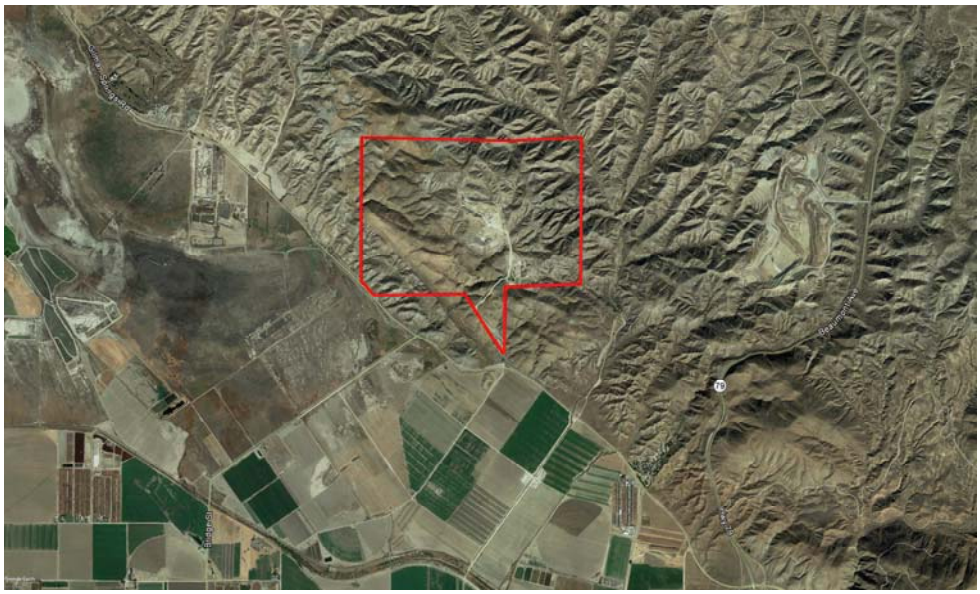
# A. Introduction

## 1.1 Purpose & Scope



The following Preliminary Hydrology & Hydraulics Report has been prepared for Surface Mining Permit (SMP) 159R2 in Riverside County, CA.

**The scope of this Report is as follows:**

- Identification and delineation of the watershed tributary to the project site.
- Identification of historical (pre-disturbance) conditions on-site drainage areas and calculation of peak flow rates and runoff volumes for these areas.
- Identification of existing conditions on-site drainage areas and calculation of peak flow rates and runoff volumes for these areas.
- Identification of developed conditions on-site drainage areas and calculation of peak flow rates and runoff volumes for these areas.
- Comparative analysis of historical vs. existing vs. developed conditions hydrology.
- Identification of floodplain(s) impacting the site.
- Summary of findings & conclusion.

## 1.2 Project Overview

Per Exhibit "A" for SMP 159R2 (revised December 19, 2017) provided by Chandler Aggregates, Inc., the project entails revision to an existing surface mining permit to allow excavation of approximately 204.8 acres to a maximum depth of 461 feet, and subsequent reclamation activities.

Site Location

The project site is approx. 1,021 acres and is located in Riverside County approximately 1.5 miles northwest of the City of Beaumont and 3 miles north of the City of San Jacinto. Access to the site is provided via a private roadway off of Gilman Springs Road to the south. The study watershed is approximately 3,882 acres in size, of which 2,844 acres is tributary (offsite). Of this, 2,855 acres is attributed Laborde Canyon, which drains through the northeast corner of the project site.

All runoff from the study watershed ultimately discharges to the San Jacinto River, which flows northwesterly approximately 1.5 miles south of the project site.

Refer to Exhibit "A" for an aerial orthophoto of the project site. Refer to Exhibit "B" for a USGS quadrangle of the project site and study watershed.

## 1.3 References

The following documents have been made part of this report by reference:

1.) Hydrology Manual (April 1978) – Riverside County Flood Control & Water Conservation District.

2.) Surface Mining Permit (SMP) 159R2 Exhibit "A" (December 19, 2017) – Chandler Aggregates, Inc.

3.) Web Soil Survey "Western Riverside Areas, CA" (v.10, September 12, 2017) – National Resource Conservation Service (NRCS).

4.) 2011 National Land Cover Database (NLCD) – Multi-Resolution Land Characteristics (MRLC) Consortium.

# B. Methodology

## 1.1 General Methodology

The requirements and recommendations found in the Riverside County Hydrology Manual (April 1978) provided by the Riverside County Flood Control & Water Conservation District (RCFC & WCD) was used as the basis for the methodology and calculations found in this report. Unit Hydrograph calculations were performed for historical (pre-disturbance, per USGS quadrangle data), existing (reflecting the existing SMP operation and improvements), and developed conditions (per SMP 159R2) for the 100-year, 1, 3, 6, and 24-hour storm events, for comparative analysis of peak flow rates and runoff volumes. For developed conditions areas proposing complete retention of runoff, the 100-year, five-day storm was used.

## 1.2 Geographic Information System (GIS) Data

Due to the size of the study watershed, Geographic Information System (GIS) data was used for verification of hydrologic soils groups, land cover, hydrographic features, and topography discussed in this report. ArcGIS was used for area-averaging of precipitation and losses (SCS values).

## 1.3 Sources of Topography

On-site topography was based on 2 ft. and 10 ft. contours generated from a 2 ft. aerial topographic survey provided by Inland Aerial Surveys, Inc. and dated January 04, 2019. Off-site topography was based on contours interpolated from 20 ft. USGS quadrangle maps.

## 1.4 Watershed Precipitation

Watershed precipitation values, and the Slope of Intensity Curve (0.50) used in this report were based on the isohyetal maps found in the Riverside County Hydrology Manual (see Exhibit "C"). Note that these isohyetals were digitized and converted to raster data using ArcGIS, to calculate specific interpolated values for each drainage area for historical, existing, and developed conditions. These drainage area-specific values are tabulated as Attachment No. 1.

