Professional Experience

2014-Present **HES Team Lead – Air Permitting,** ***Chevron North American Exploration and Production***

· Leading team of 2-4 engineers responsible for air permitting and compliance support for fields in the following Districts: San Joaquin Valley, Monterey Bay and San Luis Obispo

· Developing new employees through assignments, coaching and role modeling.

2013-2014

HES Specialist – Air Permitting, ***Chevron North American Exploration and Production***

· Led multi-phase project to reduce NOVs and variances.

· Developed new employees through assignments, coaching and role modeling.

· Led permit streamlining projects for SJV sources

· Efficiently prepared air quality permit applications using Microsoft tools and evaluated compliance with BACT, NSR, GHG, CEQA, Title V, Air Toxics, and SJVAPCD

2012-2013

Associate/Engineer, ***Insight Environmental Consultant***

· Efficiently prepared air quality permit applications using Microsoft tools and evaluated compliance with BACT, NSR, GHG, CEQA, Title V, Air Toxics, and SJVAPCD or Bay Area AQMD rules and regulations.

· Assisted clients with Title V compliance auditing.

· Successfully collaborated with Air District to dispute and clarify rule applicability.

· Assisted clients in negotiating NOV settlement.

· Prepared waste discharge reports (WDRs) in accordance with State Water Quality Control Board Requirements.

· Managed a waste discharge monitoring and reporting program, which included preparing program reports, corrective action plans, and salinity control plans.

· Recommended project budgets and efficiently worked within quoted budgets and project timelines.

2010-2012

Air Quality Engineer, ***San Joaquin Valley Air Pollution Control District***

· Worked with key stakeholders to permit wide range of emission sources using tools such as Microsoft Excel, Word, and Outlook. Projects evaluated for BACT, NSR, GHG, CEQA, Title V, Air Toxics, and compliance with SJVAPCD rules

· Worked collectively with co-workers to promote teambuilding as a member of the Healthy Air Living (HAL) committee.

· Recognized for excellence in Service, Teamwork, Attitude, and Respect with the District's 2011 S.T.A.R. of the Year Award

· Used excel to evaluate bio-solid and green waste composting technical data to aid in District rule development.

· Identified gap in District Rule. Collaborated with District Management to create internal guidance document.

Education

2005-2009 B.S. Civil Engineering, *University of California, Davis*

Highlights of Certifications and Professional Memberships

- Certified Air Permitting Professional
- Engineer in Training (E.I.T.)
- Air and Waste Management Association – Board Member
- Member of 2013 American Society of Civil Engineers (ASCE)

Dennis J. Champion, PE

Work History

California Resources Corporation	**Manager Air and GHG Programs**	**08/01/2014**	**Present**

Responsibilities: Manage Statewide air quality and GHG program coordination and integration. Maintain active review of current/proposed regulations, advocate at the local, State, and federal level concerning issues related to air quality and GHG regulations. Coordinate emission reduction credit use and tracking, fugitive emissions monitoring and reporting, and greenhouse gas data collection and reporting. Prepare and present Management review documentation.

Occidental of Elk Hills, Inc	**Senior Environmental Engineer**	**04/10/1988**	**08/01/13**

Responsibilities: Oversee air quality and greenhouse gas compliance programs and all affiliated work processes. Provide oversight of other staff including engineers (air quality and Facility) and technicians. Proactively develop and implement programs to collect, review, report and train to work processes utilizing spreadsheet, database, presentation, and visual basic applications. Strive to integrate systems into daily routines to minimize impacts to Operations.

Kern County Air Pollution Control District	**Air Pollution Engineer**	**04/01/1986**	**04/01/1988**

Responsibilities: Responsible for review of engineering data to verify compliance with applicable federal, State, and local air quality regulations. Developed several methodologies to streamline permitting activities and reduce time necessary to issue permits. Developed computer program to estimate emissions from gas-fired turbines and developed additional tools for evaluating pump and compressor operations. Developed permits for turbines, oil and gas operations, aggregate plants, air filtration systems, and other emitting activities.

Projects/Accomplishments

Date Completed	Project	Description
Ongoing	Implement GHG Program	Developed State and federal reporting program for GHG. Prepare and submit annual reports to corporate, the State, and the EPA. Active advocacy resulting in reduced data demands and ease of reporting. Continuing efforts to develop overall transparent programs.
08/15/2012	Cryogenic Gas Plant	Responsible for oversight of HES and permitting activities associated with construction of the project including air, water, waste, biology, and safety permitting issues. Directly involved with all regulatory agencies, oversight of support staff, and provided direct interface with Management.
06/01/2002	Elk Hills Power Project	Managed preparation of the Elk Hills Power AFC. All permitting documents; direct oversight of all subcontract support staff and personnel from Sempra and Oxy. Negotiated directly with regulatory agencies and associated legislative representatives.

Education

Degree	Major	School	Degree Date
Bachelor's Degree	Political Science	CA St University, Bakersfield	06/01/1979
Bachelor's Degree	Chemical Engineering	CA St Polytechnic University, Pomona	06/01/1985

Licenses, Certificates, and Memberships

Registered Professional Engineer (CH 4695)	**Start Date**:	06/30/1992	**Expiration:**	06/30/2016
American Institute of Chemical Engineers		04/01/1985		

References upon request

Peggy Shue

Profile:

Ms. Shue has 35 years of experience in various aspects of the oil and gas production industry. The majority of her work has involved environmental permitting and compliance with a focus on air quality issues.

Experience:

1997 to present - Aera Energy LLC
1980 to1997 - Mobil Exploration and Producing U.S., Inc

Led company-wide air quality permitting and compliance – 18 years:

- Provide technical support and mentoring for field-based environmental professionals
- Wrote and continue to manage corporate air quality programs
- Prepared or supervised preparation of numerous local and federal air permit applications including PSD permitting with EPA and Title V initial and renewed permits with SJVPACD, MBUAPCD, and VCAPCD.
- Directed company Greenhouse Gas reporting efforts beginning with voluntary reporting to CCAR in 2006 and continuing through current required reporting to EPA and California ARB
- Championed and assisted in implementation and maintenance of enterprise software for Title V compliance management, criteria pollutant reporting, and greenhouse gas emission reporting
- Directed company-wide Air Toxic Hot Spots compliance since 1991
- Participate through industry groups and corporate involvement in evaluating and providing comments on local and state air quality rulemaking
- Prepare parent companies with internal company air quality emissions and compliance reporting
- Provided air quality compliance/regulatory technical support for several company mergers and acquisitions/divestitures

Managed onsite environmental compliance at oil production facilities – 6 years:

- Obtained air permits and variances. Led compliance efforts. Prepared and maintained required compliance reports and documentation.
- Developed and implemented training for operations personnel on variance environmental topics including air permit conditions. Provided technical environmental issue information to non-technical partners
- Designed and implemented Threatened & Endangered Species program, revised SPCC plans and Hazardous Material Business Plans, coordinated cleanup of stream channels to meet requirements of abatement order.

Facilities and Process Engineering – 11 years

- Designed oil treating facilities for heavy oil projects including specifying and purchasing equipment. Acted as project manager for installation of various oilfield equipment and pipeline projects
- Provided engineering support for numerous air permitting applications
- Conducted engineering studies to optimize performance of existing facilities
- Negotiated and administered contracts purchasing gas for processing at gas plants in Oklahoma and Kansas and selling processed natural gas to natural gas suppliers
- Prepared economic analyses for ongoing operations and for potential new projects

Education & Certifications:

University of Colorado, Boulder: Bachelor of Science in Chemical Engineering
University of California Extension, Davis: Certificate in Air Quality Management
San Joaquin Valley APCD: Certified Air Permitting Professional

BOSTON, ROBERT

405 Carr St., Bakersfield, CA 93309 | 661-323-2501 | bostonio@aol.com

SUMMARY

Environmental, Health and Safety Generalist with a passion for values-driven approach to culture building and EH&S leadership.

HIGHLIGHTS OF QUALIFICATIONS

Competencies

- Resource and results management – utilizes available resources to effectively and efficiently accomplish objectives.
- Strategic thinking/visioning and alignment – Proposes course of action that furthers the objectives, priorities and vision of organization.
- Client Focus – Provides support to operations/technical teams for execution of long-range plans.
- Creativity and Innovation – Generates viable regulatory approaches and solutions
- Impact and Influence – Gains others' support
- Proactivity & Self-Motivation – sets goals, standards and takes initiative
- Project Management – Planning, implementing, monitoring, and completing projects
- Teamwork – Works collaboratively with others to achieve organizational goals

Pertinent Certifications

- Certified Air Permitting Professional

EXPERIENCE

2014-Present EH&S Manager, *LINN Energy*

- Regulatory and compliance management for Company assets in California.
- Transition/integration to LINN's values-based business model; lead corporate initiatives.

2001-2013 EH&S Manager, *Berry Petroleum Company*

- Regulatory and compliance management for Company assets in California, Utah, Colorado, Texas, and Louisiana
- Built a team of EH&S professionals and EH&S management systems/programs, which was led at all levels within the organization and integrated with business practices.
- Led the regulatory effort that allowed for execution of Berry's North Midway Sunset Diatomite Development project including NEPA/CEQA Mitigated Negative Declarations, Biological Opinion, and Incidental Take permit.

EDUCATION

1974-1978 B.S. Petroleum Engineering, *Montana Tech*

SHAMS HASAN
1611 Torino Street, Redlands, CA 92374
shams.hasan193@gmail.com
661-428-8095 cell

PROFILE

- HSE Manager at a California-based independent oil exploration and production company
- Air quality expert – Extensive experience with Climate Change programs, GHG emissions management, Carbon trading, AB-32, Emission Reduction Credits, and offsets
- Experienced environmental professional with broad experience in project management, policy implementation, strategic planning, and development and implementation of environmental laws and regulations pertaining to energy, oil and gas, construction, manufacturing, and other industries
- Excellent self-leadership, interpersonal communication skills, and cultural sensitivity with the ability to effectively and tactfully interact with individuals
- Several years of professional experience in ambient air quality monitoring, emission inventory compilation with expertise in air quality management protocols and strategies
- Experience in the development of criteria pollutant and greenhouse gas inventories
- Excellent analytical and leadership skills, including motivation, negotiation skills and conflict resolution
- Experience in strategic planning, milestone creation, project scheduling and overseeing external relations with relevant stakeholders including academia, government officials, elected representatives, members of industries, community activists and others
- Excellent communication skills - experienced in writing detailed technical reports and making verbal and written presentations
- Proven record of building and managing teams and creating an enabling environment, including the ability to effectively lead, supervise, mentor, develop and evaluate multi-cultural and multi-ethnic staff
- Computer proficient in spreadsheets, analytical tools and proprietary software

SUMMARY OF WORK EXPERIENCE:

May 2012 – Present: E & B Natural Resources Management Corp.
Bakersfield, CA

Current Position: Manager HSE

Job function:

- Ensure that oil exploration and production activities are in compliance with federal, state, and regional environmental rules and regulations
- Ensure compliance with all environmental regulations and programs including (1) Climate Change, Global Warming Solutions Act, Cap and Trade, carbon trading and Low Carbon Fuel Standards; (2) State Water Resources Control Board; and (3) Other regulations
- Coordinate with consultants, Engineering, Operations and Production staff to discuss and resolve issues, exchange information, and provide specialist guidance and support for environment - related issues
- Lead interface and frequent liaison with regulatory agencies, industry associations, outside consultants and contractors with respect to environmental projects, applications, permits, and compliance activities
- Coordinate implementation and maintenance of environmental permits and report monitoring
- Advise management on emerging environmental issues, and present recommendations to address these issues
- Experienced in identifying and evaluating potential compliance risks and related operational and business impacts resulting from environmental legislation and regulation
- Negotiate and procure emissions offsets and credits
- Coordinate permitting and compliance activities with all regulatory agencies
- Identify new or amended regulatory initiatives and take proactive steps to minimize disruption or excessive cost
- Lead key regulatory negotiations including settlement of notices of violation
- Oversee compliance tracking database and implementation
- Coordinate with exploration and production divisions to ensure that all environmental permits are available before any exploration or production activity commences and without delay in project deadlines

July 1988 – May 2012 **South Coast Air Quality Management District (SCAQMD)**

Last position (March 1999 – May 2012) **Air Quality Specialist**

Job function:

- Independently developed and coordinated air quality programs and regulations
- Identified and evaluated potential compliance risks and related operational and business impacts resulting from air quality legislation and regulation

- Determined pollutant inventories, established emission baselines, and formulated reduction goals
- Formed external and internal multi-disciplinary, working groups to involve impacted stakeholders including private sector, NGOs, and major interest groups in environmental policy dialogue and development
- Analyzed, reviewed and evaluated existing environmental regulations and programs and recommended modification or amendment to reflect recent changes in federal or state laws
- Provided operational support to solve challenges related to air pollution control, emission estimating, regulatory compliance, permitting issues, and other air related areas
- Participated in dialogue with impacted stakeholders to develop the support necessary to enhance the management of priority environmental concerns and ensure effective implementation of agency's policies

Projects managed:

- New Source Review (NSR) program administration and development
- Proposed amendments to NSR to comply with US EPA implementation requirements for $PM_{2.5}$
- Harmonized Best Available Control Technology (BACT) guidelines for attainment and non-attainment pollutants at major and non-major sources
- Allocation of Emission Reduction Credits (ERCs) to power plants, energy projects of regional significance, and other essential services
- Regulatory program to control emissions and fugitive dust from agricultural operations, poultry farms, and confined animal facilities

January 1998 – March 1999 **Air Quality Engineer II**

SCAQMD – Diamond Bar, CA

Job function:

- Negotiated and finalized air pollution permits
- Developed and conducted environmental compliance and permitting training
-
- Conducted health risk assessment based on emissions and modeling data

Programs developed and administered include:

- Comprehensive system to track ERCs for NSR equivalence
- BACT guidelines for major and minor sources
- Certified Permitting Professionals Program (CPPP). Authored CPPP training manual
- Equipment Certification and Registration Program
- Air Toxics Risk Assessment Procedure

July 1988 – January 1998 **Air Quality Inspector II**

SCAQMD – Diamond Bar, CA

Job function:

- Provided regulatory expertise to all stakeholders to ensure compliance with air quality regulations.
- Provided leadership to and mentored air quality inspectors as they investigated causes and sources of air pollution
- Supervised administrative, technical, and professional activities, programs, and personnel
- Conducted periodic inspections of stationary to ensure implementation of local, state and federal environmental regulations
- Monitored air emission sources; performed opacity and emission tests
- Assisted small businesses in achieving environmental compliance
- Completed several voluntary environmental audit of NSR air permits and regulatory applicability review of facilities, identifying and recommending corrective actions for the potential non-compliant situations discovered
- Facilitated a number of agency inspections and complaint responses

Programs developed and administered include:

- Self Audit Program for Dry Cleaning Industry
- Rule effectiveness study on spray equipment for Volatile Organic Compounds (VOC)
- Control of CFCs and other ozone depletion compounds (ODCs)

INDEPENDENT ASSIGNMENT

December 2009 – June 2010
Environmental impact assessment consultant and expert for a USAID funded dam and clean water supply project in Pakistan.

