemed significant in accordance with the following table:

Pre-Project V/C	LOS	Project Related Increase in V/C
0.701 - 0.800	C	equal to or greater than 0.040
0.801 - 0.900	D	equal to or greater than 0.020
> 0.901	E,F	equal to or greater than 0.010

[b] All-Way Stop-Controlled Intersection.

[c] Two-Way Stop-Controlled Intersection. Reported values represent the delays associated with the most constrained approach of the intersection.

13.0 CITY OF LYNWOOD TRAFFIC ANALYSIS

The traffic impact analysis prepared for the two study intersections located within the City of Lynwood using the CMA methodology and application of the City of Lynwood significant traffic impact criteria is summarized in ***Table 13–1***. The CMA data worksheets for the seven analyzed intersections are contained in *Appendix G*.

13.1 Existing Conditions

13.1.1 *Existing Conditions*

As indicated in column [1] of *Table 13–1*, one of the two study intersections (both signalized) located in the City of Lynwood are presently operating at LOS D or better during the weekday AM and PM peak hours under existing conditions. The following intersection is currently operating at LOS E or worse during the peak hour shown below under existing conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour: *v/c* = 0.972, LOS E

The existing traffic volumes at the study intersections during the weekday AM and PM peak hours are displayed in *Figures 5–1* and *5–2*, respectively.

13.1.2 *Existing With Project Conditions*

As shown in column [2] of *Table 13–1*, application of the City's threshold criteria to the "Existing With Project" scenario indicates that the proposed project is expected to create significant impacts at one of the two study intersections located in the City of Lynwood. As indicated in *Table 13–1*, a significant transportation impact is expected at the following intersection during the peak hours shown below under existing with project conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour *v/c* increases 0.047

The existing with project traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in *Figures 9–1* and *9–2*, respectively.

13.2 Future Cumulative Conditions

13.2.1 *Future Cumulative Without Project Conditions*

The future cumulative without project conditions were forecast based on the addition of the traffic generated by ambient annual growth rates and the completion and occupancy of the other related projects. The *v/c* ratios and delay value at the study intersections are incrementally increased with the addition of traffic generated by the other related projects (including the project) listed in *Table 6–1*. As indicated in *Table 13–1*, incremental changes in *v/c* ratios are noted at both study intersections due to the cumulative developments in the project vicinity.

As presented in column [3] of *Table 13–1*, one of the two study intersections is expected to operate at LOS D or better during the weekday AM and PM peak hours with the addition of

Table 13-1

[a] According to the City of Lynwood, a transportation impact on an intersection shall be deemed significant in accordance with the following table:

Final v/c	LOS	Project Related Increase in v/c
0.701 - 0.800	C	equal to or greater than 0.040
0.801 - 0.900	D	equal to or greater than 0.020
> 0.901	E, F	equal to or greater than 0.010

growth in ambient traffic and related project traffic under the future cumulative without project conditions. The following intersection is expected to operate at LOS E or worse during the peak hour shown below under future cumulative without project conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour: *v/c* = 1.001, LOS F

The future cumulative without project traffic volumes at the study intersections during the AM and PM peak hours are illustrated in *Figures 9–3* and *9–4*, respectively.

13.2.2 *Future Cumulative With Project Conditions*

The future cumulative with project conditions were forecast based on the addition of traffic generated by the project plus completion and occupancy of other related projects. As shown in column [4] of *Table 12–3*, application of the City's threshold criteria to the "Future With Project" scenario as compared to the "Future Without Project" scenario indicates that the proposed project is expected to create a significant impact at one of the two study intersections located in the City of Lynwood. As indicated in *Table 13–1*, a significant transportation impact is expected at the following intersection during the peak hours shown below under future cumulative with project conditions:

- Int. No. 3: Wright Road / Imperial Highway — AM Peak Hour *v/c* increases 0.048

The future cumulative with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections during the weekday AM and PM peak hours are illustrated in *Figures 9–5* and *9–6*, respectively.

14.0 MITIGATION MEASURES

The significant pre-mitigation transportation impacts due to the project are identified in Sections 9.0 through 13.0 above for the study intersections located in Downey, South Gate, Paramount, Los Angeles County and Lynwood. Where deemed to be potentially feasible, transportation mitigation measures have been proposed to mitigate the impacts at the affected intersections.

14.1 City of Downey

As shown in *Table 9–1*, the project is forecast to cause significant traffic impacts at the following study intersections located in the City of Downey in the Existing with Project and Future with Project scenarios (except where noted):

- Int. No. 15: Industrial Avenue / Gardendale Street
- Int. No. 16: Erickson Avenue / Gardendale Street
- Int. No. 17: Arizona Avenue / Gardendale Street (Future with Project only)

As previously noted, all three intersections are stop-sign controlled, with stop signs controlling traffic from the minor side streets. Installation traffic signals may improve the Levels of Service at these stop-sign controlled intersections, thereby mitigating the potential traffic impacts associated with the project. However, there is insufficient side street volume to warrant the installation of traffic signals at the Industrial Avenue / Gardendale Street (Intersection No. 15) and Arizona Avenue / Gardendale Street (Intersection No. 17) intersections (i.e. the intersection does not meet signal warrants). The analysis of traffic signal warrants is discussed further in Section 15.0.

As shown in Column [5] of *Table 9–1* (City of Downey study intersections), the recommended mitigation measure for Intersection No. 16 would be installation of a traffic signal that would mitigate the effects of project traffic to a less-than-significant level at the Erickson Avenue / Gardendale Street intersection.

> **MM-1** Los Angeles County shall provide a fair share contribution towards the signalization of Intersection No. 16 (Erickson Avenue / Gardendale Street). Such payment shall be paid after approval of such signalization by the City of Downey and the City of South Gate.

It is noted, however, that the intersection is under the jurisdiction of the City of Downey (and City of South Gate and County of Los Angeles). As the County of Los Angeles does not have direct control over the operation of the intersection, it cannot guarantee that the City of Downey (and City of South Gate) will agree with implementation of the recommended mitigation measure. Therefore, if the City of Downey (and City of South Gate) does not permit construction of the improvements, the impact of the project would remain significant and unavoidable.

14.2 City of South Gate

As shown in *Table 10–1*, the project is forecast to cause significant traffic impacts at the following study intersections located in the City of South Gate in the Existing with Project and Future with Project scenarios:

- Int. No. 3: Wright Road / Imperial Highway
- Int. No. 7: Garfield Avenue / Monroe Avenue
- Int. No. 15: Industrial Avenue / Gardendale Street
- Int. No. 16: Erickson Avenue / Gardendale Street
- Int. No. 17: Arizona Avenue / Gardendale Street

As previously noted in Section 14.1 above, Intersection Nos. 15, and 16 are stop-sign controlled, with stop signs controlling traffic from the minor side streets. Similarly, Intersection No. 7 (Garfield Avenue / Monroe Avenue) is also stop-sign controlled, with stop signs controlling traffic from the minor side street. Installation traffic signals may improve the Levels of Service at these stop-sign controlled intersections, thereby mitigating the potential traffic impacts associated with the project. However, there is insufficient side street volume to warrant the installation of traffic signals at the Garfield Avenue / Monroe Avenue (Intersection No. 7), Industrial Avenue / Gardendale Street (Intersection No. 15), and Arizona Avenue / Gardendale Street (Intersection No. 17) intersections (i.e. the intersection does not meet signal warrants). Therefore, the traffic impacts due to the project are significant and unavoidable at Intersection Nos. 7, 15, and 17. The analysis of traffic signal warrants is discussed further in Section 15.0.

For Intersection No. 3 (Wright Road / Imperial Highway), the following mitigation measure is recommended:

> **MM-2** Los Angeles County shall provide a fair share contribution towards restriping the eastbound Imperial Highway approach to the Wright Road intersection to provide one left-turn lane, two through lanes, and one optional through/right-turn lane. The revised lane configurations can be implemented without modifying the existing curb-to-curb roadway width on Imperial Highway. Such payment shall be paid after approval of this improvement by the City of South Gate and the City of Lynwood.

As shown in Column [5] of *Table 10–1* (City of South Gate study intersections), the recommended mitigation measure would mitigate the effects of project traffic to a less-than-significant level at the Wright Road / Imperial Highway intersection (Intersection No. 3). It is noted, however, that the intersection is under the jurisdiction of the City of South Gate (and City of Lynwood). As the County of Los Angeles does not have direct control over the operation of the intersection, it cannot guarantee that the City of South Gate (and City of Lynwood) will agree with implementation of the recommended mitigation measure. Therefore, if the City of South

Gate (and City of Lynwood) does not permit construction of the improvements, the impact of the project at Intersection No. 3 would remain significant and unavoidable.

As shown in Column [5] of *Table 10–1* (City of South Gate study intersections), the recommended mitigation measure for Intersection No. 16 that would mitigate the effects of project traffic to a less-than-significant level at the Erickson Avenue / Gardendale Street intersection.

> **MM-1** Los Angeles County shall provide a fair share contribution towards the signalization of Intersection No. 16 (Erickson Avenue / Gardendale Street). Such payment shall be paid after approval of such signalization by the City of Downey and the City of South Gate.

It is noted, however, that the intersection is under the jurisdiction of the City of South Gate (and City of Downey and County of Los Angeles). As the County of Los Angeles does not have direct control over the operation of the intersection, it cannot guarantee that the City of South Gate (and City of Downey) will agree with implementation of the recommended mitigation measure. Therefore, if the City of South Gate (and City of Downey) does not permit construction of the improvements, the impact of the project would remain significant and unavoidable.

14.3 City of Paramount

As shown in *Table 11–1*, the project is forecast to cause significant traffic impacts at the following study intersections located in the City of Paramount:

- Int. No. 20: Paramount Boulevard / Gardendale Street (direct project and cumulative)

For Intersection No. 20 (Paramount Boulevard / Gardendale Street), the intersection is completely built-out. No street improvements would be possible without modifying the existing curb-to-curb street widths, which would likely require the acquisition of private property and removal of a business located adjacent to the intersection, which is considered infeasible. Therefore, as there are no reasonable or feasible mitigation measures available at this intersection, the impact of the project would remain significant and unavoidable.

14.4 County of Los Angeles

As shown in *Table 12–1*, the project is forecast to cause significant traffic impacts at the following study intersections located in the County of Los Angeles:

- Int. No. 16: Erickson Avenue / Gardendale Street (direct project and cumulative)

As previously noted in Section 14.1 above, Intersection No. 16 is stop-sign controlled, with stop signs controlling traffic from the minor side streets. As shown in Column [4] of *Table 10–1* (County of Los Angeles study intersections), the recommended mitigation measure for

Intersection 16 that would mitigate the effects of project traffic to a less-than-significant level at the Erickson Avenue / Gardendale Street intersection.

> **MM-1** Los Angeles County shall provide a fair share contribution towards the signalization of Intersection No. 16 (Erickson Avenue / Gardendale Street). Such payment shall be paid after approval of such signalization by the City of Downey and the City of South Gate.

It is noted, however, that the intersection is under the jurisdiction of the Cities of Downey and South Gate (and County of Los Angeles). As the County of Los Angeles does not have direct control over the operation of the intersection, it cannot guarantee that the Cities of Downey and South Gate will agree with implementation of the recommended mitigation measure. Therefore, if the Cities of Downey South Gate do not permit construction of the improvements, the impact of the project would remain significant and unavoidable.

14.5 City of Lynwood

As shown in *Table 13–1*, the project is forecast to cause significant traffic impacts at the following study intersection located in the City of Lynwood in the Existing with Project and Future with Project scenarios:

- Int. No. 3: Wright Road / Imperial Highway

As previously noted in Section 13.2 above, for Intersection No. 3 (Wright Road / Imperial Highway), the following mitigation measure is recommended:

> **MM-2** Los Angeles County shall provide a fair share contribution towards restriping the eastbound Imperial Highway approach to the Wright Road intersection to provide one left-turn lane, two through lanes, and one optional through/right-turn lane. The revised lane configurations can be implemented without modifying the existing curb-to-curb roadway width on Imperial Highway. Such payment shall be paid after approval of this improvement by the City of South Gate and the City of Lynwood.

As shown in Column [5] of *Table 13–1* (City of Lynwood study intersections), the recommended mitigation measure would mitigate the effects of project traffic at the Wright Road / Imperial Highway intersection to a less-than significant level. It is noted, however, that the intersection is under the jurisdiction of the City of Lynwood (and City of South Gate). As the County of Los Angeles does not have direct control over the operation of the intersection, it cannot guarantee that the City of Lynwood (and City of South Gate) will agree with implementation of the recommended mitigation measure. Therefore, if the City of Lynwood (and City of South Gate) does not permit construction of the improvements, the impact of the project would remain significant and unavoidable.

14.6 Residual Impacts

The following provides a summary of the potential transportation impacts of the project at the study intersections.

Significantly Impacted Intersections with No Feasible Mitigation. The project would cause a significant transportation impacts at the following study intersections for which there are no feasible mitigation measures:

- Int. No. 7: Garfield Avenue / Monroe Avenue (City of South Gate)
- Int. No. 15: Industrial Avenue / Gardendale Street (Cities of Downey and South Gate)
- Int. No. 17: Arizona Avenue / Gardendale Street (Cities of Downey and South Gate)
- Int. No. 20: Paramount Boulevard / Gardendale Street (Cities of South Gate and Paramount)

Significantly Impacted Intersections with Feasible Mitigation But Implementation is Not Guaranteed. The project would cause a significant transportation impacts at the following study intersections for which potential mitigation measures have been proposed, but implementation is not guaranteed because the intersections are outside the jurisdiction of the County of Los Angeles (therefore impacts are considered significant and unavoidable at these intersections):

- Int. No. 3: Wright Road / Imperial Highway (Cities of South Gate and Lynwood)
- Int. No. 16: Erickson Avenue / Gardendale Street (Cities of Downey and South Gate)

15.0 TRAFFIC SIGNAL WARRANT ANALYSIS

Traffic signal warrants were prepared for Garfield Avenue / Monroe Avenue (Intersection 7), Industrial Avenue / Gardendale Street (Intersection 15), Erickson Avenue / Gardendale Street (Intersection 16), and Arizona Avenue / Gardendale Street (Intersection 17). The traffic signal warrants were prepared based on criteria set forth in Chapter 4C of the *Manual on Uniform Traffic Control Devices (MUTCD)*[11]. Warrant No. 3 (Peak Hour Volume) traffic signal warrants were prepared for the four stop-controlled intersections. The traffic signal warrant calculations were based on existing traffic volumes and future forecast plus project traffic volumes along all approaches. Copies of the traffic signal warrant data worksheets are contained in ***Appendix G***.