## 1.5 Watershed Losses

Refer to Exhibit "D.1" for a map of the hydrologic soils groups identified within the study watershed, based on National Resource Conservation Service (NRCS) Web Soil Survey "Western Riverside Areas, CA" (v.10, September 12, 2017). ArcGIS was then used to intersect these soils groups with the land cover types discussed below for the three analyzed conditions, to establish SCS (Soil Conservation Service) Curve Number (CN) values (per the Riverside County Hydrology Manual excerpts included as Attachment No. 2). These SCS values (AMC II) were then converted to raster data using ArcGIS, to calculated specific interpolated values for each drainage area.

Refer to Exhibit "D.2" for historical (pre-development) conditions land cover types, per 2011 National Land Cover Database (NLCD) provided by the Multi-Resolution Land Characteristics (MRLC) Consortium. Note that the NLCD classifications were translated to the nearest approximated cover type found in the

Riverside County Hydrology Manual for the purposes of SCS selection. Refer to Exhibit "D.3" for historical (pre-development) conditions SCS values established by intersecting the historical conditions cover types with the watershed soils groups. Note that all historical conditions drainage areas were assumed to be 100% pervious.

The historical conditions land cover types were altered to reflect existing conditions cover, as indicated on Exhibit "D.4". All existing disturbed areas were assumed to be "barren" based on analysis of aerial imagery and field investigation. Refer to Exhibit "D.5" for existing conditions SCS values established by intersecting the existing conditions cover types with the watershed soils groups. Note that existing conditions drainage areas impervious values were adjusted, as applicable, based on analysis of aerial imagery and field investigation.

The existing conditions land cover types were altered to reflect developed conditions cover, as indicated on Exhibit "D.6". All developed disturbed areas were assumed to be "barren" based on review of SMP 159R2 Exhibit "A" provided by Chandler Aggregates, Inc. Refer to Exhibit "D.7" for developed conditions SCS values established by intersecting the developed conditions cover types with the watershed soils groups. Note that developed conditions drainage areas impervious values were adjusted, as applicable, based review of SMP 159R2 Exhibit "A".

Exhibit "D.8" illustrates the General Plan Land Use designations for the project watershed. Based on this information, the development potential of the tributary watershed appears to be very low.

Specific SCS and impervious percentage values for all drainage areas are included in the hydrograph input values provided in Sections "E", "F", and "G" of this report. Note that AMC III was used for all 100-year calculations included in this report.

### 1.6 Unit Hydrograph Method Calculations

The Riverside County Unit Hydrograph Method (UNRIV) software applications provided by CivilDesign® Corporation were used for the unit hydrograph method calculations included in this report. Lag time for all hydrographs was calculated using the Army Corps (Snyder) lag equation.

## C. FEMA Floodplain Identification & Considerations

Per FEMA Flood Insurance Rate Map (FIRM) Panel No's. 06065C0795H and 06065C1460H (revised August 18, 2014), the project site is not impacted by any identified floodplains. Refer to Exhibit "E" for an overlay of the project site on the applicable FEMA FIRMs.

# D. Drainage Analysis by Condition

## 1.1 Historical (Pre-Development) Conditions

Refer to Exhibit "F" for the historical (pre-development) conditions study map. Per the USGS quadrangles for the study watershed, offsite flows within Laborde Canyon (Drainage Area 1 – 2,855.4 acres) originate approximately 1.5 miles north of the project's northern boundary and flow southerly through relatively steep canyons as an identified blue line stream before flowing through a small portion of the project site's northeastern corner. The majority of the remaining watershed flows are on-site, originating near the center of the project site and breaking to the east, west, and south before discharging off-site. On-site slopes are shown as moderate to relatively steep.

The USGS quadrangle indicates five additional blue line streams traversing the site. The most significant of these (for Drainage Area 14 – 355.4 acres) is shown as draining southerly and southwesterly through the approximate middle of the site.

## 1.2 Existing Conditions

Refer to Exhibit "G" for the existing conditions study map. The existing project site is partially developed as a surface mining operation/quarry. The majority of land disturbance is located at the approximate center of the site (within Drainage Area 31). Flows associated with the blue line stream discussed above (historical conditions Drainage Area 14) have been routed around the existing operation to the west side of the existing paved access road. These flows then continue in a manner substantially identical to historical conditions prior to discharge off of the site. The remaining five blue line streams (including Laborde Canyon) have not been disturbed by the existing mining operation and associated improvements. An existing aggregate processing plant is located within the northern portion of Drainage Area 32.

## 1.3 Developed Conditions

Refer to Exhibit "H" for the developed conditions study map, which shows the final permitted extents of SMP 159R2 (Drainage Area 45) and the associated aggregate processing plant area (Drainage Area 46). Flows associated with the blue line stream discussed above will be maintained, and the other blue line streams (including Laborde Canyon) will remain undisturbed. All other drainage areas will remain effectively unchanged from existing conditions.

The proposed excavation (Drainage Area 45) will have a capacity of 7,714 a.f., which will retain and infiltrate the calculated 100-year, 5-day runoff volume of 73.18 a.f. (see Section G of this report) at a depth of 1.54 ft. The proposed aggregate processing plant area (Drainage Area 46) will have a minimum capacity of 20 a.f., which will retain and infiltrate the calculated 100-year, 5-day runoff volume of 19.81 a.f. (see Section G of this Report).