Job function:

Extensive review, edit, and preparation of the Environmental Site Assessment / Environmental and Social Impact Assessment (ESIA) for Gandao Dam/Drinking Water Safety Scheme for Ghalanai, Mohmand Agency in Pakistan's Federally Administered Tribal Areas, a project funded by United States Agency for International Development (USAID). In collaboration with a local environmental consulting company based in Islamabad, my role in the project was as the foreign expert and consultant, to ensure the EA properly analyzed potential environmental impacts, provided a significance determination and mitigated where necessary and feasible pursuant to the National Environmental Protection Act (NEPA) and USAID Code of Federal Regulations, Part 216.

EDUCATION:

- Masters Business Administration (MBA), California State University, San Bernardino, 1995
- BS, Mechanical Engineering, University of Engineering and Technology, Lahore, Pakistan, 1976

CERTIFICATION:

- Certificate in Workplace Health & Safety Management, University of California, Riverside, 1996

LANGUAGES:

- English – Fluent in speaking, writing, and reading. Highly skilled in making oral and written presentations.
- Urdu – Native language: Fluent in speaking, writing, and reading. Highly skilled in making oral and written presentations.
- Arabic – Fluent in speaking and reading. Competent in making oral presentations.
- Punjabi – Fluent in speaking, writing, and reading. Highly skilled in making oral and written presentations.

PROFESSIONAL AFFILIATIONS:

- Air and Waste Management Association (A&WMA), USA
- Institute of Engineers

PUBLIC PRESENTATIONS:

- "Air pollution and Carbon Trading", a special presentation to Federation of Pakistan Chambers of Commerce and Industry (FPCCI), Karachi, February 2009.
- Keynote speaker on "Environment in relation to air pollution, poverty alleviation and agriculture", organized by United Nations Development Program (UNDP), Pakistan, at University of Arid Agriculture, Rawalpindi.
- Featured speaker at seminars organized by Institute of Heating and Air Conditioning Industries (IHACI), Los Angeles, California, on CFC Rules and Regulations and "Use of CFCs and the effects of Ozone Depleting Compounds (ODCs)".
- Delivered a series of lectures to the Refrigeration Service Engineers Society (RSES), Los Angeles, California on CFCs and other ODCs.

PUBLICATIONS:

- "Enhancing the Availability of Emission Reduction Credits in an Extreme Non-Attainment Area" – abstract submitted to A&WMA, January 2003.
- "Structuring an Emissions Offset Solution for New Power Plants in the Los Angeles Basin in the Midst of California's Energy Crisis" – Paper Presented to Air & Waste Management Association (A&WMA) National Conference, June 2002.

ADDITIONAL INFORMATION:

- Member Offsets Working Group, Santa Barbara Air Pollution Control District
- Past Chairman Board of Directors, Al-Shifa Free Clinic, San Bernardino, California; (honorary position), a non-profit medical and dental clinic providing free healthcare to the indigent and under-served population in San Bernardino County and surrounding regions
- Member Advisory Committee, International Standards Authority Inc., USA

Steven Richard Radis

Qualifications:

Mr. Radis is a Principal at Marine Research Specialists (MRS) and is located in their Ventura, California office. His expertise includes consequence and risk analysis, fire and explosion dynamics, hazard evaluation, external events analysis, fault tree analysis, meteorological modeling and analysis, air quality modeling and health risk assessment, and model development.

Mr. Radis earned an M.A. and B.A in Climatology from California State University, Northridge. He is a member of the American Meteorological Society, and the Air and Waste Management Association. He has also periodically served as a guest lecturer at the University of California Santa Barbara in the areas of meteorology and atmospheric diffusion modeling.

Prior to joining MRS, Mr. Radis worked for Arthur D. Little, Inc. as a Principal in their Global Environment and Risk Practice, Dames & Moore as a Senior Meteorologist, Radian Corporation as an Atmospheric Scientist, Southern California Edison Company as a Research Meteorologist and California State University, Northridge as a technical assistant. He has more than thirty years of numerical modeling experience.

Mr. Radis has worked on a wide variety of studies for commercial and government clients involving meteorological modeling, quantitative risk assessments, health risk assessments, consequence analysis, risk management, air quality modeling (inert/photochemical pollutants, toxic air contaminants) and environmental impact reports/statements.

- Mr. Radis has prepared more than 200 risk analyses for a wide variety of fixed facility and transportation projects, including refineries, chemical manufacturing facilities and power generation facilities. Transportation projects have included marine terminals, pipelines, rail and truck transportation of a variety of materials including nuclear fuel, toxic inhalation hazard (TIH) chemicals, acutely hazardous materials, propellants, crude oil, petroleum products and liquefied/compressed gases.

- For the Center for Chemical Process Safety (CCPS) of the American Institute of Chemical Engineers (AIChE), Mr. Radis co-authored a book entitled *Guidelines for Postrelease Mitigation Technology in the Chemical Process Industry*. As part of this effort, Mr. Radis prepared numerical simulations and quantitatively evaluated the effectiveness of a variety of mitigation technologies.

- Mr. Radis was the project manager for the Alon Bakersfield Refinery Crude Flexibility Project Environmental Impact Report that was prepared for the Kern County Planning Department. The purpose of the proposed project is to allow greater flexibility for the existing refinery to process a variety of crude oils on-site. To facilitate this request, the project proposes the following: 1) Expansion of existing and construction of new rail, transfer and storage facilities; to include construction of a double rail loop from a new on-site spur connection off of the existing BNSF Railway and the addition of up to three boilers; 2) Construction of process unit upgrades and/ or modifications; 3) Repurposing of existing tankage; and, 4) Relocation and modernization of existing Liquefied Propane Gas (LPG) truck rack and upgrades to sales rack.

- For the County of San Luis Obispo, Mr. Radis completed the Hazards and Hazardous Materials section of the Environmental Impact Report for the Phillips 66 Rail Spur Extension And Crude Unloading Project. For this analysis, Mr. Radis prepared a Transportation Quantitative Risk Analysis (TQRA) for several potential rail routes to the refinery within California. The Rail Spur Project would involve unloading of up to five unit trains per week, with a 250 annual maximum number of trains. In a unit train configuration, each train would consist of three locomotives, two buffer cars, and 80 railcars each carrying between 26,076 and 28,105 gallons for a total of between 49,670 and 53,532 barrels of crude oil per unit train.

- Mr. Radis completed a safety and vulnerability analysis of the Diablo Canyon Power Plant (DCPP) and the San Onofre Nuclear Generating Station (SONGS) Steam Generator Replacement Projects for the California Public Utilities Commission. The EIR analyses evaluated a range of equipment and operational failure modes and quantitatively evaluated the associated radiological consequences of core damage accidents and releases. Failure modes, release mechanisms and consequences associated with terrorist attacks were also evaluated.

- For the County of San Luis Obispo, Mr. Radis completed a safety and vulnerability analysis of the Diablo Canyon Power Plant (DCPP) Independent Spent Fuel Storage Installation (ISFSI). The EIR analysis evaluated a range of equipment and operational failure modes and quantitatively evaluated the associated radiological consequences of spent fuel pool and dry cask storage accidental releases. Failure modes, release mechanisms and consequences associated with terrorist attacks were also evaluated.

- Mr. Radis has prepared more than 100 health risk assessments for a variety of facilities including power plants, oil and gas projects, hazardous waste sites (both State and Superfund listed sites), chemical milling facilities, the mining industry and waste disposal sites.

- Mr. Radis has prepared air quality impact and dispersion modeling analyses for hundreds of projects ranging from power plants, oil and gas development and site remediation. These analyses have included the development of meteorological data sets, emission inventories, terrain simulations, and in some cases, the development of site-specific models. These analyses included the use of several meteorological models, including the Mesoscale Meteorological Model, CALMET and AERMET, and a wide variety of EPA and proprietary dispersion models. Dispersion models that have been used include the Urban Airshed Model (UAM), CALPUFF, CALGRID, AERMOD, Complex Terrain Dispersion Model (CTDM and CTDM+), Rough Terrain Dispersion Model (RTDM), Offshore and Coastal Dispersion Model (OCD), Industrial Source Complex Short Term (ISCST3) model, and many others.

- Mr. Radis has worked on the development of several models including the development or revisions to several accidental release models, an oil spill model, a multi-component pool model, atmospheric diffusion models, fixed facility and transportation quantitative risk analysis mopdels, an integrated human exposure and health risk assessment model, and several meteorological models.

Gas Flare Noise Assessment Report

This page intentionally left blank.

ACOUSTICAL ANALYSIS

GAS FLARE NOISE ASSESSMENT
OIL AND GAS DEVELOPMENT EIR
KERN COUNTY, CALIFORNIA

PREPARED BY

WJV ACOUSTICS, INC.
VISALIA, CALIFORNIA

wjv acoustics

OCTOBER 15, 2015

113 N. Church Street, Suite 203 · Visalia, CA 93291· (559) 627-4923 ·

INTRODUCTION

Project Description:

This is a noise analysis of gas flares utilized for oil and gas exploration, extraction, operations, and production activities in unincorporated Kern County and includes recommendations to update development standards and conditions to address environmental impacts.

Location:

The project area generally includes the unincorporated areas of Kern County, California where oil and gas development and production has historically occurred or is likely to occur in the future.

Acoustical Analysis:

This acoustical analysis has been prepared to supplement the previously submitted environmental noise assessment (ENA) prepared by Brown-Buntin Associates, Inc. (BBA) to determine if significant noise impacts would occur as a result of the use of various types of gas flares and to describe mitigation measures for noise if significant impacts are determined. Please note, this analysis will not include a description of the existing noise environment, please refer to the above-referenced ENA for such information.

Appendix A provides definitions of the acoustical terminology used in this report. Unless otherwise stated, all sound levels reported in this analysis are A-weighted sound pressure levels in decibels (dB). A-weighting de-emphasizes the very low and very high frequencies of sound in a manner similar to the human ear. Most community noise standards utilize A-weighted sound levels, as they correlate well with public reaction to noise.

REGULATORY SETTING

Appendix G (Environmental Checklist Form) of the CEQA Guidelines indicates that significant noise impacts may be assumed to occur when a project will expose people to noise levels in excess of standards established in local noise ordinances or general plans, or causes a substantial permanent or temporary increase in noise levels above levels existing without the project.

Noise Level Standards:

The project area does not include incorporated cities within Kern County. However, project-related activity results are relevant to the incorporated cities within the County if such activities occur near or adjacent to incorporated city boundaries. The project area also includes land that is under the jurisdiction of the U.S. Bureau of Land Management (BLM). Noise standards for the County, certain cities within the project area and the BLM are therefore addressed by this study.

It is noted that most jurisdictions within Kern County and the BLM utilize the Day-Night Average Level (DNL) or Community Noise Equivalent Level (CNEL) to describe noise exposure for noise compatibility planning purposes. Both the DNL and CNEL represent the

time-weighted energy average noise level for a 24-hour day, with a 10 dB penalty added to noise levels occurring during the nighttime hours (10:00 p.m.-7:00 a.m.). The CNEL includes an additional penalty of 5 dB (technically 4.77 dB) that is added to noise levels occurring during the evening hours between 7:00 p.m. and 10:00 p.m. The CNEL is utilized to describe aircraft noise exposure as required by the State of California. Both the DNL and CNEL represent cumulative exposure to noise over an extended period of time and are therefore calculated based upon *annual average* conditions. The DNL and CNEL are considered to be equivalent descriptors of the community noise environment for the purposes of this study.

Some jurisdictions also apply hourly standards to noise from non-transportation sources that are not preempted from local regulation by existing state or federal standards. Transportation noise sources include traffic on public roadways, railroads and aircraft. Non-transportation (or stationary) noise sources generally include commercial and industrial activities.

Kern County

The Kern County Noise Element of General Plan[1] (2004) establishes a land use compatibility criterion of 65 dB DNL for exterior noise levels in outdoor activity areas of residential uses. Outdoor activity areas generally include backyards of single-family residences and individual patios or decks of multi-family developments. The intent of the exterior noise level requirement is to provide an acceptable noise environment for outdoor activities and recreation.