15.1 Warrants Input Factors and Data

The following provides a summary of the warrants input factors assumed in the review and data collected in preparing the traffic signal warrant analysis:

- The Garfield Avenue / Monroe Avenue intersection is currently controlled by a stop sign facing the side street (Monroe Avenue) approach.

- The Industrial Avenue / Gardendale Street, Erickson Avenue / Gardendale Street, and Arizona Avenue / Gardendale Street intersections are currently controlled by a stop sign facing the side street (Industrial Avenue, Erickson Avenue, and Arizona Avenue) approaches.

- For the Garfield Avenue / Monroe Avenue intersection, Garfield Avenue was assumed to be the major street while Monroe Avenue was assumed to be the minor street.

- For the Industrial Avenue / Gardendale Street, Erickson Avenue / Gardendale Street, and Gardendale Street / Arizona Avenue intersections, Gardendale Street was assumed to be the major street while Industrial Avenue, Erickson Avenue, and Arizona Avenue were assumed to be the minor streets.

- Garfield Avenue and Gardendale Street are posted for a 35 miles per hour speed limit in the project vicinity. Industrial Avenue, Erickson Avenue, and Arizona Avenue are posted for a 25 miles per hour speed limit in the project vicinity.

- Manual peak hour traffic counts were conducted at the unsignalized intersections. Copies the traffic counts for the intersection and approaches are contained in *Appendix A*.

The future cumulative with project scenario evaluated existing traffic volumes, project-related traffic volumes, traffic from other related projects, as well as ambient traffic growth.

[11] *Manual on Uniform Traffic Control Devices (MUTCD),* 2014 California Supplement, November 7, 2014. http://www.dot.ca.gov/trafficops/camutcd/camutcd2014rev4.html

15.2 Traffic Signal Warrant Analysis

15.2.1 *Garfield Avenue / Monroe Avenue (Intersection No. 7)*

The following paragraphs provide a detailed discussion of the traffic signal warrant prepared for the Garfield Avenue / Monroe Avenue intersection.

Warrant 3: Peak Hour Volume Warrant

The Peak Hour Volume Warrant is applied for land uses that attract or discharge large numbers of vehicles over a short period of time. Warrant No. 3 is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 for the applicable number of approach lanes. The lower threshold for a major street approach with two or more lanes is 600 vehicles per hour while the lower threshold for a minor street approach with one lane is 100 vehicles per hour.

As indicated in Figure 4C-3 provided in *Appendix H*, the plotted points for the peak hours are below the applicable curve for future with project conditions for the Garfield Avenue / Monroe Avenue intersection. Therefore, Warrant No. 3 is not satisfied for the intersection under future with project conditions.

15.2.2 *Industrial Avenue / Gardendale Street (Intersection No. 15)*

The following paragraphs provide a detailed discussion of the traffic signal warrant prepared for the Industrial Avenue / Gardendale Street intersection.

Warrant 3: Peak Hour Volume Warrant

The Peak Hour Volume Warrant is applied for land uses that attract or discharge large numbers of vehicles over a short period of time. Warrant No. 3 is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 for the applicable number of approach lanes. The lower threshold for a major street approach with one lane is 500 vehicles per hour while the lower threshold for a minor street approach with one lane is 100 vehicles per hour.

As indicated in Figure 4C-3 provided in *Appendix H*, the plotted points for the peak hours are below the applicable curve for future with project conditions for the Industrial Avenue / Gardendale Street intersection. Therefore, Warrant No. 3 is not satisfied for the intersection under future with project conditions.

15.2.3 *Erickson Avenue / Gardendale Street (Intersection No. 16)*

The following paragraphs provide a detailed discussion of the traffic signal warrant prepared for the Erickson Avenue / Gardendale Street intersection.

Warrant 3: Peak Hour Volume Warrant

The Peak Hour Volume Warrant is applied for land uses that attract or discharge large numbers of vehicles over a short period of time. Warrant No. 3 is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 for the applicable number of approach lanes. The lower threshold for a major street approach with one lane is 500 vehicles per hour while the lower threshold for a minor street approach with one lane is 200 vehicles per hour.

As indicated in Figure 4C-3 provided in *Appendix H,* the plotted point for the PM peak hour is above the applicable curve, while the plotted point for the AM peak hour falls below the applicable curve for future with project conditions for the Erickson Avenue / Gardendale Street intersection. Therefore, Warrant No. 3 is satisfied for the intersection under future with project conditions for the PM peak hour.

15.2.4 *Arizona Avenue / Gardendale Street (Intersection No. 17)*

The following paragraphs provide a detailed discussion of the traffic signal warrant prepared for the Arizona Avenue / Gardendale Street intersection.

Warrant 3: Peak Hour Volume Warrant

The Peak Hour Volume Warrant is applied for land uses that attract or discharge large numbers of vehicles over a short period of time. Warrant No. 3 is satisfied when the plotted point, representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour on the higher volume minor street approach (one direction only) for one hour of an average day, falls above the curve in Figure 4C-4 for the applicable number of approach lanes. The lower threshold for a major street approach with one lane is 500 vehicles per hour while the lower threshold for a minor street approach with one lane is 100 vehicles per hour.

As indicated in Figure 4C-3 provided in *Appendix H,* the plotted points for the peak hours are below the applicable curve for future with project conditions for the Arizona Avenue / Gardendale Street intersection. Therefore, Warrant No. 3 is not satisfied for the intersection under future with project conditions.

15.3 Traffic Signal Warrants Conclusions

Table 15–1 provides a summary of the traffic signal warrants analysis prepared for the existing stop-sign controlled intersection and the future proposed traffic signal. The findings are provided below:

Garfield Avenue / Monroe Avenue

- The Warrant 3 (Peak Hour) is not satisfied for future plus project conditions.

Industrial Avenue / Gardendale Street

- The Warrant 3 (Peak Hour) is not satisfied for future plus project conditions.

Erickson Avenue / Gardendale Street

- The Warrant 3 (Peak Hour) is satisfied for cumulative future plus project conditions during the PM peak hour.

Arizona Avenue / Gardendale Street

- The Warrant 3 (Peak Hour) is not satisfied for future plus project conditions.

As noted in the MUTCD document, the satisfaction of traffic signal warrants does not necessarily justify the installation of a traffic signal, which are dependent on several factors, including policy decisions by local jurisdictions. Delay, congestion, approach conditions, driver behavior, intersection location/vicinity, and/or other evidence of the need for right-of-way assignment beyond that which could be provided by stop-sign control may also be demonstrated.

Table 15-1
TRAFFIC SIGNAL WARRANTS SUMMARY [A]

NO.	INTERSECTION	FUTURE + PROJECT WARRANT 3 PEAK HOUR SATISFIED? [B]
1	Garfield Avenue / Monroe Avenue	NO
2	Industrial Avenue / Gardendale Street	NO
3	Erickson Avenue / Gardendale Street	YES
4	Arizona Avenue / Gardendale Street	NO

[B] Traffic signal warrant data worksheets are contained in *Appendix G*.

16.0 CONGESTION MANAGEMENT PROGRAM TRAFFIC IMPACT ASSESSMENT

The Congestion Management Program (CMP) is a state-mandated program that was enacted by the California State Legislature with the passage of Proposition 111 in 1990. The program is intended to address the impact of local growth on the regional transportation system.

As required by the 2010 Congestion Management Program for Los Angeles County, a Traffic Impact Assessment (TIA) has been prepared to determine the potential impacts on designated monitoring locations on the CMP highway system. The analysis has been prepared in accordance with procedures outlined in the *2010 Congestion Management Program for Los Angeles County*, County of Los Angeles Metropolitan Transportation Authority, 2010.

According to Section D.9.1 (Appendix D, page D-6) of the 2010 CMP manual, the criteria for determining a significant transportation impact is listed below:

> "A significant transportation impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C $\geq$ 0.02), causing or worsening LOS F (V/C > 1.00)."

The CMP impact criteria apply for analysis of both intersection and freeway monitoring locations.

16.1 Intersections

The following CMP intersection monitoring locations in the Project vicinity have been identified:

- CMP Station — Intersection

  No. 4 — Lakewood Boulevard / Rosecrans Avenue

  No. 17 — Old River School Road / Firestone Boulevard

  No. 18 — Lakewood Boulevard / Firestone Boulevard

  No. 144 — Atlantic Avenue / Firestone Boulevard

The CMP TIA guidelines require that intersection monitoring locations must be examined if the proposed project will add 50 or more trips during either the AM or PM weekday peak hours. The proposed project would not add 50 or more trips during either the AM or PM weekday peak hours (i.e., of adjacent street traffic) to CMP monitoring intersections in the project vicinity, which is stated in the CMP manual as the threshold criteria (screening criteria) for a traffic impact assessment.

Specifically, the project is forecast to add the following peak hour traffic volumes to the CMP intersection monitoring locations:

- Lakewood Boulevard / Rosecrans Avenue:
    - 31 AM peak hour trips, 27 PM peak hour trips
- Old River School Road / Firestone Boulevard
    - 39 AM peak hour trips, 34 PM peak hour trips
- Lakewood Boulevard / Firestone Boulevard
    - 31 AM peak hour trips, 27 PM peak hour trips
- Atlantic Avenue / Firestone Boulevard
    - 39 AM peak hour trips, 34 PM peak hour trips

Therefore, no further review of potential impacts to intersection monitoring locations that are part of the CMP highway system is required.

16.2 Freeways

The following CMP freeway monitoring locations have been identified in the project vicinity:

CMP Station	Location
No. 1043	I-105 Freeway east of Harris Avenue
No. 1080	I-710 Freeway north of Firestone Boulevard

The CMP TIA guidelines require that freeway monitoring locations must be examined if the proposed project will add 150 or more trips (in either direction) during either the AM or PM weekday peak periods. The proposed project would not add 150 or more trips (in either direction) during either the AM or PM weekday peak hours to CMP freeway monitoring locations which is the threshold for preparing a traffic impact assessment, as stated in the CMP manual.

Specifically, the project is forecast to add the following peak hour traffic volumes to the CMP freeway monitoring locations:

- I-105 Freeway east of Harris Avenue:
    - 89 AM EB peak hour trips, 12 AM WB peak hour trips
    - 15 PM EB peak hour trips, 72 PM WB peak hour trips
- I-710 Freeway north of Firestone Boulevard

- 15 AM NB peak hour trips, 64 AM SB peak hour trips
- 88 PM NB peak hour trips, 11 PM SB peak hour trips

Therefore, no further review of potential impacts to freeway monitoring locations that are part of the CMP highway system is required.

16.3 Transit Impact Review

As required by the *2010 Congestion Management Program for Los Angeles County*, a review has been made of the potential impacts of the project on transit service[12]. As discussed in Subsection 4.4 above, existing transit service is provided in the vicinity of the proposed Rancho Los Amigos South Campus project.

The project trip generation, as shown in *Table 7–1*, was adjusted by values set forth in the CMP (i.e., person trips equal 1.4 times vehicle trips, and transit trips equal 3.5 percent of the total person trips) to estimate transit trip generation. Pursuant to the CMP guidelines, the proposed project is forecast to generate demand for 51 transit trip during the AM peak hour and 43 transit trip during the PM peak hour. Over a 24-hour period, the proposed project is forecast to generate demand for 365 daily transit trips. Therefore, the calculations are as follows:

- AM Peak Hour = 1,038 × 1.4 × 0.035 = 51 Transit Trips
- PM Peak Hour = 884 × 1.4 × 0.035 = 43 Transit Trips
- Daily Trips = 7,443 × 1.4 × 0.035 = 365 Transit Trips

As shown in *Table 4–1*, 11 bus and train transit lines are provided near the project site. The current service provides 103 buses and trains during the AM peak hour and 98 buses and trains during the PM peak hour. Therefore, on average the project would add less than one new transit rider per transit bus/train route during the weekday AM and PM peak hours. As shown in ***Table 16–1***, the 11 bus and train transit lines provided near the project site have an average capacity of 12,568 transit trips during the AM peak hour and 12,311 transit trips during the PM peak hour. As such, it is anticipated that the existing transit service in the project area will adequately accommodate the increase of project-generated transit trips. No project impacts on existing or future transit services in the project area are expected to occur as a result of the proposed project.

[12] OPR's December 2018 Technical Advisory on Evaluating Transportation Impacts under CEQA explains "When evaluating impacts to multimodal transportation networks, lead agencies generally should not treat the addition of new transit users as an adverse impact." (OPR Technical Advisory, p. 19.) As also discussed in OPR's SB743 amendment package transmittal letter "Legislative findings in Senate Bill 743 plainly state that CEQA can no longer treat vibrant communities, transit, and active transportation options as adverse environmental outcomes."Similarly, the state has implemented a number of policies to encourage development in proximity to transit and to foster additional transit use to reduce environmental impacts. (SB 375; see also the SCAG 2016 RTP, which includes expanding access to transit.) However, the current 2010 CMP still requests a transit impact analysis.

Metro Rapid Bus - 66 seated / 75 seated and standing

17.0 CALTRANS FREEWAY OFF-RAMP ASSESSMENT

Three off-ramps, one from the I-710 Freeway, and two from the I-105 Freeway, were analyzed to determine the whether the length of the ramps were sufficient to accommodate vehicle queue lengths. The queue lengths were estimated using methodology provided in the *Highway Capacity Manual* (HCM) published by the Transportation Research Board.

The assessment of the off-ramps includes a review of the vehicle queue length as compared to the total available queueing capacity of the ramp to determine whether the vehicle queue would extend beyond the length of the ramp onto the mainline. To this end, the queueing analysis looks at two separate components of the ramp capacity: the length of each approach lane to the intersection, and the remaining length of the ramp, behind any approach lane delineation lines, to the point where the ramp diverges from the freeway mainline. The queue may exceed the striped length of a given approach lane, as long as there is sufficient additional queueing capacity on the ramp, it will not spill over onto the mainline. HCM reports the 95th percentile queue length, in feet, for each approach lane on the off-ramp. The HCM data worksheets for the three analyzed off-ramps are contained in *Appendix F*.

17.1 Existing Conditions

17.1.1 *Existing Conditions*

As shown in ***Table 17–1***, none of three analyzed freeway off-ramps exceed the available storage on the ramp during the AM and PM peak hours under existing conditions. The existing traffic volumes at the off-ramp study intersections during the weekday AM and PM peak hours are displayed in *Figures 5–1* and *5–2*, respectively.

17.1.2 *Existing With Project Conditions*

As shown in *Table 17–1*, none of the three analyzed freeway off-ramps exceed the available storage on the ramp during the AM and PM peak hours under "Existing With Project" conditions. The existing with project traffic volumes at the analyzed off-ramps during the weekday AM and PM peak hours are illustrated in *Figures 9–1* and *9–2*, respectively.