# H. Summary & Conclusion

## 1.1 Summary of Conditions

Summaries of the unit hydrograph calculations for the three analyzed conditions are tabulated below:

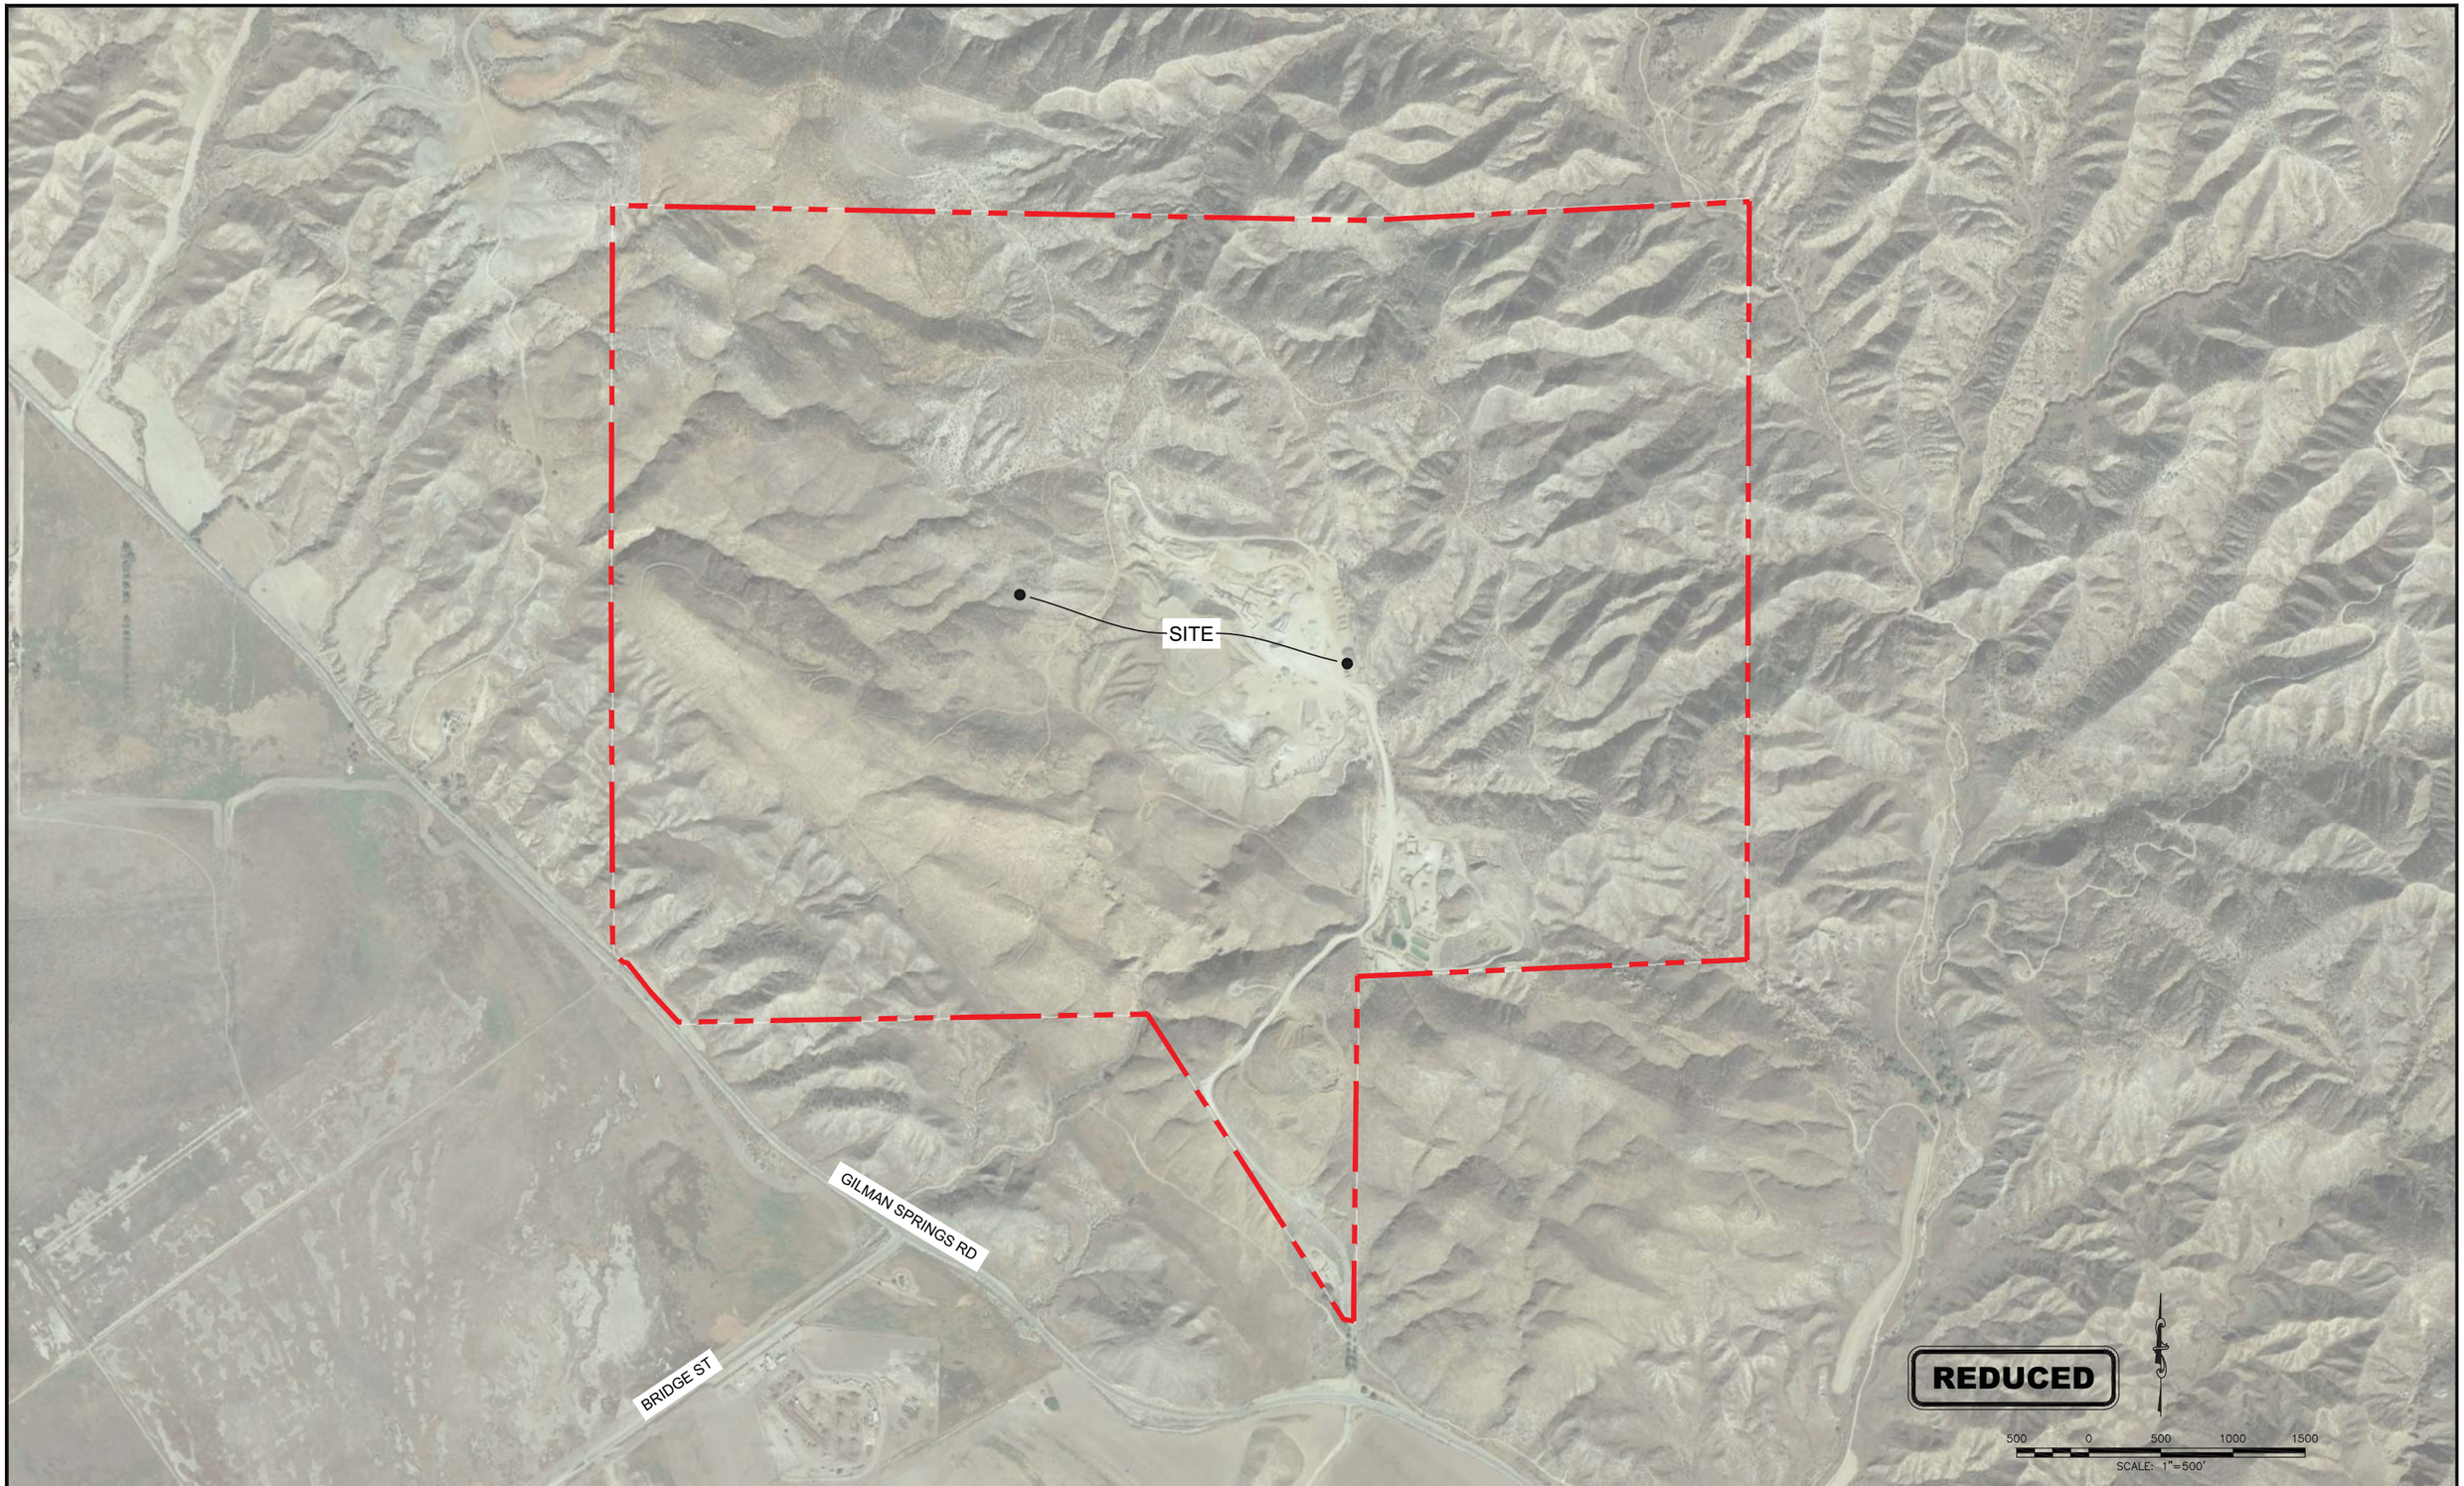
As shown above, total combined peak flows are relatively the same from historical to existing conditions. Small differences exist due to differences in drainage area lag times based on different topographic sources (USGS vs. aerial topography), as well as the existing drainage improvements. Total combined runoff volumes are increased slightly from historical to existing conditions, due to the changes in SCS and imperviousness values resulting from the existing mining operation and associated improvements.