The noise element also requires that interior noise levels attributable to exterior noise sources not exceed 45 dB DNL. The intent of the interior noise level standard is to provide an acceptable noise environment for indoor communication and sleep.

City of Delano

The City of Delano General Plan (2005) contains noise level standards applicable to transportation and non-transportation sources. For noise-sensitive uses exposed to noise from transportation noise sources, the exterior noise level standard (Table 7-2 of the noise element) is 65 dB DNL/CNEL. The interior noise level standard for noise-sensitive uses is 45 dB DNL/CNEL.

For non-transportation sources, the noise element establishes hourly noise level standards in terms of the equivalent sound level (L_{eq}) and maximum noise level (L_{max}) descriptors. The standards are more restrictive during the nighttime hours between 10:00 p.m. and 7:00 a.m. The hourly L_{eq} standards are 55 dB during the day and 50 dB during the night. The hourly L_{max} standards are 75 dB during the day and 70 dB during the night.

City of McFarland

The City of McFarland has adopted by reference the Noise Element of the Kern County General Plan. The exterior noise level standard is therefore 65 dB DNL for noise levels in outdoor activity areas of residential and other noise-sensitive uses. The interior noise level standard is 45 dB DNL within interior living spaces or other noise-sensitive interior spaces.

City of Wasco

The City of Wasco General Plan (2002) utilizes the same noise level standards as Kern County. The exterior noise level standard is 65 dB DNL for noise levels in outdoor activity areas of residential and other noise-sensitive uses. The interior noise level standard is 45 dB DNL within interior living spaces or other noise-sensitive interior spaces.

City of Shafter

The City of Shafter General Plan (2005) establishes noise objectives for different land uses in terms of the CNEL. The general plan noise objective for rear yards of single-family dwellings and open areas within multi-family developments is 60-65 dB CNEL. For school classrooms and play areas, the noise objectives are 60 dB and 70 dB CNEL, respectively. The noise objective for the interior of hospitals and libraries is 60 dB CNEL. For commercial and industrial uses the noise objective is 65-70 dB CNEL at the front setback. The general plan does not specifically establish an interior noise level standard for residential uses. However, the general plan makes reference to enforcing the California Noise Insulation Standards which require an interior noise exposure of 45 dB DNL/CNEL for new multi-family dwellings and transient lodging.

City of Arvin

The City of Arvin General Plan (1989) utilizes the same noise level standards as Kern County. The exterior noise level standard is therefore 65 dB DNL for noise levels in outdoor activity areas of residential and other noise-sensitive uses. The general plan does not specifically establish an interior noise level standard for residential uses. However, the general plan makes reference to enforcing the California Noise Insulation Standards which require an interior noise exposure of 45 dB DNL/CNEL for new multi-family dwellings and transient lodging.

City of Bakersfield

The Metropolitan Bakersfield General Plan (2002) establishes noise level standards for transportation and non-transportation sources. For transportation sources, the noise element sets a standard of 65 dB CNEL at the exterior of noise-sensitive uses. Noise-sensitive uses include residences, schools, hospitals and recreational areas. An interior noise standard of 45 dB CNEL applies within interior living spaces.

For non-transportation noise sources, the noise element applies hourly noise level performance standards at residential and other noise-sensitive uses. Table 1 summarizes the applicable hourly noise level standards.

TABLE I

HOURLY NOISE LEVEL PERFORMANCE STANDARDS
STATIONARY NOISE SOURCES
METROPOLITAN BAKERSFIELD GENERAL PLAN

Maximum Acceptable Noise Level, dB		
Min./Hr. (L_n)	**Day (7a-10p)**	**Night (10p-7a)**
30 (L_{50})	55	50
15 (L_{25})	60	55
5 ($L_{8.3}$)	65	60
1 ($L_{1.7}$)	70	65
0 (L_{max})	75	70

Note: L_n means the percentage of time the noise level is exceeded during an hour. L_{50} means the level exceed 50% of the hour (30 minutes), L_{25} is the level exceed 25% of the hour (15 minutes), etc.

Source: Metropolitan Bakersfield General Plan

City of Taft

The City of Taft General Plan (2009) contains a land use compatibility chart (Table 8.0-1) that specifies acceptable noise exposure for various land uses. The acceptable exterior noise exposure for noise-sensitive uses, including residential, transient lodging, mixed use, schools, libraries, churches, hospitals and nursing homes, is 65 dB DNL/CNEL. For playgrounds, neighborhood parks, office buildings and commercial buildings, the acceptable exterior noise exposure is 70 dB DNL/CNEL. For industrial, manufacturing and agricultural uses, the acceptable exterior noise exposure is 75 dB DNL/CNEL. The noise element also specifies an acceptable interior noise exposure for the above-described noise-sensitive uses of 45 dB DNL/CNEL or below.

City of Maricopa

The City of Maricopa noise standards are contained within its zoning ordinance. The standards are the same as those contained within the County's noise element. The exterior noise level standard is therefore 65 dB DNL for noise levels in outdoor activity areas of residential and other noise-sensitive uses. The interior noise level standard is 45 dB DNL within interior living spaces or other noise-sensitive interior spaces.

State of California

There are no known state noise standards that are applicable to the project.

Federal Noise Standards

The U.S. Department of the Interior, Bureau of Land Management (BLM) has jurisdiction over part of the land within the project area. The BLM does not employ specific noise level standards but historically has referred to guidelines contained with U.S. Environmental Protection Agency (EPA) document entitled "Information on Levels of Environmental Noise Requisite to Protect

the Public Health and Welfare with an Adequate Margin of Safety"[2] (1974 EPA Levels Document).

One of the purposes of the 1974 EPA Levels Document was to provide information for use by state and local governments in developing their own noise standards. It was intended that such information be utilized along with other factors such as the balance between costs and benefits when establishing noise level standards. Information contained within the document was taken into consideration by the State of California when it published guidelines for developing local general plan noise elements. The noise level standards of Kern County and its incorporated cities are based upon those guidelines.

The 1974 EPA Levels Document identified an exterior noise exposure of 55 dB DNL and an interior noise exposure of 45 dB DNL as sufficient to *prevent* activity interference and annoyance. As noted above, such recommendations do not take into account the balance between cost and benefit. The noise level standards adopted by Kern County and its incorporated cities are intended as a compromise to protect the public health and welfare while allowing for reasonable development and commerce.

Other federal standards that could be considered applicable to the project include the U.S. Department of Housing and Urban Development (HUD) standards. The HUD standards are the same as those of Kern County with an exterior noise standard of 65 dB DNL and an interior standard of 45 dB DNL. The HUD standards come into play when federal funds may be used for housing development projects.

Substantial Noise Increases:

CEQA does not define what constitutes a substantial increase in noise levels. Some guidance is provided by the 1992 findings of the Federal Interagency Committee on Noise (FICON) [3], which assessed changes in ambient noise levels resulting from transportation noise sources. The FICON recommendations are based upon studies that relate aircraft and traffic noise levels to the percentage of persons highly annoyed by the noise. The rationale for the FICON recommendations is that it is possible to consistently describe the annoyance of people exposed to transportation noise in terms of the DNL (or CNEL). Annoyance is a summary measure of the general adverse reaction of people to noise that results in speech interference, sleep disturbance, or interference with other daily activities.

Although the FICON recommendations were specifically developed to address transportation noise impacts, they are used in this analysis for all noise sources that are described in terms of cumulative noise exposure metrics such as the DNL or CNEL. Table II summarizes the FICON recommendations.

TABLE II

MEASURES OF SUBSTANTIAL NOISE INCREASE FOR TRANSPORTATION SOURCES

Ambient Noise Level Without Project (DNL/CNEL)	Significant Impact Assumed to Occur if the Project Increases Ambient Noise Levels By:
<60 dB	+ 5 dB or more
60-65 dB	+3 dB or more
>65 dB	+1.5 dB or more

Source: FICON, 1992, as applied by WJV Acoustics, Inc.

GAS FLARE NOISE IMPACTS AND MITIGATION

Kern County and its incorporated cities within the project area all apply an exterior noise level standard of 65 dB DNL/CNEL for noise-sensitive receptors and an interior noise level standard of 45 dB DNL/CNEL for interior spaces of noise-sensitive buildings. Additionally, the cities of Bakersfield and Delano have hourly noise level standards (described above under Regulatory Setting). Such standards are only applicable to non-transportation (or stationary) noise sources that may be regulated by a local jurisdiction. Stationary noise sources include most project-related activities that could affect nearby noise-sensitive uses.

The precedent for using cumulative noise exposure metrics such as the DNL and CNEL has been well established for land use compatibility planning purposes. However, from a CEQA standpoint, it has been successfully argued that the DNL or CNEL do not by themselves adequately define the potential noise impacts resulting from intermittent sources of noise that may occur at different times of the day or night. For that reason, hourly noise level standards are recommended to determine if a project-related activity will result in a significant impact and the need for noise mitigation.

For consistency with local jurisdictions in Kern County and elsewhere in the San Joaquin Valley, hourly equivalent sound level (Leq) standards of 55 dB during the daytime hours (7:00 a.m.-10:00 p.m.) and 50 dB during the nighttime hours (10:00 p.m.-7:00 a.m.) are applied. Additionally, hourly maximum noise level (L_{max}) standards of 75 dB during the daytime hours and 70 dB during the nighttime hours are applied.

Compliance with the above-described hourly noise level standards will ensure compliance with the 65 dB DNL standard that has been adopted by Kern County, even if the source were to operate 24 hours per day. A constant noise level of 50 dB for 24 hours per day would result in a DNL/CNEL of approximately 57 dB. A constant noise level of 55 dB for 24 hours per day would result in a DNL/CNEL of approximately 62 dB.

Noise levels generated by the project are considered a significant impact if any of the following conditions would be expected to occur:

1. The project will cause noise levels exterior to any existing or planned noise-sensitive receptor to exceed 65 dB DNL. Noise-sensitive uses include residential, transient

lodging, churches and other places of worship, schools, libraries, hospitals, long-term care facilities, and any other use deemed noise-sensitive by Kern County.

2. The project will cause noise levels exterior to any existing or planned noise-sensitive receptor to exceed an hourly equivalent sound level (L_{eq}) of 55 dB during the daytime hours (7:00 a.m.-10:00 p.m.) or 50 dB during the nighttime hours (10:00 p.m.-7:00 a.m.).

3. The project will cause noise levels exterior to any existing or planned noise-sensitive receptor to exceed an hourly maximum sound level (L_{max}) of 75 dB during the daytime hours (7:00 a.m.-10:00 p.m.) or 70 dB during the nighttime hours (10:00 p.m.-7:00 a.m.).

4. The project will cause a 5 dB or greater increase in the ambient noise level, as defined by the annual average DNL, at the location of any existing or planned noise-sensitive receptor. The annual average DNL may be estimated from noise exposure information contained within the general plan of the affected jurisdiction, or from the findings of a project-specific noise analysis performed by a qualified individual.

Project-Related Noise Impacts:

Noise levels associated with gas flare activities were measured at several locations throughout Kern County in September, 2015. For each analyzed flare, noise level measurements were taken in multiple directions from the flare to account for variations that occur as a result of localized conditions, such as wind or site-specific shielding.

Noise measurements were conducted using a Larson Davis Model 824 Sound Level Meter to document the spectral (frequency) components of each source. The meter was calibrated prior to use with a Larson Davis CA250 calibrator to ensure the accuracy of the measurements. A windscreen was used over the microphone to avoid interference resulting from wind sources during outdoor measurements.

Descriptive flare information was provided by the flare operators.

1. Hopkins Flare: Operated by Freeport McMoRan. John Zink 21.0 MMBTU/Hour. Average waste gas, 450 MCF/Day. The Hopkins flare is considered a continual use flare and has a pilot which burns approximately 5 MCF/Day PUC gas.

2. Redbank and Edison Flare: Operated by CRC. Air assisted natural gas flare permitted for 10.41 MMBTU/Hour, currently incinerating approximately 29 MCF/Day. Mactronic continuous natural gas pilot.

3. Semitropic Flare: Process flare permitted continuous use at 100K CF/Day, typically operating at 50-75% permitted use.

4. Shafter Flare: Operated by CRC. 41.7 MMBTU/Hour, Coanda high pressure flare tip. Available for use 24-hours per day, but not in use under typical conditions. According to the operator, the flare was operating in anomalous conditions during the measurement period, as pipelines were undergoing maintenance, resulting in excess gas being

incinerated. This type of flare is rare within Kern County, and infrequently operates at the observed conditions.

5. Maricopa Flare: Operated by Drilling and Production Company. 15.1 MMBTU/Hour Kaldair Indair Produced gas flare. At time of measurement the flare was incinerating approximately 200 MCF/Day, 575 BTU/SCF (approximately 4.8 MMBTU/Hour).

Flare-related noise levels were calculated using the SoundPLAN noise model. SoundPLAN utilizes measured spectral sound power levels to determine noise exposure from a noise source. Inputs to the model include noise source spectral sound power levels, topography, atmospheric conditions, ground absorption factors, shielding from existing walls or buildings, noise source height and receiver height. Since this analysis is not site specific, some assumptions and generalities were made in order to calculate potential project-related noise levels. Table III summarizes the assumptions used for the model. These assumptions represent a worst-case assessment in regards to noise propagation from gas flare activities.