17.2 Future Cumulative Conditions

17.2.1 *Future Cumulative Without Conditions*

The future cumulative without project conditions were forecast based on the addition of the traffic generated by ambient annual growth rates and the completion and occupancy of the other related projects. As presented in ***Table 17–2***, none of the study intersections are expected to exceed the available storage on the ramp during the weekday AM and PM peak hours with the addition of growth in ambient traffic and related project traffic under the future cumulative without project conditions. The future cumulative without project traffic volumes at the analyzed off-ramps during the AM and PM peak hours are illustrated in *Figures 9–3* and *9–4*, respectively.

17.2.2 *Future Cumulative Without Conditions*

As shown in *Table 17–2*, none of the three analyzed freeway off-ramps exceed the available storage on the ramp during the AM and PM peak hours under "Future Cumulative With Project" conditions. The future cumulative with project traffic volumes at the analyzed off-ramps during the weekday AM and PM peak hours are illustrated in *Figures 9–5* and *9–6*, respectively.

18.0 CONSTRUCTION IMPACT ASSESSMENT

18.1 Construction Assumptions

There are two phases related to construction of the proposed project, each with separate trip generation characteristics. First is the shoring/excavation phase which generally results in the highest number of truck trips per day as compared to other phases of project construction. Second is the building construction phase which typically generates the highest number of construction workers on site as compared to other phases of construction.

Shoring/Excavation

The shoring/excavation phase of the project would result in the need to export approximately 5,333 cubic yards of material from the project site. During this phase, hauling of material from the Project Site would occur on weekdays between 7:00 AM and 3:00 PM (i.e., an 8-hour period). Up to 226 truck one-way trips per day (i.e., 113 inbound and 113 outbound), or approximately 14 trucks per hour, carrying approximately 12 cubic yards of material per truck are expected. It is anticipated that soils for campus grading would be balanced on site over a period of 10 hauling days. The removal of the 5,333 cubic yards of material for soil remediation would occur over a period of 15 hauling days.

The primary route to be used by haul trucks traveling to and from the project site will include the following two designated truck-routes: Imperial Highway and the I-710 (Long Beach) Freeway.

In addition to the trips by hauling trucks, there would be 40 one-way trips per day by construction workers (20 inbound and 20 outbound) related to the shoring/excavation phase.

Building Construction

Building construction is estimated to occur over an 18-month period. During peak construction activity, it is estimated that approximately 830 construction workers will be on-site per day. The 830 construction workers would generate approximately 1,660 one-way trips per day (830 inbound and 830 outbound), as well as 698 daily one-way trips by miscellaneous delivery trucks (349 inbound and 349 outbound).

Building construction is assumed to occur on weekdays between 7:00 AM and 7:00 PM.

Construction Worker Parking and Roadway/Sidewalk Closures

Parking for construction workers would be provided within the project site by the County. Street parking by construction workers would not be permitted.

The construction of the project would not require the closure of any vehicle travel lanes adjacent to the site (i.e., on Imperial Highway and Gardendale Street). Also, construction of the proposed project is not expected to result in the loss of any street parking or require the temporary closure of any existing sidewalks. The Design-Builder/Contractor would prepare a work site traffic

control plan prior to the start of construction. That plan would show the location of any warning signs and access to abutting properties.

18.2 Vehicle Trip Generation

The potential transportation impacts of the project at build-out and occupancy are assessed in Sections 9.0 through 13.0 herein based on the evaluation of operations at local intersections during the weekday morning (AM) and afternoon (PM) commuter peak hours. Set forth below is a similar forecast of trip generation related to project construction, which is provided for the AM and PM peak hours for comparison purposes to the project at build-out. Also provided for informational purposes is a forecast of the weekday daily (24-hour) trip generation related to construction of the project.

In addition to the construction assumptions outlined in the prior section, the following additional assumptions are made relative to vehicular trip generation during the construction period:

- Typically, most construction workers arrive and depart the worksite outside of the commuter peak hours. For this analysis, it has been conservatively assumed that 20% of the inbound daily trips would arrive at the project site during the AM peak hour and that 20% of the outbound daily trips would depart the project site during the PM peak hour.

- Trucks utilize more of the physical roadway as compared to passenger cars and small trucks. Thus, for trips generated by trucks, a passenger car equivalency (PCE) factor of 2.0 has been assumed based on factors provided in the *Highway Capacity Manual* published by the Transportation Research Board.

Table 18–1 provides the trip generation forecast related to construction of the Project. As shown in *Table 18–1*, the forecast trip generation by phase of construction is as follows:

- Shoring/Excavation
    - 492 daily trips (246 inbound/246 outbound)
    - 32 AM peak hour trips (18 inbound/14 outbound)
    - 6 PM peak hour trips (0 inbound/6 outbound)

- Building Construction
    - 3,056 daily trips (1,528 inbound/1,528 outbound)
    - 306 AM peak hour trips (236 inbound/70 outbound)
    - 306 PM peak hour trips (70 inbound/236 outbound)

Table 18-1
CONSTRUCTION TRIP GENERATION [1]

Phase Subtotal (PCE Adjusted)	**3,056**	**236**	**70**	**306**	**70**	**236**	**306**

[1] Source: ESA
[2] A Passenger Car Equivalent (PCE) factor of 2.0 was applied to all trucks based on standard traffic engineering practice to conservatively estimate the equivalent number of vehicles associated with the trucks.

18.3 Transportation Assessment

Table 7–1 provides the trip generation forecast for the Project at build-out. As shown in *Table 7–1*, the project is forecast to generate 7,443 net new trips during a typical weekday, including 1,038 net new AM peak hour trips and 884 net new PM peak hour trips. By comparison, the shoring/excavation phase is estimated to generate 492 daily trips, 32 AM peak hour trips and 6 PM peak hour trips while the building construction phase is estimated to generate 3,056 daily trips, 306 AM peak hour trips and 306 PM peak hour trips. Thus, construction activity at the project site would generate significantly fewer trips than the operation of the project following its completion.

It is reasonable to conclude that the potential transportation impacts related to construction of the project have been suitably evaluated through the transportation impact analysis provided herein for the project at build-out. In addition, the potential transportation impacts related to be construction would be substantially less as compared to the project's operational trips due to the relatively lower trip generation associated with construction as compared to project operation. Therefore, no additional impacts associated with construction of the project would occur.

19.0 CONCLUSIONS

This traffic impact analysis has been prepared to evaluate the potential impacts to the local street system due to the Rancho Los Amigos South Campus project. Twenty-seven intersections were identified and analyzed in the County of Los Angeles, as well as the nearby cities of Downey, South Gate, Paramount and Lynwood in order to determine changes in operations following construction and occupancy of the proposed project. The project is forecast to cause significant traffic impacts during the weekday AM and/or PM peak hours at six of the 27 intersections evaluated.

The following provides a summary of the potential transportation impacts of the project at the study intersections.

Significantly Impacted Intersections with No Feasible Mitigation. The project would cause a potentially significant transportation impacts at the following study intersections for which there are no reasonable and feasible mitigation measures:

- Int. No. 7: Garfield Avenue / Monroe Avenue (City of South Gate)
- Int. No. 15: Industrial Avenue / Gardendale Street (Cities of Downey and South Gate)
- Int. No. 17: Arizona Avenue / Gardendale Street (Cities of Downey and South Gate)
- Int. No. 20: Paramount Boulevard / Gardendale Street (City of Paramount)

Significantly Impacted Intersections with Potentially Feasible Mitigation But Implementation is Not Guaranteed. The project would cause a potentially significant transportation impacts at the following study intersections for which potential mitigation measures have been proposed, but implementation is not guaranteed because the intersections are outside the jurisdiction of the County of Los Angeles:

- Int. No. 3: Wright Road / Imperial Highway (Cities of South Gate and Lynwood)
- Int. No. 16: Erickson Avenue / Gardendale Street (Cities of Downey and South Gate, County of Los Angeles)

APPENDIX B

ICU AND LEVELS OF SERVICE EXPLANATION
ICU DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS
CITY OF DOWNEY

INTERSECTION CAPACITY UTILIZATION (ICU) DESCRIPTION

Level of Service is a term used to describe prevailing conditions and their effect on traffic. Broadly interpreted, the Levels of Service concept denotes any one of a number of differing combinations of operating conditions which may occur as a roadway is accommodating various traffic volumes. Level of Service is a qualitative measure of the effect of such factors as travel speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience.

Six Levels of Service, A through F, have been defined in the 1965 *Highway Capacity Manual*, published by the Transportation Research Board. Level of Service A describes a condition of free flow, with low traffic volumes and relatively high speeds, while Level of Service F describes forced traffic flow at low speeds with jammed conditions and queues which cannot clear during the green phases.

The Intersection Capacity Utilization (ICU) method of intersection capacity analysis has been used in our studies. It directly relates traffic demand and available capacity for key intersection movements, regardless of present signal timing, The capacity per hour of green time for each approach is calculated based on the methods of the *Highway Capacity Manual*. The proportion of total signal time needed by each key movement is determined and compared to the total time available (100 percent of the hour). The result of summing the requirements of the conflicting key movements plus an allowance for clearance times is expressed as a decimal fraction. Conflicting key traffic movements are those opposing movements whose combined green time requirements are greatest.

The resulting ICU represents the proportion of the total hour required to accommodate intersection demand volumes if the key conflicting traffic movements are operating at capacity. Other movements may be operating near capacity, or may be operating at significantly better levels. The ICU may be translated to a Level of Service as tabulated below.

The Levels of Service (abbreviated from the *Highway Capacity Manual*) are listed here with their corresponding ICU and Load Factor equivalents. Load Factor is that proportion of the signal cycles during the peak hour which are fully loaded; i.e. when all of the vehicles waiting at the beginning of green are not able to clear on that green phase.

Intersection Capacity Utilization Characteristics

Level of Service	Load Factor	Equivalent ICU
A	0.0	0.00 - 0.60
B	0.0 - 0.1	0.61 - 0.70
C	0.1 - 0.3	0.71 - 0.80
D	0.3 - 0.7	0.81 - 0.90
E	0.7 - 1.0	0.91 - 1.00
F	Not Applicable	Not Applicable

SERVICE LEVEL A
There are no loaded cycles and few are even close to loaded at this service level. No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.

SERVICE LEVEL B
This level represents stable operation where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

SERVICE LEVEL C
At this level stable operation continues. Loading is still intermittent but more frequent than at Level B. Occasionally drivers may have to wait through more than one red signal indication and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.

SERVICE LEVEL D
This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak hour, but enough cycles with lower demand occur to permit periodic clearance of queues, thus preventing excessive backups. Drivers frequently have to wait through more than one red signal. This level is the lower limit of acceptable operation to most drivers.

SERVICE LEVEL E
This represents near capacity and capacity operation. At capacity (ICU = 1.0) it represents the most vehicles that the particular intersection can accommodate. However, full utilization of every signal cycle is seldom attained no matter how great the demand. At this level all drivers wait through more than one red signal, and frequently through several.

SERVICE LEVEL F
Jammed conditions. Traffic backed up from a downstream location on one of the street restricts or prevents movement of traffic through the intersection under consideration.

APPENDIX C

ICU AND LEVELS OF SERVICE EXPLANATION
ICU DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS
CITY OF SOUTH GATE

INTERSECTION CAPACITY UTILIZATION (ICU) DESCRIPTION

Level of Service is a term used to describe prevailing conditions and their effect on traffic. Broadly interpreted, the Levels of Service concept denotes any one of a number of differing combinations of operating conditions which may occur as a roadway is accommodating various traffic volumes. Level of Service is a qualitative measure of the effect of such factors as travel speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience.

Six Levels of Service, A through F, have been defined in the 1965 *Highway Capacity Manual*, published by the Transportation Research Board. Level of Service A describes a condition of free flow, with low traffic volumes and relatively high speeds, while Level of Service F describes forced traffic flow at low speeds with jammed conditions and queues which cannot clear during the green phases.

The Intersection Capacity Utilization (ICU) method of intersection capacity analysis has been used in our studies. It directly relates traffic demand and available capacity for key intersection movements, regardless of present signal timing, The capacity per hour of green time for each approach is calculated based on the methods of the *Highway Capacity Manual*. The proportion of total signal time needed by each key movement is determined and compared to the total time available (100 percent of the hour). The result of summing the requirements of the conflicting key movements plus an allowance for clearance times is expressed as a decimal fraction. Conflicting key traffic movements are those opposing movements whose combined green time requirements are greatest.

The resulting ICU represents the proportion of the total hour required to accommodate intersection demand volumes if the key conflicting traffic movements are operating at capacity. Other movements may be operating near capacity, or may be operating at significantly better levels. The ICU may be translated to a Level of Service as tabulated below.

The Levels of Service (abbreviated from the *Highway Capacity Manual*) are listed here with their corresponding ICU and Load Factor equivalents. Load Factor is that proportion of the signal cycles during the peak hour which are fully loaded; i.e. when all of the vehicles waiting at the beginning of green are not able to clear on that green phase.

Intersection Capacity Utilization Characteristics

Level of Service	Load Factor	Equivalent ICU
A	0.0	0.00 - 0.60
B	0.0 - 0.1	0.61 - 0.70
C	0.1 - 0.3	0.71 - 0.80
D	0.3 - 0.7	0.81 - 0.90
E	0.7 - 1.0	0.91 - 1.00
F	Not Applicable	Not Applicable

SERVICE LEVEL A
There are no loaded cycles and few are even close to loaded at this service level. No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.

SERVICE LEVEL B
This level represents stable operation where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

SERVICE LEVEL C
At this level stable operation continues. Loading is still intermittent but more frequent than at Level B. Occasionally drivers may have to wait through more than one red signal indication and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.

SERVICE LEVEL D
This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak hour, but enough cycles with lower demand occur to permit periodic clearance of queues, thus preventing excessive backups. Drivers frequently have to wait through more than one red signal. This level is the lower limit of acceptable operation to most drivers.

SERVICE LEVEL E
This represents near capacity and capacity operation. At capacity (ICU = 1.0) it represents the most vehicles that the particular intersection can accommodate. However, full utilization of every signal cycle is seldom attained no matter how great the demand. At this level all drivers wait through more than one red signal, and frequently through several.

SERVICE LEVEL F
Jammed conditions. Traffic backed up from a downstream location on one of the street restricts or prevents movement of traffic through the intersection under consideration.

APPENDIX D

ICU AND LEVELS OF SERVICE EXPLANATION
ICU DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS
CITY OF PARAMOUNT

INTERSECTION CAPACITY UTILIZATION (ICU) DESCRIPTION

Level of Service is a term used to describe prevailing conditions and their effect on traffic. Broadly interpreted, the Levels of Service concept denotes any one of a number of differing combinations of operating conditions which may occur as a roadway is accommodating various traffic volumes. Level of Service is a qualitative measure of the effect of such factors as travel speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience.