Total combined peak flows and total combined runoff volumes are reduced for all analyzed events for developed conditions, due to complete retention of all flows for developed conditions Drainage Areas 45 and 46 (flows and volumes for these areas were therefore not included as part of the developed condition portion of the above tabulation).

## 1.2 Conclusion

Based on analysis of historical (pre-development), existing, and developed conditions, it is concluded that:

1.) SMP 159R2 will maintain the existing routing of one blue line stream that substantially mimics historical (predevelopment conditions);



2.) SMP 159R2 will not have any other hydrologic impact on any other identified blue line streams currently traversing the site;

3.) SMP159R2 will not result in any increase of peak flows or runoff volumes for any flows discharging from the project site limits, and will therefore not have any detrimental hydrologic impact to downstream properties, conveyances, or receiving waters.

## NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

**Coastal Base Flood Elevations (BFEs)** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or State Plane zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

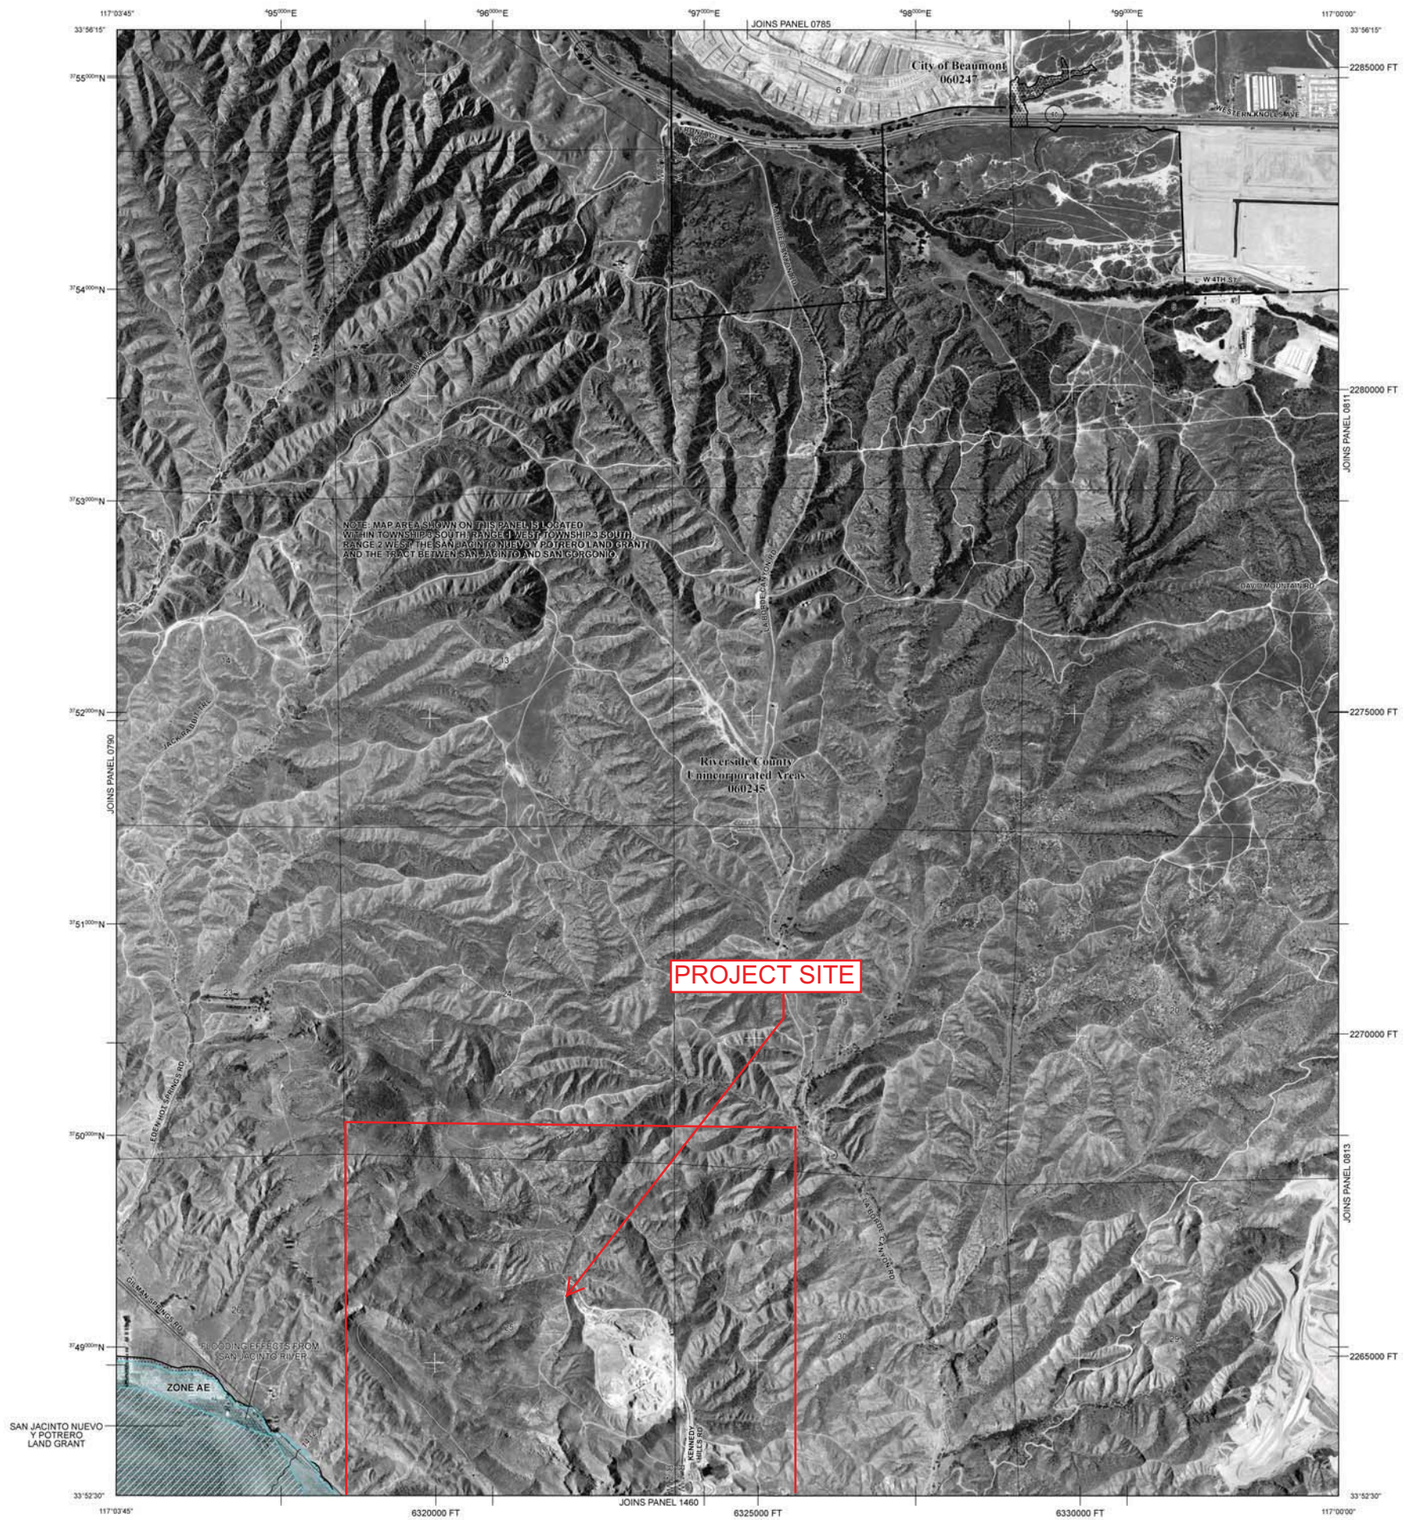
To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242** or visit its website at http://www.ngs.noaa.gov/.