TABLE III

GAS FLARE NOISE MODELING ASSUMPTIONS
KERN COUNTY OIL AND GAS PRODUCTION EIR

Gas flares are utilized for various applications throughout Kern County, with oil and gas operations. Typically, the gas being combusted is considered “associated gas”. Associated gas is gas that is contained within an oil producing formation, but due to quality or quantity, may not a viable source of gas. The gas is then burned off through the use of a gas flare. Oil field production flares are also utilized during well drilling and well testing, and aid in the determination of a viability of an oil well. Since the construction and structural components of flares vary based upon intended use, location and output, associated noise levels can vary widely.

For each modeled gas flare, the loudest observed measurement was utilized as a basis for modeling potential project-related noise exposure for future activities. Therefore, gas flare noise levels described below represent a worst case assessment of gas flare noise exposure.

TABLE IV

GAS FLARE NOISE EXPOSURE
KERN COUNTY OIL AND GAS PRODUCTION EIR
SHORT-TERM Leq LEVEL

Flare	Distance (feet) to Leq Contour	
	50 dB	**55 dB**
Hopkins Flare	43	24

Prescriptive Noise Mitigation Measures

Tables IV and V summarize the flare-related activities and provide distances from each flare to various noise levels for the L_{eq} and DNL metrics. Table IV provides the distances between the activity and a noise-sensitive use where an applicable threshold of significance will not be exceeded (50 and 55 dB Leq contours) such as in the cities of Delano and Bakersfield. The distances provided in Table IV can be used when statistical (L_{eq} or L_{50}) standards are applicable.

Table V provides the distances between the activity and noise-sensitive uses that must be achieved when DNL noise level standards are applicable. The Noise Element of the Kern County General Plan establishes a land use compatibility criterion of 65 dB DNL for exterior noise levels in outdoor activity areas of residential uses. Additionally, the 65 dB DNL exterior noise level criterion is commonly applied throughout incorporated areas of Kern County, and therefore should be used to determine project compliance in most instances.

Compliance with the distances summarized by Table IV and Table V should be interpreted to mean that a significant noise impact would not be expected as a result of the project and additional noise mitigation will not be required. However, determination of whether the project could result in a 5 dB or greater increase in the existing annual average DNL will require that noise exposure information for the project site be analyzed by reference to appropriate documents or a site-specific analysis be conducted.

Additionally, if more than one of the above-described activities are occurring in close proximity to each other, the distances to the contours described in Tables IV and V would likely increase. Tables IV and V do not address the additive nature of multiple noise sources. Decibels are logarithmic units that cannot be added linearly. For example, if two identical noise sources are added together, noise levels would increase by 3 dB over the individual source levels (65 dB + 65 dB=68 dB). It is not possible to quantify or describe every potential scenario of combinations.

It should be noted; distances described in Tables IV and V for "Shafter Flare" should not be applied to common gas flare operations performed in Kern County. The Shafter Flare was operating under anomalous conditions during the measurement period. Noise setback analysis distances described in Tables IV and V for the flares excluding the Shafter Flare represent noise levels that are to be expected from commonly used gas flares throughout the county.

It is recognized that there may be instances where the noise level data and distances presented in Tables IV and V may not adequately define the potential for significant noise impacts. The determination of such circumstances should be made by Kern County. Factors that should be considered in making such a determination should include the noise generation potential of the project due to modified or specialized equipment or processes that were not analyzed as a part of this study, the topographical relationship between the source and affected noise-sensitive receptors, the duration and proposed hours of operation of the project, and the potentially unique character of the receiving land use or existing ambient noise levels. Under such circumstances, an acoustical analysis may be required to determine project-related noise levels and required mitigation measures. Potential additional noise mitigation measures are described below.

1. Limits on hours of operation: Since the hourly noise level standards are 5 dB more restrictive at night between the hours of 10:00 p.m. and 7:00 a.m., a particular activity could occur closer to a sensitive receiver if hours of operation were restricted to the daytime hours between 7:00 a.m. and 10:00 p.m.

2. Temporary or permanent noise barriers: Depending upon site-specific conditions, noise barriers could be used to reduce project-related noise levels at nearby sensitive receivers. For projects that could operate for an extended period of time, sound walls or earthen berms may be an effective form of mitigation. Temporary noise barriers, such as sound blankets, plywood or other portable materials, could be used to mitigate noise from temporary sources or construction activities. Most temporary noise barriers are effective noise reduction if properly positioned without gaps that could create sound flanking paths.

3. Use of "quiet technology" equipment: If equipment is modified or equipment with special sound reduction capabilities is utilized, and it may be demonstrated that such

equipment is quieter than the equipment analyzed for this study, potential significant noise impacts may be mitigated. Examples of such measures include use of electric motors in place of internal combustion engines and the use of equipment with special sound attenuation equipment.

4. Implementation of a quiet mode drilling plan or other sound reduction technology or practices.

5. Arranging for temporary relocation of sensitive receptors during the high noise period.

6. Or other methods that prevent or reduce noise exposure to sensitive receptors.

The conclusions and recommendations of this acoustical analysis are based upon the best information known to WJV Acoustics, Inc. (WJVA) at the time the analysis was prepared concerning the equipment type, proposed activities and hours of operation. Any significant changes in these factors will require a reevaluation of the findings of this report. Additionally, any significant future changes to the proposed activities, equipment, noise regulations or other factors beyond WJVA's control may result in long-term noise results different from those described by this analysis.

Respectfully submitted,

Walter J. Van Groningen
President

WJV:wjv

APPENDIX A

ACOUSTICAL TERMINOLOGY

AMBIENT NOISE LEVEL: The composite of noise from all sources near and far. In this context, the ambient noise level constitutes the normal or existing level of environmental noise at a given location.

CNEL: Community Noise Equivalent Level. The average equivalent sound level during a 24-hour day, obtained after addition of approximately five decibels to sound levels in the evening from 7:00 p.m. to 10:00 p.m. and ten decibels to sound levels in the night before 7:00 a.m. and after 10:00 p.m.

DECIBEL, dB: A unit for describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).

DNL/L_{dn}: Day/Night Average Sound Level. The average equivalent sound level during a 24-hour day, obtained after addition of ten decibels to sound levels in the night after 10:00 p.m. and before 7:00 a.m.

L_{eq}: Equivalent Sound Level. The sound level containing the same total energy as a time varying signal over a given sample period. L_{eq} is typically computed over 1, 8 and 24-hour sample periods.

NOTE: The CNEL and DNL represent daily levels of noise exposure averaged on an annual basis, while L_{eq} represents the average noise exposure for a shorter time period, typically one hour.

L_{max}: The maximum noise level recorded during a noise event.

L_n: The sound level exceeded "n" percent of the time during a sample interval (L_{90}, L_{50}, L_{10}, etc.). For example, L_{10} equals the level exceeded 10 percent of the time.

A-2

ACOUSTICAL TERMINOLOGY

NOISE EXPOSURE CONTOURS: Lines drawn about a noise source indicating constant levels of noise exposure. CNEL and DNL contours are frequently utilized to describe community exposure to noise.

NOISE LEVEL REDUCTION (NLR): The noise reduction between indoor and outdoor environments or between two rooms that is the numerical difference, in decibels, of the average sound pressure levels in those areas or rooms. A measurement of "noise level reduction" combines the effect of the transmission loss performance of the structure plus the effect of acoustic absorption present in the receiving room.

SEL or SENEL: Sound Exposure Level or Single Event Noise Exposure Level. The level of noise accumulated during a single noise event, such as an aircraft overflight, with reference to a duration of one second. More specifically, it is the time-integrated A-weighted squared sound pressure for a stated time interval or event, based on a reference pressure of 20 micropascals and a reference duration of one second.

SOUND LEVEL: The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the response of the human ear and gives good correlation with subjective reactions to noise.

SOUND TRANSMISSION CLASS (STC): The single-number rating of sound transmission loss for a construction element (window, door, etc.) over a frequency range where speech intelligibility largely occurs.

INTRODUCTION

The purpose of this transportation study is to assess potential traffic impacts of future oil and gas development and production within Kern County, California. This study was prepared in support of the Environmental Impact Report (EIR) for proposed changes to the Kern County Zoning Ordinance involving local permitting of oil and gas operations.

The findings of this report are preliminary and will not be finalized until consultations with the County Roads and Planning Departments can be completed. Due to scheduling issues this study is being submitted to the County while those consultations are ongoing. Any mitigation program will be developed at the County's sole discretion after extensive review.

A. Background

Oil and gas development in Kern County has been an important part of the local economy since the late 1800's. Authority for issuance of permits involving oil and gas development has historically been held by DOGGR (California Department of Conservation, Division of Oil, Gas and Geothermal Resources). Where land use conflicts exist, authority for issuance of permits is held by Kern County.

In a public hearing on January 22, 2013, representatives of three oil and gas industry associations (collectively referred to hereinafter as "applicant") submitted a request to the Kern County Board of Supervisors to amend Title 19 (Kern County Zoning Ordinance). Specifically, the proposed amendment to Chapter 19.98 (Oil and Gas Production) includes new site development standards for all oil and gas exploration, extraction, operations and production activities in unincorporated Kern County. These

standards would place the authority for land use within the purview of the County, allowing DOGGR's authority to remain with subsurface interests.

The Board directed County staff to proceed with processing the zoning ordinance amendment request, including the development of an EIR to identify and evaluate potential environmental impacts related to future oil and gas development and production activities undertaken pursuant to the amendment. This transportation study is one of the technical studies to be prepared in support of the EIR.