Six Levels of Service, A through F, have been defined in the 1965 *Highway Capacity Manual*, published by the Transportation Research Board. Level of Service A describes a condition of free flow, with low traffic volumes and relatively high speeds, while Level of Service F describes forced traffic flow at low speeds with jammed conditions and queues which cannot clear during the green phases.

The Intersection Capacity Utilization (ICU) method of intersection capacity analysis has been used in our studies. It directly relates traffic demand and available capacity for key intersection movements, regardless of present signal timing, The capacity per hour of green time for each approach is calculated based on the methods of the *Highway Capacity Manual*. The proportion of total signal time needed by each key movement is determined and compared to the total time available (100 percent of the hour). The result of summing the requirements of the conflicting key movements plus an allowance for clearance times is expressed as a decimal fraction. Conflicting key traffic movements are those opposing movements whose combined green time requirements are greatest.

The resulting ICU represents the proportion of the total hour required to accommodate intersection demand volumes if the key conflicting traffic movements are operating at capacity. Other movements may be operating near capacity, or may be operating at significantly better levels. The ICU may be translated to a Level of Service as tabulated below.

The Levels of Service (abbreviated from the *Highway Capacity Manual*) are listed here with their corresponding ICU and Load Factor equivalents. Load Factor is that proportion of the signal cycles during the peak hour which are fully loaded; i.e. when all of the vehicles waiting at the beginning of green are not able to clear on that green phase.

Intersection Capacity Utilization Characteristics

Level of Service	Load Factor	Equivalent ICU
A	0.0	0.00 - 0.60
B	0.0 - 0.1	0.61 - 0.70
C	0.1 - 0.3	0.71 - 0.80
D	0.3 - 0.7	0.81 - 0.90
E	0.7 - 1.0	0.91 - 1.00
F	Not Applicable	Not Applicable

SERVICE LEVEL A
There are no loaded cycles and few are even close to loaded at this service level. No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.

SERVICE LEVEL B
This level represents stable operation where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

SERVICE LEVEL C
At this level stable operation continues. Loading is still intermittent but more frequent than at Level B. Occasionally drivers may have to wait through more than one red signal indication and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.

SERVICE LEVEL D
This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak hour, but enough cycles with lower demand occur to permit periodic clearance of queues, thus preventing excessive backups. Drivers frequently have to wait through more than one red signal. This level is the lower limit of acceptable operation to most drivers.

SERVICE LEVEL E
This represents near capacity and capacity operation. At capacity (ICU = 1.0) it represents the most vehicles that the particular intersection can accommodate. However, full utilization of every signal cycle is seldom attained no matter how great the demand. At this level all drivers wait through more than one red signal, and frequently through several.

SERVICE LEVEL F
Jammed conditions. Traffic backed up from a downstream location on one of the street restricts or prevents movement of traffic through the intersection under consideration.

APPENDIX E

ICU AND LEVELS OF SERVICE EXPLANATION
ICU DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS
COUNTY OF LOS ANGELES

INTERSECTION CAPACITY UTILIZATION (ICU) DESCRIPTION

Level of Service is a term used to describe prevailing conditions and their effect on traffic. Broadly interpreted, the Levels of Service concept denotes any one of a number of differing combinations of operating conditions which may occur as a roadway is accommodating various traffic volumes. Level of Service is a qualitative measure of the effect of such factors as travel speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience.

Six Levels of Service, A through F, have been defined in the 1965 *Highway Capacity Manual*, published by the Transportation Research Board. Level of Service A describes a condition of free flow, with low traffic volumes and relatively high speeds, while Level of Service F describes forced traffic flow at low speeds with jammed conditions and queues which cannot clear during the green phases.

The Intersection Capacity Utilization (ICU) method of intersection capacity analysis has been used in our studies. It directly relates traffic demand and available capacity for key intersection movements, regardless of present signal timing, The capacity per hour of green time for each approach is calculated based on the methods of the *Highway Capacity Manual*. The proportion of total signal time needed by each key movement is determined and compared to the total time available (100 percent of the hour). The result of summing the requirements of the conflicting key movements plus an allowance for clearance times is expressed as a decimal fraction. Conflicting key traffic movements are those opposing movements whose combined green time requirements are greatest.

The resulting ICU represents the proportion of the total hour required to accommodate intersection demand volumes if the key conflicting traffic movements are operating at capacity. Other movements may be operating near capacity, or may be operating at significantly better levels. The ICU may be translated to a Level of Service as tabulated below.

The Levels of Service (abbreviated from the *Highway Capacity Manual*) are listed here with their corresponding ICU and Load Factor equivalents. Load Factor is that proportion of the signal cycles during the peak hour which are fully loaded; i.e. when all of the vehicles waiting at the beginning of green are not able to clear on that green phase.

Intersection Capacity Utilization Characteristics

Level of Service	Load Factor	Equivalent ICU
A	0.0	0.00 - 0.60
B	0.0 - 0.1	0.61 - 0.70
C	0.1 - 0.3	0.71 - 0.80
D	0.3 - 0.7	0.81 - 0.90
E	0.7 - 1.0	0.91 - 1.00
F	Not Applicable	Not Applicable

SERVICE LEVEL A
There are no loaded cycles and few are even close to loaded at this service level. No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.

SERVICE LEVEL B
This level represents stable operation where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

SERVICE LEVEL C
At this level stable operation continues. Loading is still intermittent but more frequent than at Level B. Occasionally drivers may have to wait through more than one red signal indication and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.

SERVICE LEVEL D
This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak hour, but enough cycles with lower demand occur to permit periodic clearance of queues, thus preventing excessive backups. Drivers frequently have to wait through more than one red signal. This level is the lower limit of acceptable operation to most drivers.

SERVICE LEVEL E
This represents near capacity and capacity operation. At capacity (ICU = 1.0) it represents the most vehicles that the particular intersection can accommodate. However, full utilization of every signal cycle is seldom attained no matter how great the demand. At this level all drivers wait through more than one red signal, and frequently through several.

SERVICE LEVEL F
Jammed conditions. Traffic backed up from a downstream location on one of the street restricts or prevents movement of traffic through the intersection under consideration.

APPENDIX F

HCM AND LEVELS OF SERVICE EXPLANATION
HCM DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS

LEVEL OF SERVICE FOR UNSIGNALIZED INTERSECTIONS

In the *Highway Capacity Manual (HCM)*, published by the Transportation Research Board, 2000, level of service for unsignalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions, in the absence of incidents, control, traffic, or geometric delay. Only the portion of total delay attributed to the traffic control measures, either traffic signals or stop signs, is quantified. This delay is called *control delay*. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay.

Level of Service criteria for unsignalized intersections are stated in terms of the average control delay per vehicle. The level of service is determined by the computed or measured control delay and is defined for each minor movement. Average control delay for any particular minor movement is a function of the service time for the approach and the degree of utilization. (Level of service is not defined for the intersection as a whole for two-way stop controlled intersections.)

Level of Service Criteria for TWSC/AWSC Intersections

Level of Service	Average Control Delay (Sec/Veh)
A	≤ 10
B	> 10 and ≤ 15
C	> 15 and ≤ 25
D	> 25 and ≤ 35
E	> 35 and ≤ 50
F	> 50

Level of Service (LOS) values are used to describe intersection operations with service levels varying from LOS A (free flow) to LOS F (jammed condition). The following descriptions summarize *HCM* criteria for each level of service:

LOS A describes operations with very low control delay, up to 10 seconds per vehicle.

LOS B describes operations with control delay greater than 10 and up to 15 seconds per vehicle.

LOS C describes operations with control delay greater than 15 and up to 25 seconds per vehicle.

LOS D describes operations with control delay greater than 25 and up to 35 seconds per vehicle.

LOS E describes operations with control delay greater than 35 and up to 50 seconds per vehicle.

LOS F describes operations with control delay in excess of 50 seconds per vehicle. For two-way stop controlled intersections, LOS F exists when there are insufficient gaps of suitable size to allow side-street demand to safely cross through a major-street traffic stream. This level of service is generally evident from extremely long control delays experienced by side-street traffic and by queuing on the minor-street approaches.

LEVEL OF SERVICE FOR SIGNALIZED INTERSECTIONS

In the *Highway Capacity Manual (HCM)*, published by the Transportation Research Board, 2000, level of service for signalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and increased travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions: in the absence of traffic control, in the absence of geometric delay, in the absence of incidents, and when there are no other vehicles on the road. Only the portion of total delay attributed to the control facility is quantified. This delay is called *control delay*. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay.

Level of Service criteria for traffic signals are stated in terms of the average control delay per vehicle. Delay is a complex measure and is dependent on a number of variables, including the quality of progression, the cycle length, the green ratio, and the *v/c* ratio for the lane group in question.

Level of Service Criteria for Signalized Intersections

Level of Service	Control Delay (Sec/Veh)
A	≤ 10
B	> 10 and ≤ 20
C	> 20 and ≤ 35
D	> 35 and ≤ 55
E	> 55 and ≤ 80
F	> 80

Level of Service (LOS) values are used to describe intersection operations with service levels varying from LOS A (free flow) to LOS F (jammed condition). The following descriptions summarize *HCM* criteria for each level of service:

LOS A describes operations with very low control delay, up to 10 seconds per vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay values.

LOS B describes operations with control delay greater than 10 and up to 20 seconds per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.

LOS C describes operations with control delay greater than 20 and up to 35 seconds per vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.

LOS D describes operations with control delay greater than 35 and up to 55 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high *v/c* ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

LOS E describes operations with control delay greater than 55 and up to 80 seconds per vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high *v/c* ratios. Individual cycle failures are frequent occurrences.

LOS F describes operations with control delay in excess of 80 seconds per vehicle. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the lane groups. It may also occur at high *v/c* ratios with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such delay levels.

APPENDIX G

CMA AND LEVELS OF SERVICE EXPLANATION
CMA DATA WORKSHEETS – WEEKDAY AM AND PM PEAK HOURS
CITY OF LYNWOOD

CRITICAL MOVEMENT ANALYSIS (CMA) DESCRIPTION

Level of Service is a term used to describe prevailing conditions and their effect on traffic. Broadly interpreted, the Level of Service concept denotes any one of a number of differing combinations of operating conditions which may take place as a roadway is accommodating various traffic volumes. Level of Service is a qualitative measure of the effect of such factors as travel speed, travel time, interruptions, freedom to maneuver, safety, driving comfort and convenience.

Six Levels of Service, A through F, have been defined in the 1965 *Highway Capacity Manual*. Level of Service A describes a condition of free flow, with low traffic volumes and relatively high speeds, while Level of Service F describes forced traffic flow at low speeds with jammed conditions and queues which cannot clear during the green phases.

Critical Movement Analysis (CMA) is a procedure which provides a capacity and level of service geometry and traffic signal operation and results in a level of service determination for the intersection as a whole operating unit.

The per lane volume for each movement in the intersection is determined and the per lane intersection capacity based on the Transportation Research Board (TRB) Report 212 (*Interim Materials on Highway Capacity*). The resulting CMA represents the ratio of the intersection's cumulative volume over its respective capacity (V/C ratio). Critical Movement Analysis takes into account lane widths, bus and truck operations, pedestrian activity and parking activity, as well as number of lanes and geometrics.

The Level of Service (abbreviated from the *Highway Capacity Manual*) are listed here with their corresponding CMA and Load Factor equivalents. Load Factor is that proportion of the signal cycles during the peak hour which are fully loaded; i.e. when all of the vehicles waiting at the beginning of green are not able to clear on that green phase.

Critical Movement Analysis Characteristics

Level of Service	Load Factor	Equivalent CMA
A (free flow)	0.0	0.00 - 0.60
B (rural design)	0.0 - 0.1	0.61 - 0.70
C (urban design)	0.1 - 0.3	0.71 - 0.80
D (maximum urban design)	0.3 - 0.7	0.81 - 0.90
E (capacity)	0.7 - 1.0	0.91 - 1.00
F (force flow)	Not Applicable	Not Applicable

SERVICE LEVEL A
There are no loaded cycles and few are even close to loaded at this service level. No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication.

SERVICE LEVEL B
This level represents stable operation where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

SERVICE LEVEL C
At this level stable operation continues. Loading is still intermittent but more frequent than at Level B. Occasionally drivers may have to wait through more one red signal indication and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.

SERVICE LEVEL D
This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak hour, but enough cycles with lower demand occur to permit periodic clearance of queues, thus preventing excessive backups. Drivers frequently have to wait through more than one red signal. This level is the lower limit of acceptable operation to most drivers.

SERVICE LEVEL E
This represents near capacity and capacity operation. At capacity (CMA = 1.0) it represents the most vehicles that the particular intersection can accommodate. However, full utilization of every signal cycle is seldom attained no matter how great the demand. At this level all drivers wait through more than one red signal, and frequently through several.

SERVICE LEVEL F
Jammed conditions. Traffic backed up from a downstream location on one of the street restricts or prevents movement of traffic through the intersection under consideration.