**Base map** information shown on this FIRM was derived from multiple sources including the Riverside County, CA effective database, and the National Geodetic Survey. Base map imagery for Riverside County, CA is a mosaic of the NAIP 2009 images, 1 meter resolution.

The **"profile base lines"** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the "profile base line", in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information and questions about this map, available products associated with this FIRM including historic versions of this FIRM, how to order products or the National Flood Insurance Program in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Map Service Center website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website. Users may determine the current map date for each FIRM panel by visiting the FEMA Map Service Center website or by calling the FEMA Map Information eXchange.

## LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

| | |
|---|---|
| **ZONE A** | No Base Flood Elevations determined. |
| **ZONE AE** | Base Flood Elevations determined. |
| **ZONE AH** | Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined. |
| **ZONE AO** | Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined. |
| **ZONE AR** | Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood. |
| **ZONE A99** | Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined. |
| **ZONE V** | Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined. |
| **ZONE VE** | Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined. |

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

| | |
|---|---|
| **ZONE X** | Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood. |

OTHER AREAS

| | |
|---|---|
| **ZONE X** | Areas determined to be outside the 0.2% annual chance floodplain. |
| **ZONE D** | Areas in which flood hazards are undetermined, but possible. |

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

## NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

**Coastal Base Flood Elevations (BFEs)** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or State Plane zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