B. Location and Setting

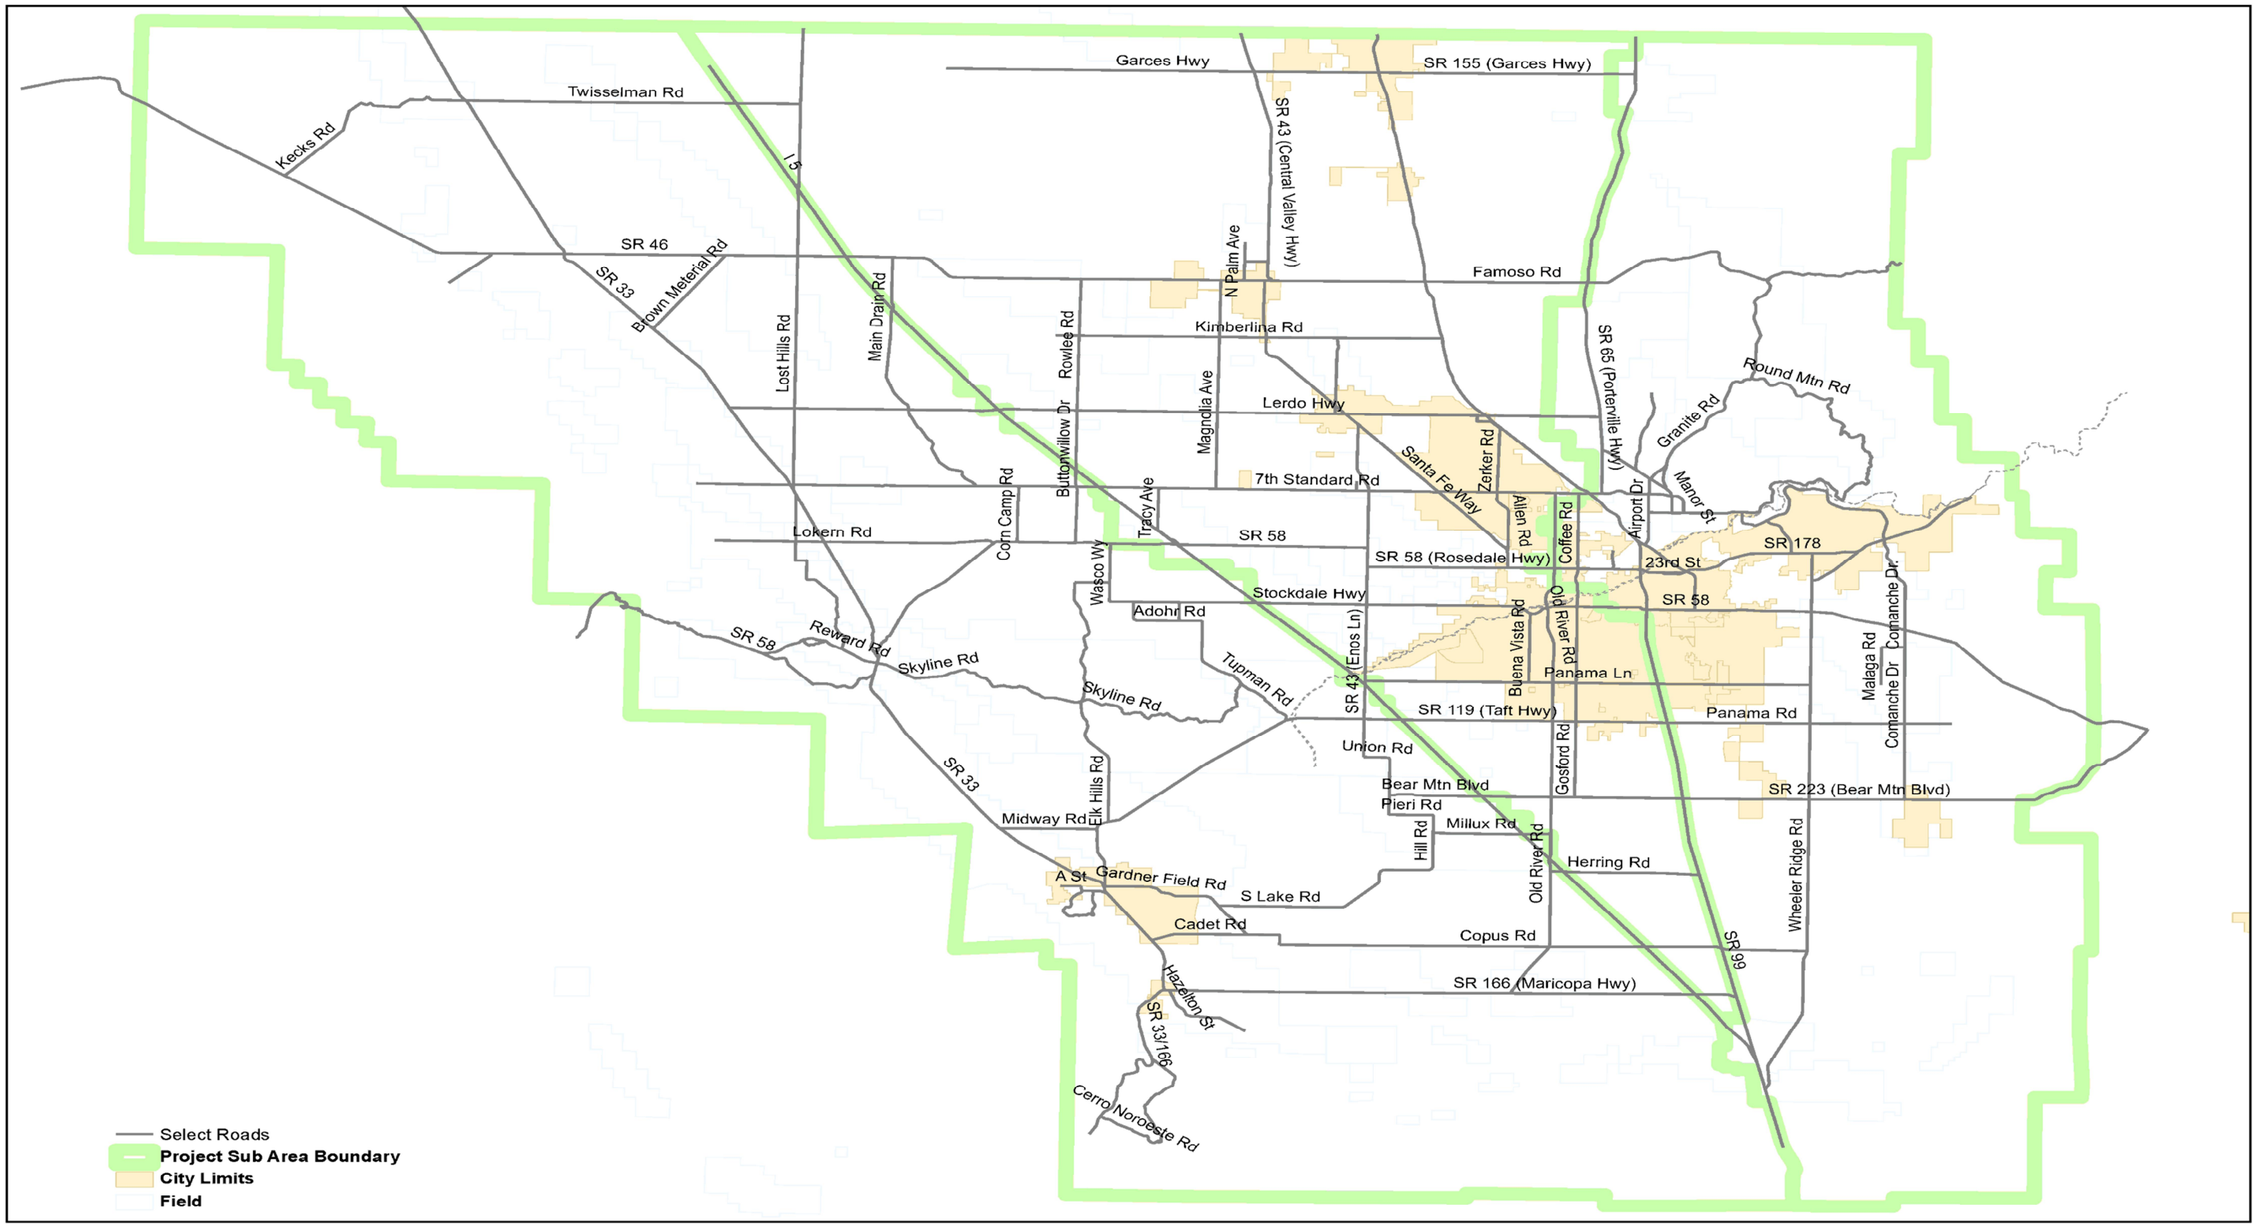
Kern County is situated at the southern end of the California Central Valley and encompasses approximately 8,202 square miles of land area. The geography of Kern County is diverse and includes mountainous terrain, agricultural lands and desert areas.

The valley floor is relatively flat and includes major transportation routes which serve both local and regional traffic. Major state corridors include Interstate 5 and State Routes 33, 46, 58, 99, 119 and 166. Major county roads include Lerdo Highway, Seventh Standard Road and Stockdale Highway. Mainlines for two major railroads (Union Pacific Railroad and BNSF Railway) also traverse the valley floor.

Eight incorporated cities are located in the valley portion of Kern County, the largest of which is the City of Bakersfield with a metropolitan area population of approximately 510,000. In general, oil and gas development exists in areas located outside of incorporated jurisdictions and oil and gas service companies are located primarily in the metropolitan Bakersfield area. A network of county rural roads provides access to oil and gas well fields.

C. Study Area and Subregions

The study area consists of approximately 3,650 square miles of unincorporated lands within Kern County and generally includes most of the San Joaquin Valley floor up to an elevation of 2,000 feet. The valley floor and the lower elevations of the surrounding mountains contain numerous deposits of oil and gas resources. The study area boundary was established by County Staff based on generally available information regarding potential or confirmed oil and gas resources.



The study area was divided by County staff into three subregions: Western, Central and Eastern. As shown in Figure 1, the lines between subregions follow DOGGR Administrative Boundaries along major transportation corridors. In general, all three subregions contain a mix of oil and gas, agriculture, regional and local traffic with higher percentages of traffic related to oil and gas activities and agriculture in areas located outside of incorporated cities.

D. Well Development and Production Phases

For the purposes of this study, well development includes all activities needed to bring an oil or gas well into production, including exploration and land preparation, well drilling, completion and stimulation, and construction / installation of support infrastructure (e.g., flow lines, electric systems, etc.) and ancillary facilities (e.g., separators, storage tanks, etc.). The development phase for a single oil or gas well generally occurs over a period of approximately 30 to 90 days.

Figure 1

Study Area and Subregions

Also, for the purposes of this study, well production includes routine daily operations and inspections, regular well maintenance and reworks, and plugging and abandonment when a well no longer fulfills its intended purpose. An oil or gas well can remain in production for decades.

STUDY APPROACH

This study differs from a typical traffic impact study insomuch as oil and gas activity has been an established component of the local economy for decades. Therefore, traffic patterns associated with this activity are generally well defined and were observable within the study area. One of the challenges of the study was differentiating oil and gas traffic from other traffic within the overall traffic stream. While the project is not defined as past oil and gas activity, it is the continuation of historic activity, along with a potential increase as defined in Table 1.

A. Methodology

Evaluation of the potential impacts of vehicular traffic associated with oil and gas well activity was broken into three main areas: traffic operation, roadway physical conditions and safety. The traffic operations sections included level of service (LOS) analysis of intersections during the AM and PM peak hour periods, and a volume to capacity (V/C) analysis of average daily traffic on roadway segments. Roadway physical conditions were evaluated based on County and Caltrans roadway conditions reports and rating systems. Potential safety considerations were evaluated through review of County and Caltrans traffic data and interviews with County Roads Department staff regarding recent history of accidents primarily within oil field related areas.

It is important to note that well development and production activities are highly variable and depend upon a multitude of factors (e.g., geological formation, well depth, construction methods, etc.). Consequently, assumptions were required in order to complete the analyses for this study. All study assumptions were made based on the best available information regarding oil and gas industry operations and / or input from the applicant and / or Kern County staff.

B. Traffic Analysis Scenarios

The scope of this study includes the following traffic analysis scenarios:

Existing Traffic

Existing traffic volumes are comprised of the combination of published daily traffic volumes, generally between the years of 2012 and 2014, and AM and PM peak hour turning movements which were counted in 2014. These traffic volumes are a combination of traffic generated by non-oil and gas (NOG) activities (traffic completely unrelated to oil and gas operations), as well as traffic generated by already existing oil and gas operations. The analysis of the existing condition indicates the current operational status of intersections and roadways. This information allows for a cost analysis to determine the immediate funding requirements if improvements are needed in the existing year.

2035 % Growth Only

This scenario utilizes growth rates (based on a review of KCOG data) and the existing count data to project traffic volumes for the year 2035. This analysis provides results that would be typical of how traffic study impacts are determined for a future

year; however, oil and gas operations may not necessarily grow at the same rate as non-oil and gas traffic. For this reason, the scenario below was also analyzed for comparison.

2035 NOG + O&G Projection

This scenario utilizes existing non-oil and gas (NOG) traffic volumes projected to the year 2035, plus the addition of the projected 2035 oil and gas traffic (growth rates for projected oil and gas data were based on input provided by the applicant and Kern County staff). This scenario, where the oil and gas and non-oil and gas traffic volumes were projected at different rates, provides an additional data set from which potential impacts associated with the increase in oil and gas well activity, as defined by the County and applicant, may be identified.

EXISTING ROADWAY SYSTEM

Well field access within the study area is provided primarily from state highways and two-lane county roads. Many of these roadways also serve as regional routes.

A. North-South Routes

Interstate 5 and State Route 99 are major north-south routes which converge approximately 25 miles south of Bakersfield. Interstate 5 extends from Mexico to Canada through the states of California, Oregon and Washington, and exists as a four-lane freeway with paved shoulders and a graded median within the study area. State Route 99 extends through the Central Valley of California and operates as either a six-lane or eight-lane freeway within the study area.

State highways expected to provide north-south access to study area well fields include State Routes 33, 43 and 65. State Route 33 extends north from State Route 1 in Ventura County to Interstate 5 near Tracy and currently operates as a two-lane conventional highway within the study area. State Route 43 extends north from State Route 119 in Kern County to State Route 99 in Kings County. It operates as a four-lane highway between the cities of Shafter and Wasco and as a two-lane highway elsewhere within the study area. State Route 65 extends north from State Route 99 north of Bakersfield to State Route 198 east of Visalia. It currently operates as a two-lane conventional highway within the study area.

Most north-south county roads expected to provide access to study area well fields operate as two-lane roadways within the study area.

B. East-West Routes

Several state highways which provide access to study area well fields also function as links between Interstate 5 and State Route 99: State Routes 46, 58, 119 and 166. State Routes 46, 58 and 166 also extend westerly to the California coast. In addition, State Route 58 extends to the east and connects to Interstate 15 in the city of Barstow. State Routes 46, 58, 119 and 166 all operate as two-lane roadways in the vicinity of the well fields.

County roads which are expected to provide access to study area well fields and also serve as links for regional traffic include Lerdo Highway, Seventh Standard Road and Stockdale Highway. These roadways all operate with two lanes within the study area with the exception of Lerdo Highway from State Route 43 to State Route 99, and Seventh Standard Road from Santa Fe Way to State Route 99. Both of these segments operate as four-lane roadways.

Other county roads expected to provide east-west access currently operate as two-lane roadways in the vicinity of the well fields.

PROJECT TRAFFIC

A. Trip Generation

Traffic engineers and planners typically use trip generation rates, equations and data contained in the ITE (Institute of Transportation Engineers) Trip Generation Manual to estimate traffic volumes generated by conventional land use development (e.g., commercial, residential, recreational, etc.). However, the ITE manual does not contain similar information for oil and gas development and production.

Therefore, for the purposes of this study, a multi-tiered approach was used to estimate daily volumes of oil and gas traffic within the study area. This approach involved the use of three data sources: (1) well field vehicle counts; (2) oil and gas employment figures; and (3) AADT (Annual Average Daily Traffic) volumes. Daily trip rates developed based on the latter two data sources were used to estimate an adjustment factor for the daily trip rate developed from the first data source.

The Western Subregion and associated traffic and oil and gas data were used as the model for developing trip generation estimates due to its limited and well defined access points and high volume of oil field activity and limited number of other trip generation sources.

Well Field Counts

DOGGR data indicates that there were 36,058 active producing wells and 1,001 new wells were drilled in the Western Subregion in 2012. For the well based trip

generation estimates, activity was broken into two phases: development and production. The parameters and calculations for each phase are as follows.

Development Phase

Assume 30 trips per well per day based on oil / gas records, field observations and other studies (range 20 to 40 trips per well per day)

Assume 60 days needed to bring a new well into production (range 30 to 90 days)

30 trips per well per day x 60 days = 1,800 trips per well

Given 1,001 new wells drilled in Western Subregion in 2012

1,001 wells x 1,800 trips per well = 1,801,800 trips
(1,801,800 trips / (0.75 x 365days)) = 6,580 trips per day

SUBTOTAL: 6,600 trips / day

Production Phase

Trips per day based on oil / gas records, field observations and other studies (includes daily operation, well reworks / maintenance and plug / abandonment)

0.17 trips per well per day

Given total active producing well count of 36,058 in Western Subregion in 2012

0.17 trips per well per day x 36,058 wells = 6,130 trips per day

SUBTOTAL: 6,100 trips / day

TOTAL: 12,700 trips / day

The well based estimate for oil and gas trip generation in the Western Subregion is approximately 12,700 trips per day.