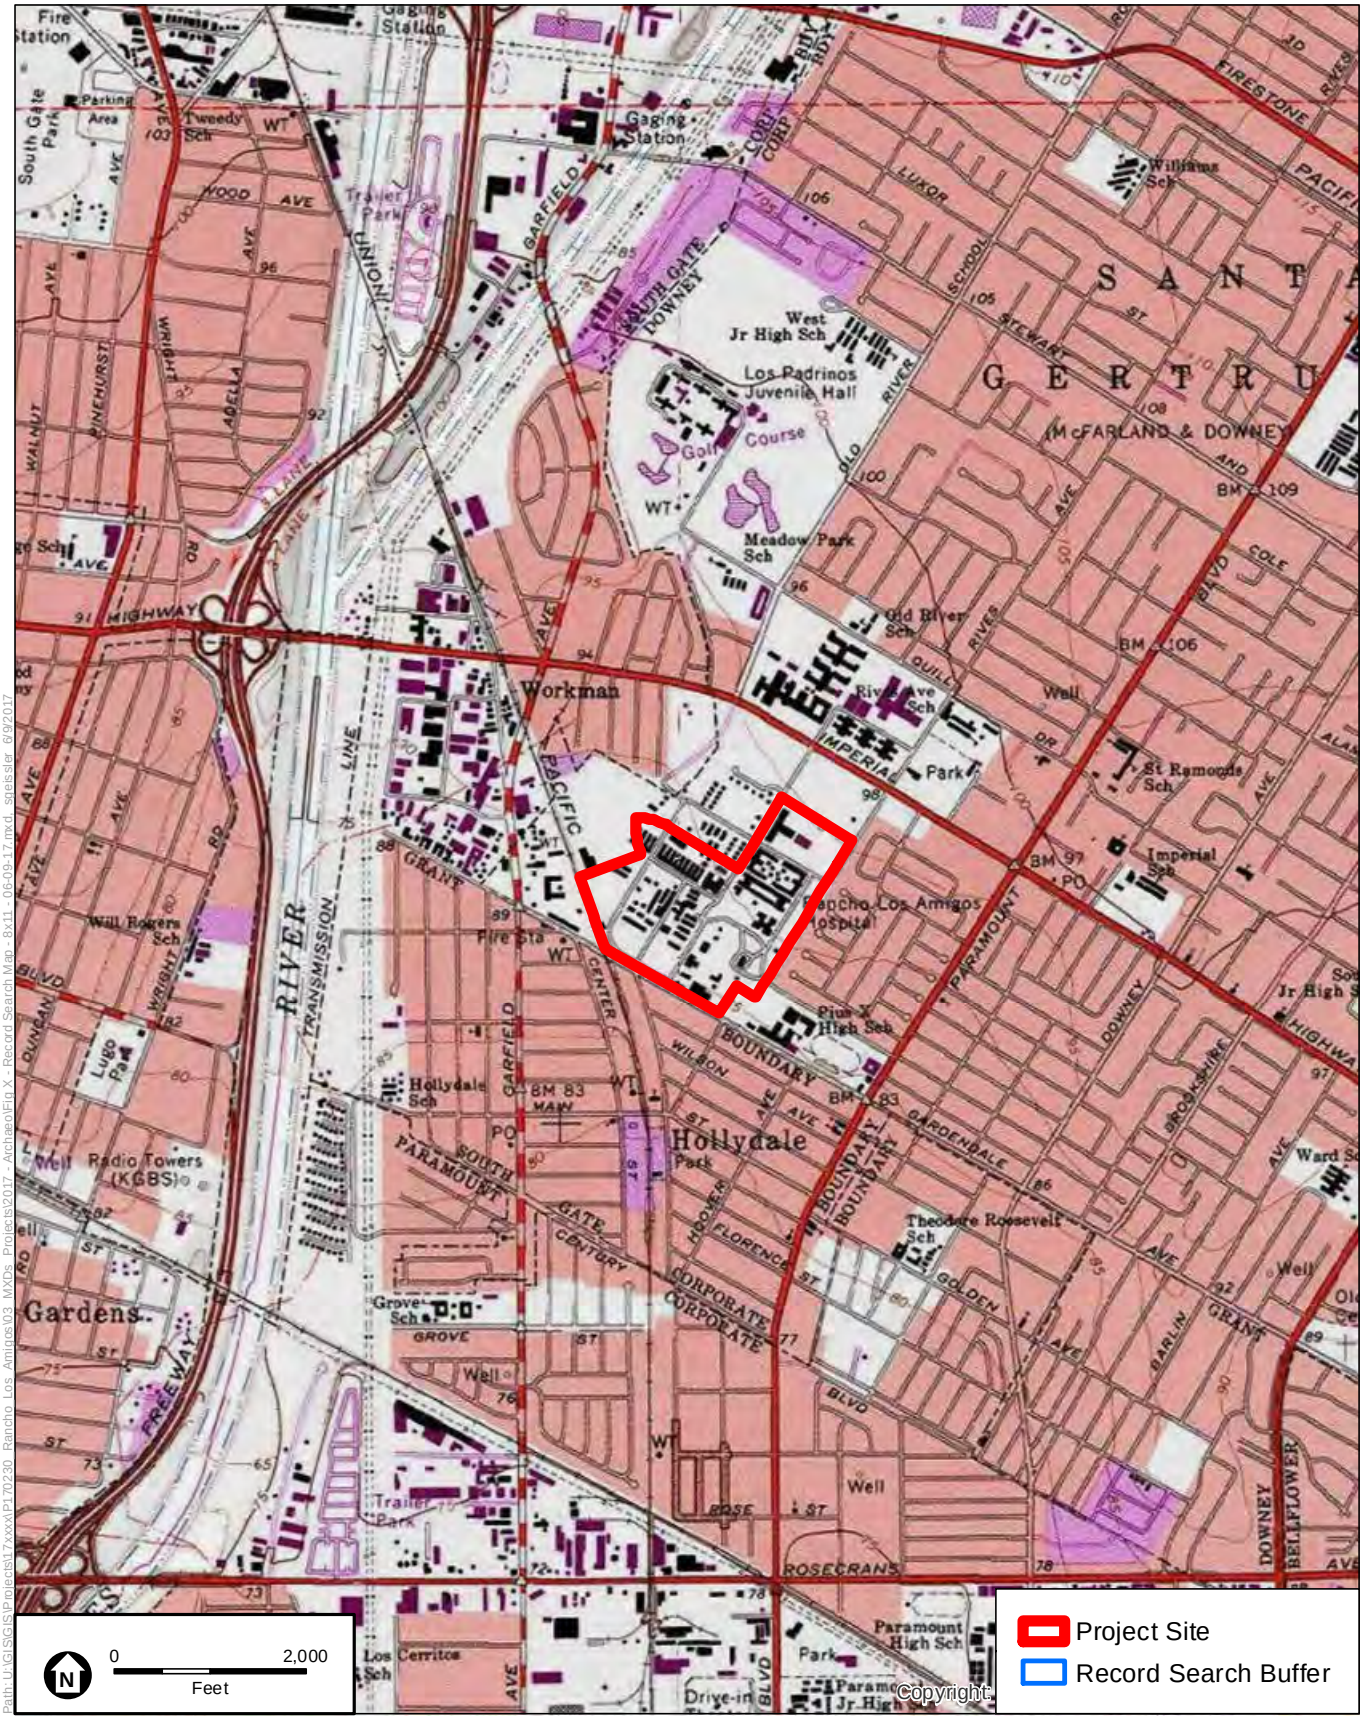
Native American Heritage Commission
1550 Harbor Blvd., Suite 100
Sacramento, CA 95691

Subject: Sacred Lands File Search and Native American Contact List Request: Proposed Rancho Los Amigos Project, City of Downey, Los Angeles County, California.

Dear Native American Heritage Commission Representative:



ESA is preparing environmental documentation for the proposed Rancho Los Amigos Project ("the Project") located in the south westernmost part of the city of Downey. The Project is also located within the Rancho Los Amigos Historic District, which is eligible for listing in the NRHP/CRHR under Criterion A for its association with significant events with consensus from the California State Historic Preservation Officer in 1995. As part of the environmental documentation, ESA will prepare an updated Historic District Analysis Report and archaeological and paleontological resource assessment reports.

To ensure that any areas containing previously recorded cultural resources and sacred lands are identified and considered, ESA is requesting a Sacred Lands File search of the Project Site and a Native American Contact List. The Project Site is depicted in an unsectioned area of Township 3 South, Range 12 West of the South Gate, CA United States Geological Survey 7.5' topographic quadrangle map (Figure X, Records Search Map, attached).

Thank you for your assistance with our efforts to address possible Native American concerns that may be affected by the proposed project. If you have any questions or need additional information, please contact me at (949) 753-7001 or via email at fclark@esassoc.com.

Sincerely,

Fatima Clark
Archaeologist

RE: Proposed Rancho Los Amigos Project, City of Downey; South Gate USGS Quadrangle, Los Angeles County, California

Dear Ms. Clark:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE.

Attached is a list of tribes culturally affiliated to the project area. I suggest you contact all of the listed Tribes. If they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

Tribal Cultural Resources (AB 52)

In preparation for the implementation of AB 52 (2014) , The County of Los Angeles is providing contact information for California Native American tribes that request in writing to be informed when the County of Los Angeles, as the lead agency under the California Environmental Quality Act, considers projects in the geographic area that is traditionally and culturally affiliated with the tribe..

Written requests for notification should include a lead contact person and, if possible, a map of the affiliated geographic area. Please send requests to:

Chairman Andrew Salas
Gabrieleno Band of Mission Indians – Kizh Nation
P.O. Box 393
Covina, CA 91723

Dear Chairman Salas:

NOTICE OF PROPOSED PROJECT PURSUANT TO PUBLIC RESOURCES CODE SECTION 21080.3.1
RANCHO LOS AMIGOS SOUTH CAMPUS PROJECT

We are sending you this letter to inform you that the County of Los Angeles (County) is preparing an Environmental Impact Report (EIR) for the proposed Rancho Los Amigos South Campus project described below in accordance with Public Resources Code Section 21080.3.1(d). The Gabrieleno Band of Mission Indians – Kizh Nation (Tribe) has requested notification of proposed projects within the geographic area that is traditionally and culturally affiliated with the California Native American Tribe. Per Assembly Bill 52 (AB 52), the Tribe has the right to consult on a proposed public or private project prior to the release of a negative declaration, mitigated negative declaration, or EIR (Public Resources Code Section 21080.3.1(b)).

The County is currently conducting scoping and will be preparing an EIR for the proposed Rancho Los Amigos South Campus Project (proposed Project). The Rancho Los Amigos Campus (Campus) is located on approximately 123 acres of County-owned land within the City of Downey. The Campus is crossed by Imperial Highway, creating two distinct campuses: a 49-acre campus north of Imperial Highway (North Campus), and a 74-acre campus south of Imperial Highway (South Campus). The proposed Project would be located entirely on the South Campus (Project Site), and new facilities described further below would be constructed within a portion of the Project Site, referred to as the Development Area. The Project Site including the Development Area is located entirely on land owned by the County, and is on the western edge of the City of Downey.

The Project Site is approximately 1 mile east of U.S. Interstate 710 (Long Beach Freeway), 1-mile north of U.S. Interstate 105 (Century Freeway), 3.3 miles west of U.S. Interstate 605 (San Gabriel River Freeway), and 3.3 miles northeast of U.S. Interstate 5 (Golden State Freeway). The South Campus is bound by Flores Street and Golondrinas Street to the north, Gardendale Street to the south, Laurel Avenue to the west, the Union Pacific Railroad to the southwest, and a strip that runs east along Consuelo Street to Paramount Boulevard. The proposed Development Area is located in the north part of the 74-acre Project Site, and is bound by Flores Street and Golondrinas Street to the north, the parking lot adjacent to Dahlia Street to the east, Descanso Street and Consuelo Street to the south, and Laurel Avenue to the west (see Figure 1).

The County proposes to develop new County administrative buildings on the Project Site including the Internal Services Department (ISD) Headquarters, Probation Department Headquarters, and a Sheriff's Department Crime Laboratory. The ISD Headquarters would be up to approximately 370,000 square feet; the Probation Department Headquarters would be up to approximately 220,000 square feet; and the Sheriff's Crime Laboratory would be up to approximately 60,000 square feet. The final configuration of these buildings may potentially change through the design process, however, the total square footage for the proposed Project would be up to approximately 650,000 square feet. The ISD and Probation Headquarters buildings would have a maximum height of six stories, and the Sheriff's Crime Laboratory a maximum height of two stories. The proposed Project would include development of a parking structure, with a height not to exceed of nine stories, and surface parking lots to be used for employee and visitor parking. The proposed Project would include all necessary utilities and points of connection, roadways, curbs and gutters, sidewalks, medians, site structures, hydrants, vaults, manholes, substations, street lights, street signage, landscaping and irrigation for the proposed new development. The proposed Project would also include the widening and other street improvements along Erickson Avenue. The proposed Project would also include demolition of all buildings within the Development Area and may include some or all buildings on the remainder of the South Campus. A copy of the Notice of Preparation of the EIR has been attached for your convenience.

Under Section 21080.3.1, the Tribe has 30 days from the date of this letter to request consultation with the County in writing under the process established by AB 52 on the proposed Project. Please provide the lead contact person's contact information in your response. Please contact me as soon as possible at the address listed below and indicate whether you wish to engage in consultation. My contact information is as follows:

Anthony Morales, Chief
San Gabriel Band of Mission Indians
P.O. Box 693
San Gabriel, CA 91778

Dear Chief Morales:

NOTICE OF PROPOSED PROJECT PURSUANT TO PUBLIC RESOURCES CODE SECTION 21080.3.1
RANCHO LOS AMIGOS SOUTH CAMPUS PROJECT

We are sending you this letter to inform you that the County of Los Angeles (County) is preparing an Environmental Impact Report (EIR) for the proposed Rancho Los Amigos South Campus project described below in accordance with Public Resources Code Section 21080.3.1(d). The San Gabriel Band of Mission Indians (Tribe) has requested notification of proposed projects within the geographic area that is traditionally and culturally affiliated with the California Native American Tribe. Per Assembly Bill 52 (AB 52), the Tribe has the right to consult on a proposed public or private project prior to the release of a negative declaration, mitigated negative declaration, or EIR (Public Resources Code Section 21080.3.1(b)).

The County is currently conducting scoping and will be preparing an EIR for the proposed Rancho Los Amigos South Campus Project (proposed Project). The Rancho Los Amigos Campus (Campus) is located on approximately 123 acres of County-owned land within the City of Downey. The Campus is crossed by Imperial Highway, creating two distinct campuses: a 49-acre campus north of Imperial Highway (North Campus), and a 74-acre campus south of Imperial Highway (South Campus). The proposed Project would be located entirely on the South Campus (Project Site), and new facilities described further below would be constructed within a portion of the Project Site, referred to as the Development Area. The Project Site including the Development Area is located entirely on land owned by the County, and is on the western edge of the City of Downey.

The Project Site is approximately 1 mile east of U.S. Interstate 710 (Long Beach Freeway), 1-mile north of U.S. Interstate 105 (Century Freeway), 3.3 miles west of U.S. Interstate 605 (San Gabriel River Freeway), and 3.3 miles northeast of U.S. Interstate 5 (Golden State Freeway). The South Campus is bound by Flores Street and Golondrinas Street to the north, Gardendale Street to the south, Laurel Avenue to the west, the Union Pacific Railroad to the southwest, and a strip that runs east along Consuelo Street to Paramount Boulevard. The proposed Development Area is located in the north part of the 74-acre Project Site, and is bound by Flores Street and Golondrinas Street to the north, the parking lot adjacent to Dahlia Street to the east, Descanso Street and Consuelo Street to the south, and Laurel Avenue to the west (see Figure 1).

The County proposes to develop new County administrative buildings on the Project Site including the Internal Services Department (ISD) Headquarters, Probation Department Headquarters, and a Sheriff's Department Crime Laboratory. The ISD Headquarters would be up to approximately 370,000 square feet; the Probation Department Headquarters would be up to approximately 220,000 square feet; and the Sheriff's Crime Laboratory would be up to approximately 60,000 square feet. The final configuration of these buildings may potentially change through the design process, however, the total square footage for the proposed Project would be up to approximately 650,000 square feet. The ISD and Probation Headquarters buildings would have a maximum height of six stories, and the Sheriff's Crime Laboratory a maximum height of two stories. The proposed Project would include development of a parking structure, with a height not to exceed of n ine stories, and surface parking lots to be used for employee and visitor parking. The proposed Project would include all necessary utilities and points of connection, roadways, curbs and gutters, sidewalks, medians, site structures, hydrants, vaults, manholes, substations, street lights, street signage, landscaping and irrigation for the proposed new development. The proposed Project would also include the widening and other street improvements along Erickson Avenue. The proposed Project would also include demolition of all buildings within the Development Area and may include some or all buildings on the remainder of the South Campus. A copy of the Notice of Preparation of the EIR has been attached for your convenience.