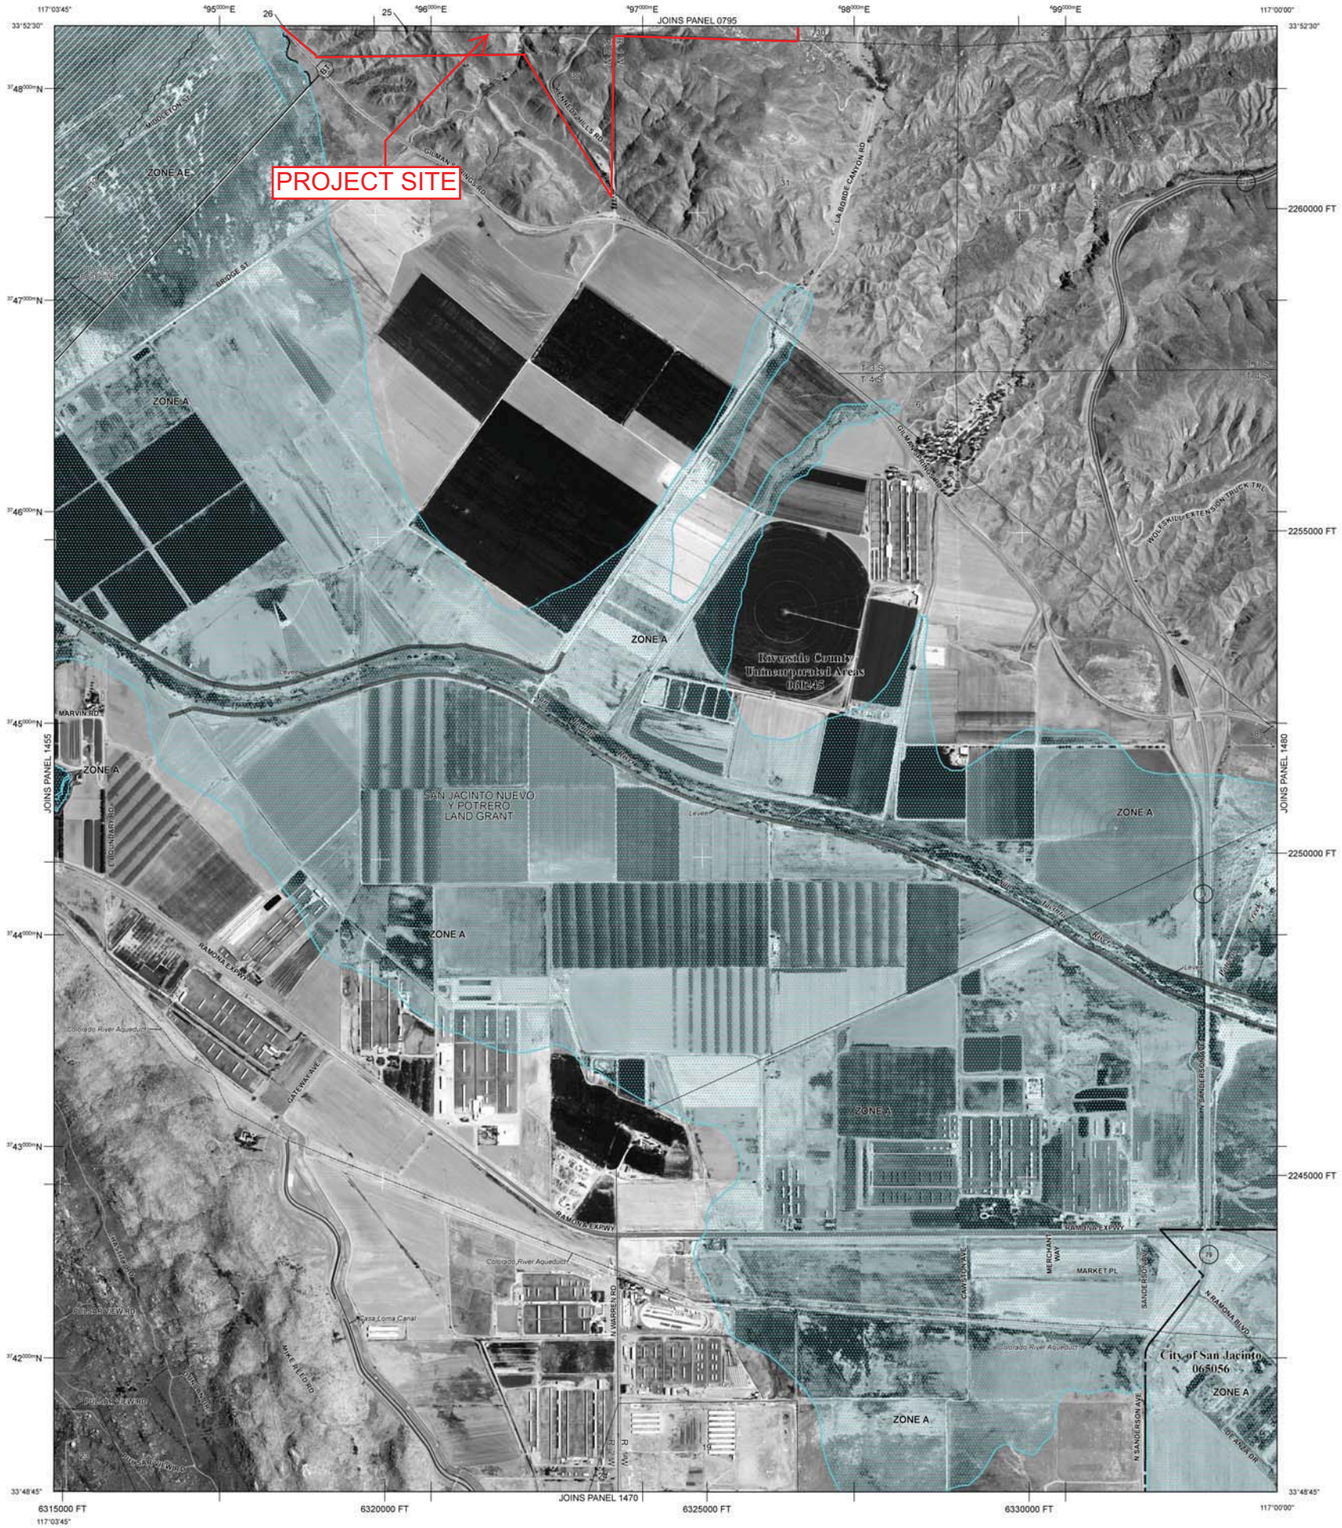
To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242** or visit its website at http://www.ngs.noaa.gov/.



**Base map** information shown on this FIRM was derived from multiple sources including the Riverside County, CA effective database, and the National Geodetic Survey. Base map imagery for Riverside County, CA is a mosaic of the NAIP 2009 images, 1 meter resolution.

The **"profile base lines"** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the "profile base line", in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information and questions about this map, available products associated with this FIRM including historic versions of this FIRM, how to order products or the National Flood Insurance Program in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Map Service Center website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website. Users may determine the current map date for each FIRM panel by visiting the FEMA Map Service Center website or by calling the FEMA Map Information eXchange.

## LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

| | |
|---|---|
| ZONE A | No Base Flood Elevations determined. |
| ZONE AE | Base Flood Elevations determined. |
| ZONE AH | Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined. |
| ZONE AO | Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined. |
| ZONE AR | Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood. |
| ZONE A99 | Areas to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no Base Flood Elevations determined. |
| ZONE V | Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined. |
| ZONE VE | Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined. |

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

| | |
|---|---|
| ZONE X | Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood. |

OTHER AREAS

| | |
|---|---|
| ZONE X | Areas determined to be outside the 0.2% annual chance floodplain. |
| ZONE D | Areas in which flood hazards are undetermined, but possible. |

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

Notes:

1. Land use should be based on ultimate development of the watershed. Long range master plans for the County and incorporated cities should be reviewed to insure reasonable land use assumptions.

2. Recommended values are based on average conditions which may not apply to a particular study area. The percentage impervious may vary greatly even on comparable sized lots due to differences in dwelling size, improvements, etc. Landscape practices should also be considered as it is common in some areas to use ornamental gravels underlain by impervious plastic materials in place of lawns and shrubs. A field investigation of a study area should always be made, and a review of aerial photos, where available may assist in estimating the percentage of impervious cover in developed areas.

3. For typical horse ranch subdivisions increase impervious area 5 percent over the values recommended in the table above.

IMPERVIOUS COVER FOR DEVELOPED AREAS

PLATE D-5.6

## COVER TYPE DESCRIPTIONS

NATURAL COVERS -

Barren - Areas with 15 percent or less of the ground surface covered by plants or litter. It includes rockland, eroded land, and shaped or graded land. Barren land does not include fallow land.

Chaparral, Broadleaf - Areas on which the principal vegetation consists of evergreen shrubs with broad, hard, stiff leaves such as manzonita, ceanothus and scrub oak. The brush cover is usually dense or moderately dense.