Oil / Gas Employment

The Bureau of Labor Statistics data for the year 2012 indicate that there were approximately 14,500 oil and gas field employees in Kern County. For purpose of the employee based estimate, it was assumed that the number of employees in the Western Subregion was proportional to the number of producing wells. It was also assumed that there was an average vehicle occupancy rate of 1.5 people per vehicle. The parameters and calculations for the employment based trip rate are as follows.

SOURCE: 2012 Bureau of Labor Statistics, Quarterly Census of Employment and Wages for Kern County.

Oil / gas field employees in Kern County = 14,500

Given total active producing well count of 53,943 in study area in 2012

Oil / gas field employees in Western Region = (36,058 / 53,943)
x 14,500 = 9,700

Assume vehicle occupancy rate of 1.5

Daily trips = 9,700 employees / 1.5 employees per vehicle

x 2 trips per vehicle = 12,933

TOTAL: 12,900 trips / day

The employment based trip generation estimate for the Western Subregion is approximately 12,900 trips per day, which correlates very closely with the well based estimate of 12,700 trips per day.

AADT

Regional access to the Western Subregion is limited to three routes along the western boundary and six routes along the eastern boundary. The average of the differential between published AADT volumes on the routes along each boundary was used to estimate the AADT based trip rate. The parameters and calculations are as follows.

SOURCE: Published 2012 AADT volumes from Caltrans (state routes)

SOURCE: Published 2012 AADT volumes from KernCOG (county roads)

Net AADT in Western Region (total traffic minus pass-through traffic)

= 23,400

Estimate 45% of Net AADT = agriculture and municipal / local traffic

Assume remaining 55% of Net AADT = oil / gas traffic

ADDT attributable to oil / gas activity = 0.55 x 23,400 = 12,870

TOTAL: 12,900 trips / day

The AADT base trip generation estimate for the Western Subregion is approximately 12,900 trips per day, which is the same as the employment based estimate. And both are very close to the well based estimate of 12,700 trips per day.

Adjustment Factor for Well Estimate

In consideration of the employment and AADT based estimates, the well based trip generation estimate was adjusted slightly upward.

12,900 / 12,700 = 1.02 or 1% negligible adjustment, therefore
use 12,900 trips / day for Western Region

Baseline (2012) Trip Generation for Study Area

DOGGR data indicates there was a total of 53,943 producing wells within the entire study area in 2012. A baseline trip generation estimate for the entire study area was calculated by dividing the Western Subregion trip generation estimate by the ratio of the number of producing wells in the Western subregion to number of producing wells in all three subregions. As shown below, the resultant study area baseline trip generation estimate is 19,300 trips per day.

12,900 / (36,058 / 53,943) = 19,298 trips / day

TOTAL EXISTING: 19,300 trips / day

Future Study Area Trip Generation

Future oil and gas traffic volumes were estimated by applying the well count trip rates above for development and production to annual well count projections provided by the applicant. Resultant annual future oil and gas trips for the years 2015 through 2035 are presented in Table 1.

B. Trip Distribution

For the purposes of this study, trip distribution represents the movement of oil and gas traffic between the well fields and the central metropolitan Bakersfield area. It was assumed that all oil and gas trips originate and terminate within the study area.

Oil and gas trips were assigned to roadways based on well field production rates, published AADT volumes and input from Kern County Roads Department staff regarding known well field access routes. Oil and gas trips for the year 2015 are shown in Figures 4a through 5b. The same for the year 2035 is shown in Figures 10a through 11b.

EXISTING AND FUTURE TRAFFIC

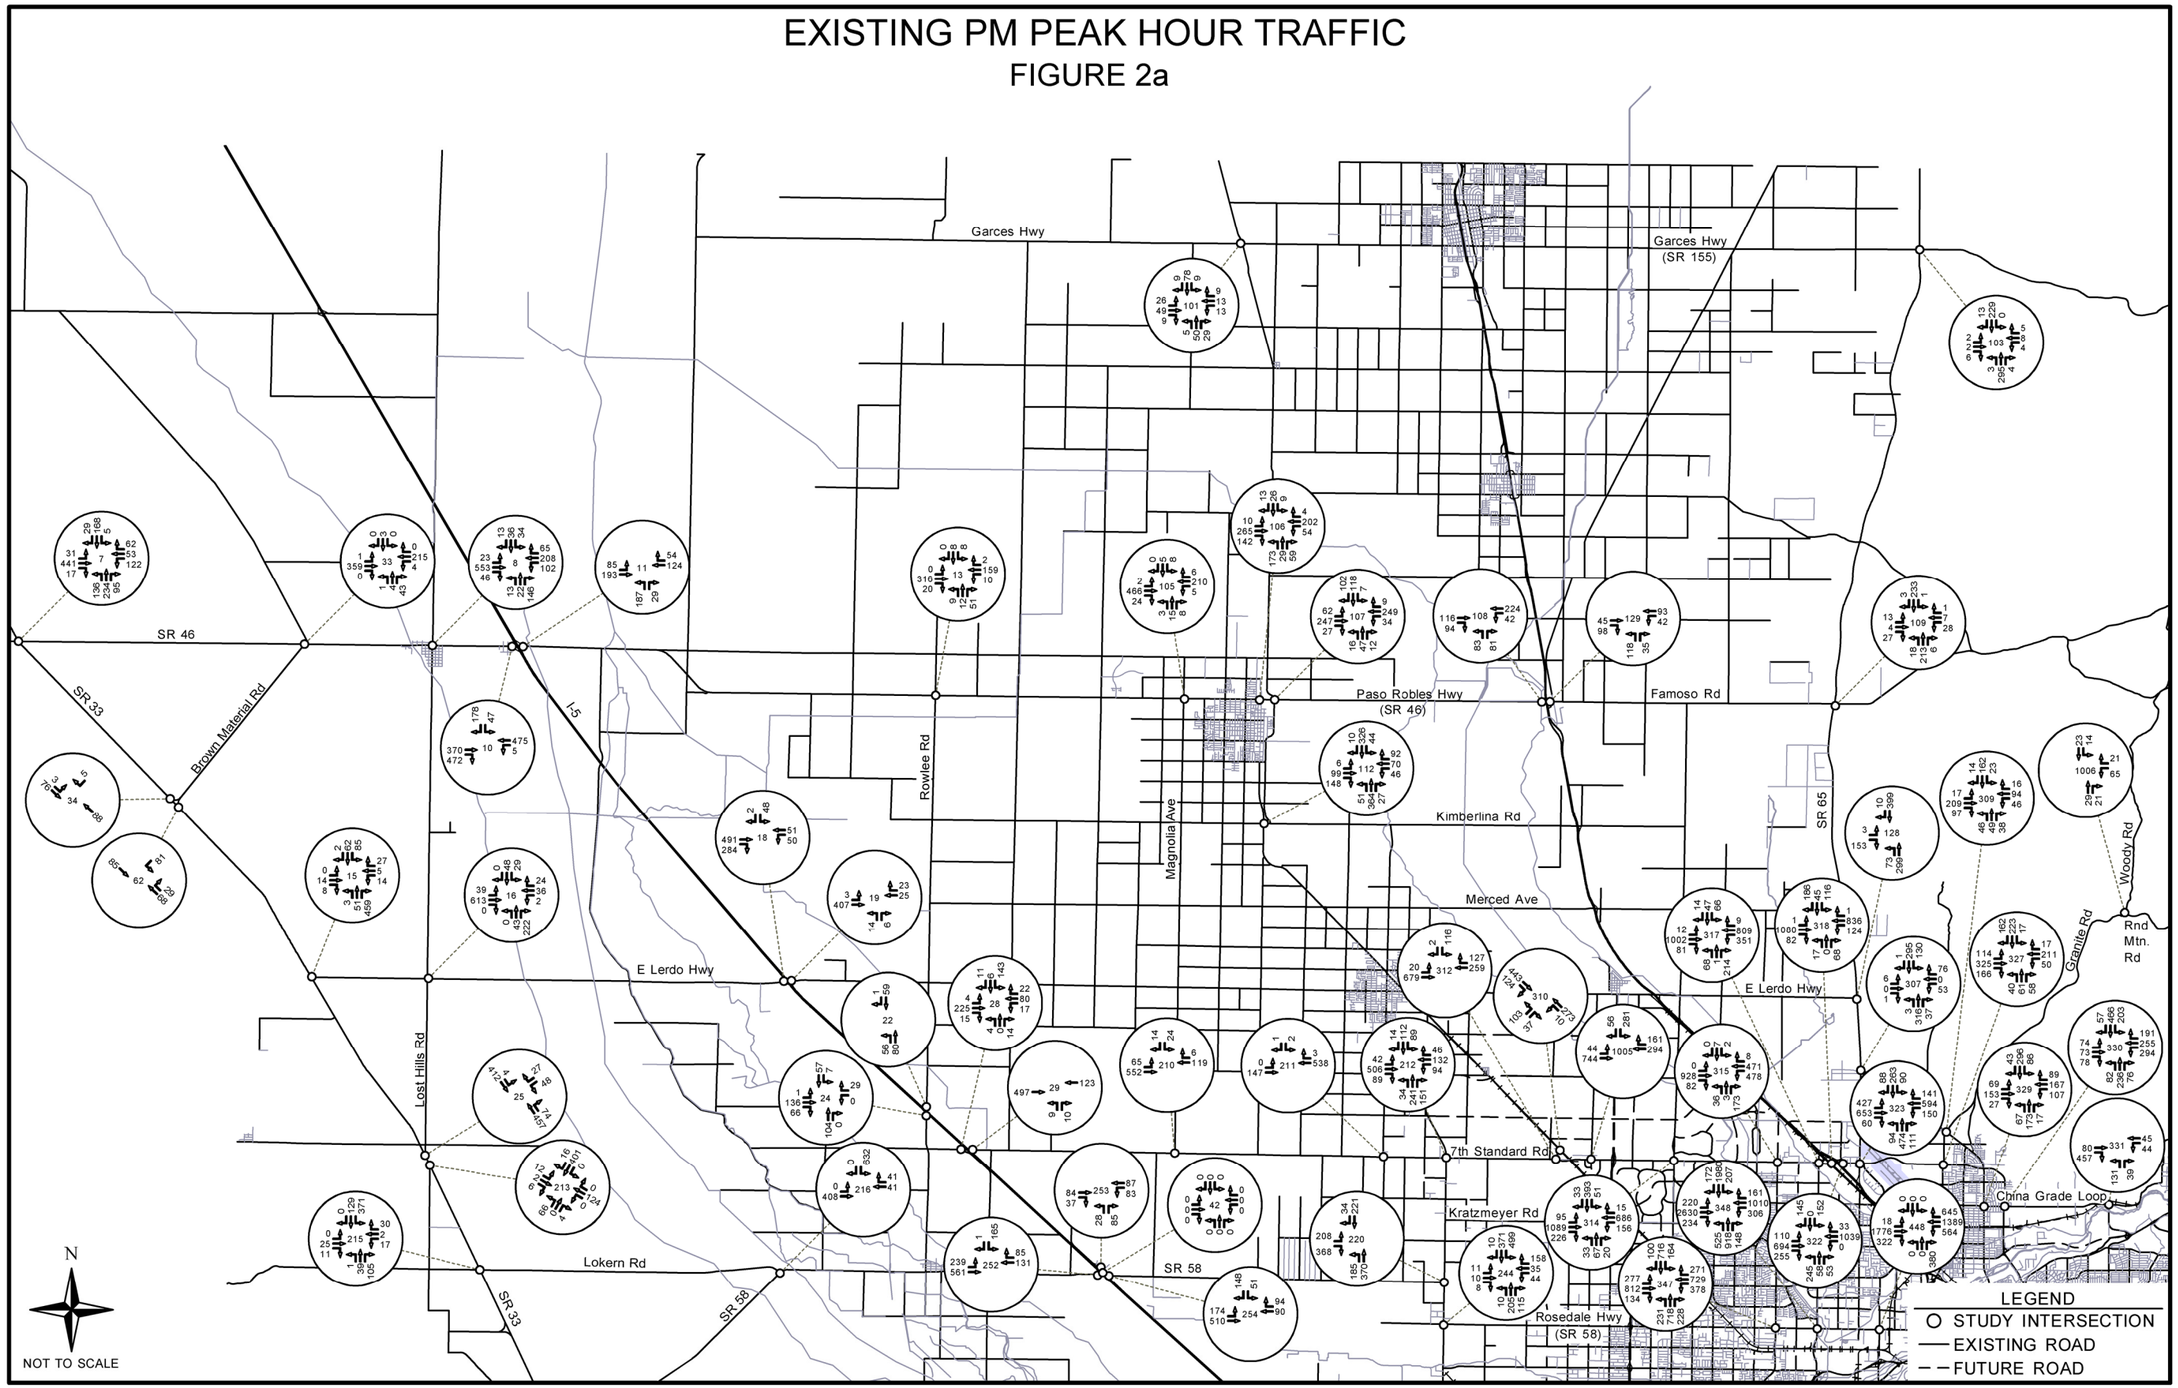
A. Existing Traffic

Traffic volumes fluctuate throughout the day, with peak periods generally occurring from 5:30 to 7:30 AM and 3:30 to 5:30 PM for the non-metropolitan regions of Kern County. Traffic impacts are typically evaluated for a one-hour peak period of traffic on the adjacent street system in both the morning and evening.

Existing weekday peak hour turning movement volumes were field measured at the study intersections in 2014. These volumes are shown in Figures 2a through 3b. It is important to note that existing traffic volumes are a combination of traffic generated by non-oil and gas (NOG) activities, as well as traffic generated by already existing oil and gas operations.