Under Section 21080.3.1, the Tribe has 30 days from the date of this letter to request consultation with the County in writing under the process established by AB 52 on the proposed Project. Please provide the lead contact person's contact information in your response. Please contact me as soon as possible at the address listed below and indicate whether you wish to engage in consultation. My contact information is as follows:

Dear Chairman Salas,

Thank you for your response to the County's notification letter for the Rancho Los Amigos South Campus Project (proposed project). This email serves to initiate formal government-to-government consultation pursuant to Public Resources Code Section 21080.3.1(e). The County would like to set up a meeting in person or via telephone as soon as possible, and we will be contacting your office to schedule an appointment per your request below. We would like our consultant, ESA, to participate in the meeting since they are currently engaged in cultural resources studies for the proposed project and are preparing the EIR on the County's behalf, as long as there are no objections on your part. A formal letter acknowledging this initiation of government-to-government consultation pursuant to Public Resources Code Section 21080.3.1(e) will follow. In the meantime, if you have any questions about the proposed project or require additional information, please do not hesitate to contact me. The County looks forward to meeting with you and your participation in the proposed project.

Dear Mr. Ramirez,

It was a pleasure speaking with you this morning. This email is to confirm the phone consultation scheduled for:

September 27th, at 11:00am.

As discussed, we will utilize your conference bridge, due to the number of participants who will be joining in the conference call . At your earliest convenience, please provide for us the dial in number and conference bridge.

Thank you for your time, and we look forward to speaking with you and your team soon.

Kindest Regards,

Vivian Martinez

Mr. Andrew Salas, Chairman
Gabrieleño Band of Mission Indians– Kizh Nation
P.O. Box 393
Covina, CA 91723

Dear Mr. Salas:

ASSEMBLY BILL 52 – CONSULTATION FOR THE PROPOSED RANCHO LOS AMIGOS SOUTH CAMPUS PROJECT

On August 8, 2017, the County of Los Angeles sent a letter notifying the Gabrieleño Band of Mission Indians – Kizh Nation (Kizh Nation) of its intent to conduct environmental review of the proposed Rancho Los Amigos South Campus project under the California Environmental Quality Act and requested a response within 30 days if the Tribe wished to engage in government-to-government consultation under Assembly Bill (AB) 52 pursuant to Public Resources Code (PRC) Sections 21080.3.1(b) and 21080.3.1(d). The letter included a description of the proposed project, a map depicting the project location, and the County's contact information, and asked if the Kizh Nation were interested in consulting.

On August 9, 2017, Mr. Salas of the Kizh Nation replied to the County via email requesting consultation on the proposed project. The response requested that the County contact the Kizh Nation's office to schedule a consultation appointment.

On August 15, 2017, the County replied to Mr. Salas via email initiating formal government-to-government consultation with the Kizh Nation in accordance with PRC Section 21080.3.1(e). The County requested to set up a meeting in person or via telephone as soon as possible and indicated that the County would be contacting the Kizh Nation's office to schedule an appointment per their request. The email also asked if the County's consultant, Environmental Science Associates, could participate in the meeting since they were engaged in the cultural resources studies for the proposed project and were preparing an Environmental Impact Report (EIR) on the County's behalf. On September 7, 2017, the County contacted the Kizh Nation via telephone to schedule a consultation meeting via teleconference.

On September 27, 2017, representatives from the County, including representatives from their environmental consultant ESA, and the Kizh Nation consulted via a telephone conference. The purpose of the call was to provide an opportunity for the Kizh Nation to identify resources potentially qualifying as "Tribal Cultural Resources" (as defined by PRC Section 21074). The meeting agenda provided by the County included Team

Introductions, Project Overview (County), Tribe's Perspective on Cultural Resources (Kizh Nation), and Next Steps (County). The County was interested in understanding the nature of any concerns related to resources that could potentially qualify as Tribal Cultural Resources and potential impacts to those resources resulting from implementation of the project, if any were identified, in accordance with PRC Section 21080.3.2. Although the Kizh Nation indicated during the consultation meeting that they considered the project site to be highly sensitive for the presence of archaeological resources, no specific resources that could potentially qualify as "Tribal Cultural Resources" were identified within or immediately adjacent to the project site.

During and after the meeting, the Kizh Nation provided additional information to the County via email. This included a document with the Kizh Nation's standard cultural resources mitigation measures regarding Tribal Cultural Resources and Human Remains and associated funerary objects within the Kizh Gabrieleño Tribal Territory for use in the EIR; photographs of a mortar from another project that had been discussed during the consultation meeting; and a 1938 Los Angeles County map depicting known Native American villages in the county. The materials were reviewed by the County and did not indicate the presence of resources that could potentially qualify as "Tribal Cultural Resources" within or immediately adjacent to the project site.

On January 29, 2018, the County sent a letter to the Kizh Nation indicating the County had considered the verbal and documentary information shared by the Tribe and that no resources potentially qualifying as "Tribal Cultural Resources" as defined in PRC Section 20174 have been identified within or immediately adjacent to the project site. The County further indicated that it considered consultation concluded under PRC Section 21080.3.2(b)(2), that it will consider the information provided in the EIR analysis of Tribal Cultural Resources, and that the Kizh Nation will be added to the list of recipients of the Draft EIR for the project when it is published for public review and welcomes any additional comments to the Cultural Resources or other sections of the EIR.

On February 6, 2018, Mr. Salas of the Kizh Nation replied to the County via email indicating concern about the County's disregard for oral tribal cultural history provided during consultation. Mr. Salas reiterated that the Kizh Nation regarded the project site as highly sensitive for the presence of Tribal Cultural Resources and specifically identified the villages of Sejat and Nacuangna as well as traditional trading routes as being Tribal Cultural Resources. The letter also referenced legal counsel of the Native American Heritage Commission and Executive Order B-10-11 to emphasize that oral history constitutes evidence in support of Tribal Cultural Resources identification. In the letter, Mr. Salas requested that a copy of the project mitigation measures be provided for review. On April 4, 2018, the County sent a letter attachment to the Kizh Nation via email expressing its understanding that during the consultation meeting on September 27, 2017, the Tribe had indicated that the general region, including the project site, were considered sensitive for archaeological resources. Examples cited by the Tribe during the meeting included burials identified at Hawaiian Gardens located 7 miles southeast of the project site and an ergonomic metate in Pomona, located approximately 25 miles northeast of the project site. The County's letter also addressed five specific

areas of importance identified by the Kizh Nation during the consultation meeting (the villages of Sejat and Nacuangna, a trading route near these villages that would later become the El Camino Real, La Jaboneria (soap factory), and digger bees near rover confluences) and provided three map figures, the third of which included the approximate mapped locations of these five resources, all of which are located between 3 and 8 miles from the project site with the exception of the confluence of the Los Angeles and Rio Hondo rivers, located approximately 3/4-mile from the project site. In the letter, the County went on to request confirmation of the mapped resource locations and expressed its understanding of its obligation to assess impacts to Tribal Cultural Resources under the California Environmental Quality Act. No response to the County's April 4, 2018, letter has been received from the Kizh Nation.

The County appreciates the Kizh Nation's interest in this project as well as the verbal and documentary information provided by the Kizh Nation in assisting the County in its consideration of impacts to Tribal Cultural Resources. Based on the information received from the Kizh Nation to date as well as supported by the results of the sacred lands file search conducted by the Native American Heritage Commission, no resource potentially qualifying as a "Tribal Cultural Resource" as defined in PRC Section 21074 has been identified within or adjacent to the project site. Therefore, based on the above description of the consultation process and its results, the County is hereby considering consultation concluded.

The County has added the Kizh Nation to the list of recipients receiving the Draft EIR for the project and welcomes comments from the Tribe during the public review period, aside from the AB 52 consultation process. Thank you for your cooperation and assistance in our effort to identify potential project-related environmental impacts to Tribal Cultural Resources.

If you have any questions, please call me or your staff may contact Mr. Cliff Stokes at (626) 300-3273.

Very truly yours,

1. INTRODUCTION

1.1. PROPOSED PROJECT DESCRIPTION

Los Angeles County (County) is preparing an EIR to analyze environmental impacts associated with implementation of the proposed 474-acre Rancho Los Amigos South Campus Project (Project Site). The County proposes to develop three new County administrative buildings in the 28-acre Development Area on the Project Site, including the Internal Services Department (ISD) Headquarters, Probation Department Headquarters, and a Sheriff's Department Crime Laboratory. The total staffing for these buildings is expected to be approximately 3,000 employees. The final configuration of these buildings may potentially change through the design process; however, the total square footage for the proposed Project would be up to approximately 650,000 square feet, including:

- ISD Headquarters - approximately 370,000 square feet
- Probation Department Headquarters - approximately 220,000 square feet
- Sheriff's Crime Laboratory - approximately 60,000 square feet

The proposed Project also would include development of a parking structure, with a height not to exceed nine stories, and surface parking lots to be used for employee and visitor parking. The proposed Project plan is shown on **Figure 1** and is expected to be operational by 2021. Additional development to the Rancho Los Amigos South Campus Project is considered in this WSA to quantify the cumulative impact of the entire Project.

The proposed Project would be designed to achieve the Leadership in Energy and Environmental Design (LEED) gold rating (or a successor equivalent standard established by the U.S. Green Building Council) or better. Recycled water would be used on site to reduce the potable water demand. Construction could begin as early as the first quarter of 2019 and is anticipated to last up to approximately 30 months. The proposed Project would also require demolition of existing structures within the Development Area and the larger Project Site. The areas of the buildings demolished within the Project Site would be hydro seeded. This short-term water use is not included in this long-term Water Supply Assessment.

1.2. BACKGROUND

The California Water Code section 10910 (also termed Senate Bill 610 or SB610) requires that a water supply assessment (WSA) be provided to cities and counties for projects (of a specified type and size) that are subject to the California Environmental Quality Act (CEQA). The County recognizes the Rancho Los Amigos South Campus Project as subject to CEQA and SB610. Cities and counties are mandated to identify the public water system that might provide the Project's water supply and then to request a WSA, which includes a discussion regarding whether the public water system's total projected water supplies (available in normal, single dry, and multiple dry years during a 20-year projection) will meet the

projected water demand associated with the proposed Project in addition to the public water system's existing and planned future uses. The City of Downey (City) is the public water provider for the Rancho Los Amigos South Campus Project. Therefore, water supply and demand information for the City of Downey is presented herein.

A foundational document for preparation of the WSA is the Urban Water Management Plan (UWMP). The 2015 UWMP, which was adopted on February 2018, is available and relevant data have been updated by the City where applicable. WSAs and UWMPs both require water supply reliability information to be provided for the water service area in five-year increments over a 20-year planning horizon.

The 2015 UWMP estimates that the existing water service area population is approximately 112,400 persons as of 2015, based upon the California Department of Water Resources (DWR) Population Tool, and is estimated to increase to approximately 123,100 by the year 2030 (Stetson Engineers, 2018). The Project is expected to add a maximum of 3,000 new employees. The 2015 UWMP concludes that if projected imported and local supplies are developed as anticipated, no water shortages are anticipated in the City's service area during the planning period (Stetson Engineers, 2018). Furthermore, these calculations assume per capita consumption of 144 gallons per capita per day (GPCD) (Stetson Engineers, 2018), which is high relative to recent water demand rates and thus would tend to overestimate future water demand. As of June 2015, the City had reduced water use by 20.8 percent and thus achieved its water conservation standard set by the Water Conservation Act of 2009, which called for a 20 percent reduction by 2020 (SWRCB, 2016). The 2015 UWMP provides a more detailed discussion of water sources and supplies, water quality, reliability planning, conservation measures, contingency planning, and water recycling.

1.3. PURPOSE

The purpose of this WSA is to document the City's existing and future water supplies for its service area and compare them to the area's future water demand including that of the proposed Project. This comparison, conducted for both normal and drought conditions, is the basis for an assessment of water supply sufficiency in accordance with the requirements of California Water Code section 10910 (Senate Bill 610).

2. PROJECT WATER DEMAND

This section addresses water demands for the proposed land uses.

2.1. EXISTING WATER USE

The proposed Rancho Los Amigos South Campus Development Area is largely vacant and has been for some time. Previously, the area contained medical uses served by groundwater provided by the County. Water was supplied via groundwater wells operated by the County. While existing water use of the Development Area may include some minor irrigation, water use over the past five years has been minimal and for this WSA, it is assumed to be 0 AFY.

2.2. ESTIMATED FUTURE WATER DEMAND

Estimation of the future water demand for the proposed Project options involves application of water demand factors. The City's UWMP does not include an established methodology for estimating future demand. However, Project consultants provided estimates, which were reviewed for reasonableness. Project water demand estimates are summarized in Table 1.

The engineering consulting firm, KPFF, estimated the water demand of the proposed Project development as well as the demand for a sports center project (a separate project) and open space improvements. These are indicated as additional demand in Table 1. The demands were based on data provided by Syska Hennessy Group and the office of James Burnette; the potable demands total 134 acre-feet per year (AFY).

To confirm the water demand estimates supplied by KPFF, the water demand was calculated using a water use factor and square footage of each building. The proposed Project, Phase 1 B, includes mainly office space, with the ISD Headquarters and Probation Department Headquarters combined to be 590,000 square feet. The remaining 60,000 square feet is the Sheriff's Crime Laboratory. The office water demand factor is estimated at 0.15 gallons per day per square foot (gpd/sf) based on a previous WSA prepared for the City of Burbank (Todd 2017). A typical laboratory currently uses five times as much energy and water per square foot as a typical office building (Watch, 2016). Therefore, the laboratory water use estimate is 0.75 gpd/sf. Laboratory water use could include disinfection of equipment, washing, equipment cooling, and other uses. This check (based on water use factors and proposed area) calculates Project potable demand to be 149.5 AFY, higher than the KPFF estimate, but providing reasonable verification. One explanation for the difference is that the factor-based estimates assume that water demand continues seven days per week and the KPFF estimate assumes potable use for five days per week. For the purposes of this WSA, the KPFF water estimates (which are used in other parts of the EIR) are assumed to ensure consistency of approach.