Chaparral, Narrowleaf - Land on which the principal vegetation consists of diffusely branched evergreen shrubs with fine needle-like leaves such as chamise and redshank. The shrubs are usually widely spaced and low in growth. If the narrowleaf chaparral shrubs are dense and high; the land should be included with broadleaf chaparral cover.

Grass, Annual - Land on which the principal vegetation consists of annual grasses and weeds such as annual bromes, wild barley, soft chess, ryegrass and filaree.

Grass, Perennial - Areas on which the principal vegetation consists of perennial grass, either native or introduced, and which grows under normal dryland conditions. Examples are Stipa or needle grass, Harding grass and wheat grass. It does not include irrigated and meadow grasses.

Meadow - Land areas with seasonally high water table, often called cienegas. Principal vegetation consists of sod-forming grasses interspersed with other plants.

Open Brush - Principal vegetation consists of soft wood shrubs, usually grayish in color. Examples include California buckwheat, California sagebrush, black sage, white sage and purple sage. It also includes vegetation on desert facing slopes where broadleaf chaparral predominate in an open shrub cover.

Woodland - Areas on which coniferous or broadleaf trees predominate. The crown or canopy density, the amount of ground surface shaded at high noon, is at least 50 percent. Open areas may have a cover of annual or perennial grasses or of brush. Plant cover under the trees is usually sparse because of leaf or needle litter accumulation.

Woodland, Grass - Areas with an open cover of broadleaf or coniferous trees usually live oak and pines, with the intervening ground space occupied by annual grasses or weeds. The trees may occur singly or in small clumps. Canopy density, the amount of ground surface shaded at high noon, is from 20 to 50 percent.

URBAN COVERS -

Residential or Commercial Landscaping - The pervious portions of commercial establishments, single and multiple family dwellings, trailer parks and schools where the predominant land cover is lawn, shrubbery and trees.

COVER TYPE DESCRIPTIONS

URBAN COVERS (cont.) -

Turf - Golf courses, parks, cemeteries, and similar lands where the predominant cover is irrigated mowed close-grown turf grass. Parks in which trees are dense may be classified as woodland.

AGRICULTURAL COVER -

Fallow - Fallow land is land plowed but not yet seeded or tilled. It is more effective than barren land in reducing storm runoff.

Legumes, Close Seeded - Alfalfa, sweetclover, timothy, etc. and combinations, either planted in close rows or broadcast.

Orchards, Deciduous - Land planted to such deciduous trees as apples, apricots, pears, walnuts and almonds. The ground cover during the rainy reason alters the hydrologic response to storm rainfall. Ground cover may be annual grass or perennial grass with or without legumes. Occasionally legumes are used alone. Use runoff index numbers which apply to the land use or the kind and condition of cover during storm periods. If orchards are kept bare by disking, or through the use of herbicides, fallow applies.

Orchards, Evergreen - Land planted to evergreen trees which include citrus and avocado orchards and coniferous plantings. The effectiveness of this kind of land use is in part determined by the tree, the litter and the ground cover. In these groves the ground cover may be legumes alone or annual or perennial grasses with or without legumes. The ground cover may be entirely litter if the tree canopy is sufficiently dense to produce a substantial quantity of fallen leaves or needles. As with deciduous orchards, management practices affect the runoff potential of evergreen orchards.

Pasture, Dryland - Equivalent to annual grass. Land on which the principal vegetation consists of annual grasses and weeds such as annual bromes, wild barley, soft chess, ryegrass and filaree.

Pasture, Irrigated - Irrigated land planted to perennial grasses and legumes for production of forage and which is cultivated only to establish or renew the stand of plants.

Row Crops - Lettuce, tomatoes, sugar beets, tulips or any field crop planted in rows far enough apart that most of the soil surface is exposed to rainfall impact throughout the growing season. At plowing, planting and harvest times it is equivalent to fallow.

Small Grain - Wheat, oats, barley, flax, etc. planted in rows close enough that the soil surface is not exposed except during planting and shortly thereafter.

Vineyards - As with orchards, ground cover and land condition must be considered in estimating runoff potential. Use runoff index numbers which apply to the kind and condition of cover. For example either annual grass or fallow may apply.

Notes:

1. All runoff index (RI) numbers are for Antecedent Moisture Condition (AMC) II.

2. Quality of cover definitions:
   Poor-Heavily grazed or regularly burned areas. Less than 50 percent of the ground surface is protected by plant cover or brush and tree canopy.
   Fair-Moderate cover with 50 percent to 75 percent of the ground surface protected.
   Good-Heavy or dense cover with more than 75 percent of the ground surface protected.

3. See Plate C-2 for a detailed description of cover types.

4. Use runoff index numbers based on ground cover type. See discussion under "Cover Type Descriptions" on Plate C-2.

5. Reference Bibliography item 17.

Drainage Area = 3.30(Ac.) = 0.005 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 3.30(Ac.) = 0.005 Sq. Mi.
Length along longest watercourse = 709.00(Ft.)
Length along longest watercourse measured to centroid = 382.00(Ft.)
Length along longest watercourse = 0.134 Mi.
Length along longest watercourse measured to centroid = 0.072 Mi.
Difference in elevation = 120.00(Ft.)
Slope along watercourse = 893.6530 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.040 Hr.
Lag time = 2.38 Min.
25% of lag time = 0.60 Min.
40% of lag time = 0.95 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)

Drainage Area = 5.20(Ac.) = 0.008 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 5.20(Ac.) = 0.008 Sq. Mi.
Length along longest watercourse = 627.00(Ft.)
Length along longest watercourse measured to centroid = 335.00(Ft.)
Length along longest watercourse = 0.119 Mi.
Length along longest watercourse measured to centroid = 0.063 Mi.
Difference in elevation = 185.00(Ft.)
Slope along watercourse = 1557.8947 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.032 Hr.
Lag time = 1.95 Min.
25% of lag time = 0.49 Min.
40% of lag time = 0.78 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