B. Future Traffic

Future traffic volumes, evaluated in this study, were developed for both, typical traffic volume growth and for oil and gas industry specific growth. These future traffic volume scenarios are referred to as “2035 % Growth Only” and “2035 NOG + O&G Projection” respectively.



Future traffic is typically projected from the existing traffic volumes using growth rates based on Kern COG traffic models; however, these growth rates may not directly apply to oil and gas activity. For this reason, future traffic was also analyzed where oil and gas traffic volumes were projected independently. In order to do this, known oil and gas generated traffic volumes were subtracted from the existing traffic volumes, growth rates were then applied to each, and finally, the two volumes were recombined to obtain the “2035 NOG + O&G Projection” volume.

Growth rates for non-oil and gas growth projections range from approximately 0.5% to 2.5%. While an average annual growth rate of 0.76% was used for projected growth of oil and gas activity, the actual annual growth rates range from 0.72% to 0.81%.

Future weekday peak hour turning movement volumes are shown in Figures 8a through 9b.

TRAFFIC IMPACT ANALYSIS

An analyses of the roadway network utilized by oil and gas generated traffic within Kern County was conducted for this study. The analysis included intersection levels of service, roadway levels of service, and pavement conditions. While pavement conditions were analyzed for all roadways within the study area, intersection and roadway levels of service were not analyzed where improvements are already included as part of the Metropolitan Bakersfield Regional Transportation Impact Fee (RTIF) program Phase IV proposed improvements.

A. Intersection Level of Service

A capacity analysis of the study intersections was conducted using Synchro 8 software from Trafficware, which utilizes the 2010 Highway Capacity Manual (HCM) analysis methodology. The analysis was performed for the following AM and PM traffic scenarios:

- Existing Traffic
- 2035 % Growth Only
- 2035 NOG + O&G Projection

Criteria for unsignalized and signalized intersection level of service (LOS) are summarized in the tables below.

LEVEL OF SERVICE CRITERIA

UNSIGNALIZED INTERSECTIONS

Level of Service	Average Control Delay (sec/veh)	Expected Delay to Minor Street Traffic
A	≤ 10	Little or no delay
B	> 10 and ≤ 15	Short traffic delays
C	> 15 and ≤ 25	Average traffic delays
D	> 25 and ≤ 35	Long traffic delays
E	> 35 and ≤ 50	Very long traffic delays
F	> 50	Extreme delays

LEVEL OF SERVICE CRITERIA

SIGNALIZED INTERSECTIONS

Level of Service	Average Control Delay (sec/veh)	Volume-to-Capacity Ratio
A	≤ 10	< 0.60
B	> 10 and ≤ 20	0.61 - 0.70
C	> 20 and ≤ 35	0.71 - 0.80
D	> 35 and ≤ 55	0.81 - 0.90
E	> 55 and ≤ 80	0.91 - 1.00
F	> 80	> 1.00

The minimum level of service goal for roadways within the Bakersfield and Kern County metropolitan areas is LOS "C." The minimum level of service goal for roadways within the non-metropolitan region of Kern County is LOS "D," and for Caltrans' facilities, the minimum level of service goal is "C."

Based on this level of service grading system, two performance criteria are generally used for determining whether a traffic forecast would cause a significant impact and therefore require mitigation. First, a significant impact is found where the addition of project traffic causes the level of service of an intersection to drop below the minimum level of service goal. Second, a significant impact is found if an intersection operates below the minimum level of service goal in the base year prior to the addition of

project traffic, and the added project traffic lowers the level of service below its pre-project status.

Levels of service for the unsignalized intersections in the study are presented in Table 2. Levels of service for the signalized intersections in the study are presented in Table 3.

B. Roadway Capacity

The volume-to-capacity ratios for the roadways within the study area were calculated with published annual average daily traffic (AADT) information and future projected traffic. Where current AADT data was not available, the most current year's data was projected out to the existing year using an appropriate growth rate for the specific roadway. AADT volumes are shown in Table 4. AADT volumes are also shown graphically in Figures 12 through 16.

The Circulation Element of the Metropolitan Bakersfield General Plan lists the following daily traffic capacities for various types of roadways.

Roadway Class & Number of Lanes	Ultimate Capacity
8-lane freeway	187,500 vehicles
6-lane freeway	140,625 vehicles
4-lane freeway	93,750 vehicles
6-lane expressway	75,000 vehicles
6-lane arterial	60,000 vehicles
4-lane arterial	40,000 vehicles
4-lane collector	30,000 vehicles
2-lane collector	15,000 vehicles

A volume-to-capacity ratio (v/c) of greater than 0.80 corresponds to a LOS of less than C, as defined in the Highway Capacity Manual.

The minimum level of service goal for roadways within the Bakersfield and Kern County metropolitan areas is LOS "C." The minimum level of service goal for roadways within the non-metropolitan region of Kern County is LOS "D," and for

Caltrans' facilities, the minimum level of service goal is "C." A significant impact is found where project traffic reduces the LOS to below the minimum level of service goal, or where the pre-existing condition of the roadway is below the minimum level of service goal, and the LOS degrades below the pre-existing level of service with the addition of the project.

The volume-to-capacity ratios calculated for the study roadways are shown in Table 4. The volume-to-capacity ratios are also shown graphically in Figures 17 through 19.

C. Pavement Condition

Analysis of the potential impacts of future oil and gas development on the pavement condition of roadways within the study area involved estimating remaining pavement service life and assessing the need and timing for maintenance and rehabilitation improvements. The analysis was conducted for each of the study years (2015 through 2035) and included approximately 640 centerline miles of county roads and approximately 545 centerline miles of state routes.

Two primary data sources were used for the pavement condition analysis: truck load and pavement condition.

Truck Load

Heavy truck traffic is the primary factor affecting pavement condition. Pavements are designed using a Traffic Index (TI) which is a measure of the cumulative number of heavy trucks expected to load a pavement over its service life. As per Caltrans methodology, TI's are estimated by converting mixed truck loads to 18,000-pound Equivalent Single-Axle Loads (ESAL's).

A TI for a 20-year design life (standard for new roadway construction) was assigned to each study roadway. Caltrans truck count data for the year 2012 were used to develop TI estimates for state routes per Caltrans methodology. When available, design TI's obtained from record drawings were used for county roadways. For each of the remaining county roadways, TI's were estimated based on a review of KernCOG traffic count data and roadway classification. The range of 20-year TI's used for this study along with corresponding maximum ESAL values are presented in Table 5.

Table 5

TI and Maximum ESAL

Roadway Type	20-Year Traffic Index (TI)	Maximum Equivalent Single-Axle Load (ESAL)[1]
FREEWAY State	10.0 – 15.5	3,020,000 – 112,000,000
HIGHWAY State	8.0 – 12.0	487,000 – 13,500,000
ARTERIAL County	9.0 – 10.0	1,270,000 – 3,020,000
COLLECTOR County	7.0 – 8.5	164,000 – 798,000

[1]Taken from Table 613.3C, Caltrans Highway Design Manual (September 1, 2006)

Pavement Condition Data

Caltrans assesses the condition of the California State Highway System (SHS) through its Pavement Condition Survey (PCS). The PCS data collection process involves conducting pavement surface condition inspections and measuring ride quality. As defined in Table 6, PCS data are grouped into one of three pavement "condition states."

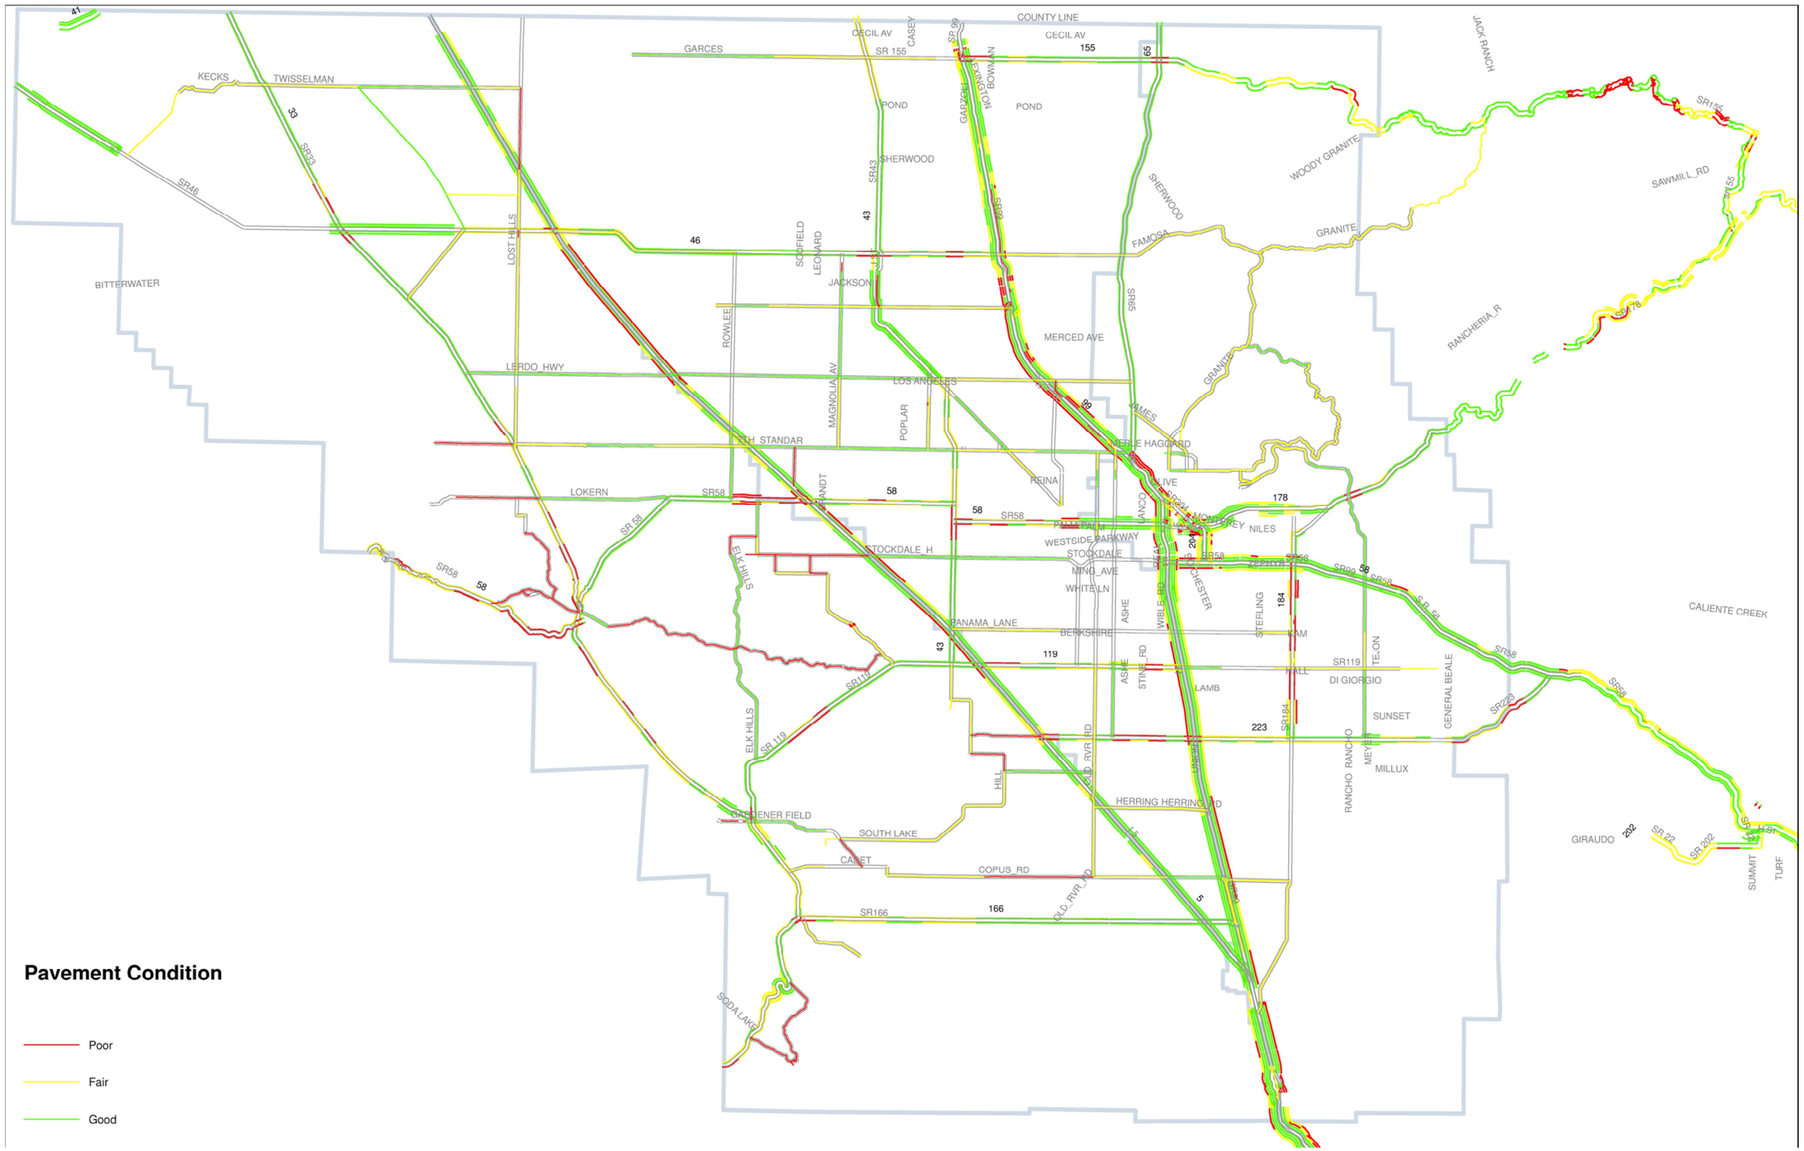
Table 6

State PCS Conditions

Pavement Condition	Condition State	Visible Distress
GOOD	**1**	Pavement in good/excellent condition No or few potholes or cracks
FAIR	**2**	Pavement in fair condition Minor surface distress (cracking, raveling and potholes)
POOR	**3**	Pavement in poor condition with extensive/significant cracks or poor ride only

Kern County assesses pavement condition using the PASER (Pavement Surface and Evaluation Rating) system. PASER ratings are assigned to County roadways based on visual surface condition inspections and range from "1" (failed pavement in need of reconstruction) to "10" (new pavement or pavement with no visible signs of distress). For the purposes of this study, PASER ratings were grouped as shown in Table 7 to generally correspond with Caltrans' pavement condition states.