While no specific landscape plans are provided, general parameters regarding future landscaped areas were considered. All planting areas are to be irrigated using high-efficiency sensors and automatic rain sensor controllers. Plants are expected to be a mix of turf, trees, and ornamental plantings (Gensler, 2017). The minimum requirement for the landscaped area for the Project was estimated using the County's guidelines; these state that 30 percent of the approximately 28-acre development footprint (8.4 acres) should be open space and at

least 50 percent of that should be landscaped, and presumably irrigated (4.2 acres). Accordingly, the estimated landscaped area would be approximately 4.2 acres or 183,000 square feet. Additional water will be used during the construction phase to hydroseed the landscaped area. However, this water demand is not expected to continue past the first six months. Based on this plan for irrigation, this plant mix, irrigation efficiency, and landscaped area, the water demand estimates presented by KPFF [104 acre-feet per year (AFY)] are reasonable. The water demand would be less if artificial turf is used at the Sports Center.

Based on the KPFF water demand estimates, calculation of potable water demand for the proposed Project is shown on **Table 1**. The total water demand at Project completion, 2021, is expected to be 184.7 AFY.

2.3. ESTIMATED FUTURE RECYCLED WATER USE

Recycled water is currently a supply source for the City and may be used to irrigate landscape in the development area. Los Angeles County, the City, and the Central Basin Municipal Water District (CBMWD, the recycled water provider) are working together to extend the recycled water conveyance system to the site (County, 2017). Recycled water eventually will be used for irrigation as well as dual plumbing for restrooms.

To minimize demand on the City's potable water system, developments at this site will be required to use recycled water in dual plumbing and irrigation systems. If a recycled water main is going to be extended to the site, it would be most beneficial to use dual plumbing for toilets and urinals; thereby providing a large reduction in demand of potable water. Once recycled water is implemented at the site for dual plumbing, non-potable demand may increase potentially up to 48 percent. Toilet use is approximately 66 percent of office demand and 13 percent of laboratory uses (USAID, 2017).

Table 1 shows the break-down of potable and non-potable use with complete implementation of recycled water. Non-potable use represents all irrigation water demand, 66 percent of office demand, and 13 percent of laboratory uses. The remaining water demand is assumed to be potable. The total long-term potable and non-potable use for the project is 47.5 AFY and 93.5 AFY, respectively. The cumulative development of the site would have a total potable and non-potable use of 52.2 and 132.5 AFY, respectively.

2.4. FUTURE WATER CONSERVATION

The Water Conservation Act of 2009 (SBx7-7) calls for a 20 percent reduction in urban water use by the year 2020. The water code was amended to require 2015 and 2020 water use targets to be developed in the 2010 UWMPs with updated targets in the 2015 UWMPs. According to the 2010 UWMP, the City set a 2020 compliance target for per capita water consumption of 138.5 GPCD in accordance with Section (10608.20) (b)(3) of the Water Code (Stetson Engineers 2012). Based on per capita water use from 2010 to 2015, the City of Downey has already achieved this compliance target (City of Downey, 2017). The City's water efficiency has increased since 2010, which is partly due to conservation measures and

awareness. Much of the water conservation is a result of Governor Jerry Brown's 2015 executive order mandating a 25 percent reduction in urban potable water use in response to the drought (State of California, 2015). In June 2015, in compliance with the State's executive order, the City approved its Ordinance 15-1341 which mandated water conservation regulations and restrictions.

The water conservation measures limit outside watering of potable water to only six minutes, two to three days a week (depending on the time of year), between 7 pm and 8 am; require that leaks are fixed within four days; prohibit watering within 48 hours after a rain event; and place restrictions on filling and refilling of pools, spas, and ponds (City of Downey 2016). Other measures require automatic shut off nozzles for hoses, restrict irrigation run off, prompt leak repair, and restrict swimming pools, for example. These measures were made permanent and are still active (City of Downey, 2017). Since June 2015, the City achieved its conservation standard by reducing water use by 20.8 percent (SWRCB, 2016).

Because of these regulations and the environmentally-aware design of the Project, water demand (especially landscape irrigation) could be lower than estimated. However, recycled water is not required to be conserved during drought periods. Given that much of the demand will be satisfied by recycled water, the more conservative pre-conservation water demand estimates were applied in the WSA to ensure adequate supply for the Project.

3. CITY OF DOWNEY WATER DEMAND

This section summarizes water demands for the City's service area, the proposed retailer for the Project.

The first part describes the factors affecting total water demand, including climate, population and employment, plus the mix of customer types, such as residential, commercial, agricultural and industrial. The second part documents water demands, not only under normal climatic conditions, but also during drought.

3.1. CLIMATE

Climate has a significant influence on water demand on a seasonal and annual basis. This influence increases with the portion of water demand for outside uses, specifically landscape irrigation.

Table 2 summarizes representative climate data for the City, including average monthly and annual rainfall and evapotranspiration (ETO) from the California Irrigation Management Information System, Monrovia (CIMIS) station (CIMIS, 2017). The City has a semi-arid, Mediterranean climate, characterized by dry summers and wet winters with year-round moderate-to-warm temperatures. Reflecting this pattern, water demand in the City is greater in the summer than in the winter.

As it would for the entire region, climate change may affect future water supply availability for the City by reducing water availability, changing local precipitation patterns, and increasing water demands. As discussed in greater detail below, the City largely relies on groundwater but is increasing its recycled water supply source to help offset potable demand.

California recently experienced a serious drought in 2012-2015, and is still recovering. In response, and as summarized in Section 2.4, the City passed permanent water conservation measures in June 2015.

3.2. POPULATION

City population, a key factor in water demand, is analyzed in the 2015 UWMP. **Table 3** reproduces the UWMP population value for the City's water service area with projections to 2040.

3.3. CURRENT WATER USE SECTORS AND WATER DEMAND

Table 4 documents the historical water demand for the City's service area by water use sectors for fiscal years 2010 through 2015 from the DWR Public Water Supply Statistic (PWSS) reports (DWR PWSS 2010-2015). The water use sectors (customer types) are listed on the left. Water demand data by sector were available only through 2011; for subsequent years, the sectors were adjusted proportionally based on total supply. Overall during the six-year period, total water use declined slightly, reflecting the success of water conservation programs among other factors. Unaccounted water, which includes routine pipeline flushing, unmetered use, water losses and inaccurate meter registration, is approximately 15.4 AFY (DWR PWSS 2010-2015).

3.4. PROJECTED WATER DEMAND

Table 5 summarizes actual 2015 and projected water demands for the City's service area from 2020 to 2040. The demand per sector was based on the projected required supply from the City, described in section 4 on the PWSS and distributed by sector based on available historical water demand by sector (PWSS, 2017). Overall, the projections indicate increasing water demands to 2040 for each water use sector. The projected residential and commercial water demands reflect water demand increases associated with general commercial and residential growth in the City, and have not been allocated to specific development projects.

3.5. WATER DEMAND IN NORMAL AND DROUGHT PERIODS

Water conservation is important to Southern California's water sustainability with direct effect on water demand, particularly during drought. As summarized in Section 2.4, the Water Conservation Act of 2009 calls for a 20 percent reduction in urban water use by the year 2020. In June 2015, the City of Downey Ordinance 15 -1341 mandated various water

conservation practices including limits on landscape irrigation practices, exterior washing, recreational use, and indoor use. The City is also a partner in The California Water Efficiency Partnership (formerly the California Urban Water Conservation Council). The CWEP provides resources, innovation, leadership and expertise on water efficiency for its partners. The group assembled 14 Best Management Practices for water conservation, which generally coincide with the five Demand Management Measures (DMMs) outlined in the Urban Water Management Plan guidelines, as follows:

- BMP 1: Utility Operations
- BMP 2: Public Education and School Education
- BMP 3: Residential Programs
- BMP 4: Commercial, Institutional, and Industrial Programs
- BMP 5: Landscape Programs

The total future demand may be lower than estimated as the City implements these best management practices for water efficiency.

4. CITY OF DOWNEY WATER SUPPLY

The City of Downey is the water retailer and provides water supply for domestic, irrigation and fire protection use. The 2015 UWMP states that the City overlies and pumps groundwater from the Central Basin, which is its principal source of potable water.

Table 6 lists the historical water supply sources from 2010 to 2016. Based on the seven-year average presented on **Table 6**, groundwater contributes 95 percent of the total water supply for Downey and 100 percent of potable supply. Recycled water contributes 5 percent of the total supply. Imported water is listed in **Table 6**, but has not been utilized since 2001.

The Rancho Los Amigos South Campus Project will utilize recycled water as a future water supply. As part of the development, connections to the recycled water system will be installed.

4.1. GROUNDWATER

As indicated in **Table 6**, groundwater is the main source of water supply for the City. Groundwater is pumped from the Coastal Plain of Los Angeles County Groundwater Basin, Central Basin, designated by the Department of Water Resources (DWR) as groundwater basin number 4-11.04 (DWR, 2003). The Central Basin is the southeastern portion of the Coastal Plain with a surface area of 277 square miles. The basin extends southeast to Coyote Creek and southwest to the Newport-Inglewood fault system.

The water bearing deposits include the unconsolidated and semi-consolidated marine and alluvial sediments of Holocene, Pleistocene, and Pliocene ages. The Holocene alluvium, (Gaspur and Semiperched aquifers), Pleistocene Lakewood (Bellflower and Gardena aquifers), and San Pedro Formations (Silverado aquifer) are the main groundwater

producing units. The storage capacity for the Central Basin is approximately 13.8 million AF (DWR, 2003).

Groundwater extraction by pumping wells is the primary means of groundwater discharge from the basin. The basin receives inflow from artificial recharge projects, subsurface flow from the San Gabriel Valley, and percolation from rainfall. DWR estimated groundwater for urban use in the basin at 217,367 AFY.

The Salt and Nutrient Management Plan (SNMP) for the Central Basin and West Coast Basin (Todd Groundwater, 2015) documents that average salt and nutrient concentrations in the West Coast Basin groundwater do not meet water quality objectives of the Regional Water Quality Control Board because of historical seawater intrusion. However, existing and planned implementation measures (including the barrier projects, desalters, recharge projects and other programs) ensure that salt and nutrient levels in groundwater will achieve the objectives in the future.

In 1961, the West Coast Basin was adjudicated to prevent overpumping (which caused seawater intrusion) and to restore groundwater levels. The Court appointed DWR to serve as Watermaster and account for water rights and groundwater extraction. As part of the adjudication, the Central and West Basin Water Replenishment District (WRD)[1] was created to manage, regulate, and replenish the Central and West Coast Basins.

On January 2, 1962, the WRD filed Case No. 786,656 in the Superior Court, County of Los Angeles, naming more than 700 parties as defendants. It sought to adjudicate water rights of groundwater and regulate pumping from the Central Basin. The first Central Basin Judgment became effective on October 1, 1966. The first amendment to the Judgment was implemented on March 21, 1980, and transitioned the administrative year from a water year (October 1 to September 30) to a fiscal year (July 1 to June 30). On May 6, 1991, the Judgment was amended again to modify the carryover and overproduction provisions. The Judgment was most recently amended by the Court in December 2013, which effected a water storage program. The City has an Allowed Pumping Allocation (APA) of 16,553.62 AFY. However, the total can be adjusted based on carryover rules and additional water can be leased from other water rights holders in the Central Basin.

The City operates and maintains 20 deep groundwater well sites and three MWD imported water connections. The proposed Project site contains an existing LA County well, but the Project does not include the use of this well or installation of new water wells. The City will provide groundwater from their existing network.

4.2. RECYCLED WATER

Although the property does not currently receive recycled water, the City is actively pursuing opportunities to increase its use of recycled water. The City purchases recycled

[1] Renamed Water Replenishment District (WRD) of Southern California

water from Central Basin Municipal Water District (CBMWD). CBMWD purchases and resells tertiary-treated recycled water produced at the Los Angeles County Sanitation Districts Los Coyotes and San Jose Creek Water Reclamation Plants. The City uses recycled water for irrigation of landscaping and replenishment of several park ponds. Businesses at the Downey Promenade also use recycled water in dual plumbing equipped restrooms.

As presented on **Table 6**, the City used an average of approximately 731 AFY of recycled water between 2010 and 2016, accounting for approximately 5 percent of the water supply.

4.3. IMPORTED WATER

Imported water provided by MWD from the Colorado River and the Sacramento-San Joaquin River Delta (Delta) is purchased and delivered to the City. These two sources provide Southern California with approximately 2 million acre-feet (MAF) of water annually for urban uses. The Colorado River provides approximately 4.4 MAF annually for agricultural and urban uses while the Delta supplies Southern California with over 1 MAF annually. MWD receives its water supply via the Colorado River Aqueduct and the California Aqueduct. The Colorado River Aqueduct, managed by MWD, is 242 miles long and conveys water from the Colorado River to Lake Matthews. The California Aqueduct, part of the State Water Project and operated by the California Department of Water Resources, is 444 miles long and carries water from the Delta to Southern California (Stetson Engineers, 2018).

MWD distributes imported water to its 26 members, including the Central Basin Municipal Water District (CBMWD), the water wholesaler that has supplied water to the City. Until fiscal year (FY) 2000-01, the City purchased small amounts of treated imported water from CBMWD when needed to augment the City's annual potable water supplies. Beginning in FY 2000-01, groundwater became the sole source of drinking water for the City. Due to the high cost of the imported CBMWD water, the City intends to rely solely on its groundwater wells to meet the potable water demands of its customers into the future. However, the City will continue to maintain its imported water connections with CBMWD by paying readiness–to-serve and capacity charges to CBMWD in the event this water is ever needed for emergency purposes.

4.4. WATER SUPPLY IN NORMAL AND DROUGHT PERIODS

The California Water Code requires a WSA to include discussion of how supply will meet demand during normal, single dry, and multiple dry years during a 20-year projection. The City's 2015 UWMP provides discussion of water supply and demand in normal and drought periods, included herein by reference. The UWMP documents the City's Water Contingency Plan adopted as Ordinance No. 925 that includes a four-stage water-rationing plan, with reductions of up to 50 percent (Stetson Engineers, 2018). The four stages implement various consumption reduction methods to reduce demand by 15, 25, 35, and 50 percent for stages I through IV respectively.

Based on the City's projected water supply, **Table 7** summarizes water supply and demand for the City for a normal year. The increase in water supply and demand was estimated by Dan Mueller, Principal Engineer and Utilities Manager at the City of Downey (Downey 2017). Groundwater and recycled water demand are estimated to increase by 2.8 percent annually until fiscal year 2020 and then 1 percent annually through 2040.

Tables 8 and **9** show supply and demand in single-year and multi-year dry conditions. The available water supply in a single-dry and multiple dry years was estimated using the observed ratio of normal to dry years in past years. The historical normal year was selected as FY 2007-08 (or 18,402 AF) and FY 2011-12 (or 16,886 AF) was used as a historical single dry year. The historical multiple dry year period including FY 2011-12, FY 2012-13, and FY 2013-14 (or 16,886 AF, 17,215 AF, and 17,279 AF, respectively) was used to estimate the City's projected water demands during a multiple dry year period. Recycled water supply is expected to remain constant throughout either drought.

The City can expect to meet future demands for both single and multiple dry years through 2040 (Stetson Engineers, 2018). Even so, future drought response would follow the water use efficiency mandates as shown through the most recent drought.

4.5. PROJECTED WATER SUPPLY

Table 7 shows the projected supply in Downey in a normal year. The total water demand of the Project is anticipated to be met with the current portfolio of supply discussed in the following section. Groundwater production is capped at the City's adjudicated Allowed Pumping Allocation (APA) of 16,553.62 AFY. The December 2013 amendments to the Judgment allows for a party to the Judgment to store up to 50 percent of that Party's Allowed Pumping Allocation. Unused Pumping Allocations may be converted to stored water. The stored water may be used to adjust the carryover volume equal to the difference between 60 percent of the party's Allowed Pumping Allocation and unused Allowed Pumping Allocation converted to storage. The City is allowed to store up 200 percent (33,107 acre-feet) of its 16,553.62 acre-feet Allowed Pumping Allocation. According to the 2015 UWMP (Stetson Engineers, 2018), if additional supply is needed, it can be leased from other water rights holders in the Central Basin.

5. COMPARISON OF SUPPLY AND DEMAND

The City of Downey 2015 Urban Water Management Plan (adopted February 2018) did not specifically include the South Campus Project but did recognize potential commercial, institutional, and industrial expansion.

As shown in **Table 1** for the proposed Project Phase 1, the City water demand would experience a net increase of 47.5 AFY in potable water demand and a net increase of 93.5 AFY in non-potable demands. This assumes that recycled water deliveries would serve all

irrigation demand and dual plumbing is fully implemented. For the City, these increases are within planned increases in water demand. The commercial sector is expected to increase in demand from 2,702 in 2015 to 3,511 AFY in 2040 (Table 5), an increase of 809 AFY.

Table 1 also shows the projected cumulative water demand for the Sports Center, other Open Space Irrigation, and the HOME Project. Together, the water demand for all facilities on the south campus is 52.2 AFY and 132.5 AFY for potable demand and non-potable respectively. There are no other approved projects considered in the City at this time, but other projects may be considered in the future.

As documented in **Tables 7**, **8**, and **9**, the City has sufficient water supply for existing water demands and projected water demands, including the demand of the proposed Project, if it can lease additional supply in normal years as expected. Projected water demands may be less than projected with implementation of ongoing conservation measures. The City has sufficient water supply to manage demand in single dry, and multiple dry years during a 20-year projection.

Dan

Please find attached the revised WSA for the Rancho Los Amigos South Campus project addressing your comments for your final review and approval.

To keep us on schedule, could we obtain the City of Downey's approval of this document by Thursday, 6/21/18.

Thanks.

MEMORANDUM

To:	Charles Smith ESA	Date:	July 11, 2019
From:	David S. Shender, P.E. Jason A. Shender Linscott, Law & Greenspan, Engineers	LLG Ref:	5-17-0354-1
Subject:	**Traffic Assessment of Project Alternative Ranch Los Amigos South Campus Project**		

This memorandum has been prepared by Linscott, Law & Greenspan, Engineers (LLG) to provide an assessment of the potential traffic impacts related to the Alternative to be evaluated in Draft Environmental Impact Report to be prepared for the Rancho Los Amigos South Campus project (the "Project"). The potential traffic impacts of the Project were evaluated in a traffic study[1] prepared by LLG.

Traffic Analysis of the Project

The Project proposes to construct three new County administrative buildings on the Project site. The ISD Headquarters (up to 315,000 square feet), Probation Department Headquarters (up to 168,000 square feet), and the County Office Building (up to 167,000 square feet) and associated parking and infrastructure would be constructed within the 35-acre Development Area, in the northern part of the Project site. In total, up to 650,000 square feet of net new building floor area is proposed to be developed, accommodating up to 3,000 County employees.

A secured Level 1 (ground floor) public entrance to the Project site would be provided from Golondrinas Street, which is currently gated and does not allow for regular vehicle access. A dedicated entrance from the secured parking area to the ISD and Probation Department Headquarters buildings would also be provided. Off-campus visitors would arrive on campus through a new parking structure. The parking structure would contain a minimum of two vehicular entry/exit locations from the extended Rives Avenue and/or Golondrinas Street, as well as two pedestrian access points. Loading docks for the ISD and Probation Department Headquarters buildings are proposed to be located along Rives Avenue. The loading docks are proposed to be integrated into the building façade and be fully screened.

The County Office Building and associated parking structure would be accessed from vehicular entry/exit points from Flores Avenue and Laurel Street, and will be fully contained within the security wall with controlled access through ingress and egress gates. The primary access point for the County Office Building would be set back from the street and may include a covered entry. The vehicular access points for the parking structures serving the ISD and Probation Department Headquarters buildings and County Office Building have not been finalized.

[1] *Traffic Impact Study – Rancho Los Amigos South Campus*, LLG, July 8, 2019

Trip Generation – Operations

Based on data provided in the traffic study, the Project is forecast to generate 7,443 net new vehicle trips (3,722 in, 3,721 out) during a typical weekday. During the weekday morning (AM) commuter peak hour, the Project is forecast to generate 1,038 net new vehicle trips (913 in, 125 out). During the weekday afternoon (PM) commuter peak hour, the Project is forecast to generate 884 net new vehicle trips (150 in, 734 out).

Traffic Analysis – Operations

The traffic analysis for the Project as provided in the traffic study evaluated the potential traffic impacts of the Project at 27 nearby study intersections. The traffic study concluded that the Project would result in potentially significant traffic impacts at five intersections: Wright Road/Imperial Highway; Garfield Avenue/Monroe Avenue; Industrial Avenue/Gardendale Street; Erickson Avenue/Gardendale Street; Arizona Avenue/Gardendale Street; and Paramount Boulevard/Gardendale Street. A mitigation measure is recommended to eliminate the potential traffic impacts of the Project at the two of the five significantly impacted intersections: Wright Road/Imperial Highway and Erickson Avenue/Gardendale Street. There are no feasible or reasonable mitigation measures for the other intersections.

Traffic Analysis of Alternative Project

The Alternative Project proposes to construct three new County administrative buildings on the Project site. The ISD Headquarters (up to 315,000 square feet), Probation Department Headquarters (up to 168,000 square feet), and the County Office Building (up to 167,000 square feet) and associated parking and infrastructure would be constructed within the 35-acre Development Area, in the northern part of the Project site. In total, up to 650,000 square feet of net new building floor area is proposed to be developed, accommodating up to 1,651 County employees. There are no differences in the proposed site access for the Project Alternative.

Trip Generation – Operations

The trip generation forecast for the Alternative Project is provided in ***Table 1*** attached. As shown in *Table 1*, the Alternative Project is forecast to generate 4,616 net new vehicle trips during a typical weekday (2,308 in, 2,308 out). During the weekday morning (AM) commuter peak hour, Alternative 1 is forecast to generate 648 net new vehicle trips (570 in, 78 out). During the weekday afternoon (PM) commuter peak hour, the Alternative Project is forecast to generate 572 net new vehicle trips (97 in, 475 out). When compared to the Project, the Project Alternative is forecast to generate 2,827 fewer daily trips, 390 fewer AM peak hour trips and 312 fewer PM peak hour trips.

LINSCOTT LAW & GREENSPAN engineers

Traffic Analysis – Operations

A traffic analysis for the Project Alternative was prepared similar to the analysis of the Project as provided in the traffic study and supplemental traffic analysis. The analysis evaluated the potential traffic impacts of the Project Alternative at 27 nearby study intersections. ***Table 2***, ***Table 3***, ***Table 4, Table 5***, and ***Table 6*** provide summaries of the traffic analysis prepared for the City of Downey, City of South Gate, City of Paramount, County of Los Angeles, and City of Lynwood study intersections, respectively. The traffic analysis concluded that the Project Alternative would result in potentially significant traffic impacts at four intersections: Wright Road/Imperial Highway; Garfield Avenue/Monroe Avenue; Erickson Avenue/Gardendale Street; Arizona Avenue/Gardendale Street; and Paramount Boulevard/Gardendale Street. The mitigation measures recommended in the traffic study to eliminate the potential traffic impacts of the Project at the Wright Road/Imperial Highway and Erickson Avenue/Gardendale Street intersections would also eliminate the potential traffic impacts associated with the Project Alternative at these affected intersections. ***Table 7*** provides a summary of the significant impact comparison between the Project and the Project Alternative.

MEMORANDUM

To:	Charles Smith ESA	Date:	July 11, 2019
From:	David S. Shender, P.E. Jason A. Shender Linscott, Law & Greenspan, Engineers	LLG Ref:	5-17-0354-1
Subject:	**Traffic Assessment of Project Alternative Ranch Los Amigos South Campus Project**		

This memorandum has been prepared by Linscott, Law & Greenspan, Engineers (LLG) to provide an assessment of the potential traffic impacts related to the Alternative to be evaluated in Draft Environmental Impact Report to be prepared for the Rancho Los Amigos South Campus project (the "Project"). The potential traffic impacts of the Project were evaluated in a traffic study[1] prepared by LLG.

Traffic Analysis of the Project

The Project proposes to construct three new County administrative buildings on the Project site. The ISD Headquarters (up to 315,000 square feet), Probation Department Headquarters (up to 168,000 square feet), and the County Office Building (up to 167,000 square feet) and associated parking and infrastructure would be constructed within the 35-acre Development Area, in the northern part of the Project site. In total, up to 650,000 square feet of net new building floor area is proposed to be developed, accommodating up to 3,000 County employees.

A secured Level 1 (ground floor) public entrance to the Project site would be provided from Golondrinas Street, which is currently gated and does not allow for regular vehicle access. A dedicated entrance from the secured parking area to the ISD and Probation Department Headquarters buildings would also be provided. Off-campus visitors would arrive on campus through a new parking structure. The parking structure would contain a minimum of two vehicular entry/exit locations from the extended Rives Avenue and/or Golondrinas Street, as well as two pedestrian access points. Loading docks for the ISD and Probation Department Headquarters buildings are proposed to be located along Rives Avenue. The loading docks are proposed to be integrated into the building façade and be fully screened.

The County Office Building and associated parking structure would be accessed from vehicular entry/exit points from Flores Avenue and Laurel Street, and will be fully contained within the security wall with controlled access through ingress and egress gates. The primary access point for the County Office Building would be set back from the street and may include a covered entry. The vehicular access points for the parking structures serving the ISD and Probation Department Headquarters buildings and County Office Building have not been finalized.

[1] *Traffic Impact Study – Rancho Los Amigos South Campus*, LLG, July 8, 2019

Trip Generation – Operations

Based on data provided in the traffic study, the Project is forecast to generate 7,443 net new vehicle trips (3,722 in, 3,721 out) during a typical weekday. During the weekday morning (AM) commuter peak hour, the Project is forecast to generate 1,038 net new vehicle trips (913 in, 125 out). During the weekday afternoon (PM) commuter peak hour, the Project is forecast to generate 884 net new vehicle trips (150 in, 734 out).

Traffic Analysis – Operations

The traffic analysis for the Project as provided in the traffic study evaluated the potential traffic impacts of the Project at 27 nearby study intersections. The traffic study concluded that the Project would result in potentially significant traffic impacts at five intersections: Wright Road/Imperial Highway; Garfield Avenue/Monroe Avenue; Industrial Avenue/Gardendale Street; Erickson Avenue/Gardendale Street; Arizona Avenue/Gardendale Street; and Paramount Boulevard/Gardendale Street. A mitigation measure is recommended to eliminate the potential traffic impacts of the Project at the two of the five significantly impacted intersections: Wright Road/Imperial Highway and Erickson Avenue/Gardendale Street. There are no feasible or reasonable mitigation measures for the other intersections.

Traffic Analysis of Alternative Project

The Alternative Project proposes to construct three new County administrative buildings on the Project site. The ISD Headquarters (up to 315,000 square feet), Probation Department Headquarters (up to 168,000 square feet), and the County Office Building (up to 167,000 square feet) and associated parking and infrastructure would be constructed within the 35-acre Development Area, in the northern part of the Project site. In total, up to 650,000 square feet of net new building floor area is proposed to be developed, accommodating up to 1,651 County employees. There are no differences in the proposed site access for the Project Alternative.

Trip Generation – Operations

The trip generation forecast for the Alternative Project is provided in ***Table 1*** attached. As shown in *Table 1*, the Alternative Project is forecast to generate 4,616 net new vehicle trips during a typical weekday (2,308 in, 2,308 out). During the weekday morning (AM) commuter peak hour, Alternative 1 is forecast to generate 648 net new vehicle trips (570 in, 78 out). During the weekday afternoon (PM) commuter peak hour, the Alternative Project is forecast to generate 572 net new vehicle trips (97 in, 475 out). When compared to the Project, the Project Alternative is forecast to generate 2,827 fewer daily trips, 390 fewer AM peak hour trips and 312 fewer PM peak hour trips.

LINSCOTT LAW & GREENSPAN engineers

Traffic Analysis – Operations

A traffic analysis for the Project Alternative was prepared similar to the analysis of the Project as provided in the traffic study and supplemental traffic analysis. The analysis evaluated the potential traffic impacts of the Project Alternative at 27 nearby study intersections. ***Table 2***, ***Table 3***, ***Table 4, Table 5***, and ***Table 6*** provide summaries of the traffic analysis prepared for the City of Downey, City of South Gate, City of Paramount, County of Los Angeles, and City of Lynwood study intersections, respectively. The traffic analysis concluded that the Project Alternative would result in potentially significant traffic impacts at four intersections: Wright Road/Imperial Highway; Garfield Avenue/Monroe Avenue; Erickson Avenue/Gardendale Street; Arizona Avenue/Gardendale Street; and Paramount Boulevard/Gardendale Street. The mitigation measures recommended in the traffic study to eliminate the potential traffic impacts of the Project at the Wright Road/Imperial Highway and Erickson Avenue/Gardendale Street intersections would also eliminate the potential traffic impacts associated with the Project Alternative at these affected intersections. ***Table 7*** provides a summary of the significant impact comparison between the Project and the Project Alternative.

[a] According to the City of South Gate, a transportation impact is considered significant if the final volume-to-capacity ratio (v/c) equals or exceeds the thresholds shown below:

Level of Service	Final V/C	Project-Related Increase in V/C
E,F	> 0.900	equal to or greater than 0.02

[b] Two-Way Stop-Controlled Intersection. Reported values represent the delays associated with the most constrained approach of the intersection.