Table 7



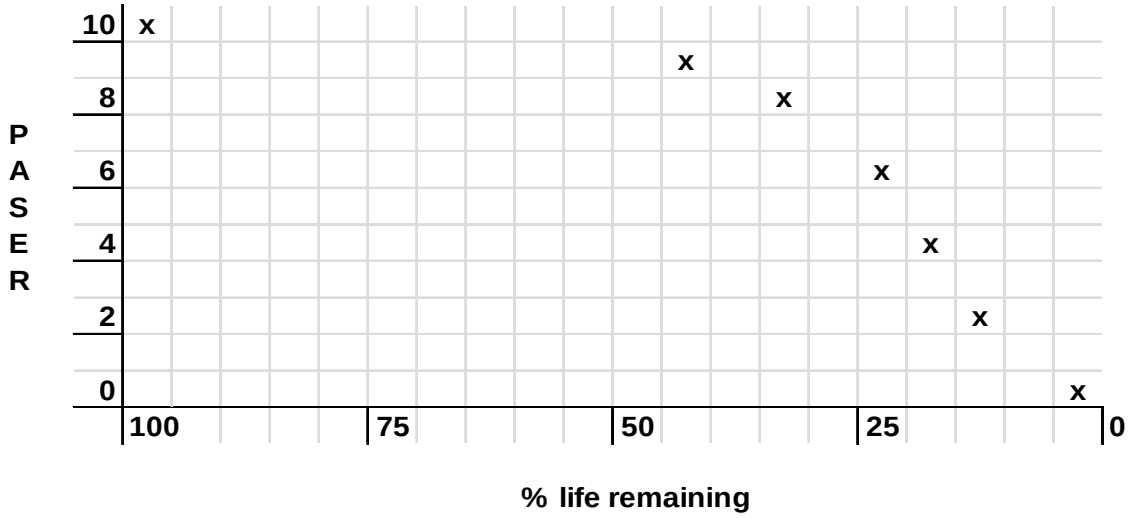
County PASER Ratings

Pavement Condition	PASER Rating	Visible Distress
GOOD	**10**	NONE (new construction)
	9	NONE (recent overlay)
	8	Sealed or light linear cracks
FAIR	**7**	Moderate linear cracks, no or light surface wear, no or few patches in excellent condition
	6	Severe linear cracks, early block cracking, light surface wear, patches in good condtion
	5	Secondary linear cracks, block cracking, moderate surface wear, patches in good condition
POOR	**4**	Multiple linear cracks, block cracking, severe surface wear, patches in fair condition, ruts
	3	Multiple linear cracks, severe block cracking, some alligator cracking, patches, ruts, potholes
	2	Alligator cracking, severe ruts, extensive patches in poor condition, potholes
	1	Extensive amounts of severe distress

PCS and PASER data for the year 2013 were used for this study. Corresponding pavement conditions (GOOD, FAIR and POOR) for roadway segments within the study area are shown in Figure 20.

Figure 20

Pavement Condition Map



The Kern County Roads Department has a general policy goal of maintaining at least 50 percent of its roadways at or above a PASER rating of 5 (GOOD or FAIR condition). A review of the study pavement condition data revealed that county roadways within the study area met this goal in 2013. Similarly, it was also found that at least 50 percent of study area state routes were in GOOD or FAIR condition in 2013. These 2013 condition levels were used as the baseline conditions for the pavement condition analysis.

Analysis

The pavement condition analysis consisted of assessing the need and timing for maintenance and rehabilitation improvements per roadway segment per study year based on estimates of remaining pavement service life. Both remaining life and improvement needs were estimated based on a pavement life cycle curve developed for this study. The curve, presented in Figure 21, closely approximates a "typical" pavement life cycle curve and correlates PASER ratings to pavement condition.

Figure 21

Pavement Life Cycle Curve

The study pavement life cycle curve and 2013 pavement condition data were used to estimate a baseline remaining service life for each study roadway. As shown below, the baseline percentage of remaining life per roadway segment was then applied to the maximum ESAL corresponding to the roadway's twenty-year TI in order to establish the baseline ESAL total for the roadway segment.

baseline ESAL total = (baseline % remaining service life) x (maximum ESAL)

For each of the subsequent years, remaining service life per roadway segment was estimated by deducting the annual ESAL from the ESAL total for the preceding year. Annual ESAL's were calculated for each study roadway using Caltrans' methodology based on future traffic volume projections (discussed previously) and estimates of total truck and axle group percentages (developed based on Caltrans and KernCOG traffic count data).

For the purposes of this study, the need for a pavement condition improvement per study roadway per study year was identified when one of the remaining service life threshold conditions shown in Table 8a was met. The scheduling of needed improvements, as shown in Table 8b, was prioritized based on pavement condition and traffic volume, as shown in Table 9, in order to maintain the baseline pavement conditions for county roads and state routes. In general, roadways were scheduled for needed maintenance or rehabilitation in priority order (1 through 9) for each study year until these baseline conditions were met. All unscheduled improvements were deferred except for overlays when, if not done in the present year, would lead to reconstruction in the following year. The remaining life resets in Table 8a were applied in the year the corresponding pavement condition improvement was scheduled.

Table 8a

Pavement Condition Improvement

Thresholds and Resets

Type	PREVENTIVE MAINTENANCE		CORRECTIVE MAINTENANCE		MAJOR REHABILITATION		ROADWAY RECONSTRUCTION

Scheduling Prioritization

Traffic Volume	Pavement Condition		
	GOOD C: PASER Rating 8 - 10 S: PCS State 1	**FAIR** C: PASER Rating 5 - 7 S: PCS State 2	**POOR** C: PASER Rating 1 - 4 S: PCS State 3
HIGH C: AADT $\geq$ 5,000 S: AADT $\geq$ 25,000	1	2	5
MEDIUM C: 2,000 $\leq$ AADT < 5,000 S: 10,000 $\leq$ AADT < 25,000	3	4	6
LOW C: AADT < 2,000 S: AADT < 10,000	7	8	9

C = County
S = State

A breakdown of roadway improvements needed over the study period (2015 through 2035) is shown in Table 10. These improvements are based on estimates of existing and future pavement conditions and include impacts attributable to oil and gas activities within the study area. The relative impact of future oil and gas development on pavement condition is addressed under "MITIGATION."

Table 10

Roadway Maintenance and Rehabilitation Summary

Study Years: 2015-2035

	Maintenance and Rehabilitation			
	Preventive Maintenance (lane miles)	Corrective Maintenance (lane miles)	Major Rehabilitation (lane miles)	Reconstruct Roadway (lane miles)
All Study Roadways	4,180	1,766	1,419	379

It is noted that preventive and corrective maintenance measures are designed to maintain pavement with little-to-moderate levels of distress in good condition and generally have an expected service life of less than ten years. It is for this reason that roadways within the scope of this study would be scheduled for preventive and corrective maintenance multiple times over the 20-year study period. In contrast, rehabilitation measures are designed to provide structural enhancement to severely distressed pavements and have an expected service life ranging from ten years for a structural overlay to twenty or more years for complete reconstruction. Consequently, study roadways would receive structural enhancement once or twice over the 20-year study period.

D. Accident History

Roadway accident history data obtained from the county and state were reviewed for this study. Potential areas of concern regarding accidents were also discussed with Kern County Roads Department staff. In general, there were no specific findings

indicating increased accidents rates on study area roadways related to oil and gas activity. Historically, the county has addressed various safety and operational issues which have arisen periodically over the years due to changes in roadway activity along oil and gas routes.

E. Geometrics

Discussions with Kern County Roads Department staff regarding potential roadway geometric concerns indicated that occasional issues regarding roadway widths, curve radii and corner returns periodically occur due to changes in large truck activity and traffic volumes on historically low traffic roadways with no, or minimum-width, paved shoulders. These issues have been dealt with in the past through the addition of paved shoulders or other miscellaneous improvements.

MITIGATION

A. Intersection LOS & Roadway Capacity

Intersection and roadway improvements needed in the years 2015 and 2035 in order to maintain or improve the operational level of service of the roadway system within the study area are shown in Tables 11 and 12, respectively. Improvements shown for the year 2035 assume that mitigation identified for the year 2015 was not completed.

Tables 11 and 12 also include the project percent share of the cost for the implementation of the noted mitigation measures. The project percent share is calculated by dividing the oil and gas traffic by the total traffic.

$$\text{Percent Share} = \frac{\text{Oil \& Gas Traffic}}{\text{Total Traffic}} \times 100$$

B. Pavement Condition

It is anticipated that the county will develop and implement a pavement condition mitigation program. The purpose of pavement condition mitigation is to ensure that project-related activities contribute a fair share for the preservation, upkeep and restoration of county roads and appurtenant facilities. The project-related activities will occur on and contribute to the general deterioration of roads throughout Kern County.

Determining when roads within the county need maintenance is necessarily qualitative and depends on various factors, including the level and type of activity, planned transportation improvements and prioritization of financial resources. The Kern County Roads Department is responsible for this evaluation and implementation of related improvements.

Unlike a traffic mitigation program that might prescribe particular improvements that are necessary to maintain an identified level of service, the pavement condition mitigation program would contribute funding to the county's general road maintenance program, as administered by the Roads Department, to fund the fair share attributable to project activities of necessary improvements to the county-wide road system, consistent with the county's existing program, expertise and prioritization.

Roadway maintenance and rehabilitation work needed to maintain or improve the pavement condition of county roads and state routes within the study area in each of the study years, 2015 through 2035, is shown in Table 12.

Table 12 also includes the project percent share of the cost to complete needed work. For each study year, the project percent share for pavement condition improvements

is based on the ratio of oil and gas truck loading to total truck loading, as shown below:

$$\text{Percent Share} = \frac{\text{Oil \& Gas Truck Loading}}{\text{Total Truck Loading}} \times 100$$

Oil and gas truck loading was estimated using the truck percentages shown below. Both the percent total trucks and percentages for the axle groups were estimated based on KernCOG truck count data for roadway segments within the study area that were assumed to be used primarily, if not almost exclusively, by oil and gas traffic.

10% oil and gas traffic = heavy trucks

- 35% = 2-axle trucks
- 10% = 3-axle trucks
- 25% = 4-axle trucks
- 30% = 5-or-more-axle trucks

Approximately 1,185 centerline miles of state routes and county roads are included in the scope of this study and were evaluated for potential pavement condition impacts resulting from oil and gas truck traffic. Approximately half of this total (approximately 593 centerline miles) was considered to be primary and secondary routes for oil and gas traffic. For the purposes of this study, specific volumes of oil and gas traffic were assigned to primary and secondary routes and a nominal volume was assumed for the remaining roadways. To account for the nominal traffic volumes, a 1 percent proportionate share for pavement condition improvements was assigned to non-primary and non-secondary routes.

[1]Most high volume roads have acceptable conditions.

[2]Roadway cannot be expanded further.

[3]Assumes no mitigation implemented in 2015.

[4](NOG)None Oil and Gas Traffic; (O&G) Oil and Gas Traffic

C. Accidents and Geometrics

As stated previously, there are no specific items identified for improvement or mitigation related to recent accident history or existing roadway geometrics. In addition, the specific nature of issues which may arise in the future is unknown at this time. However, historical activity indicates that such issues may arise periodically, and therefore, it is recommended that an improvement item in the cost range of less than $500,000 every five years be included in the listed potential mitigations.

CONCLUSION

This transportation study assessed the potential traffic impacts of future oil and gas development and production within Kern County, California. Evaluation of the vehicular traffic associated with oil and gas well activity was characterized by three main areas: traffic operations, roadway pavement conditions and safety.

Of the approximately 593 centerline miles of primary and secondary routes utilized by oil and gas traffic, approximately 36 centerline miles currently operate below the adopted level of service standard, and approximately 159 centerline miles are anticipated to operate below the level of service standard by 2035. In general, the decrease in level of service, which is anticipated by 2035, is the result of anticipated population growth.

Additionally, of the 101 study intersections evaluated for operational level of service, 34 currently operate below the adopted level of service standard, and an additional 15 intersections are anticipated to operate below the level of service standard by 2035. Most of the decrease in level of service is caused by the anticipated population growth and associated increase in travel for the region.

Pavement conditions and the service life for each roadway within the study area were also evaluated. This analysis, summarized in Table 12, resulted in maintenance measures and the project percent share for the recommendations.

Potential mitigation measures and proportionate share responsibility for the traffic associated with oil and gas well activity, as defined for this study, have been identified for intersection improvements, roadway widening and pavement condition improvements. These improvements are anticipated over the next 20 years to maintain acceptable roadway operations.
